ABSTRACT

The preparation of eight-membered carbocycles with tri-substituted double bonds has been attempted using RCM reactions. One of the stereoisomers subjected to the RCM reaction provided a desired compound which will be used for the synthesis of YW3699.

YW3699 (1)¹ is a fungal metabolite isolated in 1998 by Wang et al. (Fig. 1) and was shown to inhibit the biosynthesis of glycosylphosphatidylinositol (GPI) in tripanosoma.^{2,3} It has a unique carbon skeleton, namely four consecutive five-, eight-, six-, and fivemembered rings, with an ester of C9 hydroxycarboxylic acid. The absolute configuration is yet to be established. We have been studying the preparation of carbocycles with tri-substituted cycloheptenes using the ring-closing methathesis (RCM) reaction.⁴ Our next challenge was the preparation of eight-membered carbocycles by the RCM reaction. Recently more than ten papers^{5–13} describing the application of RCM reactions to the synthesis of eight-membered substances have been reported. However, the construction of the eight-membered carbocycles especially having a tri-substituted double bond is still a challenging task in the synthetic work. Syntheses of cyclooctenes are attempted by carefully planning the precursors. Here we report our preliminary results on the applications of the RCM reactions to the construction of the eight-membered carbocycles.

The strategy for the total synthesis of YW3699 (1) is to construct the ring D as well as to introduce the oxygen function of the ring A at the last step. ¹⁴ Thus, the target molecule is the simple tri-cyclic substance like compound **6**. We would like to know the feasibility of the cyclization to the tri-substituted eight-membered carbocycle. Therefore, we have planned to test the RCM reactions of the four diastereoisomers with the epoxide ring. The trans relationship of the eight- and six-membered rings in rings B and C was realized by the conjugate addition to compound **2**. The epoxide ring was introduced to a five-membered enone as illustrated in Scheme 1.

The 1,4-addition of i-PrOSiMe₂CH₂MgCl in the presence of CuBr-Me₂S and the Tamao reaction¹⁵ to enone 2^{16} afforded 7, as the sole isomer with trans stereochemistry (Scheme 2). The stereo-

chemistry was established based on 2D NMR spectra. Protection of the primary alcohol as a TBDPS ether, ketalization using the

Scheme 2. Reagents and conditions: (a) *i*-PrOSiMe₂CH₂Cl, Mg, CuBr–Me₂S, THF; then KF, KHCO₃, H₂O₂, 86%: (b) TBDPSCl, NEt₃, DMAP, CH₂Cl₂, 93%; (c) TMS-OCH₂CH₂OTMS, TMSOTf, CH₂Cl₂, 70%; (d) TBAF, THF, 76%; (e) Dess–Martin Oxid., 99%; (f) trisylhydrazone of 2-allylcyclopentanone, *t*-BuLi, THF, 90%; (g) Dess–Martin Oxid., **4a** (46%), **4b** (37%); (h) H₂O₂, NaOH; (i) *t*-BuOOH, VO(acac)₂; (j) Dess–Martin Oxid., **5a** (28%), **5b** (22%).

Tsunoda and Noyori method, 17 deprotection of the silyl ether (TBAF), and Dess-Martin periodinane oxidation¹⁸ gave aldehyde **3**. The trisyl hydrazone of 2-allylcyclopentanone was treated with t-BuLi¹⁹ and was reacted with **3** to produce alcohol **11** as a mixture of diastereoisomers with a 90% yield.²⁰ The mixture of alcohols **11** was oxidized (Dess-Martin) into separable enones 4a and 4b and gave yields of 46 and 37%, respectively. Enone 4a was converted $(H_2O_2, NaOH)$ into epoxides $5a^{21}$ and $5c^{22}$ with yields of 67% and 13%, respectively. Enone 4b was also converted into epoxides 5b and **5d** with yields of 65% and 18%, respectively; however, the configuration was not determined at this stage. Alternatively, alcohol 11 was converted into epoxides under Sharpless epoxidation conditions²³ followed by oxidation, to generate two diastereoisomeric epoxides, 5a and 5b, with yields of 28% and 22%, respectively. The configurations were later assigned by the analysis of the cyclized compound 6a.

Each epoxide was treated with Grubbs II $(30 \text{ mol } \%)^{24}$ in CH₂Cl₂ (1 mM) under reflux for 10 h (Scheme 3). The diene **5a** efficiently afforded the tri-carbocyclic ketone **6a**²⁵ with an 80% yield as the sole product. The structure of **6a** was solved by X-ray crystallographic²⁶ and 2D NMR spectral analysis. The 3D structure is shown in Figures 2 and 3.

From $\bf 5c$, cyclized product $\bf 6c$ was obtained only in trace amounts. However, epoxide $\bf 5b$ (or $\bf 5d$) provided a ring-contracted seven-membered compound $\bf 12$, $^{27-29}$ dimeric at the terminal vinyl group $\bf 13^{29}$ and the styrene adduct $\bf 14$. Epoxide $\bf 5d$ (or $\bf 5b$)

Scheme 3. Reagents and conditions: (a) Grubbs II (30 mol %), CH₂Cl₂ (0.5 mol %), reflux. 10 h.

afforded many products without recovery of the starting material, which could not be analyzed due to the minute amounts. The product **6a** had the desired configurations for the synthesis of YW3699 **(1)**. Compound **6a** was further efficiently converted to **15**³⁰ with Tebbe reagent (85%) (Fig. 2).³¹ We then carried out the RCM reactions of compounds **4a** and **4b** to compare the effect of the epoxide ring and the double bond at the 3,4-positions. However, the starting material was recovered.

In summary, we have reported the synthetic efforts toward the sesterterpenoid YW3699 (1). The RCM reaction was successfully applied to the construction of the tri-substituted cyclooctene ring. Interestingly, only one diastereoisomer was efficiently cyclized to the corresponding tri-cyclic compound. This result confirms the

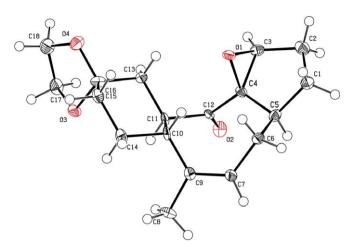

Figure 3. The 3D structure of compound 6a analyzed by X-ray crystallography.

importance of the conformation of the diene substrate. Namely, only one of the four possible diastereoisomers, 5a-d, had the suitable geometry for cyclization. The total synthesis of YW3699 (1) is currently under progress in this line.

Acknowledgments

We thank Dr. Masami Tanaka and Miss. Yasuko Okamoto, Tokushima Bunri University, for acquiring the 600 MHz NMR and MS spectra, respectively.
