

Publishers' Announcement

Readership of *Tetrahedron Letters* continues to grow at a very rapid pace.

Over two million *Tetrahedron Letters* articles were downloaded from ScienceDirect last year, an increase of over 60% on the 2002 figure. Similar growth is expected this year.

Authors can be confident that with the inclusion of their paper in ScienceDirect, their research is being widely read internationally. ScienceDirect is the world's leading scientific database—it currently includes 5.6 million articles, and over nine million researchers have access to the database. During 2003, almost 140 million full text articles were downloaded.

The outstanding features of ScienceDirect include:

- *Articles in Press*. Providing the most rapid dissemination of research, Articles in Press are put online as soon as the author corrections have been incorporated in the proof. Articles in Press can be cited using the Digital Object Identifier (DOI).
- *Back files*. All articles back to volume 1 issue 1 of all Elsevier chemistry titles are now available: the first major chemistry publisher to complete this huge task. For *Tetrahedron Letters*, this amounts to over 73,000 articles, dating back to 1959.
- *Trusted archive*. Elsevier has entered into a number of arrangements with third parties, to ensure the long-term security of its electronic archive. For example, the Koninklijke Bibliotheek (the National Library of the Netherlands) is an official digital archive for Elsevier journals. Maintaining access to the database is of fundamental importance to all the parties involved: authors, readers, librarians, funding bodies and the publisher.
- *Reliable service*. ScienceDirect itself maintains extremely high standards of service, and has invested in multiple back-up systems to ensure availability around the clock. This makes ScienceDirect one of the most reliable online providers of scientific articles.
- *Dymond linking*SM. Innovative linking technology enables readers to directly interrogate the CrossRef Beilstein database using structure searching.
- *Reference linking*. Most references are now linked to an abstract or full text article, through the inter-publisher CrossRef organization. To make use of reference linking, readers should go to the HTML version of the article.
- *Free abstracts*. All abstracts and tables of contents are freely available to readers. In addition, the first issue of each year is a free sample copy, so all articles can be accessed.

Publishing in *Tetrahedron Letters* will make your research part of the world's leading scientific database—guaranteeing that your work will be accessible and read globally.
