Abstract: Dimethyl (3R,4R)- and (3S,4S)-diphenyladipate were synthesized enantioselectively by electroreductive intermolecular hydrocoupling of chiral N-trans-cinnamoyl-2-oxazolidones and subsequent methanolysis.

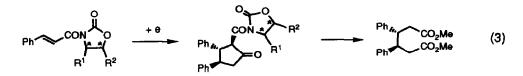

Electroreductive hydrocoupling of α,β -unsaturated compounds in aqueous solution is well known as a practical method for synthesis of adipic acid derivatives (eq 1).¹ The electroreductive hydrocoupling of β -

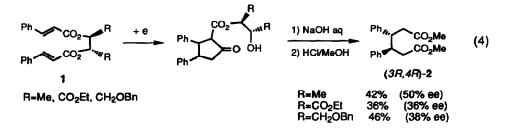

substituted α,β -unsaturated compounds is, however, usually non-diastereoselective. On the other hand, it has been reported that the electroreduction of cinnamic acid esters in aprotic solution gave cyclized products of hydrodimers² and they were obtained as all-*trans* isomers stereospecifically (eq 2).^{2a-c} These results prompt us

$$Ph \sim CO_2 R \xrightarrow{+e} Ph_{H_1} = 0$$
 (2)

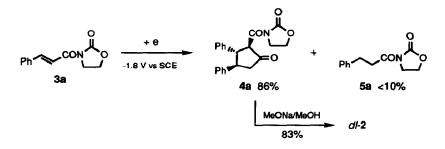

to investigate enantioselective hydrocoupling of cinnamic acid derivatives. We wish to report herein an enantioselective synthesis of 3,4-diphenyladipic acid utilizing electroreductive intermolecular hydrocoupling of chiral *N*-trans-cinnamoyl-2-oxazolidones (eq 3).

First, we examined the intramolecular hydrocoupling of chiral diesters 1 prepared from L-tartaric acid derivatives and *trans*-cinnamoyl chloride (2 equiv.). The results of the electroreductive hydrocoupling of some diesters 1 and the subsequent transformation of adducts to dimethyl 3,4-diphenyladipate 2 are shown in eq 4. The material and optical yields of (3R,4R)-2 were, however, not satisfactory.

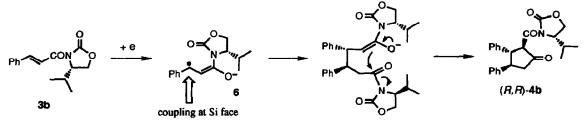

Next, we studied the intermolecular hydrocoupling of *N*-trans-cinnamoyl-2-oxazolidones $3.^3$ The electroreduction of *N*-trans-cinnamoyl-2-oxazolidone 3a also yielded hydrocoupling product 4a as a single stereoisomer together with a small amount of hydrogenated product 5a (eq 5).⁵ The treatment of 4a with sodium

methoxide in methanol gave $dl \cdot 2^6$ in 83% yield and meso-2 could not be detected. This fact shows that the stereoconfiguration of the two phenyl groups in 4a is trans. Accordingly, we tried the enantioselective synthesis of 2 by the hydrocoupling of chiral *N*-trans-cinnamoyl-2-oxazolidones 3b-f. The results of the electroreduction of 3b-f and the subsequent conversion of adducts 4b-f to 2 are summarized in Table I. This method afforded chiral 2 in moderate optical yields and starting chiral 2-oxazolidones were recovered (>90% from 3b-f in two steps). Although the cyclized products 4b-f were obtained as the mixtures of two diastereoisomers, the stereoisomers of 4b and 4e could be separated⁷ and therefore optically pure 2⁸ was accessible from each isomer of them. The absolute configuration of chiral 2 was determined by the comparison with the authentic sample of (3S, 4S)-2.9

The reaction mechanism of the hydrocoupling of 3 can be speculated similarly to that reported previously for cinnamic acid esters.^{2a,b} The stereoselectivity in the formation of 4b-f can be explained by the steric interaction between the substituents on oxazolidone rings. In the case of the coupling of 3b (Scheme I), intermediate anion radical 6 couples each other preferentially at less hindered side (Si face = β side) and subsequent cyclization of resulting dimer yields (R,R)-4b.

- 5. General procedure is as follows: A solution of 3 (2 mmol) and Et4NOTs (3 g) in dry acetonitrile (35 ml) was put into a cell (50 ml beaker) equipped with a lead cathode (5 X 10 cm²) and platinum anode (2 X 2 cm²). Electricity was passed at constant potential of -1.8 V vs SCE at room temperature until almost all of 3 was consumed (ca. 400 c). The mixture was poured into water (100 ml) and extracted with dichloromethane. The product 4 was isolated by column chromatography on silica gel. 4a: Rf 0.55 (hexane/ethyl acetate = 1/1); mp 158-160 °C; ¹H NMR (200 MHz, CDCl₃) δ 2.70 (dd, 1 H, J = 12.7 and 19.2 Hz), 3.03 (dd, 1 H, J = 8.1 and 19.2 Hz), 3.44-3.70 (m, 1 H), 3.84-4.19 (m, 3 H), 4.28-4.52 (m, 2 H), 5.35-5.62 (m, 1 H), 7.06-7.32 (m, 10 H); ¹³C NMR (50 MHz, CDCl₃) δ 42.46 (t), 46.31 (t), 47.66 (d), 52.37 (d), 61.88 (t), 62.17 (d), 127.17 (d), 127.35 (d), 127.73 (d), 128.68 (d), 138.80 (s), 139.93 (s), 153.57 (s), 167.77 (s), 208.10 (s).
- 6. General procedure is as follows: To a solution of sodium methoxide (2.2 mmol) in methanol (20 ml) was added a solution of 4 (1 mmol) in methanol (5 ml) at 0°C and the temperature was allowed to room temperature. After stirring for 8 h, the mixture was neutralized with *IN* HCl and extracted with ether. The product 2 was isolated by column chromatography on silica gel (hexane/ethyl acetate = 7/1). *dl*-2: mp 69-71

°C; ¹H NMR (200 MHz, CDCl₃) δ 2.54-2.81 (m, 4 H), 3.42-3.58 (m, 2 H), 3.55 (s, 6 H), 6.82-6.96 (m, 4 H), 7.10-7.24 (m, 6 H); ¹³C NMR (50 MHz, CDCl₃) δ 37.47 (t), 46.14 (d), 51.52 (q), 126.86 (d), 127.98 (d), 128.90 (d), 140.19 (s), 172.76 (s).

- 7. The cyclized products 4 were obtained as the mixtures of (R,R)- and (S,S)-4. Although the stereoisomers of 4c, 4d, and 4f could not be separated, those of 4b and 4e could be isolated by column chromatography on silica gel.
