

On the Ambiguity of Complex Structures Derived from one Set of Rotational Constants

H. Dreizler* and S. Kassi

Laboratoire de Physique des Lasers, Atomes et Molecules Université des Sciences et Technologies de Lille F-59655 Villeneuve d'Ascq

Z. Naturforsch. **53 a**, 743–746 (1998); received June 22, 1998

It is shown algebraically that from one set of rotational constants or moments of inertia of a complex formed by an asymmetric top molecule and a rare gas atom, eight generally different structures result which are compatible with the moments of inertia.
