FORMATION OF QUINOACRIDINIUM SYSTEM.

A NOVEL REACTION OF QUINALDINIUM SALTS

Abstract - N-Ethylquinaldinium salts heated in a solvent in the presence of a secondary amine yield 8,13-diethyl-6-methyl-8H-quino[4,3,2-de] acridinium salts. The structure of the iodide is determined by X-ray analysis. It is found that bond distances in quinoacridinium system are strongly affected by resonance interactions.

In the course of our studies on cyanine dye formation we have found that if syntheses using N-alkylquinaldinium salts are carried out in the presence of a strongly basic secondary amine, such as piperidine or pyrrolidine, instead of the commonly used sodium or potassium hydroxide, several coloured products are formed in considerable amounts in addition to the required cyanine.¹ The distribution of these products depende on the substrate as well as on the reaction conditions.

In this paper a novel reaction of N-ethylquinaldinium iodide in the presence of piperidine is reported and the structure of the reaction product, as determined by X-ray analysis, is described.

RESULTS

We have found that N-ethylquinaldinium iodide heated in ethanol with an equimolar amount of piperidine yields as the main product (over 60%) an intensely red crystalline compound which, according to elemental analysis, might have the same formula as pseudocyanine iodide. However, its UV-VIS spectrum (Fig. 1) indicated that there were considerable differences in their structures.

Both ¹H and ¹³C NMR spectra indicated that the compound contained 19 carbon atoms in a heteroaromatic system and a methyl group. Thus it was evident that two molecules of quinaldinium iodide had taken part in the reaction. The number of quaternary carbon atoms (9 according to the off-resonance spectrum) indicated that in reaction a novel ring closure had occurred. To determine the structure of the reaction product an X-ray analysis was undertaken. The compound was thus identified as 8,13-disthyl-6-methyl-8H-quino-[4,3,2-de]acridinium iodide.

Fig. 1. UV-VIS spectrum of 8,13-diethyl~6-methyl~8H-quino[4,3,2-de]acridinium iodide (full line) and pseudocyanine iodide (dotted line).

The structure of the product shows that it is formed in a multistep reaction as a result of ring opening at the C2-N bond of one of the molecules of N-ethylquinaldinium iodide and two ring closures. The reaction requires cleavage of 6 bonds, one C-N and five C-H, the formation of 4 new bonds: one double and two single ones, and removal of five hydrogen atoms. The reaction sequence needs clarification. It remains unclear how the hydrogen atoms are removed, but it seems probable that another molecule of the quinaldinium salt might serve as the acceptor of hydrogen atoms, and in further reactions decomposes to tar.

STRUCTURE

The shape of the cation with the numbering system is shown in Fig. 2 and torsion angles in Fig. 3. Bond lengths and angles are given in Table 1 and Table 2. The bond lengths are generally those expected from consideration of the 18 resonance forms with the positive charge located at N(18) or N(13). The G-G and G-N bond lengths in the ring system are in the range 1.36(1) - 1.47(1) and 1.36(1) - 1.40(1) Å respectively. The longest bond is between C(4A) and C(4B); only two of above mentioned 18 resonance forms have a double bond at this position.

Substitution of N(13) with the ethyl group results in overcrowding between C(12) and C(17). Analogously to overcrowded regions in polycyclic aromatic hydrocarbons, we can refer to it as "the bay region". In hydrocarbons the overcrowding is relieved mainly by bond torsions, with the planar distribution of bonds around C atoms preserved.² The presence of a more easily deformable N atom in the "bay region" introduces an additional way to relieve the strain. The nitrogen N(13) atom in the "bay region" shows a slightly pyramidal configuration of bonds and is at a distance 0.103(1) Å from the plane through C(17), C(13A) and C(12B). However, as in polycyclic hydrocarbons, bond torsions also give rise to ring buckling. While for the planar conformation torsion angles should be 0° or 180° , in the "bay region" values as high as $-16(1)^{\circ}$ are observed (Fig. 3).

Fig. 2. View of the cation showing the atomic numbering

Fig. 3. Torsion angles in the cation system

Another overcrowded region in the cation lies between C(4) and C(5). Here the strain is mainly relieved by torsion φ C(4) - C(4A) - C(4B) - C(5) = -16(1)^o, and distortion of valence angles from the typical 120^o values, so that finally the H stoms connected to C(4) and C(5) are 2.1 Å spart.

The crystal packing is shown in Fig. 4 and intermolecular distances are given in Table 3. In addition to the cation and anion there are two chloroform molecules in the asymmetric part of the unit cell. One of the chloroform molecules is disordered between two possible orientations occupied with 1:1 proportion. The C atoms of the chloroform molecules have close contacts with the I[®] ion (Table 3).

All distances between the anion and cation are longer than 4 Å. There is a considerable overlap of the system of two symmetry—related cation (inversion centre at 1/2 1/2 0). Table 1. Bond distances (Å).

EXPERIMENTAL

Synthesis

Piperidine (1 ml, 0.01 mole) was added to a boiling solution of N-ethylquinaldinium iodide (3 g, 0.01 mole) in ethanol (100 ml), and the mixture was boiled for 10 hrs. After concentration to 20 ml and cooling to room temp., a red crystalline precipitate of 8,13-diethyl-6-methyl-8H-quino [4,3,2-de] acridinium iodide is obtained, m.p. 204 - 205 ^OC after recrystallization from acetone (1.47 g, 63.2%).

The product is easily soluble in trifluoroacetic acid and trifluoroacetone, and slightly soluble in methanol, ethanol, acetone, chloroform, methylene chloride, nitromethane, DMF and DMSO.

TLC: Silicagel (Merck, 0.25 mm), eluent: n-butanol - acetic acid - water (1:1:2). Rf = 0.36.

Elemental analysis: 61.13% C, 5.29% H, 6.34% N ; C₂₄H₂₃N₂I requires: 61.81% C, 4.97% H, 6.01% N.

Spectra:

NMR spectra were measured at room temperature as solutions in DMSO-d $_6$ to provide the deuterium lock, with internal TMS as reference.

The ¹H NMR spectrum was recorded at 100 MHz on Varian XL 100 spectrometer. The ¹³C NMR spectra were recorded on a Jeol Co FX 90Q 22.50 MHz spectrometer. 8000 scans were accumulated for the proton decoupled ¹³C spectrum and 20000 scans for the ¹³C spectrum with off-resonance proton spin decoupling. A 7 µs pulse width with a repetition time of 1.1 s, a spectral width of 4000 Hz and 8K data points were utilized for accumulation, which were then Fourier transformed with a Jeol-980 computer.

X-ray structure determination:

Red crystals were obtained by recrystallization from chloroform. X-ray diffraction data were collected on a Syntex P2, diffractometer from a well - formed crystal with dimensions $0.5 \times 0.4 \times 0.4$ mm. The crystals of $[C_{24}H_{23}N_2]^+$ I⁻ 2 CHCl₃ are triclinic, P1, with a = 11.858(4), b = 13.120(4), c = 11.091(2) Å,

 $\alpha = 94.45(2), \beta = 113.84(2), \gamma = 106.48(2)^{\circ}, V = 1476.6(6) Å^3, Z = 2, \mu(Mo_{K_{\pi}}) = 15.23 \text{ cm}^{-1}, D_{\pi} = 1.57, D_{\chi} = 1.59 \text{ gcm}^{-3}.3585 \text{ unique reflections with}$ $29 \leqslant 45^{\circ}$ were measured of which 2503 had I \ge 1.96 $\sigma(I)$ and were considered observed. The I ion position was found from a Patterson map and the positions of the remaining atoms were determined using the DIRDIF³ program. The structure was refined by full-matrix least-squares techniques (with counter-weights) to a final value of R = 0.058 and R_w = 0.055. The final refinement included anisotropic non-H atoms and an empirical isotropic extinction parameter x, used to correct the calculated structure factors according to $F_c = F_c (1 - xF_c^2 / sin\theta)$, which converged at x= 1.9(2) 10⁻³. All hydrogen atoms were placed in idealized positions and contributed to F_c but were not refined. All calculations were performed using DIRDIF³, SHELX 76⁴ and local programs⁵. ORTEP⁶ and PLUTO⁷ were used for drawings. All supplementary crystallographic data are available on request from the Cambridge Crystallographic Data Centre⁸.
