### Abstract

A relationship is established, using the least-squares method, between the heat of decomposition and the heat of decomposition divided by the peak absolute temperature.

**Keywords:** DSC; Heat of decomposition

---

In a previous paper [1], the relationship between the heat of decomposition and heat of explosion of forty-seven polynitroaromatic compounds (PNAC) was studied. In order to obtain information about the correlation of heats of decomposition ( $Q_{dec}$ ) and the peak temperatures ( $T_m$ ) of the exothermic decomposition reactions in the DSC curves of the PNACs, the values of  $Q_{dec}$  and  $T_m$  tabulated in Ref. [1] or [2] (for original data see Table 1) are fitted to the equation  $Q_{dec} = 73.87 + 558.9(Q_{dec}/T_m)$  by the linear least-squares method.

Fig. 1 shows a linear interdependence between the parameters  $Q_{dec}$  and  $Q_{dec}/T_m$  for the exothermic decomposition reactions of forty-seven PNACs, indicating that

$$Q_{dec} = \frac{73.87 T_m}{(T_m - 558.9)}$$
