h HVAC Narrative. Please provide a brief narrative of the building's HVAC systems.

Variable speed centrifugal chillers serve the 4 pipe fan coils which condition the residential units. Condensing boilers supply the hot water plant. A parallel system delivers ventilation air directly to the units, and includes heat recovery. These units are also chilled water. A waterside economizer provides free cooling when the outdoor air temperature permits. VFDs are included on all pumps, large fan systems, and cooling towers.

The baseline includes 4 pipe fan coil units which supply ventilation air directly to the residential space.

i Air-Side HVAC

Each individual system may be entered separately, or multiple systems may be grouped together if all input parameters identified with an (*) are similar.

When the cooling tower is enabled the spray and sump isolation valves shall open and the fan shall be commanded off with its speed commanded to 0%. When further cooling is needed to maintain the condenser water supply temperature at set point the second tower cell shall be enabled by opening the spray and sump isolation valves. When an additional tower cell is enabled, an additional primary condenser water pump shall be enabled. As its condenser water supply temperatures rises above the condenser water supply temperature set point, the lead tower fan shall be commanded on and ramp to its minimum speed as defined at the VFD control panel. If the condenser water supply temperature continues to rise, the second tower cell fan shall start in the same fashion. All enabled fans shall run in unison to maintain CW supply water temperature set point.
7. If enabled cooling tower fans are operating at less than 40% (adj.) speed for a period of 3 minutes (adj.), the lead fan shall be shut down. As the temperature drops further, the next fan shall be shut down. 10. Freeze: Basin heaters shall cycle as required to maintain a minimum water temperature and to prevent freezing. Under no load conditions, the system pumps shall de-energize and the starter interlock shall energize the heater circuit. All active fans shall be cycled during cold weather operation to avoid long periods of idle operation, and subsequent possibility of ice build-up. Basin heaters shall be inhibited when a low water condition exists. A low or high water temperature condition shall be annunciated.
11. Vibration: Cooling tower vibration switches shall stop the fan when vibration exceeds set point. Monitor each switch and annunciate alarm at operator's workstation.

2. When the HX is enabled through the BMS, the chillers shall stop. The heat exchanger isolation valves (chilled water and condenser water) shall open allowing flow to the heat exchanger and the chiller isolation valves (chilled water and condenser water) shall close. The timing of the automatic control valves shall take into consideration the proper shut down of the chillers and sufficient water flow through the chillers until they can be cycled off. Coordinate with chiller manufacturer. Individual open and close limit switches shall provide positive valve position indication to the BMS.
3. When the HX is disabled, the valves shall close to the heat exchanger and open to the chillers.
4. Control cooling towers to maintain set point. The calculated set point shall be the sum of the tower approach temperature and outside wet bulb. If the calculated set point is above chilled water temperature requirements, the chillers shall be activated and HX shall be off. If the calculated set point is equal to or below the chilled water temperature requirements, the HX shall be activated.
5. In the switch over from free cooling to mechanical cooling, the condenser water supply temperature shall be allowed to reach a minimum temperature of 60° F (adj.) prior to enabling mechanical cooling by opening bypass valve and closing tower valves.

3. For fans greater than 2,000 CFM, provide a high discharge static pressure switch if dampers are located upstream of the fan and/or a low static pressure switch if dampers are located downstream of the fan to prevent mechanical damage if a damper fails to open. The switch shall stop the fan when duct pressure exceeds design. The fan shall remain off until the pressure switch is reset.
4. Where required, the duct smoke detector shall stop the fan upon the presence of smoke through a signal from the fire alarm system. The Fire Alarm System shall signal the BMS when a fire alarm is present.
5. BMS Contractor shall provide a lockable cover for the space temperature sensor if the sensor is located in a public area where it is subject to tampering or damage.
6. All freeze protection pumps shall be commanded on through the BMS when the outdoor air temperature falls below 40°F (adj.) and shall be commanded off when the outdoor air temperature rises 2°F above the on setpoint. If the pump fails to operate an alarm shall be annunciated at the BMS.

B. Energy Recovery Unit

The BMS contractor shall be responsible for furnishing, installing, and wiring any controls not furnished, installed, or wired by others that are required for an operational system.
2. The CV box shall be indexed on when the associated Air Handling Unit serving it starts. The CV box damper shall modulate to maintain the flow setpoint. Modulate the reheat coil valve to maintain space temperature setpoint. As the space temperature falls below the space temperature setpoint, the reheat valve shall modulate open as necessary to maintain space temperature at setpoint.
3. The CV box shall be programmed for occupied and unoccupied settings. The space temperature sensor shall have a push-button override to index the space to the occupied mode for a timed period.

H. Hot Water Unit Heater/Cabinet Unit Heater

1. The BMS contractor shall furnish, install, and wire a thermostat and control valve to control the unit heater. On a fall in space temperature below set point, the thermostat shall open the valve and energize the unit fan. On a rise in space temperature, the fan shall be de-energized and the valve shall close.
2. An aqua-stat on the return line of each unit shall stop the fan when hot water is not available The UH shall be furnished with local controls for stand-alone operation.

I. Generator Room

1. When preset limits of natural gas or carbon monoxide are exceeded, the gas detection system shall go into alarm.

5. Close the gas safety shut off valve feeding the boilers/generator.

6. Provide a break glass switch at each entrance to the boiler room. The break glass switches shall be wired such that all equipment shall be shut down when glass is broken. The BMS will monitor all break glass switch positions. If an emergency occurs, the control panels will initiate a shutdown for the plant: shutting down all pumps and closing all isolation valves. A critical alarm will be issued to the BMS.
7. Provide an alarm horn, strobe light and silence switch at each entrance to the boiler room, above the break glass switch. Alarm to activate when gas leak occurs. Horn shall be silenced from switch and strobe shall continue to operate until condition is cleared.

	EXISTING WATER VALVE
	PROPOSED SEWER PIPE

	ALLOWABLE AREA

	CANOPY AREA (UNDETAINED)

DESIGN CALCULATIONS
SITE CONNECTION PROPOSAL AREA = 9,083 SQ. FT. = 0.209 ACRES
DESIGN CALCULATIONS FOR ALLOWABLE SANITARY AND STORM FLOWS ARE PER CHAPTER 31 OF TITLE 15 OF THE RULES OF THE CITY OF NEW YORK. REQUIRED VOLUME FOR THE UNDERGROUND STORM WATER DETENTION BASIN WAS CALCULATED PER NYCDEP "GUIDELINES FOR THE DESIGN AND CONSTRUCTION OF STORMWATER MANAGEMENT SYSTEMS".

SANITARY SEWER FLOWS

PROJECT SITE IS LOCATED IN THE C5-5 ZONING DISTRICT OR R10 EQUIVALENT DISTRICT. PER TITLE 10 SECTION IIIB, THE SEWAGE FLOW IS CALCULATED USING 150 GALLONS PER DAY PER PERSON WITH AN R10 ZONE POPULATION DENSITY OF 785 PERSONS PER ACRE AND A PEAK FACTOR OF 4.

$$Q_{san} = \frac{150\ (\text{GALLONS/DAY/PERSON}) \times \text{POPULATION DENSITY} \times \text{AREA (ACRES)}}{7.48 \times 86{,}400}$$

$$Q_{san} = \frac{150 \times 785 \times 0.209}{7.48 \times 86{,}400}$$

$Q_{san} = 0.038 \times 4 = 0.152$ CFS

STORM FLOW

ALLOWABLE STORM FLOW, $Q_{all} = C \times I \times A$
INTENSITY IS 5.95 IN/HR. BASED ON 6 MINUTES TIME OF CONCENTRATION FOR THE 5 YEAR STORM EVENT. FOR THE BOROUGH OF MANHATTAN THE ALLOWABLE STORM INTENSITY IS 5.95 IN/HR AND THE RUNOFF COEFFICIENT IS 0.60.

$Q_{all} = 0.60 \times 5.95$ IN/HR $\times$ A (ACRES)

A = TRIBUTARY AREA PER ABOVE REFERENCE.

Q_{all} (Greenwich St.) = $0.60 \times 5.95 \times 0.074 = 0.26$ CFS
Q_{all} (Thames St.) = $0.60 \times 5.95 \times 0.128 = 0.46$ CFS
Q_{all} (Trinity Place) = $0.60 \times 5.95 \times 0.007 = 0.03$ CFS
Q_{all} (total) = $0.60 \times 5.95 \times 0.209 = 0.75$ CFS

DEVELOPED CONDITIONS
ROOF AREA = 8,841 SQ. FT. = 0.203 ACRES
CANOPY/PAVEMENT AREA (UNRESTRICTED) = 242 SQ. FT. = 0.006 ACRES
ROOF C = 0.95
PAVEMENT C = 0.95
WEIGHTED $C_w = 0.95$

DEVELOPED STORM FLOW, $Q_{dev} = A \times I \times C_w$

Q_{dev} ROOF = $0.203 \times 5.95 \times 0.95 = 1.15$ CFS
Q_{dev} CANOPY/PAVEMENT AREA (UNRESTRICTED) = $0.006 \times 5.95 \times 0.95 = 0.03$ CFS
$Q_{dev} = 0.209 \times 5.95 \times 0.95 = 1.18$ CFS

DETENTION CALCULATIONS
A DETENTION TANK AND PUMPS LOCATED IN THE BUILDING BASEMENT WILL BE USED TO LIMIT THE DEVELOPED STORM FLOW OF 1.18 CFS TO THE GREATER OF 0.25 CFS OR 10% OF THE NYCDEP MAXIMUM ALLOWABLE FLOW (Q_{max}), UNLESS THE ALLOWABLE FLOW IS LESS THAN 0.25 CFS.

$0.75 \times 0.10 = 0.075$ CFS
0.075 CFS < 0.25 CFS
THEREFORE, USE 0.25 CFS

REQUIRED DETENTION VOLUME
Q_{all} FROM DETENTION = 0.25 CFS

PAVEMENT AREA WILL CONVEY 0.03 CFS OF UNRESTRICTED RUNOFF TO A PROPOSED THAMES STREET CONNECTION.

Q_{all} FROM DETENTION = 0.25 CFS − 0.03 = 0.22 CFS

THE DETENTION TANK AND PUMPS WILL BE LOCATED ALONG GREENWICH STREET, WHICH HAS AN ALLOWABLE FLOW OF 0.26 CFS. THEREFORE, $Q_{rr} = 0.22$ CFS.

STORM DURATION FOR DETENTION FACILITIES WITH A CONSTANT OUTFLOW
$T = 0.23 \cdot ((C_w \cdot A)/Q_{rr})^{(0.5)} - 15$
$= 0.23 \cdot ((0.95 \cdot 8{,}841)/0.22)^{(0.5)} - 15$
$= 29.94$ MINUTES

REQUIRED STORAGE VOLUME FOR DETENTION FACILITIES WITH A CONSTANT OUTFLOW
$V = [((0.19 \cdot C_w \cdot A)/(T+15)) - (57 \cdot Q_{rr})] \cdot T$
$= [((0.19 \cdot 0.95 \cdot 8{,}841)/(29.94+15)) - (57 \cdot 0.22)] \cdot 29.94$
$= 688$ CF (MIN.)

PROPOSED STORAGE VOLUME:
GREENWICH STREET DETENTION TANK = 1,950 CF > 688 CF
TOTAL STORAGE VOLUME = 1,950 CF

ROOF FLOW OF 1.15 CFS WILL BE RESTRICTED TO 0.22 CFS ON GREENWICH STREET BY MEANS OF DETENTION FACILITIES AND PUMPS. PAVEMENT AREA WILL CONVEY 0.03 CFS OF UNRESTRICTED RUNOFF TO A PROPOSED THAMES STREET CONNECTION.
