

GENERATION OF *sec*-THIOAMIDE DIANIONS AND THEIR REGIOSELECTIVE REACTION  
WITH ELECTROPHILES.

Summary. The enolates of *sec*-thioamides **8**, which are generated by three different methods (scheme II and equation 1), are alkylated selectively at the  $\alpha$ -carbon to the thiocarbonyl group. The unusual  $\beta'$ -lithiation to provide an intermediate **11** is observed for *N*-methyl- $\alpha,\beta$ -dimethylthioacrylamide and *N*-methylthiocyclohexenecarboxamide.

Although it has been believed that the alkylation of *sec*-thioamide and its monoanion takes place selectively at a sulfur atom to provide *S*-alkylthioimidate (e.g., **5**),<sup>1</sup> we have found that the regioselectivity of alkylation depends on the nature of alkylation agent. Alkylation of monoanion with trimethylsilyl chloride (TMS-Cl) takes place on a nitrogen atom selectively as indicated by the isolation of ketene *S,N*-acetal (e.g., **6**) and also by the complete recovery of the starting thioamide after aqueous work-up (Scheme I). The present selective *N*-alkylation was successfully applied to the activation of  $\alpha,\beta$ -unsaturated *sec*-thioamide as a Michael acceptor.<sup>2</sup> These results suggest that the sulfur atom might not always be the center, which undergoes the alkylation even toward the soft nucleophiles.<sup>3</sup>

Taking this idea in mind, we examined the alkylation of *sec*-thioamide dianion (**4**) in expectation of alkylation of the carbon atom  $\alpha$  to thiocarbonyl, because this carbon atom shares the allylic termini both of iminoenolate and thioenolate and might be the center with the highest nucleophilicity among the three allylic termini. Indeed this proved to be the case and alkylation took place selectively on this carbon. Results are summarized in Table I. The dianion **8** (scheme II), which can be generated according to procedures A or B, is confined

Scheme I

to the thioamides  $\underline{1}$  with the combination of either  $\text{R}^1 = \text{aryl (or vinyl)}$  and  $\text{R}^2 = \text{alkyl}$  or  $\text{R}^1 = \text{alkyl}$  and  $\text{R}^2 = \text{aryl}$ . For the sec-thioamide with  $\text{R}^1 = \text{aryl (or vinyl)}$  and  $\text{R}^2 = \text{alkyl}$ , the dianion can be generated either by treatment with 2.2

Scheme II.

equiv. of  $n\text{-BuLi}$  or by treatment with 2.5 equiv. of  $i\text{-PrMgBr}$ . In the case of  $\text{R}^1 = \text{alkyl}$  and  $\text{R}^2 = \text{aryl}$ , use of 2.2 equiv. of  $n\text{-BuLi}$  or lithium diisopropylamide is necessary. Interestingly, dilithio  $N\text{-methylthioacetamide}$  ( $\underline{8}$ ,  $\text{R}^1 = \text{H}$ ,  $\text{R}^2 = \text{CH}_3$ ) is generated cleanly by treatment with 2.2 equiv. of  $n\text{-BuLi}$  (THF,  $0^\circ\text{C}$ ), which makes a contrast to an unsuccessful dianion generation from the corresponding amide (entry 6, Table I).<sup>4,5</sup>

Table I. Alkylation of sec-Thioamide Dianions 8<sup>a)</sup>

Entry	Thioamide <u>1</u>		Method	Electrophile	% Yield of <u>9</u>
	R <sup>1</sup>	R <sup>2</sup>			
1	C <sub>6</sub> H <sub>5</sub>	CH <sub>3</sub>	A	CH <sub>3</sub> I	71
2	CH <sub>3</sub>	C <sub>6</sub> H <sub>5</sub>	A	CH <sub>3</sub> I	83
3	CH <sub>3</sub>	C <sub>6</sub> H <sub>5</sub>	A	trans-CH <sub>3</sub> CH=CHCH <sub>2</sub> Br	80
4	CH <sub>3</sub>	C <sub>6</sub> H <sub>5</sub>	A	CH <sub>2</sub> =CClCH <sub>2</sub> Cl	67
5	C <sub>5</sub> H <sub>11</sub>	C <sub>6</sub> H <sub>5</sub>	A	CH <sub>3</sub> I	57
6	H	CH <sub>3</sub>	A	C <sub>6</sub> H <sub>5</sub> CH <sub>2</sub> Br	92
7	CH <sub>2</sub> =CH	CH <sub>3</sub>	B	C <sub>2</sub> H <sub>5</sub> Br	89
8	CH <sub>2</sub> =CH	CH <sub>3</sub>	B	CH <sub>2</sub> =CHCH <sub>2</sub> Br	84
9	CH <sub>2</sub> =CH	CH <sub>3</sub>	B	trans-CH <sub>3</sub> CH=CHCH <sub>2</sub> Cl	73 <sup>b)</sup>
10	CH <sub>2</sub> =CH	CH <sub>3</sub>	B	CH <sub>2</sub> =CHCH(CH <sub>3</sub> )Cl	56 <sup>b)</sup>

a) Refer to scheme II for the structures of 1 and 9 and for the methods A and B.

b) A mixture of R<sup>3</sup> = trans-crotyl and R<sup>3</sup> = α-methylallyl (94:6 for entry 9 and 22:78 for entry 10).

By the 1,4-addition technique, we can also generate the dianion,<sup>2</sup> which undergoes the selective C-alkylation nicely as shown in equation 1.

Table II. Reaction of sec-Thioamide Dianions 11 with Electrophiles<sup>a)</sup>

Entry	Thioamide <u>10</u>			R <sup>4</sup> -X	% Yield of <u>12</u> and <u>13</u> ( <u>12</u> : <u>13</u> )
	R <sup>1</sup>	R <sup>2</sup>	R <sup>3</sup>		
1	-(CH <sub>2</sub> ) <sub>3</sub> -		CH <sub>3</sub>	D <sub>2</sub> O	77
2	-(CH <sub>2</sub> ) <sub>3</sub> -		CH <sub>3</sub>	C <sub>2</sub> H <sub>5</sub> Br	43
3	-(CH <sub>2</sub> ) <sub>3</sub> -		CH <sub>3</sub>	CH <sub>2</sub> =CHCH <sub>2</sub> Br	44
4	-(CH <sub>2</sub> ) <sub>3</sub> -		CH <sub>3</sub>	C <sub>6</sub> H <sub>5</sub> CHO	77 <sup>b)</sup>
5	CH <sub>3</sub>	H	CH <sub>3</sub>	(CH <sub>3</sub> ) <sub>2</sub> CHCHO	73 (7.3:1) <sup>b)</sup>

a) Refer to equation 2 for the structures of 10, 12, and 13.

b) Aldol addition products, whose diastereomeric ratios are not determined.

Next, we examined the alkylation of sec-thioamide dianion of a type 11 (equation 2), which possesses a unique structure of the deconjugated two allylic anion units.<sup>2</sup> Though the dianion 11 seems to be prepared in good yield as judged by the results of deuteration and aldol addition (entries 1, 4, and 5, Table II), the yield of alkylation with alkyl halide is pretty low. We are now under investigation of any side products, which might stem from a wrong regioselectivity.
