It was reported that compounds **6d** and **6i** were obtained as a mixture of *E/Z* isomers. In fact, compound **6i** was obtained as pure *E* isomer, while compound **6d** was obtained as a mixture of the pure *E* isomer (60%) and a by-product (40%) resulting from the addition of the nitrocompound **1d** to the carbon bearing the sulfone group (instead of the carbon bearing the cyano group), followed by elimination of nitrous acid.
