2015: Opportunities and Predictions

Before we put together the first issue of *RadioResource International* magazine in 2015, we conducted a reader survey to get a pulse on our readers' needs and plans for the year. Nearly half of our readers plan to upgrade their communications networks during 2015, and nearly 17 percent of respondents plan a complete network replacement.

As the industry's only global vendor resource, this Worldwide Buyers Guide issue will be a year-long asset to professional mobile radio (PMR) users looking for new equipment for mobile radio networks. The "Product Category Index" on Page 32 will help you find the companies that provide the specific equipment you are looking for. Then you can find the website for each company that you are interested in beginning on Page 24 in the "Suppliers Index."

Our editorial and research departments spend a great deal of time throughout the year keeping the information in this issue up to date, so take advantage of the data to boost your communications network. And if you have suggestions for improvements, please let us know.

The majority of our readers will have 2015 communications budgets that are larger than their 2014 budgets, which bodes well for our industry. Along with new fiscal responsibility, the new year brings challenges and promise.

Here are the topics that I predict will continue to develop during 2015. Emergency number evolution from voice only to multimedia will occur in more countries, as we've witnessed in Australia, some European nations, and the United States and Canada. The digital radio transition will continue and will affect more vertical markets from utilities to transit agencies to public safety. Spectrum allocation and standards for public-safety broadband will make huge headway this year leading up to and during the World Radio Conference (WRC) in November. Countries will continue to

We value your opinions! Please email your feedback to me at swendelken@RRMediaGroup.com.

define their disaster response best practices, and communications will become an even larger part of their plans.

We welcome your predictions as well. Best wishes for 2015!

IDAS™ dPMR™ System Enhanced Functionality and Extended Capability

ASIA

South Korea Selects 700 MHz Band 28 for Nationwide Public-Safety LTE Network

The South Korean government confirmed its public-safety Long Term Evolution (PS-LTE) public protection and disaster recovery (PPDR) network frequency band as 718 – 728 MHz uplink and 773 – 783 MHz downlink. This is band 28, the standard frequency for the Asia-Pacific Telecommunity (APT) band plan known as APT-700.

In July, the South Korean government adopted plans to build a broad-band network dedicated to public safety using LTE technology to be deployed nationwide by 2017. The plan calls for 20 megahertz of dedicated spectrum

South Korea

in the 700 MHz band. The specific frequencies were not defined until November.

Following a request for proposals

(RFP) process, the government selected LG CNS to create the information strategy plan (ISP). Three companies, including Korea Telecom, SK C&C and LG CNS, submitted bids for the ISP contract.

The ISP draft result was expected to be announced in December, said Dujong Choi, Telecommunications Technology Association (TTA) of South Korea. At press time, the announcement had not been made. The ISP will address many questions, including expected cost, network site specifics and vendor involvement.

HONG KONG — The Dynamic Spectrum Alliance (DSA) is working to promote Asian regulatory policies that will pave the way for innovative new wireless technologies, addressing increasing wireless data challenges.

The Chinese government made advancements regarding management of its spectrum resources as it continues a public consultation period on revising its radio spectrum management policies. In Singapore, the Info-comm Development Authority (IDA) developed a regulatory framework for unlicensed access to 180 megahertz of unused radio spectrum in the broadcast TV frequency bands, which went into effect in November.

The Taiwan Dynamic Spectrum Access Pilot Group is working to create and develop a dynamic spectrum access ecosystem in Taiwan. This will leverage Taiwan's capabilities in semiconductor design and fabrication, component and device manufacturing, and systems integration and solutions.

Separately, the IEEE Standards Association (IEEE-SA) announced the availability of the IEEE 802.19.1 "Standard for TV White Space (TVWS) Coexistence Methods."

"The IEEE 802.19.1 standard

enables the line of IEEE 802 wireless standards to effectively utilize the TV white space," said Steve Shellhammer, chair of the IEEE 802.19 Wireless Coexistence Working Group. "This is accomplished by providing standardized coexistence methods among dissimilar or independently operated TVWS networks. The TVWS is made up of vacant frequencies made available for unlicensed use and provides good RF propagation characteristics for unlicensed wireless communications. The IEEE 802.19.1 standard is intended to help achieve fair and efficient spectrum sharing."

In addition, **AirTies, Aruba Networks, ATDI, Broadcom and Saankhya Labs** are the latest members to join the Dynamic Spectrum Alliance, with Broadcom and Aruba Networks being elected to its board of directors.

EUROPE

LONDON — A new service developed by **British Telecom (BT), EE** and **HTC** can pinpoint the source of 9-9-9 emergency calls from mobile phones 4,000 times more accurately than the current system — to a radius of 30 meters or less — cutting the han-

dling time for emergency services.

The new geographical location system, called Advanced Mobile Location (AML), can identify the source of a mobile phone emergency call to within 0.003 square kilometers.

About 60 percent of 9-9-9 and 1-1-2 calls in the U.K. are made from mobile phones, all of which are handled by BT call centers. Emergency services are only able to identify approximate locations of callers to within a few square kilometers.

When an emergency call is made with an AML-enabled smartphone, the phone automatically activates its location service and sends its position by text message to the 9-9-9 service — on average within 18 seconds. This text message is not visible on the handset and is free. The text is automatically matched to the voice call and compared with the network's cell-based information to ensure it is valid. The location is then sent to the appropriate emergency service, supplementing the cell-based information.

"I'm delighted to see this development," said Sue Lampard, president of British Association of Public Safety Communications Officials (BAPCO). "The 9-9-9 service has remained

Australia Undertakes Review of Emergency Number System

Nearly 40 responses to the Australian government's review of the national triple zero emergency number were received and will be reviewed and incorporated into a report to the Minister for Communications by March 2015.

Triple zero (0-0-0) is Australia's primary emergency service number to obtain assistance from the police, fire or ambulance service in a time-critical or life-threatening situation. Australia has two secondary emergency service numbers that work only with particular technologies: 1-1-2 is the international standard emergency number that can be called from a GSM mobile, and 1-0-6 is the text-based emergency number for people who are deaf or have a hearing or speech impairment and can be called from a teletypewriter (TTY).

The government released a discussion paper on the review of the national triple zero number in July, and comments were

due in August. The review is considering how the number can adapt to the changing telecommunications environment so it can continue to support emergency communications into the future.

Telstra is the triple zero operator but is subject to a competitive tender scheduled for June 2016. Future public expectations for the voice-only service include that it be available easily and quickly anywhere at anytime for free. Australia's review includes a list of eight questions to determine how the service can best move forward.

The University of Melbourne's Centre for Disaster Management and Public Safety, Association of Public-Safety Communications Officials (APCO) Australasia and the Victorian Spatial Council submitted joint responses. The groups said triple zero service in the future should comprise both voice and data components and needs to be built on an open standards roadmap. The response raises about 20 key points about the future triple zero service for further discussion regarding what the tender and the contract for the service will need to address to contribute to the future security and well-being of all Australians. Numerous governmental, private entities and citizens also submitted responses.

Similar initiatives are underway in Europe for its 1-1-2 service and in the United States for next-generation 9-1-1 (NG 9-1-1).

voice-centric since 1937 — whilst multimedia technology has developed around it. In the 21st century it is hard to believe that the U.K. emergency services are unable to receive good location data; they are reliant on the caller to tell them. Invariably during a 9-9-9 call, the caller will be distressed, so trying to pinpoint their location adds unnecessary time before resources can be deployed."

AML is available for emergency calls made on the EE network on all new HTC phones. The companies are working with the other U.K. mobile networks to offer the same approach by all networks and manufacturers free. It is expected that it will be available on HTC handsets on other networks shortly, and a number of other handset manufacturers have started to develop it for future models.

GENEVA — The International Telecommunication Union (ITU) membership meeting in Busan, South Korea, for the Plenipotentiary Conference passed a resolution to

improve global flight tracking for civil aviation. The new resolution instructs the forthcoming World Radiocommunication Conference in 2015 (WRC-15) to consider global flight tracking in its agenda and instructs the director of ITU's Radiocommunication Bureau to submit a specific report on the matter to WRC-15.

This report will include the results of studies, which have been carried out in the ITU Radiocommunication Sector (ITU-R) for the past two years and are being accelerated as a result of this resolution.

This follows the March 2014 disappearance and loss of Flight MH370 with 239 people on board, which spurred worldwide discussions on global flight tracking and the need for coordinated action by ITU and other relevant organizations.

In June, ITU also established a focus group under the umbrella of the Telecommunication Standardization Sector (ITU-T) on aviation applications of cloud computing for flight

data monitoring. This group will study the requirements for telecommunications standards to enable an "aviation cloud" for real-time monitoring of flight data, including those for the protection, security and ownership of flight data and the technical mechanisms and policies to govern access to these data.

LONDON — The global professional mobile radio (PMR) systems market is expected to grow at a modest pace and post a compound annual growth rate of 9.42 percent between 2014 and 2018, according to a report from research firm TechNavio.

The report identified the increasing number of devices supporting Long Term Evolution (LTE) and PMR networks as a major trend set to impact the overall market.

"The industry is expected to gain more traction in terms of demand for devices that support LTE and PMR networks. These types of devices will lend a competitive

European PMR Operator Expands to U.K. with DMR Network

Entropia Digital, a European commercial professional mobile radio (PMR) operator, announced its expansion into the Greater London area with a new Digital Mobile Radio (DMR) Tier 3 network for business users. This DMR network brings the number of Entropia networks to three,

joining TETRA networks in Belgium and the Netherlands.

Tait Communications signed a long-term agreement to provide the DMR network, including terminals and technical support. Entropia will deploy a minimum of 200 sites with Tait infrastructure to provide

London

coverage across the U.K. for thousands of portable and mobile users, said Philip Vercruysse, Entropia founder and CEO.

The network rollout will begin in London before expanding to the southeast and other key metropolitan areas, including Birmingham, Manchester and north to Scotland.

The TETRA network in Belgium is supplied by Rohde & Schwarz, while the TETRA network in the Netherlands is a Motorola Solutions network. The Netherlands' network is the largest commercial TETRA network in the country and had a full upgrade in August. In addition, the network is equipped with double high redundant IP TETRA network switches that are geographically separated. The network is supported via TetraNed.

Entropia's networks are designed for business users and provide all the equipment and services needed, including mobile radios. The PMR voice communications for all three systems include group conversation, multiple groups, individual call, selective call, emergency call and telephone connection. Data communications include status service, short data service and package data communications. The company also offers paging in the Netherlands.

Additionally, the company offers control room software to aid communications between groups of mobile workers and a central control room or dispatch center. Entropia offers customers a digital gateway between the Entropia network and conventional networks.

The PMR operator features an extensive business partner channel to serve its markets, said Vercruysse. The business partners act as a service point, connecting end customers and providing accessories and maintenance.

edge to organizations choosing to capitalize on them, as they can switch easily between both the technologies based on the requirement at hand,” said Faisal Ghaus, vice president of TechNavio.

SUWANEE, Georgia, USA — Four new companies joined the NXDN

Forum. The new member companies are **Alinco, Cimarron Technologies, Data Over Radio** and **Numonix**.

The new members comprise two-way radio application providers and radio manufacturers and will add to the support of the NXDN standard. There are more than 1.5 million NXDN terminals and infrastructure in the market.

Antarctica Winter Expedition Uses Codan HF Radios

Codan Radio Communications was selected to provide the HF radios for Sir Ranulph Fiennes and his Ice Team for The Coldest Journey to cross Antarctica in winter.

Paul McCarter, the communications adviser for the expedition, worked with Sir Ranulph for more than a year to gain support from global companies to use the best equipment for the communications challenge. The final array of equipment included HF radios, satellite base stations, navigation equipment, and short-range marine and land handheld radios.

When the expedition was complete, the communications equipment was handed over to the International Polar Foundation.

“To provide communications from one of the remotest and coldest places in the world, you need extraordinary radio equipment that can withstand the rigors of the journey and perform in the extremes,” said Fiennes, co-leader of The Coldest Journey and one of the world’s leading explorers. “We selected Codan as we knew their HF radios would guarantee communications, and they did not let us down.”

The Coldest Journey was tasked with ensuring that Fiennes and his six-man team could traverse the South Pole in polar winter, a feat so dangerous that it has never before been attempted. It required the best equipment just to keep the team alive throughout the six-month expedition. In the end, Fiennes was extracted because of frostbite in the early stages of the expedition. The remaining team continued the attempt but had to abandon the traverse because of extremely difficult crevassing.

connections for life's necessities. This expectation of always being connected has influenced the design of everything from cellular phones to automobiles to appliances such as water heaters and refrigerators. Critical service industries such as electric, gas and water systems are not immune to the expectation of connectivity.

The organizations that provide electricity, water, gas and petroleum to the public are under pressure to upgrade their infrastructure, some of which is more than 40 years old. The electric industry has envisioned a "smart grid" where devices are connected and assigned IP addresses. Utilities are under regulatory scrutiny to provide higher reliability and higher quality power, while preventing terrorists and adversarial nation states from accessing their networks. The water, gas and petroleum businesses are under similar pressure. The only way to increase reliability and quality for these resources is to give the operators more insight into their own operations. This is accomplished with sensors, switches, regulators and other hardware that automate network restoration and operation. The only effective way to provide connectivity to these devices is with wireless communications.

Wireless communications relies on radio spectrum, and access to suitable radio spectrum has been an issue for mission-critical communications firms for decades. Spectrum options for utilities are often limited, especially in urban areas. North American utilities often use the same unlicensed spectrum as wireless routers and baby monitors for meter reading and other

With digital radio standards, it is feasible to use the same technologies for both voice and data communications in the same network.

By Klaus Bender

Digital voice land mobile communications systems are becoming more common as the standards mature and the market becomes more familiar with the technologies. These systems also offer data communications capabilities, and this article examines the feasibility of using the same technologies for both voice and data communications in the same system.

Digital Challenges and Opportunities

Wireless communications continues to serve a critical role in our society, as technologies advance at an astounding rate. Wireless devices possess more computing power than their laptop computer ancestors of a decade ago. Society depends on being connected and often requires broadband

BIRD HAS YOUR CITY COVERED

Total reliability in public safety LTE is more than possible. It's *essential*.

Public safety can't be a "maybe" or "tomorrow" or "we're working on it." It has to be NOW and always ON. Bird reliability *saves* lives in mission-critical situations in the most challenging cityscapes and their buildings. With the advancement of public safety broadband over LTE, Bird is building reliability from the INSIDE-out. Using the full strength of trusted brands Bird, DeltaNode and TXRX, you get *essential reliability*.

When lives are at stake, rely on Bird.

1. Digital BDA (TX RX Systems):

Flexible digital filters can be configured to pass signals of interest and reject interfering signals

2. Fiber DAS Head End (DeltaNode): Modular system can be used to condition and combine both narrowband and broadband signals and send over fiber

3. Fiber DAS Remotes (DeltaNode): High output power coupled with low noise figure gives efficient coverage without sacrificing uplink performance

4. Low PIM Couplers/Components (Bird): Low PIM components prevent interference and maximize system performance

RF Test and Measurement Systems and Services:

Get the system operating and keep it operating with the equipment and skill set of Bird's RF Experts

noncritical applications. However, the possibility of harmful interference on these frequencies makes their use for critical communications problematic. Similarly, relying on wireless carriers to provide connectivity is equally problematic, because wireless carriers do not construct their networks to the reliability standards needed by mission-critical communications companies, especially in rural areas. Critical infrastructure providers are forced to build their own networks and often struggle to find spectrum for these networks.

Voice Communications

Another important part of improving the quality and reliability of critical resources relies on voice communications with field employees. Utility workers often arrive at accidents and other emergencies before other first responders, and reliable voice communications is vital. While some critical communications firms use commercial mobile operators for field force communications, a majority of the industry uses professional mobile radio (PMR) systems for voice communications. Many firms have upgraded their PMR systems to use digital modulation. Other companies face the end of life of their systems and are looking at replacements. These utilities must convince their management that it makes more sense to buy a system costing millions of dollars than to buy the service from a wireless carrier.

PMR systems are designed to provide consistent coverage across the entire service territory, not just urban areas. PMR systems are often more reliable than commercial carriers, as mission-critical communications firms use battery and diesel generator backup more readily than commercial networks. Critical infrastructure providers have control over the cost and features of their systems, tailoring the technology to their current and future needs. As land mobile communications moves to digital technologies, operators can examine if the network used to deliver PMR voice communications may also be used to support the increasing need

Technology	Frequencies	Bandwidth	Data Rate
DMR	VHF, UHF, 800 MHz, 900 MHz	6.25 kHz 12.5 kHz	9,600 bps
dPMR	VHF, UHF	6.25 kHz	4,800 bps
NXDN	VHF, UHF, 800 MHz	6.25 kHz 12.25 kHz	4,800 bps 9,600 bps
Project 25	VHF, UHF, 700 MHz, 800 MHz, 900 MHz	6.25 kHz 12.5 kHz	9,600 bps
TETRA	VHF, UHF, 800 MHz	25 kHz	28,000 bps

to provide data capability to thousands of control devices.

M2M Communications

Several terms describe the type of communications needed to maintain critical resources such as electricity, water and gas. Supervisory control and data acquisition (SCADA) is often used in the utility industry, as well as telemetry. Machine to machine (M2M) has been used recently to broadly describe the class of communications in which devices are remotely connected to interact with each other, taking action based on environmental factors and the operations of other devices, often with no human intervention. The devices include capacity banks, line switches, circuit breakers and reclosers. The water industry has pumping stations, sensors and meters, as do the gas and petroleum industries.

It is common practice to break down the communications requirements of common maintenance and emergency restoration procedures into "use cases." Each use case describes essential communications parameters of the specific applications. Communications parameters often considered are bandwidth, end-to-end latency, reliability and security.

Without analyzing the specifics of each application or use case, M2M communications for critical infrastructure management and control systems

can be divided into several categories categorized by bandwidth and end-to-end latency. End-to-end latency is the amount of time it takes for a sensor to transmit information to a remote device and receive either confirmation or instructions. Some traffic, such as the data from smart meters, requires significant bandwidth to transmit information from millions of meters to billing centers, but latency is not an issue, so the data can be transported by mobile operators in most instances. Using the smart grid as an example, components such as circuit breakers and reclosers in the electric network require near instantaneous response from remote devices, demanding a latency that commercial systems cannot provide. However, the amount of data to be transmitted, and therefore the required bandwidth, is relatively small. Transmissions are often infrequent. If voice communications in the same operating area is also infrequent, it is possible for a voice and data network to share the same technology.

Digital PMR Systems

There was a time when communications networks were designed to meet a specific goal, servicing one type of application, often with a single-vendor, proprietary solution. This was true for voice and data communications. Many industries are now embracing open standards for the communications

EXPERIENCE IN DIGITAL SOLUTIONS

ConnectTel is an authorized Motorola distributor with over 23 years of know-how in the design, distribution, installation and service of analogue and digital radio communication systems. Ranging from basic analog to digital trunking systems, ConnectTel provides solutions for customers throughout Central and Eastern Europe, the Baltics, Russia, Africa and the Middle East.

Facing challenges like time table compliance, service interruptions and operational control, Public Transport companies rely more and more on modern radio communication systems. One example is the TETRA system of the Prague Public Transportation Department, where nearly 2000 trams and buses transported more than 1.2 bn passengers last year. Motorola Dimetra IP system supplied by ConnectTel for City of Prague in 2013 and customized applications developed by ConnectTel like onboard information systems on trams and buses provide further benefit to the passengers.

In order to minimize disruption of services both in terms of extent and time, Utility companies require reliable radio communication systems which are independent from any public system. ConnectTel's experience with the Utility industry is proven by the award of a large radio communication system for CEZ, the power distribution company in the Czech Republic. The system consists of 130 IP connected MOTOTRBO™ repeaters, over 1500 subscriber radios and SCADA System.

With large infrastructures to manage and maintain, radio communication networks are essential to improve team work, increase the safety of the employees and improve productivity. Data communication for remote wellhead, reservoir and pipeline monitoring as well as people and vehicle location tracking can be achieved by the same radio network, thereby adding additional value to the radio network. Over the past several years CONNECTTEL has implemented a number of TETRA and P25 radio communication systems worldwide achieving full satisfaction of customers in the upstream, midstream and downstream segment of the oil & gas industry.

Using open-standard equipment allows customers to take advantage of a larger market to reduce costs.

that carry both their voice and data traffic. Open standards give customers the ability to mix components from different vendors to meet their communications needs. Using open-standard equipment allows customers to take advantage of a larger market to reduce costs. There are several common open

standards for digital land mobile radio. A short summary is provided below.

DMR. Digital Mobile Radio (DMR) is a European standard available in 6.25- and 12.5-kilohertz channels. The technology is viewed as a low-cost digital solution. Nonetheless, the technology offers a 9,600 bits per

second (bps) data rate in both the 6.25- and 12.5-kilohertz channels. DMR systems are available in the VHF, UHF, 800 MHz and 900 MHz bands.

dPMR. digital Private Mobile Radio (dPMR) is a European narrow-band 6.25-kilohertz FDMA technology that offers many forms of voice and/or data applications. dPMR exists in a range of functional levels: dPMR446 is the license-free product for peer-to-peer operations without base stations or repeaters in the 446 MHz band. dPMR Mode 1 is the general purpose peer-to-peer application for all forms of licensed PMR use. dPMR Mode 2 is the licensed version that includes all base station and repeater functionality and allows interfaces via gateways. Mode 3 is fully functional and can be offered by managed access multisite complex systems including the same interfaces and gateways as Mode 2.

NXDN. NXDN is a standard introduced in 2006 for mission-critical applications for medium- to large-sized systems. The standard is being deployed for data, telemetry and remote monitoring/command operation by freight railroads and other users. The technology offers 4,800 bps for 6.25-kilohertz channels and 9,600 bps for 12.5-kilohertz channels. NXDN radio systems are offered in the VHF, UHF and 800 MHz bands.

Project 25 (P25). P25 is an IP-based standard for an integrated voice and data (IV&D) PMR network designed to meet mission-critical communications needs. Developed in North America under local, state and federal representatives and Telecommunications Industry Association (TIA) governance, P25 uses a 12.5-kilohertz radio channel. Phase 1 carries one voice conversation per 12.5-kilohertz channel, and Phase 2 has the capability of two voice conversations per channel. Both Phase 1 and 2 have a channel data capacity of 9,600 bits per second. P25 systems are available at VHF, UHF, 700, 800 and 900 MHz.

FIT USB
Fast Installation Tester

small - compact housing, no need for extra instruments, perfect for mobile operations

efficient & flexible - automatic identification of SW/FM, CW, GSM-R, TETRA and DMR

easy to read - monochrome graphic touch display; easy data exchange and firmware updates via USB

TETRA. TETRA is a digital trunked mobile radio standard developed to meet the needs of traditional PMR user organizations. TETRA uses a 25-kilohertz channel and divides that channel into four slots. In Tier 1, each slot has the data capability of 7,200 bits per second. In Tier 2, higher bandwidths are available, and the data rate of a dedicated 25-kilohertz channel is 28,000 bits per second. TETRA equipment is available in the VHF, UHF, 800 MHz and 900 MHz bands.

While open standards play an important role in the life of a communications network, a proprietary system may be the best solution, as long as the buyer understands the limitations of relying on one vendor. A clear understanding of the communications requirements for voice and data applications could reveal solutions initially ruled out. For the data network, a key parameter is duty cycle and device population. A small number of devices that transmit short bursts of information during non-peak hours could share

that channel as a voice system. Several vendors have found success for metering products in the VHF and UHF bands because the duty cycle of their devices is so short that co-channel voice systems never hear them.

Frequency band selection makes a huge difference in PMR system design. Some rugged terrain areas make using higher frequencies prohibitively expensive because of the number of base stations required.

Practical Considerations

There are regulatory considerations involved in using PMR channels for data communications. When a licensee has exclusive use of the channel on a site-by-site basis, implementation becomes easier but the licensee still can't always dedicate channels entirely for data communications and meet regulatory rules.

While the need of the moment often drives companies to construct voice and data networks in the same territory, it may not be necessary. Imagine the

Editor's Note: An upcoming white paper by the Utilities Telecom Council (UTC) and Motorola Solutions provides additional details for readers seeking more information.

cost savings if only one antenna system, including combiners, filters and antennas, could service both voice and data traffic. Dedicated, broadband spectrum for critical infrastructure is still needed. The spectrum allocation process takes time, and leveraging existing assets, including a PMR system, may provide necessary relief for narrowband data operations until a spectrum allocation is realized. ■

Klaus Bender, PE, is principal engineer with Site Safe, a division of Velocitel, where he provides subject matter expertise on RF safety, land mobile and microwave systems licensing and smart grid communications. Bender previously was senior director of engineering for the Utilities Telecom Council (UTC). Email comments to editor@RRMediaGroup.com.

TH9 Power on Hand

Airbus Defence and Space releases a new TETRA handheld with powerful, robust features.

The TH9 is a ruggedized TETRA radio with IP65 protection class. Its high 1.8W output power provides extended coverage. Excellent usability for mission-critical voice and data makes TH9 a powerful communication tool for heavy duty users.

The new audio design of TH9 offers clear sound and excellent audibility for voice calls. A large QVGA display shows all critical information and visual icons clearly and sharply. User-friendly Night vision mode optimises the display for dark conditions.

The easy-to-use and intuitive user interface with the unique voice feedback provides extra user comfort. Java™ support enables usage of customer specific applications.

Bluetooth® wireless technology integrated in TH9 enables users to free themselves from wires when using accessories.

Additionally TH9 has two robust connectors: side connector for audio and data accessories and bottom connector for charging, data and programming.

The advanced Work alone and Lifeguard solution (man down) are for better user safety. When Lifeguard is activated and the radio stops moving or remains horizontal for too long, it triggers a local alert. If the user does not respond, the radio automatically activates an alarm and sends its coordinates to a predefined destination.

Global Navigation Satellite System (GNSS) positioning chip inside TH9 brings extra benefits for the users. These include faster time-to-fix, more accurate and more reliable location information. This is achieved by increased sensitivity and

simultaneous usage of two satellite systems (GPS, Glonass, BeiDou or Galileo).

In critical situations it is important to know if additional resources are nearby. The 'Where are you?' feature shows on the radio display during a call how far your team members are. When you press the PTT, they will also see where you are. During emergency call the radio sends its coordinates.

PERFORMANCE MANAGEMENT SOLUTIONS FOR DIMETRA AND ASTRO® 25 PUBLIC SAFETY NETWORKS

GenWatch3® pulls together vital system radio traffic data on Dimetra and ASTRO 25 networks

-  Monitors system activity in real time on every talkgroup, channel and slot
-  Archives system data long-term using SQL databases for forensic reporting
-  Alerts users with critical system notifications via:
 - Desktop alerts
 - Email alerts
 - SNMP alerts

More: genesishworld.com/GW3

PULSE monitors ambulance response times to save time, money, property, and lives

-  Alerts users upon detection of service that does not meet contractual standards
-  Displays real-time unit and incident data on Google Maps™
-  Delivers Key Performance Indicators, real-time status feedback, and on-demand reports
-  Replays system-wide events to review and optimize unit assignments and route choices

More: genesishworld.com/PULSE

Schedule your own FREE WEBINAR and talk to us about your system requirements!

When stable and reliable radio data communications are the highest priority, HAL Communications can deliver at lower costs.

HAL Communications CLOVER modems are known for their stable and reliable transmission of fax, email, chat and data over radio. Field proven in the most remote and inhospitable locations around the world, HAL Communications have been partnering with system integrators to provide proven solutions to meet the developing requirements of primary and backup data communications solutions covering large geographic regions.

HAL meets the needs of system integrators through product development, customization, and integration.

Low cost. Low complexity. High performance.

Isn't it time you discovered more about dPMR™?

dPMR™ is a low cost, low complexity, high performance digital radio protocol specifically designed to offer solutions to users requiring an ETSI compliant*, fast deployment two-way radio solution.

It employs narrowband (6.25 kHz) FDMA technology for maximum spectrum efficiency in voice and/or data applications and offers conventional and multi-site trunked configurations to provide flexibility and scalability.

There are eighteen respected companies contributing to the ongoing development of dPMR™, so you can be sure of support for the protocol and competitive availability of products and solutions into the future.

dPMR™ systems are widely in use by the Humanitarian Community in disaster relief situations, with business and industry customers across Hospitality, Construction, Mining and Transport and in public service with Police, Prisons and Local Authorities.

Discover much more at: www.dpmr-mou.org

*The FDMA protocol specified in both TS102 490 and TS102 658 ETSI standards complies with the European Harmonised Standard EN301 166-2 for use in 6.25 kHz channels.
dPMR is a registered trademark of the dPMR Association

New Products

DMR Radios

Hytera Mobilfunk expanded its Digital Mobile Radio (DMR) product line. The PD3 series radios are compact and light and feature an LCD. Other features include

selectable transmitting power of either 1.5 or 3 watts (W); CTCSS or CDCSS sig-

naling; military standard shock and vibration resistance; DMR text messages with up to 64 characters; four programmable keys; charging and programming via micro-USB interface; scan function for digital and analog channels; voice calling options including individual, group and broadcast in digital channels; and protection against dust and water. The PD6 series — including the PD665 and PD685 — are designed for professional use and include a lightweight aluminum frame, a display and a complete keyboard. The radios include

GPS functionality, secure DMR encryption, expansion interface for applications, optional man-down function, leasing function and several voice-calling options.

www.hytera-mobilfunk.com

TETRA Portable Radio

The TH9 from **Airbus Defence and Space** is a TETRA hand-portable radio designed for use in harsh and demanding

conditions. The radio supports direct mode operation (DMO) in the 406 – 410 MHz band and transmits at 1.8 watts (W). The radio is equipped with integrated GPS for positioning services and operations, embedded

Bluetooth for hands-free access to standard accessories, a large color display, a metallic chassis and front cover to protect it against shocks, and IP65 class protection for dust and water resistance.

www.airbusdefenceandspace.com

Digital Portable

Motorola Solutions presented the MOTOTRBO SL1600 digital portable, a two-way radio intended for use in industries such as retail, hospitality, event management and private security. The radio's ergonomic design is slim, lightweight and allows for one-handed use. It features a shatter-

proof display, shielding to minimize dust and particles, several easy-to-reach buttons for one-handed operation, Range Max technology for delivering enhanced range and the ability to seamlessly work with existing communications systems through digital and analog technology.

www.motorolasolutions.com

NEXEDGE/P25 Portable

JVC Kenwood announced a portable radio that operates on the NEXEDGE protocol, as well as the Project 25 (P25) standard.

Eliminate interference with Fiplex Programmable Active Crystal Filters

- For Aeronautical Bands (118-137MHz), VHF, UHF, 700/800MHz
- Crystal-based filtering system
- Software programmable tuning in 6.25 KHz steps
- 12.5 KHz standard bandwidth, 25 KHz optional
- Sharp filtering response
- Front end LNA included for low noise figure
- User adjustable gain
- High linearity
- Suitable for highly congested RF environments and Air-to-Ground and Ground communications

fiplex
COMMUNICATIONS INC.

www.fiplex.com

info@fiplex.com

The radio offers multiprotocol operation in P25 Phase 1 and Phase 2, NXDN and analog protocols. The radio is the first on the

market to include two digital standards in one unit, according to industry insiders. The NX 5200, 5300 and 5400 model portable radios can operate in VHF, UHF, and the 700 MHz and 800 MHz bands. Mixed digital and FM analog operation allows intelligent migration in mixed sites and easy migration with digital radios in other sites. In P25 mode, the radio provides talk group and individual ID lists, caller ID display, remote monitor and check, and radio inhibit.

DMR Tier 3 Products

Sepura announced the availability of its Digital Mobile Radio (DMR) Tier 3 product

line to the global market. Sepura's DMR product offering was accelerated by the acquisition of Fylde Micro in May. The Sepura DMR Tier 3 system provides a cost-effective, scalable, trunking solution

that is available as an upgrade to existing Sepura Tier 2 deployments or as a variety of preconfigured systems. DMR Tier 3 is the latest addition to Sepura's product portfolio of TETRA and DMR systems, terminals and applications. The line includes rugged hand portables, fully featured mobiles and a multifunctional system incorporating the Sepura Controller developed in collaboration with Fylde Micro, a company spokesperson said.

www.sepura.com

IP/WLAN System

Icom UK announced an IP advanced radio

system that provides full hands-free duplex two-way radio communications with an optional headset. The IP/WLAN system offers a scalable, license-free system using standard wireless networking. The system offers seamless roaming where the IP100H handset uses the nearest access point if two or more wireless access points are deployed on an IP network, and it can roam between the available access points.

Icom also introduced the IC-F29SR professional-grade, license-free walkie-talkie

device. The slim, compact radio includes a transmit button, volume control and rotary channel selector. A simple interface makes it ideal for high-turnover environments and shift work where the radio is frequently passed from person to person. A BC-279 Li-ion battery provides up to 21 hours of operating time. Other features include a smart ring function that checks whether the radio is in communications

The complete DMR Solution

including DMR Tier III

With over one million digital radios shipped globally, Sepura is a market leader in critical communications in over 30 countries. Our robust and rugged DMR product family has been developed for professional and industrial users by experts in digital radio communications.

- › New DMR Tier III – in combination with trunking solutions leaders, Fylde Micro (a Sepura company)
- › Analogue to digital migration operational continuity – low risk, minimal disruption
- › Committed to open standards – future-proofing customers' communications requirements

range with a ringer sound. A built-in inversion voice scrambler ensures privacy.

www.icomuk.co.uk

Speaker Mic and Dynamic Controller

The ULTRA CSM from **Sepura** is a controller speaker microphone that offers all-weather performance and good audio quality for use in challenging conditions.

An ergonomic design makes it easy to use with gloved hands or in poor light, and the device is compatible with the company's STP8000 and STP9000 series radios.

The accessory can

work at very high temperatures thanks to a casing constructed of a durable self-extinguishing material. Key radio functions are included on the speaker mic itself.

The company also announced the Sepura Dynamic Controller (SDC), which connects GSM and TETRA devices to the company's line of covert accessories. The controller features noise-eliminating technology, wireless control and secure Bluetooth and allows users to switch between devices with one press of a discreet remote control unit. The product supports all standard induction covert earpieces and off-the-shelf headphones. It also operates in GSM-only mode and supports all of Sepura's existing wired and wireless accessories.

www.seapura.com

Bluetooth Tool

Imtradex upgraded its OnGuard BlueTalk Bluetooth tool that allows concealed

observations in conjunction with Bluetooth-enabled mobile phones. The device now includes

a Li-poly battery, increasing operating time to eight hours. The tool also has an optional wireless push-to-talk (PTT) button with up to four silent keys and a wireless transmit button that is secured against accidental operation. Calls can be answered or ended with one button. The tool is compatible with many Bluetooth-enabled mobile

phones, including the iPhone.

Imtradex also expanded the FireTalk series with the FireTalk S model helmet set. Designed with fire department needs in mind, the set provides smooth commu-

nications even in extreme heat. A waterproof electret gooseneck microphone is included,

and the housing and PTT buttons are splashproof and shockproof. The universal communications unit can be adapted to all standard fire helmets.

www.imtradex.com

Broadband Antennas

Procom added two broadband base station antennas to its portfolio of antenna products. The CXL 108-185C works in the 108 – 185 MHz range and is designed to be used on supporting tubes with outer diameters between 27 and 65 millimeters. The radiating element is enclosed in a glass fiber tube. The CXL 380-470C is a vertically polarized, omnidirectional antenna that works in the 380 – 470 MHz range. The antenna comes with the company's C mast bracket, which is epoxy coated and made of noncorrosive materials. The accompanying U-bolts and fittings are made of stainless steel. The antenna can be mounted on 27- and 65-millimeter diameter mast tube. The antenna element is completely enclosed in a glass-fiber shroud. All metal parts are direct current (DC) grounded.

www.procom-uk.com

Digital PMR Analyzer

The RF AirAnalyzer from **fjord-e-design Sales** is a digital protocol analyzer for assessing different professional mobile radio (PMR) systems. The compact device

provides real-time analysis as well as simultaneous uplink and

downlink analysis. Functions include quality analysis of the air interface and services, analysis of voice communications quality, interoperability checks, resource monitoring, interference detection, mobile

radio coverage measurements, detecting problems associated with new installations and verifying security features. The product works with a notebook computer connected via an Ethernet connection.

www.fjord-e-design.com

Remote Analyzers

Narda Safety Test Solutions introduced the NRA RX series of remote analyzers. The devices can analyze signals up to 6 GHz in the frequency and time domains and exhibit receiver characteristics at the same time. An RF module in the devices

was specifically developed to allow for low phase noise and low intrinsic interference. When used with software, the analyzers allow users to define up to 500 channels or frequency ranges to monitor, and a demodulation function allows users to listen to FM, AM, upper sideband (USB), lower sideband (LSB) and continuous wave (CW) signals with external headphones. The devices are intended for use in automated and remote-controlled measuring systems and have a 10-megahertz reference input to synchronize to system frequency. The devices can also be operated on a standalone basis with a PC.

www.narda-sts.com

Mobile Air Traffic Control

Selex ES introduced the Aerodrome Flight Information System (AFIS), a mobile con-

trol tower for ground-to-air-to-ground air traffic control (ATC) communications. The system

is transportable on a C-130J aircraft and is rapidly deployable for remote operation. Ideal for emergency situations where timely aeronautical communications is needed, the product is effective for managing critical phases of a flight including take-off, approach and landing. Mechanical arms

deploy the system into a fully operational ATC tower. The product consists of four radios for marine and aeronautical communications in the VHF and UHF bands, a TETRA radio system for land communications in the UHF band, a meteorological system and a GPS. The radio communications are managed through two operator workstations that connect via VoIP EURO-CAE ED137B. Technical management of systems is handled by the company's network management suite, which also allows remote network management.

www.selex-es.com

Radio-Planning Software

Ranplan introduced the newest version of its BuildNet Tablet software, which helps with quoting, planning, deploying and optimizing both indoor and outdoor radio networks. The software is an all-in-one tool for deploying small cell and heterogeneous

networks (HetNets). It features pre-defined templates for costs and regulatory requirements,

access to a comprehensive product database, and empirical models to manage network design and performance calculations. The product allows a tablet's camera and input data to create and annotate complex 3D buildings, along with installation diagrams and reports. The software operates on any tablet running Microsoft Windows 8.0 or 8.1.

www.ranplan.co.uk

Terrain Analysis

SoftWright released the accelerated Okumura Propagation Module for its Terrain Analysis Package (TAP) version 6.2. The new version features a calculation engine that improves execution speed, especially when paired with solid state drive data storage. Okumura is predominantly used for predicting field strength in urban areas. Corrections for suburban and open terrain are included. The explicit frequency range is 150 MHz to 1.92 GHz. The Okumura curves directly apply to

propagation distances of 1 – 100 kilometers.

www.softwright.com

Medical Video Conferencing

DigiGone Remote Communication

Solutions introduced remote telemedicine kits for marine, aviation and land-based applications. Based on the company's SecureChat video encryption and compression software, the DigiMed kits provide real-time teleconferencing with emergency medical service professionals using satellite or terrestrial wireless links, enabling face-to-face consultations between patients and doctors. Three versions are available. DigiMed Mini includes a Windows tablet with built-in camera,

Bluetooth headset with microphone, Wi-Fi macro camera and power adapter in a small case. DigiMed Vital includes the

same components as well as an electrocardiogram (EKG) sensor and DigiMed Access dashboard software to stream the device information. DigiMed Plus adds Bluetooth sensors for a digital thermometer, blood pressure cuff, blood glucose meter and other medical devices and is contained in a larger case.

Asia: A Promising and Challenging Market

The Asia Pacific and Middle East regions are among the most dynamic areas for the wireless two-way radio market. The regions comprise some of the most progressive and some of the poorest countries in the

world. Economic forecasts are improving, and the need for two-way radio to support economic growth and public security needs is increasing, but challenges remain for the regions.

Many governments have upgraded their communications systems to improve emergency response to terrorist acts and natural disasters. Political, economic, sporting and tragic events provided opportunities for governments to upgrade or enhance their communications capabilities and improve services to protect the public.

The challenge for many governments is allocating sufficient budgets for communications solutions that provide the required reliability, performance and security for major events and public-safety use. Some cities, such as Hong Kong and Singapore, have justified citywide TETRA systems for public security. Many other cities in Australia, India and Indonesia are buying Project 25 (P25)-based solutions to provide similar communications needs.

Regulators in each country face pressure to find new spectrum to address the increasing needs of economically advancing countries. The traditional professional mobile radio (PMR) bands of VHF, UHF and 800 MHz continue to exist in all countries. Digital Mobile Radio (DMR) and P25 technologies continue to fit into those traditional bands. Several Asian countries have allowed TETRA to coexist with non-TETRA technology in the

UHF band, which opens more technology choices for end users. Many Asian countries have narrowbanded the VHF/UHF spectrum from 25 to 12.5 kilohertz. Narrowbanding allows countries to double the channels available for reallocation to new users. Regulators also are encouraging TDMA-based technologies to gain some spectrum efficiency by loading more users onto the existing channels, a viable alternative technique.

However, finding new spectrum or loading more users onto existing spectrum is only part of the answer. Other methods, such as migrating to a site-based frequency allocation system that allows for reuse of frequencies in different parts of the country, must also still be developed. This will aid in more efficient use of spectrum.

Enforcement of licensed spectrum will also aid in efficient use. Most Asian countries still do not have good enforcement techniques to discourage interferers or regulations that impose civil penalties on interferers. This results in existing users asking for more spectrum to get away from the interferers. Finally, regulators also need to recover unused or underutilized spectrum from licensees. Government officials and legislators should allocate more funding to regulatory functions so that they can better manage the entire wireless environment.

PMR remains the reliable technology of choice for workgroup communications for public safety and heavy industries. Both TETRA and P25 technologies have been deployed in the Asia Pacific and Middle East regions and will continue to be adopted in the regions for many years to come. Many companies offer TETRA. A few more manufacturers have entered the P25 marketplace, and this open standard remains vibrant. The fast adoption of DMR shows the world's insatiable

demand for two-way radio that is cost effective and feature rich. Many new DMR manufacturers have entered the marketplace, making it one of the most dynamic markets for future growth.

Analog radio remains a viable choice for many countries seeking cost effectiveness, but the number of analog products is on the decline as end users are seeing the benefits of digital. The competitive environment in the Asia Pacific and Middle East regions will remain robust for customers seeking both analog and digital technologies.

More recently, 4G Long Term Evolution (LTE) technology has created interest and business activity in the region. Mobile video and broadband have been the Holy Grail for public safety for years, and they are finally within reach. Spectrum must be in place first before deployment can happen. Many Asian and Middle Eastern countries are clearing TV broadcasters, and are close to assigning broadband channels. All countries have agreed to standardize on LTE technology.

However, some vendors are overselling the promise of what LTE can do for public safety. There are business consequences to deploying LTE, a cellular-based technology. Many public-safety organizations understand the complexities of LTE deployment and are adopting a two-layer approach, where traditional PMR is deployed everywhere for voice, and LTE will be deployed in strategic areas for mobile broadband only. A looming issue is the disparate mobile broadband spectrum plan for some Asian countries. ■

ARE THESE THE TYPICAL CONDITIONS AT YOUR TOWER SITE?

WE DIDN'T THINK SO.

That's why we design and build antennas to operate below zero or well over 100°F. Our attention to every detail eliminates expensive down time, from a phasing harness protected by our proprietary Millennium seal technology to the Txylan finish

that resists corrosion and a 1/4" thick fiberglass radome designed to flex, preventing ice build-up. Call Telewave for antennas and more, all built to survive in the real world.
