93 New products

From the raw material to the finished component, Erie has been deeply involved in producing crystals for the past twenty years – to exacting specific – ations. The factory and test facility complies with the latest MIL standards. Each crystal is tested at least nine times during manufacture. Only after a final check against the customers specification is it allowed through the door. Erie crystals from 1 KHz to 100 MHz, oscillators and filters, whether standard range or custom-built, could be the answer to your frequency control problem. Consult us with your specification. WW - 006 FOR FURTHER DETAILS

DON'T GAMBLE WITH PERFORMANCE BUY LEVELL TESTERS

Tests bipolar transistors, diodes and zener diodes. Measures leakage down to 0.5 nA at 2V to 150V. Current gains are checked from 1µA to 100mA. Breakdown voltages up to 100V are measured at 10μA, 100μA and 1mA. Collector toemitter saturation voltage is measured at 1mA, 10mA, 30mA and 100mA for I_C/I_B ratios of 10, 20, 30. The instrument is powered by a 9V battery.

TRANSISTOR RANGES (PNP OR NPN)

CBO & LEBO: 10nA, 100nA, 1µA, 10µA and 100µA f.s.d. acc. ±2% f.s.d. ±1% at voltages of 2V, 5V, 10V, 20V, 30V, 40V, 50V, 60V, 80V, 100V,

120V, and 150V acc. ±3% ±100mV up to $10\mu A$ with fall at $100\mu A < 5\% + 250 \text{mV}$.

10V or 100V f.s.d. acc ±2% f.s.d. ±1% at BVCBO: currents of $10\mu\text{A}$, $100\mu\text{A}$ and $1\text{mA} \pm 20\%$.

10nA, 100nA, 1μ A . . . 10mA f.s.d. acc. \pm 2% f.s.d. \pm 1% at fixed I $_{E}$ of 1 μ A, 10 μ A, 100 μ A, 1mA, 10mA, 30mA, and 100mA acc. \pm 1%.

3 inverse scales of 2000 to 100, 400 to 30 and 100 to 10 convert I B into h FE readings.

1V f.s.d. acc. ±20mV measured at conditions on h_{FE} test.

1Vf.s.d. acc. ±20mV at collector currents of 1mA, 10mA, 30mA and 100mA with I _C/I _B selected at 10, 20 or 30 acc. ±20%.

DIODE & ZENER DIODE RANGES

As I EBO transistor ranges. DR:

Breakdown ranges as BV_{CBO} for transistors.

1V f.s.d. acc. ±20mV at I_{DF} of 1μA, 10μA, 100μA, 1mA, 10mA, 30mA and 100mA.

type £145

V_{CE(sat)}:

A logarithmic scale covering 6 decades is used to display either insulation resistance or leakage current at a fixed stabilised test voltage. The current available is limited to a maximum value of 3mA for safety and capacitors are automatically discharged when the instrument is switched off or to the CAL condition. The instrument operates from a 9V internal battery.

RESISTANCE RANGES

10M Ω to 10T Ω (10¹³ Ω) at 250V, 500V, 750V and 1kV. 1 M Ω to 1 T Ω at 25V, 50V and 100V.

100k Ω to 100G Ω at 2.5V, 5V and 10V.

 $10k \Omega$ to $10G \Omega$ at 1V.

Accuracy $\pm 15\% + 800 \Omega$ on 6 decade logarithmic scale. Accuracy of test voltages ±3% ±50mV at scale centre.

Fall of test voltages < 2% at 10μA and < 20% at 100μA. Short circuit current between 500µA and 3mA.

CURRENT RANGE

100pA to 100µA on 6 decade logarithmic scale.

Accuracy of current measurement ±15% of indicated value. Input voltage drop is approximately 20mV at 100pA, 200mV at 100nA and 400mV at 100µA.

Maximum safe continuous overload is 50mA.

MEASUREMENT TIME

< 3s for resistance on all ranges relative to CAL position.

< 10s for resistance of 10G Ω across 1 μ F on 50V to 500V. Discharge time to 1% is 0.1s per µF on CAL position.

RECORDER OUTPUT

1V per decade ±2% with zero output at scale centre. Maximum output $\pm 3V$. Output resistance 1k Ω .

Optional extras are leather cases and mains power units. Prices are ex works, V.A.T. extra in U.K.

Acorn Memory
A high quality fibre glass, through hole plated, PCB with solder resist and component identification, this eurocard has provision for 8K of RAM (2114) and 8K of EPROM (2732).

Nett V.A.T. Total 8K RAM (Kit) 95.00 14.25 109.25

ACORN V.D.U. Board connects to the Acorn V.D.U. Board connects to the Acorn Computer Bus and contains memory mapped character storage RAM which is transparently written to or read from, by the C.P.U.

from, by the C.P.U.

An MC 6845 programmable controller I.C.
Provides all the synchronisation signals to drive a 625 line 50 fields per second
V.D.U. together with read addresses for the character R.A.M. Characters are then fed to an SAA 5050 character generator I.C which produces the necessary dot patterns to create the characters to refresh the V.D.U.

The SAA 5050 produces Teletext standard characters and has Red, Green and Blue drive outputs giving coloured characters or graphics.

Bigger and better than ever!

Commodore NAS Corner

A complete Computer for the price of a good typewriter! With a library of over 200 programs in business, science, education

conventially occupies large storage capacity, and solve numerical problems traditionally tedious and time consuming.

Ease of Operation
The Commodore PET comes complete with
a built-in T.V. screen, and keyboard as
well as its full computer circuitry. It is
plugged into any 13 amp and no special
computer knowledge is needed for
running standard programs. Personal
programs can readily be written in the
BASIC computer language of PET which is
easily learned.

An Expandable System
Further expansion is a prime design
concept enabling PET to be made the heart
of a much larger system incorporating
printers, floppy discs etc., as and when
required.

Computers

The Mighty Microdigital Microdigital are one of the largest and longest established Microcomputer firms in Europe.

We sell a wide range of systems, backed up by support services that are second to

we sen a wide range of systems, backed up by support services that are second to none.

Our present retail outlet is at 25 Brunswick Street, Liverpool. Our well informed staff are happy to demonstrate equipment, provide technical help, or just chat. Microdigital (mail order) is the fastest, friendliest and most efficient mail order service available. All orders (or an acknowledgement if the goods are temporarily out of stock) are despatched by return post. Telephone orders are welcome (24 hours a day) and we even have a "Freepost" service so you don't have to remember the stamp! Microdigital Manufacturing is our hardware department. We carry out repairs and servicing in-house rather than depending on the manufacturer. In addition we design and manufacture our own peripheral boards for the systems we support. Custom design services are also available.

Microdigital (Software) is responsible for the development of commercial, high quality, computer programs. We can advise on the suitability of an existing package, modify the package, or write a completely new system to the customers specification.

Microditial (Hire) provides a service for potential customers — the capabilitities of a particular machine can be evaluated without a substantial capital investment.

All in all we try and provide the most competent service in the Microcomputer industry.

WW - 016 FOR FURTHER DETAILS

If QUAD amplifiers are so perfect, why does it still sound better in the concert hall?

In real life, the sounds from all the instruments and sometimes parts thereof are independently radiated and so are not 'phase locked' together nor are they subjected to common eigentones.

These mutually incoherent wavefronts are subjected to tiny but important reflections at the pinna and finally end up as just two channels representing the pressure at the two ear drums. It is not possible to achieve this transfer accurately by means of loud-speakers or headphones however good these components may be.

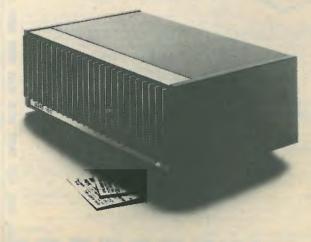

Nevertheless with good amplifiers and loudspeakers (and on those occasions when the people at the recording and transmitting end get it right) a musical experience can be achieved which is extremely satisfying and one of the greatest pleasures of our time.

For further details on the full range of QUAD products write to: The Acoustical Manufacturing Co. Ltd., Huntingdon, Cambs. PE18 7DB. Tel: (0480) 52561.

QUAD
for the closest approach
to the original sound

QUAD is a registered Trade Mark

WW - 092 FOR FURTHER DETAILS

We wouldn't knock our rivals.

After all, it was they who inspired us to design and manufacture our own power loudspeakers... because of the frustration we experienced when trying to obtain power loudspeaker components for our enclosures. Nobody could consistently supply components to the exacting HH standards of quality, power and performance – at any price.

So, our designers started from a clean drawing board and were prepared to defy convention in the construction of a superior power loudspeaker. Our powerful computer calculated optimum cone

profiles, whilst our scientists pushed back the frontiers of adhesives technology to develop new construction methods. Then we tested them relentlessly and did our best to destroy these new products (that was the hardest part.)

Now this range of superior power loudspeakers, crossover networks, "bullet" radiators, compression drivers and horns can be purchased at sensible prices from HH dealers. In their new and convenient packs you will also find an applications book, full of useful hints.

Send for our brochure, so you can convince yourself why our components are *superior*,

by following our logical scientific arguments. Then you'll realise why we never need to knock our "rivals".

In future, recording the present will be a thing of the past.

What's past is past. And said to be best forgotten.

But it's fundamental to the very existence of communications recording to be able to replay a selected portion of tape to find out what was said by who, to whom ... and when. And 'when' can be vital

Equally vital, particularly in emergencies when every second counts, is the ability to obtain such replay access rapidly, precisely, automatically. With absolute certainty—and without time-consuming multiple knob-twiddling aided by guesswork.

Racal Recorders has recognized this need and produced TIMESEARCH—designed specifically for its ICR range of multi-channel communications recorders—and providing just these facilities.

TIMESEARCH can generate a coded time reference signal of crystal accuracy and index it onto the tape. It can read and display that signal. It can search a tape at high speed for a pre-selected time signal and automatically initiate replay at that time.

In communications recording, the future becomes the present; the present becomes the past. And when you need to recall the past with precision, you need TIMESEARCH.

And for providing precise time signals every 10 seconds for recording onto magnetic tape: the International Timing Unit.

Racal Recorders always on the right track

Racal Recorders Limited, Hardley Industrial Estate, Hythe, Southampton, Hampshire, SO4 6ZH, Telephone: 0703 843265. Telex: 47600.

Quantum

NEW PRODUCTS — NEW PRODUCTS

Our product range for the 80s is outlined but it is impossible to cover everything in such a small space. For detailed information and a price list send a large SAE or a dollar bill.

PRE-AMP & POWER AMP KITS

The pre-amp is now available in kit form in versions to suit any cartridge and consists of the module C1 (below) and the hardware kit HK1. No soldering is involved and assembly takes about 20 mins. There are six power amp kits, four mono and two stereo, from 45 to 260W to satisfy virtually every requirement. They use ready-built and tested p.c. boards to achieve an ease of construction similar to module based kits at lower cost. There are also mains supply kits to enable independent use of the pre-amp, which is normally powered via our power amp. Similar equipment is also available ready-built from us or via our dealers.

C1 + HK1 £68.70 C1mc + HK1 £70.95

MOVING-COIL & PRE-AMP MODULES

Previously restricted to trade and export, the C1 pre-amp module is now available separately in 3 versions to match any cartridge. It has unbeatable specifications, caters for disc, auxiliary and 2 or 3 head tape machines and requires only a rough supply of ± 18 to 35V d.c. The new moving coil pre-pre-amp achieves low thd, high overload, good r.f., rejection and good noise performance without resorting to the expensive multiple transistro design. Only tantalum capacitors and metal oxide resistors are used in the signal path and it can be powered either via the C1 or by a battery. Hardware kits are available to build both types and they are also available ready-built.

MC1 Module: £22.25

C1 Module: £49.50

C1 mc £51.75

POWER AMP MODULES AND SUPPLIES

The power amp modules are now also available to retail customers in a variety of powers and formats up to 260W r.m.s. They use the same high performance circuitry as the kits above, giving t.h.d. below. 01% at 1kHz, but are capable of sustained high level use with excellent reliability. There are power supplies for use with any one or two of these modules, all of which use toroidal transformers, also available separately. The module illustrated is a medium duty 150W r.m.s. type, the M1508, which requires the MS3 supply.

M1508: £35.79

MS3: £26.28

Exports: We can deal efficiently with orders to any country. Please write with your specific requirements for a quote by return. All equipment can be wired for 110V mains.

The Thinking Cap

Now you can measure, sort and check capacitance in less time, with more accuracy.

The new 3001 Digital Capacitance Meter is yet another superb instrument from C.S.C. Designed specifically for professional laboratories, test and production benches, it offers outstanding accuracy with features and accessories to match All in a well designed, rugged unit for only £155*

As usual, we continued where everyone else left off. Behind the 31/2-digit LED display is a unique Dual Threshold circuit that gives an accuracy of 0.1% of the reading (0.5% in the two highest ranges). Other features include nine overlapping ranges up to 0,1999 F, with down to 1pF resolution, automatic over and under-range indications, and the 3001 isn't fooled by dielectric absorption. Once the range is selected, measurement is speedy — less than half a second!

Our back panel ! as more facilities too. An easy interface for eliminate battery problems an AC mains input

A great deal of thought has been put into the accessories which include a production test fixture, a Limits Unit, a variety of test cables, and an extremely comprehensive manual covering not only measurement on capacitors but also applications to testing other types of components and even cables.

The 3001 Digital Capacitance Meter. The only one worth thinking about.

WW - 104 FOR FURTHER DETAIL

Britain's first compete Computer Kit.

A complete personal computer for a third of the price of a bare board.

Also available ready assembled for £9995

The Sinclair ZX80.

Until now, building your own computer could easily cost around £300 - and still leave you

with only a bare board for your trouble.

The Sinclair ZX80 changes all that. For just £79.95 you get everything you need to build a personal computer at home...PCB, with IC sockets for all ICs; case; leads for direct connection to your own cassette recorder and

television; everything!
And yet the ZX80 really is a complete, powerful, full-facility computer, matching or surpassing other personal computers on the market at several times the price. The ZX80 is programmed in BASIC, and you could use it to do quite literally anything from playing chess to running a power station.

The ZX80 is pleasantly straightforward to assemble, using a fine-tipped soldering iron.
Once assembled, it immediately proves what a good job you've done. Connect it to your TV set...link it to an appropriate power source* and you're ready to go.

Your ZX80 kit contains...

- Printed circuit board, with IC sockets for
- Complete components set, including all ICs - all manufactured by selected worldleading suppliers.
- New rugged Sinclair keyboard, touchsensitive, wipe-clean.
- Ready-moulded case.
- Leads and plugs for connection to any portable cassette recorder (to store
- programs) and domestic TV (to act as VDU)

 FREE course in BASIC programming and

Optional extras

- Mains adaptor of 600 mA at 9 V DC nominal unregulated (available separately - see coupon .
- Additional memory expansion board plugs in to take up to 3K bytes extra RAM chips. (Chips also available -

*Use a 600 mA at 9 V DC nominal unregulated mains

Two unique and valuable components of the Sinclair ZX80.

The Sinclair ZX80 is not just another personal computer. Quite apart from its exceptionally low price, the ZX80 nas two uniquely advanced nents: the Sinclair BASIC interpreter; and the Sinclair teach-yourself BASIC manual.

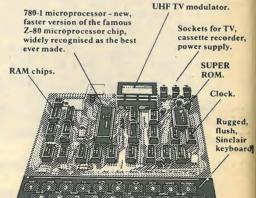

The unique Sinclair BASIC interpreter...

- offers remarkable programming advantages: Unique 'one-touch' key word entry: the ZX80 eliminates a great deal of tiresome typing. Key words (RUN, PRINT, LIST, etc.) have their own
- single-key entry. Unique syntax check. Only lines with correct syntax are accepted into programs. A cursor identifies errors immediately. This prevents entry of long and complicated programs with faults only discovered when you run them.
- Excellent string-handling capability takes up to 26 string variables of any length. All strings can undergo all relational tests (e.g. comparison). The ZX80 also has string inputto request a line of text when necessary. Strings do not need to be dimensioned.
- Up to 26 single dimension arrays. FOR/NEXT loops nested up 26.
- Integer names of any length.
- BASIC language also handles full Boolean arithmetic, conditional expressions, etc.
- Exceptionally powerful edit facilities, allows modification of existing program lines.
- Randomise function, useful for games and secret codes, as well as more serious applications.
- Timer under program control.
- PEEK and POKE enable entry of machine code instructions, USR causes jump to a user's machine language sub-routine

- High-resolution graphics
- with 22 standard graphic symbols. • All characters printable in reverse under program control

and the Sinclair teach-yourself BASIC manual.

If the features of the Sinclair interpreter listed alongside mean little to you-don't worry. They're all explained in the specially-written 96-page book free with every kit! The book makes learning easy, exciting and enjoyable, and represents a complete course in BASIC programming-from first principles to complex programs. (Available separately - purchase price refunded if you buy a ZX80 later.)

Fewer chips, compact design, volume production more power per pound!

The ZX80 owes its remarkable low price to its remarkable design: the whole system is packed onto fewer, newer, more powerful and advanced LSI chips. A single SUPER ROM, for instance, contains the BASIC interpreter, the character set, operating system, and monitor. And the ZX80's 1K byte RAM is roughly equivalent to 4K bytes in a conventional computer, because the ZX80's brilliant design packs the RAM so much more tightly. (Key words, for instance, occupy just a single byte.)

To all that, add volume production – and

you've that rare thing: a price breakthrough that really is a breakthrough.

The Sinclair ZX80. Kit: £79.95. Assembled: £99.95. Complete!

The ZX80 kit costs a mere £79.95. Can't wait to have a ZX80 up and running? No problem! It's also available, ready assembled, for only £99.95.

Whether you choose the kit or the readymade, you can be sure of world-famous Sinclair technology - and years of satisfying use. (Science of Cambridge Ltd is one of the Sinclair companies owned and run by Clive Sinclair.)

To order, complete the coupon, and post to Science of Cambridge for delivery within 28 days. Return as received within 14 days for full money refund if not completely satisfied.

TOTAL AMPLIFICATION FROM CRIMSON ELEKTRIK

WE NOW OFFER THE WIDEST RANGE OF SOUND PRODUCTS -

STEREO PRE-AMPLIFIER

CPR 1 - THE ADVANCED PRE-AMPLIFIER. The best pre-amplifier in the U.K. The CFR 1 — THE ADVANCED PRE-AMPLIFIER. The best pre-amplifier in the U.K. The superiority of the CPR 1 is probably the disc stage. The overload margin is a superb 40dB, this together with the high slewing rate ensures clean top, even with high output cartridges tracking heavily modulated records. Common-mode distortion is eliminated by an unusual design. R.I.A.A. is accurate to 1dB; signal to noise ratio is 70dB relative to 3.5mV; distortion < .005% at 30dB overload 20kHz.

Following this stage is the flat gain/balance stage to bring tape, tuner, etc. up to power amp. signal levels. Signal to noise ratio 86dB; slew-rate 3V/uS; T.H.D. 20Hz—20kHz<008% at

F.E.T. muting. No controls are fitted. There is no provision for tone controls. CPR 1 size is 138x80x20mm. Supply to be ± 15 volts.

MC 1 — PRE-PRE-AMPLIFIER. Suitable for nearly all moving-coil cartridges. Sensitivity 70/170uV switchable on the p.c.b. This module brings signals from the now popular low output moving-coil cartridges up to 3.5mV (typical signal required by most pre-amp disc inputs). Can be powered from a 9V battery or from our REG 1 regulator board.

XO2:XO3 - ACTIVE CROSSOVERS. XO2 - two way, XO3 - three way. Slope

REG 1 — POWER SUPPLY. The regulator module, REG 1 provides 15-0-15v to power the CPR 1 and MC 1. It can be used with any of our power amp supplies or our small transformer TR 6. The power amp kit will accommodate it.

POWER AMPLIFIERS. It would be pointless to list in so small a space the number of recording studios, educational and government establishments, etc., who have been using CRIMSON amps satisfactorily for quite some time. We have a reputation for the highest quality at the lowest prices. The power amp is available in five types, they all have the same specification. T.H.D. typically.01% any power 1kHz 8 ohms. T.I.D. insignificant, slew rate limit 25V/uS; signal to noise ratio 110dB; frequency response 10Hz-35kHz. — 3dB; stability unconditional, protection drives any load safely; sensitivity 775mV (250mV or 100mV on request), size 120 x 80-25mm.

POWER SUPPLIES. We produce suitable power supplies which use our superb TORQIDAL transformers only 50mm high with a 120-240 primary and single bolt fixing (includes capacitors) bridge rectifier).

POWER AMPLIFIER KIT. The kit includes all metalwork, heatsinks and hardware to house any two of our power amp modules plus a power supply. It is contemporarily styled and its quality is consistent with that of our other products. Comprehensive instructions and full back-up services enable a novice to build it with confidence in a few hours.

This includes all metalwork, pots, knobs, etc., to make a complete pre-amp with the CPR1(S) module and the MC1(S) module if required.

| POWER AMPLIFIER MODULES | | POWER AMP KIT £35.03 |

CAMBRIDGE **LEARNING ENTERPRISES**

Instruction Courses

Microcomputers are coming - ride the wave! Learn to program. Millions of jobs are threatened but millions more will be created. Learn BASIC- the

language of the small computer and the most easy-to-learn computer language in widespread use. Teach yourself with a course which takes you from complete ignorance step-by-step to real proficiency with a unique style of graded hints, In 60 straightforward lessons you will learn the five essentials of programming: problemn definition, flowcharting, coding the program, debugging, clear documentation.

Book1 Computers and what they do well; READ, DATA, PRINT, powers, brackets,

variable names; LET; errors; coding simple programs.

Book 2 High and low level languages; flowcharting; functions; REM and documentation; INPUT, IF....THEN, GO TO; limitations of computers, problemn Book 3 Compilers and interpreters; loops, FOR....NEXT, RESTORE; debugging; arrays;

bubble sorting; TAB. Book 4 Advanced BASIC; subroutines; string variables; files; complex programm

examples; glossary.

Understand Digital Electronics

Written for the student or enthusiast, this course is packed with information, diagrams and questions designed to lead you step-by-step through number systems and Boolean algebra to memories, counters and simple arithmetic circuits and finally to an understanding of the design and operation of calculators and computers.

Book 1 Octal, hexadecimal and binary number systems; conversion between number systems; representation of negative numbers; complementary systems.

Book 2 OR and AND functions; logic gates; NOT, exclusive-OR, NAND, NOR and

exclusive-NOR functions; multiple input gates; truth tables; De Morgans Laws; canonical forms; logic conventions; karnaugh mapping; three state and wired logic. Book 3 Half adders and full adders; subtractors; serial and parallel adders; processor and ALU's; multiplication and division systems.

Book 4 Flip flops; shift registers; asynchronous and synchronous counters; r Johnson and exclusive—OR feedback counters; ROMS and RAMS.

Book 5 Structure of calculators; keyboard encoding; decoding display data; register systems; control unit; program ROM; address decoding.

Book 6 CPU; memory organisation; character representation; program storage; address modes; input/output systems; program interrupts; interrupt priorities; programming, ssemblers; computers; executive programs; operating systems.

GUARANTEE - No risk to you

If you are not completely satisfied your money will be refunded on return of the books in good condition.

....Computer Programming in BASIC (4 books) @ £7.50 .. Design of Digital Systems (6 books) @ £11.50

The New FM/AM 1000s with Spectrum Analyser-we call it the SUPER-S

A portable communications service monitor from IFR, light enough to carry anywhere and good enough for most two-way radio system tests. The FM/AM 1000s can do the work of a spectrum analyser, oscilloscope, tone generator, deviation meter, modulation meter, signal generator, wattmeter, voltmeter, frequency error meter-and up to five service engineers who could be doing something else!

WW-038 FOR FURTHER DETAILS

TEST TRIO INSTRUMENTS THE RANGE HAS INCREASED -THE PRICES ARE DOWN

THE CS1830 30 MHz + Sweep Delay

The CS1830 is a completely new 30 MHz dual trace oscilloscope employing a square format, internal graticle, PDA tube for accurate bright display. A new feature is the inclusion of calibrated sweep delay with a range of 1µS-100 mS and trace bright up to show the delay position. As you can see from close study of the photograph, the CS1830 has all the facilities you could require in a high performance instrument but for more detail, simply ask us for a comprehensive leaflet

Brief specification

Rectangular PDA tube 120 × 96 mm. P31 phosphor.
Bandwidth DC—30 MHz

5mV/cm (30 MHz) 2mV/cm (20 MHz) Input R.C. 1 M /23 pF

Overshoot less than 3% Sween time 200nS/cm-0.5.S/cm Linearity better than 3%
Trig. bandwidth DC—30 MHz
Sweep delay 1µS-100 mS

CS1830 only £455 + VAT includes 2 probes

THE C51572 30 MHz for the VTR Lab. If you are in Video, you need the CS1572

The CS1572 is a dual trace 30 MHz oscilloscope designed for the video tape recorder engineer. Video delayed sweep facilities are provided to allow magnification and analysis engineer. Video delayed sweep facilities are provided to allow magnification and analysis of any point in a single video frame together with separation of video odd and even fields. A truly unique tool for anyone concerned with video measurements as well as a top specification dual trace wide band oscilloscope for general lab use. The complete range of video facilities is too great to explain in a small advertisement so why not call us and ask for the full story on the CS1572

Brief Specification

As for CS1830 except that the sweep delay feature is replaced by comprehensive video sweep delay facilities which allow complete analysis of video wave forms and VTR

CS1572 only £425 + VAT, includes 2 probes

THE CS1577 30 MHz at 2mV + Signal Delay The most popular scope in the range.

The CS1577 is, without doubt, our most popular oscilloscope and hundreds of satisfied users in all sections of the electronics industry will confirm this. The CS1577 combines a wide bandwidth DC-30 MHz performance with extremely wide trigger bandwidth (DC-40 MHz) and 2 mV sensitivity over the full bandwidth.

Fixed signal delay is provided by a helix delay line which allows viewing of the leading adges of fast pulses for accurate rise time measurement, and the 130 mm PDA tube gives a bright, stable trace even at the highest sweep speeds (20 nS/cm using × 5 expansion). Good triggering, even at low levels has always been an outstanding feature of Trio oscilloscopes and the CS1577 demonstrates this to perfection. Triggering, as in the other 30 MHz instruments can be from CH1 or CH2 or can be alternated with the beam switching so that input signals of differing frequency will provide stable displays. Truly an oscilloscope masterpiece. CS1577.

CS1577 only £410 + VAT, includes 2 probes.

THE CS1575, unique dual trace 4 function Audio Scope

The CS1575 is a unique tool for the audio engineer. It features the normal facility of dual trace display with sensitivity to 1 mV/cm but not only can it display the input signal on two channels, it can simultaneously display the phase angle between them and measure the phase angle referenced to a zero phase calibration display. In addition to these unique features, you also have independent triggering from each channel to give stable displays even with widely differing input frequencies.

Absolutely indispensable to the professional audio engineer, the CS1575 is now in use all over the world. See it in action or send for complete details

CS1575 only £235 + VAT.

Go for Wow/Flutter standard from **Bang & Olufsen** when precision, versatility and good value for money are high on your list of priorities.

The Bang & Olufsen microprocessor quartz controlled Wow and Fluttermeter calibrator is a compact low cost device, especially designed to calibrate Wow/ Fluttermeters with great accuracy according DIN, IEC, CCIR and IEEE standards. The application in this microprocessor controlled instrument has rendered calibration obsolete. Therefore the first and the last produced WFC 1 will be exactly alike!

- Center frequency: 3 KHz or 3.15 KHz. Sinus and Squarewave outputs.
- Wow/Flutter generator: (5 ranges).
- Drift: (4 ranges)
- Pulsgenerator, to check the meter ballistics.
- Modulation signal generator.
 Accuracy and stability for all functions < 50 ppm.
- Option 1 portable
- Option 2 adaption to your mains supply.

Bang & Olufsen Instruments A solid investment

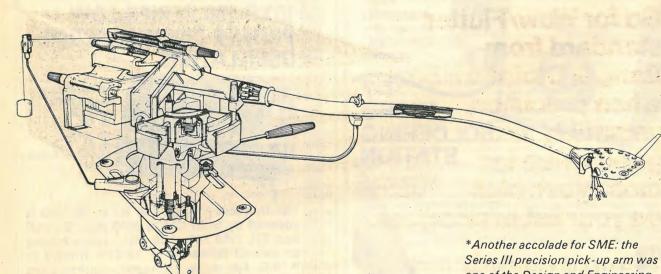

The pre-eminent pick-up arm

Whilst able to explore the best of the present, the Series III precision pick-up arm anticipates the greater engineering elegance of impending miniature cartridges which may weigh as little as one and a half grammes.

Its unique patented balance system minimises mass and inertia, presenting optimum conditions for even the most delicate transducer.

No other pick-up arm is as versatile, a reason why the Series III is already playing its part in the development of tomorrow's cartridges.

Choose it for your listening pleasure today with confidence in the future.

one of the Design and Engineering Awards at the 1979 U.S Summer Consumer Electronics Show, the only pick-up arm to be acknowledged in this way.

Series III precision pick-up arm

The best pick-up arm in the world

Pye Voltage Converter MF24PU 24v plug-in converter for Europa range of sets, to provide for 12 volt floating ground from 24 volt supply. £15.00.

PHILLIPS 25" Monochrome Monitorr new condition with service manual. £25.00, carriage £2.00. IC TEST CLIPS, clip over IC while still soldered to pcb or in socket. Gold plated pins, ideal for experimenters or service engineers. 28 pin DIL £1.75. 40 pin DIL £2.00. Or save by buying one of each for

IC AUDIO AMP. PCB. Output 2 watts into 3 ohm speaker. 12 volt DC supply. Size approx $5\frac{1}{2}$ "×1" high, with integral heatsink,

NICAD CHARGER CONVERTER PCB. (Low power inverter). Size 4"×13"×1" high. 12v dc supply. 60v dc output through pot on pcb for charging portable battieres from mobile supply. Only needs one BFY50/51/52 or similar transistor which can be mounted direct on the pcb pins on the board fitted with a star type heatsink (not supplied)

10.7 MHz SSB XTAL FILTERS (2.4 kHz Bandwidth) Low imp. type. Carrier and unwanted side-band rejection min —40db (needs 10.69835 & 10.70165 xtals for USB/LSB. not supplied) Size approx 2"×1"×1". £10.00 each. LOW PASS FILTERS (Low imp. type). 2-9 MHz,

small metal encapsulation. Size 1½"×¾"×¾"
75p each.

BSR AUTOCHANGE RECORD PLAYER DECKS with cue device. 33-45-78 rpm for 7" 10 12" records. Fitted with SC12M Stereo Ceramic cartridge and styli. Brand new £12,00 each.

XTALS FOR TV SY NC GEN. 20.25 kHz for 405

line, B7G glass type. £2.00 each.

RED LEDs (Min. type) 5 for 70p.

VIDICON SCAN COILS (Transistor type, but no

data) complete with vidicon base £6.50 each. Brand

UR41 ATTENUATOR CABLE, Nominal 72ohm overall dia. approx. ¼", Att. per 100ft: 100 MHz 218dB, 200 MHz 316dB, 600 MHz 449dB, 3000 MHz 625dB. Ideal for Rx or Low power Tx fixed attenuators. Supplied with attenuation graph. 4

HIGH QUALITY RELAYS, 4 pole C/O, 3A contacts, 12V DC coil, 150 ohm. Size approx. 1"×34"×114", with plastic covers. 80p each or 2

OSMOR REED RELAY COILS (for reed relays up dia., not supplied) 12V, 500ohm coil, 2 for

RIGHT ANGLED UHF SERIES ADAPTORS, PL259 to SO239 £1.00 each.

BACK-TO-BACK SO239 SOCKETS, £1.00 each.

A selection of items below from our 1980 catalogue, the products we stock are by Eagle, Weller, Draper, Spiralux, Knipex, Servisol, Barnard's & Babani, Newnes, Jaybeam, Vero, and others. If you send us £1.35 you will receive the catalogue plus five bi-monthly shortform catalogues to keep you up to date with prices and special offers. A free pack of Blob Board comes with this month's

built-in voltage sensor. Remote drive system makes fitting easier. Aerial length, 1,000mm, below wing 220mm, lead length 9,000mm, flexible drive link 700mm, Price £16.95 plus VAT.

EAGLE MA780T Electric fully automatic 6 section retractable car aerial with

EAGLE DD7 Paging microphone, impedance 600 ohm or 50 K ohms, sensitivity 2.25mV at 50 K ohms, frequency response 300-9000 Hz. desk or

FAGLE MULTIMETER EM50 50,000 opv. DC volts: 0-1200 volts, AC volts: 0-1200 volts, DC current 0-6A, Resistance 0-10 megohms. Price £19.95 plus

DRAPER super-chrome 1/4" square drive socket sets. 38 piece, 9 AF hexagon sockets, 3 AF bi-square sockets, 11 MM hexagon sockets, 9 BA hexagon sockets, and 6 accessories. Price £12.75 plus VAT.

SPIRALUX metric nut spinner sets, contains 8 nut spinners 4, 4.5, 5, 5.5, 6, 7, 8, 9, 10mm. Packaged in a plastic wallet with cellulose ecetate handle. Price

WELLER TCP3 IRONS 24 volt series, 3 wire power units, for applications requiring earthed tip. TCP3 irons £13.84, PU3D power units. £04.12 plus VAT.

WELLER instant heat guns Model No. 8100D £13.21 each plus VAT.

WELLER cordless soldering irons Model No. WC100 £25.47 plus VAT.

JAYBEAM "STEREOBEAM" VHF/FM antennas Model SMB2, folded dipole

and reflector with universal clamp. £8.00 each. Full range of Jaybeam aerials and accessories available. (See 1980 Catalogue).

and accessories available. (See 1980 Catalogue).

ECA TVT78/78 semiconductor equivalent and data books. Data covering 12,000 transistors and more than 60,000 equivalents. 2 volumes for £6.00

ORYX DE-SOLDER TOOLS model SR3A, desoldering pump with built-in

safety guard. Price £6.50 plus VAT.

As from Sat. 3rd February 1980 we will hold weekly auctions on Saturday mornings of Radio & Electronic components & equipment, you bring and buy.

Entries will be accepted on morning of sale from 8 am. The Sale will start at 10 am. So come along and bring something with you to sell. Light refreshments will

Callers welcome by appointment

SINE WAVE INVERTERS: 120 to 1000 VA -NOW USING WAVEFORM SYNTHESIS-

DESIGNED FOR FIXED, MOBILE OR MARINE USE AND STANDBY A.C. POWER FOR DATA PROCESSING, COMMUNICA-TIONS, LABORATORY AND MANY OTHER APPLICATIONS.

A.C. Output: 220-240V or 110-120V, 50 Hz or 60 Hz

D.C. Input: 12 VOLTS or 24 VOLTS

Waveform synthesis, with pulse width modulation to regulate the output voltage, has been used in high power inverters for some

Now, for the first time, CARACAL have developed this technology to produce a complete range of high quality sine wave inverters from 120 VA to 1000 VA AT COMPETITIVE, VALUE-FOR-MONEY PRICES.

The result is a very low distortion output waveform which is very stable, both in voltage and frequency, over all load and battery

And that is not all - replacing obsolescent tuned transformers has resulted in lighter weight and high efficiency on both part and full loads, with low standby current drain.

CASE SYSTEMS "CLASSIC" RANGE OF CASES All cases designed and manufactured by Case Systems

Although the cases are designed as a low-cost case, they are well finished and truly look expensive. This effect is enhanced by the proportion of anodised aluminium, to shiny black leather textured top and bottom plates. Such features as these panels slotting into the front and rear extrusions and into milled grooves in the side plates, keeping them completely flat, increases the impression of a costly case.

All Case System cases are available with Discounts 5 off—10%, 10—12%, 25—15%, 50—20%, 100—25%. Prices incl Terms c.w.o. S.A.E. for details: 20 HUNT LANE, CHADDERTON, LANCASHIRE, ENGLAND TEL: 061-652 1580 ounts 5 off—10%, 10—12%, 25—15%, 50—20%, 100—25%. Prices include p. & p. U.K.

"HOW CAN I BE SURE OF BUYING THE RIGHT VIDEO?"

It's easy to make mistakes when buying video equipment.

Buy the cheapest and you may soon find that it can't meet the varying needs of all the people (in marketing, management, training and security, for example) who will want to use it.

Buy the most expensive and you could literally waste thousands on features never used.

Forget compatibility and the future and you could find yourself spending more money on extra equipment - or discarding equipment you've just bought.

WIDE CHOICE, GOOD ADVICE,

Through our network of Video Centres, we at Bell & Howell distribute one of the largest video ranges in the U.K. This means that we can offer well-founded advice about the many options and thus help you avoid investing in mistakes. So talk to us before buying video. Ask us "What's right for me?"

We answer that question by first helping you to define how you're going to use a video system.

We pose the questions buyers often forget to ask (and sellers sometimes ignore). Who will use it? When? And where? Is colour necessary? Do you want to edit your own programmes? Will you use tapes

from libraries or other companies? Will you want a lot of duplicate tapes?

From your answers we can build up a video package to meet your exact needs. It could be a simple monochrome camera with a VHS video recorder. Or a sophisticated three-tube colour camera with portable recorder, monitor and electronic editing suite. Whatever it is, we make this promise.

If you don't need something, we'll tell you so. If you do need it, we can supply it - all the way to a total video system which, because it has been tailored to your individual needs, will be right for you.

AND SUPERSHIELD.

No matter what you buy from the Bell & Howell video range, our unique Supershield warranty will guarantee you free adjustments, repairs or replacements (except for tapes and tubes) for two years after purchase. And if the job can't be done on the spot, we'll provide transport to and from a specially equipped Supershield video workshop.

Like our practical advice, that's also free. Because we believe Service starts before a sale and continues long, long after.

fact:
five New Shure Cartridges
feature unique, state-of-the-art
technology

the M97 Era IV Series pickup cartridges

| Model | Stylus Configuration | Tip Tracking Force | Applications | | |
|--------------------------------|-------------------------------|--------------------------|---------------------------------|--|--|
| М97НЕ | Nude Hyperelliptical | 34 to 11/2 grams | Highest fidelity | | |
| M97ED | Nude Biradial (Elliptical) | 3/4 to 11/2 grams | where light tracking forces | | |
| M97GD | Nude Spherical | 3/4 to 11/2 grams | are essential. | | |
| M97EJ | Biradial (Elliptical) | 1½ to 3 grams | Where slightly heavier tracking | | |
| M97B | Spherical | 1½ to 3 grams | forces are required. | | |
| 78 rpm Stylus for all M97's | Biradial (Elliptical) | 1½ to 3 grams | For 78 rpm records. | | |

Shure writes a new chapter in the history of affordable hi-fi by making the latest cartridge technological breakthroughs available in a complete line of high-performance, moderately priced cartridges; the M97 Era IV Series Pickup Cartridges, available with five different interchangeable stylus configurations to fit every system and every budget.

The M97 Series incorporates such vanguard features as the Dynamic Stabilizer—which simultaneously overcomes record-warp caused problems, provides electrostatic neutralization of the record surface, and effectively removes dust and lint from the record—and a unique telescoped stylus assembly which results in lower effective stylus mass and dramatically improved trackability

Each of these features...and more...has been incorporated in the five cartridges in the M97 Series—there is even an M97 cartridge that offers the low distortion Hyperelliptical stylus!
What's more, every M97 cartridge features a unique lateral deflection assembly, called the SIDE-GUARD, which responds to side thrusts on the stylus by withdrawing the entire stylus shank and tip safely into the stylus housing before it can bend!

The performance of the cartridges is highly faithful to the

recorded music. Hear it you must!

NEW! M97 Series Era IV Pickup Cartridges... Five new invitations to the new era in hi-fi.

Education for integration

Since a television programme put the cat among the pigeons and made the world at large believe that Karel Capek's view of the future was to materialise in about a fortnight at the very latest, engineering persons have become accustomed to hearing references to 'chips' from the unlikeliest of sources. Cabinet ministers, trade union leaders, industrial writers, popular magazine and newspaper columnists, television commentators - all kinds of non-engineering person never seem to tire of discussing integrated-circuit technology and its impact on society in terms that imply total familiarity with semiconductors in all their manifestations.

It is quite difficult to discover the received picture of modern electronics possessed by people whose interests do not include engineering. The crescendo of strident and frequently doom-laden prophecy, initiated by the adoption of 'the chip' as a sort of 1970s Spinning Jenny substitute, coupled with saner (because better informed) comment from engineers, must have generated considerable confusion among those whose only present involvement is the direct or indirect provision of finance.

The integrated circuit in question is, of course, the microprocessor. Most of the others have arrived at the stage where they are thought of as components, and are consequently not newsworthy: decade counters, operational amplifiers and phase-locked loops are used in a manner almost as abandoned as were discrete transistors ten years ago, But the microprocessor has an aura of sanctity about it which its lineage and capabilities do not warrant, and which

may well be not only technically but politically perilous.

A Ludditic reaction to 'new technology', fuelled by badly disseminated information and mass news posing as information, is one possibility: the newspaper industry has already seen an illustration. The alternative is to demonstrate the respectability of the microprocessor as a down-to-earth, extremely useful, but entirely non-occult electronic component in a programme of education carried out by people who really do know what they are talking about. We have seen far too many newspaper and television pieces whose aim has been to describe the applications of integrated circuits in the 'wonder of modern science' manner, heightening in a most irresponsible way modern man's ingrained and well-founded suspicion of single-minded, but accident-prone technocrats.

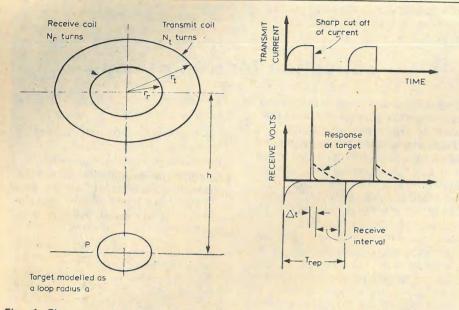

The attitude of mind which impels otherwise reasonable people to walk out on strike when 'new technology' is discovered in the offing is unlikely to be of much assistance to anyone. If an organisation is compelled by a lack of understanding to stick to outmoded methods of working, its customers will simply go to another source of supply which has taken advantage of modern developments. Many people will no doubt need to change their skills, but there is no reason to think that a smaller total workforce will be needed in the society of the next decade.

The microprocessor is not an invention of the Devil, but in the face of sensational reporting it will tax the skill of educators to prove it.

Pulse induction metal detector

Experimental system for overcoming magnetic viscosity effects

by J. A. Corbyn

1 Elements of a pulse induction system

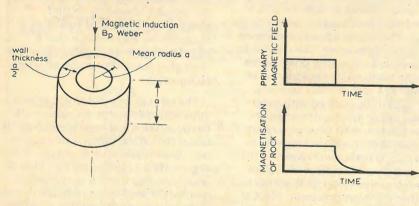

Fig. 2 Standard cylinder target

Fig. 3 Response of soil or rock when the primary magnetic field is switched off.

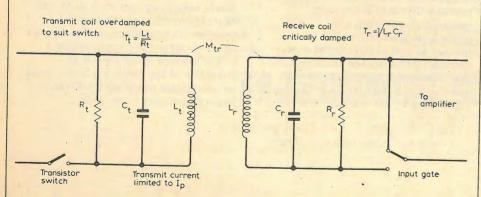

Fig. 4 Equivalent circuit of the transmit and receive coils.

Because the author considers buried "treasures" to be the most lasting and potentially most informative repositories of human history, he feels that their detection and excavation should be restricted to approved organisations. This article describes an experimental metal detector, originally developed for detecting gold in Western Australia (so far unsuccessfully), that can be adapted for archaeological or military applications. Particular emphasis is placed on magnetic viscosity and how to eliminate this undesirable effect.

Metal detectors used in searching for buried metallic objects are similar in concept to those used for geophysical exploration. All such instruments depend on the measurement of a magnetic field associated with eddy currents induced in the target by a primary magnetic field. The two main groups of metal detector are the continuous wave type where normally a sinusoidal primary magnetic field produces eddy currents in the target, and the pulse induction system where the primary field is a series of pulses. In a continuous wave detector, coupling between the transmitter and receiver is effected by the geometry of the system which must be rigid for detecting small metallic targets such as archaeological artifacts. Rigid geometry is not so important in a pulse induction system because there is no direct coupling between the transmitter and receiver.

Early metal detectors were mainly continuous wave types because simple circuits could be used. However, pulse induction systems have been described in the geophysical context by Grant and West1, and in the archaeological context by Colani².

In a conventional pulse induction system a primary magnetic field is switched off and induces eddy currents in a conductive target. Voltages induced by the decay of these eddy currents are detected and then displayed. Fig. 1 shows a system comprising circular primary and receive coils which are coaxial with a target illustrated as a conducting loop. Fig. 2 shows the case where a magnetic flux of B_n Weber is normal to a loop of radius a and effectively falls to zero in time Δt . If L is

the self inductance of the loop, R the resistance and i is the current then

WIRELESS WORLD, MARCH 1980

$$iR = -\frac{d}{dt}[B_p\pi a^2 + Li] \qquad (1)$$

If $B_p = B_0$ at t = 0, $B_p = 0$ at $t = \Delta t$ and $i_{\Delta t}$ is the current at $t = \Delta t$,

$$i_{\Delta t} = \frac{\pi a^2}{L} B_0 - \frac{R}{L} \int_0^{\Delta t} i dt \qquad (2)$$

If $\Delta t \ll L/R$, equation (2) can be approximated by

$$i_{\Delta t} \approx \frac{\pi a^2 B_0}{L}$$
 (3)

If the target is given a standard form of a cylinder with radius a, height a and wall thickness a/2, L can be calculated. from an adaptation of Wheeler's formulae

$$L = a \times 2.07 \times 10^{-6} H$$
 (4)

Although equation (4) is an approximation it is sufficient for practical purposes because targets are rarely standard shapes. The resistance can be calculated

$$R = \frac{0.289 \times 10^{-6} \times k}{a} \Omega \tag{5}$$

where it is assumed that the specific resistance of the metal is for gold $(0.023 \times 10^{-6} \Omega \text{m})$ and k is the specific resistance in relation to gold. When the primary magnetic field is removed the

current in the target decays exponentially with a time constant.

$$T = \frac{L}{R} = \frac{7.16a^2}{k}$$
s (6)

The eddy current induced in the model target is then

$$i = \frac{\pi a^2 \mu_0 H_0}{a \times 2.07 \times 10^{-6}} e^{-\frac{t \times k}{7.16a^2}} A$$

and setting μ_0 at $4\pi \times 10^{-7}$ H/m

$$i = 1.907aH_0e^{-\frac{t \times k}{7.16^2}}$$
 (7)

In the pulse induction system of Fig. 1 the primary magnetic field at P is approximately

$$H_0 = \frac{\pi r_t^2 N_t I_p^2}{4\pi h^3} = \frac{r_t^2 N_t I_p}{2h^3} A/m$$
 (8)

The voltage at the receiver coil is determined by the rate of change of flux linkage originating from the target and is given by

$$\frac{r_{\rm t}^2 N_{\rm t} I_{\rm p}}{2h^3} 1.907a \left(\frac{-k}{7.16a^2}\right) e^{\frac{-tk}{7.16a^2}} \frac{\mu_0 a^2}{2h^3} \pi r_{\rm r}^2 N_{\rm r}$$

$$V_{\rm r} = 0.262 \times 10^{-6} r_{\rm t}^2 r_{\rm r}^2 N_{\rm r} N_{\rm t} I_{\rm p} \frac{ak}{h^6} e^{\frac{-tk}{7.16a^2}}$$
(9)

If the received signal is integrated the mean output signal level V_m will be

$$\frac{1}{T_{\text{rep}}} \int_{0}^{\infty} V_{\text{r}} dt =$$

$$1.875 \times 10^{-6} \frac{r_{\text{t}}^{2} r_{\text{r}}^{2} N_{\text{t}} N_{\text{r}} \alpha^{3} I_{\text{p}}}{T_{\text{cos}} h^{6}}$$
(10)

where T_{rep} is the repetion interval defined in Fig. 1 and $T_{\text{rep}} \gg T$.

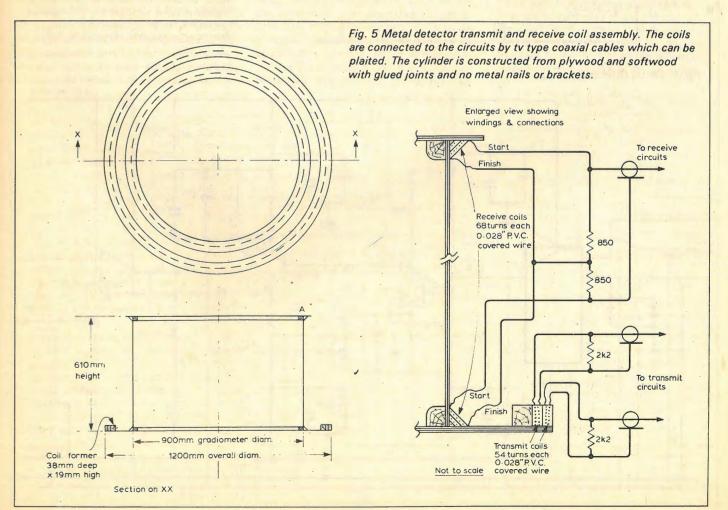

As an example, consider the case where T_t is 0.6m, T_r is 0.45m, N_t is 54 turns, N_r is 68 turns, a is 0.04m, h is 1m, In is 1A and T_{rep} is 0.016s. Equation (10) gives a V_{m} of 1.1 μ V and for k=1, T=5.7ms. This is very approximate because h is not much greater than r...

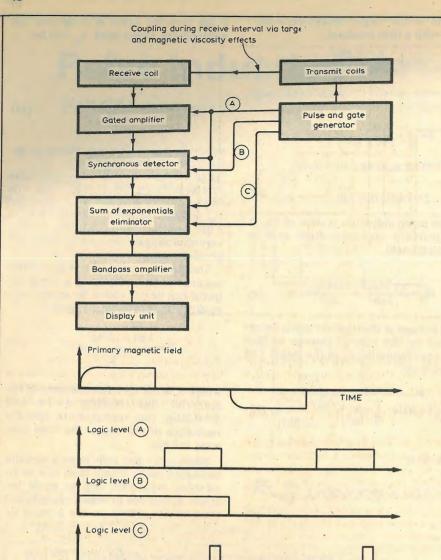

The time constant of a non metallic material in the vicinity of a metal detector can be calculated by appropriate modifications to equation (6) as

$$T = \frac{1.64 \times 10^{-6} a^2}{S}$$
 (11)

where S, is the specific resistance of the material. Substituting a = 1m and $S = 0.2\Omega m$, the approximate specific resistance of sea water, the time constant is 0.8 µs.

Most rocks and soils have a specific resistance much higher than this so an effective separation can be made between signals due to metallic targets and conductivity effects in the ground by

introducing a delay Δt between switch off of the transmitter current and observation of the returned signal. In practice delays from $40\mu s$ to $300\mu s$ are suitable.

Magnetic viscosity effects

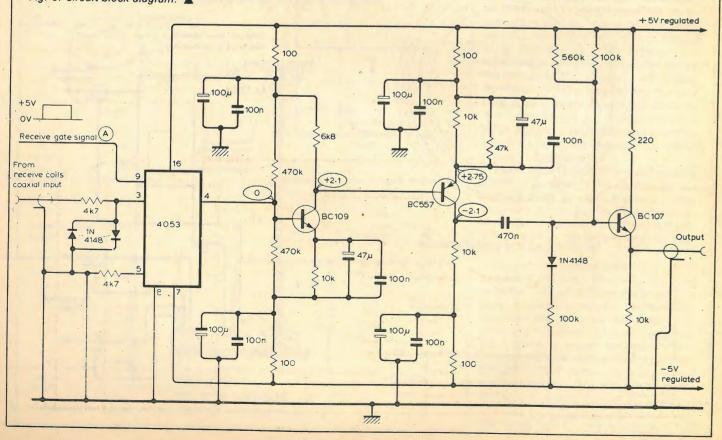

The magnetic properties of soils and rocks are mainly attributable to magnetite and maghaemite. These minerals exhibit a magnetic viscosity effect because their magnetization does not instantaneously follow an applied magnetic field. Magnetic viscosity is qualitatively similar to the effects of a conductor on a metal detector. The direction of temporary magnetization is the same as the primary magnetic field and the magnetic flux in the conductor being detected. Although there is no comprehensive theory of magnetic viscosity, Tropin3 has critically reviewed Neel's theory which is described by Stacey and Banerjee⁴. Useful data for metal detector design has been provided by Colani and Aitken⁵.

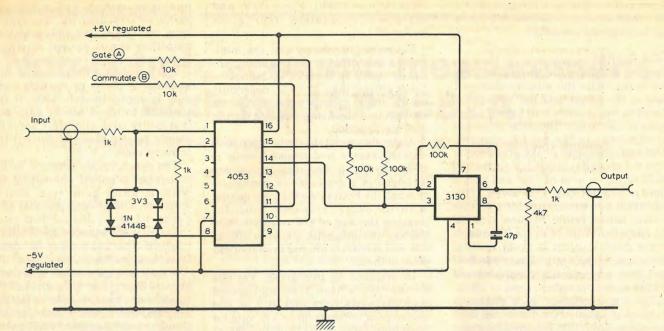

When designing a pulse induction metal detector it is necessary to know the response of soil or rock to a decreasing step in magnetic field. A general equation is

$$M \propto K \Delta Hg(t)$$
 (12)

Fig. 7 Gated amplifier. Note that only one section of the 4053 is used, all unused inputs should be connected to ground. All voltages are d.c., measured with a high impedance meter. All capacitors are ceramic or aluminium electrolytic types.

Fig. 6. Circuit block diagram.

where K is the magnetic susceptability and M is the magnetic moment per unit volume of material resulting from a change ΔH in the magnetic field at time t after this change. Equation (12) is linear in that g(t), which describes the decay of the magnetization, is independent of the primary magnetic field. At t=0, g(t) should be finite and as $t\to\infty$ g(t) should go to zero. Furthermore, g(t) from practical experiences should be a decreasing function of t. Fig. 3 shows. the response of a soil or rock to a decreasing step in magnetic field. A review of available literature and some experimental work shows that g(t) can be expressed as a sum of two exponentials. An electronic system was constructed to simulate the sum of exponentials and

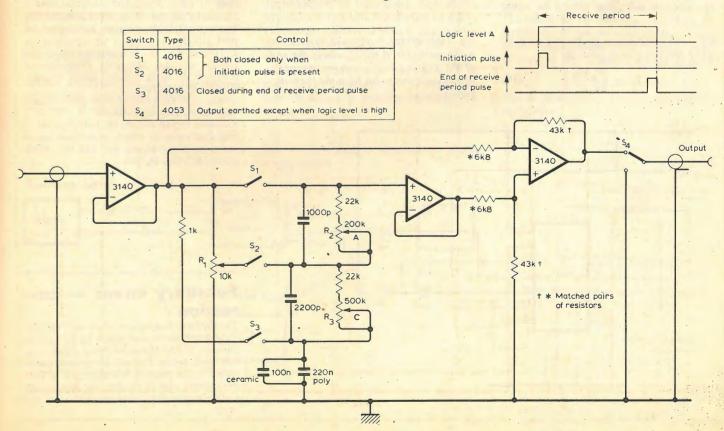

compare the result with the response of soil or rock. A satisfactory model for the derivative of g(t) is

$$g^{1}(t) = (1-P)e^{-t/T_{1}} + Pe^{-t/T_{2}}$$
 (13)

where T_1 is 75 μ s, T_2 is 550 to 800 μ s and P is in the range 0.08 to 0.30. These observations apply to lateritic soils in the goldfield region of Western Australia. The function $g^1(t)$ does not depend on the physical dimensions of the material being magnetized and the form of the decay due to a conductive target is generally a simple exponential decay as in equation (7). I therefore decided to construct a ground effect elimination system for a pulse induction metal detector by determining the difference

Fig. 8 Synchronous detector. The regulated power supply is shared with the gated amplifier. The 47pF compensation capacitor is soldered directly to the 3130 leads

Fig. 9 Sum of exponentials eliminator. Resistor R_1 controls the mixture of exponentials, R_2 controls the decay constant T_1 , and R_3 controls the decay constant T_2 . Production of the initiation pulse from logic level A is shown in Fig. 10

between the response of the ground and the observed response, assumed to be due to magnetic viscosity.

Coil design

Design objectives for the coil system are to maximise the primary magnetic field at the target and the voltage induced in the receiver coil by eddy currents in the target. The noise level due to variations in the earth's magnetic field and movement of the gradiometer over the ground is about luV with a coil of 25 turns, an area of 1 m² and with a similar coaxial coil 1 m away. This limitation was determined for a receive system with a centre frequency of 200 Hz and a bandwith of 10 Hz. The major noise contribution is from normal variations in the earth's magnetic field and does not account for man-made electrical interference.

The time constant of a critically damped gradiometer constructed with the above limitation is generally under 10µs for a coil diameter above 1 m.

Transmitter coil design is controlled by the decay resistance required to prevent an excessive voltage being applied to the transistor switch, see Fig. 4. Neglecting coil capacitance, the decay of current I through a coil of self inductance L, and decay resistance R, is

$$I = I_{to}e^{-t/Tt} \tag{14}$$

where $T_{\rm t}$ is the decay constant $R_{\rm t}/L_{\rm t}$ and $I_{\rm to}$ is the initial current through the transmit coil. If $M_{\rm tr}$ is the mutual inductance between transmit and receive coils and $V_{\rm p}$ is the peak voltage permitted at the switch, the voltage decay at the receive coil due to the current decay through the transmit coil is, for $I_{\rm c} \ll I_{\rm c}$.

$$V_{\rm r} = V_{\rm p} \frac{M_{\rm tr}}{L_{\rm t}} e^{-t/Tt} \tag{15}$$

If $V_{\rm e}$ is the maximum permitted voltage at the receive coil at time Δt

$$\Delta t = T_{\rm t} \log_{\rm e} \left(\frac{V_{\rm p} M_{\rm tr}}{V_{\rm e} L_{\rm t}} \right) \tag{16}$$

With $V_p = 750$ V, $V_r = 1\mu$ V and $M_{\rm rt}/L_t = 0.1$, equation (16) gives $\Delta t/T_t = 18.1$.

Equation (16) shows that the minimum value of Δt is determined principally by T_t . In practice T_t cannot be much greater than 5% of Δt , depending on the ability of the circuit to reject a background decaying voltage during the receive period.

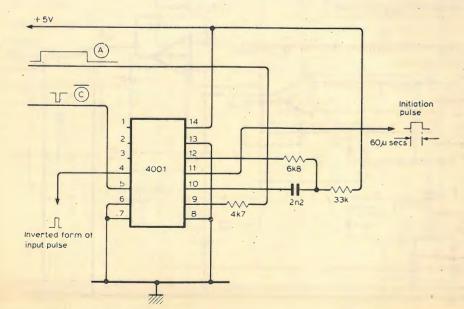

A circular metal detector array with coaxial receive and transmit coils is shown in Fig. 5. The receive coils are arranged in a gradiometer configuration and the bottom winding is coplanar with the larger transmit coils. Increasing the size of the transmit coils reduces the magnetic viscosity effects due to a relatively intense primary field close to them.

In addition to this array, various circular types have been constructed with diameters from 0.05 to 2 m, and rectangular versions up to 2 m long for searching large areas. For the larger arrays it is desirable to keep coil capacitance as low as possible by careful winding design. As previously noted, rigid system geometry is not essential for a pulse induction system and the simple wooden structure described is sufficient.

Circuit design

A block diagram of the metal detector circuit is shown in Fig. 6. An alternating primary magnetic field is used to avoid magnetic polarization of the ground and to improve the overall signal-tonoise ratio. The gated wideband amplifier in Fig. 7 consists of a high voltage protection network, a c.m.o.s.

Fig. 10 Interface, buffer and initiation pulse generator. A 4001 inverts the end of the receive period pulse and derives a 60 µs initiation pulse from the receive period signal.

analogue switch and a transistor amplifier designed for fast recovery from saturation. The 4053 grounds the amplifier input except during the receive period when the receive coils are connected. The passband of the amplifier is 20 Hz to 100 kHz and the gain is approximately 4000. It is not practical to use a higher gain due to instability and amplifier saturation caused by the decay of current in the transmit coils.

The synchronous detector in Fig. 8 recognises a pulsed alternating signal with a unity-gain sign switched amplifier. The op-amp provides an output of +1 or —1 and the 4053 grounds the input when a useful signal cannot be received. The rise-time of the detector for a square wave is about 25 µs.

A sum of exponentials eliminator is shown in Fig. 9. This circuit takes samples of 60 µs duration at the beginning and end of the receive period and simulates the magnetic viscosity effect of the ground by inserting a function as shown in equation (13). The simulated ground effect is subtracted from the input signal to give an output when the response does not match that caused by the ground. The parameters T_1 , T_2 and Pcan be changed to suit the ground conditions. RC combinations are used for the simulation and a 0.32 µF capacitor stores the background level to which the sum of exponentials decays. With the components shown the range for T1 is 20 to 240 us (typically 80 us), for To 50 to 900 µs (typically 800 µs) and P is from

New Hewlett-Packard spectrum analyser uses digital signal processing

by R. N. Grubb, Auris of Boulder, Colorado

The HP3582A is a recently announced audio spectrum analyser using fast Fourier transform analysis. A number of its features can be exploited in the measurement of loudspeakers and microphones in non-echoic conditions. These are described and some practical examples of its application given.

THE RECENTLY announced model 3582A spectrum analyser by Hewlett-Packard is an example of the new generation of instruments which depend on microprocessor technology to provide powerful capabilities at a lower price than has previously been possible. In this case, digital signal processing technology is used to implement a flexible 0.02 Hz-25.5kHz spectrum analyser. using the fast Fourier transform (FFT) of the digitized input signal to calculate the signal spectrum in the frequency domain from a sample of the input signal in the time domain. Although the instrument is a computer system, the mechanics usually associated with the use of a computer are completely transparent to the user, who is presented with a fairly conventionallooking front-panel control layout. The program is, of course, contained in read-only memory.

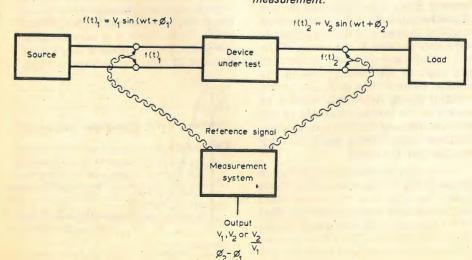

The 3582A is not a real time third octave analyser. In fact, one thing which may put off the average audio engineer is the lack of anything but

linear frequency-scale presentations. However, it is inherent in the fast Fourier transform approach that a linear, equally-spaced set of spectral estimates is produced. The resolution and bandwidth of each estimate depends on the length and shape of the time window used to select the signal sample for analysis. Thus a logarithmic presentation of the data would necessarily be only cosmetic, information at the higher frequencies being lost, if a constant proportional resolution were displayed. As the available frequency ranges of the instrument are very extensive, all the information is available, although it is perhaps more time consuming to

By audio spectrum-analysis standards, the capabilities are unconventional, including measurement of phase, measurement of transfer functions and time-domain signal averaging before analysis.

Measurement of the phase response of audio systems, particularly of loud-speakers, has recently become of interest in the quest for the more realistic reproduction of transients. The 3582A provides in one box the means to make response measurements, including phase, on loudspeakers and other audio trandsucers, without requiring an anechoic chamber, or the roomful of minicomputer used by loudspeaker manufacturers to make such measurements.

Fig. 1. Arrangement required for phase measurement.

Phase

Before proceeding to explain how to use the analyser for this hurpose, it may be useful to some readers to review what is meant by phase response and in particular how it can be measured by a spectrum analyser. The phase response of a device refers to a measurement of relative phase, usually the difference between the input and the output of the device. Unlike amplitude, or spectral amplitude, which is measured with a single connexion to the system under test, two separate connexions are needed to measure phase response as in Fig 1. Thus, although a spectrum analyser is normally a single-input device. with analysers like the 3582A, one must think in terms of two inputs to measure phase. Simply feeding in a composite signal to one channel of the instrument will give a perfectly good amplitude spectrum, but the phase answer computed will be different for each time sequence analysed because of the lack of a reference. This may not matter in some applications. For instance, if we want to know whether sidebands observed on a carrier are due to amplitude or phase modulation, their phase relationships to the carrier itself as seen in Fig 2 and a single sample

Phase spectrum of amplitude modulation sidebands average to 0° or 180° with respect to the carrier

Fig. 2. Identifying amplitude or phase

Phase spectrum of frequency modulation sidebands average +90°or -90° with respect to the currier

Fig. 3. Comparison of two AKG C451 microphones. Lower trace-amplitude. Upper trace-phase.

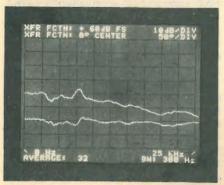

Fig. 4. Comparison of two 1in diameter capacitor microphone capsules in a stereo coincident pair configuration. Lower trace-amplitude. Upper trace-phase.

Fig. 5. The effect of a foam windshield on a C451. Upper trace — without windshield. Lower trace — with windshield. (Scales are the same as Figures 3 and 4).

analysis will give us the answer we want.

Transfer function

The most straightforward mode of operation to give repeatable phase measurements is that of the transfer function measurement. The two channels of the analyser are connected across the input and the output of the device to be tested and one of the two built-in noise sources connected to the input. The analyser now plots the ratio of the amplitudes and the difference in the phase of its two inputs versus frequency.

This transfer function measurement

capability can be applied very neatly to the measurement of microphones. By connecting two microphones, one of which is to be regarded as the standard, to the two inputs of the analyser and placing them close together and in the sound field of a loudspeaker fed from the analyser noise source, their responses can be compared directly and very quickly. Figure 3 shows the result of comparing two nominally-identical C451 microphones with CK1 capsules. This disclosed the interesting information that although the microphones are well matched up to 15kHz, the two differed by nearly 6 dB at 17.5KHz. In this case, since neither microphone could be regarded as a standard, it was not possible to say which microphone or whether one or both was at fault. Exchanging the capsules on the microphone bodies showed the problem to be in the capsules and not in the microphone electronics or the amplifier chains.

The upper trace shows the phase difference. The constant phase slope at low frequencies shows that the "test" microphone was slightly in front of the reference microphone and it was possible by careful adjustment of the relative microphone position to make the phase slope zero. It is interesting that the difference between the capsules shows up in the phase at a lower frequency than in the amplitude. One thing to note in this and in most of the other examples shown is that the lowest-frequency point plotted by the analyser in the zero frequency start mode is in fact actually 0Hz, i.e., d.c. and the position of this point depends on the analyser amplifier d.c. offsets or externally applied d.c. In this case, of course, the microphone amplifiers are a.c.coupled, so the zero frequency point is quite meaningless.

Figure 4 shows another comparison of two microphones, in this case two lin capacitor capsules mounted one above the other in the same case and designed to be used as a coincident stereo pair. The lower trace is the magnitude again. This showed a good match at all frequencies, except in the region 3-9kHz, where there are 2-3dB differences. Some experiment and the use of another microphone as a comparison standard showed that the irregularities were only present in the lower of the two capsules and were very sensitive to the angle of the microphone in the vertical plane to the direction of the incident sound field. This seemed to show that the problem was due to diffraction effects at the microphone case, the lower capsule being much closer to the case than the upper.

Yet another interesting comparison is shown in Fig. 5. This is the pair of C451s again, but this time the stored trace facility has been used to show the effect of the standard foam windshield on one of the microphones. The effect is easily measurable and amounts to nearly 3dB

at 15kHz (unfortunately, I forgot to illuminate the graticule for this photograph!)

Impulse testing

All the preceding three examples were measured in a normal room with some acoustic treatment, but nevertheless far from anechoic. Thus, the sound field at the microphones being compared is composed of direct and reflected components. The comparison results have to be based on the assumption that the microphone polar responses are similar. It is only possible by this method to compare a cardioid microphone with another cardioid or an omnidirectional one with another omnidirectional microphone, etc. Providing the pair of microphones is not too far from the source compared with the dimensions of the room, and that the room is reasonably non reverberant. then small errors in polar response should have little effect on the comparison. However, we can do this kind of measurement in a non-anechoic room without these restrictions by using the capability of the instrument to analyse the impulse response of loudspeakers and microphones and present the results in the more familiar terms of amplitude and phase and it is to this, probably least familiar, mode that I now turn.

Fourier transform theory tells us that a zero width pulse contains equal energy per unit bandwidth (power spectral density — p.s.d.) at all frequencies, i.e., it possesses an infinite bandwith. Of course, this is a mathematical abstraction because, unless the impluse is infinitely large in amplitude its energy in any particular bandwidth will be infinitely small. Fortunately for any given audio bandwidth, it is easy to produce an impulse sufficiently narrow for the p.s.d. to be flat. The theory tells us that the power spectrum of a pulse of width t is

$$P(f) = \begin{pmatrix} A\sin\pi ft \\ -ft \end{pmatrix}$$

This function, the familiar $\sin x/x$, is plotted in Fig. 6. By choosing t to be small enough, we can make the p.s.d. as flat as we wish over the working bandwidth. For instance, it is easy to calculate that a 1 μ s wide pulse is only 0.01dB down at 25 kHz, the maximum band-

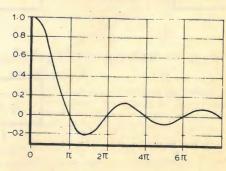

Fig. 6. The function sin x/x.

width of the analyser. A 10µs pulse is only ≈ 1dB down. At the rear of the 3582A is a t.t.l.-level impulse output. This gives a positive-going pulse which is≈ lµs long at the widest analysis bandwidth (25kHz) and which increases in width as the analysis bandwidth is reduced. If this output is connected to the input of the analyser, the displayed amplitude spectrum will show the first of the problems of impulse analysis which has to be carefully considered in order to obtain valid results. Indeed, the analyser shows a flat spectrum but, as the sensitivity is increased to bring the observed spectrum above the baseline the input channel overload light rapidly comes on. In fact, it is impossible to get more than a 20dB measurement range above the noise floor. This, of course, is because the test signal has a very high ratio of peak to mean value, and the analyser input dynamic range, which is set by its analogue to digital converter, only permits this limited range in the spectral domain. This situation can be improved considerably, however, if an external impulse source is used. As calculated above, a pulse of ten times the width (10µs) is about 1dB down at 25kHz. This gives another 20dB of analysis dynamic range, which is adequate for nearly all acoustic testing; it is easy to correct for the small loss at high frequencies of the test signal, if 1dB is important.

Phase

Having developed the test signal, the next question to consider is what is meant by the phase of the test signal and how the analyser measures it. The reference, in this case, is set in the time domain by the position of the time window, in which the analyser samples the input signal. At a time t_0 one can think of all the reference frequencies starting simultaneously at zero phase (zero amplitude for a cosine wave). If the impulse is positioned at t_0 , then its spectrum consists of all frequencies also starting at zero phase and the analyser will read 0° at all frequencies. If the impulse is displaced from to then there will be a progressive displacement, increasing with frequency, in the analysed phase expressed by the formula for the group delay introduced by the displacement

$$\frac{\Delta \phi}{-} = \Delta t \times 360^{\circ}$$

(φ in degrees, f in Hz.)

where $\Delta \phi/\Delta f$ is the phase slope with frequency. For a positive delay (signal later than t_o) the phase of the higher frequencies lags the lower and vice versa. Note that a linear rate of change of phase implies only a delay and no waveform distortion.

In the 3582A, t_0 is set at the middle of the time window when the 'flat top' or

Hanning passband shape is selected, or at the start of the time window when the 'uniform' passband shape is selected. The latter is the passband intended for transient analysis. In the former cases, the passband shape is set by amplitude weighting in the time domain so that a transient at the beginning or end of the time window would not be analysed correctly. To be able to interpret the phase readout from the analyser, it is necessary to place the impulse close to t_0 , because a large phase slope due to a time difference will obscure the properties of the system under test and, if too large, renders it discontinuous, because the discrete samples computed by the analyser are not close enough together to resolve the rapid phase change. To adjust the timing, the analyser can be operated in

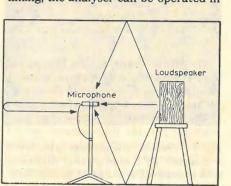

Fig. 7. Sound paths for direct and reflected sound in a small room.

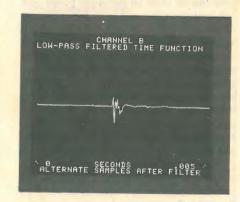

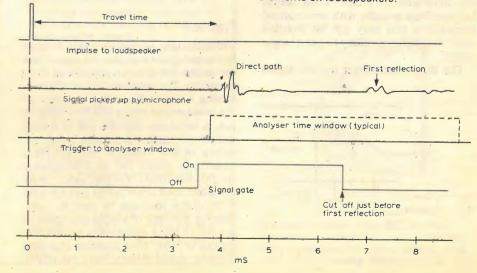

Fig. 8. Typical loudspeaker time domain response when driven by an impulse.

two ways and can be thought of more like an oscilloscope. In fact, the time-domain sampled waveform can be selected for display on the c.r.t.; this is an almost indispensable mode for setting up the analyser for transient analysis. In the free-run mode, the instrument repeatedly starts new time windows as soon as it is ready to analyse new data. The rear-panel impulse outout occurs at the start of each time window. Alternatively, the analyser can be triggered like an oscilloscope by an input signal on channel A or by a t.t.l. level pulse at a rear-panel input.

Echo gating

The advantage of using a transient signal to analyse the response of acoustic devices is that it is possible to suppress the effect of room reflections entirely without having to work in an anechoic room. To a close approximation, sound travels 1 foot per millisecond: the typical response of a loudspeaker to a 10 µs wide impulse is over in 2-3ms, depending on the physical size of the cabinet. Even in a quite small room with a loudspeaker 3 to 4 feet from the floor and the measuring microphone 8 feet away, the first room reflection will arrive at the microphone 3-4ms later than the direct sound. Figure 7 shows the situation. A typical time domain response of a loudspeaker to a 10 µs wide impulse is shown in Fig 8, which was taken from the analyser screen, with the instrument set on the 0-25kHz range. On this range the time window is ≈ 5ms long and, by controlling the trigger time, the transient picked up by the measuring microphone can be positioned near the centre of the time window with the first reflection just outside the window. This enables the amplitude response to be obtained, but as explained above, the transient should really be positioned near the start of the time window if the phase response is desired. Since the time window gets longer as the analysis bandwidth is reduced (necessary if the

Fig. 9. Timing diagram for impulse measurements on loudspeakers.

www.amoricanradiahistory.co

low frequency response is to be examined in detail), an electronic signal gate is needed so that the first directpath signal can be isolated. To do this and to be able to adjust all the delays. correctly and generate the test impulse required some auxilliary equipment in addition to the analyser itself. This is unfortunate because it seems that it would have been quite simple to build all the required functions into the analyser in the first instance.*

Figure 9 shows the overall timing and gating required. Because the analyser time window must be started later than the impulse sent to the loudspeaker, it is best to generate the measurement repetition rate externally. This should be set to the highest rate which allows, all room responses to die out before the next pulse.

Two delayed trigger pulses are then needed - one to start the analyser time gate at the correct time with respect to the transient picked up by the measurement microphone, and one to start the signal gate. A convenient way to get the first delay is to use a second. microphone slightly closer to the loudspeaker under test and feed its amplified output to channel A of the analyser as the trigger signal. The measurement' microphone output is fed to channel B. The delay is adjusted by setting the relative distances of the two microphones to bring the received transient just at the start of the time window on channel B. Channel A should also be examined to make sure that the trigger point on the transient is a stable one.

It is very important to make sure that all the significant energy from the transient radiated by the loudspeaker is included in the time gate. This can be checked both by inspection in the time domain and by changing the signal gate window over a small range and seeing if it affects the transformed frequency and phase response. With high quality loudspeakers of small dimensions, it seemed the response died essentially to zero after about 3ms, and it seemed to be possible to get a clean separation between the direct arrival and the first reflected arrival in a room with a smallest dimension of 8 feet. With larger loudspeakers or units with pronounced resonances, this may not be possible and it would be necessary to use a larger room

The delay mechanism for the signal

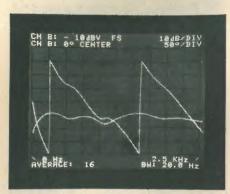

Fig. 11. Frequency and phase response of a Spendor BC1 loudspeaker measured with an impulse, a) 0-25kHz, b) 0-2.5kHz.

gate and the signal gate itself need to be electronic. Commercial pulse generators can be used to generate these and the basic impulse and its repetition rate or, with the aid of a few digital i.cs, a special generator and controller could! be assembled. Some commercial signal gating devices may be satisfactory in this application - a simple shunt f.e.t. switch such as is shown in Fig. 10 works well. It is most important that the switch does not introduce appreciable transients itself in the signal path. When the analyser bandwidth is reduced, the time window becomes longer and it may be necessary to readjust the system repetition rate. Also, as discussed previously, the impulse length must be increased proportionately to preserve approximately constant spectral power density.

Practice

Unfortunately, no measuring technique is completely free of disadvantages and the gating-out of room reflections is no exception. The problem is that of determining whether the initial response of the loudspeaker really has died away or not. It turns out that the use of a time sample of length t produces an uncertainty in the value of the spectral amplitude points for all frequencies roughly less than 1/t in frequency. Why the effect is an uncertainty and not just a calculable loss can be seen by considering a couple of simple examples. If the device being analysed is perfect (i.e. a piece of wire) then locating the time window would clearly have no effect,

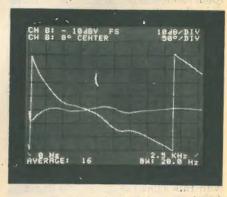

Fig. 12. Frequency and phase response of a Chartwell LS3/5A loudspeaker measured with an impulse. a) 0-25kHz, b) 0-2.5kHz.

because the input impulse signal has a zero value at all times except for a small interval near zero time. However, if the device had a low-frequency cut off caused by the equivalent of a single pole RC network, then its response to the impulse would have an overshoot following the impulse which returns to the baseline exponentially with a time constant of RC seconds. In this case, a significant error will be made in the low-frequency response measurement unless the time window is maintained for 5 or 6 time constants, so that the response has reached zero for all practical purposes. Locating the impulse response at a point where the net remaining area under the response is negative will result in an apparent enhancement of low frequencies well below 1/t and vice versa. Thus the effect of the truncation depends entirely on the exact form of the impulse response.

Fig. 13. Apparent response of a BC1 with the signal gating disabled and the first room reflection included.

WIRELESS WORLD, MARCH 1980 Figures 11 and 12 show typical results obtained in the author's studio with a Spendor BC1 and a Chartwell LS3/5A. The phase responses clearly show the effects of the crossover in the case of the Chartwell as a change in time delay (phase slope) starting at ≈ 3kHz. With a little more flexible arrangement, the average phase slope could have been brought closer to zero with resultant ease in interpretation. In all cases, the measurement microphone was about on axis and 6 feet from the loudspeaker. Figure 13 shows the effect of disabling the signal gate and allowing some of the room reflection to be analysed! I found that these loudspeaker measurements were relatively unaffected by the microphone used, providing it was a capacitor type and of professional quality, since these microphones invariably have a much flatter response than monitor loudspeakers. If a standard measuring microphone is not available, then a 1/2 in diameter. omnidirectional capacitor microphone such as the AKG C451 with a CK2 capsule would be the best second choice. The examples shown were made with this same microphone but with a CKI capsule, which probably does affect the results somewhat. In all cases the low frequency response below about 2-300 Hz appears to be attenuated

compared with the published responses of these particular speakers, so it must be assumed that some truncation of the impulse response was taking place.

Care should be taken not to overdrive the loudspeaker with the impulse: A few watts peak power should be all that is required. The sound should be that of a quite quiet tick similar in volume to that of a typical alarm clock. If the measurement conditions are quiet, then the response can be obtained with only one impulse. However, if you don't live in the country or have a well isolated studio handy, there is no need to despair; use the last unique feature of the analyser, time domain averaging. This adds together, algebraically, each successive sample at the same time with respect to the trigger. The wanted signal is preserved but non coherent background noise cancels itself on the average. Thus, not only do you not need an anechoic room to make loudspeaker measurements, you do not even need a quiet one. The examples in Figs. 11 and 12 used a signal average of 16 impulses.

All the comparison tests of microphones described earlier can be better done using a loudspeaker excited by an impulse with the appropriate delays and gating. In this case, since both signal channels will be needed for the measurement, the rear-panel t.t.l.-

level trigger input must be used. Absolute measurement of microphone response requires an acoustic impulse generator of known characteristics. It has been reported in the literature that a high-voltage spark discharge or an exploding wire forms a useful source for this purpose, providing the construction of the electrodes is such that the sound radiation is unimpeded. However, the author has not yet tried this.

* It is possible to do the signal gates within the instrument using the IEEE 488 bus programing input. However, this means significant additional complication and expense.

Abridged specification

Input channels

2n 1MΩ + 60pF impedance, sensitivity +30dBV to -50dBV in 10dB steps. Overload indicator light.

Frequency spans

1 Hz to 25 KHz full scale in zero-start mode, 1-2.5-5-10 sequence. Bandpass mode 5Hz-25kHz span in 1-2.5-5-10 sequence

Frequency resolution

256 spectral points are calculated in the single-channel mode, 128 in the dual-channel mode. The resolution depends on the passband selected. There are available, a "Flat top" optimised for harmonic analysis of tone signals, a "Hanning" passband optimised for general random noise measurement and a 'Uniform" passband intended for transient analysis and use with the built-in periodic noise source.

Display

The digitally driven c.r.t. has infinite storage capability. It can display up to two traces of data from either the current measurement or from up to two traces stored from previous measurements. It provides an alphanumeric readout of trace calibration, a cursor readout of trace values in engineering units and error messages. Amplitude display 10dB or 2dB per division (8 divisions vertically) or linear. Phase ± 200°. Frequency displayed linearly.

Measurement modes

- 1. Frequency spectrum, amplitude and
- 2. Transfer function, ratio of input channel amplitudes and difference in phase.
- 3. Coherence function, the degree of coherence (0-1) between the input channels.

Signal sources

- 1. Random noise. This is generated digitally and adjusts automatically with the frequency range selected to maintain a constant power output in the analysis
- 2. Periodic noise. This is also generated digitally and is arranged to have a "comb" spectrum which exactly matches the calculated spectral points. This gives the same effect as a tracking generator in a conventional swent analyser with the advantage over random noise that no frequency domain averaging is needed to get an accurate answer.
- 3. Impulse. This varies in width depending on the frequency range selectedm It is timed to occur at the start of each analysis time window.

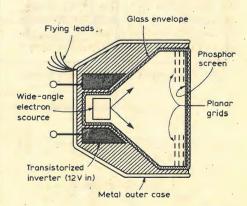

Averaging modes

- 1. Frequency Domain
- a) r.m.s. average of calculated spectral points with 4-256 points averaged or an exponential "running average" mode.
- b) Peak, 4-256 points or peak hold in a continuous mode.
- 2. Time domain.
- 4-256 input signal time sequences averaged. The zero time is set by a trigger circuit on input channel A or by an external trigger input at t.t.l. level.

EEV provides bright lights for ATV games

A large scale, computer-controlled electronic display board supplied by English Electric Valve Co. can be seen by television viewers of the Bob Monkhouse "Family Fortunes" panel game on Sunday evenings.

The main body of the display consists of 300 "character display tubes" (a form of c.r.t. costing about £100 each), which EEV say offer very high variable brightness, low power consumption and electronic switching with low level logic. The control logic, including a keyboard and v.d.u. control console, includes an Intel single board computerand the complete installation is said to have cost ATV about £80,000.

Cross-sectional view of the EEV character display tube. The flying lead grid connections are for multiplexing; the "expected life" of the tube is 40,000 hours or about five years.

Clock timer - 2

Memory circuit, construction and testing

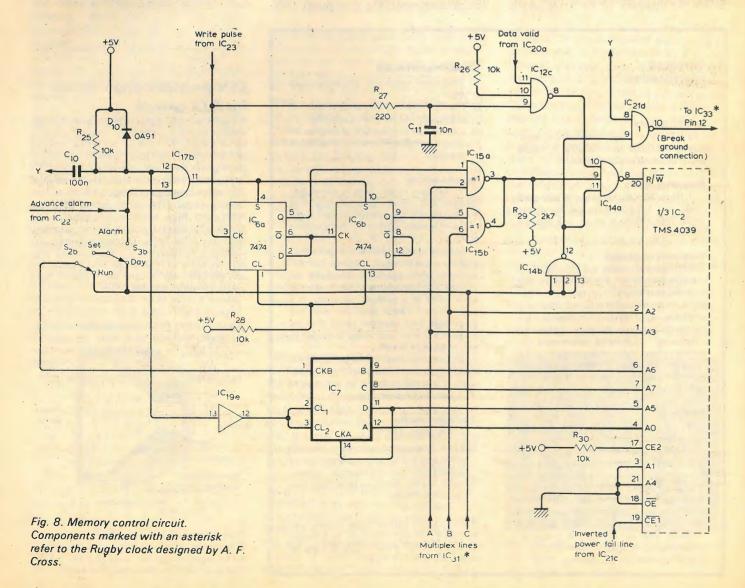

By R. D. Clemow and T. C. Carden.

Numerical data from the keyboard is encoded to b.c.d. and fed to the memory data inputs. Four of the memory address pins are used to address an alarm time and are driven by a 4-bit binary counter. Two of the pins address the four digits of the alarm time and are connected directly to the A and B multiplex control lines from the clock. In the Set mode the alarm key clocks the counter and accesses the memory locations which store the next alarm time. In the Run mode, control line C clocks the counter so that the alarm times are scanned at one every 6ms. The read/ write control circuit ensures that only the correct memory locations are used.

The memory input circuits are shown

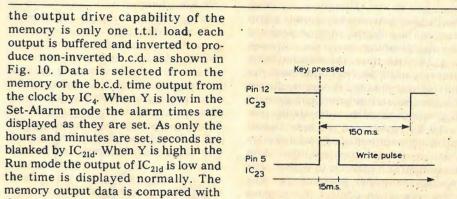

in Fig. 5 and Fig. 8. To set an alarm time, S2 is switched to Set and S3 to Alarm which takes Y low. This transition is differentiated by C₁₀ and R₂₅, see Fig. 8, and takes pin 12 of IC_{17b} momentarily low. The output of IC_{17b} goes low which sets both Q outputs of IC, high and also resets IC, via IC, In Fig. 5, if no key is pressed, the outputs of IC, are all high and data valid is low. If a numerical key is pressed, an inverted binary code of the number appears at IC, output, data valid goes high and the first monostable in IC23 is triggered which in turn triggers the second. This produces a 15ms write pulse at pin 5 of IC23 and, because the first monstable has a period of about 150ms, the second monostable cannot

be retriggered by contact bounce, see Fig. 9. The write pulse clocks IC60 in Fig. 8 and the Q output goes high which clocks IC6b whose Q output goes low. The Q outputs of IC, are compared with the multiplex control lines A and B by exclusive NOR gates IC_{15a} and IC_{15b}, and the output is high only when the control lines are both low. The write pulse from IC23 is delayed by R27 and C11, to allow IC6 to be clocked, and is gated to the memory r/w pin if data valid is high and all three multiplex lines are low. Data present at the memory inputs is then written into the tens-of-hours locations for the first alarm time. Pressing a second key clocks IC6a again so that its Q output goes high. Therefore, writing

can only occur when control line A is high and B, C are low which means that the data is written into the hours location of the memory. This procedure is repeated for the tens-of-minutes data. If a mistake is made, pressing four more keys overwrites the incorrect data. When the first alarm time has been set. the alarm key is pressed which triggers the second monostable in IC22 and produces a low advance-alarm pulse at the output. This pulse is gated through IC_{17b} to the set inputs of IC₆ so that the Q outputs are high. The advance-alarm pulse also clocks IC, via S2h and S3h so that the memory locations corresponding to the second alarm time are addressed, see Table 2. If a numerical key is released in less than 15ms the datavalid line goes low to force the memory r/w pin high and prevent the writing of false data.

A display selector switches the actual time or the alarm time and is controlled by the Run-Set and Alarm-Day switches. A comparator compares the actual time with the output from the memory and the comparison detector recognises an agreement if the alarm is enabled. The output circuit then drives a relay or other suitable device. Because

IC2. Normally, IC7 is clocked by control line C via S_{2h} so that the alarm times are fed out from the memory in sequence at one every 6ms. This sequence repeats after 16 × 6 i.e. 96ms. The comparator output in Fig. 10 is high when all four bits of a digit in the time agree with the memory data. The two inputs to IC14c are high only when the alarm is enabled by IC18d output going low, and during the first four seconds of a minute, i.e. tens-of-seconds A, B and C, and seconds Cand D are all low. The output of IC13c is high only when the above conditions are met, control line C is low, i.e. tensof-seconds or seconds data is not being processed, and the clock is not being updated at 100kHz i.e. the set-timepulse line is low. Therefore, if a true comparison between the stored alarm time and the displayed time exists, a 4ms high pulse appears at the output of IC_{13c}. The 4ms pulse is repeated at 96ms intervals until four seconds past the start of the minute. However, during this time shorter pulses may appear at IC13c output such as a 3ms pulse produced by agreement of three consecutive digits in one alarm time. Pulses which are not 4ms long are rejected by the comparison detector in Fig. 11. The comparator output goes low for 2ms every 6ms when control line C goes high. Capacitor C₁₆ therefore discharges through D₂₀ to around 0.7V in the 2ms period, and then charges via R43 when the comparator output goes high. Resistor R43 is adjusted so that C16 charges sufficiently to switch Tr9 on if the comparator output remains high for 3.5ms. When the collector of Tro goes low, the 555 monostable triggers and produces an output pulse adjustable from 4 to 15s by R46. This method of detecting the 4ms pulse provides high noise immunity and is easy to adjust although an error of up to 96ms can be produced in any serial alarm-time output. A simple relay driver for the comparison detector output is shown in Fig. 12. Diode D22 protects Tr₁₀ and R₄₉ limits the voltage across the relay. Resistor R46 can be used to adjust the duration of the alarm.

Construction alignment and testing

Construction of the timer depends largely on how the clock has been built. In the prototype a Rugby clock was assembled on two 8×8in boards and the timer was built on a third board. The keyboard and day indicator were mounted on the board inside a case to prevent unauthorised setting. The remaining components were positioned carefully to minimise wiring. The memory must be handled carefully to avoid damage by static charges and the 5V supply to the i.cs should be decoupled at regular intervals with 10nF capacitors.

Alignment and testing is best carried out on individual sections. After constructing the power supplies check that no switching spikes are present on the

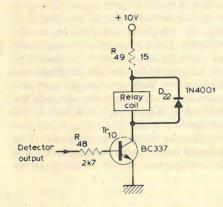

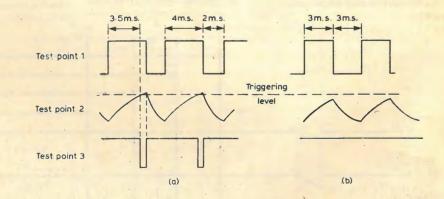

Fig. 11. Comparison detector. Resistor R_{43} is adjusted so that pulses shorter than 4ms are rejected.

Fig. 12. Relay driver.

Fig. 13. Circuit waveforms.

battery charger and control circuit when the mains is switched on and off. Adjust R_1 until the charging current is about 45mA and then disconnect the battery. Next, construct the keyboard encoding and debouncing circuit and insert all of the i.cs except for the memory. Check that pins 4 and 12 of IC₂₂ give single 150ms pulses when the respective keys are pressed and only when S_2 is switched to Set. Check that pin 5 of IC₂₃ gives a 15ms pulse when any numerical key is pressed.

Assemble the day-of-the-week-indicator and check that the day advances each time the day key is pressed. To test the midnight-pulse circuit, set the clock to 23.59 by injecting pulses into the divider chain with the clock aerial disconnected, and check that the day indicator advances by one when the

display changes to 00.00.00. Construct the alarm-enable/inhibit section and set the switches to Set Day. Test that the alarm-enable l.e.d. switches on by pressing key 1, and off by pressing key 0. Check that the data is recycled correctly by pressing the Day key seven times.

Construct the read/write control circuit and comparator, then modify the clock for display blanking and switch-on-reset as shown in Fig. 8 and Fig. 4 respectively. Insert the memory, check that the time is displayed with S₂ at Run and that only hours and minutes are displayed with S₂ at Set and S₃ at Alarm. These digits will be random due to the unprogrammed memory. Pressing a numerical key should write into the

Microwave radar alarm

Improvements to the 1977 design

Accumulated experience since publication of Mike Hoskings design (July & August 1977) has led to a number of useful comments being received on the operational performance which, when combined with some circuit re-design, has resulted in a generally improved alarm system. This article presents the new system, which still has Home Office type approval for indoor use.

The alarm operates on the Doppler effect whereby a frequency shift occurs when a signal source and a receiver are moved relative to each other. For a given source frequency, the Doppler shift depends only on the relative radial velocity and is expressed by $f_{\rm d} = 2V/\lambda$, where V is the radial velocity, and λ is the source wavelength. In this intruder alarm, the source and receiver are combined together into a single module, which then operates like a single radar.

The transmitter is a Gunn device mounted in a resonant cavity and produces a c.w. signal. This signal spreads out over a wide beam and when positioned in a room portions of the signal are reflected back into the receiver. The receiver front-end consists of a single Schottky-barrier mixer diode, operating as a superhet by mixing a directly-coupled portion of the transmitter power with the reflected signal. A difference or beat frequency is then extracted from the mixer output terminals.

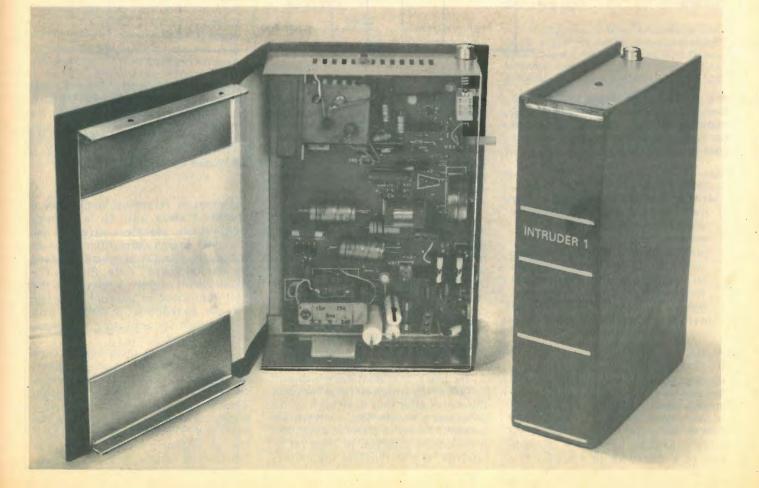

When no movement is present, the received radar signal is at exactly the same frequency as that transmitted and so there is no output frequency (only a rectified d.c. level) from the mixer. As soon as any movement occurs, such as from an intruder, a Doppler frequency shift is imposed upon the reflected signal and appears at the mixer output. The appearance of such a signal can

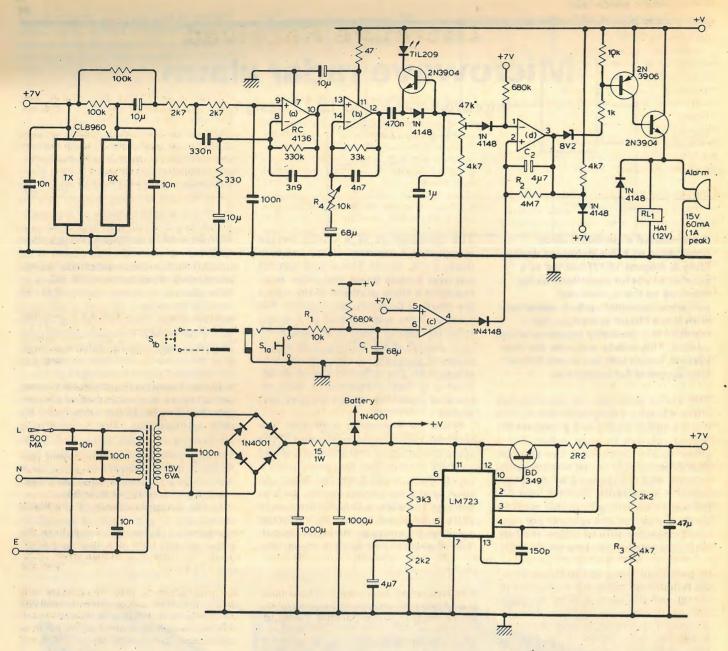

then be used to operate a remote alarm system.

Such is the basic simplicity of the alarm, but when account is taken of false alarms, transient movements, r.f. interference and special triggering requirements, then careful circuit design is necessary. It is in the amplifying, filtering, triggering and control sections that the up-dates and improvements to this intruder alarm have taken place.

In this country, the emission characteristics of the radar module are specified by the Home Office and for this application, the transmitter frequency is 10.687GHz. From the equation, the linear relationship between Doppler frequency and radial velocity is 71.25Hz for each metre per second (or 31.85Hz per mile/h).

In the complete circuit of the alarm shown the power supply is essentially the same as the previous supply to the radar module and provides an adjust-

able, highly stable output voltage with low ripple. This aspect is important as it minimizes the a.m. and f.m. content of the transmission. The main differences from the original version are

- -fewer components
- -conversion to a single-sided supply rail, making battery operation more convenient.
- -active filtering
- -modification to the diode pump circuit to give increased immunity to interference and transient responses
- -automatic switch-off and alarm reset after sounding for a period.

At the heart of the electronics is the RC4136 quad op-amp. Each individual op-amp is similar to the popular 741, but has a lower input noise figure. The first stage is used as a filter with a fixed gain of about 60dB, leading into a variablegain second stage. Following the second stage is the diode pump, with the addition of a transistor to act as a fast discharge path and so prevent the circuit charging up on short-lived inputs such as might be generated by interference, insects or twitching curtains. This, together with the mains and i.f. input filter gives an excellent immunity to false alarms and ensures reliable triggering on more sustained movement.

A feature of the original circuit which is retained, but implemented differently is a built-in delay of about 45 seconds from the time of initial switch-on to when the alarm will start to respond. This allows one to leave the room after switching on the alarm. The delay is provided by the charging time constant of R₁ and C₁ to switch the output level of IC2c, and hence the correct noninverting input of IC2d. Conversely, a new feature is now provided by the R2, C2 feedback combination which will automatically switch off the subsequent transistors after they have been on for about half a minute. This is a relatively long time for a loud alarm to sound and is considered sufficient to scare off an intruder. It also removes the embar-

Printed circuit board for this improved version of the 1977 intruder alarm is available from Intignex Ltd, Portwood Industrial Estate, Church Gresley, Burton-on-Trent, Staffs DE11 9PT, for £3.75 plus v.a.t.

rassment of returning home after a weekend away only to face one's neighbours, sleepless after an incessantly ringing alarm. After the re-set action, the alarm is, of course, returned to the "on-guard" state. Finally, the alarm circuit suggests a relay, with the coil connected in parallel with the sounder, so that a set of contacts may be provided for activating additional external circuitry.

Switch S_{la} is a push-button type which will manually re-set the alarm and is also connected to a jack socket for connection to a remote switch. Thus, one has the choice of deliberately triggering the alarm on entering the room and re-setting at the alarm itself thereby providing a check that it was functioning satisfactorily, or else re-

setting from some other, concealed, position.

WIRELESS WORLD, MARCH 1980

A printed circuit board has been designed for the new alarm and all the components are intended for board. mounting. The original idea has been maintained, enclosing this board with a chassis and fitting it with a cover to disguise the complete assembly as a book. The alarm thus becomes smart in appearance and can be situated unobtrusively on a bookcase or table.

Constructional points

The mixer diode in the radar module is easily damaged by static and similar precautions to the handling c.m.o.s. devices should be taken. As supplied, a shorting link is attached which should only be removed after assembly is finished.

Wiring associated with the input circuitry should be kept as short as possible to avoid noise pick-up.

The Gunn transmitter will be permanently damaged by a reverse polarity. Set the +7V supply to within ±0.1V, using R₃ with a dummy load resistor of 470hm, 1W in place of the Gunn device and then remove the dummy load and connect to the transmitter

When the complete alarm is reassembled, the final operation is to set the sensitivity using R4. This is done by observing the l.e.d. flash in response to movement in front of the alarm. It continues to flash whilst the gain is increased with R4, until a point is reached when self-oscillation begins and the l.e.d. remains permanently on. Decrease the gain from this point until the l.e.d. just remains off when no movement is present and the alarm will be at maximum sensitivity.

In common with all devices that emit r.f. signals, approval to operate is required from the Home Office. In this instance, the complete alarm system has been granted Home Office type approval and provided the circuit shown is used, a licence will be granted on application (see page 82).

Literature Received

Range of professional electron tubes, cathode ray tubes, vacuum capacitors and special products such as reed capsules and gas detectors are described in the EEV/M-0V abridged data book for 1980/81. An equivalents index is included. Available free of charge in response to requests on company letter heads

A colour brochure on the production and design processes used in the CELLMOS integrated circuits by GEC is available free from GEC Semiconductors Ltd, East Lane, Wembley, Middx HA9 7PP

Catalogue of edge connectors is produced by Molex Electronics Ltd, Holder Road, Aldershot, Hants.

A leaflet giving details of a range of toroidal power transformers rated up to 130VA, in p.c.b. or leadout style can be obtained from Avel-Lindberg Ltd, South Ockenden, Essex

A suite of modules forming STATUS — an information retrieval system for use with many types of computer - is described in a leaflet by BNF Metals Technology Centre, Grove Labs, Dechworth Road, Wantage, Oxfordshire OX12 9BJ.

BS4739, entitled "Expression of the properties of cathode-ray oscilloscopes," is identical with IEC351 and is in two parts. Part 1 deals with general-purpose types, Part 2 being concerned with storage instruments. Part 1 at £12.50 and Part 2 at £4.50 can be obtained from BSI Sales Dept, 101 Pentonville Road, London N1 9ND.

A booklet on the Telpro range of hand tools and production equipment for electronics can be had from Tele-production Tools Ltd. Stiron House, Electric Avenue, Westcliff-on-Sea, Essex SS0 9NW.

Three IEC publications have recently been received; IEC147 details a measuring method standard for i.cs; IEC 430 is on test procedures for high-purity Ge detectors, and IEC647 is concerned with dimensions for magnetic oxide cores. They are obtainable from the International Electrotechnical Commission. 1211 Geneva 20, Switzerland at S.fr.70 (147), S.fr. 32(430) and S.fr. 16 (647).

The first issue of a monthly newsletter from Rapid Recall, intended to be of interest to anyone concerned with micro-processors or memories, can be had from 6 Soho Mills. Woodburn Industrial Park, Wooburn Green, Bucks.

A method of using a computer to write programs for a computer has been developed by Compelec, who call it Instant Software. A leaflet describing the facility and how customers can make use of it is obtainable from Compelec Electronics Ltd, Fourth Floor, 14-15 Berners Street, London W1P 3DE.

WW 407

A film entitled "The challenge of choice," written by David Weir and directed by James Hill for STC, examines the effect of developments in telecommunications on people's lives. A brochure containing the script is

available from STC at STC House, 190 Strand, London WC2R 1DU.

A bulletin on the various sound systems which can be assembled from equipment made by Millbank, describing several specimen installations, is obtainable from Millbank Electronics Group Ltd, Uckfield, Sussex TN22 1PS.

Connectors of various types, including those for printed boards, modular connectors and other multi-way and single-pole kinds, are illustrated and briefly described in a leaflet from Hypertac Connectors, Chronos Works, North Circular Road, London NW2 7JT.

WW 410

A vapour deposition system for production work on semiconductor materials is the subject of a leaflet, available from Metals Research Ltd, Melbourn, Royston, Herts SG8

Multiplexed monitoring and control systems made by Vindicator is described in a leaflet from the UK representatives, Fieldtech Ltd, London (Heathrow) Airport, Hounslow,

Performance optimization, fault-finding and evaluation of minicomputer using logic analysers is the subject of an application note from Hewlett Packard Ltd, King Street Lane, Winnersh, Wokingham, Berks.

Analogue and digital test-meters made by Sanwa are described in a catalogue from Quality Electronics Ltd, 24 High Street, Lydd, Kent TN29 9A.I.

An introduction to laser velocimetry and details of systems and components available are offered in a publication from Biral Bristol Industrial Research Associates Ltd, PO Box 2, Portishead, Bristol BS20 9JB.

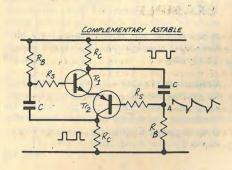

Weighing cells type Z7, which are shearbeam transducers for tensile and comprehensive loading, are the subject of a leaflet from the manufacturers, HBM, Stonefield Way, Ruislip, Middx HA4 0JT.

The 1980 catalogue from Livingston Hire is now available from Shirley House, 27 Camden Road, London NW1 9NR.

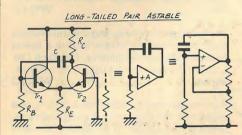

'Radio navigation and radar'

The article on 'Radio Navigation and radar' in the January issue, p 47, contained an error, pointed out to us by LCDR R. E. Burke, Jr. The description of the Loran-C hyperbolic system on p 48 was in reality that for Loran-A. Loran-C is also a pulsed system, working on a 100 kHz carrier, but the time differences are measured on the carrier itself, giving errors of 50 to 300 feet from the starting point on a return trip. Ground wave, LCDR Burke tells us, extends up to 1000 miles, with a position accuracy of 0.25 nautical mile. We apologise for the mistake.

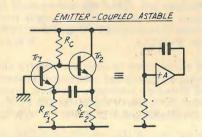

by Peter Williams Ph.D. Paisley College of Technology

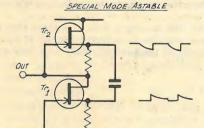

These have generally been designed for special rather than general purpose use. Both transistors go off and on simultaneously. In circuits such as the one shown a long space is obtained by making $R_B\gg R_C$. Hence the current is only on for a small part of the time and the mean current is low. Similarly astables based on the complementary pair shown earlier in the unijunction model have been used as pacemakers for heart stimulus. In these applications a space to mark ratio of up to 10,000:1 is needed to prolong battery life. Such circuits have an additional advantage in that the mean dissipation is also reduced for a given peak output current. The basic principle of the circuit shown is seen by assuming both devices are conducting though not saturated and then switch off. Point A rises sharply because of the positive step at Tr_1 collector while B corresponding falls. The capacitors then recover with R_C+R_B determining the rate of recovery and A and B approach and then pass each other. When the difference is about 1V the transistors just begin to conduct and regenerative switching forces A down and B up. The base currents are dependent on the current gains and the pulse duration is relatively short but ill-defined.

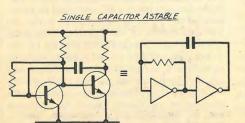

The two-transistor astable is often advocated because it can provide anti-phase and square-wave outputs. That facility is easily attainable with logic gates and flip-flops from almost any astable or pulse generator and more attention is due to such alternators. The long-tailed pair is the basis of a current-switching astable which operates at much higher speeds because neither transistor need be saturated. In this it is closely linked to the e.c.l. gate with which it can be implemented. The emitter resistor is sometimes replaced by a true constant-current circuit but this is not critical. Provided $R_{\rm c}\ll R_{\rm E}$ the circuit will not saturate; keeping $R_{\rm c}$ low reduces output pulse size, but generally improves the speed of response. Assume Tr_2 goes into conduction. The fall in collector voltage drives the base of Tr_1 negative and Tr_1 cuts-off transferring all of $R_{\rm E}$'s current to Tr_2 . As the base of Tr_1 recovers toward zero the amplifier enters its linear region. Tr_1 begins to conduct and current is diverted from Tr_2 . Its collector voltage rises and regenerative switching carries it up to +V. All the current in $R_{\rm E}$ now flows in Tr_1 until the base of Tr_2 again returns to its linear region and the cycle recommenced. The long-tailed pair is a non-inverting amplifier of finite gain and the circuit is equivalent to a known form of op-amp astable.

A similar conclusion can be drawn about the emitter-coupled astable if it is considered as cascaded common-base and common-collector stages. The long-tailed pair comprises cascaded common-collector and common-base stages. The non-inverting combination having both $A_{\downarrow}\!>\!1$ and $A_{\downarrow}\!>\!1$ consists of a pair of cascaded common-emitter stages and this example is treated later. The analysis of this astable is easiest if R_{E1} and R_{E2} are replaced by constant-current sources I_1 and I_2 . The capacitor must change its p.d. by equal and opposite amounts during succeeding portions of the cycle as the p.d. must always return to its original value at the start of each cycle in any stable oscillator. When the emitter of Tr_2 goes high, Tr_1 is cut off and the current in C is I_1 . When Tr_1 conducts it pulls the base of Tr_2 below its emitter cutting it off and the current in C is I_2 . Hence $I_1t_1=I_2t_2$ and the mark-space ratio is unity for $I_1=I_2$. If R_c $\ll R_{E1}$, R_{E2} the voltage steps on the resistors are small compared to the mean values and the waveforms and frequency differ little from the constant-current case. The circuit is again non-saturating and is capable of high speed.

Current-operated circuits extend the range of possibilities as compared to the restriction of voltage operation. A halfway house is provided where active devices are operated in series from a voltage supply. These are again a specialized sub-group of astables, but can be simple and effective. The version shown is a serial form of the emitter-coupled astable though implemented with junction f.e.t.s as this eliminates a number of bias components.

This circuit has been referred to above and can be approached in more than one way: as a conventional astable in which one of the capacitive couplings is replaced by a direct connection, as one of the two-amplifier single capacitor astables similar to a c.m.o.s. astable, or as equivalent to a single positive-gain amplifier with CR feedback. In this last interpretation the two inverting stages perform the same function as the two non-inverting stages of the long-tailed pair and emitter-coupled astables. This emphasizes the danger of "is" statements in electronic circuits. To say that a given circuit "is" a particular type refers only to the way in which the designer or user has decided to partition it. Each redrawing or repartitioning may reveal a new pattern, a new way of classifying it, or even a new class of which it is the first member. This particular astable has still greater significance when related to the classic two-transistor monostable.

Alternative astable circuits

THEORY

- From symmetry then, when the transistors are conducting, the emitters are both at $V_{\rm S}/2$ with the bases \pm 0.6V about that level. The timing is imprecise depending **inter alia** on $h_{\rm FE}$. It is only one of a number of such complementary astables and no analysis is offered though the period is primarily defined by $R_{\rm B}C$.
- In this circuit the output voltage step is of magnitude V_sR_c/R_E for a supply of $\pm V_s$ as the current in R_E is switched between Tr_1 and Tr_2 . If the circuit were to have a linear voltage gain A_c , then the switching thresholds would be at $\pm V_sR_c/R_EA_c$, and the appropriate values of V_1 , V_2 are

$$V_{1} = V_{S} \left(1 - \frac{R_{C}}{R_{E}A_{v}} \right)$$

$$V_{2} = \frac{V_{S}R_{C}}{A_{v}R_{E}}$$

$$V_{2} = \frac{1 - \frac{R_{C}}{A_{v}R_{E}}}{\frac{R_{C}}{A_{v}R_{E}}}$$

$$t_{2} - t_{1} = \tau log_{e} \left[\frac{1 - \frac{R_{C}}{A_{v}R_{E}}}{\frac{R_{C}}{A_{v}R_{E}}} \right]$$

$$\tau log_{e} \left[\frac{A_{v}R_{E}}{R_{C}} - 1 \right]$$

For R_E, R_C comparable A_v ≫ 1

WE SHE HERE OF THE PARTY

WIRELESS WORLD, MARCH 1980

$$T \approx 2 \pi \log_{\bullet} \left[\frac{A_{\nu} R_{E}}{R} \right]$$

A more accurate analysis uses the transistor exponential characteristics to derive the non-linear transfer function $V_0 = \operatorname{ktanh}[V_1]$ From this the condition $dV_0/dV_1 = 1$ can be obtained, fixing the switching threshold accurately.

● Assume $R_c \ll R_{E1}$, R_{E2} so that voltage swing is small. Then charging and discharging currents are approximately constant at V_s/R_E for supply $\pm V_s$ and $R_{E1} = R_{E2} = R_E$.

Hence the transitions are separated by a time interval governed by $\Delta V \approx R_c V_s / \frac{1}{2} R_E$ (since for Tr_1 conducting, R_c carries currents in both tails while for Tr_2 conducting the current in R_c is negligible) while the current in the capacitor in each case is V_s/R_E . Thus $T\approx 2$. $C\Delta V/I=4CR_{\odot}$.

The above involves a number of approximations that make the result useful as a guide to the behaviour but not an accurate one. It suggests that neither $R_{\rm E}$ nor the negative supply rail have any significant effect on the frequency of oscillation though they directly control the amplitude.

- Circuit behaviour is strongly dependent on the variable fet characteristics.
- The voltage step at Tr₁ collector is $V_{\rm BE}(sat)_2 V_{\rm CE}(sat)_1 \approx 0.5 V$. The voltage available to control the current in the capacitor is too small for a stable well-defined frequency to be achieved. An additional resistor in the base of Tr₂ helps.

EXAMPLE

A long-tailed pair astable has $R_c = R_E$ and supply voltage of \pm 5V. Assume that the differential output current (I_0) of a long-tailed pair is given by $I_0/I = \tanh[V/2kT/q]$ where V is the large-signal differential input voltage and I is the tail current. Determine the value of V at which the open-loop voltage gain from input base to output collector falls to unity. Hence determine the amplitude of the waveform at the base and the frequency of oscillation in terms of $T = R_a C$.

The gain will be half that for the differential output condition i.e. the latter is derived and equated to 2.

$$V_0 = I_0 \cdot R_c = IR_c \tanh \left(\frac{V}{2kT/q} \right)$$

But $I = \frac{V_s}{R_s}$ for a supply of $\pm V_s$

$$\frac{dV_0}{dV} = \frac{V_s R_c}{2kT_{RE}} \cdot \operatorname{sech}^2 \left(\frac{V}{2kT/q}\right)$$

kT/q≈26mV at room temperature and substituting for dV₀/dV=2 etc

$$2 = \frac{5 \times 10^3}{52} \frac{\text{sech}^2}{\text{sech}^2} \left(\frac{\text{V}_1}{52.3} \right) \text{ where V is in mV}$$

$$\therefore \cosh^2\left(\frac{V}{52}\right) \approx 48, \cosh\left(\frac{V}{52}\right) \approx 7$$

but $\cosh\theta = e^{\theta} + e^{-\theta}$

V≈100mV

The circuit should thus switch when the input base reaches about +100mV and again at -100mV giving a peak-peak amplitude of 200mV.

The collector step voltage is V_s . This might lead to saturation and a slowing of the response; reducing R_c to $R_E/2$ avoids this but reduces the threshold to 80mV and the peak-peak amplitude to 160mV.

For a step of V_S , the resistor voltage is raised from -V to $-V+V_S$ i.e. from -0.1 up to 4.9V, decaying to +0.1V before initiating the switching action again.

$$\therefore t_2 - t_1 = \tau \log_e \left(\frac{V_1}{V_2} \right) \approx 3.9\tau$$

From symmetry $f = \frac{1}{T} = \frac{1}{2 \times 3.9\tau} = \frac{1}{7.8\tau}$ assuming $R_B \gg R_C$.

For $R_c = R_E/2$ the step size is reduced making $V \approx 2.4V$ but the gain is also reduced

$$\cosh^2\left(\frac{V}{52}\right) = 24$$

V≈80mV

$$t_2 - t_1 \approx \tau \log_e \left(\frac{2.4}{0.08}\right) = \tau \log_e 30 = 3.4\tau$$

This is a reduction of about 13% for a 50% fall in resistance. This is reasonable stability for a fast and simple circuit.

WORLD OF AMATEUR RAIDIO

What's cooking?

The reluctance (for whatever reasons) of the Home Office to introduce a lowpower citizens' band radio facility in the UK is in marked contrast with the open-ended permission given to the public to install crude, high-power transmitters in their homes in the form of microwave ovens, Radioastronomers at Jodrell Bank have investigated (Nature, Vol 282, 6 December 1979) the amount of broadband spurious "out-of-band" emission from typical ovens and have confirmed that this is sufficient to cause interference to extra-terrestrial signals when picked up on the sidelobes of large radiotelescopes at distances up to 20km or more on some frequencies.

Ovens generally use the "rectified a.c." form of pulsed, self-excited microwave generators on the i.s.m. (industrial, scientific, medical) frequency of 2.45GHz with a power output of the order of 1-2kW.

The primary source of leakage of unpolarized radiation is, the report states, from the seals around the oven door: "The seals are non-contacting and seem to consist of a resonant, quarterwavelength choke nominally tuned to 2450MHz, followed by microwave absorbing material." It is emphasised that while this form of sealing is sufficiently effective at 2.45GHz to satisfy the UK safety regulations (i.e. exposure to microwave radiation), It fails to give adequate out-of-band suppression to prevent possible interference with other radio services authorized to operate within the 1-6GHz spectrum. Elsewhere it has been suggested that harmonic emission from ovens could prove to be: the major source of interference to 12GHz reception of television from. direct-broadcast satellites.

The use of large numbers of microwave ovens in residential areas could also prove a major problem for radio amateurs interested in the development of microwave communication at low signal levels.

The Jodrell Bank team complain that for the past ten years they have been urging the Home Office to specify permitted levels of out-of-band spurious radiation from ovens.

A boom in the hobby

Amateur radio in the UK experienced a sharp boom during 1979 and a record 26,981 licences were current in December. The number of new licences issued by the Home Office during the year amounted to 3155, of which 1054 were Class A (all modes, all bands) and 2101 Class B (v.h.f./u.h.f., no morse). Some 2400 people passed the first

"multichoice" Radio Amateurs' Examination held in May 1979 and a considerable number sat the December examination.

The RSGB reports a 10.5 per cent increase in membership with some 4145 new members enrolled during 1979.

It remains to be seen whether these exceptional increases in the hobby were part of a long term trend or were partly the result of the unusual amount of media coverage during 1979 which included the "Open Door" and "Nationwide" programmes. The British electronics manufacturing industry, however, has benefited only marginally from this boom, with the overwhelming majority of factory-built equipment coming from overseas. While there appear to be no figures on the total UK amateur market, Electronics estimates the US market as worth \$23-million in 1979, rising to an estimated \$26-million

Topics in the air

The New Year brought forth a flurry of "new prefix" activity. East German amateurs appeared under the guise of "Y2" instead of the long familiar "DM" in what seems likely to be a permanent change. A selected 200 Russian amateurs in Moscow, Leningrad, Tallinn, Kiev and Minsk introduced a series of prefixes to mark the country's hosting' of the Olympic Games, using RX, RZ, RK and RU prefixes for what are termed "special Olympic ham operations." Club stations in Moscow and Tallinn will similarly change prefixes on July 1st; and those in Leningrad, Kiev and Minsk on July 15th. These special prefixes end on August 3rd.

The first complete break in 50MHz long-distance propagation in more than two months came on December 15th, 1979 when the expected decline in solar flux took effect. A feature of the period of high solar activity was its remarkable freedom from geomagnetic disturbances, normally expected at sunspot maxima. An aspect of v.h.f. propagation in the USA that does not appear to occur in the UK is a regular winter Sporadic E season affecting signals on 28 and 50MHz.

A 432MHz amateur television repeater is in operation in the Wellington area of New Zealand, providing opportunities for tv transmission over distances of 60 to 100 miles, with several more in the planning/construction stage. An estimated 50 such repeaters are now operational in various parts of the world. A special "intruder watch" callsign – ZL61W – has been issued by the New Zealand Post Office but will not be used for normal contacts.

A new reciprocal operation agree-

ment between Canada and the USA came into force on January 21st with exceptionally liberal terms. It allows amateurs of either country while visiting the other to operate without needing to obtain prior written permission. However, since US-type novice and technician licences are not issued in Canada, US amateurs with such licences are still not permitted to operate in Canada.

The Vojvodina Amateur Radio Federation of Yugoslavia has more than 10,000 members and its basic aims are: "to maintain radio links, teach and train young people in electronics and telecommunications and train all members for all-people's defence and social self-protection". The national amateur society in Yugoslavia is SRJ (Savez Radioamatera Jugoslavija).

Special event callsigns in the UK in the series GB4 plus two or three letters are being issued through the RSGB; the GB3 plus two letter calls will in future be used for repeater stations, and GB3 plus three letters for beacons. Special event callsigns in the series GB2 and GB8 continue to be issued.

A number of FCC employees who received callsigns in a manner stated to have been "inconsistent" with official procedures are to be allotted new calls. This follows an investigation into fraudulent upgrading and licensing of stations in recent years.

A special Certificate of Membership has been presented by the Royal Naval Amateur Radio Society to 87-year-old Mrs F. V. McKenzie, OBE, former VK2FV who was Australia's first YL operator, first qualified woman electrical engineer and founder of the Women's Emergency Signalling Corps (later Women's Royal Australian Naval Service) which trained about 11,000 Australian, American and Indian radio operators during World War 2.

In brief

A new RSGB award for microwave operation will require confirmation of contacts with five "large QTH locator squares" on any of the bands between 1.3 and 24GHz. . . . FCC is expected soon to permit American rtty enthusiasts to use ASCII. . . . A regular moonbounce newsletter is being organized by the Oxford University EME Group (G3WDG, 10 The Crescent, Pattishall, Towcester, Northamptonshire) . . . Rev G. C. Dobbs, G3RJV, Hon. Secretary of the "G-QRP-Club" has changed address to 17 Aspen Drive, Chelmsley Wood, Birmingham B37 A linear translator (repeater) on the 1296MHz band is operating in San Jose, California.

PAT HAWKER, G3VA

Impedance mismatching

A pitfall to be avoided when using Thevenin and Norton equivalent sources

by F. J. Lidgey, Ph.D., B.Sc. Oxford Polytechnic

Power transfer from a source into a load is frequently discussed in circuit theory. Also a parameter of interest is the transfer efficiency (η) defined as the ratio of load power P_L to total power delivered by the source P_S . The proposal of this article is to outline a common error made in calculating η which stems from an incorrect assumption regarding the power delivered by a Thevenin or Norton equivalent source.

With transfer efficiency in mind it is easy to show that a 'mismatching' of load to source impedance reduces power dissipation in the source impedance. For example, in Fig. 1:

$$P_{L} = i_{L}^{2} R_{L} = v_{s}^{2} \frac{R_{L}}{(R_{s} + R_{L})^{2}}$$

$$P_{s} = v_{s} \cdot i_{L} = i_{L}^{2} (R_{s} + R_{L}) = \frac{v_{s}^{2}}{(R_{s} + R_{L})}.$$

Thus
$$\eta = \left(\frac{R_L}{R_s + R_L}\right)$$
.

η tends to zero for $R_L/R_s \ll 1$ and η tends to its maximum value of one for $R_LR_s \gg 1$. If for example $R_s = 50\Omega$ then 80% efficiency of transfer of power into R_L occurs for $R_L = 200\Omega$ and $P_L = 64\%$ of P_{Lmax} . However, there is obviously no optimum choice, as can be seen from the plot of Fig. 2, which shows that for η of 100%, i.e. no power dissipated in the source, then no power flows in the circuit, since $R_L/R_s \rightarrow \infty$ and $i_L \rightarrow 0$.

All this seems quite reasonable and as one would expect, if R_s and v_s are really known in any circuit. At first sight, it appears that they are: all that seems necessary is to generate the Thevenin equivalent source, which gives R_s and v_s ; hence, η may be obtained from the expression given previously. This, however, is a fallacy, which can be exposed by the example of Fig. 3.

Taking the special case of $v_1 = 2v_s$ and $R_1 = 2R_s$, then applying Thevenin's Theorem, the source can be replaced by a voltage source of v_s and a source resistance of R_s , exactly as in the circuit of Fig. 1. Clearly, P_L is the same but is P_s ?

For Fig. 3:

$$P_{s} = (2v_{s})^{2} / \left(2R_{s} + \frac{2R_{s}R_{L}}{2R_{s} + R_{L}} \right)$$

$$= \left(2 + \frac{R_{L}}{R_{s}} \right) \frac{v_{s}^{2}}{(R_{s} + R_{L})} = P_{s3}.$$

For Fig.

$$P_{s} = \frac{v_{s}^{2}}{(R_{s} + R_{L})} = P_{s1} = \frac{P_{s3}}{\left(2 + \frac{R_{L}}{R_{s}}\right)}$$

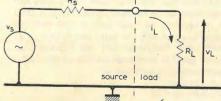

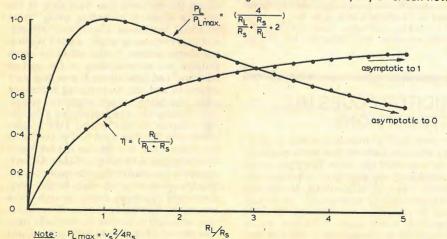

Fig. 1. Simple series circuit with $\eta = R_{L}$, $R_{L} + R_{S}$

Fig. 2. For maximum η no power can flow.

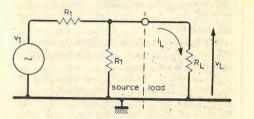

Fig. 3. Thevenin equivalent of this circuit gives different η to circuit of Fig. 1.

and so $P_{s3} > P_{s1}$ whatever the choice of R_{1}/R_{1}

Unless the circuit is a Thevenin type source we cannot use the expression for η derived earlier, so what is going wrong? The mistake lies in the use of Thevenin's Theorem. In deriving the Thevenin equivalent source the current and voltage at the terminals of the equivalent source are exactly equal to those of the original source. But there is no one-to-one correspondence between the previous sources and the new Thevenin equivalent voltage source which depends on both the terminal voltages and all the source resistors, and so the power delivered from the Thevenin source is in general different to the power from the original source. The difference between P, and P, must be the power flow in the source resistance P_D , i.e., $P_D = P_s - P_L$. As already stated, in obtaining the Thevenin equivalent source P₁ remains the same, so P_s-P_D must remain the same; since the source powers are different, Pp is different in the two circuits; the power dissipated in the source resistance of the Thevenin equivalent source is not equal to the power dissipated in the original source.

The same argument applies if a current source is substituted for the voltage source, as in the circuit of Fig. 4, which is a Norton equivalent of Fig. 1.

$$P_{L} = i_{L}^{2}R_{L} = \left(\frac{v_{s}}{R_{L} + R_{s}}\right)^{2}R_{L}$$

$$P_{s} = i_{s} \cdot v_{L} = \left(\frac{v_{s}}{R_{s}}\right)^{2} \left(\frac{R_{L}R_{s}}{R_{L} + R_{s}}\right)^{2}$$

$$= \frac{v_{s}^{2}}{(R_{L} + R_{s})} \frac{R_{L}}{R_{s}}$$

$$\eta = \frac{P_{L}}{P_{s}} = \frac{R_{s}}{R_{L} + R_{s}}$$

Continued on page 78

STATUS OF ENGINEERS

Regarding the status of engineers, as discussed in your editorials and correspondence. One factor seems to be overlooked, viz, that the status and respect given to doctors and lawyers increases exponentially with age, right up to their 70s, whereas that of an engineer, however experienced. reaches a plateau at 25 and then drops off rapidly beyond 35. How many jobs offered in WW advertisements are open to anyone over 30? Precious few!

Nor is this exclusive to Britain, but has already spread to the USA and is now beginning to be felt in Japan.

In countries devoted to production in support of the almighty deutschmark, engineers are still accorded some degree of respect in their middle years, but one wonders how long it will stay so when production there also falters, as indeed it must eventually in a world of resource shortages.

The sad fact is that engineers don't stay engineers long enough to get status! It would be interesting to know what old engineers do. for a living. Is there a suitable subject for a survey there? (They can't all retire at 40!)

A final word: no matter how much headway young engineers make, the days when they might have made it socially have gone. Yet, somehow, I don't ever expect to see aged doctors or lawyers being thrown out of work by computers or young graduates!

Ronald G. Young Peacehaven Sussex

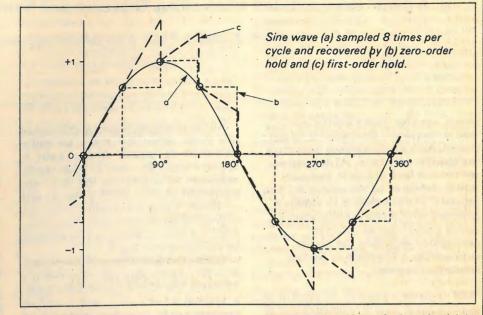

DIGITAL FILTERS

Perhaps, following Mr Gray's letter in your January 1980 issue, I could raise a point which is not always well-made in text books and which space did not permit me to touch on in my article on simple digital filters in the July 1979 issue.

A digital filter algorithm performs calculations and outputs certain values at fixed intervals of time. Strictly speaking, the output values are only meaningful at those exact instants, and what happens in between is not defined; hence the plots of the points only in Figures 2 and 5 of my article.

This, however, is not particularly helpful in practice since we generally wish to produce some analogue waveform for further use or inspection on an oscilloscope. As soon as we do this we enter the field of waveform recovery and make implicit assumptions about the technique involved. Most frequently, as Mr Gray's Fig. 1 implies, a zero-order-hold is assumed, the properties of which have been well discussed by Zuch, and include an average delay of half the iteration interval and a linear phase response equal to 90° lag at the Nyquist frequency. If Mr Gray finds a phase advance of half the iteration interval, I would suggest he has made an error in interpreting or plotting his

Other methods for waveform recovery are, however available. A first-order hold retains the value of the previous iteration as well as the present one, and uses this data to

generate a slope which will, one hopes, lead towards the point where the next sample will arrive as shown here. This method effects a significant reduction in the delay terms. A second order hold is also possible and this will generate sections or parabolae. I do not know of any applications in real time where this technique is used, but it is not uncommon for curve generation in the computer numerical control of milling machines, for example.

These factors are of importance to the practical engineer, since they imply that the exact response obtained from a digital filter as we approach the Nyquist frequency may owe as much to the waveform recovery technique as to the filter itself.

Incidentally, the reference to Nyquist derives from the communications field; it may he of interest to note that in the process industries virtually the same law is known as Shannon's Theorem² but the formulation places greater emphasis on the exclusion of frequencies higher than 1/2t.

AUDITORY CUES IN STEREOPHONY

We were most interested in Philip Vanderlyn's article on auditory cues in stereophony in the September 1979 issue. The whole piece begs one particular question - what does the current craze of multimiking do for our stereo perception? Perhaps Mr Vanderlyn could be persuaded to relate his research experiences in this aspect. I, for one, would be interested in a researcher's views of this

particular debasement of Alan Blumlein's original ideas.

But more immediately I would question Mr Vanderlyn's attribution of "in the head" sounds to dummy head derived stereo, listened to on headphones. We are currently marketing a number of binaural records and would claim that "in the head" sounds are the last things being achieved. Real distance "out of the head" effects are clearly discernible on many parts of our discs. True, it is easier to get distance, side and rear effects as opposed to "out front" images, but to describe the effect as "in the head" clearly defeats the reason for the marketing of our

M. G. Skeet Whitetower Records Milton Keynes

The author replies: First of all multimiking is not a current craze; it has been going on almost from the introduction of stereo records. Secondly, it owes nothing to research, so I have no experience of it in that context. Thirdly, my personal opinion of it is not for publication, but I would agree with him that it represents a debasement of Blumlein's conception. There is a fourth aspect, the economic one. Very early in the practice of stereo recording using "pure Blumlein" techniques it was found difficult and time consuming to get a good musical and spatial balance. It also called for much patience and understanding on the part of musicians and conductors. It was thus very expensive and the multimiking technique came into being, which permitted subsequent editing and which produced a colourable imitation of "real" stereo. I did wonder at one time whether it fell foul of the Trade Descriptions Act, but because the definition of stereophony in BS 661 is so widely drawn it appears it can unblushingly be called stereo. Nonetheless it is a fact that, in this way, many very satisfying stereo records have been made that would not or could not had it. been necessary to keep to theoretically rigorous methods. We have to bear in mind, as I

am sure Mr Skeet does, that record companies exist to sell home entertainment rather than to demonstrate scientific truths.

My comments on headphone stereo were based on early experiences when it was found impossible to create a convincing image using dummy head techniques. The expression "in the head" was a form of words used to describe the vivid but unnatural effects produced. At that time the only headphones readily available were those affectionately known as "cans" - excellent for reading Morse code signals but not really suited for serious listening. Now that there are many excellent high quality headphones the situation is different and it is possible to listen with pleasure to all types of programme material. I must admit that on more than one recent occasion I have heard realistic external sounds, but these have been from special recordings which preserved possible cues due to the pinna. I am inclined to think that the role of the pinna, which has only recently been studied in detail, has hitherto been underrated. However, I still feel that the head rotation cue is an essential part of any convicingly external image, at any rate over an appreciable period of time. and there seems to be no possible way to provide this using transducers held in a fixed relationship to the ears. Philip Vanderlyn

RUMBLE CANCELLATION FILTER

Congratulations to J. P. Macaulay for his elegant method of removing rumble from stereo disc reproduction without degrading the deep bass response (Circuit Ideas, September 1979 issue). The concept of turning the lowest bass into a mono signal is so beautifully simple that one wonders why this technique is not widely used.

After having studied the discrete circuit design, I decided to build a simplified and

separation is maintained only down to

High performance rumble

cancellation filter. Channel

improved version, making use of today's superior integrated op-amps. The diagram shows how a TL074 quad op-amp i.c. is used together with a simpler matrixing system to form a rumble cancellation filter (as I prefer to call it) with near ideal characteristics. The TL074 exhibits a performance, in terms of extremely low distortion coupled with high slew-rate and bandwidth, that is hard to beat using even complex discrete designs. Expected figures will be around 10µV noise, d<0.002%(to 20kHz) and $f_{ij} \approx$ several MHz.

In his filter Mr Macaulay uses equal C-values (33nF); this will not give a Butterworth characteristic. For this a ratio of 2:1 is required, hence my corrected values of

It should be kept in mind that the rumble filter inverts the polarity of the input signal. If it is ever to be installed in a system where it may be switched in or out of service, inverting gain-of-one buffers must be used for the polarity convention to be preserved.

TRICKLE DOWN OR TRICKI F UP?

Referring to the November editorial, I thought that in general the "trickle down" theory of reducing poverty by development was discredited, though there are exceptions. Where a country has a resource which can be turned into cash, as for example Britain's North Sea oil, there is a case for using the cash for capital investment in industry. This was also the Shah's policy in Iran; and no-one who has seen the traffic jams (of private cars) in Teheran would suppose that the beneficiaries of this policy were very few in number, though they might well be a minority of the whole population. On the issue of intermediate technology versus

capital-intensive technology, there is also the prestige consideration which may be rationalised in the form: "If we are going to buy machinery from abroad, we should obviously buy the most up-to-date."

Those who are seriously interested in under-developed countries should see a book such as "Income Distribution Policy in Developing Countries" by Irma Adelman and Sherman Robinson.* Much of this book is concerned with the technicalities of constructing a computer model (for South Korea); but the authors do discuss various economic policies and conclude that the most effective single way to reduce poverty in such countries is to assist agriculture.

A pocket calculator is of no use to an under-nourished family; and such things as radio communication to call a doctor improve the amenities but do not reduce the poverty. The positive contribution of electronics is through computer simulation of the economy, which makes it possible to answer the question "What will happen if we do such-and-such?" without actually implementing an experiment which might prove to be disastrous. "Chips with everything" may be all right for developed countries, but we should be modest enough to admit that high technology alone cannot solve all the world's problems.

D. A. Bell Walkington Beverley Yorks

*Published for the World Bank by Oxford University Press, 1978. There are many books on income distribution, but this one (a) is concerned with developing countries and (b) has a computer model, based on continuing processes rather than extrapolation of past data, which appears to match reality successfully.

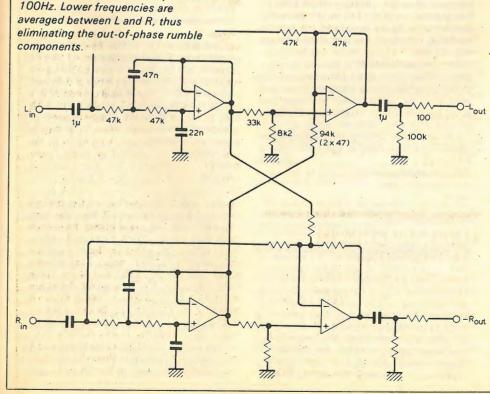

3D TELEVISION

K. P. Wood (October 1979 letters) suggests that it is impossible to provide stereoscopic viewing of a moving object on a flat screen without viewer discomfort. This he claims is because of conflict between focusing and convergence clues received by the viewer. However, his claims are pure hypothesis without any attempt to provide qualitative or quantitative evidence.

A major factor he omits to mention is perspective, a subject all painters and photographers have to fully comprehend to master heir arts and crafts. A very strong illusion of depth is conveyed in mono pictures whether paintings or projected kinematograph films by the correct use of perspective in images on a flat surface. If Mr Wood is correct there would be a strong case for supposing that viewing of painted pictures with strong perspective would cause viewer discomfort. Surely he would not sustain this argument?

It is true that viewing of red/green analglyph 3D images is tiring, but this is because it is quite an abnormal situation for one eye to see only deep red images whilst the other sees only green.

It is also true that viewing of a large number of early 3D polaroid colour films produced headaches and eye strain. However, it has now been established, as a result of research and a better understanding of the subject, that this was not due to the factors postulated by Mr Wood. It was because the camera men and directors who made the early 3D films did not properly understand

the rules that apply to stereocinematography and both in camera work and subsequent editing produced visual cue conflict situations much worse than Mr Wood postulates.

There is now no reason to believe that a correctly photographed and edited 3D stereo film of the colour/polaroid type will produce any viewer discomfort even over long periods. If there is any scientific evidence to the contrary I shall be most interested if Mr Wood will quote the basis of it.

Meanwhile, recommended reading for those interested in factual accounts of work done in this field is: "Introduction to 3D" by H. Dewhurst, Chapman & Hall, 1954; and American Cinematographer, (special 3D issue), April 1974, 1782, North Orange Drive, Hollywood, Calif. 90028.

Reading Berks

HERE BE DRAGONS

In his piece on audio in your 'Into the 'eighties' feature (January issue), Adrian Hope expresses his surprise that so many people "are prepared to venture so far north into the provinces as to make Harrogate an annual success . . .". If Wireless World were to consider holding a 'Remark that could have been better put' competition, then I am confident that Mr Hope would stand every chance of winning first prize.

Attacks by marauding bands of savage Yorkshiremen, in their distinctive flat caps, on traffic on the A1 have lessened markedly in recent years, and many travellers from the south have claimed that it is now relatively safe to venture north - even well beyond Watford. The only real danger lies in any reckless suggestion to one of the natives that Harrogate is a curious place to hold a national exhibition: black puddings can be unpleasant, particularly when stuffed whole into unlikely places.

W. Dampier Wallington Surrey

THE "WHY?" OF ELECTRONICS

I was just reflecting on our good fortune in having in Wireless World a high quality technical journal which (unlike the numerous trade journals) is not afraid to discuss the why? and what for? of electronics as well as the how? when I came across Mr Greenwood's letter (January issue) calling for an end to "political rhetoric" in your editorials.

Unlike Mr Greenwood I think it needs more than a few "delightful moments of humour" to "demonstrate that technical people can be human." Technology is changing society now faster than at any other time: some changes are for the better, some for the worse. The people who find their lives changed as a result of the engineers' combined efforts will not think us "human" if we blindly and mechanically create what we're told to without sparing so much as a comment in a technical journal on the desirability of what we are creating. Technology has great potential for improving the quality of life - if applied sensibly. As technologists we must make our contribution to the discussion of how to apply it sensibly, rather than allow its control to pass unquestioned to those primarily concerned with financial gain in the short term.

So, long may Wireless World continue its perceptive and searching editorial comment. followed I hope by vigorous discussion in the letters pages.

"TRIVIAL" AMPLIFIER DESIGNS

In reply to Mr Duncan's letter "Trivial amplifier designs", in the January issue, whilst I am in general agreement with his views on psycho-acoustics, I feel he may have missed the object of my article ("Low distortion amplification," October 1979).

The nature and control of distortion and other important parameters in a.f. amplification are generally misunderstood, resulting in the growth of jargon and mysticism (as witnessed by Mr Duncan). The aim of my article was to combat this by defining the problems in engineering terms and using the solutions as design criteria for a gain cell block. Although the article described its use in a domestic sound reproduction system it could have equally been applied to a laboratory amplifier, low distortion oscillator, distortion factor meter etc.

To take Mr Duncan's objections to their logical conclusion, should design in any one field of engineering be terminated due to imperfections in another? R J Codd

Medical Physics Department Leicester Royal Infirmary

FAILURE OF DISTRESS SIGNALS AT SEA

I was surprised on reading the letter by R. Philpot (November) and a previous letter by John Wiseman (June) about the problems encountered at sea operating at 500 kHz. In theory a solution of salt and water effectively earths the r.f. power present in the aerial's insulator, which makes electrical contact

The practical solution is the use of e.h.t. cable, so that there is no electrical contact with the conductor. A 150-watt input has been used, but much higher levels are believed possible. In the experiment, RS Components 18kV e.h.t. cable was used.

I feel sure that this is a late, but effective answer, and with lives at stake the cost is

Peter C. Gregory, G4 HXV Ashton-under-Lyne

Mr Wiseman replies:

The use of e.h.t. cable would be similar in principle to the naval practice of using p.v.c. coated whip aerials. However, the statement that "... a solution of salt water effectively earths the r.f. power . . . " is an oversimplification. I have letters from people at sea reporting severe problems with 'wet insulators' at 500kHz but less effect at 2182kHz and similar, and very little at all at h.f. in the 4 to 21 MHz marine bands, and my own experience confirms that. Since Mr Gregory gives an amateur call sign, the experiments he refers to will have been carried out in the amateur bands 1.8 to 30 MHz. A ship's main aerial is invariably greater than 1/4 wave-length at h.f., and why h.f. is almost unaffected I leave to others to explain, but at 500kHz the antenna is always less than 1/4 wavelength and its capacitance forms part of the pi-coupler resonant tank circuit. It is, in my opinion, change in antenna capacitance due to Kohlrausch Effect that is the cause of the problem at 500 kHz. For reasons of economics, the pi-coupler range of adjustment will be much less at 500 kHz than at h.f., due to the size of components required. The pi-coupler may be able to accommodate changes in aerial parameters at h.f. which it cannot accommodate at 500 kHz.

E.h.t. cable of the automotive kind would present some problems. Coated with salt water it might become a concentric capacitor, aggravating pi-coupler problems. It would lack mechanical strength and would not stand up to rough treatment; once the insulation was cut or bruised it would be rendered ineffective, and it does not lend itself to easy repair if broken by a wharf crane, for example. John Wiseman

PROGRAMMABLE NOTES FOR MUSICAL INSTRUMENTS

Mr Waters is incorrect on several points in his letter in vour January issue.

The system of temperament that was discarded when equal temperament was adopted about 140 years ago (not 250 as Mr Waters states) was mean tone temperament, not natural or just temperament. Mean tone temperament is based on natural temperament with a few judicious changes which produce harmonious music in 6 major keys and 3 minor keys. The remaining keys suffer from the effects of the changes and have rough harmonies. Handel and Bach had instruments tuned to this system. Equal temperament is an artificial system not based on the natural system at all. The result is that all keys have equally rough harmonies but music can be played in all

The system I am proposing uses natural temperament, which sounds best, and allows modulation to any key. Surely, had such a system been available to Bach he would have adopted it in favour of equal temperament. I would be interested to find out in which ways Mr Waters's musician friends consider my proposal is retrograde since it has not been possible hitherto!

M. Robins Rilton Rugby

I was very interested in M. Robins's letter "Programmable Notes for Musical Instruments" in the November 1979, issue since I did some research on the possibilities a couple of years ago for my own amusement. I would like to mention, for anyone interested in pursuing this subject, the excellent treatise "On the Sensations of Tone" by Helmholtz, which is published by Dover with many extra appendices and tables; the theoretical work on harmony and tuning has never been bettered.

The information required by an instrument to perform a perfect job of just tuning is more complex than merely the key of the music. It requires some skill in analysing harmonies to derive the data, and more than a few extra keys to enter it into the instrument. I do not believe that performers would welcome additional manual input to the instrument of this complexity.

WIRELESS WORLD, MARCH 1980

My research concerned a computer model of an instrument which would analyse the music in real time and tune from the knowledge gained. Actually, it is theoretically impossible to make a perfect job of this in real time, as M. Robins probably knows, because the context of the harmony must be known, including what follows. My work showed that only about half of the job could be done this way, and it would not be cheap, given the amount of computer power it consumes.

Just temperament is interesting, but it is not obvious that it is musically desirable all the time. Unaccompanied singing, such as the close harmony which I have done, tends to go flat, for good reasons related to the tuning changes that occur when modulating in just temperament. This would be unacceptable in an instrument. Further, the sound of chords in just temperament is very smooth and restful, lacking the high frequency beats which are normal in any other temperament. These are important, since they add "life" to the instrument, which would be dull and monotonous without them. The power of indefinite modulation, which arrived with equal temperament, is now such a central feature of music that it cannot be discarded. as would prove necessary with the progressive flattening otherwise encountered in just temperament.

I believe that just temperament is not a marketable feature, since the research and development costs would be considerable, as my work has shown. Nevertheless, it would be nice to see some organ manufacturer offer it as an optional (and no doubt very expensive) feature. Otherwise it should remain what it has been for the last few hundred years - a guide used by musicians, but not blindly followed, in aiming at acceptable compromises in tuning

Michael C. Bailey Winchester Hants

C-D IGNITION PROBLEMS

Recent letters in Wireless World on motor cycle c.d. mentioned "false triggering" and "cross talk". My problem does not involve motor cycles but misbehaviour of c.d. ignition in cars of various units built. This shows up as a slight roughness in the engine at about 2000 r.p.m.

My first unit which showed this problem was the Marston, but a cure was effected by changing the triggering circuit to a unijunction circuit. Perfect operation was enjoyed for some months until the h.t. lead worked its way out of the coil, causing the thyristor and the unijunction to expire. Upon fitting new components, the unit once more worked but with this irritating misfire. Many hours of work produced no cure, so the Marston unit was regretfully removed. The distributor was even removed from the car as well as the coil and driven by a lathe while monitoring the h.t. voltage with a good oscilloscope, but this showed only a perfect train of sparks.

Then I came across an article in Electronic Engineering of December 1974 written by Jorgen Hoyer of Motorola, who advanced a most interesting theory as to the cause of this erratic misfire - to quote: "Very often the petrol/air mixture is far from being ideal. It may be too rich or too weak and usually is very unevenly mixed, in fact, an ignitable mixture may not have even reached the spark gap at the time the first arc occurs. Under these conditions an arc must be maintained for the lucky event where inflammable gas happens to move into the spark gap." Mr Hoyer goes on to describe a simple method of increasing the period. This he accomplished by connecting a suitable diode across the ignition coil primary.

However, this made no difference at all when tried on my car. Also a unit which would not function correctly on my car would perform well on a different make of

Another peculiar point is that tests were done on three identical units built on p.c.bs with machine wound inverter transformers. Two gave the same erratic miss but the third worked perfectly. No discernible differences could be found in the units, which were all factory built.

If any of your readers have had similar problems, I would like to hear from them as this is a problem I would dearly like to solve. D. J. Bruvns

Withank Republic of South Africa

INTERFERENCE WITH MSF RECEPTION

A popular student project is the reception of the Rugby transmitter (MSF) which puts out time and frequency standards and can be used to drive a self-setting clock.

The service area is large; it is claimed to include most of Europe but in some areas interfering signals may cause trouble. There is a powerful transmitter 1800 hertz away from MSF and in the Manchester area it is 10dB larger than MSF. In Preston it is 20dB larger. A relatively wide band receiver is needed to make use of the coded time signals and this project has defeated several of our

May we suggest that anyone considering the problem should do a few measurements in his area before building the complete clock? It would be interesting to know if your readers have ever had trouble with commercial equipment in this area.

Another source of interference is the fourth harmonic of the tv line timebase but this can be solved by moving the receiver. T. G. Izatt

Preston Polytechnic M. D. Samain University of Salford

We understand that the interfering transmitter (on 61.8kHz) is in fact H.M.S. Inskip, between Preston and Blackpool. - Ed.

MAGAZINE PROJECTS AND KITS

It occurs to me that many of your readers may be puzzled as to why different companies quote such widely differing prices for kits of parts for projects in the magazines, and possibly a few words explaining this might be of interest.

The fact is that when engineers design/ build projects, they use any materials which happen to be at hand, and then when the project is finalised, a list of parts is sent out by the magazine to the leading companies for

If completely standard parts, normally carried in stock by the firms concerned, are specified, then there is no problem, and all companies should be able to offer competitive prices. Unfortunately, this is seldom the situation, and very often special nonstock items have to be obtained. Even this in itself would be unimportant if one knew how many kits were going to sell, but it is usually pure crystal-ball gazing, and because of this the special parts have to be costed on a one-off hasis

Another problem is that for convenience a designer often uses a purely trade source to obtain his parts. This would not be particularly important if retailers were able to buy competitively from these sources, but one of the best and most reliable trade sources offers no discount for the retailer, and will not sell direct to retail customers, which means the retailer has to add his margin, and the end product becomes very expensive.

This letter is not meant as a criticism of designers or magazines, but might assist designers to provide economical kits. There is no doubt that if there was more liaison at the design stage with the retailers concerned many of these problems could be overcome. J. N. Shipton

A. Marshall (London) Ltd London NW6

HIJACKING CARFAX?

D. P. Leggatt of the BBC (October letters) in replying to Peter Manson's letter expresses optimism that the designers of the Carfax service have adequate means to control the security and authenticity of the information broadcast. Surely such a system is fundamentally vulnerable to hijacking for the following reasons.

Firstly, inexpensive Carfax decoders are going to be manufactured in large quantities; therefore their principles of operation cannot be inordinately complex. Secondly, some 80 genuine transmitters throughout the country will be quite openly broadcasting the "secret" initiation code every few minutes. Thirdly, test generators producing the appropriate signals will, no doubt, be extensively used in service workshops.

But, perhaps, traffic wardens will have their duties extended to ensure that no obscene, humorous or alien messsages are being transmitted. Mandy Peterson

Swindon Wilts

The BBC replies:

Mandy Peterson will not let me get away with my rather generalised statement on Carfax security, and she makes some very relevant comments.

Certainly 'secret' initiating codes would have their limitations, but there are other techniques available including comparisons between the originated and transmitted signals.

As ever, it will be difficult to ensure absolute security and I must confess that our obscenity detector is not yet perfected! D. P. Leggatt

Head of Engineering Information Dept BBC, London W1

Concerning the comments on Reverse Polish notation by W. H. Powell in August letters, I for one certainly prefer the normal Basic notation as opposed to its Reverse Polish form. The last-mentioned may be useful when minimising keystrokes on a calculator, but my policy is to make the machine do the work.

However, the notation for formulae is not of great significance. Far more controversial is Mr Powell's belief that languages should use Reverse Polish notation throughout (presumably including key words like IF, ELSE) for efficiency. I would suggest that his notions of efficiency are concerned purely with the output from a compiler (i.e. smaller, faster) and should not influence the appearance of the written program, which one hopes is a clear, readable document making use of control and data structures (Pascal perhaps?). Apart from certain high-speed, real-time applications, I have no objection to clearly readable programs with a few inefficiencies. Michael Parr

DIGITALLY CONTROLLED ATTENUATOR

West Yorkshire

I read the Circuit Idea on the digitally controlled attenuator by Mr S. R. Taylor, in the December issue with interest. The AD75XX series of c.m.o.s. d-to-a converters are all inherently 4-quadrant multiplying devices. They can all therefore be used for audio applications, one of which Mr Taylor describes. It is not a large step of course to implement a stereo balance and volume control system using two such circuits running from updown counters fed serially.

Perhaps I could emphasize one or two general points with regard to such audio applications. Compared with analogue-controlled electronic attenuators, digitally-controlled attenuators offer some distinct advantages. Total harmonic distortion figures are significantly better, bandwidth is significantly wider and noise immunity greatly improved. In addition, such systems have the facility for remote operation under touch-switch or microprocessor control.

Could I also make a recommendation with regard to Mr Taylor's circuit? The selection of the operational amplifier should be done with care. The output resistance of the d.a.c. changes with code-setting (as does its capacitance). This means that an amplifier with a large input-offset should be avoided as a code-dependent variable output-offset will result. This may produce significant noise during code change. As the d.a.c. has a few pF output capacitance typically 37-120pF (depending on code), capacitive feedback-compensation must be employed when using wide-bandwidth amplifiers. This is usually about 10-20pF depending on the amplifier.

Instability may occur at some code settings if no compensation is used. Mr Taylor shows a gain-adjust potentiometer in the feedback loop of his system. I would suggest a fixed, low noise, resistor of value $1k\Omega$ in the feedback loop and include a $2k\Omega$ adjustable resistor in the in the input line to the AD7520. (However, I suspect that there is only a limited need for a full scale absolute accuracy

of better than 0.1% in anything other than test equipment).

In conclusion, perhaps to back up the above comments, Mr Taylor and other audio engineers may be interested to know that Analog Devices intend introducing a device specifically aimed for the audio field, the AD7110, in mid March 1980. The AD7110 is a monolithic c.m.o.s. digitally controlled attenuator in a 16-pin d.i.l. package. The analogue output voltage decreases logarithmically as the 6-bit digital-input code increases. The attenuation range is 0 to 88.5dB (plus full muting facility) in 1.5dB steps. The total harmonic distortion is better than -98dB (0.002%) and the signal-to-noise ratio is 124dB. When tested with a commonly available audio op-amp, a bandwidth of 0 to 250kHz was observed.

WHAT'S SO NATURAL ABOUT e?

I would like to suggest two thoughts on the article "What's so natural about e?" by J. C. Finlay in your December 1979 issue. First, perhaps I have missed something, but I do not see how memorising or writing a "trick" such as 193/71 for e is easier or simpler than memorising or writing e itself. Particularly since if you have memorised e to five decimal places (2.71828) you have also memorised it to nine decimal places (2.718281828) because of the repetition of the "1828" digits.

Second, I agree that it is a nice touch for some calculator manufacturers to print values such as e on the calculator. However, we are not limited to what the manufacturer may print on the calculator. I find it convenient to keep a small data booklet in my calculator case, and to consider the booklet as an accessory for the calculator.

In closing, I enjoyed reading the article, and the rest of the issue, and look forward to receiving Wireless World each month.

AND NOW THE PICOBEL

Contrary to Anne King's letter (November 1979), the millibel has immediate and important application in musical recording/reproduction systems. In fact, a lengthy article in *International Audio Review 3* was devoted entirely to the ear's sensitivity to 2-5 millibel deviations in frequency response, and the consequent need for very precise RIAA de-emphasis in phono preamplifiers.

This article discussed how those traditional experiments, which established the entrenched belief about our hearing insensitivity to loudness changes on single tones of less than 1 dB, are irrelevant to our hearing sensitivity to frequency response deviations on broadband signals, such as music.

Our experiments have established that we can hear frequency response differences in the 2-5 millibel area, as has empirical work by our friend Stanley Lipshitz and others. Not only can we reliably detect that there is a difference (which is a sufficient criterion to establish an auditory threshold). The difference is so clearly perceivable that we can correctly describe it, qualitatively, and, yet more remarkably, quantitatively.

For example, we aurally compared one pre-amplifier against a straight wire on music. In spite of the masking presence of the pre-amplifier's distortion byproducts, which seemed to add distorted bright energy to music above 5kHz, we also heard what seemed to be a purely tonal balance anomaly. We aurally judged this anomaly to be a plateau hinged at the 2120Hz RIAA breakpoint, and estimated its magnitude at 20 mB. Only then did we measure the pre-amp. Its actual RIAA frequency response was flat save for a plateau hinged at 2120Hz that measured 20 mB in magnitude (±1 mB). The pre-amplifier's designer and manufacturer, who witnessed this experiment, asked why we even bothered with measurements, if the human ear could be that perceptive and calibrated.

Incidentally, our measuring technique presented in IAR 3 can reliably measure down to about 0.2 millibels, unlike the 0.5 dB limitation of Ms King's meters. And since IAR 3 we have extended our measuring sensitivity (using differential techniques) into the picobel region. Therefore, and in sympathy with Mr Marks' desire to end decimal point confusion, I herewith enter a plea for the picobel as the standard unit of commerce! Also, if we are to capitalize engineering unit names in deference to the scientists they honour, let us do the job right and revert from bel to Bell, not Bel. That bell which tolls is hardly ever capitalized, so the confusion should be minimal.

J. Peter Moncrieff International Audio Review Berkeley California, USA

In the UK it is standard practice to use capital letters for the abbreviations of unit names but not for the full names. – Ed.

LIQUID-STATE AMPLIFIER

The late Professor Fleming's account of the thermionic diode (November 1979 issue) reminded me of a little search for the 'missing' counterpart of the vacuum gas and solid-state devices — the liquid-state amplifier

Although it might be argued that this is the biological amplifier of choice, as, for example, in the form of the 'cochlear microphonic' signal generator available in the mammalian ear (a signal capable of driving an ordinary audio amplifier), I was interested to find that a liquid 'ionic diode', at least is easy to arrange. A diode made with a platinum wire and a silver/silver-chloride wire dipped in dilute sulphuric acid gave a forward to reverse conductance ratio better than 25:1 for signals of less than ±100mV amplitude d.c. Moreover, Professor Fleischmann (Southampton) was able to describe a two-membrane 'ionic triode' which he constructed as a research student in 1947.

Considering the speeds of the various charge carriers estimated below:

- > 105 m.s -1 in a hard valve,
- < 10⁻² m.s ⁻¹ in a copper wire,
- ~ 10⁻⁷ m.s ⁻¹ in an ionic liquid,

for an electric field of 1Vm⁻¹, I expect the frequency response of the wet triode is, well, wet.

Electronic combination lock

Non-volatile logic devices give easy programming and long-term storage

by Alan Oakley, B.Sc. Plessey Semiconductors

This article describes how an ordinary key operated mechanical door lock can easily be converted to a 4-digit, multi-code electronic security lock, using non-volatile logic devices. The data in these devices can be altered easily but once entered can be retained for a considerable time even in the absence of applied power. The 4-digit combination codes are easily programmed and the versatility of the design means that the system does not need clearing down. It is a simple matter to extend the system from a 4 digit code (some 65,000 odd combinations) to any greater number of codes by adding more quad latches. Apart from the normal door latch such a system could find application anywhere where access is to be restricted, and could also be converted to be remote controlled.

The MN9102 quad latch is one of the NOVOL range of integrated circuits produced using the Plessey 'metalnitride-oxide-silicon' (m.n.o.s.) process. This is essentially a p-channel, metalgate process, but with the additional feature that variable-threshold memory transistors may be fabricated alongside conventional fixed threshold m.o.s. transistors. These memory transistors can be used to retain data even in the absence of applied power and therefore provide the facility of non-volatile data storage in standard m.o.s. circuits.

Data may be stored in the MN9102 for at least one year, in the absence of applied power, over a 0°C to 70°C temperature range. The device runs off standard m.o.s. supplies of +5V and-12V which are used internally to generate the high-voltage supply normally associated with m.n.o.s. memory devices, and requires only a single external capacitor to act as a charge reservoir for supplying current when writing into the memory. The data that is applied to the four inputs is written into the memory when the SAVE control is taken to a logic 0 level and the data subsequently appears on the four outputs. Typically, ten million 'save' operations may be made before the performance of the device is impaired. The stored data is automatically restored to the outputs whenever power is reapplied. An output enable is also available which, when taken to a logic 0

level, presents a high-impedance state on each data output line, thus permitting multiplexed operation.

The digital security code system uses the MN9102 quad latch to store hexadecimal digit data in the absence of applied power. When this data is interrogated with the correct incoming data from a keyboard there is a 2½ second delay before an electro-mechanically operated mortice catch is opened for 2½ seconds. The delay and opening times may be varied easily and are included to improve security and conserve power. The number of digits in the security code is totally dependent on the number of quad latches.

Data is entered into the system via a hexadecimal keyboard with a diode/ resistor decoder, if a 16, single-pole output keyboard is used. Alternatively, the data may be entered using a 16 key encoder (74C922) if a 4 × 4 matrix output keyboard is in use. Either system generates the four data signals and 'anykey,' which is normally low but goes high when a key is pressed; this signal is used to generate the timing pulses. The four data signals are fed into a c.m.o.s. quad D-type flip-flop (74C175) which is clocked by SRCLK, generated from two monostables gated with 'anykey' to prevent any keyboard bounce effects. Once clocked, this data is then compared with the stored data in the

MN9102 using a c.m.o.s. four-bit magnetic comparator (14585). If the keyboard data is the same as the stored data, then the A = B output of the comparator will go high. For more digits the quad latches, comparators and flip-flops are cascaded as follows. The outputs of the nth flip-flop are connected to the inputs of the (n+1)th flip-flop, with all the 74C175 connections the same: i.e., SRCLK to CLK, clear held high, and all the Q outputs unused. The outputs of the nth flip-flop are also connected to the inputs of the nth quad latch (for use in programming), and to the 1st set of inputs of the nth comparator. The outputs of the nth quad latch are connected to the second set of inputs of the nth comparator, of which the nth A=B output is connected to the (nth+1)th A = B comparator input. Other common connexions are A>B and A<B held low with their respective outputs unused for the 14585, and output enable held high and Save inputs common for programming on the quad latch.

When a 4-digit code is stored the following sequence of events will occur when the code is interrogated. If, for example, the code stored was 9102, the data stored would be with 2 in latch A, 0 in latch B, 1 in latch C and 9 in latch D. The 9 when entered would be clocked in to the output of flip-flop A and compared

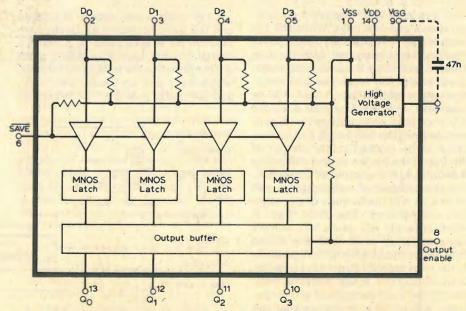

Fig. 1. Internal block diagram of MN9102 quad latch.

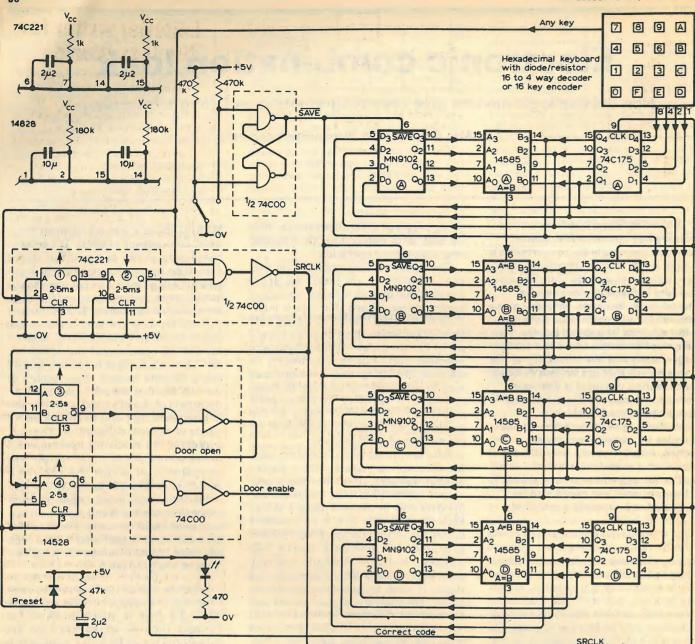

Fig. 2. Circuit diagram of lock logic.

with 2 in latch A, giving A=B on comparator A as a low level. When the 1 is entered, the 9 is clocked to the output of flip-flop B and compared with the 0 in latch B; hence A = B out of comparator B will also be low level. The 1 will be at the output of flip-flop A and will be compared with the 2 in latch A, so the A = B output on comparator A will remain low. The third digit 0 will cause the 9 to be clocked to the output of flip-flop C, the 1 to the output of flip-flop B and the 0 to the output of flip-flop A. The A = B output of comparator C will be low, as will the outputs of the other two comparators. The final digit 2, when entered, will cause the correct digits to fall in place with the stored data, hence the 2s will match in position A, the 0s in position B, the 1s in position C and finally the 9s will match in position D: the A = B outputs of all comparators will go high, indicating that the code was correct.

To program a new code, it is entered and the Save inputs to all latches are held low for at least 10ms, by pushing a switch for that time. The switch poles are connected to the inputs of a bistable, which have pull up resistors to +5V, and the centre pole is at 0V. When the

switch is operated, the outputs change state, giving a high-to-low transition on on one of the bistable outputs, going high again when the switch is released: it is this signal which is used as the common Save.

To make the system more secure

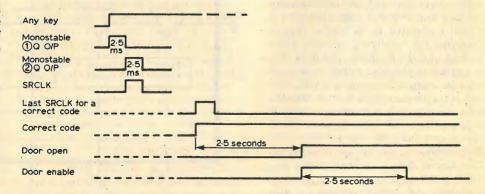

Fig. 3. Timing diagram of logic.

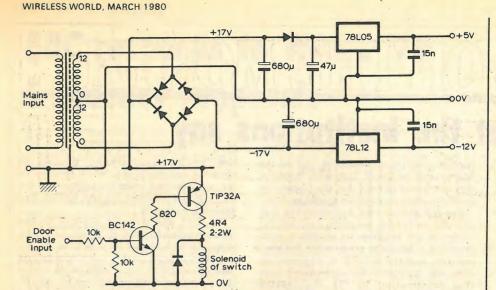

Fig. 4. Power supply and switch driver.

there is a 21/2 second delay after the correct code has been found. This is achieved by means of a 14528 retriggerable c.m.o.s. monostable, which is positive-edge triggered from SRCLK. and initially preset with a delayed power-up pulse. When Q goes high again it is ANDed with 'Correct code' to give 'Door open', which is normally low but which goes high 21/2 seconds after 'Correct code' goes high. The positive edge of 'Door-open' triggerrs another 14528 retriggerable monostable whose O output, when it goes low again after 21/2 seconds, is ANDed with 'Correct code', thus producing a 'Door enable' pulse. Although this signal is normally a low level, going high 21/2 seconds before going low again, the values of the resistors and capacitors on the monostables

may be varied to give different 'Door enable' delays and widths. The 'Door enable' signal is used to drive two bipolar transistors, which in turn activate the electromechanically operated mortice. The second inverter consists of a high-power p-n-p transistor, which is designed to switch between the unregulated supply and zero volts to provide 1.5 for the solenoid. A l.e.d. and resistor are used to indicate when the door is

Further modifications may be made to the outlined system with provision to activate an alarm when more than three incorrect codes are entered or possibly control the logic remotely, depending on the user's requirements. The system described would need only the minimum modifications.

Clock timer — 2

continued from page 52

memory and change the display accordingly. Pressing more than four keys should repeat the writing process. Pressing the Alarm key should access the memory for the next alarm time. Incorrect times may be entered such as 30.15 to fill up unwanted space if sixteen alarm times are not required. Alternatively, the alarm times may be repeated.

Assemble the comparison detector and relay driver and with IC13 omitted, connect pin 5 of IC14 to test point 1. Set an alarm time to the actual time, leave the switches at Set Alarm and display test point 1 on an oscilloscope which should follow Fig. 13(a). Display test point 3 and adjust R₄₃ until the negative going edge occurs 0.5ms before the negative edge at test point 1. Set an alarm time so that only tens-of-hours, hours and tens-of-minutes digits agree.

with the real time. Leave the switches at Set Alarm and check that the waveforms agree with Fig. 13(b). Insert the remaining i.cs and adjust R46 for a suitable output pulse length. Note that if the value of R₄₆ is too low, IC₅ is retriggered and produces a double output pulse. If the timer does not operate correctly when the tested circuits are connected together it is probable that 100Hz ripple on the 10V supply is turning Tr₂ off every 10ms which produces spikes on the power fail line. This is easily cured by increasing the value of

Modifications

The output of the 555 timer is t.t.l. compatible and can directly drive a variety of interface units. A simple flipflop enables an external circuit to be

Editorial writer for Wireless World

Wireless World needs a new person on its editorial staff. Technical experience in electronics and/or communications and an ability to write are essential. The work is varied and includes writing technical news reports and other material, attending meetings, exhibitions, press conferences and other events, some abroad, and editing contributed technical articles. A good deal of freedom will be given to a person who shows ability and responsibility. Preferred age range 25 to 35. Write to: The Editor, Wireless World, Dorset House, Stamford Street, London SE1 9LU

switched on at one alarm time and off at the next. A counter and decoder allows the system to be expanded for the control of several different devices. The alarm-enable/inhibit circuit can be modified to select one of two different alarm-time programmes by taking the alarm-inhibit line to a spare address input on the memory, pin 3 or 21, and grounding pin 13 of IC_{13b}.

Up to 64 alarm times can be obtained by adding two flip-flops to the chain in IC, and connecting the two new outputs to the spare memory address pins. If the alarm-enable/inhibit section is not required, the circuit can be omitted except for IC_{21c}. Alternatively, if the alarmenable/inhibit section is duplicated and the two alarm-inhibit lines are connected to the spare memory address pins, four alarm-time programmes are obtained. If this modification is made, the control logic IC $_{16b}$ and IC $_{16c}$ must be altered so that keys 0, 1, 2 and 3 select the appropriate programmes.

The timer can be used with a conventional digital clock which has a suitable multiplexed display and multiplex control lines coded in binary. A midnight pulse and the inputs to IC13a and IC13b have to be decoded from the display. The five inputs to IC13 can be replaced by the tens-of-seconds C bit driving a monostable to give a pulse of at least 100ms duration at the start of each minute. If switch-on-reset is not needed the set-time-pulse input is grounded and the circuit around Tr, Tr, omitted.

NEWS OF THE MONTH

Finniston — what the Institutions say

The long-awaited Finniston Report (see p36 Jan., p88 March and p46 June, 1978 issues) has now been officially published, some weeks after much of it had been leaked. Having had time to consider the proposals in the report, the professional institutions are welcoming it, but they also have reservations.

The Council of the IERE was disappointed to find that the Finniston Committee had little to say about what the IERE considered to be the root cause of the inadequate performance of the nation's manufacturing industry, namely the general lack of enthusiasm for work at non-professional levels and the consequent low standard of industrial relations within many areas of British industry. They also regretted that the summary report failed to give credit to the engineers concerned with the design and manufacture of electronic equipment and with systems engineering, and that it did not reflect "the high regard in which the British electronic and radio engineer is held over-

This institution particularly endorsed the committee's recommendations to improve and extend the balance of theory and practice in the pattern of education and training for the engineer of the future. The Council also welcomed the formation of the British Engineering Authority, and in particular the proposal that this would endeavour to bring together groups such as working engineers, employers, engineering teachers, public agencies and the Government, who have common interests but who, at present, tend to act in relative isolation from each other because there is no active mechanism for linking them.

Concern was felt about the proposal that the Authority would maintain an "expert staff" to implement its policies. This proposal, they thought, could deny the Authority direct access to the institutions, which according to the IERE are "the focal points of the best expertise available in each of the engineering disciplines at both Board and working levels". It is the IERE Council's view that this would also create an unnecessarily expensive new area of bureaucracy for the registration of engineers in place of the present self-financed resources available in and through the engineering institutions. However, the Council was pleased to note the recommendation that the learned society task of the institutions might be advantageous to the profession as a whole. "This", the council said, "reflected the point made by the IERE President, Professor Gosling, in his 1979 Inaugural Address, that it was perhaps time that they gave careful consideration to whether the engineering profession was not now two professions - the old with its scientific basis of Newtonian mechanics and the new, as represented by the IERE, whose business was founded on quantum mechanics and the new concepts of network theory, control theory and information science'

Finally, the IERE was relieved to see the Finniston team's unanimous view that the new statutory register must embrace the

current stock of engineers as well as the engineers of the future. They were, however, very concerned to note that the Committee could not agree on how this should be done.

The IEE particularly welcomed the proposed distinction between courses for students and engineering students, each involving substantial cooperation between industry and the schools of engineering. They also welcomed the committee's hope that registration by the engineering authority would become in effect a licence to practice, but regretted that the Committee had not put forward firm proposals for legislation to implement that view. "If registration does not open avenues of employment in limited areas otherwise closed to engineers, the authority will be deprived of the strength needed to implement its policy", said an IEE report.

The Chairman and Officers of the CEI, after discussions with the presidents of member institutions and the chairman and senior members of the Engineers Registration Board (ERB), made a statement in which they endorsed the Finniston Report's analysis of the ills of the British manufacturing industry and its broad objectives for recognising and improving the contributions to be made by professional engineers. The council particularly supported the view that employers must be encouraged to look on their engineers as valuable investments to be developed, rather than assets to be exploited; and the need for thorough practical training for engineers in industry. The CEI, however, had reservations about the proposed methods of attaining these objectives, and the relevance of these proposals to the practical and urgent needs of manufacturing industry, they thought, would require critical examination.

According to the CEI, the benefits to industry claimed by the Finniston Report could be achieved much more cheaply and quickly by an evolutionary process — that of developing the already existing machinery of the engineering institutions to meet the broad objectives set in the report — rather

than by the revolutionary process of replacing this machinery, which operates in the public interest under the authority of the CEI's Royal Charter, by the British Engineering Authority.

The CEI was strongly opposed to the recommendation that all members of the proposed BEA should be appointed by the Secretary of State, as they saw this as having their affairs taken out of their hands — it is characteristic of all professions in the UK that they are mainly self-regulating and consist of members who have been elected or nominated by the profession itself.

Being aware that the new engineers — products of the proposed education arrangements — could not become fully qualified engineers before the late 1980s, and that for the next half-century the majority of practising engineers will be those who now exist or who are under training by the present methods, the CEI warn that unless the morale of these engineers and international confidence in their ability are fully maintained, very great damage would be caused to the national interest.

The CEI considered that the report's failure to make any proposals for improving the education, training and progression of engineering technicians was a serious weakness

A union view

Ken Gill, General Secretary of the Technical, Administrative and Supervisory Section of the AUEW was disappointed with the Finniston Report because the Committee of Enquiry had failed to deal with the pay and status of engineers. "It is surprising that in a report of 253 pages only about six pages are devoted to engineers' pay and the role of the trade unions in the engineering industry", he said. TASS, he said in a recent report, blamed the engineering professions' lack of status on inadequate salaries and the lack of rational salary structures. "If urgent consideration is not given to raising the salary and status of engineers, the British manufacturing industry will fail to attract and recruit a large enough number of new engineers", he added.

"In the beginning....."

Analysis of the cosmic microwave background radiation left over from the "big bang," the primordial explosion which it is believed began our universe, suggests the existence of clusters of galaxies containing hundreds of millions of stars. Data collected by NASA's U-2 aircraft in the upper atmosphere from remnants of radiation points to the conclusion that the Milky Way galaxy, of which we are a part, is hurtling toward the constellation Virgo at more than a million miles an hour, under the gravitational influence of a "supercluster" around it.

University of California scientists believe the supercluster contains 30 to 40% more galaxies than are normally found in the same volume of space and that it may be 2 billion light years across.

The supercluster would account for about

1% of the volume of the observable universe, which extends through 10 billion light years of space. Dr. George Smoot has pointed out that not enough time has elapsed since the "big bang" for such a supercluster to have formed, which implies that such a gigantic concentration of mass dates back to the beginning of the universe: "If one such huge concentration of matter exists," says Dr. Smoot, "there are probably others."

The new findings introduce an element of doubt into the previously accepted idea that the event which started the universe about 15 billion years ago was a powerful but tightly controlled expansion of matter in all directions at a uniform speed. The supercluster's existence implies that the primordial fireball was "lumpy" and that the vast forces released were by no means uniform in their effects.

BBC responds to WARC '79 frequency proposals

In a recent engineering press statement the BBC outlines its reactions to the WARC '79 frequency allocations, those for Region 1 having been given in our February 1980 issue.

The Corporation's response is generally favourable where domestic broadcasting is concerned, but is "less happy with the implications for external services on the h.f. bands." For domestic radio broadcasting, extension of the v.h.f. band II to 108 MHz is welcomed. Although formal international agreement does not provide for complete clearance for broadcasting use until 1995, some additional programme channels can be made available much earlier than this, and services which now have to share the three national v.h.f. channels can be separated. The band II extension is also welcomed for the future development of local radio services.

Allocation of the sub-band 519.5-526.5kHz is welcomed for use with the BBC Carfax motoring information system, but such use is subject to non-interference with navigational beacons in neighbouring countries; the

BBC would have been happier with an exclusive allocation.

Extension of the v.h.f. television band III by two 625-line channels will be of value if this band is to be re-developed after closure of the 405-line service. The current WARC proposals require the closure of this service by 31st December 1986, although the Annan report suggested a phased programme of closure beginning in the early 1980s. On the u.h.f. television bands the provision of up to four additional channels will considerably ease the planning of further extensions of u.h.f. coverage throughout the country.

Allocations for s.h.f. satellite links are also welcomed, but the rearrangement of the h.f. bands for overseas broadcasting falls considerably short of the BBC's wishes, especially at frequencies below 9MHz where no extensions have been agreed.

The statement ends with the BBC asserting its support for the reservations entered by the UK and the USA delegations to the conference, retaining the right to "take whatever steps may be necessary to maintain the effectiveness of our external services."

Scripts by wire at Bush House

Two mini-computers and an array of disc storage units form the heart of a "scripts by wire" system now in operation at the BBC's Bush House, the Overseas Broadcasting department's headquarters.

Some 30 million scripts covering news stories, talks and features can now be distributed each year by electronics to more than 200 outlets in the complex. The central newsroom contains 39 v.d.u.s and journalists dictate their stories to operators who type them into the system. Once written, the story can be directed by the computer to specific language sections and can be printed out in individual offices.

Both short pieces and longer talks can be written into the system which can accommodate items of up to 5000 words; news stories are kept on file for seven days, current affairs talks for 14 days and general features for 100 days.

A selective "list" can be drawn up on the v.d.u. according to subject matter, or the full list of talks may be checked. On the other hand, stories which only apply to a particular part of the world may be called up for display.

The electronic distribution system is controlled by two General Automation 16/440 mini-processors. Both are in continuous operation and receive the same input, but only one provides output. If a fault occurs, the standby processor can take over immediately. Each processor is associated with a 2 megabyte fixed-head disc and a 24 megabyte disc pack drive. New material is entered on magnetic tape and later transferred to microfiche for archive storage.

Each of the 137 v.d.u.s distributed around the building can undertake full text editing, but only those in the news, talks and features areas are free to amend stories in the central store. Hard copies are available from 85 printers strategically placed amongst the offices.

Ken Clayson, engineering manager in charge of the new system says, "The system is saving an enormous amount of time and paper and it lets us make far wider use of the material we prepare. Every one of the broadcasting sections at Bush House now has access to every script prepared here. In the days when we relied entirely on paper that was just not possible."

The hardware was provided by the data system division of ITT Business Systems to a specification set up by the BBC's Capital Projects Department.

Microwave unit detects cancer

An instrument containing a sensitive radiometer capable of measuring temperature variations of less than 0.1° Celsius (0.2° Fahrenheit), part of a microwave applicator made by Microwave Associates, an American company, is being used to locate and possibly destroy cancerous tissue. The equipment has located tumours in 14 known cancer patients and has detected a cancerous site in one patient which was not revealed by the use of conventional techniques.

The principal advantages offered by the new instrument are that it does not emit harmful radiation, can be used outside the body and could become relatively inexpensive if mass-produced.

Cancerous tissue is hotter than healthy surrounding tissue and conventional methods such as infra-red thermography can detect tumours near the surface of the skin, but the new method permits checking at a much deeper body level.

If the instrument proves itself effective, after an extensive series of hospital and laboratory tests, it could become standard equipment in doctor's surgeries. Patients could be quickly and easily tested for many forms of cancer, just as they are now tested in a routine manner for heart malfunction by means of an electrocardiograph.

The treatment side of the new instrument's use would involve microwave heating of a tumour to destroy cancer cells. Tumours have a relatively poor vascular system (compared with healthy tissue) and researchers believe that a tumour will heat faster and remain hot longer than surrounding tissue because there are fewer blood vessels to carry the heat away.

The next stage in the instrument's test programme will be its use on cancers in large animals in the Norfolk, (Virginia) Medical School laboratories

Mullard to "axe" 900 jobs

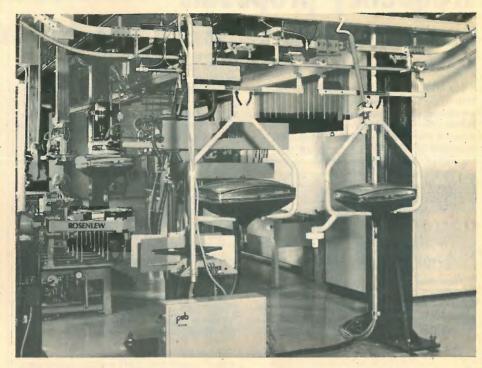

Mullard's decision to "streamline" its tube production business will, according to a report in *The Times*, 16th Jan 1980, result in the loss of 900 jobs at its Durham and Simonstone, Lancashire works.

The main changes, to take place over the next two years, will involve further automation and alterations to quality control departments; these moves are seen as necessary to compete with the high output of quality tubes and tv receivers from Japanese manufacturers and in the face of the development of domestic products using tv-like tubes.

The National Economic and Development Office has recently identified certain trends in the tv and components industries and a study of production costs of colour television sets in the UK, Japan, South Korea and W. Germany has shown that Japan in particular gains a high cost advantage from its overall higher level of investment in advanced automated plant, superior efficiency in manufacturing and design and more rigid quality control of components.

The Mullard decision reflects an awareness of these findings and also links up with NEDO's main recommendations which include the "rationalization" of UK tv production into larger units producing five times the current number of receivers, more involvement directly with Japanese technology, to improve and introduce more new designs and to carry out more research and development.

Only about 100 of the threatened jobs will go in 1980 and Mullard says that it "intends to continue to invest substantially in the picture tube business."

A modern tv tube production line in Finland using "Japanese" technology, in this case a Hitachi range of 20in, 22in and 26in tubes of the "in-line" variety, featuring quick-start heater, 110° deflection angle, temperature-compensated shadow mask, electrostatic focusing and self-converging integrated neck components. This automated plant, operated by the Automation Group, Valmet Oy, Finland is expected to be producing about 500,000 tubes by the end of 1981.

Multi-I.e.d. aircraft instruments under test

A 4in by 3in screen incorporating more than 49,000 l.e.ds, providing a resolution of 64 lines per inch is currently being evaluated by the USAF Flight Dynamics Laboratory as part of a joint project between the USAF and the Canadian Department of Industry, Trade and Commerce.

The device is intended as a replacement for the mixture of dials and c.r.t. displays at present found in aircraft cockpits; it is computer-controlled and is designed to provide the pilot with information on various subsystems, such as navigation or weapon delivery. This information can then be called up at the flick of a switch, the data being depicted on the l.e.d. screen.

Walter Melnick, of the Flight Dynamics Laboratory says that the new display system is an advance on the c.r.t. form due to its less cumbersome nature and higher reliability—he estimates a c.r.t. display life of 500 hours and an l.e.d. display life of 10,000 hours. Furthermore, while all information can be lost in the event of tube failure, even if several thousands of l.e.ds fail, the display can still be read.

Several technical solutions to the problem were examined before deciding on the l.e.d. method, and this was eventually selected because it is adaptable to the "building block" mode of construction, where one inch squares of the diodes can be assembled into a variety of display sizes.

Bowmar Instruments, of Weybridge, are the UK representatives of the makers of the display, Optotek Ltd. of Canada.

Getting wise to electronic mail

According to a report from Mackintosh International and Communications Studies and Planning Ltd, organizations which rely on post and telecommunications services should urgently review their communications needs to take account of the opportunities presented by "electronic mail."

The report, entitled "Electronic Mail: user alternatives in the 1980s" stresses that it is not too late to take advantage of the cost-effectiveness of equipment and services currently available. However, prompt action is necessary, says the report, because users must take transitional measures over a

period of time to ensure that the benefits of the new equipment, such as communicating word processors, text and graphic terminals and the next generation of "facsimile," are realised.

One of the report's main aims is to advise non-technical business users about the scope and benefits of electronic mail equipment and services on offer from manufacturers and telecommunications authorities. It also stresses that users should prepare for the introduction of the enhanced telex service, to be known as Teletex, which begins operation in Germany and Sweden sometime in 1980.

Disobedient spacecraft

Radio contact with Voyager 1 was lost on 3rd January just after the spacecraft had been commanded to turn in space and fire thrusters for a trajectory correction. The manoeuvre apparently took place but the antenna alignment was not entirely successful. However, later in the day NASA controllers received confirmation that command signals intended to switch on the low-gain antenna and place it in a two-way reception mode, had been received and executed.

Efforts are being made to correct the antenna/Earth alignment, the problem requiring some analysis to ensure that attitude control fuel is not wasted.

Voyager 1 was launched in September 1977 and flew past Jupiter in March 1979. The spacecraft is now 660 million miles from Earth and is scheduled to encounter Saturn in November 1980. Voyager 2, a sister craft, is due to encounter Saturn in August 1981.

News in brief

The FCC is proposing to award additional frequencies for c.b. use on s.s.b. operation and may also liberalize rules on the distances c.b. stations are permitted to work over. The use of variable frequency oscillators may also be permitted.

Car to telephone service launched in Norwich

A new car telephone service, claimed by Air Call Ltd. as the first of its kind in England, was started in Norwich on the 21st January

This service, known as "interconnect", enables direct two-way communication between a car telephone user and subscribers to the public telephone network and is now available to Air Call's East Anglian customers. The company's branch manager, Derek Cunningham, says that Interconnect will be available to subscribers in addition to the existing range of services, which includes message handling, "talking bleeper" and

telephone answering services.

In order to house the additional equipment required, the Norwich control complex has been moved to larger premises in the city centre, and plans have been drawn up to extend the Interconnect service to most of the company's 34 control centres during the coming year.

Car telephone users can take advantage of the new service without necessarily changing the equipment in use; the cost of all messages and inland telephone calls is included in the rental charge.

Paul Barton, a research engineer with Standard Telecommunication Laboratories, has received the William E. Jackson award from the Radio Technical Commission for Aeronautics (USA).

ITT researcher wins award

Mr Barton won the award, consisting of an honorarium and commemorative plaque, for his thesis, "Airborne Signal Processing for the Microwave Doppler Landing System," submitted for a Ph.D degree from University College, London. He graduated from Churchill College, Cambridge with an honours degree in mechanical sciences and joined STL in 1965, working with the late Alec Reeves on pulse code modulation and electro-optic systems.

In 1971, he began work on the microwave landing system (MLS) programme, being

Personal computer

The Sinclair Research ZX80 computer measures 218 x 170 x 50mm, weighs 12oz and features a 1kbyte memory, claimed to be "equivalent to 4kbytes in a conventional computer." How the latter trick is accomplished is not explained in the otherwise useful literature which comes with the computer, and which includes BASIC programming instructions, presented in a lighthearted manner, ideal for the beginner to the mysteries of programming.

A cassette player can be used directly to store programs, and the unit dispenses with the need for a dedicated v.d.u. by virtue of the "plug in to your tv aerial socket" facility. A further useful feature, especially for the beginner (and the unit seems particularly suitable for use in schools, where "computer science" is becoming a popular subject) is the syntax error check. This ensures that only syntactically correct lines can be added to the program list at the top of the page. A marker identifies a syntax error and thus helps to speed up the production of an error-free program.

The display format is 24 lines of 32 characters; the unit costs £99.95 inc. v.a.t. fully assembled, becoming available in March, or in kit form at £77.95 inc. v.a.t. Prices include the cost of the 'programming manual, but exclude mains adaptors, which cost £8.95 extra.

particularly concerned with the design of the Doppler scanning system and in 1976 began the work which led to the winning thesis. He holds some 20 patents in the MLS and radar fields and is currently leading a team working on radar and adaptive systems at STL.

The award is a memorial to William E, Jackson, a pioneer in the development and implementation of the present airways, air traffic control and aviation communication systems.

News in brief

The British Amateur Electronics Club, which claims that it is the only national amateur electronics club, is seeking help from established local electronics groups, its main problem being difficulty in finding premises for meetings. The mainly scattered nature of the membership adds to the problem and if local groups are willing to welcome BAEC members to their meetings, they would be prepared to pay an affiliation fee. The chairman of the BAEC will send out a copy of a simple questionnaire to any reader who is interested enough to contact him: Cyril Bogod, "Dickens", 26 Forrest Rd, Penarth, S. Glam., or telephone 0222 707813.

The IEETE have the following lecture events planned for March 1980:

5th March, J. J. Fallon of MK Electric will present "Standardisation of the proposed international plug and socket system" at the Duke of Cornwall Hotel, Millbay Rd, Plymouth, at 8 p.m.

17th March, "Robots and telechirs for Industry", presented by Prof. M. W. Thring at the IEE Building, Savoy Place, London, at 6 p.m.

20th March, G. W. Lord, Merlin Gerin (UK), will present "Up-to-date development in moulded case circuit breakers", at the Y.E.B. Staff Restaurant, 161 Gelderd Rd, Leeds 12, at 2 p.m.

27th March, "Lasers and their uses" will be presented by J. Dawson of the REME School of Engineering, at the REME School of Electronic Engineering, Aborfield, Reading, at 7.30 p.m.

28th March, G. Simpson, Champion Fire Defence Ltd, will lecture on "Developments, standards and future of automatic alarm systems" at the Royal Dublin Hotel, O'Connell St, Dublin, at 8 p.m.

The IERE propose to hold the following conferences in 1980: 22-25 April, "The electronic office", at 99 Gower St, London WC1; 3-4 July, "Re-training in the electronics industry for the microprocessor age", at 99 Gower St, and 16-18 Sept., "Electromagnetic compatibility", at the University of Southampton.

The IEE will be running a conference on "Radio transmitters and modulation techniques" from 24 to 25 March, 1980. The conference programme and application forms are available from the IEE, Savoy Place, London, WC2. Hotel booking forms are available from Exp-O-Tel, Strand House, Great West Rd, Brentford, Middlesex.

The 22nd International Festival of Sound will be open to the public from Wednesday 5th to Sunday 9th March 1980 at the Palais des Congres, Porte Maillot, Paris. Doors open from 10 a.m. until 8 p.m., open late on Saturday the 8th — until 10 p.m. Trade days are from 2nd to 4th March inclusive. On Monday 3rd March two conference debates will be held on the subjects "tapes and high fidelity" and "standardization and high fidelity".

An exhibition to mark the 50th anniversary of Baird's 30-line tv transmissions from the BBC's transmitter at Brookmans Park (March 1930) is being staged by the Science Museum, Kensington, beginning 27 March 1980, running for six months.

The show is called "The Great Optical Illusion" and the introductory exhibit will illustrate first principles of television. The "illusion" theme will be set up by other demonstrations, including "chromakey", an electronic overlay method which will show visitors as performing a feat of aerial daring, while "front axial projection" will insert them optically into a projected scene.

There will be a range of exhibits outlining the development of television since the opening of the 405-line service in 1936 and period room settings will show a montage of contemporary programmes on restored receivers of appropriate vintage; these will include a pre-war receiver with a five-inch tube and a projection set of the early 'fifties.

Frequency change for BBC's Ventnor Radio 3 Transmitter

In order to escape interference from the French transmitter at Caen in Normandy, the BBC's Ventnor v.h.f. transmitter has changed frequency (on 1st February). The previous frequency of 91.6MHz has been changed to 91.7MHz, but no change will be made to the shared Radio 1/2/4 frequencies also relayed by this transmitter.

The station is located at St. Boniface Down, on a height above the town, serving about 6,000 people in the Ventnor and Bonchurch area and also relays the tv services of BBC1, BBC2, and ITV on 625 lines (u.h.f) and the 405-line BBC1 service. Listeners will only have to change the tuning of their receivers by a very small amount.

More frequency allocations

WARC 79 decisions for 10GHz to 275GHz in Region 1

Last month we published a list of frequency allocations, as decided at the 1979 World Administrative Radio Conference. Geneva, for radio services up to 10GHz. We now present the remainder of the frequency allocations made at WARC 79, from 10GHz up to 275GHz. This, of course, is the microwave region of the electromagnetic spectrum (centimetre and millimetre wavelengths) and is occupied mainly by services such as radar, satellites, and radio astronomy. These highly specialized activities are of interest to only a small number of Wireless World readers, but in fact this 10-275GHz region is also available for amateur radio, while the satellite allocations include broadcasting satellites, which of course will eventually bring new types of domestic. receivers and aerials to homes everywhere (see January 1979 issue, pp 38-

As in the February issue, the list is restricted to Region 1 as defined by the International Telecommunication Union (Europe, Africa, Middle East and Russia) and does not include the numerous footnotes giving additions, qualifications etc for particular countries. Nor does it distinguish between the three categories of service, primary, permitted and secondary (see February for definitions); but as a rough guide the first code letter, to the immediate right of the frequency band, is almost always a primary service, while the remainder. reading from left to right are divided among primary, permitted and secondary services in that order. Where secondary services are allocated they are always on the extreme right.

In the previous frequency plan, embodied in the Radio Regulations resulting from the WARC of 1959, the following bands were not allocated to any services: 48-50GHz, 71-84GHz, 152-170GHz, 200-220GHz and 240-250GHz. It will be seen from the list that these are now occupied. Neither the 1959 nor the 1979 conference attempted to allocate anything to the region above 275GHz (which, after all, goes into wavelengths of less than a millimetre) but this remains available for individual governments to permit experimentation. In particular a need has been identified for making spectral line measurements at various frequencies from 278GHz to 381GHz.

An outstanding feature of the present list is the large amount of spectrum space now allocated to satellites communication, broadcasting, Earthexploration and so on. It will be seen from the key to the code letters that, of the traditional categories of terrestrial radio services (fixed, mobile broadcasting, amateur etc.), there are now seven which also have a corresponding service provided through satellites. The coming of the satellite was first recognized officially by the ITU at an Extraordinary Administrative Radio Conference in 1963 and there have been others devoted to satellites since then. The results of a 1971 space conference were already embodied in the Radio Regulations before WARC 79 took place, and now, following WARC 79, three further ITU conferences devoted to space services have been planned or

As we reported earlier, the UK Home Office had recommended that allocations for communication satellites should be increased in the 10-11GHz band. This proposal has in fact been generously implemented by a doubling of the spectrum space available. The original allocation was 500MHz, split into two separated bands at 10.95-11.2GHz and 11.45-11.7GHz, but now, as will be seen from the list, there is a new, uninterrupted 1GHz band from 10.7 to 11.7GHz in which, in fact, communication satellites are a primary service (although this band is shared with fixed and mobile primary services). In the space-to-Earth direction of communication this is a world-wide allocation. In the Earth-to-space direction, however, for Region 1 countries this band is also reserved for use by feeder

*The first, in mid 1983, will be a Regional Administrative Radio Conference for detailed planning (channel assignments, orbit positions etc.) of broadcasting satellite services in the 12GHz band and associated uplinks in Region 2. The second, in late 1983, will be an Administrative Radio Conference for planning uplinks to broadcasting satellites operating in the 12GHz band in Regions 1 and 3. The third will be a World Administrative Radio Conference for space services in general; it is expected to be held in two sessions, possibly in Autumn 1984 and early 1986, but detailed arrangements will be decided later by the ITU.

links ("uplinks") to broadcasting satellites (see later).

The needs of the maritime mobile-satellite as well as the aeronautical mobile-satellite services have been provided for and as a result these systems will be able to develop without hind-rance. Also, in principle, it was agreed to provide for the feeder links to these services in the bands allocated below 10GHz. A mobile-satellite service has been introduced and frequencies have been provided for this.

Passive sensing in the Earth exploration-satellite and space research services have been identified as important activities in the future, so provision has been made for these services. Furthermore, in some parts of the spectrum where the fixed and mobile (except aeronautical mobile) services operate under a footnote provision, agreements have been reached to either limit or phase out the fixed and mobile services over a period of time with the intention of providing exclusive bands for the passive services. Increases have been made to the spectrum space allocated to Earth exploration satellites and space research. In addition, provision has been made for the operation of radars on board spacecraft in these services (e.g. in the band 35.5-35.6GHz).

Key to code letters in list

Amateur

| AR | Aeronautical radionavigation |
|------|------------------------------------|
| AS | Amateur — satellite |
| В | Broadcasting |
| BS | Broadcasting — satellite |
| BSL | Broadcasting satellite feeder link |
| F | Fixed |
| FS . | Fixed — satellite |
| IS | Inter satellite |
| ISM | Industrial, scientific, medical |
| LMS | Land mobile — satellite |
| M | Mobile |
| MA | Meteorological aids |
| MS | Mobile — satellite |
| RA | Radio astronomy |
| RL | Radiolocation |
| RN | Radionavigation |
| RNS | Radionavigation - satellite |
| S | Space research |
| SAT | Earth exploration satellite |
| SFTS | Standard frequency and |

time signal - satellite

Additional spectrum has been allocated to the fixed-satellite service in the Earth-to-space direction near 100GHz, keeping in mind the allocation to the broadcasting-satellite service in the band 85-86GHz (see later).

WIRELESS WORLD, MARCH 1980

The pattern of allocations to the inter-satellite and the fixed-satellite services follow, in general, that laid down by the 1971 space conference, i.e., with the former concentrated in the absorption bands so as to take advantage of the atmospheric attenuation to

provide shielding between the space and the surface (or low-altitude) systems, and the latter located in parts of the spectrum between the absorption bands.

In certain combinations of space and terrestrial services the conference concluded that there was inadequate information on sharing. Footnotes were therefore added to reflect this uncertainty and the subjects were referred to the CCIR for further study.

The three bands for direct broadcast-

Table of frequency allocations for Region 1

| GHz | Services | GHz | Services |
|----------------------------|----------------------|--------------------|-------------------------|
| 10.0-10.45 | F, M, RL, A | 36.0-37.0 | SAT, F, M, S |

ing from satellites remain substantially unchanged. 11.7-12.5GHz is completely unchanged (and it will be recalled that 40 channels within this band were assigned at the 1977 satellite brandcasting conference - see January 1979 issue, p.41). However, the original 41-43GHz satellite broadcasting band has now been shifted slightly downwards to 40.5-42.5GHz. This has been done to give better clearance for various radio astronomy frequencies around 43GHz which are used for spectral observations of silicon monoxide. Furthermore the band is now shared with three other services - terrestrial broadcasting (on a "permitted" basis) and fixed and mobile communications (secondary basis). The third band for satellite broadcasting, 84-86GHz, is unchanged in its band limits, but, whereas in the 1977 frequency plan written into the Radio Regulations it was exclusively for this use, it is now shared with primary fixed, mobile and terrestrial broadcasting services. (Although there is a footnote saying that these three must not cause harmful interference to broadcasting satellites to which frequencies are assigned.)

What is completely new in relation to broadcasting satellites is the set of frequencies chosen for the uplinks to them - the communication channels which convey the programme signals to the satellites' transmitters. These were not planned at the 1977 space conference. At WARC 79 a wide range of proposals came from different countries. For example, the official British proposal was 21.2-22GHz (which the Scandinavians objected to because of rain attenuation at their northern latitudes), while the Indian proposal was 14.5-15.35GHz (which the USA and UK objected to because it conflicted with fixed communication services including military systems). In the end a world-wide compromise was found which did not conflict too seriously with the other services sharing allocations with it (see list), and this was 17.3-18.1GHz. At the same time the door was left open for two other bands to be used in particular areas. Outside of Europe and for Malta, 14-14.8GHz may be used for the uplinks, with the lower end, 14-14.5GHz, "subject to co-ordination with other networks in the fixedsatellite service". And in Region 1, the uplinks may, as mentioned above, use the new 10.7-11.7GHz allocation which is otherwise intended for communication satellites, fixed and mobile services.

An unusual type of satellite uplink, pioneered by the IBA in Britain, is a road transportable earth station on a trailer designed for sending television outside broadcasts from any location straight up to a communications satellite (see picture in January issue, p. 42). It has already been used, in fact, with the OTS satellite. Largely through the IBA's initiative, supported by the BBC, a decision was made at WARC 79 to allocate

www.americahradiohistory.c

Radio amateurs will note that amateur satellites have received an allocation at 10.45-10.5GHz. This is worldwide and on a secondary basis, the primary service in this band being, of course, 3cm radar. The amateur and amateur satellite bands between 24 and 24.25GHz remain unchanged. There is a new amateur and amateur satellite allocation at 47-47.2GHz (6mm), two more at 75.5-76GHz (primary) and 76-81GHz (secondary, sharing with radar), and a further linked pair in the 2mm wavelength region at 142-144GHz (primary) and 144-149GHz (secondary). The highest amateur bands of all to be allocated are in the previously unoccupied region 240-250GHz, and are at 241-248GHz (on a secondary basis) and 248-250GHz (primary basis), both including a satellite service. These are all somewhat different from the UK proposals for the amateur service taken to Geneva by the Home Office (December 1979 issue, p. 62).

Three new bands have been designated for ISM (industrial, scientific, medical) applications. Two significant factors in these allocations are (a) that the bands are in harmonic relationship and (b) that the use of the bands is subject to special authorization by the government of the country concerned in agreement with other administrations whose radiocommunication services might be affected.

Radiolocation allocations have been made in two distinct groups - in the absorption bands for shorter range systems with a high potential for frequency re-use, and in the radio "windows" between those bands for longer-range systems.

Additional spectrum has been made available to radio astronomy, with recognition of the nature of the observations, e.g. spectral lines. The requirement to observe emissions from extraterrestrial sources has been accepted and frequency bands are identified where these observations are likely to be made.

It will be noticed that numerous allocations for the fixed and mobile communication services run right through the list, up to the very highest frequencies. According to one Home Office official, this was the result of certain countries being "obsessed" with making their mark on the frequency plan, regardless of whether these frequencies could actually be used or not with current available technology.

Acknowledgment. We are indebted to Dr G. J. Phillips, BBC Research Department, for a great deal of help in the preparation of this article.

Radio and Electronic Laboratory Handbook, by M. G. Scroggie, is probably far too wellknown and respected to need much introduction. It has changed considerably, however, in the forty years since it was first published, having been continually revised to keep pace with accelerating change in the industry. It is now in its ninth edition, this one updated largely by G. G. Johnstone.

The plan of the book remains the same, information on measuring equipment being concentrated in the first half. Measuring techniques take up most of the second half of the book, and the already large reference section is extended for this edition: the piece on filter design is particularly useful. Throughout the text, references to the literature are lavishly scattered. The book is published in hard back at £17.99 by Newnes-Butterworths, and contains 592 pages.

Frequency Engineering in Mobile Radio Bands, by W. M. Pannell. Continuous expansion of land mobile radio communication makes it essential to plan allocations inside a frequency band in such a manner that interference is kept to a low level and that the spectrum is used to its fullest possible extent. The book is intended to help in the early stages of frequency planning, and is in two sections, the first dealing with general procedures and the second of a more specific nature. Mr Pannell has many years of experience in the mobile radio field, and was responsible for the Pannell Report on future spectrum requirements for mobiles in the UK. Published in hard back, at £25.00 by Granta Technical Editions, Hargrave Lodge, 7 Brooklands Avenue, Cambridge.

Audio Equipment Tests, by Gordon J. King, is intended to demonstrate the performance testing of high-fidelity sound equipment to technicians, dealers and those users who take an interest in the technicalities of their equipment. Each component of an audio chain from f.m. tuner (no a.m.) to loudspeaker is allotted a number of test procedures with a list of equipment needed, a diagram of connexions, the procedure to follow and a few clarifying remarks. The author has a long experience of writing on hi-fi subjects for the audio magazines, and of reviewing audio equipment. The book is published at £6.50 by Newnes-Butterworths, Borough Green, Sevenoaks, Kent, and has 158 pages.

BBC Handbook 1980 is now on sale. It is similar in format to earlier editions and contains the familiar tightly-packed mass of information on technical, artistic, commercial and political subjects in the broadcasting field. It is published in limp back at £3.00 by the BBC, 35 Marylebone High Street, London W1M 4AA.

The Einstein Myth and the Ives papers is, not surprisingly, an attack on Einstein's theories of relativity and a substitution of the ideas propounded by Herbert E. Ives of Bell Labs. About half of this substantial book is a series

of papers and a lecture by Ives, the rest consisting of The Einstein Myth, in which one of the editors, Dean Turner, puts the case for a universal 'nowness' or simultaneity. He argues for the reality of space and time, eliminating, among other concepts in relativity, the Twins Paradox. Papers and notes by other scientists take up the rest of

In essence, Ives replaces Einstein's principle of covariance (which says that physical laws must apply to systems in any kind of motion, including acceleration) with a restricted theory, in which gravitational and kinetic energy are equivalent. The book is easy to read, and seems to be aimed as much at the layman as at the physicist, only in isolated places becoming mathematical, and even then merely algebraic. The book is in hard back, is A4 sized, contains 447 pages and is published at 22 dollars 50 cents by The Devin-Adair Company, Old Greenwich, Connecticut 06870, USA.

Radio Enters the Home is a reprint, by Vestal Press, of the 1922 catalogue of RCA receiving equipment. In common with most catalogues, it contains full descriptions and illustrations of contemporary wireless sets and, most usefully, a large number of circuit diagrams of 1922 commercial receivers. The first few pages demonstrate the novelty of 'wireless', being illustrated with photographs of groups of people staring fascinated at loudspeakers as though expecting a materialization, and of malevolent infants being tranquillized by a bedtime story.

The sets described range from the Model ER-753 crystal receiver at 18 dollars to the Aeriola Grand valve detector, amplifier and loudspeaker model, complete with battery, charger, aerial and stand and covering 150-550m at a cost of 409 dollars.

In 1922, the catalogue cost 35 cents: now, it is published by The Vestal Press, 320 N. Jensen Road, PO Box 97, Vestal, NY 13850, USA at 12 dollars 50 cents, plus postage.

Entertainment Year Book

What used to be simply the Hi Fi Year Book has now been extended in scope to include reference material on colour television sets, electronic organs, video cassette recorders and television games. This is in addition to the familiar illustrated information on current audio products, including descriptions, technical data, prices (where available) and suppliers' names, addresses and telephone numbers. There are four survey articles on various audio topics. The 1980 "Hi Fi Year Book & Home Entertainment" contains over 580 pages and can be obtained from booksellers at £3.75. Alternatively it can be obtained directly from the publishers, IPC Business Press Ltd, by writing to the General Sales Manager, Room CP34, Dorset House, Stamford Street, London SE1 9LU and sending £4.25 which includes packing and pos-

if you are desperate.

solder, a heat sink and a booklet, 'How to Solder'. Priced at £5.95 (1.53)

cable and battery clips.

Packed in a strong plastic
envelope it can be left in a
car, a boat or a caravan ready
for soldering in the field.

Our new auto-ranging digital multimeter won't take a second

The trouble with most auto-ranging DMM's is that they are comparatively slow to respond. Which let's face it rather defeats the object of an auto-ranging facility.

Avo have changed all that with the new

Avo DA117 which has a response time of less than a second on d.c. and resistance ranges. Indeed, even on the a.c. range the DA117 will respond in less than three.

The Avo DA117 has many other fine features. A large, easy-to-read

1,025 Ma

31/2 digit liquid crystal display with automatic indication of decimal point and the unit of measurement - so reading errors are virtually eliminated. There is automatic polarity indication for d.c. measurement, visual displays for when

There is also a range-up or range-down facility incorporated for manual range selection.

So now you have a choice of digital multimeters from Avo. The DA116 - for accurate

manual operation; and the DA117 which does the same thing automatically.

Contact your usual Avo distributor for further details, or call us direct. We'll be quick to respond.

Maxwell's equations revisited

A critique of orthodox electromagnetic theory

by Ivor Catt. CAM Consultants

"It was once told as a good joke upon a mathematician that the poor man went mad and mistook his symbols for realities; as M for the moon and S for the sun."

Oliver Heaviside, Electromagnetic Theory, 1893, volume 1, page 133:

". . . the universe appears to have been designed by a pure mathemati-

Sir James Jeans, The Mysterious Universe, 1931, page 115.

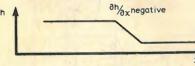

Faraday's Law of Induction, $v = -d\phi/dt$, seems to imply:

1. A causality relationship; the rate of change of magnetic flux through a surface causes a voltage around the circumference of the surface.

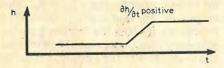

2. A reluctance, or resistance to the change of magnetic flux indicated by the minus sign.

A careful analysis of this one equation will give an insight into the bogus nature of contemporary mathematical operations in electromagnetic theory. First let us discuss the minus sign, which leads us to the idea of a Lenz's Law reluctance, or resistance, to the change do/dt. We shall see that a minus sign can occur in an equation when no causality can be involved.

Consider a high speed (125) railway train with sloping front passing an observer. As the front face passes, the observer will see a negative slope $\partial h/\partial h$ dx as shown below. However, if the

observer had watched the event through a narrow slit in a fence, he would have seen a rising edge $\partial h/\partial t$, as shown here.

It would be absurd to suggest that there was a causality relationship between $\partial h/\partial x$ and $\partial h/\partial t$. They are both descriptions associated with the passage of the train. Since Newton, it is accepted that a body continues in its state of uniform motion without a continuing cause, or push. (However, this principle is taking a long time to be applied to electromagnetic waves.)1,2

Now we regard the velocity of the train $\partial x/\partial t$ as positive. This creates an anomaly when we want to write the equation

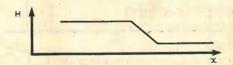

$$\frac{\partial h}{\partial x} \cdot \frac{\mathrm{d}x}{\mathrm{d}t} = \frac{\partial h}{\partial t} \tag{1}$$

because the left hand side product is negative when the right hand side is positive, as in the case of the leading face of the train.

This kind of absurdity, or anomaly, is ignored when Newton's Laws are considered. It is reasonable to do so, because Newton's Laws are close to common sense and the obvious. Common sense will prevent absurd conclusions from creeping into a Newtonian theoretical framework, even though the mathematical formulation of Newton's Laws has always been slovenly in this respect.* (Another perhaps permissible slovenly aspect is the use of the = sign for numerous different, mutually contradictory meanings.)

Maxwell's Equations are not in the. same class. Common sense will not save us from absurdity and nonsense if our initial formulations are ambiguous or wrong.

Let us consider an electromagnetic wave front advancing at the speed of light. When the step (or more accurately ramp) passes, as shown here

 $\partial H/\partial x$ is negative. However, $\partial H/\partial t$ for the step is positive. To get the algebra right, we are forced to conclude that

$$\frac{\partial H}{\partial x} \cdot \frac{\mathrm{d}x}{\mathrm{d}t} = -\frac{\partial H}{\partial t} \tag{2}$$

However, no one would propose that the minus sign indicated a causality relationship between $\partial H/\partial x$ and $\partial H/\partial t$.

The last equation never appears in the text books. In the books, one of the terms is first converted into a function of E according to the formula

$$\frac{E}{H} = \int \frac{\mu}{\epsilon}$$

The result is either

$$\frac{\partial E}{\partial x} = -\frac{\partial B}{\partial t} \tag{3}$$

$$\frac{\partial H}{\partial x} = -\frac{\partial D}{\partial t} \tag{4}$$

The text books say the "solution" to this pair of equations is a sine wave! See references 3 to 7. (In fact, almost anything is a solution to these equations.)

At this stage, the whole subject starts to look sophisticated and profound. Really it is neither. The minus signs have no significance, as we have seen. B and D are introduced on the r.h.s merely to suppress μ and ε using the formula

$$\frac{E}{H} = \sqrt{\frac{\mu}{\epsilon}}$$

In fact, the last two equations (3), (4) are meaningless. If the front end of the high speed train were pointed, sloping out sideways as well as upwards, and w were the term given to width (as H stands for height), exactly the same pair of equations could be constructed.

$$\frac{\partial w}{\partial x} = -\mu \frac{\partial H}{\partial t}$$

$$\frac{\partial H}{\partial x} = -\epsilon \frac{\partial v}{\partial t}$$

As with e-m theory, we could conclude with equal validity that a train's height (and width) must vary sinusoidally along its length, making our trains look like the Loch Ness monster, or more accurately, like a row of short sausages, as shown here.

It is shocking that this nonsense has survived for a century at the core of a subject as crucial as electromagnetic theory. We see now that mathematical formulation of e-m theory, far from making the subject more rigorous, has

^{*} Even the brilliant philosopher Ernst Mach failed to notice this anomaly.

made it ludicrous and false. We see that the mathematicians are incompetent where physical reality is concerned and hide their incompetence and confuse others by conjuring up nonsensical, interrelated formulae.

When Hertz established that electromagnetic waves existed, Maxwell's equations should have been reexamined, and the large rubbish element removed. Instead physically ignorant mathematicians took over, piling garbage on garbage, frightening away those with real insight into the subject – the latter-day Faradays.

Those who try to build extensions, or additions to, the House of Newton should not assume that since the foundations were good enough for Newton's simpler theory, they are strong enough to support their own more complex constuctions. Minkowski's failure to re-examine the foundations of Newton, in particular his assumption that velocity is positive and the passage of time is positive, makes his constructions useless in the same way as Maxwell's equations are useless.

In the Minkowski sense⁸ time really flows from $+\infty$ to $-\infty$, not, as he thought (and our clock faces, with their ascending sequence of numbers, think), from $-\infty$ to $+\infty$. Velocity, being the gaining of distance in return for the loss of time, is negative. This points to a fundamental difference between space and time, and means that the "spacetime continuum" as Minkowski formulated it is bogus. At best, we see his pronouncements as oracular, similar to the answer that Delphos gave when being asked about the sex of an unborn child, "Girlnoboy". This remark could well be interpreted as true, but really it has no content.

Einstein failed to consider the problem of the sign of time and of velocity. Also⁹, he never succeeded in fighting his way through the mass of mathematical garbage surrounding electromagnetic theory.

Impedance mismatching

continued from page 59

Thus, for maximum power transfer efficiency from the Norton source, the load must be such that $R_{\rm L}/R_{\rm s} \rightarrow 0$ (the opposite of the voltage source case). A similar set of arguments to those used above can be used to show that the expression for η is meaningless unless the actual circuit is a simple current source with source impedance.

Despite the fact that Thevenin/ Norton equivalent sources do not allow calculation directly of the transfer efficiency, it is perfectly true that to attain maximum power transfer into a load, the load impedance should be chosen to match the Thevenin or Norton source impedance (they are the same) but to say that this means 50% of the power from the source is lost in the source resistance is in general not true; often the power loss in the source resistance is higher!

Despite the cautions outlined in this paper the notion of transfer efficiency is not without its uses, since a number of

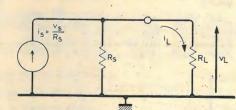

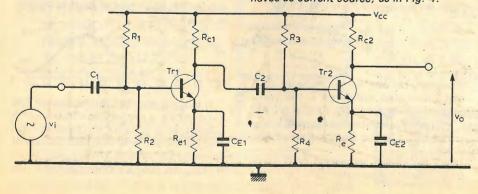

Fig. 4. Current equivalent to Fig. 1.

Fig. 5. Amplifier inter-stage coupling behaves as current source, as in Fig. 4.

frequently encountered circuits behave as true Thevenin or Norton circuits; for example, the common emitter amplifier shown in Fig. 5. Neglecting the biasresistance loading effects and assuming that all capacitors are short circuits, the mid-band voltage gain is given approximately by

$$\begin{split} A_{\rm v} &= \frac{v_0}{v_{\rm i}} \left(\frac{-R_{\rm c2}}{r_{\rm e2}} \right). \quad \left(\frac{-R_{\rm c1}\beta_2 r_{\rm e2}}{R_{\rm c1} + \beta_2 r_{\rm e2}} \right). \left(\frac{1}{r_{\rm e1}} \right) \\ A_{\rm v} &= \left(\frac{R_{\rm c2}}{r_{\rm e1}} \right) \quad \left(\frac{\beta_2}{1 + \frac{\beta_2 r_{\rm e2}}{R_{\rm c1}}} \right) \\ A_{\rm vmax} \sim \left(\frac{R_{\rm c2}}{r_{\rm e1}}. \beta_2 \right), \end{split}$$

which occurs when the input impedance of Tr_2 is much less than the collector resistance of Tr_1 , i.e. $\beta_{2^{\text{re}2}} \ll R_{\text{cl}}$. The output of Tr_1 is a current source of impedance R_{cl} and the Norton transfer efficiency result obtained above tells us that $R_{\text{L}}/R \to 0$ for good transfer efficiency, i.e. $\beta_2 r_{\text{e2}}/R_{\text{cl}} \ll 1$.

In conclusion, I would stress that extreme care should be taken to interpret the components of a Thevenin or Norton equivalent circuit correctly especially in deriving expressions for losses in power transfer.

Microwave intruder detector — 2

Design with good interference rejection and noise monitoring

by K. Holford, C.Eng., Philips Research Laboratories

This design provides a simple but effective circuit which uses a cycle counting scheme to prevent the alarm being triggered by short movements or pulses. The circuit has excellent interference rejecting properties. A noise monitoring circuit is described that allows the alarm to be set up easily and reliably in terms of a low false-alarm probability.

The complete intruder alarm circuit designed for use with the Mullard CL8960 module is shown in Fig. 9. It requires a nominal 12 volt power supply able to produce at least 300mA during switch-on but in general less than 200mA unless a high current relay is used (about 160mA plus the relay). This supply can be a car battery with the usual voltage variation during charging such as up to 16 volts. The minimum voltage is safely 11 volts with a 7.5 volt V_a (or 10.5 volts with a 7.0 volt setting). With a selected 748 as in the text, this can be reduced by up to another 0.5 volts. However, with supply ripple, these represent an alarm risk level and should be avoided.

Supply ripple within these restrictions can be up to 1V pk-pk without affecting performance and some prototypes have tolerated 5V pk-pk with a 13 volt supply and a V_g of 7.5 volts.

The radar sensitivity is limited en-

tirely by that of the microwave module, afterwards just called a module, rather than the circuit design. However, to realise this, due regard must be paid to the use of short screened leads at the amplifier input, because of the gain the circuit has to 50Hz and 100Hz signals.

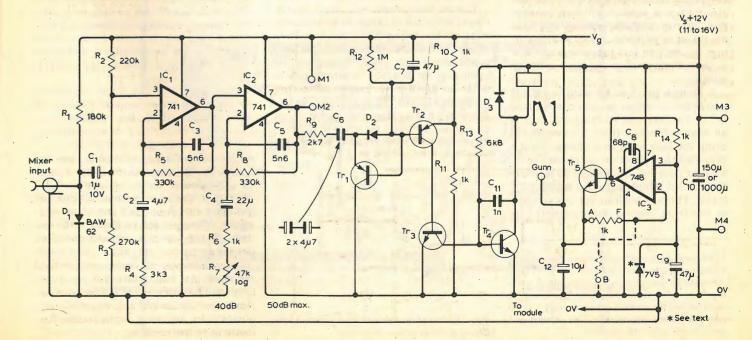

Two 741 op-amps are used as the main Doppler amplifier. These can be a single (twin) 747, if required. Thus the complete circuit uses one 1.5 watt power transistor, four small transistors and three cheap i.cs. Much of the circuit is directly connected which saves on components.

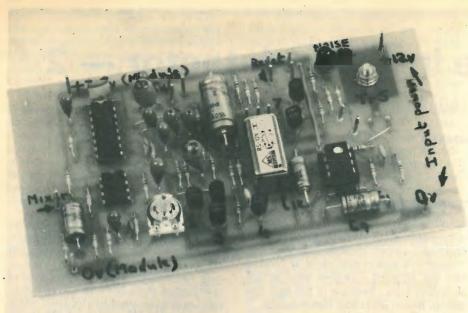

The microwave module requires some cautionary remarks because the mixer contains a diode of extremely small electrical proportions so as to respond to the 10.687GHz frequency. If the mixer, or its lead to the amplifier, is touched with a measuring lead or an object which has not been grounded to the module metalwork it could be destroyed by static discharge. If a shorting clip across the mixer is supplied leave it in situ until connections have been made.

Fig. 9. Components: Tr_1 , BC557, Tr_3 , Tr_4 , BC547 or BC107, Tr_5 , BC135 or BFY51, with $50^{\circ}C/W$ fin. Capacitors: Bead tantalum maximum leakage C_4 , $2\mu A$, C_7 $1\mu A$ at t_{max} . Resistors: all 0.1W. R_2 and R_3 are 2% the rest 5% or could be 10%

Connect the module to the amplifier circuit as follows. Use a screened input lead and make the amplifier connection first. The braid is connected to 0V at only the amplifier end. Keep exposed unscreened ends down to about 12mm. Next make the amplifier 0V connection to the module 0V metalwork. Then clip a lead with crocodile clips between the soldering iron bit and the module metalwork to equalize potentials. If the iron is not earthed, make a second lead between the module and earth. The lead from the amplifier which is to be connected to the mixer should now be touched on the module metalwork just prior to connection. Maintain one finger on the metalwork while the joint is being made to discharge and prevent the build-up of static also on the solder. Remove any shorting clip while the metalwork is being contacted and after making the connections.

Should it be necessary to measure the mixer direct voltage while it is working contact the metalwork beforehand and while the leads are being handled; but make the 0V connection first. To ensure no static, fit a $10k\Omega$ resistor to the end of the measuring lead and touch on the metalwork just prior to the measurement. Mixer failure is evident by loss of sensitivity and by little or no direct voltage when passing a direct current, such as the $40\mu A$ bias current.

Circuit description

The circuit supplies about $40\mu A$ of current via R $_1$ for mixer d.c. bias. Mixer bias will be about 300mV with no microwave energy and ideally about half this with the optimum mixer power. However, voltages from about 90 to 270mV with a 300mV diode will only cause a 1.5dB loss in signal-to-noise ratio at the extremes but require 5dB more gain for the same signal at the upper bias point. Observe the precautions mentioned when measuring mixer voltage to avoid static discharge damage; nothing must inadvertently touch the live mixer-to-amplifier lead.

The mixer power for the CL8960 is obtained by leakage across the two waveguides outside the module. Thus during measurement it is best to point it upward and have no obstruction in front for at least 300mm. Covering the module requires special material (see data sheet) which is near-transparent to microwayes.

A hand moved slowly at about 150mm in front of the module should move the bias by a few tens of mV and confirm that microwaves are present and that the mixer is probably good. A bias voltage of 50mV or less together with 5mV or less of movement suggests a faulty mixer.

A 2mm screw can be used to reflect power and to either set the correct bias or, at another spaced distance, cancel an over-reflection from a covering to bring the bias back to a correct level,* provided the reflection is not excessive, such as causing the voltage to be more than about 100mV negative without the screw. The best position for this screw is in the front shroud supplied with the

*The intended optimum mixer power will occur naturally if the module is bolted to a 160×43mm aperture in a 1/16in plate, such the side of a box, provided the plate is sandwiched between the front shroud, Fig. 10 and the rest of the module. The shroud and module are supplied together.

module, Fig. 10, at a position in line with the centre web, such as between 4 and 8mm out from the shroud-to-module interface joint (without the plastics cover).

The supply voltage to the amplifiers is also used for the Gunn microwave oscillator in the module and so should lie between 7.25 and 7.75V. Lower voltages than 7.0V may not allow the oscillator to work properly, although will cause no damage. Voltages above 8.0V risk damage; the life at 10V can be just a few seconds. Thus the 7.5V line should be checked before connection.

Using a 7.5V zener diode with IC $_3$ will usually produce a voltage within the above spread. Lower voltages can be corrected using the $1 \mathrm{k}\Omega$ resistor across link AF, with a second resistor of higher value across FB. For instance a $10 \mathrm{k}\Omega$ resistor will raise the voltage by about 10%. No adjustment exists for too high a voltage other than changing the diode. Alternatively a 6.8V zener may be fitted, in which case the resistor FB will lie between about 3.9 and $18 \mathrm{k}\Omega$.

The module produces audio frequencies in response to radial movement, the relationship being 32Hz per 1 mile/h. Movement across the 140° beam will produce a much lower frequency, or even zero at perfect constant radius with no change in target reflection properties during the movement. Range depends on the target size and is about 10 metres or could be more if C₂ were increased and R₄ decreased. But a high

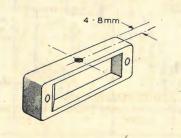

Fig. 10. Mixer power can be adjusted by fitting a 2mm screw in shroud.

◆ Circuit board for combined alarm and monitor circuits of Figs. 9 & 11 includes noise indicator on board for demonstration use Board pattern appears on page 81 with location diagram on page 84.

sensitivity has false alarm risk due to extraneous movement.

Signals from the module are coupled in via C1 and amplified by IC1 and IC2 to produce a clipped "square" sinewave of 4 to 5V pk-pk amplitude out of IC2 or less at long range. This drives the following circuit which counts beat cycles and is set to alarm when the voltage across C, reaches about four volts. This will take about 600mm of travel with C7 of 47μF or 300mm with 25μF. Capacitor C₆ is used as a bucket to discharge into C₇ once for each beat cycle. A cycle occurs for each 14mm of radial distance change towards or away from the radar. The larger C7 the greater one singlemovement distance can be before an alarm is given. The method affords protection against an alarm from odd spurious pulses and short single events.

The result of movement is stored in C_7 to prevent an approach by a series of short movements. The memory is discharged by R_{12} to prevent built up to an alarm by odd spurious events. C_7 will ideally have a leakage current less than R_{12} for a long storage time. At four volts $(4\mu A \text{ per } 1M\Omega) \text{ Tr}_2$ and Tr_3 will conduct and Tr_4 will be turned off thus setting the contacts for an external alarm.

The floating change-over contact is intended to be used for a more powerful external relay operating an audible warning device such as a bell or door opener. The relay is a low current type to preserve battery life during mains failure and its contact rating must be observed. If this is not required a more powerful relay may be fitted with a coil current up to 100mA. A diode across the relay absorbs inductive voltage and protects the transistor at switch off. If a relay is used with this already fitted, the coil must be connected the correct way round, otherwise both the diode and the transistor may be destroyed. A shorted diode will mean a useless relay unless it can be burnt away.

Sensitivity is set by R_7 , which should be a log.-law potentiometer for smooth control and with the low resistance end the last to be shorted. A standard log. pot. will increase gain anti-clockwise.

The d.c. working point of IC₁ and IC₂ is set by 2% tolerance resistors R₂ and R₃. The design centre voltage from IC₁ and IC₂ is 3.9 to 4.4V with a 7.5V line and roughly in proportion for other voltages. Voltages above about 4.8V can infrequently occur due to end-of-spread leakage current in C₂ and C₄ and if this happens a selected component should be used. An inaccurate d.c. level will limit the output voltage swing from IC₂. Leakage has limited the value of these capacitors and they would otherwise have been increased by a factor two.

Setting the sensitivity

Setting the sensitivity can be done using an oscilloscope, but the noise monitor circuit of Fig. 11 is strongly recommended. The alarm starts to operate when the signal output from IC₂ reaches 1.5V pk-pk and 2.0V pk-pk will usually lead to an alarm. The sensitivity should be set for no more than 0.5V pk-pk from IC₂ to leave a margin for unforeseen events. This noise level will be entirely due to extraneous disturbance as the noise level of the alarm itself in a perfectly "quiet" room with the circuit values shown will be several times less than this.

Setting the sensitivity without either an oscilloscope or the circuit of Fig. 11 is more difficult if it is important that a false alarm should not occur. By shunting R_{12} with $100k\Omega$ the memory can be shortened and an indicator l.e.d. can be fitted to the relay contacts and a walkabout test carried out. Fitting the 100kΩ' will shorten the memory time to five seconds to 37% of previous movement stored in C₇. However, to be sure that there will not be a build up to an alarm with the 100kΩ removed the gain of the amplifiers really needs to be increased by 3 or 4 times or more as a test. This could be done by reducing R4 to, say, 1kΩ and increasing C2 to 22μF to maintain the low speed response, but precautions must be taken to see that an alarm is not false due to the introduction of hum with long unscreened wires and that the leakage of the 22µF does not cause the voltage out of IC, to go above 5V.

It is much better, and there will be more reliability, to build the noise monitoring circuit given. This will also monitor the MID environment and give warning that the safety factor is insufficient.

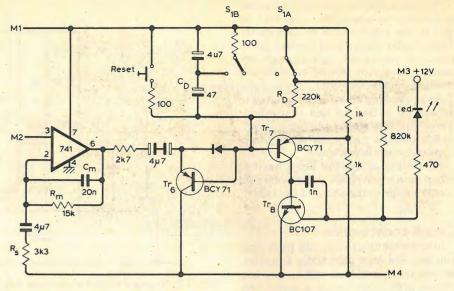

Fig. 11. Noise level monitor uses I.e.d. to indicate when noise level exceeds safe limit as well as simplifying setting-up procedure. Switch is shown in setting-up mode.

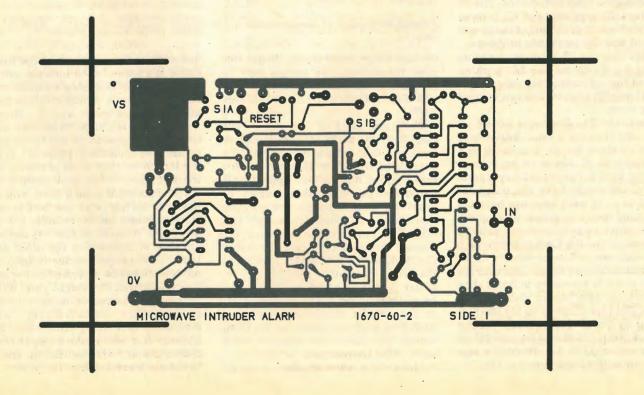

For instance, with a lot of extraneous interference it may be necessary to accept a lesser degree of protection from the alarm and reduce the value of R₁₂. Where the alarm is intended as an automatic door opener the distance walked may be very short and the value of C, may be reduced to, say, 22µF. Storage time is reduced with a reduced C, but also R, can be reduced. Thus the values may be suited to the application. With large values of C,, so as to tolerate a large single infrequent movement without an alarm, the leakage current should be selected to be low so as to get the desired time of storage.

False alarms

The MID circuit should be well screened from 50Hz pick-up and preferably in a metal box with a good fitting lid. There should be no mains transformer nearby to induce 50Hz voltages.

The alarm should not be used in the same room as fluorescent lamps while they are on as the gas in these ionizes at 100Hz to become a fluctuating reflector. Fans inside equipment, having apertures through which microwave energy can pass, will cause signals. These apertures can be screened with gauze of, say, not more than 6mm mesh size, and tested by placing the radar fairly close.

The alarm sensitivity should not be greater than necessary bearing in mind that radar signals grow very quickly as range is shortened. The rate is four times in voltage per range halving and so if a target is detected occasionally at one range it will be detected most positively at half that range.

Flat metal surfaces should be treated as mirrors via which the radar may be able to see a movement or fluorescent lamps, Radar signals pass through glass, although weakened, and through dry plaster board. Any testing must include walking outside windows.

Short flapping movements can lead to an alarm. A flap of less than about 14mm can give rise to one pulse into C. and an extra pulse for each 14mm approach and recede travel.

Movement across the beam has less. effect than when radial and may be used to advantage in the siting of the radar.

Circuit construction

In constructing the circuit treat it as you would a high gain audio amplifier. Screen the input lead and mount the circuit preferably inside a metal box with just the business end of the module protruding. Avoid earth loops and don't spread out the circuit. Insulate the box from the circuit and connect to the 0V line by only a single connection. Ideally the module metalwork would be insulated from the box, but if this is not so the module metalwork is already 0V and no other 0V connection should be made to the box.

If the box is bonded to earth, as preferred, leave the power supply floating. so as to be earthed via the 0V and the box. Preferably use the same bolt to earth the box as used for the 0V connection inside the box. If both must have separate earth wires do not use the box as a conductor for 0V, nor take the earths for the box and that of the power supply to two different ground points.

Avoid long leads in circuit wiring associated with transistor connections because these high frequency devices. can produce h.f. oscillation. In the case of Tr₄ a capacitor of lnF is fitted across it and close to it to prevent this being caused by the relay inductance. The 0V lead from the regulator and IC3 is three separate leads to each part of the circuit to avoid possible earth loop problems.

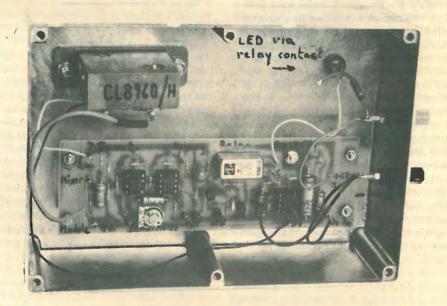

Apart from the 2% tolerance resistors R₂ and R₃, which set the d.c. working point of the i.cs resistor tolerance is not critical and 5% or even 10% can be used if they must.

Transistor Tr₅ dissipates about 1.5 watts and requires a small heatsink of 50degC/watt or better. This could be a fin of say 15 × 25mm or an area of printed board copper of say 12mm square, and could have the transistor bolted to it. In each case use heatsink compound or silicon grease in the joint.

The microwave module can be obtained from RS Components who also send out a licence form with it. Unfortunately they do not deal with the public and it is necessary to find a shop or someone who has an account with them. The cost depends on the mark up put on by the shop. For single units a price of about £33 should be aimed at, as of September 1979. An alternative supplier might be found in one of the Tot-

V₅ + 12 V (11 to 16V) 150 µ

Fig. 12. To give a limited alarm time, say 2-5 min, use a 555 timer as suggested in Fig. 8, part 1, but with a diode and capacitor combination across the relay to prevent

Internal photograph of demonstration model shows circuit board using Fig. 9 circuit

tenham Court Road shops. People forming themselves into groups may be able to deal more directly with stockists and obtain them for about £25 plus

The open ends of the microwave. module should preferably be covered to keep out dust which may eventually degrade performance. However, such a cover must not reflect appreciable microwave power or this will upset the mixer working. A simple and effective covering is to sandwich a very thin polythene membrane between the module shroud, Fig. 10, and the rest of the module, Fig. 1. Ordinary plastic bag material is suitable; the thinner the better. A capacitor of about 10nF should be soldered across the Gunn connection to the module metalwork to prevent high frequency oscillation on the Gunn supply lead due to the negative resistance of the Gunn diode.

Microwave intruder alarms are re-

quired to be licensed so that the Home Office is aware of their location should there be an interference problem with other equipment. A licence costs £1.40 and last for 5 years and is called a Telapproach Licence. Normally only finished equipment is approved as a production equipment. However, as the microwave module is set at the factory to meet Home Office requirements, the Home Office will issue a licence on the understanding that the frequencysetting screws on the module are not disturbed from their factory settings and the equipment is operated only indoors. When applying for a licence the module should be described as the Mullard CL8960/H, the H signifying the use by a home constructor, as opposed to a professional manufacturer with frequency measuring equipment. The address is, Radio Licence Department, Home Office, Waterloo Bridge House, Waterloo Road, London SE1 8UA.

Provided that the frequency setting is not disturbed the possibility of interfering with other services is extremely remote. Some mutual interference with another alarm in the vicinity is a possibility where the two microwave frequencies drift through each other to produce a spurious signal. Where two must be operated in these circumstances it is normal practice to install as pairs having their frequencies staggered by about 5MHz.

False alarm confidence indicator

WIRELESS WORLD, MARCH 1980

The intruder alarm circuit of Fig. 9 seems to be about the simplest that can be produced and still achieve the standard considered necessary in a microwave intruder alarm. But unless it can be readily set up to work as intended with a low false alarm risk, it is likely to remain a novelty. Thus some attempt should be made at providing a setting up and monitoring circuit for completeness.

Basically what is needed is an amplifier with about five times voltage gain to follow the last amplifier of the previous circuit and which will show by means of an l.e.d. whether the noise level of the MID, with its chosen setting of sensitivity, is too high to be reliable from a false alarm point of view. This would not only monitor the noise due to the alarm circuits themselves but also the environment in which the alarm worked.

There are really two requirements. One for a quick response for setting-up the installation, and a second which allows the equipment to be monitored to see that the noise level stays within safe limits. The monitor should have an amplifier but ideally should also be followed by indentical bucket counting as in the main part of the MID circuit. Furthermore, the long-term monitor should have an l.e.d. indicator which stays on once it is lit until reset manually with a push button.

A circuit with a two-way switch, S, is shown in Fig. 11 for these purposes. It has been built and tested on a one-off basis and worked extremely well. The connections M1 to M4 go to the similarly marked points on the MID Fig. 9. As shown the switch is in the setting-up mode and the values of R_p and C_p are 220kΩ and 4.7μF for quick response and extinguish. When the switch is thrown these are increased to approximately $1M\Omega$ and 4.7μ F, as in the main MID circuit. Also the capacitor discharge resistor is taken to the collector of Tr. The l.e.d. then locks-on and the reset button has to be pressed to extinguish it. The lock-on mode may also be preferred for setting up, as this can then be done by one person; in which case S_{1a} should just short out the 820kΩ from Tr. collector.

Setting up the MID is now easy. Check that the monitor is working by walking in the protected area. Turn the

Voltage rating of capacitors is that of components used by author. They need be no more than 16V in practice

sensitivity to maximum, set the monitor switch as shown and carry out tests by walking outside windows etc, thumping walls to simulate vibration (and therefore possible MID movement) and see if the l.e.d. can be made to indicate. If the l.e.d. indicates or the sensitivity is higher than needed, reduce the sensitivity.

In the setting-up mode the circuit responds much faster than the main MID circuit and also has less memory time, which speeds the setting-up process. Having established a safe sensitivity setting, it remains to check that the MID is sensitive to an intruder. In doing this there is no need to be too critical as signals increase in voltage by a factor of four each time range is halved. Thus occasional detection at one range becomes most positive at 70% of that range.

It is a good idea to mount the l.e.d. outside the protected area, so that with the monitor switched to the long time constant, the safety factor can be monitored without intruding the protected area. Any tendency to approach a risk situation will be latched in by the l.e.d. staying on until reset. In the case where the MID is set to sound an alarm for five minutes and stop if there is no further movement, it is worth fitting a second latched l.e.d. by the side of the first to show that the main MID circuit has alarmed. This will help sort out the situation where the monitor l.e.d. is latched. For instance. was this due to an intruder or a noise problem? If the main MID indicator is out then it is most likely, though not certain, that it is an interference problem to be aware of.

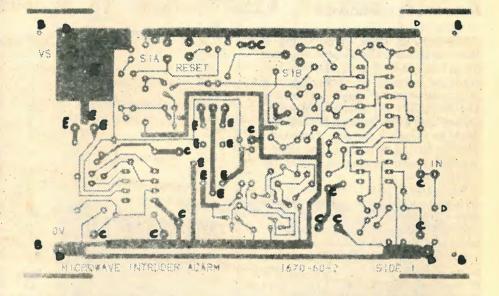

The above setting-up does not cover the case where the MID appears to have a safe setting but in fact is close to making the l.e.d. indicate and so a second attempt has to be made to get it correct; after perhaps one day seeing the l.e.d. indicating. This would need some two-stage gain control so that the alarm is first set up and then the gain is reduced even more to ensure a onceonly setting up. An alternative, well worth considering, is to give the monitor circuit a higher gain in the setting up mode than in the monitor mode. Perhaps seven times for setting up and four as a monitor. The gain is $1 + R_m/R_a$ and the reader can choose the value of R to

One can carry on increasing the complexity of MID's almost indefinitely. For instance, a clock could be included to show the time of the intrusion. But the above system in my opinion is the least that should be provided in any professional equipment. A great advantage of such monitors is that it allows the MID to go on test for a few days without being connected to an

For a long time there has been a need for this type of monitor circuit. True an oscilloscope can be used to look at the noise level in a particular installation,

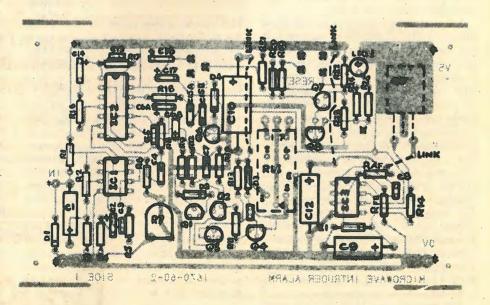

but this is no substitute for proper monitoring. Poor design in the past has been one reason for the growth of companies which now intercept alarm calls before passing these on to the appropriate security people. Of course, the problem of protecting a warehouse,

where the roof may rise and fall in the wind, is much more difficult than a house or shop, and such problems may be helped by a security house who know about the difficulty. So would a wind meter which turned down the sensitivity in a storm.

You'd expect a Sweep Function Generator from Feedback to contain a lot more features for your money. And you'd be right—the SFG606 with its crisp frequency marker does just that.

It sweeps up to 4 decades of frequency—bi-directionally. So you can avoid problems of transient effects. It maintains low signal distortion with absolute precision over the entire sweep range. It features a choice of decade or octave sweep – so it's ideal for narrow band analysis. It provides sine, square or triangle outputs over the frequency range 0.01Hz to 1MHz.

And with that beautifully sharp, fine line frequency marker that gives you accurate determination of spot frequency on the display, the SFG606 really does score top marks. Read all about the SFG606 and all its companion test instruments in the Feedback 600 range. Send to Feedback for literature today. Feedback

Microelectronics and the Third World

An argument against labour intensive technology for less developed countries

by S. Jacobsson Research Policy Institute, University of Lund, Sweden

Microelectronics based technologies are now spreading into economies with already high unemployment levels. After discussing the possible implications of this technical change for employment in these countries, the author argues against the widespread view that the solution to the problems of the less developed countries lies in labour intensive manufacturing. Human labour has natural limitations and cannot match the abilities of the new electronic machines and the superior technologies that result from them.

Concern about the effect of microelectronics on future employment is now strengthened by the fact that microelectronic based technologies are being diffused into economies with already high unemployment levels. In the OECD (Organization for Economic Co-operation and Development) area the level of unemployment in the second half of the 1970s was the highest ever since the second world war1 and, more importantly, it stayed at a high level also in the post-recessionary period of 1975-8.2. While this situation in the OECD area is serious enough to warrant more attention than is given to it today, it is nevertheless rather insignificant in comparison with that of the less developed countries (LDCs). In the rest of this article I shall outline some possible effects of technical change induced by the diffusion of microelectronics on the employment situation in these economies.

The prevalent view on the evolution of the employment structure in the development process has suggested that the manufacturing sector would gradually absorb the rural labour force and transform the employment pattern in LDCs into something similar to that which prevails in the industrialized world of today. Table 1 gives a rather interesting perspective on this hypothesis. (A similar table is found in Stewart (1978).3). It shows that, on the basis of past trends, not even the yearly addition to the labour force has been absorbed by the expanding manufacturing sector in any of the countries. Indeed, apart from the Republic of Korea, the jobs provided by the manufacturing sector were extremely inadequate in relation to the number of jobs required as a result of only the growth of the labour force, not to mention the already vast number of unemployed. (The figure of 1 billion has been mentioned by the ILO.).

Now it seems reasonable to ask whether this inadequate employment generation potential will prevail also in the future and, if so, what implications will it have. While there are several factors which may determine the answer to this question, e.g. rate of population growth and capital accumulation, we shall deal with only one factor, namely technical change, as this is the one most strongly associated with the diffusion of microelectronics.

The overwhelming majority of the world's technology is produced in the OECD area and there is nothing that. points to any significant reduction in

Source: Jones (1978)18

the LDCs' technological dependence on the developed countries in the future. What happens here is therefore of greatest relevance for the LDCs.

In Table 2 we have reproduced data on trends in manufacturing output and employment in the 'EEC-five' countries. (The same trends exist also in Britain: see Clarke (1979).4).

The table reveals that in the postwar period and in particular since the early 1960s, there has been a strong downward trend in employment generation for a given rate of change in output. While the data covers only the period up to the 1973 'oil crisis', the trends have continued also in the post-recession period. Thus, the manufacturing output did not only recover but increased after 1975, while manufacturing employment has fallen in absolute numbers in most OECD countries.5.

While part of the change in labour input versus output can be explained by a structural shift of relatively labour intensive processes to the LDCs, for example in garment manufacturing, the magnitude of the change strongly suggests that the figures reflect an intensified process of labour saving technical change, that is, a jobless growth 1, 4. This trend is important for LDCs for two reasons. Firstly, it would not be unreasonable to suggest that the LCDs experience a time lag in the vintage of their technologies. This implies that the recent strong labour saving bias has not yet been fully transplanted to the LDCs. Secondly, and most importantly, the trends reflected in Table 2 will most likely continue, and perhaps in an intensified way by the diffusion of microelectronics into industry. The important implication of this is that the already extremely insufficient labour absorptive potential of the manufacturing sector will decline even further in the future.

Before elaborating on the implications of this statement, we have to examine the very widespread suggestion that it is possible to reverse these trends and develop economically efficient labour intensive technologies on the scale needed.* i.e. technologies which are deemed to be more 'appropriate' in labour abundant economies.

This I believe is wrong, since the basis for the proposal that labour intensive technologies can be developed on a

large scale is the neoclassical economist's conceptualization of alternative technologies in terms of different quantities of capital and labour. I would instead suggest that there are extremely important qualitative differences between the two factors of production. To my knowledge the first economist or social scientist who pointed out the qualitative differences between capital and labour was Marx. The distinctive feature of what he called large scale modern industry was that the characteristics of the worker and his physical limitations did not constitute a limiting factor in the design of the production processes. In line with his analysis, it is simple to argue that the physical properties of labour are quite different from those of a machine. In relation to a machine a person is first of all variable, which implies uneven quality; secondly he is weak, which has obvious implications; thirdly, he cannot achieve the same precision, which is absolutely basic in any machine-making activity; fourthly, he cannot stand extreme heat, and heat is essential in key processes such as steel and chemical production; fifthly he is slow, which implies that any industry which produces above a certain minimum level of output will use machines instead of people. From studying the history of technical change one may, as Marx did, draw the conclusion that technical change is to a very large extent a process of overcoming the restrictions set by these properties of human labour, through increasing the capital intensity of the production

Today developments in electronics mean that it is not so much human muscle as human intelligence⁶ which is replicated and extended.

Thus any system which involves the processing of data, decision making, or control of systems and equipment - in short, any task involving logic - is a candidate for the application of electronics. A list (not exhaustive) of these tasks includes:7

- -controlled movement of materials, components, products
- -control of process variables
- -shaping, cutting, mixing, moulding, etc. of materials
- -assembly of components into subassemblies and finished products
- -control of quality at all stages of manufacture by inspection, testing or
- -organisation of the manufacturing process, including design, stockkeeping dispatch, machine maintenance, invoicing and the allocation of tasks.

This all-embracing character of electronics will probably have important implications for the application of more labour intensive technologies in LDCs and thus for the possibility of absorbing a greater proportion of the labour force in the manufacturing sector through reversing the trend towards more capital intensive technologies.

The reason behind this assertion is that the cause of increased competitiveness through using electronically based innovations lies not only in their labour saving nature (which is less important in cheap labour economies), but also in probable savings in investment, materials and also in producing a better quality product, thus leading to superior technologies.8, 2. The labour saving nature has been amply dealt with in the public debate, but the lastmentioned characteristics need some elaboration. I shall give examples from two sectors which traditionally have been very labour intensive, the mechanical industries and the garment

Mechanical Industries. In metalwor' king industries batch production dominates over flow-line techniques, with an associated low efficiency through poor machine utilization. Numerically controlled machine tools (n.c. machines) constituted a first attempt to increase the efficiency in this sector. With these machines, the control signals containing the information needed to produce the part are fed into the machine as the operation is performed. The control signals imitate the instructions given by a skilled machine operator, but with much greater speed and precision. By changing the control tape, an n.c. machine can be quickly switched to the next job which may involve a totally different sequence of operations. In this way the downtime the setting time - of the machine tool is reduced, which is very important for machine utilization in small batch production work. By replacing the still relatively inflexible hard-wired circuitry in the n.c. machines by software in mini- or micro-computers - i.e. producing computerized numerically controlled machine tools (c.n.c.) - the versatility and flexibility of the machine tools are considerably enhanced.9.

The capital saving nature of technical change in this sector stems not only from increased machine utilization. C.n.c. and direct numerical control (which involves one computer controlling several machine tools) also increase quality, for example in precision lathing. They also increase the throughput and reduce inventories, which saves capital embodied in materials. Furthermore they allow for in-process quality control, which makes possible early discovery of mistakes, and correction of process variables through electronic feedback systems. The latter source of capital saving is of considerable importance for process flow techniques

also, for example in paper pulp and glass production, where work in progress often constitutes a very substantial part of total capital cost. Finally, the fixed investment costs are reduced by price cuts in the cost of control systems. According to one Japanese 10 source, "today's n.c. systems are priced at a quarter of those of ten years ago".

Garments. The clothing sector has been characterized by having capital costs among the lowest in manufacture⁶. The complexity of the production process and ever changing fashions have not justified purpose built equipment except in some cases. However, with microelectronics both a high flexibility and a high degree of automation are made possible. As Dr Juan Rada explains6,

"The use of self-programming robotic

arms for cutting, and computerised systems for design, producing patterns, monitoring quality of fabric and guiding laser beam cutters, is changing the face of the industry. Microprocessors are being used to control knitting heads (instead of the centuries old Jacquard's card), to control ink-injectors with high flexibility to change design and colours; they are used to control sewing patterns and fast stitching. These are part of a growing number of applications - the trend being towards a "total system concept" which means the use of computerised techniques to detect flaws. keep track of patterns and orders, monitor the progress of work throughout the plant, automate the matching of patterns and the cutting and sewing. These applications save labour, skills and materials (in the case of cutting, the saving ranges from 8 to 15 per cent)."

The investment saving nature of microelectronic based innovations in this sector has been particularly emphasized by Raphael Kaplinsky²† who gives the example of a UK firm who produced an electronic pattern machine for a circular knitting loom. This machine cut down time in the change-over of knitting patterns by more than 50% "as well as lowering the hardware costs of the control system (itself at 20% of the total loom cost) by 50 percent":

Thus, because of the breakthrough made possible by microelectronics, in the near future the competitive edge in garments manufacturing will probably no longer be labour costs but techno-

All in all, it seems therefore very unlikely that more labour intensive technologies may be chosen in LDCs to the extent that the trends towards more capital intensive techniques may be altered or reversed.

The transformation of the technology

†Kaplinksy, together with Kurt Hoffman, Howard Rush and Luc Soete at IDS and SPRU, University of Sussex, is working on the implication of microelectronics on developing countries. I have greatly benefited from discussions with them.

in some traditional industries, i.e. not only garments but also textiles, leather and shoes², may have particularly severe implications for LDCs. The contribution to the total increase of manufacturing employment in the period 1968-1975 from these industries accounted for 30% for all LDCs and nearly 38% for the Asian LDCs11.

WIRELESS WORLD, MARCH 1980

Furthermore in some Asian countries such as the Republic of Korea and Hong Kong, manufacture for exports accounts for a sizeable part of total employment¹¹. For example, it has been estimated that more than one half of the total increase in manufacturing employment during 1963-1970 in the Republic of Korea was due to an expansion of exports11. (This may partly explain Korea's exceptional performance as shown in Table 1.) The important point is that it is particularly in these economies where textiles, garments, leather and footwear products account for a considerable part of manufacturing exports2.

Two implications can be drawn. Firstly, these traditional industries which account for a considerable part of yesterday's and today's employment generation in LDCs will probably fail to do so in the future. Secondly, as R. Kaplinsky has pointed out2, the export oriented growth and employment strategy - much cherished today among both LDCs and Western economists - which so successfully has guided the industrialization strategy of the Republic of Korea, will probably not be able to be duplicated by other LDCs in the future. This is essentially so since cheap labour will probably lose its importance as a factor in determining international trade. Of course, some more advanced LDCs with the necessary skills and 'industrial environment' might be able to pursue a growth strategy based on the new technologies. but the employment impact will then be marginal. (It could be argued, as has convincingly been done by R. Kaplinsky, that the high and possibly increasing unemployment figures in the OECD area will restrict the market for these countries.)

The implication of the previous analysis is that the manufacturing sector in most LDCs will not be able to absorb the growing labour force, not to speak of transforming the structure of employment in a way similar to what has happened in the OECD area. While the urban-based service sector may improve the employment situation slightly, the only possible way out seems to be that the agricultural sector will have to absorb the main part of the labour force permanently. This sector has greater potential to fulfil this task as it is much more flexible in the degree of mechanisation than the manufacturing sector - mainly due to the fact that the human limitations of precision/speed/ quality etc. are not so critical in agriculture as in industry.

Well, what is the problem then? one

may ask. Why not let a very 'modern' industrial sector coexist with a very labour intensive agriculture?

There are at least two very considerable ones.** Firstly, institutional changes - mainly concerning distribution of land - need to be implemented if agriculture is to absorb a growing proportion of the labour force. This is widely recognized - even by the World Bank - so I will not elaborate on it. Secondly, even if the employment problem were to be solved in this way, the LDCs would experience a gigantic distributional problem since they would be faced with vastly different labour productivities in the industrial and agricultural sectors. (I was first made aware of this problem by C. Edquist at the Research Policy Institute, Lund. Sweden.) To take China as an example, as she has undertaken the most far reaching institutional changes in recent 'decades, the pressure on the agricultural sector to absorb the growing labour force has been associated with a decreasing marginal productivity of labour between 1959 and 197512. Indeed, this occurred in spite of massive capital formation projects such as irrigation schemes. Thus, while the agricultural sector may absorb the labour force, the price to be paid for it, as noted already by the classical economists, is a very low and possibly decreasing labour productivity.

The very important point here is that as the industrialization process continues and the agricultural sector is charged with the job of absorbing the labour force, the political problem of transferring income from the high productive, and geographically concentrated, industrial sector to the low productive agricultural sector will take on increasingly stronger dimensions. This distributional issue will probably be one of the key ones for developing countries to deal with. ††

This article is a revised version of an article 'Technical Change, Employment and Distribution' which was attached to the Lund Letter of Science and Technology for Basic Human Needs, 13 June, 1979, published by the Research Policy Institute, University of Lund, Sweden. We are indebted to both the Salen Foundation and to SAREC for financial support for that essay. The Salen Foundation also generously sponsored 'the Lund workshop on technological change in industrialized countries and its consequences for developing countries', held in Lund in May 1979. Part of the content of this article has greatly benefited from discussions in the workshop. In addition, many people have contributed with very helpful comments on earlier drafts. In particular, we would like to thank Claes Brundenius, Kurt Hoffman, Howard Rush, Jon Sigurdson and John Wilton, but also Enrique Bautista, Richard Conroy, Charles Edquist, Christopher Freeman and Hans Gustafsson.

ttIndeed, as the absolute number of people engaged in industrial production in the OECD area declines, the very same problem of taxing this sector in order to provide employment and income in other sectors mainly public services where microelectronics is likely to displace proportionally little labour - may become (is?) a major

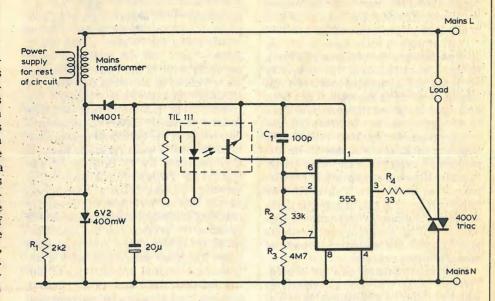

^{*}From the figures in Table 1, we can see that if only the yearly addition to the labour force were to be absorbed by the expanding manufacturing sector, the labour intensity of new investment projects would on average have to increase by a factor of 12.25 in the Philippines, 8.5 in India, 5.3 in Peru and 3.3 in Brazil and Kenya.

^{**}I will not, due to space limitations, treat the problems of surplus production by a labour intensive agriculture, which is needed if the industrial sector is to grow. See Jacobsson (1979), reference 8.

Optically-isolated triac

A common problem with optical isolators is that a separate power supply is required. A tapping from a mains transformer primary can be used, but this is not always available, particularly on small transformers. A simple solution is to use the transformer primary as a current limiter for a suitable low voltage supply. However, triacs often require a gate current of around 50mA, which is more than this type of supply can provide. To overcome this problem, gate current is pulsed with a duty cycle of about 10%. The current required by the l.e.d. to turn the triac off is about 250µA, so it can be directly driven by c.m.o.s. logic. Resistor R₁ is included for protection in case the Zener diode goes open circuit.

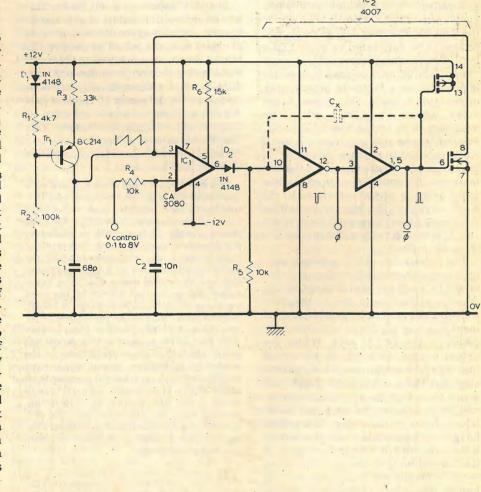

G. R. Rulter Woking Surrey

Voltage-to-period converter

In some circuits it is more convenient to have an oscillator whose period, rather than frequency, has a linear relationship to the control voltage. This circuit was developed to drive an analogue delay line for audio signal processing. Resistors R₁, R₂, R₃, diode D₁ and Tr₁ form a reasonably temperature-stable current source, which charges C, until the ramp voltage exceeds the control voltage. The comparator is biased by R6 for high current and fast slew rate, and R₄, C₂ decouple the control input and prevent spurious triggering. The output is taken via D2, R5, which prevent negative bias, to a c.m.o.s. buffer and discharge circuit. With the values shown, antiphase outputs equal to the reset pulse width are available from pins 12 and 1 of IC2. The reset pulse width of around 100ns is determined by propagation delays in the i.cs. If a longer pulse width is required, Cx may be used to form a monostable with a period of approximately C_x R₅. If low-frequency operation is required, C1 must be completely discharged and Cx should be equal to $C_1/6$. The value of C_1 is limited by the ability of IC2 to discharge it without damage and, in the prototype, a 100nF has been successfully used. With the values shown the period varies from about 0.5 µs to 30 µs for control voltages from 0.15 to 8V.

E. J. Leonie-Smith Royston Herts

Enlarger analyser

WIRELESS WORLD, MARCH 1980

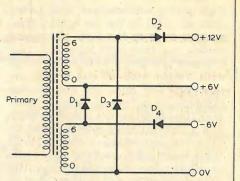

This analyser uses a recently introduced silicon-blue photoamplifier i.c. to achieve high linearity at low light values. A bridge circuit measures the current drawn by an open-collector output of the TFA 1001W and a set-time control converts this current into a voltage which is compared with a reference level. The reference is set by a speed control for various brands of printing paper. Bridge balance is indicated by a TCA965 window discriminator and three l.e.ds. The bridge is fed with a few millivolts of a.c. from the transformer to overcome hysteresis. At balance the set-time control is used with the 555 timer to expose the paper. S₁ turns the enlarger on for focussing and measurement, or allows S2 to start the exposure. Times from 2 to 140 s with paper speeds from 80 to 400 ANSI can be selected after speed calibration using test strips.

In the prototype, the photoamplifier was housed in a potting box together with the linearity control, associated components and twin-screened lead to the main circuit. Linearity is adjusted, with a d.v.m. across the time control set to $1M\Omega$, by using the halving values obtained from progressively stopping the lens. Judicious setting of linearity can compensate for reciprocity failure. Note that linearity setting only applies at low light values and the components may be omitted if higher levels only are used

R. I. Harcourt Thornton Heath Surrey

Economic three rail supply

In t.t.l. circuits which use 710 type comparators, power supplies of +5V, +12V and -6V are needed. The common arrangement is inefficient and costly compared with this circuit, which provides the voltages required from a single standard transformer. Although the 5V rail may have to provide a substantial current, the other supply rails only need to deliver small currents which can be provided by half wave rectification. During positive halfcycles the lower winding feeds the +6V rail via D₁, and the two windings in series feed the +12V rail via D₁ and D₂. Diodes D₃ and D₄ are biased off. During negative half-cycles D, and D, are biased off and the windings are isolated. The top winding now feeds the +6V rail with a return via D3 and the lower winding feeds the -6V rail via D4. Therefore, the +6V rail is fed during both half cycles by the two secondary

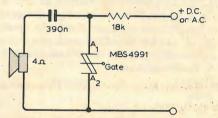

windings alternately and both low current rails are fed on alternate halfcycles. The voltages shown increase when capacitors are connected to provide an adequate margin for the regulators.

R. M. Adelson Hornby Lancaster

Simple oscillator

A silicon bilateral switch, s.b.s., is a useful component for producing a simple, economic and versatile audio oscillator. With a 12V d.c. supply the circuit oscillates at 100Hz and draws only 400 μA. Direct or alternating supplies can be used and with suitable component values, mains operation is possible. Frequency modulation or on/ off control is achieved by feeding a voltage or pulse to the gate. Minimum direct supply voltage is about 10V but an 18kΩ resistor between the gate and

A₂ reduces this to around 3V. An 8Ω speaker can also be used with a small reduction in output power.

Triggered timebase

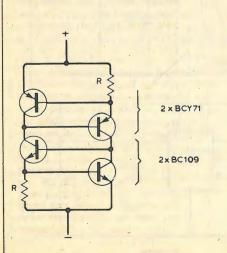

High-quality oscilloscopes with sweep rates up to 0.1 us/cm use special components, such as fast f.e.ts and tunnel diodes, together with logic i.cs. This timebase provides a wide sweep range with trigger hold-off and bright-line functions and does not require any expensive or uncommon devices. Three NAND gates generate a rampwaveform, and a Schmitt trigger shapes and inverts the square wave from gate C. When the flip-flop is set the output goes low and C₁ discharges via D₁ to provide the flyback at pin 3 and a pulse at pin 4. Ramp rate is varied by R₁, and C₁ is switch-selectable for a wide range of sweeps. The trigger input is shaped by a 710 and gated by a Schmitt trigger, so the flip-flop is only clocked when the output of gate C is high. This sets the output high and charges C, linearly. The 710 output also goes to D, and an integrator, which negatively charges C2 and disables the oscillator around gate K. When disabled, the oscillator output is high and therefore enables gate G to clock the flip-flop. When no input signal is present, the oscillator feeds the clock input of the flip-flop and provides automode operation for the timebase.

Two terminal constant current source

Most constant-current sources require output, ground and supply connexions to a circuit. However, a two-terminal arrangement can be obtained by combining two standard sources, of opposite polarity, back-to-back. In the circuit diagram the current is $2V_{\rm be}/R$. J. J. Ellis Cambridge

MEW PRODUC

Prestel / Viewdata printer

The Olympia International NMP 40 mechanism, incorporated in a printer terminal, forms one of the first screen image printers to appear in the UK. A hard copy of displayed Prestel/Viewdata images can be made with the printer which Dataplus, the equipment's distributor, claims as "very quiet" in operation. The unit will print alphanumeric characters and graphics at high speed and paper loading is simple. The printhead consists of 240 discrete electrodes equally spaced across the 127mm wide paper and each is spring-loaded, obviating the need for adjustment. The rubber platen is driven by a small d.c. motor, this being the only moving part. Overall dimensions of the terminal are 250mm wide × 360mm deep × 150mm high. Production quantities of the unit will be available in late 1980 as will the full drive electronics to suit UK television receivers. Dataplus Ltd, 39-49 Roman Road, Cheltenham.

WW301

Individual keys, rows of keys or groups of keys, elements of the series 87 family of switches, can be used to create keyboard forms for prototypes, short runs or volume production, according to the makers, Highland Electronics. Legending of switches is achieved by hot stamping of the buttons to customers' requirements before delivery, although for prototype work, versions of the switches are available with snap-on caps. In this event a legend sheet is supplied and each legend is placed under the cap. The series 87 employs snap-dome contacts previously used on Highland series 83, 84 and 86, all 16 button keypads. A typical circuit for these switches is single-pole/common-bus and the 3 × 4 and 4 × 4 keypads are also available with matrix switching. Highland Electronics Ltd, Highland House, 8 Old Steine, Brighton, East Sussex.

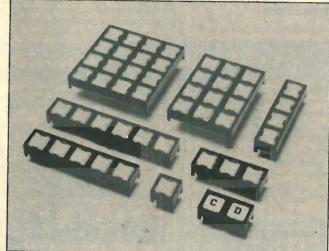

WW302

V.s.w.r. / power meter

Direct reading of v.s.w.r. and output power without the need for interpolation is one of the capabilities of the v.s.w.r./power meter offered by Zycomm Electronics. The unit is autoranging

WW301

for power output measurement. covering 20W to 2kW in three ranges for 1.8 to 30MHz and 50 to 150MHz, and 2W to 200W for the 430 to 470MHz range, V.s.w.r. from 1:1 to infinity can be measured. Separate sensing heads are supplied to cover each frequency range and these can be connected at any point in the feed line, including the masthead, for precise radiated power indication. Push switches on the front panel permit the selection of the appropriate head and the display of forward or reverse power as either peak or r.m.s. readings. The electronic comparator included in the unit permits constant readout of v.s.w.r. irrespective of power variation, thereby giving true indication during speech on s.s.b. The unit is for operation on 240v 50Hz mains. Zycomm Electronics Ltd, 47, 49 and 51 Pentrich Rd, Ripley, Derby

WW303

Digital slow scan transceiver

The Colorado Video model 285 is intended to provide "quality" tv picture transmission over data channels and is available as a receiver, a transmitter or transceiver. Features incorporated are "frame freeze", a repeating "freeze and scan" mode for surveillance applications and continuous display at the receiver as each new image wipes off the previous image. The unit accepts ty signals from camera, v.t.r. or video disc recorder and also produces a signal for viewing on c.c.t.v. monitors. Transmission is in the synchronous serial digital form at rates up to 500 k/bits/s and the equipment requires no adjustment when changing rates, the unit itself tracking the modem clock rate. The operator may select left-to-right or top-tobottom scanning to suit the item scanned and may transmit either a single field (shorter transmission time at reduced resolution) or a full frame, i.e. normal transmission time at full resolution. Transmission times vary according to the grey-scale levels chosen, either 64 levels (6 bit) or 256 levels (8 bit) depending upon the bit rate. Data may be encrypted for security purposes. Prices start at \$9,000, this being the price for the receiver only. Colorado Video, Box 928, Boulder Co. 80306, USA. WW304

High temperature contact adhesive

Oakington, Cambridge CB/4

Excellent acid resistance, high moisture resistance and good dielectric strength are properties which Aremco Products International attributes to its Aremco-Bond 570, an elastomer-phenolic adhesive intended for the bonding of ceramic, glass and metallic materials at temperatures up to 315°C. A further characteristic is its good shock resistance due to a small degree of flexibility being present after curing, thus allowing bonding of materials with a dissimilar coefficient of expansion. The adhesive is applied in the usual manner to both surfaces, which are allowed to dry before pressing together and final heat cure under pressure will produce a high temperature high strength bond. Aremco-Bond 570 costs £21.50 per pint, plus carriage costs. Photograph shows the adhesive being used to bond together two ceramic bushes. The Meclec Company, 5-6 Towerfield Close, Shoeburyness, Essex SS3 9QP.

WW306

Spark gap c.r.t. protectors

The focusing electrode of a c.r.t.

can be protected from the damaging effects of excessive e.h.t., by the spark gap series 5389, manufactured by Welwyn Electric. These units can also be used to protect v.d.u. tubes, oscilloscopes and photomultipliers from high voltage discharges and transients. The three items in the series cover the "popular" (perhaps not so for the ty service technician!) breakdown bands of 7 to 9kV, 8.5 to 10.5kV and 10 to 12kV all with current handling up to 1500 amps. These spark gap protectors meet BS2011 ("Components for printed circuit applications,") and are flame retardant in accordance with BS415-14/4. Welwyn Electric, Bedlington, Northumberland NE22 7AA.

Radio i.cs

Two new i.cs which the makers claim will considerably increase the level of integration possible in professional radio equipment, are available in 8 lead TO5 or 8 lead d.i.l. plastic packages. These two circuits, the SL6270 and the SL6310, are additions to the recently introduced Plessey SL6000 series of linear radio circuits. The SL6270 is a microphone amplifier with integral gain control, the control circuit providing a constant output level whether the level of the incoming speech signal is high or low, making it suitable for use in the fields of tape recording and public address. The SL6310 is an audio i.c., designed to avoid the high quiescent current consumption typical of portable receivers. A "mute" signal switches off the circuits in weak or noisy signal conditions, the normal standby current being 5mA while still maintaining an output power of 500mW. Plessey Semiconductors Ltd, Cheney Manor, Swindon,

WW308

WW309

"Crowbar" s.c.rs

A range of s.c.rs which the

makers, Motorola, describe as

"the first in the industry to be specifically characterised and specified for "crowbar" applications, is accompanied by data sheets giving a graph detailing peak capacitor discharge current. This plot indicates peak discharge current as a function of power supply discharge time; permitting power supply designers to select a specific s.c.r. whose peak current characteristics are suited to a particular supply circuit. Each item in the MCR67-71 range of s.c.rs is capable of dumping peak currents of 300 to 1700A, thus discharging the power supply output capacitors and clamping the voltage to the on-state voltage of the s.c.r. until a fuse or circuit breaker opens. Gate trigger current for the series is 2mA minimum and 30mA maximum. The s.c.rs are available in both metal and plastic packages with operating voltages between 25 and 100V. Motorola Ltd, Semiconductor Products Division, York House, Empire Way, Wembley, Middlesex HA9 0PR.

Infra-red detectors

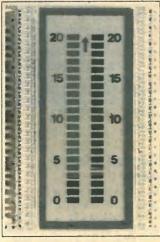

A range of lead sulphide and lead selenide infra-red detectors manufactured by the American Optoelectronics Inc. is now being marketed by Wentworth Laboratories. These detectors are available in single element or multi-array packages incorporating standard units made up from elements in sizes from 1 to 5mm square. Detectors for use at room temperatures are included and these can be provided as standard units or units with an optional built-in thermoelectric cooler. Thermistors may be used in conjunction with the detectors for the monitoring of detector temperature and to allow closer control of performance. Wentworth Laboratories Ltd, Sun St, Potton, Beds, SG19 2LR.

WW310

Bar graph I.c.d. unit

Numerical annunciation and over-range/under-range indication are features included in the 20 element bar-graph liquidcrystal display unit from Hamlin Electronics. Each bar has a separate backplane enabling each of the two bars to be driven independently. The display is available with pins for d.i.l. mounting or with snap-on terminal strips. An applications note, including a drive circuit for the display, is also available. Hamlin Electronics, Diss, Nor-

ILLUMINATED POCKET MICROSCOPE WITH MEASUREMENT GRATICULE

The low-cost illuminated pocket microscope designed for close observation and measurement of minute detail too small to be seen with the naked eye, Gives a sharp and brilliant vision with wide field of view at 20 X magnification. plus built-in focusing system and illumination system.

Ideal for close inspection of PCB, components, metals, depth of cracks, samples, minerals and tissues. A valuable aid to Quality Inspectors, research engineers and laboratory personnel.

Complete with batteries and plastic pocket case at the special price of £13.99, including postage and V.A.T.

The graticule is calibrated to 4mm overall in increments of 0.1mm, with angles shown from 30° to 90° and hole sizes of 0.2, 0.3, 0.4 and 0.5mm diameter

CASH WITH ORDER Carriage 50p. VAT 15%. Account facilities available for established customers. **Quotations** given for large quantities.

THE FOR-1004 A NEW WIDEBA **GRAPHICAL RECORDER**

9 Recording Modes

generation from Medelec. A highly versatile graphical recorder, it has been specially developed for wide ranging applications in research and industry. In both performance and economy it has many advantages over conventional instrumentation.

There are nine recording modes all push button controlled, which permit the optimum presentation of most graphical data. Triggering is fully automatic and displayed signals High Resolution, can be monitored via an internal loudspeaker. The fast response time and wide range timebase allows the detailed examination of transients and trends.

and ease of operation combine to make the FOR-1004 an important new instrument.

Simultaneous View and Record

Four High Input Signal Channels

Inexpensive Records

ILP'S NEW GENERATION OF HIGH

With I.L.P. performance standards and quality already so well established, any advances in I.L.P. design are bound to be of outstanding importance - and this is exactly what we have achieved in our new generation of modular units, I.L.P. professional design principles remain - the completely adequate heatsinks, protected sealed circuitry, rugged construction and excellent performance. These have stood the test of time far longer than normally expected from ordinary commercial modules. So we have concentrated on improvements whereby our products will meet even more stringent demands such, for example, as those revealed by vastly improved pick-ups, tuners, loudspeakers, etc., all of which can prove merciless to an indifferent amplifier system. I.L.P. modules are for laboratory and

other specialised applications too.

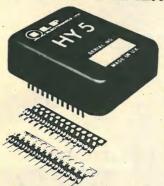

PRODUCTS OF THE WORLD'S FOREMOST SPECIALISTS IN ELECTRONIC MODULAR DESIGN

Whatever it is, the HIH S' range of power amplifiers will handle it

The S' range is designed to handle heavy industrial usage in the fields of vibrator driving, variable frequency power supplies and servo motor systems.

S 500D

Dual Channel
19" rack mount 3½" high
500w r.m.s. into 2.5 ohms per channel
900w r.m.s. in bridge mode
DC—20 KHZ at full power
0.005% harmonic distortion (typical) at
300w r.m.s. into 4 ohms at 1 KHZ
3KW dissipation from in-built force cooled
dissipators

S 250D

Single Channel
19" rack mount 3½" high
500w r.m.s. into 2.5 ohms
Retro-convertible to dual channel
DC—20 KHZ at full power
Full short and open circuit protection
Drives totally reactive loads with no
adverse effects

A complete range of matching transformers and peripheral equipment for closed loop, constant current and voltage use are available.

Alternative input and output termination to order. Rack case for bench use built to specifications. For complete data write or call.

WW - 034 FOR FURTHER DETAILS

Finally, you can have all the advantages of DMMs and none of the disadvantages of analogues for about the same price.

Our new 169 is a tough, lightweight, battery-powered digital multimeter for use in the field or on the bench. It is a 31-digit, full 5-function DMM with respectable .25% DC accuracy.

Its low-parts-count, high-efficiency design keeps power consumption to a minimum for longer component life and fewer failures. MTBF is 20,000 hrs, or about 10

All 5 functions are fully protected – 1400V peak on DCV and ACV, 300V on Ω, 2A (250V) on DCA and ACA. The fuse is

Is this the end

2A (250V) on DCA and ACA. The fuse is externally accessible for quick replacement.

Extensive vibration stress-testing assures the 169 will stand up to all the mechanical shock and abuse normally associated with tough for Analogue and abuse no applications.
Cost-co

Cost-conscious ease of maintenance is so thoroughly designed into the 169 that

meters? only one calibration adjustment a year is required. That adds up to a cost-of-ownership no other competitive DMM can touch. For example, the 169 needs only one battery change

per year at a cost of about £1.50. When you factor in features like function and range annunciation right on the

display, auto-zero, auto polarity, 60% larger display than other DMMs and the easy-to-read, colour coded front panel, we think you'll get the point. No analogue meter or DMM can match the price/ performance of the new 169. It costs £99 (plus VAT)

For information on the 169 or any Keithley DMM call (0734) 861287

PEAK PROGRAMME AND DEVIATION MONITORING **PEAK DEVIATION METER**

MONITORING MONO OR STEREO FOR MONITORING MONO OR STEREO LEVELS there is nothing to quite match the easy perceptibility of pointer instruments. One of the principal reasons for this is that the meter display moves in an arc while most other things in the operator's field of view are straight lines. Combine this with fast but defined attack, slow fall-back, uncluttered logarithmic scaling and a white pointer on a matt black background and it's a peak programme meter. The coaxial red and green pointers of the TWIN movement offer a unique way of monitoring stereo programmer. Emest Tumer 640, 642, 643, TWIN, flush mounting adaptors and illumination kits available from stock.

Meets IEC268-10A draft BS5428-9.

MAIL ORDER PROTECTION SCHEME (Limited Liability)

If you order from mail order advertisers in this magazine, except for classified advertisements, and pay by post in advance of delivery. Wireless World will *consider* you for compensation if the advertiser should become insolvent or bankrupt, provided

- . You have not received the goods or had your money returned; and
- 2. You write to the publisher of Wireless World explaining the position not earlier than 28 days from the

day you sent your order and not later than 2 months from that day. Please do not wait until the last moment to inform us. When you write, we will tell you how to make you

claim and what evidence of payment is required. We quarantee to meet claims from readers made in accordance with the above procedure as soon a We guarantoe to meet claims from readers made in accordance with the above procedure as soon as possible after the advertiser has been declared bankrupt or insolvent up to a limit of £3,500 per annum for any one advertiser so affected and up to £10,000 per annum in respect of all insolvent advertisers. Claims may be paid for higher amounts, or when the above procedure has not been complied with, at the discretion of Wireless World; but we do not quarantoe to do so in view of the need to sot some limit to this commitment and to learn quickly of readers' difficulties.

This guarantee covers only advance payments sent in <u>direct</u> response to an advertisement in this magazine (not, for example, payments made in response to calalogues, etc., received as a result of answering such advertisements. Personal advertisements are excluded.

LINSLEY HOOD CASSETTE RECORDER 1

We are the Designer Approved suppliers of kits for this excellent design. The Author's reputation tells all you need to know about the circuitry and Hart expertise and experience guarantees the engineering design of the kit. Advanced features include: High quality separate VU meters with excellent ballistics. Controls, switches and sockets mounted on PCB to eliminate difficult wiring. Proper moulded escutcheon for cassette aperture improves appearance and removes the need for the cassette transport to be set back behind a narrow finger trapping slot. Easy to use, robust Lenco mechanism. Switched bias and equalisation for different tape formulations. All wiring is terminated with plugs and sockets for easy assembly and test. Sophisticated modular PCB system gives a spacious, easily built and tested layout. All these features added to the high quality metalwork make this a most satisfying kit to build. Also included at no extra cost is our new HS15 Sendust Alloy record / play head, available separately at £7.60 plus VAT, but included FREE as part of the complete kit at £81.50 plus VAT.

REPRINTS of the 3 articles describing this design 45p No VAT.

VFL 910. Vertical front loading Super Hi-fi deck, as used in our new Linsley-Hood Cassette Recorder 2. £31.99 + VAT. Set of knobs £1.46 + VAT.

CASSETTE HEADS

FEEL DEEP DOWN

SUB FREQUENCY SYNTHESIZER

When connected to your HiFi system or PA this unit will generate frequencies one octave below the lowest frequency recorded on your discs or cassettes. SUB FREQUENCY SYNTHESIS adds a fourth dimension to sounds. It enables you not only to hear, but to feel the vibrations created by bass instruments. Connected to a high powered HiFi system the S F S assails your body with blasts of infra-sound. A disc (or cassette) recording lacks most of the frequencies below 50 Hz that were present in the original music. The S F S recreates these lost parts of the sound image, widening the dynamic range of the recording.

lower. These high tonal purity sub-harmonic signals are then added to the existing bass to produce a smooth spectral extension of the recorded sound. Higher frequencies are not affected by the S F S.

The S F S was tested by the Swedish Audio magazine R&T (no.5/1979) which praised the unit for its sensational effect when connected to a system of adequate power capacity. The sensation of feeling sound was described as tremendous.

The S F S is available as a kit comprising a mounted and tested PC board, aluminium case, mounting hardware and assembly instruction. The kit, when completed, is easily connected to any HiFi system, following the instructions provided. Cost is £ 76 + p&p (£ 3.) + V.A.T. Enclose cheque for £79 when ordering.

WW - 010 FOR FURTHER DETAILS

The frequency and amplitude of recorded signals in the range 60 to 120 Hz are used to synthesize frequencies one octave

Two controls on the front match the input signal to the synthe-sizer level and control the level of sub-harmonic sound.

J. L. Linsley Hood **High Quality** Cassette Recorders

LINSLEY HOOD CASSETTE RECORDER 2

Our new improved performance model of the Linsley Hood Cassette Recorder incorporates our VFL 910 vertical front mechanism and circuit modifications to increase dynamic range. Board layouts have been altered and improved but retain the outstandingly successful mother and daughter arrangement used on our Linsley Hood Cassette Recorder 1.

Cassette Recorder 1.

This latest version has the following extra features. Ultra low wow-and-flutter of .09%—easily meets DIN Hi-fl spec. Deck controls latch in rewind modes and do not have to be held. Full Auto stop on all modes. Tape counter with memory rewind. Oil damped cassette door. Latching record button for level setting. Dual concentric input level controls. Phone output. Microphone input facility if required. Record interlock prevents re-recording on valued cassettes. Frequency generating feedback servo drive motor with built-in speed control for thermal stability. All these desirable and useful features added to the excellent design of the Linsley-Hood circuits and the quality of the components used makes this new kit comparable with built-up units of much higher cost than the modest £94.90 + VAT we ask for the complete kit.

SUPER BARGAIN OFFER LENCO FFR CASSETTE DECK

For those who missed our recent bargain CT4s we now are delighted to be able to offer Brand New Lenco FFR Decks complete with motor speed and auto-stop control board fitted and tested. These will control board fitted and tested. These will operate with any supply between 9 and 16 volts. This deck can be used for both record and playback applications and is fitted with an erase head. A mono record/play head is fitted and we can supply an extra stereo head, if ordered with the deck at the very special price of £2 plus VAT. We also supply, with each deck and completely FREE, one of our specially moulded escutcheons. This deck would normally cost about £25 but we are able to offer them, while they last, at only £9.99 plus VAT.

BAILEY 30 WATT AMPLIFIER

We have now completed our redesign of this popular amplifier to make it as easy to build as our latest kits. The power amplifiers are complete modules plugging into a power supply master board, all possible wiring has been eliminated but faith has been maintained with the existing metal work to eachly warms to existing metal work to enable owners to update if they wish. Send for full details in

LINSLEY HOOD 30-WATT AMPLIFIER

Advanced new cost-effective amplifier of impeccable specification from the 'master'. Published in the January and February issues of Hi-Fi News. We are supplying full kits to

STUART TAPE CIRCUITS

(For reel-to-reel decks)

These circuits are just the thing for converting that old valve tape deck into a useful transistorised recorder. Total system is a full three head recorder with separate record and replay sections for simultaneous off tape monitoring. We also stock the heads. This kit is well engineered but does not have the detailed instructions that we give with our more recent designs. We would not therefore recommend it to beginners. Reprints of the original three articles 45p. Post free. No VAT.

Our Signal Processing Components come highly recommended

Space/Satellite/Military specification

Since 1967, Merrimac has developed sixty seven different items designed for more than twenty five space and missile applications.

In addition, many other signal processing devices are in use in fighter and reconnaissance aircraft demonstrating a reliability that is second to none.

As UK agent for Merrimac, Pascall can offer the most comprehensive standard product line of signal processing

components in the industry - over seven hundred and fifty catalogue items from DC to 18GHz incorporating lumped element, stripline or ferrite technology. And if this isn't sufficient to meet your requirements Merrimac offers custom designed derivatives of all these products which surely will.

Pascall in-depth service and advice Pascall is technically equipped to

discuss the Merrimac range in detail and recommend integrated component packages - providing controlled component electrical

interfaces at lower costs than the purchase of individual components.

Why not get the full facts on

WIRELESS WORLD, MARCH 1980

There's a range of answers.

There's something every one of our scopes has in common. Great accuracy, tremendous reliability and keener pricing, plus free delivery on UK mainland.

Take the new 4D-10B. The fully stabilised power supply gives 3% accuracy. There's a XY facility using CMOS ICs for extra reliability, Z modulation for brightening or dimming the trace, 10MHz scan at full bandwidth over the full screen area, trace locate and TV field trigger. At £210.00* it's astonishing value.

Or the 4D-25. A dual trace model with DC-25MHz bandwidth and 10mV/cm sensitivity. Signal delay allows you to trigger from and see the leading edge of any signal. Trigger level and slope are selected on one dual function control. 3% accuracy and still only £360.00*.

Plus the 4S6 single beam 6MHz bandwidth model with easy to use controls. 10mV sensitivity and timebase range of 1 us to 100ms/cm. Lightweight, compact and a very good price. £144.00*.

Return the coupon for full details of the range that gives you a lot more scope.
*UK list price excluding VAT.

low error rate tape interface

NEW LOW PRICE!

2 MICROPROCESSORS

2 MICKOPHOLESSONS
280 the powerful CPU with 158 instruction, including all 78 of the 8080, controls the MM57109 number cruncher. Functions include +, -, *, /, squares, roots, logs exponentials, trig functions, inverses, etc.

Range 10⁻⁹⁹ to 9 x 19⁻⁹⁹ to 8 figures plus 2 exponen

EFFICIENT OPERATION

Why waste valuable memory on sub routines for numeric processing? The number cruncher handles everything internally!

RESIDENT BASIC

With extended mathematical capability Only 2K memory used but more powerful than most 8K Basics!

1K MONITOR

SINGLE BOARD DESIGN

Even keyboards and power supply cir-cuitry on the superb quality double-sided plated through-hole PCB.

COMPLETE KIT NOW ONLY £249 + VAT

Cabinet Size 19.0" × 15.7" × 3.3"

Television by courtesy of Rumbelows Ltd., price £58.62

PSI Comp 80 Z80. Based powerful scientific computer. Design as published in Wireless World, April-September, 1979.

The kit for this outstandingly practical design by John Adams being published in a series of articles in Wireless World really is complete! Included in the PSI COMP 80 scientific computer kit is a professionally finished cabinet, fibre-glass double sided, plated-through-hole printed circuit board, 2 keyboards PCB mounted for ease of construction, IC sockets, high reliability metal oxide resistors, power supply using custom designed toroidal transformer, 2K Basic and 1K monitor in EPROMS and, of course, wire, nuts, bolts, etc.

PSI COMP 80 Memory Expansion System

Expansion up to 32K all inside the computer's own cabinet!

By carefully thought-out engineering a mother board with buffers and its own power supply (powered by the computer's transformer) enables up to 3 8K RAM or 8K ROM boards to be fitted neatly inside the computer cabinet. Connections to the mother board from the main board expansion socket is made via a ribbon cable.

Fibre glass double sided plated through hole P.C.B. 8.7" x 3.0" set of all components including all brackets, fixing parts and ribbon cable with socket to connect to expansion plug £39.90

8K Static RAM board

Fibre glass double sided plated through hole P.C.B. Set of components including IC sockets, plug and socket but excluding RAMs £11.20 2114L RAM (16 required) £5.00 Complete set of board, components, 16 RAMS £89.50

Fibre glass double sided plated through hole P.C.B. 5.6" x 4.8" £12.40 5.6" x 4.8" £12.40
Set of components including IC sockets, plug and socket but excluding ROMs £10.70
2708 ROM (8 required) £8.00 Complete set of board, components, 8 ROMs £78.50

Floppy Disk, PROM programmer and printer interface coming shortly!

THE CRÊME DE LA CRÊME OF ELECTRONIC ORGANS FOR YOU TO BUILD

Yes, any one of these superior instruments can be built by yourself in the comfort of you own home. The unique WERSI Kit-pack system is designed around modular units using the latest IC technology. Fully drilled P.C. boards together with beautifully illustrated instructions and preformed harnesses lead you to the final product which is now becoming accepted as the world's most advanced instrument. All cabinets come fully assembled in a wide range of veneers. Home construction enables you to build one of these fabulous organs at 40% below factory price. All Electro-Voice showrooms have resident demonstrators so why not come along and hear for yourself the wonder of WERSI. Alternatively send

£1 for the 140 colour information package. (FREEPOST Electro-Voice, Rickmansworth, Herts RD3 6PF).

HIGH EFFICIENCY POWER AMPS 200W to 2000W

These amplifiers are not for those who wish to heat their dinner on as they remain cool without the need for expensive and heavy cooling fans.

They are d.c. coupled throughout giving low distortion but excellent transient response.

Typical Part Specification

Output Power 500W into 4ohms

Full Power Efficiency 90%

1/4 Power Efficiency 70%

Frequency Response DC — 100KHz

Signal to Noise >80 dB

Short Circuit Indication and Protection

Overload Indication

Weight 15 kgs

S-2020TA STEREO TUNER/AMPLIFIER

SOLID MAHOGANY CABINET

A high-quality push-button FM Varicap Stereo Tuner combined with a 24W r.m.s. per channel Stereo Amplifier.

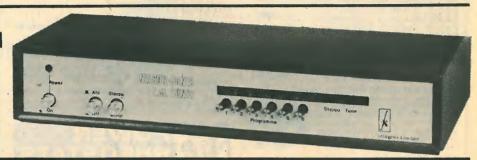

Brief Spec. Amplifier Low field Toroidal transformer, Mag, input, Tape In/Out facility (for noise reduction unit, etc.), THD less than 0.1% at 20W into 8 ohms. Power on/off FET transient protection. All sockets, fuses, etc., are PC mounted for ease of assembly. Tuner section uses 3302 FET module requiring no RF alignment, ceramic IF, INTERSTATION MUTE, and phase-locked IC stereo decoder. LED tuning and stereo indicators. Tuning range 88-104MHz. 30dB mono S/N @ 1.2 \(\triangle V \). THD 0.3%. Pre-decoder 'birdy' filter.

PRICE: £59.95 + VAT

NELSON-JONES Mk. 2 STEREO FM **TUNER KIT**

PRICE: £69.95 + vat

NRDC-AMBISONIC UHJ SURROUND SOUND DECODER

The **first ever** kit specially produced by Integrex for this British NRDC backed surround sound system which is the result of 7 years' research by the Ambisonic team. W.W. July, Aug., '77.
The unit is designed to decode not only UHJ but virtually all other 'quadrophonic' systems' (Not CD4), including the new BBC HJ 10 input selections.
The decoder is linear throughout and does not rely on listener fatiguing logic enhancement techniques. Both 2 or 2 input signals and 4 or 6 output signals are provided in this most versatile unit.

Complete with mains power supply, wooden cabinet, panel, knobs, etc.

Complete kit, including licence fee £49.50 + VAT or ready built and tested £67.50 + VAT

S5050A STEREO AMP

50 watts rms-channel, 0.015% THD, S/N 90 dB, Mags/n 80 dB. Output device rating 360w per channel.

Tone cancel switch. 2 tape monitor switches. Metal case — comprehensive heatsinks.

Complete kit only £63.90 + VAT

INTRUDER 1 Mk. 2 RADAR ALARM

With Home Office Type approval

The original "Wireless World" published Intruder 1 has been re-designed by Integrex to incorporate several new features, along with improved performance. The kit is even easier to build. The internal audible alarm turns off after approximately 40 seconds and the unit re-arms. 240V ac mains or 12V battery operated. Disguished as a hard-backed book. Detection range up

Complete kit £49.50 plus VAT, or ready built and tested £64.50 plus VAT.

Wireless World Dolby noise reducer

Trademark of Dolby Laboratories Inc.

Complete Kit PRICE: £43.90 + VAT

Also available ready built and tested Calibration tapes are available for open-reel use and for cassette (specify which)

Single channel plug-in Dolby (TM) PROCESSOR BOARDS (92 x 87mm) with gold plated contacts and all components We guarantee full after-sales technical and servicing facilities on all our kits, have you checked that

these services are available from other suppliers?

Noise reduction better than 9dB weighted.
Clipping level 16.5dB above Dolby level (measured at 1% third

Harmonic distortion 0.1% at Dolby level typically 0.05% over most of band, rising to a maximum of 0.12%

Signal-to-noise ratio: 75dB (20Hz to 20kHz, signal at Dolby level at Monitor output

JVC-VICTOR HIGH FIDELITY STEREO CASSETTE TRANSPORT MECHANISM

ELECTRO-TECH COMPONENTS have secured a very large quantity of cassette transport mechanisms, equipped with all the latest improvements, as well as "SEN-ALLOY" type 1.5 micron record/replay heads, and solenoid-controlled auto-stop action. These were manufactured by JVC/VICTOR of Japan to specification of TANDBERG OF NORWAY, for inclusion in a cassette deck costing over £250. This mechanism alone would normally cost over £50.

- ★ Close-tolerance, high-quality, top loading transport
 ★ "Sen-Alloy" (SA type) R / P head
 ★ Solenoid-driven autostop circuit

- ★ Automatic head cleaning device
- ★ Air damped "soft" cassette eject
- * Miniature microswitches for switching
- Pre-aligned heads and calibrated motor speed regulator built in
- * Three-digit tape position counter Six-function keyboard controls: "Record," "Rewind," "Forward,
- "Play " "Ston / Fiect " "Pause ★ PCB connectors and cables attached
- ★ High-mass balanced flywheel with permanent lubrication spindle * Full specifications for motor, heads, and switches available on

Price of above unit £14.95 VAT Inc.

Trade and Export Enquiries Invited

Regular readers of WIRELESS WORLD will know of the original LINSLEY-HOOD CASSETTE DECK design, published in May 1976. Subsequent articles by Mr. Linsley-Hood have confirmed that the design far exceeded his original expectations, so much so that he published a number of improvements, modifications, and additional features to the original design, which are now incorporated in our:

*CASSETTE DECK KIT BASED ON DESIGN OF MR. LINSLEY-HOOD *

We have developed an outstanding stereo cassette kit with the aid of Mr. Linsley-Hood, to complement the improved specification and latest important advances in cassette electronics since the original design was published. The kit is ideal for use in conjunction with the JVC transport mechanism (above).

Included in the kit are two fibreglass PCB's, drilled and plated for immediate assembly, two VU meters. Dual LED Peak Meters, Variable Bias system, Power Supply, over 10 micro-circuit IC's for the most up-to-date performance, as well as monitoring amplifier, test and calibration casse

Price of Kit (without transport mech.) £35.95 VAT inc. plus £1.00 P&P

Also available: A custom-designed case for the Kit, this is a fully screened enclosure, sloping panel, satin anodised, wood end panels, professional finish.

Price of Case £9.75 VAT inc. plus £1.00 P&P. OFF THE SHELF

PRICE FOR COMPLETE KIT £35.90 + VAT

AVAILABLE AS COMPLETE KIT ONLY

This is a simple, low cost design which can be constructed easily without special alignment runs is a simple, low cost design which can be constructed easily without special alignment equipment but which still gives a first-class output suitable for feeding any of our very popular amplifiers or any other high quality audio equipment. A phase-locked-loop is used for stereo decoding and controls include switchable afc, switchable muting and push-button channel selection (adjustable by controls on the front panel). This unit matches well with the T20+20 and T3C+30 amplifiers.

INCREASED CAPACITY AT OUR BIG NEW FACTORY MEANS MANY PRICES DOWN! ALL OTHER FROZEN!

Another superb design by synthesizer expert Tim Orr!

As featured in Electronics Today International August, September October, 1979 issues

DIGITALLY CONTROLLED, TOUCH SENSITIVE, POLYPHONIC, MULTI-VOICE SYNTHESIZER

The Transcendent PDX is a really versatile new 5 octave keyboard instrument. There are two audio outputs which can be used simultaneously. On the first there is a beautiful harpsichord or reed sound — fully polyphonic i.e. you can play chords with as many notes as you like. On the second output there is a wide range of different voices, still fully polyphonic. It can be a straightforward piano or a honky tonk piano or even a mixture of the two! Alternatively you can play strings over the whole range of the keyboard or brass over the whole range of the keyboard or should you prefer — strings on the top of the keyboard and brass at the lower end (the keyboard is electronically split after the first two octaves) or vice versa or even a combination of strings and brass sounds simultaneously. And on all voices you can switch in circuitry to make the keyboard touch sensitive? The harder you press down a key the louder it sounds — just like an acoustic piano. The digitally controlled multiplexed system makes practical sensitivity with the complex dynamics law necessary for a high degree of realism. There is a master volume and tone control, a separate control for the brass sounds and also a vibrato circuit with variable depth control together with a variable delay control so that the vibrato comes in only after waiting a short time after the note is struck for even more realistic string sounds. in only after waiting a short time after the note is struck for even more realistic string sounds.

ole as separate packs — prices in free catalgoue

COMPLETE KIT ONLY £299.00 + VAT!

To add interest to the sounds and make them more natural there is a chorus / ensemble unit which is a complex phasing system using CCD (charge coupled device) analogue delay lines. The overall effect of this is similar to that of several acoustic instruments playing the same piece of music. The ensemble circuitry can be switched in with either strong or mild effects. As the system is based on digital circuitry data can be easily taken to and from a computer (for storing and playing back accompaniment with or without pitch or key change, computer composing etc., etc.), and an interface socket (25 way D type) is provided for this purpose.

Although the DPX is an advanced design using a very large amount of circuitry, much of it very sophisticated, the kit is mechanically extremely simple with excellent access to all the circuit boards which interconnect with multiway connectors, just four of which are removed to separate the keyboard circuitry and the panel circuitry from the main circuitry in the cabinet.

The kit includes fully finished metalwork, solid teak cabinet, professional quality components (all resistors 2% metal oxide), nuts. bolts. etc., even a 13A plug — you need buy absolutely no more parts before plugging in and making great music! When finished you will possess an instrument comparable in performance and quality with ready-built units selling for over £1200!

EXPORT A SPECIALITY! Our Export Department can readily despatch orders of any size to any country in the world. Some of the countries to which we sent kits last year are shown in this advertisement. To assist in estimating postal costs our catalogue gives the weights of all packs and kits. This will be sent free on request, by airmail, together with our "Export Postal Guide" which gives current postage prices. There is no minimum order charge, Prices same as for U.K. customers but no Value Added Tax charged. Postage charged at actual cost plus £1 documentation and handling. Please send payment with order by Bank Draft, Postal Order, International Money Order or cheque drawn on an account in the U.K. Alternatively for orders over £500 we will accept Irrevocable Letter of Credit payable at sight in London.

Value Added Tax not included in prices **UK Carriage FREE**

PRICE STABILITY. Order with confidence! Irrespective of any price changes we will honour all prices in this advertisement until April 30th, 1980, if this month is advertisement is mentioned with your order.

Errors and VAT rate changes excluded.

U.K. ORDERS. Subject to 15% surcharge for VAT. No charge is made for

carriage. Or current rate if changed.

SECURICOR DELIVERY: For this optional service (U.K. mainland only)

add £2.50 (VAT inclusive) per kit. **SALES COUNTER:** If you prefer to collect your kit from the factory, call at Sales Counter. Open 9 a.m. to 12 & 1 p.m. to 4.30 p.m. Monday-

QUALITY: All components are brand new first grade full specification guaranteed devices. All resistors (except where stated as metal oxide) are low noise carbon film types. All printed circuit boards are fibreglass, drilled roller tinned.

ELECTRONIC KITS OF DISTINCTION FROM

DE LUXE EASY TO BUILD LINSLEY-HOOD 75W STEREO AMPLIFIER £99.30 + VAT

This easy to build version of our world-wide acclaimed 75W amplifier kit based upon circuit boards interconnected with gold plated contacts resulting in minimal wiring and construction delightfully straightforward. The design was published in Hi-Fi News and Record Review and features include rumble filter, variable scratch filter, versatile tone controls and tape monitoring whilst distortion is less than 0.01%.

A pre-aligned front-end module makes this Wireless World published design very simple to construct and adjust without special instruments. Features include an excellent a.m. rejection push-button station selection as well as infinitely variable tuning and a phase locked loop stereo decoder, incorporating active filters for "birdy" suppression.

LINSLEY-HOOD CASSETTE DECK £79.60 + VAT

This design, published in Wireless World, although straightforward and relatively low cost provides a very high standard of performance. There are separate record and replay amplifiers and switchable equalisation together with a choice of bias levels are also provided. The mechanism is the Goldring-Lenco CRV with electronic speed control.

TRANSCENDENT 2000 SINGLE BOARD SYNTHESIZER

Cabinet size 24.6"x15.7"x4.8" (rear) 3.4" (front)

The kit includes fully finished metalwork, fully assembled solid teak cabinet, filter sweep pedal, professional quality components (all resistors either 2% metal oxide or ½% metal film!) and it really is complete — right down to the last nut and bolt and last piece of wire! There is even a 13A plug in the kit — you need buy absolutely no more parts before plugging in and making great music! Virtually all the components are on the one professional quality fibre glass PCB printed with component locations. All the controls mount directly on the main board, all connections to the board are made with connector plugs and construction is so simple it can be built easily in a few evenings by almost anyone capable of neat soldering! When finished you will possess a synthesizer comparable in performance and quality with ready synthesizer comparable in performance and quality with ready built units selling for between £500 and £700!

Comprehensive handbook supplied with all complete kits! This

CHROMATHEQUE 5000 5-CHANNEL LIGHTING EFFECTS SYSTEM

This versatile system featured as a constructional article in ELECTRONICS TODAY INTERNATIONAL has 5 frequency channels with individual level controls on each channel. Control of the lights is comprehensive to say the least. You can run the unit as a straightforward sound-to-light or have it strobe all the lights at a speed dependent upon music level or front panel control setting or use the internal digital circuitry which produces some superb random and sequencing effects. Each channel handles up to 500W and as the kit is a single board design wiring is minimal and construction very straightforward.

Kit includes fully finished metalwork, fibreglass PCB, controls, wire, etc. — Complete right down to the last nut and bolt!

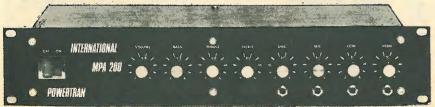

COMPLETE KIT ONLY £49.50 + VAT

Panel size 19.0"x3.5". Depth 7.3"

MPA200 100W MIXER/AMPLIFIER

Featured as a constructional article in Electronics Today International the MPA 200 is an exceptionally low-priced but professionally finished general purpose, rugged, high-power amplifier which has an adaptable range of inputs such as disc, microphone, guitar, etc. There are 3 wide range tone controls and a master volume control. Mechanically the design is simplicity in the extreme with minimal wiring making construction very straightforward. Kit includes fully finished metalwork, fibreglass PCB's, controls, wire, etc. — Complete right down to the last nut and

OEM — let Drake Transformers advise you on a component specification and design to solve that special problem. Preproduction prototypes and development undertaken as necessary.

Well known over a quarter century for personal service and high-quality products. Drake specialise in the design and manufacture of transformers and other wound components for large and small quantity production.

Expertise and service put DRAKE TRANSFORMERS in a class of their own.

Electronic Engineers – What you want, where you want!

TJB Electrotechnical Personnel Services is a specialised appointments service for electrical and electronic engineers. We have clients throughout the UK who urgently need technical staff at all levels from Junior Technician to Senior Management. Vacancies exist in all branches of electronics and allied disciplines - right through from design to marketing - at salary levels from around £4000 to £8000 p.a.

If you wish to make the most of your qualifications and experience and move another rung or two up the ladder we will be pleased to help you. All applications are treated in strict confidence and there is no danger of your present employer (or other companies you specify) being made aware of your application.

TJB ELECTROTECHNICAL PERSONNEL SERVICES.

12 Mount Ephraim. Tunbridge Wells, Kent. TN4 8AS.

Radio Communications Electronics Engineers and Software Designers

Mid-Sussex—S.W. London

Salaries up to £8,000

To join our expanding R&D Laboratories covering a wide range of R.F. spectrum, from L.F. to V.H.F. Equipments include transmitters and receivers for marine- and land-based use, radio navaids and radio monitoring remote computer-controlled systems

Electronics Engineers should have experience in transmitter or receiver design, analogue or digital circuit design, microprocessor applications. Software Designers should be experienced Programmers with an interest in control, signal processing or navigational software

Attractive salaries are complemented by excellent prospects and generous benefits.

Contact: David Bird, Redifon Telecommunications Limited, Broomhill Road, Wandsworth, London, S.W.18. Phone: 01-874 7281 (reverse charges)

DATEK SYSTEMS LTD.

A leading company in the phototypesetting industry manufacturing minicomputer based VDU terminals, incorporating the latest in MSI and LSI techniques in real time applications.

SENIOR TEST ENGINEERS

Qualified to at least HNC with considerable experience in digital electronics including some knowledge of machine language software

A background of word processing or printing industries would be beneficial. The position involves occasional overseas travel

JUNIOR TEST ENGINEERS Salary £3500+

This position requires a young engineer with HND, HNC or C and G Full Tech

Some experience of TTL logic or microprocessors would be an advantage, but a real interest in electronics is more valuable.

The company provides 4 weeks holiday and pension scheme

Write or phone for application form to: Miss Bux, Datek Systems Ltd., 849 Harrow Road, Wembley, Middx. Tel. 01-904 0061.

Appointments

Our channels are open for communication

The sophisticated communications systems and ancillary services produced by IAL help people all over the world to stay in touch. However, on this occasion, we would like you to do the communicating.

An increasing number of projects, embracing everything from mobile radio centres to all types of telephone telegraph and data switching centres, means we need additional specialist personnel. It is in your interest to get in touch.

Installation/Commissioning Engineer

£5200-£6800

You will lead a small team responsible for installing all types of communication systems and allied equipment. As well as being appropriately qualified, you will have about seven years' experience of radio link installation, testing and commissioning, three of which should have been spent at supervisory level and some overseas. The job will necessitate travelling abroad for limited periods at short notice, often to remote areas. Quote ref K/025.

Maintenance Technician Electronic Services Unit

£4200-£5800

You will be involved in the installation, commissioning and maintenance of a wide range of electronic, digital and radio equipment. Maintenance is to component level, including DIL/IC packages, transistorised equipment and some valve circuits. Experience is needed in some of the following fields: facsimile, computer peripherals, VHF radio, the control/operation of systems over private wires and data transmission. You should be qualified to ONC Electronics or equivalent, capable of working unsupervised and under pressure and prepared to be on out-of-hours standby. Quote ref K/026.

Salaries for both positions are negotiable and are at present under review; there are also a wide range of attractive company benefits. For more information, please contact the Senior Recruitment Officer, IAL, Aeradio House, Hayes Road, Southall, Middlesex. Tel: 01-574 5134.

HNC Level Engineers~

(Electrical or Electronic)

Train for the future as a Broadcast Transmission Engineer

Through our network of over 500 transmission stations the IBA is responsible for the transmission of all Independent Television and Local Radio services. With a steadily increasing number of stations, the preparations for the fourth television channel and more local radio stations now underway we are taking on increased responsibilities.

We take great pride in the fact that our system is one of the best in the world and great importance is placed on maintaining the efficiency of the service. To do this we have teams of highly trained and experienced engineers all over the country.

Internal promotions and continued expansion have created a number of opportunities for H.N.C. or H.T.C. or equivalent level engineers (male or female) to train for a challenging future. Our carefully devised training programme, which will commence this summer, can lead to a recognised Diploma and combines theoretical study and practical training. This comprehensive training is a step beyond traditional learning and gives a grounding in broadcast engineering that is second to none. Naturally, course fees, accommodation and meals will be paid during the course. A full driving licence is required, but if you do not already have one, we will assist you by arranging and paying for instruction.

On the satisfactory completion of the training programme, your salary will be £5.880 per annum and then rise annually to £7.280 per annum, with further progression to £8.202 per annum. (During the training period you will receive a salary of up to £4.700 per annum, depending upon experience.) At higher levels it will be up to you to demonstrate your ability as promotions are based on internal competition – all of our Regional engineering managers started their careers at transmitting stations.

Employment benefits include Free Life Assurance and Personal Accident Schemes, a Contributory Pension Scheme, generous relocation expenses and subsidised mortgage facilities.

Please write or telephone Mike Wright for a fully illustrated information package and application form, at IBA, Crawley Court, Winchester, Hampshire SO21 2QA. Telephone: Winchester 822574.

Electronics Technician Space Research Projects

An Electronics Technician is required by the Rutherford and Appleton Laboratories to work on the instrumentation of rocket-born scientific experiments making measurements of the upper atmosphere (60 to 150 km). Duties will include the development and construction of digital and analogue circuits and the assembly of experiments; the integration of experiments with rocket and telemetry systems; the calibration and environmental testing of equipment; the carrying out of pre-launch assembly and final check-out of the experiments on the launch sites. The work will involve collaboration with the University College of Wales, Aberystwyth, and with overseas groups and the successful candidate will be expected to travel occasionally to rocket ranges in the UK and abroad for periods of a few weeks.

The vacancy is as Professional and Technology Officer Grade III level. Applicants should have at least ONC or a TEC/SCOTEC Certificate with a minimum of 4 years experience including the design, construction and operation of analogue and digital circuits.

The Salary scale is under review but currently stands at £5309 - £5876, inclusive of Outer London Weighting Allowance. There is a noncontributory pension scheme. The post will be located at Ditton Park, Slough until mid 1981 when it is anticipated that the work will be transferred to the Laboratories' site at Chilton, Oxfordshire.

Please request an application form, quoting reference VN5017

Rutherford and Appleton Laboratories

Mrs Jane Williams, Rutherford and Appleton Laboratories, Chilton, Didcot, OXON OX11 0QX. Tel: Abingdon (0235) 21900 – Extension 510.

UNIVERSITY OF DUNDEE

There is a vacancy for an

ELECTRONICS WORKSHOP TECHNICIAN

to work in the above Department. The duties of the post will include the construction and modification of equipment for the Department's teaching and research work. Servicing and repair of a wide range of equipment is also a requirement.

Applicants for the post should have an appropriate ONC or equivalent qualification and not less than seven year's relevant experience in engineering.

Salary scale £3996 to £4668, Grade 5 (to be reviewed in April 1980) with point of entry dependent on qualifications and experience. Grant towards removal assistance to Dundee.

Application forms and further particulars may be obtained from the Establishments Office, The University, Dundee DD1 4HN and should be returned by 5th March, 1980. Please quote Ref: EST/106/80WW. (171)

Technomark Engineering and Technical Recruitment

11 Westbourne Grove London W2. 01-229 9239 (9257)

Royal Military College of Science, Shrivenham

Lecturers/Senior Lecturers Electronic Engineering

The College is a residential establishment, running first degree and postgraduate CNAA courses, Army Staff courses and specialist courses, for both civilian and military students. It has an academic staff of over 100, whose duties are similar to those of University Lecturers. There are comprehensive laboratory, computing, workshop and library facilities, and staff are given every opportunity to become involved in research and development work, and read for higher degrees.

The Electronics Branch is responsible for instruction in the principles of electronic devices, the fundamentals of signal transmission and processing, and in the applications of these topics to telecommunications, radar, telemetry and radio guidance. The Lecturer(s) appointed will be expected to take an interest in one of the topics listed above, but the posts will be mainly concerned with digital electronics and signal processing. For further information contact Professor Hill, Shrivenham 782551, ext. 290.

Candidates must have a first or second class honours degree or equivalent in electrical engineering or applied

physics (with electronics). Experience in the field of electronics or communications is desirable and preference will be given to candidates with experience in the design and application of modern digital electronic systems, including microprocessors.

Appointment will be as Senior Lecturer (£6330-£8705) or Lecturer (£4210-£5485) according to age and experience. At least 4 years' post graduate experience is necessary for appointment as Senior Lecturer. Starting salary may be above the minimum at each level. Non-contributory pension scheme and promotion prospects to a salary of £11,000 and above. Accommodation may be available for single staff and housing for married persons.

For further details and an application form (to be returned by 14 March 1980) write to Civil Service Commission, Alencon Link Basingstoke, Hants. RG21 1JB, or telephone Basingstoke (0256) 68551 (answering service operates outside office hours). Please quote reference: S(C)908.

In Electronics, there's Good and ULTRA Good.

UEL have established a formidable international reputation for the innovation and manufacture of advanced technological equipment. By applying their engineering ability in a highly sophisticated and creative way, UEL have been awarded. numerous long term contracts for which they require a diversity of talented personnel. Because of the high standards employed in . these projects, we are therefore looking for the following experienced people.

Electronic Development Engineers £5000-£6500

You should be a graduate or equivalent, with a minimum of 2 years development experience in an electronic laboratory.

A knowledge of Radio Frequency and Analogue Circuit Design is necessary (ideally on MOD project work). Working within a close knit team, you will report to a Project Engineer and be assisted by laboratory technicians.

* A specific vacancy also exists for a Test Equipment Design Engineer *.

Quality Engineers £4500–£6000

You should ideally be an experienced Quality Engineer, but suitable Inspectors or Test Engineers would be considered. Holding at least an ONC, you should have a good command of English combined with some mathematical ability. Responsibilities include development of quality procedures for new product ranges and the maintenance and development of existing product quality.

At UEL you will work in a small group environment and can look forward to a stimulating and demanding job with good career prospects. There are many benefits – sports and social club, contributory pension scheme, 22 days annual holiday, subsidised canteen and a weekly attendance bonus.

If you feel you are one of the few who can help by injecting a rather rare combination of skills, expertise and enthusiasm, we would be pleased if you'd contact us.

To find out more, please ring Gavin Rendall on 01-578 0081.

SALES ENGINEER Public Address Systems

EXCELLENT PROSPECTS—A Public Address Sales Engineer with wide experience is required to head up the Vortexion Division of this Company.

The applicant must be experienced in this field, prepared to handle sales enquiries through to the wiring and installation stage, also to develop and expand the sales of Vortexion amplifier equipment to existing Agents / Distributors in the UK. In this position he/she will be responsible to the Sales Manager.

The successful applicant will be selfmotivated, with a professional approach and a willingness to travel, initially in the UK and later in export markets.

An excellent career is assured, together with negotiable salary/commission, company car, incurred expenses, BUPA Plan, and a good working environment in the suburbs of London. Age is not important, experience and a desire to carry out a job well is paramount.

Applications should be addressed to: Personnel Manager, Clarke & Smith Mfg Co Ltd, Melbourne House, Melbourne Road, Wallington, Surrey SM6 8SD. Tel: 01-669 4411, ext 32.

Test Engineers

Pye Telecommunications are a well established company, involved in the field of radio communications, both at home and overseas. The Pye trademark is synonymous with systems that are highly reliable. To ensure that reliability, we need Test Engineers to check our VHF/UHF systems to very exacting specifications prior to delivery.

We are looking for skilled men and women with experience of fault diagnosis, alignment and testing of electronic equipment, preferably communications equipment. Formal qualifications are desirable, but less important than sound practical ability. Armed Forces experience would be particularly acceptable.

We can offer you job security and long term career opportunities, both within the company and the Pye and Philips Group as a whole. Our salaries are competitive and we offer up to five weeks' annual holiday. Attractive additional benefits include contributory pension scheme, good canteen facilities and assistance with relocation expenses where appropriate.

If you are interested please contact: Jane Easy,

WIRELESS TECHNICIANS

We require staff, male or female, to prepare and maintain the latest in communications equipment used by the Police and Fire Brigades in England and

You will need to be qualified to at least City and Guilds Intermediate Telecommunications standard and be able to demonstrate practical skills in locating and diagnosing faults in a wide range of equipment from computer based data transmission to FM and AM radio systems. You would live near to and work from one of our service centres located at Andover, Hants: Bishops Cleeve, Gloucs; Hannington, Basingstoke, Hants; Shapwick, Somerset; Harrow,

Specialised courses or training are run to assist staff to keep up to date with developments and new equipment and there are opportunities for day release to gain higher qualifications. Applications from registered disabled persons will be considered.

Promotion prospects are good and the work represents a secure future with generous leave allowance and non-contributory pension scheme.

Possession of a driving licence is essential since some travelling will normally be involved.

The salary scale is as follows: __ £3900; £4160; £4420; £4680; £4940; £5200; £5530.

If you are interested in working with us, then write for further details and application form to:-

Mr. C. B. Constable, Directorate of Telecommunications, Horseferry House, Dean Ryle Street, London SW1P 2AW. Telephone 01 211-5293.

TRAINEE BROADCAST ENGINEERS

ITN needs more engineers to support its expanding programme of news coverage — expansion which is expected to continue through the '80s with the introduction of the fourth channel.

We have a number of vacancies for Engineering Trainees - vacancies which could give you the opportunity to start a career in Broadcast Television

Firstly, we need you to have a firm interest in pursuing a career in the technical side of broadcasting.

Then you should have completed or expect to complete theoretical training in Electronic Engineering or allied subjects this academic year.

Applicants may have a wide range of acceptable initial qualifications, but those generally most suitable are either the IEC's Higher Technical Diploma, Higher Technical Certificate, HNC or HND.

After a training period of nine months you would be employed on the operation and maintenance of a wide range of studio, outside broadcast and computer type equipment at ITN's Central London studio centre near Oxford Circus from which the ITV national news programmes are networked

Successful applicants will join ITN in the summer of 1980.

Starting salaries would depend on qualifications and experience, but would lie within the range of £3,857 (at 18) to £4,898.

Please call us on 01-637 3144 for an application form quoting vacancy number 40799 or write to: The Director of Engineering, ITN House, 48 Wells Street, London W1P 4DE, with a short resume of your interests, qualifications and SCOTTISH HOME AND HEALTH DEPARTMENT

WIRELESS **TECHNICIAN**

Applications are invited for one post of Wireless Technician in the Scottish Home and Health Department

The post is in Inverness.

QUALIFICATIONS:

Candidates must hold an Ordinary National Certificate in Electronic or Electrical Engineering or a City and Guilds of London Institute Certificate in an appropriate subject or a qualification of a higher or equivalent standard

EXPERIENCE:

3 years' appropriate experience

STARTING SALARY:

£3,900, scale maximum £5,530

Applicants should have sound theoretical and practical knowledge of Radio Engineering and Radio Communications equipment in HF, VHF and UHF bands. The work involves installation and maintenance of equipment located at considerable distance from headquarters. A clean current driving licence and ability to drive private and commercial vehicles are essentia

The appointment is unestablished initially but there is prospect of an established (i.e. permanent) appointment after 1 year's satisfactory service.

Application forms and further information are obtainable from Scottish Office Personnel Division, Room 110, 16 Waterloo Place, Edinburgh EH1 3DN (quote ref: PM(PTS) 2/2/80) (031-556 8400, Ext. 4317 or 5028).

Closing date for receipt of completed application forms is 18 April,

DRG Flexible Packaging

INSTRUMENTS & ELECTRONICS SUPERVISOR

DRG Flexible Packaging is one of Europe's largest converters of protective packaging materials using a wide variety of sophisticated plant and machinery

There is a vacancy for a Supervisor in the instruments and electronics section of the engineering department. The section consists of six electronics and three industrial technicians and is responsible for the maintenance and development of industrial electronic equipment including photo-electric, process control and measuring equipment and machine drives. The section works mainly double shift (although it serves a treble shift factory) but the Supervisor's job is a day position. The successful applicant will have had several years' experience in electronics and hold a relevant qualification such as City and Guilds **Full Technical Certificate**

The Company offers a competitive salary, 4 weeks' holiday a year, a contributory pension scheme and other benefits associated with working for a large company.

Applications should be made in writing, giving brief career details and current salary to

> Mr. P. Hawkins DRG FLEXIBLE PACKAGING **Filwood Road** Fishponds, Bristol BS16 3RY

A Dickinson Robinson Group Company

R & D Engineers

required to work on digital circuits for micro-processor based industrial and commercial

The candidate should have a working knowledge of TTL and CMOS logic and have experience of programming at assembler language level for micro-processor systems.

Engineers should hold a degree / HNC or equivalent qualifications. Salary will be commensurate with qualifications, age and experience.

If you are seeking an enjoyable position involving both hardware and software development, write giving your career to date or telephone

COURSES

UNIVERSITY OF LANCASTER **MSc COURSE IN**

SEMICONDUCTOR

Microelectronic devices - their operation one-year course. The current national ex pansion in the production of microelectro devices will result in a need for experts in the device physics, design and manufacture of semiconductor devices. This course covers material problems associated with the manufacture and involves laboratory work on the basic manufacturing processes as well as the theory of operation. There is a project done in collaboration with industry.

The course is approved by the Science Research Council for award of their Advanced Course Studentships, Applicants should hold a first or second class degree in Physics or Engineering or equivalent

Further details and application form from: Professor R. H. Tredgold, Department of Physics, University of Lancaster, Lan-caster LA1 4YB. (147)

UMIST POSTGRADUATE COURSE IN SOLID-STATE ELECTRONICS (M.Sc and Ph.D.)

A 12-month MSC course comprising two terms of lectures, followed by a 5-month research project, starts at UMIST in October each year. This course, suitable for gradu-ates in Physics, Electrical Engineering or ates in Physics, Electrical Engineering or related subjects, is concerned with the design and behaviour of solid-state devices such as transistors, integrated circuits, magnetic computer memories, etc. and the solid-state physics on which they are based. Suitable candidates may be situated. Suitable candidates may be given the opportunity to proceed to Ph.D. work. SRC studentships are available for suitably qualified candidates.

Further information from Dr. K. E. Singer, Department of Electrical Engineering and Electroncs, UMIST, Manchester M60 1QD.

Cassette **Editing Kit**

Make editing simple with the Bib splicer, tape cutter and splicing tape, with 6.3mm adaptor.

Ref 56 £2.88 inc. VAT

USA Pat. No. 4067563 (splicer) Brit. Pat. No. 1507583 Brit Pat. No. 1258280 (method of splicing)

Groov-Kleen Automatic Record Cleaner

For single-play turntables. Removes harmful dust to protect records and stylii. Finished in chrome, bright anodised aluminium and shiny black £2.99 inc. VAT

The Bib Cassette Fast Winder enables you to wind tape in one cassette whilst you are listening to another cassette. If you have a battery recorder, always use the Fast Winder to save the high battery consumption when fast winding. It winds a C.90 cassette in 60 seconds — faster than most recorders. Ref. 78 £1.59 inc. VAT

Groov-Guard XL-2

Anti-static liquid and record preservative Following years of research, Bib

laboratories have developed Groov-Guard XL-2, Anti-static Record Preservative. When applied to the record, eliminates static charge for the expected life of the record Another advancement with Groov-Guard XL-2 is that it reduces the frictional wear of the record surface thus giving extended life. Safe pump action dispenser, Non-flammable

Ref. 27 f2.48 inc. VAT

All prices shown are recommended retail, inc. VAT.

In difficulty send direct, plus 20p P & P. Send S.A.E. for free copy of colour catalogue detailing complete range. Bib Hi-Fi Accessories Limited, Kelsey House, Wood Lane End, Hemel Hempstead, Herts., HP2 4RQ.

Soft bristles on leading edge remove dust and humid velvet pad collects particles. This advanced cleaner is engineered in a fine shiny black finish and is supplied with dust cover and a 22ml, bottle of anti-static cleaner. Ref. 47

Tape Head Maintenance Kit

Everything necessary for cleaning heads, capstan and pinch wheel on all types of recorders

Cleaning and polishing pads, cleaning liquid and brush inspection mirror included.
