Abstract : *The synthesis of simplified 16- and 17-membered ring macropolypeptides was achieved by Ni⁰ mediated carbon-carbon ring closure of properly substituted linear precursors. © 1998 Published by Elsevier Science Ltd. All rights reserved.*

Kistamycin¹ and Chloropeptin I, II² are polycyclic macropolypeptides whose eastern substructure bears close analogy. Indeed, they comprise a tryptophane **F** connected at C-6 or at C-7 to a central dihydroxyphenyl glycine **D** by an *endo* C-C bond and a variously substituted phenylglycine **E** forming a characteristic 16- or 17-membered ring macrocycle. The recently reported unsuccessful macrolactamisation approach³ prompts us to publish the results of our own investigations which led to the first synthesis of simplified 16- and 17-membered ring macrocycles *via* C-C ring closure as models of the eastern part of the title compounds.

To perform the key C-C ring closure step, we devised an approach based on the intramolecular version of the Suzuki-Pd mediated arylation of indole at C-6 and C-7 which in preliminary work had been shown to give moderate, but useful yields of cross coupled products⁴. Intramolecular reactions mediated by low order cuprates⁵ and Ni⁰⁶ were also considered.⁷

Starting from 6- or 7-bromo indole, standard methods^{8,9} gave the key components **5** and **6** from which the four precursors bearing appropriate function on the terminal rings were prepared. Coupling of **5** or **6** with 3-benzylamine boronic acid gave **7** and **10** ready for intramolecular Suzuki Pd-catalyzed reactions while coupling with 3-bromo benzylamine gave **8** and **11**, ready for testing low order cuprate and Ni⁰ mediated intramolecular reactions.

The approach based on intramolecular Suzuki Pd-catalyzed reactions was performed on **7** and **10** and failed to give the target compounds **12** and **13**. Only the reduction compound **9** was isolated and identified from these reactions. The cuprate mediated cyclisation attempted on **8** and **11** led to **9** as the major product along with several unidentified compounds. In contrast, the intramolecular version of the Ni⁰ based coupling reaction led to a mixture from which was isolated and characterized, besides the

reduction product **9**, the 17-membered ring macrocycle **12**¹⁰ resulting from C-C bond formation at C-6. The yield was moderate but reproducible. The 16-membered ring compound **13**¹⁰ was similarly obtained from **11** by coupling at C-7. It is likely that steric hindrance at this position and additional factors pertaining to the intramolecular Ni⁰ mediated reaction (which remains to be investigated further) rendered this cyclisation less efficient than that which had led to **12**.

The simplified 17-membered ring macrocycle **12** is the model compound of the eastern substructure of Kistamycin and Chloropeptin II while the 16-membered ring macrocycle **13** is the corresponding model of Chloropeptin I. Further work is in progress.
