SECTION I INTRODUCTION

1-1. SCOPE. This illustrated parts breakdown (IPB) lists and illustrates the parts for the MU-695/TYQ Disk Memory Unit, which is manufactured by the Aerospace Division of Control Data Corporation, Minneapolis, Minnesota, in accordance with contract number F19628-77-C-0185. The IPB is used for requisitioning, storing, issuing, and identifying parts, and for illustrating assembly and disassembly relationships. At the end of this section is an illustration showing how to use the illustrated parts breakdown.

1-2. RELATED PUBLICATIONS. The following Navy manual contains information for equipment similar to that covered by this illustrated parts breakdown.

SE600-AA-MMM-0 1 0/AN/UYH-3(V)

1-3. SECTION I - INTRODUCTION. The introduction defines the IPB and explains how to use it.

1-4. SECTION II - MAINTENANCE PARTS LIST (MPL). The MPL lists and illustrates all repairable and replaceable assemblies installed at the time the disk memory units were manufactured. When an assembly or part (including vendor items), which is different from the original assembly or part, is installed during the manufacture of later disk memory unit configurations, that part is listed and coded (refer to Usable On Code description). When the original assembly or part does not have continued application (no spares of the original were procured, or such spares are no longer authorized for replacement), only the preferred assembly or part is listed. Also, when an assembly or part is installed during modification, and the original does not have continued application, only the preferred item is listed. Interchangeable and substitute assemblies and parts, subsequently authorized by the Government, are not listed in this manual. Such items (if any) are identified by information available through the interchangeable and substitute (I&S) data systems (refer to T.O. 00-25-184). Bulk and consumable items such as wire, insulating sleeving, and solder are not listed.

a. FIGURE & INDEX NUMBER Column. This column lists the numerically assigned figure number for each illustration. On each figure, numerically arranged index numbers are assigned to aid in locating a part in the MPL and on the associated illustration. Whenever possible, each figure is indexed in the order of disassembly. Included are attaching parts (AP) which immediately follow the parts they attach. Sheet numbers for figures which are illustrated on two or more sheets are formatted differently than those figures which are illustrated on one sheet. For example, 1/2-72 indicates that the part indexed 72 is illustrated on sheet 2 of figure 1. If figure 1 was on one sheet, the entry would be 1-72. When all of the pieces of an assembly are repairable or replaceable, the assembly is not assigned an index number.

b. PART NUMBER Column. This column lists the manufacturer's part numbers, and includes Government standard parts; for example, AF, AN, MS, JAN, MIL, and USN. Parts which are used exactly as purchased; that is, in a condition ready for installation, are listed by the manufacturer's part number, with the Control Data specification control drawing number parenthetically following the nomenclature in the DESCRIPTION column. If *SELECT appears in the PART NUMBER column, refer to table 2-1 for items selected during depot repair.

c. FSCM Column. The FSCM (federal supply code for manufacturers) column lists the five-digit vendor codes for manufacturers and Government agencies. These vendor codes are found in cataloging handbooks H4-1, H4-2, and H4-3, Federal Supply Code for Manufacturers. The FSCM code-to-name list (table 1-1) is in numerical sequence; the FSCM name-to-code list (table 1-2) is in alphabetical sequence.

d. DESCRIPTION Column. This column contains the nomenclature for all Control Data or vendor piece parts and assemblies. Following the nomenclature is a Control Data specification control drawing number (when a vendor part number is listed in the PART NUMBER column). Indentation indicates the relationship of a part to the next higher assembly. For example, a part shown in column 3 is part of the preceding next higher assembly shown in column 2 (excluding attaching parts for the next higher assembly). Attaching parts (AP) are listed immediately beneath the item to be attached at the same indentation level, and precede any detail parts of that item.

e. UNITS PER ASSY Column. The quantity listed in the UNITS PER ASSY column is the total quantity used at the indicated location. For piece parts indented and listed under assemblies, the quantities listed are those used per assembly and do not necessarily reflect the total used per equipment. For attaching parts, the quantities listed are those required to attach one unit or assembly. If REF is shown in the UNITS PER ASSY column, refer to the figure indicated in the DESCRIPTION COLUMN. If AR (as required) is shown in the UNITS PER ASSY column, the quantity is indefinite.

f. USABLE ON CODE Column. Part variations within groups or models are identified by a code (consisting of letters of the alphabet) in the USABLE ON CODE column. The absence of a code indicates that the part so shown is usable as a replacement on all groups or models covered by this manual.

Usable On Code

A
B

Description

Serial number 101 thru 123
Serial number 124 and up

g. SMR CODE Column. This manual contains Joint Military Services Uniform SMR codes. Definitions of these codes are available in T.O. 00-25-195. By referring to the SMR codes, the user can determine whether a part should be requisitioned, manufactured, or is nonprocurable.

NOTE

SMR codes which are preceded by a plus (+) apply to the Air Force and Army only. Associated Marine Corps SMR codes for identical part numbers are listed in the numerical index (Section III).

1-5. SECTION III - NUMERICAL INDEX. The numerical index is an alphabetical listing of all of the part numbers listed in the MPL PART NUMBER column. Also included are assigned national stock numbers (NSN) or class codes; figure and index numbers; the total quantity per end item; and the SMR code, special stockage indicator (SSI) code, and replacement (REPL) factor for Marine Corps items.

a. PART NUMBER Column. This column lists all of the MPL part numbers, in accordance with the following order of precedence.

- (1) First position order:
 - (a) Letters A through Z
 - (b) Numerals 0 through 9
- (2) Second and succeeding position order:
 - (a) Space
 - (b) Symbol
 - (c) Letters A through Z
 - (d) Numerals 0 through 9

b. NSN Column. This column lists the national stock numbers, if assigned, for centrally managed parts required to support the disk memory unit. The NSN is a unique identifier, independent of the manufacturer, used for ordering replacement parts from the supply system. If an NSN has not been assigned to an applicable part number, a four-digit class code will appear in the NSN column, identifying the type of part (resistor, capacitor, etc.) described. When NSNs have been assigned, they should be used in all supply operations, from original purchase to final disposition. The absence of an NSN indicates that the part is not normally stocked as a repairable item. If a part is required which has not been assigned an NSN, use the SMR code to determine if that part can be obtained from other sources. Items not stock numbered, which cannot be obtained from other sources, may be requisitioned using the FSCM and the manufacturer's part number.

c. FIGURE & INDEX NUMBER Column. This column lists the numerically assigned figure and index numbers for each illustration. When an assembly or part has not been assigned an index number, the figure and index number of the preceding part in the MPL is used with the letter F (standing for follows) preceding the figure number; for example, F7-6.

d. QTY PER END ITEM Column. The quantities listed in this column are the total quantities used per disk memory unit. For totals of specific piece parts under separate indentation, refer to MPL UNITS PER ASSY column in Section II.

e. USMC SMR CODE Column (Marine Corps only). This column lists the SMR codes which are assigned to parts subordinate to or associated with an end item; that is, spares or repair parts. The uniform code format is comprised of three parts: a two-position source code; a two-position maintenance code; and a one-position recoverability code. The SMR code provides the user with the following information for each part:

- (1) Method (source) of obtaining the part; for example, by requisition, fabrication, or salvage.

NOTE

Maintenance and recoverability codes are not applicable when the following source codes are used: XA, XB, and XC.

- (2) The lowest maintenance echelon authorized to remove, replace, and use the part; and the lowest echelon capable of performing a complete repair.
- (3) Disposition (recoverability) action on unserviceable parts.

NOTE

The numerical index USMC SMR CODE column lists Marine Corps codes only. Refer to MPL SMR CODE column in Section II for Air Force/Army codes.

f. USMC SSI CODE Column (Marine Corps only). This column lists the conditions for stocking unique maintenance parts (those assigned NSNs and coded in the P series (source) of the SMR code). The SSI codes are as follows:

- (1) No code - indicates that the part may or may not be authorized in initial allowances to using or supporting organizations. The initial allowance is explained in the REPL Factor description which follows.
- (2) I - applied to maintenance parts for which predicted consumption would not warrant inclusion in mount-out but, for which a quantity of one is authorized as insurance for mount-out using a 360-day criteria based on the total density of equipment employed by the DIV/WING team. Mount-out allowances, so authorized, will be stocked by the FSR or MWSG for Marine wing peculiar equipment, as applicable.
- (3) D - applied to maintenance parts that are not considered critical or essential stockage; therefore, they are not authorized in initial allowances. However, these items are stocked within the supply system and may be requisitioned when needed.
- (4) T - indicates that the part is authorized in garrison operating allowances to comply with state and local laws; however, the part is not authorized in mix-out since it is not combat essential.

g. USMC REPL FACTOR Column (Marine Corps only). This column lists the replacement factor assigned to each national stock numbered maintenance repair part. The REPL factor is a decimal number which indicates the average rate at which the type of part so coded has been used by Marine Corps field units, or the rate at which design engineers anticipate the part will fail, wear out, or otherwise require replacement. All computations are based on a replacement period of 1 year.

(1) Initial authorized stockage levels of consumable and salvageable parts for an organization are to be computed for predicted consumption based on the number of parts employed and/or supported by an organization within the number of days for which stockage is authorized. In computing garrison operating stock or mount-out, authorized levels can be determined by the requiring Marine Corps unit by multiplying the REPL factor times the quantity used per equipment times the number of end items employed by the using organization or supported by the service organization times the authorized day level expressed in months and divided by 12. Specific formulas and examples are provided in Marine Corps Order (MCO) P4400 79. The REPL factors used in initial stockage computations should be revised, if warranted, after significant usage is experienced, in accordance with guidelines of MCO 4400.32A. Use the following formula for revising the REPL factors based on actual usage. W equals the revised REPL factor. X is the usage experience of 1 year; A is the application per equipment; and B is the number of equipments supported.

$$W = \frac{X}{A+B}$$

(2) Initial allowances for maintenance float items (recoverability codes F, H, and D) for FMF and appropriate post and stations are as furnished by initial issue actions. Changes to maintenance replacement rates resulting from actual usage may require recomputation maintenance float allowances by holding units. Recomputation should be made in accordance with MCO 4442.3_.

1-6. SECTION IV - REFERENCE DESIGNATION INDEX. The reference designation index lists the electrical and electronic parts which are referenced on schematics, with applicable figure and index number for each reference designation.

a. REFERENCE DESIGNATION Column. This column lists the reference designations, in alphanumeric sequence, which have been assigned to electrical/electronic parts. Refer to USA Standard Reference Designations of Electrical and Electronic Parts and Equipment, Y32.16 for a complete explanation of reference designations.

b. FIGURE & INDEX NUMBER Column. This column lists the figure and index number for each reference designated item. When a part has not been assigned an index number, the figure and index number of the preceding part in the MPL is used with the letter F (standing for follows) preceding the figure number; for example, F7-6.

1-7. ABBREVIATIONS. The abbreviations used throughout this manual are in accordance with MIL-STD-I 2.

1-8. SIMILAR ASSEMBLIES. When two different but similar assemblies have 51 percent or more of their parts identical, both assemblies can be illustrated with one figure and listed with one maintenance parts list. If the parts or quantity of parts used are different for the two assemblies, both parts are listed and their use is defined in the DESCRIPTION column.

HOW TO USE THE ILLUSTRATED PARTS BREAKDOWN

IF YOU *Don't* KNOW THE PART NUMBER ...

Do This

1 Refer to list of figures in Section II of Table of Contents. Select figure which most likely has desired part illustrated.

Locate page number of figure in right column; turn to that page.

2 Find desired part on illustration. Note both figure and index number of part.

Turn to MPL listing for figure 1.

3 Find index number under FIGURE & INDEX NUMBER column. Part number, FSCM, description, etc. are provided at right of index number.
