REPORT

Indole synthesis: a review and proposed classification

Douglass F. Taber*, Pavan K. Tirunahari

pp 7195–7210

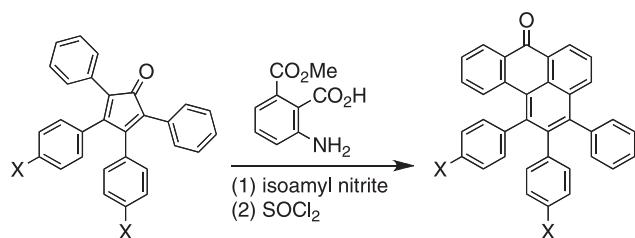

The indole alkaloids, ranging from lysergic acid to vincristine, have long inspired organic synthesis chemists. Interest in developing new methods for indole synthesis has burgeoned over the past few years. These new methods have been fragmented across the literature of organic chemistry. In this review, we present a framework for the classification of all indole syntheses.

Thermal epimerization of inositol 1,3-benzylidene acetals in the molten state

pp 7280–7288

Bharat P. Gurale, Shobhana Krishnaswamy, Kumar Vanka, Mysore S. Shashidhar*

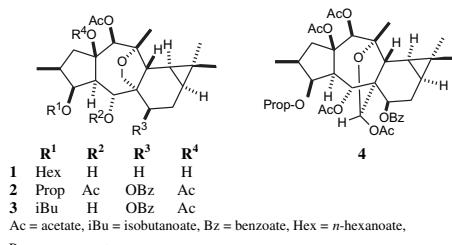

Certain 1,3-benzylidene acetals of inositols undergo epimerization at the acetal carbon when melted. This epimerization does not occur in the solid state or in solution. These results suggest that in the molten state aggregated molecules achieve the fine balance between the rigidity of the matrix, and the molecular motion needed for their reaction.

Single-crystal X-ray diffraction study of *p*-H-thiacalix[4]arene as a cesium complex demonstrated that a supramolecular architecture is constructed by intra- and inter-molecular interactions, such as metal coordination, aromatic-H···S hydrogen bonding, and alkali metal cation–π interaction. On the guest-binding behaviors of two complexes toward three alcohol molecules, the complexes exhibited a high adsorption capability toward ethanol molecule.
