## SYNTHESIS OF $\alpha$ -METHYLENE- $\beta$ -ALANINE AND ONE OF ITS NATURALLY OCCURRING $\alpha$ -KETOAMIDES

Arne Holm<sup>1</sup> and Paul J. Scheuer\*

Department of Chemistry, University of Hawaii at Manoa Honolulu, HI 96822

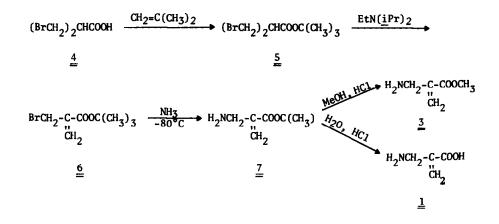

Abstract --  $\alpha$ -Methylene- $\beta$ -alanine (1) has been synthesized from t-butyl bisbromomethyleneacetate by successively generating the  $\alpha$ -methylene, then the  $\beta$ -amino function from a bromomethylene. Hydrolysis or methanolysis completes the synthesis of 1.HCl, and of its methyl ester (3).HCl, from which the  $\alpha$ -ketopalmitic acid amide of I was prepared.

Kashman <u>et al.</u><sup>2</sup> first reported isolation of a new toxic amino acid,  $\alpha$ -methylene- $\beta$ -alanine, from a Red Sea sponge <u>Fasciospongia</u> <u>cavernosa</u>. This presumed antimetabolite occurs in the sponge as its methyl ester, which is <u>N</u>-acylated by a series of C<sub>16</sub>-C<sub>20</sub> fatty acids.

Yunker and Scheuer<sup>3</sup> subsequently isolated three sets of <u>N</u>-acyl derivatives of the same amino acid methyl ester from a black Hawaiian sponge <u>Spongia</u> cf. <u>zimocca</u>.<sup>4</sup> The amide linkage in two groups of their compounds is formed with fatty acids which, remarkably, bear <u>alpha</u> keto<sup>5</sup> or <u>CH2</u> <u>alpha</u> hydroxy functions [RNCH<sub>2</sub>-C-COOMe; R = COCHOH(CH<sub>2</sub>)<sub>n</sub>CH<sub>3</sub> (<u>2a</u>); R = COCO(CH<sub>2</sub>)<sub>n</sub>CH<sub>3</sub> (<u>2b</u>), n = 11-13]. We now report the first synthesis of  $\alpha$ -methylene- $\beta$ -alanine and of one of its naturally occurring derivatives (<u>2b</u>, n = 13).

 $\alpha$ -Methylene- $\beta$ -alanine (<u>1</u>) and its methyl ester (<u>3</u>) were prepared by a sequence of reactions shown in the Chart. Compound <u>5</u><sup>6</sup> was obtained from <u>4</u><sup>7</sup> (0.2 mol) and isobutylene<sup>8</sup> (1 mol) in a mixture of benzene (40 mL), diethyl ether (20 mL), and conc H<sub>2</sub>SO<sub>4</sub> (1 mL). After stirring for 60 h under Hg seal, the solution was washed with satd sodium bicarbonate solution. Evaporation of the solvent gave <u>5</u> in 90% yield (mp 47-48°C, 50°C<sup>9</sup>), from which <u>6</u> was prepared according to the published method.<sup>9</sup> Compound <u>7</u>,<sup>10</sup> obtained by treatment of <u>6</u> with ammonia, is surprisingly Chart

reactive and on attempted isolation at room temperature a white wax, mp 70-78°C, was obtained. According to mass spectral data the wax is a composite of polycondensates (Eq. 1).

$$\begin{array}{c} H_2 \text{NCH}_2 \text{-}C-\text{COOC}(\text{CH}_3)_3 & \xrightarrow{-\text{HOC}(\text{CH}_3)_3} & H_2 \text{NCH}_2 \text{CO}(\text{NHCH}_2 \text{C}-\text{CO})_n \text{-}\text{NHCH}_2 \text{-}\text{CCOOC}(\text{CH}_3)_3 & (1)_1 \\ H_2 \text{CH}_2 & H_2 \text{CH}_2 & H_2 \text{CH}_2 & H_2 \end{array}$$

However, in the synthesis of  $\underline{1}$  or  $\underline{3}$  from  $\underline{7}$ , the polycondensation may be suppressed under the following conditions. Compound  $\underline{6}$  (1.2 g) was added to ammonia (20 mL) at -80°C and left with stirring but without external cooling for 2 h. More ammonia may be added. The mixture was poured onto a mixture of ice (30 g) and methylene chloride (3 mL) and the aqueous phase was washed with methylene chloride (2 × 3 mL). After washing with ice water and drying at 0°C, a solution of HCl in MeOH (2 mL) was added, followed by removal of the solvents <u>in vacuo</u>. The remaining product was dissolved in a solution of HCl in MeOH (10 mL) and left at room temperature overnight. The solvent was removed <u>in vacuo</u> to give an oil which was dissolved in dry acetone (2 mL) and cooled in Dry Ice-acetone to give crystalline <u>3</u> as the hydrochloride (27% yield, mp 107-8°C<sup>11</sup> (recrystallized by dissolving in MeOH, followed by addition of 5 volumes of acetone).<sup>12</sup> <sup>1</sup>H-NMR (D<sub>2</sub>O) & 4.23 (OCH<sub>3</sub>), 4.28 (NCH<sub>2</sub>), 6.52 (=CH<sub>2</sub>), 6.97 (=CH<sub>2</sub>); <sup>13</sup>C-NMR (D<sub>2</sub>O) ppm, C-1 167.9, C-2 133.0, C-3 41.2, C-4 133.8, OCH<sub>3</sub> 53.8; mass spectrum m/e 115 (M<sup>+</sup>).<sup>13</sup>

Cpd  $\underline{1}$  is obtained in a manner similar to that of  $\underline{3}$  by slowly adding the above methylene chloride solution to conc HCl (10 ml) at 0°C. After separation of the phases the aqueous solution was left overnight at room temperature. Concentration in vacuo gave crystalline  $\underline{1}$  as the

hydrochloride (31% yield, mp 153-54° (dec), from MeOH followed by addition of acetone. <sup>1</sup>H-NMR  $(D_2O) \delta 4.25 (NCH_2)$ , 6.49 (=CH<sub>2</sub>), 6.91 (=CH<sub>2</sub>); <sup>13</sup>C-NMR ( $D_2O$ ) ppm, C-1 169.2, C-2 133.2, C-3 41.3, C-4 133.7; mass spectrum m/e 101 (M<sup>+</sup>). <u>Anal</u>. Calcd: C, 34.92; H, 5.86; N, 10.18%. Found: C, 35.17; H, 5.94, N, 10.03%.

Cpd <u>2b</u> was prepared by adding <u>3</u> as the hydrochloride  $(1.2 \times 10^{-3} \text{ mole})$  to an equivalent amount of NaOMe in MeOH (1 mL) at 0°C. After stirring for 2 min the solvent was removed <u>in</u> <u>vacuo</u> at 0°C and equivalent methylene chloride solutions of first dicyclohexylcarbodiimide (1.5 mL) and then 2-oxopalmitic acid (215 mL)<sup>14</sup> were added at 0°C. After standing overnight at room temperature the solution was filtered and the amide <u>2b</u> isolated in 21% yield after column chromatography (25 g Bio-Sil A 200-400 mesh, CH<sub>2</sub>Cl<sub>2</sub>) (Mp 59.5-60°C, hexane); <sup>1</sup>H-NMR (CDCl<sub>3</sub>) & 7.36 (NH), 6.32 (=CH<sub>2</sub>), 5.84 (=CH<sub>2</sub>), 4.15 d (NCH<sub>2</sub> J = 7), 3.82 (OCH<sub>3</sub>), 2.92 t (COCH<sub>2</sub>, J = 7), 1.26 bs (CH<sub>2</sub>)<sub>n</sub>), 0.88 t (CH<sub>3</sub>, J = 7); <sup>13</sup>C-NMR (CDCl<sub>3</sub>) ppm, C-1 not observed, C-2 135.8, C-3 40.5, C-4 127.7, <u>CONH</u> 160.1, <u>COCONH</u> 198.9; mass spectrum m/e 367 M<sup>+</sup> C<sub>21</sub>H<sub>37</sub>NO<sub>4</sub> (Calcd: 367.2723. Found: 367.2732) 142 base peak (C<sub>6</sub>H<sub>8</sub>NO<sub>3</sub>, Calcd: 142.050. Found: 142.048) 225 (C<sub>15</sub>H<sub>29</sub>O). The spectral data are thus identical with those found by Yunker and Scheuer<sup>3</sup> for the mixture of fatty acid amides <u>2b</u> (vide supra).
