(Z. Naturforsch. 30 a, 1493–1494 [1975];
received October 7, 1975)

A comparison is given between hydrogen-like and Hartree-Fock calculated and experimental absorption data for Silicon. Some values omitted in an earlier paper are added.

1. Recent theoretical determinations of the imaginary parts of the atomic scattering factors of Si for 12 characteristic X-ray wavelengths using both hydrogen-like¹ and Hartree-Fock eigenfunctions² have shown that both theoretical approaches give almost identical results for this particular element and X-ray energy range. Nevertheless we wish to reemphasize in this note the limitations of the H-like theory and the X-ray energy regions to which it can be applied successfully.

For the more extensive hydrogen-like calculations given in³ for elements $Z=6$ to 54 and 18 characteristic wavelengths in the medium X-ray energy range 5 to 25 keV the comparison given in⁴ shows that the

hydrogen-like calculations are in satisfactory agreement with other more rigorous theoretical values and those estimable from measured X-ray absorption coefficients only if we consider elements whose values lie between the following limits

$$6 \lesssim Z \lesssim Z_{E(2s)},$$

where $Z_{E(2s)}$ is the atomic number of an element having the 2s electron (hydrogenlike) eigenvalue closest to that of the incident X-ray photon energy. This region restricts the calculations to the major K and L atomic absorption shells.

Further we show in Table 1, that the H-like calculations given for Si in both^{1,2} are in slightly better agreement with experiment than the H-F-calculations² when other scattering contributions $\blacktriangle$ (CS, TDS), estimated from the theoretical values given in⁵, are added.

For comparison the values given in the recent edition of the "International Tables for X-Ray Crystallography"⁷ are also repeated in Table 1. These data are mean weighted values obtained from many experimental and theoretical sources. They show remarkable disagreement with the other theoretical and experimental values in Table 1.

2. We wish to correct several errors and omissions which have occurred in our earlier published papers.

Table 1. Linear absorption coefficients cm^{-1} for Si. The mass absorption coefficients μ_0/ρ given in the "International Tables..."⁷ have been converted to linear absorption coefficients using $\rho_{\text{Si}}=2.3283 \text{ g}\cdot\text{cm}^{-3}$.

line	Theory			Theory, corr.			Experiment ⁶	Int. Tabl. ⁷
	H—F ²	H-like ^{1,3}	$\blacktriangle$ ⁵	H—F	H-like	¹		
AgK α	7.28	6.94	0.34	7.62	7.28	7.32	7.61	7.58
