# A concise and efficient solid-phase synthesis of 2-amino-4(3H)-quinazolinones 

Rui-Yang Yang* and Alan Kaplan<br>ArQule, Inc., 19 Presidential Way, Woburn, MA 01801, USA

Received 17 June 2000; revised 7 July 2000; accepted 11 July 2000

#### Abstract

A concise and efficient solid-phase synthesis of 2-amino-4(3H)-quinazolinones is described. Reaction of polymer-bound isothiourea with isatoic anhydride provides 2 -amino-4( 3 H )-quinazolinones with good yields and excellent purity. © 2000 Elsevier Science Ltd. All rights reserved.

Keywords: quinazolinones; thioformamidines; solid-phase synthesis.

The high-throughput syntheses of small organic molecules in both solution-phase and on solid support has become a routine practice for lead discovery and lead optimization in pharmaceutical research. As a result, the development of reaction conditions suitable for automated parallel chemistry has attracted substantial attention in the past few years. ${ }^{1,2}$

4(3H)-Quinazolinone has been identified as an important class of heterocyclic compounds in medicinal chemistry, having anticonvulsant, ${ }^{3}$ antihypertensive, ${ }^{4}$ antidiabetic, ${ }^{5}$ and anti-tumor ${ }^{6}$ activity. Antimicrobial and antihistaminic activities have also been documented. ${ }^{7}$ A number of syntheses of these types of compounds has previously been reported. Recently, Mayer and co-workers ${ }^{8}$ disclosed a solid-phase synthesis approach to 2 -alkyl substituted analogs. Villalgordo and co-workers ${ }^{9}$ reported a solid-phase synthesis based on an aza Wittig-mediated annulation strategy; however, a mixture of two isomers was formed. More recently, a paper by Gopalsamy ${ }^{10}$ disclosed a related solid-phase synthesis of 2-amino-4(3H)-quinazolinones. Our approach differs from those previously reported in its efficiency of chemical steps and feasibility of side-chain functionality.

The general approach for the solid-phase synthesis of 2-amino-4(3H)-quinazolinones is shown in Scheme 1. Thiourea $\mathbf{1}$ is efficiently loaded to a chloromethylated polystyrene resin 2 ( $2 \%$ DVB Merrifield resin, $2.3 \mathrm{mmol} / \mathrm{g}$ ) in DMF at $80^{\circ} \mathrm{C}$ to form the polymer-bound isothiourea 3. The results for the conversion of chloro resin $\mathbf{2}$ to isothiourea $\mathbf{3}$ are summarized in Table 1. All the conversions are nearly quantitative, as determined by microanalysis of sulfur and nitrogen of

| 2 | Allyl | 1.82 | 1.80 | 99 |
| 3 | Cyclohexyl | 1.69 | 1.64 | 97 |
| 4 | Ph | 1.70 | 1.65 | 97 |

a. Theoretical loading is calculated based on $100 \%$ conversion.
b. Calculated based on the microanalysis results of S and N of polymer-bound 3 .
polymer-bound 3. Reaction of $\mathbf{3}$ with isatoic anhydride $\mathbf{4}$ in DMF in the presence of diisopropylethylamine at $80^{\circ} \mathrm{C}$ afforded 2-amino-4(3H)-quinazolinones 5. These products were formed via acylation of the polymer-bound isothiourea 3 by isatoic anhydride 4, followed by cleavage of the resulting product via an intramolecular cyclization. Results are summarized in Table 2. Unlike most solid-phase chemistries that require a large excess of reagents to push the reactions to completion, this reaction proceeds well with a stoichiometric amount of isatoic anhydride 4. Reaction conditions are general with respect to both the thiourea and the isatoic anhydride. All the desired products 5 were obtained in good to high yields with excellent purity. The results are reported as isolated yields and calculated based on the amount of compound 4 used in the reaction. Purity was determined by HPLC analysis of crude product 5 by both UV and ELSD. All of the products were also fully characterized by ${ }^{1} \mathrm{H}$ NMR and mass spectrometric techniques. ${ }^{11}$

In summary, we have disclosed a concise and efficient synthesis of 2-amino-4(3H)-quinazolinones on solid support. This protocol only requires a two-step procedure and provides 2 -amino-4(3H)-

Table 2
Solid-phase synthesis of 2-amino-4(3H)-quinazolinones 5

| Entry | Product 5 | Yield ${ }^{\text {a }}$ | Purity ${ }^{\text {b }}$ |

| 8 |  | 53\% | 84\% (90\%) |
| 9 |  | 80\% | 95\% (100\%) |
| 10 |  | 60\% | 94\% (100\%) |

a. Yields are calculated based on the quantity of $\mathbf{4}$ used. b. Purity was determined by HPLC using both UV $(254 \mathrm{~nm})$ and ELSD detectors, numbers in the brackets are from ELSD detector.
quinazolinones in good yield with excellent purity. Both building blocks mono-substituted thioureas and isatoic anhydrides used in this chemistry are readily available from commercial sources or can be easily synthesized. ${ }^{12,13}$ Unlike the method reported by Gopalsamy, ${ }^{10}$ which involved the release of foul smelling methylthiol, the thiol generated in this method remains attached to the solid support, thus providing a more environmentally benign and practical synthesis of 2 -amino- $4(3 \mathrm{H})$-quinazolinones.
