

J. T. PITNEY.  
SPECULUM.

No. 2,191.

Patented July 23, 1841.

# UNITED STATES PATENT OFFICE.

JOSEPH T. PITNEY, OF AUBURN, NEW YORK.

CONSTRUCTING THE SURGICAL INSTRUMENT DENOMINATED THE SPECULUM ANI.

Specification of Letters Patent No. 2,191, dated July 23, 1841.

*To all whom it may concern:*

Be it known that I, JOSEPH T. PITNEY, of Auburn, in the county of Cayuga and State of New York, have made a new and useful  
5 improvement in the manner of constructing the instrument used in surgical operations and known under the name of "speculum ani," which improved instrument I denominate the "forceps-speculum ani;" and I  
10 do hereby declare that the following is a full and exact description thereof.

The instrument called the speculum ani, is one generally known to surgeons, and it has been made to assume different forms,  
15 with the design of rendering it more convenient in use; but it has not, as heretofore made, been found to fulfil the intention of its formation. The form in which I have made it, and from which I have given it the  
20 name of the "forceps speculum ani," is represented in the accompanying drawing, in which—

Figure 1, is a perspective view of the instrument, and Fig. 2, a levator which accom-  
25 panies, and is used with, it.

A, A, Fig. 1, is that portion of the instrument which is to enter the rectum, and this part consists of two blades which are convex  
30 on their outer, and concave on their inner surfaces; they are made tapering, or conical, diminishing in size from the handles to their outer ends, as shown in the drawing, in which the instrument is represented as of  
35 about one half of its ordinary, or medium, size. The edges of this part are carefully rounded off, and made perfectly smooth. These blades are attached to the forceps handles B, B, these two parts standing at  
40 an angle of about one hundred and twenty degrees, more or less, with each other. Through one of the forceps handles passes

a set screw C, by which the blades may be more gently opened; and retained in place when opened to the required extent; and that in a manner more convenient, and more  
45 readily controlled, than in speculums of the different constructions which have become known to me. By means of the forceps handles, the instrument can be readily rotated or moved around, when in use, and  
50 the seat of any fistulous opening, lesion, ulcer, or other complaint, may be ascertained, and the requisite remedy applied, or operation performed.

Fig. 2, is a levator, which is of essential  
55 service in sustaining and examining the sides of the rectum when the speculum has been inserted therein; this is so well understood as not to require any further description.  
60

Having thus fully described the nature and construction of my speculum ani, and how the same is to be used, I do hereby declare that I claim as of my invention the  
65 manner in which I have formed and combined the respective parts; that is to say, I claim—

The forming of a speculum ani with tapering, or conical blades, united at their larger ends to forceps handles, standing at  
70 a suitable angle with the blades to admit of the ready inspection of the parts, and furnished with a set screw to regulate the opening of the blades, by which combination and arrangement of its parts, the in-  
75 strument is rendered more effective, and more convenient in use, than such as have been heretofore made for the same purpose.

JOSEPH T. PITNEY.
