(Received in Germany 8 February 1988)

Abstract: Pyridazine and C-alkylpyridazines were found to yield N-ethoxycarbonyl-1,2-dihydropyridazines $\underline{1} - \underline{6}$ when subjected to conditions of homolytic ethoxycarbonylation. This is the first example of an attack of a radical at the nitrogen atom of a N-heteroarene in Minisci-type reactions.

Substitution reactions employing nucleophilic carbon-centered free radicals are versatile tools for the introduction of alkyl, acyl, aroyl, a-alkoxyalkyl and a-N-amidoalkyl groups into the protonated pyridazine system³. In the course of an investigation⁴ directed to the synthesis of alkyl pyridazinecarboxylates by means of *Minisci*-type reactions³ we recently observed (besides formation of the expected C_{\bullet} -carboxylated products) occurrence of compounds, which surprisingly proved to be N-alkoxycarbonyl-dihydropyridazine derivatives.

We here report on the determination of the structures of these novel compounds isolated in up to 36% yield (cf. table 1) after mplc separation of the mixtures obtained in homolytic ethoxycarbonylation reactions. Moreover, a plausible mechanistic interpretation of the formation of N-substituted dihydroheteroarenes in Minisci-reactions, which to our knowledge is unprecedented, is discussed.

Elemental analyses, ms molecular weight determinations and $v_{(c=0)}$ absorption bands between 1745 and 1707cm⁻¹ as well as between 1690 and 1640cm⁻¹ clearly indicate the products, which exhibit striking fluorescence (on irradiation with UV_{3550m}), to be N-ethoxycarbonyl-dihydropyridazinecarboxylic acid esters. In addition, N-H stretching vibrations at ~3000cm⁻¹ in the ir spectra and broadened one-proton signals in the ¹H-nmr spectra (slowly disappearing after D₂O addition) permit to exclude other structures than those of 1,2-dihydropyridazine derivatives. The positions of substituents in compounds $\underline{1} - \underline{4}$ could be determined by means of ¹H-nmr spectroscopy. According to the spectral data structures $\underline{1}$ and $\underline{2}$ have to be assigned to the N-ethoxycarbonyl compounds obtained from the parent heterocycle. Also the two tricarboxylates resulting from reaction of 3-methylpyridazine with ethoxycarbonyl radicals easily can be discriminated, since the ¹Hnmr spectrum of <u>3</u> shows NH-CH coupling (J=4Hz), whereas in the spectrum of compound 4 the one-proton signal at 6.82ppm appears as a singlet.

Table 1. Yields of 1-ethoxycarbonyl-1,2-dihydropyridazine derivatives (based on starting heteroaromatic substrate)

Starting compound	<pre>base:peroxide=1:3</pre>	<pre>base:peroxide=1:10</pre>	
pyridazine	<u>1</u> (17%) <u>2</u> (<1%)	<u>1</u> (35%) <u>2</u> (1%)	
3-methylpyridazine	<u>3</u> (12%) <u>4</u> (16%)	<u>3</u> (18%) <u>4</u> (18%)	
4-methylpyridazine	<u>5a(6%) 6(3%)</u>	<u>5a</u> (6%) <u>6</u> (7%)	
4-(2-phenylethyl)-pyridazine	<u>5b(15%)</u>		
ethyl 4-pyridazinecarboxylate	<u>1</u> (36%) <u>2</u> (<1%)		
diethyl 4,5-pyridazine-	<u>1</u> (24%) <u>2</u> (<1%)		
dicarboxylate (<u>7g</u>)			

Also in the tricarboxylate derived from 4-methylpyridazine the signal of the olefinic proton is split into a doublet. This, however, does not permit an unequivocal structure proof, since triethyl 5-methyl-1,4,6-(1,2-dihydropyridazine)tricarboxylate as well as triethyl 4-methyl-1,5,6-(1,2-dihydropyridazine)tricarboxylate have to be taken into consideration. But assignment of structure $\underline{6}$ unambigously could be achieved by an additional experiment: diethyl 4-methyl-3,5-pyridazinedicarboxylate⁴ ($\underline{7e}$) yielded an identical product upon homolytic ethoxycarbonylation.

Besides compound <u>6</u>, the reaction of 4-methylpyridazine afforded a C,N-dicarboxylate, the ¹H-nmr spectrum of which exhibits two signals within the observed range of protons a to nitrogen atoms in N-ethoxycarbonylated 1,2-dihydropyridazines (doublet at 7.44ppm, singulet at 6.52ppm). Again, these data alone do not permit to draw definitive conclusions regarding the position of the N-COOEt moiety relative to the alkyl substituent. Ring-H / methyl-H coupling could not be observed, we also failed in attempts to elucidate the substitution pattern by n.o.e. experiments. Neither did ¹³C-nmr spectroscopy provide sufficient information. As illustrated in table 2 the replacement of a COOEt moiety attached to a ring carbon-atom in N-ethoxycarbonyl-1,2-dihydropyridazinetricarboxylic acid ester <u>8a</u> (=2) by a methyl group causes an upfield shift of the olefinic proton signal, the

Pyridazines-XXXIX

magnitude of which decreases with increasing number of bonds between this proton and the alkyl substituent. A similar phenomenon is observed with H_{α} in pyridazinecarboxylic acid esters <u>7a-h</u>. Considering that in the C,N-dicarboxylate obtained from 4-methylpyridazine the olefinic proton singulet is shifted upfield to a larger extent than the doublet of the second olefinic proton in comparison to H-3 and H-6 of compound <u>8d</u> (=<u>1</u>) (see table 2), one may assume the methyl group to be attached to ring carbon-atom 5 rather than to C-4. Thus, assignment of structure <u>5a</u> (=<u>8f</u>) to the novel compound appears to be reasonable. Similar considerations prompt us to propose structure <u>5b</u> (=<u>8h</u>) for the C,N-dicarboxylate obtained from 4-(2-phenylethyl)pyridazine.

Table 2. Chemical shifts of Eq in pyridazinecarboxylic acid esters^{4,6} and 1,2-dihydropyridazinecarboxylic acid esters

δH_α (=R¹)

δH_α' (=R⁴)

In order to obtain insight into the mechanism which accounts for the occurence of these unusual reaction products, homolytic ethoxycarbonylation reactions employing ethyl 4-pyridazinecarboxylate, diethyl 4,5-pyridazinedicarboxylate ($\underline{7g}$) and ethyl 5-methyl-4-pyridazinecarboxylate ($\underline{7h}$) were investigated. N-carboxylates $\underline{1}$ and $\underline{2}$ as well as $\underline{5}$ and $\underline{6}$ (thus being products identical with those obtained from pyridazine or 4-methylpyridazine, respectively) were found to be formed in these reactions under standard conditions⁴, i.e. in the absence of an organic layer.

Accordingly, when <u>7g</u> and <u>7h</u> are considered to be intermediates in the formation of the above mentioned N-carboxylates, one might propose pathway I displayed below, which is characterised by attack of the radical at the non-protonated nitrogen-atom of the 1.2-diazine system.

PATHWAY I

In a similar manner pathway I may account for the formation of compounds 2 and 6, since 6 also was obtained when 7e was used as the educt. In this context it has to be referred to the report by *Minisci* and co-workers on reactions of diazonium salts with nucleophilic carbon-centered radicals⁷.

Of course, formation of N-carboxylates $\underline{1}$ and $\underline{5}$ from the parent heterocycle or its 4-methyl derivative also could take place according to pathway II via interaction of two radicals (the COOEt radical and radical <u>B</u>).

Pyridazines-XXXIX

However, this mechanism does not permit to explain that compounds $\underline{1}$ and $\underline{5}$ also are obtained, when $\underline{7g}$ or $\underline{7h}$ are subjected to the homolytic alkoxycarbonylation reaction and that compounds $\underline{2}$ and $\underline{6}$ are formed from $\underline{7a}$ or $\underline{7e}$, respectively. Neither can pathway II provide a reasonable explanation for the results of ethoxycarbonylation experiments with pyridazine and 4-methylpyridazine in the presence of dichloromethane⁴. Under these conditions, which enable us to prepare 4,5disubstituted pyridazines in high yield by avoiding additional radicalic attack at ring carbon-atoms, only traces (<1%) of N-ethoxycarbonylated products are formed⁴.

Finally, it should be noted that the electronic properties of an alkyl and an alkoxycarbonyl substituent call for assuming protonation of N-1 in 4-methylpyridazine and of N-2 in ethyl 5-methyl-4-pyridazinecarboxylate ($\underline{7h}$) thus permitting to exclude other pathways than those discussed above. This is supported by the fact that only compound $\underline{5a}$ but not its isomer <u>8e</u> is formed from 4-methylpyridazine.

EXPERIMENTAL

The homolytic ethoxycarbonylation reactions were performed as described in ref.⁴ applying base:peroxide ratios of 1:3 (method A) and 1:10 (method C). For yields see table 1.

Melting points (uncorrected) were determined with a Kofler apparatus. Ir spectra were recorded on a Jasco IRA-1 spectrometer (KBr disks, unless otherwise noted; v in cm⁻¹). ¹H-nmr spectra were recorded with a Varian EM 390 (90MHz), using CDCl₃ as solvent; chemical shifts (J in Hz) are reported in ppm downfield from internal TMS. Mass spectra were obtained on a Finnigan MAT 311A and on a Hewlett Packard 5970B-MSD. Microanalyses were performed by the Institut für Physikalische Chemie (University of Vienna, Dr.Zak). Glc analyses were carried out with a Hewlett Packard 5890A/ 5970B-MSD, using a 12m HP1-FS-WCOT column. Medium pressure liquid chromatography (mplc) was carried out in Lobar^m glass columns filled with 250g LiChroprep^m Si 60 (Merck). Preparative thin layer chromatography (prep. tlc) was carried out on aluminium oxide plates (type T, Merck).

Triethyl 1,4,5-(1,2-dihydropyridazine)tricarboxylate (<u>1</u>). Separation by mplc of a reaction mixture obtained from pyridazine (dichloromethane/ethyl acetate 5/1), analytic sample by kugelrohr distillation ($180^{\circ}C, 10^{-1}mbar$), yellow crystals, mp <25°C; ms: M⁺ at m/e 298, major peaks at 225 (100°), 125, 80; ir: 3120 (v_{m-M}), 1745, 1727, 1672 ($v_{c=0}$); nmr: 8.99 (d, J=4, 1H, H-2, exchangeable with D₂O), 7.62 (d, J=4, 1H, H-3, s after D₂O exchange), 6.84 (s, 1H, H-6), 4.46-4.03 (m, 6H, 3x CH₂), 1.48-1.10 (m, 9H, 3x CH₃); Anal. calcd. for C₁₃H₁₀N₂O₆: C, 52.34; H, 6.08; N, 9.39. Found: C, 52.67; H, 6.18; N, 9.49.

Tetraethyl 1,4,5,6-(1,2-dihydropyridazine)tetracarboxylate (2). Separation by mplc of a reaction mixture obtained from pyridazine (dichloromethane/ethyl acetate 5/1), analytic sample after mplc (dichloromethane/ethyl acetate 8/1), yellow crystals, mp <25°C; ms: M⁺ at m/e 370, major peak at 297 (100%); ir 3080 (Ψ_{N-H}), 1728, 1640 ($\Psi_{C=O}$); nmr: 9.67 (d, J=4, 1H, H-2, exchangeable with D₂O), 7.67 (d, 1H, J=4, H-3, s after D₂O exchange), 4.50-4.06 (m, 8H, 4x CH₂), 1.53-1.12 (m, 12H, 4x CH₃); Anal. calcd. for C_{1e}H₂₂N₂O₂: C, 51.89; H, 5.99; N, 7.56. Found: C, 51.90; H, 6.11; N, 7.20.

Triethyl 6-methyl-1,4,5-(1,2-dihydropyridazine)tricarboxylate (<u>3</u>).Separation by mplc of a reaction mixture obtained from 3-methylpyridazine (dichloromethane/ethyl acetate 5/1), analytic sample after preparative tlc on aluminium oxide (dichloromethane/ethyl acetate 3/1), colourless crystals, mp=62-66°C; ms: M⁺ at m/e 312, major peaks at 239 (100%), 211, 139; ir: 3120 (v_{N-H}), 1730, 1723, L670 ($v_{C=O}$); nmr: 8.13 (d, J=4, 1H, H-2, exchangeable with D₂O), 7.62 (d, J=4, 1H, H-3, s after D₂O exchange), 4.43-4.06 (m, 6H, 3x CH₂), 2.19 (s, 3H, C-6-CH₃), 1.43-1.13 (m, 9H, 3x CH₂-<u>CH₃</u>); Anal. calcd. for C₁₄H₂₀N₂O₈: C, 53.84; H, 6.46; N, 8.97. Found: C, 53.66; H, 6.40; N, 8.67.

Triethyl 3-methyl-1,4,5-(1,2-dihydropyridazine)tricarboxylate (<u>4</u>). Separation by mplc of a reaction mixture obtained from 3-methylpyridazine (dichloromethane/ethyl acetate 5/1), analytic sample after kugelrohr distillation (75°C, 10^{-1} mbar), yellow crystals, mp=99-101°C; ms: M⁺ at m/e 312, major peaks at 239 (100%), 237, 211, 139, 94; ir: 3110 (\mathbf{v}_{N-H}), 1738, 1654 (\mathbf{v}_{C-O}); nmr: 7.72 (s, 1H, H-2, exchangeable with D₂O), 6.82 (s, 1H, H-6) 4.40-4.01 (m, 6H, 3x CH₂), 2.32 (s, 3H, C-3-CH₃), 1.42-1.10 (m, 9H, 3x CH₂-<u>CH₃</u>). Anal. calcd. for C₁₄H₂₀N₂O₆: C, 53.84; H, 6.45; N, 8.97. Found: C, 54.14; H, 6.41; N, 8.78.

Diethyl 5-methyl-1,4-(1,2-dihydropyridazine)dicarboxylate ($\underline{5a}$). Separation by mplc of a reaction mixture obtained from 4-methylpyridazine (dichloromethane/ethyl acetate 10/1), analytic sample after mplc (dichloromethane/ethyl acetate 5/1), yellow crystals, mp <25°C; ms: M⁺ at m/e 240, major peaks at 167 (100%), 139, 121; ir: 3110 (v_{N-H}), 1735, 1728, 1688 (v_{C-O}); nmr: 8.32 (d, J=4, 1H, H-2, exchangeable with D₂O), 7.44 (d, J=4, 1H, H-3, s after D₂O exchange), 6.52 (s, 1H, H-6), 4.40-4.03 (m, 4H, 2x CH₂), 1.48 (s, 3H, C-5-CH₃), 1.39-1.13 (m, 6H, 2x CH₂-<u>CH₃</u>); Anal. calcd. for C₁₁H₁₆N₂O₄: C, 54.99; H, 6.71; N, 11.66. Found: C, 55.09; H, 6.72; N, 11.35.

Diethyl 5-(2-phenylethyl)-1,4-(1,2-dihydropyridazine)dicarboxylate (5b). Separation by mplc of a reaction mixture obtained from 4-(2-phenylethyl)pyridazine (dichloromethane/ethyl acetate 5/1), analytic sample after mplc (dichloromethane/ethyl acetate 5/1), analytic sample after mplc (dichloromethane/ethyl acetate 5/1), analytic sample after mplc (dichloromethane/ethyl acetate 8/1), colourless crystals, mp=83-85°C; ms: M⁺ at m/e 330, major peaks at 257 (100%), 91; ir: 2990 (v_{N-H}), 1740, 1730, 1690 ($v_{C=O}$); nmr: 7.88 (d, J=4, 1H, exchangeable with D₂O), 7.52 (d, J=4, 1H, H-3, s after D₂O exchange), 7.40-7.16 (m, 5H, phenyl), 6.51 (s, 1H, H-6), 4.38-4.01 (m, 4H, 2x <u>CH</u>₂-CH₃), 2.68-1.70 (m, 4H, CH₂-CH₂), 1.40-1.13 (m, 6H, 2x CH₂-<u>CH₃</u>). Anal. calcd. for C_{1B}H₂₂N₂O₄: C, 65.44; H, 6.71; N, 8.48. Found: C, 65.01; H, 6.76; N, 8.16.

Triethyl 5-methyl-1,4,6-(1,2-dihydropyridazine)tricarboxylate (<u>6</u>). Separation by mplc of a reaction mixture obtained from 4-methylpyridazine (dichloromethane/ethyl acetate 10/1), analytic sample after kugelrohr distillation (190°C, 10^{-1} mbar), yellow crystals, mp<25°C; ms: M⁺ at m/e 312, major peaks at 279, 239 (100%), 167; ir: 3080 (v_{N-H}), 1738, 1707, 1640 (v_{C-O} ; nmr: 8.80 (d, J=4, 1H, H-2, exchangeable with D₂O), 7.45 (d, J=4Hz, 1H, H-3, s after D₂O exchange), 4.45-4.02 (m, 6H, 3x CH₂), 1.50 (s, 3H, C-5-CH₃), 1.44-1.12 (m, 9H, 3x CH₂-<u>CH₃</u>); Anal. calcd. for C₁₄H₂₀N₂O₆: C, 53.84; H, 6.45; N, 8.97. Found: C, 54.04; H, 6.26; N, 8.41.

2454

Diethyl 5-methyl-3,4-pyridazinedicarboxylate ($\underline{7d}$). Separation by mplc of a reaction mixture obtained from $\underline{7h}$ (method A) (dichloromethane/ethyl acetate 3/1), analytic sample after mplc (ethyl acetate), yield: 24%, yellow oil; ms: M⁺ at m/z 238, major peaks at 165, 122, 94 (100%); ir: (CH_2Cl_2) 1730 (v_{c-c}); nmr: 9.30 (s, 1H, H-6), 4.70-4.33 (m, 4H, 2x CH₂), 2.47 (s, 3H, C-5-CH₃), 1.59-1.25 (m, 6H, 2x CH₂-<u>CH₃</u>). Hrms calcd. for C₁₁H₁₄N₂O₄: 238.095(4). Found: 238.095(6) <u>+</u> 0.002.
