We are developing a general biomimetic synthesis of camptothecin (1), its analogs ${ }^{2}$, and other medicinally important indole alkaloids, in which a key synthon is secologanin (2a) or a structurally similar compound. Although $2 a$ is an abundant, easily isolable compound ${ }^{3}$, its versatility as a synthetic intermediate is somewhat limited due to the difficulty in removing its giucosyl substituent in good yield and without extensive rearrangement of the aglucone ${ }^{4}$. Thus, we have developed an efficient synthesis of $2 b^{5}$ and of a synthon (7) that should be capable of elaboration tc 3,4 -dihydroanalogs of 2 b , to $\underset{\sim}{1}$, and to other indole alkaloids along already established lines ${ }^{2,6}$. Since this synthon appears to be generally useful, we are reporting its synthesis herein.

1

2a, $\quad R=D-g l u c o s e$
$2 b, \quad R=M e$

Our approach involves a Diels-Alder reaction of 2 -methoxy-5-oxo-5,6-dihydro-2H-pyran (4) with butadiene followed by a one-carbon homologation to a $C(11)$ nitrile. The latter then can be converted into an amide, acid, or methyl ester (Scheme).

The synthesis of 5 initially was attempted according to Jones ${ }^{7}$; contrary to his report, treatment of the Diels-Alder adduct of $3_{\sim}^{8}$ under a variety of acetalization conditions gave a mixture of $\underset{\sim}{5}$ and its $C(4)$ ketal, the latter usually predominating. Consequently, we prepared $4 \underset{\sim}{4}$ according to Torii et al. ${ }^{9}$, from which $\frac{5}{7}$ (m.p. $75^{\circ} \mathrm{C}$ ) could be prepared directly in moderate yield ${ }^{10}$ using the conditions reported by Jones ${ }^{7}$ (excess butadiene, DME, $90-110^{\circ} \mathrm{C}$ ). In this manner only one $C(1)$ epimer of $\underset{\sim}{5}$ was obtained, in contradistinction to the ca. 1:1 mixture of $C(1)$ epimers obtained by the method of Jones ${ }^{7}$.

The one-carbon homologation of 5 was attempted by several methods before a sultable route was found. Conversion of $\underset{\sim}{5}$ to its ketenedithioacetal (11) by reaction with 2-1ithio-2-trimethyl-silyl-1,3-dithiane ${ }^{11}$ proceeded well ( $85 \%$ yield), but subsequent hydrolysis ${ }^{11}$ to the C(11) carboxyl or carbomethoxyl group could not be achieved in good yield. We attribute this difficulty

$\underset{\sim}{6}$
4, $R=M e$

11

$\underset{\sim}{12}$
to the acid sensitive acetal and nucleophilic nature of the $C(7)$ double bond of 11 . Similarly, the use of tosylmethylisocyanide, an established reagent for one-carbon homologation of aldehydes and ketones ${ }^{12}$, was unsuccessful for preparation of 7. However, the desired homologation was smoothly achieved in $70 \%$ overall yield by the method of Ziegler and Wender ${ }^{13}$ via the carbomethoxyhydrazone (6): $\underset{\sim}{6}-\mathrm{m} . \mathrm{p} .170-171^{\circ} \mathrm{C}$; ir ( KBr ), v, $3180,3120,2998,2876,1715$ and $1680 \mathrm{~cm}^{-1}$; $\mathbf{1}_{\mathrm{H}}$ NMR $\left(\mathrm{CDCl}_{3}\right), \delta, 1.80-2.90(\mathrm{~m}, 6 \mathrm{H}), 3.43(\mathrm{~s}, 3 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}), 4.27\left(\mathrm{AB} \mathrm{q}, \mathrm{J}=15 \mathrm{~Hz}, \mathrm{CCH}_{2} 0\right), 4.62$ $\left(\mathrm{d}, \mathrm{J}=2 \mathrm{~Hz}, \mathrm{CHCH}\right.$ ), $5.70(\mathrm{br} \mathrm{s}, \mathrm{CH}=\mathrm{CH})$, and 7.83 (br s, NH ) ppm. 6a: m.p. $44.5-46^{\circ} \mathrm{C} ;{ }^{1} \mathrm{I}_{\mathrm{H}} \mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}\right), \delta, 1.80-2.60(\mathrm{~m}, 6 \mathrm{H}), 3.38(\mathrm{~s}, 3 \mathrm{H}), 3.79\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CO}_{2} \mathrm{CH}_{3}\right), 3.81(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CCH}-2), 4.29(\mathrm{~d}$, $\underline{J}=4 \mathrm{~Hz}, 1 \mathrm{H}), 4.60(\mathrm{br} \mathrm{s}, \underline{J}<1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{NHN}), 5.71(\mathrm{br} \mathrm{s}, 2 \mathrm{H})$, and $6.27\left(\mathrm{~d}, \mathrm{~J}=4 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{NNHCO}_{2}\right)$ $\mathrm{ppm} ;{ }^{13} \mathrm{CNMR}\left(\mathrm{CDCl}_{3}\right), \delta, 25.55(\mathrm{~d}, \mathrm{C}-5, \mathrm{C}-10), 34.96,36.55(\mathrm{dt}, \mathrm{C}-6, \mathrm{C}-9), 52.85$ ( $\mathrm{q}, \mathrm{C}-1 \mathrm{OMe}$ ), $54.95\left(\mathrm{qCO}_{2} \mathrm{Me}\right), 62.67(\mathrm{~d}, \mathrm{C}-3)_{2} 62.02(\mathrm{~s}, \mathrm{C}-4), 98.84(\mathrm{~d}, \mathrm{C}-1), 118.76(\mathrm{~s}, \mathrm{cN}), 123.4,125.6(\mathrm{t}, \mathrm{C}-7, \mathrm{C}-8)$, and 158.8 ( $\mathrm{s}, \mathrm{C}=0$ ) ppm. 7a - m.p. $56.5-57.5^{\circ} \mathrm{C}$; ir ( KBr ), $\nu, 3035,2920,2845,2240$, and $1660 \mathrm{~cm}^{-1}$;
 $12 \mathrm{~Hz}, \mathrm{CHCH}_{2} 0$ ), 4.58 (br s, 1H), and 5.64 (br s, 2 H ) $\mathrm{ppm} ; \mathrm{ms}, \mathrm{m} / \mathrm{e}, 161.0837$ ( $\mathrm{M}^{+}-\mathrm{MeOH}$ calcd 161.0847 for $\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{NO}_{2}$ ). 7b - m.p. $77-78.5^{\circ} \mathrm{C}$; ir (KBr), $v, 3030,2925,2840$ and $1660 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right), \delta, 1.20-2.80(\mathrm{~m}, 7 \mathrm{H}), 3.38(\mathrm{~s}, 3 \mathrm{H}), 3.86,3.89(\mathrm{~d} \mathrm{AB} \mathrm{q}, \mathrm{J}=8,11 \mathrm{~Hz}, 2 \mathrm{H}), 4.53(\mathrm{~d}$,
$\underline{J}=3 \mathrm{~Hz}, 1 \mathrm{H})$, and $5.69(\mathrm{br} \mathrm{s}, 2 \mathrm{H}) \mathrm{ppm} ; \mathrm{ms}, \mathrm{m} / \mathrm{e}, 161.0836\left(\mathrm{M}_{-}^{+}-\mathrm{MeOH}\right)$. The preferential formation of 7 a is consistent with addition of HCN to 6 a from the least hindered beta face followed by predominantly kinetic protonation of the $C$ (4) carbanion during base catalysed decomposition of the cyanodiazene carboxylate ${ }^{13}$. TLC and ${ }^{13} \mathrm{C}$ NMR data failed to exhibit any evidence for the presence of two HCN adducts of 6 , however.

The synthon represented by 7 was readily transformed into 8,9 , and 10 as follows: 8a reflux 27 hr in aq. ethanol containing BioRad AG-1-X4 ( $\mathrm{OH}^{\ominus}$ ) ion exchange resin; 92\%; m.p. 156-
 EtOH ( $1: 1$ ); $85 \%$; m.p. $160.5-163^{\circ} \mathrm{C}$; ir ( KBr ), v, $3450 \mathrm{br}, 3025,2910,2840,2650 \mathrm{br}$, and $1710 \mathrm{~cm}^{-1}$. 10a - treatment of ga with $\mathrm{CH}_{2} \mathrm{~N}_{2}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$; ( $60 \%$ ); oil; ir ( $\mathrm{CHCl}_{3}$ ), $v, 1730 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H} \mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}\right), \delta, 1.4-2.6(\mathrm{~m}, 7 \mathrm{H}), 3.34(\mathrm{~s}, 3 \mathrm{H}), 3.66\left(\mathrm{~s}, 3 \mathrm{H}, 0 \mathrm{CH}_{3}\right) 3.72,3.82(\mathrm{~d} \mathrm{AB} \mathrm{q} 2 \mathrm{H}),, 4.48(\mathrm{~d}$, $\underline{J}=5 \mathrm{~Hz}, 1 \mathrm{H}$ ) and $5.60(\mathrm{br} \mathrm{s}, 2 \mathrm{H})$. Direct hydrolysis of 7 a to 9 a under strongly basic conditions gave predominantly the ring opened compound 12 resulting from beta elimination, which is why a two-step reaction sequence was chosen. Thereby the formation of diene 12 was reduced to a minor amount. Attempted methanolysis of $\underset{\sim}{7 a}$ to $\underset{\sim}{10}$ using dry HC1 gas and methanol gave apparent rearrangement products (20\%) plus the C(1) hemiacetal of 7 ( $60 \%$ ), although this method worked well for the conversion of cyclohexyl nitrile to 1-carbomethoxy cyclohexane.

The analogous derivatives of $\underset{\sim}{7}$ were also obtained using identical reaction conditions: $8 b$ $78 \%$, m.p. $153-156^{\circ} \mathrm{C}$; ir ( KBr ) , $\nu, ~ 3390,3175,3020,2910,2835$, and $1660 \mathrm{~cm}^{-1}$. $9 \mathrm{~b}-72 \%$; m.p. $68-71^{\circ} \mathrm{C}$; ir $(\mathrm{KBr}), v, 3400 \mathrm{br}, 3020,2910,2850,2650 \mathrm{br}$, and $1710 \mathrm{~cm}^{-1}$. $10 \mathrm{~b}-70 \%$; ir ( $\mathrm{CHCl}_{3}$ ), $\nu, 1730 \mathrm{~cm}^{-1},{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right), \delta, 1.5-2.6(\mathrm{~m}, 7 \mathrm{H}), 3.35(\mathrm{~s}, 3 \mathrm{H}), 3.66(\mathrm{~s}, 3 \mathrm{H}), 3.71(\mathrm{~d} \mathrm{AB} \mathrm{q}, 2 \mathrm{H})$, $382,4.48(\mathrm{~d}, \underline{\mathrm{~J}}=3 \mathrm{~Hz}, 1 \mathrm{H})$, and $5.60(\mathrm{br} \mathrm{s}, 2 \mathrm{H}) \mathrm{ppm}$.

The utility of $\underset{\sim}{9}$ for the synthesis of $\underset{\sim}{1}$ is being explored, based on the methodology of van Tamelen ${ }^{6 b, c}$. Using a similar approach it should be possible to employ 10 in the synthesis of geissosch1zine ${ }^{6 b}$ and ajmalicine ${ }^{6 d}$.
