Z. Naturforsch. **62c**, 661–667 (2007); received December 7, 2006

The aqueous methanolic extract of the aerial parts of *Fagonia arabica* L. (family Zygophyllaceae) was successively fractionated using certain organic solvents. From the ethyl acetate fraction, two flavonoid glycosides were isolated and identified as kaempferol-7-*O*-rhamnoside and acacetin-7-*O*-rhamnoside. Four triterpenoidal glycosides were isolated from the butanolic layer. Their structures were elucidated on the basis of the spectral and chemical data as 3-*O*- β -D-glucopyranosyl-(1 \rightarrow 3)- α -L-arabinopyranoside oleanolic acid (**1**), 3-*O*- α -L-arabinopyranosyl quinovic acid 28-*O*- β -D-glucopyranoside (**2**), 3-*O*-[β -D-glucopyranosyl-(1 \rightarrow 2)]- β -D-glucopyranosyl-(1 \rightarrow 3)- α -L-arabinosyl oleanolic acid (**3**) and 3-*O*- β -D-glucopyranosyl-(1 \rightarrow 3)- α -L-arabino-pyranosyl quinovic acid 28-*O*- β -D-glucopyranoside (**4**). The two monodesmosidic saponins **1** and **3** were found to possess strong molluscicidal activity against *Biomphalaria alexandrina* snails, the intermediate host of *Schistosoma mansoni* in Egypt (LC₉₀ = 13.33 and 16.44 μ M), whereas the other two bidesmosidic saponins **2** and **4** as well as the two flavonoid glycosides were inactive up to 50 μ M.

Key words: *Fagonia arabica*, Flavonoids, Triterpenoidal Glycosides, Molluscicides
