UNITED STATES PATENT OFFICE.

DAVID B. TIFFANY, OF XENIA, OHIO.

IMPROVEMENT IN CURTAIN-FIXTURES.

Specification forming part of Letters Patent No. 188,955, dated March 27, 1877; application filed January 6, 1877.

To all whom it may concern:

Be it known that I, D. B. TIFFANY, of Xenia, in the county of Greene and State of Ohio, have invented certain new and useful Improvements in Curtain-Fixtures; and I do hereby declare that the following is a full, clear, and exact description thereof, reference being had to the accompanying drawings, and to the letters of reference marked thereon, which form part of this specification.

My invention relates to curtains which are capable of being raised and lowered from the top of the window; and it consists in a curtain-roller mounted in brackets which are fastened to flexibly-jointed side bars sliding in vertical guides attached to the window-frame, and held at any desired point by projecting pins entering perforations in the jointed side bars, all as hereinafter more fully set forth.

In order to enable others skilled in the art to which my invention appertains to make and use the same, I will now proceed to describe its construction and operation, referring to the annexed drawing, in which—

Figure 1 is a front elevation of a window with curtain and my improved fixtures attached thereto. Fig. 2 is a vertical section through the line *x x*, Fig. 1; and Fig. 3 is a cross-section through the line *y y*, Fig. 1.

A represents an ordinary window-frame, with upper and lower sash. On the front of each siderail of the frame A is secured a vertical metal guide, B, extending from the top downward for a suitable distance. This guide may be made of sheet metal, with its edges turned inward, as shown in Fig. 3, to form a dove-tailed groove; or it may be made in any other suitable manner, to allow a bar, D, to slide therein vertically up and down. To the bars D D, at or near their upper ends, are secured

suitable brackets C C, in which the curtain-roller G is mounted in any of the known and usual ways. To the lower end of each bar D is attached another bar, D', by means of a spring-plate, *a*, or its equivalent, so that the two bars virtually form one bar with a flexible joint in it. The bar D' is provided with a suitable knob, E, and has also a series of perforations, *b b*, through it. From the window-frame on each side projects a pin, *d*, which may be entered into either one of the perforations *b*.

It will thus be seen that the curtain-roller can be raised and lowered, and held firmly at any point desired, without in any way interfering with the rolling and unrolling of the curtain, the device for holding the curtain-cord being attached to one of the bars D, as shown.

Having thus fully described my invention, what I claim as new, and desire to secure by Letters Patent, is—

1. The combination, with a curtain-roller, G, of the brackets C, the flexibly-jointed sliding bars D D', moving in guides on the window-frame, and a mechanism for holding the jointed bars at any point desired, substantially as set forth.

2. The combination of the vertical guides B B, the sliding bars D D, carrying the curtain-roller, the perforated bars D' D', flexibly jointed to the bars D D, and the pins *d d*, projecting from the window-frame, all substantially as and for the purposes herein set forth.

In testimony that I claim the foregoing as my own I affix my signature in presence of two witnesses.

DAVID B. TIFFANY.
