**A ligand-free, copper-catalyzed cascade sequence to indole-2-carboxylic esters**

pp 6549–6551

Stefan G. Koenig*, John W. Dankwardt, Yanbing Liu, Hang Zhao, Surendra P. Singh

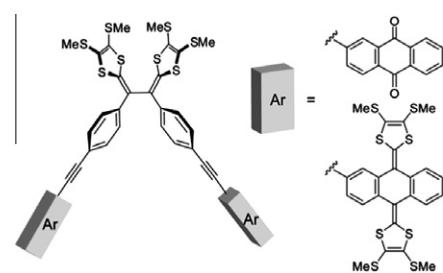

A variety of indole-2-carboxylic esters are accessible in yields up to 61% through a ligand-free, copper-catalyzed reaction of a series of commercially available 2-halo aryl aldehydes with benign glycine amidoesters, including the common reagent ethyl acetamidoacetate. This one-pot, three-reaction format allows ready entry to the desired heterocycles from starting substrates in the reactivity order of iodoo > bromoo \geq chloroo substituents. An assortment of functional groups is tolerated, adding to the generality of this methodology.

Two molecular tweezers containing a tetrathiafulvalene vinylogue (TTFV) core were synthesized via sequential Sonogashira and Horner–Wadsworth–Emmons (HWE) reactions. The electrochemical and spectroscopic properties of these TTFV tweezers were investigated by UV-vis absorption spectroscopy, cyclic voltammetry, and spectro-electrochemical measurements. The property characterizations suggest potential application in electrochemically-actuated molecular switching devices.
