ABSTRACT

Proanthocyanidins, known as condensed tannins or oligomeric flavonoids, exist in many edible plants and show various interesting biological activities. We have developed a simple and versatile method of synthesizing procyanidin oligomers consisting of (–)-epicatechin and (+)-catechin. This method is applicable to the synthesis of various 3-*O*-substituted oligomers. We report here the stereoselective and length controlled synthesis of [4–8]-condensed (–)-epicatechin series procyanidin oligomers. We described the details of the synthesis of an two tetramers, (–)-epicatechin-(–)-epicatechin-(–)-epicatechin-(–)-epicatechin and (–)-epicatechin-(–)-epicatechin-(–)-epicatechin-(+)-catechin (arecatannin A1), (–)-epicatechin pentamer and two 3,3′,3′′-tri-*O*-galloyl trimers, (–)-epicatechin-(–)-epicatechin-(–)-epicatechin-3,3′,3′′-tri-*O*-gallate and (–)-epicatechin-(–)-epicatechin-(+)-catechin-3,3′,3′′-tri-*O*-gallate with the condensation method using TMSOTf as a catalyst. The ability of DPPH radical scavenging activity and DNA polymerase inhibitory activity of these oligomeric compounds were investigated.

1. Introduction

Oxygen is biologically important for energy production, but active oxygen and free radicals in the body can injure cells and genes. They are also thought to be a cause of cancer, a lifestyle-related disease, and to contribute to aging. Therefore, there is currently great interest in the research and investigation into compounds that have strong anti-oxidation activity and superior ability to scavenge radicals. Thus, food and ingredients that can eliminate active oxygen and free radicals have recently received increased attention.

Proanthocyanidins (condensed tannins or oligomeric flavonoids)^{1,2} are known to be extremely strong antioxidants: investigating them has become increasingly important because of various strong biological activities. In many cases, however,

proanthocyanidins are obtained as a mixture of various analogues, making purification of each compound difficult. An elegant contribution by Kozikowski et al.,³ reported the synthesis of oligomeric catechin and epicatechin derivatives.⁴ We also developed and reported a simple, versatile, and stereoselective method of synthesizing procyanidin oligomers consisted with (–)-epicatechin (**1**) and (+)-catechin (**2**) (Fig. 1).^{5–15} Our synthetic methodology is applicable to various procyanidin oligomers, such as the 3-*O*-substituted oligomer.^{13–15} In particular, numerous galloyl-substituted flavan-3-ols and proanthocyanidins have been also isolated from plants, and demonstrated strong bioactivity.^{1,2} For example, epigallocatechin-3-*O*-gallate (EGCG), the major polyphenol in green tea, which belongs to the flavan-3-ol group, has notably been the focus of intense research interest for its protective

Figure 1. The structure of (–)-epicatechin (**1**) and (+)-catechin (**2**).

effect against a variety of cancers, such as that of the lung, prostate, and breast.¹⁶ Furthermore, the receptor that mediates the anti-cancer activity of EGCG was identified,¹⁷ but the effect of the galloyl group in proanthocyanidins is poorly understood.

Our study aimed at synthesizing various pure proanthocyanidins and measuring activity systematically. We previously reported the stereoselective synthesis of procyanidin dimers (B1,⁹ B2,⁹ B3,^{5,6} B4,⁹ *cis*-diastereomer of B3⁷ and their galloyl derivatives^{13–15}) with intermolecular condensation^{5,6,8,13–15} and intramolecular^{7,8,11} condensation using TMSOTf as the catalyst. Using this same condensation method, we synthesized procyanidin trimers stereoselectively in good yields.^{10,12} We also reported their antioxidant activities, the Maillard reaction inhibitory activity and DNA polymerase inhibitory activities. Here, we describe the stereo, regio, and oligomerization degree controlled synthesis of two epicatechin series tetramers, epicatechin-(4 β -8)-epicatechin-(4 β -8)-epicatechin-(4 β -8)-epicatechin (**3**) and epicatechin-(4 β -8)-epicatechin-(4 β -8)-epicatechin-(4 β -8)-catechin (arecatannin A1) (**4**), a epicatechin pentamer, epicatechin-(4 β -8)-epicatechin-(4 β -8)-epicatechin-(4 β -8)-epicatechin-(4 β -8)-epicatechin (**5**) and two galloyl-substituted

epicatechin series trimers, epicatechin-(4 β -8)-epicatechin-(4 β -8)-epicatechin, 3,3',3'''-*O*-trigallate (**6**) and epicatechin-(4 β -8)-epicatechin-(4 β -8)-catechin 3,3',3'''-*O*-trigallate (**7**) (Fig. 2). Their antioxidant and DNA polymerase inhibitory activities were also described.

2. Result and discussion

2.1. Synthesis

There have been numerous studies concerning isolation, semi-synthesis, and bioactivity.¹⁸ Many condensation methods for procyanidin oligomers using Lewis acids were studied after Kawamoto's report,¹⁹ however, systematic study of proanthocyanidins is still difficult even now. As previously mentioned separating purely individual structural analogues from the plant is very difficult because these compounds are presented as mixtures of a number of structurally related compounds. Furthermore, the structural determination of these compounds is not easy. Therefore, a technology for synthesizing these compounds purely and systematically is very useful and important. We already developed and reported on a synthesis methodology applicable to various (4–8) linked procyanidin dimers, trimers, and their gallate derivatives. We report here further study of the synthesis of epicatechin series tetramers (**3**, **4**), pentamers (**5**), and gallate trimers (**6**, **7**).

The key step is the coupling reaction between the oligomer nucleophile and monomer electrophile using Lewis acid as an activator. We created 2-ethoxyethoxy derivatives on the C-4 position as building blocks for procyanidin synthesis. Treatment of 5,7,3',4'-tetrabenzylepicatechin with DDQ in the presence of 2-ethoxyethanol provided the 2-ethoxyethoxy derivative **8**.⁵ As shown in Scheme 1, condensation of monomer electrophile **8** with trimer nucleophiles **9**¹⁴ and **10**¹⁴ in the presence of TMSOTf in CH₂Cl₂ at –40 °C gave corresponding tetramers **11** and **12** in 88% and 89% yields, respectively. Pentamer **13** was also obtained from the condensation of **8** and tetramer **11** in 84% using same procedure. In the condensation reaction, nucleophiles **9–11** were used in fourfold excess to avoid higher oligomer formation. The **8** reacted with **9–11**

Table 2IC₅₀ values of compounds on the activities of mammalian DNA polymerases α and β ²⁵

Entry	Compound	IC ₅₀ values (μ M)	
		Calf DNA polymerase α	Rat DNA polymerase β
1	1	>100	>100
2	2	>100	>100
3	3	0.178 \pm 0.009	31.2 \pm 1.6
4	5	0.075 \pm 0.004	26.0 \pm 1.3
5	6	0.230 \pm 0.011	38.5 \pm 1.9
6	7	0.243 \pm 0.012	40.7 \pm 2.1
7	20	0.575 \pm 0.028	57.9 \pm 3.0

Calf DNA polymerase α , and the substitution of 3-O-position with galloyl groups was highly efficacious in inhibition of DNA polymerase α .

3. Conclusion

We have developed a simple and versatile method of synthesizing procyanidin oligomers. We showed here the synthesis of (–)-epicatechin series tetramers, pentamer, and 3-O-galloyl trimers. DPPH radical scavenging activity, and DNA polymerase inhibitory activity of synthesized oligomers were also investigated. All of the oligomers showed strong DPPH radical scavenging activity. Furthermore, synthesized oligomers had potent inhibitory activity against DNA polymerase α . The elongation of oligomers and the substitution of 3-O-position with the galloyl group were shown to be highly effective for DNA polymerase inhibition.

4. Experimental

4.1. Synthesis

Optical rotation was measured with a Horiba SEPA-300 spectrometer. ¹H NMR spectra were measured with JEOL JNMLA400 spectrometer. MS spectra were recorded with a JEOL JMS-AX500 instrument. HPLC purification was carried out on a Mightysil® RP-18 GP column (Kanto Chemical Co. Inc, Japan; 250 \times 20 mm, 5 mm) using the solvents (A) 0.05% CF₃CO₂H in CH₃CN and (B) 0.05% CF₃CO₂H in H₂O. Elution was done with a linear gradient 5–100% A in 40 min (flow rate, 4.0 mL/min).

4.1.1. [4,8:4'',8''':4''',8''']-2,3-cis-3,4-trans:2'',3''-cis-3''',4'''-trans:2''',3''''-cis-3''''',4''''-trans-2''''',3''''''-cis-Hexadeca-O-benzyl-tetra-(–)-epicatechin (**11**)

To a solution of **9** (779 mg, 0.40 mmol) and **8** (73.9 mg, 0.10 mmol) in CH₂Cl₂ (80 mL) was added dropwise TMSOTf (0.20 mL, 0.10 mmol, 0.5 M solution in CH₂Cl₂) at –40 °C. After stirring for 5 min, the pale yellow reaction mixture was quenched with satd sodium hydrogen carbonate. The aq solution was extracted with CHCl₃ and the organic phase was washed with water and brine, and dried (Na₂SO₄). Filtration, concentration, and preparative silica gel TLC purification (hexane/EtOAc, 2/1) afforded a 228 mg of **11** (0.088 mmol, 88%) of as a colorless oil: [α]_D²⁴ +104.8 (c 0.94, CHCl₃), [α]_D²⁴ +80.5 (c 1.00, EtOAc), [lit.^{3a} [α]_D +85.9 (c 12.0 g L⁻¹, EtOAc)]; ¹H NMR (400 MHz, CDCl₃, 0.5:0.5 mixture of rotational isomers) 7.50–6.39 (89H, m), 6.39 (0.5H, s), 6.37 (0.5H, d, J=8.3 Hz), 6.33 (0.5H, d, J=8.3 Hz), 6.27 (0.5H, d, J=2.2 Hz), 6.23 (0.5H, s), 6.14 (0.5H, dd, J=1.7, 8.3 Hz), 6.07 (0.5H, d, J=2.2 Hz), 6.05 (0.5H, d, J=8.3 Hz), 6.03 (0.5H, dd, J=1.7, 8.3 Hz), 5.91 (0.5H, s), 5.90 (0.5H, s), 5.88 (0.5H, s), 5.86 (0.5H, d, J=2.2 Hz), 5.75 (0.5H, s), 5.75 (0.5H, br s), 5.63 (0.5H, d, J=2.2 Hz), 5.23 (0.5H, br s), 5.43 (0.5H, dd, J=1.7, 8.3 Hz), 5.39 (0.5H, br s), 5.37 (0.5H, br s), 5.23–3.92 (37H, m), 4.30–4.22 (0.5H, m), 4.25–4.20 (0.5H, m), 4.11–4.05 (1H, m), 4.01–3.93 (1.5H, m), 3.68–3.64

- These compounds were incubated with each DNA polymerase (0.05 units). One unit of DNA polymerase activity was defined as the amount of enzyme that catalyzed the incorporation of 1 nmol of dNTP (dTTP) into the synthetic DNA template-primers (i.e., poly(dA)/oligo(dT)_{12–18}, A/T=2/1) in 60 min at 37 °C under normal reaction conditions for each enzyme.^{26,27} Enzyme activity in the absence of the compound was taken as 100%. Data are expressed as the mean±SD; *n*=3.
