INTRODUCTION

This manual is divided into two volumes:

Volume 1, TM 55-1925-207-10-1 consists of Chapters 1 and 2,

Volume 2, TM 55-1925-207-10-2 consists of Chapter 3 through Appendixes A through E.

The Appendixes in Volume 2 are applicable to both volumes.

WARNING

MODIFICATION HAZARD

Unauthorized modifications, alterations or installations to this equipment are prohibited and are in violation of AR 750-10. Any such unauthorized modifications, alterations or installations could result in death, injury or damage to the equipment.

HIGH PRESSURE HYDRAULIC SYSTEM HAZARDS

Hydraulic systems can cause serious injuries if high pressure lines or equipment fail.

Never work on hydraulic systems or equipment unless there is another person nearby who is familiar with the operation and hazards of the equipment, and who can give first aid. A second person should stand by controls to turn off hydraulic pumps in an emergency.

MOVING MACHINERY HAZARDS

Be very careful when operating or working near moving machinery. Running engine, rotating shafts, and other moving parts could cause personal injury or death.

ELECTRICAL HAZARDS

Do not be misled by the term "low voltage." Potentials as low as 50 volts may cause death under adverse conditions. Be careful not to contact 115-Vac input connections when installing operating equipment. Whenever the nature of the operation permits, keep one hand away from the equipment to reduce the hazard of current flowing through the body.

FLAMMABLE LIQUID AND COMBUSTIBLE VAPOR HAZARDS

Gasoline, fuel oil, lubricating oil, grease, paint, paint thinner, cleaning solvents and other combustible liquids present a serious fire hazard. Always store combustible liquids in approved containers and in designated compartments or deck storage locations. Ensure exhaust and ventilation fans are operating while using cleaning solvents or paint products. Never store or charge batteries in a confined space without ventilation or near operating electrical equipment.

When refueling and defueling the vessel, ensure appropriate signs are posted in visible locations and warnings are announced over the vessel's public address system. Smoking, welding and any operation which involves open flames must be prohibited throughout the vessel.

CAUSTIC AND CORROSIVE CHEMICAL HAZARDS

Battery acid and water purification chemicals such as bromine and chlorine can cause serious burns to eyes or exposed areas of skin. Always wear eye protection and protective clothing when working with caustic and corrosive chemicals. If chemical accidentally contacts skin or eyes, immediately flush with large quantities of water and seek medical attention.

COMPRESSED AIR HAZARDS

High pressure compressed air tanks, piping systems and air operated devices possess potential for serious injury to eyes and exposed areas of skin due to escaping air pressure.

ELECTROMAGNETIC RADIATION HAZARDS

Electromagnetic radiation from the searchlight, radar, and radio antennas has the potential for serious radiation burns. Do not stand in the path of radiation emissions.

HIGH TEMPERATURE FLUID HAZARD

Hot fluids such as engine coolants, hot water, engine lubrication oil, and hot hydraulic fluid possess the potential for serious burns to personnel.

HIGH INTENSITY LIGHT HAZARDS

High intensity light from the searchlight and other flood lights possess the potential to shatter lens covers creating a danger from flying glass.

Never stand directly in front of the searchlight or other powerful lights. Allow elements and bulbs to cool prior to performing maintenance. If elements and bulbs must be replaced while hot, wear protective gloves.

HALON FIRE SUPPRESSANT HAZARDS

All personnel must immediately evacuate spaces when HALON fire suppressant systems are activated. HALON displaces oxygen to smother combustion. It can cause death by suffocation if personnel do not evacuate within 25 seconds after activating handle is pulled.

FM-200 FIRE SUPPRESSANT HAZARDS

In the event the FM-200 system electric horns/strobes or the warning lights (amber strobes) are activated always leave the protected space immediately. FM-200 is being released within 60 seconds.

FIRE SUPPRESSANT HAZARDS

Fire suppressant chemicals displace oxygen and can cause suffocation. Immediately evacuate areas where they will be used.

For Artificial Respiration, refer to FM 21-11.

REPORTING ERRORS AND RECOMMENDING IMPROVEMENTS

You can help improve this publication. If you find any mistakes or if you know of a way to improve the procedures, please let us know. Submit your DA Form 2028 (Recommended Changes to Publications and Blank Forms), through the Internet, on the Army Electronic Product Support (AEPS) website. The Internet address is <http://aebs.ria.army.mil>. If you need a password, scroll down and click on "ACCESS REQUEST FORM". The DA Form 2028 is located in the ONLINE FORMS PROCESSING section of the AEPS. Fill out the form and click on SUBMIT. Using this form on the AEPS will enable us to respond quicker to your comments and better manage the DA Form 2028 program. You may also mail, fax or email your letter, or DA Form 2028 direct to: AMSTA-LC-
CI/TECH PUBS, TACOM-RI, 1 Rock Island Arsenal, Rock Island, IL 61299-7630. The email address is TACOM-TECH-PUBS@ria.army.mil. The fax number is DSN 793-0726 or Commercial (309) 782-0726.

THESE LUBRICATION INSTRUCTIONS ARE MANDATORY

3-25. Ship's Service Diesel Generator.

NOTE

THESE LUBRICATION INSTRUCTIONS ARE MANDATORY

3-26. Steering Gear.

NOTE

THESE LUBRICATION INSTRUCTIONS ARE MANDATORY

SECTION II. TROUBLESHOOTING PROCEDURES

3-27. Malfunctions. When a malfunction occurs, check to ensure that proper operating procedures, as specified in Chapter 2, were followed. If the malfunction is not corrected, refer the malfunction to unit maintenance for troubleshooting.

SECTION III. MAINTENANCE PROCEDURES

3-28. Maintenance Actions. All maintenance actions, except for operator preventive maintenance checks and services (see Table 2-2) are contained in the appropriate Unit, Intermediate Direct Support, and Intermediate General Support maintenance manual. Refer maintenance problems to unit maintenance for assistance.

APPENDIX A REFERENCES

A-1. Scope This appendix lists all forms, field manuals, technical manuals, and miscellaneous publications referenced in this manual.

APPENDIX B

COMPONENTS OF END ITEM AND BASIC ISSUE ITEMS LISTS SECTION I. INTRODUCTION

B-1. Scope. This appendix lists components of the end and basic issue items for the Large Tug (LT) to help you to inventory items required for safe and efficient operation.

B-2 General. The components of the End Item (COEI) and Basic Issue Items(BII) Lists are divided into the following sections:

a. Section II. Components of End Item. The basic COEI listing is for informational purposes only, and is not authority to requisition replacements. These items are part of the end item. As part of the end item, these items must be with the end item whenever it is issued or transferred between property accounts. A listing of On-Board-Spares shall appear in the same format as required for the Basic COEI listing. When ON-Board-Spares apply, there shall be a break in text of the listing and the new heading "On-Board-Spares" shall be used. This manual is your authorization to request/requisition replacement On-Board-Spares.

b. Section III. Basic Issue Items. These are the minimum essential items required to place the LT in operation, to operate it, and to perform emergency repairs. Although shipped separately packaged, BII must be with LT in operation and whenever it is transferred between property accounts. The illustrations will assist you with hard to identify items. This manual is your authority to request/requisition replacement BII, based on TOE/MTOE authorization of the end item.

B-3 Explanation of Columns. The following provides an explanation of columns found in the tabular listings:

a. Column (1)- Illustration Number (Illus Number). This column indicates the number of the illustration in which the item is shown.

b. Column (2)- National Stock Number. Indicates the National Stock Number assigned to the item and will be used for requisitioning porpoises

c. Column (3)- Description. Indicates the Federal Item Name, and , if required, a minimum description to identify and locate the item. The last line for each item indicates the CAGEC (in parentheses) followed by the part number.

d. Column (4)- Unit of measure(U/M). Indicates the measure in performing the actual operational/maintenance function. This measure is expressed by a two character alphabetical abbreviation (e.g., ea., in, pr)

e. Column(5)- Quantity Required (Qty Rqr). Indicates the quantity of the item authorized to be used with/on the equipment.

**APPENDIX C
ADDITIONAL AUTHORIZATION LIST**

Not Applicable

C-1/(C-2 blank)

APPENDIX D
EXPENDABLE/DURABLE SUPPLIES AND MATERIALS LIST

Section I. INTRODUCTION

D-1. Scope. This appendix lists expendable/durable supplies and materials you will need to operate and maintain the Large Tug (LT). This listing is for informational purposes only and is not authority to requisition the listed items. These items are authorized to you by CTA 50-970, Expendable/Durable Items (Except Medical, Class V, Repair Parts, and Heraldic Items), or CTA 8-100, Army Medical Department Expendable/Durable Items.

D-2. Explanation of Columns

a. **Column(1) - Item Number.** This number is assigned to the entry in the listing and is referenced in the narrative instructions to identify the material (e.g., "Use the cleaning compound, item 5, App. D").

b. **Column (2) Level.** This column identifies the lowest level of maintenance that requires the listed item.

C - Operator/Crew

O - Organizational Maintenance

F - Direct Support Maintenance

H - General Support Maintenance

c. **Column (3) - National Stock Number.** This is the National Stock Number assigned to the item; use it to request or requisition the item.

d. **Column (4) -Description.** Indicates the Federal item Name and, if required, a description to identify the item. The last line for each item indicates the Federal Supply Code for manufacturer (FSCM) in parentheses followed by the part number.

e. **Column () Unit of Measure (U/M).** Indicates the measure used in performing the actual maintenance function. This measure is expressed by a two character alphabetical abbreviation (e.g., ea, in, pr). If the unit of measure differs from the unit of issue, requisition the lowest unit of issue that will satisfy your requirements.

APPENDIX E

STOWAGE AND SIGN GUIDE FOR COMPONENTS OF END ITEM, BASIC ISSUE ITEMS, AND APPLICABLE ADDITIONAL AUTHORIZATION LIST ITEMS

E-1. Scope. This appendix shows the locations for the stowage of equipment and material required to be carried on the Large Tug (LT).

E-2. General. The illustrations on the following pages show the decals, stencils, and metal signs used on the vessel. Most of these signs provide operational information. Some are cautions or information you need to operate the vessel safely. Table E-1 list the locations of the signs.

Table E-1. Sign Locations

Figure	Location
E-1	Engine room near oily bilge pump. AMS II on each bilge and ballast pump motor controller.
E-2	Engine room near valve SD-8.

Figure E-5

HALON 1301 FIRE SUPPRESSION SYSTEM OPERATION

ENGINE ROOM & AUX. MACHINERY ROOM NO. 1

GENERAL

This Halon 1301 Fire Suppression System is operated by manual means only. If a fire is discovered, do not delay in manually operating the system. The effectiveness of Halon 1301 Agent is significantly increased by controlling the fire in its early stages.

WARNING

Alert and evacuate personnel from fire hazard area immediately on detection of fire and where possible prior to actuation of system.

SECURE AREA

1. Close Fire Damper in 01 Level Vent Plenum Port and Stbd.
2. Place Canvas Covers on to 02 Level Vent Plenum Exhaust Louvers.
3. Secure AMS I Supply and Exhaust Watertight Covers Located 01 Level Port FR-45, Sbd FR-51.
4. Close AMS II Sliding Watertight door.

MANUAL OPERATION

REMOTE: Remote manual fire suppression system operation is performed as follows:

1. At remote station in the Vestibule, Main Deck.
 - A. Break glass and pull handle of Valve Control Pull Box.
 - B. Immediately break glass and pull handle of Cylinder Control Pull Box.

Alarm sounds 60 seconds prior to gas discharge, warning personnel to evacuate space.

LOCAL: Local manual fire suppression system operation is performed as follows:

1. Proceed to C02 supply cylinder in AMS II.
 - A. Open Control Valve by removing locking pin and operating lever of control head mounted on Control Valve.
 - B. Discharge cylinders by removing locking pin and operating lever of control head mounted on C02 Cylinders.
 - C. If desired, discharge delay may be by-passed by removing locking pin and operating lever of control head mounted on Discharge Delay.

CAUTION: Do not enter hazard area in which fire has been extinguished with an open flame or lighted cigarette as the possible presence of inflammable vapors may cause re-ignition or explosion.

For deep seated hazards, the hazard space should be kept tightly closed for 30 to 60 minutes after discharge of the Halon 1301 Agent. Be sure fire is completely extinguished before ventilating area thoroughly or ensure self-contained breathing apparatus is being used.

Figure E-6. (Sheet 1 of 2)

ENGINE ROOM & AUX. MACHINERY ROOM NO. 1 (Continued)

- C. If desired, discharge delay may be by-passed by removing locking pin and operating lever of control head mounted on Discharge Delay.

CAUTION: Do not enter hazard area in which fire has been extinguished with an open flame or lighted cigarette as the possible presence of inflammable vapors may cause re-ignition or explosion.

For deep seated hazards, the hazard space should be kept tightly closed for 30 to 60 minute after discharge of the Halon 1301 Agent. Be sure fire is completely extinguished before ventilating area thoroughly or ensure self-contained breathing apparatus is being used.

HALON 1301 FIRE SUPPRESSION SYSTEM**PAINT LOCKER****WARNING**

Alert and evacuate personnel from fire hazard area immediately on detection of fire and where possible prior to actuation of system.

SECURE AREA

Close 3 Fire Dampers.

LOCAL: Local manual fire suppression system operation is performed as follows:

1. Discharge cylinder by removing locking pin and operating lever of control head mounted on Cylinder.
2. If desired, discharge delay may be by-passed by removing locking pin and operating lever of control head mounted on Discharge Delay.

CAUTION: Do not enter hazard area in which fire has been extinguished with an open flame or lighted cigarette as the possible presence of inflammable vapors may cause re-ignition or explosion.

For deep seated hazards, the hazard space should be kept tightly closed for 30 to 60 minutes after discharge of the Halon 1301 Agent. Be sure fire is completely extinguished before ventilating area. Before permitting anyone to enter the space, ventilate area thoroughly or ensure self-contained breathing apparatus is being used.

Figure E-7.

MAIN PROPULSION ENGINES

1. Ensure Port and Starboard main engine and reduction gear lube oil sumps and fresh water cooling systems are at the proper operating levels.
2. Ensure Port and Starboard main engine governor oil levels are at the proper operating levels.
3. Open Port and Starboard main engine air box drainsto remove any oil that may have accumulated. Close drains.
4. Check intake air filters for dirt and obstructions.
5. Ensure power is available to the reduction gear cooling pumps, main engine prelube pumps, and main engine control panels.
6. Align main engine pre-lube systems by opening valves LO-47 and LO-48 and prelube engines for 5 minutes if engines have been shut down for 12 hours or longer. Do not exceed 5 minutes with valves open as oil will enter valve seats.
7. Align cooling water system by opening valves FWC-2, FWC-4, FWC-14, FWC-16, for port main engine reduction gear and FWC-3, FWC-1, FWC-15 and FWC-13 for stbd main engine and reduction gear. Start reduction gear cooling pumps.
8. Ensure adequate supply of fuel oil is available in day tanks and open valves FO-15, FO-20, and FO-35 for Stbd main engine taking suction from and returning to Stbd day tank or valves FO-13, FO-14, FO-20, FO-34, and FO-33 for Stbd main engine taking suction from and returning to the Port day tank. Open valves FO-13, FO-19, and FO-33 for Port main engine taking suction from and returning to Port day tank or valves FO-15, FO-14, FO-19, FO-34, and FO-35 for Port main engine taking suction from and returning to Stbd day tank.
9. Ensure that diesel starting air receivers are charged and that starting air system to Port and Stbd main engines are lined up by opening valves CA-1, CA-2, CA-1, CA-12, CA-8, and CA-9.
10. Ensure that propulsion control air receiver is charged, air dryer is running, and propulsion control system is set up for normal operation with propulsion control from EOS station and Port and Stbd main engine throttles in the neutral position.
11. Ensure that alarms are cleared on local control panels.
12. Blow down cylinders to remove accumulated moisture by opening indicator cocks and rotate engine slowly (engine may be rotated by manually depressing starting solenoid valve while throttling air with engine mounted ball valve). Close indicator cocks after completion.
13. Momentarily press engine start push-button on engine control cabinet to start turbo oil pump (allow turbo oil pump to run at least 60 seconds before starting engine).

Figure E-8. (Sheet 1 of 2)

MAIN PROPULSION ENGINES (continued)

14. Start engine by depressing the start button on the local control panel or by pressing the remote start button in the EOS. Release start button after engine starts.
15. After engine starts, observe local or remote instrumentation to verify proper engine and reaction gear operation
16. See propulsion control instructions for operating main propulsion controls, engaging clutches, and cooling shaft seals.
17. To secure engines, remove load and allow temperatures to cool, approximately 3 - 5 minutes if engine has been under load.
18. Depress engine stop button on local control panel or remote panel in the EOS (in an emergency situation, engines may be shut down by tripping the overspeed trip lever).
19. Secure reduction gear cooling pumps.

Figure E-8. (Sheet 2 of 2)

BOW THRUSTER ENGINE

1. Ensure engine sump, marine gear sump, bow thruster lube oil system, and jacket water cooling levels are at the proper operating levels.
2. Line up fuel oil system to allow engine to take suction from and return to Port day tank by opening valves FO-30, FO-13, and FO-33 or Stbd tank by opening valves FO-30, FO-14, FO-15, FO-34, and FO35.
3. Line up cooling system by opening valves ASW-18, ASW-17, ASW-21, ASW-22, and AE-28.
4. Ensure that diesel starting air receivers are charged and that starting air system to bow thruster engine is lined up by opening valves CA-5, CA-4, CA-3, CA-11, CA-12, CA-1, and CA-2.
5. Ensure oiler on air starting system is at proper level.
6. Ensure that propulsion control air receiver is charged and propulsion control system is set up for normal operation. Transfer switch at the EOS station shall be in the remote position with pilothouse having control and bow thruster throttle in the neutral position.
7. Ensure that 24V control power is available to engine.
8. Release engine lockout switch.
9. Turn start switch to run position and start engine by lifting the start button on the local control panel or by pressing the remote start button in the pilothouse. Release start button after engine starts (observe illumination of remote run light in pilothouse when starting remotely).
10. After engine starts, observe local or remote diesel engine instrumentation to verify proper engine operation.
11. Allow engine to warm up until all temperatures and pressures have stabilized.
12. Speed and direction of bow thruster rotation shall be controlled by moving the bow thruster throttle at any of the four bow thruster control stations in the desired thrust direction. (See Propulsion Control System Instructions.)
13. To secure engine, remove load and allow temperatures to cool approximately 3 - 5 minutes if engine has been under load.
14. Stop engine by depressing the stop button on the local control panel or by depressing the remote stop button in the pilothouse. Release stop button after engine stops (observe extinguishing of remote run light in pilothouse when stopping remotely). When stopping remotely, hold stop button down until run light extinguishes.
15. To operate engine in local manual control, lift on hand throttle to change from air control position and engage teeth in manual position. Rotate handle CCW to increase speed. Engine may be stopped by pushing lever CW past idle.

Figure E-9.

AIR COMPRESSORS

1. Ensure oil level in compressor crankcase is at the proper operating level.
2. Ensure power is available to automatic moisture separators and air compressor control panels.
3. Manually drain moisture from system by depressing the override button on the moisture separators. During automatic operation the moisture separator will automatically open and close at a pre-determined rate and duration.
4. Line up compressed air system by opening valves CA-1, CA-2, CA-11, CA-1 2, CA- 3, and CA-4. Other valves in system shall be opened as desired.
5. Place air compressor motor controllers in the automatic mode and start compressors. In the automatic mode, compressors will cycle ON and OFF at 225 psi and 250 psi.
6. To manually operate compressors, place motor controllers in the manual mode and control compressor operation manually by depressing the start/stop pushbuttons.

CAUTION: Do not leave compressors unattended in manual mode as pressure switches will not function.

7. After compressors are running, verify power operation by observing compressor oil pressure and system pressure.

Figure E-10.

SWITCHBOARD**SHORE POWER**

To connect shore power:

- 1) Ensure that shore power breaker is open.
- 2) Connect shore power cable to plug. MN DK, FR 21
- 3) Check for proper phase rotation.
- 4) Open all other breakers feeding IS and 2S buses (i.e., SSDG No. 1, No. 1, EDG, Feedback).
- 5) Close Shore Power breaker.

SINGLE GENERATOR OPERATION

- 1) Start SSDG No. 1 or No. 2 (see operating instructions).
- 2) Adjust voltage to 450V, frequency to 60 HZ.
- 3) Open all other breakers feeding 1S and 2S buses (shore power, EDG feedback and other SSDG, if running).
- 4) Close generator breaker.
- 5) Adjust voltage and frequency as required.

PARALLEL OPERATION

NOTE: SSDG No. 1 is set with synchronous governor.
 SSDG No. 2 is set with 3% droop governor.

- 1) Apply single SSDG to 1 S/2S bus (see above).
- 2) Start second SSDG, adjust voltage and frequency to match on-line SSDG.
- 3) Turn synchroscope to incoming SSDG.
- 4) Adjust speed of incoming SSDG until synchroscope moves slowly clockwise (FAST)
- 5) When synchroscope is just before 1200 position, and synchronizing lamps are off, close breaker of incoming SSDG.
- 6) Adjust speed of droop SSDG (No. 2) as load changes to maintain equal loads on both SSDGs.

Figure E-11. (Sheet 1 of 3)

SWITCHBOARD (continued)**SPLIT BUS OPERATION**

1. In case of emergency, 1S and 2S buses may be fed separately Open bus fire switch and follow steps for single generator operation for each SSDG.

CAUTION: UNDER NO CIRCUMSTANCES SHOULD AN ATTEMPT BE MADE TO CLOSE THE BUS TIE SWITCH WHILE BOTH 1 S AND 2S BUSES ARE ENERGIZED.

EDG OPERATION**NORMAL MODE**

Manual Run:

1. Start EDG (see operating instruction).
2. Open Main Bus Tie Breaker

NOTE: For push-button operation of motorized Main Bus Tie Breaker, mode switch must be in "Hand or Auto" and door on breaker closed.

3. Close ECG breaker.

STAND BY (Normal at-set condition):

- 1) Place MODE switch to "AUTO".
- 2) Place EDG engine control switch to auto start (see operating instruction).
- 3) Ensure that EDG engine is set up for STAND BY operation (see operating instructions).
- 4) Upon loss of power from main switchboard:

EDG will start, the main bus tie circuit breaker will open, and the EDG breaker will close, automatically.

FEEDBACK MODE

With EDG running and breaker closed:

- 1) Ensure that no power is fed to the main switchboard (i.e. SSDG No. 1, SSDG No. 2, and shore power breakers are open).
- 2) Insert key and turn to feedback position.
- 3) Close main bus tie breaker and either 1 S/E or 2S/E breaker on main switchboard.

Figure E-11. (Sheet 2 of 3)

SWITCHBOARD (continued)**SAFETY INTERLOCKS:**

Figure E-11. (Sheet 3 of 3)

NO. 1 DIESEL GENERATOR SET

1. Ensure engine sump and jacket water cooling levels are at the proper operating levels.
2. Line up fuel oil system to allow engine to take suction from and return to stbd day tank by opening valves FO-15, FO-21 and FO-35 or port day tank by opening valves FO-13, FO-14, FO-21, FO-34, and FO-33.
3. Line up cooling system by opening valves FWC-9 and FWC-11.
4. Prime fuel oil system on engine, if necessary, with engine-mounted handpump.
5. Ensure battery charger is energized and batteries are charged.
6. Start engine by depressing start button on local control panel or remotely in the EOS. Release start button after engine starts. For remote start, local switch must be in run position.
7. After engine starts, observe local or remote diesel engine instrumentation to verify proper engine operation.
8. Allow engine to warm up until all temperatures and pressures have stabilized.
9. See switchboard operating instructions for placing generator on-line.
10. To secure engine, remove load (see switchboard operating instructions).
11. Allow temperatures to cool. approximately 3 - 5 minutes if engine has been under load.
12. Depress engine stop button on local control panel or remotely in EOS. In EOS, stop button must be held down until run light goes out.

Figure E-12.

NO. 2 DIESEL GENERATOR SET

1. Ensure engine sump and jacket water cooling levels are at the proper operating levels.
2. Line up fuel oil system to allow engine to take suction from and return to port day tank by opening valves FO-13, FO-22, and FO-33 or stbd day tank by opening valves FO-15, FO-14, FO-34, and FO-35.
3. Line up cooling system by opening valves FWC-10 and FWC-12.
4. Prime fuel oil system on engine if necessary, with engine-mounted hand pump.
5. Ensure that diesel starting air receivers are charged and that starting air system to generator is lined up by opening valves CA-7, CA-4, and CA-3.
6. Ensure oiler on air starting system is at proper level.
7. Start engine by depressing start button on local control panel or remotely in the EOS. Release start button after engine starts.
8. After engine starts, observe local or remote diesel engine instrumentation to verify proper engine operation.
9. Allow engine to warm up until all temperatures and pressures have stabilized.
10. See switchboard operating instructions for placing generator on-line.
11. To secure engine, remove load (see switchboard operating instructions).
12. Allow temperatures to cool approximately 3 - 5 minutes if engine has been under load.
13. Depress engine stop button on local control panel or remotely in EOS.

Figure E-13.

EMERGENCY DIESEL GENERATOR**MANUAL START:**

1. Ensure engine and jacket water cooling levels are at the proper operating levels.
2. Line up fuel system to allow engine to take suction from and return to EDG day tank by opening valve FO-32.
3. Prime fuel oil system on engine, if necessary, with engine-mounted hand pump.
4. Ensure battery charger is energized and batteries are charged.
5. Place generator mode switch in the OFF position.
6. Reset ALL shutoff devices.
7. Turn mode switch to the start position.
8. After engine starts, observe local instrumentation to verify proper engine operation.
9. Allow engine to warm up until all temperatures and pressures have stabilized.
10. See switchboard operating instructions for placing generator on-line.
11. To secure engine, remove load (see switchboard operating instructions).
12. Allow temperatures to cool approximately 3 - 5 minutes if engine has been under load.
13. Place engine mode switch in the stop position.

AUTOMATIC START:

1. Ensure steps 1 - 6 above are performed.
2. Place mode switch to the auto position.
3. See switchboard operating instructions for automatic start sequence.

Figure E-14.

PUMP DRIVE ENGINE

1. Ensure engine sump and jacket water cooling levels are at the proper operating levels.
2. Line up fuel oil system to allow engine to take suction from and return to port day tank by opening valves FO-31, FO-13, and FO-33 or stbd day tank by opening valves FO-31, FO-14, FO-15, FO-34, and FO-35.
3. Line up cooling system by opening valves ASW-17, ASW-19, ASW-20, ASW-22, and AE-28.
4. Ensure that diesel-starting air receivers are charged and that starting air system to pump drive engine is tied up by opening valves CA-6, CA-4, CA-3, CA-12, CA-1, CA-2, and CA-1.
5. Ensure oiler on air starting system is at proper level.
6. Ensure that fire fighting pump is declutched from engine and that tow winch hydraulic system is properly aligned by opening valves TH-1, TH-26, and TH-27 and closing TH-2, TH-3, and TH-4. Ensure tow winch hydraulic reservoir is at the proper level.
7. Ensure that 24V control power is available to engine.
8. Release engine lock-out switch.
9. Start engine by lifting start button on local control panel. Release start button after engine starts.
10. After engine starts, observe local or remote diesel engine instrumentation to verify proper engine operation.
11. Allow engine to warm up until all temperatures and pressures have stabilized.
12. Adjust engine speed as required by moving governor control handle.
13. To secure engine, remove load and allow temperatures to cool approximately 3 - 5 minutes if engine has been under load.
14. Depress engine stop button on local control panel.
15. For remote operation: Follow steps 1-7 above. Place local engine control switch in run position. Engine may be started and stopped from EOS.

Figure E-15.

OILY WATER SEPARATOR

Sigma S1-3 .5T-OWS

START-UP

1. Set valves as follows:

V1	Inlet Check	Automatic
V1A	Inlet Bypass	Closed
V2	Oil Disk, Check	Automatic
V2A	Oil Dish, Isolation	Opened
V3	Backflush Inlet Solenoid	Auto a/Man. Bypass
V4	Effluent Discharge	Automatic
V5	Recirculate	Automatic
V7	Pressure relief 15psi	Preset/Auto
V8	Isolation/Flow Control	4gpm/Opened
V14	Sample Petcock	Closed

2. Open OWS Discharge OB17.
3. Open Effluent Discharge valve OB10.
4. Open OWS Suction OB15, OB16.
5. Open bilge inlet OB16.
6. Purge all air from inlet piping by backflushing manually.

MANUAL BACKFLUSH:

- 1) Switch OWS "OFF".
- 2) Close the oil discharge isolation valve (V2A).
- 3) Open inlet bypass valve (V1A).
- 4) Open backflush inlet solenoid valve (V3).
7. After the separator and piping are water-filled, return valves to original positions outlined in step 1.

OPERATION: (Switching positions during operation)

8. Switch systems to "MAN". The system will now operate continuously, independent of any liquid level switches. If oil concentration exceeds 15PPM, unit will recirculate to suction.

Figure E-16.

OILY BILGE SYSTEM**MODES OF OPERATION:**

1. Primary drainage of bilge pockets to oily waste storage tank is through oily bilge transfer pump.

VALVE LINE-UP: Open OB14, OB8, OB17, and approximate bilge pocket valve.

2. Transfer from drain tank to storage tank.

VALVE LINE-UP: Open OB7, OB14, OB8, and OB17.

3. Oily/Water separation is normally from storage tank only.

VALVE LINE-UP: Open OB16, OB15, and OB10.

OPERATION OF PUMP:

- Ensure built-in reservoir is filled with 10-weight motor oil.
- Turn on air supply to pump.
- Monitor pump discharge pressure gauge and duplex suction pressure gauge.
- Turn off air supply to secure pump.

Figure E-17.

FIRE FIGHTING/AFFF SYSTEM**FIRE FIGHTING**

1. Align the fire fighting system to allow the diesel-driven fire fighting pump to take suction from the forward sea chest and discharge up to the fire monitors by opening valves AE-8 and FM-1. Individual supply valves to fire monitors, FM- 60, FM-61, and FM-62, may be opened as required.
2. Follow steps 1-12 of pump drive engine operating instructions.
3. Clutch in fire fighting pump and observe fire fighting pump discharge pressure gauge. Engine RPM shall be set at 2200 when discharging from two monitors.
4. To secure system, declutch fire fighting pump and follow steps 13-15 of pump drive engine operating instructions.

AFFF

1. Ensure AFFF tank is at the proper operating level.
2. Line up system to allow the AFFF pump to take suction from the AFFF storage tank and discharge to the in-line foam proportioner by opening valve FM-84.
3. Ensure power is available to the AFFF pump motor controller.
4. Follow steps 1-3 of fire fighting operating instructions.
5. Start AFFF pump by depressing start button on AFFF pump motor controller.
6. Observe system duplex pressure gauge at the foam proportioner. AFFF concentrate supply pressure should be approximately 5 psi higher than the fire fighting supply pressure.
7. To secure system, depress stop button on the AFFF pump motor controller and allow fire fighting pump to continue discharging out of the monitors to flush system of remaining AFFF concentrate.
8. Upon completion of flushing system, approximately 2-3 minutes, declutch fire fighting pump and follow steps 13-15 of pump drive engine operating instructions.

Figure E-18.

STERN TUBE SEAL**NORMAL OPERATIONS**

1. Stern tube seal operates without operator adjustment. During normal operations, a continuous sea waterflush to the seal cavity must be maintained at a pressure of about 10 PSIG.
2. Valves GS-42 and GS-43 should always be open.

EMERGENCY OPERATIONS

1. To prevent uncontrolled leakage, the shaft must be stopped and the inflatable seal pressurized. Connect hose from reducing station (CA-31) to quick disconnect for seal and pressurize to 25 psi.
2. See John Crane Technical Manual for instructions to convert sealing arrangement to a stuffing box in case of emergency.

Figure E-19.

PROPELLION CONTROL SYSTEM**START UP & STATION TRANSFER:**

1. Ensure Compressed Air System is fully charged and in the automatic mode; see Air Compressor Operating Instructions.
2. Line up Compressed Air System to feed the control air reservoir and control air lines from the reservoir to supply the control air dryer.
3. Energize control air dryer.
4. Ensure all control station throttles are in the center neutral position.
5. Place the EOS command transfer valve in the EOS position. Control air pressure will be shown on the local gauge mounted on the EOS control console indicating that the local station has control.
6. To transfer control from the local EOS station to any of the remote stations, place the command transfer switch in the remote position and pull up on any of the remote station transfer switches until indication of control air pressure is seen on the applicable remote control air pressure gauge. At this time, all other command stations are disabled. Transfer of command from the EOS to remote stations may only be initiated from the EOS and the EOS station may regain control at any time by placing the command transfer switch back in the EOS position.
7. To transfer command from one remote station to another, lift up on the station transfer switch at the desired station until control air is indicated on the control air gauge.

MAIN ENGINE THROTTLE CONTROL:

1. Ensure that engine throttles at the active station are in the neutral center position, or the start interlock feature of the control system will prevent engines from starting.
2. Start main engines. (See Main Engines Operating Instructions.)
3. Position throttle levers from the center detent position to either the 20 degrees ahead or astern position for clutch selection. Continued lever movement in the selected clutch quadrant will increase engine speed.
4. To change reduction gear ration, main engine throttles at the active station must be in the central neutral position.

BOW THRUSTER THROTTLE CONTROL:

1. Ensure that bow thruster throttle lever controls (located at remote operating stations only) are in the neutral center detent position.
2. Start bow thruster engine. (See Bow Thruster Operating Instructions.)

Figure E-20. (Sheet 1 of 2)

3. Position throttle levers from the center detent position to either the 20 degrees port or starboard position for clutch selection. Continued lever movement in the selected clutch quadrant will increase engine speed.
4. Emergency Towing - If brake failure occurs, as the last resort, the dog may be engaged with the drum stopped for emergency towing.
 - a. Engage the dog in the ratchet teeth.
 - b. Loosen clutch-brake slowly while drum turns slightly and all load is transferred to the dog.
 - c. Re-tighten clutch-brake.

WARNING

Never engage the dog while the drum is rotating in the payout direction. This could break the dog and could cause serious injury to personnel in the vicinity.

5. Emergency Release of Towline - Release the clutch-brake and auxiliary brake and allow towline to pull off the drum.
6. Gypsy Head Use - Loosen clutch-brake to allow free rotation of the shaft. Tighten auxiliary brake. Operate machine as in HEAVE or PAYOUT mode.

Figure E-20. (Sheet 2 of 2)

TOW WINCH

1. Normal Operation - Start pump drive engine with hydraulic system aligned for normal operation. (See Pump Drive Engine Operation Instructions.)
Back-up Operation - Align valves in accordance with Central Hydraulic System Operating Instructions. Start both motorized hydraulic system pumps. (See Central Hydraulic System Operating Instructions.)
2. Energize tow winch control panel.

MODES OF OPERATION

1. Payout or Heave. Normal and Low Speed Ranges- Set the clutch brake and release the auxiliary brake. With the control lever in NEUTRAL position, push the speed range selector knob into the desired position, up for low speed, down for normal speed. Push the control lever in the PAYOUT or HEAVE direction. The machine will run at a speed proportional to the lever movement.

CAUTION

Do not exceed 80 FPM Payout speed while powering with the hydraulic motor. Overhauling the motor will cause cavitation and severe mechanical damage.

The tug speed must be carefully controlled while powering out the line because the tug can easily overpower the towing machine motor.

2. Free Spooling - With the towline under light tension and the hydraulic motor in its stopped and braked condition and the auxiliary brake released, slowly release the clutch-brake compressor until the line begins to pull out.

The towline may be pulled out at a speed of up to 400 ft./min. (approximately 4 knots). Tension can be maintained on the rope by adjusting the clutch-brake compressor to achieve a slight braking action on the rotating drum.

CAUTION

Since this procedure produces heat in the clutch-brake band, it must be carefully observed so as not to smoke the brake lining. If the band overheats, release the clutch-brake compressor and/or slow down the tug.

In the event of overheat and subsequent tightening of the clutch-brake, the clutch-brake may freeze to the drum surface if left tight for long periods of time. Loosen the clutch-brake at the earliest opportunity to assure that it does not stick.

Check the tug speed before tightening the clutch-brake. Severe shock loading can occur if the clutch-brake is tightened while the line is being pulled out at full speed. The speed should be minimal when the clutch-brake is tightened.

Figure E-21.

CENTRAL HYDRAULIC SYSTEM

1. Ensure power is available to hydraulic power unit control panel and main circuit breaker on control panel face is closed.
2. Check reservoir level and ensure it is at the proper operating level.
3. Place mode selector switch in the "ON" position for local control or "REMOTE" for remote control from the EOS.
4. Select pump P1, P2, or both on pump selector switch. Simultaneous operation of both pumps is only required when the central hydraulic system is cross-connected to the towing winch hydraulic system. When cross-connecting to the towing winch hydraulic system, open valves TH-1, TH-2, TH-3, and TH-4 and close valves TH-26 and TH-27.
5. Press local or remote start button to start pump or pumps. When pump selector switch is set for both pumps there is a-preset time delay to stagger pump startup.

NOTE: When operating both pumps simultaneously for extended periods of time, pay close attention to reservoir temperature as this mode of operation may cause excessive oil temperatures.

6. Once pump or pumps have started, observe local instrumentation to verify proper operation and observe return filter pressure gauge. When it exceeds 20 psig with one pump running, the elements must be changed.
7. To secure power unit, remove load from system and depress local or remote stop button.

Figure E-22.

REFRIGERATION**STARTUP:**

1. Ensure crankcase heater has been energized at least twenty-four (24) hours prior to startup.
2. Line up valves for pulldown or holding mode is indicated in valve lineup and indicators table. Line up General Service System and supply SW to the condenser.
3. Apply power to unit coolers in chill box and freeze room.
4. Open compressor suction valve approximately one full turn.
5. Start compressor by placing main disconnect switch in the ON position. Immediately continue to open compressor suction valve; open slowly to prevent rapid pumping down.
6. Monitor compressor operation for about five (5) minutes. If there is no sign of liquid refrigerant returning to the compressor, open suction valve wide. If there is evidence of liquid refrigerant returning to the compressor, throttle suction valve until proper suction is obtained.
7. Change over from pulldown to holding mode, secure one unit in accordance with securing instructions, and open interconnecting valves RFSS-13 and RFSS-20.

SECURING:

1. Close dehydrator inlet valve. Let compressor run until it cuts out on suction pressure switch.
2. TURN-OFF main disconnect switch.
3. Close compressor suction valve.

NOTE: Control power (110v) must be left on to keep heater energized.

AIR CONDITIONING PLANT

STARTUP:

1. Ensure crankcase heater has been energized at least twenty-four (24) hours prior to startup.
2. Line up valves for normal or single unit mode as indicated in valve lineup and indicators table. Line up General Service System and supply SW to the condenser.
3. Apply power to fan coil unit R1-25-2 and RO1-32-2.
4. Open compressor suction valve approximately one full turn.
5. Start compressor by placing main disconnect switch in the ON position. Immediately continue to open compressor suction valve; open slowly to prevent rapid pumping down. Observe suction pressure to maintain greater than 5 in Hg.
6. Monitor compressor operation for about five (5) minutes. If there is no sign of liquid refrigerant returning to the compressor, open suction valve wide. If there is evidence of liquid refrigerant returning to the compressor, throttle suction valve until proper suction is obtained.
7. Change over from normal to single unit mode, secure one unit in accordance with securing instructions, and open interconnecting valves RFAC-39 and RFAC- 41.
8. Change over from single unit to normal mode, shut interconnecting valves RFAC-39 and RFAC-41, and start another unit in accordance with startup instructions.

SECURING:

1. Close dehydrator inlet valve. Let compressor run until it cuts out on suction pressure switch
2. TURN-OFF main disconnect switch.
3. Close compressor suction valve.

NOTE: Control power (110v) must be left on to keep heater energized.

Figure E-24. (Sheet 3 of 3)

SEWAGE COLLECTION, HOLDING AND TRANSFER (CHT) SYSTEM

The CHT system has the following modes of operation:

- a) Directly Overboard
- b) Through the Marine Sanitation Device (MSD) to Overboard
- c) To the Sewage Holding Tank

DIRECTLY OVERBOARD

1. To direct sewage drains directly overboard, close SD-3 (sewage drain to holding tank) and SD-1 (sewage inlet to MSD) and open valves SD-2 and SD-13 (sewage overboard discharging).

THROUGH THE MARINE SANITATION DEVICE (MSD) TO OVERBOARD

1. To direct sewage drains to the MSD, close valves SD-3 (sewage drain to holding tank), SD-2, and SD-13 (sewage overboard discharge) and open SD-1 (sewage inlet to MSD).
2. See MSD operating instruction for MSD discharge overboard.

TO THE SEWAGE HOLDING TANK

1. To direct sewage drains to the sewage holding tank for eventual discharge overboard or to shore connections, close valves SD-1 (sewage inlet to MSD), SD-2, and SD-13 (sewage overboard discharge) and open valve SD-3 (sewage drain to holding tank).

NOTE: The tank level indicating system will sound an alarm when tank is at the 95% full condition.

2. To discharge sewage from holding tank to overboard, align system by opening valves as follows:

#1 Sewage Discharge Pump: SD-5, SD-7, SD-8, and SD-13

#2 Sewage Discharge Pump: SD-4, SD-6, SD-8, and SD-13

NOTE: When discharging sewage overboard from holding, tank pumping may be enhanced by leading plumbing drains to the holding tank for dilution of sewage.

3. Ensure power is available to #1 and #2 sewage discharge pump motor controllers.
4. Start either pump by depressing start button and observe pump discharge pressure gage and local tank level indicator meter.
5. To secure pump, depress stop button on motor controller.

Figure E-25. (Sheet 1 of 2)

SEWAGE COLLECTION, HOLDING AND TRANSFER (CHT SYSTEM (continued))

6. To discharge sewage from holding tank to Port or Stbd shore connection, align system by opening valves as follows:
 - #1 Sewage Discharge Pump To Port Conn.: SD-5, SD-7, and SD-10
 - #1 Sewage Discharge Pump To Stbd Conn.: SD-5 SD-7, and SD-10
 - #2 Sewage Discharge Pump to Port Conn.: SD-4, SD-6, and SD-10
 - #2 Sewage Discharge Pump To Stbd Conn.: SD-4, SD-6, and SD-11
7. Ensure that shore connection chosen is properly connected to a suitable collection tank.
8. Follow steps 3-5 above for start/stop of discharge pumps.

Figure E-25. (Sheet 2 of 2)

FIREMAIN/WDCM/GENERAL SERVICE SYSTEM

At all times, one pump shall be aligned for general service and one for standby firemain.

FIREMAIN

1. Align firemain for #1 or #2 fire and general service pump supply by opening valves as follows:

#1 Fire & General Service Pump: AE-27, FM-2, FM-3, FM-6, and FM-16

#2 Fire & General Service Pump: AE-27, FM-2, FM-3, FM-7, and FM-14

NOTE: Valve alignment of standby fire pump for firemain service shall be maintained at all times when pump is set for remote control; Standby pump shall be determined by pilothouse indicator.

Individual fire station valves shall be opened as required.

2. Ensure power is available to motor controller of pump selected for use on firemain.
3. Place motor controller in either the local or remote position and start pump by depressing start button. Remote start/stop control is from pilothouse and EOS.
4. To secure system, depress local or remote stop button as required. Remote start and stop of fire pump may be verified by indicating light at the remote start/stop station.
5. As a backup to the fire and general service pumps, the diesel-driven fire fighting pump may be used to feed fire main. Open valves AE-28, FM-1, and FM-13. Individual fire station valves shall be opened as required.
6. See fire fighting system operating instructions to start/stop diesel-driven firefighting pump.

WDCM

1. Align the WDCM system for #1 or #2 fire and general service pump supply by opening valves as follows:

#1 Fire & General Service Pump: AE-27, FM-2, FM-3, FM-6, FM-16, & WDCM-11

#2 Fire & General Service Pump: AE-27, FM-2, FM-3, FM-7, FM-14, & WDCM-11

2. Follow steps 2-6 of firemain instructions to start/stop fire and general service pumps or diesel-driven fire fighting pump.

Figure E-26. (Sheet 1 of 2)

FIREMAIN/WDCM/GENERAL SERVICE SYSTEM (continued)

3. When using the diesel-driven fire fighting pump to feed the WDCM system, open valves AE-28, FM-1, FM-13, and WDCM-11.

GENERAL SERVICE SYSTEM

1. Align general service system for #1 or #2 fire and general service pump supply by opening valves as follows:

#1 Fire and General Service Pump: AE-27, FM-2, FM-3, FM-6, FM-17, FM-9, and GS- 12

#2 Fire and General Service Pump: AE-27, FM-2, FM-3, FM-7, FM-15, FM-9, and GS- 12

Individual component supplies and overboards shall be opened as required.

2. Follow steps 2-4 of firemain instructions to start/stop fire and general service pumps.

3. Ensure that pressure reducing station is set for 60 psi.

EMERGENCY BILGE SUCTION

1. The engine room bilge area is fitted with an emergency bilge suction which is led directly to the suction side of the fire and general service pump No. 1 for discharge overboard.

2. Align system for #1 fire and general service pump suction by opening valves as follows:

#1 Fire and General Service Pump: FM-4, FM-6, FM-8, and FM-31

3. Follow steps 2-4 of firemain instructions to start/stop fire and general service pumps.

Figure E-26. (Sheet 2 of 2)

REVERSE OSMOSIS DESALINATION SYSTEM**STARTUP PROCEDURE**

The following instructions must be carried out each time the Sea Recovery system is started. Failure to follow the procedures exactly could lead to system failure and cause damage to the components.

1. Close the chemical circulation pump valve (40).
2. Close the membrane clean valve (32).
3. Close the system store & rinse valve (31).
4. Position the media filter backflush valve (3) to the full up (normal filter) position by gently lifting and twisting, counterclockwise, the handle.
5. Position the system brine & rinse/clean & store valve (39) towards the thru- hull overboard fitting (20) (normal operating brine discharge position).
6. Position the system filter/clean valve (33) towards the prefilter (6) (normal operating position).
7. Open the back pressure regulator valve (18) fully (turn full counterclockwise).

CAUTION: Ensure that the feed water pressure does not exceed 45 psi. If 45 psi is exceeded, adjust the ship's sea water supply line pressure to maximum 45 - minimum 30 psi.

8. Open the system feed water supply line shutoff valve (30) fully.
9. Switch the electrical power source (47) to the system ON. **DO NOT** push the salinity controller START switch at this time.
10. Start the system by depressing the START switch (SW-1) momentarily for approximately 2 seconds.
11. The GPM feed water flow meter (8) will allow observation of the water passing through it. Refer to manual for proper feed flow into the system. To bleed the air from the Multi Media Filter (4) and Prefilters (5 & 6), open the air bleed valve located at the top of the respective housing until water displaces all of the air.
12. Slowly increase the system operating pressure by turning the back pressure regulator valve (18) clockwise until 600 psi is achieved.

PERMANENT DAMAGE TO THE R.O. MEMBRANE ELEMENT WILL RESULT IF PRODUCT WATER FLOW SPECIFICATIONS ARE EXCEEDED.

Figure E-27. (Sheet 1 of 3)

REVERSE OSMOSIS DESALINATION SYSTEM (continued)**STARTUP PROCEDURE**

13. As 600 psi is achieved (full sea water salinity use), the system will begin to pass product water through the R.O. membrane elements (16) (without pressure applied, water passes over, not through, the R.O. membrane elements). With 600 psi applied, product water will continue passing through the membranes and on into the GPM product water flow meter (22), the salinity probe (23), the three-way diversion valve (24), and back to the feed source (20).
14. Determine that water has been introduced into the three-way diversion actuator valve (24). This can be assured by a noticeable flow through the GPM product flow meter (22).
15. The system running, properly interconnected and pressurized, may not produce "potable" water for up to 30 minutes. The salinity of the product water diminishes gradually, until the quality of the product water reaches the factory microhm setting at which time the unpotable (red) water light will go out, and the actuator valve (24) will energize to the 'potable' (good water) position. This allows product water to pass into the post filtration components (25), and in turn, into the product water storage tank (44).
16. Adjust the back pressure regulator valve (18) clockwise slowly until either 850 psi is achieved at the high pressure gauge (sea water feed source only) or 42 GPM of product water flow is achieved, whichever occurs first. Do not produce a greater than 42 GPM of product water and do not operate the system above 850 psi.

Figure E-27. (Sheet 2 of 3)

REVERSE OSMOSIS DESALINATION SYSTEM (continued)**SHUTDOWN PROCEDURE**

1. Release the pressure on the system by turning the back pressure regulator valve (18) counterclockwise fully open.
2. Ensure that the emergency bypass switch (SW-5), located on the main printed circuit board, is "OFF" so that high salinity product water produced in the first few minutes after the next startup will not contaminate the product storage tank.
3. Momentarily depress the STOP switch (SW-2) on the salinity controller (36) to shut down the system. Check to make sure that the high pressure pump (11) has stopped rotating, and the POWER light is off.
4. Place the system operation mode switch (SW-3), located on the front of the controller panel, in the "OFF" (center) position.
5. Immediately after stopping the system, close the system inlet feed shutoff valve (30).
(By closing the inlet valve (30) immediately after system shutdown, siphoning will not occur prior to the next startup.)
6. Turn off the electrical power source (47) (circuit breaker) to the system.

Figure E-27. (Sheet 3 of 3)

LUBE OIL PURIFIER

1. Ensure oil level in gear chamber is in the upper third of sight glass.
2. Release break and verify that bowl turns easily by hand.
3. Ensure power is available to purifier control panel and main circuit breaker on control panel is closed.
4. Line up lube oil system to allow purifier to take suction from No. 1 or No. 2 main engines by opening the following valves:
No. 1 Main Engine LO-23, LO-24, LO-29, and LO-31
No. 2 Main Engine LO-25, LO-26, LO-30, and LO-32
5. Start purifier by depressing start button and allow bowl to reach rated speed, approximately 3-4 minutes. Once bowl has reached rated speed, motor start light will extinguish and motor run light will illuminate.
6. Fill bowl with seal water and adjust needle valve to obtain the proper amount of make-up water, 1-3 drops/second max.
7. Open shut-off valve in suction line of purifier to feed dirty oil to heater.
8. Once heater is full, as determined by opening pet cock on heater outlet, energize heater.
9. After sufficient warm-up time, close control power switch and solenoid valve will open, feeding dirty oil to purifier. Rate of dirty oil flow to purifier is controlled by throttling suction line valve.
10. To secure purifier, shut off power to oil heater, stop dirty oil supply, stop seal water supply, shut off control power, switch off motor, and apply break.
11. Open drain cock and clean bowl if necessary.

Figure E-28.

MARINE SANITATION DEVICE**START UP PROCEDURE**

1. Close all air and water valves on unit.
2. Fill media tank with water until water in wet well sight glass reaches a level 1/2 way up.
3. Valve Settings - All valves must be either fully opened or fully closed.

<u>Valve</u>	<u>Function</u>	<u>Position</u>
Wet Well Suction	Pump Suction from Wet Well	Open
Media Tank Drain	Pump Suction from Media Tank	Closed
Air Lift	Compressed Air Discharge Air Lift	Open
Air Scour	Compressed Air Discharge to Air Scour	Closed

4. Open overboard discharge line valve, SD-13.
5. Open sewage supply line valve into media tank, SD-1.
6. Control Settings

<u>Pushbutton</u>	<u>Position</u>
Blower	On
Pump	Auto

7. Bleed air out-of centrifugal pump casing.
8. Gradually add more water to media tank and check for proper cycling of pump.
9. Charge the downstream feed tube of the tablet chlorinator.

Figure E-29. (Sheet 1 of 2)

MARINE SANITATION DEVICE (continued)**SHORT-TERM LAY-UP**

1. If the crew will be off of vessel for 2 weeks or less, electrical power should be left on. Leave the system on-line with the blower running.

LONG-TERM LAY-UP/SHUTDOWN

1. There should be no flow into the MSD unit.
2. Remove Dry Tablet Chlorinator feed tube and store properly.
3. Laundry bleach containing a 5-1/4% solution of sodium hypochlorite may be used to disinfect the Media Tank. Six gallons of bleach is required for each 1000 gallons of water held in the Media Tank. Laundry bleach may be flushed into the Media Tank from a toilet.
4. Pump water held in Wet Well overboard. Isolate Wet Well.
5. Air scour Media Tank for 2 hours and pump contents into a suitable receiving facility.
6. Refill Media Tank with water. Air scour for 30 minutes and pump water overboard.
7. Add antifreeze to Media Tank if water must be left in tank. Air scour and antifreeze test to assure water will not freeze; Approximately one gallon of antifreeze is required for each gallon of water remaining in the Media Tank.
8. Shut off electrical power to system.
9. Inlet and discharge piping to the blower should be plugged. The blower casing should be filled with oil (20W or 30W).
10. Drain pump casing.
11. Pack motor and machinery bearings with grease.
12. Drain all piping, fittings, and traps containing water.

Figure E-29. (Sheet 2 of 2)

CAPSTAN

1. Pressurize central hydraulic system as described on motorized hydraulic power unit operating instructions.
2. Stroke directional control valve by pulling or pushing the handle in the desired heave or payout direction.
3. Control speed by throttling the directional control valve.
4. As a back-up to the motorized hydraulic power unit, the diesel-engine-driven hydraulic pump may be used. See towing winch hydraulic system operating instructions.

Figure E-30.

COLD POTABLE WATER SYSTEM**OPERATION:****Cold Potable Water Service**

1. Ensure power is available to #1 and #2 potable water pump motor controllers.
2. Ensure sufficient water is available in potable water storage tanks and align potable water system to allow pumps to take suction from port or stbd potable water tank and discharge to the hydropneumatic tank by opening valves as follows:

#1 Pump - PW-14 (Port Tank Suction), PW-15 (Stbd Tank Suction), PW-16, PW-76, PW-18, and PW-78.

#2 Pump - PW-14 (Port Tank Suction), PW-15 (Stbd Tank Suction), PW-17, PW-77, PW-18, and PW-78.

All other valves in cold potable water system shall be opened as required to serve individual components and spaces.

3. Place either #1 or #2 pump motor controller in the auto position. In the automatic mode, the starting and stopping of the selected pump is controlled by a pressure switch mounted on the hydro-pneumatic tank-and set to start pump at 40 psi and stop at 60 psi. In the manual mode, the start/stop control is done manually by depressing the start/stop push buttons.

CAUTION: Do not leave pumps unattended in the manual mode as pressure switch will not function. Normal operation is with one pump only in the auto mode.

4. To secure system, place motor controllers in the manual mode and depress stop button.

Bromination

1. To brominate water being discharged from the reverse osmosis units, open valves PW-85, PW-86, PW-37, PW-38, PW-2, PW-12 (Port Potable Water Tank Fill), and PW-13 (Stbd Potable Water Tank Fill).
2. To recirculate water from port or starboard potable water tank, open valves PW-84, PW-37, PW-38, PW-12 (Port Potable Water Tank Fill), and PW-13 (Stbd Potable Water Tank Fill).

NOTE: When recirculating water from potable water tanks, cold potable water system shall be fully charged.

Figure E-31.

ANCHOR WINDLASS

OPERATION:

Powered Wildcats

1. Activate central hydraulic system (see motorized hydraulic power unit operating instructions).
2. Select speed range, LSHT or HSLT.
3. Engage Dog Clutch.
 - a. Insert special tool in nearest slot in clutch shifting ring.
 - b. Loosen both wing nuts on face of shifting ring.
 - c. Push forward (50 movement of clutch shifter ring is required to fully engage or disengage Dogs).
4. Release band brake.
5. Remove chain stoppers if set.
6. Operate control lever for desired speed and direction.

Gypsy Heads Only

1. Engage band brake and set chain stoppers.
2. Disengage Dog clutch.
3. Select speed range.
4. Activate central hydraulic system.
5. Operate control lever for desired speed and direction.

Free Wheeling

1. Remove chain stoppers.
2. Disengage Dog clutch.
3. Release band brake to allow anchor to free fall. Manipulate brake to retard or stop the anchor as desired.

CAUTION: During free falling, carefully observe speed to prevent chain from "Jumping the Cat" due to centrifugal force. Apply brake slowly or chain may jump a link.

LSHT - Low Speed High Torque (For Heavy Loads)

HSLT - High Speed Low Torque (For Normal Loads and Speeds)

Figure E-32.

CARGO CRANE

PRE-START CHECKS

1. Make sure that unit has been properly lubricated and serviced.
2. Make sure Boom is not lashed down.
3. Make sure that all controls are in the neutral center position.
4. Make sure the wire rope is not frayed or damaged.
5. Ensure work area around crane is clear of personnel and equipment.
6. Do not attempt to lift loads which exceed load chart ratings.

OPERATION

1. Energize central hydraulic system (see central hydraulic system operating instructions).
 - a) Swing Operation: To swing crane to the right, pull control lever backward. To swing the crane to the left, push the control lever forward.
 - b) Telescope Operation: To extend the Boom, push the control lever forward. To retract the Boom, pull the control lever back.
 - c) Winch Operation: To lower the hook, push the control lever forward. To hoist the hook, pull the control lever back.
 - d) Main Boom Operation: To lower the Main Boom, push the control lever forward. To raise the Main Boom, pull the control lever back.

NOTE: All control levers are attached to the crane spindle. Control levers are spring-centered proportional control. When levers are released, they will automatically return to the neutral position. Moving the levers progressively farther from the neutral position in either direction will increase the rate at which the controlled function operates.

Figure E-33.

HOT POTABLE WATER SYSTEM

1. Align the hot potable water system to allow #1 and #2 hot water heaters to be fed from the cold potable water system and to feed the hot potable water distribution lines, including the hot water recirculating pump, by opening valves PW-78, PW-79, PW-80, PW-81, PW-82, PW-42, PW-43, and PW-44. All other valves serving various component and spaces shall be opened as required.
2. With hot water heaters at the proper operating level, energize heaters by closing circuit breakers on main switchboard in the EOS.
3. Ensure power is available to the hot potable water recirc pump motor controller and start pump by depressing start button.
4. To secure system, depress stop button on the hot potable water motor controller and open circuit breakers feeding the hot water heaters.

Ballast Water Tank No: 2S Sounding Table	G-18
Sewage Holding Tank Sounding Table.....	G-19

G-1. Scope. This appendix contains sounding tables for the LT. Sounding tables provide a means estimating the gallons of fluid contained in the tank from the depth of fluid (sounding) in the tank.

G-2. Using the Tables. To estimate the fluid contained in a tank, follow the procedures below:

- a. Sound the tank to obtain the measurement of fluid level.
- b. Using the table of contents for this appendix, find the appropriate table.
- c. Using the appropriate table, find the measurement in feet in the left hand column and read across the table to the right until under the measurement in inches. This is the approximate amount of fluid contained in the tank.

By Order of the Secretary of the Army:

GORDON R. SULLIVAN
General, United States Army
Chief of Staff

Official:

MILTON H. HAMILTON
Administrative Assistant to the
Secretary of the Army
01460

DISTRIBUTION:

To be distributed in accordance with DA Form 12-25E, (qty rqr block no. 5667).

U.S. GOVERNMENT PRINTING OFFICE : 1995 O - 165-661

These are the instructions for sending an electronic 2028

The following format must be used if submitting an electronic 2028. The subject line must be exactly the same and all fields must be included; however only the following fields are mandatory: 1, 3, 4, 5, 6, 7, 8, 9, 10, 13, 15, 16, 17, and 27.

The Metric System and Equivalents

Linear Measure

1 centimeter = 10 millimeters = .39 inch
 1 decimeter = 10 centimeters = 3.94 inches
 1 meter = 10 decimeters = 39.37 inches
 1 dekameter = 10 meters = 32.8 feet
 1 hectometer = 10 dekameters = 328.08 feet
 1 kilometer = 10 hectometers = 3,280.8 feet

Weights

1 centigram = 10 milligrams = .15 grain
 1 decigram = 10 centigrams = 1.54 grains
 1 gram = 10 decigrams = .035 ounce
 1 dekagram = 10 grams = .35 ounce
 1 hectogram = 10 dekagrams = 3.52 ounces
 1 kilogram = 10 hectograms = 2.2 pounds
 1 quintal = 100 kilograms = 220.46 pounds
 1 metric ton = 10 quintals = 1.1 short tons

Liquid Measure

1 centiliter = 10 milliliters = .34 fl. ounce
 1 deciliter = 10 centiliters = 3.38 fl. ounces
 1 liter = 10 deciliters = 33.81 fl. ounces
 1 dekaliter = 10 liters = 2.64 gallons
 1 hectoliter = 10 dekaliters = 26.42 gallons
 1 kiloliter = 10 hectoliters = 264.18 gallons

Square Measure

1 sq. centimeter = 100 sq. millimeters = .155 sq. inch
 1 sq. decimeter = 100 sq. centimeters = 15.5 sq. inches
 1 sq. meter (centare) = 100 sq. decimeters = 10.76 sq. feet
 1 sq. dekameter (are) = 100 sq. meters = 1,076.4 sq. feet
 1 sq. hectometer (hectare) = 100 sq. dekameters = 2.47 acres
 1 sq. kilometer = 100 sq. hectometers = .386 sq. mile

Cubic Measure

1 cu. centimeter = 1000 cu. millimeters = .06 cu. inch
 1 cu. decimeter = 1000 cu. centimeters = 61.02 cu. inches
 1 cu. meter = 1000 cu. decimeters = 35.31 cu. feet

Approximate Conversion Factors

<i>To change</i>	<i>To</i>	<i>Multiply by</i>	<i>To change</i>	<i>To</i>	<i>Multiply by</i>
inches	centimeters	2.540	ounce-inches	newton-meters	.007062
feet	meters	.305	centimeters	inches	.394
yards	meters	.914	meters	feet	3.280
miles	kilometers	1.609	kilometers	yards	1.094
square inches	square centimeters	6.451	square centimeters	miles	.621
square feet	square meters	.093	square meters	square inches	.155
square yards	square meters	.836	square meters	square feet	10.764
square miles	square kilometers	2.590	square kilometers	square yards	1.196
acres	square hectometers	.405	square hectometers	square miles	.386
cubic feet	cubic meters	.028	cubic meters	acres	2.471
cubic yards	cubic meters	.765	cubic meters	cubic feet	35.315
fluid ounces	milliliters	29,573	cubic meters	cubic yards	1.308
pints	liters	.473	milliliters	fluid ounces	.034
quarts	liters	.946	liters	pints	2.113
gallons	liters	3.785	liters	quarts	1.057
