## **RAM Building Story Shears**

RAM Structural System

RAM Frame 15.03.00.000

DataBase: 14442\_lap\_snh\_dl\_161027\_Lateral Framing\_No Theatre

11/01/16 16:55:07

**CRITERIA:**

Rigid End Zones: Ignore Effects  
 Member Force Output: At Face of Joint  
 P-Delta: Yes Scale Factor (DL): 1.20 Scale Factor (LL): 0.50  
 Scale Factor (Roof): 1.00 Scale Factor (Snow): 1.00

Ground Level: Base

Mesh Criteria :

Max. Distance Between Nodes on Mesh Line (ft) : 6.00  
 Merge Node Tolerance (in) : 0.2000  
 Geometry Tolerance (in) : 0.0050

Walls Out-of-plane Stiffness Included in Analysis.  
 Sign considered for Dynamic Load Case Results.  
 Rigid Links Included at Fixed Beam-to-Wall Locations  
 Eigenvalue Analysis : Ritz Vectors (Load Dependent)

### CRITERIA:

Rigid End Zones: Ignore Effects  
 Member Force Output: At Face of Joint  
 P-Delta: Yes Scale Factor (DL): 1.20 Scale Factor (LL): 0.50  
 Scale Factor (Roof): 1.00 Scale Factor (Snow): 1.00

Ground Level: Base

#### Mesh Criteria :

Max. Distance Between Nodes on Mesh Line (ft) : 6.00

Merge Node Tolerance (in) : 0.2000

Geometry Tolerance (in) : 0.0050

Walls Out-of-plane Stiffness Included in Analysis.

Sign considered for Dynamic Load Case Results.

Rigid Links Included at Fixed Beam-to-Wall Locations

Eigenvalue Analysis : Ritz Vectors (Load Dependent)

Frame #1 *W<sub>x</sub> = 750 kips Lvl 16/14* *W<sub>y</sub> = 1490 kips Lvl 10*

14TH FLOOR FRAMING PLAN

- NOTES:**
- THIS DRAWING SHALL BE USED WITH THE ARCHITECTURAL AND MECHANICAL DRAWINGS.
  - FOR FLOOR FINISHES SEE ARCHITECTURAL.
  - DATUM IS SET AT EL. 188'-3".
  - TOP OF CONCRETE IS AS SHOWN IN ELEVATION UNLESS SHOWN OTHERWISE.
  - TOP OF STEEL IS 7/16" BELOW TOP OF CONCRETE UNLESS NOTED THIS ELSEWHERE ON PLAN.
  - FLOOR CONSTRUCTION SHALL BE 4" TOP OF NORMAL WEIGHT CONCRETE PLACED OVER A 3" - 18 GAGE WELDED WIRE FABRIC PLACED 3/4" FROM THE TOP OF THE DECK REINFORCED WITH ONE LAYER OF #4 @ 18" x 18" WITH 4" MINIMUM CLEARANCE TO THE DECK'S SHOW THROUGH ON PLAN.
  - THE NUMBER OF #4 CHAMBERS (10" LONG) SUBMERGED STUDS SHALL BE EQUALLY SPACED AT 12" ON CENTER FOR THE ENTIRE SPAN.
- FOR COLUMN SCHEDULE SEE DRAWINGS S 501 THRU S 714.
  - FOR TYPICAL DETAILS SEE DRAWINGS S 701 THRU S 714.
  - FOR GENERAL NOTES SEE DRAWINGS S 721 AND S 722.
  - 3 DENOTES COLUMN BELOW ONLY.
  - 4 DENOTES COLUMN ABOVE ONLY.
  - 5 DENOTES BEAM OPENING. SEE DETAIL ON DRAWING S 801 FOR BEAM OPENING REINFORCEMENT.
  - VERIFY IN FIELD ALL EXISTING CONDITIONS. INFORM THE CONTRACTOR TO COORDINATE ALL SLAB PENETRATIONS TO AVOID CUTTING CORING OF EXISTING BEAMS.
  - CR DENOTES CR # 11.8
  - L4 DENOTES L4 # 4 x 6/8"
  - WB DENOTES W8 x 16
  - WB DENOTES W8 x 16
  - 20 DENOTES NEW STEEL BEAM
  - 21 DENOTES EXISTING STEEL BEAM
  - 22 DENOTES SHORE. CUT AND RECONNECT EXISTING BEAM TO NEW WORK CONNECTION WHERE NO MOMENT IS SHOWN.
  - 23 DENOTES APPROXIMATE AREA OF NEW CONCRETE INFILL/PATCH
  - 24 DENOTES APPROXIMATE EXTENT OF NEW CONCRETE TOPPING SLAB
  - 25 DENOTES EXISTING SLAB TO REMAIN

15TH FLOOR FRAMING PLAN  
1/8" = 1'-0"

NOTES:

- THIS DRAWING SHALL BE USED WITH THE ARCHITECTURAL AND MECHANICAL DRAWINGS.
- FOR FLOOR FINISHES SEE ARCHITECTURAL...
- DATUM IS SET AT EL. 193'-11 1/2".
- TOP OF CONCRETE SLAB IS AT DATUM ELEVATION UNLESS SHOWN THUS (EL. ±.....) ON PLAN.
- TOP OF STEEL IS 7 1/2" BELOW TOP OF CONCRETE UNLESS NOTED THUS (EL. ±.....) ON PLAN.
- FLOOR CONSTRUCTION SHALL BE 4 1/2" OF NORMAL WEIGHT CONCRETE PLACED OVER A 3" - 18 GAGE GALVANIZED COMPOSITE METAL DECK AND REINFORCED WITH ONE LAYER OF 6" X 6" - W14 X W14 WELDED WIRE FABRIC PLACED 3/4" FROM THE TOP OF THE CONCRETE SLAB. THE SPAN DIRECTION OF THE DECK IS SHOWN THUS ----- ON PLAN.
- THE NUMBER OF 3/4" DIAMETER (4 1/2" LONG) SHEAR STUDS IS SHOWN THUS ( ) ON PLAN. WHERE NO STUDS ARE SHOWN, STUDS SHALL BE EQUALLY SPACED AT 12" ON CENTER FOR THE ENTIRE SPAN.
- FOR COLUMN SCHEDULE SEE DRAWINGS S-501 THRU...
- FOR TYPICAL DETAILS SEE DRAWINGS S-701 THRU S-714.
- FOR GENERAL NOTES SEE DRAWINGS S-721 AND S-722.
- ⊙ DENOTES COLUMN BELOW ONLY.
- ⊙ DENOTES COLUMN ABOVE ONLY.
- ⊗ DENOTES BEAM OPENING. SEE DETAIL ON DRAWING S-501 FOR BEAM OPENING REINFORCEMENT.
- VERIFY IN FIELD ALL EXISTING CONDITIONS. INFORM THE EOR OF ANY DEVIATIONS.
- CONTRACTOR TO COORDINATE ALL SLAB PENETRATIONS TO AVOID CUTTING/CORING OF EXISTING BEAMS.
- C8 DENOTES C8 x 11.5
- L4 DENOTES L4 x 4 x 5/16"
- WB DENOTES W8 x 15
- DENOTES NEW STEEL BEAM
- - - DENOTES EXISTING STEEL BEAM
- - - ● DENOTES SHORE, CUT AND RECONNECT EXISTING BEAM TO NEW WORK
- ⊕ DENOTES MOMENT CONNECTION. PROVIDE FULL CAPACITY MOMENT CONNECTION WHERE NO MOMENT IS SHOWN.
- DENOTES APPROXIMATE AREA OF NEW CONCRETE INFILL/PATCH
- ▨ DENOTES APPROXIMATE EXTENT OF NEW CONCRETE TOPPING SLAB
- ▩ DENOTES EXISTING SLAB TO REMAIN

NOT FOR CONSTRUCTION

9TH FLOOR (EX.7) FRAMING PLAN  
1/8" = 1'-0"

NOTES:

- THIS DRAWING SHALL BE USED WITH THE ARCHITECTURAL AND MECHANICAL DRAWINGS.
- FOR FLOOR FINISHES SEE ARCHITECTURAL...
- DATUM IS SET AT EL. 117'-0".
- TOP OF CONCRETE SLAB IS AT DATUM ELEVATION UNLESS SHOWN THUS (EL. ±.....) ON PLAN.
- TOP OF STEEL IS 7 1/2" BELOW TOP OF CONCRETE UNLESS NOTED THUS (EL. ±.....) ON PLAN.
- FLOOR CONSTRUCTION SHALL BE 4 1/2" OF NORMAL WEIGHT CONCRETE PLACED OVER A 3" 18 GAGE GALVANIZED COMPOSITE METAL DECK AND REINFORCED WITH ONE LAYER OF 8" X 8" W1.4 X W1.4 WELDED WIRE FABRIC PLACED 3/4" FROM THE TOP OF THE CONCRETE SLAB. THE SPAN DIRECTION OF THE DECK IS SHOWN THUS ----- ON PLAN.
- THE NUMBER OF 3/4" DIAMETER (4 1/2" LONG) SHEAR STUDS IS SHOWN THUS (L) ON PLAN. WHERE NO STUDS ARE SHOWN, STUDS SHALL BE EQUALLY SPACED AT 12" ON CENTER FOR THE ENTIRE SPAN.
- FOR COLUMN SCHEDULE SEE DRAWINGS S-501 THRU...
- FOR TYPICAL DETAILS SEE DRAWINGS S-701 THRU S-714.
- FOR GENERAL NOTES SEE DRAWINGS S-721 AND S-722.
- ⊙ DENOTES COLUMN BELOW ONLY.
- ⊙ DENOTES COLUMN ABOVE ONLY.
- ⊗ DENOTES BEAM OPENING. SEE DETAIL ON DRAWING S-501 FOR BEAM OPENING REINFORCEMENT.
- VERIFY IN FIELD ALL EXISTING CONDITIONS. INFORM THE EOR OF ANY DEVIATIONS.
- CONTRACTOR TO COORDINATE ALL SLAB PENETRATIONS TO AVOID CUTTING/CORING OF EXISTING BEAMS.
- C8 DENOTES C8 x 11.5
- L4 DENOTES L4 x 4 x 5/16"
- WB DENOTES WB x 15
- DENOTES NEW STEEL BEAM
- - - DENOTES EXISTING STEEL BEAM
- - - ● DENOTES SHORE, CUT AND RECONNECT EXISTING BEAM TO NEW WORK
- ⊕ DENOTES MOMENT CONNECTION. PROVIDE FULL CAPACITY MOMENT CONNECTION WHERE NO MOMENT IS SHOWN.
- DENOTES APPROXIMATE AREA OF NEW CONCRETE INFILL/PATCH
- ▨ DENOTES APPROXIMATE EXTENT OF NEW CONCRETE TOPPING SLAB
- DENOTES EXISTING SLAB TO REMAIN

NOT FOR CONSTRUCTION

**CRITERIA:**

Rigid End Zones: Ignore Effects  
 Member Force Output: At Face of Joint  
 P-Delta: Yes Scale Factor (DL): 1.20 Scale Factor (LL): 0.50  
 Scale Factor (Roof): 1.00 Scale Factor (Snow): 1.00

Ground Level: Base

## Mesh Criteria :

Max. Distance Between Nodes on Mesh Line (ft) : 6.00

Merge Node Tolerance (in) : 0.2000

Geometry Tolerance (in) : 0.0050

Walls Out-of-plane Stiffness Included in Analysis.

Sign considered for Dynamic Load Case Results.

Rigid Links Included at Fixed Beam-to-Wall Locations

Eigenvalue Analysis : Ritz Vectors (Load Dependent)

# 1 Structure Data

This chapter provides model geometry information, including items such as story levels, point coordinates, and element connectivity.

## 1.1 Story Data

Table 1.1 - Story Data

| Name           | Height in | Elevation in | Master Story | Similar To | Splice Story |
|----------------|-----------|--------------|--------------|------------|--------------|

**1.7 Groups**

**Table 1.12 - Group Definitions**

| Name | Color  |
|------|--------|
| All  | Yellow |

## 2 Properties

This chapter provides property information for materials, frame sections, shell sections, and links.

### 2.1 Materials

**Table 2.1 - Material Properties - Summary**

| Name     | Type     | E<br>lb/in <sup>2</sup> | v   | Unit<br>Weight<br>lb/ft <sup>3</sup> | Design Strengths  |
|----------|----------|-------------------------|-----|--------------------------------------|---|
| 6000Psi  | Concrete | 4415201                 | 0.2 | 150                                  | Fc=6000 lb/in <sup>2</sup>                                |
| 8,000Psi | Concrete | 5098235                 | 0.2 | 150                                  | Fc=8000 lb/in <sup>2</sup>                                |
| A36      | Steel    | 29000000                | 0.3 | 490                                  | Fy=36000 lb/in <sup>2</sup> , Fu=58000 lb/in <sup>2</sup> |
| A615Gr60 | Rebar    | 29000000                | 0.3 | 490                                  | Fy=60000 lb/in <sup>2</sup> , Fu=90000 lb/in <sup>2</sup> |
| A992Fy50 | Steel    | 29000000                | 0.3 | 490                                  | Fy=50000 lb/in <sup>2</sup> , Fu=65000 lb/in <sup>2</sup> |

### 2.2 Frame Sections

**Table 2.2 - Frame Sections - Summary**

| Name    | Material | Shape               |
|---------|----------|---------------------|
| SC3&4   | A36      | Steel I/Wide Flange |
| W10X100 | A992Fy50 | Steel I/Wide Flange |
| W10X45  | A992Fy50 | Steel I/Wide Flange |
| W10X68  | A992Fy50 | Steel I/Wide Flange |
| W14X145 | A992Fy50 | Steel I/Wide Flange |
| W14X233 | A992Fy50 | Steel I/Wide Flange |
| W14X342 | A992Fy50 | Steel I/Wide Flange |
| W14X426 | A992Fy50 | Steel I/Wide Flange |
| W14X61  | A992Fy50 | Steel I/Wide Flange |

### 2.3 Shell Sections

**Table 2.3 - Shell Sections - Summary**

| Name        | Design Type | Element Type | Material | Total Thickness in |
|-------------|-------------|--------------|----------|--------------------|
| 12"SW       | Wall        | Shell-Thin   | 4000Psi  | 12                 |
| 18"SW       | Wall        | Shell-Thin   | 4000Psi  | 18                 |
| 48x57-SC3&4 | Wall        | Shell-Thin   | 4000Psi  | 48                 |

### 2.4 Reinforcement Sizes

**Table 2.4 - Reinforcing Bar Sizes**

| Name | Diameter in | Area in <sup>2</sup> |
|------|-------------|----------------------|
| #4   | 0.5         | 0.2                  |
| #6   | 0.75        | 0.44                 |
| #9   | 1.128       | 1                    |

## 2.5 Tendon Sections

**Table 2.5 - Tendon Section Properties**

| Name    | Material  | StrandArea<br>in <sup>2</sup> | Color |
|---------|-----------|-------------------------------|-------|
| Tendon1 | A416Gr270 | 0.153                         | Red   |

### 3 Assignments

This chapter provides a listing of the assignments applied to the model.

#### 3.1 Joint Assignments

**Table 3.1 - Joint Assignments - Summary**

| Story      | Label | Unique Name | Diaphragm | Restraints |
|------------|-------|-------------|-----------|------------|
| 16th Floor | 1     | 109         | From Area |            |
| 16th Floor | 2     | 108         | From Area |            |
| 16th Floor | 69    | 1962        | From Area |            |
| 16th Floor | 70    | 1963        | From Area |            |
| 16th Floor | 71    | 1966        | From Area |            |
| 16th Floor | 72    | 1967        | From Area |            |
| 15th Floor | 1     | 5           | From Area |            |
| 15th Floor | 2     | 107         | From Area |            |
| 15th Floor | 69    | 1961        | From Area |            |
| 15th Floor | 70    | 1949        | From Area |            |
| 15th Floor | 71    | 1965        | From Area |            |
| 15th Floor | 72    | 1964        | From Area |            |
| 14th Floor | 1     | 1648        | From Area |            |
| 14th Floor | 2     | 104         | From Area |            |
| 14th Floor | 69    | 1969        | From Area |            |
| 14th Floor | 70    | 1968        | From Area |            |
| 14th Floor | 71    | 1971        | From Area |            |
| 14th Floor | 72    | 1970        | From Area |            |
| 14th Floor | 18    | 125         | From Area |            |
| 13th Floor | 1     | 6           | From Area |            |
| 13th Floor | 2     | 103         | From Area |            |
| 13th Floor | 69    | 1973        | From Area |            |
| 13th Floor | 70    | 1972        | From Area |            |
| 13th Floor | 71    | 1986        | From Area |            |
| 13th Floor | 72    | 1985        | From Area |            |
| 12th Floor | 1     | 101         | From Area |            |
| 12th Floor | 2     | 100         | From Area |            |
| 12th Floor | 58    | 114         | From Area |            |
| 12th Floor | 59    | 115         | From Area |            |
| 12th Floor | 60    | 116         | From Area |            |
| 12th Floor | 69    | 185         | From Area |            |
| 12th Floor | 70    | 183         | From Area |            |
| 12th Floor | 71    | 184         | From Area |            |
| 12th Floor | 72    | 186         | From Area |            |
| 12th Floor | 18    | 119         | From Area |            |
| 12th Floor | 22    | 123         | From Area |            |
| 12th Floor | 23    | 124         | From Area |            |
| 11th Floor | 1     | 98          | From Area |            |
| 11th Floor | 2     | 99          | From Area |            |
| 11th Floor | 69    | 181         | From Area |            |
| 11th Floor | 70    | 179         | From Area |            |

## 4 Loads

This chapter provides loading information as applied to the model.

### 4.1 Load Patterns

Table 4.1 - Load Patterns

| Name | Type | Self Weight Multiplier | Auto Load |
|------|------|------------------------|-----------|
| Dead | Dead | 1                      |           |
| Live | Live | 0                      |           |
| Wind | Wind | 0                      | None      |

### 4.2 Applied Loads

#### 4.2.1 Point Loads

Table 4.2 - Joint Loads - Force

**1.7 Groups**

**Table 1.11 - Group Definitions**

| Name | Color  |
|------|--------|
| All  | Yellow |

## 2 Properties

This chapter provides property information for materials, frame sections, shell sections, and links.

### 2.1 Materials

**Table 2.1 - Material Properties - Summary**

| Name     | Type     | E<br>lb/in <sup>2</sup> | v   | Unit<br>Weight<br>lb/ft <sup>3</sup> | Design Strengths  |
|----------|----------|-------------------------|-----|--------------------------------------|---|
| 6000Psi  | Concrete | 4415201                 | 0.2 | 150                                  | Fc=6000 lb/in <sup>2</sup>                                |
| 8,000Psi | Concrete | 5098235                 | 0.2 | 150                                  | Fc=8000 lb/in <sup>2</sup>                                |
| A36      | Steel    | 29000000                | 0.3 | 490                                  | Fy=36000 lb/in <sup>2</sup> , Fu=58000 lb/in <sup>2</sup> |
| A615Gr60 | Rebar    | 29000000                | 0.3 | 490                                  | Fy=60000 lb/in <sup>2</sup> , Fu=90000 lb/in <sup>2</sup> |
| A992Fy50 | Steel    | 29000000                | 0.3 | 490                                  | Fy=50000 lb/in <sup>2</sup> , Fu=65000 lb/in <sup>2</sup> |

### 2.2 Frame Sections

**Table 2.2 - Frame Sections - Summary**

| Name    | Material | Shape               |
|---------|----------|---------------------|
| SC1&2   | A992Fy50 | Steel I/Wide Flange |
| W14X342 | A992Fy50 | Steel I/Wide Flange |
| W14X455 | A992Fy50 | Steel I/Wide Flange |
| W14X730 | A992Fy50 | Steel I/Wide Flange |
| W24X335 | A992Fy50 | Steel I/Wide Flange |
| W24X370 | A992Fy50 | Steel I/Wide Flange |

### 2.3 Shell Sections

**Table 2.3 - Shell Sections - Summary**

| Name          | Design<br>Type | Element<br>Type | Material | Total<br>Thickness<br>in |
|---------------|----------------|-----------------|----------|--------------------------|
| 36x44.5-SC1&2 | Wall           | Shell-Thin      | 4000Psi  | 36                       |

### 2.4 Reinforcement Sizes

**Table 2.4 - Reinforcing Bar Sizes**

| Name | Diameter<br>in | Area<br>in <sup>2</sup> |
|------|----------------|-------------------------|
| #4   | 0.5            | 0.2                     |
| #6   | 0.75           | 0.44                    |
| #9   | 1.128          | 1                       |

### 2.5 Tendon Sections

**Table 2.5 - Tendon Section Properties**

| Name    | Material  | StrandArea<br>in <sup>2</sup> | Color |
|---------|-----------|-------------------------------|-------|
| Tendon1 | A416Gr270 | 0.153                         | Red   |

### 3 Assignments

This chapter provides a listing of the assignments applied to the model.

#### 3.1 Joint Assignments

**Table 3.1 - Joint Assignments - Summary**

| Story      | Label | Unique Name | Diaphragm | Restraints |
|------------|-------|-------------|-----------|------------|
| 16th Floor | 3     | 479         | From Area |            |
| 16th Floor | 4     | 375         | From Area |            |
| 16th Floor | 73    | 764         | From Area |            |
| 16th Floor | 74    | 680         | From Area |            |
| 16th Floor | 75    | 786         | From Area |            |
| 16th Floor | 76    | 773         | From Area |            |
| 16th Floor | 179   | 759         | From Area |            |
| 15th Floor | 3     | 480         | From Area |            |
| 15th Floor | 4     | 374         | From Area |            |
| 15th Floor | 73    | 763         | From Area |            |
| 15th Floor | 74    | 654         | From Area |            |
| 15th Floor | 75    | 697         | From Area |            |
| 15th Floor | 76    | 771         | From Area |            |
| 14th Floor | 3     | 239         | From Area |            |
| 14th Floor | 4     | 240         | From Area |            |
| 14th Floor | 73    | 779         | From Area |            |
| 14th Floor | 74    | 682         | From Area |            |
| 14th Floor | 75    | 800         | From Area |            |
| 14th Floor | 76    | 2017        | From Area |            |
| 14th Floor | 179   | 789         | From Area |            |
| 13th Floor | 3     | 237         | From Area |            |
| 13th Floor | 4     | 238         | From Area |            |

## 4 Loads

This chapter provides loading information as applied to the model.

### 4.1 Load Patterns

Table 4.1 - Load Patterns

| Name | Type | Self Weight Multiplier | Auto Load |
|------|------|------------------------|-----------|
| Dead | Dead | 1                      |           |
| Live | Live | 0                      |           |
| Wind | Wind | 0                      | None      |

### 4.2 Applied Loads

#### 4.2.1 Point Loads

Table 4.2 - Joint Loads - Force

| Story      | Label | Unique Name | Load Pattern | FX kip | FY kip | FZ kip | MX kip-ft | MY kip-ft | MZ kip-ft | XDim in | YDim in |
|------------|-------|-------------|--------------|--------|--------|--------|-----------|-----------|-----------|---------|---------|

## 1 Structure Data

This chapter provides model geometry information, including items such as story levels, point coordinates, and element connectivity.

### 1.1 Story Data

**Table 1.1 - Story Data**

| Name           | Height in | Elevation in | Master Story | Similar To | Splice Story |
|----------------|-----------|--------------|--------------|------------|--------------|
| 48th Screening | 180       | 6435.9996    | No           | None       | No           |

**1.6 Groups**

**Table 1.10 - Group Definitions**

| Name | Color  |
|------|--------|
| All  | Yellow |

## 2 Properties

This chapter provides property information for materials, frame sections, shell sections, and links.

### 2.1 Materials

**Table 2.1 - Material Properties - Summary**

| Name     | Type  | E<br>lb/in <sup>2</sup> | v   | Unit<br>Weight<br>lb/ft <sup>3</sup> | Design Strengths  |
|----------|-------|-------------------------|-----|--------------------------------------|---|
| A36      | Steel | 29000000                | 0.3 | 490                                  | Fy=36000 lb/in <sup>2</sup> , Fu=58000 lb/in <sup>2</sup> |
| A615Gr60 | Rebar | 29000000                | 0.3 | 490                                  | Fy=60000 lb/in <sup>2</sup> , Fu=90000 lb/in <sup>2</sup> |
| A992Fy50 | Steel | 29000000                | 0.3 | 490                                  | Fy=50000 lb/in <sup>2</sup> , Fu=65000 lb/in <sup>2</sup> |

### 2.2 Frame Sections

**Table 2.2 - Frame Sections - Summary**

| Name    | Material | Shape               |
|---------|----------|---------------------|
| W14X132 | A992Fy50 | Steel I/Wide Flange |
| W14X176 | A992Fy50 | Steel I/Wide Flange |
| W14X233 | A992Fy50 | Steel I/Wide Flange |
| W14X257 | A992Fy50 | Steel I/Wide Flange |
| W14X342 | A992Fy50 | Steel I/Wide Flange |
| W14X500 | A992Fy50 | Steel I/Wide Flange |
| W14X605 | A992Fy50 | Steel I/Wide Flange |
| W14X730 | A992Fy50 | Steel I/Wide Flange |
| W24X62  | A992Fy50 | Steel I/Wide Flange |
| W30X90  | A992Fy50 | Steel I/Wide Flange |

### 2.3 Reinforcement Sizes

**Table 2.3 - Reinforcing Bar Sizes**

| Name | Diameter<br>in | Area<br>in <sup>2</sup> |
|------|----------------|-------------------------|
| #4   | 0.5            | 0.2                     |
| #6   | 0.75           | 0.44                    |
| #9   | 1.128          | 1                       |

### 2.4 Tendon Sections

**Table 2.4 - Tendon Section Properties**

| Name    | Material  | StrandArea<br>in <sup>2</sup> | Color |
|---------|-----------|-------------------------------|-------|
| Tendon1 | A416Gr270 | 0.153                         | Red   |

### 3 Assignments

This chapter provides a listing of the assignments applied to the model.

#### 3.1 Joint Assignments

**Table 3.1 - Joint Assignments - Summary**

| Story     | Label | Unique Name | Diaphragm | Restraints |
|-----------|-------|-------------|-----------|------------|
| 9th Floor | 78    | 292         | From Area |            |
| 9th Floor | 79    | 293         | From Area |            |
| 9th Floor | 80    | 294         | From Area |            |
| 9th Floor | 81    | 295         | From Area |            |
| 9th Floor | 83    | 231         | From Area |            |
| 9th Floor | 304   | 1725        | From Area |            |
| 9th Floor | 23    | 23          | From Area |            |
| 8th Floor | 78    | 287         | From Area |            |
| 8th Floor | 79    | 288         | From Area |            |
| 8th Floor | 80    | 289         | From Area |            |
| 8th Floor | 81    | 290         | From Area |            |
| 8th Floor | 83    | 230         | From Area |            |
| 8th Floor | 98    | 309         | From Area |            |
| 8th Floor | 304   | 3315        | From Area |            |
| 8th Floor | 62    | 229         | From Area |            |
| 8th Floor | 63    | 3313        | From Area |            |
| 8th Floor | 64    | 3314        | From Area |            |
| 7th Floor | 78    | 282         | From Area |            |
| 7th Floor | 79    | 283         | From Area |            |
| 7th Floor | 80    | 284         | From Area |            |
| 7th Floor | 81    | 285         | From Area |            |
| 7th Floor | 4     | 4           | From Area |            |
| 7th Floor | 7     | 7           | From Area |            |
| 7th Floor | 8     | 8           | From Area |            |
| 7th Floor | 22    | 22          | From Area |            |
| 6th Floor | 78    | 277         | From Area |            |
| 6th Floor | 79    | 278         | From Area |            |
| 6th Floor | 80    | 279         | From Area |            |
| 6th Floor | 81    | 280         | From Area |            |
| 6th Floor | 3     | 3           | From Area |            |
| 6th Floor | 15    | 15          | From Area |            |
| 6th Floor | 21    | 21          | From Area |            |
| 5th Floor | 78    | 272         | From Area |            |
| 5th Floor | 79    | 273         | From Area |            |
| 5th Floor | 80    | 274         | From Area |            |
| 5th Floor | 81    | 275         | From Area |            |
| 5th Floor | 14    | 14          | From Area |            |
| 5th Floor | 20    | 20          | From Area |            |
| 4th Floor | 78    | 267         | From Area |            |
| 4th Floor | 79    | 268         | From Area |            |
| 4th Floor | 80    | 269         | From Area |            |

## 4 Loads

This chapter provides loading information as applied to the model.

### 4.1 Load Patterns

Table 4.1 - Load Patterns

| Name | Type | Self Weight Multiplier | Auto Load |
|------|------|------------------------|-----------|
| Dead | Dead | 1                      |           |
| Live | Live | 0                      |           |
| Wind | Wind | 0                      | None      |

### 4.2 Applied Loads

#### 4.2.1 Point Loads

Table 4.2 - Joint Loads - Force

# 1. INTRODUCTION

Rowan Williams Davies & Irwin Inc. (RWDI) was retained by CFMDC BWAY Hotel Acquisition LP to study the wind loading on the proposed 1568 Broadway Development, in New York, New York. It is our understanding that the project involves proposed changes to the existing structure and the addition of several floors to the top of the tower.

The objectives of this study were:

- i. to provide wind loading information for the overall structural design of the tower; and,
- ii. to determine the wind-induced accelerations at the uppermost occupied floors.

The following table summarizes relevant information about the design team, methods used, results of the study and the governing parameters:

| Project Details:  |   |  |
|---|---|--|
| Structural Engineer                                       | Severud Associates Consulting Engineers, New York, New York |  |
| Architect   | PBDW Architects, New York, New York                         |  |
| Measurement Technique                                     | High Frequency Pressure Integration (HFPI)                  |  |
| Key Results and Recommendations:                          |   |  |
| Coordinate System for Structural Wind Loading Application | Figures 4a-4b   |  |
| Summary of Predicted Peak Overall Structural Wind Loads   | Tables 2a and 2b  |  |
| Effective Static Floor-by-Floor Wind Loads                | Tables 3a (i), 3a (ii), 3b (i) and 3b (ii)                  |  |
| Recommended Wind Load Combination Factors                 | Tables 4a (i) and 4b (i)                                    |  |
| Predicted Peak Accelerations at Top Occupied Floor        | see Figures 6a and 6b                                       |  |
| Selected Analysis Parameters:                             |   |  |
| Design Wind Speed per New York City Building Code 2014    | 98 mph 3-second Gust Speed at 33 ft in open terrain         |  |
| Importance Factor on Wind Pressure                        | 1.0   |  |

The wind tunnel test procedures met or exceeded the requirements set out in Section 31.2 of the ASCE 7-10 Standard. The following sections outline the test methodology for the current study, and discuss the results and recommendations. Appendix A provides additional background information on the testing and analysis procedures for this type of study. For detailed explanations of the procedures and underlying theory, refer to RWDI's Technical Reference Document - Wind Tunnel Studies for Buildings (RD2-2000.1), which is available upon request.

## 2. WIND TUNNEL TESTS

### 2.1 Study Model and Surroundings

A 1:400 scale model of the proposed development was constructed using the architectural drawings listed in Table 1. The model was tested in the presence of all surroundings within a full-scale radius of 1600 ft, in RWDI's 12 ft × 7 ft boundary layer wind tunnel facility in Guelph, Ontario.

Photographs of the wind tunnel study model are shown in Figure 1. An orientation plan showing the location of the study site is given in Figure 2.

### 2.2 Upwind Profiles

Beyond the modelled area, the influence of the upwind terrain on the planetary boundary layer was simulated in the testing by appropriate roughness on the wind tunnel floor and flow conditioning spires at the upwind end of the working section for each wind direction. This simulation, and subsequent analysis of the data from the model, was targeted to represent the following upwind terrain conditions. Wind direction is defined as the direction from which the wind blows, measured clockwise from true north.

| Upwind Terrain                   | Wind Directions (Inclusive) |
|----------------------------------|-----------------------------|
| Urban – heavily built-up terrain | 10° to 360°                 |

## 3. WIND CLIMATE

In order to predict the full-scale structural responses as a function of return period, the wind tunnel data were combined with a statistical model of the local wind climate. The wind climate model was based on local surface wind measurements taken at JFK International Airport, Newark Liberty International Airport, LaGuardia International Airport and a computer simulation of hurricanes. The hurricane simulation was provided by Applied Research Associates, Raleigh, NC using the Monte Carlo Technique. Over 100,000 years of tropical storms were simulated to account for the variability of hurricane wind speed with direction.

Figure 3 shows a comparison of strength and directionality of the Hurricane, Extra-tropical and Extra-tropical + Hurricane wind climate for New York. These plots are illustrative only and are not to be used directly for predictions of wind loads. The upper two plots show the directionality of common winds on the left and extreme winds on the right. Since Extra-tropical + Hurricane are extreme events, they are only included on the right plot. It can be seen that for the extreme events, the winds from the Northwest are the strongest. The lower plot shows the wind speeds from each data set as a function of return period. It is clear from the plot that the common events (i.e., lower return periods) are dictated by the extra-tropical winds whereas at longer return periods, the hurricanes generate the most significant wind speeds for strength design.

The design wind speed for New York, as specified in the NYCBC 2014, is a 3-second gust wind speed of 98 mph at a height of 33 ft in open terrain. This wind speed is also shown in Figure 3. For the wind loading predictions for strength design, the wind climate model was scaled to match the design wind speed at the 50-year return period. For the determination of the 10-year return period loads, the ASCE 7-10 code recommended 3-second gust wind basic wind speed of 76 mph at a height of 33 ft in open terrain was used. For the prediction of wind-induced accelerations, it is common practice to consider a more representative wind climate, therefore the code wind speed matching approach was not used for the acceleration predictions.

## 4. RESULTS AND RECOMMENDATIONS

### 4.1 Predicted Peak Shear Forces and Moments

The reference axes systems used to define the forces and moments are illustrated in Figure 4a. The overall wind-induced overturning moments, shear forces and torsional moments acting at level 'Fground' have been predicted for the two return periods and are presented in Tables 2a and 2b, for 50-year and 10-year return periods, respectively.

The loads were determined using the fundamental building vibration frequencies listed in Tables 2a and 2b, and the corresponding mode shapes provided by the structural engineer on November 22, 2016. Appendix B contains a summary of the provided dynamic properties. The damping ratios were taken as 2% of critical for the 50-year return period strength design as requested by the structural engineer. For the determination of the 10-year return period wind loads a damping ratio of 1.5% of critical was used which was considered representative for the building's structural system for serviceability design.

In addition to the wind tunnel predicted wind loads, estimated ASCE peak loads for Exposure Category B are also provided in Table 2a for the 50-year return period 3-second gust wind speed of 98 mph. This calculation includes a directionality factor of  $K_d = 0.85$ . From Tables 2a, the wind tunnel predicted base overturning moment  $M_y$  is in line with the 2014 NYC Building Code 1609.1.1.2.1 provision for lower limits on main wind-force resisting system. However, the wind tunnel predicted base overturning moment of  $M_x$  is below the lower limit of 80% of the design base overturning moment determined in accordance with Section 6.5 of ASCE 7 Standard. Therefore, an upward adjustment of the wind tunnel predicted  $M_x$  overturning moment will be required to satisfy the above NYC Building Code provision. However, as requested by the structural engineer, the wind loads presented in this report correspond to the wind tunnel predicted loads with no adjustment to satisfy the code minimum loading requirement.

For illustrative purposes, the overall wind-induced loads for each wind direction are presented in Figure 5 for 50- and 10-year return periods. The loads in this figure are the values based on the design wind speed, assuming this wind speed applies equally to all directions. In other words, there is no allowance for the relative probability that the design wind speed will occur from different directions. This information simply illustrates the raw source data used in predicting the peak design loads.

Effective static wind loads that correspond to the predicted overall moments and shears are provided on a floor-by-floor basis in Tables 3a (i) and 3b (i) for 50- and 10-year return period respectively. To account for the simultaneous action of the x, y, and torsional components in Tables 3a (i) and 3b (i), recommended wind load combination factors are provided in Tables 4a (i) and 4b (i). There are 24 basic combinations in these tables, representing each of eight possible sign sets (+++, ++-, +-+, etc.) with each of  $F_x$ ,  $F_y$  and  $M_z$  reaching their individual maximum percentages for that sign set. As an example of applying the combination factors, let us consider Load Case 1 of Table 4a (i). This load case requires the application of +100% of the  $F_x$ , +45% of the  $F_y$ , and +45% of the  $M_z$  floor-by-floor loads from Table 3a (i). **It is recommended that all load cases be considered for overall structural design.**

An alternative presentation of the effective static floor-by-floor loads are presented in Tables 3a (ii) and 3b (ii) for the 50-year and 10-year return period loads, respectively. The loads in these table are presented in the form of a resultant force 'FR' applied to the structure at an angle ' $\theta$ ' (measured in the anticlockwise direction from X-axis) and acting at a perpendicular distance of d (x, y) from the structural origin (0,0). The coordinate system for this presentation of the loading is shown in Figure 4b. Similar to the loads presented in Tables 3a (i) and 3b (i) the loads presented in Tables 3a (ii) and 3b (ii) include 24 load distributions that correspond to the 24 load combination presented in Tables 4a (i) and 4b (i). **It is recommended that all load cases be considered for overall structural design.**

**The wind loads provided in this report include the effects of directionality in the local wind climate. These loads do not contain safety or load factors and are to be applied to the building's structural system in the same manner as would wind loads calculated by code analytical methods.**

## 4.2 Deflections

Deflections have not been specifically evaluated in this study. Normally the structural engineer evaluates floor-to-floor and overall deflections by applying the wind load distributions derived from the wind tunnel tests to a structural computer model of the building. These deflections may then be reviewed by the structural engineer to assess the potential for excessive shearing in wall systems and partitions.

## 4.3 Accelerations

The predicted wind-induced accelerations at the top occupied floor, taken as Level 'F45' (493.3 ft above 'Fground'), are summarized in Figures 6a and 6b for 1.5% and 1.0% of critical damping ratios, respectively. In addition to the peak values shown in the plot, the peak X, Y and torsional components are also tabulated. The peak accelerations were determined as a function of return period for the provided frequencies, and overall damping ratios of 1.5% and 1.0% of critical which were considered as representative upper and lower bounds of damping for the building's structural system for serviceability considerations. The torsional component, which was included in the total acceleration predictions, was calculated at a representative distance of 52 ft, based on the radius of gyration, from the reference z-axis (given in Figure 4a). Results were evaluated both with and without the influence of hurricanes in the wind climate model. As discussed in Appendix A, occupant comfort is assessed at shorter return periods when hurricanes are included in the

analysis since, for stronger hurricanes, occupants who choose to remain should not expect normal conditions to prevail.

Figures 6a and 6b also presents acceleration criteria from the International Organization for Standardization (ISO 10137:2007(E)), and RWDI's suggested criteria based on different occupancies. In all cases, 10-year criteria apply to non-hurricane winds only.

From Figure 6a, it can be seen that the predicted peak accelerations for 1- and 10-year return period are within the ISO and RWDI based residential criteria respectively for 1.5% inherent damping ratio.

For the lower bound of inherent structural damping assumed as 1% of critical (Figure 6b), predicted peak acceleration for the 1-year return period satisfies the ISO motion comfort criteria for a residential occupancy. However, the predicted 10-year peak acceleration is marginally above the RWDI criteria of 15 to 18 milli-g for a residential tower. Since the predicted wind motions for more frequent wind events satisfy the 1-year ISO comfort criteria, the marginal exceedance of the 10-year criteria is less of a concern. Therefore, it is our opinion that the predicted accelerations are acceptable for human comfort in a residential building. It should be noted that building accelerations are a serviceability issue and typically not a safety issue, provided the associated deflections are accounted for in the structural design and the cladding/glazing system design.

#### 4.4 Torsional Velocities

Also of interest for occupant comfort are the peak torsional velocities. The Council on Tall Buildings and Urban Habitat (CTBUH) have suggested torsional velocity limits for the 1- and 10-year return periods. As with the accelerations, the 10-year predictions are only of practical concern during non-hurricane winds. **Note that these guidelines are tentative and based on limited research which is still ongoing.** The predicted torsional velocities at the top occupied floor are also shown along with the tentative criteria in Figures 6a and 6b. It can be seen that the predicted torsional velocities are at or within the criteria for the 1- and 10-year return period. Therefore, in our opinion the torsional velocities are acceptable for human comfort.

#### 4.5 Parametric Studies

A sensitivity study was conducted to quantify the sensitivity of the loads and accelerations to variations from the baseline dynamic structural properties. The base moments are affected by changes in period and damping, while accelerations are impacted by mass as well. The impact of mass on loading is only in changing the building period. In other words, a change in mass accompanied by changes in stiffness to maintain the same period will result in no change to the base loads.

Note that changes to the mode shapes – i.e., curvature and/or coupling – would cause additional changes to the responses beyond what is shown. For these simple parametric studies, it has been assumed that the baseline mode shapes are unchanged. Clearly, the larger the change in mass and stiffness in particular, the more likely it is that some change in mode shape will occur.

Parametric plots for the 50-year return period base moments are given in Figure 7 and the accelerations are shown in Figures 8 and 9 for the 1- and 10-year accelerations, respectively. The plots generally show that lengthening the periods in general will increase the response, which is as expected.

## 5. APPLICABILITY OF RESULTS

---

### 5.1 The Proximity Model

The structural wind loads and building motions determined by the wind tunnel tests and the associated analysis are applicable for the particular configuration of surrounding buildings modelled. City development over time can cause changes in the surroundings from those tested, resulting in loads and accelerations that could differ from those predicted in this report.

Changes in surroundings can be divided into two categories:

- a) addition or demolition of buildings far upwind, having the effect of changing the roughness of the earth's surface and thereby changing the general wind exposure of the site; and
- b) addition or demolition of buildings close to the site, which can cause changes in the local flow patterns about the study building.

Based on the past history of city developments it appears that, with respect to Category (a), development over time is far more likely to increase rather than reduce building density. This implies that the development over time would more likely diminish loads on the study building rather than increase them. With respect to Category (b), the wind tunnel tests were conducted to represent the current state of the development of the nearby surroundings. If, at a later date, additional buildings besides those considered in the tested configuration are constructed near the project site, then some load changes could occur. Unless, however, a building of unusual stature is constructed nearby, the normal use of safety or load factors can be expected to cover the potential increases in structural loads. The consequence of increased motion, should it occur, is that a greater percentage of the occupants would notice the motions or find them objectionable.

### 5.2 Study Model and Structural Properties Information

The results presented in this report pertain to 1) the structural properties, as shown in Appendix B; and, 2) the scale model of the proposed development, constructed using the architectural information listed in Table 1. Should there be any design changes that deviate substantially from the above information, the results for the revised design may differ from those presented in this report. Therefore, if the design changes, RWDI should be contacted and requested to review the impact on the wind loads and building responses.

# TABLES

## TABLE 1: DRAWING LIST FOR MODEL CONSTRUCTION

The drawings and information listed below were received from Severud Associates Consulting Engineers, PC and were used to construct the scale model of the proposed 1568 Broadway. Should there be any design changes that deviate from this list of drawings, the results may change. Therefore, if changes in the design are made, it is recommended that RWDI be contacted and requested to review their potential effects on the wind-induced structural responses presented in this report.

| 80% of ASCE PEAK - Exposure B - $K_d=0.85$ | 2.67E+08        | 7.70E+08        | -               | 9.83E+05        | 2.77E+06        |

Notes:

- The above loads are the cumulative summation of the wind-induced loads at the structural level 'Fground' (i.e. grade) centered about the reference axis shown in Figure 4a, exclusive of combination factors.
- A total damping ratio of 2.0% of critical was used for structural load calculations.
- The above loads are based on the structural properties as provided on November 17, 2016 and updated mode shapes and building frequencies provided on November 22, 2016. The natural building frequencies were as follows:
  - Mode 1: 0.2096 Hz (primarily Y coupled with X)
  - Mode 2: 0.2367 Hz (primarily X coupled with Torsion and Y)
  - Mode 3: 0.3933 Hz (primarily Torsion coupled with X and Y)
- The above loads correspond to a 50-year return period basic wind speed (3-second gust) of 98 mph.
- The ASCE code estimates are also based on a 50-year return period basic wind speed of 98 mph (3-second gust) and include a directionality factor  $K_d = 0.85$ .

**Notes:**

1. The loads given in this table should be used with the load combination factors given in Table 4a (i).
2. The loads given in this table are centered about the reference axis shown in Figure 4a.
3. The above loads correspond to a 50-year return period Basic Wind Speed (3-second gust) of 98 mph.

**Notes:**

1. The loads given in this table should be used with the load combination factors given in Table 4b (i).
2. The loads given in this table are centered about the reference axis shown in Figure 4a.
3. The above loads correspond to a 10-year return period Basic Wind Speed (3-second gust) of 76 mph.

**Notes:**

1. Load combination factors have been produced through consideration of the structure’s response to various wind directions, modal coupling, correlation of wind gusts and the directionality of strong winds in the local wind climate.

## APPENDIX A: WIND TUNNEL PROCEDURES

---

### OVERVIEW OF WIND TUNNEL PROCEDURES FOR THE PREDICTION OF WIND-INDUCED STRUCTURAL RESPONSES

#### A.1 Wind Tunnel Test and Analysis Methods

##### A.1.1 Wind Tunnel Tests

RWDI's boundary layer wind tunnel facility simulates the mean speed profile and turbulence of the natural wind approaching the modeled area by having a long working section with a roughened floor and specially designed turbulence generators, or spires, at the upwind end. Floor roughness and spires have been selected to simulate four basic terrain conditions, ranging from open terrain, or water, to built-up urban terrain. During the tests, the upwind profile in the wind tunnel is set to represent the most appropriate of these four basic profiles, for directions with similar upwind terrain. Scaling factors are also introduced at the analysis stage to account for remaining minor differences between the expected wind speed and turbulence properties, and the basic upwind flow conditions simulated in the wind tunnel. The full-scale properties are derived using the ESDU methodology<sup>1, 2</sup> for predicting the effect of changes in the earth's surface roughness on the planetary boundary layer. For example, this procedure distinguishes between the flows generated by a uniform open water fetch upwind of the site, versus a short fetch of suburban terrain immediately upwind of the site with open water in the distance.

Wind direction is defined as the direction from which the wind blows in degrees measured clockwise from true north. The test model (study model and surroundings) is mounted on a turntable, allowing any wind direction to be simulated by rotating the model to the appropriate angle in the wind tunnel. The wind tunnel test is typically conducted for 36 wind directions at 10° intervals.

##### A.1.2 Measurement Techniques

This study addresses the horizontal wind loads on the structural system of a building, the moments produced by those loads and the horizontal accelerations of the upper part of the building. Predictions of these responses are required in order that the structural system can be designed to safely resist the wind loads and, at the same time, provide an environment in which sensations of motion by occupants do not exceed normal guidelines for comfort. In special cases, vertical wind loads can also be addressed, but they are typically not significant for tall buildings. There are two techniques, based on wind tunnel testing of rigid models that are commonly used to make these predictions. The first technique uses measurements on a base balance and the second involves the integration of simultaneous pressure measurements. In the case of structures that are unusually tall or flexible, an aeroelastic model may be used.

### A.1.2.1 The High-Frequency Force-Balance (HFFB) Technique

The mathematical basis of the HFFB technique is the well-established modal analysis theory. The practical basis of the approach is that base moments and shears, as measured on a very rigid (hence “high-frequency”) wind tunnel model of a building, can be used to determine the wind-induced mean and dynamic loads, that can be expected to occur under given conditions. These loads can then be combined analytically with the dynamic properties of the full-scale structure to determine the wind-induced responses.

For the test, a model of the building is constructed with the aim of being as light and stiff as possible. The model is then mounted on the HFFB (Figure 1a), which consists of a stiff rectangular sway flexure mounted on top of a stiff torsional flexure. The resulting mass and stiffness of the assemblage (i.e., flexures and model) should produce sway and torsional natural frequencies well above the range of interest for the subsequent analysis. Residual dynamic amplification effects associated with the model frequencies are removed during the post-test analysis.

During the HFFB test, instantaneous overturning and torsional moments are recorded from strain gauges attached to the force-balance flexures. The sway flexure consists of two levels of strain gauges, from which the base moments may be determined at the appropriate level (e.g., grade). The instantaneous shear is computed from the difference in strain gauge readings at the two levels. The strain gauges are calibrated by applying a range of known static loads (sway and torsion) to the flexures prior to the wind tunnel tests.

For each of the test wind directions, the recorded data are analysed to obtain mean and root-mean-square (RMS) values of the base moments, shears and torsional moments. In addition, the RMS values and the power spectral density functions of the modal forces and torque acting on the building are calculated. A modal force (or torque) is the integral of the force (or torque), weighted by the modal deflection shape, over the height of the building. To calculate this from the HFFB data, the base overturning moments and shears are used to determine a linear distribution of pressure with height for each sway direction, from which a force distribution with height can then be obtained. The distribution of torque with height is predicted from a weighted average of the sway pressure distributions.

Where the project involves two or more towers that are structurally linked, the HFFB technique can be extended to these cases by use of multiple force balances recording data simultaneously. The details of the methodology for these cases may be found in Xie and Irwin<sup>3,4</sup>.

<sup>3</sup> Xie, J., and Irwin, P.A., “Application of the Force Balance Technique to a Building Complex”, Journal of Wind Engineering and Industrial Aerodynamics, Vols. 77 & 78 (1998), pg. 579-590.

<sup>4</sup> Xie, J., and Irwin, P.A., “Wind-Induced Response of a Twin-Tower Structure”, Wind and Structures, Vol. 4, No. 6 (2001), pg. 495-504.

### A.1.2.2 The High Frequency Pressure Integration (HFPI) Technique

The mathematical basis of this technique is also the modal analysis theory. The practical basis of this approach is that wind pressure measurements, taken simultaneously over the surface of a building, can be summed (or integrated) to determine the wind-induced mean and dynamic loads, which can be expected to occur under given wind conditions. These loads can then be combined analytically with the dynamic properties of the full-scale structure to determine the wind-induced responses.

For the test, a model is constructed and instrumented with pressure taps at enough locations (Figure 1b) to fully describe the overall wind loading at any instant in time. During the testing, time series of the simultaneous pressures are recorded for post-test processing. The measured data are converted into pressure coefficients based on the measured upper level mean dynamic pressure in the wind tunnel.

During the post-test analysis, the integration is carried out to determine time series of the base moments, shears, torsional moments and modal forces. From these time series, the mean and RMS values and power spectral density functions may be determined and then the analysis proceeds in the same manner as for an HFFB study.

An advantage of the HFPI method is that it lends itself to the testing of more complex structures since the modal loads are determined directly with no assumptions necessary about the form of the pressure distribution. It also allows the overall structure to be broken down into multiple substructures and the loads on each identified separately.

### A.1.2.3 Aeroelastic Model Testing

An aeroelastic model is designed to simulate the mass, stiffness and damping properties of the actual structure. The responses of the model, in the form of moments, forces, displacements and accelerations, therefore reflect the total response including the inertial loading. Because the motion of the structure is simulated, aeroelastic forces arising from the relative motion between the structure and the wind are also inherent in the measured responses. The result is a more precise prediction of the structural responses. This appendix focuses primarily on rigid model techniques, and details on aeroelastic modelling techniques may be found elsewhere<sup>5</sup>.

## A.1.3 Determination of Structural Responses

The rigid model (i.e., HFFB or HFPI) data are used to determine the modal loads for each of the 36 tested wind directions. The modal loads are then combined with the specific properties of the building, provided by the structural engineer, to determine the dynamic components of the various structural responses. These properties included the mass distribution, natural frequencies for the fundamental sway and torsional modes of vibration, and selected structural damping values. For each principal wind direction, mean, root-mean-square, maximum, and minimum values of the important overall structural loads are calculated for a range of full-scale wind speeds.

<sup>5</sup> Irwin, P.A., "Model Studies of the Dynamic Response of Tall Buildings in Wind", Proceedings, Canadian Society for Civil Engineering, 1982 Annual Conference, Edmonton, Alberta.

For assessing building motions, the quantity of interest is the total acceleration at the uppermost, occupied floors. Total acceleration is a result of two components due to the sway motions of a building,  $a_x$  and  $a_y$  and a component due to the rotational motion of the building,  $a_z$ . The rotation-induced component varies with position in the floor plan, being negligible near the center of rotation and greatest at the far corner locations. The total acceleration would therefore be greatest at such corner locations, but this would not be representative of where most occupants are likely to be. As an effective compromise between extreme options, a radial arm equivalent to the mass radius of gyration of the top occupied floor from the center of the building is typically selected by RWDI as the representative distance for calculating the rotational component.

#### A.1.4 Determination of Peak Factors

The RMS value of a structural response multiplied by a peak factor gives the peak dynamic value for the response. For a Gaussian process, which is the common case for the random vibrations, the peak factor can be calculated as follows:

$$g_p = \sqrt{2\ln(NT)} + \frac{0.577}{\sqrt{2\ln(NT)}}$$

where  $N$  is the average fluctuation rate and  $T$  is the duration to be considered. As the response of a tower tends to be a narrow band process (i.e., the energy of the response is highly concentrated around the tower's natural frequency),  $N$  is approximately equal to the building's natural frequency. When the reference wind speed is converted to a mean hourly speed,  $T$  can be taken as 3600 seconds. The peak factor calculated in this manner is used for an HFFB or HFPI analysis. Aeroelastic model tests simulate the total response and therefore allow the peak factor to be measured directly. Lower values of the peak factor are generally measured in cases where vortex-induced oscillations, or some other aerodynamic instability, are present.

#### A.1.5 Consideration of the Local Wind Climate

Carrying out the procedures described in the previous sections determines the structural responses to be expected at full-scale for a given set of building properties and for any given wind direction and mean wind speed. However, in order to account for the varying likelihood of different wind directions and the varying strengths of winds that may be expected from different directions, the calculated structural responses are integrated with statistical records of the local wind climate to produce predicted peak values as a function of return period. In the case of structural loads, it is appropriate to consider peak loads associated with return periods comparable to the design life of the structure. The choice of return period will be governed by local code requirements, that consider the intended use of the building, but 50 years is often used (with the appropriate load or safety factors applied) for structural design. In the case of building motions, the concern is one of occupant comfort and it is common to consider much shorter return periods, typically in the range of 1 to 10 years.

Wind records taken from one or more locations near to the study site are generally used to derive the wind climate model. In areas affected by hurricanes or typhoons, Monte Carlo simulations are typically used to generate a better database since full scale measurements, if available for a given location, typically provide an inadequate sample for statistical purposes. The data in either case are analysed to determine the probabilities of exceeding various hourly mean wind speeds from within each of 36 wind sectors at an upper level reference height, typically taken to be 600 m (2000 ft) above open terrain. This coincides with the height used to measure the reference dynamic pressure in the wind tunnel.

In order to predict the wind-induced responses for a given return period, the wind tunnel results are integrated with the wind climate model. There are two methods typically used by RWDI to perform this integration. In one method, the historical (or simulated as is the case with hurricanes or typhoons) wind record is used to determine the full-scale wind-induced responses for each hour, given the recorded wind speed and direction and the wind tunnel predictions for that direction. By stepping through the wind speed and direction data on an hour-by-hour basis, a time history of the desired response is generated. Then, through the use of extreme value fitting techniques, statistically valid peak responses for any desired return period are determined.

The second method is the Upcrossing Method as described by Irwin<sup>6</sup> and Irwin and Sifton<sup>7</sup>. In simple terms, this can be thought of as an analytical representation of the first method, in which a fitted mathematical model of the wind statistics is used in place of the detailed wind records themselves. The Upcrossing Method is currently used by RWDI for HFFB and HFPI studies of the structural loads and responses of tall buildings.

#### A.1.6 Design Wind Speeds in Hurricane/Typhoon Regions

It may be of interest to compare design wind speeds with the Saffir-Simpson hurricane categories, although this should be done with caution. In particular, while associating the building strength or performance with a given category of hurricane may sound appealing, it ignores the likelihood of that category of storm actually occurring at a given site. It also ignores the distinction between a direct hit from a weak hurricane compared with a glancing blow from a strong one. For this reason, when adopting criteria for both strength and serviceability, building codes and standards relate design wind speeds to return period rather than simply to storm categories or other similar systems.

The commentary to the ASCE 7-05 has a discussion in Section C6.5.4 regarding the relationship between the Basic Wind Speeds in the standard and the Saffir-Simpson scale. The Basic Wind speeds given currently in the ASCE 7 are 3-second gust speeds at 33 feet over land. The ASCE commentary also provides guidance on conversion to other wind speed durations *in the same terrain conditions*, which may be considered if the design wind speeds are taken from other sources.

Hurricane wind speeds commonly referred to with the Saffir-Simpson scale are 1-minute averages over water. The conversion between these different averaging times and terrain conditions is

<sup>6</sup> Irwin, P.A., "Pressure Model Techniques for Cladding Loads", Journal of Wind Engineering and Industrial Aerodynamics 29 (1988), pg. 69-78.

<sup>7</sup> Irwin, P.A. and Sifton, V. L., "Risk Considerations for Internal Pressures", Journal of Wind Engineering and Industrial Aerodynamics, 77 & 78 (1998), pg. 715-723.

complicated by the fact that the effective roughness of the sea surface varies with wind speed. The ASCE commentary (Table C6-2) provides the following approximate conversions, although they are the topic of ongoing research:

| Saffir/Simpson Hurricane Category | 1-minute average speed, 33 ft (10 m) over water, mph (m/s) | 3-second gust speed, 33 ft (10 m) over land, mph (m/s) |
|-----------------------------------|--|--|
| 1                                 | 74-95 (33.1-42.5)  | 82-108 (36.7-48.3)                                     |
| 2                                 | 96-110 (42.6-49.2)   | 109-130 (48.4-58.1)                                    |
| 3                                 | 111-130 (49.6-58.1)  | 131-156 (58.2-69.7)                                    |
| 4                                 | 131-155 (58.2-69.3)  | 157-191 (69.8-85.4)                                    |
| 5                                 | >155 (>69.3)   | >191 (>85.4)   |

When relating the design speed for a particular area to the above categories, it is worth considering the impact of the load factor. For example, a basic wind speed of 120 mph specified by the ASCE 7-05 corresponds to a Category 2 hurricane, as is. With the load factor of 1.6 (or 1.26 on wind speed), this corresponds to 152 mph and a Category 3 storm.

**A.1.7 Determination of Wind Load Distribution with Height**

The wind-induced forces generated within a building are constantly changing due to turbulence in the wind as well as the inertia of the building as it sways and twists. However, it is convenient for structural design computations to convert these fluctuating wind loads into equivalent static wind load distributions. Such wind load distributions are determined by accounting for the vertical distributions of the quasi-static and resonant components of the wind loads independently. The quasi-static wind loads essentially represent the direct wind loading on the building, which may be characterized by a mean component and a fluctuating background component. The resonant wind loads are produced by the inertial loads of the building as it oscillates in its primary modes of vibration. The distribution of the resonant forces and moments may be inferred to a good approximation from the building accelerations, mode shapes for sway and twisting motion, and from the building's mass distribution. The quasi-static loads are then determined from the difference between the overall loads and the resonant loads. The quasi-static loads are distributed based on the resulting quasi-static shear forces and overturning moments, and the building geometry.

These distributions correspond to the predicted peak overall loads in each of the two sway directions, and also in torsion. These three load distributions will not necessarily occur at the same instant in time or during the same storm and, therefore, should not be treated as simultaneous loads. Reduction factors are subsequently introduced to account for the peak design values occurring at different times. These reduction factors can be determined by a process that compares the peak overall loads in each of the two sway directions, and in the torsional direction to the building's force data measured on a direction by direction basis and factored by its meteorological directional probability. This procedure produces a set of load combinations that are simply defined and expected to provide adequate loading of all members of the primary structural system.

## A.2 Discussion of Acceleration Criteria

Acceleration levels that are acceptable to people are dependent on many physiological factors and consequently are subjective to some degree. Some background to the suggested criteria for acceptability of building accelerations is discussed in this section.

As with any other response to wind loading, acceleration is a random, fluctuating quantity, which must be described in statistical terms. There are two statistics that are commonly used in the literature to describe accelerations: the root-mean-square (RMS) values and the peak. The acceleration predictions that are provided for the various return periods in this report are peak values, expected to occur a few times each hour during a windstorm.

Research indicates that people first begin to perceive accelerations when they reach about 5 milli-g (where milli-g is 1/1000 of the acceleration of gravity). However, it is not realistic to require that no accelerations ever occur above this level. In addition, there is a distinction to be made between the perception of motion, and the tolerance of it. That is, simply because occupants can perceive motion does not necessarily mean they will object to it, as long as such motions do not occur too often. Criteria have therefore been developed that relate acceleration levels and their acceptability to various frequencies of occurrence.

The first building code document to give guidance on building motions was the National Building Code of Canada (NBCC). It suggested that 10-year return period accelerations in the range of 1.0% to 3.0% of gravity (10 to 30 milli-g) were acceptable, with the upper end of the range being appropriate for office buildings and the lower end for residential buildings.

Research conducted during the development of the acceleration criteria in the NBCC indicated that peoples' sensitivity to motion becomes less as the natural frequency of the building becomes lower (at least in the range of interest for tall buildings, 0.1 Hz to 1.0 Hz). This dependence is not reflected in the NBCC, which provides a single set of criteria based on results for frequencies primarily in the range 0.15 to 0.3 Hz. The criteria suggested by the International Organization for Standardization (ISO) are expressed as a function of frequency. The upper limit of the ISO criteria is based on magnitudes of acceleration which approximately 2% of those occupying the upper third of a building may find objectionable. The ISO Criteria generally have used shorter return periods than 10 years.

ISO initially published criteria (ISO 6897:1984) based on a 5-year return period, which were expressed in terms of the RMS acceleration. The corresponding 1-year criterion was tentatively suggested by ISO to be 0.72 times the 5-year criterion. It should be noted that the ISO 6897 made reference to “buildings used for general purposes,” in reference to the above criteria, with no distinction between commercial and residential occupancies as suggested in the NBCC.

In the new ISO standard (ISO 10137:2007(E) – Annex D) on building serviceability, the acceleration criteria are expressed as peak values at the 1-year return period. The expression for building frequencies ranging from .06 Hz to 1 Hz (which is the range of interest for high-rise buildings) is as follows:

$$\text{1-Year Peak Criterion in milli-g} = \text{constant} \times f^{-0.445}$$

where  $f$  is the building frequency in Hz, and the constant is 6.12 for office buildings, and 4.08 for residential buildings. In other words, the residential criteria are 2/3 of the office criteria. In the absence of information to the contrary, it is assumed that the corresponding 5-year criterion can be obtained by dividing the 1-year criteria by the 0.72 factor given in ISO 6897.

In addition to the NBCC and ISO guidelines, acceleration criteria were developed based on a consensus between design teams, developers, and the wind engineering community’s experience with many towers constructed and wind tunnel tested during the 1980’s and 1990’s. The Council on Tall Buildings and Urban Habitat (CTBUH) recommends 10-year accelerations of 10 to 15 milli-g for residential buildings and 20 to 25 milli-g for office buildings<sup>8</sup>. Based on discussions between RWDI and the designers of numerous high-rise towers, we have found it desirable to relax the residential criteria to a range of 15 to 18 milli-g, noting that the consequence of higher accelerations is an increased likelihood of occupant discomfort, rather than an issue of life safety. After numerous studies using this less stringent criteria<sup>9</sup>, we are not aware of any complaints of building performance. It should be noted that these criteria, which are not expressed as functions of frequency, may not be appropriate particularly for buildings with unusually high or low frequencies. For more typical frequencies, these criteria essentially follow the trend of the ISO-derived 1-year and 5-year criteria.

A hotel will fall somewhere between office and residential buildings as far as criteria for occupant comfort are concerned, unless the upper floors are occupied by long term residents in which case the residential building criteria would apply.

<sup>8</sup> Isyumov, N. “Criteria for Acceptable Wind-Induced Motions of Tall Buildings,” International Conference on Tall Buildings, CTBUH, Rio De Janeiro, 1993.

<sup>9</sup> Irwin, P. and Myslimaj, B. “Practical Experience with Wind-Tunnel Predicted Tall Building Motions” – 17-th Congress of IABSE, Chicago, September 17-19, 2008.

The above-mentioned reference, which contains the CTBUH criteria, also suggests that the North American practice of using the 10-year return period for assessing accelerations and occupant comfort is not appropriate for areas subjected to hurricanes, and recommends the 1-year return period be considered in such regions. Use of the 1-year return period is consistent with current practice in Japan, where typhoons are a significant consideration for the design of high-rise towers. If building occupants choose to remain during a hurricane, it is reasonable to suggest that they should not expect normal conditions to prevail. Furthermore, research into occupant comfort indicates that motions tend to be more tolerable as long as they are not completely unexpected. While structural modifications and/or auxiliary damping could be employed to reduce the motions during hurricanes, such measures are typically undertaken to address motions during more common wind events. Therefore, simply educating building occupants as to the likelihood of motion during stronger hurricanes might be a more appropriate way to address occupant comfort, particularly in tall slender towers.
