THE
BRITANNICA YEAR-BOOK
1913

TO THE OWNER OF THIS YEAR-BOOK

THE Britannica Year-Book has for its province the temporary aspects of the world's life. It affords information that holds for the current phases of things. *The Encyclopædia Britannica* (Eleventh Edition) deals with the vastly wider realm of knowledge and information that has withstood the test of time. It supplies the basis on which the new information, the new developments, the substantial progress of the present year must rest, that great account to which the new acquisitions are but small additions in the sum total of the things men know and by which their actions in the present are inevitably guided.

A description
of the new
Encyclopædia
Britannica is
printed as an
advertisement
at the back of
the Year-Book

What the Britannica Year-Book does for the limited section of knowledge affected by a year's changes the *Encyclopædia Britannica* does for the whole vast range of human thought and achievement throughout all history. The 29 volumes of the *Encyclopædia* are indispensable as an interpretation and survey of the vast masses of facts lying behind the events of the day to which the new information contained in the Year-Book must necessarily continually refer, because all history, all development, is continuous, and a fact that comes into prominence to-day, a new step in the evolution of knowledge, cannot be isolated from the facts that went before and are a part of the heritage from the preceding age.

These two books, products of the modern spirit of efficiency, the Britannica Year-Book and the *Encyclopædia Britannica*, spring from a common impulse and are part of a single plan, executed by the same international organization of authorities. They attain their greatest usefulness when serving together, each, as the complement, or companion, to the other, and it is especially the Year-Book reader who by his tastes and requirements will best appreciate the invaluable services which the *Encyclopædia Britannica* can render and whose need for this work is most pressing.

SEND FOR THE 160-PAGE PROSPECTUS

No advertisement and no mere pamphlet are adequate to describe this wonderful new work. We have therefore had to prepare a book about it of 250,000 words, with many illustrations and specimen pages on India paper. It costs us more than fifty cents a copy to print and mail. You should examine this prospectus describing the most notable literary undertaking of the age. It will be sent you, by mail, without any obligation to you, together with full particulars of prices, payments, bindings, bookcases, etc.

PREFACE

This volume is designed to fill a somewhat conspicuous gap in the critical literature hitherto available to the general public concerning contemporary affairs. In a more systematic way than has been attempted before, and for a larger area and range of subjects than are covered by ordinary Year-Books, it puts into convenient shape, as a Review for continuous reading and a Register for occasional reference, what may be described as an international stock-taking, by carefully selected authorities, of the progress of events all over the world and the substantial advances in all branches of knowledge from about 1909-10 up to the beginning of 1913.

It differs in several notable respects from the familiar type of Year-Book.

In the first place, it is a "double number." Instead of dealing with the past year only, it shows the *status quo* at the beginning of 1913, by means of a historical record and review which includes 1911 as well as the whole of 1912, and goes back even earlier so as to make the genesis of the contemporary situation, and the essential facts bearing on it, fully comprehensible.

Secondly, while omitting, as sufficiently accessible already in various widely used Almanacs and Annuals of guide-book character, a good deal of purely formal detail unconnected with the real march of progress, it brings together, on the other hand, by means of a narrative survey, a mass of information and research on subjects of great practical interest, ignored or quite inadequately dealt with by the ordinary type of Year-Book, but here carefully digested and critically presented.

Thirdly, it is planned throughout, with the co-operation of contributors specially qualified for the purpose, not only to deal with the salient facts of national progress in different countries, but to approach them, as well as those subjects (*e. g.* the sciences, arts and industries) which represent a world-movement independently of national or racial divisions, as far as possible from an international standpoint, and not, as in other Year-Books intended for English-speaking readers, from one that is more or less narrowly and disproportionately English or American.

Fourthly, the BRITANNICA YEAR-BOOK, while complete in itself as a record and survey of the new material of contemporary interest and importance during the period it covers, is deliberately conceived at the same time as having behind it, for all questions on which earlier and more general information is desired,—together with subjects on which no substantial addition has been made to the knowledge available in 1910,—the *Encyclopaedia Britannica* itself, the 11th edition of which may be regarded as a digest of innumerable Year-Books up to the time of its publication. Each is thus a complement of the other. The YEAR-BOOK not only provides, independently, an encyclopaedic review of purely contemporary additions to history and knowledge, focussing attention on the new *data* accruing from 1910 to 1913, but also acts organically as a companion—and *pro tanto* a corrective—to what is admittedly the most comprehensive and most authoritative of all general works of reference, for which, when published in 1910-11, all this later material was non-existent. In the latter respect it comes in direct series, though in a different form, with the 11th edition of the *Encyclopaedia Britannica*, and carries on, under the same auspices, with the same ideals, and with the same *corpus* of contributors—selected and enlarged for adaptation to the circumstances—the same attempt to give accurate and disinterested expression to the best judgment of the civilised world.

The progress of today is indeed organically related to that of yesterday. The recent additions to history and knowledge which the BRITANNICA YEAR-BOOK reviews for a limited period have naturally an independent importance, simply as constituting the active movements of prime contemporary interest in 1913, a knowledge of which is essential to any rational understanding of current affairs and opportunities. But

these, after all, are but the passing scene; the great drama is of the ages, and can only be appreciated with all its acts on record.

A "Year-Book" must, of course, include many details which are beyond the scope of an encyclopaedia, and *vice versa*. A general encyclopaedia cannot reasonably be expected to deal with certain aspects of practical life determined by purely contemporary conditions, the facts in regard to which are bound to alter as each new year comes round. It is the function of shorter lived periodical publications, arranged on different lines, to provide the public with the material necessary for acquaintance with what is strictly contemporary; they are not wanted for the purpose of covering the whole history of any subject, or the whole accumulation of knowledge about it, in so far as time has sifted its value,—this is the function of the encyclopaedia,—but only to record the additions and alterations that have been made within a limited period, or the *status quo* for a new start in regard to matters which, by their nature, are periodically changing. Thus, by contrast with the *Encyclopaedia Britannica*, it is the object of the BRITANNICA YEAR-BOOK, while serving substantially to bring up-to-date the information there given, and to guide the reader where desirable to such information in it as is specially valuable concerning matters in which lapse of time has made no difference, to provide, in its turn, adequate material for reading or reference on such contemporary questions as can be dealt with from an annual standpoint more practically and in relatively greater detail than is possible or suitable in an encyclopaedia. It is planned accordingly on lines which are primarily appropriate to an annual survey. The treatment of different sorts of information is grouped, according to subject-matter, in Parts and Sections, and not under a succession of dictionary headings in alphabetical order; but it is indexed so as to provide not only for convenient internal reference but also for the use of those who wish to supplement the information given in the *Encyclopaedia Britannica* by the later information given in the YEAR-BOOK.

The fundamental idea which dominates the plan of the volume is that the world's progress may be regarded from two points of view, as concerned either (1) with matters of general—*i.e.* non-national and non-local—interest, or (2) with directly national and local developments. The progress of Science, for instance, is really an international question; from a scientific point of view it does not essentially matter in what country a new discovery may be made. Science has its own world, and so have Philosophy, Religion, Education, Law, Literature, Art, Industry and Sport. For this reason the YEAR-BOOK is divided into two main parts, Part I dealing in a series of sections, subdivided where necessary, with general subjects which have an independent interest irrespective of nationality, and with political and economic questions which are primarily of common international concern, while Part II deals with political, social, and economic progress in each of the different countries of the world, taken as sovereign national units playing a distinctive part in the organisation of human effort and achievement. It is only natural that a work which, being in the English language, will circulate mainly among English-speaking readers, should deal more fully in this latter respect with conditions in the British Empire and the United States than with those of foreign countries; but the increasing importance of international relations is so widely felt among the English-speaking people in all its branches that the attempt of the BRITANNICA YEAR-BOOK to provide a more complete annual register of progress in all parts of the world, inspired by the desire to eliminate national prejudice and to enable its readers to know what is going on in the other countries besides their own, is calculated to promote both national and international interests.

The character and scope of the BRITANNICA YEAR-BOOK may be best understood from its list of Contents; but both are the direct result of its origin, which may be given a few words of explanation.

The name itself indicates that the YEAR-BOOK issues from the same mint as the *Encyclopaedia Britannica*. When the 11th edition of that work—by common consent in a class by itself among encyclopaedias for scholarly international authority and comprehensiveness of treatment—was completed in 1910, its publication brought to a

formal conclusion a unique combination of the world's ripest judgment on every sort of subject, in the shape of a vast body of individual contributors and advisers, linked up and concentrated as they had been, for several years, for the purpose of co-operating with one another and with the editorial staff in recording the sum of human knowledge and activity according to the latest sources and materials. But the relations created by long and close association still subsisted. The great "engine of co-operative effort, dedicated to the service of the public," was finished; the engineers remained, no longer in that workshop, but forming still an aggregate of "consulting opinion" such as had never before been ranged under one organisation. Although no question of a later edition of the *Encyclopædia Britannica* was likely to arise for a considerable period, the opportunity for utilising again so widespread an alliance of expert knowledge, and maintaining it for public use, was the direct outcome of a new feature in the 11th edition itself, by which it differs radically both from previous editions and also from other works of similar magnitude.

The simultaneous publication of all its volumes in 1910-11 had made it possible from the first to plan it in all its parts as a single organism, so that the whole work embodies an ordered system, representing uniformly a survey taken at the same date; its separate articles, though distributed for convenience of reference under alphabetically-arranged headings throughout the volumes, are closely interrelated by a consistent scheme, with a common point of view and a common terminus; they are thus peculiarly adapted for systematic study or reference as compared with any number of disconnected books or treatises produced independently by individual authors at varying dates. Its last complete predecessor, the 9th edition, had been brought out in successive volumes at intervals during fifteen years, a method of publication and therefore of preparation which made it impossible in that case—and similarly makes it impossible in so many other contemporary works of correspondingly ambitious aims—to obtain any homogeneity or consistency of treatment or to secure the advantage of real co-operation as distinct from a mere collection of individual contributions. The result is that, for the first time in the history of publications of this calibre, the 11th edition of the *Encyclopædia Britannica* stands comprehensively, within the lines reasonably possible for a general encyclopædia at all, for a complete survey taken at a single date, namely 1910, according to the materials then available for judgment.

This fact by itself, taken in connection with the inevitable fate attending all publications, in the continuous progress of events and accumulation of new materials after they once appear, brought to light a further *desideratum* in regard to the later progress. What the organisation which had been brought into being for surveying the sum of knowledge up to 1910 had done, it might also do, with peculiar advantage to the public, for surveying and recording what was new and of special interest for strictly contemporary purposes. The present volume is the result. For the period since the date of the survey in the 11th edition of the *Encyclopædia Britannica*,—short indeed in time, but exceptionally fertile in the emergence of new issues and in the record both of international and of national progress, especially as regards the sort of information which is of interest and importance for immediate current use as distinct from the place it may eventually take in the perspective of history,—the *BRITANNICA YEAR-BOOK*, so to speak, takes up the running where the *Encyclopædia Britannica* stopped.

For the selection of the subjects dealt with, particularly those in the various sections of Part I, the Editor has not only utilised the willing and valuable services of some of the most eminent of his former contributors, and others of equivalent distinction who are recognised authorities on the new questions here treated, but has had the advantage of suggestions and advice from many others among what may well be considered the most representative body of "consulting opinion" in the world. In numerous cases, it need hardly be said, the contributors of important articles in the *Encyclopædia Britannica* have advised that, in so short a time, nothing of sufficient moment had occurred to make any addition to the account given there desirable. Naturally this applies especially to technical subjects of a general kind, the accounts of which in the *En-*

cyclopaedia Britannica are by specialists whose knowledge is at the stage which it takes some years of general practice to keep up with. The names of the contributors of the various articles might speak for themselves as regards the authority of the writers. It may be added however that it sometimes happens that, the higher the authority, the more incumbent it is, for official or national reasons, to preserve anonymity; and this has been necessary in at least one instance in the present volume. It was not the object of the Editor, in the case of the BRITANNICA YEAR-BOOK any more than in that of the *Encyclopaedia Britannica*, merely to parade a number of eminent or fashionable authors, but to provide the public with the best available knowledge from the most competent sources, where a disinterested care for real enlightenment and candid criticism were the abiding motives for publicity.

In the preparation of the BRITANNICA YEAR-BOOK, the Editor desires to acknowledge in particular, among the services of his staff, those of Mr. O. J. R. Howarth, especially in the organisation of sections i and iii in Part II, Mr. C. C. Whinery, head of the New York editorial staff, in the organisation of section ii of Part II, and Mrs. W. L. Courtney (Janet E. Hogarth) in general editorial work and the compiling of the index.

HUGH CHISHOLM.

February, 1913.

DIARY OF EVENTS

January:—

1911

1. Pauper disqualification for old age pensions in the United Kingdom ceases to be operative.—Gen. Juan Estrada inaugurated President of Nicaragua.—U. S. Dept. of State renews diplomatic relations, broken off Dec. 1, 1900, with Nicaragua.—A French Jew, Léon Beron, found stabbed to death on Clapham Common, London.—Druses defeated by Turks east of Kerak, in the Hauran and driven into the desert.—New star discovered in the Milky Way by T. H. Espin of Walsingham Observatory, Durham.
2. Statute of General Wolfe unveiled by Lord Roberts at Westminster, Kent.
3. London Police surround a house in Sidney Street, Mile End, to effect the capture of the murderers of three policemen on Houndsditch on Dec. 16, 1910. Soldiers and inmates destroyed by fire.—Govt. of India publish order prohibiting from July 1 emigration of indentured Indians to Natal.—Railway accident at Gaika's Loop, near Cathcart, Cape Colony; 18 killed, 50 injured.—M. Regnard, French actor, shot dead in a restaurant at Paris.—Sweden agrees to lend officers for the Persian *gendarmarie*.—First Postal Savings Banks opened in U. S. post offices.—U. S. Government's Panama Canal libel suit instigated in 1908 by Pres. Roosevelt against New York *World* dismissed by U. S. Supreme Court.
4. Earthquake at Vyernyi in Russian Turkestan; 40 people killed.—Peru agrees to submit her dispute with Ecuador to Hague Tribunal.—Australia wins test match against South African cricketers at Melbourne by 80 runs.—Death of Syed Abdul Ahad, Emir of Bokhara.—Institute of France declares against admission of women to membership.—U. S. Govt. files in New York City petition in equity under Sherman law against Hamburg American Packet Co. and 12 other trans-Atlantic lines.
5. King of Spain and Señor Canalejas, Prime Minister, leave Madrid on a visit to Melilla, Morocco.
6. £20,000 contributed for the relief of sufferers by the colliery disaster at Bolton, Lancashire, on December 21.—David Davies, "the old shepherd of Dartmoor," released from prison by order of the British Home Secretary.—Resignation of Tang Shao-yi, Pres. of Chinese Ministry of Communications; he is succeeded by Sheng Kan-pao.
7. The Commission of Senators in Italy report that the Second Chamber should be more representative.—Prince Albert of Monaco grants constitutional govt.—Carnegie Trust Company of New York closed by state superintendent of banks.
8. Rioting in Lisbon; newspaper offices wrecked.
9. Mr. Lloyd George confers with Parliamentary Committee of Trade Union Congress on British Govt. scheme for insurance against sickness and invalidity.—Treaty between France and Liberia signed in London.—Stinie Morrison arrested in London for murder of Léon Beron on Clapham Common.—Board of Trade inquiry into loss of the "Waratah" resumed in London.—First South American Postal Congress meets in Montevideo.—Elliott Northcott (b. 1869) of W. Va. appointed U. S. minister to Nicaragua.
10. Pres. Taft instructs Secretary of American Navy to reprimand Commander Sims for saying at the Guildhall, London, that his country would come to the aid of Great Britain in the event of a foreign war.—French Chamber reopens; M. Brisson re-elected Pres.—Prussian Landtag reopens.—Debate on Lorimer case begins in U. S. Senate.—Royal Commission on Canals and Waterways in Great Britain issues tenth Report.—Manuel E. Oranjo elected Pres. of Salvador.—Secretary of State Knox and Juan Parades, special envoy for Honduras, sign treaty by which U. S. guarantees loan from American bankers to Honduras without assuming financial protectorate.—Cincinnati (Ohio) Chamber of Commerce and other buildings burned, with a loss of about \$1,000,000.
11. German Emperor's Society for the Promotion of Scientific Research formally constituted in Berlin. Chinese National Assembly dissolved.—Emilio Estrada elected Pres. of Ecuador.—New Palace of Justice, Rome, opened by King Victor Emmanuel.—Resignation of Rumanian Liberal Cabinet; M. Carp forms Conservative Ministry.—General strike declared on Portuguese railways, followed by strike of shop assistants in Lisbon.—Fighting between Mexican Govt. troops and insurgents near Comstock, Texas.
12. Rioting at Bombay between Shiah and Sunni Mahomedans.—Señor de Almeida, Portuguese Minister of the Interior, threatens resignation.—New Ministry formed in Chile by Señor Rafael Orrego.—Pres. Taft in special message to Congress asks \$5,000,000 for fortifying Panama Canal.
13. Portuguese Cabinet crisis averted.—Another earthquake in Russian Turkestan; over 200 killed.—Settlement of Atlantic Fisheries Regulations announced from Washington.—South Africa wins third test match against Australian cricketers at Adelaide by 38 runs.—Rembrandt's "Night Watch" in Ryks Museum, Amsterdam, damaged with knife by discharged naval cook.—Robert Caldwell, principal witness in Druce case (see *E. B.* xiii, 119d) dies in New York City in insane asylum.
14. Judgment of High Court of Bombay in Nasik conspiracy case published in London; sentence of transportation for life with forfeiture of property on Savarkar, Indian student, confirmed.—Portuguese railway strike settled; gas-workers on strike in Lisbon ejected by govt. troops.—French force ambushed in Morocco; 5 killed, 6 wounded.—U. S. battleship "Arkansas," 26,000 tons displacement, launched at Camden, N. J.
15. Railway accident at Vire, France; 3 killed.—Three negroes lynched at Shelbyville, Kentucky.—King Alfonso returns to Spain from Melilla.
16. M. Pichon, in French Chamber, defends the Anglo-Russian agreement.—Remains of German balloon, "Hilderbrandt," containing bodies of two aeronauts, found under ice in lake in Pomerania.—Keels laid at Portsmouth and Devonport of two new British battleships, "King George V" and "Centurion."
17. M. Briand, French Premier, shot at by Jizoline, a madman, in Chamber of Deputies.—German submarine U 3 sinks in Kiel harbour; 3 lives lost.—Redistribution of Seats Bill occasions violent scenes in Parliament of Western Australia.—Explosion on U. S. battleship "Delaware" causes 8 deaths.—Death of Sir Francis Galton, aged 88.
18. The Mujtahids of Nedjif issue manifesto exhorting Sunnis and Shi'ahs to sink all differences and combine to protect Turkey and Persia from foreign aggression.—French Senate pass bill for regulating liquor traffic in France.—Dr. Kotoku and 23 others sentenced to death at Tokio for conspiracy against life of Mikado.—Mrs. Horace West wins libel action in the High Court, London, against her father-in-law, Sir Algernon West; damages £1,250.—Colombian troops invade Peruvian territory.—H. Clay Howard (b. 1866) of Kentucky appointed U. S. minister to Peru, as successor of Leslie Combs.—Powder explosion at Keating gold mine, Radersburg, Montana; six lives lost.
19. Ways and Means Committee of the U. S. House of Representatives given power to appoint committees.—American Institute of Architects closes its 44th annual convention at San Francisco.—Reciprocity Conferences take place between Canadian ministers and U. S. State Dept.—Chinese Assembly's Constitutional programme published with the Throne's modification.—Mr. Percy Simmons, defeated Unionist candidate for St. George's in the East, London, wins £5,000 damages for libel from *Liberal Opinion*.—Champagne riots at Epernay, France.—Resignation of Pres. Gondra of Paraguay; succeeded by Col. Jara.
20. M. Briand, French Premier, speaks in Chamber on the government's relations to the General Confederation of Labour.—Dr. Talbot, Bishop of Southwark, translated to Bishopric of Winchester.—Rioting at Hankau quelled by British and German bluejackets; 12 Chinese killed, 13 wounded.—Ecuador refuses to submit her dispute with Peru to the Hague Tribunal.—Andrew Carnegie adds \$10,000,000 to endowment of Carnegie Institution of Washington, D. C.—Dr. H. C. Bumpus (b. 1862), director of American Museum of Natural History since 1902, resigns.
21. Pres. Taft speaks in New York on the duty of the U. S. to fortify the Panama Canal.—Mexican Govt. troops ambushed at Galanea by insurgents, losing 80 dead and 50 wounded.—U. S. War Dept. sends cavalry to Mexican frontier to preserve neutrality of American territory.—Rifaat Pasha speaks in Turkish Chamber on Russo-German Agreement and Bagdad railway.—Wales beats England in Rugby football at Swansea by 15 points to 11.
22. Honduran gunboat "Hornet" seized by U. S.

cruiser "Tacoma" for violating neutrality.—U. S. Govt. agrees to act as arbitrator in Haiti and Santo Domingo boundary dispute.

23. Accident on Taft Vale Railway, S. Wales; 11 killed, 7 injured.—British Minister at Teheran presents fresh note to Persia, since the three months given her to restore order have expired.—Prof. Edouard Branly elected to the French Academy by 30 votes as against 28 for Mme. Curie.—Mr. D. G. Phillips, American author, shot dead in New York.—Vinoyak Savarkar put on trial at Bombay for abetment of murder of Mr. Jackson Indian official at Nasik in December 1909.—Mahomed Farid, Egyptian Nationalist leader, sentenced to six months' imprisonment at Cairo for seditious writings.—Inauguration at Paris of the Oceanographic Institute built by Prince Albert of Monaco.—National Republican Progressive League (of U. S.) organised at Washington.

24. Twelve Japanese anarchists executed at Tokio for conspiracy against life of Mikado.—Lord Gladstone arouses indignation in Rhodesia by commuting death sentence passed on Umtali native for assaulting a white woman.

25. Four troops of American cavalry sent from Fort Sam Houston, Texas, to preserve neutrality on Rio Grande in Mexican revolution.—Lord Curzon installed Lord Rector of Glasgow University.

26. Summary of proposed Reciprocity Agreement between Canada and U. S. published at Washington and Ottawa. Pres. Taft urges U. S. Congress to adopt it.—Bill providing for adoption of Greenwich time in France read a first time in French Senate.—Death of Sir Charles Dilke in London, aged 69.—Monsignor Duchesne elected to French Academy in place of Cardinal Mathieu.—Pres. Taft sends to U. S. Senate special message recommending ratification of treaty of January 10 with Honduras for a loan from American bankers.

27. Lord Methuen, at King William's Town, South Africa, advises formation of a S. African army.—Port of London Authority publishes improvement scheme, estimated to cost £14,427.—Lord Morley of Blackburn delivers Presidential address to the English Association on "Science and Letters."

28. Duke of Connaught announced to succeed Earl Grey as Governor of Canada.—Constitution and Franchise bills of Alsace-Lorraine read a first time in German Reichstag.—Internat. Rugby football match between England and France at Twickenham won by England, 37 points to nil.—Wales beats Ireland in Association football at Belfast by 2 goals to 1.—Diamond Match Company (U.S.A.) surrenders for general use patent for harmless friction match.

29. Mexicala captured by Mexican insurgents.—Pres. Alfaro of Ecuador forced to abandon plan to lease Galapagos Islands to U. S. for 99 years.

30. Duke of Connaught entertained at Guildhall, London, on return from S. Africa.—Eruption of Taal volcano in Lake Bourbon, Luzon, Philippine Is.; 1,300 killed.—Bill creating permanent tariff board passed by U. S. House of Representatives 186 to 93.—United Mine Workers of America amend their constitution by requiring call for general strike to be referred to members.

31. British Parliament meets; Mr. J. W. Lowther elected Speaker for the fourth time.—Sir Wilfrid Laurier speaks in Dominion House of Commons in favour of reforming rather than abolishing the Senate.—German Foreign Secretary and British Ambassador in Berlin sign treaty extending extradition to various British colonies and protectorates.—River and Harbour appropriation bill (\$36,000,000) passed by U. S. Senate.—Canadian Board of Trade declares (60-44) against reciprocity.

February:—

1. Dynamite explosion at Jersey City, U.S.A.; 30 persons killed, 200 wounded, much damage to buildings and shipping.—Trial and conviction in King's Bench Division, London, before Lord Chief Justice, of Edward Frederick Mylius for libelling King George V, by stating that prior to his marriage with Queen Mary he had beenmorganatically married; sentence 12 months' imprisonment.—"Thunderer," British super-Dreadnought, launched from Thames Ironworks.—Annual Conference of British Labour Party at Leicester; Pres. urges reversal of Osborne judgment.—Board of Trade enquiry into loss of "Waratah" concluded. General lock-out declared by Master Printers' Association in London.

2. National Convention of Welsh Nonconformists at Cardiff pass resolution demanding disestablishment and disendowment of Church in Wales.—M. Pichon replies in French Senate to criticisms of Anglo-French Treaty of 1904.—Rt. Rev. J. B. Crozier, Bishop of Down, elected Archbishop of Armagh and Primate of all Ireland.—

Revolution in Northern Haiti.—Persian parliament authorises employment of five Americans as financial advisers.—Honduras Congress refuses to approve negotiations for American loan.—Alfred Stedman Hartwell, Chief Justice of Supreme Court of Hawaii, resigns.

3. German Crown Prince arrives in Calcutta.—Sir John Fuller appointed Governor of Madras.—Sir T. G. Carmichael appointed Governor of Victoria.—Mr. Charles Aitken appointed Keeper of Tate Gallery, London, *vice* Mr. D. S. MacColl, appointed Keeper of Wallace Collection.—Fishing village on ice outside Björkö, Finland, carried out to sea; most of the inhabitants saved.—Sir Joseph Ward, New Zealand Premier, speaks at Wellington, N. Z., on Imperial Defence.—Pres. Taft tenders services of U. S. to assist in restoring peace in Honduras.—20,000 Chicago garment workers on strike decide to return to work on whatever terms they can make individually.

4. Russian Govt. demand strict precautions in Manchuria to prevent plague spreading into Siberia.—Poisoning case at Dalkeith, Scotland.—Mr. Charles Hutchinson and his guests at a supper party seized with illness; two deaths result, and his son Mr. John Hutchinson, disappears (see Feb. 19).—Wales beats Scotland in Rugby football at Edinburgh by 32 points to 10.

5. Socialist demonstration in Berlin at funeral of Paul Singer.

6. State opening of British Parliament by King George V, the four self-governing dominions being represented by their High Commissioners.—British Labour Party elect Mr. Ramsay MacDonald as Chairman.—French Chamber pass Govt. Bill for protecting champagne.—Archbishop of Canterbury presides at meeting in London to promote friendly relations between England and Germany.—Dynamite explosion at Piute Powder Co., Ishpeming, Mich., U.S.A., killing 15 men.—Sani-ed-Dowleh, Persian Minister of Finance, assassinated.—Sublime Porte, Constantinople, partially destroyed by fire.

7. Ways and Means Committee, U. S. House of Representatives, approves Reciprocity Agreement with Canada.—Mr. Justice Grantham at Liverpool Assizes defends himself against charges made in House of Commons of partisanship in trying election petitions.—Plague in Manchuria reported to be spreading.—South African cricketers beat Victoria at Melbourne by 8 wickets.—Execution of Gen. Millionard, leader of Haitian revolutionists.

8. Pres. Taft sent to U. S. Senate for ratification a draft treaty with Great Britain for protection of seals in Bering Sea.—Mr. Asquith in House of Commons strongly condemns Mr. Justice Grantham's speech at Liverpool.—Mexican Govt. troops defeated by insurgents near Mulata.—Pres. Davilla of Honduras and General Bonilla, revolutionary leader, agree to an armistice.

9. Mr. Asquith receives Trade Union deputation on Electoral reform.—Turkey indicates desire to open up pourparlers with British Govt. concerning Mesopotamia and Persian Gulf.—Lord Charles Beresford retires under age rule (65) from Active List of British Navy.—Debate on Reciprocity Agreement with U. S. opened in Canadian Parliament.—£20,000 contributed by Aga Khan and Nawab of Rampur towards foundation of Mahommedan University at Aligarh.

10. Royal Commission on Land Transfer Acts publishes final report in London.—Persia's appointment of W. Morgan Shuster to reorganise her finances announced at Washington, D. C.

11. Pres. Taft and Mr. Roosevelt speak in defence of Reciprocity Agreement with Canada.—Russia begins to withdraw from Kazvin troops sent there two years before.

U. S. Senate follows House (Jan. 31) in choosing San Francisco as site for Panama Canal Exposition in 1915.—Ireland beats England in Rugby football at Dublin by 3 points to nil.—England beats Ireland in Association football at Derby by 2 goals to 1.—Oxford beats Cambridge at Association football in London by 3 goals to 2.

12. Visit to London of Belgian Minister of Commerce and members of Belgian Executive Committee of Brussels Exhibition.

13. Debate on second reading of German Navy Estimates begins in Reichstag.—Nicaragua placed under martial law after an explosion in gov't. barracks Managua.

14. Arbitration between France and Great Britain concerning escape of Savarkar from Marseilles begun at the Hague.—Statute to 8th Duke of Devonshire unveiled in London by Lord Lansdowne.—Railway accident at Courville, France; three trains collide and catch fire, 10 killed.—McCall Canadian Reciprocity bill passed by the U. S. House of Representatives 221 to 92.—Twenty-two men indicted for selling votes at election held in Menard county, Illinois, in Nov. 1910.

15. Sir Edward Grey, Sir Alfred Lyall and Sir William Anson elected trustees of British Museum.—U. S. Commerce Court holds its first public session.—Announced at Washington that contracts have been signed by the Honduran envoy and American bankers for a \$7,500,000 loan to Honduras.

16. Mr. Fielding makes statement in Canadian Parliament on Reciprocity Agreement.—By-election for Cambridge University results in return of Sir J. Larmor (Unionist).—Dr. T. H. Warren, Pres. of Magdalen College, Oxford, elected Professor of Poetry, Oxford.—Juarez, Mexico, placed under martial law.—Russia decides to make military demonstrations against China because of alleged violations of St. Petersburg treaty of 1881.

17. Horncastle division of Lincolnshire by-election results in return of Capt. A. G. Weigall (Unionist), majority 107.—Convocation in London passes resolutions deprecating marriage in church of divorced persons and any extensions of facilities for divorce.

18. Chinese Govt. reply to Russian note of protest on disregard of treaty obligations in Chinese Turkestan.—Pres. Taft signs bill opening lands to homesteaders in Red Lake Indian reservation, Minn.—Manuel Bonilla with three other Honduran revolutionists, indicted in U. S. District Court at New Orleans for violation of neutrality laws (see April 22).—Mark Twain Library dedicated at Redding, Conn.—Hoe Art Sale begins in New York.

19. John Hutchinson, charged with poisoning his father and another at Dalkeith, Scotland, arrested in Guernsey, but immediately commits suicide (see Feb. 4).—Japan denounces existing commercial treaty with Canada.

20. Dr. Gregory, Dean of St. Paul's, aged 92, resigns.
21. Train catches fire near Perm, Russia; 7 killed, 32 injured.—Australians beat South African cricketers at Melbourne by 530 runs, and win the rubber.—King George V holds his first Levée at St. James's Palace.—China's reply to Russian ultimatum received and approved in St. Petersburg.—Meeting held in Sydney in support of active defence policy and compulsory military training.—Police constable murdered in Calcutta.—Treaty of Commerce and Navigation, operative July 17, 1911 for twelve years, signed at Washington by representatives of U. S. and Japan.

22. Parliament Bill read first time in British House of Commons by 351 to 227.—Court of Inquiry in London decides that "Waratah" capsized on July 28, 1909, between Port Natal and Cape Town.—Canadian Parliament carry unanimously resolution affirming Canada's decision to preserve intact bond of union with Empire and full liberty to control her own fiscal policy.—Wiltshire (Westbury) by-election results in return of Hon. Geoffrey Howard (Liberal), majority 581.

23. Debate in German Reichstag on second reading of Army Bill.—Lord Minto, ex-Viceroy of India, presented with freedom of City at Guildhall, London.—North Louth election petition, Mr. H. Hazellon (Ind. Nationalist) unseated.—Death of Gen. Lebrun, French Minister of War.—French Chamber of Deputies pass bill for construction of two battleships.

24. Hague Tribunal finds in favour of Great Britain in the Savarkar case (see Jan. 14).—German Reichstag pass Army Bill.—French Government's majority falls to 16 in debate about clerical legislation.—U. S. Senate ratifies new commercial treaty with Japan.—Lord Rosebery speaks on Dickens at Mansion House, London.—Gloucestershire (Forest of Dean) by-election results in return of Mr. H. Webb (Liberal), majority 3,068.

25. Court of Appeal gives judgment in favour of plaintiff in case of Osborne v. Amalgamated Society of Railway Servants.—Five Bulgarian Ministers charged with systematic violation of the law to their own advantage.—Ireland beats Scotland in Rugby football at Edinburgh, 16 points to 10.—In Manila about 300 native dwellings are destroyed by fire.

27. Resignation of French Cabinet under M. Briand.—Second reading of Parliament Bill moved in House of Commons by Mr. Asquith; Opposition amendment moved by Mr. A. Chamberlain.—Death of Lord Wolverhampton, aged 81.

28. Mr. Fisher, Prime Minister of Australian Commonwealth, announces that his govt. intends to nationalise monopolies.—British War Office announce organisation of Air Battalion.

1. New French Cabinet formed under M. Monis.—General Smuts outlines Government proposals for South African defence in Union Parliament.—Pres. Taft approves Appalachian Forest Reserve Act of U. S. Congress.—John Mitchell, former head of United Mine Workers of America, resigns from National Civic Federation.—José Batlle y Ordóñez elected Pres. of Uruguay.

2. Second reading of Parliament Bill passes British House of Commons by majority of 125.—British Departmental Committee on Accidents in Factories and Workshops issue report.—Conference at Leeds draws up agreement as to working hours for provincial and Irish printing trade.—Lord Denman appointed Governor General of Australian Commonwealth.—Gainsborough's "Portrait of the Linleys" and Titian's "Man in a Red Cap" sold in London for £40,000 and £30,000 respectively.—Henry S. The Britannica Year-Book

PART I. GENERAL

SECTION I. POLITICS AND ECONOMICS

The political history of the world since 1909-10 is dealt with, so far as individual countries are concerned, in Part II of the YEAR-BOOK. From what may be described as the international point of view—that of an observer of the world's general progress rather than of the recorder of purely national domestic events—the salient aspects of national history and *Welt-politik* ultimately form a single unit; but for practical purposes it is convenient in such a volume as this to deal under each country with its own political history, and to isolate certain special aspects of events of international importance, in which more than one nation is primarily involved or interested, for treatment apart. This is therefore done in the present section of Part I of the YEAR-BOOK, the other sections of which are devoted to the progress made in those general subjects which have a life and interest of their own, irrespective of the nationality of those who are agents in their continuous development for the benefit of humanity at large.

SPECIAL INTERNATIONAL AFFAIRS AND EVENTS

More and more, as the world in all its parts is brought into closer touch, is an adequate knowledge of international relations vital to the nations by themselves and their individual citizens. The individual exertions of nations and their citizens are dominated by international conditions in the world's organisation, not only for war and peace as positive ends, but also for purposes of political, social, financial, and commercial progress, which are directly affected by events, movements, and influences, originating beyond the control of any one of them.

During the period from 1910 to the end of 1912, it so happens, there have been, in all the continents of the world, Europe, Asia, America, and Africa, exceptionally momentous political and territorial developments, and even outside these continents the boundaries of the sphere of knowledge have been enlarged in the untracked spaces of the Antarctic by Amundsen's and Scott's achievements in reaching the South Pole. Since 1911 China has started on a new career as a Republic, and there is no telling what germinating consequences may follow from the change. In the middle East the state of Persia has developed to a point at which the interests of the rest of the world peremptorily demand some better system of orderly government. The Turkish Empire, as the result of the Balkan War, is in convulsions; and in the Balkan Peninsula itself new Powers have arisen, whose future relations with the international grouping in Europe have still to be settled. That grouping—with the Triple Alliance on one side and the Triple Entente on the other—has become more firmly established as the result of prolonged tension, mainly due to a continued assertion by Germany of her military strength, and her naval ambitions. While the domestic politics of the United Kingdom are passing through a stage of perplexing uncertainty and bitter conflict, great advances have been made towards the organisation of the British Empire as a

unit of political strength. In the United States the presidential campaign of 1912 and its result have brought a new political party into existence; and the defeat of the Reciprocity Agreement in Canada has checked a notable movement towards cooperation with the neighbouring Dominion. Meanwhile a period of bounding commerce and good financial credit has synchronised with a widespread movement of industrial unrest, largely stimulated by the increased cost of living, in all the countries of Western civilisation. Most of these movements, and the details concerning them, are treated elsewhere in the YEAR-BOOK; in what follows a few specially interesting questions are dealt with, which are of direct international importance and fall naturally for discussion under no one country in particular.

THE MOROCCO CRISIS OF 1911

The main disturbance in European politics during 1911 was due to the action of Germany in claiming compensation from France on account of the new situation in North Africa which was being brought about by the extension of French influence in Morocco. It had been hoped that the Act of Algeiras¹ in 1906, followed by the Franco-German Convention of 1909, had finally settled the lines on which France enjoyed a privileged position, as the mandatory of Europe, in the "peaceful penetration" of that country; but the progress of affairs (see MOROCCO, in Part II, sect. iii of the YEAR-BOOK) compelled an extension of the French military occupation, which, in the view of the German Government, went altogether beyond what was warranted, and in June an intimation to this effect was given in Paris by the German Ambassador, who suggested that the German objection to French control of Morocco might be removed by concessions of territory elsewhere. The French Government, apparently not taking this diplomatic move seriously, and fortified by the Anglo-French *entente*, was not disposed to offer any such "compensation," or to admit that its action in Morocco went beyond what had been provided for by existing agreements; and the world was startled soon afterwards (July 1st) by the announcement that the German gunboat "Panther" (joined shortly after by the cruiser "Berlin") had been sent to the closed port of Agadir, near the mouth of the Sus river, for the protection of German trading firms in that part of Morocco. At the same time the German Press became very active, and the suggestion was made that Germany meant to occupy the port of Mogador and assert herself in the southern part of the country. The impression was distinctly given that Germany intended to reopen the whole Morocco question, and to proceed *de novo* by way of partition between herself, France, and Spain; and though such a policy was afterwards repudiated by the German Chancellor (Nov. 9th), this was the interpretation which both the British and the French Governments and public opinion generally first gave to the German *coup*.

On July 3rd, Sir Edward Grey plainly told the German Ambassador in London that the Cabinet must discuss the situation as an entirely new one; the British attitude could not be "disinterested" and Great Britain would decline to recognise any new arrangements made without her being consulted; and on July 6th Mr. Asquith stated categorically in the House of Commons that Great Britain would act in concert with France. The speeches delivered later in the year by the German Chancellor (Nov. 9th and Dec. 5th), and Sir Edward Grey (Nov. 27th), after the crisis had passed away, were the first public explanations of the actual course of events; and for a protracted period, while "conversations" were passing between France and Germany, and the French and English Governments were acting in loyal fulfilment of the understanding between them, peace and war hung in the balance. As Sir Edward Grey subsequently made clear, the real aims and objects of Germany were at first very imperfectly disclosed, and the apparent inspiration given to the German Press seemed to indicate that they would be incompatible with either French or British interests.

The first concrete proposal (July 15th) from Germany by way of territorial compensation for the alleged damage to her rights in Morocco was that France should cede the

¹ See *E. B.* xviii, 858.

whole of French Congo from the coast to the river Sanga, and also her right of preemption to the Belgian Congo; but up to July 21st, the requests made by the British Government for definite information as to German intentions were passed by in a way which suggested that Great Britain was being treated as of no particular account in the matter. The result was that, after consultation with Mr. Asquith and Sir Edward Grey, Mr. Lloyd George made a speech that day at the Mansion-house which caused considerable sensation, particularly as it was delivered by a British statesman who had been generally regarded as sympathetic towards Germany and an opponent of militarism. He declared pointedly that if a situation were to be forced on Great Britain in which peace could only be preserved by the surrender of her position in Europe, and she was to be treated as of no account in the Cabinet of Nations, peace at that price would be an intolerable humiliation. So far as the actual language used by Mr. Lloyd George was concerned, it might have been a rhetorical flourish in the mouth of any statesman in any country; indeed the German Chancellor afterwards (Nov. 9th) accepted his words as a patriotic declaration which might equally well have come from a German minister. But it was meant as a warning to Germany, and was universally interpreted, and welcomed both in England and in France, in that sense, while in Germany it created a furious uproar and a situation of unprecedented bitterness. In the result, and in opening diplomatic communications, in an ostensibly amicable spirit, between the German and British Governments, its effect was a good one, but not by any means in the immediate relations between the two peoples. Anti-English feeling in Germany boiled over, and for a time it looked as though a rupture was inevitable.

This state of tension between England and Germany, though relieved by the peaceful issue of the Franco-German conversations, was in fact independent of the Morocco difficulties themselves. Mr. Lloyd George's speech simply put the match to an highly inflammable situation, brought about by mutual suspicion and jealousy; and the determination of Great Britain, without distinction of party, not to allow France to be brow-beaten by Germany over the Morocco-question, brought all the elements of national antagonism into play. On the part of the Governments on both sides however cooler heads were displayed. On July 24th the German Ambassador told Sir Edward Grey that Germany did not propose to establish herself in Morocco, and was prepared to make concessions to France; and on July 27th the German Government sent a dispatch, repudiating any intention to injure British interests, and expressing the hope that the arrangement contemplated with France would diminish further opportunities for friction. From this point the negotiations concerning Morocco and the compensation to be made to Germany proceeded more smoothly, though at times they caused considerable anxiety. At length however, on November 4th, two Franco-German treaties were signed, one recognising a French protectorate over Morocco, and the second providing for the cession by France of about 100,000 square miles of territory in the Congo basin.

It was perhaps inevitable that, in the circumstances, no particular national satisfaction should exist in either country over the result. In Germany the public had been led to expect much more, and the Colonial Minister, Herr Lindequist, resigned in protest against the insufficiency of the compensation obtained. The discussions in France over the ratification of the treaties disclosed some intriguing on the part of the Premier, M. Caillaux, behind the back of the Foreign Minister, M. de Selves, during the negotiations, which resulted in the resignation of M. de Selves, and then to the fall of the Ministry. But peace had been preserved, with honour, under highly unpropitious conditions. Germany had asserted herself, in a decidedly provocative way, and with the result of securing a large addition of Colonial territory. France had obtained a free hand in Morocco, at a price well worth paying. And Great Britain had shown her determination to uphold the Anglo-French *entente* at all costs. It should be added that, on the merits, and irrespectively of the methods adopted, the French action in Morocco, though practically forced upon France by the conditions in that country, undoubtedly provided justification for the German view that the arrangements contemplated in 1906 and 1909 had been altered to Germany's detriment. The Anglo-French agreement of 1904, by

which Great Britain obtained a free hand in Egypt in return for giving France one in Morocco, had no real parallel in the shape of French concessions to Germany; and it could hardly be expected that Germany would be contented without compensation of some sort. This was secured, and Germany's reiterated claim for a larger place "in the Sun" was aggressively vindicated.

The achievement left the international situation in Europe where it was. Germany could count, of course, on her allies, when she threw the sword into the scales. Any idea however that may have been entertained that France could be coerced, and that the Anglo-French *entente* would not stand the test, must have been dissipated. It was clear that French confidence, by no means conspicuous in the crisis of 1905, had been completely restored. The *entente* with Great Britain was decidedly strengthened; and as between Germany and England an object-lesson was given to the British Empire, which all parts of it were quick to grasp, of the dangers of the naval situation, with Anglo-German relations as they existed, and Germany forcing the pace in competition with Great Britain on the sea. The naval rivalry between the two countries remained one of the permanent dangers in international politics, and German susceptibilities were once more touched on the raw a little later when on February 9, 1912 Mr. Winston Churchill at Glasgow described the British fleet as a "necessity" and the German only a "luxury," but the British Government sent Lord Haldane to Berlin on a mission to smooth matters over, with apparently good results, and relations gradually became normal again. As between the Triple Alliance (Germany, Austria, Italy) and the Triple Entente (France, Russia, England) the crisis served even to clear the air; and this was shown in the most public way at the beginning of July 1912, when the German and Russian Emperors had a meeting, accompanied by their foreign ministers, at Port Bel'tic. Emphatic recognition was then given to the relations existing between the Powers by an official *communiqué* saying that "there could be no question of producing alterations in the grouping of the European Powers, the value of which for the maintenance of equilibrium and of peace has already been proved."

ITALY AND TRIPOLI

The case is somewhat different with the ensuing annexation of Tripoli and Cyrenaica by Italy, to which, after a one-sided war (see below) had gone on from November 1911 till October 1912, Turkey was compelled to submit by the pressure of the Balkan crisis. The contemporary historian cannot satisfactorily pronounce, for want of exact information, on either the moral or the legal aspects of this piece of territorial self-aggrandisement. The reasons given in Italy's sudden ultimatum to Turkey (Sept. 26, 1911), prefaced by no warning to any of the Powers, but announcing her intention to proceed to establish a military occupation in Tripoli and Cyrenaica, followed as it was by a declaration of war (Sept. 29th) which gave no proper opportunity for peaceful negotiations, were by themselves quite insufficient—however adequate to justify the taking of strong measures—to satisfy impartial international jurists that a simple redress of the undoubted grievances of which Italy had a right to complain was the real motive for such peremptory action. If consideration is given only to the normal procedure expected between nations in such circumstances, it can only be said that in this case once more "might" asserted itself, irrespectively of public law or international rights. But the real circumstances are still not definitely known. There is good reason for believing that Italy's action was really forced on her as an alternative to other eventualities, which, without in any way safe-guarding Turkish rights in Tripoli, would have demolished the whole claim of Italy herself—long an integral part of her national policy—to fall heir to those rights whenever Turkey should become unable to exercise them.

If, as has been hinted, the Italian government had information that the Franco-German negotiations were proceeding in such a way that Germany was being driven to look for compensation for the French annexation of Morocco by extending her influence elsewhere along the North African coast,—and it is suggested that, with Turkey's consent, Germany had an eye on a Tripolitan harbour for a Mediterranean *point d'appui*,—

no other course was open than some immediate action, which would once for all secure for Italy what had long been understood to be her special preserve, without offering any formal opportunity for a split within the Triple Alliance itself. If the moment had come in any case, for some other Power than Turkey to become master of Tripoli, the whole case against Italy, from the point of view of the public law of Europe, as presented by the contemporary critics who accused her of wantonly breaking the peace without adequate cause, would fall to the ground. The situation in September 1911 was in that case one of deep concern for Italy, her relations with the Triple Alliance being complicated by the necessities of her own Mediterranean policy; she acted swiftly and finally, and as matters turned out with entire success.

To what extent the actual possession of Tripoli and Cyrenaica, with a somewhat undefined *hinterland* of uncertain value, may prove a remunerative addition to Italian territory, has yet to be discovered; the substitution of Italian for Turkish sovereignty however can only be regarded, on the merits, with satisfaction from the point of view of the world's progress. The course of the military operations is dealt with elsewhere in the YEAR-BOOK, but one particular aspect of the war may be emphasized here. It put Italy in a position of considerably increased strength as a factor in international politics. One-sided as the war was, it provided an opportunity for testing the Italian military and naval resources and giving both army and navy practice and experience under service conditions, the importance of which can hardly be exaggerated. Instead of being the weak member of the Triple Alliance, Italy at the end of 1912 was full of a new consciousness of national vigour and efficiency, the effect of which on the balance of power in Europe was not likely to be to her disadvantage.

THE BALKAN STATES AND TURKEY

After a protracted period of tension over the Macedonian question (see *E. B.* xvii, 221, 222), the long expected crisis between the Balkan States and Turkey reached an acute stage at the opening of October 1912. In the early summer Bulgaria, Serbia, Montenegro and Greece had come to a definite agreement for co-operating as a league in a common policy, not merely for securing from Turkey the long promised "reforms" in Macedonia and enforcing the old stipulations of the Berlin Treaty, but for obtaining a real autonomy for Turkey's European provinces with their Christian inhabitants. The insurrection in Albania had for some time been creating trouble; and in August fresh exasperation was caused by Turkish massacres of Bulgarians at Kotchana and of Serbs at Berane, so that throughout the Balkan States public opinion became hot for action. The governments of Bulgaria, Serbia, Montenegro and Greece now prepared to deliver an ultimatum insisting on their demands, and for this purpose started mobilising their forces on September 30th. Turkey replied with similar measures, and for some days it was uncertain whether war could be averted, while the Great Powers, and especially Russia and Austria, strove for peace by diplomatic pressure on Turkey.

On behalf of Austria-Hungary Count Berchtold had only recently been trying to set the Powers in motion once more for a common policy in Macedonia, and now they hastily entered into communication, under the lead of France, to devise some formula which would satisfy the Balkan League without either creating differences between themselves or making concessions too difficult for Turkey. The Porte, tardily recognising the necessity of doing something, made it known that it was prepared to give effect to the abortive "Law of the Vilayets" drawn up in 1880; and it was arranged by the Powers that a Joint Note should be presented to Turkey, inviting the immediate discussion of reforms, coupled with the intimation that no breach of the territorial integrity of the Ottoman Empire was proposed. At the same time it was left to Austria and Russia jointly, on behalf of Europe, to urge patience on the Balkan League by assurances that reforms would be instituted. The Balkan Allies, however, wanted more than that. They stipulated, not only that the Powers should guarantee Macedonian autonomy, but that they themselves should be included with the Powers as its administrators; and though on October 10th the Collective Note was duly presented to Turkey, the situation

had then passed beyond the power of diplomacy to control the march of events. On October 8th Montenegro declared war and invaded Albania; on the 13th Greece, Bulgaria and Serbia presented their ultimatum; and by the 17th a formal state of war existed between the Allies and Turkey. (For the events of the war, see below).

At the outset it was the declared object of the Powers to co-operate in localising the war, themselves remaining neutral, and to keep its results, whatever they might be, from embroiling the rest of Europe. With this end in view they agreed to notify the belligerents that the territorial *status quo* would not be allowed to be altered. But the unexpectedly rapid and overwhelming success of the Allies, and the complete collapse of the Turkish arms, upset all the preliminary formulas. By the end of October it was clear that the old maps of Eastern Europe might be rolled up, and that "Turkey in Europe" had ceased to exist. It was no longer a question of maintaining the *status quo*. That was gone for ever so far as Turkey was concerned. The "Eastern Question" (see *E. B.* viii, 831 *et seq.*) had entered an entirely new phase, with the proof that Bulgaria and the allies were in a position, by their own strong hand, to make "the Balkan States for the Balkan peoples" the principle of a territorial readjustment. The problem now was how the old ambitions and rival sympathies of Austria and Russia in that part of the world should be reconciled with the new situation. Speaking at the Guildhall, London, on November 9th, Mr. Asquith gave public expression to the necessity of recognising the logic of the stricken field, when he said that "on one thing I believe the general opinion of Europe to be unanimous—that the victors are not to be robbed of the fruits which have cost them so dear;" and in reference to alarming reports of growing tension between Austria-Hungary and Serbia concerning the latter's declared policy of extending her territory to the Adriatic, he emphatically deprecated the raising and pressing at this stage of isolated questions which would probably assume a more tractable aspect when the time came for a general settlement in which Europe as a whole must have a voice.

Mr. Asquith's speech was made at an opportune moment. Just previously (Oct. 30th) a proposal by the French Premier, M. Poincaré, that all the Powers should make a declaration of "disinterestedness," in the territorial readjustment resulting from the war, had done harm rather than good. Austria was not prepared to be other than very much "interested" in the matter, and was irritated at the suggestion that she should subscribe to such a declaration. But Mr. Asquith's "wait and see" formula—putting into other words for the policy of Europe his favourite advice on difficult points of English domestic politics—had a soothing influence and was generally approved.

Everything now depended however on a speedy conclusion to the actual fighting. The Bulgarians had driven Nazim Pasha's main army back to the Chatalja lines and were threatening to march on Constantinople itself. An appeal was made by Turkey to the Powers to mediate, but to no purpose; and on November 12th the Porte applied directly to the Allies for an armistice, as the Powers advised. On the 19th the terms of the Allies were notified, plenipotentiaries being nominated by them and invited from Turkey in order to discuss conditions of peace. The Allies demanded the surrender of all Turkish positions still holding out in Europe, including the Chatalja lines, as well as Adrianople, Scutari and Yanina, only Constantinople and a strip of adjacent territory being left to Turkey. On the 21st the Porte rejected these terms, bitterly complaining that Europe, which had stepped in to save Greece in 1897 when Turkey was the victor, would do nothing now for Turkey when the position was reversed. Nazim Pasha was ordered to continue fighting till "reasonable and moderate conditions" were proposed. At the same time, however, he and Izzet Pasha, Osman Nizami Pasha and Shadan Bey, were appointed Turkish plenipotentiaries to carry on further negotiations for an armistice, Dr. Danef, General Savoff and General Fitcheff being nominated as Bulgarian delegates.

The possibility of European complications at this juncture acted as an encouragement to Turkey to hold out. Serbia, whose arms had been so conspicuously successful in the west-central area, was straining the patience of Austria almost to breaking-point by aggressively announcing her determination to incorporate the whole of northern Albania, including a good deal more of the Adriatic coast than the Dual Monarchy was

prepared to see in her hands. On November 23rd M. Pashitch, the Servian Premier, issued a statement to the Press, of which the crucial portion was as follows:

"Servian arms have conquered far more territory than Servia intends to retain, but Servian policy has established a minimum of territorial expansion which does no more than cover her conationals and her national necessities. For this minimum Servia is prepared to make every sacrifice, since not to do so would be to be false to her national duty. No Servian statesman or Government dare betray the future welfare of the country by considering for a moment even the abandonment of this minimum. Servia's minimum requisite to her national development is economic independence, save, possibly, in so far as regards a Customs union with her allies and a free and adequate passage to the Adriatic Sea on the Adriatic coast. It is essential that Servia should possess about 50 kilometres from Alessio to Durazzo. This coastline would be joined to what was formerly Old Servia approximately by the territory between a line from Durazzo to Ochrida Lake in the south and one from Alessio to Djakova in the north."

So flagrant a defiance of Austria's susceptibilities made European diplomacy in the interests of non-intervention and peace a matter of the greatest difficulty. Moreover Austrian public opinion was stirred up during November by reports of Servian ill-treatment of the Austrian consul at Pristrend, Herr Prochaska; for some time his whereabouts was not known, and it was even suggested that he had been killed. Eventually he was found to be unharmed, and the truth appears to be that he had himself acted with great indiscretion. By the middle of December the Prochaska affair had ceased to trouble, but so long as the worst of the tension lasted between Austria and Servia over the Albanian question it was used by the Austrian Press Bureau as a method of exciting anti-Servian feeling. The consequence was that at the end of November Austria made open preparations for emergencies by establishing a military censorship and taking other preliminary steps for mobilisation; and Russia was forced, for this reason, to strengthen her forces at the same time, since the Austrian mobilisation was clearly directed against the possibility of Russia feeling bound to give effect to her sympathies with Servia.

The Albanian question was in any case certain to be, for some time to come, the least "tractable" of all the problems in the new territorial settlement; but the advance of such extreme Servian pretensions at this stage was discountenanced even by those Powers who were prepared to see a considerable extension of Servian territory, including a sufficient access, for commercial purposes, to the Adriatic. In view of inevitable later developments it should be noticed that, apart altogether from considerations of political expediency, the full Servian demand as put forward by M. Pashitch, and justified by him on ethnological and historical grounds, might well appear an exaggerated one to an impartial student of the international question. According to M. Pashitch "about 10 per cent of the 150,000 inhabitants" of the territory claimed were Servian; "more than half the Albanians are Christians; observers such as Hahn and Baldacci admit that the Albanians in the district" (*i.e.* the northern half) "are of ancient Servian origin," and so forth. This is not borne out by the article on Albania in the *Encyclopaedia Britannica* (i, 481 *et seq.*), which is perhaps the most authoritative independent account available, from first-hand knowledge, of the country and its inhabitants. Moreover it is in direct conflict with the careful analysis of the ethnological position in Albania given in the London *Times* of November 25th; writing from Constantinople on November 12th (before M. Pashitch published his manifesto), the *Times* correspondent gave the following facts with regard to the territory in question.

"The Vilayet of Skutari there is one Slav village—that of Vranka, near Skutari. Gusinje is inhabited by a majority of Albanians. The balance of its population is composed of Mahomedan Slavs. In the Novi Bazar region, though the Kazas (counties) of Akova (Bielopolyé) and Kolashin are mainly Albanian, the majority of the population is Christian Slav with a fair proportion of "Bosniaks" (Moslem Serbs). Leaving this important tongue of land, we come to Ipek. In the entire Kaza (county) of Ipek there are, according to the best ethnological map of the district—the work of neither Serb nor Albanian, Austrian, or Turk—42 villages inhabited exclusively by Serbs, 123 villages inhabited by Albanians, Moslem and Catholic, 44 "mixed" villages inhabited by Moslem Albanians, Catholic Albanians, and Serbs, and the "mixed" town of Ipek. Allowing for the proportion of Serbs and Albanians in the "mixed" villages and in Ipek as being equal, and assuming, as do Turkish census reports, that a house represents five souls, one finds that the inhabitants of

the 13,511 houses of Ipek Kaza at the beginning of the 20th century: were 46,015 Moslem and Catholic Albanians, 21,390 Serbs, and 150 Gipsies. These results hardly justify Slav ethnological claims to Ipek, the more so as the balance has swung further against the Serbs in the last ten years. In Djakova there are not 5 per cent of Serbs. In Rozhaj Kaza, north of Ipek, the Albanians have a four to one majority. Prisrend was once the seat of Servian Kings. But to-day, according to the best available information, four-fifths of the population of Prisrend Kaza are Albanians. Even further east the Albanians are in a majority. There are less than 150 Serb houses in the Kaza of Katchanik; if Mitrovitza is mainly Servia Vuchitrn is Arnaut, and Albanians form the majority of the population of the Prishtina and Ghilan districts. In all Kossovo north of the Shar range, omitting the Kaza of Katchanik but including the Sanjak of Novi Bazar, there were in the first years of the 20th century at least 300,000 Moslem and Catholic Albanians, against 120,000 Christian and perhaps 30,000 Moslem Serbs. These figures scarcely support the contention of Goptchevitch and other writers, ever ready to create "facts" in support of their propaganda that Old Servia is predominantly Slav. Historical claims founded on temporary occupation or on episodes such as the conquests of Stephan Dushan are not too strong. If the Serbs once overran all Albania, the Turks overran Servia and Hungary. As for the theory that the majority of the Moslems of Old Servia are in reality "Albanized and Islamized Serbs," the fact that the present majority of the population of Old Servia differs in language and religion from the Servian minority is surely a sufficient answer."

Albanian "nationalism," in fact, is a question which really provides difficulties of its own for the future government of this part of the Balkan area. On November 28th a further complication was introduced by a movement started by the Albanian leader, Ismail Kemal Bey, under whom as "president of the provisional government" the independence of Albania was proclaimed by a "national assembly" at Valona. This step, combined with the determination of the Powers not to allow the extreme Servian demand to act as an apple of discord, resulted in relaxing the tension as regards Austria during December; and meanwhile events were proceeding more satisfactorily in the direction of peace negotiations between the Balkan Allies and Turkey.

On November 29th discussion began at Chatalja over the terms of an armistice, and on December 3rd an agreement was signed for a suspension of hostilities and for peace negotiations to begin in London on December 13th, the belligerents meanwhile simply remaining in the positions already occupied. The armistice was signed by Bulgaria, Servia, and Montenegro, but not by Greece, though Greece proposed to take part in the peace negotiations; so that war still went on between Greece and Turkey. At the same time there was a marked improvement in the relations of the Great Powers, owing largely to a proposal made by Sir Edward Grey on November 27th that their representatives in one of the capitals should hold informal and non-committal consultations for the purpose of mutual agreement on the points on which Europe must make her voice heard in the final settlement. On December 11th Sir E. Grey was able to announce that all the Powers had agreed, and that their ambassadors in London would act.

In spite of the danger to European peace which still existed in the fact that Austria, and therefore Russia, kept her military preparations on a war footing, the situation during December was cleared a good deal by explicit declarations of policy in Germany, France and Russia. On December 2nd the German Chancellor, speaking in the Reichstag, said that the exchange of views between the Powers was having "favourable results, promising a satisfactory settlement." If, as he hoped would not be the case, insoluble difficulties appeared, it would, of course, be for the Powers directly concerned to give effect to their claims. "This applies to our allies. If, contrary to all expectations, they are attacked and find their existence menaced, we, in loyalty to our duty, should have to take our stand firm and determined at their side." This declaration of solidarity as between the Powers of the Triple Alliance was coupled with a notable statement by the German Foreign Minister, Herr von Kiderlen-Waechter (his last important utterance before his sudden death within a month), as to German relations with England and therefore with the Triple Entente. During the recent crisis, he said, German relations with England had been those of peculiar confidence, "and have not only provided a happy intimacy but have done good service to the promotion of agreement;" and he expressed his "confident expectation that this will continue." On December 5th the French Premier too made a general statement both on the Chamber

and on the Senate. The aims of France, he said, would be "(1) continuity of her foreign policy, and consequently attentive and persistent exercise of her alliances and friendship, (2) sincere and constant endeavours to secure the agreement of Europe and peace, (3) a firm and calm resolve to make French rights respected and to maintain the national dignity." Finally on December 18th the Russian Premier, M. Kokovtsoff, in the Duma, said that while Russia could not remain indifferent to the efforts of the Slav peoples to obtain better conditions, she had no selfish designs; "faithful to our alliances and understandings, and sure of the support of our friends, we can see no use in setting up groups of Powers one against the other." These declarations showed that, while the grouping of the Powers remained firm, it was modified by a recognition that there were common European interests above the group interests. The announcement on December 8th that the Triple Alliance, which would nominally expire in May 1914, had been renewed for another seven years, was obviously made in the interests of Austria. But having made her demonstration, Austria was now taking the situation more calmly, and relying on her power to assert herself, with her allies, only if necessity should arise. Count Berchtold's own policy was a peaceful one, but his task was complicated by the existence of a domestic party more inclined to wave the sword; and it was rather a matter of domestic interest than as bearing on European diplomacy that on December 9th the Austro-Hungarian War Minister (Gen. von Auffenburg) and Chief of the Staff (Gen. von Schemua) resigned, and were succeeded by Gen. Kroatkin and Gen. Konrad von Hötendorf. What was of more importance, for international reasons, was the heavy military expenditure in Austria, which was straining her finances and upsetting the money markets.

London was now the scene both of the meeting of the Peace Delegates, and of the conferences between the ambassadors of the Powers. By December 13th the plenipotentiaries had arrived, and their first meeting was held on December 16th. Bulgaria was represented by Dr. Danef, M. Majoroff, and Gen. Paprikoff, Greece by M. Venezelos, M. Skoulidis, M. Gennadius, and Dr. Streit; Servia by M. Novakovich, M. Nikolich, and Dr. Vesnich; Montenegro by M. Mioutchkovich, M. Popovich, and Count Voinovich; Turkey by Mustafa Reshid Pasha, Gen. Salih Pasha, and Osman Nizami Pasha. Little progress was made at the meetings held on December 17th, 19th and 21st, owing first to the objection of Turkey to the Greeks being included, which was eventually waived; and then to Turkey asking for the revictualling of Adrianople, which was flatly refused. Meanwhile the ambassadors had begun to meet on December 17th, and at their third meeting on December 20th they came to an important agreement as regards Albania, which was promptly announced as follows: "The ambassadors have recommended to their governments, and the latter have accepted, the principle of Albanian autonomy, together with a provision guaranteeing to Servia commercial access to the Adriatic. The six governments have agreed in principle on these two points."

On the 23rd the Balkan allies presented their demands to the Turkish delegates, and on the 28th Turkey made her first counter-proposals, which were promptly rejected, and followed these on January 1st (after an abortive session on Dec. 30th) by others. The Allies demanded the surrender by Turkey of all territory west of a line extending from Rodosto to Cape Malatra, 5 m. S. of Midia, and of all the islands of the Aegean, including Crete, with the exception of certain islands near the mouth of the Dardanelles to be specified by the Powers, but so as to leave the peninsula of Gallipoli to Turkey; they were content to leave the Powers to decide as to the administration of Albania. The Turkish proposals, as defined on January 1st, conceded the surrender of all occupied territory west of the vilayet of Adrianople, but insisted on the retention of the vilayet of Adrianople subject to a rectification of frontier with Bulgaria, and of the Aegean Islands, while leaving the protecting powers to decide as to Crete. In answer to these counter-proposals the Allies "took note" of Turkey's agreement to cede the territories west of Adrianople, with the proviso that this must include territory whether occupied or not yet completely occupied; the rest they described as "unacceptable." On January 3rd Reshid Pasha went a little further, and was prepared to cede even the south-western

district of the vilayet of Adrianople; but the patience of the Allies was now nearly exhausted. They gave the Turkish delegates till Monday, January 6th, to decide whether Turkey would (1) relinquish her sovereignty over Crete, (2) cede the Aegean Islands, and (3) agree to a frontier leaving the town of Adrianople to the Allies; otherwise, they declared, the negotiations would be broken off. Reshid Pasha's reply was at first promised for the following day, and was then postponed till the 6th, but it was believed that he had received instructions from Constantinople to refuse to give way on the question of Adrianople. This proved to be the case. On the 6th Reshid Pasha read out a statement, which, though conciliatory in tone, insisted that Turkey could not add Adrianople to her other concessions. The Balkan delegates then declared the negotiations "suspended."

Consultations followed between the Great Powers, and on Jan. 17 a collective note was presented to Turkey advising the Porte to give way as regards Adrianople and to leave the Powers to arrange as to the Aegean Islands. The Turkish Cabinet on Jan. 22 obtained the approval of the National Council for this course, but next day the Young Turks again asserted themselves in Constantinople and upset the government. A crowd collected in the streets, and Enver Bey at their head demanded the resignation of the Grand Vizier, which immediately took place. Kiamil Pasha was succeeded by Mahmud Shevket Pasha, and once more the demands of the Balkan Allies were refused. At the end of January the armistice was formally declared to be at an end.

THE INDEPENDENCE OF MONGOLIA

The setting up of a Republic in China introduces a new international problem in that part of the world; and it remains to be seen how far the balance of power in Asia may be affected by results under the new *régime*. The Chinese revolution provided an opportunity for a formal assertion of independence on the part of the northern or Outer section of Mongolia, inhabited by the Kalka tribes, whose capital is Urga, and whose native ruler is the Hutukhta Lama, known as Bogdo Gegen (Living God). It was to Urga that in 1904, when the British expedition went into Tibet, the Dalai Lama went for refuge for about two years; one of the chief centres of Lamaistic Buddhism, it is the object of yearly pilgrimages, especially by the Russian Buriats; and Russian commercial interests are also strongly represented, in view of its proximity to the frontier town of Kiackta. Under Manchu rule, Outer Mongolia was subject to the authority of a resident Chinese *Amban*, but the immediate result of the fall of Manchu power in China and the setting up of a Chinese Republic was a revolution at Urga, and the repudiation of Chinese suzerainty. The four Khans of Tushetu, Setzen, Sainnoyan and Jassaktu (see *E. B.* xv, 642d)—Mongol Princes reputed to be descendants of Jenghiz Khan—combined under the Hutukhta Lama to set up an independent government; and the safety of the Chinese officials in Urga, and the protection of the Chinese bank, were only secured by the presence of the Russian Cossack troops who formed a permanent garrison in connection with the Russian consulate.

It is obvious that this breaking-away of Mongolia from China simply means an accretion to the Asiatic territory subject to Russian influence. In effect it is a distinct step in the partition of the Chinese Empire, and marks a natural development in the slow opening of the unknown East to modern ways. It is worth noting that the *Times* correspondent (Aug. 8, 1912), who gave some details of the state of affairs at Urga, says that "while expressing the most friendly sentiments towards Russia, the Mongols appear to view with suspicion all advances from America. This suspicion is based on the alleged preference shown in the past by Americans to Chinese and Manchus in the matter of favours which were refused to Mongolian Princes, such as the facilitating of the education of their children in America. The Americans are considered to be too friendly with the Chinese to be real friends of the Mongols." In fact Russia, like Japan, has a civilising mission in this part of Asia, in which, both for geographical and for racial reasons, neither Britain nor America can play anything like so effective a part; and it is important to recognise that the closer accord between Russia and Japan, who in 1912

agreed in defining their respective spheres of interest in Manchuria and Mongolia, makes any recovery of Chinese authority improbable. The Chinese Government was warned in September 1912 that Russia would support the Mongols if an expedition were sent against them.

THE SITUATION IN TIBET.

Similarly, in Tibet, the attempt made after the British expedition to Lhasa in 1904 to maintain a recognition of Chinese authority has broken down, in direct consequence of the new situation in China itself. British intervention in 1906 was prompted by apprehensions of Russian intrigue, in the person of the Buriat Dorjjeff, whose ascendancy in Lhasa at that time was inimical to British interests and to the relations between Tibet and India. The result of the expedition, and of the Anglo-Russian Convention in 1907, was to remove the difficulties so far as England and Russia were concerned, but the internal situation in Tibet developed on lines which had not been foreseen, in consequence of the reestablishment of a Chinese suzerainty which previously had become merely nominal.¹ Chinese troops were sent to Lhasa, the Dalai Lama fled to India and was formally deposed by the Chinese Government, and a direct exercise of Chinese suzerainty was instituted; but when the Chinese revolution occurred, the garrison at Lhasa mutinied and committed gross excesses, and retaliation by the Tibetans resulted in a state of turmoil, in which Chinese authority was destroyed. The Dalai Lama returned to Lhasa and reasserted himself in practical independence.

A new situation was thus created in the autumn of 1912, in which the recognition of Chinese suzerainty, contained in the Anglo-Chinese Convention of 1890, the Anglo-Chinese Convention of 1906, and the Anglo-Russian Convention of 1907, ceased to be operative; and it became clear that the arrangements made on behalf of the Indian Government for the protection of British interests in Tibet would require reconsideration. It was known moreover that Dorjjeff had once more made his appearance in Lhasa. The immediate prospect was thus unsatisfactory in various ways. What is certain is that the conditions are entirely adverse to another restoration of Chinese authority. Tibet has become independent of the new Chinese *régime*, and, in so far as British relations depended on the recognition of Chinese control, this aspect of its international *status* disappears. The Anglo-Russian Convention of 1907 definitely admitted "the fact that Great Britain, by reason of her geographical position, has a special interest in the maintenance of the *status quo* in the external relations of Tibet;" and the Treaty of Lhasa, besides dealing with British commercial rights, provided that, without British consent, Tibet might not cede or lease any territory, admit representatives or agents of any foreign power, give mining or other concessions to foreigners, or pledge her revenues. It may be expected that British relations with Tibet will in future be readjusted so as to assert British influence there irrespectively of the obsolete international theory that it is part of the Chinese Empire. British policy in this matter was defined in a Memorandum presented on August 17, 1912 to the Chinese Government, in which it was intimated that Great Britain would make it a condition of her recognition of the Republic that China should leave the Tibetan situation to develop on its own lines and should cease to regard Tibet as a Chinese province.

THE PANAMA CANAL ACT CONTROVERSY

On August 24, 1912 President Taft signed the Panama Canal Act, which had been passed by the American Congress, and it became law in spite of a protest from Great Britain which has led to a controversy of considerable international interest.

The Act provided in detail for the general operation of the Canal and the regulation of commerce passing through it, but the point in question was concerned with the tolls. The President was empowered, within his discretion, to impose tolls not exceeding \$1.25 per registered ton on all vessels using the canal except vessels engaged in the American coastwise trade (restricted by law already to American vessels) on which no tolls at all were to be levied. The British contention, more or less informally con-

¹ See *E. B.* xxvi, 928.

veyed to the American Government, while the Act was still under discussion, by way of a warning that a formal protest would follow,¹ was that this was a violation of Article III of the Hay-Pauncefote Treaty of 1901, which said that "the canal shall be free and open to all vessels. . . so that there shall be no discrimination against any nation in respect of the conditions and charges of traffic." It was also intimated on behalf of Great Britain that if the Act was passed, in spite of the protest, she would appeal for arbitration as to its legality to the Hague Tribunal under the Treaty of 1911. The result of this protest was a special message to Congress by President Taft on August 10th, before the bill was finally passed, in which he argued that the exemption of American "coastwise vessels" from tolls was not a violation of the treaty. (It may be noted that on December 21, 1911, he had sent an earlier message, dealing with the importance of leaving it to the President, within certain limits, to fix the tolls, and had said, without referring to the Hay-Pauncefote Treaty, that he was "confident that the United States has the power to relieve from the payment of tolls any part of our shipping that Congress deems wise.") As, however, "distinguished lawyers of the House and Senate" and also Great Britain differed from this construction, he recommended Congress to pass a resolution, or add a clause to the bill, distinctly saying that nothing in it should be "deemed to repeal any provision of the Hay-Pauncefote Treaty or to affect the judicial construction thereof," and giving a right of appeal against the United States in the District Courts, with appeal to the Supreme Court, to any foreigner who considered the provisions of the Treaty to be violated to his detriment. This suggestion, however, was not acted on, and, so far as Great Britain was concerned, was regarded as obviously unsatisfactory. A domestic court of law was not the place for arguing the violation of a treaty right. According to President Taft's contention, and the purport of the new Panama Canal Act, the Hay-Pauncefote Treaty was not being violated at all, and the proper place for having that question decided, according to the Arbitration Treaty of 1911, was the Hague Tribunal.

In the Press of both countries during August and September President Taft's attitude in this matter was sharply criticized, more hotly indeed in the United States than in England owing to the approaching Presidential Election. A considerable body of American opinion regarded the passing of the Act, without further consideration for the British protest, as a reproach to the national honour, and President Taft was bitterly accused of making the United States appear guilty of a breach of faith. This was rather unjust, because President Taft made it quite clear that he did not consider the exemption of coastwise shipping from tolls to be a violation of the Hay-Pauncefote Treaty; on the other hand it was difficult to understand how, on the wording of the Treaty and the Act, he could arrive at such a conclusion, or how, if a difference of opinion existed, he could resist the British contention that a decision should be given by the Hague Tribunal, as provided in the Arbitration Treaty of which President Taft himself had been a notable champion. In England this naturally was the view generally taken. In the United States, on the other hand, there had always been among the public at large a tendency to regard both the Clayton-Bulwer Treaty and its successor the Hay-Pauncefote Treaty as really inapplicable to the conditions under which the Panama Canal was actually being constructed; the United States was paying the whole cost, and the rest of the world was contributing nothing. — what right could Great Britain have to interfere? The fact was that, while the legal right was disputed by so eminent a lawyer as President Taft, the moral right in other respects was clearly on the American side, and it seemed absurd to Americans, on general principles, that they should be prevented from giving a preference to American shipping if they wanted to

So far as concerns American and British shipping, the substantial facts of the economic and commercial situation might well seem to an impartial critic to make the point at issue comparatively unimportant, while affording a very natural explanation

¹ The formal protest was contained in Sir E. Grey's despatch of Nov. 14, delivered at Washington on Dec. 9.

of American anxiety to obtain some advantage from the canal in return for the enormous cost of constructing it single-handed. For American shipping, in fact, carries only a small proportion of American trade, and there is no immediate prospect of serious competition with British shipping in this respect. According to a report issued by the U.S. Commissioners of Navigation,¹ the percentage of United States exports and imports carried in American vessels fell from 75.2% in 1850 (in 1870, 35.6%) to 8.7% in 1910; of the total American sea-borne trade in 1910, valued at 5,700 million dollars, more than nine-tenths was carried in foreign vessels.

Apart altogether from the effect of the Civil War, the character of American shipping has changed in later years, the shipping engaged in the foreign trade having steadily diminished from 1,518 thousand tons in 1865 to 782 thousand tons in 1910; the shipping engaged in the coasting trade has indeed greatly increased, especially since 1895,—from 3,381 thousand tons in 1865 (3,728 thousand tons in 1895) to 6,668 thousand tons in 1910,—but this, of course, is due to the coasting trade being restricted to American vessels. The prime factor in the decline of American merchant shipping and shipbuilding, so far as general foreign trade is concerned,—and this has been shown conclusively by the American Merchant Marine Commission,—is the fact that wages in the shipbuilding industry are about twice as much in the United States as in Great Britain, and freights cannot be earned to compensate for the higher cost of American ships. The advocacy of protection and subsidies for American shipping, which is common to all political parties in the United States, is due to a natural and patriotic revolt against what nevertheless is the fact, namely that the carriage of American sea-borne trade (other than the coasting trade) is, to the extent of nine-tenths, in the hands of Great Britain and Germany in the Atlantic together with Japan in the Pacific, simply because wages in those countries are so much lower. How this can be altered so as to recover American trade for American shipping is a very large question, which will not be solved to-day or to-morrow. Undoubtedly there has been a sanguine expectation that, particularly as regards the trade between North and South America, the making of the Panama Canal would enable some advantage to be gained for American shipping at the expense of foreign shipping, and this is at the root of the controversy as to the rights of the American Government under the Hay-Pauncefote Treaty. But whatever may be the rights of that matter, it is well to bear in mind that, on the general question of the comparative extent of national shipping in international trade, it is really not of much importance. For the American Government to subsidise American vessels engaged in the coasting trade by giving them an advantage in the passage of the Panama Canal—whether this can or cannot be done justly and honourably under the terms of the Treaty—is of very minor consequence to non-American shipping because in any case it is excluded by American law from the coasting trade altogether; and no subsidy of this kind, consistently with what is economically possible for the working of the finances of the Canal at all, can be enough by itself to enable American shipping to compete in neutral markets with non-American. So far as British shipping is concerned the conditions under which it does so much of the American carrying trade cannot be appreciably affected, at any rate for some time; and any new conditions arising in the distant future must be treated according to circumstances.

Whether it is wise of the United States to raise such questions at all, which challenge international friction and also foreign action in defence of other national economic interests, is, of course, another matter altogether. The making of the Panama Canal was for the United States primarily a strategic undertaking, impelled by the importance of being able to join up the Atlantic and Pacific Oceans more readily than by sending ships round the Horn as was necessary in the Spanish-American War. As a factor in international commerce the economic value of the Canal cannot yet be safely estimated. Geographically, as compared with land transport across Central America, it has not the same trade advantage as the Suez Canal, and it has been far more costly to make. Owing to its effect on shortening the routes for sea-borne commerce, as between certain

¹ See an article by J. Ellis Barker in the *Nineteenth Century and After*, for October 1912.

countries, it is, no doubt, destined to play a considerable part in local industrial development; and in this direction Great Britain appears to stand to lose in comparison with the Eastern American States and also with Japan. But the resulting increase in the carrying trade itself will go where the shipping can be most economically produced and freights most economically earned.

ENGLAND'S WITHDRAWAL FROM THE SUGAR CONVENTION

Some surprise was expressed in the British Parliament at the suddenness with which, at the beginning of August 1912, Mr. Asquith's Government appeared to have arrived at the decision to give notice (as had to be done, if at all, before Sept. 1st) that Great Britain would withdraw from the Brussels Sugar Convention. But Mr. Asquith was quite entitled to reply that anybody who had followed the course of events since the Convention of 1902 was renewed in 1907 for a further five years had no valid reason for surprise at notice of withdrawal being given. The declaration in Parliament that Great Britain would withdraw was indeed somewhat mysteriously abrupt, coming as it did at the fag-end of the summer just when Parliament was about to adjourn; and it was natural for the Opposition to suspect that the Free-Trade party in power had an eye on influencing the impending by-election in South-west Manchester, though, if this was so, the result was a signal failure. But otherwise the action of the Government was in accord, rightly or wrongly, with their avowed policy since 1908 (see *E. B.* xxvi, 45-47). In the autumn of 1911 Sir Edward Grey had explicitly declared (Dec. 7th) that unless Russia was allowed to export in the ensuing year at least 500,000 tons of sugar instead of the 200,000 to which she was restricted by the arrangement of 1907, Great Britain would no longer be a party to the Convention; and owing to the opposition to this proposal, mainly from Germany, this threat only had the effect of getting the signatory Powers to agree to increasing the limit of the Russian export by 50,000 tons a year. In such circumstances the British decision was inevitable, apart altogether from the fact that the Liberal party and its leaders had always been opposed in principle to the Convention and had for several years been seeking an excuse to denounce it.

What is of more importance is to note the incontrovertible success which had followed the adoption of the Brussels Convention in 1902, and which had made it possible for the British Government to denounce it in 1912 without much fear of a renewal of the conditions which had originally brought it into being. The object of the Convention had been to abolish the bounty-system by which the production of beet-sugar in Continental Europe was bolstered up, and for practical purposes the bounties had now been abolished and were not likely to be renewed, because France, Germany, Austria-Hungary, Belgium and Holland had decided to maintain the Convention, in spite of Great Britain's withdrawal (which was followed by that of Italy), for another five years. The security against unfair competition provided by the machinery of the Convention, which had already given new life to cane-sugar manufacture in the West Indies and elsewhere, was therefore in a fair way to be maintained without the necessity of British adhesion. It was to save the West Indies that Mr. Chamberlain had taken the matter up in 1896, with the result that the Brussels Conference of 1898 was convened, leading eventually to the agreement of 1902; and during these years, owing mainly to its operation, the economic situation had entirely altered. In the discussion in the House of Commons on August 8th it was remarkable that the official representatives of a Liberal Government gave no countenance to the more extreme Free Trade view, still asserted by a few Radical members of Parliament, that the Convention had done no good and had even been detrimental to British interests. On the contrary, Mr. Acland, the Under-Secretary for Foreign Affairs, explicitly denied that the operation of the Continental bounty-system, by which the British consumer for a time obtained sugar at an artificially cheap price, while the Continental consumer paid an artificially dear one, was economically sound or advantageous, even from the British point of view. He justified the action of the Government on the ground that the object sought had been attained, and that there would be no going back, but that failure to realise expectations in this respect would not

prejudice any further measures. And on the point that injury would be done to the nascent industry of beet-cultivation in England both he and the Prime Minister insisted that the return to "economic freedom" would untie the hands of the Government and enable the Treasury to give it financial assistance.

So far as the production of cane-sugar in India is concerned, it will be remembered that in 1899 countervailing duties on bounty-fed imports were actually imposed by the Indian Government; and, if necessary, the same course would presumably be adopted again. In the West Indies, apart altogether from the improbability of the renewal of the Continental bounty-system, the whole situation had materially altered since the Brussels Convention had come into existence. Though the efforts successfully directed towards establishing the cultivation of other agricultural products—cotton, cocoa, fruit, etc.—in the West Indies could never do away with the fact that the growing of cane-sugar is their staple industry, yet they had done much to add to the resources of the islands. But, what was of more importance, the market for West Indian sugar had been extended and seemed likely to become more profitable in the United States, and, under the new system of Canadian preference, exports to Canada were being stimulated. The possibility therefore that the British withdrawal from the Convention might injure West Indian prospects in the British home market had no longer the same terrors for West Indian sugar-producers. They had come to look to the American and Canadian market, and West Indian imports to Great Britain had consequently diminished even while the Brussels Convention protected them there,—a point which English opponents of the Convention entirely misinterpreted as involving its failure to benefit the West Indies at all. What the Convention did to promote British home interests, so far as the West Indies were concerned, consisted primarily in restoring confidence and a sense of security to the cane-sugar industry, so that British capital again flowed into it, and orders were regularly given, to a considerable amount, for machinery from British manufacturers. The principal danger to be anticipated from Great Britain's withdrawal would be the renewal of that want of confidence in the security of the industry which had done so much harm in the years preceding 1902, and a corresponding loss to home traders and manufacturers; but on the whole such a result is now improbable. At the same time, from a British Imperial point of view, it was not a comfortable reflection that the economic prosperity of the British West Indies was being secured by reliance on Canada and the United States, with the mother-country standing aloof and introducing what, on the face of it, was an element of insecurity.

THE TITANIC DISASTER

No single event in 1912 could compare, in the intensity of its universal appeal to human emotion, with the awful disaster to the "Titanic." At 2.20 A.M. on April 15th, that great White Star liner, the largest afloat, on her maiden voyage, went to the bottom of the Atlantic in lat. $41^{\circ} 46''$ N., long. $50^{\circ} 14''$ W., about $2\frac{3}{4}$ hours after striking at full speed on an iceberg, with a loss of 1,513 souls out of 2,224 on board.¹ It had been supposed that such a vessel was unsinkable, and the tragedy has raised numerous questions as to methods of ship construction, and additional provision of life-saving equipment, reference to which is made elsewhere in the YEAR-BOOK (under "Ships and Shipbuilding"). Whether much good however can be expected in this direction simply from increased provision of boats appears highly doubtful. The "Titanic" had nominally boat accommodation for double the number saved, and the 20 boats launched were meant to hold 1,178 persons instead of the 652 they actually contained when they left the ship; moreover the disaster occurred under exceptional conditions for getting people safely off, in the way of smooth water and fine weather. The most salutary lessons would seem to lie in the following directions: first, improved design and construction so as to provide a really unsinkable ship; secondly, greater precautions in navigation and look-out,—for the "Titanic" was going at 18 knots (according to Lord Mersey an "excessive speed"), though it was known that icebergs were exceptionally numerous on the

¹ The exact figures are doubtful, but those given are from Lord Mersey's report.

course; thirdly, better and more regular organisation on ship-board, by boat-drill (there had been none on the "Titanic") and otherwise, for the emergency of having to abandon ship; and fourthly, a compulsory service of "wireless" on all liners, working day and night,—for it was one of the most lamentable incidents in the whole terrible story that the "Titanic's" "wireless" call for help, picked up all over the ocean and nobly responded to by the "Carpathia" (Capt. Rostron) seventy miles off, fell on deaf ears on the "Californian" only 8 or 10 miles away.¹ The full record of the disaster is contained in the reports of the inquiries held at once in America by a committee of Congress under Senator Smith, and later in London by a special commission presided over by Lord Mersey (report issued July 30th). Painful and difficult though it may be to distribute blame in such a case, there can be little doubt that the loss of life—817 passengers out of 1316, and 696 out of a crew of 908—was much greater than ought to have been possible. Captain E. J. Smith (b. 1853), a highly experienced seaman who had been for 38 years in the service of the White Star Company and who now went down with his ship, seems to have been averse from taking steps at first which might cause a panic on board; otherwise there should have been time, if adequate means of organisation and of commanding discipline had existed, not only to get more people into the boats but to improvise rafts. In naval circles it is known that the opinion is strongly held that this should have been done, since the injuries received by the ship made it certain that she would sink in a given time. If this be so, it points to a weakness in the higher command, or the means provided for exercising it in the organisation of the crew on the "Titanic," for which no merely material equipment could compensate. It may be admitted that a natural expectation of security had been engendered, alike among the owners, officers and passengers of these magnificently appointed liners, which, until a crisis actually came, had made it almost unthinkable that it could come in that way; but the fact remains that the responsibility for the lives of passengers rests with those who control the ship. In this case it was not the inadequacy of the physical means of escape that accounts for the large proportion of the lost who remained on board; it was the inadequate organisation for purposes of using them, and inadequate information as to the necessity. Apart from that, both Great Britain and America could mingle sorrow and pride over many fine incidents of the tragedy, with its long death-roll of prominent people from both sides of the Atlantic. When it came to the sending away of the boats, the order was "women and children first." The figures of the 711 saved by the "Carpathia" (including about 60 who were picked up in the boats after the ship went down) speak for themselves:—*Women*: 1st class, 140 out of 144; 2nd class, 80 out of 93; 3rd class, 76 out of 165; crew, 20 out of 23. *Children*: 1st class, 6 out of 6; 2nd class, 24 out of 24; 3rd class, 27 out of 79; *Men*: 1st class, 57 out of 175; 2nd class, 14 out of 168; 3rd class, 75 out of 462; crew, 192 out of 885. Altogether the percentage of women saved was 74.35, of children 52.29, of men 20.27. The comparatively small proportion of 3rd class passengers saved was shown to be purely accidental and not due to any preference being deliberately given to others; they were handicapped however by their quarters being remote from the boat-deck, and by so many of them being foreigners.

GENERAL BOOTH

The death of "General" Booth on August 20, 1912, at the age of eighty-three; has removed a remarkable personality from the world. The founder of the Salvation Army had lived to see it grow from small revivalist beginnings in the 'sixties—the name itself being adopted and a definite system established in 1880—and to pass through a period of contempt and hostility, till for some years before he died it had become a recognised institution, of widespread religious power and social efficiency. The "General" was

¹ Apart from the "Californian's" "wireless" operator having gone to bed, however, Lord Mersey was satisfied that if her captain had realised the situation properly she could have saved "many, if not all, of the lives that were lost;" for evidence showed that distress rockets sent up on the "Titanic" were actually seen from the "Californian," though no action was taken in response to them. The incredibility of such a disaster appears, in that case, to have paralysed the capacity for inference.

² See E. B. iv, 239, and xxiv, 100.

a leader whose strong will and personal magnetism were allied with an intense belief in his mission to "save souls," of a type rare at any period in history, and unique—at any rate in its practical results—in these latter days. The fundamental fact in human nature that man is a religious animal, and that religion, hot and strong, appeals to factors in human life which are open to no other influences, has been illustrated once more by the success which attended the initiation of his missionary zeal and fervour. Superior people might scoff at what Huxley called a "corybantic" type of revivalist Christianity, but it caught hold of thousands from whose lives the very foundations of social refinement and intellectual culture were absent. In this respect indeed the Salvation Army was not original: what was original was the way in which "General" Booth gave organic form, under a quasi-military system, to revivalist methods which have always been emotionally effective, and the extent to which he brought its influence to bear on the most intractable of social problems, the moral and economic wreckage of the underworld of the modern community. Intense faith, profound and tireless sympathy, and a disinterested devotion superior to all criticism on the score of crudity of ideas and methods, could alone have won for "General" Booth the place he came to occupy in the social and religious world towards the end of his life. In the early 'nineties he might have passed away simply as the fanatical hot-gospeller of an insignificant sect of street-corner psalm-singers; it would have been inconceivable then that he should end his life as one for whom a place in Westminster Abbey was thought appropriate, one of the autocrats of the religious world. Whatever may be the future of the vast organisation created under his leadership, such a history is sufficient testimony to the strength of character of the man who brought it into being, and the immensity of the opportunity for social service which he had the genius to grasp and set in motion. "General" Booth was primarily an evangelist, and the immense extension of the administrative work of the Salvation Army, involved in the social and economic enterprises connected with various aspects of the "Darkest England" scheme since 1890, was only made possible, no doubt, by the devoted co-operation of others, within the Army and outside; but all of this depended on the disciplined obedience and passionate religious solidarity which issued from the evangelical fervour of which he was the fount and origin. In his successor, his son Mr. Bramwell Booth (b. 1856), nominated for that position in sealed orders by the founder as long ago as 1880, a new "General" steps into his place, whose long executive experience as "Chief of the Staff" should augur well for the maintenance of the social activities of the Salvation Army throughout the world; and its characteristics simply as a religious organisation have long become fixed on lines which will naturally follow the inspiration given by their creators.

LABOUR UNREST AND "SYNDICALISM"

During 1910-12, as may be seen from the historical accounts for individual countries in Part II of the YEAR-BOOK, the "Labour Unrest" has been a very conspicuous social feature in all the countries of Western civilisation, both in Europe and America. Generally speaking, the new symptom which has riveted public attention in the unrest of the wage-earning classes has been the rise of what is known as "Syndicalism," under the influence of which has become manifest a further stage of the evolution of ideas, and the evolution of organised action, in the assertion of the claims of Labour as opposed to Capital. In the readjustment of social-economic relations between operatives and employers, notably in Great Britain, America, France and Germany, Syndicalism is a new development, superimposed upon the older ideals and aims represented both in the general theory of Socialism and in the practical work of trade-unionism, whether of the earlier and more restricted industrial and friendly-society type or of the newer militant political type which is actively represented in the parliamentary Labour parties. For "Syndicalism"—which, as a term, is derived simply from the French word for trade-union (*syndicat*)—comprises in itself both an extreme application of Socialist theory and an extended application of the methods of militant trade-unionism.¹

¹ For detailed accounts of the rise and progress of the modern Labour movement and its ideas and organisation, see especially the articles in the *E. B.* on "Labour Legisla-

The connection between Syndicalism and both Socialism and Trade-unionism may be seen at once from a summary of its three leading ideas: (1) Labour is the source of all wealth and therefore the only proper title to its enjoyment; (2) the workers in any great branch of industry ought to own the materials and machinery with which they work, and to control the administration; (3) the method of achieving this result is for trade-unions to take "direct action" by strikes, and particularly by "general" strikes.

But the distinguishing feature of Syndicalism, as a form of socialistic trade-unionism, is really in its interpretation and application of these three principles, each of which, no doubt, is part of the general theory either of orthodox Socialism or of ordinary trade-unionism; for the rise of Syndicalism is directly due to disappointment among the convinced Socialists of the operative class at the economic results hitherto attained either by trade-unionism, by the Co-operative movement, or by parliamentary action on the lines of state-socialism.

Starting with the proposition that labour is the only source of wealth, the syndicalist is in passionate revolt against society as organised. He regards it as essentially unjust that those who do what (in his view) is the hardest, most disagreeable, and most necessary work should receive individually a comparatively small proportion of the value of the product, while others, contributing either nothing in work, or doing what is comparatively pleasant and (as he thinks) easy, receive large salaries or amass enormous fortunes. And, in his view, the only remedy for this is for the operative class to insist on owning and controlling the materials and machinery of industry, and distributing the profits according to their own more enlightened estimate of the relative values of the various sorts of labour which have made the industry a remunerative one. He is thinking of his own particular sort of Labour, and not of the community as a whole, and this is the point at which he parts company with the ordinary Collectivist who advocates state or municipal ownership. The usual idea of modern democracy is not at all satisfactory from the syndicalist point of view, because the public as a whole includes not only "Labour" (*i.e.* manual labour) but the upper and middle classes as well,—a host of people, in fact, who are regarded by him as only unproductive consumers, fattening on the real workers. The State, as such, he sees organising itself, even on democratic lines, in such a way as to keep Labour still in subjection to the propertied classes; and parliamentary action in consequence proceeds in a manner which makes things substantially no better for Labour than before. Having come to the conclusion that, on existing lines, the increased political representation of Labour in Parliament is to a large extent a sham and a humbug, the syndicalist falls back on the necessity of working directly for the rights of the operative class by means of the weapon to their hand in the trade-union organisation. This is the meaning of "direct action." It includes anything that will drive Capitalism out of the industrial organisation, and compel it to hand over the control to the workmen themselves. For this purpose anything is legitimate, from malingering and shirking to destruction of machinery and wrecking of trains; but the strike is the effective weapon, and particularly the "general strike," a simultaneous strike of all workers—either in one industry, allied industries, or all industries—which will put Property at Labour's mercy and consummate the social revolution.

In the case of an inchoate movement of class-opinion like this, what is of most immediate importance to society at large is to realise its existence, and to know what are the ideas behind so many of the contemporary manifestations of "Labour unrest." They have been admirably analysed, and no less admirably criticised, by Mr. and Mrs. Sidney Webb,—who are not likely to be accused of want of sympathy with either the socialist or the trade-unionist movements,—in a special supplement of *The Crusade* for August 1912 (the organ of the National Committee for the Prevention of Destitution, tion" (xvi, 7 *et seq.*), "Socialism" (xxv, 301 *et seq.*), "Communism" (vi, 791 *et seq.*), "Anarchism" (i, 914 *et seq.*), "Cooperation" (vii, 82 *et seq.*), "Trade Unions" (xxvii, 140 *et seq.*), "Strikes and Lock-outs" (xxv, 1024 *et seq.*), "Arbitration and Conciliation" (ii, 331 *et seq.*); and other articles indicated under "Economics and Social Science" in Index Volume, p. 893. On the whole question, historically, no single books are so informing as Mr. and Mrs. Sidney Webb's *Industrial Democracy and History of Trade Unionism*.

37, Norfolk Street, Strand, London). As they point out, the documentary materials for a detailed study of syndicalism are not easily accessible, but it may be useful to give (with some corrections) their note on the literature of the movement, under the influence of which its ideas have recently spread so widely:

"The series of pamphlets by Mr. Tom Mann, under the general title of *The Industria Syndicalist* (Bowman, 4, Maude Terrace, Walthamstow), from June, 1910, onwards, are perhaps the most important English source; together with *The Miners' Next Step* (Robert Davies & Co., Tonypany, 1912). Of easily purchasable books in English there are not many. Far and away the best is *The Labour Movement in France, a Study in Revolutionary Syndicalism*, by Dr. Louis Levine (Columbia University Series, 1912). A corrective on the other side is *Syndicalism and the General Strike*, by Mr. Arthur Lewis (Fisher Unwin: 1912). A volume by Mr. J. Ramsay MacDonald, M.P., on *Syndicalism* (Independent Labour Party Office, 1912), should be consulted. But for the best exposition the student must turn to France, and must there go through the files, especially of *Le Mouvement Socialiste*, and, further, of *La Voix du Peuple*, *L'Action Directe*, *La Vie Ouvrière*, *La Bataille Syndicaliste*, and other weekly and monthly journals. No less characteristic are the numerous pamphlets by Edouard Berth, Paul Delesalle, Victor Griffuelhes, A. Labriola, Hubert Lagardelle, L. Niel and Émile Pouget (mostly published by Marcel Rivière, Paris). The most considerable "intellectual" on the Syndicalist side is Georges Sorel¹ (*Reflexions sur la Violence*, 1908 and 1910; *La Décomposition du Marxisme*, 2d edition, 1910; and various other works). Other Syndicalist books are: *La Grève Générale et le Socialisme: enquête internationale, opinions et documents*, by Hubert Lagardelle (Cornély, Paris, 1905); and the very explicit *Comment nous ferons la révolution*, by E. Pataud and Émile Pouget (Tallandier, Paris) a lengthy "Utopia" describing both the process of revolution and the way the new society organises itself. Of expository and critical books, the reader will find most useful *Syndicalisme Révolutionnaire et Syndicalisme Réformiste*, by Felicien Challaye (Alcan, Paris, 1909); *Syndicalisme et Démocratie*, by C. Bouglé (Paris); *Le Syndicalisme contre le Socialisme: origine et développement de la Confédération Générale du Travail*, by Mermeix. *Les Transformations de la Puissance Publique: les Syndicats des fonctionnaires*, by Maxime Leroy, 1907, will be found suggestive. For modern Trade Union history in France, see *Histoire des Bourses du Travail*, by Fernand Pelloutier, 1902; *L'Évolution du Syndicalisme en France*, by Mlle. Kritsky, 1908; and *Histoire du Mouvement Syndical en France, 1789-1906*, by Paul Louis (Paris, 1907)."

The account given by Mr. and Mrs. Webb, as the result of their careful study of Syndicalist literature, should be studied in full, but a few extracts may be made here in summarised form. As to the class-feeling behind the movement, they say:

"The manual working wage-earner sees himself and all his fellow wage-earners toiling day by day in the production of services and commodities. This toil is continued without cessation year in and year out, under the orders of persons of another social class who do not share his physical exertion. He sees the service and commodities that he feels *he* is producing sold at prices far exceeding the amount which he receives in wages. He has, of course, been told that this price has to pay large salaries to managers and other officials, and has to cover payment of rent and interest to the owners of the land and the capital. But this does not satisfy him of the reasonableness of the enormous and constant inequality between the wage he receives and the income enjoyed either by the owners of the instruments of production or by their managers and agents who rule his life. This inequality of income results in a society in which one-tenth of the population own nine-tenths of the accumulated wealth; in which one-fifth of the adults take to themselves two-thirds of the annual product, and allow only one-third to be shared among the four-fifths who are manual working wage-earners; in which, in spite of a wealth-production greater than the world has ever known, one-third of all these manual working wage-earners have scarcely a bare subsistence, whilst most of the other two-thirds are so little removed from this low level that the slightest interruption or dislocation of industry reduces many of them to destitution. In dramatic contrast with this penury and destitution he sees hundreds of thousands of wealthy families wasting in idleness and senseless extravagance hundreds of millions of pounds annually out of the wealth that is produced. Something is radically wrong with a society that produces this inequality. To the wage-earners who are 'class-conscious' the explanation seems simple. Whilst they and their fellows are contributing the whole of the physical toil involved in the production, distribution, and exchange of commodities, they are excluded from the ownership both of the instruments of production and of the products of their labour. The ownership of the land and the other instruments of production carries with it the power of giving orders as to how they shall be used. The manual working wage-earner finds himself spending his whole life in subjection to the arbitrary orders, even the irresponsible caprices, of the employers and their agents.

¹ M. Sorel however has recently abandoned Syndicalism and become the editor of a French Legitimist journal.

"To the growing intelligence of the manual workers in the great industries it seems that trade-unionism, however much it benefits particular sections, has in no way diminished inequality. The trade-union of the orthodox type assumes and accepts as permanent the very organisation of industry against which the 'class-conscious' wage-earner is revolting. If the workers in an industry can form a trade-union, and elect their own officials to lead them in a strike, or to negotiate with the employer, why should not the same body of manual workers, who form in every business organisation the immense majority, elect the general manager and the foreman, the buyer and the salesman, who are now appointed by the capitalist private owner of the enterprise to administer it for his own profit? All that stands in the way seems to be the private ownership of the instruments of production, entailing as it does the ownership of the whole product."

Neither Co-operation nor State-Socialism of the ordinary political type appears to offer any real remedy for the social inequality of which our revolting wage-earner is so bitterly conscious. Successful as the Co-operative movement has been, so far as the working-class members are concerned who are consumers, he feels that it has done very little for the producers whom the co-operative societies employ:

"Thus in England, though the fifty million pounds of capital of this most profitable business is owned by the two and a half million working-class members, and all the managing committees are most democratically elected, yet the 120,000 men and women who work in the stores and their factories are, as producers, paid weekly wages, and work under the orders of managers and foremen over whom they exercise no more influence and control than in the enterprises of private capitalism."

It is the same with "nationalisation" or "municipalisation," which have become the ideal of the Fabianite State-socialists, and also with the results, so far as our wage-earner sees, of getting Labour members into Parliament, where conventional ideas of property and the necessity of the support of a miscellaneous electorate block the way:

"When Socialism was worked out to mean the transfer of industry from private to public ownership, it became plain that it by no means meant handing industry over to the manual workers. The ownership and control passed to the whole body of citizens, among whom the wage-earners in any particular industry found themselves in an insignificant minority, receiving wages and obeying orders just as before. Nor do the Syndicalists see that the progress of this sort of Socialism has in itself any tendency to lead to any other state of things. Its tendency is to induce the manual workers to put their reliance on the promises of the politicians, who are for the most part not of the manual working-class, while such working-class members as are elected quickly fall away, with the great change in the circumstances of their lives, from that full 'class-consciousness' which is bred of the wage-earner's insecurity, impecuniosity, and subjection to the orders of others."

The Syndicalist, in fact, objects to one of the fundamental doctrines of democracy. Unlike the ordinary Socialist, who relies for progress on the conversion of a majority of the community, the Syndicalist has no satisfaction in the subjection of the "conscious minority" of intensely feeling workmen to the "incompetent vote" of an inert and apathetic mass, and is not prepared to wait for their conversion. "French Syndicalism," writes Hubert Lagardelle, one of its leaders, "was born of the reaction of the proletariat against democracy." "The minority," writes Émile Pouget, the most representative of French syndicalists, "is not disposed to give up its claims and aspirations before the inertia of a mob not yet animated and stirred by the spirit of revolt." Instead of looking to the "public," or the whole community, the Syndicalist considers that the manual wage-earners must rely exclusively on themselves. "The working-class movement," says M. Victor Griffuelhes in *L'Action Syndicaliste*, "having arisen from the miseries of the wage-earners, ought to include only wage-earners, and ought to be conducted only by wage-earners, exclusively for the specific interests of the wage-earners." Instead of being "guided by abstract ideas expounded by intellectuals," it is the business of the manual workers simply to "fight against the employers, in order to extract from them, and to their hurt, even greater ameliorations of the worker's lot, on the way to complete suppression of exploitation."

In the organised warfare which the manual workers are to wage on employers, without any foolish consideration for anybody but themselves, the two principal weapons used by the Syndicalists are the "irritation strike" and the "general strike,"—strikes being advocated not so much as a means of insisting, as with the older trade unionism, on

collective bargaining, but directly for the purpose of hurting Capital and making the control of industry by anyone but the workers impossible. The "irritation strike," as may be read in the *Miners' Next Step*, "depends for its successful adoption on these men holding clearly the point of view that their interests and the employer's are necessarily hostile. If the men wish to bring effective pressure to bear, they must use methods which tend to reduce profits. One way of doing this is to decrease production while continuing at work." The French form of "irritation" is what is known as *sabotage*, concerning which M. Pouget blandly writes as follows:

"If you are a mechanic, it is very easy for you, with a pennyworth of some sort of powder, or even with sand, to score lines on your rollers, to cause loss of time, or even costly repairs. If you are a carpenter or cabinet-maker, what is easier than to injure a piece of furniture, so that the employer will not notice it, nor at first the customer, but so that customers will presently be lost? A tailor can quite easily ruin a garment or a piece of stuff; a shopman with some stains will make it necessary to sell off damaged goods at a low price; a grocer's assistant causes breakages by faulty packing. No matter who may be to blame, the master loses his customers. . . . As the employer is an enemy, it is no more disloyal for the workman to entrap him into ambushes than to fight him face to face."

But the fullest form of "direct action" is the general or national strike, by which the continuance of industry is to be paralysed altogether, and by which the syndicalist aims at consummating the transfer of all industries from control by the capitalist class to control by the operatives:

"The general body of wage-earners, by deliberately suspending all labour on a given day, by tearing themselves away from the exploitation to which they are subjected and by which the existing social order is maintained, cut away that social order at its very base. If they cease to work for the employing class, and for the great joint stock companies, they destroy at one blow the economic dominion exercised upon them. And as this economic dominion is translated in the region of politics by the authority of the State government, the State government itself will crumple to pieces simultaneously with what is but its other side, the system by which millions of men are used for the profit of a minority. From this paralysis of the machinery of the State, and of all its services, public and private, to the socialisation of the means of production is but a step." (P. Louis.)

The complete "general strike" is, of course, the final Revolution, but, as M. Griffuelhes says, "the industrial or localised general strikes which precede it really constitute a necessary gymnastics, just as the army manoeuvres are the gymnastics of war."

And what next? On that point Syndicalism is decidedly vague. "Directly we think of definite aims," says M. Griffuelhes, "endless disputes arise. Some will say that their aims will be realised in a society without government, others that they will be realised in a society elaborately governed and directed. Which is right? I do not take the responsibility of deciding. I wait to decide whither I am going until I shall have returned from the journey which will itself have revealed whither I am actually going." "No more dogmas or formulas," writes Hubert Lagardelle, "no more futile discussions as to the future of society; but a feeling of the fight, quickened by practice, a philosophy of action which accords preeminence to intuition, and which declares that the simplest workman in the heat of combat knows more about the matter than the most abstract doctrinaires of all the schools."

These then are the general ideas behind the Syndicalist movement, and their connection with much that has recently happened and is happening in Europe and America is not far to seek. From a different point of view, and a different point of feeling, from that of the wage-earner, with his limited outlook, it is not difficult to criticise them. Mr. and Mrs. Webb do so, alike on ethical and on practical grounds; the methods advocated are, they say, wrong in themselves, and would not result in achieving their object. But meanwhile society has to realise the sort of passionate feeling that animates the movement, and to consider on what lines, of education on the one hand and of wise social reform and industrial regulation on the other, its militant propaganda can best be met. The problem is most acute in Great Britain and the United States. In France syndicalism is already on the wane, and one of its French originators recently described it as now only an "article d'exportation." (HUGH CHISHOLM.)

THE TURCO-ITALIAN WAR, 1911-12

On September 28, 1911, the Italian ultimatum demanding that Turkey should permit the military occupation of Tripoli was presented to the Porte, and on the 29th the Italian Government declared war. Italy, having taken the initiative in the dispute, was in advance of Turkey with her preparations. In order to give the Italian expedition a national character, a special force was formed of contingents from different army corps, and was assembled at Naples, Genoa and Palermo. The Italian fleet had been practically ready since September 1st, and needed only to summon its reservists. Lieut.-General Caneva was appointed Supreme Commander of the naval and military forces, composed as follows:

Navy.—Commander in-Chief, Vice-Admiral Aubry. First and Second Squadrons (1st, 2nd, 3rd and 4th Divisions). *First Squadron*: 4 battleships, 4 cruisers, 8 destroyers; *Second Squadron*: 4 battleships, 5 cruisers, 8 destroyers; *Training Division*: 4 battleships, 1 cruiser; *Independent Division*: 1 battleship, 3 cruisers, and a torpedo flotilla; *Red Sea Division*: 5 cruisers, 6 torpedo craft.

Expeditionary Army Corps. *1st Division*, (1st and 2nd Brigades); *2nd Division*, (3rd and 4th Brigades); *Army Troops*, 7 battalions infantry, 6 mountain batteries, besides technical troops, 2 dirigibles and 6 aeroplanes. *Total*: 31 battalions, 6 squadrons, 18 batteries, about 40,000 men. Steps were taken to mobilise a 3rd, and subsequently a 4th torpedo.

The Turkish Navy consisted of 4 battleships, 2 protected cruisers and 27 torpedo craft, besides some old gun boats in the Red Sea. The inefficiency of the *personnel* rendered this fleet a negligible factor. The Turkish force in the vilayet of Tripoli consisted of the 42d Independent Division, (14 battalions, 10 squadrons, 6 batteries) with an actual strength of about 5000, to which must be added some 3000 Redifs. The coast defences of Tripoli town were old fashioned masonry forts armed with obsolete guns. Munir Pasha was in command of the troops. Three Turkish divisions were stationed in Yemen, whence a raid might seem possible against Eritrea.

The Libyan coastline is rocky, and difficult of access. Marsa Tobruk is the best harbour. Tripoli itself is exposed in northerly winds; Benghazi and Derna are open roadsteads. The country consists of an arid plateau divided into two portions, corresponding to Tripolitana and Cyrenaica, by the deep indentation of Sydra Bay. Caravan roads enter the province on the east from Sollum and Siwa; on the west along the coast by Zuara, and further inland by Nalut to Gharian. Important oases in the interior are Azizie and Gharian, in the west, and Aujila in the east. The population of the interior consisted of Berbers and nomad Arabs. The chief influence among the latter was that of the Senussi sect.

Naval Operations.—During the first week of the war, the Duke of the Abruzzi's Independent Division sank or blockaded in their ports, all the Turkish torpedo craft in the Adriatic. In deference to Austrian sentiment, these operations were then suspended. On the 4th of October part of the 1st Squadron seized Marsa Tobruk, which was required as a base. The Turkish fleet had left Beyrout on September 28th and had only learned of the outbreak of war when off Rhodes next day. No attempt was, apparently, made by the Italians to intercept it, and it reached the Dardanelles on October 1st. On October 3d, when the exodus of Italian subjects was complete, the 2d Squadron and Training Division bombarded the coast forts of Tripoli; the garrison, except for a few gunners, had withdrawn inland towards Gharian. On the 4th, the forts were finally silenced and on the 5th the town was occupied by a naval brigade. A blockade of the Libyan coast was declared on the 3d of October.

Transport of the Italian Expeditionary Force.—Some 40 transports had been chartered for the expedition; tonnage was allowed at the rate of 1300 tons per battalion; 900 per squadron and 1100 per battery. About 1000 infantry and artillery of the 2d Division sailed on October 5th to garrison Marsa Tobruk. But for the rest of the force a pause of some days ensued. Meanwhile the situation at Tripoli was critical, as the enemy were showing signs of activity; five infantry battalions were therefore hurried on in advance, reaching Tripoli on the 11th of October. The transport of the bulk of the 1st Division commenced on the 9th and was concluded on the 18th, by which time about 20,000

troops had landed. The remaining 5 battalions of this division were landed at Homs on October 21st.

The transports conveying 10,000 men of the 2d Division arrived off Benghazi on October 18th escorted by part of the First Squadron. On the morning of the 19th, fire was opened by the ships and a landing was effected on Giuliana Point, west of the harbour, in the face of opposition by some 300 Turkish regulars and 2000 Arabs. In the afternoon the troops, under General Ameglio, advanced on Berca, which was captured by nightfall. After a nocturnal bombardment by the fleet Benghazi was occupied by the Italians on the 20th. The rest of the 2d Division occupied Derna on the 18th, an attempt made on the 11th having failed, owing to bad weather. During the passage of these convoys from Italy to Africa, the Independent Naval Division patrolled the entrances to the Aegean Sea.

Land Operations.—The Italian operations were limited, at the outset, to the occupation of the coast towns. The defeat of Adowa (1896) had not been forgotten and public opinion favoured a cautious policy. It was hoped that the Arabs would accept the situation, and that the Turkish troops, cut off from the coast, would surrender or retreat across the frontier. The Italian entrenchments round Tripoli had a front of 10 miles; on the right, west of Bu Mellian wells, the field of fire was good; in the centre, near "Fort" Mesri—an old earthwork—it was indifferent; for two miles on the left, in the oasis, it was limited to a few yards.

The Turks had now established an advanced base at Ain Zara. Early on October 23d, Neschat Bey, who had succeeded Munir Pasha, directed a strong attack through the oasis, against the left of the Italian line. At the crisis of the fight, when most of the reserves had been drawn in, the Arabs in the suburbs behind the entrenchments treacherously rose in arms, and assailed the Italians in rear. The situation was for a time most critical, and it was only after eight hours fighting that the attack was driven off by the remaining reserves. After this incident, drastic measures were taken to disarm the natives and to clear the zone in rear of the outpost line. On October 26th the Turks again attacked the centre and left of the line, and were only repulsed when most of the Italian reserves had been employed.

General Caneva now withdrew his left to Mesri and Dahra, abandoning Fort Hamidieh and "Fort" Mesri. The attacks on the 23d and 26th had cost the Italians 374 killed and only 158 wounded, the small proportion of the latter being remarkable.

It was now evident that the Arab population must be considered hostile and that more troops would be needed. General Caneva was, therefore, reinforced by the 3d Division from Italy; the 1st and 3d Divisions at Tripoli were organised as an Army Corps under General Frugoni.

On November 5th the annexation of Tripoli and Cyrenaica by Italy was decreed, possibly as an indication that no compromise would be accepted.

Thus reinforced, General Caneva resumed the offensive. On the 7th of November Fort Hamidieh was retaken by a brigade of the 3d Division, and on the 26th, after an attack by three brigades, the old outpost line and "Fort" Mesri were reoccupied. This success was followed up on December 4th by an attack on the Turkish base at Ain Zara. The advance was carried out in three columns, of a brigade each, which converged on the Turkish position. The Turks, finding their flanks threatened, abandoned their camp and eight guns, and retreated towards Gharian, leaving detachments at Tarhuna and Azizie. Ain Zara was now strongly fortified by the Italians; Tajura was occupied, and the whole oasis was cleared of the enemy.

On the night of December 18th and 19th, a force of three battalions, one squadron, and one battery under Colonel Fara, set out from Ain Zara to surprise a hostile force reported at Bir Tobras. Misled by incorrect maps the column lost its way; at day-break the enemy was encountered in superior force; after maintaining its ground with difficulty during the day, the column withdrew by night to Ain Zara. That a disaster was averted was due to the skill and gallantry of Colonel Fara, who was rewarded by promotion to Major-General.

Heavy rain fell from November 13th onward, adding greatly to the discomfort of the troops and increasing the difficulty of operations.

During this period the aeroplanes had done good service, in spite of violent winds; the dirigibles had, however, been reshipped to Italy for repairs owing to damage suffered in a storm in December 1911.

Meanwhile in Cyrenaica the Turks had attacked Benghazi on the night of December 10th and 11th and Derna on December 16th and 26th. On the latter occasion the Italians lost 4 killed and 77 wounded. In January Enver Bey, who had now assumed command of the Turks in this quarter, took up a central position near Benghazi, and tried to entice the Italians beyond the range of the ships' guns. Additional reinforcements (including one brigade 4th Division and a combined Brigade) reached Cyrenaica in November and December 1911.

The total number of Italian troops in Africa at the end of 1911 had risen to 100,000 distributed approximately as follows:

	Battalions.	Squadrons.	Batteries.
Tripoli and Ain Zara	37	6	18
Homs	5		2
Benghazi	18	2	5
Derna	13	1	3
Tobruk	6		2
	<hr/>	<hr/>	<hr/>
	79	9	30

In addition 4 battalions, 2 squadrons and 10 batteries were awaiting embarkation at Naples. A battalion of Askaris from Eritrea reached Tripoli early in February 1912.

The Turks and Arabs combined were estimated at 12,000 round Tripoli and 10,000 to 20,000 in Cyrenaica.

The Winter of 1911-12.—After the action of Bir Tobras the war entered on a new phase, which lasted till April 1912. Except for local enterprises the Italians remained on the defensive on land, allowing the enemy to waste his strength in attacking their entrenchments. These attacks were pressed with great vigour and sometimes succeeded against outlying works, but were always repulsed in the end with heavy loss to the assailants. The only exception to this policy was an attempt to occupy Zuara with troops of the 10th Brigade from Italy. The town was bombarded on the 17th of January, but no landing could be effected owing to the rough weather and to the opposition of the Turks entrenched on the beach.

The seizure of the French vessels "Manouba" and "Carthage" by Italian warships January 16th and 18th, on suspicion of carrying contraband and combatants, evoked a protest from France; Italy finally gave way and released the vessels.

On January 18th and 19th the defensive perimeter of Tripoli was extended by the occupation of Gargaresch; on February 27th the heights of Merkeb, two miles south-east of Homs, were captured by the Italians and held in spite of efforts by the Turks to retake them on February 28th and March 5th and 6th. On February 11th and again on March 3d vigorous attacks were made on the Italian lines at Derna; on the latter occasion Enver Bey is said to have been wounded. Marsa Tobruk was attacked on February 23d and again on March 11th.

On March 12th a brilliant success was gained by General Ameglio over a strong force of the enemy assembled near the Fojat oasis within range of the defences of Benghazi. The attack was carried out by two columns supported by heavy artillery; the enemy were completely defeated, losing 400 killed. The Italians lost 29 killed and 62 wounded. This victory earned General Ameglio a step in rank.

Meanwhile, on February 23d, Italian cruisers had appeared off Beirut and had sunk two small Turkish warships which were in the port. This step was, perhaps, intended as a warning that Italy would extend her sphere of operations if peace were not concluded.

Operations in the Red Sea.—The Italian operations in the Red Sea were directed to neutralising the Turkish ship boats in this sea, and, indirectly, to putting pressure on

Turkey by hampering her operations in Yemen. On January 7, 1912, owing to reports of an intended raid on Eritrea, some Italian destroyers searched the channels among the Farsan Islands and put seven Turkish gun boats out of action, while two cruisers bombarded Jebel Tahr and Loheia. A blockade was then declared of the coast between $14^{\circ} 30' N.$ and $15^{\circ} 11' N.$ This limit was afterwards extended to $15.15 N.$ so as to include Kamaran Island. On various occasions Turkish camps and forts at Akaba, Hodeidah, Mocha, Djebana, and Sheikh Said were shelled by Italian warships.

Operations in the Spring of 1912.—An attempt at mediation having failed early in March, steps were taken by Italy for more active operations. The next phase of the war consisted in the strengthening of the Italian hold on the Mediterranean littoral, and the extension of naval operations to the Aegean.

The town of Zuara, near the Tunisian frontier, served the Turks as a collecting centre for contraband of war, smuggled in over the Tunisian frontier. On April 10th a force of about 10,000 men from Italy, Tripoli and Homs, were landed on the Macabez Peninsula, under cover of a demonstration by the fleet against Zuara. Forwa, on the mainland, which is accessible by a ford from Macabez, was occupied next day. The enemy still retained Sidi Said at the neck of the peninsula and could use the caravan route through Regdalin, 10 miles further inland.

The dirigibles "P₂" and "P₃," which had now returned from Italy, flew over from Tripoli during these operations, and subsequently carried out reconnaissances, and dropped bombs into hostile camps and entrenchments.

On May 2d the garrison of Homs captured Lebda, two miles further east along the coast, and retained it in spite of determined attacks on May 30th, and June 8th and 12th. On the latter occasion the Turco-Arabs captured two forts, but were finally repulsed with a loss of 400 killed.

Admiral Aubry died on March 4th and was succeeded by Admiral Viale. On April 15th, the First Squadron left Taranto and a concentration with part of the Second Squadron and the Duke of Abruzzi's flotilla took place in the southern Aegean. On the 18th, after cutting the cables between Lemmos and Imbros, the fleet (less the 3d Division) under Admiral Viale approached the Dardanelles, preceded by two cruisers which tried to lure the Turkish ships out of the channel. Failing in this object the fleet bombarded the outer forts. Meanwhile the 3d Naval Division destroyed some wireless telegraph stations in the Southern Aegean, and sank a Turkish gunboat at Vathy (Samos). Under cover of these operations the Italians occupied the island of Stampalia, where they established a naval station; the Turks replied by closing the Dardanelles to all traffic, an action which involved them, as was perhaps foreseen by the Italians, in difficulties with neutrals. The straits were reopened for traffic on May 10th.

Early on May 4th a force consisting of about 10,000 troops from Benghazi, Tripoli and Tobruk, in 7 transports, arrived off the island of Rhodes. A disembarkation was effected in Kalithea Bay on the south coast of the island, while a portion of the fleet demonstrated against the town; 8000 troops were disembarked in two hours and the whole force within eight hours. The town of Rhodes was occupied next morning, but the majority of the garrison withdrew to Psithos, twelve miles inland. On May 15th, by a skillfully combined movement with two columns, which landed by night on opposite sides of the island, and a third which moved inland from the town of Rhodes, the Turkish force, about 1000 strong, was forced to surrender. By the end of May the Italians had occupied the islands of Stampalia, Neros, Piscopos, Kharki, Rhodes, Scarpanto, Casos, Karpathos, Patmos, Kalminos, Lipsos, Kos and Simi.

Meanwhile, at Tripoli, it had been decided to crush a Turco-Arab force which was entrenched at the oasis of Zanzur. The total force employed was 13,000 men. At day-break on June 8th, the attacking force (2 brigades 1st Division) advanced eastwards from Gargaresch, keeping touch with the fleet on its right. The remaining troops were held in reserve in two bodies, at Gargaresch and Bu Mellian, to protect the left flank and rear of the attack. After severe fighting the 1st Division captured the position, but other bodies of Arabs hurried up from the south and intervened between the 1st

Division and Gargaresch, till the advance of the second group of reserves compelled them to retire. The Italians then fortified a point on the coast north of Zanzur but the oasis itself was not yet occupied.

Occupation of Misrata.—The victory of Zanzur enabled General Caneva to spare troops for the occupation of the important oasis of Misrata. On June 15th a composite division about 10,000 strong, drawn from Italy, Tripoli, Derna and Benghazi, under General Camerana, landed at Bu Sceifa, five miles from Misrata, under cover of a demonstration by the fleet at Ziliten. After repelling an attack by 5000 Turco-Arabs on July 2d, Camerana moved against Misrata on the 9th. The advance was made in three columns, the right column keeping touch with the fleet. The centre column took Zuruk after severe fighting while the right column routed the enemy's left. The force then occupied Misrata. The Italian casualties were 9 killed and 121 wounded. An attack on Gherem by General Fara (southwest of Misrata) on July 20th brought on a rear guard action which cost the Italians 19 killed and 87 wounded.

Meanwhile, on the western frontier, on June 26th, Garioni had attacked the enemy's position at Sidi Said with two columns, one advancing along the Peninsula and one moving parallel to it from Fort Forwa. After three days' fighting, the enemy were driven from successive positions and fell back to Sidi Ali. The Arabs could, however, still use the road through Regdalin and Zuara and the occupation of these places was therefore decided on. Garioni's force was first increased to 20,000 men. On August 4th a demonstration was made to the south-west of Tripoli by the 3d Infantry Division. On the same night a force of 5000 men (6 battalions and 2 batteries) under General Tassoni, landed just east of Zuara which was captured next morning. Simultaneously Garioni's force moved east along the coast from Macabez and joined hands with Tassoni. The enemy withdrew to Regdalin. On August 15th the combined forces under Garioni captured the Samad hills, between Regdalin and Mensua, thus definitely closing the coastal roads to contraband traffic.

General Caneva's policy of allowing the enemy to wear themselves out by attrition had caused some discontent in Italy. It was urged that for 100,000 regular troops to remain on the defensive against some 6000 Turks and 20,000 Arabs was injurious to Italian prestige. On September 5th, it was announced that, the first phase of the campaign having been concluded by the occupation of all the points of the coast, General Caneva's task was accomplished. He was then recalled, and two independent commands were formed under Generals Briccola and Ragni in Tripolitana and Cyrenaica respectively. It was understood that an expedition to Gharian would take place in the autumn of 1912.

The last naval operation took place on the night of July 12th and 13th, 1912. About midnight five Italian torpedo boats, under Commander Millo, entered the Dardanelles to attack the Turkish fleet anchored above the narrows. After reaching Kilid Bahr under a heavy fire, the leading boats were stopped by steel cables and the flotilla retired. Four of the boats were hit but none seriously damaged. The fear of an Italian landing compelled the Turks to keep 30,000 troops within reach of the Dardanelles forts.

We now reach the closing phase of the war. Early on September 22d a force of three brigades from Tripoli attacked the Turco-Arab position south of Zanzur. The defenders, who were estimated at 8000, were driven off by 8 A.M. Two impetuous counter-attacks by Turco-Arab reinforcements, which hurried up from Suani Beni Adam, were defeated by the evening after fierce fighting at close quarters. The Italians lost 208 killed and 256 wounded.

The last serious fighting took place in Cyrenaica. On September 15th the Italian garrison of Derna had advanced their line to Kasr el Lebn and Casa Aronne three miles south-east of the town. On the 17th these positions, which were held by three brigades, were attacked by Enver Bey with a strong force supported by guns. After severe fighting the Turco-Arabs were repulsed with a loss of 1100 killed. On October 7th the Italians captured the important position of Sidi Abdullah, three miles south-west of Derna; under cover of this operation a battalion and two batteries landed at Bombah,

which was occupied without fighting. On October 11th, the Italian line was still further advanced on the Sidi Abdullah plateau, the enemy being driven back with heavy losses.

The Italian troops now present in Libya numbered about 110,000, *viz.* Tripoli and neighbourhood 45,000; Zuara and Sidi Said 15,000; Homs 6000; Misrata 10,000; Benghazi 12,000; Derna 20,000; Tobruk 6000. The Turco-Arab forces were estimated at about 40,000, with a few guns.

Meanwhile, the Balkan crisis had arisen, and the Turkish mobilisation was being hampered by inability to transport troops across the Aegean Sea.

Peace with Italy was indispensable, but the negotiations came to a deadlock on October 12th. Preparations were being made in Italy for active naval operations when on October 15th the Porte accepted the Italian terms, and peace was signed. Turkey agreed to withdraw her troops from Libya, without formally recognising Italian sovereignty. Italy consented to restore the captured islands and to guarantee a portion of the Ottoman debt corresponding to the revenues of Libya.

The war had cost Italy about sixteen millions sterling, up to the end of August 1912, or £47,250 a day. (H. H. WADE. Major.)

THE BALKAN WAR: *October–December 1912.*

Military conventions for joint action against Turkey had been signed during the summer of 1912 between Bulgaria, Servia, Greece and Montenegro. Some preparatory naval and military measures were taken by the Allies during September, at first secretly, and more openly on the announcement in the latter part of September that grand manoeuvres of 200,000 Turkish troops were to be held near Adrianople. The manoeuvres in question were cancelled on the advice of the Powers, and the Turkish reservists were dismissed; nevertheless, on September 30th, the four States of the Balkan League issued orders for mobilisation, a step to which the Porte replied by a similar order on October 1st, and by impounding some 150 Greek vessels lying in Ottoman ports. Mobilisation and concentration appear to have been completed in Bulgaria, Servia, and Greece about October 12th to 16th; and in Montenegro, where distances are shorter, by the 7th. In Turkey serious delay was caused by the inability to transport troops over the Aegean because of the war with Italy, and by the absence of many units from their peace stations owing to recent political disturbances.

Montenegro, having finished her concentration first, declared war on October 8th. This step was probably taken to anticipate intervention by the Powers; it may also have been desired to capture Scutari before its defences could be further strengthened, and to detain as many Turkish troops as possible in the west. On October 13th the other States of the Balkan League presented an identic note to Turkey demanding reforms in Macedonia, and the demobilisation of the Turkish Army. On the 17th the Porte, declining further negotiations, declared war on Bulgaria and Servia. Some attempt was made to detach Greece from the League, but on the evening of the 17th that Power declared war upon Turkey.

The Turkish territory in Europe was divided geographically into three principal regions, forming distinct theatres of war:—an eastern region of open country in Thrace; a western mountainous region between the Vardar Valley and the Adriatic; and a central belt of rugged country between the Aegean Sea and the Rhodope Mountains; the latter range was crossed by passes on the Uskub-Sofia and Serres-Struma Valley-Sofia roads, but was otherwise impassable for large bodies. Strategically, the eastern theatre of war, on the direct road to Constantinople, was of greatest importance, and it was in this direction that Bulgaria deployed her largest masses. But the geographical conditions and the territorial ambitions of the other allied States favoured a development of their chief strength in the western theatre of war.

The Bulgarian forces destined to invade Thrace consisted of 8 regular divisions, various reserve brigades (afterwards formed into 2 additional divisions), and 1 cavalry division, with a total strength of about 200,000. These troops were organised in three

armies:—the 1st Army (General Kutincheff), comprising the 1st and 8th Divisions (50,000 men with 100 guns), which was originally assembled near Sofia and then secretly transported by rail through Philippopolis to Yamboli; the 2nd Army (General Ivanoff), composed of the 3rd and 8th Divisions and the Cavalry division (50,000 men with 260 guns), which was concentrated about Tirnova; and the 3rd Army (General Dimitrieff) with the 4th, 5th, 9th Divisions (72,000 with 250 guns), which was concentrated east of Yamboli. A secondary force composed of the 7th Division (General Todoroff), about 24,000 strong, was assembled near Dubnitza; the object of this force was to invade Macedonia by the Struma and Mesta Valleys and preserve communication between the allied forces in the eastern and western theatres of war. Finally the 2nd Division (24,000) under General Kovacheff was to cross the frontier south of Haskovo and safeguard the right of the 2nd army. A Bulgarian detachment, said to be formed from the 1st Army Inspection, accompanied the 2nd Servian Army along the Kustendil-Uskub road. The total force under arms at the outset was 340,000. General Savoff was in chief command, with headquarters at Stora Zagora.

The Servian forces were concentrated in 4 groups or armies:—the 1st Army, consisting of three 1st line, or two 2nd line divisions, and 1 cavalry division (about 97,000 with 232 guns), under the Crown Prince and General Putnik, on the Nish-Vranya road; the so-called 2nd Army (General Stephanovich), composed of one 1st line division (21,000 with 36 guns), strengthened by a Bulgarian detachment, on the Kustendil-Uskub road; the 3rd Army (General Yankovich), composed of one 1st line and two 2nd line divisions, (50,000 with 120 guns), near Kursumlje; and a 4th or Ibar Army (General Zikhovitch), consisting of one 2nd line division (15,000) at Raska, with detachments of 7,000 and 3,000 3rd line troops at Ivanjica and Vzice respectively. The total force under arms was 200,000 men with 430 guns.

The Greek forces were assembled in two principal masses. On the east the main army of 4 divisions (44,000), afterwards increased by 3 reserve divisions, under the Crown Prince and General Danglis, was concentrated near Larissa and Trikala with a view to operations in Thessaly against the Turkish Southern Army; on the west a secondary group (originally about 12,000) under General Sapuntsakis, based on Missolonghi, was to neutralise the Turkish forces in Epirus, and capture Prevesa.

The Montenegrin forces formed 3 armies:—a Central Army, under Prince Danilo, of 5 brigades (14,000 men), with 20 guns; a Southern Army of 3 brigades (8,000 men), with heavy artillery; and a Northern Army of 3 brigades (9,000 men), with 12 guns. The first two armies were destined to advance north and south of Lake Scutari against the town of Scutari and Mount Tarabosch. The Northern Army was to invade the Sanjak of Novi Bazar, and join the Servians. Headquarters were at Podgoritzza.

The Turkish forces were organised in 3 principal armies and several minor groups, as follows: (1) A Main or Eastern Army in Thrace, consisting of the 1st, 2nd, 3rd, 4th, 17th and 18th Army Corps and a cavalry corps, besides various *Redif* divisions, making, it is said, about 116,000 rifles, 3,000 sabres and 312 guns in all at the outbreak of war. This force, which was commanded by Abdullah Pasha, was based on Constantinople, Eregli, and Rodosto, and was being concentrated in the area Dimotika, Eski Baba, Kirk Kilisse, Adrianople. The latter place was surrounded by a girdle of strong modern forts with a perimeter of at least 22 miles, and garrisoned by about 32,000 men under Shukri Pasha. Kirk Kilisse had only 3 permanent forts, but these had been supplemented by numerous semi-permanent works, converting it with an entrenched camp. (2) A Western Army destined to oppose the Servians, consisting of the 5th, 6th and 7th Corps and six *Redif* divisions (64,000 with 260 guns), under Zekki Pasha; the greater part of this army was in the Plain of Uskub, with advanced posts pushed up towards Vranya and Kustendil; three divisions, with numerous Arnaut auxiliaries, making about 40,000 in all, were in the Sanjak of Novi Bazar and in the Lab Valley. (3) A Southern Army, including 2 independent and 1 Asiatic *Redif* divisions, about 30,000 in all, under Hassan Tahsin Pasha, concentrated at Kozhani and Diskata, and intended to oppose the Greek main army. In addition there was a force of 24,000, known as the Struma Army (24,-

oo0) at Serres and a detachment of 15,000 near Gumuljina, keeping touch between the Turkish Eastern and Western armies. There were also independent groups of 18,000 under Essad Pasha in Epirus, between Janina and the Greek frontier; and of 20,000 chiefly Albanian *Redifs*, at Scutari and Tuzi under Hassan Riza Pacha. The above figures are necessarily only estimates, representing the best information available at Christmas 1912. The numbers in Thrace were being constantly augmented by the arrival of troops from Asia. Ali Riza Pasha was in chief command in Macedonia. The supreme command of the whole Ottoman forces was given to Nazim Pasha.

As regards the maritime forces, the Greek Navy (1 modern cruiser, 21 torpedo craft and 1 submarine) was assembled off Salamis; 4 destroyers purchased in England and 3 obtained from Germany were still on their way out. The Bulgarian flotilla (6 coast-defence torpedo boats) was at Varna, which port, like that of Burgas, was fortified and defended by mine fields. The Turkish Fleet (3 battleships, 2 cruisers and 20 torpedo craft) was in the Bosphorus and the Dardanelles; both these Straits were defended by powerful coast defences; while the Dardanelles channel was mined at Chanak.

Eastern Theatre of War.

Operations of the Bulgarian Armies.—The Turks hoped to complete their concentration on the railway while the Bulgarians wasted their strength against Kirk Kilisse and Adrianople. They apparently believed that the latter fortress, which lies on the natural line of invasion from Eastern Rumelia, would be the first objective of the invaders. General Savoff's initial dispositions were designed to confirm this impression, though his main attack was really to be directed against Kirk Kilisse.

On October 19th the 2nd Army (Ivanoff), which had advanced from about Simenli-Tirnova, moving on both banks of the Maritza, occupied the frontier post of Mustapha Pasha; on the two following days it closed on Adrianople from the north and west; meanwhile, the 3rd Army (Dimitrieff) was advancing on Kirk Kilisse from the north in four columns, on a front of 30 miles (Petra to Samakov); the 1st Army (Kutincheff) advanced on the right (west) of the 3rd army.

From October 22nd to the 24th the 1st and 3rd Bulgarian Armies were engaged north and north-west of Kirk Kilisse. It appears that the Turks, who had brought 70,000 men up to this flank, attempted a night attack, which was repulsed by the Bulgarians, and that a panic then ensued among certain *Redif* divisions. Kirk Kilisse was captured on the 24th with large quantities of supplies, and the Turkish army, much disorganised, fell back to the railway and to Bunarhissar. Dimitrieff's centre was moved forward to Kavakli, where a Turkish rearguard was driven back after an obstinate fight.

Meanwhile, the 2nd Army had attacked Adrianople (22nd–23rd), but had failed to capture any of the main defences; a Turkish sortie had been repulsed with the loss of 12 guns. On October 23rd the 1st Bulgarian Army pushed its right wing to the Tunja Valley, north of Adrianople; it next advanced its left wing to the Maritza Valley, south of that fortress, thus completing the investment (Oct. 29th). The Bulgarian cavalry occupied Eski Baba (Oct. 27th), capturing 4 locomotives and 243 trucks.

While these operations were in progress, the 2nd Bulgarian Division had crossed the Rhodope range from the north, and defeated a Turkish force at Kirjali (Oct. 20th); part of this division then descended the Arda valley to join the 2nd Army before Adrianople. Further east, the main body of General Todoroff's force in the Struma Valley had captured the important Kresna defile and was approaching Demirhissar, while a force detached to the Mesta Valley had occupied Buk on the Salonica-Dedeagach railway, thus severing communication between the Turkish Eastern and Western Armies; other portions of the 7th Division had advanced south-west to Kochana and Strumnitza.

The Bulgarian 1st and 3rd Armies made no further advance till October 28th; the pause, which was perhaps due to the failure of the attack on Adrianople, enabled Abdullah Pasha¹ to effect a change of front to the line Lule Burgas-Viza; this position, 20 miles in extent, was held by the 4th, 1st and 2nd Corps (in order from left to

¹Accounts differ as to whether Nazim Pasha or Abdullah Pasha was in command.

right), while the 3rd Corps was in reserve in rear of the right. Abdullah Pasha's plan was to remain on the defensive on the left at Lule Burgas, while his right wing, supported it is said, by some troops landed at Midia, took the offensive towards Kirk Kilisse.

The Bulgarians attacked on the 29th with the 1st Army, reinforced by 3 brigades from the troops investing Adrianople, against Lule Burgas, and with the 3rd Army against Viza. The Turkish positions in the open country on the left were poorly entrenched; their troops had been for days without food, and ammunition was scarce. From the first their artillery was overwhelmed by the better served guns of the Bulgarians. On the 31st their left centre (1st Corps) gave way, and on November 1st the whole left wing fell back in some disorder to Chorlu, abandoning a great part of its artillery. The 3rd Corps in the hilly and wooded ground, on the right flank gained some success on October 31st, but on November 2nd it too was driven back. The Bulgarians only pursued for a short distance, and the Turks retreated slowly towards the Chatalja lines, covered by a cavalry division. This battle ended the first stage of the war in Thrace, which had cost the Turks about 30,000 killed and wounded and at least 20,000 missing.

For reasons which remained obscure the Bulgarian Army—or at any rate its right wing—halted on the battlefield till November 7th; this delay was concealed at the time, and reports were disseminated in the Press of a vigorous pursuit, and of a second victory near Cherkesskeui. Actually the Turkish rearguard did not leave Chorlu till November 6th; on the following day the Bulgarians advanced on both sides of the railway; on the 10th/11th their right wing drove the Turks out of Rodosto in spite of the fire of a Turkish warship; by the 13th they had pressed the Turks back across the Kara Su.

The Chatalja lines, in which the Turkish Army was now assembled, were a position of great natural strength extending along a chain of heights across the peninsula from sea to sea, protected on either flank by lakes, and in front by a swampy river valley. The defences consisted of about 110 works of various dates, armed with heavy guns and providing several tiers of fire. Owing to the absence of pursuit, the Turkish army had largely recovered from its disorganisation, and the arrival of Asiatic reinforcements had to some extent replaced the losses suffered at Lule Burgas. But cholera had broken out and was making ravages among the troops and refugees in rear of the lines.

On November 17th the Bulgarians unmasked their batteries and commenced an attack with the 1st Army (3 divisions) on the Hamidieh forts west of Hademkeui, and with the 3rd Army (4 divisions) against the Turkish lines south of Lake Derkos. The Bulgarian artillery, consisting chiefly of field batteries, was unable to silence the enemy's fortress guns on the higher ground. The Turkish warships rendered effective assistance on the southern flank. After gaining ground on the night of the 17th/18th, the attacking troops were either withdrawn or driven back across the Kara Su, and the action was broken off by the Bulgarians under cover of an artillery cannonade on the 19th. The bulk of the Bulgarian forces was withdrawn west of Chatalja village, and billeted in villages along the railway, covered towards the east by entrenchments about Chilskeui and Kalissakeui.

Meanwhile, negotiations for an armistice had been commenced at the instance of Turkey. The Allies demanded as guarantees the surrender of the besieged fortresses and the evacuation of the Chatalja position, conditions which the Turks, elated by their success, refused even to consider. Hostilities were resumed on November 21st, but discussions were again commenced on the 24th, and no serious land fighting took place in this quarter till the signature of the armistice (Dec. 3rd).

The reports of an intended attack on the Dardanelles led the Turks to assemble 30,000 troops in the Gallipoli Peninsula, where Torgut Shefket Pasha was appointed to command. Some Kurdish and Hamidieh cavalry were shipped across the Sea of Marmora to operate in the Kuru Dagh and Tefkur Dagh hills, north of the Peninsula.

Meanwhile, in the central theatre of war, General Todoroff with the main body of the 7th Division had advanced from Demirhissar on Salonica, reaching that town just after its capitulation to the Greeks. Portions of this army then occupied Kavalla (Nov. 15th) and Serres (Nov. 20th).

The end of November was marked by a Bulgarian victory near the Aegean coast. As already mentioned, a force of 15,000 Turks had been defeated at Kirjali on October 20th and had retired towards Gumuljina, where their presence constituted a threat on the rear of the troops investing Adrianople. During November, operations against this force were undertaken by various Bulgarian detachments; one column of the 2nd Division, advancing from Kirjali, drove the Turks southwards to Gumuljina; while other columns, consisting largely of cavalry, pushed down the Maritza valley to cut the Turks off from Dedeagach. Gumuljina was captured on November 22nd; the Turks then retired along the railway to Fere station, and finally took up a position north of Merhanli village. There the Bulgarian columns closed round them, and after an artillery combat on the 26th, the whole force surrendered on the 27th. The prisoners numbered 12,000, including Yawer Pasha and his two divisional commanders. While these operations were in progress, a portion of one of the Bulgarian columns, which had descended the Maritza valley, had entered Dedeagach (Nov. 26th), capturing large quantities of rolling stock; another detachment had moved farther east to Malgara, midway between Dedeagach and Rodosto. The occupation of Dedeagach rendered possible the transfer of part of General Todoroff's army to Thrace. This force, numbering about 12,000, was embarked at Salonica in Greek transports between November 23rd and 27th, and landed at Dedeagach about the 28th-30th. Railway communication from Dedeagach to Dimotika was opened about November 22nd.

Of the siege of Adrianople meanwhile few details became known; the garrison under Shukri Pasha maintained an active defence, and, in spite of prolonged bombardment and numerous costly attacks, no important success was gained by the besiegers, except the capture of the Kara Tepe and Papas Tepe forts on November 10th. It does not appear that the Bulgarian ordnance was of sufficient power for the task imposed on it. After the capture of Kirk Kilisse (Oct. 24th) a portion of the investing force was withdrawn to reinforce the field army, and their places were taken by 3rd line troops. At the beginning of November 45,000 troops of the 1st and 2nd Servian Armies are said to have joined the besieging force. Attempts by the garrison to break out towards the south and east were repulsed on November 18th and 24th. A final unsuccessful assault was made on the west front just before the conclusion of the armistice.

The Bulgarian recruits of the 1913 and 1914 contingents were called out to replace losses, and left for the front after a short training on November 25th.

Western Theatre of War.

Operations of the Servian Armies.—The Servian plan of campaign was apparently for the 1st and 2nd Armies to converge on the plain of Uskub while the 3rd Army safeguarded the right flank of the movement, captured Prishtina, and moved on Uskub via the Kachanik Pass. The 4th Army, in the Sanjak of Novi Bazar, was to get touch with the Montenegrins and neutralize the Moslem elements in this region. On the other hand Zekki Pasha's intention was, it is stated, to keep his army concentrated near Uskub, and act on interior lines against the Servian 1st and 2nd Armies; while the troops in the Sanjak were to prevent a junction of the Servians and Montenegrins, and to raid the Servian communications.

On October 19th the 1st Servian Army crossed the frontier, and on the 22nd—after delaying, to allow the advance of the 2nd and 3rd Armies to make itself felt—it came in touch with the Turkish 6th and 7th Corps near Kumanovo. The Turks attacked on the 23rd, but were repulsed; early on the 24th the Servian 1st Army took the offensive, assisted by a detachment of the 2nd Army, and gained a complete victory. Meanwhile the Servian 2nd Army had occupied Strazin on November 22nd, and had reached Kratovo, where part of the Turkish 5th Corps was defeated on the 26th. The Turkish Army, demoralised by its defeat at Kumanovo and finding its retreat threatened, evacuated Uskub without further fighting, abandoning most of its artillery (115-120 guns) and immense quantities of stores. The Servians entered Uskub on the 26th.

The greater part of Zekki Pasha's Army retired from Uskub to Kaprulu; but one

detachment, too late to follow this road, escaped westwards to Kalkandele. After a vain attempt to reorganise the troops, Kuprulu was abandoned on November 1st, and the Turkish army continued its retreat in two portions, a detachment following the Vardar valley, while the main body retired through Perlepe towards Monastir.

Meanwhile, the Servian 3rd Army had taken Mitrowitz and Prishtina (October 22nd)—the latter after severe fighting—and was advancing by Ferisovich towards Prisrend. In the Sanjak of Novi Bazar the 4th Army had captured Sjenica on October 24th, gaining touch with the Montenegrins, and Novi Bazar after 3 days fighting on October 27th. Plevlje was taken on the 28th, the Turkish garrison escaping over the Austrian frontier; Nova Varosh surrendered on November 5th. By the middle of November the region north of Kachanik Pass was practically in the hands of the Allies. The main body of the 4th Servian Army reinforced by two newly formed reserve divisions then moved towards Ipek, and continued the pacification of the country.

After the capture of Uskub the Servian armies were partly reconstituted. One 2nd line division of the 1st Army and the one division of the 2nd Army, under General Stephanovitch, were dispatched by rail, via Sofia, to assist the Bulgarians in Thrace. A portion of the 1st Army, consisting chiefly of cavalry, pushed down the Vardar Valley, defeated some Turkish detachments at Demir Kapu, and Doiran (Nov. 5th), and eventually entered Salonica after its surrender to the Greeks on November 8th.

The bulk of the 1st Army (4 divisions) pursued the main body of Zekki Pasha's Army along the Kuprulu-Monastir road. The Turkish rearguard was defeated in a two days battle (Nov. 4th/5th), near Perlepe, which town was occupied on the 6th. Here the advance of the Servians appears to have been suspended for a week, owing perhaps to difficulties of supply and to a heavy snowfall which commenced on November 7th.

The 3rd Servian Army moved from Ferisovich against the Turkish detachment which had retired westwards from Uskub; this army occupied Kalkandele on October 31st. From this point the pursuit was continued by the Morava 2nd line division, which now came under the orders of the 1st Army, to Gostivar (Nov. 3rd), and thence to Kirchevo; here the Turks were reinforced, but were again defeated after heavy fighting on November 6th. The Morava Division now suspended its pursuit and prepared to co-operate with the 1st Army's advance from Perlepe on Monastir.

Though a decisive battle was still to be fought, political reasons induced the Servians to send the remainder of Yankovich's army (2 divisions) on a difficult march across the snow-covered mountains to the Adriatic coast. The route taken was by Prisrend, and across the Mirdite country, where the troops were well received. The Servians captured Alessio on November 17th/18th after slight opposition, with the aid of 5 Montenegrin battalions. After a short rest at Alessio a portion of the 3rd Army, accompanied by several hundred Malissores, marched southwards along the Adriatic coast to Durazzo, which they reached on November 28th.

The main body of the 1st Servian Army (4 divisions and 1 cavalry division) appears to have resumed its advance about November 14th, by which time the Morava 2nd line Division from Kirchevo had come up in line with it on the right. The Turkish Army, consisting of the remains of the 5th, 6th and 7th Corps, occupied a front of 20 miles from Novak to Gopes; 2 independent divisions were in reserve at Monastir. Their total strength is variously put at 35,000 men with 50 guns and 90,000 men with 100 guns. On the 17th, without waiting for the arrival of the Greek Main Army from Salonica, the Servian troops forced the passage of the swift running Cerna, wading breast deep through the icy water. On the 18th and 19th the Morava Division, on the right flank, enveloped the Turkish left, while the approach of the Greek Army from Ostrovo threatened their line of retreat. After four days fighting, in which the Servian gunnery again asserted its superiority, the Turks gave way (Nov. 10th/20th). Some fragments of their army broke through towards Florina and Gonitza, and reached the Grammos mountains; but the greater part were dispersed or fell into the hands of the Greek columns near Banitza. The Servians captured 5,000 prisoners and the greater part of the Turkish artillery. Their cavalry pursued as far as Florina, where they joined hands

with the Greeks. The Morava Division captured Resna on November 21st, and a force was then despatched via Elbassan (Dec. 1st) to Tirana, where touch was gained with the Servian troops at Durazzo. Dibra surrendered on November 29th. On the same day, at Valona, Ismail Kemal Bey proclaimed the independence of Albania.

Operations of the Montenegrin Armies.—Montenegro had started the war, and on October 9th all three Montenegrin armies were set in motion. The Northern Army (Vukovich) occupied Bjelopolje on the 13th, and then turned off towards Berane, where the Turks (5 battalions, and 3,000 Arnauts) were defeated on the 15th with the loss of 700 prisoners and 12 guns. Berane was occupied on the 16th. Vukovich next occupied Plava (Oct. 19th), and Ipek, after an obstinate defence, on October 31st. Meanwhile, a portion of his army had advanced to Sjenica, where it got touch with the Servians on October 24th. Farther north an irregular brigade crossed the Tara and attacked Plevlje on October 28th in conjunction with the Servians.

The Central Army fired the first shot in the war on October 9th. On the 10th it stormed the fortifications of Dechich; on the 14th it obtained the surrender of Tuzi with six Nizam battalions and three guns. Meanwhile General Martinovich's army was advancing south of Lake Scutari; a right wing detachment of this army was thrown across the Boyana River. Both armies were, however, brought to a standstill in the second week of October, before the defences of Scutari and Mt. Tarabosh; siege operations were then commenced and were carried on chiefly by artillery fire, but the fortifications proved too strong for the Montenegrin guns; the defence was active, and repeated sorties were made against the investing troops.

In November one brigade of Martinovich's army was detached southwards along the Adriatic coast and occupied San Giovanni de Medua on the 16th, afterwards assisting the Servians to capture Alessio on the 17th/18th. On November 23rd this brigade was recalled to the siege of Scutari, where the situation had become critical owing to the attitude of the Mirdites. On the 28th all the Montenegrin forces—except some detachments in the Sanjak of Novi Bazar—were ordered to concentrate round Scutari; the King then took over the supreme command, with General Vukovich as Chief of the Staff. Operations round Scutari were continued during the peace conference, as the armistice was not recognised by the Turkish commander.

Operations of the Greek Armies.—On October 18th the Greek Main Army crossed the frontier at the Meluna Pass; on the 19th the Turkish advanced troops were driven from Elassona; a Greek detachment was sent from the latter place to Caterina (on the coast) which was occupied on the 28th. Meanwhile the Main Army advanced northwards and completely defeated the Turkish Southern Army at the Sarantoporos Defile, capturing 22 guns. The Greeks pursued through Serfije (Oct. 23rd) to Kozhani, whence the 5th Division was detached as a left flank guard, towards Banitza. The rest of the Greek Army advanced to Verria, which was reached, after some fighting at the Tripotamos defile, on October 29th. The Turkish Struma Army made a final attempt to save Salonica by taking up a position with its main body (25,000 men) at Yenidje Vardar on the left flank of the Crown Prince's line of advance, while a detachment at Plati Bridge barred the direct route to Salonica. The Greek Army defeated both these forces on November 2nd, capturing 14 guns, and, after a difficult march across the swampy Kampania plain, received the surrender of Hassan Tahsin Pasha and 29,000 Turkish troops at Salonica on November 8th. An attempt by part of the garrison to break out towards the east was frustrated by Tocloroff's Bulgarian force on the 9th.

The 5th Greek Division, 4,500 strong, which had diverged to the north-west from Kozhani, engaged a Turkish rearguard at Nalbandkeui on October 29th; on November 2nd it was attacked near Banitza by 15,000 Turks and fell back on Sorovech; here it suffered a further reverse on November 5th and retreated towards Kozani, losing—it is said—12 guns, which were retaken by the Servians at Monastir.

On November 15th 5 divisions of the Greek Main Army left Salonica, to co-operate with the Servian 1st Army, marching in two columns, one via Kailar, which picked up the 5th Division on its way, and one by the direct Salonica-Vodena road, on Monastir.

The 2 columns united near Banitza, encountering little opposition, though their approach no doubt influenced the result of the battle of Monastir. As it was, they captured large numbers of prisoners and several guns in the defiles of Pisoderi and dispersed some bodies of Turkish troops retreating via Florina. On November 25th, the Greek cavalry, supported by an infantry division, attacked Kastoria (south-west of Sorovech), capturing more prisoners and guns. In December the Main Army, advancing by Goritza, defeated the Turks at the Sangoni Pass, and then pushed on towards Janina.

The Western Greek Army under General Sapuntsakis crossed the frontier near Arta on the outbreak of war, and detached a force with some heavy guns to besiege Prevesa; that fortress surrendered on November 4th, after bombardment by sea and land, with 500-600 prisoners. The main column continued its advance towards Penti-pigadia, but met with a slight reverse on October 23rd. On November 14th General Sapuntzakis had again advanced and had captured Mount Metsovo. On November 28th his troops appeared before Janina. Meanwhile the Turkish force in Epirus had been reinforced by the remnants of the Western Army from Monastir.

Hostilities were continued during the Peace Conference, as the Greeks were not parties to the armistice. About December 10th an attack was made on the Turkish position near Janina, while a force of 2 Greek battalions and some irregulars was landed at Santa Quaranta to effect a diversion on this flank. This detachment was re-embarked after an encounter with 8 Turkish battalions west of Janina. On December 12th/13th the Greeks attacked Janina and made some progress towards the Bizani fort; on the 20th/22nd the Turks took the offensive against the Greek forces south of Janina but were repulsed with heavy losses.

Naval Operations.

Except in the inland seas the Greek fleet had held undisputed maritime command throughout the war. About October 17th some destroyers were detached to the Ionian Sea to assist in the siege of Prevesa and blockade the Epirus coast; about December 4th Greek warships are said to have bombarded Valona and occupied the island of Sasseno, evoking a protest from the Albanian provisional government. The remainder of the fleet, under Admiral Conduriotis, acting in the Aegean, occupied Mudras Bay (Lemnos) as a base, on October 21st, and blockaded the Dardanelles. Subsequently the islands of Thasos, Imbros, Samothrace, Tenedos, Ikara, Psara, and Strati were captured by the fleet, and troops were landed on Chios and Mitylene, where fighting continued for some weeks. On October 31st a Greek torpedo boat sank the old Turkish cruiser Feth-i-Bulend in Salonica harbour.

The Turkish fleet was occupied during October in conveying transports from Trebizond and Sinope to Constantinople, and in blockading the coast of Bulgaria. In November it assisted in the defence of the Chatalja lines, enfilading the Bulgarian attacks on the southern flank. On November 21st the cruiser Hamidieh was badly damaged by a Bulgarian torpedo attack about 15 miles off Varna. On December 16th the Turkish fleet issued from the Dardanelles and exchanged shots with the Greek squadron, afterwards retiring within the straits.

After negotiations commencing on November 25th between the plenipotentiaries of the Turks and Allies at Bagchekeui, in front of the Chatalja lines, an armistice was signed on December 3rd between Turkey on the one hand, and Bulgaria, Servia, and Montenegro on the other. The chief conditions were that the belligerent armies should retain the positions they then occupied; that the besieged fortresses should not be revictualled, and that the Bulgarian army should receive supplies by way of the Black Sea and of Adrianople, but not for 10 days after the signing of the armistice. It was also stipulated that negotiations should begin in London on December 13th. Greece declined to sign the armistice, being unwilling to relax the blockade of the Epirus coast. The interruption of the Turkish maritime communications was therefore maintained during the peace conference.

(H. H. WADE.)

THE WORLD'S ARMIES AND THEIR DEVELOPMENT

I. Tendencies of Military Progress.

During the years 1910-12 no very large increase in numbers has been made in any army. On the other hand certain European armies have suffered more or less serious losses in men and war material as the result of recent campaigns. No important change in organisation is recorded except in the case of the Russian army which is now being reorganised. In some armies organisation has been modified with a view to perfecting arrangements for rapid and secure mobilisation and for increasing the numbers available on the outbreak of war. The most important as well as general change in military armaments has been the employment of aircraft, the influence of which upon land warfare is an interesting problem, while in some cases improvements and increase in artillery and machine guns are also recorded. Both the intercommunication and rearward services of armies generally have been improved through the development of wireless telegraphy and mechanical transport.

The tendency of military progress undoubtedly continues to lie in the direction of constant readiness for war based upon very complete and thorough previous preparations. The Great Powers have been concentrating their energies and resources during peace in developing the power to strike with their whole strength and with the fullest effect immediately hostilities commence. It is considered in military circles that wars between neighbouring civilised states in adjacent territories will not under existing conditions be long or protracted. They will tend to be comparatively short, but extremely severe struggles. Under these conditions the power to strike quickly and with overwhelming force at decisive points is essential for success. Modern strategy accordingly aims at securing the initial advantage by surprise if necessary, and pressing it by a sustained offensive until resistance is crushed without affording either time or opportunity for the enemy to recover his morale and strength. The whole object of good strategy is to gain the initiative and strike the first effective blow, and then follow it as quickly as possible with a decisive blow.

It is possible, of course, that conflicts between civilised peoples may still be protracted as in the case of the South African and Manchurian campaigns, if armies have to be despatched great distances over land or sea to operate in vast theatres of war thinly populated with civilised men or inhabited by savage races and lacking in adequate supplies, roads, railways and other facilities for communication. But in wars between neighbouring states such as the first phase of the Balkan campaign of 1912, or in conflicts between Great Powers, when opposing armies will come quickly into touch and operate in thickly populated theatres of war well supplied with roads and railways, which make it possible for troops, with the help of efficient rearward services and mechanical transport, to move rapidly over considerable distances, the final crisis cannot under ordinary circumstances be delayed very long. It is highly improbable that such struggles will be protracted, more especially in the case of great industrial communities.

Apart altogether from the loss of life and expenditure involved in actual fighting, which in conflicts between Great Powers must be stupendous, the interruption of the normal activities of national existence and particularly the paralysis of trade and industry consequent upon warlike operations on a vast scale, coupled with the probable shortage and increased cost of the necessities of life, will all seriously drain the resources and sap the strength of the combatant peoples if continued for any length of time. There is moreover the possibility that such conflicts, owing to factors that are considered below in relation to the Balance of Power, may become almost universal, involving many allied peoples whose territories comprise whole continents with calamitous effects which must be felt throughout the world. Although these considerations are not likely to deter nations from engaging in wars upon sufficient provocation in the present temper of humanity, they will certainly tend to make them more onerous and costly and therefore less protracted.

In view of these tendencies success in war to-day depends primarily upon readiness

for war during peace. Nations will stand or fall according to their strength at the hour of trial and the rapidity with which they are able to develop it to strike an effective blow. It must be remembered that while the duration of war tends to become shorter, the time required for making necessary preparation for it tends to become longer. An army is now too complicated a piece of mechanism to improvise or create hastily. It is no longer possible to make men in a short time into efficient soldiers, much less into efficient officers, upon whom devolves the whole work of training armies in peace and leading them in war. Even weapons have been transformed by science into instruments which are only effective in expert hands. For all these reasons the tendencies of military progress strongly militate against the possibility of making untrained or half trained men into efficient soldiers after war breaks out with any prospect of success or utility. On the other hand to oppose efficient soldiers with partly trained or ill-equipped troops, however courageous and strong in numbers, is utterly futile. That they will be doomed to useless slaughter and certain defeat under such circumstances is the clearest of military truths. To-day nothing but complete readiness justifies the experiment of war.

II. Numbers, Organisation, Armament.

The following figures are approximate throughout and include all ranks.

Austria-Hungary.—Establishments: Peace 425,000; War, 2,300,000. The effect of the Army Bill of 1912 will be to add about 45,000 men during the next five years. There has been no important change in organisation. The chief development in armaments, apart from aircraft, has been a large increase in machine guns.

France.—Establishments: Peace, 610,000; War, 3,900,000. The normal organisation of the army consists of 23 Army Corps and 41 Cavalry Brigades. The chief development in organisation and armament, apart from aircraft, has been the reorganisation of the field artillery, as the result of which 656 field and mountain guns, 12 heavy guns and about 6,000 men have been added to the peace establishment.

Germany.—Establishments: Peace, 623,000, War, 4,150,000. By the recent Defence Law (Military) two new Army Corps have been organised out of the extra divisions and brigades of the former 23 Army Corps—thus making in peace 25 Army Corps, each of two divisions and six extra brigades. To complete the two new Army Corps, field and foot artillery batteries, 2 Pioneer Battalions and 2 Train Battalions were to be raised in 1912. In addition, the number of machine gun companies is being doubled—at present one regiment in each infantry brigade is provided with a machine gun company. These changes will result in an increase of numbers.

British Empire.—*United Kingdom*:—Regular Army (Peace establishment) 137,500. Army Reserve¹ (strength) 139,000. Special Reserve (strength) 91,000. Territorial Force² (strength) 260,000. *India*:—Regular Army (War strength) 76,700. Indian Army, Native troops (regimental establishments) 159,000. Reserve 36,000. *Colonies and Egypt*:—Regular Army (Peace establishment) 45,000. *Self-Governing Dominions*:³—*Canada*:—Dominion Troops, Permanent Force 3,000; Militia 42,000. *Australia*:—Commonwealth Troops, Permanent Force 2,400; Citizen Forces 35,000. *New Zealand*:—Dominion Troops, Permanent Force 500; Territorial Force 34,000. *South Africa*:—the Union Defence Force has not yet come into existence. Changes in the armament of the Regular Army in the United Kingdom, apart from aircraft, include the issue of an improved cartridge and the adoption of a new Howitzer gun. There has been no important change in the organisation or armament of the Regular Army abroad, the Indian Army or the Territorial Force. The Canadian Militia has been reorganised and the Australian and South African Forces established on the basis of a moderate

¹ A National Reserve has been formed, but enlistment carries no obligation of training or service and the force is at present without organisation, equipment, arms or uniform.

² This force is not fit to take the field against continental troops. Its training and equipment are to be completed after the outbreak of war and it is expected that some months must elapse before it is ready for service.

³ The troops of the Self-Governing Dominions as a whole are not yet organised, equipped, staffed, trained or armed to fulfil the requirements of modern war.

amount of more or less general compulsory training for youths and adults between certain ages. It will be some years before these forces can reach their full strength.

Italy.—Establishment: Peace 250,000; War 1,215,000. The period of service in the army has been altered from three to two years without affecting its numbers. There has been no important development in organisation or armaments apart from aircraft. The campaign in Tripoli has not appreciably weakened the army through losses of men or war material.

Japan.—Establishment: Peace, 226,000; War 1,001,000. No important development in organisation or armament, apart from aircraft, is recorded.

Russia.—Establishment: Peace 1,200,000; War 5,530,000. The army is at present in the process of reorganisation. When completed this work will simplify military organisation and render it more homogeneous without, however, increasing the army in numbers. The former active army organisation of field and reserve troops has been modified by abolishing reserve units and substituting a number of new field units which add 6 new Army Corps and a Cavalry Division to the peace establishment. The troops have also been redistributed, 7 Army Corps and 2 Cavalry Divisions being centrally massed about Moscow and Kazan ensuring greater security for mobilisation. The most important development of armaments, apart from aircraft, has been a large increase of artillery.

Other Countries.—No important change in numbers, organisation and armament, apart in some cases from the provision of aircraft, is recorded in the case of other armies throughout the world with the following exceptions. The reorganisation of the United States and Belgian armies has been decided. In the latter case an increase in numbers and efficiency will result in the course of time. The Turkish army sustained severe losses in men and war material as the result of the campaigns in Tripoli and the Balkans. The Greek, Servian and Bulgarian armies sustained losses which are to some extent counterbalanced by the capture of Turkish war material, including artillery.

III. The Influence of Aircraft.

The influence of aircraft on military operations, despite peace tests, must to a large extent remain a theoretical and speculative question until decided by actual experience in war. Consequently the subject can only be dealt with tentatively and very generally. Both dirigible airships and aeroplanes of different types, the latter carrying observers as well as pilots, will be employed. Their activities will be affected according to the season of the year and by conditions of weather, wind, cloud, mist and darkness. Airships will have the advantage of longer flight, greater stability and larger radius of action, while aeroplanes will be swifter, present less vulnerable targets and be less costly to provide. At present the main tendencies in the employment of aircraft are: (1) in the case of *dirigible airships*, their development for (a) strategical reconnaissance over a large area, (b) night reconnaissance; (2) in the case of *aeroplanes*, their development for (a) tactical reconnaissance by day, (b) observation of artillery fire. Both types of aircraft will be used for aerial wireless telegraph signals and intercommunication services generally, especially over a wide front when other communications are blocked or difficult. Both will further be employed for aerial photography, making aviation maps and in varying degrees for offensive action with light guns and explosives.

Thus the principal use of aircraft will be to obtain and transmit information. Their radius of action in strategical or tactical reconnaissance will be far greater and swifter than that of cavalry. Within a few hours the results of an aeroplane reconnaissance along seventy miles of country should be in the hands of a commander—a task which cavalry would probably require some days to perform. The information obtained by aircraft reconnaissance will probably be more accurate and complete than that which would usually be supplied by cavalry. For example, mountains, rivers and covering troops cannot screen the movements of an army from aircraft, and though small numbers of troops may be hidden from them in broken or wooded country, it will be extremely difficult for large numbers or marching columns to escape observation.

Aircraft, then, will mainly influence operations through increased facilities for information. They will enable commanders to base plans upon certainties where formerly they were forced to act upon conjecture or in ignorance of material factors. They will render it more difficult to mislead or mystify an opponent. They will probably tend to concentrate power in commanders-in-chief and curtail the freedom of subordinate leaders. They will save cavalry much distant reconnaissance and accordingly increase the value of that arm in its other duties, which consist of affording protection to troops and action on the battlefield. Aircraft will not replace cavalry nor revolutionise its action. They will supplement but not wholly usurp one of its functions, namely, reconnaissance.

In regard to offence, a certain amount of the moral effect will be produced by dropping bombs on troops, arsenals and cities; and this effect will undoubtedly be great on a civilian population even if the explosives do little damage. It is certain that attempts will be made to limit the activities of aircraft and to destroy them, for which purpose special weapons will be perfected for use on airships, aeroplanes and on land. It is also certain that opposing forces will attempt to gain superiority in aircraft which will result in an overwhelming advantage against an enemy. Hostilities in future may possibly commence with a preliminary phase of aerial combat between opposing aircraft with the object of obtaining the "command of the air." The results that an unopposed aircraft may be able to achieve will obviously be reduced to a great extent by the pressure of efficient hostile aircraft.

IV. The Balance of Power.

In considering the effect of recent military changes and developments upon the balance of international power, it is necessary to remember that the military factor of this problem cannot be considered wholly independently of its other main factors, policy, sea power and wealth. The naval and military energies of war-power are closely interrelated, and both are influenced by considerations of policy on the one hand and wealth on the other. It must also be remembered that the more equally the scales of power are balanced the more sensitive they become to the play of the various forces which disturb their equipoise and react upon nations in unrest and at times in acute tension. Under these conditions which prevail at the present day even relatively unimportant military developments must appreciably affect the balance of power, while those of a far-reaching nature may completely alter the whole international situation.

Three formal alliances and one unwritten accord still in the main preserve the balance of power between the great nations of the world. These are the Triple Alliance between Germany, Austria and Italy, the Dual Alliance between France and Russia, an unwritten accord known as the Triple Entente between Britain, France and Russia, and an alliance between Britain and Japan. The Triple and the Anglo-Japanese Alliances have both recently been confirmed and extended for a further term of years while the grouping of the Powers during political crises in the present and more immediate past tend to confirm the strength, reality and continuance of the Triple Entente. For practical purposes the operation of the Triple and Dual Alliances and the Triple Entente is confined to the continent of Europe, while the scope of the Anglo-Japanese Alliance is definitely limited to the territories of the allies in Asia.

Among the various peoples of European descent who inhabit and dominate the continents of North and South America, Africa and Australasia, there is at present no "balance of power" in the sense of the international policy in force in Europe and Asia. They are not yet divided by dangerous rivalries and sharp racial antagonism or grouped accordingly like older nations into opposing armed camps nor do they appreciably affect the balance of power in Europe and Asia. They are happily to a great extent domiciled upon different continents according to their principal national and racial origin as Spanish and Portuguese Latins and Anglo-Saxons, and many of them are separated from the others by natural barriers and vast distances of land or sea. The British Self-Governing Dominions, owing to the peculiar constitution of the British

Empire, are under no definite obligation to furnish troops to assist the mother country beyond their borders in the event of war in any part of the world, but the trend of Imperial policy inclines towards combined action by the naval and military forces of the whole British Empire in a supreme emergency.

Practically the whole military power of the world is thus confined, for international purposes, between the shores of Britain and Japan, within the contiguous continents of Europe and Asia. Its strongest and most numerous armies are massed in the smallest of its continents. Europe is the pivot of world power and the great danger zone of political cyclones. The armies of Europe are the huge counterweights which turn or balance the scales of international power. To-day these armies control the destiny of Europe; to-morrow they may control the destiny of the world. For the rapid development of sea-power by the great military nations—which is the most important development in armaments since the substitution of nations-in-arms for standing armies of limited size—may extend their power of offence to territories surrounded by ocean frontiers. The significance of this possibility can be realised by remembering that the limits of military power at present are racial as well as geographical. The Slavs, Teutons and Latins of Europe possess it. With a single exception the independent Asiatic races, the Latins of America and the Anglo-Saxons throughout the world, in a comparative sense lack military power.

Factors of Change.—It is clear from this general survey that the effect of recent military developments upon the balance of power must be considered separately in relation firstly to Europe, secondly to Asia, and lastly to the international situation as a whole. With regard to Europe the question is no longer limited to changes in the relative strength and advantages of the Triple Entente and the Triple Alliance respectively. With the probable continuance of the Balkan League as constituted in 1912, apart from the possible ultimate inclusion of Rumania and Turkey, a new military power may have come into existence, destined to exercise a profound influence upon the balance of power not only in Europe but also in Asia and perhaps beyond the confines of these continents. Even in the somewhat improbable event of the disruption of the League, the principal results of the Balkan war—the practical disappearance of Turkey from Europe, a Mediterranean seaboard for Bulgaria, the economic independence of Servia with an outlet to the Adriatic, and the political independence of Albania—must in time affect the balance of power in Europe through economic considerations and changes in policy and sea power as well as through military developments.

Apart from the Balkan War perhaps the most important recent military changes in Europe are those which affect the balance of power through the completion of railways, redistribution of troops and mobilisation. These changes aim at gaining the initiative and strategic advantage on the outbreak of war by a rapid mobilisation and concentration of troops at the desired points. The German strategic railways running both to the Eastern frontier and the Belgian frontier have been completed and the German railway system is now linked up with that of Belgium. The conversion of the Russian railways running to the Western frontier from a single to a double track is practically complete. While rearrangements in the German army ensure more rapid mobilisation and an increase of numbers in the first line on the outbreak of war, the redistribution of the Russian army makes mobilisation more secure as well as more rapid.

In the event of war these changes affect the relative position of France and Germany on the one hand and Germany and Russia on the other. Through an alliance or understanding with the Belgians or by violating their neutrality and overwhelming their resistance, the Germans may attempt the rapid concentration of a large force in Belgian territory with the object of turning the line of the French northern frontier defences by advancing into France through Belgium. Although Russia formerly possessed on her Western frontier a force superior to that with which the Germans could oppose it, the latter could be mobilised more quickly. Under the present scheme of reorganisation Russia should be secure from the danger of German attack before her mobilisation is complete, but on the other hand, notwithstanding the improvement of her western

railway, some time must elapse before the Russian army can take the offensive against Germany and her allies.

The Triple and Dual Alliances.—In the absence of exact information regarding the war plans of different nations it is difficult to estimate the precise effect of these changes in advantage to one or other of the great groups of European Powers in the event of hostilities in which actual fighting at any time must be confined to a comparatively few uncertain points in an immense theatre of war. While France and Russia possess the advantage in numbers the Triple Alliance undoubtedly possesses great advantages as regards situation in the theatre of war. The French and Russian armies together number on war establishment alone about 9,500,000 men as against the total war establishment of about 7,500,000 German, Austrian and Italian troops.¹ The armies of the Dual Alliance, however, are widely and completely separated by the territories of their possible enemies, while those of the Triple Alliance are better situated for combined action because for the purpose of war their territories become a single country cutting Europe in two from North to South, with coasts upon the Baltic, North Sea and Mediterranean. The land communications of their territories until invaded are secure, enabling the three armies to concentrate and reinforce one another, while the French and Russian armies must depend for these facilities upon sea communications threatened by hostile fleets.

On the whole therefore the changes under consideration seem to favour German strategy, with its principle of a strong offensive, upon which the war plans of the Triple Alliance are probably based. They will undoubtedly facilitate these plans, the object of which may be to launch swift, overwhelming attacks from one or more points simultaneously against France and Russia, or alternatively to hold back the Russian forces while every effort is concentrated upon crushing their apparently more accessible and vulnerable French ally as quickly as possible—a task which should not be easy, as the French army is one of the most formidable and efficient in the world. If the latter plan proves successful Russia will be faced with the necessity of making peace or continuing the war single-handed. Thus the Powers of the Triple Alliance, owing to advantages of situation, may succeed in concentrating their combined strength upon the armies of the Dual Alliance in turn—a manoeuvre which is practically impossible for the latter to employ against the former.² It is clear, however, that the military situation as it stands may be altered by two important factors. These are the intervention of Great Britain as a member of the Triple Entente and possible developments of recent events in the Balkans.

The Triple Entente.—The military potentialities of Great Britain either as a kingdom or as an empire cannot be considered apart from sea power. Her power of military offence depends entirely upon the maintenance of her sea communications by the force of predominant naval strength. Without command of her sea communications as a whole her troops in any part of the world may become immobile beyond her frontiers and incapable of combined action with the rest. Thus situated the British Empire is without unity for the purpose of military offence. Its scattered armies may be isolated from one another and the power of each limited to the defence of a portion of its enormous territories. Even with the command of their sea communications as a whole assured to the British it is uncertain to what extent in a supreme emergency the combined military strength of their Empire could be concentrated in any part of the world and whether it could be so concentrated in time to be effective. The military forces of the Dominions are all organised for local defence in separate places, not for combined offence in any one place. In no case are these troops yet ready to meet the best Euro-

¹ Despite the dispersion of the Russian army for the defence of a vast Asiatic Empire the Dual Alliance should be sure of superior numbers in Europe, though not necessarily at decisive points at the decisive moment.

² The forces of the Dual Alliance, however, may be able to exert effective simultaneous pressure against Germany, as it is claimed that combination by separated armies, though still difficult, has been made easier by the use of telegraphy. German opinion is said to hold that the telegraph has made operations on exterior lines effective.

pean armies in the field, and in view of the exigencies of warfare it is not certain whether, or to what extent, or when, any of them would be available for service abroad. Nor is it certain whether or how far, the Regular Army in India, Egypt and the Colonies together with the native Indian Army would be available as reinforcements for Britain or her allies at decisive points either at the decisive moment or at all.

The British Empire is not one in a military sense. Its navies do not command the seas as a whole against those of the Triple Alliance. Even with the help of the French and Russian fleets it is improbable that its shortest and most direct line of sea communications with Egypt, India and Australasia through the Mediterranean would be sufficiently secure for the transport of troops at the outbreak of war and while the Austrian and Italian fleets were in being. These facts, considered in connection with the tendency of any wars between great European Powers to be comparatively short in duration, make it probable that the effective military intervention of Britain in such a war would be confined to troops from the United Kingdom. Unless the struggle became prolonged or the combined fleets of the Triple Entente in its early stage gained complete command of the sea and more especially of the Mediterranean, it is improbable that reinforcements from India, the Colonies and the Dominions would arrive in time to intervene effectively in Europe as part of a British force. It might, moreover, be impossible either in time for effective action or at all for the British to withdraw troops from certain parts of the Empire without imperilling their safety or disturbing the tranquillity of territories inhabited by vast alien and subject populations.

Thus British military intervention in Europe, in the early stage of war at any rate, would probably be limited to troops from the United Kingdom, namely the Expeditionary Force, which includes practically the whole of the Regular Army in home stations, brought up with reserves to six divisions, numbering with cavalry about 168,000. These troops, would probably be despatched to co-operate with the French army. At first sight the intervention of 168,000 men in a struggle between armies together numbering over 17,000,000 men on war establishments may seem unimportant, especially as it would still leave the French troops numerically inferior to the German. This small force, however, might prove of the utmost value to its allies, especially if the Germans attempted to advance through Belgium, for the British command of the sea would enable it, with or without French or Belgian reinforcements, to threaten the enemy's flank and lines of communication from the coast—an operation the risks and difficulties of which are clearly great but not insuperable. If utilised with judgment, skill and daring, and provided it could be despatched in time and maintained in the field, the British Expeditionary Force might help materially to turn the scales of advantage in favour of the Triple Entente, and enable the French and Russian armies to gain the initiative and press a vigorous attack against the Germans and their allies.

It is, however, doubtful, whether the Expeditionary Force could be despatched to the Continent in time or at all. The position of Britain in the event of war between the Triple Alliance and the Triple Entente will disclose the reason for this doubt. If the fleets of the Triple Entente gain command of the sea Britain is practically secure from military offence by the Triple Alliance. If Britain loses command of the sea her power of offence is paralysed and her existence is at stake on the fortune of war upon the continent and perhaps in any event. With her fleet "in being," Britain is considered secure from military offence by the Triple Alliance, except for possible raids. In theory it is considered that the results of these raids would be limited to their moral effect upon the nation, which might be very great, and to the loss and confusion occasioned by the possible destruction of naval bases, of communications such as bridges and railways, and of property in harbours, industrial centres and generally. The invasion of the United Kingdom, despite British fleets in being, by a hostile raiding force of at least 70,000 men has authoritatively been declared to be a practical possibility, and there can be no certainty that its strength will never exceed this number.¹ It is both asserted and

¹ It may, however, be that the enemy would not be able to detach largely from his force for the invasion of Britain, at any rate in the early stages of the struggle under consideration.

admitted on the highest authority that the Territorial Force, which is intended for the defence of Great Britain—and presumably Ireland—in the absence of the Regular Army abroad, is unfit to meet good Continental troops in the field, and that this weakness cannot be remedied until some months after the outbreak of war.¹

This then is the position of Great Britain. Her obligations to the Triple Entente, as well as her own vital interests and ultimate security, might and most probably would demand the despatch of the Expeditionary Force to the help of her allies on the continent immediately war broke out or very soon afterwards. Sound strategy in any event would also demand this step, in order to develop the greatest possible strength at the decisive point, which in this case is the Continent. But under the circumstances Britain could not fulfil her obligations to her allies nor act in her own interest to the best advantage and in accordance with the principles of sound strategy, without leaving herself to a serious extent defenceless in the event of invasion for some months after hostilities commenced owing to the unreadiness of the Territorial Force. Theoretically she might be well advised to despatch the Expeditionary Force to the continent and take what strategists would term the "minor" war risks of invasion by raiding forces. Actually this is what she might do if the principles of strategy were the sole consideration and statesmen and soldiers were perfectly free to act upon them. Once war broke out, however, many other factors would be certain to influence and determine the national councils. It is possible that the instinct of self-preservation might impel a frightened people to forbid the despatch of the Expeditionary Force until too late or perhaps altogether, because rightly or wrongly they would feel that its absence would leave them insufficiently protected against the dreaded risk of invasion. In this case neither the demands of national honour and interests nor those of sound strategy might be able to make head against the clamour of popular fear whether it were justified or not. It must be remembered that panic clouds the vision and dominates the acts of nations as well as men, and that statesmen without distinction of party have never been more subservient to the force of public opinion than at present.

For these reasons it is not sufficiently certain that Britain would be able to render military aid to the Triple Entente in the event of war with the Triple Alliance.² The counterstroke of invasion would probably be threatened or made by Germany with the object of frightening the British people into retaining the Regular Army at home and depriving their allies of its assistance. If the military offence of Britain were paralysed the balance of advantage from the recent changes under discussion would seem to lie in favour of the Triple Alliance as against the Triple Entente. But this conclusion, together with estimates based upon it regarding the value of Great Britain to the Triple Entente, must be modified when other essential factors of the problem, such as wealth and sea-power, are taken into account. The nations of the Triple Entente, whose resources include the immense wealth of Britain, are better able to sustain the financial strain of war, especially if it becomes prolonged, than those of the Triple Alliance whose individual and combined economic strength is not so great. The supe-

It is questionable whether it would be sound strategy for him to do so before the power of the formidable armies arrayed against him were broken, or finally defeated.

¹ It is argued that the defects of the Territorial Force under existing conditions are to some degree irremediable, as its armament in artillery and rifles is inferior, as it is without adequate and efficient rearward services and other necessary equipment such as aircraft, which cannot well be improvised hastily, while its officers, upon whom will devolve the duty of training and leading it, are themselves to a large extent untrained.

² Certainty as to the power of Britain in this and perhaps in any event to intervene effectively in hostilities on the continent by despatching a military force appears to depend upon three essential conditions. The first is the readiness and fitness of an adequate force to undertake the military defence of the British Isles against Continental troops immediately war breaks out. The second is public confidence in the military arrangements for dealing with any hostile forces which may succeed in invading the British Isles during the absence of the Regular Army. The third is power to despatch the reinforcements and material necessary to make good the wastage of war, and maintain the Expeditionary Force in the field, while providing amply for the requirements in men and material of garrisons in naval bases, forts, etc., and of field forces in the United Kingdom.

rior naval power of the Triple Entente, which is largely due to British fleets, if maintained, together with their peculiar advantages of situation, should enable Great Britain and France to keep their oversea channels of trade and food supplies open to the world during war, while they closed up those of their more or less land-locked enemies of the Triple Alliance, with the gravest economic consequences, especially in the case of Germany. Finally, if their superior naval strength gained them complete command of the sea, both France and Britain might be able to draw reinforcements from their armies abroad, and perhaps if necessary, from Russia.

The Balkan League.—If the Balkan League, with or without addition to its component states, becomes a permanent factor of European policy, a new great military Power may be added to those which constitute the Triple Alliance and the Triple Entente. In this case the results of the Balkan war may completely transform the conditions which have so far governed the balance of power. At the opening of 1913 it was impossible either to anticipate exactly the land and sea frontiers and the ultimate component states of the League, or to say whether its policy would be one of isolation from the two rival groups of great Powers or an alliance or other understanding with one of them with regard to common action in the event of war. It has become clear, however, that the balance of power in Europe may henceforth depend to a great extent upon the policy of the League. The general situation of its territories places its armies on the flank of Austria and may possibly place them on the flank of Russia, while its future fleets can be based on the Black Sea and the Mediterranean. The intervention of the League, therefore, in favour of either group of Powers would be of the utmost consequence and might prove the determining factor of victory in a war between them. The very possibility of such intervention must lead to careful reconsideration, and in some cases perhaps to modifications, of the strategic principles upon which the respective war plans of the Powers have been based.

The Balance of Power in Asia.—No recent development of naval, military or political activities tends at the present time to disturb the balance of power in Asia as adjusted by the Anglo-Japanese Alliance. On the contrary the good relations existing between the three great Asiatic Powers, Russia, Britain and Japan, have enabled them to deal with difficult and even dangerous problems in a spirit of amity and mutual consideration which makes for the maintenance of peace. Possible rivalries in the south-west and north-east of Asia have been averted by the division of Persia into Russian and British spheres of influence, while the Chinese provinces of Mongolia and Manchuria have been divided into Russian and Japanese spheres of influence. As a result the recent Persian and Chinese revolutionary movements have not reacted unfavourably upon the international situation in Asia or elsewhere. It is impossible to forecast exactly the consequences of what may prove to be the practical expulsion of the Turks from Europe and their concentration in Asia Minor, but there is no reason to suppose that these changes will disturb the balance of power in Asia in the immediate future.

The International Situation.—The international situation is never free from elements of uncertainty and danger. It is also subject to continual change because its political activities are generally measures of temporary expediency adapted to the play of forces which unite or divide nations according to the agreement or conflict of their interests at any time. So long as the balance of power between the various groups of allies in any part of the world is maintained, the danger to peace from issues between them is minimised. The moment the balance of power between these groups is seriously disturbed, the danger to peace from such issues becomes acute, for the very foundation upon which the international structure rests is weakened or fails to support it. Thus the gravest perils of the political situation at all times are not concrete issues between rival groups of allies, which as a rule tend to unite the nations of each group more closely together in defence of their common interests and, as it were, automatically lock the scales of power at an even balance. They are usually forces which disturb the balance of power itself by weakening or disintegrating one of the groups essential for its maintenance or by altering the grouping of nations so as to make any one combination

predominant. At the end of 1912 the possible results of the unfinished Balkan War, and the problem of British military weakness for offensive purposes, constituted the most important uncertain factors in the equilibrium of international power and therefore of international peace.

(E. JOHN SOLANO.)

THE WORLD'S NAVIES¹

Since 1910 progress in the navies of the world has taken two directions: (1) the number of countries claiming a measure of sea-power has been enlarged; (2) the power of existing navies has shown a progressive increase, less in numbers than in size, power, vision, hearing and reach of warships.

Spain, Holland, Argentina, Chile and Australia have joined the number of those States which aspire to own "Dreadnought" ships. Brazil was already included in the list, and, despite recent events, it may be necessary to include Turkey also. Negotiations were proceeding at the end of 1912 for the construction of two "Dreadnoughts" to the order of Portugal. With the opening of the Panama Canal, sea-power will be found to be established in all the oceans of the world.

In regard to the second point, we may deal first with size and power. Table I compares the latest ships building in 1912 for the naval Powers with the original Dreadnought. The increase in the displacement of battleships is from about 18,000 tons to over 30,000.

Table I. Battleships.

¹ See E. B. xix, 308 *et seq.*

We turn next to battle cruisers, a new class of ship of great significance in the naval progress of the world. Of these there are three types in existence, although two of the three do not bear the name. The first type is represented by the Italian "San Giorgio" class, the Russian "Rurik," and the Greek "Giorgios Averoff." They range from 10,000 tons to 15,000, and are armed with weapons of about 10-inch calibre. The second type are the Japanese "Tsukuba" and "Kurama" classes, ranging from 12,000 to 14,000 tons, and carrying as their primary armament 12 inch weapons. The third type are the vessels, only built by Great Britain, Germany and Japan, which are fast "Dreadnoughts." Table II gives particulars of this latter class.

Table II. *Battle Cruisers.*

GREAT BRITAIN (British Empire):—

1911	Kongo		8-14 inch
			16- 6 inch
			27,500 tons

The "Australia" (a sister ship of the "Indefatigable") and the "New Zealand" are contributions of the British Dominions to the world's naval progress.

The worth of the battle cruiser is shown by the fact that the British Admiralty have determined to compose the Mediterranean Fleet entirely of this class of ship. It will probably also in the future constitute the whole of the British fleets on distant service.

Increase of "vision," in the case of ships, does not primarily belong to the ships themselves, but is owing to the immense advance made in aviation. The hydroplane is now a recognised arm of the naval service, and it cannot fail to have far-reaching results in the early obtaining of information about an enemy's fleet. It is too early to say that the aeroplane has been properly co-ordinated with the naval service. But the establishment of a naval section of the Royal Flying Corps in connection with the British Navy gives promise of an efficient service. While Great Britain, France and the United States have adopted the aeroplane, Germany seems rather to rely on the dirigible.

"Hearing" is, of course, wireless telegraphy. A British warship off the coast of Spain communicated in 1912 direct with Bombay. A British Imperial chain of stations is being established which will need only one relay from England to Australia. During the Balkan crisis in the autumn of 1912, the "Weymouth," a British cruiser, was in continuous communication from Constantinople with Whitehall.

"Reach" may be either strategical or tactical. The former is expressed in the term "enduring mobility," and is bound up in the question of oil fuel, which is estimated not only to give three knots extra speed, but also to increase the fuel endurance of ships by 25 per cent. Added to which, they can take in fuel wherever they happen to be without returning to port for it. The latest battleships of the British Navy are designed to carry oil fuel only. A Royal Commission, with Lord Fisher as Chairman, has sat to consider the question of the supply of oil fuel to the Navy, and the feasibility of adopting the internal combustion type of engine as the propulsive power. The Commission were confronted in 1912 with the difficulty that internal combustion engines were all of the reciprocating type. They were looking for one on the turbine principle. The only internal combustion engine based on the turbine principle was the Gnome, generally used

for aeroplanes; and so far it had proved beyond the power of mechanics and metallurgists to produce this type outside France.

Tactical reach is involved in the increased range of guns and torpedoes. In 1908 and onwards, the Germans, abandoning their principle of arming their ships with the lightest heavy gun which would be effective against armour, adopted a weapon corresponding to the 12-inch which was for years the standard heavy weapon in other navies. The details of this weapon are as follows:—

Calibre.	Weight.	Length in calibres.	Weight of projectile.	Muzzle velocity.
12.01 in.	51½ tons	50	981 lbs.	2,838 f. s.

But the following year saw a general advance in the size of primary artillery. Great Britain led the way with a 13.5 inch gun, of which the following are the particulars:—

Calibre.	Weight.	Length in calibres	Weight of projectile.	Muzzle velocity.
13.5 in.	76 tons.	45	1,250	2,821 f. s.

This weapon is mounted in the "Orion" and "Lion" classes, but it has been followed by another of identical calibre but slightly increased weight, firing a projectile of 1,400 lbs. This is mounted in the "King George V," "Queen Mary" and subsequent classes. It is likely that the new ships will mount a weapon of 15, or some probably of 16.25, inch calibre, weighing 122 tons, and firing a projectile of 2,200 lbs.

Other nations which have adopted a gun above 12 inch calibre, so far as is known, are the following:—

Country.	Calibre.	Weight.	Weight of projectile.
Chile	14 inch	83 tons	1,700 lbs.
France	13.4 inch	66.3 tons	1,332 lbs.
Germany	15 inch	90.7 tons	1,653 lbs.
Italy	15 inch	102 tons	1,653 lbs.
Japan	15 inch	96 tons	1,900 lbs.
U.S.A.	14 inch	70.3 tons	1,400 lbs.

In regard to some of these countries, the information must be accepted with reserve. The guns have certainly been built and tested; but there is no official information that they have been adopted for naval use. Notably is this the case with Germany.

As regards the torpedo, all the naval nations have now adopted a 21-inch weapon, which, with hot air, has an extreme range of 10,000 yards and an initial speed of 33 knots.

Armour.—Krupp cemented continues to be the standard armour of the world, at any rate for heavy plates. The American Bethlehem plate is a modification thereof. The Richardson armour, which is an alloy of molybdenum, has given excellent results on the testing ground, but has not at present been adopted, owing to the reluctance of the great manufacturing firms to incur the expenditure involved in laying down the necessary plant. For lighter plates, a vanadium compound has been adopted by the British Admiralty, which proposes to employ it for the light-armoured cruisers ordered under the programme of 1912-13.

There is a distinct tendency noticeable towards an increase both in the prolongation and in the thickness of the armour belt. The 11 inches of the "Dreadnought" have become 13 inches in later vessels, while, in the American "Oklahoma" class, the belt is to extend over 400 feet of the 575 which is the total length of the ship.

In British battleships the main armour-belt, which was 11 inches thick in the "Dreadnought" and the "Bellerophon" classes, was reduced to 9½ inches in the "St. Vincent" class, rose to 12 inches in the "Neptune" and "Orion" classes, and has been further increased to 13½ inches in the "King George V" and subsequent classes. For battle cruisers, it has risen steadily from 7 inches in the "Invincible" to 9 inches in the "Lion." The latest classes are to have special armoured gratings over the funnels as a protection against attack by aeroplane, and also an armoured upper deck.

In German battleships, the main belt has progressed from 9¾ inches in the "Nassau"

class to 12 inches in the "Kaiser" class, the latest completed, while in the "S" now building it is alleged that a 15 inch belt is contemplated. Battle cruisers vary from 7 inches in the "Von der Tann" to 9½ inches in the "Seydlitz."

American practice has varied considerably. The "Michigan" class have a long, narrow belt of 11 inches tapering to 9 inches covering two-thirds of their length. In the "Delaware" the belt is also of 11 inch armour, long and narrow, but continued upwards about the turret bases. In the "Utah" and "Florida" this extension is again abandoned; in the "Texas" class the thickness of the plate is increased to 12 inches, but the belt remains narrow, whereas in the "Nevada" there is a long and wide belt of no less than 14 inches in thickness, and this armour is carried up to the base of the funnels and to the top of the barbets and conning-tower. These ships will be the most heavily armoured in existence; but American practice has been curiously inconsistent in the matter of armour protection.

The Japanese do not pin their faith to armour. Their "Dreadnought" battleships have a 12 inch belt amidships which covers less than one-third of the ship. It is, however, very wide. The battle cruisers are to have a 10 inch belt amidships.

The French navy has apparently abandoned its faith in heavy plating, for the new "Dreadnought" battleships of the "Courbet" and "Lorraine" classes only have very short and narrow belts of 10¾ inch armour, the rest of the hull being covered with 7 inch plates. The turrets, however, are protected by 12 inch armour in the former class, and by no less than 17 inch in the latter.

The Italians, true to their tradition, are armouring their new ships of the "Dante Alighieri" and "Conte Cavour" classes very lightly. A short but wide belt 9½ inches in thickness is their main defence, and the turrets are equipped in the same manner.

The Austrian "Viribus Unitis" class has a short and narrow belt of 11 inches, and the turrets have the same protection. The belt is reduced to 4 inches near the ends, and the extreme bow and stern are unprotected.

Naval opinion, which tends to uniformity all over the world in the matter of armament and speed, is thus seen to be curiously divided as to the value of armour protection and the best way of applying it.

The Battle Cruiser.—In the British Navy the fast armoured cruiser of the "Dreadnought" type has now been definitely distinguished from other classes by the name "battle cruiser." The Germans, on the other hand, retain the name "Panzer-kreuzer" for all armoured cruisers alike. But the functions of the battle cruiser, as understood in Great Britain, are specific. She is neither a heavily armed cruiser nor a lightly armoured and speedy battleship. She is sometimes traced to Italian influence; but she embodies the very antithesis of the Italian conception of including battleships and armoured cruisers alike under the title of "nave di battaglia."

The term "cruiser" to denote a separate class of ship belongs to the day of the iron-clad. In the sailing era, warships were divided into ships-of-the-line and frigates. The former, up to the 74's, and in some cases including them, were used frequently for cruising duties. They were detached to act independently if required; they were flung first into battle in a general chase; they were occasionally used, as Nelson proposed to use them at Trafalgar, as a separate light squadron. Battle cruisers are intended to perform similar duties; they have nothing whatever in common with the frigate, which is to-day represented by the smaller armoured cruiser, the protected cruiser and the scout. In the British Navy, the battle cruiser, with her high strategical mobility—the sum of speed and fuel endurance—is particularly marked out for oceanic service, where distances are long, and where rapid reinforcement of a threatened area may be required. If the past is any guide to the future, the Imperial Fleet will be composed, so far as its fighting units go, of battle cruisers.

So far, only three Powers have adopted the battle cruiser:—Great Britain, Germany and Japan. The type has developed into the biggest ship afloat, and is extremely costly, the price of construction running up to £2,500,000 in the case of the German ships. Table III shows the evolution of the type.

THE WORLD'S NAVIES

Table III. Battle Cruisers.					
Year.	Ship.	Armament.	Speed.	Fuel Capacity.	
GREAT BRITAIN:—					
1905	Invincible	8-12 inch	28.6	2,500 tons	
1908	Indefatigable	8-12 inch	29.12	2,500 tons	
1909	Lion	8-13.5 inch	31.78	3,500 tons	
1910	Queen Mary	8-13.5 inch	designed 28	3,500 tons	
1911	Tiger	8-?	designed 31	4,000 tons	
GERMANY:—					
1907	Von der Tann	8-11 inch	28.12	2,800 tons	
1908	Moltke	10-11 inch	28.57	3,100 tons	
1910	Seydlitz	10-12 inch	designed 27	3,100 tons	
1911	"X"	10-12 inch	designed 30	3,100 tons	
JAPAN:—					
1910	Kongo	8-14 inch	designed 27	4,000 tons	

Cruisers and Scouts.—The needs of different nations in the matter of commerce protection and in the distances over which their fleets may have to operate are so various that it is hopeless to look for any common rule in the construction of light cruisers and scouts. Moreover, the perfecting of wireless telegraphy and the arrival of the aeroplane have fundamentally altered the conditions of the question, in the opinion of many naval officers. Within the last four years, Great Britain, Germany, Japan, Italy, Austria-Hungary and Brazil have alone built light cruisers.

The only striking variation in type has been made by Great Britain, a new class of "light-armoured cruiser," designed for a special tactical reason, having been projected in the current programme. Of these ships, eight are being laid down. They will be of 3,700 tons displacement, will carry 6-6 inch guns (or ten 4 inch); will be protected with four inches of special vanadium steel armour; speed 31 knots. Their special function is to repel attacks by torpedo craft on the battle fleet during a fleet action.

Apart from these ships, the cruiser construction of Great Britain has been under two heads:—(1) Protected cruisers designed for fleet and general service, (2) unprotected cruisers designed for service with the torpedo flotillas.

The details of British and foreign building are given in Table IV.

Table IV. Cruisers.					
Year.	Ship.	Displacement.	Armament.	Speed.	
GREAT BRITAIN (protected):—					
1908	Bristol (4)	4,820 tons	2-6 in.; 10-4.7 in.	25	
1909	Yarmouth (4)	5,250 tons	8-6 inch	25	
1910	Dublin (3)	5,400 tons	8-6 inch	25	
1911	Birmingham (3)	5,440 tons	8-6 inch	25	
(unprotected):—					
1907	Boadicea (1)	3,300 tons	10-4 inch	25	
1908	Bellona (3)	3,300 tons	10-4 inch	25	
1910	Active (2)	3,440 tons	10-4 inch	25	
1911	Fearless (1)	3,440 tons	10-4 inch	25	
GERMANY:—

Note.—The figures after a ship's name denote the number of the class. To the British total there should be added three ships identical with the "Birmingham" class building for the Australian Government.

Torpedo Craft (Above Water).—There has been continuous activity in the construction of torpedo craft among all naval nations since 1909, but the type presents few new features, except in the engineering department. The British Admiralty are experimenting with a boat fitted with geared turbines, and with one with internal combustion engines for cruising purposes. The details concerning this type of ship are given in Table V.

Table V. Above-Water Torpedo Craft.

1911	Bystry (9)	1,050 tons	3-4 inch	34

Destroyers have also been built, or were being built in 1912, for Argentina, Brazil, Chile, China, Denmark, Sweden, Norway, Holland, Spain, Portugal and Rumania, while Greece has recently purchased four from Argentina. The increased size, which is a common feature, has been devoted, in the majority of cases, to increased fuel supply, and to the fitting of enlarged torpedo-tubes to carry the 21 inch torpedo. The primary rôle of the destroyer, namely, as an antidote to the torpedo-boat, is being more and more lost sight of. The ships are used for cruiser duties and for service with battle-fleets. But the above-water torpedo-boat is practically obsolete. All modern destroyers are fitted with wireless telegraphy.

Submarines.—The submarine has taken the place of the above-water torpedo-boat as a weapon of offence. The latest designed type are of 940-1,200 tons displacement, have a radius of action of 2,000 miles or over, a surface speed of 20 knots, mount two 4 inch guns, are fitted for wireless telegraphy, and have ample living accommodation for officers and men. In Table VI an interesting comparison is given between the latest type (F class) of British submarine, an earlier type (A class), a torpedo-boat of the "coastal" type, and a destroyer of the 27 knot class, now passing out of service.

Table VI.

Vessel.	Displacement.	Armament.	Speed (On surface)
"F" class (submarine)	1,200	{ 2-12 pdrs. 6 tubes	20 kts.
"A" class	204	2 tubes	12 kts.
Torpedo boat 13	308	2-12 pdr.; 3 tubes	26 kts.
Destroyer "Boxer"	260	1-12 pdr.; 5-6 pdr. 1 tube	27 kts.

THE WORLD'S NAVIES

The table shows that the submarine has taken her place among the offensive forces of sea-power, and that we are approaching a time when there will be one type of torpedo-craft only—that which is able to operate above or below the surface at will.

Table VII shows the comparative strength in 1912-13 of the naval Powers in effective ships of all the various classes.

Expenditure.—Owing to the differing budgetary methods of the various States, it is difficult to compare naval expenditure satisfactorily. The difference of cost of the voluntary *personnel* of Great Britain and the United States on the one hand, and the conscript navies of all the other Powers on the other, vitiates the comparison. For instance, in the German Budget, the charges for non-effective services and naval works are borne on other estimates. The following are the charges (1912) of the chief naval Powers:—Great Britain, £44,085,400 (plus £990,000 supplementary); German Empire £22,008,746 (plus £734,000 under new Navy Act); United States, £25,944,798; France, £16,931,140; Japan, £9,461,817 (plus £250,000 extraordinary); Italy, £8,675,444; Austria-Hungary, £5,823,200; Russia, £18,660,825. It must be borne in mind that, in the newer navies, those of Germany, Austria-Hungary and Japan, for instance, the sum devoted to new construction is proportionately more and that devoted to maintenance

proportionately less. All things being taken into consideration, there is probably little difference between the naval expenditure of Italy and Austria-Hungary, or even between that of the United States and Japan, regarding what each gets for its money.

Personnel.—The number of active service ratings voted by the several Powers is as follows:—Great Britain, 137,000 with 58,000 reserves; German Empire, 54,691 with 110,000 reserves; United States, 60,217; France 62,000 with 120,000 reserves; Japan, 48,000 with 15,000 reserves; Italy, 33,500; Austria-Hungary, 18,500; Russia, 50,313, with 30,000 reserves. The reserve figures are only approximate.

German Navy Law.—The most important feature of the naval year 1912 was the passing of the new German Navy Law. By this, three additional first-class armoured ships were to be added to the German navy, the first to be laid down in 1913, another in 1916, and the third at some date unspecified; a third battle-squadron is to be kept in commission with full crews and the *personnel* to be increased by 14,310 men. The effect of German expansion on international relations is shown in the British Admiralty Memorandum set out below.

The British Dominions.—The entry of the British Dominions oversea into the area of naval affairs may be said to date from 1909, when New Zealand voted a battle cruiser for the service of the Royal Navy, and Australia began to create a Fleet Unit, to consist at the outset of one battle cruiser, three protected cruisers, three destroyers, and some submarines. All the ships of the three former classes are now in the water, and two of the destroyers in commission. The Australian Fleet Unit will eventually be manned by Australian crews, and will be administered by a Navy Board in the Commonwealth itself. The officers will be trained in an Australian Naval College. A larger scheme, worked out by Admiral Sir Reginald Henderson, has been adopted by the Australian Government, by which, in 22 years, the Commonwealth will be provided with a fleet of four battle cruisers, twelve protected cruisers, and twenty-four destroyers, with submarines. The whole will pass under the British Admiralty in the event of war.

Canada, in the meantime, under the government of Sir Wilfrid Laurier, took the preliminary steps towards creating a small navy, to consist of five small cruisers of the Bristol class and one Boadicea, with 6 destroyers and submarines. Arrangements were made for training officers and men, and the cruisers "Niobe" and "Rainbow" were purchased from the British Government as a nucleus. When Mr. Borden succeeded Sir Wilfrid Laurier, however, these dispositions were altered, and, as a result of conferences held between Canadian ministers and the Home Government in 1912, it was proposed that the Dominion should contribute three ships to the mother navy as an emergency measure pending future arrangements by which an Imperial Admiralty might be established to control the naval defence of the whole Empire. (See CANADA in Part II.)

The Union of South Africa has been in consultation with the Admiralty as to the best way in which it may join in the movement for naval defence; New Zealand has been contemplating a further offer; the Council of the Federated Malay States, on the motion of the Sultan of Perak, offered in November 1912 a first-class armoured ship to the Home Government, which accepted the offer; and a movement was even said to be in progress among the native princes of India for co-operating in the same direction.

The Panama Canal.—The approaching opening of the Panama Canal is likely to have an important bearing on the naval situation in the near future. Theoretically, the power of the Navy of the United States is almost doubled thereby, since the journey of about 9,000 miles round Cape Horn necessary to shift the Atlantic fleet to the Pacific area is thereby avoided; but it has yet to be seen whether, in point of fact, public opinion in America will permit of the transfer. The opening of the Canal indubitably gives importance to the fleets of the South American Republics, which will shortly have seven "Dreadnought" ships in their hands. The existence of an "A.B.C. Alliance" (Argentina, Brazil, and Chile), however, rests only on rumour. The United States harbour of Guantanamo, with Jamaica in friendly hands, controls the Atlantic entrance to the Canal, while, if the efforts to obtain the Galapagos Islands are successful, the Pacific entrance will be equally secure.

The British View of the Balance of Power.

Under "Canada" in Part II of the YEAR-BOOK, the proposed addition to the British Navy of three Canadian "Dreadnoughts" is fully dealt with, but it will be useful to give here the pertinent Admiralty Memorandum of December 5, 1912, which explains why, in the opinion of the British Government, the international naval position has become a menace to the Empire:—

1. The Prime Minister of the Dominion of Canada has invited His Majesty's Government through the Board of Admiralty to prepare a statement of the present and immediately prospective requirements of the naval defence of the Empire for presentation to the Canadian Parliament if the Dominion Cabinet deem it necessary.

The Lords Commissioners of the Admiralty are prepared to comply and to supplement, in a form which can be made public, the confidential communications and conversations which have passed between the Admiralty and Ministers of the Dominion Parliament during the recent visit to the United Kingdom.

The Admiralty set the greatest store by the important material, and still more important moral, assistance which it is within the power of Canada to give to maintaining British naval supremacy upon the high seas, but they think it necessary to disclaim any intention, however indirect, of putting pressure upon Canadian public opinion, or of seeking to influence the Dominion Parliament in a decision which clearly belongs solely to Canada.

The Admiralty therefore confine themselves in this statement exclusively to facts, and it is for the Dominion Government and Parliament to draw their own conclusions therefrom.

2. The power of the British Empire to maintain the superiority on the sea, which is essential to its security, must obviously be measured from time to time by reference to the other naval forces of the world, and such a comparison does not imply anything unfriendly in intention or in spirit to any other Power or group of Powers. From this point of view the development of the German Fleet during the last fifteen years is the most striking feature of the naval situation to-day. That development has been authorised by five successive legislative enactments, *viz.*, the Fleet Laws of 1898, 1900, 1906, 1908 and 1912. These laws cover the period up to 1920.

Whereas in 1898 the German Fleet consisted of 9 battleships (excluding coast defence vessels), 3 large cruisers, 28 small cruisers, 113 torpedo-boats and 25,000 men, maintained at an annual cost of £6,000,000, the full Fleet of 1920 will consist of 41 battleships, 20 large cruisers, 40 small cruisers, 144 torpedo-boats, 72 submarines and 101,500 men, estimated to be maintained at an annual cost of £23,000,000. These figures, however, give no real idea of the advance, for the size and cost of ships have risen continually during the period, and, apart from increasing their total numbers, Germany has systematically replaced old and small ships, which counted as units in her earlier Fleet, by the most powerful and costly modern vessels. Neither does the money provided by the Estimates for the completed law represent the increase in cost properly attributable to the German Navy, for many charges borne on British naval funds are otherwise defrayed in Germany; and the German Navy comprises such a large proportion of new ships that the cost of maintenance and repair is considerably less than in navies which have been longer established.

3. The naval expansion of Germany has not been provoked by British naval increases. The German Government have repeatedly declared that their naval policy has not been influenced by British action, and the following figures speak for themselves:—In 1905 Great Britain was building 4 capital ships, and Germany 2. In 1906 Great Britain reduced to 3 capital ships, and Germany increased to 3. In 1907 Great Britain built 3 capital ships, and Germany built 3. In 1908 Great Britain further reduced to 2 capital ships, and Germany further increased to 4.

It was not until the efforts of Great Britain to procure the abatement or retardation of naval rivalry had failed for 3 successive years that the Admiralty were forced in 1909, upon a general review of the naval situation, to ask Parliament to take exceptional measures to secure against all possible hazards the safety of the Empire. In that year, 8 capital ships were laid down in Great Britain, and 2 others were provided by the Commonwealth of Australia and the Dominion of New Zealand respectively—a total of 10.

4. In the spring of the present year the fifth German Navy Law was assented to by the Reichstag. The main feature of that law is not the increase in the new construction of capital ships, though that is important, but rather the increase in the striking force of ships of all classes which will be immediately available at all seasons of the year.

A third squadron of 8 battleships will be created and maintained in full commission as part of the active battle fleet. Whereas, according to the unamended law, the active battle fleet consisted of 17 battleships, 4 battle or large armoured cruisers, and 12 small cruisers, it will in the near future consist of 25 battleships, 8 battle or large cruisers, and 18 small cruisers; and whereas at present, owing to the system of recruitment which prevails in Germany, the German Fleet is less fully mobile during the winter than during the summer months, it will, through the operation of this law, not only be increased in strength, but rendered much more readily available. Ninety-nine torpedo-boat destroyers, instead of

66, will be maintained in full commission out of a total of 144; 72 new submarines will be built within the currency of the new law, and of these it is apparently proposed to maintain 54 with full permanent crews. Taking a general view, the effect of the law will be that nearly four-fifths of the entire German Navy will be maintained in full permanent commission; that is to say, instantly and constantly ready for war.

So great a change and development in the German Fleet involves of course, important additions to their *personnel*. In 1898 the officers and men of the German Navy amounted to 25,000. To-day that figure has reached 66,000. The new law adds 15,000 officers and men, and makes a total in 1920 of 101,500.

The new construction under the law prescribes the building of 3 additional battleships—1 to be begun next year, 1 in 1916—and 2 small cruisers, of which the date has not yet been fixed. The date of the third battleship has not been fixed. It has been presumed to be later than the six years which are in view. The cost of these increases in men and in material during the next six years is estimated as £10,500,000 spread over that period above the previous estimates.

The facts set forth above were laid before the House of Commons on July 22, 1912, by the First Lord of the Admiralty.

5. The effect of the new German Navy Law is to produce a remarkable expansion of strength and readiness. The number of battleships and large armoured cruisers which will be kept constantly ready and in full commission will be raised by the law from 21, the present figure, to 33—an addition of 12, or an increase of about 57 per cent.

The new fleet will, in the beginning, include about 20 battleships and large cruisers of the older type, but gradually as new vessels are built the fighting power of the fleet will rise until in the end it will consist completely of modern vessels.

The complete organization of the German Fleet, as described by the latest law, will be 5 battle squadrons and a fleet flagship, comprising 41 battleships in all, each attended by a battle or armoured cruiser squadron, complete with small cruisers and auxiliaries of all kinds and accompanied by numerous flotillas of destroyers and submarines.

This full development will only be realised step by step; but already in 1914 2 squadrons will, according to Admiralty information, be entirely composed of what are called Dreadnoughts, and the third will be made up of good ships like the "Deutschlands" and the "Braunschweigs," together with 5 Dreadnought battle cruisers.

This great fleet is not dispersed all over the world for duties of commerce protection or in discharge of Colonial responsibilities; nor are its composition and character adapted to those purposes. It is concentrated and kept concentrated in close proximity to the German and British coasts.

Attention must be drawn to the explicit declaration of the tactical objects for which the German Fleet exists as set forth in the preamble to the Naval Law of 1900 as follows:—

"In order to protect German trade and commerce under existing conditions, only one thing will suffice namely, Germany must possess a battle fleet of such a strength that even for the most powerful naval adversary a war would involve such risks as to make that Power's own supremacy doubtful. For this purpose it is absolutely necessary that the German Fleet should be as strong as that of the greatest Naval Power, for, as a rule, a great Naval Power will not be in a position to concentrate all its forces against us."

6. It is now necessary to look forward to the situation in 1915.

In Home Waters.—In the spring of the year 1915 Great Britain will have 25 "Dreadnought" battleships and 2 "Lord Nelsons." Germany will have 17 "Dreadnought" battleships. Great Britain will have 6 battle cruisers. Germany will have 6 battle cruisers. These margins in new ships are sober and moderate. They do not err on the side of excess. The reason they suffice for the present is that Great Britain possesses a good superiority in battleships, and especially armoured cruisers, of the pre-Dreadnought era. The reserve of strength will steadily diminish every year, actually because the ships of which it is composed grow old, and relatively because the new ships are more powerful. It will diminish more rapidly if new construction in Germany is increased or accelerated. As this process continues greater exertions will be required by the British Empire.

Mediterranean Station.—Four battle cruisers and four armoured cruisers will be required to support British interests in the Mediterranean during the years 1913 and 1914. During those years the navies of Austria and Italy will gradually increase in strength, until in 1915 they will each possess a formidable fleet of 4 and 6 Dreadnought battleships respectively, together with strong battleships of the pre-Dreadnought types and other units, such as cruisers, torpedo-craft, &c. It is evident, therefore, that in the year 1915 our squadron of 4 battle cruisers and 4 armoured cruisers will not suffice to fulfill our requirements, and its whole composition must be reconsidered.

Overseas.—It has been necessary within the past decade to concentrate the fleet mainly in Home waters. In 1902 there were 160 British vessels on the overseas stations against 76 to-day.

7. Naval supremacy is of two kinds, general and local. General naval supremacy consists in the power to defeat in battle and drive from the seas the strongest hostile navy or

combination of hostile navies wherever they may be found. Local superiority consists in the power to send in good time to, or maintain permanently in, some distant theatre forces adequate to defeat the enemy or hold him in check until the main decision has been obtained in the decisive theatre. It is the general naval supremacy of Great Britain which is the primary safeguard of the security and interests of the great Dominions of the Crown, and which for all these years has been the deterrent upon any possible designs prejudicial to or inconsiderate of their policy and safety.

The rapid expansion of Canadian sea-borne trade, and the immense value of Canadian cargoes always afloat in British and Canadian bottoms, here require consideration. On the basis of the figures supplied by the Board of Trade to the Imperial Conference of 1911, the annual value of the overseas trade of the Dominion of Canada in 1909-10 was not less than £72,000,000; and the tonnage of Canadian vessels was 718,000 tons, and these proportions have already increased and are still increasing. For the whole of this trade wherever it may be about the distant waters of the world, as well as for the maintenance of her communications, both with Europe and Asia, Canada is dependent, and has always depended upon the Imperial Navy, without corresponding contribution or cost.

Further, at the present time and in the immediate future, Great Britain still has the power, by making special arrangements and mobilising a portion of the reserves, to send, without courting disaster at home, an effective fleet of battleships and cruisers to unite with the Royal Australian Navy and the British squadrons in China and the Pacific for the defence of British Columbia, Australia and New Zealand. And these communities are also protected and their interest safeguarded by the power and authority of Great Britain so long as her naval strength is unbroken.

8. This power, both specific and general, will be diminished with the growth not only of the German Navy, but by the simultaneous building by many Powers of great modern ships of war.

Whereas, in the present year, Great Britain possesses 18 battleships and battle cruisers of the Dreadnought class against 19 of that class possessed by the other Powers of Europe, and will possess in 1913 24 to 21, the figures in 1914 will be 31 to 33; and in the year 1915, 35 to 51.

The existence of a number of navies all comprising ships of high quality must be considered in so far as it affects the possibilities of adverse combinations being suddenly formed. Larger margins of superiority at home would, among other things, restore a greater freedom to the movements of the British squadrons in every sea, and directly promote the security of the Dominions. Anything which increases our margin in the newest ships diminishes the strain, and augments our security and our chances of being left unmolested.

9. Whatever may be the decision of Canada at the present juncture, Great Britain will not in any circumstances fail in her duty to the oversea Dominions of the Crown.

She has before now successfully made head alone and unaided against the most formidable combinations and she has not lost her capacity by a wise policy and strenuous exertions to watch over and preserve the vital interests of the Empire.

The Admiralty are assured that His Majesty's Government will not hesitate to ask the House of Commons for whatever provision the circumstances of each year may require. But the aid which Canada could give at the present time is not to be measured only in ships or money. Any action on the part of Canada to increase the power and mobility of the Imperial Navy, and thus widen the margin of our common safety, would be recognised everywhere as a most significant witness to the united strength of the Empire, and to the renewed resolve of the overseas Dominions to take their part in maintaining its integrity.

10. The Prime Minister of the Dominion having enquired in what form any immediate aid that Canada might give would be most effective, we have no hesitation in answering, after a prolonged consideration of all the circumstances, that it is desirable that such aid should include the provision of a certain number of the largest and strongest ships of war which science can build or money supply.

INTERNATIONAL LAW, ARBITRATION AND PEACE

Since 1910, events have been testing the value of some of the principles and institutions with which jurists and statesmen had endeavoured to create a distinctive character for the new century. Whether these new principles and institutions are standing the test satisfactorily is still more or less a matter of conjecture. The object of this survey is to examine different international manifestations in reference to the law and practice of nations which it has been the object of the Hague Conferences of 1899 and 1907 to make precise and binding, the progress made by arbitration as a method for arranging difficulties between States, its displacement of coercive methods, and the prospects of peace as a positive object of the many agencies at work for its preservation.

I. The Development of "International Law."

When the various articles on questions of "International Law" in the 11th edition of the *Encyclopædia Britannica* were written, the Hague Conventions of 1907 were still fresh and the controversy on the Declaration of London had not yet become a serious obstacle to its ratification. Since then there has been time for the rules therein laid down and codified to undergo careful examination. Leaving the Convention (No. 12) relating to the establishment of an international Prize Court (which has been ratified by none of the parties) out of consideration, the result as regards the Hague Conventions¹ has been that Great Britain has ratified all but the 1st, relating to the pacific settlement of disputes, the 5th, referring to the rights and duties of neutral states and persons in war on land, the 10th, adapting the principles of the Geneva Convention to naval war, and the 13th, relating to the rights and duties of neutral Powers in maritime war. The United States, on the other hand, has ratified the 1st, the 5th, the 10th and the 13th, but not the 6th affecting the status of merchant ships at the outbreak of hostilities or the 7th relating to the conversion of merchant into war ships. The states which have ratified none of the Conventions include Italy, Turkey, Bulgaria, Servia, Greece and Montenegro.² France, Germany and Austria-Hungary have ratified all but the 14th, and Russia all but the 11th and 14th. Of the great Powers, only Great Britain and the United States have ratified the 14th, prohibiting projectiles from air ships.

It is an interesting, though no doubt quite a fortuitous fact, that none of the belligerents in contemporary wars (1910-12) have thus far bound themselves to observe any of the Conventions of 1907. Italy, Turkey, Greece, Servia and Montenegro, however, ratified the Conventions of 1899,³ and, although there is no specific provision in the Convention for the pacific settlement of international disputes, as there is in the 1907 conventions, ensuring the observance of the earlier convention pending ratification of the revised versions of 1907, Art. 9 of that of 1907 states that "the present convention, on being duly ratified, shall take the place in the relations between the contracting Powers of the convention for the pacific settlement of international disputes of July 29, 1899." In the case of the other renewed conventions the clause runs: "The convention of 1899 remains in force as between the Powers which signed it, which do not ratify also the present convention." Captious critics might ask what force attaches to this clause in an unratified agreement, but it has, at any rate, the value of an uncontested acknowledgment by the parties to the conventions of 1899 that the mere signing of modified conventions on the same subject is not a denunciation of the existing conventions.

In spite of the non-ratification of the 1907 conventions by the Parties engaged in the Italo-Turkish and Balkan-Turkish wars, there could be little doubt that they would

¹ The following is a list of the conventions adopted in 1907:—

1. For the pacific settlement of international disputes. 2. Respecting the limitation of the employment of force for the recovery of contract debts. 3. Relative to the commencement of hostilities. 4. Concerning the laws and customs of war on land. 5. Respecting the rights and duties of neutral Powers and persons in war on land. 6. Relative to the status of enemy merchant ships at the outbreak of hostilities. 7. Relating to the conversion of merchant ships into war ships. 8. Relative to the laying of automatic submarine contact mines. 9. Respecting bombardment by naval forces in time of war. 10. For the adaptation of the principles of the Geneva Convention to maritime war. 11. Relative to certain restrictions on the exercise of the right of capture in maritime war. 12. Relative to the establishment of an International Prize Court. 13. Respecting the rights and duties of neutral Powers in maritime war. 14. Prohibiting discharge of projectiles, etc., from balloons.

² The others are Argentina, Brazil, Chile, Colombia, Cuba, the Dominican Republic, Ecuador, Spain, Luxemburg, Paraguay, Peru, Persia, Uruguay and Venezuela. These and the 5 mentioned make 19 out of the 44 states represented at the Hague in 1907.

³ The Hague Conventions adopted in 1899 were as follows:—

1. For the pacific settlement of international disputes. 2. Relating to the laws and customs of war by land. 3. For the adaptation to maritime warfare of the Geneva convention of 1864. Three declarations on the following matters were also adopted:— (a) Prohibition of the launching of projectiles and explosives from balloons. (b) Prohibition of the use of projectiles, the only object of which is the diffusion of asphyxiating or deleterious gases. (c) Prohibition of the use of expanding bullets.

endeavour to carry out their provisions in so far as applicable to the military operations involved. The rules laid down at the Hague have more than the nature of "pious wishes." They were the deliberate enunciation of international law based on universally acknowledged principles, as understood by specialists on the subject from every quarter of the world. They have been, in turn, incorporated by specialists and teachers in the common law of civilised states, and, ratified or not ratified, where principles and deductions therefrom are involved the Hague Conventions are now law as international law has never before quite been law.¹ It will be seen below that something similar has happened as regards the Declaration of London, and it is well-known that though neither Spain nor the United States were parties to the Declaration of Paris, they both observed its provisions during the war of 1898,² simply because the provisions of that Declaration had become a part of the public law of Europe, and not to have observed them, irrespectively of the Declaration, would have been illegal.

The future of the Declaration of London seems, in this respect, likely to be similar to that of the Declaration of Paris. The Declaration consisted of a series of articles relating to blockade, contraband of war, destruction of neutral prizes, transfer to the neutral flag, convoy, resistance to search etc., which had been drawn up for the guidance of the International Prize Court, provision for the establishment of which had been made under No. 12 of the Hague Conventions.³

The Convention for the establishment of the Court had provided under Art. 7 that in the absence of a treaty between the parties, governing the case, the Court should apply "the rules of international law," and that if "no generally recognised rule" existed, the Court should give judgment in accordance with "the general principles of justice and equity." The London Conference was called for the purpose of "laying down the generally recognised principles of international law in accordance with Art. 7 of the Convention" in question. On December 8, 1911 the Naval Prize Bill, providing for the accession of Great Britain to the Convention and consequentially to the Declaration of London, was adopted in the House of Commons by a majority of 172 to 125 votes. On the 13th of the same month it was rejected by a majority of 145 to 53 votes in the House of Lords. Under the Parliament Act it might still become law in two years with other bills thrown out by the House of Lords, but this would require three successive adoptions by the Commons and rejections by the Lords, and public feeling in Great Britain has not seemed sufficiently friendly to the measure to warrant any certainty that the Government would be able to count on ultimate success for the Bill even in the Commons. The objections formulated against the Bill referred both to the composition of the International Prize Court and to provisions of the Declaration itself.

The two subjects are really distinct, though the British Government has seemed to regard them as inseparable. The fact that the preamble is worded in such a way as to assume ratification of the Convention for the establishment of an International Prize Court, has not prevented the Italian and Russian governments from treating the Declaration as a statement of the international law of prize. By a Royal Decree, dated October 13, 1911, the Italian government issued instructions "in conformity with" the Declaration of Paris and with the principles laid down in the Hague Conventions "as well as in the Declaration of London of February 26, 1909, which the Royal Government desires should be equally observed in so far as the dispositions of the laws of the Kingdom

¹ See *E. B.* xiv, 694, "International Law."

² See *E. B.* vii, 914, "Declaration of Paris."

³ That Convention had provided that "jurisdiction, in matters of prize, is exercised in the first instance by the Prize Courts of the belligerent captor" and that "the judgments of the national Prize Courts" might be "brought before the International Prize Court—(1) when the judgment of the national Prize Courts affects the property of a Neutral Power or individual, (2) when the judgment affects enemy property and relates to (a) cargo on board a neutral ship, (b) an enemy ship captured in the territorial waters of a neutral Power, when that Power has not made the capture the subject of a diplomatic claim, (c) a claim based upon the allegation that the seizure has been effected in violation, either of the provisions of a convention in force between the belligerent Powers, or of an enactment issued by the belligerent captor. (Arts. 2 and 3). See *E. B.* xxii, 374, "Prize:"

allow, although they have not yet been ratified by Italy," for the conduct of naval commanders in relation to capture and prize.¹

The terms of this Italian Decree, which are specially interesting as being based substantially on the provisions of the (unratified) Declaration of London, may be taken as the latest embodiment of international practice on the subject. They were communicated to other Powers, including Great Britain, and no objection was taken to them.

"Exercise of the Right of Capture and of Prize in Time of War.

"By a Royal Decree, dated October 13th, there were approved the following instructions in conformity with the Declaration of Paris of April 16, 1856, which belligerent states are under the obligation to observe, and with the principles laid down in the Hague Convention of October 18, 1907, as well as in the Declaration of London of February 26, 1909, which the Royal Government desires should be equally observed in so far as the dispositions of the laws of the Kingdom allow, although they have not yet been ratified by Italy, and which are to regulate the conduct of naval commanders in operations relating to capture and prize during the war.

"I. Turkey having taken no action to show that she intends to abstain from the capture and making prize of Italian merchant ships, but having been the first to make prize of Italian ships, the capture and making prize of Turkish merchant vessels and of their cargoes being enemy's property, is hereby authorised, with the exception of fishing boats and small coasting vessels.

"II. National or neutral merchant ships under any flag will be captured, according to the dispositions of the following paragraphs, if they: (a) Try to violate the blockade. (b) Carry contraband of war. (c) Give assistance to the enemy. (d) Forcibly resist visit.

"III. The blockade must be effective, that is, maintained by a force sufficient to prevent access to the blockaded ports and coast. Violation of the blockade consists in an attempt to penetrate within the blockaded zone or to leave it during the period established by the declaration of blockade. The capture of ships attempting to violate the blockade cannot take place outside the sphere of action of the ships charged with maintaining it.

"IV. If the vessel making for a blockaded place is in ignorance of the existence of the blockade, which has been declared after her departure from the last port of call, notification of the blockade shall be given her and an entry to that effect made in the ship's log by an officer of one of the blockading vessels.²

"V. Vessels that under stress of necessity are obliged to touch at a blockaded port will be allowed to enter, after giving proof that they are compelled by *force majeure*, and to leave again, provided that they do not take in or discharge cargo there.³ If, however, the vessel is carrying articles of contraband of war it shall be arranged that these shall be deposited on board one of the blockading ships. Neutral warships shall always be allowed to pass freely through the blockading line.⁴

"VI. Contraband of war are: cannons, guns, carbines, revolvers, pistols, sabres and all sorts of portable firearms; munitions of war, military implements of all kinds, and in general everything which, without manipulation, can serve directly for land or sea armament.

"Such articles are subject to capture or confiscation if it is proved that their destination is the enemy's territory or naval forces, whether transported directly or by means of transshipment or of transit overland.⁵

"VII. If the articles of contraband constitute a small part of the cargo, the naval commanders can, if they think good, receive such articles in deposit, making an entry to this effect in the ship's log or, failing this, issuing a declaration to that effect, and then permit the vessel freely to continue her voyage.

"VIII. Ships are liable to capture for assisting the enemy which (a) directly take part in the operation of war in the enemy's favour, (b) are chartered by the Government of the enemy State, or placed under the orders or inspection of one of his agents or employed to carry troops or news in the enemy's interest.⁶

"IX. Ships or goods captured or taken as prize will be conducted to the nearest port of the Kingdom, or, when that is not feasible, to a neutral port to be put at the disposition of the naval authorities or of the consular authorities, as the case may be, together with a detailed report of the capture or prize accompanied by the relative documents.

"If the observance of this prescription might compromise the safety of the capturing vessel or the success of the warlike operations in which she is engaged, the commander shall have the faculty of destroying the prize, after having provided for the safety of the persons, papers and documents on board and of everything else which may be material to arriving at a decision as to the legality of the prize.⁷

"X. Members of the enemy's armed forces found on board a neutral vessel may be made

¹ See Sir T. Barclay, *Turco-Italian war and its problems* (1912), p. 123.

² See Decl. of London, Art. 16.

⁵ See Decl. of London, Art. 30.

³ See Decl. of London, Art. 7.

⁶ See Decl. of London, Art. 46.

⁴ See Decl. of London, Art. 6.

⁷ See Decl. of London, Art. 49.

prisoners of war, even if the vessel—either in the absence of the conditions laid down in paragraph 8, or in circumstances where the captain's good faith is manifest—be not liable to capture.¹

"XI. To fulfill the above conditions, the visiting of merchant vessels shall take place (with the exception of the cases treated in the following articles) every time there is sufficient motive for believing that the exercise of this right may result in the confiscation of the ship or cargo in accordance with the practice authorized in such cases by the regulations in force, and by international maritime usages.

"XII. Ships escorted by a neutral war vessel are exempt from visit; naval commanders will limit themselves in such cases to demanding, when they think fit, from the commander of the conveying ship a written declaration regarding the nature and cargo of the convoys.

"If there is reason to believe that the confidence of the commander of the conveying vessel has been abused, these suspicions shall be communicated to him in order that he may proceed alone to make the necessary verifications, issuing a written report on the subject.²

"XIII. Naval commanders must abstain from the right of visit, capture, and prize, and from any act of hostility in the ports or territorial waters of neutrals.

"The Prize Commission.

"By another Royal Decree of the same date, a Prize Commission, presided over by a magistrate with the rank of President of the Court of Appeal, or of President of Section of the Court of Cassation, has been composed as follows:—Ordinary members: (a) An admiral, member of the Superior Naval Council. (b) A legal adviser of the Foreign Office. (c) A Councillor of State. (d) The Director-General of the Mercantile-Marine. (e) The Inspector of the body of Harbour Authorities. (f) A Councillor of the Court of Appeal. There shall be four assessors, of whom two shall be chosen from among the admirals and two from categories (c) and (f). A magistrate of the Public Prosecutor's Office, of not lower rank than a Public Prosecutor ("*procuratore del Re*"), shall act as Royal Commissioner. He has no deliberative voice, and is charged with stating the case in the Government's name, and with giving his conclusions. He shall not be present at the voting. The Commission shall be assisted by a secretary, who has no vote. Five members of the Commission form a quorum; in the case of an equality of votes, the President, or whoever is fulfilling his functions, shall have the casting vote. The parties shall have the right to present written memoranda, which are to be given to the President of the Commission. The representatives of foreign Powers accredited to the Royal Government can address to the Royal Commissioner such observations as they shall think advisable in the interests of their nationals. The sentences of the Prize Court shall be supported by a statement of the grounds on which they are based. The only appeal from these sentences, which are otherwise not subject to appeal, challenge or revocation, is to the Supreme Court of Cassation according to the letter and practice established by Article 3 of the law of March 31, 1877. The decisions of the Prize Commission shall be communicated to the Ministers of Foreign Affairs and Marine within eight days of their pronouncement."

A rumour that the Ottoman Government had declared grain contraband of war (Oct. 1911) led the Russian Government, in order to prevent any misunderstanding, to issue a note in which it stated that "basing itself on the Declaration of Paris of 1856 and on Articles 24 and 33 of the Declaration of London," it considered that cargoes of corn were subject neither to arrest nor to confiscation when addressed from Russian ports on the Black Sea to Italian or other ports so long as such cargoes are not destined for Italian field forces or for Italian official consignees. "Any attempt to arrest or confiscate the above-mentioned cargoes," the note went on, "the Russian Government will regard as a violation of the rights of Russia, and the Government gives warning of the heavy responsibility which the Turkish Government would incur in such circumstances."

The Turkish Government immediately replied by issuing a list of articles declared to be contraband of war, comprising grain, but it was coupled with a declaration stating that, although Turkey had not adhered to the Declaration of London she intended conforming thereto. Thus contraband, visit and search, and questions of neutral shipping generally, would be dealt with in accordance with the provisions of the Declaration. Under Article 24 of the Declaration of London food-stuffs are expressly stated to be conditional contraband, but another Article (Art. 35) provides that conditional contraband is not liable to capture except when found on board a vessel bound for territory belonging to or occupied by the enemy or for the armed forces of the enemy and when it is not to be discharged in an intervening neutral port. Another Article provides that even when conditional contraband (except bullion, coin and paper money) is destined

¹ See Decl. of London, Art. 47.

² See Decl. of London, Art. 62.

to a government department of the enemy state, if the circumstances show that the goods cannot in fact be used for the purposes of the war, it is not liable to capture.¹

Thus Russia and Turkey have adopted the rules of the Declaration of London relating to contraband; and Italy has applied it practically in full, although it has not yet been ratified by any Power,² and this has been done without any question whatsoever of the existence or non-existence of an International Prize Court. The obvious conclusion is that its provisions are becoming an authoritative statement of international law adjusted to the needs of civilised mankind, and, whether ratified or not, and whether an International Prize Court ever comes into being or not, they seem destined to become, like the Declaration of Paris, part of the public law of Europe and the world.

II. Disregard of Treaties.

The value of international treaties has been much discussed in connection with Russia's action in Persia and Italy's attack on Turkey. As regards Persia, under the Anglo-Russian agreement of August 31, 1907, the parties, having "mutually engaged to respect the integrity and independence of Persia," entered into purely negative covenants not to seek or promote concessions of a political or commercial character in zones neighbouring each others' territories north and south of certain lines of demarcation, with an intermediate zone open to both. The occupation of Tabriz and other Persian towns by Russian troops, the hanging by Russian military authorities of the leaders of the progressive party under martial law,³ the imposing of the resignation of an American Treasurer-General (Mr. Shuster) employed by the Persian Government,—all were cases of intervention in apparent violation of the agreement of 1907.

The Italian aggression against Turkey, of whose "independence and territorial integrity"⁴ she was one of the guarantors; and the annexation of Tripolitana and Cyrenaica, were similarly violations of her treaty engagements which may some day be explained, but, nevertheless for the present remain ill-omened precedents. The breaches were not confined to a violation of Turkey's territorial integrity. When Russia in 1871 proposed that, circumstances having changed since 1856, a modification in certain of the provisions of the Treaty of Paris was necessary, the subject was submitted to a fresh conference of the Powers, who thought the occasion a suitable one for recording a solemn contractual pledge as to the sanctity of treaties. The protocol, which forms part of the existing public law of Europe, runs as follows:

It is an essential principle of the law of nations that no Power can liberate itself from the engagements of a treaty, nor modify the stipulations thereof, unless with the consent of the contracting Powers, by means of an amicable arrangement.

This was undoubtedly intended to prevent any party to the Treaty of Paris from setting up the rule *rebus sic stantibus*, which is supposed to be a tacit condition attaching to all treaties, enabling parties to them to escape from their provisions when the circumstances under which they were entered into have so changed as to render them obsolete or incapable of application. Italy was a party to this protocol. Moreover, the Treaty of Paris (Art. 8) provides that:

If any difference arise between the Sublime Porte and one or more signatories threatening the maintenance of their good relations, the Sublime Porte and any or each of these Powers, before resorting to force, will place the other contracting parties in a position to prevent recourse to such an extremity by their mediating influence.

An official denial was given to the statement⁵ that Italy had given an opportunity to

¹ Barclay, *Turco-Italian war* (1912), p. 99.

² See Barclay, *op. cit.* p. 99.

³ See Prof. E. G. Browne, *The Reign of Terror at Tabriz* (Oct. 1912).

⁴ Art. 7 of the Treaty of Paris of 1856 provides that: Their majesties undertake, each for himself, to respect the independence and territorial integrity of the Ottoman Empire, to guarantee in common the strict observance of this undertaking, and consequently they will consider any act of a nature which might infringe it as a question of general interest.

⁵ On November 3d, in reply to a question, Sir E. Grey said: "The first communication of any intention to seize Tripoli which H.M. Government received was the notification of the declaration of war on September 30th." See Barclay, *op. cit.* p. 37.

the British Government, before proceeding to extremities, to exercise this "mediating influence." It is obvious that the very object of the clause was to prevent the creation of *faits accomplis* by such actions as Italy's aggression.

These violations of treaties can only be considered by themselves as tending to set back the progress of law and order in the civilised world. The sanctity of treaties is the very foundation of international morals, and any violation of them is a shock to that fabric of mutual trust and consideration which has been built up in the course of a century, and which forms at present the public law of the civilised world—a law governing not only the relations of states with one another, but safeguarding security in the international dealings and intercourse of their respective citizens.

The case of the Panama Canal, again, is one of particular interest between Great Britain and the United States. Under the Hay-Pauncefote Treaty of November 18, 1901 it is provided that "the canal shall be free and open to the vessels of commerce and of war of all nations . . . on terms of entire equality, so that there shall be no discrimination against any such nation, or its citizens or subjects, in respect of the conditions or charges of traffic or otherwise." By the Panama Canal Act of 1912, passed by the United States Congress, such a discrimination however was distinctly made. Sec. 5 provided that "no tolls shall be levied upon vessels engaged in the coastwise trade of the United States," and the American coastwise trade is restricted to American vessels. This departure from the terms of the treaty was supported in the United States on the alleged ground that the circumstances under which the treaty was concluded had undergone an essential change,—in other words, though not specifically stated, that the rule of *rebus sic stantibus* applied. President Taft's Memorandum, in reply to the British diplomatic note protesting against the Panama Canal Act, set out not only that "the canal is being constructed by the United States wholly at its own cost, upon territory ceded to it by the Republic of Panama for that purpose," but that, as "the treaty leaves all nations desiring to use the canal with full right to deal with their own vessels as they see fit, the United States would only be discriminating against itself if it were to recognise the soundness of the British contention." It is unnecessary here to discuss a situation which at the time of writing was open to more than one mode of friendly settlement; all that need be said is that, in the ordinary course, such a case would be an entirely proper one to be submitted to arbitration.

III. Open-door Policy.

The "open-door" policy which tends to prevail wherever it is possible to safeguard the general interest of mankind against the encroachments of individual states, was re-enunciated in the Franco-German agreement of November 4, 1911. In Article 4 of that agreement "the French Government" declared that, "firmly attached to the principle of free trade in Morocco," it would not lend itself "to any inequality either in the establishment of customs duties, dues or other taxes or in the establishment of transport tariffs by railway, river and any other way and in general in any matter affecting transit." The treaty contains further restrictions to prevent preferences being given under colour of weights and measures, rebates or any other method by which French or any other subjects might obtain an advantage over those of any other state.

Another interesting and significant application of the same principle is provided by the agreement of August 11, 1910 between Sweden, Norway and Russia with reference to the status of Spitzbergen. On February 25, 1909, at the instance of the Norwegian Government, a conference met at Christiania to discuss the position which had arisen out of the discovery of mining resources on the island. The states invited to the conference were Sweden, Russia, Great Britain, Germany, France and the United States. The capital invested in Spitzbergen coal-mining was of Norwegian, British and American origin, but Norway claimed prior rights owing to the preponderating share of Norwegians in the Spitzbergen fisheries. Sweden claimed a prior right on account of her scientific expeditions to the country, which had practically made industrial exploitation there possible. In 1871 the Swedo-Norwegian Government proposed to annex the island,

but, owing to objections on the part of Russia, this idea was abandoned. Since then, Germany has come upon the scene, and, true to her policy of keeping as much of the world open to free competition as possible, she had objected to control over the island being granted to any single Power. A project for the Government of Spitzbergen and the adjacent islands by a commission of the three contiguous Powers, Sweden, Norway and Russia, drawn up and submitted to the other Powers, was amended to meet certain observations. The three Powers met at Christiania from January 15 to 26, 1912, and the agreement then finally adopted has now been ratified.

This document guarantees equality of rights to subjects and citizens of all Powers alike while declaring that the islands continue to retain their character of *terra nullius*. The rather ambiguous sense of *terra nullius* is explained in a chapter of the Convention itself. The term is used more especially in respect of sovereignty, inasmuch as the island belongs to no Power, is not annexable and is permanently neutral. However, as regards property, all the soil is public property (Art. 41) and only rights of occupation are grantable. It will be interesting to see how this condominium, which resembles to some extent the Anglo-French *régime* in the New Hebrides, will develop as a practical method of dealing with hitherto unoccupied territory.

IV. Territorial Waters.

The problems connected with territorial waters continue to perplex Foreign Offices in Northern Europe. The contention between the English trawlers and the Scottish line fishermen in Moray Firth, the one for freedom to fish outside the three-mile limit without reference to ultimate consequences detrimental to the fish supply itself, and the other for protection of the spawning beds and against the destruction of immature fish in the trawl-nets, continue to be a source of trouble, especially owing to the fact that the trawling interest can elude the operation of the Scottish Acts by registering their vessels in a foreign port and carrying a foreign flag.

The difficulty in the way of a solution of the problem is the existence of a rule-of-thumb practice which embraces in one formula fishery questions and those which are involved in the law of neutrality. The experience of the last few years has only accentuated the need of separating the two subjects. The investigations of the International Council for the exploration of the North Sea may "bring the exercise of sea-fishing more into accord with the natural conditions regulating the growth and increase of fish in neighbouring seas and thus permanently increase the supply in the North Sea markets." The recent accession of the United States to the Council and the expected accession of France show that the objects for which the Council was founded by the North Sea States commend themselves to others not immediately interested in the present scope of the Council's investigations.

The common interest of mankind in the preservation of the fish supply, and in the consequent protection of spawning areas, and prevention of the destruction of young fish, may ultimately entail a different and more complicated treatment for fishery rights than the very simple formula of the three-mile limit. In fact, it may involve a change of principle under which a common interest in the prosperity of high sea fishing may outweigh the local interest attaching to the inshore industry.¹

In 1911 considerable emotion was caused among the British trawling interests by a claim put forward by Russia to extend the width of her territorial waters to 12 miles. The subject arose in connection with the so-called White Sea, or, to speak more precisely, the Barents Sea Fisheries. The trawling banks extend, it seems, some 120 miles to the north and west of the Kanin peninsula which borders the east side of the entrance to the White Sea. The Russians, therefore, argue that the proposed 12 mile limit would only very slightly reduce the available fishing area. Russia claims the sea south of a

¹ Meanwhile an interdepartmental committee has been appointed by the British Government "to consider if it is practicable or desirable to extend for fishery purposes the limits of territorial waters, and whether prohibition or further regulation as to the methods or times of sea fishing are desirable, more particularly in relation to trawling for herring and to report accordingly." *Times*, June 28, 1912.

line from Cape Sviatoi to Cape Kanin as a closed sea, a claim in which it is contended both Norway and Great Britain have tacitly acquiesced.¹

Involving analogous considerations is the still controverted question of Hudson Bay, which is entirely surrounded by Canadian territory. Its entrance like that of the White Sea exceeds any width suggested for the closing of bays. In principle there is no difference between Hudson Bay and the Gulf of St. Lawrence. Yet it is held by certain authorities that Hudson Bay like the White Sea is a closed sea. No such claim has ever been made for the Gulf of St. Lawrence, which is in a similar position.²

The question of bays in connection with the existing territorial waters practice was dealt with in the North Atlantic Fisheries case by the Hague Court in its award of October 25, 1910. The three-mile limit was confirmed and bays were the subject of a recommendation to adopt in principle the ten-mile width of the North Sea Fisheries convention.³ The award is dealt with more fully below in connection with arbitration.

V. *The Law of the Air.*

The law of the air of late has from time to time occupied the attention of Governments. Under a British Act (Aerial Navigation Act, June 2, 1911) "for the purpose of protecting the public against danger," the Government is empowered to forbid aerial navigation over certain areas according to circumstances or limit it to certain kinds of air-craft. These very wide powers are obviously capable of application on such a scale as practically to amount to the assertion of absolute sovereignty over the superincumbent air of the whole of British territory.

Questions affecting international law may arise out of any far-reaching exercise of this claim. Have foreign air-vessels a right of innocent passage through the air, as they have through the territorial waters, of any state? It has been suggested that, following the analogy of the sea, no state is entitled to claim sovereignty over a greater height than cannon-range can command, that to assert a claim over the air *ad coelum* over any country is as exaggerated as the now obsolete claims over whole seas, which were eventually whittled down to a margin of sea following the trend of the adjacent coast. The Institute of International Law,⁴ at its Ghent meeting in 1906, declared the air free, subject only to such rights as the necessities of self-preservation required. This view seems to follow the analogy of the relation of the high sea to territorial waters.

Mr. H. Brougham Leech ("The Jurisprudence of the Air," *Fortnightly Review*, August 1912) has made the following apt observations on the subject:

"There is, from one important point of view, a marked difference between the open sea and supraterritorial air. An ordinary vessel on the open sea cannot damage persons or property on land; a war-vessel cannot do any such damage save of deliberate intention. Furthermore, collision at sea cannot be productive of any injury to those on land. But any vessel traversing the supra-territorial air can do much mischief to those on the earth beneath; any accident to such vessels may result in serious injury; and accidents, arising either from collision, storm, or the failure of the machinery, are not only more liable to happen, but they may involve injuries to third parties, from the risk of inflicting which, sea-going vessels are entirely free. Therefore the analogy between the open sea and the supra-territorial atmosphere breaks down and the state is entitled to protection against these unusual dangers."

Prof. Sir Erle Richards, in a lecture delivered at Oxford (Oct. 26)⁵ on the sovereignty of the air, has expressed the opinion that the theory of the air being free had in fact never been accepted as a principle of International Law. It found no support in any analogy which could be drawn from the Laws of Nations. "States," he said, "must be the judges of the necessary safeguard they imposed for their protection." "The principle of state sovereignty over the air was the only basis on which International Law could safely rest."

¹ *Times*, March 11, 1911.

² See, on the contention that Hudson Bay is by immemorial usage an open sea, T. W. Balch, "la Baie de Hudson," *Revue de droit international*, 1911.

³ See *E. B.* xix, 787; "North Sea Fisheries." Also xxviii, 409; "Territorial Waters."

⁴ See *E. B.* xxi, 15; "Peace."

⁵ See *Times*, October 28, 1912.

A suggestion has been made, and seems to have obtained considerable support among French jurists, that there is a distinction between freedom of the air and freedom of passage through the air, that all the progress and development of aviation requires is freedom of passage and that there is no need to lay down any principle as to freedom of the air in connection with aviation. This, however, is a mere theoretical distinction, and facts are settling the matter for themselves. As it is only when comparatively near to earth that the flight of aviators can be controlled by any police, no effort seems as yet to have been made to impose regulations exceeding what it is practically within their power to enforce. Very serious matters will, nevertheless, some day arise out of aviation in time of peace. The more important have been summed up by Mr. Leech as follows:

- (a) Provision for the collection of customs dues, and for the prevention of smuggling;
- (b) Prevention of the landing of persons suffering from infectious diseases;
- (c) Prevention of the importation of undesirable aliens;
- (d) Prevention of the inspection from airships, and of the sketching and photographing of forts, arsenals and Government stores and buildings.
- (e) Special precautions against the operations of anarchists, bomb-throwers, and other such persons, and prevention of the importation of dynamite and other dangerous explosives.

The questions arising out of the use of air-vessels in time of war are still more serious. At the Hague Conference of 1899 the following declaration was adopted:

"The Contracting Powers agree to prohibit, for five years, the discharge of projectiles and explosives from balloons, or by other new methods of a similar nature. The present Declaration is only binding on the Contracting Powers in case of war between two or more of them. It shall cease to be binding from the time when in a war between the Contracting Powers, one of the belligerents is joined by a non-Contracting Power."

Only Great Britain did not ratify it, but on expiry of five years it ceased to be operative. At the Conference of 1907, however, it was renewed till the close of the next Conference. This time only Great Britain and the United States, among the Great Powers, ratified it, and in fact ample use was made of aeroplanes for bomb-dropping during the Turco-Italian war. At present, therefore, aviation in wartime is subject only to the general provisions of warfare as laid down by the Hague Military Conventions and such general principles of International Law as states choose to respect.

VI. Arbitration.

Those who regarded the new Arbitration treaties as heralding the ever wider adoption of judicial methods in the settlement of serious differences between states must have been disappointed by the course of recent events. In February 1904 the Russo-Japanese war broke out; in 1905 came the Franco-German crisis over the Morocco question; in 1907 began the Russian intervention in Persia; in 1910 came the French intervention in Morocco; in 1911 a fresh Franco-German crisis coupled with serious Anglo-German friction; in the same year began a war between Italy and Turkey, and in 1912 the Balkan war. In none of these cases of violence, potential or actual, was any attempt at a solution of the difficulties by arbitration even suggested by any Power.

This is not, however, imputable to ill-will towards arbitration on the part of European Foreign Offices alone. It would have been difficult to submit any of the cases in question to adjudication by a tribunal for the application of "justice," and no rules but those of justice have yet been devised for the decision of cases between states. Really dangerous difficulties with few exceptions have thus far involved considerations which have no reference to the moral principles governing the private life of civilised mankind. Thus, it is difficult to see how a court of arbitration could deal with a claim based on a preponderating interest, with the invasion of a neighbouring state on the ground that it was not properly governed, or with a claim to colonial territory by a state which had too little against another which had more than it could employ.

On the other hand, the cases which have been tried by the Hague Court have *pro tanto* removed causes of friction past and possible, as well as causes which might have been fanned into greater importance by difficulties of direct settlement.

Eleven cases¹ have now been tried by the Hague Court since its creation in 1899:

1. U. S. A. v. Mexico (Pious Funds of the Californias). Award: October 14, 1902.
2. Germany, Britain, Italy v. Venezuela (Claims). Award: Feb. 22, 1904.
3. Germany, France, Britain v. Japan (Jap. House Tax). Award: May 22, 1905.
4. France v. Great Britain (Muscat Dhows). Award: August 8, 1905.
5. France and Germany (Deserters at Casablanca). Award: May 22, 1909.
6. Norway and Sweden (Maritime Frontier). Award: October 23, 1909.
7. Great Britain v. U. S. A. (Atlantic Fisheries). Award: Sept. 7, 1910.
8. U. S. A. v. Venezuela (Orinoco S. S. Co.'s Claim). Award: October 25, 1910.
9. France v. Great Britain (Arrest of Savarkar). Award: February 24, 1911.
10. Italy v. Peru (Canavaro Claim). Award: May 3, 1912.
11. Russia v. Turkey (Claim for Unpaid Interest). Award: November 11, 1912.

The case of the deserters of Casablanca was one which, had the relations between Germany and France been good, would probably never have arisen at all. In the French army there is a "foreign legion" used for colonial service. Six privates belonging to it deserted and obtained passports from the German Consulate at Casablanca. All six were supposed to be German subjects, but it turned out eventually that only two were Germans. The deserters were arrested, in spite of some resistance on the part of persons in the service of the Consulate. Hot words passed in the newspapers, but the two Governments agreed to refer the matter to the Hague, which gave its decision in favour of France on grounds too obvious to require examination.

The case between Sweden and Norway turned on a frontier question which arose out of the separation of these two states. It was decided in favour of Sweden without a murmur on the part of the Norwegians.

The case of the North Atlantic Coast Fisheries² was the most important of the matters which have as yet been dealt with by the Hague Court, not only on account of the gravity of the issue generally, but also on account of the different delicate questions dealt with in the award. The case related to the respective British and American rights in Newfoundland waters under Art. 1 of the Anglo-American Convention of October 20, 1818. This article provided that the inhabitants of the United States should forever, in common with British subjects, have liberty to take fish of every kind on certain specified coasts of Newfoundland, and that they should also for ever have liberty to dry and cure fish in any of the unsettled bays, harbours and creeks, on the specified parts of the southern shores of Newfoundland and of the coast of Labrador, but that, so soon as any portion thereof became settled, it would not be lawful for these American fishermen to dry or cure fish thereat without previous agreement for such purpose with the inhabitants, proprietors or possessors of the ground. The United States, on the other hand, renounced liberty to take, dry or cure fish on or within three marine miles of any of the British American coasts, bays, creeks or harbours not included within the specified limits. American fishermen, however, had the right to enter such bays and harbours for the purpose of shelter or repairs, the purchase of wood, and the obtaining of water, but they were to be under restrictions to prevent any abuse of their privileges.

Differences arose as to the scope and meaning of these provisions. The United States authorities protested against the British claim to deal in their regulations with the hours, days and seasons when fish may be taken, with the methods, means and implements used in fishing operations etc. There was also a difference of opinion as to the mode of measuring the three marine miles off any of the coasts, bays, creeks, or harbours referred to in this article. There were also a number of subsidiary points.

The award confirmed the British claim to make such regulations as were appropriate or necessary for the protection and preservation of the fisheries or desirable or necessary on grounds of public order and morals, provided they did not unnecessarily interfere with the fishery itself and were not so framed as to give an advantage to local over American fishermen; any question as to the reasonableness of any regulation was to be referred

¹ The first four of these cases are dealt with in *E. B. ii*, 328, 329.

² The arbitrators were Prof. Lammasch of Vienna (President), Dr. Savornin Lohman, Dutch Minister of State, Judge George Gray, Sir Ch. Fitzpatrick and Dr. Drago, ex-Minister of Foreign Affairs of the Argentine Republic.

to a commission of three expert specialists, one to be designated by each of the Parties and the third not to be a national of either Party and to be appointed by the Court.¹

To enable the Governments to deal with any difference of views between them before resorting to the Commission, the Court recommended official publication of any regulations as to hours, days and seasons for taking fish, as to methods, means and implements, etc. two months before their coming into operation, to enable the United States Government to raise any question as to their inconsistency with the treaty of 1818, in which case the Commission would decide on the difference. On the question of the mode of measuring the three marine miles, the Court decided that in case of bays, the three marine miles should be measured from a straight line drawn across the body of water at the place where it ceases to have the configuration and characteristics of a bay. At all other places the three miles were to be measured following the sinuosities of the coast. It recommended, however, adoption of the method followed in the North Sea Fisheries Convention (May 8, 1882) of fixing the line at the part of the bay nearest the entrance when the width does not exceed ten miles. From the operation of this general proposition, the award excepted a certain number of bays "where the configuration of the coast and the local climatic conditions are such that foreign fishermen, when within the geographic headlands, might reasonably and *bonâ fide* believe themselves on the high seas," and fixed for these certain points between which the line should be drawn.

The long and detailed award is full of interesting points connected with fishery methods, territorial waters and bays, and will certainly have considerable influence in the treatment of similar matters in the future.

The Orinoco S.S.Co. claim between the U.S.A. and Venezuela raised the question whether, if an umpire exceeds his powers and bases his decision on errors of law and fact essential to the issue, the award is liable to revision. The Court decided that it was, and proceeded to revise it accordingly,—a precedent of the greatest moment.

The Savarkar case turned on the delicate question of whether a fugitive under a criminal charge, who had escaped from the ship on which he was being conveyed to his place of trial (India) and had been arrested by the police of the country (France) to which he escaped and immediately handed over (in error) by that police to those in charge of him, should not have been delivered back to the Government of the state to which he had escaped and been dealt with under the Extradition treaty existing between the two states concerned. The Arbitrators decided that as there had been in the circumstances no "atteinte a la souveraineté" of the country to which the prisoner had escaped and all parties had acted in good faith and no disavowal of the surrender had been made known till two days later, after the departure of the vessel, the action of the local police though taken in error closed the incident. This decision, based on considerations outside the strictly legal question involved, marks the difference between arbitrators, who as such can disregard technical questions, and a judiciary court, which has little latitude when confronted with an unquestioned legal principle such as the universal one that a fugitive who sets foot on foreign soil is beyond the jurisdiction of the police of his country except by operation of a treaty of extradition. The fact that the French Government made a claim shows that it had not waived its right. Though it is evident that, if France had declined to grant extradition (as she very possibly might), the liberation of Savarkar by the British authorities might have involved difficulties, the precedent should be regarded as a compromise rather than a judicial decision.

The Canevaro affair between the U.S.A. and Peru arose out of a loan made to the Dictator Pierola in 1880 by semi-Italian bankers. The question turned on an assessment involving no principle of law of any general interest.

The Turco-Russian case related to interest on an indemnity payable by Turkey to Russian claimants or their nominees, which had been satisfied by instalments after long intervening delays. The arbitrators while admitting the justice of the claim in

¹ The Court appointed Dr. P. P. C. Hoek, scientific adviser to the Netherland Fisheries. The other members who have since been appointed are Dr. Hugh Smith, on behalf of the U.S.A., and the Hon. Donald Morison, Newfoundland Minister of Justice.

principle, decided against Russia on the ground that the Russian Government when accepting instalment, never made any reserve as to interest.

As regards standing Arbitration Treaties the efforts made to meet the difficulty of embracing in any formulae all differences which may arise between the contracting states have rather tended to show where that difficulty really lies than to solve it. A number of treaties, certainly, have been concluded in which all differences without distinction of character are made arbitrable. The latest of these, the Treaty of November 20, 1909 between Italy and the Netherlands, provides that:

"The high Contracting Parties engage to submit to the Permanent Court of Arbitration established at the Hague by the Convention of July 29, 1899 all differences of whatever character which may arise between them which they have not been able to solve by diplomatic methods, and this shall apply also to differences arising out of facts prior to the conclusion of the present convention."¹

Nearly all the standing treaties hitherto concluded, however, except "national honour" and "vital interests" from their operation. It would appear as if few Governments were ready to take the responsibility of binding themselves to arbitrate without a means of escape from the obligation. The new treaties between Great Britain and the United States, and the United States and France, are no real exception in this respect. Though they provide for investigation by a preliminary joint commission of inquiry for all cases whatsoever, they confine arbitration to "claims of right made by one against another under treaty or otherwise, and justiciable in their nature by reason of being susceptible of decision by the application of the principles of law or equity" (Art. 1). This obviously excepts from arbitration all questions based on policy and not on grounds of legal right, which amounts for practical purposes to the adoption under another formula of the "vital interests" clause. Under the ordinary formula, it is in the discretion of either party to a dispute to describe the difference as involving a "vital interest," and it is then removed from the operation of the treaty. An aggressor who has no equitable basis for an application to the Hague Court or any other tribunal of independent judges, is obviously not likely to accept the jurisdiction of a court which would practically have no alternative but to find against him. Thus, in his ultimatum to Turkey (Sept. 26, 1911) the Marquis di San Giuliano took care to state that the issue between his country and Turkey constituted "so far as Italy is concerned a vital interest of the very first order." This was evidently intended to enable his Government to meet any suggestions as to arbitration with the reply that no great Powers had yet agreed as between them to have recourse to arbitration where vital interests were concerned.

The Anglo-American Treaty of Arbitration of August 3, 1911, is, nevertheless, a most interesting new departure in the effort to deal with "vital interests" by pacific means though not by arbitration. The treaty sets out by defining the scope of arbitration. It does not, however, provide that arbitration, even when applicable, shall forthwith come into operation, but prescribes a certain number of preliminary stages:

1. Request by either party to submit any differences to a Joint Commission of Inquiry.
2. Power to either party to postpone the reference to the Commission for one year from the date of the request "to afford an opportunity for diplomatic discussion and adjustment of the questions in controversy, if either party desires such postponement."
3. The appointment by each party of three of their nationals to the Commission.
4. Holding of the inquiry followed by a report upon the "particular questions or matters referred to it, for the purpose of facilitating the solution of disputes by elucidating the facts and to define the issues presented by such questions, and also such recommendations and conclusions as may be appropriate."
5. If the difference persists, the case becomes the subject of an agreement of reference to arbitration, which is to provide for the organisation of the tribunal, define the scope of the powers of the arbitrators and determine the question or questions at issue.

The obvious object of the treaty is to create a series of steps calculated to divert attention from the issue to the method of settlement, and thus enable diplomacy to gain

¹ Italy entered into a similarly all-embracing treaty with the Argentine Republic during the last Hague Conference (Sept. 18, 1907). Other unlimited treaties are in force between the Argentine Republic and Chile (1902), Denmark and the Netherlands (1904), Denmark and Italy (1905), Denmark and Portugal (1907).

time for a calm examination of the points involved. The merit of the treaty lies chiefly in the ingenuity with which the procedure of conciliation and settlement is prolonged. When the two Governments are equally desirous of a peaceful adjustment, the treaty will be a means for the removal of any question, whether arbitrable or not, from being complicated by controversy on the part of an over-zealous public opinion.

A less ambitious, but much improved edition of the existing "common form" of standing arbitration treaty is that which has been adopted by France and Denmark (Aug. 9, 1911). This treaty provides as usual (Art. 1) that:

"Differences of a judicial character and more particularly those relating to the interpretation of treaties existing between the two contracting parties, which may arise between them and which it has not been possible to settle by diplomacy, shall be submitted to arbitration, in the terms of the convention for the pacific settlement of international differences" (Hague, Oct. 18, 1907), "provided they do not affect the vital interests, independence or honour of either of the contracting parties nor the interests of third Powers."

Art. 2, however, provides the exception that "Differences relating to the following matters shall be submitted to arbitration without the reservations mentioned in Art. 1:

"1. Pecuniary claims for damages when the principle of an indemnity has been admitted;
"2. Contractual debts claimed from the Government of one of the parties by the Government of the other as due to its nationals;

"3. Interpretation and application of conventional stipulations relating to commerce and navigation.

"4. Interpretation and application of conventional stipulations relative to:—Industrial property, copyright, . . . posts and telegraphs . . . submarine cables . . . &c.

"In respect of class 4, the contracting parties have the right to defer submitting such cases to arbitration until after the national courts have decided finally on them."

This treaty also contains a clause providing that the arbitral court shall decide, in case of difference, what category a case belongs to.

Thus three new forms of arbitration treaties have been devised in the course of the last three or four years in the place of the old common form of treaty (*i.e.* the Anglo-French form of October 14, 1903). The old form applies to "differences of a juridical order or relating to the interpretation of treaties" and excepts from its operation matters involving "vital interests" or "national honour." That between France and Denmark of August 1911 makes "vital interests" and "national honour" a part of the principle, and, excepting them from its operation, makes arbitration obligatory without qualification in certain defined matters. The Anglo-French and Anglo-American Treaties of August 1911 go further, and provide a pacific method, though not arbitration, for dealing with cases even involving vital interests and national honour; and that between Italy and the Netherlands of November 1909 throws out the exception altogether.

The progress of experience has not confirmed the expectation current at the beginning of the present century that arbitration might become a substitute for war. Only states between which no *casus belli* seems possible have, thus far, ventured to place all cases without exception within the scope of compulsory arbitration, and in the Turco-Italian and Balkan wars no reference to a court of arbitration could have dealt with the issues involved except on principles of treaty obligation and justice which would have necessarily condemned the aggressors. Nevertheless, arbitration removes from controversy all the smaller issues, and, under the influence of public opinion, its scope is being gradually enlarged, and the number of possible cases of conflict correspondingly reduced.

The following later treaties of arbitration (renewals starred) have been added to the list given in the article on "Peace" in *Ency. Brit.*, Vol. xxi:

1909.		Costa Rica-Panama	Mar. 17.
Brazil-China	Aug. 3.	Brazil-Haiti	Apr. 25.
Argentina-Portugal	Aug. 27.	Brazil-Dominican Republic	Apr. 29.
Brazil-Salvador	Sept. 3.	Belgium-Honduras	Apr. 29.
Brazil-Peru	Nov. 5.	Brazil-Colombia	July 7.
Italy-Netherlands	Nov. 21.	*Austria Hungary-Great	
Brazil-Sweden	Dec. 14.	Britain	July 16.
Greece-Spain	Dec. 16.	Russia-Spain	Aug. 15.
		Brazil-Russia	Aug. 26.
		Brazil-Greece	Aug. 28.
1910.		Greece-Italy	Sept. 2.
Costa Rica-Italy	Jan. 8.		

Italy-Spain	Sept. 2.	*Bolivia-Peru	Mar. 31.
Argentina-France	Sept. 7.	Italy-Sweden	Apr. 30.
*Argentina-Chile	Sept. 13.	Argentina-Ecuador	July 16.
Austria-Hungary-Brazil	Oct. 19.	Argentina-Venezuela	July 24.
Italy-Russia	Oct. 27.	*United States-France	Aug. 3.

	1911.	Brazil-Denmark	Nov. 27.
Brazil-Uruguay	Jan. 12.		1912.
Brazil-Paraguay	Feb. 24.	Argentina-Colombia	Jan. 20.

VII. Restrictions on War.

The next best condition of things to avoiding war is to restrict its area and effects when it unfortunately break out to the minimum consistent with its object. Such a restriction was one of the features of the Turco-Italian war. Thus simultaneously with the despatch of the ultimatum to Constantinople, the Marquis di San Giuliano despatched a note to the Italian Legations and Consulates in the Balkan States—of which the following passage is significant:

The Italian Government is determined to settle the Tripoli question in conformity with the interests and dignity of Italy; but, whatever the means she may have to employ in order to secure this end, the basis of her policy will continue to be the maintenance of the territorial *status quo* in the Balkan Peninsula and the consolidation of European Turkey. Not only, therefore, does the Royal Government not wish to encourage any movement against Turkey in the Balkan Peninsula, but it is firmly resolved to redouble its efforts to prevent, particularly at this moment, anything of the kind happening, and if any hopes or illusions have been formed or are likely to be formed in that sense they must be dispelled immediately, and you will suit your conduct and language to these ends directly the opportunity presents itself to do so.

At the beginning of the war, Italy also declared her intention not to land any troops in any part of the Ottoman Empire except Tripoli and Cyrenaica. The extinction of the lights along the Adriatic, Mediterranean and Red Sea coasts of Turkey, nevertheless, became a very serious matter. Italy's undertaking not to carry operations of war beyond the coast of the territory in question did not overcome the difficulty, inasmuch as it was to be presumed that she would only so bind herself provided Turkey entered into an engagement not to invade her Red Sea possessions. Nor did she restrict herself absolutely in accordance with her engagements, but, later on, landed troops on Greek islands, and threatened, and, in certain cases fired upon, different cities on the coast of Asia Minor, though she explained that this was solely for the purpose of destroying Turkish war vessels, which might otherwise have attacked Italian merchant ships.

The neutralization of the Red Sea was also mooted in the course of the war, and indeed the reason which led to the neutralization of the Suez Canal seems to be almost as strongly in favour of the Red Sea, as a more or less narrow highway of navigation, being assimilated to it. The inconvenience of the extinction of lights on the Turkish coast brought the need of such neutralization home to the shipping interests using the canal.

Incidentally it may be mentioned that, neutralized as the canal is, it is still legally on Turkish soil, as was admitted in the "Kaissari" incident at the beginning of the war. The vessel in question was conveying troops to replace others in the Yemen whose terms of service had expired. It was considered as not affected by the twenty-four hours rule imposed by Art. 4 of the Suez Canal Convention, and allowed to remain at Port Said under cover of the canal being a part of Turkey as well as neutralized.

VIII. The Malecka Case.

Of isolated international incidents, the only truly interesting one of late years has been that of the arrest in Poland of Miss Malecka, which once more raised the vexed question of mixed nationalities. This lady was Russian by descent under Russian law and British by reason of her birth in England under British law. She was arrested early in 1911 on a charge of abetting a political conspiracy, and seemed exposed to being detained in prison without trial for an indefinite time. But owing to pressure from the British government she was at last put on trial at Warsaw, and on May 10, 1912 was

found guilty and sentenced to four years penal servitude to be followed by exile to Siberia for life. So far as the law was concerned, the Russian Government was acting within its international rights; but distrust of the Russian law and procedure, and especially of the Russian punishments to which this Englishwoman was exposed, excited British public feeling. The Russian Government wisely found a means of letting the lady return to England. On June 10th, as the result of a petition to the Tsar, she was released on the terms that she should not again set foot in Russia. The case showed indeed the desirability of assimilating the laws of different states on nationalities. Assimilation, however, would mean, in the case of English law, the surrender of time-honoured principles in favour of foreign principles which, if more logical, are less elastic and might not be suited to the varied conditions of a wide-spread empire.

Among recent literature, bearing on the subject of this article, the following books may be mentioned:—Higgins, *Hague Peace Conference* (London, 1909), and *War and the Private Citizen* (London, 1912); James B. Scott, *Hague Peace Conferences* (2 vols., Baltimore, 1909); Oppenheim, *International Law* (2 vols. 2nd edition, London 1912); George G. Wilson, *International Law* (St. Paul, Minn., 1910); F. E. Smith and J. Wylie, *International Law* (London, 1911); Alvarez, *Le droit international Américain* (Paris, 1910), and *Codification du droit international* (Paris, 1912); Bray, *British Rights at Sea under the Declaration of London* (London, 1911); T. G. Bowles, *Sea Law and Sea Power* (London, 1910); Cohen, *Declaration of London* (London, 1911); Bentwich, *Declaration of London* (London, 1911); Lemonon, *Conférence navale de Londres* (Paris, 1909); Reventlow *Grossbritannien, Deutschland und die Londoner Konferenz*, (Berlin, 1911); Niemeyer, *Seekriegsrecht nach der Londoner Declaration* (Berlin, 1910); Catellani, *La dichiarazione di Londra* (Padova, 1912); Wehberg, *Capture in War on Land and Sea* (trans. London, 1911); Civis, *Cargoes and Cruisers, Britain's rights at sea* (London, 1911); Baty, *Britain and Sea Law* (London, 1911); P. Müller-Heymer, *Der Panamakanal* (Berlin, 1909); Lord Ch. Beresford, *The Betrayal* (London, 1912); Norman Angell, *The Great Illusion* (London, 1910); Barclay, *Turco-Italian War and its Problems* (London, 1912); Hazeltine, *Law of The Air* (London, 1911). (THOMAS BARCLAY.)

INTERNATIONAL FINANCE AND ECONOMICS¹

The four years 1909-12 constituted a period of rapidly increasing prosperity throughout the world from a financial point of view, and in every respect were the antithesis of the years from 1893 to 1896. Fully to appreciate the conditions it is essential to recollect those of the former period. In the nineties the world suffered from a general breakdown of credit which brought bankruptcy and disaster to many countries. The four years since 1909 have been a period of unbounded confidence and good credit, bringing expansion and progress to almost every nation. In the nineties prices of commodities fell to figures not previously recorded in modern times; in recent years they have risen to a level not witnessed for nearly 30 years. In the nineties employment was scarce, more especially in the young and food-producing countries; in recent years employment has become plentiful both in the young and in the old countries, and wages have advanced in most countries to rates not previously reached. In the nineties the fall in prices of commodities had a specially detrimental effect upon the welfare of the food-producing countries; while the industrial or manufacturing countries and districts derived much benefit from the low cost of food and material. In recent years the rise in prices of commodities has brought renewed prosperity to persons engaged in agriculture throughout the world; and while the advance in the cost of living has in some degree diminished the consuming power of those engaged in the manufacturing industries, the conditions have been beneficent for the world in general and much more equitable for all sections, the creditor and manufacturing countries having enjoyed a high degree of prosperity, in company with, and not at the expense of, the debtor and mainly agricultural lands.

The period has been marked by a great deal of labour unrest. This unrest occurred in the mining, manufacturing and distributing industries, in which the cost of living had risen much more rapidly than the rate of wages in comparison with the previous abnormal period of low cost of living. The re-adjustment of wages, and the advances in prices of manufactured goods and of minerals that have now taken place, have again

¹ See E. B. x, 347 *et seq.* ("Finance"), and articles enumerated in Index Vol., p. 893.

given the manufacturing countries a fair participation in the general prosperity. It is apparent, however, that the prosperity of the last four years has been felt mainly by the agricultural countries and districts, which have gained advantage from the recovery in prices of foodstuffs and of raw material, and which suffered so seriously in the nineties from the low prices which then prevailed. The influence exercised upon the economic welfare of the wage earners of Great Britain by the movements in prices and in wages and by the variations in the volume of employment is apparent from a contrast of the Board of Trade index-numbers of prices, wages and employment respectively, first, in the four years of good credit throughout the world which culminated in 1891, next, in the four years of bad credit from 1893 to 1896, and finally, in the past four years. This is shown in Table I.

Table I. *British Board of Trade Index Numbers.*

	Prices of Commodities.	Rate of Wages.	Employ- ment.
Good Credit period:—			
1888	102.7	84.7	98.3
1889	104.0	87.5	100.4
1890	104.0	90.3	100.4
1891	107.4	91.5	99.0
Average 4 years	104.5	88.5	99.5
Bad Credit period:—			
1893	100.0	90.1	94.6
1894	94.2	89.5	95.1
1895	91.0	89.1	96.4
1896	88.2	89.9	99.1
Average 4 years	93.3	89.6	96.3
Good Credit period:—			
1909	104.0	100.0	93.6
1910	108.7	100.2	97.3
1911	109.3	100.3	99.3
1912 (approx.)	114.0	103.0	100.0
Average 4 years	109.0	100.9	97.5

It would take us too far here to describe in any detail the various causes of the greatly increased activity of trade, the relatively high cost of living, the labour unrest, and the advances in wages throughout the world in the last four years.

The influence of capital. But in the main these things, as well as the great volume of emigration from Europe to the New World, result from a single cause, viz., the high condition of credit in the young and food-producing countries, and the great sums of capital which the lending countries have consequently supplied to them. This high condition of credit has partly arisen from the world's great output of gold, from the accumulation of gold, and from the encouragement which large stocks of gold have given to the free investment of capital wherever it could be profitably employed.

To realise the importance of these things it is again necessary to recollect the adverse conditions in the nineties, when the credit of the young countries was at a low ebb, and the borrowing states could not secure the capital needed for their develop-

Stocks of gold. At that time, with bad credit and very low prices of foodstuffs and raw material, gold accumulated in the Banks of England, France and Germany notwithstanding the world's small production of gold; in the past four years of good credit gold has accumulated in the young or borrowing countries, and not in the old or lending states, and this has materially assisted the movement of capital from the old to the young countries. This will be apparent from a contrast, first, of the stocks of gold in the Banks of England, of France and of Germany in 1896 in comparison with 1892, and second, of the stocks of gold in these three institutions in 1912 in comparison with 1908. This is shown in Table II.

Table II. Stocks of Gold in Lending Countries.

a. Bad Credit Period, 1892-96.

	June 30, 1896.	June 30, 1892.	Increase.
	£	£	£
Bank of England	49,200,000	27,800,000	+21,400,000
Bank of France	81,800,000	63,500,000	+18,300,000
Bank of Germany	43,600,000	40,700,000	+ 2,900,000
Total	174,600,000	132,000,000	+42,600,000

b. Good Credit Period, 1908-12.

	June 30, 1912.	June 30, 1908.	Increase.
	£	£	£
Bank of England	41,100,000	39,400,000	+ 1,700,000
Bank of France	130,500,000	126,100,000	+ 4,400,000
Bank of Germany ¹	61,400,000	51,600,000	+ 9,800,000
Total	233,000,000	217,100,000	+15,900,000

¹ Includes about £17,000,000 of silver.

The comparison becomes the more striking when supplemented by a statement (Table III) of the world's gold productions in 1893-96 and in 1909-12 respectively.

Table III. World's Gold Productions in 1893-96 and 1909-12.

Bad Credit Period.		Good Credit Period.	
	£		£
1893	32,600,000	1909	93,400,000
1894	37,200,000	1910	96,200,000
1895	40,800,000	1911	97,300,000
1896	41,500,000	1912 (approx.)	100,000,000
Total 4 years	152,100,000	Total 4 years	386,900,000

It will be noticed that, whereas in 1893-96 the world's production of gold was only £152,000,000, and the accumulation of gold in the three principal lending countries was £42,000,000, in the past four years, in which the world's production of gold has been £387,000,000, the accumulation of gold in these countries came to less than £16,000,000. It is unnecessary to make similar comparisons as to the chief borrowing countries in the two periods; it suffices to state that whereas in the period of bad credit they held little or no gold, at the end of 1912 they possessed enormous stocks.

Some notion of the immense sums of gold accumulated by the chief borrowing countries, in comparison with the amounts held in 1896, may be obtained from Table IV.

Table IV. Gold Held by Debtor Countries in 1896 and 1912.

INTERNATIONAL FINANCE

With such large stocks of gold in the borrowing countries and with the activity of trade which the good credit has created, there is no nervousness concerning the ability of the borrowing countries to meet their engagements, and the investment of capital by the older in the younger countries is on a great scale. Indeed, from one end of the world to the other, great works of public utility are under construction with borrowed capital, and consumption has reached a very high level per head of population. The amounts of capital publicly raised in London, Paris, Berlin and New York in 1909-12 are shown in Table V.

New capital issues.

(a) From *The Statist*: (b) From the *Moniteur des Intérêts Matériels*: (c) From the *Frankfurter Zeitung*: (d) Railroad & Industrial Corporations from the *New York Journal of Commerce*. x Approximate.

The aggregate sum, £1,056,000,000, of new capital raised by public issues in the four leading money markets of the world in 1912, is by far the largest ever publicly subscribed in one year, and indicates the feeling of confidence and the spirit of enterprise which animate investors everywhere. Indeed, at no time has capital shown greater mobility. From all quarters of the world demands for capital have been readily responded to by the capitalists of England, of France and of Germany. Moreover, although the American people have borrowed from Europe a good deal of capital on the one hand, they have, on the other, invested considerable sums in Mexico and in Central and South America. The greatness of the sums of capital supplied by Great Britain alone in the last four years to various countries will be apparent from Table VI, taken from the *Statist*.

A large part of the capital subscribed in recent years has been for new railway construction in Canada, Argentina, Brazil and Russia, and the completed mileage of new railways in the decade ended in 1915 will reach a greater total than has been attained since the eighties and will be nearly twice as great as completed in the nineties. This railway construction is opening up to settlement vast areas of virgin land, and, in conjunction with the renewed profitability of the farming industry throughout the world, is the main cause of the great volume of emigration from the old to the new countries. The number of immigrants into the United States, Canada, Argentina and Brazil in the last four years has been unprecedented, and all the preliminary preparations have been made for bringing into cultivation the additional land upon which to produce the food and raw material needed by a population growing in numbers, in wealth and in consuming power. Among the great reproductive and costly works now almost completed are the Panama Canal and the Canadian Transcontinental Railway. The prosperity of Australia in consequence of good seasons and the high prices of wool and of mutton has caused immigration to be resumed on a large scale after practical suspension for over 15 years, and is causing preparations for opening up the whole of the continent from north to south and east to west by great transcontinental systems of railways.

Indeed, from one end of the world to the other there has been movement, progress and prosperity, and production and consumption have been unprecedented both actually and in proportion to population. In this movement the East has participated in common with the West. Probably the greatest single event of the period has been the revolution in China in 1911, which caused the overthrow of the Manchu dynasty and the conversion of the country to a modern system of Government and to Western ideas of education and of progress. This event is as yet too recent for its real influence to be appreciated or felt. But the re-awakening of China, following upon that of Japan, is expected to modify profoundly the course of history both politically and economically. One of its first effects has been the willingness of foreign nations in general and of Great Britain in particular to supply China with the capital needed for her development. Throughout 1912 negotiations were in progress for a loan of £60,000,000 to China by the Six Powers especially interested in the country politically or commercially, and at the close of the year arrangements were practically concluded for a loan of £25,000,000. During the negotiations a loan of £10,000,000 was placed in London with the firm of Birch Crisp & Co., by China, against the wish of the British Government, which was only partially carried out.

The prosperity of India, in consequence of good crops, favourable prices of commodities, and a high state of credit, also calls for notice, especially as this prosperity has brought about a great expansion both in the export and import trade of the country and caused the import of no less than £27,000,000 of gold in the 12 months to March 31, 1912. The amount of gold absorbed by India since 1909 is, indeed, so remarkable and of such wide economic importance that the annual figures (years ending March 31st) are worth setting out in detail, together with those for the total world's gold production. In 1909-10, the world's gold-production being £93,000,000, the net value of gold imported and produced in India was £17,000,000; in 1910-11 the corresponding figures were, world £96,000,000, India £18,000,000; in 1911-12 world £97,000,000, India £27,000,000; 1912 (six months), world £50,000,000, India £13,000,000. The total for 3½ years comes to, world production £336,000,000, India consumption £75,000,000.

But for this great absorption of gold by India, representing 27 per cent of the world's gold production in the 18 months up to September 1912, trade would probably have become even more active and prices of commodities would have risen to still higher levels. The prosperity of India has brought about a great demand for silver rupees, and after an interval of five years the India Government has again had to purchase a large quantity of silver for coinage.¹ Up to middle of December 1912 these

¹The secrecy with which this operation had to be conducted, to avoid a rise in the price

purchases of silver had reached £7,000,000, and for the whole of the fiscal year ending March 31, 1913, they were expected to reach £10,000,000. These purchases of silver were operating already to reduce the amount of gold imported into the country, and if as anticipated India were to buy foreign goods in 1913 as freely as was indicated by the orders in existence at the end of 1912 the quantity of gold that would be sent to that country in 1913 might well fall to more moderate proportions, a factor which would tend to prevent monetary stringency in the world's money markets.

The activity of trade throughout the world in recent years did not extend to the United States in any marked degree until 1912. This was due to consumption increasing and trade improving after the 1907 banking crisis faster than the economic conditions warranted; to an excessive speculation in Western farm lands in 1909-10 which caused a temporary lock-up of banking resources; and to relatively poor crops. In 1912, however, the American crops of every kind and description proved superabundant, and far more than sufficient to meet the needs of the American people; and as the world's consumption is on a great scale no difficulty has been experienced in disposing of the surplus production to other lands. At the close of 1912 conditions in the United States appeared to be unusually sound. Indeed confidence regarding the continuance of international prosperity was in some measure due to the excellent position on the American side of the Atlantic. The consequences of the lock-up of American banking funds in farm mortgages in 1910 would have been much more serious than they were but for the activity of international trade and the ability of the American people to sell manufactured goods freely in the world's markets. The course of trade in recent years in the United States has been, extreme depression in 1908 following upon the banking crisis of 1907, a great recovery in 1909, a halting tendency in 1910 and 1911, and another great expansion in 1912 after it became evident that the crops would be unusually abundant. In brief, the United States had not up to 1912 played any great part in bringing about the activity in international trade (apart from an increased demand for foodstuffs in consequence of short crops), but it was expected to be a factor of real importance in the crop season of 1912-13, both in supplying other countries with food and raw material and in purchasing manufactured goods in return.

The great flow of capital in recent years to the borrowing states has stimulated production and consumption from one end of the world to the other. All countries produce commodities needed directly or indirectly by all other states; and when credit is good everyone can produce the things required in whatever part of the world they are produced. Hence in the period of good credit under consideration the volume of international trade has grown by leaps and bounds. To deal with the foreign trade of the whole world would be beyond the limits possible to the present survey. But the figures for Great Britain will indicate the remarkable expansion in international trade in recent years, the immense effect which periods of good and bad credit have upon international commerce, and the influence of the period of good credit upon foreign trade so far as that country is concerned. The values of British trade in typical years in which the credit of the younger or borrowing nations was good or bad are set out in Table VII.

In considering the growth of British imports and of the trade balance, account has to be taken of the rapidly increasing income of Great Britain from interest on capital placed abroad, from shipping, and from services rendered to other nations, by British bankers, brokers, insurance offices and others. It is computed that the income from these sources is now upwards of £300,000,000 per annum. An excess of imports over exports of £146,000,000 for 1912 confirms the of silver, led to the contract being placed by the Indian Council with Messrs. Samuel Montagu & Co., and one result was a curious parliamentary incident. Sir Stuart Samuel, the Liberal M.P., was a partner in the firm, and it was contended that he had vacated his seat by making a profit out of a government contract. The question was investigated by a select committee, which was unable to decide it and recommended its reference to the Privy Council; and no conclusion had been arrived at when 1912 ended.

Britain.**

Table VII. Trade of Great Britain (in Millions of £'s).

	Condition of Credit of Borrowing States.	Net Imports.	Exports of British Goods.	Balance of Imports over Exports.
1872	Good	£ 297	£ 256	£ 41
1877	Bad	341	199	142
1887	Good	303	222	81
1894	Bad	359	216	134
1903	*	474	287	187
1911	Good	578	449	129
1912	Good	633	487	146

*Great Britain's ability to lend was interfered with by South African War.

evidence that about £160,000,000 of British capital was supplied to Indian, Colonial and foreign countries during that year. In the last 10 years Great Britain has supplied other lands with about £1,200,000,000 of new capital, and the large growth of £159,000,000 in British imports since 1903 arises as to about two-thirds from the growth in the income of the country from interest and services, and as to only one-third from the expansion in exports. On the other hand the expansion of £200,000,000 in the exports of British goods in 1912 compared with 1893 was mainly brought about by the large additional sums of capital supplied by Great Britain to other lands. In brief, by lending capital freely abroad Great Britain has given the outside world about £160,000,000 a year additional spending power, a sum which has passed from hand to hand and from country to country, expanding consumption and production wherever the influence of the credits was felt, until finally the credits were settled by exports of goods to those persons and to those countries which desired to purchase British goods.

A typical instance may be given of the effect of these great investments of capital. In the last five years Great Britain has supplied Canada publicly with £176,000,000 of capital and privately with a considerable sum in addition. The total amounts are calculated to average about £40,000,000 a year. A growth of between four and five per cent per annum in the population of the country, a probable expansion of nearly 100 per cent in the country's railway mileage in the decade to 1915, and a several-fold expansion in the agricultural output in the last ten years, show clearly the effect of these great loans of capital upon the internal trade of Canada. The effect upon her foreign trade has been equally remarkable (see Table VIII). In the year ending August 1903, when Great Britain supplied Canada with but a small quantity of capital, the imports into the country were worth only £48,000,000; but in the year ending August 1912 they were valued at no less than £121,000,000. In this period (1903-12) the exports from Canada only grew from £46,000,000 to £66,000,000. Thus an expansion of £73,000,000 in imports was attended by a growth of only £20,000,000 in exports, the balance of £53,000,000 being paid for by capital borrowed from abroad and wealth taken into the country by immigrants. The greater portion of this sum was met by the large investment of about £40,000,000 of British capital in Canada in 1912 in comparison with a relatively small sum in 1903.

Table VIII. Trade of Canada — 12 months to August 31st. (In Millions of £'s).

	1911-12	1902-3	Inc.
Imports for consumption	£ 121	£ 48	+73
Exports of Canadian produce	66	46	+20
Excess of imports	55	2	+53
Gold; net imports	1	2	-1
Excess of imports	56	4	+52

The experience of Canada is the same as that of other countries supplied with large amounts of capital from abroad. Although the expansion in the exports of goods from Great Britain to Canada has not corresponded to the great amounts of capital supplied by British investors to that country, the capital invested has brought an increased demand from other countries for British goods, and the generous credits granted to Canada have been settled by the expansion in the exports of goods by Great Britain to the world in general.

In brief, the great loans of capital by the lending countries in the last few years of good credit have brought about an expansion of trade in all the countries which produce things needed by other nations.

The spirit of enterprise which has been so marked in the last three or four years has in some measure been fostered and stimulated by the international political situation in Europe, and by the fear that the building of a great navy by Germany and the corresponding increase in the British navy might ultimately lead to a conflict between these powers. Furthermore, the Moroccan difficulty between France and Germany, which became acute in 1911, the seizure of Tripoli by Italy, and later the attack upon Turkey by all the Balkan States with the exception of Rumania, created intermittent feelings of anxiety lest a European conflict should become inevitable. It is true that these difficulties were settled one after the other; that Germany withdrew all claims upon Morocco on receipt of compensation in the French Congo; that Italy and Turkey arranged peace; that the relations between Germany and England steadily improved throughout 1912; and that the rapid success of the Balkan Allies simplified one part at all events of the problem in the east of Europe; nevertheless, these events caused investors to place capital outside of Europe to an unprecedented extent. At the end of 1912 additional anxiety was caused by Serbia's claim not only to all the territory forming part of Old Serbia, but also to Albania, a claim which caused preparations for war and the mobilisation of a great army by Austria. There was, indeed, for a time in November and December serious uneasiness lest a peaceful solution of the situation, as between the Great Powers themselves, should not be found. Much was done to dispel these fears at the end of the year by the prospect of a general agreement to create an open port on the coast of Albania, to construct a railway from Serbia to the sea under the guarantee of the Powers, and to set up an autonomous Albania. The immediate consequence, even while the conclusion of peace between Turkey and the allies was still uncertain, was a renewed feeling of confidence in the stability of the European situation and in the strength of European securities; but on balance the prices of European securities showed a serious decline, owing to the desire of investors to purchase stocks not likely to be affected by the political complications in Europe.

Another influence affecting the security market has been the desire to dispose of low-interest stocks and to transfer the capital to securities giving a higher return. In fact, the fashion in securities in the last few years of good credit has been, as one would expect, the exact opposite of that in a period of bad credit. In the nineties, when the credit of the young countries was at a low ebb and capital accumulated in the older countries, the demand was almost exclusively for safe stocks, and no thought was paid to the rate of interest so long as the stocks were considered secure. In the recent period of good credit stocks possessing "chances" have been much sought for, and little or no attention has been paid to the security of the stocks provided there was the prospect of increased dividends and the possibility of a substantial increase in the market value of the security. The result of this fashion has been that speculative securities upon which the dividends were increasing have been in great demand, while stocks and bonds upon which the dividends were stationary — whether shares of public companies, or the obligations of governments — have been out of favour. A comparison of the prices of securities in various countries shows that the change of fashion has been universal, the securities sought after being those upon which dividends were increasing

Credit and politics.

Effect of high or low yield on securities.

or were likely to increase, while the securities paying fixed rates of interest or steady rates of dividends have been ignored. This condition of mind caused a boom in rubber securities in 1910, when over £21,000,000 of capital was raised in the London market for new rubber companies, and when prices of rubber shares rose to high figures in consequence of actual or anticipated dividends. It also created a great demand for securities of oil, shipping and other companies' shares, where the profits have expanded rapidly in consequence of the trade activity. In Table IX the prices of a number of securities quoted on the London Stock Exchange at the end of 1912 are contrasted with those at the end of 1908. The changes show clearly the demand for securities giving relatively high rates of interest or increased rates of dividend in comparison with securities where the rates of interest and dividend have been low or stationary. The prices of securities at the end of September 1912 are added to show the fall in stocks in the last three months of 1912 in consequence of the Balkan crisis.

It is noteworthy that gold-mining shares have also suffered neglect in common with high-class securities in the recent good-credit period. In the nineties the demand for gold-mining shares arose from the recognition that the supply of gold was inadequate to the world's needs. At the present time it is generally admitted that the world's production of gold is sufficient, and inasmuch as large incomes can be gained from the investment in securities which have benefited and are benefiting from the activity of the world's trade arising in part from the great production of gold, the inducement to purchase gold-mining shares has largely disappeared. Of course, diamond, silver and other mining shares are not in the same

Gold-mining shares.

category as gold-mines, for the prices of diamonds, of silver, of copper and of other metals have risen, whereas the price of gold is stationary; indeed, measured by other commodities it has fallen heavily. In other words, gold has depreciated, while the prices of all other commodities have appreciated; and whereas the profit from gold-mining has declined and is declining, the profit from producing other commodities has greatly risen and is still rising. The rise in silver and diamond-mining shares and the decline in gold-mining shares will be apparent from Table X. The price of Rio Tintos in December 1912, it may be noted, shows a decline brought about by recent liquidation in Paris in consequence of the Austrian mobilisation.

The fall in high-class securities on the continent of Europe, and the appreciation in industrial stocks and in banking shares, which on the continent so largely participate in the increased profits of industrial companies, are shown in Table XI. The great decline in prices in consequence of the Balkan war will be evident.

In the United States similar conditions have prevailed (see Table XII), and prices of bonds and shares have generally fallen except where the profits are expanding and the dividends are increasing.

The immense production of gold has prevented any great rise in the rate of interest for "banking money." Of course, "banking money" is an entirely different commodity to "investment money" or capital. Money that is placed permanently in securities is the savings of the public and is mainly under the control of the general investor; whereas banking money consists for the great part of the unused cash balances of companies, business houses, and individuals,

*Banking
money.*

and is under the control of bankers. In Great Britain banking money is increasing at the rate of about £30,000,000 a year; whereas the total savings of the country available for investment in securities or in other forms of property or for the acquisition of other wealth are now about £350,000,000 per annum. In other countries the amount of money under the control of bankers also represents but a small part of the savings available for investment. Although the general public changes its policy in the matter of investments from time to time, at one period demanding high-class stocks with low rates of interest, and at another low-class stocks with high rates of interest, bankers pursue practically the same policy in periods of good and of bad credit. Banking money in Great Britain is mainly engaged in financing international commerce and national trade from the producer to the consumer, and the nature of the securities upon which banking funds are advanced is practically the same from period to period. The fluctuations in the rate of interest are brought about by the changing volume and values of the goods to be financed in proportion to the funds which bankers have at their disposal. The great production of gold in recent years has enabled payment to be made to the backward countries, whose systems of banking and of currency are not highly developed, with unusual facility, and has kept down the demand that otherwise would have been made upon banking credits in proportion to the values of the goods to be financed. Nevertheless, the volume of international trade has become so great that relatively high rates of interest have been current notwithstanding the great production of gold.

High rates of interest for banking money are sometimes brought about by a sudden feeling of anxiety and consequent contraction of credit, a condition of things that subsequently creates a redundant supply of money and brings low rates of interest. Owing to the banking crisis in the United States in 1907, the breakdown of the banking system of that country at that time, and the exceptional demand upon the stock of gold in Great Britain, the Bank of England rate in that year averaged £4. 18s. 6d. per cent. In the following year, when trade, both in the United States and in other countries, seriously suffered from the after effects of the crisis, and when the demand for banking accommodation was exceptionally small, the average Bank of England rate was only £3. 0s. 3d. per cent. In 1909, when trade was still affected in some measure by the previous crisis in the United States, the average rate was still as low as £3. 1s. 8d., although the Bank rate rose to 5 per cent in October in consequence of a great rise in the price of cotton and an unusual drain of gold to Egypt. In 1910, however, the money market felt the effect of the rapid recovery in trade in America, of the rise in the prices of commodities, and of the exceptional lock-up of bankers' resources in financing a real-estate speculation in the Western states of the American Union, and the average Bank of England rate rose

Bank rates.

to £3. 14s. 6d. per cent on the average for the year. In 1911 there were no abnormal demands for money; indeed, the uncertainties with regard to the Moroccan situation caused investment money to accumulate in the banks, and the average Bank of England rate for the year was no higher than £3. 9s. 4d. In 1912 the average Bank of England rate rose to £3. 15s. 6d., in consequence mainly of the disturbance to credit arising from the wars between Italy and Turkey, and the Balkan States and Turkey. These wars, with the anxiety they created as to a conflict between the Great Powers, caused large withdrawals of cash from the State Banks of France, Germany and Austria. The withdrawals of cash were increased by the mobilisation of troops in Austria and the payment for supplies by loans obtained from bankers. The political situation thus caused an expansion in the coin and note circulation of the three banks mentioned of nearly £80,000,000 in a period of four months instead of a normal sum of about £30,000,000. The result of this great drain upon the resources of the State Banks of France, Germany and Austria was an advance in the value of bankers' money throughout the world. During the closing months of 1912 the Bank of England rate was 5 per cent, the Bank of France rate 4 per cent,—an unusually high rate in France,—while the German and Austrian bank rates were 6 per cent. The conclusion of peace between the Allies and Turkey was looked forward to with the expectation that it would result in a great reflux of cash into the continental banks and renewed ease in the money markets. Whether or not an improvement in the general political situation would induce French bankers to replace the money they had withdrawn from Germany and from Austria had yet to be determined. If not, the value of bankers' money in both of these countries would remain relatively high for some time to come. Having regard, however, to the probable activity of the world's trade and the great volume and value of the merchandise to be financed, it was evident that banking money would remain in good demand at profitable rates of interest notwithstanding a gold production at the rate of about £100,000,000 per annum.

The average rates for banking money in England, France, Germany, Holland and Belgium since 1902 are shown in Table XIII.

(GEORGE PAISH.)

THE EXTENSION OF INTERNATIONAL TELEGRAPHY

Submarine Cables.—The approximate length of submarine cable in active work at the end of 1912 was 277,000 miles, of which but a sixth was under any government control, the remainder being administered by private enterprise, the capital invested representing some 35 million pounds sterling. Whilst it has generally been recognised that the cables afford a highly efficient method of telegraphy, and that the parties administering them provide, as a whole, an eminently satisfactory service, it has for a long time been felt by governments and by the public at large that the service is of a very costly nature; and that having regard to the increasing demand for speedy com-

munication with a country's outlying possessions—as well as with other nations—it requires considerable development on a basis of substantial reductions in the tariff.

From a national standpoint, the actual control of a cable is a matter of first importance. It means that a country can gather together its distant resources at short notice when desired without fear of interruption, and by this means is provided with an extra insurance against attack. Thus cable control under normal peace conditions is of even greater value than the achievement of such control in times of war.

Partly on strategic accounts and partly with an eye to improving on the facilities for rapid communication with distant dependencies, a general feeling has of late sprung up amongst the principal European powers for establishing their own national cable links. Hence, within comparatively recent years, Italy, France and Germany have each in turn produced their own factories for the construction of submarine telegraphs, and these countries have now their own separate cables to most of their respective outlying dominions and tributaries. Thus, an agreement was recently entered into between the French and German governments, the object of which is to render these countries independent of British cables—more especially for communication with Africa. But, immediately, perhaps, the most striking feature of this agreement is the laying of a Franco-German state cable between Brest and Emden, with German extension to Monrovia (West Coast of Africa) and Pernambuco (South America).

Another highly important event occurred when, at the beginning of 1912, the Western Union Telegraph Company of America took over on a 99 years lease all the five cables of the Anglo-American Telegraph Company, together with the single line of the Direct United States Cable Company. By this practical absorption all the trans-Atlantic Cables between the United Kingdom and Canada (or the United States) have come under American control, the Commercial Cable Company of New York being the "Western Union's" only competitor. It seems quite likely that this absorption may make for an improved service in certain respects as well as lead the way to further developments. It is also obviously beneficial from a general American standpoint. But from a national British point of view the change has led to serious misgivings.

If telegraphic communication between a Great Power and its over-sea dominions were only needed for private individual purposes, there would be no sufficient justification for a government embarking on the expenditure of public money for state-owned cables. But such communication has important national aspects, (1) strategically, (2) politically, and (3) for developing inter-imperial trade. Whatever may be thought about state trading in general, there are more sound reasons in favour of government-owned strategic cables to distant possessions than would apply in the instance of state railways or the government land telegraph system of a country, both of which may be said to serve individual interests rather than national or imperial.

For Great Britain the most striking case for a state cable is between the mother country and Canada. Indeed, whilst in order to effect a satisfactory connection with the Imperial Pacific cable, there has always been the need for an All-British Atlantic cable and land line across Canada, this need—in the opinion of constructive British Imperialists—became a positive and urgent necessity so soon as all the existing Atlantic cables came directly under the control of a United States Company. Other gaps in an All-British system are between Gibraltar and Bathurst, and between Bathurst and Barbados, and the suggestion has been made that in the latter case an extension to Bermuda would meet and connect up with the proposed Imperial Atlantic cable via Halifax.¹

¹ Telegraphic communication to and between the West India Islands is in a highly unsatisfactory position. The Royal Commission appointed in 1909 to enquire into the trading relations between Canada and the West Indies strongly urged that the rival cable systems should be taken over by the state. Though having the benefit of evidence from "wireless" experts, they recommended further cables rather than "wireless," except in a few minor instances. The Imperial government have not acted on this report, proposing that any necessary developments should be effected by "wireless." On the other hand, Canada and the West Indies adhere to the findings of the Canada-West Indies Commission, and at the Ottawa Conference in April 1912 adopted (unanimously) resolutions to that effect.

Far the greater amount of the existing cable systems is in the hands of private enterprise. But it is obvious in such a case that national interests and those of the public are liable to run counter to those of the companies concerned. Thus the feeling in favour of the communicating links with the rest of the British Empire being administered by the state has, of late, gained considerable force. There are some, indeed, who would like the entire cable system as at present controlled by British cable companies taken over by the government. That, however, will be clearly inadvisable for high diplomatic reasons. Moreover, it would in all probability be quite impracticable.

The cable companies—almost entirely the outcome of British private enterprise—have certainly effected very substantial reductions in the telegraph tariff to different parts of the world. These rebatements appear at their best when a comparison is made with the earliest days, when the desire for communication at such distances was far less, and when the commercial pioneers had a greater right to exact high rates.

Whilst increased overhead charges and the cost of additional cables constitute a genuine commercial objection to tariff reductions, this difficulty has of late been, to a great extent, met by the invention of the cable relay. This permits of a cheaper type of cable for a given volume of traffic; and, correspondingly, by its adoption at intervening points, the same type of cable has a greater earning capacity.

It is now over ten years since a proposal was made for a universal 6d., 9d., or 1s., rate throughout the British Empire, the suggestion being that the traffic revenue of the various lines to different parts of the Empire should be "pooled together." Since then, there have been a number of irresponsible proposals of a sort that moves public fancy and sensation—about enormous cable rates reduced to even as low a figure as 1d. a word on a universal footing throughout the world. A reform of this character would involve numerous international difficulties. Moreover, it is more natural that each nation should limit its energies for reform to the reduction of rates within its own sphere of action.

It was on the first day of 1912 that reduced rates for deferred messages by cable became an accomplished fact. An innovation of this character satisfies, in a great measure, prevailing needs in supplying an alternative service intermediate between the sometimes unnecessarily speedy yet costly cablegram and the despatch of a letter by mail occupying several weeks in transit. The reform is mainly effective for developing private messages, for increasing the bulk of press news between the different parts of the world—thereby tending towards greater accuracy and better understanding. It also obviates the necessity of coding and decoding in the case of many business cablegrams of a non-urgent character. For the eventual realisation of deferred "ordinary" rates between the mother country and the greater part of the British empire, English people are largely indebted to the persistence of the British Postmaster-General (Mr. Herbert Samuel). In the case of long distances such as that between the United Kingdom and Australia, this innovation is especially appreciated—owing to the length of time occupied by the mail on the one hand, the cost of "cabling" on the other; and the All-British Pacific cable may, therefore, be cited as a good example of the way in which deferred rates turn the line to better account during the more or less idle hours of the night, as well as during non-mutual business hours. On this line alone up to the end of September as many as 228,437 words had been sent at deferred rates during 1912.¹ When this system of deferred rates comes to be more widely known and understood, it will undoubtedly be even more utilised—for social as well as business purposes. With the opening of 1913 a system of cheap week-end cable letters (not less than 30 words) came into operation between the United Kingdom and nearly every other part of the British Empire. The system was inaugurated as far as Canada was concerned by the Western Union Telegraph Company in the early part of 1912, and was some months later adopted by the Eastern Telegraph Company and the Pacific Cable Board between the mother country, South Africa and Australia. The messages can be handed in on any day

¹ The All-British Pacific cable is, as a matter of fact, an excellent example in every way of expansion. Laid in 1902, it only carried about 200,000 words in all during its first year whilst its present volume of traffic exceeds ten times that amount.

during the week to be transmitted on a Saturday night or during Sunday for delivery on Monday or Tuesday.

The "deferred" rate system has also been applied to Press cablegrams, and this should prove an enormous impetus to the circulation of news of a not too urgent character. A reduction in press rates between any two countries invariably means that the newspapers of each print a greater volume of matter about the other, which, again, means an increase of business between them—in addition to a better understanding and more friendly relations being developed. In fact, a lowering of price in anything invariably leads to increased demand—and in proportion to the degree of rebate. Where some sort of guarantee of traffic is given, further reductions should reasonably be looked for in many directions. The cable companies at present demur to extending the deferred rate plan to coded messages, fearing apparently that too large a proportion of their traffic would become "deferred."

If the effect of distance is to be satisfactorily overcome we must commune a great deal more than we do through wires that bring us into speedy touch. The facilities at present available do not permit of this, partly owing to cost, but also on account of an actual insufficiency of cables to bear any considerable increase of traffic during mutually busy hours. Many more cables are required in a variety of directions, for accommodating an increase of traffic such as would undoubtedly result from any considerable reduction of tariff. It may be said that, meanwhile, the network goes on increasing steadily from year to year—as much as ever. The preponderance of cable worked by private enterprise as against that by governments is gradually becoming greatly modified, partly because it is seen that public interests are bound to differ from shareholders' interests in such a case. It will, no doubt, in time be recognised that a nation's oversea communicating links should be put on the same footing with general defence—the Navy, Army, etc.—to which it serves as so important an auxiliary. A great war may, at any moment, make this abundantly clear, but in that case the lesson will be dearly bought.

Radiotelegraphy.—A few years ago there would have been but little to record in regard to radiotelegraphy or "wireless," except in the matter of experimental work. But things have moved rapidly of late years, following on steady progress in the practical realisation of this branch of applied science.

It suffices here to say that—like most other branches of applied science—radio-telegraphy, even in its present form alone, is the work of many hands of different nationalities. The different systems at present available, in so far as they differ fundamentally, do so mainly in regard to the form of oscillations, or waves, emitted and the method of producing them. These may be classed under the following heads, in the order in which they were brought to public notice:—(a) the spark, or intermittent wave, of Marconi and others, (b) the quenched spark—Telefunken, Lepel, etc., (c) the continuous (undamped) wave of Poulsen and others.

By far the most of the practical, and long distance continuous commercial work has, as yet, been effected by the Marconi and Telefunken systems,¹ though, on the other hand, in the opinion of some, other systems possess several advantages. For instance, the Galletti system has certain favourable characteristics. This method has recently been taken up by the Indo-European Telegraph Company with a view to serving as an auxiliary to their cable and land line service between England and India. With this idea, it is being put on trial for working between France and the United States.

A recent invention that is likely to prove of great value is the high-frequency alternator of Prof. Rudolph Goldschmidt. The Goldschmidt patents are worked by the *Compagnie Universelle de Télégraphie et de Téléphonie sans Fil* (10 million francs capital) of Paris. This company has just established a high-power trans-Atlantic station near Hanover (Germany) with two Goldschmidt alternators (150 K.W. high frequency out-

¹At the end of 1912, of coast stations—European and non-European—there were 107 Marconi stations and 161 others, of which 85 were Telefunken stations. Of ship stations, there were 726 Marconi (including the Italian Navy) and 583 others, of which the Telefunken Company had 289; or, adding the 245 Telefunken stations of the German Navy, we get Marconi 726, others 828, of which 534 were Telefunken.

put), which will shortly have its counterpart in a corresponding station at Atlantic City New Jersey, U.S.A. As soon as this is completed a trans-Atlantic service will be established between Germany and the United States, which is to be supplemented by another station equipped by the same French company on the west coast of France.

The quenched musical spark system of Baron von Lepel was bought up within the last 2 years by the *Compagnie Générale Radiotélégraphique* of Paris, which now effects the greater part of French radiotelegraphy. This company has lately disposed of its English and colonial patent rights to the Anglo-French Wireless Company of London, which also works the Goldschmidt patents in England on behalf of the *Compagnie de Télégraphie et de Téléphonie sans Fil*.

The French Government have determined to establish wireless communication between France and her colonies. It is proposed to establish as many as five separate chains of stations. One of these will have stations in the south of France, in Tunis, Jibutil, Pondicherry, and Cochin China, with a branch to Madagascar. The South American and African chain, starting from the same station in the south of France, will connect with stations in Morocco, Colomb-Bechar, Senegal, Timbuctoo, Bangui, and Martinique. These two systems will be followed up by a connection across the Pacific, with stations at Noumea and Tahiti. One is also to be erected in the west of France to establish communication with North America. The total cost of the complete system will be about £807,800.

The Poulsen system was first put into practice in Denmark some six years ago, and a little later a station was established at Cullercoats on the eastern coast of England—this station having since been taken over by the British Post-office, along with all the other commercial stations previously owned by wireless companies. For some years, the system was turned to very little practical use, though the reasons for this are in no way associated with its technical merits as a system. Within the last two years the Poulsen system has been greatly developed by means of (automatic working) improvements due to Professor Pedersen. In this form the system has been lately taken up by an American organisation, the Federal Telegraph Company of San Francisco, formed, in the first place, for establishing wireless communications between San Francisco and Honolulu, the range being over 2,000 miles—or somewhat in excess of that dividing the North Atlantic Ocean. Wireless stations on the Poulsen-Pedersen system have also been established by this Company at 14 different cities—some covering land ranges of over 1,000 miles—in different parts of the United States. In the case of San Francisco and Los Angeles additional apparatus has had to be installed to meet the increased traffic since the original installation was effected in 1911. The Canadian government also contemplate the adoption of the Poulsen-Pedersen system for effecting wireless communication with the mother country—between Halifax and a station in the British Isles, subject to satisfactory demonstrations of its capacities.

Like the Australian Commonwealth, the United States government recently decided not to pledge themselves to any particular system. They propose to buy what is wanted in the open market and establish their own system of radiotelegraphy. On this basis the following were at the end of 1912 the projected radiotelegraphic stations of the United States government—some of which had actually been installed:—Arlington (Washington), Panama, San Francisco, Honolulu, Guam, Manila, Porto Rico, San Antonio (Texas), Fort Leavenworth (Kansas), Fort Omaha and Fort Riley. Several of these are intended to serve strategic ends. It may be added that the amended Radiotelegraph Act of the United States came into operation on December 13, 1912. It establishes a system of complete Federal control over wireless communication, and requires all operators to be licensed, amateurs being placed under very severe restrictions and forbidden to transmit messages over more than 750 feet, with the object of preventing them from interfering with the operations of the State and commercial systems.

France, Germany, and Japan have each been maturing large schemes of wireless communication in the Pacific. Three years ago a secret conference at which the British Government were represented was held at Melbourne to consider the same ques-

tion. The conference agreed that wireless stations in the Pacific which could be put in protected places would prove exceedingly useful for communication with the fleet and in the event of the existing cables being cut. It was therefore determined to erect the stations without delay. This, however, was not done, and the causes seem to be that the Admiralty adopted the theory that such a means of communication in the Pacific would be of small strategic value, and that the Postmaster-General held that its commercial value would be negligible. The Australian and New Zealand Governments think the exact reverse; and they have repeatedly told the Home Government that in their efforts to maintain the supremacy of British trade in the Pacific they would be seriously handicapped if any interested foreign Power established radiotelegraphic communication ahead of them. The French Government apparently agree as to the importance of wireless telegraphy in the Pacific, and it will probably be found that the Governments of Germany and Japan are of the same opinion.

From a British standpoint, the most important wireless project is undoubtedly the Imperial wireless scheme, which towards the end of 1912 was under close discussion by a select committee of the House of Commons. As proposed by the government the scheme embraced stations on the Marconi system in England, Egypt, the East African Protectorate, South Africa, India and Singapore. Apart from its strategic purpose, such a scheme could not fail to be of immense advantage for the rapid and simultaneous dissemination of important Imperial news to the various corners of the British Empire. Neither the Dominion of Canada, the Commonwealth of Australia, nor the Dominion of New Zealand, however, became parties to the scheme, preferring, in each case, to make their own arrangements for a system of radiotelegraphy with the same objects in view.

It is evident that the Atlantic Ocean will soon be the scene of much radiotelegraphy; for in addition to the various projected stations already referred to, the Marconi Company are establishing a second trans-Atlantic service between Norway and the United States for the Norwegian government.

Since the realisation of the International Convention of 1906, wireless telegraphy has proved invaluable on several occasions to ships under distress as well as in connection with the saving of life in the case of actual wrecks. The most notable instance of this was the "Titanic" disaster, since it was to radiotelegraphy more than anything else that the survivors owed their lives. Not the least amongst the lessons inculcated by that tragedy were those associated with maritime radiotelegraphy, the most important being the absolute necessity of a continuous watch by night as well as day. Another is obligatory inter-communication between all ships installed with the apparatus—irrespective of the system used.

The second conference under the International Radiotelegraphic Convention was held in London from June 4 to July 6, 1912. Perhaps the most important new regulation passed at this conference was that relating to compulsory inter-communication. The principle had already been accepted by the majority of the administrations adhering to the Convention, but on this occasion those which had previously stood out from its practice—the United Kingdom and the British possessions, Italy, Japan and Portugal—announced their future adherence. Thus the principle is now embodied in the Convention. A proposal for the obligatory installation of an emergency source of power met with unanimous approval. The conference passed a resolution in favour of compulsory equipment of ships. Provision was further made for improved watch on ships. Ships in distress are now to control the working of the station in the neighbourhood, whilst the ship operator is placed under the captain's control.

Developments in radiotelegraphy have occurred at such a pace that we may be any day brought face to face with a complete change in the art, and even now there are several inventors closely working at the problem of effective wireless signalling without any vertical aerial. This in itself would be a very important revolution, if only on account of the large proportion of the cost in long range work that is attributable to the extremely high steel masts at present involved.¹ It is generally recognised that radio-

¹ Under the proposed Imperial wireless contract these were to be 300 feet high, and the

telegraphy is still more or less in its infancy. This being so, every incentive should be given towards encouraging ingenuity. At one time the construction and laying of cables was closely confined. Since those days, however, the public and the taxpayer—if not the shareholders—have benefited by the healthy competition that is now the rule.

Cables and "Wireless": Relative Value.—As there appears to be an impression that radiotelegraphy is likely to be more effective than cables from a strategic point of view, let us especially consider the two methods from this standpoint. To begin with, the wireless method has an obvious and highly important advantage here, in that communication can be directly effected with a fleet itself instead of merely with the nearest cable station. We have, however, to remember that, by cable, a message—besides being more sure to reach the other end—is far more strictly confined to the quarter for which it is intended. It is sometimes suggested that the use of a secret code meets all objections under this head. On the other hand it may be questioned whether radiotelegraphy as yet adapts itself sufficiently to codes to render it suitable for codework on anything like a large scale, and certainly no reliance should be placed on the secrecy of codes. Again from a strategic standpoint, one great objection to placing reliance on radiotelegraphy in its present stage is that messages can be transmitted without their source being detected by the receiver. This may be an advantage to the belligerent; but, on the other hand, it is equally likely to be the reverse. Similarly, it is impossible for the sender of a wireless message to tell who may—or who may not—be at the other end, or how many ends there are. In short, radiotelegraphy is likely to prove a double edged weapon in warfare. Indeed, a cable—the location of both ends of which is known—is really the only satisfactory and sure source of communication in a strategic sense. "Wireless" is so new as to be still something marvellous; but if the order of the two inventions had happened to be reversed the cable would now be regarded as an obvious improvement, coming as a boon for confining the paths of our messages direct to the individuals for whom they are alone intended. And apart from being, as we already know, a ready prey to gales, etc., radiotelegraphic stations, even though placed well inshore, must always form a fairly easy target for shooting down from a distance.¹ Shallow water cables are, of course, always liable to be cut in time of war; but probably the safest means of communication in such emergencies is the really deep sea line in the open ocean—such as the All-British Pacific cable. From the strategic point of view, too, it should be remembered that interruption to a cable is more speedily remedied than the destruction of a wireless station. The station at Nauen was actually estimated to take as much as 6 months to reinstate, and in November 1912 had still not been made good though that period has already elapsed. Again, the cable can even be worked from a small row boat in emergencies. That, however, is of course impossible with radiotelegraphy. In the matter of working speed, the advantage hitherto associated with the cable is now in some doubt; for at least one "wireless" system is capable of working at an equal if not greater speed, though not yet demonstrated on extreme ranges. Where, however, the cable has still the advantage here is in the effective working speed maintained, say, throughout a day, owing to the far less amount of repetition work involved. This is largely due to certain external and unavoidable interruptions of one sort or another, seriously influencing the regular progress of "wireless" work where they do not affect cable telegraphy. The cable is also still at a distinct advantage as regards regular uninterrupted—indeed invariable—day and night service, independent of atmospheric and climatic conditions. With radiotelegraphy this state of things cannot, in reality, be said to prevail to-day, though certainly very great advances have, of late, been made in this direction. For instance, when the Marconi Company first established their trans-Atlantic service messages could scarcely be sent by day at all; now, however, a more or less continuous service has been provided. "Atmospherics" (electricity in

thirty at each station were to cost £32,500—a fairly large proportion of the proposed £60,000 per station for the proposed initial 6 stations in this considerable scheme.

¹ Experiments have been directed towards obviating the use of high masts or towers, but do not appear to have been turned to practical account so far.

thunderstorms, etc.) are still, however, a constant source of trouble in all "wireless," the atmosphere causing discharges—of an especially powerful character in the case of work, whereas cables are practically immune to such disturbances—forming, indeed, what may be termed a "closed circuit." It is notorious that most of the messages from Tripoli during the recent Turco-Italian war came by cable rather than by "wireless;" moreover the Italian government has since established further cable communication. Germany, France and Italy, though with far fewer important distant possessions than Great Britain, are developing their cables particularly as methods of communication. The German government subscribes annually to two Atlantic cables no less than £85,000, and a further £75,000 towards the German-Dutch cables to the East.

Dealing with facts as they are to-day the mean view of the relative merits of telegraphy by cable and "wireless" leads to the conclusion that each has its independent sphere. Whereas the cable has still the advantage in the matter of sureness, accuracy and secrecy, a wireless system can be established at less cost. Thus, the tariff of the latter should be on these two accounts lower than that which prevails with the former. We have an example of this in the case of the Marconi trans-Atlantic service, where the rates are now half those charged by the cables serving between the same points.¹ It only remains to be said that if cables were to be supplemented in each case by radiotelegraphy (instead of by another cable) an eminently practical comparison of the service in every respect would be thereby afforded. The two rival methods should be worked together. Radiotelegraphy is bound to be extremely useful to a cable system—as feeders to a trunk line, for auxiliary and breakdown purposes, etc. Similarly, the cable is evidently extremely useful to wireless organisations—trans-Atlantic and otherwise—in meeting prevailing difficulties.

(CHARLES BRIGHT.)

THE WOMAN SUFFRAGE MOVEMENT²

In England the movement for securing the parliamentary franchise for women entered afresh upon a "militant" stage in the autumn of 1910. Its supporters had been encouraged by the grant of two days of Government time in July to the debate on Mr. Shackleton's Bill, known as the "Conciliation" Bill, and by the majority of 110 on the second reading; and they were proportionately discouraged when, in November 1910, Mr. Asquith announced in a letter to Lord Lytton that he could give no further facilities before the dissolution of parliament. The immediate result of his refusal was a raid on the House of Commons, organised (Nov. 18th) by the Women's Social and Political Union. Many arrests were made, but when the prisoners were brought up the next day at Bow Street, the magistrate, acting on instructions from the Home Office, took the unusual course of discharging them all. This leniency, far from propitiating the militants, led to further troubles, and 153 women were arrested on November 22nd for a raid on Downing Street. They received sentences either of a fine, or imprisonment for 1 or 2 months. On the other hand the more cautious suffragists, after Mr. Asquith had said in reply to a question in the House of Commons on November 22nd, that if his government were still in power, he would in the next parliament give "facilities for effectively proceeding with a Bill," framed to admit of free amendment, claimed that this made woman suffrage an issue at the general election of December, and awaited the verdict of the country. Comparatively little attention however was given to the subject by the electorate, and in a few places where woman suffrage was directly put forward by candidates it was a pronounced failure. A suffragist candidate in East St. Pancras obtained only 22 votes; the Liberal candidate for South Salford, whom they strongly supported, lost the seat; and Sir Victor Horsley, a pronounced suffragist, was defeated for the University of

¹ At one time there was in reality very little difference between the two charges, but since the Post Office have more completely recognised the Marconi trans-Atlantic system, and—as with cables—service instructions no longer have to be paid for, the apparent difference has become an actual difference.

² See *E. B.* xxviii, 786 *et seq.*

London. Nevertheless, a modified "Conciliation" Bill, introduced the following session into the new House of Commons by Sir George Kemp, was read a second time by a majority of 167 on May 5, 1911, and a promise was given by the Government that as time was not available that year, the Bill would be given special facilities during 1912.

Meantime, by way of calling attention to their grievance, many suffragist women determined to evade the Census enumeration on April 2, 1911, on the ground that if the Government denied them citizenship, it could not reasonably enrol them as citizens. They, therefore, arranged to spend the night in the houses of sympathising friends or in public places, and their project was in a measure successful. On June 17th the largest procession of women ever marshalled, said to exceed 40,000 persons and over 4 miles in length, marched from the Thames Embankment to the Albert Hall. Over 5,000 meetings were held in favour of the "Conciliation Bill," a demonstration attended by 500,000 people took place in Hyde Park, and another, attended by 10,000 people, in Trafalgar Square.

It was understood that militancy was to be abandoned until the fate of the new Bill should be known, but when in November 1911 Mr. Asquith announced to a deputation his intention of bringing in an Electoral Reform Bill for something akin to adult manhood suffrage, violent agitation broke out afresh, the contention being that this was being done in order to make the extension of the franchise to women a political impossibility. A deputation of the suffragist leaders was assured by Mr. Asquith on November 17th that though he personally was opposed to their movement the Government would bow to the decision of the House of Commons should an amendment to the new Reform Bill admitting women to the franchise be introduced and carried. But the Women's Social and Political Union refused to be pacified, and on the night of November 22nd window-breaking occurred at the Government offices and in many parts of London. Amongst others arrested was Mrs. Pethick Lawrence, who was sentenced to one month's imprisonment.

On December 12th and 13th the majority of the window-breakers were sentenced to two months' imprisonment. On December 17th Mr. Lloyd George was assaulted on his way back from a meeting at the Horticultural Hall, London, where he and Sir Edward Grey had spoken in favour of Woman Suffrage. Nevertheless on February 23, 1912 Mr. Lloyd George again appeared upon a Suffrage platform at the Albert Hall and spoke in favour of the cause. Sir Edward Grey had expressed his sympathy with the movement in letters to Lord Lytton published in November and December 1911. On the other hand Mr. Winston Churchill declared his opposition in a letter to a Dundee correspondent on February 24, 1912, and on February 28th Lord Chancellor Loreburn and Mr. Lewis Harcourt took the same side at a large meeting in the Albert Hall organised by the National League for Opposing woman suffrage. It was clear that the Government were hopelessly divided; but the fate of the Conciliation Bill, which might have profited by cabinet disagreement, was adversely affected by a violent outburst of window-breaking and disorder which occurred between March 1st and 4th, 1912. By a pre-concerted plan a number of women, armed with hammers, went out and broke the plate glass windows of the principal London shops. When brought before the magistrates many of the window breakers received sentences of hard labour. The wantonness of the damage and the loss caused to innocent people produced a reaction in public and parliamentary opinion, and on March 28th the Conciliation Bill was rejected on second reading by a majority of 14. Seeing the need of some change of tactics, the non-militant National Union of Women's Suffrage Societies formed an alliance with the Labour party, and decided on May 14th to support Labour candidates in opposition to Liberal candidates, where the latter were unsatisfactory on the woman suffrage question. The Women's Freedom League adopted the same policy. The Labour party responded by largely supporting Mr. Philip Snowden's suffrage amendment to the Home Rule Bill.

On March 5, 1912 the headquarters of the Women's Social and Political Union, at Clement's Inn, London, were entered by the police, who arrested Mr. and Mrs. Pethick Lawrence on a charge of conspiracy in connection with the window-breaking raid.

Extra-parliamentary tactics.

Militancy resumed.

Rejection of Conciliation Bill.

Warrants had also been issued against Mrs. Pankhurst and her daughter Christabel; the former was already in custody for window-breaking, but the latter fled the country.

Conspiracy trials, and others. On May 15th the trial of Mrs. Pankhurst and Mr. and Mrs. Pethick Lawrence for unlawful conspiracy to incite members of the Women's Social and Political Union to commit damage began before Mr. Justice Coleridge at the Central Criminal Court, London. It resulted in a conviction and sentences of nine months' imprisonment in the Second Division. On June 3rd the three prisoners were transferred to the First Division upon undertaking not to repeat their offence while in prison. Miss Christabel Pankhurst remained out of the country.

On July 13, 1912 Miss Helen Craggs was arrested near Nuneham House, Oxford, the residence of Mr. Lewis Harcourt, with house-breaking tools and petroleum in her possession, and on July 23rd Dr. Ethel Smyth was arrested in connection with the attempt on Nuneham, but was discharged on the 26th. Miss Craggs was convicted at the Oxford assizes on October 19th and sentenced to nine months' hard labour.

In the same way Mrs. Mary Leigh and Miss Gladys Evans were arrested in Dublin, in connection with Mr. Asquith's visit there, for attempting to set on fire the Theatre Royal on July 18th. Mrs. Leigh was also charged with throwing a hatchet at Mr. Asquith's carriage on July 19th. The two were convicted at Dublin on August 6th and sentenced to five years' penal servitude.

None of these sentences was actually served. Mrs. Pankhurst and Mrs. Pethick Lawrence were released on June 24th and Mr. Pethick Lawrence on June 27th. Mrs.

Prison treatment. Leigh and Miss Evans were released on September 20th and October 3rd respectively, and Miss Craggs on October 30th (after only a week's imprisonment). In each case the release was on grounds of health, the prisoner having usually resorted to the tactics of refusing food and resisting forcible feeding, known as the "hunger strike," which had already been pursued by a number of suffragist prisoners since 1908. The persistence in these tactics had continued to cause serious embarrassment to the Government, and the practice of forcible feeding greatly exercised the public conscience, violent protests being made by many people against such methods of "torture." On April 18th the Home Secretary had stated in the House of Commons that forcible feeding was only administered if the prisoner's health could stand it; if not, she was discharged, or let out on ticket of leave. On June 14th an influential petition for First Division treatment for all suffragist prisoners was presented to the Home Secretary. On June 25th Mr. George Lansbury, a Labour member, spoke very hotly in the House of Commons against forcible feeding, and on June 28th Lord Robert Cecil brought about a debate on the subject by moving to reduce the salary of the Home Secretary. The Home Secretary then explained that after First Division privileges had been granted to the leaders convicted for conspiracy, the other suffragists then in prison for window-breaking had claimed the same treatment and had adopted the hunger strike as a protest against its refusal, so that the Government were faced with the dilemma of treating acts of wilful damage or calculated to endanger life as political offences, or else of setting the prisoners free, with or without a short preliminary period of forcible feeding, which, when resisted, was undoubtedly capable of being injurious to health. From this dilemma no escape was found, Mr. Bernard Shaw's cynical suggestion that, if the women insisted on trying to starve themselves to death, they should be allowed to, being rather too logical for official minds.

The dissensions amongst the different sections of suffragists on the vexed question of militant tactics came to a head in October 1912, when Mr. and Mrs. Pethick Lawrence who had contributed largely to the funds of the militant societies, announced **Secession of Mr. and Mrs. Pethick Lawrence.** their withdrawal from the Women's Social and Political Union, which under the guidance of Mrs. Pankhurst and her daughter was preparing for a further campaign. A difference as to the proposed plans was the reason given for this Pethick Lawrence secession. Protests against militancy and violence had meanwhile been made by the National Union of Women's Suffrage Societies and by the Men's League for Women's Suffrage at intervals during the two years, especially

in March 1912, after the window-breaking raid, and in July 1912, after the Dublin outrages. But the appeals were unheeded. On September 21st women suffragists interrupted a speech by Mr. Lloyd George at Llanystumdwy, and were very roughly handled by the crowd; while in Dublin, after the attack on Mr. Asquith on July 19th, the suffragists barely escaped being thrown into the Liffey. New forms of irritation were now introduced. On the night of November 28th an organised attempt was made to destroy by corrosive liquid the contents of a large number of pillar post boxes in London and certain provincial towns; and other similar occurrences continued during the year.

Meanwhile, on November 5, 1912, Mr. Philip Snowden moved as an amendment to the Home Rule Bill for Ireland that the local government register should be substituted for the parliamentary register, a measure which would have enfranchised Irish women ratepayers; but the amendment was lost by 314 votes to 141. It was supported by five-sixths of the Labour members present. On November 26th Mr. George Lansbury, who had resigned his seat in the House of Commons as member for Bow & Bromley in order to test the feeling of his constituency on the suffrage question failed to secure re-election, when he stood as a Suffragist and Socialist candidate.

The final blow to hopes of early legislation was dealt when in February 1913 the government dropped its Franchise Bill, and the proposed amendment to include women went with it. The Speaker unexpectedly ruled that if Sir E. Grey's amendment were carried, to that effect, it would become a different Bill from the one introduced and must begin *de novo*: and no other course was possible but to withdraw it. This disappointment added fresh fuel to the flames of "militancy," and its activity was shown in a further series of outbreaks, including the destruction of letters in pillar-boxes and a bomb explosion at Mr. Lloyd George's country-house, which was in process of building.

Outside Great Britain the chief advance of the movement has been in California, where woman suffrage was adopted on October 10, 1911 by a small majority. Mr.

Roosevelt during his election campaign of 1912 appealed to the women of California, and it was claimed that his success at the "primaries" was partly due to their support. In Michigan, Kansas and Arizona a state referendum on November 5th gave a result in favour of woman suffrage.

On the other hand, in the state of Ohio, woman suffrage was rejected on September 4, 1912, and a state referendum in Wisconsin on November 5th also resulted adversely. In Norway a woman, Anna Rogstad, who had been elected as a vice-deputy to the Storting in 1909, actually took her seat there in March 1911 for a fortnight; but in the elections of October 1912 no woman candidate was successful even as vice-deputy. Iceland during 1911 adopted woman suffrage, but as the measure had to be passed by two successive parliaments, it could not become operative until 1913. A woman suffrage bill was recommended in Sweden in the speech from the Throne at the opening of Parliament, January 16, 1912. The bill introduced by the Social Democrats passed the Second Chamber in May 1912, by 66 votes; but was rejected in the First Chamber by 28 votes. In Denmark a Government bill to amend the constitution, which included the extension of the franchise to all women over 25, was introduced in October 1912, and passed the Lower House by a large majority on December 13th.

A deputation from the Women's Social and Political Union was received in London, but not encouraged, by Mr. Borden, the Canadian Premier, on August 28, 1912, and a threat was made of sending over members of the Union to inaugurate a militant campaign in Canada. Miss I. Wylie left London for that purpose on September 29th.

In June 1911 an International Woman Suffrage Alliance Congress met in Stockholm, at which 24 countries were represented. In October 1912 this Congress met again in London; and the Men's International Alliance for Woman Suffrage, formed during the Stockholm Congress, also held its first Congress.

(JANET E. COURTNEY.)

SECTION II. SCIENCE

ASTRONOMY ¹

The Sun.—There were considerable total eclipses of the sun on May 8, 1910 (visible in Tasmania), on April 28, 1911 (visible in the South Pacific), and on October 10, 1912 (visible in Brazil): but on all three occasions bad weather rendered the expeditions for observation almost fruitless. On the other hand an eclipse on April 17, 1912 (which barely reached totality in Portugal, and was annular in France, Germany and Russia), was favoured with particularly fine weather and produced results which open up new possibilities for the utilisation of eclipses, whether total or only nearly so. A. Fowler at South Kensington (magnitude of eclipse 0.92 only) observed a multitude of lines in the spectrum of the reversing layer for over half-an-hour; showing that large partial eclipses are available for important work of this kind. H. F. Newall at Cambridge obtained photographs of 30 or 40 lines within five minutes of the greatest phase (0.90), using a powerful spectrograph: he concludes that "exceedingly valuable work could be carried out with an instrument of high power by an observer who, at a total eclipse, stationed himself definitely outside the belt of totality, so as to obtain a large partial eclipse (say 0.99). At such a station his programme could be much more leisurely and complete than on the central line."

A recent outcome of earlier eclipse work is the discussion of the polarization of the corona, as observed by expeditions from the Lick Observatory. Precision has thereby been given to previously vague knowledge, the maximum of 37 per cent of polarization being put at 5 minutes from the sun's limb. This result accords well with the view that the corona consists largely of finely divided matter ejected from the sun.

Our knowledge of the physical and chemical constitution of the sun has however been extended in recent years far more by observations made without an eclipse at all, particularly by work with the spectroheliograph (*E. B.* xxv, 618) an instrument for photographing the sun in light of one wave length only. With the high dispersion obtainable with modern instruments, it is possible to limit the light used not merely to a particular "line" but to a special part of it. In the case of calcium for instance the dark K line of the solar spectrum is very wide, and over many parts of the disc it is doubly reversed, that is to say, a bright line is superposed centrally on the wider dark one, while the bright line has in turn a narrow dark one down the middle. This central dark line is denoted by K₃; its bright wings by K₂, and the outer dark wings by K₁. The letters *v* and *r* are often added to the suffixes to distinguish the violet wing from the red. It is provisionally assumed that K₁, K₂, K₃ correspond to low, mean, and high levels in the calcium envelope, with successively lowered pressure and temperature. Spectroheliographs of only moderate dispersion give pictures of K₂ and K₃ together: but recent advances have been made by separating the components, so that for instance the K₃ photographs taken by H. Deslandres at Meudon have revealed interesting features of which only the most prominent are represented in the K₂-3 pictures. At the high (K₃) level the sunspots disappear, the bright flocculi are less extended, and linear dark markings—*filaments* as Deslandres calls them—are pronounced. These filaments are even better shown when the light selected for use is the central part of the red line of hydrogen. Besides the filaments, Deslandres has described a network of fine streaks which he calls *alignments*, most of which are faintly dark, and a few feebly bright. One view of their nature is that they are the higher and cooler parts of prominences seen projected on the sun's disc, and appearing dark because of their absorption: in support of which is cited the fact that where the filaments reach the limb of the sun a prominence is almost invariably present. According to J. Evershed, however, many large prominences do not show absorption markings when the sun's rotation brings them onto the disc. Against this again may be set the conclusions of A. Ricco, who has ingeniously projected the prominences observed at the sun's limb onto his disc seven days later and finds a

¹ See *E. B.*, articles enumerated in Index Volume, p. 888.

close resemblance to the filaments, or possibly (as Deslandres suggested later) to the alignments.

We may confidently expect more light on these important points from the magnificent "tower telescope" which G. E. Hale has set up on Mount Wilson, in California. The tower itself (176 feet from ground to top of dome) was already erected in September 1910 when the International Union for Solar Research assembled on Mount Wilson; but there has been some delay in obtaining a suitable object-glass for the telescope (of 12 inches aperture and 150 feet focal length). Success was not attained till the third attempt, but a very satisfactory lens was delivered by J. Brashear in May 1912: and the latest reports indicate that the chief difficulties of this immense undertaking have been overcome. It was feared by various critics that so high a tower would shake, but Hale's ingenious plan of encasing an inner tower of rods in an outer tower of tubes (to each rod a tube surrounding it) has proved perfectly successful, so that "the delicate operation of photographing the flash spectrum has been carried out when the wind was blowing twenty miles an hour, and there has never yet been an occasion when it was necessary to stop work because of trembling of the image."

The sun's rays are reflected down this huge fixed telescope by moving mirrors at the top of the tower, and an unexpected difficulty declared itself in the unequal heating of these mirrors, with consequent changes in focal length of several feet. It was met and defeated by keeping water steadily circulating in water jackets covering the edges and backs of the mirrors.

At the foot of the tower the rays are received into a well 75 feet deep, containing a combined spectrograph and spectroheliograph. A revolving table makes it possible to change the apparatus in the well with ease and rapidity, so as to obtain within a few minutes half-a-dozen spectroheliograms in different colours, and then a number of spectrograms.

Many solar phenomena centre round the solar spots, as to the origin and nature of which we are still but ill informed. The most striking feature of their appearance is the cycle of about 11.125 years; but A. Schuster showed recently that this is not the only cycle concerned, periods of 4.8, 8.3 etc. years being also traceable in the records. His work suggests a major period of 33.375 years of which others are submultiples: thus dividing by 7 we get 4.77 years, a period found by Schuster in his analysis, and confirmed by a special small rise in the last cycle. The period of 33.375 years is close to that of the November meteors, and it is possible that the revolution of the swarm may exercise control over the occurrence of sunspots. Schuster has also examined the influence of the planets, obtaining positive evidence which satisfies him, though it has been challenged by F. J. M. Stratton working on somewhat different lines. Schuster remarks that though the tidal attraction due to a planet would be very small compared with the sun's gravitational attraction the latter may be effectively diminished by light repulsion for very small particles near the surface; in which case the tidal action of the planet might easily assert itself.

A summary of much recent work on the sun (especially by Hale who detected the magnetic phenomena through the Zeeman effect, and by Evershed who detected the radial movements in sunspots) is provided by the hypothesis as to the nature of a sunspot recently formulated by Hale, as follows:—

"As the result of an eruption or some other cause tending to produce rapid convection, a gaseous column moves upwards from within the sun toward the surface of the photosphere. Vortex motion is initiated by the difference in rotational velocity of adjoining zones, or by irregularities of structure, and is maintained by convection. The circulation in the vortex is vertically upward and then outward along the photosphere, as in a terrestrial tornado. Expansion produces cooling of the centre of the vortex, and a comparatively dark cloud (the umbra) results. As in Harker's electric furnace experiments,¹ a rapid flow of negative ions sets in towards the cooler gases at the centre from the hotter gases without. The ions, whirled in the vortex, produce a magnetic field. The descending gases (specially hydrogen) in the higher atmosphere of the sun are drawn in toward the pole of the magnet along the lines of force, as in Birkeland and Störmer's theory of the aurora. This accounts for the configuration of the hydrogen ($H\alpha$) flocculi, as shown by the spectroheliograph.

"Hitherto we have assumed the spot to be single. The typical spot-group originates through the development of a second spot to the east (following) the primary spot, the line joining the two making only a small angle with the equator. The polarities of the two principal spots (smaller companions are usually present) are opposite, and the hydrogen (H α) flocculi surrounding a bipolar group resemble the lines of force about a bar magnet. Two alternative hypotheses may be offered to account for these phenomena. According to the first, the lower extremity of the vortex of the primary spot, lagging behind the upper extremity turns up to meet the photosphere thus producing a horse-shoe vortex. As in the case of single (unipolar) spots, the hydrogen and other high-level gases flow toward the two members of the group along the lines of force. According to the second view, the two vortices are independent with nearly radial axes. The necessary criteria of selection can probably be found by a comparative study of the principal members of a bipolar group, special attention being directed to the inclination of the axes of the vortices to the line of sight (as given by the Zeeman effect), the direction of flow (inward or outward) of the vapours at different levels, and the relative temperature and pressure of the two spots."

The details of work at the Mount Wilson Observatory by W. S. Adams on the sun's rotation have been published in an important memoir. The observations are all satisfied by a law in which the velocity of rotation increases outwards from the surface, and the equatorial acceleration decreases.

The Moon.—The prediction of the precise place of the moon—in the heavens at any given moment has been a problem of increasing interest from the earliest times till now. It attracted the attention of the ancients from their desire to predict eclipses: of astronomers before Newton from their desire to help sailors to find their longitude: of astronomers since Newton from their desire to test the accuracy of the law of gravitation with the utmost refinement. Recent work has shown that the law of gravitation alone is insufficient to explain the moon's movements. The situation was thus summed up shortly before his death (in July 1909) by Simon Newcomb, who had spent much of his life on the problem:—

"I regard these (outstanding) fluctuations (of the moon) as [the most enigmatical phenomenon presented by the celestial motions, being so difficult to account for by the action of any known causes that we cannot but suspect them to arise from some action in nature hitherto unknown."

This crisp statement was only rendered possible by an enormous amount of devoted work on the part of many people; centuries of observation at the observatories of Greenwich and Paris; careful scrutiny of these records by Newcomb and more recently by Cowell; great labour in working out the theory of the moon's movements by various eminent mathematicians, and the formation of tables, especially those of Hansen; and a recent reconstruction of the theory by E. W. Brown, following the methods of G. W. Hill. Brown is proceeding, with financial help from Yale University, to the construction of new tables of the moon, which may be confidently expected to isolate these puzzling anomalies from various defects in the older tables. Meanwhile new tables have been published in France (in 1911) which represent the completion of a project begun by Delaunay half a century earlier. Delaunay was drowned by the upsetting of a pleasure boat at Cherbourg in 1872, but his work was carried on by Tisserand, Schulhof, Andoyer, Radau and others. In completing the tables full use has been made of the opportunities afforded by recent work. They will be used in the French predictions, which will give a valuable check on predictions made by Brown's tables when ready. It now remains to supplement this considerable improvement in the means of prediction by corresponding improvements in the observation of the moon's place. The way has already been shown by the successful photographic observations taken at Harvard and reduced by H. N. Russell of Princeton. By an ingenious device the moon is photographed along with the stars surrounding it. The difficulty is of course to avoid fogging the plate with the bright moonlight, and so blotting out the tiny star images. The device used by E. S. King of Harvard is to cut off the moonlight during the greater part of the exposure by a screen placed at some distance outside the lens, past which the rays from surrounding stars can edge to reach the lens.

Planets and Satellites.—H. Struve has published the discussion of measures on Mars

¹ At the British National Physical Laboratory.

and his satellites extending over 32 years, from which he deduces the mass and compression of the planet, and the rates of revolution of the planes of the orbits of his satellites. The results are perhaps not of general interest, but represent a notable advance in our accurate knowledge of the solar system.

Among discoveries of minor planets, now made by hundreds per year, one stands out as of great interest. An object designated MT was discovered by Palisa of Vienna on October 3, 1911, which was apparently very close to the earth: but after observations had been secured on October 4, moonlight and cloud interrupted them so that the tiny object could not be recovered, and was thought to be lost. However some determined computers at the Observatory of the University of California made the very most of the scanty observational material, with the happy result that images were identified on plates taken on October 11 and October 17. It now appears that the approach to the Earth is not such as to offer all the advantages at first expected, but the successful prosecution of the search is in itself matter for congratulation. Other minor planets of special interest are Eros, and the Jupiter groups. Eros was photographed at a number of observatories in 1900-1 with the object of finding the sun's distance, and the successful completion of the campaign was marked by the award of the gold medal of the Royal Astronomical Society to A. R. Hinks in February 1912 for his patient and exhaustive collation of the observations. The best measures of the sun's distance, including the wholly independent measures with the spectroscope at the Cape Observatory, are now in satisfactory accord at about 92,900,000 miles. The Jupiter groups represent in actuality a type of motion long thought to be of merely theoretical interest. If three bodies attract one another, it is impossible to predict their movements in general formulae: but if they happen to be placed at the corners of an equilateral triangle it can be proved that they will so remain. If the configuration be slightly disturbed, it will tend to recover itself. On the line joining Jupiter to the sun as base we can erect two equilateral triangles in the plane of Jupiter's orbit. The vertex of one is occupied by one known minor planet (Patroclus) and the other vertex by no less than three (Hector, Achilles and Nestor). The occupation is never exact; these little bodies describe complicated paths in the neighbourhood of the theoretical point: and their recent discovery has naturally led to the study of such motions, especially by E. W. Brown and G. H. Darwin. They have shown that departures from the equilateral triangle may be quite large, and in commenting on his results Darwin remarks:—

"These orbits throw some light on cosmogony; for we see how small planets with the same mean motion as Jove (his generalised planet) in the course of their vicissitudes tend to pass close to Jove, ultimately to be absorbed into its mass. We thus see something of the machinery whereby a large planet generates for itself a clear space in which to circulate about the sun."

New tables of Jupiter's satellites were published by R. A. Sampson in August 1910, as the outcome of twelve years' devoted work in discussing the accumulated observations of the past, especially those made by modern photometric methods at Harvard Observatory. To expedite their use in prediction Sampson issued the tables before publishing the theory on which they are based, and they have accordingly been used for the predictions of the Nautical Almanac for 1914. "In the place of antiquated tables of no value except as directing an observer when to go to his telescope, astronomers now have precise formulae with which the observations of the future will naturally be compared" (R. A. S. Council Report for 1911).

The rotation period of the planet Uranus was determined for the first time in August 1911 at the Lowell Observatory. No markings on his disc have been detected which would enable an observer to watch the rotation directly: the only hope was to measure with the spectroscope the velocities of approach and recession of the limbs. But since spectroscopes have been available the axis of Uranus has been too unfavourably placed. Slipher and Lowell took the earliest opportunity afforded by the slow revolution round the sun to better perspective, and detected a rotation in the retrograde direction in $10\frac{3}{4}$ hours. The near accordance with the 10 hour rotations of Jupiter and Saturn is noteworthy.

Comets.—Numerous comets have been recently discovered or recovered, but they have generally been too small for special notice. Halley's Comet was followed up to the beginning of June 1911. Its photographic magnitude as determined at Helwan (Egypt) was the same 394 days after perihelion as 238 days before, showing the long persistence of the exciting effect of the sun. The return of 1910 will be remembered for the accurate prediction by Cowell and Crommelin, and for the transit of the comet across the sun. The calculations of prediction were carried out with such care that the discrepancy with fact was minute: and yet the calculators were able to declare with confidence that even this minute discrepancy must be referred to "some cause whose character is not yet recognised." At the transit no trace of the comet appeared on the sun's disc, but the tail appeared unexpectedly on both sides of the earth simultaneously.

Another comet of special interest, Encke's, which has a short period of $3\frac{1}{3}$ years only, was re-discovered on July 31 at Algiers only three degrees above the horizon—striking testimony to the climate of Algiers. The subsequent observations led firstly to the detection of a clerical error in the computations, and further to a reassurance as to the correctness of the assumed mass of Mercury, on which the 1908 observations seemed to throw doubt. The anomalies in 1908 are probably due to a further change in the acceleration of the Comet's mean motion, but the return of 1914 will probably settle the point.

It has recently been asserted by E. Strömrgren that all the cases of supposed hyperbolic orbits of comets disappear on rigid examination. If this be so, we may regard all comets as permanent members of the solar system, none being alien intruders. But Strömrgren's conclusions have not yet won general acceptance, several computers having quite recently published hyperbolic elements of comets.

Comet 1911 c discovered by W. R. Brooks on July 20, 1911 became visible to the naked eye and had a tail 25° in length. Some fine photographs were secured, notably by E. E. Barnard.

A more exact knowledge of the spectra of the tails of comets dates from 1907. The spectrum consists generally of a series of double bands, which were identified by Fowler in 1909 with bands obtained from carbon monoxide at a pressure of about 0.01 mm. In one or two cases negative bands of nitrogen have also appeared. The chief bands in the head of a comet are those of cyanogen and the Swan bands of carbon, the latter being possibly derived from carbon monoxide; and it is only necessary to suppose that this gas is expelled from the head in order to explain the spectrum of the tail. The decomposition of cyanogen in the head might account for the nitrogen in the tail.

New and Variable Stars.—A new star of the 4th magnitude was discovered by the Norwegian astronomer Enebo in Gemini on March 12, 1912, and was attentively watched and photographed. Considerable interest was excited by a reported discovery of the lines of radium in its spectrum, by Giebler of Bonn: but the evidence is questioned.

A feature of recent work has been the extension of the scrutiny of variability to a higher grade of accuracy. Thus E. Hertzsprung, guided by the spectroscopic observations of the pole star which showed its velocity to be variable in a period of close on 4 days, detected a minute variation in the light in the same period. So little was this previously suspected that the pole star was used as a standard of (constant) brightness in more than one long investigation. The range found by Hertzsprung from his study of 418 photographs is less than a fifth of a magnitude—about 17 per cent of the light: and even this small range was reduced to one-third—less than 6 per cent—by J. Stebbins using a selenium photometer. Now C. G. Abbot has found variations in the radiation of our own sun at least comparable with these, so that we may regard the gap between our sun and the variables as bridged. Indeed it becomes a question whether every star is not variable within limits of this kind. The beautiful work of Stebbins with his selenium photometer opens up definite prospects of settling this great question. As an instance of the delicacy of this instrument the case of the variable Algol may be quoted. It had already been shown that the variation was due to the eclipsing of a bright body by a dark one, but former observations showed no variation in the light between the

end of one eclipse and the beginning of the next. Stebbins detected minute changes in this interval which are fairly interpreted to mean that the "dark" body has a feeble light of its own, and is moreover illuminated by the "bright" body so as to exhibit phases. Other similar cases have since been found by R. S. Dugan of Princeton.

Another addition to the facilities for accurate observation of stellar brightness is due to Schwarzschild, who passes a photographic plate to and fro in its plane so as to obtain from each star over a wide area a patch of uniform density, and has already measured in this way the brightnesses of 3522 stars ranging nearly to the 9th magnitude.

Double Stars.—Most of the doubles are revolving so slowly round each other as to suggest that we must wait many decades before we can profitably determine their orbits, or deduce other conclusions from the observations. But Hertzsprung has recently made an ingenious suggestion for reaping some of the fruits by anticipation. Assuming average values for the particulars as yet unknown to us, he deduces from the observed arc of motion, however short, the distance of the double star. Now in a number of cases this distance has been directly determined and can be compared with the above deduction: and the comparison shows that the relation of determination to deduction is nearly constant. Deductions can therefore be used to supply approximate determinations in cases where they have not been made; individual instances may be in error, but the average will not be far wrong. The new method has indicated more than one conclusion of considerable interest.

At Ottawa it has been found that γ Geminorum is a spectroscopic binary of the exceptionally long period 6 years, which bridges the gap between spectroscopic and visual doubles, since at least one of the latter has a shorter period. Betelgeux is probably also a long period spectroscopic binary.

Nebulae.—A complete descriptive list of nebulae photographed at the Lick Observatory was published in October 1912: the Reynolds reflector at Helwan in Egypt is being successfully devoted to the systematic exploration of more southern nebulae: and the five foot mirror on Mount Wilson has already produced many striking pictures. A general conclusion from all such work is that drawings (made before the days of photography) are quite untrustworthy. From his photographs of the spectra of spiral nebulae E. A. Fath concluded that they are probably unresolved star clusters with gaseous envelopes; and there is some evidence of a progressive change of spectrum with the form.

J. W. Nicholson has formulated a hypothetical constitution of certain elements with the simplest possible type of atom, one of them being provisionally called nebulium. He can thus account theoretically for all the observed lines in the spectra of nebulae, and was successful in predicting the existence of one line which had not been previously noticed, but which was found, on searching, by W. H. Wright.

The Stars in General.—A recent discovery of fundamental importance is the relation of the spectral type of a star, and therefore of its probable age, to the rate at which it moves. Briefly expressed, the law is that the older a star is, the quicker it moves. The facts supporting this statement emerged from the mass of observations with the spectroscope made at the Lick Observatory under W. W. Campbell's direction, and he made the first announcement in his Silliman lectures in January 1910: the detailed information followed later, and confirmation was forthcoming from the quite independent study of proper motions by Lewis Boss. It may be that astronomers are not justified in deducing the relative ages of the stars from their spectra, but in any case they had arranged the stars in a certain order from the appearance of their spectra, which afterwards turned out to be also the order of rapidity of their movements. (It may also be mentioned that it has recently been found possible to make estimates of the temperature of various stars, which at first were rough, but are beginning to show better accordance. These also indicate the same order as the spectra and the motions.) Campbell's remarkable table illustrating this fact may be given here:—

Type of Spectrum.	Number of Stars.	Average Radial Velocity.	Deducted Motion of Sun.	Correction K.
B	225	6.5	-20.2	+4.1
A	177	11.0	-16.8	+1.0
F	185	14.4	-15.8	+0.1
G	128	15.0	-16.0	-0.2
K	382	16.8	-21.2	+2.8
M	73	17.1	-22.6	+3.9

The first and third columns chiefly concern us. The first shows the type of spectrum on the Harvard classification, and in the order assigned for age or physical development of the star: the third gives the average velocity in km. per sec. The fourth column shows the velocity of our own sun deduced from the different groups, and the fifth a curious general correction which seems to be required by the means of the groups. (If real it would mean that the B stars for instance are moving generally outwards from the sun at 4 km. sec.: but Campbell is inclined to interpret the column K as systematic error in the measurement of the various types of spectrum.)

The meaning of this striking association of movement with age, or at least with spectral type, is not yet clear. In the astonishment immediately following the discovery some rather wild suggestions were made, as for instance that a star was at birth not subject to gravity, but only gradually came under its influence. It seems probable however that some simpler explanation than this can be found, and one such is indicated below: but the chief requirement at present is further investigation. If the B stars alone are considered, especially those with large velocities, H. Ludendorff has shown that their velocities follow J. N. Lockyer's classification of probable life-history in a striking manner, those on the ascending branch of Lockyer's curve having positive velocities (outwards from our sun) and those on the descending branch negative (inwards). There may be other facts of this kind still to come.

It is a further outcome of the Lick observations that the stars of types A and B tend to move parallel to the plane of the Galaxy. Assuming that this is exactly true, H. C. Plummer has shown that the distances of the stars and their complete movements can be deduced from a combination of telescopic and spectroscopic observations. The deductions will be exactly correct only if the assumption is exact, but if it is roughly true the deductions will also be roughly true. Plummer has accordingly deduced the complete motions of more than 150 stars with the result of finding them fall into several groups of stars with similar motions, the association being in some cases strikingly defined. It had already been suggested by J. Halm, in discussing Kapteyn's hypothesis of two star streams (for which see article "Star" in the *E. B.*), that there must be a third stream present moving towards a vertex nearly coinciding with that of one of the former two: Plummer's results suggested a still greater number of streams towards that vertex, though they fail to indicate the opposite vertex. Evidence of the complexity of stellar movements has also come from other quarters. L. Boss's discovery of a special cluster in Taurus, and Ludendorff's confirmation of the Ursa Major clusters, were followed by the detection, by three investigations simultaneously, of two groups of stars of the helium type, having nearly equal and parallel motions. One of these is spread over a large area in Scorpio and Centaurus: the other consists of about seventeen stars in and near Perseus. Finally it has been noticed that the helium stars generally do not conform to the two star-streams.

Amid this increasing complexity there is one suggestion of a unifying principle. It has been pointed out by H. H. Turner that if the stars around us form a limited system (as has been suggested by others) isolated by distances large compared with its own dimensions from other such systems, then the gravitational attraction of the system as a whole will result in a central attraction on the individual members. Further, that if the system started from rest, the movements of individual stars would approximate to oscillations backwards and forwards through the centre. Putting aside for a moment the obvious difficulties of congestion at the centre, then there would at any given mo-

ment be some stars on their way to the centre and others on their way from it, and the perspective appearance of these two classes would be precisely the same as that which has given rise to the hypothesis of two star-streams. Parallel lines and lines converging to a point have the same perspective appearance: we can only differentiate them by a knowledge of the distances. Now it is just in respect of distance that our knowledge of the stars is most deficient. Direct measures take us only a little way from our sun, and to probe further into space we must trust hypotheses such as those of Hertzsprung and Plummer above mentioned. Using Plummer's figures, Turner finds indications of an actual acceleration towards a system-centre which he fixes provisionally in direction RA 94° Dec $+ 12^{\circ}$ at a distance of 90 light years. Confirmation of these figures is also forthcoming from an entirely independent argument from the distribution of double stars in various directions, put forward by T. Lewis in 1906: and again from the general distribution of all stars.

The congestion at the centre can be avoided if there is a sufficient departure from accurately radial motion, which would be quite consistent with observed facts. Were the radial motions undiluted, the phenomenon would have earlier attracted general attention, and would not have been at first denied by so acute an observer as L. Boss. (His objection has been since withdrawn.) As it is they are largely diluted by cross motions, so that they only emerge as averages from the discussion of numbers of stars. These cross motions suffice to carry the stars wide enough of the centre to avoid collision and may even suffice in certain cases (for instance in the case of the helium stars) to destroy the "two-stream" appearance altogether. But it is quite possible that they have developed in the course of ages of interaction between the individual stars, and that if the system were originally formed from a vast nebula condensing under gravitation, the condensation may have been very nearly along radial lines, resulting ultimately in a sudden congestion at the centre which would appear to distant systems as a "new star." Such a rapid congestion would be followed by an explosive expansion, the fragments being dispersed to something short of their original distance: gravitational attraction would ultimately draw them together again, and so on. There would be a sequence of explosions of decreasing violence, seeing that on each occasion energy would be dissipated. If the fragments became stars, the earliest-formed stars would have the largest velocities, as Campbell has found. The speculation is worthy of note if only for the reason that it shows the possibility of explaining Campbell's remarkable result without having recourse to any hypothesis not already familiar.

It is mentioned above that our direct knowledge of the distances of the stars is very limited; but progress is being made, and the last year or two have seen some notable additions to the published material, especially in the work of A. R. Hinks and H. N. Russell at Cambridge and Princeton, and of Frank Schlesinger at the Yerkes Observatory. An interesting confirmation of Boss's parallax ($0''.0253$) for his Taurus cluster, found by combining spectroscopic velocities with proper motions, was obtained by the direct determination ($0''.023$) of Kapteyn.

The great 5-foot reflector of the Mount Wilson Observatory has already been effectively employed on the spectra of the stars, chiefly for types A and B, which are of special importance in the study of "star-streaming." In the course of this work more than 50 stars with variable velocities have been found; and attention is drawn to 7 stars moving with exceptional speed, including the "runaway star" Groombridge 1830, for which a velocity of 343 km. per sec. is found.

General.—Among losses by death must be specially mentioned that of Henri Poincaré (July 17, 1912), a mathematician who illuminated a wide range of sciences; and that of Lewis Boss (Oct. 5, 1912), whose patient work has put our knowledge of the positions and motions of the stars on a new basis.

The scientific papers of Sir W. Herschel (1738-1822) have been collected and published in two large quarto volumes by the Royal Society and the Royal Astronomical Society.

The meeting of the International Union for Co-operation in Solar Research on Mount

Wilson, Cal., in September 1910 was attended by 83 astronomers of 12 different nations. It was decided to extend the scope of the Union to include Astrophysics generally; and this decision following on the extension of programme of the International Committee for the Astrographic Chart in 1909 practically arranges for a friendly partition of astronomy between these two organisations.

The Directors of National Ephemerides met in conference at Paris in October 1911 and adopted various unifying principles, as well as a general scheme of co-operation.

Signals sent by wireless telegraphy from the Eiffel Tower have recently been observed at Greenwich and at observatories on the Continent; and a general scheme of longitude determinations by this method is now being arranged. (H. H. TURNER.)

GEOGRAPHY, EXPLORATION AND TRAVEL

*Antarctic.*¹—The final conquest of the North Pole by Peary and the successes of British and other expeditions in the South have shifted general interest in polar exploration from the Arctic to the Antarctic. On February 11, 1910 the French explorer Dr. Jean Charcot arrived at Punta Arenas on his ship the "Pourquoi Pas?", having carried on from his former expedition a coast survey as far as Adelaide Island. He discovered a great gulf to the south, and saw the inaccessible coast of Alexander I Land. He had wintered at Petermann Island, and made excursions thence in the South Shetlands; afterwards, again turning south, he reached 126° W., sailing between 69° and 71° S., and discovering new lands to the west and south of Alexander I Land. His party suffered from scurvy; the ship was damaged in collisions with ice, and food and coal ran short. He reached Rouen in June, and results of his journey appeared later in the year in *Rapports préliminaires* and *Pourquoi Pas? dans l'Antarctique* (Paris).

On June 1, 1910 Capt. Robert Falcon Scott (b. 1868) despatched the "Terra Nova" from London for his second Antarctic journey. She went by Cape Town (Sept. 2) and Australia to New Zealand, and in these countries additions were received to the funds or equipment of the expedition, towards which £20,000 had been granted by the Treasury. The expedition left New Zealand for the south on November 29, 1910, with a larger scientific staff than had ever previously been taken. It included Dr. E. A. Wilson (zoologist) as chief, surgeons G. M. Levick (zoologist) and E. L. Atkinson (bacteriologist and parasitologist), Lieut. H. L. L. Pennell for magnetic and meteorological observations, Messrs. T. Griffith Taylor and R. E. Priestley (geologists), E. W. Wilson and D. G. Lillie (biologists), A. C. Garrard (zoologist), C. S. Wright (chemist), Dr. G. C. Simpson (physicist) and Mr. H. G. Ponting (photographer). Lieut. (afterwards Commander) E. R. G. Evans was second in command, and Lieut. V. L. A. Campbell was to lead the "eastern party" which was intended to land in King Edward VII land.

The ship, after encountering heavy weather, entered the pack ice on December 9. McMurdo Sound was safely reached and the main party was landed, to establish winter quarters at Cape Evans. A western party was landed on the western side of the Sound. The eastern party was prevented by ice-cliffs from landing on King Edward VII land as was intended, but did so on February 18, 1911 at Cape Adare. From the "Terra Nova" investigations were subsequently carried on in the neighbourhood of the Balleny Islands, and new mountainous land was twice observed to the west of Cape North, about 69° 50'—68° 30' S. and 163° 20'—158° 15' E. Stewart Island was reached on the homeward journey on March 27, 1911. The ship returned south in the following summer, and brought back news of the year's work. Campbell's party at Cape Adare had experienced heavy weather, and had not apparently been able to proceed far afield, but meteorological and magnetic observations had been made. The "Terra Nova" embarked them on January 4, 1912, and landed them again in Terra Nova Bay, Victoria Land, on the 8th; it was intended that they should re-embark in February, after exploration overland, but this was impossible, and they would have to find their own way back to McMurdo Sound. The western party had made important geological and other investigations; they were taken off by the ship on February 15.

¹ See E. B. xxi, 960 *et seq.*

The main party was occupied in scientific work in various directions, besides laying depots for the advance towards the Pole. Dr. E. A. Wilson, writing from McMurdo Sound on October 31, 1911, reported that regular observations had been made of atmospheric pressure, temperature, and velocity and direction of wind, and that the upper atmosphere had been studied by means of small balloons for the first time in the Antarctic. Magnetic observations, gravity observations by pendulum, and tidal observations had been kept up; marine biology, parasitology, and ice study had received attention. Wilson led a remarkable expedition in June–August (winter), 1911, across the barrier to Cape Crozier, to study the winter breeding of the Emperor penguins. Petrological investigations revealed various mineral quartz veins.

The work of depot-laying being completed, Scott with the main polar party started on November 2, 1911, and proceeded at first by easy stages. He reached the continental plateau by way of Beardmore glacier on December 10, and was left by the last supporting party on January 4, 1912 in $87^{\circ}36' S.$, within 150 miles of the Pole. Lieut. Evans, who led this party, was overtaken by scurvy, and returned to New Zealand (April 1, 1912) on the "Terra Nova," but otherwise the health of all had been generally good. The latest news then brought from Scott was that he was about to move forward, with Dr. Wilson, Capt. Oates, Lieut. Bowers and petty-officer Evans as his companions. It was only on Feb. 10, 1913, that their tragic fate became known. The "Terra Nova" returned that day to New Zealand, having learnt on Jan. 18 at Cape Evans that, after successfully reaching the Pole on Jan. 18, 1912, and there finding Amundsen's tent and records (see below), they had perished on their return journey. Petty-officer Evans had died on Feb. 17 after an accident; the others were then caught in a prolonged blizzard, 11 miles south of One Ton Camp, and succumbed to exhaustion, Oates on March 17, the others (whose bodies were found by a search party under Surgeon Atkinson on Nov. 12) about March 29. A diary kept by Scott up to March 25 was found, in which he left a characteristically brave last message, explaining the misfortunes to which their end was due, and appealing to his countrymen to provide for their dependents.

It became known towards the end of 1910 that Capt. Roald Amundsen, the Norwegian explorer, before making a crossing of the Arctic region, for which plans had been announced, was to visit the Antarctic, and make an attempt to reach the South Pole. On February 4, 1911 the "Terra Nova" found the Norwegian expedition established in the Bay of Whales, but Scott, who had heard of Amundsen's intentions in New Zealand, did not allow them to affect his own plans. News was received later that Amundsen had been successful, having reached the Pole on December 14–17, 1911. His expedition was favoured with good weather conditions not only for the polar march but during practically the whole year of its sojourn in the Antarctic, while the march itself, thanks to a careful system of depots and efficient teams of sledge-dogs, was carried out without any of the deprivation and suffering characteristic of previous polar journeys. The journey southward from the base—about 870 miles—occupied 56 days, the greatest elevation reached on the plateau being 10,750 ft.; the return march was made in 39 days. Three days were spent at or in the vicinity of the Pole, complete observations being taken. The polar plateau was named King Haakon VII Plateau, and the name of Queen Maud was given to a range of lofty mountains (10,000–15,000 ft.) which were observed between about 85° and $88^{\circ} S.$, being a continuation of the mountains of South Victoria Land. Other investigations were carried out near and east of the Bay of Whales by a party under Lieut. Prestrud left behind at the base, while Nansen's famous old ship, the "Fram" (Capt. Nilsen), after landing the expedition, was employed in oceanographical research over a wide area.

An expedition left Germany in May 1911. It was led by Lieut. Filchner, who previously made a journey to Spitsbergen for the sake of experience. His plans were to proceed by way of South America to Coats Land, the coast of which was to be traced south or south-west, and a base station was to be established. An attempt was contemplated to cross the lower part of the Antarctic continent to Ross Sea. The ship (the

"Deutschland") was commanded by Capt. R. Vahsel, who had accompanied the "Gauss" expedition, and there was a scientific staff of eleven, including Dr. Heim as geologist, Dr. W. Brunnecke (oceanographer) and Dr. Barkow (meteorologist).

An Australasian expedition is also in the field, under the leadership of Dr. D. Mawson. Its chief support was obtained in Australia and New Zealand, the commonwealth and state governments in the former country having together contributed £22,000. A British Treasury grant of £2,000 was received. The vessel (the "Aurora"), under the command of Capt. J. K. Davis, left London on July 27, 1911, and Hobart in Tasmania for the south on December 2. A wireless telegraphic station was established at Macquarie Island, which was expected to be of service in obtaining the longitude of the principal base of operations in the Antarctic. On January 19, 1912 a party was landed in the previously unknown Commonwealth Bay, at the western extremity of Adélie Land. It had been intended also to put a party ashore on Knox Land. This was impossible, and the ship suffered some damage from the pack ice in the attempt to carry out the plan. But a party with provision for winter quarters was put on the barrier ice in 66°18' S., 94°58' E., and the "Aurora" returned to Hobart on March 11. The landing parties were fully furnished for scientific work, and the Prince of Monaco provided an oceanographical equipment on board the "Aurora."

A Japanese expedition under Lieut. N. Shirase started from Wellington, New Zealand, on February 11, 1911, with the South Pole as its object. Judged by European standards, it was poorly equipped, and it returned later in the year unsuccessful.

Other projects for Antarctic work have been discussed. Dr. W. S. Bruce has proposed to cross the Antarctic land-mass from a base in Weddell Sea, meeting another party working from Ross Sea. Dr. A. Forbes Mackay, who accompanied Sir E. Shackleton's expedition, has made plans for the exploration of the coasts between Graham Land and King Edward VII Land with a small party. A scheme has also been under the consideration of the Peary Arctic Club and the National Geographic Society of Washington, for an attempt to reach the Pole from a base on the opposite side of the Antarctic region to Scott's base. Dr. H. F. Osborn has suggested that the American Department of Labor and Commerce should send an expedition to study the habitat of the southern fur-seal and to make other zoological observations, and Mr. E. S. Balch has proposed the further investigation of Wilkes Land and the verification of Wilkes' discoveries.

*Arctic.*¹—An American expedition was organised to explore Crocker Land, the northernmost land known, which was sighted by Peary in 1906 to the north of Grant Land. The expedition was to be led by Professor D. B. MacMillan and George Borup, who both took part in Peary's expedition of 1909. But Borup was drowned in a canoe accident in Long Island Sound in April 1912. He was educated at Yale University, had studied in the American Museum of Natural History at New York, had worked with the United States Geological Survey, and was also a trained astronomical observer and expert photographer. It was decided to proceed with the Crocker Land expedition, as a memorial to Borup. Under the Department of Naval Service of Canada, among other hydrographical investigations, a voyage to Hudson Bay was carried out in 1910 for the study of the conditions of navigation, with particular consideration for the possibility of establishing a trans-Atlantic route from a port on the west coast of Hudson Bay. Port Churchill and Port Nelson on this coast, both of which have been spoken of as possible sites for a harbour and the terminus of a railway from the west, providing a new route of export for Canadian grain, were investigated by this expedition, and Port Churchill appeared to offer better prospects. Captain Bernier, a Canadian voyager, attempted but failed in 1910-11 to make the north-west passage by way of Melville Island, but he carried out some valuable survey work, especially on the hitherto unknown coast of Baffin Land between Cape Kater and Fury and Hecla Strait. Mr. Stefansson's expedition returned in September 1912 from four years' work on the Arctic shores

¹ See *E. B.* xxi, 938 *et seq.* Sir F. Nansen's "*In the Mists: Arctic Exploration in Early Times*" (London, 1911), is a comprehensive history of early Arctic exploration.

of Canada, where, in the neighbourhood of Coronation Gulf, they discovered Eskimo tribes of a peculiarly light colour, with instances of blue eyes and red hair. Their physical characteristics and certain of their customs are identified by the explorer with those of the early Norsemen, and they are held to be descendants of emigrants from Scandinavia to Greenland (see *E. B.* xii, p. 547).

The Danish explorer Mikkelsen, who with a companion had been left in north-east Greenland in 1910 when the rest of his party were brought back to Denmark, had been given up for lost when in July 1912 both were rescued by a Norwegian fishing vessel. They had recovered records of the lost explorer Mylius-Erichsen (see *E. B.* xxi, p. 953) dealing with his important work in the north of the island.

Spitsbergen has attracted considerable scientific attention. A Norwegian expedition under G. Isaachsen in June–September 1910, in addition to oceanographical observations between Bear Island and Spitsbergen, carried out a number of journeys into the interior of West Spitsbergen and neighbouring islands, the expedition being divided into five parties. Valuable geological investigations were made. Other expeditions have been numerous. The discovery of coal in the district of Advent Bay and the attempts made to exploit it have drawn special attention to this locality. Three Russian expeditions were at work in 1911 in Novaya Zemlya. Important geographical, botanical and zoological observations were made, and discoveries of some economic interest were those of naphtha and copper. Russian explorers have also been active in Siberia. The expedition of M. A. K. Volosovich between the Kolyma and the Lena and of M. T. A. Yolamehev east of the Kolyma in 1909 (which incidentally revealed considerable errors in existing maps) proved the possibility of a sea-route for trade between the Kolyma and Bering Strait; this route was successfully exploited in 1911 from Vladivostok, and is considered to be capable of commercial development.

Asia.¹—Among recent journeys in Central Asia may be mentioned that of Mr. D. Carruthers, whose party, in nineteen months' work (1910–11), covered much ground in the upper Yenisei region, Mongolia and Dzungaria. In the same years the French traveller Dr. Legendre carried out important exploration in Western China, especially in the valley of the Yalung between 28° and 30° N. In India, Sir M. A. Stein has investigated (1911–12) numerous sites of archaeological interest in the course of an exploratory journey on the North-West Frontier. The punitive expedition (1912) against the Abors in the north-east added considerably to topographical knowledge in spite of extreme difficulties of transport, heavy forests, and misty and wet weather. One party explored the river Dihong as far as Shimong for the first time, and carried mapping above that point; another surveyed the Padam Abor country; others, again, broke new ground in the Galong Abor country and in the valley of the Subansiri. Considerable corrections were found necessary in existing maps. Major P. M. Sykes has continued his journeys in Persia, and in particular has studied the problems connected with the ancient territory of Parthia. Dr. A. Musil in 1910 made further explorations in northern Arabia, in the region adjacent to the Hejaz railway. He claimed to have accurately identified for the first time the Mt. Sinai of the Bible.

New Guinea.²—The great island of New Guinea offers some of the most extensive areas still unexplored in the world, and here the Dutch have been particularly active. The Mambero river in the west, which had been visited by Capt. Herderschee in 1909, was ascended in 1910 by Dr. Moszkowski. He at first met with a mishap in the rapids of the river at the Vanrees Range, but subsequently reached the foot of the central Snowy Range, and estimated that its northernmost chain reaches an extreme height of 10,000 feet. The rapids again proved treacherous on his return, and he lost most of his collections in descending them. In the same year the German and Dutch expeditions for the delimitation of the German-Dutch frontier covered much new ground. The Dutch Colonial Budget of 1911 contained an appropriation of 20,000 florins in aid of a new expedition to the Snowy Range, and in that year Capt. Schaeffer penetrated the heart of the central mountains by way of Island river from the south, but was unable

¹ See *E. B.* ii, 738 *et seq.*

² See *E. B.* xix, 488.

to cross the island to the north coast. An expedition which carried out work in 1909-11 on the south coast and the southern slopes of the Nassau mountains in Dutch New Guinea was initiated by the British Ornithological Union in commemoration of its jubilee; the party was under the leadership at first of Mr. W. Goodfellow, and after he was overtaken by illness, under that of Capt. G. C. Rawling. Capt. Herderschee started in August 1912 on a second journey, intending to follow the Lorentz river from the south coast, and to investigate the highland region in the neighbourhood of Mt. Wilhelmina. In British territory (Papua) the Hon. Staniforth Smith, administrator of the territory, led an expedition in 1910-11 into the valley of the Kikor, in that part of the territory which lies east of the Fly river basin and north-west of the Gulf of Papua. Dr. Molengraaf in 1910-11 was at work in the eastern part of Dutch Timor.

*Africa.*¹—In Africa, in the course of continued activity in the direction of opening up the various territories, many journeys of geographical importance have been made. On the recommendation of the Colonial Survey Committee, a party under Capt. W. C. Macfie has carried out a topographical survey of 14,000 square miles in Uganda on the scale of 1:25,000. Mr. R. L. Reid completed in 1910 a survey of the river Aruwimi from Basoko up to Avakubi, and Messrs. C. A. Reid and A. E. H. Reid have made surveys in the adjoining parts of the Congo basin. French investigations of considerable importance have been prosecuted in Morocco. In the comparatively little-known north-east, the Muluya, the largest river in the country, has been investigated by M. A. Bernard, and previous maps rectified, while the region through which it flows, generally believed to be sterile, was found actually to contain fertile plains of considerable extent. French survey work has been continued in the Sahara under Capt. Cortier and Capt. Grosdemanger, who was killed in an encounter with raiders. An important expedition was despatched in 1910 to French Equatorial Africa under Capt. Périquet with a view to surveying a possible railway route from Libreville across the Ogowe basin and beyond. Some 3,000 miles of route-survey was made, and the project was favourably reported upon. In German South-west Africa Lieut. Trenk and others investigated in 1909-10 the almost waterless dune-belt parallel to the coast, and in 1911 Professor H. Meyer brought back from the Ruanad country in East Africa the results of important physical, ethnographical and economic investigations. Topographical surveys of an improved character, on a scale of 1:100,000, were begun in Italian Somaliland in 1910.

America.—A Report in 1910 from the Canadian government printing bureau, Ottawa, dealt with the survey carried out by Mr. J. Keele in one of the most important areas previously unexplored in the north-west of Canada, namely that between the Yukon and the Mackenzie, about the upper part of the river Pelly and its headstreams and the Gravel river. In the summer of 1910 Mr. Howard Palmer studied the orography of Mt. Sir Sandford and its vicinity in the Selkirk Range, B.C., of which not much was previously known, and exploration in the Canadian Rockies has been extended in various directions by several investigators, such as Dr. J. Norman Collie, who was travelling north of the Yellowhead Pass in 1911. The Research Committee of the National Geographic Society granted \$5,000 for the continuation in 1911 of the glacial investigations in Alaska by Prof. R. S. Tarr (b. 1864; d. March 21, 1912) and Prof. L. Martin, who led the Alaskan expedition of the Society in 1909-10 in the region of Yakut Bay, Prince William Sound, and the lower course of the Copper river.

In South America, Major Fawcett undertook in 1910 further exploration in Bolivia, in the valley of the Heath and adjacent territories. In January 1911 Col. A. J. Woodroffe led a party of British officers lent to the Peruvian government for the demarcation of the new frontier with Bolivia; this work was expected to take three years. The Yale Corporation sent an expedition to Peru in 1911, under the direction of Professor Hiram Bingham, with Professor I. Bowman as geographer and geologist and Mr. K. Hendriksen as topographer. It was divided into three parties, to carry out archaeological, topographical and geological exploration, and had three fields of operations—the Urubamba river and its affluents, a trans-Andean section from the head of navigation on the

¹ See *E. B.* i, 352.

Urubamba to the Pacific, and the vicinity of Mt. Coropuna (the estimated elevation of which was reduced to about 21,700 feet) and lake Parinacochas. On the trans-Andean section physiographical and meteorological observations were made, in addition to notes on the human and economic geography of the region, and the expedition also obtained valuable results in archaeology and natural history. Professor W. Sievers, who in 1909 continued his researches in western Ecuador and southern Peru, decided that the main source of the Marañon is the stream draining lake Lauricocha, which, however, was found to be fed by a stream from still higher lakes, and he placed the true source in the glacier of Mt. San Lorenzo. Dr. Fritz Leichart has made a systematic study of the Andean glaciers south of Aconcagua (Mt. Juncal, etc.), where is found probably the most extensive field of snow and ice in the whole system excepting for southern Patagonia. The geographical and geological commission of São Paulo, Brazil, has caused explorations of the upper Parana river to be made by its engineers.

A series of investigations which have laid down the main lines of the topography of Dutch Guiana was brought to a close in 1910, when Lieut. Kayser, taking the place of Lieut. de Haan, who died when about to continue the exploration conducted by him two years earlier, traced the Lucie, an important tributary of the Corentyn, down to its junction with the main river.

*Cartography, etc.*¹—Resolutions of the International Map Committee, which met at the invitation of the British Government in London in November 1909, were issued in 1910. They include provisions that a uniform set of symbols should be adopted by all nations for the map on the scale of 1:1,000,000, that the limits of the sheet should be uniform, with international numbers, the boundaries being meridians at successive intervals of 6°, reckoning from Greenwich, and parallels at intervals of 4° reckoning from the equator. The projection proposed is a modified polyconic with the meridians as straight lines. Altitude is to be indicated by a system of colour tints, and full provision has been made as regards other details of colouring, lettering and transliteration of names. A few sheets have already been published by the Ordnance Survey Office and elsewhere. The question of special aeronautical maps has been considered in different countries; an international commission was organised to compile such maps, and their requirements have been discussed by various aeronautical and geographical societies in France, Germany and Great Britain, and by the geographical section of the British Association (Portsmouth, 1911). An aeronautical map of France has been published by the French Society for Aerial Investigation on the scale of 1:200,000, and a series has been undertaken by the German Aeronautic Union.

A review of various directions in which progress has been made in geodesy in recent years was presented to the research department of the Royal Geographical Society by Mr. A. R. Hinks (*Geog. Jour.*, August, 1911).

A bill was passed in France on February 10, 1911 for the adoption, for ordinary purposes, of a standard time 9 minutes 21 seconds behind that of Paris,—practically that of Greenwich.

*Oceanography.*²—The "Michael Sars" expedition under Dr. J. Hjort and Sir John Murray, which left Plymouth in April 1910, made observations at seventy-four stations, from the west coast of Ireland along those of Europe and Africa as far as Cape Bojador, thence to the Canary Islands, the Sargasso Sea, the Azores and Newfoundland, and thence homeward across the Atlantic. Murray and Hjort have based principally on the results of this expedition their book *The Depths of the Ocean* (London, 1912) which, according to the sub-title, is a general account of the modern science of oceanography. The German survey ship "Planet" has carried on important work in the western Pacific in the neighbourhood of the New Hebrides, the Loyalty Islands, New Mecklenburg, the Philippines, etc. A hitherto unknown series of deep trenches in the sea-bottom has been investigated in the last locality, and in June 1912 the deepest sounding ever recorded—5,348 fathoms (upwards of six miles)—was reported east of Mindanao.

A scheme has been undertaken for oceanographical, geographical and biological

¹ See *E. B.* xvii, 629 *et seq.*

² See *E. B.* xix, 967 *et seq.*

investigations in the Adriatic under the auspices of the Austrian Adriatic Association and the Zoological Station at Triest. An institution similar to the Austrian association has been established as a department of the Italian Association for the Advancement of Science, and at a joint conference a plan of work on co-operative lines has been laid down. In connection with the Oceanographical Institute of Monaco, which was founded and is directed by the Prince of Monaco, an institute has been opened in the Rue St. Jacques, Paris, with a laboratory, lecture hall, aquarium and library, under the administration of Dr. P. Regnard.

The wreck of the "Titanic" in 1912, and the unusual southward extension of ice in the North Atlantic at the season when that disaster occurred, have indicated the desirability of a practical application of oceanographical study in particular reference to the temperature of the sea and the circumstances which govern it, and of further research to the north of the steamer "lanes."

An elementary handbook of practical oceanography, entitled *Science of the Sea* (London, 1912), has been written by members of the Challenger Society under the editorship of Dr. G. H. Fowler.

Education: Societies.—The teaching of geography in London elementary schools is the subject of a report (1911) forming one of a series issued at the instance of the London County Council education officer; the schemes therein outlined are the outcome of conferences between teachers and leading authorities in the study of geography. At Berlin a chair of Colonial Geography has been established in the University in connection with the celebration of its centenary, together with a department dealing with this subject in the Geographical Institution, through the liberality of Dr. Hans Meyer. In Vienna a professorship of commercial geography was founded in 1910 in the Exportakademie of the Imperial Museum of Commerce.

During the presidency of Lord Curzon of Kedleston, active measures have been taken for the better housing of the Royal Geographical Society (London), and in July 1912 it was announced that Lowther Lodge, Kensington Gore, had been acquired for this purpose. The Research Department of the Society, under which small periodical meetings had been held since 1903 for the discussion of specific problems, was brought to a close in 1912, without causing any break in the continuity of the support afforded by the Society to research, but rather in order to widen its appeal, for such subjects as have hitherto been brought before the departmental meetings are now included in the programme of the general meetings. The death of Mr. John Coles (b. 1833) on June 24, 1910, removed a well-known figure from London geographical circles; he was map curator to the R. G. S. from 1877 to 1900, and was also "travel editor" of *The Field* from 1884.

The American Geographical Society celebrated its jubilee in 1912, and in connection therewith a trans-continental excursion for the purposes of geographical study was planned under the leadership of Prof. W. M. Davis. The Servian Geographical Society was founded in 1910 at Belgrade, with the special purpose of promoting study of the Balkan lands; it was inaugurated under the presidency of Prof. J. Cvijič.

Geographical Literature.—Two important general works on geography may be specially noted. In *La Géographie Humaine* (Paris, 1910), Prof. J. Brunhes deals exhaustively with the influence of physical environment on the life of man and the conditions under which he lives, basing his study upon a simple classification of essential facts connected with the methods and conditions of cultivation, the working of natural resources such as minerals and various products, as well as the uses of animals, and of the erection of dwellings and the organisation of communications. In *Influences of Geographic Environment* (1911), Miss E. M. Semple approaches similar problems, but in great measure from a different point of view, drawing very freely upon historical examples and using illustrations from every part of the world.

From the beginning of 1911 the German geographical serial "*Globus*" was amalgamated with the serial "*Petermanns Mitteilungen*." (O. J. R. HOWARTH.)

GEOLOGY¹

Volcanoes.—Long-continued study of volcanic phenomena in various parts of the world, supplemented by much chemical and physical research in the laboratory, has led Dr. Albert Brun, of Geneva, to certain conclusions, which, if confirmed, will modify profoundly the generally accepted views on vulcanism (*Recherches sur l'Exhalaison volcanique*. Genève, 1911). From observations in the Mediterranean region, the Canary Islands, Java, Krakatoa and Hawaii, Dr. Brun believes that during a paroxysmal eruption no water is exhaled from the volcano. Examination of the gases evolved during an outburst at a high temperature invariably failed to show either water-vapour or the dissociated elements of water.

The great white cloud, which is so characteristic a feature of a volcano at its maximum temperature, is said by the author to be composed, not, as commonly assumed, of water-vapour expelled from the volcano and partially condensed on meeting the atmosphere, but of solid anhydrous particles of extreme tenuity, associated with certain dry gases. The solid matter consists chiefly of the chlorides of potassium, sodium, ammonium and iron, with ammonium fluoride and very finely divided silica. When the exhalation encounters the atmosphere, some of its hygroscopic salts may condense moisture, and in this way the erupted products may become more or less hydrated; but the water thus acquired is meteoric, not volcanic. In fact, the volcano instead of contributing water to the atmosphere subtracts water from it. It is notable that Dr. Brun's observations on Kilauea, in 1910, showed that the dew-point in the interior of the white cloud was lower than in the surrounding atmosphere. It was also noticed in Hawaii that the shadow of an observer projected on the white cloud was not accompanied by any trace of a glory, such as might have been expected had the cloud contained water-particles. Moreover, the volcanic vapours drawn through cold tubes deposited no moisture. Dr. Brun therefore concludes, contrary to general belief, that all paroxysmal eruptions are essentially anhydrous.

It is true that the vapour of water is present at low temperatures in the exhalations from certain fumaroles and solfataras, but it is maintained that such water is not derived from volcanic sources. It is practically pluvial water, its amount depending chiefly on the climate and on the capacity of the volcano to collect water from the atmosphere. Many igneous rocks yield water-vapour when heated to a moderate temperature, but it is held that this has been absorbed by the rock after cooling. Dr. Brun believes that whatever gases may be obtained from rocks on heating them to about 600° C. are simply gases that have been so absorbed and are therefore not of true volcanic origin.

According to Dr. Brun, the nitrogen of lavas exists mostly as nitride of silicon, which he terms *Marignacite*, after Prof. Galissart de Marignac, of Geneva. The only volcanic nitride previously recognised had been that of iron.

Etna.—An eruption of Etna, of short duration but exceptional severity, occurred in 1911, and was the subject of scientific study by Prof. A. Riccò (*Bollettino d. Soc. Sismologica Italiana*, vol. xv, p. 273) and Prof. Gaetano Platania, of Catania (*Rivista Geografica Italiana*, Anno xix, Fas. 7). Evidence of approaching activity had been observed for several months in the early part of the year, and on May 27 the serious disturbance commenced by the opening of a vent in the upper part of the central cone, on the N.E. side. The activity culminated on September 10, resulting in the formation of a radial fracture, about five miles long, running in a N.E. direction. From numerous vents which opened along this line, cinders were thrown out in enormous quantity, forming a long chain of cones. Altogether 110 new vents are said to have opened. Lava was also extruded in two streams, partly blocking the Circumetnean railway, in places nearly 100 feet high. The eruption ceased after about a fortnight, though earthquake-shocks continued for a time.

Vulcanological Institute.—In accordance with a suggestion by Sig. Immanuel Friedlaender, of Naples, at the International Geological Congress held at Stockholm in

¹ For E. B. articles on Geological Subjects, see Index Volume p. 913.

1910, steps have been taken to establish an International Vulcanological Institute at Naples, for the systematic investigation of volcanic phenomena, especially those of Vesuvius. It is believed that the detailed observation of such phenomena, carefully recorded, may eventually lead to the determination of the successive stages in the approach of an eruption, and may thus become of much practical value. The gases exhaled from various volcanoes will be subjected to thorough analysis, and light may probably be thrown in this way on the origin of certain ore-deposits. Prof. Gaetano Platania is also establishing an institute in Sicily for the special study of Etna.

Earthquakes.—A valuable "Catalogue of Destructive Earthquakes," prepared by Prof. John Milne, has been published as an Appendix to the Report of the Seismological Committee of the British Association for 1911. The entries, numbering nearly 6,000, extend from November 10, A.D. 7, to December 31, 1899. The list represents extensive research carried on for many years, and is specially notable for its records of earthquakes in China and Japan. Feeble disturbances have been excluded, the items being confined to those of sufficient violence to effect structural damage. The order of intensity is indicated by reference to a definite scale. It is believed that the earthquakes recorded in this Catalogue have generally been connected with the formation or extension of lines of fault and fracture in the crust of the earth, and have consequently much interest to the geologist.

In the Report of the Seismological Committee of the British Association at Dundee and in the Halley Lecture at Oxford in 1912 (*Bedrock*, No. 2, p. 137) Prof. J. Milne made an ingenious suggestion as to a possible cause of earthquake activity. It is found that large earthquakes, or megaseisms, resulting from a sudden relief of strain in the earth's crust, are most frequent in regions where the geothermic gradients are steepest, suggesting that the disturbances are connected with the outward flow of the earth's internal heat. Observation on the solidification of blast-furnace slag showed that the material suddenly contracted intermittently, and that the cooling mass cracked superficially, with extrusion of heated viscous matter, due to grip of the shrinking outer shell on the interior.

Such phenomena seem to admit of application to the rocks of the earth's crust. If the superficial shell contracts spasmodically at regular intervals in passing from the liquid to the solid state, or on cooling after solidification, it may suddenly fracture itself by a tight grip on the unyielding nucleus. Such action possibly throws light on many seismic phenomena, and may also explain the extrusion of lava in fissure-eruptions and dykes. Prof. Milne points out that volcanoes are too feeble to produce megaseisms, but that megaseisms often stir dormant volcanoes into activity.

The earthquakes of the Philippine Islands have been specially studied by the Rev. M. Saderra Masò, of the United States Weather Bureau. He shows that those of southern Luzon are connected with three great fractures, of which the most important runs through Taal volcano. This volcano was the seat of a disastrous eruption on January 30, 1911.

The first part of a seismic history of the southern Andes, by the Count de Montessus de Ballore, was published at Santiago de Chile in 1911.

The Zone of Rock Flowage.—It has been generally recognised of late years that the solid crust of the earth admits of division into an upper Zone of Fracture and a lower Zone of Flowage. Below a certain depth the pressure becomes so great that the existence of open spaces seems impossible, since the movement of the solid rock by flowage must tend to close all cavities. At what depth the fractures cease is a question of extreme interest, and various estimates have been made from time to time, with more or less probability, by such geologists as Heim and Van Hise. The question has recently been studied experimentally, with much ingenuity, by Prof. Frank D. Adams, of Montreal, whose results are published in a paper entitled "An Experimental Contribution to the Question of the Depth of Flow in the Earth's Crust" (*Journal of Geology*, Chicago, Vol. xx, 1912, p. 97).

Two rocks were subjected to experiment, viz. an American red granite, representing

a hard plutonic rock, and the lithographic limestone of Solenhofen, typical of a soft sedimentary deposit. The samples were worked into the form of short columns, carefully perforated axially and transversely, and were embedded in accurately fitting jackets of steel: intense pressure was then slowly applied by means of pistons. The period of pressure varied from a few hours to between two and three months, and the temperature ranged up to 550°C. Any contraction of either the longitudinal or the transverse boring was ascertained by means of an accurately gauged wire fitting into the perforation. These experiments lead to the conclusion that empty cavities may exist in granite at a depth of at least eleven miles, which is a greater depth than previous estimates had suggested.

In connection with Prof. Adams's researches the subject has been discussed mathematically by Mr. Louis V. King, who concludes that, so far as hydrostatic pressure in the earth's crust is concerned, a small cavity at normal temperature will remain open at depths down to between 17.2 and 20.9 miles.

These researches have more than academic interest. When Sir C. A. Parsons (inventor of the steam turbine) proposed some years ago that an experimental bore-shaft, for geological and mining exploration, should be sunk to a depth of perhaps 12 miles, it was objected that such a depth was unattainable since the walls would collapse by the viscous flow of the rocks. This objection is now quite untenable. Prof. Adams's investigations have an obvious bearing on the question of the depth to which mineral-veins and other ore-bodies may descend. Whether formed by deposition in fissures or by replacement of rock, it would seem that free spaces are required for reception of mineral matter. It is now seen that, in so far as fractures control deposition, ore-deposits may well continue in depth to at least 11 miles, which is probably a greater depth than could ever be reached by mining operations.

The Planetsimal Hypothesis.—To the *Journal of Geology* (Vol. xix, 1911, p. 673) Prof. T. C. Chamberlin, of Chicago, has contributed a paper in which he shows how his planetsimal hypothesis has been strengthened by the discovery of radioactivity. According to his view the earth originated in a nuclear knot of a spiral nebula, around which it was slowly built up by the aggregation of planetesimals, or discrete masses revolving in elliptical orbits around the common centre of the system. By the crossing of their paths, the planetesimals were gradually gathered into the immature earth. A certain amount of heat would be derived from the condensation of the original nucleus, and more would be developed by the infall of the captured planetesimals, but the chief source of the internal heat of the earth was found, according to the author, in the compression which the growing earth would suffer as the deeper parts were pressed by the rock-masses that gradually accumulated above. When this hypothesis was originally enunciated doubt was not unnaturally expressed as to the adequacy of progressive self-compression to account for the earth's internal heat, but any doubt as to a sufficient supply of heat was dispelled on the discovery of an additional source of thermal energy in radioactivity.

As the earth was formed by the aggregation of all kinds of planetesimals derived from the original nebula, it must have presented from the beginning a very heterogeneous composition. On sufficient elevation of temperature, the less refractory substances would pass into a state of fusion, or rather mutual solution, but such liquefaction was essentially selective, local and temporary. At no period of the earth's history was there general fluidity, like that of a molten globe. It is held that the local liquid matter would be squeezed outwards by stress-differences in the body of the earth, forming threads or tongues which would flux their way upwards along paths of easy resistance, and thus transfer heat from the central parts towards the surface.

It seems a fair assumption that originally radioactive matter would be distributed through the heterogeneous mass of planetesimals quite promiscuously. But as the presence of any heat-generating bodies would favour the liquefaction of neighbouring matter, this matter would tend to rise towards the surface of the growing earth, carrying with it the associated radioactive substances. According, then, to the planetsimal

theory there would be a tendency for radioactive mineral matter to become concentrated in or near the superficial part of the earth, thus offering an explanation of the results obtained by the Hon. J. R. Strutt in his well-known researches on this subject.

A theory of the evolution of the earth resembling in many ways that of Prof. Chamberlin seems to have been independently developed by Prof. E. H. L. Schwarz, of Grahamstown, and is set forth in his work on *Causal Geology* (London, 1910). In this work he discusses some of the fundamental problems of geology in the light of his experience gained during extensive field-work in South Africa. He concludes that the earth is throughout solid, rigid and cold. Local heat for volcanic phenomena is obtained by pressure and friction along lines of movement in the earth's crust, and from radioactive rocks. Such heat acting on water in the pores of the rocks gives rise to steam, producing explosive outbursts, whilst if the rocks are readily fusible liquid lava may be formed. In explaining the formation of that type of volcano illustrated by the caldera, or pit-crater, of Kilauea, Prof. Schwarz assumes lateral movement of the rocks by simultaneous thrust along two crossed horizontal faults, with depression of the enclosed area. The origin of the depression is therefore similar to that of the fold-basins in many parts of Cape Colony.

As South Africa seems to have stood above sea longer perhaps than any other part of the world, it has suffered superficial denudation to an exceptional extent, and Prof. Schwarz believes that the crust is there so thin that the centrosphere has actually been reached by the diamond-pipes. These channels are now occupied by materials which may be regarded as samples of the highly basic rocks of the deep-seated interior, akin to meteorites.

Pacific and Atlantic Types of Rocks.—In a presidential address to the Geological Section of the British Association at the Portsmouth meeting of 1911, Dr. A. Harker, of Cambridge, developed his views on the geographical aspect of petrology, dwelling especially on the relation that may be traced between certain types of rock and the tectonic features of the regions in which they occur. So far as the younger igneous rocks are concerned, a curious relationship seems to govern their distribution over extensive geographical areas.

It was pointed out many years ago by Prof. E. Suess that the coastlines of the Pacific and the Atlantic basins were characterised by two distinct types of structure. The Pacific is bordered for the most part by mountain chains that are folded towards the ocean, so that the outer side of the fold looks seawards. On the Atlantic coast, however, such a structure is almost absent, and if folds exist the inner side generally faces the ocean. After this distinction had been recognised Dr. Harker called attention to the fact that the Pacific structure was characterised by igneous rocks of what is called the calcic type, and the Atlantic structure by rocks of alkaline facies. The petrological distinction indicated by these chemical expressions is now believed to be of fundamental or genetic significance. All igneous rocks admit of classification in two great branches, one of which is characteristically calcic or alkali-calcic in composition, while the other being rich in potash and soda is known as the alkali branch.

There is generally a regional separation between the two groups, the typical calcic and the typical alkali rocks being characteristic of distinct petrographical regions, each including subordinate provinces. The alkali group seems to be associated with areas of subsidence believed to be due to radial contraction, whilst the calcic group is connected with areas of folding, resulting from lateral compression. Viewed broadly, the calcic branch predominates over the alkali branch, but many rocks of the latter type may be hidden by submergence in sunken areas.

According to Dr. Harker, the variations in igneous rocks have been brought about mainly by differentiation of the original magma rather than by assimilation, or absorption of local rocks by the molten matter. But the relation between differentiation and assimilation is a subject on which petrographical opinion is still much divided.

(F. W. RUDLER.)

METEOROLOGY¹

The events that have marked the progress of meteorology during the past few years may be briefly summed up under the following heads. (1) The great development of radiotelegraphy, by means of which our daily weather maps now cover the oceans and distant continents, so that every morning we have spread before us the general condition of the atmosphere over the whole northern hemisphere. (2) The remarkable development of the study of the atmosphere at altitudes of 10 to 30 kilometers by means of kites, pilot balloons and sounding balloons, leading to the establishment of the existence of an isothermal or relatively warm layer at altitudes above 9 to 12 kilometres, due to the atmospheric absorption of terrestrial radiations. (3) The publication (1907) of E. Gold's admirable survey of our knowledge of the upper atmosphere, the analogous summary by A. Wegener (1912), and the simultaneous publication (1909) by Gold and Humphreys of the importance of terrestrial radiation and atmospheric absorption in the formation of the isothermal layer. The radiation from the earth, ocean and air is mainly the same as that from water and aqueous vapour. Nearly all the rays that enter the gaseous and aqueous envelope of the globe in their passage outward are caught in the vapour atmosphere and radiated anew as from a water surface. The total resultant radiation is as though it issued from a total radiator or black surface at an elevation of 3 or 4 kilometres, which is about the centre of gravity of all the aqueous vapour floating in the atmosphere. Convective equilibrium and adiabatic control of temperature prevail up to 9 or 11 kilometres or throughout the so-called convective region. Above this is Dr. Gold's advective region, or Leon Teisserenc de Bort's isothermal region, or his stratosphere. Humphreys (*Mt. Weather Bulletin*, Vol. 4, p. 408) concludes that the air above 11 kilometres must have a uniform temperature of minus 55 degrees centigrade and is free from vertical convection, also that the volume percentages of gases at this altitude are the same as at the surface of the earth, but above this level the lighter gases gain in volume with elevation more than the heavy gases. (4) The determination by Humphreys of the zonal intensities of the earth's planetary radiation of heat, per unit of time and area at different latitudes, showing a maximum between latitudes 30° and 65° north but a minimum at the equator; this depends essentially on the atmospheric vapour and its radiating power. (5) The development, due to Bjerknes, of graphic methods of studying the dynamics of the atmosphere. The approximate solutions hitherto obtained by many scholars undoubtedly need revision in the light of the new methods devised at Christiania and now being published by the Carnegie Institution at Washington in Bjerknes's *Dynamic Meteorology*. (6) The increasing interest in precise climatology and its evident importance to the physiography of the globe and to all human labours. The publication by Hann of the enlarged third edition of his *Climatology* enables all interested therein to study this subject satisfactorily. (7) The publication of Hann's new edition of his elaborate "Lehrbuch der Meteorologie" and several general treatises by others, adapted to popular or educational purposes, such as the works of A. Wegener, Sir John William Moore, Willis L. Moore, W. H. Milham, A. Klossovski, and especially *Forecasting the Weather* by W. N. Shaw, which is really an up-to-date meteorological memoir and summarises nearly all that is at present known of the dynamical problems bearing upon the practical art of weather forecasting. (8) The establishment of weather bureaus by the Commonwealth of Australia and by the South African Union. (9) The determination of the altitude of the aurora borealis by Stoermer, by photographic methods that give us for the first time some accurate knowledge on this subject; with this may be associated A. Wegener's co-existence of hydrogen and geocoronium at all altitudes above 50 kilometres. (10) The publication of Prof. Pernter's *Meteorological Optics* (completed after his death by Dr. Felix M. Exner), the most comprehensive work on the subject now available.

International Ballooning.—In 1907 Professors Hellmann and Hildebrandsson compiled the "Official International Meteorological Codex" on behalf of the "International Meteor-

¹ See E. B. xviii, 264 *et seq.*, and allied articles.

ological Committee," which latter is the representative of the numerous meteorological congresses and conferences that have been held since 1872. This Codex is a very convenient and useful codification of the numerous conclusions expressed by European meteorologists at these meetings. At Paris in 1896 an independent organisation was recognised, for purposes of collaboration, namely the "International Commission for Scientific Balloon Ascensions." This Commission held meetings in 1898, 1903, 1904, 1906, 1909 and 1912, its first report to the International Committee being made in 1906. The work of the International Commission for Scientific Ballooning has been much promoted by the discussions at Milan (1906), Monaco (1909), and Vienna (1912).

The study of upper strata in England has been greatly helped by the freedom with which W. H. Dines of Pyrton Hill, Wallington, and E. J. P. Cave, of Ditcham Park, Petersfield, have published their laborious observations with kites and balloons. Mr. Cave's work with pilot balloons can easily be repeated in any portion of the globe.

The observations with kites and balloons at the Royal Aeronautical Observatory at Lindenberg, under Assmann, have been continued steadily, and among the results summarised by Fischli we may mention that he finds the directions of the wind at various altitudes indicate changes in the weather very much as do the passage of areas of maximum and minimum pressure, or the so-called highs and lows, at the earth's surface. The atmospheric layers in which inversions take place vary with the season of the year and with the direction of the wind, and especially with the condensation of aqueous vapour. The changes of wind direction at different levels are one cause of variations from the regular diurnal periods of temperature. The upper layer of inversion, or the so-called isothermal stratum, was attained at an average height of a little over 12,000 metres in anticyclonic areas, while in cyclonic areas it was a little over 10,000 during 1910; the mean temperatures were minus 91.2 C. at the former altitude and minus 51.5 C. at the latter.

In European regions the limits of upper inversion at which the temperature begins to increase are higher in summer than in winter. The American observations by Rotch and Blair also seem to show that the isothermal stratum is higher in summer than in winter, which may be due to the greater dryness of the American climate. In the United States the limit is higher than in Central Europe, so far as the limited number of observations can justify an average. The warm layer exists above the ocean as well as above the land. The altitude of the layer over the North Sea is about the same as over Europe, whereas Hergesell found it much higher, *viz.* 13,000 meters over the South Atlantic. The general law seems to be that the upper inversion layer is lower near the poles and higher under the equator; a similar law seems to hold good for each of the cloud formations. Assmann is probably correct in considering the isothermal layer as a feature of the general atmospheric circulation, being the upper branch of the interchange of air going on between the equator and the poles, but this is only a partial explanation of its origin and temperature. In 1909 E. Gold of London and W. J. Humphreys of Washington published quite independently their proofs that the upper inversion must be due to the absorption, by the aqueous atmosphere, of heat radiated from the earth and the ocean. The total quantity of aqueous vapour contained in the atmosphere is sufficient to render the radiation from the atmosphere equivalent to that of a surface of water, or an absolute perfect radiator, at the altitude of 4,000 metres; therefore the effective surface of terrestrial radiation is at this altitude where the mean annual temperature is about 263 degrees absolute scale; so that the planet or combined earth and atmosphere radiates like a black body at this altitude. The absorption of heat above 4,000 metres and its penetration beyond, explain the existence and the temperature of the stratosphere, while the changes in the quantity of aqueous vapour in the atmosphere explain the variations in the altitude of this layer, which must be higher in the summer and higher in dry climates but must surround the globe over continents and oceans and polar snows alike.

Teisserenc de Bort in his memoir of 1909 states as the result of his investigation at Trappes that the temperature of the thermal layer from 8 to 17 kilometres upward departs rarely less than 2 degrees, or more than 10 degrees, and on the average only 6 degrees C., from the temperature appropriate to adiabatic diminution. His balloon ascensions, some of which attained 27 km., show that in most cases after penetrating through the thermal zone the temperature returns to that which it had lower down when it entered the thermal zone. The same results are given by observations in Lapland and in the Atlantic Ocean, except only that the altitude of the stratosphere diminishes a few thousand metres as we pass from the equator to the Arctic zone. There are apparently precise relations existing between these altitudes and the lower meteorological conditions. The altitudes are in general higher within areas of high pressure than in those of low pressure. The greatest altitude is on that side of a high pressure area that is in advance of the low pressure. On the other hand the altitude of the stratosphere is lowest in the rear of a low pressure area and especially low in a trough of low pressure.

The important aeronautic expedition to Central East Africa led by Prof. Berson in 1908 attained the isothermal layer or upper inversion stratum at about 17,000 metres. At these high altitudes Berson found a strong west wind, evidently a return current, that may possibly prevail over large areas in equatorial regions, while an easterly wind prevails below.

The meteorologists of the Egyptian survey have contributed both to our knowledge of the climate of the country and to various problems of dynamic meteorology. Regular observations of the heat received from the sun have been made since 1907 with the Angstrom pyrheliometer and with the electric recorder of Callendar. Free air observations with kites, pilot balloons and captive balloons have also been prosecuted. The depth of the surface trade winds in lower regions and the character of the layers of air next above, up to 5,000 metres, have also been studied. The intermediate calm surface or transition surface, or the glide surface of Sandstrom, sometimes has a very steep inclination and sharp definition. In fact this glide surface, studied so carefully by Sandstrom in Norway, is undoubtedly a characteristic of the atmosphere in all parts of the world.

The late Dr. Rotch, by the use of kites and sounding balloons, studied the upper air at Blue Hill Observatory, Hyde Park, Mass. and in the central region of the Mississippi Valley. Up to 1,000 metres altitude there are many variations of pressure and temperature, but above this there is a steady diminution of temperature and increase of velocity, except that at 4,000 metres there is a rather sudden increase of velocity.

The behaviour of the winds in the trade region has been the subject of special studies by Mey, Campbell-Hepworth, Shaw, and of balloon observations by Hergesell, Rotch and Teisserenc de Bort, to which must be added the work by Dynes and Shaw on the anemometer records at St. Helena, and the work of Gold on the connection between air pressure and periodic variations of the wind. The studies of Wegener and Stoll on the trade winds in the neighbourhood of Teneriffe show that there are great irregularities produced by the presence of this island, and the same must be true of the island of St. Helena, therefore the study of the free trade winds in the open portions of the North and South Atlantic Oceans is especially needed.

Wagner shows that the isothermal layer is higher above an anticyclone and lower above the cyclone, the difference amounting to 3,000 metres. The isothermal layer above a cyclone is colder than above the anticyclone by ten degrees.

Auroras.—In February and March 1910 Prof. Dr. Carl Stoermer was able to carry out satisfactorily the first precise simultaneous measures of the parallax and location of the beams and arches of auroral light. He accomplished this by making simultaneous photographs of the auroras and the brighter stars at stations a few kilometres apart connected by telephone. The general result is that out of 150 well determined altitudes the lowest cases of auroral light occur at about 40 kilometres altitude, thus showing that the solar corpuscles striking the earth's atmosphere penetrate far deeper than do the beta rays from radium. The upper limit of these 150 cases was at 260 kilometres, with several cases occurring sporadically above this, showing that the study of our atmosphere and its fields of force, with its thermal and dynamic phenomena, must be extended outward to at least that altitude, or one tenth of the earth's radius.

Aerolites.—The study of the upper air by means of twilight phenomena and auroras is closely connected with its study by means of shooting stars and aerolites. A very complete summary of our knowledge of these bodies is given by Von Niessl of Vienna in Vol. vi of the *Encycl. Math. Wiss.*, from which several facts are deduced bearing on the upper air. Out of 49 altitudes of August meteors or Perseids the average appearance began at 115 kilometres and disappearance occurred at 88 kilometres. In the same way H. A. Newton found 39 meteors beginning at the average altitude 112 kil. and disappearing at 90 kil. Of the November shooting stars or Leonids 78 began at 155 and ended at 98 kil. Out of 159 miscellaneous shooting stars the average beginning was at 108 kil. and the disappearance at 86 kil. The average appearance of 121 large aerolites was at 138.6 kil. and the average disappearance of 213 large ones was at 49.7 kil. The altitudes of first visibility, namely from 108 kil. to 155 kil., are of course smaller for larger meteors than for the small molecular masses involved in the aurora which may begin visibility at 260 kil., because of the smaller geocentric velocities of the heavy meteoric masses, whose average velocity is but 72 kil. per second, compared with that of electrons moving with the velocity of light. Evidently the total diurnal heat communicated to the earth's upper atmosphere by shooting stars must be a small but appreciable percentage of that absorbed directly by the air from the sunshine, even if it be inappreciable compared with that received from the sun by the earth's surface.

Climatology.—The influence of climate on our physical condition, or the psychophysics of climate, is a study to which special attention has been given by Prof. Titchener of Cornell and by Lehmann and Pettersen of Germany. The influence of climate on the nervous system is very pronounced, quite as much so as the influence of food, drink, companionship, or habitation in forests, among mountains or on islands in the ocean.

Arctowski maintains that the compensations in the annual changes of cold and warm, drought and flood, do not balance each other perfectly year after year, but experience irregularities that must be charged to sudden changes in the solar radiation.

The diurnal variation of the direction and strength of the wind in the Adriatic Sea has been analysed by Mazelle. The bora is defined as a wind of 50 kilometres per hour or over. On days of such boras the maximum wind velocity occurs at 9 A.M. and the minimum at 4 P.M. On the scirocco days the maximum velocity of wind occurs at midday and a second

maximum at 6 P.M., with a minimum at 1 A.M. During the bora the morning maximum occurs at 10 A.M. at Trieste, but at 9 A.M. at Porer and at 8 A.M. at Lesina. On the scirocco days the principal maximum occurs at noon at Porer, but at 1 P.M. at Lesina, and this retardation of one hour also occurs in case of the 1 A.M. minimum. The greatest duration of a bora storm averaged 6.6 days at Porer in January. The greatest duration of the scirocco was 2.6 days in February. The strongest wind recorded during the 5 years, 1903-07, was 123 kilometres per hour, viz. for the bora of January 1906.

Temperature of the Globe.—The average temperature of ideal hemispheres of land or of water, and of the whole globe, which has been the subject of many theories since the days of Forbes, has recently been discussed by Liznar with the latest data from distant portions of the globe. He finds that the average temperature of a land hemisphere would be 16.99 and of water hemisphere 13.27; a difference that is much less than that found by Spitaler. He finds that a change of solar constant by one per cent would have a considerable change in the temperature of each zone the change being greatest at the equator. An equal effect would have been produced by a general change in the transparency of the sun's atmosphere, or in the sun's temperature, or by local changes in the temperature or the transparency of the sun's surface or of the earth's atmosphere.

Secular Change of Climate.—The variability of temperature and the evaporation of moisture in the dry regions of South Africa have been studied by J. R. Sutton. The relation of desert plants to soil moisture in the dry regions of Arizona has been studied by R. E. Livingston. The secular changes going on in the climates of various parts of the earth continue to attract both observers and theorists; most enthusiastic among these is Dr. Ellsworth Huntington of Yale University. His former studies in Asia Minor, Syria and Persia are now being supplemented by extensive explorations in the arid regions of America. He maintains his discovery of different periods of droughts and floods in ancient days in every country; some of these were undoubtedly followed by extensive national migrations and international wars. Dr. Huntington has even announced as a preliminary result of his study of the annual rings of growth of large trees, that precision can be given to the dates of the periods of drought.

With reference to the analogous phenomena of glaciation, Dr. Julius Hann, in his address at Innsbruck September 1905, remarked: "In connection with the many traces and observations of a progressive drying of Africa and the interior of Asia we have before us one of the greatest problems of terrestrial physics. This problem seems all the more difficult to solve since there are similar phenomena on a small scale that we may study completely as to time and space, and yet are completely powerless to explain them from a meteorological point of view: e.g. the progressive continued retreat of the Alpine glaciers that can be easily observed. Although this phenomenon is going on in a region from which it would seem that sufficient observations have continued for years, still it is not as yet possible to prove any direct connection between these variations and the variations of the meteorological elements. In such problems great results cannot be attained in a brief time but only through long continued labours prefaced by appropriate preliminary studies."

The great gorges traced out toward the middle of the Atlantic Ocean from the mouth of the Congo on the east, and from the mouths of the Hudson, Delaware, Susquehanna and Potomac rivers on the west, as well as the changes in the great lakes of America and Asia, and also the palaeontological evidence of oceanic and continental deposits that have been accumulating ever since the Permian era of the geologists, all agree with many other phenomena in showing that great climatic changes have been in progress in our atmosphere since the earliest ages, and it would not be strange if slighter changes should have continued to develop during the past 4,000 years of the world's history, quite independent of solar changes.

Glaciers.—Among climatological studies the formation of glaciers has received continued attention. W. Sievers at Carlsruhe, September 1911, discussed the glaciation in South America: he attributes the secular variations to changes in temperature during the glacial period produced by changes in solar radiation, but apparently he does not take full account of the effect of the great changes on the earth's surface in altitude and moisture and the atmospheric changes due to volcanoes.

Dr. P. Paschinger after a careful study of the relations between the snow limit and the climate finds that these vary in different regions even during the same period of time; the variations of the snow limit are greater on isolated mountains than in mountainous regions and they are least between the tropics and on plateaus. The snow limit had its maximum in the northern hemisphere after 1890 and its minimum about 1870.

In an elaborate study of the light and air of high mountain regions, Dr. C. Dorno has laid the basis for a physical study of the mountain climates of Switzerland, as minute and precise as has been hitherto devoted to lower altitudes. He has given special attention to the intensity and character of solar insolation, diffuse skylight radiation, terrestrial radiation and atmospheric electricity. Among the interesting results attained by Dr. Dorno are the determination of the great annual and diurnal variations of sunlight.

Sunspot Influences.—The last work from the pen of Prof. Simon Newcomb before his death in 1909 discussed the meteorological evidences as to variations of radiation of heat from

the sun, ending with the conclusion that the minimum temperature on the earth occurs 0.65 year after the maximum of sunspots, whereas our maximum temperature occurs 0.33 year before the minimum of sunspots. He infers that there may be fluctuations of plus or minus two-tenths of one per cent in the earth's temperature, but whether this terrestrial phenomenon is due to variations of solar radiation or of atmospheric conditions is still problematical.

The Solar Commission under the presidency of Sir Norman Lockyer continues its energetic labours, bearing on variations in the physical relations of the sun and the earth. Such variations are delicate and obscure and apt to be deceptive; it is not as yet clear that any variations in the solar conditions exist whose effects are appreciable in comparison with the variations continually going on in our own atmosphere. Koeppen showed that the so-called sunspot period in local temperature records varied with the latitudes of our stations, and was essentially a transfer from the equator towards the pole of waves of heat that may have had their origin in our own atmosphere; the obscuration of our upper atmosphere produced by the eruption of Krakatoa spread slowly for a number of years; analogous effects were produced by Skaptas Jokul in 1783; and the eruptions of 1912 in Alaska cut off appreciable amounts of insolation; similarly the short periods that have been worked out by W. J. S. Lockyer may have a terrestrial origin. The broader study of our atmosphere as a whole has been especially favoured by the great increase in the area of the daily weather maps now published in Europe, Asia, Australia and America, and still more light will be thrown on the subject when a daily map of Southern Africa is published by the South African Union.

(CLEVELAND ABBE.)

PHYSICAL SCIENCE¹

While failing to chronicle any experimental discoveries of the first importance, the last few years have witnessed a tendency towards certain very radical changes in general physical theory. In their extreme form, these changes amount to a new definition of our units of space and time, the suppression of the interstellar aether as a physical reality, and the conception of a discrete or corpuscular structure of energy. None of these new principles has as yet been fully recognised, but the rapidly increasing number of their adherents renders it necessary to take them seriously into account.

The Principle of Relativity.—The uniform failure of all attempts to discover "absolute" motion through the aether, even under the promising conditions of the classical experiment of Michelson and Morley,² was met in the first instance by FitzGerald and Lorentz's hypothesis of a shrinkage of all matter in the direction of such motion. Such an hypothesis, though not unreasonable, was entirely arbitrary, and open to the objection that the amount of shrinkage should depend in some way upon the substance in question.

A more radical solution was furnished in 1905 by Dr. Albert Einstein, of Bern, now Professor of Theoretical Physics in the German University of Prague. This solution is based on the "Principle of Relativity," a principle which extends to electromagnetic phenomena that independence of absolute motion which has been accepted for mechanical systems since the days of Newton. It makes two fundamental assumptions, which may be put concisely as follows: (1) It is impossible to discover absolute motion by means of electromagnetic (including optical) phenomena; (2) the velocity of light is a universal constant, independent of the motion of the source.³

Since this principle was put forward, a system of theoretical physics has been worked out in considerable detail on the new basis. This system is known as the Theory of Relativity. Among its chief exponents may be mentioned Minkowski, Laue, Herglotz, Noether, Tolman, Born, Frank, N. Campbell and Levi-Civita. The theory, though starting with a renunciation, leads to some very startling positive assertions. It involves a new definition of time, based upon the impossibility of synchronising two distant clocks by means of anything more rapid than light-signals. This limitation introduces the velocity of light as a disturbing factor in the synchronism of a clock "at rest" with a clock in (relative) motion. In fact, two clocks, originally

synchronous, will each, when viewed from the other, appear to lose $\frac{1}{2} \left(\frac{v}{c}\right)^2$ sec. per second, if we denote their relative velocity by v and the velocity of light by c . A rigid sphere in motion, viewed from a system "at rest," appears flattened in the ratio of

¹ See generally *E. B.* articles on "Physics" enumerated in Index Volume, p. 940.

² *Philosophical Magazine*, 24, p. 449 (1887). ³ *Annalen der Physik*, 17, pp. 891 (1905).

$1: \sqrt{1-(v/c)^2}$. This is the Fitzgerald-Lorentz shrinkage, now no longer a physical reality, but an appearance due to physical limits of observation. The velocity of light plays the part of an infinite velocity, and any speed surpassing that limit becomes meaningless.

A notable consequence, already pointed out by Einstein,¹ is that the inertia of a body depends upon the energy contained in it. This implies a fundamental identity of mass and energy. Thus, radiation must have a "mass." If a body in space were to emit radiation in a single direction, the recoil pressure of that radiation (the reality of which has been demonstrated by Poynting and Barlow),² would exert a force equal to E/c , where E is the energy emitted per second. If we call M the "mass" of the radiation E , its momentum is Mc . This momentum generated per second equals the force E/c . Hence $M = E/c^2$. Thus $c^2 = 9 \times 10^{20}$ represents in ergs a mass of 1 gram, and the solar system is filled with this new type of "radiant matter."

Once we admit the materiality of radiant energy, we are obliged to consider the question of it being subject to gravitational force. Einstein,³ indeed, goes so far as to answer the question in the affirmative and boldly predicts the observation of the gravitational deflection of a beam of light from a star by the sun's gravitational field, a deflection which, though only amounting to $0.83''$, ought to be unmistakable. Here, however, the relativity theory is on dangerous ground, for any such gravitational effect on beams of light contradicts its own second fundamental assumption, which postulates the absolute constancy of the velocity of light. This absolute constancy is all that remains of the properties of the luminiferous aether, which adherents of the relativity theory sometimes profess to have completely eliminated. As it stands, it really represents a *modus vivendi* by means of which the substance of the undulatory theory and the aether principle may be saved in spite of the overwhelming negative evidence which has accumulated against the latter. Should this attempt fail, there is always the alternative of assuming that the velocity of light is added to that of the source, as it is in the electromagnetic theory devised by Ritz.⁴ This, of course, means the total abandonment of the aether as a luminiferous medium, and the revival of the emission theory of light.⁵

Quanta of Energy.—The "materialising tendency" of present-day physics, to which Sir O. Lodge drew attention in his Becquerel Memorial Lecture (1912), is nowhere more evident than in the new theory of radiation propounded by Max Planck,⁶ according to which radiant energy is emitted in discrete quantities proportional to the vibration frequency of the emitting atomic or molecular element. The formulation of some such theory was necessitated by a breakdown of the Maxwell-Hertz electromagnetic theory of radiation when molecular oscillators are considered. Imagine a closed vessel impervious to heat, and filled with gas. Let a hot and a cold body be introduced into the vessel. Heat will pass from the hot body to the gas and to the cold body until the temperature is equalised, and the entropy has become a maximum. But that final state will also be reached if the gas is removed and the inner walls are perfect reflectors. Then the transfer of heat is made exclusively by radiation, which behaves as if it had a temperature, like the gas. Equilibrium is again established, just as if the entropy had become a maximum, whereas we can hardly speak of the entropy of a vacuum, since it is the logarithm of a probability of collocation in space of discrete elements. Thus we are led to attribute entropy to radiation itself.

The only approach to a mathematical theory of the process is through the conception of molecular oscillators and resonators. If a number of these are contained in the vessel, their energies will be distributed as among the molecules of a gas, and, since each resonator has two degrees of freedom (corresponding to electric and magnetic

¹ *Ibid.*, 18, p. 639 (1905).

⁵ See Laue, "Das Relativitätsprinzip" (Vieweg, Braunschweig, 1911).

⁶ *Deutsche Physikalische Gesellschaft, Verhandlungen*, 13, p. 136 (1911). See also his "Theorie der Wärmestrahlung" (Barth, Leipzig, 1906).

energy respectively), the mean energy of a resonator must be $1.346 \times 10^{-16} \times T$ erg, where T is the absolute temperature. Now, according to Maxwell's equations, the mean energy of a resonator exposed to a radiation of frequency ν and intensity S_ν is $\frac{C}{8\pi\nu^2} \times S_\nu$, where C is a constant. By combining these two results, we get $S_\nu = C'T\nu^2$. This result is obviously contradicted by experience, since it crowds the radiant energy into the shorter wave-lengths and makes the total radiation integrated over the whole spectrum infinite.

The only solution of this difficulty seems to be that proposed by Planck, who assumes that molecular oscillators are incapable of continuous radiation, but accumulate energy up to a certain amount proportional to their frequency, and then throw off the whole of that amount at once. The "quantum" thus thrown off is $h\nu$ ergs, where ν is the frequency in revolutions or complete vibrations per second, and h is the universal "action constant," amounting to 6.55×10^{-27} erg-seconds.

This is a grave departure from the postulate of the equi-partition of energy which has hitherto governed the dynamical theory of heat. The resonators of highest frequency obtain the greatest share of the incident energy. They absorb it without loss by radiation until the time has come to emit the whole of it. Radiation is as "chaotic" as are the molecular motions in a gas. The "temperature" of radiation is that of the emitting body, and its entropy is derived from the logarithm of the probability of its state just as it is in the case of a gas.

A difficulty arises as regards the aether, to which the energy of radiation is communicated by means of its pressure. The aether, with its infinite freedom, cannot be in equilibrium with an oscillator having only two degrees of freedom. Einstein¹ sought to overcome this difficulty by supposing that light itself is propagated in discrete "cells" or quanta, which have a fixed and definite volume, and simply increase their mutual distances as they proceed outward into space. This, as Lehmann suggests, may account partly for the twinkling of stars, and even for their visibility at enormous distances. A discrete structure of light has also been suggested by Sir J. J. Thomson, on the basis of some photoelectric experiments, and by Sir J. Larmor in his Bakerian lecture (1909).

"Natural" Units.—Planck's radiation formula is $S_\lambda = \frac{c^2 h}{\lambda^5} \frac{1}{e^{ch/k\lambda T} - 1}$, where S_λ is the energy in ergs per cm^2 of radiating black surface at the absolute temperature T °C, the radiation being of wave-length λ cm; c is the velocity of light in cm/sec, h is the "action constant," and k is the atomic gas constant expressed in ergs per degree, its value being 1.346×10^{-16} . If h , k , c and the constant of gravitation ($G = 6.66 \times 10^{-8}$) are each made unity, we obtain "natural" units for length, mass, time, and temperature which may be held in reserve for future use in case the C.G.S. system is ever to be superseded.

Atomic Heats.—Planck's law, which for large wave-lengths resolves itself into Lord Rayleigh's, while for short wave-lengths it gives Wien's law, has been found to cover the whole range of infra-red spectroscopy, and E. Baisch (1911) has confirmed it down to $330 \mu\mu$. The Stefan-Boltzmann law of total radiation and Wien's displacement law are simple deductions from it. It is therefore likely to become an important datum of physics. Whether the more speculative parts of Planck's theory are adopted or not, it is certain that its general method is fruitful. It has already led to some important results, and has become a valuable guide in physical and chemical investigations.

Thus, according to the older kinetic theory, the mean energy of an atom per degree of freedom must be $\frac{1}{2} \times 1.346 \times 10^{-16}$ erg per degree. In a solid body, whose atoms possess 6 degrees of freedom (3 kinetic and 3 potential), each atom must have six times that amount of mean energy. In one gram atom, or 0.64×10^{24} atoms, the energy is, therefore, 5.955 calories per degree. This figure, embodied in the law of Dulong and Petit, only applies to fairly high temperatures, and even at these it fails in carbon,

¹ *Physikalische Zeitschrift*, 10, p. 185, 1909.

boron, and silicon. At temperatures from 100° abs. downwards there is a rapid fall in atomic heats, which tend to zero as the absolute zero of temperature is approached. This observation forms the *raison d'être* for the theory of heat quanta propounded by Einstein and worked out more fully by Nernst,¹ which differs from Planck's (revised) theory by postulating not only a unitary emission, but also a unitary absorption of energy,—a modification for which E. Bauer has recently (1912) advanced some further theoretical reasons.

The smallness of specific heats near absolute cold is then accounted for somewhat as follows. Near 0° abs. only very few atoms will possess any quanta of energy, but the few that do will determine the temperature of the aggregate. The remainder are simply at rest. Therefore a very small quantity of heat suffices to raise the apparent temperature of the body, in other words, its specific heat is small.

But this is only one of many useful applications of the theory. It enables us to calculate not only specific heats, but melting points and heats of transformation, besides giving a quantitative expression for chemical affinity. The atomic frequency ν , which enters into all the formulae, is calculated either from absorption spectra, or from the selective photoelectric effect, as in the extensive work of Pohl and Pringsheim; or the cubic elastic compressibility. And Lindemann² gives the formula $\nu = 4.59 \times 10^{15} \sqrt{nd/A}$, where A is the atomic weight, n the valency, and d the density of the body.

F. Haber,³ who defines Planck's action constant h as "the amount of work required to extract an electron from an atom or molecule having a frequency of 1 vibration per second," deduces the relation $\nu_r = \nu_v \sqrt{m/M}$, where ν_r , ν_v are the infra-red and ultra-violet frequencies respectively, m is the mass of an electron, and M that of the atom.

The Revival of "Caloric."—How far the "materialising tendency" has proceeded in recent years is evidenced in a striking manner by Prof. H. L. Callendar's opening address to Section A of the British Association at Dundee, in which he pleaded, if not for a revival of the caloric theory of heat, at least for a recognition of the legitimate claims of some of its leading principles. The materiality of heat cannot be refuted by weighing if it consists of electrons whose mass is purely electromagnetic, or, better still, if it consists of doublets of positive and negative electrons, which would have no perceptible weight, no evident electrical properties, and no absorbing power for light. They might even constitute the aether of space, which, as Witte has shown, must not be a continuum, but have a discrete structure, if it is to exist at all. At all events, caloric would have a physical existence, instead of being merely the logarithm of a probability. It would be identical with entropy.

In this connection an observation by L. Dunoyer (1911) may be of interest. He finds that in very high vacua the vapours of potassium and sodium are precipitated on the walls of the vessels by a kind of radiation or straight-line trajectory in which obstacles produce sharply-defined shadows. This looks like a realisation of R. W. Wood's "fourth state of matter," and suggests that neutral doublets of high velocity come into action at high temperatures and low pressures. Whether these doublets are identical with Wood's electronic doublets, or with Righi's "magnetic rays" (which consist of positive atoms attended by revolving electrons) cannot at present be discussed.

Shortest Sound Waves.—Advances into the region of shortest sound waves were made almost simultaneously by Campbell and Dye⁴ and by Lebedef and Neklepajef⁵ in 1911. The former passed sparks of definite frequency close to the mouth of a Kundt's dust tube. They were able to obtain as many as 50 streaks per cm, which means a frequency in air of 830,000. The number agreed with the value deduced from the capacity and inductance of the spark circuit within 5 per cent. Lebedef calculated the shortest observable sound waves from Stokes's formula governing the attenuation of sound by the viscosity of the gas, introducing corrections made by Kirchhoff and

³ *Ibid.*, 13, p. 1117 (1911).

⁴ *Electrician*, 66, p. 862 (1911).

⁵ *Annalen der Physik*, 35, pp. 171 and 175 (1911).

Jeans. It appears that a sound wave 0.4 mm long decreases to one-hundredth of its strength within 10 cm, while a wave 0.1 mm long does so within 6 mm. Neklepajef, using spark waves concentrated by a mirror and analysed by means of a Fraunhofer grating of silver-steel rods, measured the absorption of waves down to 0.8 mm length by means of an Altberg pressure apparatus.

The measurement of the physical intensity of sound has been brought nearer to its full realisation. Heindlhofer (1912) has worked out the theory of a method of determining it by the heating of gold-leaf, while Zwaardemaker has found the energy required to sound *ah* to be about 3 megers per second.

Measurement of Visible Light.—R. A. Houstoun¹ proposes to measure light absolutely by means of a thermopile provided with an ideal light-filter to give it the same curve of sensitiveness as the human eye. The filter proposed is an aqueous solution of $\text{CuSO}_4 \cdot 5 \text{H}_2\text{O}$ of strength 0.2 gram-mols per litre, in a layer 3 cm thick, followed by an aqueous solution of $\text{K}_2 \text{Cr}_2 \text{O}_7$ of strength 0.0025 gram-mols per litre, in a layer 1 cm thick. The light would then be measured in ergs per cm^2 per second.

Meanwhile, Buisson and Fabry,² using a Heraeus mercury lamp, have determined the minimum possible expenditure of energy on a lamp which entirely transforms the energy it receives into the most advantageous luminous radiations. They find the value 0.018 watt per Hefner candle, which is about one-fiftieth of the expenditure on a metallic filament lamp. This figure might be called the "mechanical equivalent of light."

As regards the maximum of visibility, we now have the wave-lengths indicated by Nutting, of the Bureau of Standards (1911). They are 544μ for strong light and 503μ for very feeble light.

Advances in Spectroscopy.—The recent great activity of spectroscopists has been accompanied by the discovery of new methods of investigation and the devising of new aids. Thus we have Anderson's copies in collodion of Rowland's original gratings, rendered accurate by mechanical stretching where required; Féry's prisms with curved surfaces (1910), which offer a valuable saving of precious material like flourspar, and eliminate the loss at additional optical surfaces; Lehmann's ultra-violet filter (1910) consisting of Jena "uviole" glass and a layer of dimethylnitrosoaniline, which only transmits light of wave-lengths below 380μ ; and Wood's "echelette" grating, consisting of lines ruled about 1,000 to the inch on metal. This new grating has been applied with great success by Trowbridge and Wood to the resolution of the extreme infra-red residual rays from quartz.

Longest Light Waves.—The gap between the longest light waves and the shortest mechanical waves observable has been definitely bridged by Rubens and von Baeyer,³ who isolated a beam of the mean wave-length 313μ from the radiation of a mercury lamp consuming 4 amperes at 100 volts. This wave-length of about $\frac{1}{2}$ mm coincides with that of the shortest sound waves and closely approaches the shortest observable Hertzian waves.

The infra-red spectrograph recently devised by Lebedef, and Trowbridge's simple demonstration apparatus for the infra-red spectrum, in which the sensitive receiver is a stretched rubber band provided with a mirror to indicate its thermal expansion, will no doubt contribute to the advance of infra-red spectroscopy both in the laboratory and the lecture-room.

The theoretical analysis of spectrum lines by series has hitherto suffered from the presence of numerous lines which did not fit into any of the series specified by Kayser and Runge. This is now in a fair way towards solution, since Ritz indicated a principle of combination which enables us to deduce new wave-lengths from lines already fitted into a series. The principle in question has been very successfully applied by Paschen,⁴ with the aid of the Zeeman effect, which gives a valuable index to the mutual connection

¹ *Royal Society, Proceedings A* 85, p. 275 (1911). ² *Comptes Rendus* 153, p. 254 (1911).

³ *Preussische Akademie, Sitzungsberichte*, 14, p. 339 (1911). *Philosophical Magazine*, 21, p. 689 (1911).

⁴ *Annalen de Physik*, 36, p. 191 (1911).

between lines. This success is the more remarkable as Ritz's principle is almost purely empirical.

Koenigsberger¹ has worked out a theoretical formula for finding the proportion of molecules taking part in any emission or absorption of light. He finds that only about one molecule in a thousand is active at any given instant. While this result is in agreement with estimates previously based on other data, an outstanding spectroscopic difficulty is still presented by the shifting of spectrum lines with a variation in the pressure of the gas in which the source is immersed. This effect, discovered by Humphreys and Mohler, has since been studied by Duffield, Rossi, King and others, but all that is clear up to the present is that this effect has no connection with the Zeeman effect, as was at first supposed.

Radioactivity.—The confidence with which the production of helium by the atomic disintegration of radium is now regarded by physicists is shown by Strutt's² calculation of the age of some specimens of thorianite by comparison with the observed evolution of helium. He found that one specimen of thorianite was at least 280 million years old,—a figure which should satisfy all geological requirements.

A revised table of names of radioactive products has been put together by Rutherford and Geiger.³ Radium C gives rise both to Radium D and a new product called Radium C₂, which, however, starts a side branch of the radium family. Radium emanation retains its somewhat clumsy name, although Ramsay proposes to re-name it "Niton," from its intense luminosity when solidified.

E. Regener⁴ counts the number of α -rays and slow cathode ray particles (" δ -rays") by allowing them to impinge upon a spray of fine oil-particles, which are then counted in the field of an ultra-microscope. This is interesting in view of Boltwood and Rutherford's definite proof that helium is monatomic, and each atom carries two elementary positive charges.

Chemical Analysis by Alpha-rays.—The combined magnetic and electric deflection of canal-rays (α -particles) gives rise to parabolic curves and other traces on a photographic plate which vary in a characteristic manner with the nature of the gas in the vacuum tube. This observation has been utilised by Sir J. J. Thomson⁵ to initiate a new method of chemical analysis whose sensitiveness shall greatly exceed even the spectroscopic method. It has been found possible to trace the presence of monovalent hydrogen and oxygen, as well as carbon molecules of various atomicities and charges, but the method is hardly ripe for general application yet, and the work of von Dechend, Hammer, Koenigsberger, Kutschewski, Kilching, Fulcher, Gehrcke, Reichenheim, Baerwald and Stark has not sufficed to clear up all the complex details of the behaviour of these important forms of radiant matter.

Photo electric Effects.—The photo electric currents generated by the expulsion of electrons from the illuminated surface (Hallwachs), especially in the case of the alkali metals and their amalgams, have acquired a new significance since they are being used to discover selective absorption and atomic frequencies. Elster and Geitel,⁶ by covering the potassium cathode with a thin layer of colloidal potassium, succeeded in rendering the cell highly sensitive up to a region of the spectrum far in the infra-red. A cell of this kind would be suitable, as E. Bloch suggests, for use in a photophone.

Among substances whose resistance is affected by light must now be counted sulphur (Goldmann and Kalandyk); calcium sulphide (Vaillant); antimonite, both in the native macrocrystalline state (Jaegers) and as pure artificial sulphide Sb₂ S₃ (Olie and Kruyt); and even paraffin oil (Sziwessy and Schaefer). It is significant that the action of ultra-violet light on paraffin oil is in every respect similar to that of gamma-rays. Probably we shall see this action before very long brought into a clear relation with

Becquerel's photo-voltaic effect, which Samsonov¹ has recently produced in chlorophyll, and in uranyl and quinine sulphates, by illuminating one of the two translucent platinum electrodes.

Selenium.—The electronic theory of the light-action of selenium, first advocated by C. Ries, has acquired an additional value since both the photo-sensitiveness and the variation of resistance with the voltage (the "potential effect") have been discovered on a smaller scale in other substances as well. Quite recently (1912) Ries announces that the potential effect is a general property of photo-sensitive substances. The conductivity of selenium has been invested with a special interest since Kaempff² succeeded in producing in it a saturation current with a gradient of 12,000 volts per cm. This is the first time that a saturation current has been observed in a solid.

Selenium photometry, at which Stebbins, Pfund, and others have been working for some time, achieved a notable success when Stebbins (1911) discovered a slight luminosity of the "dark" companion of Algol by its means.

Another new practical application of selenium is Fournier d'Albe's "optophone,"³ which enables totally blind persons to recognise light by means of the ear, the light producing a change in a selenium resistance forming one arm of a Wheatstone bridge, and the resulting current being periodically interrupted and thus made audible in a telephone.

W. M. Thornton, who regards the eye as an electrical organ, gives (1910) 23 micro-amperes per cm² of the retina as the minimum current required to produce visual sensation. He concludes that the eye can detect one-twentieth of the energy perceptible to the ear.

Magneton.—Ampère's "molecular magnets" have acquired a new significance by a remarkable discovery made by P. Weiss,⁴ viz., that the molecular magnetic moments of bodies differ from each other in simple ratios expressible by small whole numbers. Owing to thermal agitation, these molecular moments do not co-operate except at absolute zero, but measurements can be made in liquid hydrogen, or even at higher ranges of temperature when temperature coefficients obey a well-defined law. The common constituent of the magnetic molecular magnetic moments is called a "magneton," and its value is 0.174×10^{-28} in cm-webers. The magneton-number is for iron 11, for nickel 3, and closely approaches whole numbers in a great variety of bodies.

Nickel-on-Glass Reflectors.—The silver-on-glass mirror, itself a great advance on speculum metal, is likely to give way before a nickel-on-glass mirror both as regards durability and capacity of reflecting ultra-violet light. R. W. Wood⁵ gives instructions for depositing the nickel, which is best done electrically from a solution of a double sulphate of nickel and ammonia. In this connection it should be noted that the thinnest optically effective layer of lead peroxide on a platinum mirror is 0.84μ thick, and must have the thickness of two molecules (Koenigsberger and Müller, 1911).

Fused-Silica Standard.—Owing to its low thermal hysteresis, fused silica is a suitable material for standards of length. G. W. C. Kaye⁶ describes those adopted in the Bureau of Standards. They have a very small expansion coefficient, and are light and inexpensive. They must be annealed for eight days at 450° C. and cooled slowly for fourteen days. Annealing caused a shrinkage of about half a micron in the metre standard.

(E. E. FOURNIER D'ALBE.)

CHEMISTRY ⁷

The increasing significance of chemistry as a factor in modern industrial and social progress is obvious to anyone who gives consideration to the matter. It is true that a great deal of the chemist's work seems to have no bearing on the practical side of life, but every now and then a convincing demonstration is given that laboratory research

on purely scientific lines ultimately yields results which are of the highest utility to the community, and may have far-reaching effects on its industry and commerce. A striking instance of this lies to hand, for after much laborious investigation, synthetic rubber is now an accomplished fact, and no one can yet foretell what this discovery will mean to the community. Chemistry is contributing largely also to progress in other sciences, notably biology. At the present day, organic chemists are busy investigating and building up the countless substances which are normally the products of plant and animal activity, while physical chemistry, with its accumulated data bearing on the phenomena of solution, offers valuable assistance to the physiologist in the interpretation of vital processes. The present survey of the recent progress of chemistry deals only with the purely scientific aspect of the subject. If, further, it is borne in mind that the chemical investigations reported in recognised journals all over the world number about 5,000 per annum, it is plain that only some of the more outstanding points can be discussed here.

Inorganic Chemistry.—Since 1910 two new elements have been incorporated in the table of International Atomic Weights. These are *niton* (radium emanation), atomic weight 222.4 (Gray and Ramsay, *Proc. Roy. Soc., A.*, 1910, 84, 536), and *holmium*, atomic weight 163.5 (Holmberg, *Zeitsch. anorg. Chem.*, 1911, 71, 226). In the case of some other elements recent research has led to a revision of the values previously adopted. The most notable instance of this is mercury, for which the atomic weight 200.6 is now recommended (see *J. Chem. Soc.*, 1911, 99, 1868; also Easley, *J. Amer. Chem. Soc.*, 1910, 32, 1117; 1912, 34, 137). Other recent and important investigations on atomic weights are those dealing with silver (Richards and Willard, *J. Amer. Chem. Soc.*, 1910, 32, 4; Baxter, *ibid.*, 1591), and chlorine (Gray and Burt, *J. Chem. Soc.*, 1909, 95, 1633; *Chem. News*, 1911, 103, 161; Stähler and Meyer, *Zeitsch. anorg. Chem.*, 1911, 71, 378). The claim to have fractionated tellurium (see *E. B.* xxvi, 577; also Flint, *Amer. Journ. Sci.*, [IV], 1910, 30, 209) has not stood the test of further experimental examination (Marckwald and Foizik, *Ber.*, 1910, 43, 1710; Harcourt and Baker, *J. Chem. Soc.*, 1911, 99, 1311).

Of the 82 elements as many as 27 have atomic weights which are multiples of unity to within 0.1, and this fact suggests that there may be something in Prout's hypothesis (see *E. B.* ix, 258). The bearing of the disintegration theory of radium on this point has lately been discussed by Sir W. Ramsay (*British Association Reports*, 1911, 10). Of interest also in this connection is the Faraday lecture on the fundamental properties of the elements (Richards, *J. Chem. Soc.*, 1911, 99, 1201).

Much interest has been aroused by the discovery of a chemically active modification of nitrogen (Strutt, *Proc. Roy. Soc., A.*, 1911, 85, 219; 86, 56; 1912, 86, 262). When a current of this gas at low pressure is subjected to the action of an electric discharge, it continues to glow in an adjoining tube, after passing out of the region of the discharge. The chemical change which gives rise to the glow appears to be accelerated by cooling and retarded by heating. Compression of the glowing gas increases the intensity of the glow. Ordinary phosphorus, exposed to the action of the luminous gas, is converted into the red variety. Sodium and mercury, gently heated in the glowing gas, combine with it; in both cases line spectra of the metals are developed. Hydrogen merely dilutes the glow, whilst oxygen destroys it, apparently without oxidation occurring.

Attempts are still being made to elucidate the mechanism of rusting. Pure iron does not rust in contact with pure oxygen and pure water, not even when carbon dioxide is present (Lambert and Thompson, *J. Chem. Soc.*, 1910, 97, 2426). Commercial iron, however, behaves differently. The experiments of Dunstan and Hill (*J. Chem. Soc.*, 1910, 99, 1835), who find that those dissolved substances which prevent iron rusting are those which induce the so-called "passive" state in the metal, give support, on the whole, to the electrolytic theory of rusting (see Tilden, *J. Chem. Soc.*, 1908, 93, 1356. Compare Armstrong, *Science Progress*, 1911, April and October; Friend, *J. Chem. Soc.*, 1912, 101, 50).

Much work dealing with the fundamental subject of combustion has been published

recently. The ignition temperature of a mixture of hydrogen and oxygen out of contact with any solid material is about 600° (Dixon and Coward, *J. Chem. Soc.*, 1909, 95, 514), and the corresponding point for a mixture of carbon monoxide and oxygen is about 650° . Air may be substituted for oxygen without altering these ignition temperatures. Reference may be made here also to further experiments by Dixon on the ignition of explosive gaseous mixtures (*J. Chem. Soc.*, 1910, 97, 661; 1911, 99, 589), and to an investigation, with a practical bearing on mine-explosions, in which the authors have determined the limits of inflammability in mixtures of air with the simpler paraffin hydrocarbons (Burgess and Wheeler, *J. Chem. Soc.*, 1911, 99, 2013). It is interesting to note that the experiments of Bone and others on the combustion of gases at hot surfaces have led to the development of practical methods for the raising of steam, the concentration of liquids, and the fusion of metals (see *Journal of Gas Lighting*, 1911, 114, 22, 98; *Engineering*, May 1912). A general and exhaustive report on the subject of combustion was submitted by Bone to the Chemical Section of the British Association (B.A. Reports, 1910, 469).

Mixtures of hydrogen and oxygen, submitted to the action of the silent electric discharge at the temperature of liquid air, give under certain conditions a high yield of hydrogen peroxide (Fischer and Wolf, *Ber.*, 1911, 44, 2956). The silent discharge has played a part also in the experiments of Dewar and Jones on the conditions of formation and the properties of carbon monosulphide (*Proc. Roy. Soc., A.*, 1910, 83, 408, 526; 1911, 85, 574). When carbon disulphide vapour at low pressure is exposed to the silent electric discharge, it is decomposed into sulphur and gaseous carbon monosulphide, CS. Passed into a tube cooled with liquid air, the monosulphide is condensed, along with the unchanged disulphide. If the temperature of the tube is then allowed to rise, the monosulphide polymerises with explosive violence, forming a brown substance, which may be formulated as (CS)_x. This latter may be obtained also from thiocarbonyl chloride, which reacts rapidly at the ordinary temperature with nickel carbonyl, according to the equation: $x\text{CSCl}_2 + x\text{Ni}(\text{CO})_4 = x\text{NiCl}_2 + 4x\text{CO} + (\text{CS})_x$.

Some other interesting inorganic substances, prepared lately, are worthy of mention here. Cuprous sulphate, obtained by heating methyl sulphate with cuprous oxide in the absence of water (Recoura, *Compt. rend.*, 1909, 148, 1105), is stable in dry air, but is decomposed immediately by water, with deposition of metallic copper and development of heat. It is noteworthy that the existence of the compounds $\text{NH}_3 \cdot \text{H}_2\text{O}$ and $2\text{NH}_3 \cdot \text{H}_2\text{O}$ in the solid state has been definitely proved by a study of the freezing-point curve for mixtures of ammonia and water (Rupert, *J. Amer. Chem. Soc.*, 1909, 31, 866; Smits and Postma, *Proc. K. Akad. Wetensch. Amsterdam*, 1909, 12, 186). Another interesting achievement is the preparation of solid oxygen, by the evaporation of the liquefied gas (Dewar, *Proc. Roy. Soc., A.*, 1911, 85, 580).

Organic Chemistry.—The investigation of the carbon compounds is proceeding in a multitude of directions, but interest and importance attach mainly to research work along one or two lines. In the synthesis of those substances which are normally the products of vegetable or animal activity there is a special significance, as also in the preparation and study of physiologically active compounds which find application for medicinal purposes. A glance into the current chemical literature shows clearly also the extent to which organic chemists are occupied with problems relating to molecular structure. The general principles underlying the formation of organic compounds are, it is true, well established and regularly applied in practice, but in cases where two or more structural arrangements of the atoms in the molecule are possible there is less certainty of treatment and correspondingly greater interest attaches to their elucidation. In the attack on such problems organic chemists are using physical methods to an increasing extent, and are finding them successful where purely chemical methods have failed.

The investigation of the proteins and their degradation products, albumoses, peptones, and amino-acids, has been actively prosecuted in recent years. In his Faraday lecture on the relation of synthetical chemistry to biology (*J. Chem. Soc.*, 1907, 91, 1749)

Emil Fischer enumerated nineteen amino-acids which were to be regarded as the chief hydrolytic cleavage products of the proteins (see *E. B.* i, 153 *et seq.*, article "Albumin"). One of these amino-acids, *viz.* histidine, which in 1907 had not been built up in the laboratory, has now been synthesised (Pyman, *J. Chem. Soc.*, 1911, 99, 1386), and the racemic compound obtained in the synthesis has been resolved into the optically active isomerides.

Fischer and his pupils have combined amino-acids in a great variety of ways, and have thus prepared a large number of synthetic products, termed polypeptides, the simpler ones being similar to peptones, the more complex ones resembling proteins. The study of these polypeptides, moreover, has led to improved methods of isolating and detecting decomposition products of the proteins. In this direction much work is being done by Abderhalden, who finds that for the purpose of distinguishing proteins partial hydrolysis is preferable to total hydrolysis. The latter treatment applied to different proteins may yield the same amino-acids in equal quantities, without throwing any light on the different ways in which these amino-acids were linked together in the proteins. Partial hydrolysis, however, leaves the amino-acids still associated to some extent. From silk fibroin, for instance, three dipeptides and a tetrapeptide have been successfully isolated in this way (*Zeitsch. Physiol. Chem.*, 1909, 58, 334; 63, 401).

The constitution of the alkaloids has in some instances been settled by a complete synthesis; as, for example, in the case of laudanose, the first opium alkaloid to be completely synthesised (Pictet and Finkelstein, *Compt. rend.*, 1909, 148, 925), papaverine (Pictet and Gams, *ibid.*, 149, 210), narcotine (Perkin and Robinson, *J. Chem. Soc.*, 1911, 99, 775), and berberine (Pictet and Gams, *Compt. rend.*, 1911, 153, 386). The structure of other alkaloids which have not yet been completely synthesised is being gradually elucidated (see, for instance, Perkin and Robinson, *J. Chem. Soc.*, 1910, 97, 305; 1912, 101, 1775; Rabe, *Ann.*, 1910, 373, 85; *Ber.*, 1911, 44, 2088; Pschorr and Knöfler, *Ann.*, 1911, 382, 50; Wieland and Kappelmeier, *Ann.*, 1911, 382, 306; Pyman, *J. Chem. Soc.*, 1911, 99, 668; Pschorr, *Ber.*, 1912, 45, 2212).

The hydrolysis of tannin with sulphuric acid indicates that it is a compound of one molecule of dextrose with five molecules of digallic acid, and in confirmation of this result substances resembling tannin in all respects have been prepared synthetically (Fischer and Freudenberg, *Ber.*, 1912, 45, 915).

Recent research confirms the existence of a close relationship between chlorophyll and haematin (from oxyhaemoglobin). The amorphous natural chlorophyll is the ester of a tricarboxylic acid, termed chlorophyllin, in which two carboxyl groups are esterified by methyl alcohol and phytol respectively, the third probably remaining free (Willstätter and others, *Ann.*, 1910, 378, 1, 18; 1911, 380, 148, 154, 177; 1912, 390, 269). Reduction of chlorophyll derivatives yields haemopyrrol, *iso*-haemopyrrol, and phyllopyrrol, and it is noteworthy that these compounds result also from the reduction of haematin (Willstätter and Asahima, *Ann.*, 1911, 385, 188. See also Piloty, *ibid.*, 1910, 377, 314).

The remarkable progress made in the synthesis of the terpenes (see *E. B.* xxvi, 647 *et seq.*) bears witness to the value of the Grignard reaction. The synthesis of terpineol has been followed up by the preparation of the *d*- and *l*- isomerides. Attempts to convert these active terpineols into the corresponding active limonenes have been unsuccessful; apparently during the elimination of water from terpineol a migration of the double linking occurs and the optical activity disappears (see Chou and Perkin, *J. Chem. Soc.*, 1911, 99, 526).

The great majority of the naturally occurring members of the terpene group are derivatives of *p*-cymene, but all the theoretically possible menthenols and menthadienes of the *ortho*-series have been synthesised, with the exception of the Δ^2 -isomerides. All the possible inactive *m*-menthenols and *m*-menthadienes of the type of terpineol and dipentene have been prepared synthetically, including sylvestrene (Perkin and others, *J. Chem. Soc.*, 1907, 91, 480; 1908, 93, 1876; *Proc. Chem. Soc.*, 1910, 26, 97).

Certain menthadienes are found to be characterised by an abnormally high boiling

point and molecular refraction. This has been connected with the occurrence of conjugated double linkings, a view confirmed by the fact that these menthadienes are able to combine with only one molecule of halogen or halogen acid, whereas the other isomerides can absorb two such molecules.

Much work has been done lately in connection with rubber, and there is no doubt now that synthetic caoutchouc, comparable in all respects with the natural product, can be produced by the polymerisation of the hydrocarbon isoprene and its homologues. This is best effected, as Matthews has found, by heating the hydrocarbon with metallic sodium at about 60° for several days (see Perkin, *J. Soc. Chem. Ind.*, 1912, 31, 616. Compare Harries, *Ann.*, 1911, 383, 157). Isoprene is readily obtained from the *iso*-amyl alcohol contained in commercial fusel oil. *Iso*-amyl chloride, obtained from the alcohol by the action of hydrogen chloride, is chlorinated under special conditions, so that the formation of products more highly halogenated than the dichlorides is avoided. When the mixture of dichlorides thus produced is passed over soda lime heated to about 470° , isoprene is obtained in 40 per cent yield. The possibility of turning out synthetic rubber on the commercial scale depends on an abundant and cheap supply of fusel oil. This problem appears to have been solved by Fernbach's work, which shows that the fermentation of starch may be so directed as to yield either acetone or fusel oil.

One or two other interesting compounds which have been prepared lately may be enumerated here: viz. azomethane, $\text{CH}_3\cdot\text{N}:\text{N}\cdot\text{CH}_3$, a colourless gas (Thiele, *Ber.*, 1909, 42, 2575), diphenylene, $\text{C}_6\text{H}_4:\text{C}_6\text{H}_4$, melting at $74.5\text{--}75^\circ$ (Dobbie, Fox and Gauge, *J. Chem. Soc.*, 1911, 99, 683), *cyclo*-octatetraene, C_8H_8 , the eight-membered ring compound analogous to benzene (Willstätter and Waser, *Ber.*, 1911, 44, 3423), and epicamphor,

C_8H_{14} $\left\{ \begin{array}{l} \text{CO} \\ | \\ \text{I} \\ | \\ \text{CH}_2 \end{array} \right.$ isomeric with ordinary camphor, C_8H_{14} $\left\{ \begin{array}{l} \text{CH}_2 \\ | \\ \text{I} \\ | \\ \text{CO} \end{array} \right.$ (Lankshear and Perkin,

Proc. Chem. Soc., 1911, 27, 166).

Discussion has long ranged round the question whether acetoacetic ester (see *E. B.* i, 135) is to be represented as possessing the "keto" form $\text{CH}_3\cdot\text{CO}\cdot\text{CH}_2\cdot\text{CO}_2\text{C}_2\text{H}_5$, or the "enol" form $\text{CH}_3\cdot\text{COH}:\text{CH}\cdot\text{CO}_2\text{C}_2\text{H}_5$, and latterly the view has been held that the liquid ester as ordinarily obtained is an equilibrium mixture of the two forms. Knorr has now succeeded, by carrying out operations at -80° and in the complete absence of moisture, in isolating both the ketonic and enolic isomerides in a pure state (*Ber.*, 1911, 44, 1138). A comparison of the refractive indices of these two substances with that of the equilibrium mixture usually obtained shows that the latter contains 2 per cent of the enolic form (compare, however, Meyer, *Ann.*, 1911, 380, 212; *Ber.*, 1911, 44, 2718). At the ordinary temperature both the enolic and ketonic forms change spontaneously into the equilibrium mixture, with great rapidity in the presence of certain catalytic agents. The isomeric forms of other tautomeric substances, such as methylbenzoylacetate and acetylacetone, have also been isolated (*Ber.*, 1911, 44, 2767).

In connection with optical isomerism much attention has lately been devoted to the Walden inversion. This term refers to a change of configuration occurring in an optically active compound when one of the atoms or groups attached to the asymmetric C-atom is replaced. Thus, for instance, the action of phosphorus pentachloride on *l*-malic acid produces *d*-chlorosuccinic acid, from which in turn, on treatment with silver oxide, *d*-malic acid is obtained. Hence it is possible to convert *l*-malic acid into *d*-malic acid, and the reverse change can be similarly effected. Recent investigation of analogous cases has shown that change of configuration does not necessarily accompany any particular substitution, but is dependent on the character of the reagent employed to bring about the substitution. Thus the action of phosphorus pentachloride on *l*- α -hydroxy- α -phenylpropionic acid leads to the corresponding *d*-chloro-acid, while if the replacement is effected by thionyl chloride, the *l*-chloro-acid results (McKenzie, *J. Chem. Soc.*, 1910, 97, 1016, 2566). It was thought at one time that a Walden inversion occurred only in cases where carboxyl was one of the groups attached to the asymmetric C-atom, *i.e.* in the α -substituted acids, but recent work has shown that β -amino-

and β -hydroxy-acids may also exhibit the phenomenon (Fischer and Scheibler, *Ann.*, 1911, 383, 337; McKenzie and Barrow, *J. Chem. Soc.*, 1911, 99, 1910). It is noteworthy also that a Walden inversion is accompanied by racemisation to a greater or less extent.

In connection with the interpretation of the Walden inversion Emil Fischer has adopted the view that the C-atom exerts an attractive force on atoms or groups outside the molecule of which it forms part (*Ann.*, 1911, 381, 123). That is, he assumes the existence of auxiliary valencies (see *E. B.* xxvii, 847 *et seq.*, article "Valency") and supposes that the formation of additive compounds precedes substitution. The position taken up by the replacing atom or group is not necessarily that of the atom or group which is replaced, so that in compounds containing an asymmetric C-atom substitution may be accompanied by a change of configuration. From this point of view the Walden inversion is a normal process which is as likely to occur as its opposite. Whether it occurs or not depends on the character of the reagent employed and on the nature of the groups attached to the asymmetric C-atom. Should the change of configuration not occur in all the molecules involved then partial racemisation is observed. Werner proposes a somewhat similar interpretation of the Walden inversion (*Ber.*, 1911, 44, 873. Compare Pfeiffer, *Ann.*, 1911, 383, 123).

As regards new cases of optical isomerism, chief interest attaches to the preparation of active compounds of phosphorus (Kipping and Challenger, *J. Chem. Soc.*, 1911, 99, 626; Meisenheimer and Lichtenstadt, *Ber.*, 1911, 44, 356), cobalt (Werner, *Ber.*, 1911, 44, 1887, 2445, 3272), chromium (Werner, *ibid.*, 3231), iron (Werner, *ibid.*, 1912, 45, 433), and rhodium (Werner, *ibid.*, 1228), and to the occurrence of optical activity in l-methyl-cyclohexylidene-4-acetic acid and its derivatives (Perkin, Pope and Wallach, *J. Chem. Soc.*, 1909, 95, 1789; Perkin and Pope, *ibid.*, 1911, 99, 1510). It is claimed that the optical activity of this compound is due to the asymmetry of the molecule, not to the presence of any particular asymmetric C-atom (for discussion of this point see also Everest, *Chem. News*, 1909, 100, 295; *Proc. Chem. Soc.*, 1911, 27, 285; Marsh, *ibid.*, 317).

Many workers are seeking to determine more definitely the quantitative connection between rotatory power and the various correlated factors, such as temperature, solvent, concentration, wave-length of the light employed, and the character of the atoms or groups attached to the asymmetric C-atom (see, for instance, Walker, *J. Physical Chem.*, 1909, 13, 574; Patterson and Stevenson, *J. Chem. Soc.*, 1910, 97; 2110, 1912, 101, 241; Frankland, *ibid.*, 1912, 101, 654).

A physical method increasingly employed by organic chemists is the determination of refractive power. Refractometric investigations have yielded especially interesting results with unsaturated compounds, and recent work has confirmed and extended Brühl's conclusion that the grouping C:C:C or C:C:C:O in any molecule is associated with abnormally high refractive and dispersive power (see Brühl, *J. Chem. Soc.*, 1907, 91, 115; Smedley, *ibid.*, 1910, 97, 1475; Anwers and Eisenlohr, *J. prakt. Chem.*, 1911, 84, 1, 37; *Refraktometrisches Hilfsbuch*, by Roth and Eisenlohr, 1911. Compare Thiele, *Ann.*, 1899, 306, 87). It is known that the mutual influence of contiguous unsaturated atoms finds expression also in anomalous rotatory power (Hilditch, *J. Chem. Soc.*, 1909, 95, 331; *ibid.*, 1911, 99, 224).

Another point worthy of notice is the publication of several papers demonstrating the applicability of the Barlow-Pope theory of valency volumes (see *E. B.* xxvii, 847; Le Bas, *J. Chem. Soc.*, 1907, 91, 112; *Phil. Mag.*, 1907, 14, 324; 1908, 16, 60; Jaeger, *J. Chem. Soc.*, 1908, 93, 517; Jerusalem, *ibid.*, 1909, 95, 1275; 1910, 97, 2190; 1912, 101, 1268; Colgate and Rodd, *ibid.*, 1910, 97, 1585; Barlow and Pope, *ibid.*, 1910, 97, 2308).

Physical Chemistry.—In working out relationships between physical properties on the one hand and chemical composition and constitution on the other, much success has been achieved in the case of the refractive power of liquid substances. In this connection the recent thorough revision of the atomic refraction and dispersion values is noteworthy (Eisenlohr, *Zeitsch. physikal. Chem.*, 1910, 75, 585). The new figures (which take the place of those recorded in *E. B.* vi, 70), are as follows:—

	H _α	D	D _β	H _γ	H _β -H _α	H _γ -H _α
Hydrogen	1.092	1.100	1.115	1.122	0.023	0.029
Oxygen, hydroxyl	1.522	1.525	1.531	1.541	0.006	0.015
Oxygen, ether	1.639	1.643	1.649	1.662	0.012	0.019
Oxygen, carbonyl	2.189	2.211	2.247	2.267	0.057	0.078
Chlorine	5.933	5.967	6.043	6.101	0.107	0.168
Bromine	8.803	8.865	8.999	9.152	0.211	0.340
Iodine	13.757	13.900	14.224	14.521	0.482	0.775
Carbon (singly bound)	2.413	2.418	2.438	2.466	0.025	0.056
Double linkage of carbon	1.686	1.733	1.824	1.893	0.138	0.200
Triple linkage of carbon	2.328	2.398	2.506	2.538	0.139	0.171
Nitrogen in primary aliphatic amines	2.309	2.322	2.368	2.397	0.059	0.086

The view that liquid water, on the ground of its peculiar physical properties, is a mixture of so-called "water-molecules" and "ice-molecules," the latter being more complex but less dense, has lately been strengthened by the preparation of new varieties of ice. When water at a pressure of about 3,000 atmospheres is cooled first to -80°C . and then to -180°C ., a specimen of clear ice is obtained which sinks in liquid air and is therefore denser than ordinary ice, but which swells up and crumbles to the ordinary variety when the temperature is allowed to rise to -130° (Tammann, *Zeitsch. physikal. Chem.*, 1910, 72, 609). More lately still, two new forms of ice have been described, one of which appears only *above* 0°C . (Bridgman, *Proc. Amer. Acad.*, 1912, 47, 441). There is much to be said for another view that liquid water is a mixture of ice-molecules H_6O_3 , water-molecules H_4O_2 , and steam-molecules H_2O , the relative proportion of these varying with the temperature (Bousfield and Lowry, *Trans., Faraday Soc.*, 1910, 6, 85). According to Bose (*Zeitsch. Elektrochem.*, 1908, 14, 269) even steam contains a certain proportion of double molecules.

The notable work of Morse and his co-workers on the osmotic pressure of sugar solutions has lately been summarised (*Amer. Chem. J.*, 1911, 45, 91, 237, 383, 517, 554; 1912, 48, 29). The ratio of osmotic pressure to gas pressure is constant for a given sucrose solution between 0° and 25° and tends to increase slightly with the concentration (reckoned in gm. mols. sucrose per 1000 gm. water) up to the value 1.114 for unit concentration. These results show conclusively that osmotic pressure is directly proportional to the absolute temperature. The Earl of Berkeley's work on calcium ferrocyanide solutions (*Phil. Trans., A.*, 1909, 209, 177, 319) proves that the values of osmotic pressure measured directly are in close agreement with the values deduced from the vapour pressures of the solutions (compare *E. B.* xxv, 369 *et seq.*, article "Solution").

New forms of apparatus for measuring osmotic pressure have been suggested by Fouard (*Compt. rend.*, 1911, 152, 519) and Trouton (*Proc. Roy. Soc., A.*, 1912, 86, 149). A noteworthy case of a natural membrane giving rise to osmotic effects is furnished by the covering of certain barley grains (Brown, *Proc. Roy. Soc., B.*, 1909, 81, 82).

The view that hydrates exist in aqueous solutions is now accepted by the majority of physical chemists, but opinion differs widely as to how far their composition can be ascertained (see, for instance, Washburn, *Tech. Quart.*, 1908, 21, 360; Jones, *Amer. Chem. J.*, 1909, 41, 19; Hudson, *J. Amer. Chem. Soc.*, 1909, 31, 63; Rothmund, *Zeitsch. Physikal. Chem.*, 1909, 69, 523; Armstrong, *Chem. News*, 1911, 103, 97). An analogous problem is presented by binary mixtures of organic liquids. The physical properties of a mixture of two nominally indifferent liquids may differ considerably from what is to be expected on the basis of the composition of the mixture and the corresponding properties of the pure components (see, for instance, Faust, *Zeitsch. physikal. Chem.*, 1912, 79, 97; Schulze, *Zeitsch. Elektrochem.*, 1912, 18, 77). Such deviations may be connected with the formation of a compound or with the association of similar molecules, and some noteworthy attempts have been made recently to estimate quantitatively the influence of these two factors in special cases (see Dolezalek, *Zeitsch. physikal. Chem.*, 1908, 64, 727; 1910, 71, 101; Schulze, *Physikal. Zeitsch.*, 1912, 13, 425).

Much interest attaches to the study of organic liquids as ionising media. Of these, formamide resembles water most closely; as shown by Walden, its solvent power is very similar, its dielectric constant is somewhat greater than that of water, while potassium

iodide and various alkylammonium salts are as highly ionised in formamide as in aqueous solution. The equivalent conductivity for a salt dissolved in an organic solvent increases with dilution, and the limiting value λ_{∞} may be deduced, as for aqueous solutions, on the basis of a linear relationship between the equivalent conductivity and the cube root of the concentration (see Philip and Courtman, *J. Chem. Soc.*, 1910, 97, 1261; Walden, *Zeitsch. physikal. Chem.*, 1911, 78, 257). Walden confirms the general validity of the rule according to which the product of λ_{∞} for a given salt and the viscosity of the solvent is a constant.

The evidence bearing on the validity of Ostwald's dilution law as applied to acids in aqueous solution (see *E. B.* ix, 217 *et seq.*, article "Electrolysis") has recently been examined by Kendall (*J. Chem. Soc.*, 1912, 101, 1275), who finds that the most probable value for the ionic conductivity of hydrogen is 347.2 at 25° (313.9 at 18°). A new dilution formula, shown to be in harmony with the experimental conductivity data for acids of all types, is proposed, viz: $\frac{m^2}{(1-m)_v} = k + c \frac{1-m}{m}$, where k and c are constants for each acid, and m is the coefficient of ionisation.

The position of colloidal solutions, relatively to crystalloidal solutions on the one hand and to mechanical suspensions on the other, has been made clear with the help of the ultramicroscope. The movements of colloidal particles are in harmony with the assumptions of the kinetic theory, and the agreement between the observed and calculated values for their velocity amounts to a proof of the kinetic nature of heat (see *Brownian Movement and Molecular Reality*, by Perrin, 1910; Ostwald's *Outlines of General Chemistry*, p. 485).

In connection with the osmotic activity of colloids, the case of Congo red especially has been investigated (Bayliss, *Proc. Roy. Soc., B.*, 1909, 81, 269; 1911, 84, 229; Biltz, *Zeitsch. physikal. Chem.*, 1909, 68, 357; 1910, 73, 481; 1911, 77, 91). It seems, however, that peculiar inequalities of concentration are set up on two sides of the osmotic membrane, and it is therefore not permissible in this and similar cases to deduce the molecular weight from the recorded osmotic pressure (see Donnan, *Zeitsch. Elektrochem.*, 1911, 17, 572; *J. Chem. Soc.*, 1911, 99, 1554; Moore, Roaf and Webster, *Biochem. J.*, 1911, 6, 10).

The phenomenon of adsorption attracts much attention, especially since it has a bearing on such practical problems as the mechanism of dyeing, the nature of the tanning process and the purification of sewage. Reference may be made here to investigations dealing with the adsorption of gases by charcoal (Homfray, *Proc. Roy. Soc. A.*, 1910, 84, 99; Titoff, *Zeitsch. physikal. Chem.*, 1910, 74, 641), of sugars by charcoal (Herzog and Adler, *Zeitsch. physiol. Chem.*, 1909, 60, 79), of acids by wool (Georgievics, *Monatsch.*, 1911, 32, 655; 1912, 33, 45), of iodine by starch (Barger and Field, *J. Chem. Soc.*, 1912, 101, 1394) and of dyes by sand and natural fibres (Dreaper and Davis, *J. Soc. Chem. Ind.*, 1912, 31, 100). Experiments on the adsorption of acetic acid from its aqueous solutions by charcoal show the occurrence of a maximum of adsorption. The validity, therefore, of the usual adsorption formula $x = kc^n$ must be limited (Schmidt, *Zeitsch. physikal. Chem.*, 1910, 74, 689; 1912, 78, 667; Arrhenius, *J. Chem. Soc.*, 1912, 102, ii, 139).

It is well known that the course of a chemical change may be profoundly modified by the presence of foreign substances. Recent quantitative study of the photochemical reaction between hydrogen and chlorine has shown that this change is inhibited by oxygen, nitrogen chloride, nitric oxide, ozone and chlorine dioxide, while carbon dioxide, nitrogen, nitrous oxide and chlorine monoxide act only as diluents (see Chapman and MacMahon, *J. Chem. Soc.*, 1910, 97, 845). In several well-known cases the presence of water is necessary for the occurrence of chemical change. The rate of decomposition of moist ozone at 100°, however, is not appreciably different from that of the carefully dried gas (Chapman and Jones, *J. Chem. Soc.*, 1911, 99, 1811).

Analytical Chemistry.—From the mass of detail work published in this branch only one or two points of general interest and importance can be selected.

In connection with the well-known method for estimating sulphates by precipitation with barium chloride a recent thorough investigation (Allen and Johnstone, *J. Amer. Chem. Soc.*, 1910, 32, 588) has shown that the barium sulphate precipitate as usually obtained is contaminated with alkali sulphate and barium chloride. The authors show how the errors can be reduced to negligible proportions.

For the rapid estimation of metals by electrolytic deposition it is advisable to keep the electrolyte stirred and many workers advocate rotating the electrodes for this purpose (see Price and Humphreys, *J. Chem. Soc. Ind.*, 1909, 28, 117). Others maintain that it is sufficient to pass a current of hydrogen or to work under reduced pressure; in the latter case, the gas evolved from the electrolyte occupies a much larger volume and effects thorough mixing (Fisher, Thiele and Stecher, *Zeitsch. Elektrochem.*, 1911, 17, 905).

In connection with volumetric analysis attention may be drawn to the use of titanium trichloride as a reducing agent (*New Reduction Methods in Volumetric Analysis*, 1910, by Knecht and Hibbert). It may be used, for instance, in the estimation of iron, copper, tin, hydrogen peroxide, chlorates, organic nitro-derivatives, methylene blue and indigo. A useful paper has appeared recently in which the use of phenol phthalein as an indicator is discussed, more especially in connection with its sensitiveness to carbon dioxide (McBain, *J. Chem. Soc.*, 1912, 101, 814).

The methods of gas analysis have been extended by the application of refrigerants for the purpose of fractional separation (Erdmann and Stoltzenberg, *Ber.*, 1910, 43, 1702, 1708). This procedure has been followed with very satisfactory results in the analysis of mixtures of ethylene and hydrogen, ethylene and oxygen, carbon dioxide and oxygen, nitrous oxide and oxygen. Attention may be drawn also to a valuable critical survey of modern methods for estimating carbon dioxide, moisture, methane or other combustible gas, and oxygen in air (Butterfield, *Analyst*, 1909, 34, 257).

Among recent books or new editions of old books, of special value to chemical students, the following may be noted: T. P. Hilditch, *A Concise History of Chemistry*; S. Arrhenius, *Theories of Chemistry*; W. Ostwald, *Outlines of General Chemistry* (new edition); Sir W. Ramsay's *Textbooks of Physical Chemistry*; J. C. Philip, *Physical Chemistry and its Bearing on Biology*; Wo. Ostwald, *Grundriss der Kolloidchemie*; J. W. Mellor, *Modern Inorganic Chemistry*; A. F. Holleman, *Textbook of Organic Chemistry* (3rd English edition); N. V. Sidgwick, *The Organic Chemistry of Nitrogen*; A. H. Allen, *Commercial Organic Analysis* (4th edition); Sir E. Thorpe's *Dictionary of Applied Chemistry* (new edition); *Annual Tables of Physical and Chemical Constants*.
(JAMES C. PHILIP.)

BIOLOGY AND ZOOLOGY¹

Biology and zoology are, fortunately, not like contemporary history; it seldom happens that a new discovery, like a new historical event, completely overthrows old land-marks, or transforms an account that is a year old to a halting record of knowledge. There is a vast annual output of new work with which the specialist must keep pace, each in his own branch, but the advance of knowledge is usually a slow progression, and it is even an advantage if general accounts, intended in the first place for those who are not working specialists, are a trifle belated, for there has been time for the new facts to lose some of their glamour of novelty and to fit into their appropriate and usually rather inconspicuous places.

How great is the actual output of newly published work, is not easy to realise. The annual volumes of the *Zoological Record*, published by the Zoological Society of London and by the International Catalogue of Scientific Literature, give only the titles of new memoirs and the barest indices of their contents, and yet each volume contains on an average about 1,200 closely printed pages. The Zoological Station at Naples issues each year a volume (*Zoologischer Jahresbericht*) intended to be a summary of the more important results of the period dealt with, selecting points of anatomical and morphological rather than purely systematic interest, and each of these reaches between six and seven hundred pages. A brigade of specialists is employed on the

¹ See list of *E. B.* articles in Index Volume, pp. 889, 890, 891.

preparation of such records, and yet the complaint is sometimes made that by inadvertence, or even by want of appreciation, important contributions are overlooked.

In the following survey of the principal new points of substantial interest that deserve attention since the completion in 1910 of the various articles on Zoological subjects in the *Encyclopaedia Britannica*, it is only possible to select amid a mass of detail, and to dwell on the questions of salient contemporary importance to the world at large. Many details appropriate for the consideration of the technical specialist are necessarily here passed over; for him, in his own subject, it would be impossible to select and reject. Similarly it would be superfluous to include here any of the technical descriptive matter relating to new species, mere extensions of known facts in anatomy, embryology and morphology and such subjects as would require elaborate exposition. The attempt is, however, made to pick out what has seemed to be the opening of new subjects, to modify in any important way the general conceptions of the zoologist, or to show the tendency of developing scientific opinion.

Protozoa.

Chlamydozoa.—One of the most remarkable additions to knowledge, or perhaps, it would be safer to say, to zoological theory, is associated with the name “Chlamydozoa,” which has been given by S. von Prowazek to a highly problematical set of minute organisms, believed to be the cause of certain diseases in man and animals. It is well known that since the relation between disease and the semi-vegetable organisms termed bacteria¹ was discovered, a very large number of different diseases have been traced to definite microbes belonging to that group, and the full life-history, mode of infection and propagation and so forth have been worked out. More recently still, the importance of parasitic Protozoa as the cause of many diseases, such as malaria and sleeping sickness, was discovered. Next came knowledge of the part played by the slender thread-like Spirochaetes, which are frequently transported by blood-sucking ticks, and which cause special diseases such as some of the relapsing fevers, whilst others, like the spirochaete of syphilis, discovered by Schaudinn, pass direct from case to case. There remained, however, certain diseases such as vaccinia and variola, hydrophobia, scarlet fever, measles and foot-and-mouth disease, for which an organic cause seemed certain but had not been identified.

The supposed Chlamydozoa are smaller than any known bacteria; the virus containing them passes through ordinary bacterial filters, so that they must be studied by different methods, and elude safeguards that are efficient with other microbes. They are characteristically parasites of cells, living in the general cytoplasm, or in the nucleus, and stimulating the formation of special reaction-products of the cells they infest. They have a peculiar mode of multiplication, not splitting, like bacteria, by simple fission, but forming an elongated dumb-bell shaped figure. They have not yet been successfully cultivated, but artificial infections have been made from filtrates containing these bodies and not containing bacteria. So far they have been studied only in relation to disease, and even in this respect it cannot be said that their existence and properties have been definitely established. The work relating to them, however, is very promising, and appears to open a new subject of much practical and theoretical importance. If they are real entities, it is more than possible that they will be found living as free organisms as well as parasitically. They would represent the lowest known form of living being; they are certainly not cells, but are in a lower stage of organic evolution.

Spirochaetes.—Dr. H. M. Woodcock, in dealing with Trypanosomes in the *E. B.* (xxvii, 340 *et seq.*), discussed the affinity of the Spirochaetes with those organisms, and although admitting that there were reasons for the association, was disposed to be sceptical about it. Later work has confirmed his doubts. Some observers, such as Doflein, incline to regard them as a group transitional between bacteria and the Flagellata (*E. B.* x, 464 *et seq.*); others, as closely related to the *Oscillatoriae* amongst

¹ See *E. B.* iii, 156 *et seq.*; also “Parasitic Diseases,” *E. B.* xx, 770 *et seq.*

the bacteria; and others again as an entirely separate group of unicellular organisms showing little affinity either with bacteria or with any group of Protozoa. The balance of evidence certainly points to their exclusion from the animal kingdom.

Protozoa (General).—Dobell has raised an interesting but fine-drawn point in classification, relating not only to Protozoa but to all so-called unicellular organisms, animal, vegetable and on the borderland. The definition of a cell, he says in effect, is that it is part of an organism. Metazoa and Metaphyta are certainly cellular organisms, inasmuch as their bodies are built up of cells. But Protozoa and Protophyta are not unicellular, inasmuch as they are not cellular organisms at all. So also although gametes are cells, specialised cells of multicellular organisms, the fertilised egg-cell is not a cell but a whole organism.

E. A. Minchin, in a valuable new treatise on the whole group of Protozoa (see also *E. B.* xxii, 479 *et seq.*), discusses a similar problem from a wider standpoint. He suggests that there are three stages in the evolution of organisms. First there is the evolution of the cell itself from some primitive organism, such as for instance the Chlamydozoa, if these prove to be real, independent entities. In such evolution the cytoplasm and chromatin became distinct, and the chromatin became differentiated into a nucleus. The second stage was a further elaboration of the cell, with perfection of the processes of nuclear division and the establishment of syngamy and true sex. Only after these would have come the third stage, the evolution of ordinary multicellular animals and plants in different directions. In the same treatise, following separately published memoirs by himself and others, Minchin discusses the relations between parasitic and free-living protozoa.

Much of the brilliant work on pathogenic Protozoa has been carried out by medical men and specialists, acquainted chiefly with the forms that cause disease. From the broad point of view, parasites are abnormal and aberrant members of their race, and their life-history cannot be understood without knowledge of their normal relatives. Many parasites are new products of evolution. There is reason to believe that *Trypanosoma rhodesiense*, a trypanosome fatal to human beings, has come into existence quite recently, and many others show the marked disharmony with their surroundings that is characteristic of unsettled form and changing habit. From the vast assemblage of Protozoa that live free lives in the mud or water or air, some, from time to time, find their way into the bodies of living creatures and contrive to maintain existence in their new quarters. It can seldom happen that such intruders are by accident so nicely adapted to a particular host that they can live in it and in no other. They show a general power of tolerating parasitic life by being able to live in many different kinds of animals. But they also show a want for adaptation to their new habitat by multiplying unreasonably, and causing fatal disturbance in the body of their host. Plainly it can be no advantage to a parasite to kill its host, so destroying the living substance on which it subsists, and thus in course of time, partly by modification of the parasite and partly by modification of the host, a mutual toleration is acquired. The protozoon becomes accurately adapted to life in a particular host and causes it little or no harm. Parasites of such long-settled habit abound in all kinds of terrestrial and aquatic animals, but occasionally it happens, by a new intrusion from the stock of non-parasitic creatures, or by the migration of a possible host into a new country, that cases of organic disharmony occur, with a consequent catastrophic sweep of disease.

Isle of Wight Disease of Bees.—The cause of this disease, which has been extremely destructive in recent years, has been discovered by H. B. Fantham and A. Porter. It is a minute microsporidian parasite, named by its discoverers *Nosema apis*, and infesting the alimentary tract of the bee. A spore swallowed by a bee becomes amoeboid and enters one of the epithelial cells lining the gut. It then becomes nearly spherical, feeds, grows actively, and multiplies by binary fission in several ways, producing clusters or chains. The presence of the parasite deranges the digestive activities of its host, and is frequently fatal. Ultimately sporogony takes place and each of the pan-

sporoblasts that are formed turns into a spore capable of passing to a new host. The symptoms of the disease in the bee are general ill-health, inability to fly, distention of the abdomen, and dry dysentery. Hives, honey, comb and pollen all may become contaminated with the spores, and the only mode of combatting the disease is complete destruction of the infected stocks. Dead bees, old combs and hives must be burnt. Warm weather is favourable to the bees, and cold and rainy seasons to the parasite. It seems to be the case that individual bees may become accustomed to the presence of the parasite and so form permanent reservoirs of the disease. Microscopic examination is the only method of being certain in the case of weakly or suspicious stocks. The parasite probably lives through the winter in hibernating bees, and there is no evidence of such hereditary infection as occurs in the case of the allied parasite of silkworms (*Nosema bombycis*).

Porifera (Sponges).

Most of the new work in this group (see *E. B.* xxv, 715 *et seq.*) is too technical for summary here, consisting of descriptions of new species, details as to geographical distribution, discussions of the minute anatomy, mode of origin and classification of the spicules, nature of the reproductive cells and structure of the tissues. H. F. Moore has published (in the *Bulletin* of the American Bureau of Fisheries, Vol. xxviii) two important economic memoirs. He shows that the Mediterranean fisheries still produce over half in value of the world's supply of sponges, but that the newer fisheries of the American coast produce by far the largest quantity, although a predominance of the lower priced kinds reduces the value to about one-third of that of the Mediterranean fisheries. All known and exploited sponge-beds, however, throughout the world, are showing more or less marked indications of depletion, and in some cases, especially in Florida, there has been a conspicuous falling off in the product under average conditions. This is due more to the intensity of the fishing, than to the taking of small sponges or to improper methods that could be suppressed. The demand is outrunning the supply; prices are rising, and the beds are being fished as they have never been before. Moore thinks that we must look to the development of sponge culture in territorial and extra-territorial waters as the chief hope for future progress. Experiments made under the direction of the Commissioner of Fisheries showed that the method of grafting superior varieties on inferior stocks failed in practice, the graft and the stock growing equally by simple processes of regeneration. Raising new sponges from eggs may be practical in future, but the most successful commercial process appears to be a simple propagation from cuttings. Sponges obtained in commercial fishing, that are too small or too badly shaped to be valuable, are reserved for propagation. The rather elaborate method, suggested by Dr. H. V. Wilson, of inducing the formation of degenerate bodies, which, on separation, grow up into little sponges, has been replaced by simply cutting up the sponges into pieces. From 100 to 120 "plants," each readily capable of independent growth, were obtained by this method from a six-inch sponge, but in practice it was found more economical to divide the mother sponge into a smaller number of larger pieces, each about two by three inches. The mortality was smaller and the rate of growth greater in these larger cuttings. The cuttings are attached to concrete disks by lead-cased iron wires. Assuming a mortality of about 20 per cent, the net value, at the end of four years from the date of planting, was ascertained to be about four times the cost of planting, and it was estimated that an initial outlay of about 225 dollars an acre would yield about 200 dollars per annum. The calculations were based on actual experiments and Moore believes them to be conservative.

Coelentera.

The vast bulk of new literature published on the Coelentera (see *E. B.* vi, 640 *et seq.*) does not contain much of outstanding interest. The most notable publication is A. G. Mayer's great monograph on the Medusae of the world, consisting of three

volumes containing over 700 pages, 428 figures and 76 plates. This memoir is in the first place systematic, but it contains many discussions of morphological, physiological and embryological points, and a very full list of reference to literature. The author insists that the medusa form has been acquired independently in different groups. F. Wood Jones has published an interesting contribution to the theory of coral-reef formation (see *E. B.* vii, 132 *et seq.*), the result of observations made during a prolonged residence on the Cocos-Keeling atoll. He thinks that Darwin's subsidence theory cannot explain the formation of this atoll, for the lagoon has become shallower since 1825, and the structure of the reef shows no evidence of subsidence since its first formation. Equally he rejects Murray's theory of solution, as coral sand is constantly accumulating in the lagoon and calcium carbonate is being deposited. He thinks that the process of sedimentation is the chief factor. Corals are unable to grow where sediment falls on the zooids in any quantity, and accordingly the set of winds and waves and the limit of the slope on which sediment will lie quietly are the defining conditions of coral growth. Where there is a free wash of water, the zooids are kept clear of sediment and flourish; where there is an eddy or a quiet pool, or a depth of water beyond the reach of the waves, sediment lies and inhibits coral growth.

Echinoderma.

The most important new work on the group (see *E. B.* viii, 871 *et seq.*) is Mr. H. L. Hawkins' memoir on the Holoctypoid sea-urchins, which he regards as forming an order intermediate between the regular and irregular urchins, but which have been characterised by a "persistently retarded progress in evolution," with the result that study of them throws much light on the relations and classification of the whole group.

Pearl Oysters.

Dr. Lyster Jamieson has published several memoirs dealing with the pearl-fishing industry in different parts of the world (see *E. B.* xxi, 25 *et seq.*), and the practical failure of attempts that have been made to improve it by biological investigations, a failure which he is disposed to attribute in the first place to the inexperience of the investigators with the practical side of the industry. In particular he throws doubt on an interesting theory which seemed to have a practical bearing. The pearly substance is frequently deposited round some adventitious foreign body which has found its way to the pearl oyster. In the case of the Ceylon pearl oyster, the foreign body was supposed to be the larva of a tape-worm, the adult stage of which infests a fish which preys on the oysters. It seemed a possible inference that if the fish were encouraged near the oyster beds, there would be a greater chance of oysters being infected by the eggs of the tape-worm, with a consequent increased production of pearls. Dr. Jamieson's observations lead him to dispute the fact and the inference. He thinks it more probable that the production of pearls in the oyster is the result of a pathological immigration of the epidermis into the tissues, the cause of which is unknown, and that if tape-worm larvae do really occur in the shell-fish, the case is one merely of the coincident presence of two diseases, one associated with pearl-production and the other with no practical relation to it.

Disease-Bearing Arthropods.

The new knowledge of the part played by biting and blood-sucking Arthropods in the carrying of disease from infected animals to man, from man to man, or from man to animals, has led to much careful work on the Arthropods themselves (see *E. B.* ii, 673 *et seq.*). Of this the most important are a great monograph on ticks (*Ixodoidea*) by Messrs. Nuttall, Warburton, Cooper and Robinson; the fifth and completing volume of Theobald's monograph on the Culicidae, in which there are invaluable descriptions of tropical gnats and mosquitoes; and E. E. Austen's beautifully illustrated treatise on African blood-sucking flies. On the practical side, there has been an increasing trend of opinion towards incriminating large game animals, especially in Africa, as permanent reservoirs of disease, with the consequent demand for the relaxation or abolition of the

game-laws for the protection of such animals. On the other hand it is urged that every excuse is taken for assaults on the game-laws, that the scientific indictment is far from complete, and that if the extermination of large ruminants were carried to its logical conclusion, it would be even more necessary to kill off the domesticated animals as these come into more immediate contact with man.

Social Termites.

Karl Escherich has published an unusually interesting volume on the habits of the social "white ants" or termites (see *E. B.* xxvi, 643 *et seq.*), based on studies made in Ceylon. He confirms the extraordinary fact that some of these insects cultivate fungi which they use as food, and, in the case of four Ceylonese species, describes and illustrates the fungus gardens in the termitaria. He found that two species of termites, or a species of termites and a species of ant, frequently inhabited the same nest. In every case, however, the relations appeared to be unfriendly; the actual chambers and fungus gardens of the different species were separated by walls, and if accidental breaches were made, the rivals fought bitterly. He confirms Holmgren's "exudate" theory, according to which the queen termite exudes from the surface of her body a substance that is eagerly sought by the workers. They lick her, not to keep her clean, but to obtain the coveted food, and they even distribute to other workers regurgitated morsels of it. Termites are one of the chief pests in tropical countries, all wooden structures, papers, books and cloth being attacked by them. Escherich describes a German apparatus, made for locating these insects and so marking them down for extermination. It consists of a microphone protected by a funnel-shaped guard and connected with a telephone receiver. The microphone is inserted in the earth, or in soft tree-stumps, and the crawling termites can be heard, even if they are at a considerable distance. When a termitarium has been discovered, it can be attacked in various ways. All apertures but one may be plugged with clay, and a stopping of tow soaked with carbon-bisulphide may be placed in the last opening. Still better is a device by which the fumes of arsenic and sulphur heated on glowing charcoal are blown through the nest by a small hand-pump.

General Morphology of Mollusca.

A. Naef has published the first of what is intended to be an elaborate set of investigations into the morphology of molluscs (see *E. B.* xviii, 669 *et seq.*, and allied articles). He rejects any idea of a relationship between flat-worms (Platyhelminthes) and molluscs, holding the latter to be intimately connected with annelid worms both by descent and by structure. He states that there is a sharp division between the Chitons, which he regards as not having reached the true molluscan grade, and the Eumollusca. The typical forms of the latter are the Gastropods and Cephalopods. In these the body is divided into two segments, the head-foot region and the visceral region, the two being joined by a rudimentary neck. The hind region shows traces of a primitive metamerism, and a retroflexion of the hind-gut with the mantle and shell is characteristic of it. The gastropods had primitively either a planospiral or a turbospiral shell, and it was only when swimming habits were replaced by creeping habits that the spiral was corrected by a torsion. In embryological development the appearance of the torsion has been pushed further and further back, until it appears even in the embryo. He recognises four stages in the phylogeny of gastropods:—Planospira stage (e.g. *Bellerophon*), Turbospira stage (*Pleurotomaria*), Prototrochus stage (*Trochus* and *Patella*), Metatrochus stage (*Paludina*, *Atlanta*, *Actaeon*, *Limacina*). He places *Helicina* and *Nerita* (on the morphology of which G. C. Bourne has also written an important memoir, regarding them as highly modified derivatives of a primitive type) between the last two groups.

The Relations and Phylogeny of Mammals.

W. K. Gregory has written (*Bulletin* of the American Museum of Natural History) a broadly-based study of the relations and phylogeny of the orders of Mammals (see

E. B. xvii, 520 *et seq.*, and allied articles). He insists on the importance of not being led by misleading analogies. The phylogenetic and systematic value of a character cannot be properly valued until its adaptive character has been understood; the trend of adaptation of the whole organism and of its race should be sought for. The intricate complex of homology and analogy, of adaptation and of change of function, must be analysed, and the little noticed "palaeotelic," non-adaptive characters must be looked for, as they often afford the best evidence of remote relationship. Gregory is restating in somewhat different terms what the present writer urged more than ten years ago (*Trans. of the Linnaean Society*, 1901, pp. 178 and 270), that a valuation of zoological characters must precede effective application of them to consideration of phylogenetic relationships. Unfortunately it often happens that the systematist, dealing with existing forms, finds notable distinguishing characters which sufficiently unite or separate existing animals, and is therefore content to base diagnoses on these. The first distinction to be made, however, if phylogeny is the goal, is between characters that are primitive and characters which have been modified from the primitive condition. It is plain that the common possession of primitive characters, however convenient a docket for a pigeon-hole, is no guide to affinity. If all the primitive mammals possessed five digits, there is no reason why those that still possess five digits should be more closely allied than any of them may be with those that have lost one or more of the digits. So also modified characters must be analysed; there is no reason to suppose that similar modifications imply affinity, as for instance adaptive modifications or losses of a numerical part of a common heritage. Gregory applies such reasoning in detail to the orders of mammals and has reached many interesting conclusions.

He thinks that it is unnecessary to have recourse to unknown Amphibian-like creatures of the Devonian in the search for the immediate ancestors of the Mammalia. Following Osborn and Broom, he thinks that mammals have been derived from the Triassic reptilian order Cynodontia, although not from any known member of it. He looks specially in these reptiles to the constitution of the temporal arch, the development of the secondary palate and of paired occipital condyles, the presence of teeth differentiated into incisors, canines, premolars and molars, and to the enlargement and functional importance of the dentary bone and the structure of the limb-girdles and limbs. The Cynodonts "structurally if not genetically" bridge over the gap between mammals and reptiles, for, in combination with the mammalian features that have just been mentioned, they possess many reptilian characters inherited from below. He thinks that the secretion of milk might have been a by-product of the change from cold-blooded reptiles to warm-blooded mammals, and the young reptilian mammals, hatched from eggs carried on the ventral surface of their mother, licked or sucked the secretion because "it tasted good," before it became of economic importance to them. He accepts the evidence that the primitive mammals possessed imbricated scales probably arranged in transverse rows, and that the first hairs were flattened structures protruding between the true scales.

With regard to the Monotremes, Gregory discusses but dismisses the tempting theory that they were derived from some family of Triassic or Permian reptiles other than that which gave origin to the higher mammals, and holds that the common ancestors of Monotremes, Marsupials and Placentals were already mammals. The Monotreme stock, however, must have begun to diverge from the Marsupio-Placental remnant at an exceedingly remote period. Not only do the Monotremes retain many primitive reptilian characters not found in higher types, notably in the reproductive system, shoulder girdle and pelvis, but they have also had time to acquire so many deep-seated peculiarities in the skull, that the Monotreme skull may be set in a class by itself, in contrast with the primitive Marsupio-Placental type. There is a balance of evidence in favour of accepting Seeley's view that the Protodonts may be related to the Cynodonts, but in view of the lack of evidence for placing them in either of the mammalian sub-classes and of their progressive characters as compared with reptiles, Gregory treats them provisionally as representing a primitive group to which Haeckel's name

"pro-mammalia" may be applied. The Multituberculata must be regarded as related with the marsupials, but were not diprotodont. The Triconodonts, excluding *Peralestes*, are also to be regarded as having marsupial affinities and to be distinct from the Multituberculata. The Trituberculata, although showing Creodont and Insectivore resemblances, are also more nearly related with the Metatheria. The primitive Marsupial skull on the whole approaches the Cynodont type more nearly than does that of the Monotremes, and the Marsupio-Placental remnant still retained some of these reptilian characters after the branching off of the Monotremes, but, owing to the assumption of semi-arboreal habits, it lost the Monotreme characters of the shoulder girdle. At such a point the divergence of the Marsupials and Placentals began, the former retaining and perfecting their arboreal characters. He gives a conception which he admits to be somewhat speculative, as the fossil history is obscure, of the ancestral Insectivores. These would be ordinarily related with the contemporary ancestors of the Creodonts, but would be distinguished chiefly by smaller size and less robust structure, more elongate snout and premaxillaries, smaller canines, smaller and more sharply cusped molars, and perhaps by habits that were more arboreal, less predatory and more insectivorous-frugivorous. He removes the Tillodonts from their supposed relations with the Rodents, and places them near the Insectivore-Creodont stock.

The Creodonts are to be derived from Mesozoic Insectivora, and their relationship with polyprotodont Marsupialia rests chiefly on convergence. The Sparassodonts were very early separated from the Creodonts. The Fissipede Carnivora are descended from Creodonts by way of the Miacidae. The Fissipede Carnivora, as shown especially by the close relation between seals and bears, are derivatives of Arctoid Fissipedes.

The Miotyphla (*Tupaïidae*, *Macroscelididae*), Dermoptera (*Galeopithecidae*), Chiroptera and Primates are associated in a super-order to which Gregory gives the name Archonta (*Ἀρχων*, chief, cf. German *Herrenthiere*). The separation of lemurs from apes and monkeys may date back to the Lower Eocene, but the close relationship of the two groups is accepted. The whole group Archonta is to be taken as a derivative from large-brained arboreal Insectivores resembling Tupaia in many ways.

The Rodentia form an extremely ancient order, perhaps going back to the Cretaceous, and it seems possible that their stem forms were Mesozoic Placentals, allied to the ancestors of the modern Insectivora and possibly to the contemporary ancestors of some of the Edentates. The extremely diverse character of the animals which are grouped as Edentata for convenience, is accepted, and Gregory thinks that there is a balance of evidence for the view that the Xenarthra, Tubulidentata and Pholidota are the highly modified descendants of some Mesozoic Placentals which branched off before the differentiation of Insectivores, Creodonts and Proto-ungulates. The various suborders of hoofed mammals are connected by "a tangled web of resemblances," a web which early caused the "order" Ungulata to be regarded as a natural group. It is probable, however, that convergent and parallel evolution accounts for many of the resemblances. The Artiodactyla are widely removed not only from the Perissodactyla, but from all other ungulate groups, and may be an offshoot from the ancestors of the Creodont *Mesonychidae*, or even from some Lemuroid-Insectivore group. Even in the lower Eocene, Artiodactyls and Perissodactyls are separated by deep-seated characters. All the remaining ungulate suborders may trace their ancestry back to a varied order of Cretaceous Proto-ungulates, which were primitive Placentals of small size, related with the Creodont-Insectivore stock, but falling under the original definition of the Condylarthra. By Basal Eocene times they had spread, probably from some Boreal Holarctic centre as yet unknown, into North America, South America and Europe, and had already split up into well marked families, such as Phenacodonts, Meniscotheres, Periptychids and Pantolambdids in N. America, Condylarths and Amblypods in Europe, and Condylarths, Periptychids and Homalodotheria in S. America. Later on the Amblypoda may have sprung from the N. American Pantolambdids, the Hyraces, Embrithopods, Barutheres, Proboscidea and Sirenia from a Lower Eocene African stock; the Perissodactyls and Chalicotheres from Holarctic Condylarths allied to the Phenaco-

donts; and the *Litopterna* from the S. American representatives of the *Meniscotheriidae*.

The relations of the Cetacea, including the Zeuglodonts, seem to be with the Insectivore-Creodont group, but no good evidence of a specially great antiquity of the order, or of relationship with the Marsupials or Pre-Placentals, has been advanced.

Longevity in Mammals and Birds.

P. Chalmers Mitchell has published an elaborate memoir on longevity in Mammals and Birds (see *E. B.* xvi, 974 *et seq.*), with special reference to the viability of these animals in captivity. It is obviously impossible, except in the rarest cases, to obtain information as to the duration of life in wild animals, and therefore enquiry into the duration of life of animals in captivity is the best available means of reaching knowledge as to the relative longevity in different groups, and as to their viability in captivity, or power of resistance to new environment. He examined the records of duration of life in captivity of over 20,000 individual mammals and birds, and has collated and classified these systematically, giving in the case of each species the average duration and the maximum duration, comparing the figures with maxima otherwise known or suspected. He points out, however, that the materials were defective in two important respects, inasmuch as the age and condition of the individuals at the time of their reception were unknown or unnoted.

Following Sir Ray Lankester, he distinguishes between potential longevity, the limit of age which an individual could reach if placed in the most favourable circumstances, and average or specific longevity, the average age to which the members of a species attain under the natural conditions to which a species has become adapted. The difference between the two is a measure of the severity of the conditions to which the species is subjected. When creatures of closely similar structure are compared, it appears that greater size is generally associated with longer life and higher viability. But the correlation completely fails when animals of different structure are compared; carnivores for instance, in proportion to their size, are much longer lived than herbivores; and, except for ostriches, which resemble herbivorous mammals in many respects, all birds, in proportion to their size, can attain much greater ages than mammals.

In dealing with animals in captivity, Mitchell replaces the terms "potential longevity" and "average longevity" by "maximum duration" and "average duration." He comes to the practical conclusions that the climate to which a captive animal is native has the smallest possible relation with its viability in captivity, and that the idea which has so long governed those who are responsible for captive animals, that it is necessary above all things to protect them from cold, leads to complete failure. Mammals and birds not only can endure considerable cold, but are favourably affected by frequent and rapid changes of temperature. In the long list of species that have been kept in captivity, there is no case of even reasonably good viability where the animals have been kept indoors and provided with artificial heat. All the cases of mammals and birds where there has been relative success are those where the creatures either had no artificial heat at all, or had constant access to the open air from their warm shelters. These conclusions are in harmony with the methods which are beginning to find their way into zoological gardens and stock-breeding establishments, but many stubborn prejudices have yet to be conquered. Incidentally Mitchell points out that the presence of parasites has an important bearing on viability. The conditions of small well-heated quarters are most favourable to the preservation of parasites and to the chances of healthy creatures being infected by their neighbours, so that the temperature relations in many cases may act on the viability of animals through the intermediacy of parasites.

A New Fossil Primate.

Although no reasonable biologist doubts the descent of man from ape-like ancestors, geological evidence of the actual line of descent is vague and dubious to an extent that almost justifies the existence of the popular phrase "missing link." In 1910 our state

of knowledge was roughly as follows. It was accepted on the one hand that even the lowest existing savage was much modified from any intermediate ancestor, and was truly a member of the species to which the highest civilised types belong, and on the other that the existing anthropoid apes were equally modified, probably in a degenerate or specialised direction, from the common man-ape ancestor. Human skulls like those of Neanderthal and Spy showed the existence of a race of cave-men with very low foreheads and prominent brow-ridges which in many respects were anthropoid in type, differing remarkably from the modern type and resembling adult gorillas and chimpanzees. These are of no great geological antiquity. Abundant fossil remains of a very much older date showed the existence, in Miocene and Pliocene times, of large creatures certainly apes, but more human than existing apes, and suggesting the degeneracy of the modern anthropoids. Finally Dr. Dubois's Javan discovery of *Pithecanthropus erectus* (*E. B.* xxi, 665) established the existence of a still more man-like ape, or of a more ape-like man than any form hitherto known. Its date was a matter of dubiety; Dr. Dubois was disposed to refer it to the Pliocene; a preponderance of expert opinion placed it later, in the Pleistocene. Mr. Charles Dawson has now discovered a skull that is more interesting and significant as evidence for the descent of man than any hitherto known. Four years ago, at Pilt-down, near Fletching in Sussex, he discovered the first fragment in a bed of gravel usually worked for road metal. During 1912 he and Dr. A. Smith Woodward, the Keeper of Geology at the British Museum, searched the bed assiduously and discovered enough fragments to build up an almost complete skull and to make it possible to have an internal cast which showed something of the structure of the brain. The skull had the vertical forehead of a modern man with scarcely a trace of the prominent brow ridges of the cave-man, but the back of the skull and neck were shaped much more like those of an ape than of any human type. The size of the brain was not more than two-thirds that of a modern brain. The jaw, but for the presence of two distinctively human teeth, would certainly have been referred to a chimpanzee or gorilla. The skull in short was much more like that of a young chimpanzee, those of cave-men being like adult chimpanzees. Dr. Woodward's inference is that the Pilt-down skull proves the existence of a real intermediate form, a true link between man and the ape, while the cave-men were degenerate offshoots of the ancestors of a modern stock. The gravel contained mammalian teeth of Pliocene age, and primitive shaped flints of the Lower Pleistocene. The unworn condition of the human remains suggests that the date is Pleistocene, not Pliocene, and the association with older mammalian relics accidental, but the similar staining of the human skull and the Pliocene relics is regarded as evidence for the older date.

The Preservation of Fauna and Flora.

It has long been acknowledged that in every part of the world the existing species of animals and plants are being sorely oppressed by man. Many species have become extinct within recent times, and the range of nearly every species is becoming restricted. It is no doubt part of a general biological process by which a dominant species, extending its range and becoming adapted to new and varied conditions, interferes with species already in possession. But man as a dominant species has a wider range and greater destructive powers than any of the lower forms. The danger of extermination presented itself in the most acute form with regard to well known game animals, especially in India, America and Africa, but is now being taken up on a wider basis. There is increasing evidence of a consensus of opinion throughout the civilised world that it is a duty of the present generation to preserve for the future all existing species that are not positively inimical to man. The late Lord Salisbury, so long ago as 1899, took an important initial step by arranging a convention of the Great Powers interested in Africa to consider the preservation of the "wild animals, birds and fish" of that continent. The scope of the agreement arrived at was practically limited to creatures of economic or of sporting value. Defining the number of each kind of game that can be killed, regulating the limits of size and sex within which it is permissible to shoot, or to sell the

products of the chase, and the establishment of temporary or permanent reserved tracts within which the game may recuperate, have been the principal methods advocated and adopted. These methods, however, affect only an insignificant part of the existing species, and the absolute protection afforded to certain species often has led to harmful results, as it interferes with the balance of nature.

Opinion is moving more in the direction of the establishment in all suitable places of absolute sanctuaries where no animals or plants of any kind are allowed to be killed or taken, except for the direct advantage of the denizens of the sanctuaries, as for instance by the removal of noxious individuals, the controlling of species that are increasing beyond reason, and the extirpation of diseased and unhealthy individuals. The national parks of the New World are examples on a large scale. In the United States, moreover, chiefly by private munificence, a chain of small sanctuaries suitable for birds has been formed round the coasts. In Great Britain a new society was founded in 1912 to educate public opinion and to endeavour to procure the formation of suitably placed sanctuaries and to arrange for their permanent preservation.

Marine Plankton.

"Pütterism."—The greater number of marine species (see *E. B.* xxi, 720 *et seq.*) are carnivorous, and the ultimate source of the food supply of the sea, besides its theoretical interest, may have an economic importance as bearing on the migration of pelagic fish. It has been supposed generally that the basis of the food supply consisted of microscopic plants, especially diatoms (*E. B.* viii, 169 *et seq.*), which multiply in the presence of sunlight, building up their protoplasm from inorganic constituents like the green vegetation of the land. These are devoured by larger creatures, which in turn are preyed on by still larger animals. Professor Pütter, of Bonn, partly as a deduction from observations on the frequency of marine organisms, partly from examination of the contents of their digestive organs, and to a lesser extent on experimental work, has advocated the view that a large number of marine animals can obtain their nourishment directly from organic solutions present in sea-water, so living like many parasites in a nutritive fluid, or like fungi. So far, however, this view has obtained few adherents.

Artificial Rearing of Marine Larvae.—E. J. Allen and E. W. Nelson, working at the Marine Biological Laboratory at Plymouth since 1905, have been investigating the methods of rearing the delicate pelagic larvae of marine animals. At an early stage they found it necessary to try to grow cultures of diatoms which should be either "pure," a result extremely difficult to obtain, or "persistent," by the latter term meaning a culture which can be carried on practically indefinitely by inoculating fresh supplies of sterilised water with the diatom required. Culture media, the basis of which is either natural or artificial sea-water, had to be sterilised by heat or filtration, and all the operations have to be conducted with bacteriological precautions. If normal sea-water is the basis, the concentration of the nitrates, and probably also of the phosphates, has to be increased, and some further modification, the exact nature of which the authors have not yet discovered, has to be produced by treatment with peroxide of hydrogen or with animal charcoal. Light and temperature are extremely important, but the degree of salinity is indifferent within a wide range.

They have succeeded in making a very large number of persistent cultures on these lines. In the rearing of pelagic larval forms of marine animals, the young larvae are placed in pure, sterile sea-water, along with a culture of a suitable diatom to serve as food. As far as possible all other organisms are excluded from the vessels. To obtain the larvae, pieces of ripe ovary are taken from a female with sterilised forceps and are placed in sterile sea-water in a shallow glass dish, and then fertilised with active sperm from a ripe male. In a few minutes the eggs are filtered through silk and placed in larger vessels kept at a uniform temperature. In a few hours the healthy larvae rise to the surface and can be placed in still larger vessels, where they are fed with the culture found most suitable. The amount of food must be abundant from the first, but must be prevented from getting too thick in the water, by shutting off some of the light or by

other suitable methods. In such a fashion very many delicate larvae of echinoderms and crustaceans have been reared.

Heredity, Variation and Mendelism.

The most active workers on all subjects connected with inheritance (see *E. B.* xiii, 350 *et seq.*) continue to be those who were stimulated by the rediscovery of Mendel's theories (see *E. B.* xviii, 115 *et seq.*). On the experimental side their observations continue to increase in bulk, interest and importance. Biffen, for instance, has succeeded in producing a useful variety of wheat by crossing valuable wheats, liable to the attacks of rust, with less valuable but immune races, interbreeding the hybrids of the first generation, and selecting from their progeny a stock which combines the valuable qualities of the one set with the immunity of the other set. Other investigators have produced comparable results by other methods, but Biffen's work was prosecuted on the lines suggested by the followers of Mendel, and can be readily interpreted, as indeed Biffen interprets them, in the theoretical language of Mendelism.

From the point of view of theory, the sharp contrast with other views, which appeared to delight the Mendelian school in the early days of its exuberance, is becoming more and more blurred. It was urged, for instance, that Mendelian inheritance was almost a demonstration of the views of those who held that, because species are discontinuous, they had arisen by discontinuous variation (see *E. B.* xxvii, 906 *et seq.*). It now appears that amongst continuous variations some may be due to "fluctuation," and others may be Mendelian mutations. The argument from size of variation has gone, and with it the attractive suggestion of a causal connection between the discontinuity of species and that of variation. We are back to the theoretical position of Darwin, and have to make a choice, as he did, between the probability of the one set or the other being more important. Further experimental results have broken down the conception of the sharp contrast between "dominant" and "recessive" characters. If allelomorphs always exist in pairs, one possessing a factor absent in the other, the inheritance of colour does not fit the conception of dominance. It is supposed that the colour-factors stand in series, and that the presence of the higher member of a series obscures or prevents the development of a lower member. Thirdly, the Mendelian proposition that the members of an allelomorphic pair are completely segregated in the gametes, which was originally regarded as the distinctive feature of Mendelism, is breaking down. In some cases there is either incomplete segregation or even complete fusion of what were regarded as alternative characters, and if the conception of purity of the gametes is to be maintained, a new analysis of characters must be made.

It remains to be said, however, that by far the greater part of the modifications, attenuations and extenuations of the original theory of the Mendelians has come about not from the criticism of those who are hostile to their views, but as their own interpretations of the results they have obtained. They have found a new organon and are employing it to the lasting benefit of science. (P. CHALMERS MITCHELL.)

BOTANY¹

The past few years have witnessed important changes in the modes of the study of plants. Formerly direct observation was the means chiefly adopted in order to extend the fringe of knowledge, but at the present time, the method of advance by way of experiment has spread to almost every branch of the science, and the habits of thought thus induced are influencing the point of view even in departments from which the method itself is excluded from practice. Plant physiology from its inception has been avowedly experimental, but morphology and taxonomy are also yielding to a force which everywhere tends to render the too rigid ideas of a past time more fluid, and consequently more fitted to embrace the facts which a wider knowledge has disclosed.

Genetics.—The new science of genetics utilises plants no less than animals for its material, and is eminently experimental. The remarkable results which it has achieved

¹ See *E. B.* iv, 229 *et seq.* (and articles referred to, p. 302).

are being illuminated by chemical investigations into the nature of the proximate substances which are becoming recognised as the agents responsible for some at least of the differences which separate nearly related forms. Mendelian analysis is proving a more complicated affair than many people at first anticipated, but the recognition that a character or a group of characters may require the interaction of two or more "factors" is a considerable step in advance. The researches on enzymes (especially the oxydases and peroxydases, specially investigated by Chodat and his school) in the determination of colour development and colour patterns are especially suggestive in this connection. Whiteness, for example, is a character which may be due to a variety of causes, in other words colour-absence is a term which includes more than one category. The development of a particular hue in the flowers of a considerable number of plants is recognised as depending on the simultaneous co-operation of several "factors" all of which must be present in order that the colour in question may be forthcoming, and in the absence of one or more of them the flower may be an albino or white. Oxydases and peroxydases above referred to, are known to play an important part in many of these colour productions. They clearly represent one of the factorial members of the complex, the others being made up of chromogens, substances ultimately derived, in all probability, from glucosides. But the matter is further complicated by the circumstance that whiteness may also result from the operation of a chemical "inhibitory" substance which arrests the colour production that ought to ensue from the interaction of enzyme and chromogen. The recognition of the influence of this factor, and especially its experimental investigation by Keeble and Armstrong, has served to clear away much that previously obscured the understanding of the occurrence and distribution of whiteness in flowers.

See M. Wheldale, "Plant oxydases and the chemical inter-relationships of colour varieties," *Progressus rei botanicae*, Bd. iii, 1910. Also Keeble & Armstrong, papers in the *Proc. Roy. Soc.*, vol. 85, 1912.)

Graft-hybrids.—Much light has, within the last few years, been thrown on the nature of the so-called graft-hybrids, especially by the work of E. Baur and H. Winkler. The general result of their investigations indicates that graft-hybrids consist of growths in which the cellular tissues of both stock and scion take a share, but the tissues, genetically derived from each of these two sources, however much they may be intermingled, remain organically distinct as far as the retention of their respective individual or specific characters is concerned. Sometimes the entire half of the "hybrid" shoot resembles one parent, while the other half obviously belongs to the other—or one (stock or scion) may be arranged so as to occupy a smaller sector of the shoot regarded in transverse section. These "sectorial chimaeras" are more easy to recognise than those belonging to the "periclinal" category. Periclinal chimaeras were first correctly explained by Baur, and arise when the tissues of stock and scion are so arranged that the one more or less covers the other in a concentric fashion. Although the apparent intermingling of characters especially in the periclinal chimaeras is sometimes intimate, it is to be understood that there is no fusion of the *protoplasm* of the composite structure of which the chimaera is made up. What has happened is the production of a sort of mosaic or interweaving of the tissues belonging to the respective constituents, each of which preserves its own characters intact, or only exhibits such modification as the correlative disturbance of nutritional conditions can effect. Thus it may happen, as in the well-known example of *Cytisus Adami*, that the tissues of one of the two constituents may lag in development. The resulting shoot then resumes the habit and colour of the original constituent of which it is then composed, and if the separation has really been complete no reversion either to the hybrid form or to the character of the other constituent can or does take place.

Winkler, who has successfully produced a number of "graft-hybrids," clearly states that the two co-operating tissue systems of the respective constituents continue to retain their own specific characters. The composite organism is a mosaic of the cells and tissues of the grafted individuals only. In no instance (save in one doubtful one) does the union extend to a commingling of those finer elements which are ultimately responsi-

ble for the adult characters of the future adult, even at the time when they are lurking within the confines of a single germ cell. Thus the difference between a "graft-hybrid" and a genuine hybrid is fundamental; the one depends on an accidental coalescence, as it were, of specifically distinct individuals, whilst the other owes its origin to the mingling of the parental characters in the germ cell from which it sprang. The example of Winkler's *Solanum Darwinianum* (hybrid) however may prove to be an example of a vegetative fusion of the nuclei of stock and scion since the number of its nuclear chromosomes is intermediate between those of the two parent plants.

See Baur, E. *Einführung in die experimentelle Vererbungslehre* (Berlin, 1911), a good account of the subject of graft-hybrids and also of other developments in genetic science; H. Winkler, 1907, *Ueber Propfbastarde v. Pflanzliche Chimären* (Ber. d. Deutsch. Bot. Gesellsch., Bd. xxv). Winkler has published a number of more recent papers, and his larger work entitled *Untersuchungen ueber Propfbastarde* is in course of publication by G. Fischer, Jena.

Ecology.—Another modern development of botany, ecology, consists in the endeavour not only to systematise the older "Natural History," observations, but to utilise and extend them so as to throw light on the causes which underlie and determine the grouping and mode of distribution of the plants within a given area. This study is being prosecuted with vigour, especially in Great Britain and in America. So far as the former country is concerned the recent work has been brought together in A. G. Tansley's *Types of British Vegetation*. A considerable amount of experimental work has also been undertaken with the object of unravelling the relation between the plant and its surrounding, especially the soil conditions. Perhaps the most important of these results consists in the recognition of the importance of the physical and physico-chemical factors involved. The determination of the "wilting coefficient" by Briggs and Shantz has thrown light on the question of water availability of different soils. The percentage of moisture in the soil which is just below what was required to maintain the turgidity of the plant ("wilting coefficient") varies definitely in different classes of soil according to its physical state of aggregation. This has of course long been known. They ascertained that if samples of these different soils, saturated with water, are placed in a centrifugal machine and the speed is so arranged as to exert a centrifugal force of 1,000 g, that the percentage of water which they respectively retain ("moisture equivalent") by virtue of absorption or surface tension, stands in a practically constant relation to the wilting coefficient, and they express this numerically by stating that within a very small margin of error, the ratio $\frac{\text{wilting coefficient}}{\text{moisture equivalent}} = 1.84$.

The ecological causes which determine the distributions of plants are not only physical but biological and are still for the most part obscure. Investigations, both in England and especially in Canada, have shown that grass is injurious to young apple trees, but a satisfactory and complete explanation of this has not so far been given. Indeed the mutual reactions of organisms provides a field for investigation as yet largely open.

Many of the supposed examples of symbiosis between plants and animals (e.g. ants) have not stood the test of investigation. In the pitchers of nepenthes Jensen found living larvae of 9 species of insects which pass their larval period in these receptacles. They contain "anti-ferments," which render them immune to the action of the nepenthes digestive ferment, apparently in much the same way as intestinal worms escape digestion in the gut of their animal hosts. In such an example of course the grubs are utilising for their own purposes the animal food which, collected in the pitchers, would after digestion otherwise have become available for the plant.

See Briggs and Shantz, two papers on "Wilting Coefficient" in *The Botanical Gazette*, vol. liii, 1912; A. G. Tansley, *Types of British Vegetation*, Cambridge, 1911; A. D. Hall and E. J. Russell, *Agriculture and Soils of Kent, Surrey and Sussex*, Board of Agriculture & Fisheries, London, 1911.

Cytology.—One of the outstanding results of cytological research which has stood the test of criticism consists in the recognition of the importance of the chromosomes. These bodies are commonly very constant, both in form and in number for a given

species, and as is well known they are doubled at every act of fertilisation and again reduced at some definite stage which intervenes between this act and the formation of new germ cells. But several instances are known in which the chromosomes appear to behave differently as regards their numerical constancy. Thus in the hybrid races of *Primula Kewensis* and in certain *œnothera* mutants the numbers normal for the parents are doubled, and in this duplicated fashion the corresponding numbers are retained during the succeeding generations. Moreover when again crossed with forms typical as regards the nuclear constituents the *œnotheras* at least behave in a manner different from that which the investigations of Rosenberg on *Dorsera* would lead one to expect. For at meiosis the chromosome number does not correspond with, but is as nearly as may be intermediate between, the two forms which are numerically different, as Gates, Geerts, and others have shown.

Opinions still differ widely as to how the chromosomes derived from the one parent normally pair with those originating from the other at meiosis, although nearly all investigators are united in concluding that such union actually does occur. There is almost overwhelming evidence to show that the chromosomes retain their physiological identity through the so-called resting periods of the nucleus, though they cannot then be structurally distinguished by any methods at present known to us. Furthermore that even during this period they have already passed through changes which culminate in their longitudinal fission at the next mitosis. It is not possible at present to explain at all fully either the meaning of this, or the mechanism by which it is effected. Formerly it was held that the chromosomes might themselves represent or be directly responsible for the production of the distinctive character of a species or variety. Further investigation has shown this to have been too crude a view, and although the chromosomes are almost unquestionably associated very intimately with the transmission of hereditary qualities, their precise relation in this respect still remains to be discovered. The principal evidence on which their claim to importance in the hereditary transmission of characters depends consists in (1) the exactitude with which the chromosomes are distributed between the sexual cells (and also between the cells of the whole body), (2) the probability, almost amounting to certainty, of their physiological permanence throughout the life cycle of an organism, (3) the paired arrangement which subsists between the chromosomes derived from the maternal and paternal parent respectively within the cells of the offspring, and the alternative distribution of the individuals of each pair between the sex cells to which this offspring may give rise, (4) the general harmony which exists between the results of such distribution and those observed to obtain in the breeding of hybrids and their descendants, (5) the remarkable discoveries by zoologists, and especially by E. B. Wilson on the existence of an "odd chromosome" and its distribution at meiosis among the germ cells. It is almost impossible to escape the conclusion that in this "odd chromosome" (to which many names have been given) we are witnessing the agent that is concerned in the determination of sex.

Němec and others have investigated the effects of drugs on dividing nuclei. Chloral, for example, interferes with the completion of the process, and division of the nuclei may not be followed by division of the cytoplasm. When, as often happens, the nuclei resulting from this imperfect division subsequently fuse with one another again, the large cells in which this has occurred can readily be recognised by their larger nuclei. In fact the K-b relation insisted on by Hertwig is very obvious. Such cells may continue to divide and contribute to the formation of the tissue in which they lie, and they retain their size characters as well as the increased number of chromosomes. Němec further showed that a corresponding increase of chromosomes might be produced in the haploid gametophyte of *Larix* without influencing the prothalloid character of the cells. This is, of course, in accordance with the observations made by Farmer and Digby on aposporous fern prothallia as well as with those of El. and Em. Marchal on mosses. The enlarged cells tend to disappear during the further growth of the organ (commonly the root) in which they were induced to form. Němec believes this to be effected partly by suppression of cell division, and consequently obliteration, partly by a "heterotype"

or reduction division similar to the first one which occurs in ordinary meiosis. Further observations by others have, however, not confirmed the latter view.

A considerable literature has appeared in connection with the enigmatical bodies known variously as chondriosomes, nutochondria and chromidia. Probably a number of different substances have been confused, and whilst the chromidia proper appear to represent true nuclear constituents scattered in the cytoplasm, the significance of the rest is as obscure as their origin is uncertain.

See L. Digby, "The Cytology of *Primula Kewensis*" (full citation of literature), *An. of Bot.* 26 (1912); B. Němec, *Das Problem der Befruchtungs vorgänge v. andere zytologische Fragen*, Berlin, 1910; H. Kemp, "On the Question of the Occurrence of 'Heterotypical Reduction' in Somatic Cells," *Annals of Botany*, vol. 24 (1910) El. & Em. Marchal, *Aposporie et sexualité chez les mousses*, Bull. Acad. Roy. Belgique (1911); E. W. Schmidt, *Pflanzliche Nutochondrien Progressus rei botanicae*, iv (1912); E. B. Wilson, papers in the journal of *Exp. Zool.*, Baltimore, from 1905 onwards.

Physiology.—Considerable advances have been made in our knowledge of protoplasm in relation to its permeability to substances in solution. Czapek especially has devised ingenious experiments which indicate that surface tension plays an important part in permitting or restraining the passage of solutes through plasmatic membranes. He finds that the semipermeability of protoplasm is one of the results of its surface tension properties, and has succeeded in showing that its value, as compared with the surface tension of water, is 0.68. Any substance, in a concentration sufficient to lower the surface tension of the water in which it is dissolved to 0.68 will abolish the semipermeability of the protoplasm, and its contents will consequently stream out into the surrounding watery medium in question. There are strong grounds for supposing that the low surface tension of protoplasm is to be attributed to the presence of fatty bodies in a state of emulsion, these being necessarily distributed in the surface film, though not of themselves constituting the whole film in the sense of forming a fatty pellicle such as some have assumed to be present. This view renders it possible to account for the passage of salts in solution into the cell, a point which presented difficulties under the older lipid theory of Overton, whilst it is in harmony with the fact that narcosis is produced, with great quantitative exactitude, by substances which dissolve the fatty constituents of the film. Exosmosis then is a *physical* consequence of immersion in any liquid the surface tension of which is 0.68 or less, but it may also be produced *chemically* by other substances, irrespective of their surface tension attributes, if they are able to attack and destroy the physical character of the protoplasm by combining with any of its constituent substances. Thus a poison may destroy life either by removing the conditions under which the contents of the protoplasm can be retained within the cell, or by destroying the organisation of the essential substance of which the cell consists, *i.e.* the protoplasm itself. Other important investigations bearing on the semipermeability of protoplasm and its abrogation have been conducted by Lepeschkin, and the results arrived at, though differing in detail, are not very dissimilar to Czapek's. Lepeschkin is inclined to agree with Overton in attributing to lecithin the rôle played by the lipid, whilst Czapek regards a neutral fat (which irrespective of the amount present has the surface tension of 0.68) as being the substance more probably concerned. However this may be the recognition of the importance of surface tension in the whole matter certainly constitutes one of the most important advances made in our knowledge of protoplasm within recent times. Not only is it susceptible of quantitative analysis, but the suggestive speculations and researches which it opens up can be similarly checked and controlled.

Observations made in connection with root pressure and kindred phenomena appear to indicate the existence of a difference between the plasmatic membrane on the side of entry and of exit of a cell as regards its fluid sap. This especially affects the cells abutting upon the vessels and tracheids of the primary wood of the young root. Lepeschkin in 1906 brought forward strong grounds for believing that a difference of this kind was accountable for the excretion of water from the surface of the sporangiophore of *Pilobolus*, one of the mucorine fungi. It appears difficult to resist the conclusion that a

rhythmically recurrent alteration of this kind in the root-cells concerned is responsible for the flow of sap produced as the result of what is termed root pressure. The investigations of Adrian Brown have shown that grains of barley and other cereals possess in the dead cell layers of the pericarp a membrane which is semipermeable, and in this respect it recalls some of the physical properties of plasmatic membranes. If grains of barley are steeped in dilute sulphuric acid for example the water is able to pass through and swell the grain, but the acid is excluded. This will continue till a high degree of concentration of acid is produced such as would at once prove fatal to the living cells of the grain if they were directly exposed to its action. The membranes of certain fungi, e.g. *Penicillium*, have long been known to possess this property of semipermeability in a striking degree, thus accounting for the frequent development of the mycelium in solutions containing copper sulphate, sodium arsenite, and other poisonous substances.

The effects of temperature are of importance in influencing the rate at which chemical change occurs in the plant. They are complicated however by the invariable collateral action of other factors. They have been observed to accord with expectation in experiments which can be carried on *in vitro*, as for example in the study of enzyme action. But within the organism the events are more complex. Attempts to investigate the curious results of the effects of cold in retarding plants, and of a temporary immersion in a hot bath for forcing them into premature flowering have not as yet yielded conclusive results. Muller-Thurgau, who has recently investigated this subject, many years ago ascertained the fact that cooling potatoes to about 32° F. led to the conversion of starch reserves to sugar, and that on raising the temperature increased respiration follows, some of the sugar undergoes reconversion to starch, but other changes also go on which render the potatoes unpalatable. Perhaps there is a resemblance here to the modified chemical change which was observed some years ago by Overton in the leaves of frog-bit (*Hydrocharis*) and other plants, when they were exposed to full light and low temperature; that is, to conditions under which photosynthesis was possible, but under which the means for the removal of the products of photosynthesis, either by translocation or by conversion to starch, were inadequate. The consequent abnormal concentration of sugars leads, under such circumstances, to the formation of glucosides and colour bodies characteristic of individual species of plants.

In plant metabolism important advances have been made by F. F. Blackman and his school, particularly in the processes of respiration and photosynthesis. A more complete analysis of the events included in photosynthesis has shown them to be more complex than they were formerly thought to be, and that whereas it is pretty certain that light is concerned in preliminary analytic effects, it is by no means so sure that it determines the subsequent syntheses that culminate in the production of carbohydrates. As a lateral extension of the study, particularly of the conditions that affect the metabolic processes here alluded to, a considerable clearing up has ensued of the obscurity that lurked in the old terms *optima* and *minima*. It has become recognised that any metabolic reaction (in the widest sense of the term) of plants is the net result of the interaction of a varying number of different factors. The word "optimum" therefore is not only without definite meaning, but is actually misleading, inasmuch as if used in a quantitative sense at all it entirely fails to recognise the limiting influence on a reaction which is imposed by new conditions. Thus the quantity of carbon dioxide that can be utilised in a given time by a given plant is not a necessarily constant quantity, but is affected by conditions of temperature and of illumination, and these two factors are in turn susceptible of modification in their results by others.

Many of the so-called vital processes of cells have resolved themselves into reactions that can be conducted *in vitro*, and especially is this true of reactions in which enzymes take a part. Unfortunately no enzyme has been prepared as yet in the pure state. It is always associated with extraneous, generally albuminous, matter, and it cannot be regarded as certain that each enzyme is to be considered as a specific and separable substance in the ordinary meaning of the word. The number of different enzyme actions is very large, and is still increasing, and while it is true that so far as we know at present

each fermentable substance is only affected by its own particular enzyme this does not settle the question as to whether these bodies may not be resolved into fewer substances each more or less protean in form. For it appears to be tolerably certain that enzyme-action in general is a function of the surface properties of the substances which are responsible for its occurrence. It may happen (and often does) that the enzyme is located in more or less specialised cells adjacent to, but not identical with, those which contain the fermentable material, and in some seeds and fruits the two classes of substance may even be contained in quite different tissue systems. H. E. Armstrong's investigations also show that there may exist a considerable range of variation in the accompaniment of enzyme and glucoside in nearly related varieties and species of plants. The glucoside may be very scarce, with a minimal quantity of the enzyme, or while the latter may be abundant the glucoside may be lacking. The suggestive bearing of such observations on the chemical differences between species is obvious, and the matter has already been referred to in connection with the colour inheritance of plants of hybrid origin.

An excellent résumé of the physico-chemical aspect of plant physiology, and especially of respiration in its relation to fermentation, is given in Palladin's *Pflanzenphysiologie*, Berlin, 1911, also Jost, *Vorlesungen ü. Pflanzenphysiologie*, 2te aufl.; H. E. & E. F. Armstrong, series of investigations on ferments in recent vols. of the *Proc. Roy. Soc.*; F. F. Blackman, numerous papers in the *Phil. Trans. Roy. Soc.* dealing especially with photosynthesis, and articles in recent volumes of *New Phytologist*; F. Czapek, *Ueber eine methode zur direkten Bestimmung der Oberflächenspannung der Plasmahaut von Pflanzenzellen*, Jena, 1911, and *Chemical Phenomena in Life*, London, 1911; W. W. Lepeschkin, "Ueber die einwirkung anästhesirende Stoffe auf d. Osmo. Eigenschaften d. Plasmamembran," *Ber. Deut. Bot. Gesellsch.*, Bd. 29, 1911.

Angiosperms.—Although the past few years have produced no very startling changes in the views entertained as regards the phylogeny and interrelations of the angiosperms, several important works have appeared which continue to voice the divergent opinions entertained on these questions. The point of view adopted depends largely on the value placed on different criteria. Thus whilst Wettstein regards the Monocotyledons as having arisen from Dicotyledons *via* the Ranales and Helobiae, Lotsy in his large work, still in course of publication, while admitting the probability of this view for one group of Monocotyledons, considers the whole class as at any rate diphyletic. He sees a second point of contact, through the aroids, with the Dicotyledonous piperales. In this he is supported by some American writers who have approached the matter from another, the embryological, side. Lotsy goes further than many systematists will follow him in deriving the Dicotyledons, through the magnolia-like forms, from the fossil gymnosperm type of Bennettites. Most authorities are inclined to look with scepticism on a supposed origin of the angiosperms from any gymnospermic ancestors at present known to us, and the recent discoveries of angiospermic remains of a highly organised type in the Lower Cretaceous rocks adds weight to the negative position. For the plain indication is that the angiosperms were already a flourishing family even at the time when the Bennettiteae were in their prime, whilst evidence from other sides points to the conclusion that the importance of this group of fossils may easily be overestimated in framing large phylogenetic schemes.

Gymnosperms.—Considerable attention has been focussed upon the gymnosperm ever since the discovery of motile antherozoids, first in Ginkgo and subsequently in the Cycads. The study of the fossil seeds, and of the Bennettitian remains in America have further added to and consolidated our knowledge of a group which is now perhaps better understood than most of the other important sections of the vegetable kingdom. A very large share in the elucidation of the structure and development of individual living species has been undertaken by American botanists. The results of modern investigations have been well brought together by Coulter and Chamberlain in their recent volume on the gymnosperms. Still more recently, the thorough study of the morphology of the Podocarpoid alliance has cleared up much that was obscure in this important group of genera, and has thrown light on their relationship with the cone bearing species of gymnosperms.

The mesozoic group of cycadophyta has become better known, and its range greatly extended, the researches especially of Seward, Nathorst, Wieland and others have served to show that the Williamsoniace were a very important and generalised group, of which the Bennettiteae, which formerly loomed largely in our outlook over these ancient forms, really only represented a somewhat specialised family. The strong anatomical evidence adduced by Scott and others as indicating the affinities between the Pteridosperms and Cordaitales of the palaeozoic period continues to receive fresh support, and the linking up of that ancient plexus with the more modern gymnosperms, especially with the Cycadean alliance, has been made clearer by the investigations of Oliver upon the structure of several important Pteridosperm seeds.

Vascular Cryptogams.—In the domain of the Vascular Cryptogams the principal accessions to recent knowledge have come from the palaeontological side. One of the most important series of investigations is that of Kidston and Gwynne-Vaughan on the fossil Osmundaceae, the general result of which has been to link up this group with the palaeozoic primo filicean series. Considerable contributions have also been made by P. Bertrand, W. T. Gordon and others to our knowledge of the anatomy of the ancient Pteridophyta, and to some extent they tend to rehabilitate the importance of the palaeozoic ferns. Furthermore, the brilliant discoveries of Count Solms have conclusively demonstrated the true nature of the well-known and remarkable structure of the Psaronius root sheath. One result of Count Solms' researches, however, is somewhat to weaken the security of the foundations on which the ideas as to the systematic position of this group have been built up. For further information on recent work on the anatomy of fossil fern-like plants reference may be made to the excellent summary given by P. Bertrand in the *Progressus rei Botanicae*, vol. iv (L'étude anatomique des Fougères anciennes et les problèmes qu'elle soulève), where the modern literature is fully cited.

Fungi, Bacteria.—Amongst modern advances of knowledge of the fungi perhaps the chief point of interest is centred in the ascomycetes, concerning the fructification of which the views are still very divergent. Claussen has recently adduced strong evidence to show, in the forms studied by him, that no fusion of sexual nuclei occurs in the ascogonium, but that the fusion which takes place in the young ascus is, as Dangeard maintained, to be interpreted as the real sexual act. The cells of the ascogenous hyphae contain two nuclei apiece, which may represent either morphologically, physiologically, or both, the sexual nuclei which still remain separate but divide in pairs as they do in the uredineae after the nuclear approximation has occurred in the hyphal cells. It is not until the ascogenous hypha reaches its final stage, and bends over in the well-known hook-like manner that nuclear fusion occurs. The penultimate cell is observed to contain two nuclei, whilst the terminal one and the antepenultimate one have only received one apiece. The ascus is formed from the binucleate penultimate, and the previously distinct nuclei which, though in juxtaposition, have remained separate in descent finally fuse. This account is very different from that given by other competent investigators. But it is alluring, and has been worked out with great skill. The matter urgently needs to be settled as it affects not only our views as to the nature of the ascus, but also the morphology and affinities of the whole of the ascomycetes to other groups of fungi. The main lines of advance in the fungi myxomycetes and bacteria (apart from the physiology of the latter) is along cytological lines. The last have been carefully studied by Dobell (*Quart. Journ. Micr. Sci.*, vol. 56, 1911), who believes that they are all nucleated organisms, but that these nuclei may be of "chromidial" nature (*i.e.* granules scattered through the cytoplasm) whilst they may be filamentous or of spherical form in other species. It would seem that the actual nuclear character may differ in some of the bacteria at various stages of the life history.

The most recent studies of Jahn render it almost certain that reduction (meiosis) in the myxomycetes occurs at spore formation. He adduces evidence to show that conjugation occurs during the initial stages of plasmodial formation, and when this has occurred the new plasmodium treats the non-conjugated amoebiform myxomycete

individuals, as well as those which are still swarming, as foreign bodies, ingesting and devouring them instead of admitting them into the plasmodial organisation.

The nuclei of myxomycetes and of the fungi resemble the nuclei of higher plants, and in those which have a known sexual phase nuclear meiosis is intercalated at some stage in the life history.

Meyer, *Die Zelle der Bakterien*, (Jena 1912), a useful summary of our knowledge of the bacterial organism. (J. B. FARMER.)

ANTHROPOLOGY

I. Physical Anthropology.¹

1. *Fossil Man; Homo Primigenius*.—In the course of the last five years, additions of exceptional value have been made to the stock of material evidence bearing on the characters of early prehistoric man. The outstanding general result consists in the complete recognition now accorded to the remains of *Homo primigenius* as a distinct type differing from all others whether prehistoric or modern. Prior to the finding of the Piltdown skull, late in 1912 (see under BIOLOGY above), the discoveries of greatest importance were made in France and Germany,² and their significance may be summed up as follows.

For many years the skeleton from the Neanderthal (*E. B.* xix, 321) remained almost isolated. The fossil jawbone from La Naulette (Belgium) and the Forbes Quarry skull (Gibraltar) had been in evidence almost as long, but the former is but a small fragment, and the importance of the latter was neglected or ignored. Moreover the real significance of the Neanderthal skeleton was a subject of speculation, owing partly to the lack of precise information as to its exact surroundings. Thirty years after that discovery, the announcement that skeletons of comparable form had been found near Spy in Belgium (1887) restored the Neanderthal man to prominence, and revived all the interest of this department of prehistoric anthropology.

Yet another decade had to elapse before the Krapina specimens were added (1899) to the list, though in that interval Professor Dubois had made his wonderful discovery of *Pithecanthropus* at Trinil in Java (1892). The site at Krapina (in Croatia) continued to reward the labours of Professor Kramberger until 1905, but from other regions no further records of importance are to be noted before the year 1907. From that time onwards, additional evidence has accumulated, and it is fair to say that if the Trinil fossils be excepted, the finds of the last five years are of more importance than the sum total of those made during the preceding half-century. Thus between 1907 and the finding of the Piltdown remains the following examples were placed on record: (a) The fossil jaw from the Mauer sands near Heidelberg; (b) The skeleton from the Moustier in France; (c) The skeleton from La Chapelle-aux-Saints (France); (d) The fossil teeth from S. Brélade's Bay (Jersey); (e) The skeleton from La Quina (France); (f) The three skeletons from La Ferrassie (France).

The Mauer jaw claims by far the greatest interest of these specimens, and it was equalled indeed up to 1912 by the Trinil fossils alone. With the exception of the Mauer jaw, the remaining "finds" are unhesitatingly referable to one and the same type, *viz.* that of the men of the Neanderthal, Spy and Krapina. The details upon which this conformity is established are accessible in the exhaustive accounts furnished by Professors Boule, Schwalbe, and Klaatsch, and it will suffice here to note that the advent of the new material is not merely confirmatory of views based upon the earlier finds, for it supplies information on numbers of details which were previously unknown. Thus the osteological characters of *Homo primigenius* can be illustrated now by a wealth of material which is almost comparable to that available for such extinct animals

¹ See *E. B.* ii, 108 *et seq.*, and allied articles (see *E. B.* Index Volume, p. 883).

² Duckworth, *Prehistoric Man*, 1912 (for a general review and bibliography).

as the Tertiary ungulates of North America. Consequently, an ideal long cherished by students of human palaeontology seems to approach the point of realisation.

The new discoveries present still another feature of note, *viz.* the completeness and precision of information in regard to their position and surroundings when first exposed. In this respect also they far surpass the earlier examples, and their value in evidence is enhanced correspondingly.

From all this it results that the type of the Neanderthal man is now recognised as distinct, if not literally "specific;" in point of duration this type is shown to be remarkably limited, for it is especially characteristic of the period known as the "middle Palaeolithic" one. Up to December 1912 no definite evidence was on record to show that this type as such was present either before or after that division of the Palaeolithic period. Although distinguished thus, the type of *Homo primigenius* is quite definitely human, and the problems of its precise relations to other human types, and of its origin and evolution, still remain to be solved.

2. *Significance of the Mauer and Trinil Discoveries.*—In relation to the whole question of the evolution of man, the Mauer jaw, together with the Trinil fossils, stands in a distinct category and transcends in value all other known relics of the kind. It will suffice here to recall the general result of the discussions raised by its discovery and by its anatomical conformation. The title of *Homo heidelbergensis*, conferred on the skeleton by its discoverer, indicates that on the whole it approaches the human rather than the simian type. Yet the precise relation of *H. heidelbergensis* to *H. primigenius* and *H. sapiens* is still an open question. Most probably we have to deal here with an example of a collateral stock, but it is fair to regard the jaw as a piece of material evidence as to the conformation of an early human ancestor.

On the assumption that the Hominidae and the Simiidae (anthropoid apes) are derived from a common ancestral stock, the particular ancestor indicated by the Mauer jaw should be placed close to the point at which the human line (or lines) diverged from the simian line of descent. But the expression "close to" needs further qualification, for even thus three possibilities are evidently open, and all conform to that description. In fact, the exact point in question might be, (a) on the undivided line before the point of division, (b) on the simian line of descent, (c) on the human line of descent. The evidence of the Mauer jaw indicates a stage on the human side of the point of divergence, *i.e.* the position described here as (c).

We come now to the problem of the relation of *Homo heidelbergensis* (Mauer) to *Pithecanthropus*, the famous fossil specimen from Trinil in Java. The latter is to be regarded likewise as indicating the former existence and the osteological characters of another ancestral stage in human evolution. And like *Homo heidelbergensis*, again the Javanese form suggests a stage close to the parting of the ways just mentioned. No strong osteological evidence forbids the close association of the Mauer fossil with those of Trinil. But a difference is claimed to exist in the geological horizons of the respective deposits which yielded the specimens. In any case the difference is not very great; the recent work¹ of the Selenka expedition to Trinil tends to reduce the interval, and further research may show that the geological evidence is less decisive than would appear on the claims now made for it.

The report of the Selenka Trinil-Expedition records also the finding of a tooth of human aspect, said to be derived from a geological deposit more ancient still than that which yielded the remains of *Pithecanthropus*. The discovery is thus of the highest importance; for if this claim is substantiated, it would appear that a fully-evolved human being existed in Java before *Pithecanthropus*. The tooth from Sondé (a locality not far from Trinil) challenges therefore the most searching criticism. If this be applied, the evidence will be found lacking in completeness, so that no firm or final conclusions can be based upon the specimen.

3. *Results as Regards the Antiquity of Man.*—One general result of all the discoveries is to strengthen the demand made in certain quarters for increasing the antiquity of

¹ Selenka, *Die Pithecanthropus-Schichten auf Java*, 1911.

man, for assigning a date in the Pliocene epoch to even the later stages of human evolution, or for referring that phenomenon to a time still more remote. The former existence of a distinct type of mankind, *Homo primigenius* (*neanderthalensis*), is now firmly established. Yet as regards his forbears and associates, the evidence even now available leaves much desired. The characters of *Homo primigenius* provide many suggestions, but material confirmation in the form of actual specimens is limited to a few fragments. On the theory of evolution, the former existence of a primitive type such as *Homo primigenius* is in accordance with expectation. It is also reasonable to suppose that this primitive type was once the sole representative of humanity, unaccompanied by any form more highly evolved. But doubt still persists as to whether the *Homo primigenius* known to us (through the various remains enumerated above) was always actually unaccompanied thus, even though it would seem that he alone was present in a particular period (that termed "middle Palaeolithic"). Claims continue in fact to be made on behalf of the recognition of the equal, and indeed of the greater, antiquity to be assigned to another form of man, a type indistinguishable in essentials from that of the highest modern human beings.

Weak though such claims may be considered, they cannot be ignored. If admitted, they have the effect (in the present connection) of relegating the time of what may be termed the active evolution of the higher type of mankind, to a period so remote as to be almost incredible. Advocates of the greater antiquity of the higher types of man incline to regard *Homo primigenius* as a lingering representative of his kind. They do not agree as to his ultimate fate, *i.e.* whether the type died out, or, on the contrary, entered into a composite form which is represented in modern populations. Professor Klaatsch in particular holds that the primitive race was subjected to an invasion by representatives of higher type, and that the man of Aurignac provides a representative of the latter. Upon such assumptions, a far-reaching theory of the collateral development of two human stocks has been erected. A contrast of the *Homo primigenius* (of "African" affinities and origin) with the *H. aurignacensis* (of "Asiatic" relations) was instituted first (1909) on the examination of the fossil remains in each case respectively. Undismayed by the general disapproval with which this view was received, its author did not hesitate.¹ He extended the contrast to the existing races of man, and from the bones of the skeleton to the brain (1911). It will be interesting to learn whether the later extension can survive the crushing rejoinder which it has just elicited from an expert in cerebral anatomy (1912).

But the fate of such theories is after all of subsidiary interest. The evidence remains for what it is worth, and the essential evidence here in question is that on which are based claims of the modern type of human skeleton to great antiquity. For eighty years past, since Schmerling unearthed the celebrated Engis skull, records will be found of the renewals of discoveries of highly evolved human remains in suspicious association with animals now extinct, or at least unknown in European surroundings or a climate corresponding thereto. Nor are the records confined to caves, for many examples occur in widespread deposits considered on other grounds to have been laid down before the advent of the earliest human beings. In England, the specimen known as the Galley Hill skeleton furnishes a good example of this class of case, but suspicion has not yet been finally allayed concerning the exact circumstances of its discovery. A much more recent instance, *viz.* the skeleton found in 1911 near Ipswich,² deserves very special mention. The bones in question were found beneath a stratum of boulder clay, and in fact at the horizon where this stratum overlies the so-called middle glacial sand deposit of the locality. The skeleton does not differ in essentials (with one exception, which does not however approximate it to any other known human type) from the most recent human forms. If it was deposited *in situ* before the advent of the boulder clay, the specimen establishes the existence of a

¹ Klaatsch, Korrespondenzblatt der Deutschen Gesellschaft für Anthropologie, Ethnologie und Urgeschichte, in the *Archiv für Anthropologie*, 1911, s. 84.

² Prehistoric Society of East Anglia, Annual Report, 1912.

highly evolved human type at a time much more remote from the present than is the middle Palaeolithic period, with which it has been noted the type of *Homo primigenius* is almost exclusively associated. But it is possible that the skeleton lay in a grave dug through the boulder clay, and extending (perhaps accidentally) just to the level of the upper surface of the underlying sand. Two problems, one geological, and a second which may be described as archaeological, are therefore presented by the discovery of the Ipswich bones.

On the geological side, it is believed that the crucial questions in dispute are, (1) Whether the boulder clay of the locality is identical with the widely-distributed stratum thus designated by geologists, (2) Whether the boulder clay was deposited under circumstances admitting of the preservation of the bones in close association and contact during that process, and lastly (3) Whether the local clay may not have been derived secondarily and comparatively recently from similar but adjacent material in such a way as to conform to the conditions suggested under the heading No. 2. The answers to the questions thus posed are conflicting, and the weight of authority is divided with remarkable evenness. It is appropriate therefore to recall the comment made in reference to such instances by Huxley, and to realise that on neither side is the evidence of an absolutely conclusive nature. But the validity of the claims pressed on behalf of the Ipswich bones will be affected also by the archaeological evidence. And in particular it is necessary to exclude as far as possible the question of an interment. For the latter might own a comparatively recent date. Again the evidence is not decisive in either sense, and it will thus be observed that if the claims to high antiquity have not been established satisfactorily, neither has the refutation of those claims been completely demonstrative. Consequently this instance, even if held in reserve, must be reckoned with in any discussion of human antiquity in general.

It is permissible to recall in this connection the claims now advanced in favour of the greater antiquity of the higher types of mankind, and based upon observations in another department of archaeology, *viz.* that which deals with the evidence provided by flint or other imperishable implements. The flints discovered below the Red Crag in Suffolk¹ supply evidence distinctly in favour of the possibility of man's existence in the Miocene epoch if not even earlier. The suggestion is not novel, for Dr. Wallace² advanced it distinctly more than fifty years ago. But however willing we may be to entertain such views, our adoption of these must depend after all upon the evidence. Unfortunately the palaeontological record is still imperfect, at any rate so far as our museums are concerned. From Pliocene strata the only known specimens that possess a claim to rank as a human form is *Pithecanthropus*, and both the antiquity and the rank of this fossil have been disputed. With regard to the anthropoid apes it is otherwise. Many years ago, remains of a fossil form of anthropoid ape (*Dryopithecus*) were discovered in France. They occurred in strata considered then to be of Miocene age but now referred by some geologists to the subsequent Pliocene epoch. Later discoveries were made in India, and quite recently (1911) the officers of the Indian Geological Survey have added considerably to the number of anthropoid apes found in that region.³ No fewer than four kinds of these apes are recognised now as having existed in the Pliocene epoch. They correspond, however, to the four existing kinds of anthropoid apes, being nearly if not quite so highly developed as these. Consequently it is not altogether reasonable to claim them as forms ancestral to the existing species, though they may serve to indicate some of the characters of those ancestors.

But a recent discovery of even greater interest is announced from Egypt.⁴ There have been found in the Oligocene strata of the Fayûm district, remains of monkeys, including a fossil remnant attributable to a gibbon-like anthropoid ape. This Oligocene

¹ Lankester, *Philosophical Transactions of the Royal Society*, Series B., vol. 202, 1912.

² A. R. Wallace, *Anthropological Review*; *Journal of the Anthropological Society*, 1864, p. clxvi.

³ Pilgrim, *Records of the Indian Geological Survey*, 1910.

⁴ Fraas, *Korrespondenzblatt*, etc. (cf. under Klaatsch), s. 191, 1911; Schlosser, *Beiträge zur Paläontologie und Geologie Oesterreich-Ungarns und des Orients*, xxiv, s. 51, 1911.

Egyptian ape is considered to stand in an ancestral relation to another form called *Pliopithecus*, found in Germany and assigned to the Miocene epoch. And consequently each stage of the Tertiary period, from the Oligocene division onward, is now seen to possess one or more representatives of these animals. Moreover the oldest fossil form has at least a claim to represent an ancestor of some of the later types.

The precise bearing of these palaeontological discoveries upon the question of man's antiquity is by no means slight, yet it may be overlooked. The observations suggest that the various types of anthropoid ape were already and definitely divergent from each other even in late Miocene times. Such early divergence among the apes lends colour to the view that by that time the human line of evolution had become detached from the earlier common ancestral path. The most recent investigations into the characters of the brain in man and the higher mammals (including the apes) bring in confirmatory evidence from the side of comparative anatomy. Yet however clear the inference may seem to be, it is still a matter of presumption so long as we lack fossils which can be regarded confidently as having figured in the direct line of human descent. It may be too much to expect that the actual remains should be found; but in the absence of such fossils from Miocene strata, it is impossible on palaeontological grounds to say how far man had advanced in evolution by the commencement of the Pliocene epoch. Nothing is known of the speed with which the various possible phases were traversed, and yet the question of the rate of progress is all-important.

Where so much room exists for speculation, it is not surprising to find quite an extensive range of variety in the genealogical trees which have been advanced in explanation of the descent of man; and we may well pardon the indefiniteness of one of the most recent of those schemes,¹ even though it be the outcome of patient research and well-balanced judgment.

But so far as it goes, the evidence of *Pithecanthropus*, having regard to its position near the end of the Pliocene epoch, suggests the earlier stages of this, rather than the Miocene division, as those which witnessed the final emergence of a distinctively human form. Thus the direct evidence of palaeontology, though it does not contradict, does not at present confirm the view which assigns the time of that event to the Miocene or even an earlier epoch.

4. *Existing Types of Mankind*.—The flood of anthropological researches into the physical characters of the various human types continues to increase in volume. The augmentation of the number of investigations undertaken by members of the various Slavonic nationalities and again by the Japanese forms a marked feature of recent literature. The Russian publications alone attain the most formidable proportions annually.² It is a matter for regret that on account of linguistic difficulties, these memoirs are liable to be passed over by workers in Western Europe. Indeed it seems as though the necessity for some universal script, a written *lingua franca*, will become as urgent as in the Middle Ages.

Pygmies.—Some noteworthy researches bear on the distribution and affinities of the pygmy types of mankind.³ The discovery of pygmy tribes in New Guinea has given a fresh stimulus to speculation on the subject of the original unity or the independence of these diminutive Hominidae. Those who have studied the question may be divided conveniently into three groups. Of these one holds that the pygmy type represents an early stage in the evolution of the larger varieties of mankind. The latter are regarded in fact as modified descendants of pygmy ancestors, distributed, it is supposed, over the surface of the globe and now persisting only as widely-separated groups. An elaborate theory of the cultural relations of the pygmy types with their larger neighbours has been based on such considerations. On strictly anthropological grounds, however, this view, by which the pygmies are regarded as ancestral forms,

¹ Vialleton, *Morphologie des Vertébrés*, 1911.

² Stieda, *Aus der Russischen Literatur; Archiv für Anthropologie*, 1906, and earlier volumes.

³ Schmidt, *Die Stellung der Pygmäen-Völker*, etc., 1910.

Poutrin, *Les Négrilles du Centre Africain; L'Anthropologie*, 1911-12.

can be severely criticised, and it lacks the support of palaeontological evidence. A second group of authorities regards the pygmies as varieties of the larger tribes of the respective localities in which they are met with, and a general appeal is made to their environment as the source of influences which have determined their persistence. Account is taken especially of conditions affecting nutriment. But pygmies are not necessarily starvelings, so that care must be taken to avoid laying stress on this particular argument. The third group of investigators holds the view that pygmies are neither "ancestral forms," nor stunted variants of their more bulky congeners, but that they constitute a distinct type of mankind, a collateral stock which has become modified in different areas, but which was nevertheless a parental form common to the modern pygmies. The evidence actually available at the present time seems to favour the two latter views almost equally. In the absence of any kind of experimental research, these problems will probably not receive a more definite elucidation. And even the excellent methods of employing anthropometric data for racial comparisons suggested by such recent writers as Drs. Mollison¹ and Czekanowski² provide approximations to solutions but not the actual solutions of these problems.

Apart from all the foregoing instances are the sporadic cases of pygmies appearing in the midst of a population of the larger Hominidae. Such instances are studied advisedly from a pathological rather than from a purely biological standpoint. References are made to the irregular activity of glandular organs and to other deep-seated interferences with the normal processes of growth. And it is legitimate to foresee an epoch in which the accession of precise physiological knowledge will admit of descriptions expressing these aberrations in chemical terms.

Giants.—The study of giants will be found in its trend features similar to those just mentioned as influential in the case of pygmies of sporadic appearance. In default of races of truly gigantic stature, the chief material for researches is provided by sporadic examples of giants. But the materials are not exhausted thus; for certain cases are now brought into line with giants, on account of their presenting some of the characters typical of the latter, even though they may lack the prime feature, *viz.* excessive stature.

The literature of giantism is full of suggestions as to the pathological nature of this condition. And as in the case of pygmies, reference is made to general processes of nutrition, as well as to the activity of certain glands. The recent work of Professor Geddes³ is particularly illuminating on the relation between the growth of the skeleton and that of the sexual glands. And these researches have the particular merit of adducing the evidence of experimental tests devised and executed with a view to ascertaining the validity of conclusions based in the first instance upon purely anthropological data. Thus Professor Geddes has been able to indicate with precision the chief factors concerned in the processes of excessive growth: he is able to classify examples of giantism according to the absence or presence of certain specified factors. He has contributed very largely to provide this study with a sound physiological basis. It should be added that this work contains suggestions bearing on certain features of other examples (such as the curious form and proportions of some of the limb-bones of *Homo primigenius*) which have long awaited elucidation.

Other observers have directed their investigations to the pituitary body in particular. The frequency with which this obscure glandular organ is enlarged in giants has been recognised for some years, but the exact mechanism of the processes involved is not yet fully known.

Andamanese and Malay Aborigines.—The human races threatened with extinction in the near future present a very special interest to anthropologists, and while the urgency of the matter is to be deplored, it is satisfactory to realise that investigators

¹ Mollison, *Archiv für Anthropologie*, 1907.

² Czekanowski, *Archiv für Anthropologie; Korrespondenzblatt; Jahrgang xl, No. 6, 1909; ibid.*, 1910, p. 101.

³ Geddes, *Proc. Roy. Soc. of Edinburgh*, vol. xxxi, Part I, No. 6, 1910.

of the highest ability are engaged in the study of the disappearing races while there is still an opportunity of so doing. In the Andaman Islands, Mr. A. R. Brown (Cambridge) has carried out extensive researches. In regard to the pygmy tribes of the Malay peninsula, the exhaustive works published by Professor Martin (of Zürich), and of Messrs. Skeat and C. O. Blagden still hold the first rank.

Bush Race.—The Bush race of South Africa has been studied minutely by Dr. Pöch¹ (of Vienna) and Dr. Péringuey (of the S. African Museum²). Dr. Pöch lays stress on the necessity for a precise and definite diagnosis of the Bush type as contrasted with other adjacent varieties and especially with the Hottentots. Among the features employed as aids to drawing these distinctions, the form of the ears, of the eyelids and of the upper lip are regarded as possessing the first importance; for the true Bush native presents a distinct conformation in each instance. An interesting observation is to the effect that the parotid salivary glands are very large in the genuine Bush natives. No explanation of the condition has been advanced and its significance has remained obscure. (The present writer suggests that the development may be related to the employment of clicking sounds in speech, a feature which is carried to its extreme by these natives. This suggestion is based on the observation that although Europeans may learn to employ clicks, yet a great difficulty is encountered in prolonged conversation owing to deficient saliva, the latter being essential to the proper production of the clicking sounds.) Dr. Pöch regards the well-known steatopygia of the Bush natives (it is found in both sexes) as a mode of storage of food-materials. (The present writer made this suggestion eight years ago, and even then was probably not the first person to do so.) In general, the position assigned to these remarkable representatives of humanity is that of a distinct and specialised form of mankind. It will be noticed that this view is identical with the last of the three mentioned above in connection with the pygmy tribes as a whole. Dr. Péringuey devotes a section of this work to the physical characters of the Bushmen, and Dr. Shrubbsall has added a chapter on craniometry, which is an abstract of a larger report in preparation.

Australian Aborigines.—Mr. A. R. Brown has made extensive observations on the tribes of Western Australia but the results and summary still await publication. In other parts of Australia there has been a great awakening of activity and important memoirs on the craniology of the aboriginal natives have appeared quite recently. Particular attention may be directed to the work of Professor Berry³ (of Melbourne University), who has stimulated enthusiasm in a numerous band of students and colleagues. To Professor Berry credit is due also for rescuing from obscurity a fine collection of skulls of the extinct Tasmanian aborigines. Complete descriptions and admirable drawings are now available, and the additional material investigated by Professor Berry amounts nearly to as much again as all that had been previously described. An absolutely unique specimen is a desiccated Tasmanian brain, which has been studied by Professor Elliot Smith.

Professor Berry holds the view that the Tasmanian native represented a pure, if highly-specialised stock, which was modified in Australia owing to the advent of a second stock. The latter may be termed Papuan. The Tasmanians were distinct from this, and from the Melanesians also. Herein Professor Berry is in opposition to Professor von Luschan (of Berlin).

At the University of Adelaide, the study of physical anthropology is pursued actively by Professor Stirling,⁴ who has the advantage of access to a number of skeletons of the aborigines far greater than exists in any other scientific institution. But detailed accounts are not yet accessible.

Eskimo.—The Eskimo race has been investigated quite recently by two observers of the highest competence, Drs. Oettking and Hrdlička. In view of the comparisons

¹ Pöch, *Korrespondenzblatt*, etc., s. 75; *Archiv für Anthropologie*, 1911.

² Péringuey, *Annals of the South African Museum*, vol. viii, 1911.

³ Berry, *Proc. Roy. Soc. of Edinburgh*, vol. xxxi, Part I, No. 1-4, 1910.

⁴ Stirling, *Trans. Roy. Soc. of South Australia*, vol. xxxv, 1911.

drawn so often between the Eskimo and certain early prehistoric European types, the conclusions of these authors are very important, and fortunately they are quite definite. Speaking of the skull, Dr. Oetteking¹ defines that of the Eskimo as a modification of the Mongolian type. Specific mongoloid characters are distinct, and in certain instances strongly marked. With these features others of a generalised or primitive type are blended. Dr. Hrdlička² is even more direct in his statements. And although he clearly takes full account of environment and nutrition as factors capable of modifying the form of various organs, he states nevertheless that all Eskimo crania "present absolutely no racial affinity with either the diluvial or posterior European crania, and their comparison, except for contrasts should once for all be abandoned. The kinship of the Eskimo is with Asia and America." Whether Dr. Hrdlička³ will have any further information to give on the last point mentioned by him is not yet known, but in 1912 he made an expedition to Siberia, where he discovered examples of a blond Mongolian type. His detailed description of this is awaited with interest. A word of caution may be uttered meanwhile in reference to recent and widely-circulated reports announcing the discovery of a tribe of (so-called) "white" Eskimo.

Observations on the Brain.—The anthropological work thus far laid under contribution has been almost entirely anthropometric and craniometric. But investigation of the other anatomical systems makes steady progress. In particular, the brain has received much attention. In this connection the researches of Mr. Bean⁴ on the American negroes, of Dr. Sergio Sergi⁵ on the Hereros (South-west African negroes), of Professor Weinberg⁶ on the Poles and Esthonians, and of Dr. Kohlbrugge⁷ on the Malayan peoples, have resulted in enormous additions to the stock of information previously collected. Yet it must be admitted that the naked-eye appearances fail to provide a basis for the satisfactory identification of a given specimen, so great is the variability in almost every detail of the surface anatomy. In fact, examples of lowly conformation may occur in almost any region of the surface, so that the racial factor, though doubtless present, cannot be regarded as very potent in comparison with other factors differing from the racial one in regard to their distribution. Such considerations, added to others based on a study of the weight of the brain in relation to the total body-weight, have had the tendency of directing attention more specially to the minute structure of the cortex of the organ. Conspicuous among recent publications on this subject, the latest work of Dr. Brodmann⁸ demands special notice here. Dr. Brodmann's researches have been directed to a large number of animal forms, and his conclusions are furnished consequently with a correspondingly solid basis. Of the results none is more important than that which confirms a claim already made in favour of recognising absolutely distinctive though microscopic features in a certain region of the cortical surface of the human brain. The relation of that region to certain markings of the cerebral surface is to some extent a matter of secondary importance. Further research is in progress with the object of ascertaining whether the features in question are modified by the factors of racial difference. But as yet no definite statement can be made as to the results of this enquiry.

5. *The Study of Heredity and Environment.*—It remains to consider some very striking developments of anthropological and more particularly of anthropometric research, which may be regarded as the outcome of recent advances in the study of heredity and the influence of environment. It was inevitable that mankind should be recognised as a subject for enquiry in the novel researches generated by the redis-

covery of Mendel's work, and also by the writings of Galton. Four years or more have passed since the inheritance of eye-colour in the white race was shown to conform to expectations based on the Mendelian theory. The question of hair-colour subsequently received attention, with results similar in kind though less marked in degree. Further evidence of the same sort was published next (1909) in relation to certain defects and diseases, of which the condition known as "night-blindness" provides a striking and instructive example. Another field of enquiry was successfully opened up in 1910 by the results of Professor Davenport's¹ observations on the offspring of white and negro parentage. Again (in 1911) the Jewish and Anglo-Saxon types of physiognomy² were subjected to analysis, with the result that a strong claim (if not an absolutely convincing one) is made to the effect that in the offspring of mixed parentage these facial types segregate according to Mendel's law. The work of Dr. Eugen Fischer³ (1912) marks a further advance. Here the subjects are a hybrid population, the offspring of Dutch Boers and Hottentots in German South-west Africa. Many characters usually deemed distinctive of "race" were investigated, and the fact that such characters "mendelize" out in the hybrid offspring, furnishes an argument of enormous force against any theory of the origin of racial or sub-racial types through admixture. Other noteworthy results of Dr. Fischer's work include a clear demonstration of the complete and marked fertility of the hybrids *inter se*, and again the definite demonstration of the increased bulk of offspring of mixed parentage (as compared with their parents), even in the absence of all noticeable change in the environment.

Another and very different line of research has been opened up by Dr. Brownlee⁴ (1911). He proposes to employ the Mendelian theory as a basis for the analysis of racial mixtures. Should the method withstand criticism and should the assumptions which are necessary be found justifiable, the anthropologist will have been furnished by Dr. Brownlee with an invaluable instrument of racial analysis.

The contribution to the study of environment provided by Dr. Boas in his report⁵ on the immigrants into the United States of America deserves special mention here. Two striking announcements are made in that report. In the first place, it is claimed that in regard to head-form, the offspring of immigrants stand in distinct and even marked contrast to their parents. Again the data are said to show that a change in every case takes place in the direction of convergence towards a common form or type. So that whether the parents themselves be long-headed or of the bullet-headed type, these characteristics are not transmitted. The offspring of either type tends towards an intermediate form. Environment is made prominent in the speculations as to the influences determining these results. The latter are extraordinary for two reasons. First on account of the intensity of the acting force, and again for the rapidity with which it acts. Acceptance of the conclusions in such a matter must depend on the nature of the evidence, including *inter alia* the method of collection and the actual numerical differences shown by the figures. Having regard to such points, the severe criticism⁶ which has been passed on these statements is not without justification, and it is clear that further support is needed before anything like complete recognition can be accorded to the conclusions. At the same time it would be of interest to learn whether Galton's law of regression finds any demonstration here.

(W. L. H. DUCKWORTH.)

II. Cultural Anthropology.

Prehistoric Archaeology.—In the domain of prehistorics the most recent discoveries are full of interest. As regards the supreme question of the antiquity of man, there must always be a point at which the certain shades off into the purely problematic. This

⁶ Radosavljevich, *American Anthropologist*, p. 394, 1911.

point, however, is being steadily pushed back by the aid of fresh evidence of a cultural kind. Formerly, for orthodox archaeologists, the limit of historicity was represented by the horizon of Chelles. But now M. Commont's well-established stratigraphy for the Valley of the Somme includes a pre-Chellean level. It is characterised by the presence of very rough hand-axes and small implements derived from flakes, the associated fauna comprising hippopotamus, *elephas antiquus*, and an archaic form of *elephas primigenius* (*Congrès préhist. de France*, Tours, 1910). Indeed, Professor Sollas in his recent work *Ancient Hunters and their Modern Representatives* (1911), is quite prepared to add another to the classical list of periods, and adopts for this pre-Chellean period the name Strepsonian, derived from Strépy in Belgium. M. Rutot, the inventor of the term, claims a wide distribution for the characteristic industry of this epoch (*Congrès d'Archéol. et d'Hist.*, Malines, 1911). Further, at Torralba in Spain, at a height of some 1100 metres above sea-level, the Marquis of Cerralbo has found pre-Chellean implements, side by side with tusks and other remains of *elephas meridionalis* and *elephas antiquus*, in circumstances that suggest that there stands revealed the actual camp or "station" of these early denizens of the world (*Congrès d'Anthrop. et d'Archéol. préhist.*, Geneva, 1912).

Eoliths.—If, however, we try to get still further back, we plunge into the stormy waters of the controversy about "eoliths." The question arises whether man or nature is responsible for the pieces of stone shaped and chipped with a certain appearance of design that occur in various geological formations of early pleistocene or even of tertiary age. A while ago opinion perhaps tended to side with the opponents of "eoliths." M. Boule's attack, based on the production of pseudo-eoliths by the crushing machine of a cement-factory at Mantes (*L'Anthropologie*, 1905, p. 261), had been reinforced by M. l'Abbé Breuil's discovery of other pseudo-eoliths, caused this time not by percussion but by pressure, at the base of the Parisian Eocene at Belle-Assise (*L'Anthropologie*, 1910, p. 385). Now, however, Sir Ray Lankester comes forward as the champion of man-made implements from the basement-bed of the Suffolk Red Crag, a deposit which, at the latest, marks the very beginning of the Pleistocene epoch (*Phil. Trans. of the Royal Soc.*, Series B, vol. 202, p. 283. Cf. *Nature*, Oct. 31, 1912). They were discovered by Mr. J. Reid Moir from 1909 onwards at several sites in or near Ipswich; and very similar finds have been made by Mr. W. G. Clarke in the Norwich Crag which ranks as immediately subsequent to the Red Crag (*Proc. of the Prehist. Soc. of East Anglia*, Vol. i, parts 1 and 2). Indeed, Mr. Moir has lately claimed to have lighted on human handiwork, not only in the Red Crag, but likewise in the latter middle-glacial gravels and in the still later chalky-boulder-clay of Suffolk, and, in short, to have made out a long series of these very early forms (*Times*, Oct. 19, 1912). Thus the question of "eoliths" is entering on a new and interesting phase; and, so long as they do not seek to dogmatise prematurely, the bolder spirits who are thus for putting back the beginnings of human culture, deserve a fair hearing and even encouragement.

Palaeolithic Age.—Within the traditional limits of the Palaeolithic age, the main interest consists in securing greater accuracy of classification and an exacter correlation with the changes in the geophysical conditions. As regards the drift-period, whilst our collections of "amygdaloid" implements continue to swell, very little has recently been done, at any rate in England, to improve our knowledge of the stratigraphy; and M. Commont's researches in the Valley of the Somme remain unrivalled. Even where stratigraphy fails, however, much may possibly be done by paying more attention to patina, striations, and so on, as indicated by Dr. W. Allen Sturge in two important pioneer essays (*Proc. of the Prehist. Soc. of East Anglia*, Vol. I, parts 1 and 2). The cave-period, on the other hand, is fast yielding up its secrets. What, for instance, could be a more triumphant vindication of the classificatory methods of prehistoric archaeology than what was lately revealed in the Cave of Castillo near Puente Viesgo in the North of Spain. Here MM. Breuil, Obermaier and Alcalde del Rio (acting on behalf of the Institut de Paléontologie Humaine newly founded by the Prince of Monaco, to whom the science of prehistories owes so much) actually brought to light, superim-

posed one upon the other in a section of a depth of about thirty feet, ten archaeological strata proceeding from the Mousterian (two levels) to the Neolithic by way of the Aurignacian (three levels), the Solutrian, the Magdalenian (two levels), and the Azilian. Thus the classical seriation of cultural stages is no longer a matter of theory; it is a matter of palpable fact (*L'Anthropologie*, 1912).

Passing on to consider these stages in detail, there is, in the first place, not a little new information that relates to the Mousterian epoch. Thus M. Commont has discovered in the Valley of the Somme a well-developed Mousterian industry in conjunction with a warm fauna (*Congrès d'Anthrop. et d'Archéol. préhist.*, Geneva, 1912); thus helping to confirm, we may note, the hypothesis of Professor Sollas, who, despite the usual association of the Mousterian culture with a boreal fauna, is disposed to assign it to the interval between the last two glaciations. No less than three Mousterian cave-occupations have come to light between 1910 and 1912 in the Island of Jersey, and the fact that they occurred at a time when the bed of the Channel was sufficiently elevated for Jersey to be joined to France (as is proved by the presence of a Continental fauna, *rhinoceros tichorhinus*, reindeer, and so on) provides what may prove a useful datum for solving the chronological problem (*Archæologia*, 1911, 1912; *Man*, Nov. 1912 and *Bulletins de la Société Jersiaise*). Mr. Reginald Smith has called attention to an extensive factory of Mousterian implements of an unusual size situated at Northfleet in Kent in the middle-terrace gravels of the Thames; and it remains to be seen whether the terraces of the Thames and Somme and the evidences of oscillation of the bed of the Channel cannot be brought into some sort of correlation (*Archæologia*, 1911). Finally, the utilisation of bone in late Mousterian times found by Dr. H. Martin at La Quina in Charente helps us to understand how the transition took place from the Mousterian to the Aurignacian stages of culture (*Recherches sur l'évolution du Moustérien dans le gisement de La Quina, Charente*, 1910).

On the late Palæolithic period, comprising the Aurignacian, Solutrian, and Magdalenian cultures, light continually pours in. Fresh sites are reported from almost every part of Europe. In England, for instance, the Paviland cave at Gower in S. Wales, already suspected to be Aurignacian (see Sollas, *o.c.* 213), has been proved to be so by the discovery of characteristic implements, while even Aurignacian wall-paintings are suggested by certain remains in Bacon Hole in the same neighbourhood (*Times*, Oct. 14, 15, 29, 1912); and Mr. R. Smith, more doubtfully, claims an Aurignacian age for other English sites (*Archæologia*, 1912). Here, however, it must suffice to deal in some detail with the rapidly increasing extent of our knowledge of the evolution of late-quaternary fine-art. In particular, the determination of the relative ages of various typical sets of cave-engravings and cave-paintings has recently made great strides. Whereas the contributions of the intermediate Solutrian period remain undetermined (though it is certain that the Solutrians were not artists merely in respect to flint, as witness the statuette of a mammoth in ivory discovered by Dr. Kriz at the Solutrian station of Predmost in Moravia, see *L'Anthropologie*, 1912, 273), yet there are clear proofs that on the one hand such rudimentary *graffiti* as those of Gargas in Hautes Pyrénées are Aurignacian, and, on the other hand, that the far more evolved polychromes of Font-de-Gaume in Dordogne, or of Altamira near Santander in the North of Spain, are advanced Magdalenian (L'Abbé H. Breuil, "L'âge des cavernes et roches ornées de France et d'Espagne," *Revue Archéol.*, 1912). A method, not yet fully given to the world, of constructing as it were a stratigraphy of these works of art, consists in observing the superimpositions due to the fact that the ancient painters made light of utilising an already occupied rock-surface. The cave discovered by Col. Willoughby Verner in the Serrania Ronda in the South of Spain (see *Saturday Review*, Oct. 19, 26, 1912) is destined to yield especially valuable results in this respect, having no less than a four-fold mural palimpsest to show. Apart from engraving and painting, new forms of art belonging to the late Pleistocene age are coming to light, the most notable being Dr. Lalanne's discovery of sculptured bas-reliefs representing human figures, male and female, at Laussel in Dordogne (*L'Anthropologie*, 1911, 257; 1912, 129); and the extraor-

dinary find of M. le Comte Begouen and his son, who in the cave of Tuc d'Audoubert, in Ariège, some two kilometres from the entrance, came upon the bas-reliefs of bisons modelled in clay, the sandy floor in the vicinity showing the marks of many human footsteps (*Times*, Oct. 31, 1912). The human figures of Laussel, moreover, have more than an aesthetic interest. Here the male figure is finely shaped, but the female has the secondary sexual characters emphasised to the point of exaggeration, reminding us of the statuettes of Brasempouy and Willendorf. The question may be raised whether we have here the rendering of a racial trait, or are, rather, in the presence of some magico-religious representation of fertility, it being perhaps significant that the female of Laussel raises aloft in the hand what might well be some sort of cornucopia. There are, again, human figures, both male and female, that in style remind us strongly of Bushman paintings, from a group of five Spanish sites (Cogul, Calapata, Albarracín, Ayora, Alpera) which have not yet been correlated with the classical French series, but are probably late Pleistocene (Breuil, *o.c.* 11). The men, who for instance, comprise the greater part of the twenty-four figures of Alpera, are naked save for ornaments, and wield their great bows with the most animated gestures. The women wear petticoats, but leave the torso nude, and at Cogul seem to be engaged in a dance.

Azilians, and Neolithic Age.—We begin to cross the uncertain divide that separates the Palaeolithic from the Neolithic when we come to the Azilians. Their culture, marked especially by their horn harpoons (so different, even if, as M. Breuil thinks, derived by imitation from the bone harpoons of the Magdalenians) and their painted pebbles, has a somewhat wide distribution. For it seems undoubtedly to occur in Scotland (see R. Munro, *Palaeolithic Man*, First Munro lectures, Edinburgh, 1912). Or, again, in Switzerland, at Birseck near Basel, Dr. Fritz Sarasin has found the characteristic painted pebbles, every one of them broken in two, as if, as he thinks, an enemy had tried to do away with receptacles or emblems of the tribal stock of souls such as are the very similar *churinga* of the Central Australians ("Eine steinzeitliche Station bei Basel," *Globus*, 1910). Lastly, in Spain at Castillo and elsewhere the numerous traces of them have led M. Breuil to construct a theory to the effect that they represent a wave of population driven through Spain northwards by the advance of the Neolithic peoples from North Africa (Breuil, *o.c.* 34). A further problem is whether we may connect with the Azilians, as M. Breuil is inclined to do, the numerous highly stylised and more or less geometrical designs recently found in many caves and rock-shelters in the South of Spain. On the one hand, they recall the designs on the Azilian pebbles. On the other hand they are not without analogy in certain early Neolithic idols discovered by M. Siret in the region of Almería, which are made in the form of a sort of double triangle with lateral expansions (Breuil, *o.c.* 32); as well as in the decorations of certain dolmens of Portugal, and, it may be of other dolmens further north. Evidently we have here the results of various interpenetrations of peoples and consequent contacts of cultures which have still to be worked out fully. The study of the iconography of the dolmen period has, meanwhile, received an impulse from M. J. Déchelette's interesting interpretation of the figures of New Grange and Gavrinis. He finds them to involve the schematised representation of a tattooed female personage, who in Brittany is associated with an axe; whilst solar symbols are also present (*L'Anthropologie*, 1912, 29).

Further, it is obvious that the theatre of this cultural evolution is not merely Western Europe, the North of Africa being likewise concerned and even primarily concerned therewith. Indeed, the prehistoric archaeology of Africa is beginning to compete in interest with that of Europe itself. Thus in the French Sudan painted grottoes in which geometric schematisation prevails, though there are a few realistic figures as well, suggest that, whilst a wave of Azilian or proto-neolithic culture went northwards through Spain, another may under the same influences have been diverted south (F. de Zeltner, *L'Anthropologie*, 1911, 1; compare Breuil *o.c.*). The common point of departure would on this assumption be north-west Africa, the seat of the prehistoric flint-industry known as the Capsian, which seems typologically akin to the Aurignacian of Europe (Dr. E. Gobert in *Bull. de la Soc. préhist. de France*, 1910). For the rest, atten-

tion has been directed in England to the question of the part played by North Africa in the propagation of culture in Neolithic times by Prof. G. Elliot Smith's ingenious piece of synthetic work, *The Ancient Egyptians and their influence on the civilisation of Europe* (1911). His point of departure is Reisner's theory that the utilisation of copper began in Egypt; and he suggests that one result of this was the spread of a taste for megalithic architecture, which worked its way round by North Africa to Western Europe. As regards other parts of Africa, prehistoric industries of a Neolithic facies are reported from many points, for instance, from the Anglo-Egyptian Sudan by Mr. Wellcome (*Congrès d'Anthrop. et d'Archéol. préhist.*, Geneva, 1912), and from Ashanti by Mr. Rattray and others (H. Balfour in *J. of the African Soc.*, Oct. 1912); whilst in South Africa the latest discoveries range in type from Neolithic celts to amygdaloids of river-drift pattern (J. P. Johnson, *The Prehist. Period in S. Africa*, 1910; L. Péringuey, "The Stone Ages of S. Africa" in *Annals of the S. Af. Mus.*, viii, 1911). The difficulty in respect to the African evidence throughout is that geological and palaeontological data are as yet not available for the determination of a chronological scale; whilst the backward state of many of the natives makes it possible that primitive and advanced types of stone-industry may have been more or less contemporary. Indeed, outside Europe and the immediate neighbourhood of the Mediterranean, prehistoric archaeology can scarcely boast the status of a quasi-independent interest, but tends to merge with cultural anthropology in general. As for proto-history, it is coming more and more to include the whole of the bronze-age and early-iron age cultures of Europe, as it already does those of Eastern Europe. How much we are beginning to know about the development of bronze-age culture, even in so relatively backward a region as the British Islands, may be learnt from an admirable monograph, *A Study of the Bronze Age Pottery of Great Britain and Ireland, and its associated Grave-goods* (1912), by the Hon. J. Abercromby, who ascribes its introduction to invaders, mainly of Alpine stock, who had moved gradually from some region beyond the Rhine, not far north of Helvetia.

Ethnological Method.—When we turn to the consideration of cultural anthropology as it concerns itself with the primitive peoples of modern times, we can hardly expect to encounter dramatic surprises such as are occurring almost daily in the field of pre-histories. There are nowadays but few spaces on the ethnological map that are absolutely blank. If travellers' gossip is to count, we can claim to have covered most of the ground. On the other hand, there is to be noted on all sides a demand for intensive study that, from the standpoint of science, is a most striking and welcome sign of the times. It has become clear by experience that theory based on the observations of untrained and unguided field-workers comes to nothing. The endowment of anthropological research in connection with universities and government departments and the organisation of ethnographical museums have created a body of workers intent on obtaining accurate results. Hence interest now centres chiefly in questions of method. In England attention has been called to this subject by Dr. W. H. R. Rivers in a masterly paper entitled "The ethnological analysis of Culture" (*Pres. Address to Section H., Brit. Ass., Portsmouth, 1911*). He there contrasts two methods, which he terms severally the psychological and the ethnological. The former rests on the tacit assumption of a general homogeneity of the human mind, and hence tends to explain such similarities as are found in different regions as due to the similarity of its workings; so that, given similar conditions, similar customs and institutions will develop along the same lines. The latter explains these similarities as due to the direct transmission of culture from one people to another. This new method is upheld in its most extreme form by F. Graebner, *Methode der Ethnologie*, Heidelberg, 1911 (compare his article "Die melanesische Bogenkultur und ihre Verwandten," *Anthropos*, 1909, iv, 726), who is herein supported by W. Foy (under whose editorship the annual *Ethnologica* is devoted to the illustration of this method) and, with certain restrictions, by Pater W. Schmidt (*Mitt. d. anthrop. Gesellsch. in Wien*, 1908, xxxviii, 73; and *Denksch. d. Akad. d. Wiss. Wien*, Phil.-hist. Kl., 1910, liii). All German anthropologists, however, are not adherents of this school, as will be evident from the discussions published in Petermann's *Mitt.* I. 113

and H. 143; and in *Korrespondenzbl. d. Deutsch. Ges. f. Anthrop. Ethnol. u. Urgesch.*, 1911, Jahrg. xlii, 156. In America, again, whilst it is claimed that it has long been customary with Americanists to attach importance to the effects of the blending of cultures arising from racial mixture, it is contended that allowance must likewise be made for the results of what biologists know as "convergence" or "convergent evolution" (Cf F. Boas, *Science*, Dec. 8, 1911; and R. H. Lowie, *ibid.*, Nov. 3, 1911; *J. of Am. Folk-Lore*, xxv, No. xcv, 1912). The fact would seem to be that the psychological and ethnological methods are in no sense fundamentally opposed to each other. Granted that the "adjacent anthropology," the cultural context, of each datum must be given for the latter to be understood, it is none the less possible that such a datum may ultimately serve to illustrate the evolution of human culture in general and of the mind of man in general; for, if "man" is an illegitimate abstraction, then so assuredly must "anthropology" be also. The ethnological method, in fact, stands chiefly for a self-denying ordinance on the part of the present generation of students, who are content to put off their all-embracing account of the history of culture until the history of cultures—of the developments confined to relatively discontinuous cultural areas—has been more completely worked out (cf. "The Present State of Anthropology," *Athenaeum*, Mar. 12, 1910).

Totemism.—This question of method has been raised likewise in a more concrete way by recent discussions about totemism. It must be noted, in the first place, that an admirable survey of the facts relating thereto has been given to the world in Dr. J. G. Frazer's *Totemism and Exogamy*, 1910; and it will be observed that, in accordance with modern tendency, his descriptive work is broken up into sections corresponding to geographical and ethnological provinces, though he likewise offers a general theory of totemic origins. Then, again, an important work embodying the principles of the school of thought represented by the writers in *L'Année Sociologique* has recently appeared in Prof. Emile Durkheim's *Les Formes Élémentaires de la Vie Religieuse* (1912), wherein the analysis relates especially to the "Totemic system" of Australia, though analogies from North America are allowed to play a secondary part in the argument. Meanwhile, Dr. A. A. Goldenweiser in *Totemism, an Analytical Study* (reprinted from *J. of Am. Folk-Lore*, xxiii, No. lxxxviii, 1910), instead of comparing, seeks rather to contrast the totemistic observances of Australia and of North America, insisting that each "totemic complex" is the result of a separate set of historical causes, so that to explain them on the assumption of common origins is methodologically unsound. On this point there has followed an animated controversy between Mr. Goldenweiser and the late Mr. Andrew Lang (A. Lang, *Method in the Study of Totemism*, Glasgow, 1911 privately printed, but published in a revised form in *Am. Anthropol.* N.S. xiv, No. 2, 1912; A. A. Goldenweiser, *ibid.*, xiii, No. 4; xiv, No. 2; cf. R. H. Lowie, *ibid.*, xiii, No. 2 and W. D. Wallis, *ibid.*, No. 1). Mr. Lang asks whether "convergent evolution" means "through a series of flukes," and maintains that the hypothesis of more or less parallel development from a common starting-point is sound, in that it "works." No better criterion could be proposed. It may well turn out, however, to be the fact that, as intensive study proceeds, even the homogeneity postulated for totemism within a given area, say Australia, will have to be denied in favour of some theory of a mixture of ethnological elements, in short, a theory of the same type, if not necessarily the same content, as that which Graebner or Schmidt would offer. Meanwhile, the older method of classing the peoples of the lower culture together may still bear fruit when the broader conditions and functions of primitive mentality are in question: witness the brilliant essay of Prof. L. Lévy-Bruhl, *Les Fonctions Mentales dans les Sociétés Inférieures*, 1910. Even if his description of the primitive mind as "pre-logical" will hardly bear close examination (see W. H. R. Rivers, *The Hibbert Journal*, Jan. 1912), the indistinct nature of the thinking associated with an undifferentiated social life comes out very clearly in his penetrating analysis, which includes a most valuable account of the relations between primitive thought and language. Another work on this subject, remarkable for its sanity and breadth of view, is Prof. Boas' *The Mind of Primitive Man* (1911).

Regional Anthropology.—Having considered the tendency towards ethnological

specialisation which modern method recommends, we must conclude with a rapid glance at the recent advance made in our knowledge of the primitive culture of particular regions. America, perhaps, deserves to be placed first on the list, because here intensive work on regional lines has long claimed chief attention; though general theory, especially in regard to the psychology of religion, has by no means wholly been neglected, notable contributions to this subject being E. S. Ames, *The Psychology of Religious Experience* (1910); H. Webster, *Rest Days* (1911), and J. H. Leuba, *A Psychological Study of Religion* (1912). Of outstanding importance are the results, still in course of publication, of the Jesup North Pacific Expedition, which took place under the direction of Dr. F. Boas. They are particularly interesting from an ethnological point of view, since they suggest that the peoples of N.E. Asia usually known as Paleo-Asiatics (Chukchee, Koryak, Kamchadale, Gilyak, Yukaghi) owe their indubitable affinities to the aborigines of America to the fact that they represent an ethnic reflux from the latter continent. It should be mentioned that Russian ethnologists, Messrs. Sternberg, Jochelson and Bogoras, took part in this expedition, and contributed not a little to its success. Moreover, a discussion of great interest concerning the ethnological status of the American aborigines has recently taken place, in which a number of distinguished Americanists have taken part (*Am. Anthropol.*, 1912). From the cultural point of view perhaps the most interesting contribution is that of Dr. W. H. Holmes, who reaches the same conclusion from the archaeological as does Dr. Hordlička from the somatological standpoint, namely, that the bulk of the aborigines are of Asiatic origin; though he would not wholly exclude cultural influences by way of Indonesia and Polynesia, and even, more doubtfully, from West Africa and North Europe (cf. also his paper in *Am. Anthropol.*, 1910, 149). For the rest, it is impossible here to make more than passing mention of a few of the numerous additions to our knowledge of the natives of North America, present or past, especially notable being Miss A. Fletcher and F. La Flesche, *The Omaha Tribe* (1911); Clark Wissler, *Social Life of the Blackfoot Indians* (1911) and *Ceremonial Bundles of the Blackfoot* (1912), and E. Volk, *The Archaeology of the Delaware Valley* (1911). Notice should also be taken of the recent anthropological activity displayed by the Canadian Government, which, by organising an ethnological department under the direction of Dr. Sapir, whose work, especially in the matter of linguistics, is of the highest value, has sent into the field a number of competent workers, Mr. Barbeau and others, of whom much may confidently be expected. For Central America with Mexico may be noted G. G. MacCurdy, *A Study of Chiriguian Antiquities* (1911); C. Lamholtz, *New Travels in Mexico* (1912); and K. Th. Preuss, *Die Nayarit-Expedition. Erster Band: Die Religion der Cora-Indianer* (1912), the last-named constituting a most important new source for the comparative study of religions. As regards South America, we must be content here to mention Sir C. Markham, *The Incas of Peru* (1910); T. A. Joyce, *South American Archaeology* (1912); W. B. Grubb, *Indians of the Paraguayan Chaco* (1911), and E. Nordenskiöld, *Indianlif i el Gran Chaco*, Stockholm (1911).

Something has been said already of recent archaeological work in regard to Africa. As regards the study of the present-day natives, two monographs of first-rate quality, that deal especially with the subject of religion, are, be it noted, the work of missionaries, J. Roscoe, *The Baganda* (1911), and H. Junod, *The Ba-Thonga* (1912). Several important books upon the anthropology of the Belgian Congo have recently appeared, such as E. Torday and T. A. Joyce, *Les Bushongo* (1910); F. Gand and C. van Overbergh, *Les Mandja* (1911); and T. H. Weeks, *Congo Life and Folk-lore* (1911). The former work discloses a quite remarkable state of native civilisation, the ultimate origins of which must be sought somewhere further north, probably in the neighbourhood of Lake Chad, our speculations being assisted by historical records of the mnemonic order that would seem to be trustworthy for at least several centuries back. The increasing interest shown by the British Government in anthropology, as shown either in the direct appointment of ethnological investigators or in the encouragement of officials to prosecute such studies, has borne fruit in such works as N. W. Thomas, *Ebo-speaking Peoples of Nigeria* (1910); A. N. Tremearne, *The Tailed Head-hunters of Nigeria* (1912); H. A.

Macmichael, *The Tribes of Northern and Central Kordofân* (1912); and C. G. Seligmann, *The Cult of Nyakang and the Divine Kings of the Shilluk*, in *4th Rept. Wellcome Trop. Res. Lab.*, 1911. Finally, W. S. and K. Routledge, *With a Prehistoric People* (1910) contains much sociological and technological material concerning the Akikuyu of East Africa, that has been collected with remarkable skill and method.

Passing eastwards we come upon a mass of valuable new information relating to India. Especially noteworthy in point alike of form and of contents is the series of monographs issued under the authority of the Government of Eastern Bengal and Assam of which the latest volumes are T. C. Hodson, *The Naga Tribes* (1911), S. Endle, *The Kathâris* (1911) and J. Shakespear, *The Lushei Kuki Clans* (1912). Other interesting works relating to India are E. Thurston, *Omens and Superstitions of Southern India* (1912), and L. K. Anantha Krishna Iyer, *The Cochin Tribes and Castes*, Vol. II (1912), the latter work throwing much light on the curious social system of the Nayars (Nairs). Moving still further east we find two interesting books on Borneo, E. H. Gomes, *Seventeen Years amongst the Sea-Dyaks of Borneo* (1911), and C. Hose and W. McDougall, *Pagan Tribes of Borneo* (1912), the latter a most important contribution to science. From New Guinea, one of the least known parts of the anthropological world, comes news of pygmy tribes in A. F. R. Wollaston, *Pygmies and Papuans* (1912), and R. W. Williamson, *The Mafulu Mountain People of British New Guinea* (1912), the latter work being somewhat rich in cultural particulars. C. G. Seligmann, *The Melanesians of British New Guinea* (1910), carries out an important survey of the coast-peoples in the S.E. area; whilst also about German New Guinea information is rapidly coming in (cf. M. Moskowski and R. Neubass in *Zeitschrift f. Ethnol.*, 1910, 1911). A fresh instalment (Vol. IV) of the *Report of the Cambridge Expedition to Torres Straits*, edited and mainly written by A. C. Haddon, deals with the technology of this interesting area of transition. In regard to Australia there is to be noted a well-illustrated conspectus of the three expeditions of B. Spencer and F. Gillen (*Across Australia*, 1912); but the fresh explorations of Prof. Spencer in the North and of Mr. A. R. Brown in the West are yet to be fully published. For Melanesia, again, we await the publication of the researches of Dr. Rivers, which are likely to shed much light on the problem of the peopling of the Pacific.

(R. R. MARETT.)

PHILOLOGY

In most branches of comparative philology there is little of substantial importance to record, representing progress since 1910, and the various articles in the *E. B.* (for a summary of which see xxi, 437 *et seq.*) already provide a sufficient account of the accepted results of scientific scholarship. An exception may be made, however, for one series of little-known and scattered languages, which have now been studied for a long time without the results of much patient labour being made generally known,—what is now called the “Austriac family,” those namely of the Malay-Polynesian and other Oceanic people connected with S.E. Asia. The following article summarizes the results of recent research in this field.

The Austriac Family of Languages.

The essential unity of the Oceanic languages, though partially recognized long ago by Humboldt in his *Kawisprache*, was not completely demonstrated until much more recent times. The connection between the Polynesian and Indonesian languages (including the geographically outlying Malagasy) met with ready acceptance, but the affiliation of the Melanesian was not so easy. The difficulty was partly due to purely linguistic differences, the Melanesian type of speech being superficially very different from the Indonesian and Polynesian, partly to the diversity of the races which raised the natural, but quite unjustifiable, presumption that the languages could not be of the same stock. It was, however, eventually proved that Melanesian could not be kept out of the Oceanic family,¹ and it has since been shown that Micronesia, though

¹ Kern, *De Fidji-taal in Indonesië en Polynesië*, Verhand. Kon. Akad. v. Wet. (Amsterdam, 1886), Afd. Letterk., Deel XVI; *Over de verhouding van het Mafoorsch tot de Maleisch-Polynesische talen*, Actes du VI^e Congrès International des Orientalistes.

different in race, falls linguistically into the Melanesian section. Also it ultimately became plain that of these three subdivisions Indonesian best represented the archaic family type, while Polynesian at the other extreme had gone furthest in the direction of simplification and decay.¹ Thus was established, by the strictest scientific proof, the existence of the Oceanic or Malayo-Polynesian family of languages, extending from Madagascar in the west to Easter Island in the east, and from Formosa and Hawaii in the north to New Zealand in the south.

Meanwhile further exploration and research had revealed the existence in New Guinea and some of the neighbouring islands of a number of languages which could not be fitted into this scheme of classification, and did not even apparently form any family of their own, but only a number of distinct groups between which no ultimate relationship could be safely asserted.² These so-called Papuan languages (which have since been found in portions of Dutch and German as well as British New Guinea) are therefore to be regarded as a purely provisional group, the time for their systematic classification not having as yet arrived. But it is quite certain that they have nothing whatever to do with the Oceanic family, though some of the neighbouring members of the latter have undoubtedly been influenced and to some extent modified by Papuan languages, and also vice versa, particularly in the matter of syntax.³ Moreover there exists in an outlying corner of Eastern Indonesia a small enclave comprising a number of closely related and very curious languages which differ profoundly from their neighbours of the Oceanic stock. These are the languages of the northern peninsula of Halmahera (or Jilolo), together with Ternate, Tidore, and a few other small adjacent islands. In spite of some attempts that have been made to show their ultimate connection with the Oceanic family,⁴ it cannot be said that the thesis has been proved or even rendered very probable. It is at least as likely that they are remnants of some archaic Papuan group, though the tribes that speak them are not Papuan in physical type.⁵

The Oceanic languages having thus been delimited,⁶ there remained the further question of their source of origin. By an ingenious comparison of purely linguistic data Kern had shown⁷ that the common mother-tongue from which they were derived must have been spoken on some long coastline in the Tropics, the east coast of Indo-China seeming on the whole to be the most likely one. Here there were actually languages, such as Cham and its immediate neighbours, which were plainly in some way connected with the Indonesian branch of the Oceanic family. But no really satisfactory attempt could be made to connect the Oceanic with any of the different groups of Indo-Chinese languages until the latter had been properly classified. This was done in part by Forbes⁸ and carried further by Kuhn,⁹ but the final achievement was the work of W. Schmidt. In a series of admirable monographs¹⁰ he succeeded in proving the intimate

connection of the aboriginal languages (Sakai and Sĕmang) of the Malay Peninsula, the Mon-Khmer group, the Palaung-Wa-Riang group of the Shan states, Khasi in Assam, Nicobarese, and finally the Muṅḍa languages of India proper. All these are characterised by a structure based ultimately on monosyllabic roots from which more complex words are formed by means of prefixes and infixes (in the case of Muṅḍa and Nicobarese, suffixes as well). Both in structure and vocabulary they are altogether different from the large family, or agglomeration, of languages to which Tibetan, Burmese, Siamese and Chinese belong.

On the other hand a considerable amount of work had been done, mainly by Dutch scholars such as Van der Tuuk, Kern, and Brandes, to analyse the structure of the Oceanic languages; they succeeded in showing that the superficial dissyllabism characteristic of the family was really the result of an ancient agglutinative system building upon originally monosyllabic roots.¹ This left the way open to Schmidt to show² that his newly formed synthesis of languages, which he proposed to call Austroasiatic, was ultimately related to the Oceanic (or as he would style it Austronesian) family, so that the two could be conveniently grouped under the generic name "Austrie." Schmidt's arguments were based both on similarity of structure and numerous cases of identity between the very roots of the two families; and so far as they were confined to linguistic classification his conclusions have met with general acceptance at the hands of those best qualified to judge. But his attempt to establish a corresponding anthropological unity of the very diverse races speaking all these different tongues was not so successful and must be regarded as altogether premature. Most of these populations are blends, and though conceivably there may be some thin strain of common blood running through all of them, it is impossible as yet to define it or correlate it with the common element of their speech. Nor is any such assumption a necessary conclusion from the linguistic data. The synthesis of the languages has established a purely linguistic unity, implying no identity of race and admitting the existence here and there (*e.g.* among the Negritos of the Malay Peninsula, in Melanesia and even in parts of Polynesia)³ of traces of older aboriginal languages embedded, like flies in amber, in the prevailing type of speech.

Eliminating all such doubtful matters, the establishment of the "Austrie" family of languages may well be considered the most important achievement in comparative philology during the last decade. It finally clinches the arguments in support of the Asiatic origin of the Oceanic languages, and thus sets at rest a question which had been long under discussion.

MEDICINE¹

In the following survey of the advancement of the art and science of medicine and surgery during 1910-12 it is only possible to note the outstanding facts of progress, and no attempt is made to trace out the innumerable observations which preceded each discovery and each theory. An excellent account of medicine and surgery, from year to year, is to be found in the *Medical Annual* (John Wright & Sons, Bristol).

The deaths of Florence Nightingale, on August 13, 1910, and of Lord Lister on February 10, 1912, remind us of the very origins of modern surgery and modern nursing. Long ago, they had finished the work of their lives, and had given it into other hands to be carried further; and death came to them as a quiet release from old age. They won the gratitude and the reverence of mankind; and it is no light honour to the medical profession to have these two names in its calendar. To them must be added the name of Robert Koch, who died on May 27, 1910. We associate his name so closely with his later studies of tubercle, malaria, and sleeping-sickness, that we are apt to forget his earlier study of the infective diseases of wounds, his discovery of gelatin-media for the growth of bacteria in pure culture, and his use of differential stains in bacteriology. He advanced the new learning in Germany, as Lister advanced it in England.

Next to Lister's name, we may fitly notice some of the most recent developments of operative surgery. Many operations have been performed, with very satisfactory results, for the relief of intra-cranial pressure, e.g. from intra-cerebral growths; or for the relief of intra-spinal pressure, e.g. in chronic spinal meningitis. Division of the posterior nerve-roots has been performed, with success, in some cases of spastic paralysis.² In another field of surgery, Alexis Carrel's work, at the Rockefeller Institute, on the direct suture of arteries, is leading to good results in practice: and his study of the transplantation of organs and the aseptic storage of organs and of tissues³ is of so great importance that one of the Nobel prizes for 1912 was rightly awarded to him. In the surgery of the heart, there is by this time a large number of operations, under conditions of emergency, for the suture of stab-wounds. G. T. Vaughan,⁴ in 1909, was able to collect records of 150 such cases, with 35 per cent recoveries: and more cases have been published since.

But these and other achievements of operative surgery, made possible by Lister's work, are but a small part of the medical history of the last few years. In physiology, in general medicine, and in pathology, the multitude of new facts and methods is so great that it hardly gives itself to any proper arrangement. Nothing more can be done than to note, in the order of the alphabet, some results which have been of especial interest alike in science and in practice.

Anthrax.—For some years, Scavo's serum has been used for the treatment of anthrax in man: and we now have an authoritative statement of the value of this treatment in the sixth Annual Report of the Anthrax Investigation Board for Bradford and District, whose medical adviser is Dr. Eurich (*Brit. Med. Journ.*, April 20, 1912). The authority of Dr. Eurich on all questions relating to anthrax may safely be called final. The Report gives evidence that Scavo's serum is useful in cases of infection not only through the skin, but also through the lungs (wool-sorters' disease).

Appendicitis.—Of many theories to account for the great frequency of this disease, none has yet come to general acceptance. The frequency of appendicitis may be judged by the fact that five cases were admitted during one night into one of the London hospitals, all of them in need of immediate operation. The evidence is by this time almost irresistible, that delay in operation, reckoned over large groups of cases, is not advisable. Thus, among 687 operation-cases in a hospital in New York,⁵ 20 underwent

⁵ McWilliams, *Annals of Surgery*, June 1910.

operation within 16 hours of the onset of the attack. Only one of these 20 died, and that from another disease. Of 115 who underwent operation between 16 and 24 hours after the onset, 4 died=3.5 per cent. Of 145 who underwent operation on the second day, 9 died=6 per cent. Of 103 operations on the third day, the death rate was 7.7 per cent. Of operations on the fourth day, the death rate was 18 per cent.

Beri-beri.—Few events in pathology, during late years, have been more notable, or more happy, than the discovery of the cause of this endemic disease. Beri-beri, a form of peripheral neuritis, with loss of muscular power, emaciation, and exhaustion, has been one of the scourges of the tropics. In the Federated Malay States, the estimate has been made of 45,000 deaths from beri-beri in the course of 30 years. In the Philippines, it has been a long-standing evil. During the Russo-Japanese War, it accounted for a very large part of the sickness among the Japanese.¹

In 1909 Fraser and Stanton published their *Etiology of Beri-beri*. Working on the lines suggested by C. Hose and Braddon, they traced the cause of the disease to the use of "milled" rice, *i.e.* rice which has been "polished" by the removal of its husk and outer layers. Fowls or pigeons, fed on polished rice alone, quickly showed signs of the disease: but, if the polishings of rice were added to their food, they quickly recovered. Further observations, by De Haan, Chamberlain, Eijkmann, and others, showed that the disease was not due simply to the absence of phosphates from the rice. It was due to the loss of a substance which is present as a mere trace in the husks: indeed, there are no more than 10 grains of it in a ton of rice. Funk, working at the Lister Institute, has lately isolated this substance, and has given it the name of "vitamine." A pigeon, on polished rice alone, will in three or four weeks show signs of the disease. If, a few hours before death, a minute dose of vitamine be given to it, then it will quickly recover.

The wonder does not end here. For this work on beri-beri throws light on scurvy, epidemic dropsy, scurvy-rickets, *etc.* Indeed, Funk has isolated from limes a substance similar to vitamine, and present in about 1 in 100,000 parts of the fruit. This "vitamine of the lime" has a favourable action alike on beri-beri and on scurvy. The practical result of this brilliant series of studies is bound to be very great. We may take for example, the Philippines. President Taft, speaking on May 4, 1911, of the American occupation of these islands, said, "The change of their food from polished to unpolished rice has practically stamped out the disease." Dr. Heiser (*Journ. Amer. Med. Ass.*, 1911, i, 1237) reports on a leper colony at Culion. The disease had been so common in this colony, since its founding in 1906, that, in one year, one-third of the deaths in the colony had been due to it. After the use of unpolished rice was made compulsory, no deaths occurred from the disease: moreover, cases of the disease were quickly cured by the addition of rice-polishings to their food. In May, 1910, the use of polished rice was forbidden in all civil public institutions: with the result that only 2 cases of the disease have since occurred in these institutions, and in neither case had the prohibition been strictly obeyed.

Cancer.—The Imperial Cancer Research Fund, in 1910, published its Third Annual Report, giving facts as to the production of immunity, among mice, against mouse-cancer. In its Fourth Annual Report, 1911, it upholds the theory of "the individuality of cancer" as hardly open to doubt. On this theory, "each tumour is peculiarly and genetically related to the individual in which it arises. . . . The relation of each malignant new growth to the affected animal is an individual one, parallel to that obtaining between the organs of the body and the organism as a whole." And again: "The individuality of cancer, both as regards the organism attacked and the tumour, would appear to have been placed at last beyond all further doubt. Such a relationship has long been maintained in various forms on the basis of deductions drawn from histological examination of the tissues at the site of the primary lesion, and from the nature of dissemination, but this interpretation of the findings has been as vehemently

¹ A very important discussion on beri-beri, with papers by Dr. Schaumann, Prof. Axel Holst, and others, is published in the *Transactions of the Society of Tropical Medicine and Hygiene*, v, 2, December 1911.

combated. The combination of the results arrived at by microscopical investigation and experimental study appears to complete the demonstration. A long step has thus been taken in defining the direction in which the future investigation of cancer is alone likely to be profitable." Out of the multitude of recent observations and doctrines concerning cancer, we have to note the following. (1) Much attention has been given to the subject of the biological characters of the "cancer cell," its place in nature, and what may be called its natal and prenatal conditions. See, *inter alia*, the lectures by the late Sir Henry Butlin on "Unicellula Canceri," *Lancet*, November 25 and December 2, 1911, and Mr. C. J. Bond, *Lancet*, 1911, ii, 349. (2) H. C. Ross has published a book on "Induced Cell-Reproduction and Cancer," describing his observations on leucocytes suspended in citrate solution and examined in contact with a colloid film. (3) Carrel has succeeded in cultivating particles of normal tissue, embryonic tissue, and cancer tissue, outside the body, *in vitro*, on a medium of the blood-plasma of an animal of the same species, and has been able to observe certain exchanges of influences between the plasma and the still living tissue. (4) Wassermann has obtained results of considerable significance, in mouse-cancer, by the intra-venous use of an eosin solution of selenium (See *Brit. Med. Journ.*, January 6, 1912).

Diphtheria.—Great attention has been given lately to the subject of diphtheria-carriers. How long, after recovery from diphtheria, may the patient still be harbouring the germs of the disease at the back of his throat? What is the risk of infection from such cases? What measure of virulence is still present in these lingering germs? How far are "carriers" responsible for the prevalence of diphtheria in Great Britain? At the 1911 Annual Meeting of the British Medical Association, these questions were fully discussed. It appears that about 50 per cent. of all cases of diphtheria are free from diphtheria-bacilli within three days of the disappearance of the diphtheritic membrane; and a further 25 per cent are free within another week or ten days. It is not improbable that the bacilli, in some of these cases, are of lowered virulence. The risk of infection must depend, more or less, on the patient's age, surroundings, and personal cleanliness. There seems to be, on the whole, a considerable weight of evidence that, with such precautions as are suggested by common sense, and with bacteriological examination of all especially suspicious cases, the chance of infection from diphtheria-carriers is not a very grave danger to the community. "In my opinion," says Dr. Goodall, "one of the principal factors in the persistent prevalence of diphtheria is not the carrier, but the mild, unrecognised case."

As regards diphtheria antitoxin, the latest Report (1911) of the Metropolitan Asylums Board states that "the amount of antitoxin supplied, the number of cases treated, and the amount of antitoxin used for each patient, all show a considerable increase." As compared with a death rate of 30 per cent before the introduction of antitoxin, the death rate for 1910 was 7.7, the lowest on record: the death rate for 1911 was 8.5.

There is no need here to praise diphtheria antitoxin. *Securus judicat orbis terrarum*. But every serum-treatment has this imperfection, that the serum has other qualities of its own, beside its antitoxic action: and some persons are abnormally sensitive to ill-effects from the serum itself. We must not set the risk of these ill-effects against the legions of lives which are saved: still, there the risk is, such as it is. With many patients, the serum "disagrees" (if this word may be pardoned): it gives them a rash, a high temperature, and pains in the joints, for a few days. This is the so-called "serum sickness." Much work has been done, of late years, in the hope of annulling these drawbacks without impairing the antitoxic strength of the serum: see, *inter alia*, Dr. Bauzhaf's paper on "The Preparation of Antitoxin," *Bull. Johns Hopkins Hosp.*, April, 1911. In a very small minority of these cases of "serum-sickness," the effects of the serum are more grave; and, in a few cases, they have even been disastrous. More than one method has been devised against this very rare emergency. The remoteness of the danger, in any given case, may be judged by the fact that millions of doses of antitoxin have been given without harm of any kind (see *Brit. Med. Journ.*, May 18, 1912).

The name "anaphylaxis," which is now given to this abnormal sensitiveness to the properties of a serum, was first used by Richet, in another connection, in 1902. In its widest sense, the word covers such idiosyncrasies as the occurrence of a rash from eating shell-fish. In relation to serum treatment, there are two types of this hyper-sensitiveness. In the one type, the patient is naturally hyper-sensitive. In the other type, the patient showed no ill-effects from a first use of serum, but was found, on a second use, not less than a fortnight after the first, to have become, in the interval, markedly hyper-sensitive.

So far as the treatment of diphtheria is concerned, it is probable that not one case in a thousand is put to any serious trouble by antitoxin: and it is certain that the lives saved must be reckoned, every year, in thousands. In August 1910, the Local Government Board issued an Order empowering the metropolitan Borough Councils to provide diphtheria-antitoxin for the poorer inhabitants of their districts. This good example has been followed by municipal authorities all over Great Britain. The value of the antitoxin is well shown, in London, by the annual Reports of the Metropolitan Asylums Board. In the Board Hospitals, the antitoxin was first used about November 1894. Before its use the average death-rate of the disease had been 30 per cent: it now is 8.5 per cent. In the more serious cases, the laryngeal cases, it was 62 per cent in 1894, and now is 14.9 per cent. In the tracheotomy cases, it was 70.5 in 1894, and now is 29.3 per cent.

Dysentery.—In bacillary (not amoebic) dysentery, the value of a serum-treatment, such as Shiga's, seems by this time to be widely recognised. The earlier results with Shiga's serum were brought before the Royal Commission on Vivisection by Dr. C. J. Martin, Director of the Lister Institute (see *Minutes of Evidence*, iii, 221, July 10, 1907). Rüffer and Willmore have lately published, in the *Brit. Med. Journ.*, 1910, ii, 1519, some good results, with a serum-treatment, in cases of bacillary dysentery at the El Tor pilgrim-camp; even in the "very severe and frequently gangrenous type of the disease found in the aged and worn-out class of pilgrims." In those cases which were of a purely bacillary type, the death-rate in 1909 had been 64.4 per cent; but during 1910, when the serum treatment was used, the death rate was only 10.8 per cent. It would be wrong to put great emphasis on one set of experiences even so favourable as these; but they do not stand alone.

Heart, Diseases of the.—The disorders and diseases of the circulatory system are of themselves sufficient for the study of a life-time: and the literature concerned with them is immeasurable. Among the more important subjects of recent investigation are (1) the bacteriology of ulcerative or septic endocarditis, (2) the tonic action of adrenalin on the heart, (3) the causes of diverse forms of arrhythmia. During 1910-12, arrhythmia has been studied to its finest issues, and the many constituent forces of the heart-beat have been sorted-out and measured and recorded, with wonderful minuteness, by the methods of electro-cardiography.

"The principles of electro-cardiography," says Dr. Coombs, "may be briefly stated thus. (1) A contracting muscle is comparable to a galvanic cell; the active end of the muscle is the negative pole, the passive end is the positive; and a current passes through the muscle as through the cell, from positive to negative—that is, from passive to active. It follows that when the contraction-wave reaches the middle of the muscle there is no current; and that as it passes this equator the direction of the current becomes reversed. (2) These 'action-currents' are set up in the heart-muscle in the course of each rhythmic contraction, and can be 'led-off' from the body by attaching suitable electrodes. Different 'leads' are used; the best leads-off are from the right arm or hand (corresponding to the base of the heart) and from the left leg or foot (corresponding to the apex). (3) By connecting these electrodes with a delicate recording instrument—it is the delicacy of Einthoven's string-galvanometer¹ which has made electro-cardiography applicable to clinical research—graphic records of the variations in the electrical potential of the heart may be obtained."

Dr. Waller, in his Hitchcock Lectures, *Physiology the Servant of Medicine* (University of London Press, 1910), gives a full account of this method, of which he may indeed be called one of the discoverers:

"To complete an effective circuit between one's heart and a galvanometer, all that is

¹ See *Proc. Roy. Soc. Med.*, April 1912.

necessary to do is to dip the right hand and left foot into a couple of pots or pans containing salt-solution, from which wires lead off to the two ends of the galvanometer. I did this some twenty years ago, and I remember, as if of yesterday, the keen pleasure with which I first witnessed the electrical pulsations of my own heart."

Malta Fever.—As in Malta, so in Gibraltar, Malta fever—it is called "Rock fever" in Gibraltar—has been stamped out from the British garrison by prohibition of the goats' milk which was the source of infection. More recently, it has been stamped out at Port Said: all imported goats were tested for the disease, and those which showed signs of infection were slaughtered. (Ross, *Journ. R.A.M.C.*, 1911, p. 618). The fever is very widely distributed; thus, it is not uncommon in South Africa (Garrow, *S. African Med. Journal*, 1911, p. 51); and a little group of cases was lately found, under the usual conditions of occurrence, in south-west Texas (Ferenbaugh, *Journ. Amer. Med. Ass.*, 1911, ii, 730). Sir David Bruce, at the annual meeting, 1910, of the Research Defence Society, described the discovery of Malta fever in the district of Ankole, on the eastern shore of Lake Albert Edward. The native name for the fever, in this part of Uganda, was "muhinyo." He examined some 50 cases of the disease. The symptoms were those of Malta fever; the *micrococcus Melitensis* was found in the blood of two of the cases; the tests and reactions were those of Malta fever, and the usual evidence of infection was found among the goats of the district (See also *Journ. R.A.M.C.*, 1910, p. 527).

Meningitis, Epidemic Cerebro-spinal.—In this terrible disease, the use of a serum treatment is by this time generally recognised as the best possible method. The first use of Flexner's serum—it is his work at the Rockefeller Institute which founded the present understanding of the nature of epidemic meningitis and the present treatment—was in 1905; the earlier results of the serum treatment (New York, Belfast) are already noted in *E. B.* xviii, 131b. Later results, in France, were published in the *Annales de l'Institut Pasteur*, February 1910. Of 402 cases with a serum treatment, 66 died=16.4 per cent. The ordinary death-rate from the disease, under other methods of treatment, is 70 per cent. Figures collected far and wide, from many contributors, are sometimes viewed with distrust. But, with cerebro-spinal meningitis, we have that best of all object-lessons, the continuous experience of a good hospital. In the Children's Hospital, Boston, U.S.A., the death-rate in cases of epidemic meningitis, year after year, without the serum treatment had ranged between 60 and 80 per cent. In 1908, with the serum treatment, it came down with a run to 20 per cent.

For recent facts in Great Britain, see Reports to the Local Government Board on Public Health and Medical Subjects, new series, No. 61 (*Brit. Med. Journ.*, 1912, i, 383).

As with diphtheria, so with this cerebro-spinal fever, much attention has lately been given to the subject of "carriers." By long study and experiment, it has been found certain that persons who have been in close association with cases of the disease, or have themselves suffered from an "abortive attack," may be able to spread the infection: and there seems to be valid evidence that the number of carriers, in time of an outbreak of the disease, may be as high as 20 or even 30 per cent of the persons bacteriologically examined: it may be even higher, among members of a family in which there has been a case. The spread of the knowledge of these facts will doubtless make people careful to take precautions, and to submit themselves for bacteriological examination, if there is any reason to think that they may be carrying the germs.

Mental Disorders (Neuropathology).—It may sound old-fashioned, and unscientific, to use the phrase "mental disorders," seeing the magnificent work which is being done on the chemical, physical, structural changes which attend diseases of the brain, and the steady advance towards a comprehensive statement of these diseases in terms of general pathology. The researches of Dr. F. W. Mott and others hardly leave room for doubt that the best work, henceforth, will be done on these lines. Still, the work of the psychologists has a distinctive value of its own: and the full time has not yet come for chemistry and bacteriology to administer the new kingdom which they appear to be entering.

In the purely psychological study of mental disorders, much interest has lately been roused by Freud's system of "psycho-analysis"—that is, the slow and exhaustive tracking-out and uncovering of some forgotten or hidden experience which was the starting-point of the present obsession of the patient's mind. The past is dissected back and back—and the process may go on for years—till something is found which explains everything and may itself be explained to the patient as the primal cause of his or her perversion. This underlying or subconscious something which is at last reached and detected—it may be after a year or more—is something sexual. "I can only repeat afresh," says Freud, "the principle which I have never found otherwise than true, that sexuality, in the main, is the key to the problems both of the psycho-neuroses and of the neuroses. He who disdains to use this key will never be in a position to solve them."

Freud's position has been hotly criticised: and, though his contention were true, yet the fact remains that very few have either the skill or the desire to be inquisitors on this grand scale: and the danger remains, that the inquisitor into "psycho-neuroses" may put into the patient's mind what he subsequently finds there.

Among those who suffer from obsessional habits or thoughts, many receive benefit from treatment by suggestion. It is perhaps in cases of this kind that this treatment—which may or may not be with "hypnotism"—gains some of its most signal and valuable successes.

Pellagra.—To heighten the interest of the problems of pellagra, a few cases of the disease have recently been found in the British Islands; see the paper by Dr. Sambon and Dr. Chalmers, "Pellagra in the British Islands," *Brit. Med. Journ.*, October 26, 1912. It is but a very few cases, at present, which have been found: but we may be sure,—seeing the endemic nature of the disease, its insidious onset, and its resemblance, in the final stage, to other forms of delusional insanity,—that where a few cases have been found, more are waiting to be found. In Italy, pellagra has been endemic for centuries. It occurs, also, in Spain, southern France, Hungary, Rumania, and Algeria. So far back as 1893, Dr. Sandwith recognised its presence in Lower Egypt; and his paper on the subject (*Brit. Med. Assn.*, Edinburgh Meeting, 1898) is the earliest full account in English of pellagra.

The story of the finding of pellagra in the United States is a remarkable chapter in the history of diseases. Before 1907, its existence was not generally known. "It was not until 1907, when Drs. J. W. Babcock and J. J. Watson raised the alarm, that pellagra became a subject of inquiry in the United States." Now, we know that the disease prevails in no less than thirty-three States, and that there are thousands of indubitable cases on record. "Recent importation, and spontaneous origin, are quite out of the question. Only centuries of the prevalence of the disease can explain the wide range of pellagra in North America, extending from the Atlantic to the Pacific Ocean and from the Gulf Coast to the Great Lakes; especially when we consider the peculiar topographic distribution of the disease, which, in America as in every other affected country, is limited to the foreland or 'Piedmont Section' of mountain ranges, and more particularly to the valley tracts of swift-flowing streams." A full account of the disease in the United States has been published by Dr. Niles, *Pellagra, an American Problem* (Saunders, Philadelphia, 1912).

The Transactions of the Society of Tropical Medicine and Hygiene, v, 3, 1912, contain two important papers, (1) "Pellagra in Nyasaland," by Dr. Hugh Stannus, (2) "Pellagra in Thirty-five States of America," by Dr. Sandwith. In the discussion on these papers, Dr. Sambon referred to the researches which he and Dr. Chalmers had lately made in Italy, Rumania, Hungary, and Spain. It is evident, as he says, that "this grave disease is much more widely distributed and far more prevalent than had been imagined."

Sambon's theory—founded on years of careful study of pellagra in many countries, with special regard to its geographical conditions and its mode of incidence—is that the disease is an infection, probably protozoal, like malaria, and probably conveyed by *Simulium*, a species of midge: and there is evidence that this view of the disease is gaining more acceptance than the older view, that pellagra is due to the eating of infected

maize or corn. Still, it is not impossible that, years hence, some modified form of the maize-theory may be put forward which shall be more or less adaptable, at some level not yet reached, to the theory of an insect-borne infection. At present, the latter theory is rapidly growing in favour: and the discovery of undoubted cases of pellagra in the British Islands strengthens its claim.

Phlebotomus Fever (Sand-fly fever).—In Malta, Crete, Dalmatia, Egypt, and India, there has long been known a common type of fever, which mostly went by the name of "simple continued fever." Its chief months of occurrence are between June and October: it is characterised by sudden onset, with pain and stiffness of the muscles: it is of short duration, and not dangerous to life: it leaves no permanent ill-effects; and the patient rarely suffers a second attack. During the past few years, the nature of this fever has come to be clearly understood.* Its distribution, seasonal prevalence, and conditions of occurrence indicated an insect-borne infection: and suspicion rightly fell on the sand-fly (*Phlebotomus*) as the probable agent. By a long series of experiments on volunteers (see Birt, *Journ. R.A.M.C.*, Feb. 1910) this suspicion was verified. It was proved, that sand-flies do convey the infection from man to man; that the blood is infective on the first day of the fever; that the fly becomes infective seven days after biting, and remains infective for ten days, or longer; that the incubation-period of the fever may vary from three days and sixteen hours to seven days; that the fever may also be induced by direct transmission of infective blood, and that the virus of sand-fly fever, like those of yellow fever and of cerebro-spinal fever, will pass through a fine Chamberland filter. The habits and breeding-places of *Phlebotomus* have been very minutely observed: and some progress has been made toward a reduction of the fever by protective measures. For example, the *Journal of the R.A.M.C.*, xix, 4, October 1912, contains an article by Col. Robinson and Major Blackham, on "Sand-flies and Sand-fly Fever on the North-West Frontier of India." To the fever, in this part of India, the name of "Chitral fever" was given, in 1906, by Col. McCarrison. Two types of the fever are found in the Peshawar Valley, a three days' and a seven days' fever. The writers recommend, as preventive measures (1) the use of netting of an extra-fine mesh, (2) the use of a strong punkah or electric-fan, (3) the counter-attraction of a bright lamp, (4) early isolation of cases, (5) evacuation of barracks. This last measure "has been tried extensively in this Division at Drosh. The Fort, which has hitherto been a hot-bed of sand-fly fever, was evacuated by June 1, 1911." The number of cases, which in 1910 had been 75 per cent among the native troops, was in 1911 only 27 per cent. "Other factors contributed no doubt to this happy result, but the evacuation of the barracks was undoubtedly the main one."

The Pituitary Body.—From the time of Pierre Marie's classical work, some thirty years ago, on acromegaly, the fact has been recognised that the pituitary body, a minute glandular structure at the base of the brain, exercises a profound effect on the general growth; and, as science gained more insight into the activities of the thyroid gland, the suprarenal capsules, and the parathyroid bodies, so the pituitary body likewise became an object of exact study by all possible methods of scientific observation. Within the last few years, it has been brought within the range of operative surgery. Certain operations have been performed in cases of disease of the pituitary body in man; and, for therapeutic use, an extract has been made of pituitary substance.

Much has been learned by the experimental removal of the pituitary body in animals. See the very important papers in the *Bulletins of Johns Hopkins Hospital*, May 1910 and June 1911. For a detailed study of the whole subject, from all points of view, we now have Dr. Harvey Cushing's book, *The Pituitary Body and its Disorders* (Lippincott, Philadelphia and London, 1912).

Plague.—In the winter of 1910-1911, came the outbreak of septicæmic and pneumonic (not bubonic) plague in Manchuria. For this outbreak, see the Report of the International Plague Conference held at Mukden, April, 1911, Pp. 483 (Manila, Bureau of Printing, 1912). See also Dr. Douglas Gray, *Lancet*, 1911, 1, 1152.

The Proceedings of the Royal Society of Medicine, November 1911, contain Dr.

Reginald Farrar's account, from personal observation, of this Manchurian plague; they contain also the discussion on his paper. He gives the evidence of plague occurring among the marmots.

"The first human victims claimed were probably trappers who hunt and trap this animal for the sake of its fur. After an explosive outbreak in Manchu-li, the frontier town of Siberia and Manchuria, and in Harbin, it was rapidly carried south along the railway and the roads by the hordes of Chinese coolies from Shantung, who migrate every year into Manchuria for the soya-bean harvest, and return home to worship their ancestors at the Chinese New Year. . . . The difficulties of sanitary administration were enormously enhanced by international diplomatic complications. The virulence of the infection was such that in many instances whole families and large households were mown down by the disease; and its fatality so appalling that out of more than 40,000 cases only three recoveries are claimed. . . . None dared give shelter to a stricken patient, and the sick were often thrust out into the streets to die. Those who died were often hidden under the roofs of their houses, or in other places of concealment. Burial was impossible, for the temperature of Manchuria in winter is often 40° below zero, and the ground is frozen hard to a depth of more than 3 feet.

" . . . When, however, we come to consider in cold blood the actual extent of this epidemic, we are surprised to note that its real proportions were, in fact, relatively small; we find that it was brought under control with comparative ease, despite the complete absence at the moment of its outbreak of an organised sanitary service in China; and the limitation of the epidemic rather than its extension is found to be the factor that requires explanation."

Dr. Farrar is of opinion that the limitation of the epidemic was due to the absence of rat infection, and to sanitary administrative measures.

In Suffolk, in the autumn of 1910, four cases of pneumonic plague suddenly occurred in one household; see the paper by Dr. Brown and Dr. Sleigh, *Brit. Med. Journ.*, November 12, 1910. The *bacillus pestis* was found in two of them, and there seems no reason to doubt that they were typical cases of the disease. A memorandum was accordingly issued by the Local Government Board, giving instructions as to the danger of rat infection. It will be remembered that small outbreaks of the disease, during the last twelve years, have occurred in more than one of the chief British ports.

Polio-myelitis, Epidemic.—Polio-myelitis (infantile paralysis) accounts for a very large proportion of the inmates of Cripples' Homes; and cases of it come daily to the out-patient departments of the great Hospitals. Yet, in Great Britain, the fact has only lately received general recognition, that infantile paralysis, like epidemic meningitis, must be reckoned among the infective diseases. In Great Britain it never attains to the ways of a great epidemic disease; but in other countries—America, Australia, Norway and Sweden—it reveals, by the severity of its epidemics, the sure signs of infection from child to child. Indeed, there are instances of the utmost infectivity, e.g. during an epidemic of 200 cases in a town in Nebraska, July 1909. "Numerous families had several children, all of whom were attacked by the disease: thus, in one family of six children, all were affected; in another family of six, four cases occurred; in a family of five, four cases occurred; and in a family of four, all were attacked. Some of the cases illustrate the infectivity of the disease. Thus, a woman went with her child to the wedding of a sister, in whose house a younger sister was ill with the disease. The mother with the child returned home, and nine days later one of her own children showed symptoms of paralysis. In an adjoining house there lived a family of six children, all of whom developed the disease. A woman who came to visit this family brought her baby; in four days it died of the disease." (Seidler, *Journ. Amer. Med. Ass.*, Jan. 22, 1910).

For a short historical review of some of these epidemics, see Dr. Batten's paper on "The Epidemiology of Polio-myelitis," *Proc. Roy. Soc. Med.*, June 1911. For a minute study of the clinical and pathological aspects of the disease, see the monograph by Drs. Peabody, Draper, and Rochez, *A Clinical Study of Acute Polio-myelitis* (Rockefeller Institute, New York, June 1911.) Finally, we have the Huxley Lecture, given by Dr. Flexner, in November 1912, at Charing Cross Hospital. It is to him, more than to any man, that we owe our present knowledge of the nature of epidemic polio-myelitis. From his laborious and successful study of epidemic meningitis, he advanced straight to this

further series of problems: and his Huxley Lecture (*Brit. Med. Journ.*, Nov. 9, 1912) is likely to be one of the classics of medical literature. No excuse is needed for quoting from it:—

“Polio-myelitis has been endemic in northern Europe for many years, but it is only five years since it started on that unique, and as yet unexplained movement that has carried it around the globe. . . . Some significance attaches to the fact, that the first two foci of the present epidemic—I say present, because since 1907 the disease has prevailed severely each summer and autumn at some places in the United States and Canada—arose in the Atlantic Coast cities and in the State of Minnesota in the middle West. The former receive the mass of emigrant population from Europe, and the latter, secondarily, the large contingent of Scandinavian emigrants. . . .

“Five years ago the mystery of the disease was wholly unfathomed. The outlook was suddenly brightened when Landsteiner and Popper, in 1909, announced the successful transmission of polio-myelitis to monkeys; but the high hopes raised were as quickly damped by the failure to propagate the experimental disease beyond the first generation. This obstacle was immediately removed when intracerebral was substituted for intraperitoneal inoculation, as was done by Lewis and myself, and by Landsteiner and Levaditi. By this means the disease could be, and has been, transmitted through an indefinite number of monkeys. . . .

“The virus of polio-myelitis passes readily through the more coarse and slightly through the finest filters. It is highly resistant to drying, heat, and chemical action. In dust, especially within protein matter, it survives weeks and months; in diffuse daylight indefinitely, and resists the action of pure glycerine and carbolic acid in one-half per cent solution for many months. When animal tissues containing the virus suffer softening and disintegration or disorganisation by mould, the virus survives. Recovery from polio-myelitis in man and monkey is attended and produced by an immunisation of the body. During this process microbicidal substances appear in the blood that are capable of neutralising the active virus. . . .”

Dr. Flexner goes on to give the evidence that the nasal mucous membrane is the usual way alike of ingress and of egress of the virus in cases of the disease. He discusses also the question of insect carriers, and of human carriers; the possibility of “reservoirs” of the virus among domestic animals, and the present position of treatment.

Relapsing Fever.—The infecting agent of relapsing fever (famine fever), the “spirillum Obermeieri,” is conveyed from man to man, like the infecting agents of many other fevers, by the bite of insects. The fever is thus akin to other forms of spirillum infection, or “spirochaetosis,” such as the spirochaetosis of fowls. Mackie, in India, first showed that body-lice are capable of conveying relapsing fever; and Bousfield (*Jour. R.A.M.C.* 1910, ii, 444) has published evidence of a similar way of infection in the Sudan. Other observations, e.g. in Russia, tend to prove that bugs convey the disease. And in the Western States of America, e.g., Montana, California, Idaho, there seems to be some evidence that it may be conveyed by cattle-ticks. Major Marjoribanks, I.M.S., speaking of the transmission of the fever by body-lice, puts the matter well:—

“What is the practical use of this discovery? Simply this, that the subject of relapsing fever has been lifted from the sphere of curative medicine into the far higher sphere of preventive medicine. Formerly, all we could do was to send our native assistants into infected villages with febrifuges and other paraphernalia of curative medicine. But now we can strike at the disease at the root, and, by destroying the lice on the bodies of patients, prevent its spread. The details of the campaign have still to be worked out. My own suggestion to village officers so far has been that a cauldron should be set up in each infected village, and the clothes of the patient boiled in it to destroy the lice. Other methods will suggest themselves as we gain experience: this is a bit of preventive medicine in the making.”

Sleeping-Sickness.—Dr. Sandwith, in his Gresham Lectures for 1912,¹ has told the whole story of Sleeping-Sickness, from the time of Livingstone till now. Under “Present Research Work,” he writes as follows:—

“Important investigations are being carried out under the re-constituted Sleeping-Sickness Commission in Central Africa appointed by the Royal Society, consisting of Sir David and Lady Bruce, Captain A. E. Hamerton, D.S.O., and Major D. Harvey, to find out the reason why, although man and his domestic animals have been removed from the shores of the Lake Victoria Nyanza for some three years, *Glossina palpalis*, caught on the north shores of the lake, still continues to infect susceptible animals when allowed to feed on them for experimental purposes. Their prime object is to investigate the part played by African fauna in the maintenance and spread of sleeping-sickness.

¹ *Sleeping-Sickness*, by F. M. Sandwith, M.D., F.R.C.P. Macmillans, 1912.

"The effect of the depopulation of the country was to make a two-mile area on the north shore of the lake practically a game preserve, frequented by many kinds of antelope, hippopotami, and wild pig. The late Commission set themselves the task of finding out whether this game, and especially the antelope, were capable of harbouring the parasite, being thus a perpetual reservoir from which the fly could get fresh infective material. Very complete experiments were carried out, and it was found that antelope are very readily infected with trypanosomes from flies previously infected with human trypanosomiasis, and that the blood of the artificially infected antelope again infects other susceptible animals if the *Glossina palpalis* acts as an intermediary carrier. In no single case, among many animals experimented on, was the health of the antelope in any way affected. From a paper published by the Royal Society in February 1912, we learn that one of Sir David Bruce's artificially infected antelopes still contains, after 327 days, *Trypanosoma gambiense* in its blood.

"It has now been proved that antelope living in fly-areas in N. Rhodesia and Uganda are naturally infected by the two human trypanosomes of sleeping-sickness. This is a sufficient explanation for the continued infectivity of the fly round the lakes. It is important to find out whether other wild game can, and do, act as a host of the parasite. It has already been suggested that the wild game in sleeping-sickness areas should be destroyed, but the British Government is unwilling to authorise any such wholesale extermination of animals, which might be wanted for food, until it has been more satisfactorily proved that the game are the chief reservoir of the parasite.

"... Every fresh discovery tends to increase the complexity of the problem how to deal with the question of prevention. It is now known that the fly remains infective, after feeding on infected blood, for 96 days, and possibly for the entire course of its life; that not only the *Glossina palpalis*, but also the far more plentiful *Glossina morsitans* is implicated; and now we must assume that an inexhaustible supply of infective material can be drawn by both these flies from innumerable reservoirs among wild game, and also among cattle and other domestic animals, because they can be infected so easily by experiment."

Happily, the work of protective administration has not been annulled by these further problems of science: and good work has been accomplished, under conditions of the utmost difficulty, toward holding the disease in check. It is worthy of note, that since the way in which the disease spreads was discovered, the annual death rate from sleeping-sickness on the Uganda shores of the Victoria Nyanza has fallen from 8,000 to 500. There are several causes for this happy reduction; but chief among them may be reckoned the present measures of protection and prevention to which men of science have been led by the help of experiments on animals.

Again, though no specific treatment has yet been discovered for the disease, such as quinine for malaria or antitoxin for diphtheria, there is much to be gained by treatment, if the conditions allow of continuous treatment. Unhappily, these favourable conditions, as Dr. Sandwith points out, are to be obtained in the few European cases, not in the vast multitude of the native cases:—

"The native does not usually come under treatment till he has developed the final and most serious symptoms, when his fate is sealed, and when the treatment can do no more than alleviate his sufferings and make his death less painful. Even if the negro presents himself for treatment at an earlier stage, and is apparently cured, he returns to the infected area, and his naked body is again a target for every hungry tsetse-fly, so that he may succumb to a fresh infection at once.

"But in the European the outlook is more hopeful. In most cases he comes to the doctor when he feels the first symptoms, and directly trypanosomes are detected in the blood he is sent out of the country and is safe from fresh infection. He submits to continuous treatment, and does not attempt to escape from his advisers—as the negro does when his condition begins to improve and he yearns for liberty from hospital confinement." (Sandwith, *loc. cit.*)

Sir Patrick Manson has reported two European cases: one, after 2½ years of treatment, has gained 30 lbs. in weight, and, though not absolutely cured, is well enough to walk three miles without fatigue: another, a lady, is in good health more than ten years after the onset of the disease. Among European cases which have ended fatally, there is the case of Lt. Forbes Tulloch, R.A.M.C., of the Royal Society's sleeping-sickness Commission in Uganda: he cut himself, dissecting an infected rat; trypanosomes soon appeared in his blood, and, after an unusually rapid course, the infection ended in death (June, 1906), within a few months. If any student of tropical medicine wishes to form an estimate of the volume of work done in the last few years on sleeping-sickness, he must

look at the Bulletins of the Sleeping Sickness Bureau. (This admirable Bureau, in July 1912, moved from Burlington House to the Imperial Institute: and it now is called the Tropical Diseases Bureau.)

Syphilis.—Great help has lately been given, toward the detection and study of the germs of this disease, the *Spirochaeta pallida*, by the use of lateral illumination of a dark microscope-field. The lateral rays of light are condensed by a parabolic reflector, and the central rays are cut off by a diaphragm. The spirochaetes show white against a black background. By the addition of micro-photography to this method of lateral illumination, "living pictures" have been obtained for the cinematograph.

For the diagnosis of past syphilis, and for the differential diagnosis between syphilitic and non-syphilitic lesions, the Wassermann test is of great importance, and has already become the subject of an extensive literature. See, *inter alia*, "The Wassermann Serum Reaction and Ehrlich's Salvarsan," by Carl H. Browning, M.D., and Ivy Mackenzie, M.B. (Constable, 1911.) See also a paper by Lt.-Col. Birt, in the *Journal of the R.A.M.C.*, September 1912, with a series of cases where, without the use of this test, "treatment would have been inappropriate, diagnosis would have been haphazard, prognosis mistaken, and the claims of the patient against the public would have been wrongly assessed."

The discovery and study of *Spirochaeta pallida* made it possible to observe the direct action of drugs on the living cause of the disease, under the microscope, and in the blood and tissues of experimental animals: the disease was brought into line, for the work of science, with other forms of spirochaetosis. In the latter half of 1909, came the news of Ehrlich's discovery of "salvarsan." Ehrlich gives an account of his own work in *Die Experimentelle Chemotherapie der Spirillosen* (Berlin, Julius Springer, 1910), by himself and S. Hata. Ehrlich had long been working at the arsenical compounds, *e. g.* atoxyl, arsacetin, in their bearings on syphilis: and, from these compounds, he and his fellow-workers advanced to the discovery of salvarsan. This arsenical compound (dioxydiamidoarsenobenzol, $C_{12} H_{12} N_2 O_2 As_2$) has also been called "606," and Ehrlich-Hata; a later modification is called neo-salvarsan, or "914."

No event in therapeutics since the discovery of diphtheria antitoxin has caused more wonder than the rapid and powerful action of this new weapon against syphilis. Even a single dose is capable of bringing to a sudden end the manifest signs of the disease. To be able to see, under the microscope, the destruction of spirochaetes by one dose of salvarsan, is to realise that the use of this "therapia sterilisans magna" is the greatest advance that has been made, within the memory of man, in the fight against syphilis.

It would be, in the common phrase, "too good to be true," if the use of this drug were absolutely free from risk. Salvarsan is not a drug to play with. A careful estimate of this risk has been made by Lt. Col. Gibbard, Major Harrison, and Lt. Cane: see the *Journal of the R.A.M.C.*, September 1912, for their paper on "Salvarsan and Neo-salvarsan in the Treatment of Syphilis." They point out the shortening, by salvarsan, of the period of "inefficiency" in Army cases of the disease. They refer as follows to the element of risk in the use of salvarsan: "We may say at once that in 43 subcutaneous or intra-muscular and 1613 intravenous injections, we have not experienced any untoward incident; while Wechselsmann states that, in the course of over 12,000 injections, he has not had any death which could be attributed to salvarsan. When we consider that probably more than a million injections must have been given, all over the world, fatalities amounting even to a fraction per thousand of the injections could not have been concealed, and would have filled a prominent place in the literature." (For the whole subject of syphilis, see *Proc. Roy. Soc. Med.*, v, 9, October 1912: Supplement. Pp. 214).

Tuberculosis.—In July 1911 the British Royal Commission on Tuberculosis, after no less than ten years of enquiry, issued its Final Report, founded not only on the experimental work done at Lord Blyth's farms and elsewhere, but on a vast extent of clinical, pathological, and statistical evidence. The principal findings of this Final Report are to the following effect: (1) In many cases, human tuberculosis is identical with bovine tuberculosis. (2) Tuberculosis is transmissible from mammals to man

and from man to mammals. (3) Tuberculosis is transmissible to man in the milk or the meat (pork or beef) of tuberculous animals. The risk of infection from birds (avian tuberculosis) is negligible. (4) There are three types of the bacillus of tubercle: human, bovine, and avian. (5) The bacillus of lupus is of the bovine order, but is of a modified type, and is not identical with bovine tuberculosis. (6) Strict supervision of the meat-trade and the milk-trade is of the utmost concern to the public health, especially in regard to infants and young children; and no relaxation of the present restrictions is permissible.

On January 1, 1912, pulmonary tuberculosis (consumption) was made one of the compulsorily notifiable diseases in England. The preliminary steps towards this measure are of interest. The municipal system of voluntary notification, with partial isolation, introduced by Dr. Newsholme in Brighton, gave encouragement toward further action. In 1908, the Local Government Board, taking advantage of its powers under the Public Health Act, issued the Public Health (Tuberculosis) Regulations, 1908, making the notification of consumption compulsory in all Poor-law cases of the disease, whether institutional or district. In 1911, it issued similar Regulations for all in-patients and out-patients of Hospitals and Dispensaries other than Poor-law institutions. Having thus covered two-thirds of all cases, it covered the remaining third on January 1, 1912.

In the last few years, great attention has been given to the use of "auto-inoculation" as a factor in the treatment of tuberculous disease; and to the relation of graduated exercises to auto-inoculation. Much work has also been done on the efficacy of bovine tuberculin for the treatment of tuberculosis of human origin, and the efficacy of human tuberculin for the treatment of tuberculosis of bovine origin. Along these lines, a notable advance has been made, in Germany and in the United States, toward the saving of calves born of tuberculous cows. The principle of the method has been stated as follows: "If a calf is born of a tuberculous cow and left with its mother, the calf dies. If the calf is inoculated with small doses of bovine tuberculin the calf will also die. But if that calf is taken away from its mother and inoculated with small doses of human tuberculin, the calf will live and will be able to return to the herd from which it came."¹

Typhoid Fever.—During 1910-12, the house-fly has been marked down as an important agent in the spread of typhoid fever, and, probably, of other infections. The fly does not act as an intermediate host of the *bacillus typhosus*: it does not afford such opportunities to these germs as the *Anopheles* mosquito affords to the protozoa of malaria: it simply conveys the germs, on its feet, from infective substances to our food. A full account of the subject will be found in Dr. L. O. Howard's book, *The House Fly, Disease Carrier* (Murray, 1912). The use of a protective vaccine against typhoid fever is steadily gaining ground, and there is no longer any room to doubt its validity. We have only to hope that it may be made, by further work, more efficient and more lasting. Meanwhile, we have reason to be glad of the good results which have already been obtained. Two sets of figures come to be noted here: they are concerned with the British Army in India, and with the Army of the United States.

(a) Sir William Leishman, in his address to the Glasgow Medico-Chirurgical Society on "Anti-typhoid Inoculation" (*Brit. Med. Journ.*, Feb. 17, 1912), said that "for 17 years prior to 1907 the annual number of admissions had averaged 1406, with an average of 353 deaths. In 1905, anti-typhoid inoculation was introduced as a voluntary measure; and, while at first not largely utilised, was by 1907 being taken advantage of by the troops in increasing numbers. Since that date, the admissions from enteric had fallen steadily, till in 1910 they numbered only 296, with 45 deaths." Col. Firth, in his paper on "Recent Facts as to Enteric Inoculation and the Incidence of Enteric and Paratyphoid Fevers in India" (*Journ. R.A.M.C.*, Aug. 1912) says that the whole series of facts indicates "that against enteric fever the value of inoculation as now

¹ See Major Cummin's paper on "Primitive Tribes and Tuberculosis," with discussion: *Trans. Soc. Trop. Med. and Hyg.*, June 1912.

practised is most marked, and the case in favour of the procedure much strengthened by our experiences during 1911."

(b) President Taft, at a medical banquet given to him in Philadelphia, on May 4, 1911, spoke as follows:—

"We have a division of 18,000 men in Texas and California. They have been there for two months, living under canvas, and in a country soaked with rain and deep with profanity-provoking mud. But so effective have been the regulative and preventive methods adopted to reduce sickness, that the percentage of sick men is less than it was in the posts from which these men were mobilised. I need not recall the dreadful record of sickness from typhoid fever in the camps at Chickamauga and other camps established during the Spanish-American war. The percentage of typhoid cases was so high that it is hard to believe. Of 120,000 men there were 20,000 cases, with a mortality of 7 per cent. Of the volunteer regiments mobilised during the Spanish-American War, 90 per cent became infected with typhoid fever within eight weeks from the date of mobilisation. To-day, two months after mobilisation, with the modern health regulations, and by the use of vaccination against typhoid, not one case of typhoid fever has appeared in the entire force, except that of one teamster who was not vaccinated."

A few weeks later, in the autumn of 1911, an Army Order was issued, that the protective treatment against typhoid fever was to be made compulsory in the United States Army on all officers and men under 45 years of age; excluding, of course, those who had already suffered from the fever. The total number of men to receive the treatment was 76,000.

In 1912, it was stated that a similar measure was to be adopted in the United States Navy (See *Brit. Med. Journ.*, Feb. 3, 1912). See also, on this point, Dr. Ford's paper on "The present status of the anti-typhoid campaign in Germany" (*Johns Hopkins Hosp. Bulletin*, Sept. 1912), and Dr. Vincent's results with anti-typhoid inoculation in Morocco (*Brit. Med. Journ.*, Jan. 6, 1912).

Much attention has lately been given to the important subject of carriers of typhoid and paratyphoid fever. See, *inter alia*, Dr. Bainbridge's paper, with discussion, on "The Etiology and Epidemiology of Paratyphoid Fever and 'Food-poisoning'" (*Proc. Roy. Soc. Med.*, Feb. 1911) and Dr. Hamer's paper, with discussion, on "Typhoid Carriers and Contact-Infection" (*ibid.*, April 1911). The whole subject has been reviewed in an authoritative volume by Dr. Ledingham and Dr. Arkwright, of the Lister Institute, *The Carrier Problem in Infectious Diseases* (Arnold, London, 1912).

This question of carriers came into public notice, in 1910, over an outbreak of illness in Wrexham, which affected 107 persons, with 5 deaths. The cases presented signs of paratyphoid infection; and the epidemic was associated with the eating of pork pies from a certain bakery. The bakehouse was sanitary; the meat was wholesome; the pies had tasted all right, and no chemical poison was found in them. But paratyphoid bacilli were found in them, and in blood from the heart of one of the fatal cases;¹ and, in several cases, after recovery, a blood-test gave evidence that they had suffered from paratyphoid infection. One of the staff at the bakery, apparently in perfect health, was found to be a carrier of paratyphoid bacilli identical in type with those found in the pies and in the blood from the fatal case. The opinion of the experts was, that this outbreak of "food-poisoning" was a genuine epidemic of paratyphoid fever, due to infection with "paratyphoid B bacilli;" and that the probability was "practically conclusive" that the carrier was the source of the infection.

The existence of typhoid carriers is a sure fact; but opinions differ as to the measure of danger of infection from them. Dr. Theodore Thomson, in his address on "The Enteric-fever Carriers" (*Proc. Roy. Soc. Med.*, Nov. 1910), estimates that 3 per cent of typhoid cases continue, after recovery, to be "chronic carriers;" and he thinks the estimate would be higher if more general use were made of bacteriological examination of the excreta after recovery from the disease. On a few occasions, evidence has been brought forward as to typhoid carriers which may, without offence, be called sensational. "The most noteworthy example," says Dr. Theodore Thomson, "is that of the Folke-

¹ It is to be noted, as a sign of the virulence of the infection, that this fatal case seems to have infected three persons attending on her, one of whom died.

stone cowman. There is every reason to believe that to this man might be attributed 64 per cent of the cases of enteric fever that occurred in Folkestone during the period 1806-1909; the total number of cases during this time was 222." A similar case, in New York, was that of "Typhoid Mary," to whom many cases of typhoid were traced; she was compelled therefore to submit to a very long period of isolation. But the authorities are not agreed that every typhoid carrier is dangerous to the community: and much may be gained by enforcing strict rules of personal cleanliness, and by preventing any handling of other people's food. It seems not improbable, also, that proper treatment may make the typhoid carrier a safe member of society.

Vaccine-Therapy.—Two recent contributions, of special interest, to the literature of vaccine-therapy, are (1) "Vaccine-therapy: its Administration, Value and Limitations," *Proc. Roy. Soc. Med.*, October 1910: Special Supplement; (2) Report of the Inoculation Department, St. Mary's Hospital, Paddington, 1912.

Among recent extensions of this method of treatment, we have to note Gabritschewsky's streptococcus-vaccine as a protective against scarlet fever (see *Boston Med. & Surg. Journ.*, Feb. 24, 1910). This method was used in several Russian towns and villages during outbreaks of the fever; and the results appear to be very good. Thus, of 528 persons "vaccinated" once, 8 subsequently had the fever: of 106 "vaccinated" twice, and of 149 "vaccinated" thrice, none had it. In villages without this protective treatment, 16 per cent of the children had the fever: in villages with the treatment, 1.4 per cent.

For the cure of certain infective diseases, vaccine-therapy has by this time won general recognition as a safe and efficient method, and, in some large groups of cases, as one of the best of all methods: e.g. in many cases of streptococcal or staphylococcal infection of the skin. Good results have also been obtained with a vaccine-treatment in cases of pneumonia and of typhoid fever. (Reference has already been made to tuberculin, which is a vaccine.) Good results are reported (Ziegler, *Brit. Med. Journ.*, Nov. 13, 1900) from a vaccine-treatment in a case of chronic glanders. In cases of hay-fever, benefit has been gained by what may be called a vaccine-treatment with pollen-extract, given some time before the hay-season. The advantages of vaccine-therapy, with its autogenous vaccines, over sero-therapy, are obvious: but, till science is able to give us a vaccine treatment for diphtheria and epidemic meningitis, we must be content to be thankful for the serum-treatment of these infections.

Conclusion.—Finally, a few points of special interest to the medical profession in Great Britain may be noted.

The final Report of the British Royal Commission on Vivisection, issued on March 12, 1912, was the result of five and a half years of enquiry. Happily, it is unanimous: there are "reservation memoranda," but there is no minority report. The Commissioners are all agreed "that experiments upon animals, adequately safeguarded by law, faithfully administered, are morally justifiable, and should not be prohibited by legislation." They recommend certain additional safeguards; which come within the power of the Home Office, and do not require the intervention of Parliament. They are all agreed that, by experiments on animals, "Valuable knowledge has been acquired in regard to physiological processes and the causation of disease, and useful methods for the prevention, cure, and treatment of certain diseases have resulted." Of certain statements made to them by "anti-vivisection" witnesses, they say: "After careful consideration of the above cases we have come to the conclusion that the witnesses have either misapprehended or inaccurately described the facts of the experiments. . . . So far as we can judge, we believe that holders of licences and certificates, with rare exceptions, have endeavoured with loyalty and good faith to conform to the provisions of the law." And they give an emphatic warning to the public:—

"We desire further to state that the harrowing descriptions and illustrations of operations inflicted on animals, which are freely circulated by post, advertisement, or otherwise, are in many cases calculated to mislead the public, so far as they suggest that the animals in question were not under an anaesthetic. To represent that animals subjected to experiments in this country are wantonly tortured would, in our opinion, be absolutely false."

In the Hospital world in England, one of the most important events of late years has been the removal of King's College Hospital to a site in the neighbourhood of Denmark Hill. The new buildings were almost complete in November 1912, and the Hospital was expected to be in full working-order by the beginning of the winter session, October 1913. Westminster Hospital, likewise, is preparing to move.

The International Medical Congress meets in London, in August, 1913, under the Presidency of Sir Thomas Barlow. (STEPHEN PAGET.)

DENTISTRY¹

The progress of dentistry during recent years has been characterised by marked advance in the technical procedures of its several departments and a corresponding development of its underlying scientific principles. The stimulus towards scientific investigation furnished by the publication of the results of Miller's studies of the nature and causation of dental caries during the latter decades of the past century has not only produced a large number of workers in related fields of research, but has created an appreciative interest in scientific investigation throughout the dental profession, so that the factor of empiricism so evident in earlier dental methods is being rapidly eliminated and replaced by a more rational and scientific practice.

An extensive study has been made of the problem of dental caries, not only as related to the individual, but in its broader aspects as a public health question. Carefully gathered statistics in all civilised countries point definitely to certain conclusions. First, that tooth decay is practically a universal disease among civilised peoples. Second, that between 92 and 95% of people in all nations are more or less subject to it. Third, that it is essentially a disease of youth and adolescence. Fourth, that in the life cycle of the individual there appear to be well marked periods of immunity and susceptibility. Fifth, that there appears to be a relation between the food habit of the individual and susceptibility. Sixth, not only statistics but experimental observation have demonstrated that decay of the teeth, its concomitant mouth conditions and its direct pathological results, are the cause of a degree of physical and mental deficiency in school children which, apart from humanitarian considerations, involves an economic factor of the highest importance. Dental disabilities are a cause of lowered physical and mental efficiency in children of school age, thus depreciating the value of the most important asset of the state in its future citizens, and, purely from a pecuniary point of view, it can be shown that it costs much less to remove this preventable cause of inefficiency and mental backwardness in school children than it does to continue them in school for the added time which the dental disability entails.

The extent and importance of the problem of dental disease, in its relation to public health and therefore physical and intellectual efficiency, is attracting the serious consideration of sanitarians, educators, military and naval authorities, criminologists, authorities of eleemosynary institutions and large manufacturing industries, generally speaking, in all countries. The attention of the dental profession has been focussed not only upon the improvement of all of its operations and procedures that have for their object the arrest and repair of the ravages wrought by dental disease, and the devices for restoration of lost dental organs, but also on the investigation of the causation of dental disease and particularly caries with a view to its preventative or prophylactic treatment. Much important work has already been done in connection with the fundamental aspects of the subject of dental prophylaxis, upon which later a scientific scheme of prevention of dental decay can be wrought out, mainly in the direction of so changing the composition of the mouth fluids as to render them unsuitable for the localised growth and propagation of the bacterial influences that are the direct cause of tooth decay, a change which at present is most hopefully sought in the direction of improved dietetics.

While the underlying principles of the preventative treatment of dental disease present problems of great intricacy, these are the subject of active investigation, and

¹ See *E. B.*, viii 50 *et seq.* Digitized by Microsoft®

encouraging progress is being made toward their ultimate solution. Incidentally the resources of dental art are being enlarged in all departments, with a corresponding improvement in operative and restorative procedures.

Notable advances have been made in the control of pain in the performance of dental operations by the intelligent use of both local and general anaesthesia, so complete a success having been achieved that there is no longer any proper justification for the obligatory infliction of pain in the performance of any dental operation. The scientific study of the physiological action and therapeutic application of the large number of local anaesthetic drugs now available, and the improved methods of technique devised for their rational use by numerous investigators, notably by Prof. Guido Fisher, Prof. Hermann Prinz and others, has made it possible to use them safely for anaesthetising any predetermined area about the mouth and jaws, while the element of danger from toxic effects has been practically eliminated. Moreover it is now possible to maintain for an indefinite length of time a preliminary or peripheral stage of general anaesthesia, in which the sensory nerve terminals are anaesthetized while consciousness is in no appreciable degree interfered with, or to produce a state of "analgesia" (the elimination of pain) by carefully graded administration by inhalation of a determinate mixture of nitrous oxide and oxygen. The patient breathes the requisite amount of mixed gases through a specially contrived inhaler through the nostrils until the analgesic state is produced, leaving the mouth unobstructed for the required operation, which is performed without sensation of the slightest pain by the patient, yet without disturbance of general consciousness. The administration of the mixed gases for the production of the analgesic stage of anaesthesia may be continued without danger throughout the operation.

Notable advances have been made in the study of the nervous relations of the teeth and their relations to disturbance of reflex character in other parts of the body. Many stubborn and severe neuralgias about the head and neck, some of the choreas of childhood, epilepsy, dementia praecox, lesions of the ocular muscles, tic douloureux, arrested development of the jaws, of the nasal chamber and facial region, have in a variety of instances been found to have their origin in malpositions, impeded eruption or impaction of certain of the teeth, prompt relief of the disorders having followed the removal of the source of their dental origin.

The group of inflammatory disorders that disastrously affect the supporting and retentive tissues of the teeth, referred to as gingivitis, phagedenic pericementitis, pyorrhea alveolaris, etc. or commonly referred to as "Rigg's disease," have been the subject of close and careful study for many years, but the application of modern methods and the advances made in bacteriological science have done much to clear up their pathological nature. Among the important results thus attained is the knowledge that the destructive process is not a single disorder with a specific bacterial organism as its exciter, but a mixed infection giving rise to a group of inflammatory processes having a variety of expressions, due to differences in the nature of the infecting organisms concerned in their production, and to differences as well in the character of the tissues which are the seat of the disorder. Two broadly distinguished classes of disorders are now recognised as leading to the loss of the teeth by destructive inflammation of their supporting tissues. First, those which are primarily due to the accumulation of tartar of salivary origin upon the exposed tooth surfaces, which deposits impinge upon the gum margins about the necks of the teeth, act as a mechanical irritant to the soft tissues, thus rendering it susceptible to infection by pus-producing bacteria, and, second, the class of infections of the alveolar tissues which occur in connection with a weakened condition of the body due to malnutrition in some of its many forms, in which there is a general lowering of resistance to bacterial invasion, the gum tissues because of their relatively low resistance being in these cases the selected point of entry for the disease-producing germs commonly found in the mouth cavity. The better understanding of the causation of these gingival and alveolar inflammations has made possible their more rational, and, therefore, their more successful treatment.

Thoroughness of local treatment by which every vestige of foreign matter adherent to the exposed tooth surfaces is completely removed is now recognised as essential to the cure of the disorder.

In order to achieve the necessary thoroughness of instrumental cleansing of tooth surfaces, great improvement in the number, character and adaptation of special instruments has followed, and the necessity for continued prophylactic treatment both by the dentist and the patient is recognised and insisted upon. In the more serious forms of alveolar disease, those complicated with a systemic or general nutritional disorder, attention must necessarily be directed to the correction of the impaired constitutional state; and as in such cases the general resistance of the individual to bacterial infection of the pus-producing variety is usually found to be less than normal, much therapeutic value has been derived from the administration of properly graded doses of autogenous vaccines derived from cultures of the organisms taken from the pus exudate about the affected teeth. The application of serum therapy to the treatment of alveolar pyorrhea must, however, be made with intelligent regard to the nature of the case if curative effects are to be derived from its use. In properly selected cases where the selection is based upon a correct diagnosis of the origin and nature of the disorder the use of serum therapy has given most satisfactory results.

The restorative procedures of operative dentistry have been greatly improved in usefulness and artistic quality by the development of the "inlay method" of filling cavities resulting from tooth decay, and by the improvements made in the composition of plastic filling materials, which make possible the restoration of lost tooth structure by materials so closely simulating the texture of the teeth as to render the repair unnoticeable.

The so-called inlay may be of metal or of porcelain. Gold is the metal used almost exclusively when a metallic inlay is to be constructed. The procedure is the invention of W. H. Taggart of Chicago, and consists essentially of making a stopper of specially prepared wax to fit the previously cleaned and shaped cavity in the tooth, in all respects of the same form as it is desired that the finished inlay shall assume. The wax model of the inlay is then withdrawn from the tooth cavity and embedded in a mixture of clay and plaster of Paris contained in a small ring-like flask, so arranged that a gateway reaching from a concavity formed in the free upper surface of the investing mass shall communicate with the wax form embedded in the centre of the flask so as to permit the passage of the molten gold to the matrix left in the investing mass after the wax model has been removed by heating the apparatus to a temperature that completely dissipates the wax. Pure gold fragments are then melted in the concavity in the surface of the investment by means of the flame of a compound blast lamp burning a mixture of nitrous oxide and illuminating gas. At the moment of fusion of the gold the cover of the flask is forced down upon it by means of a lever which simultaneously opens a valve admitting nitrous oxide gas, under about 40 lb. pressure, to the surface of the melted gold, forcing it into the finest intricacies of the mold. The cast filling thus made is cut free from the casting head or sprue, and its outer surface is finished with a fine polish; it is then cemented to place in the tooth cavity with a suitable fine grained cement. The cast metallic inlay, while not universally applicable in all classes of cavities, especially where the color of gold would be objectionable on aesthetic grounds, has, however, a large usefulness in restoration of molar teeth weakened by extensive caries and where great strength of material is required to withstand the stress of mastication. The porcelain inlay has its special application to the filling of cavities in exposed positions in the front teeth where the insertion of gold restorations would be unsightly. The porcelain inlay is made by first forming a matrix in platinum foil of extreme thinness (.001 of an inch) by burnishing the foil into contact with the cavity walls and then filling the matrix thus made with porcelain paste and fusing it to homogeneous mass. Any tint or texture may be thus produced, enabling the skilful operator to imitate perfectly the texture and color of the tooth into which the inlay is to be inserted.

While fillings of gold foil have for all time demonstrated their utility and trustworthiness in the saving of carious teeth, gold has nevertheless distinct disadvantages for the purpose, the recognition of which has constantly stimulated the search for an acceptable substitute that would possess its valuable tooth-saving qualities without its objectionable feature of color, high thermal and electric conductivity, and the difficulties of its manipulation. A number of plastic substances, the amalgams, various cements and gutta percha, have been in use for years, but each has been defective in certain qualities, and though used in large quantity they have nevertheless had but a limited range of usefulness. Recently considerable advance has been made in connection with the plastic filling materials by the introduction of so-called silicate or silicated cements, combinations of calcium and zinc phosphate with silica, which give promise of a decidedly nearer approach toward the long-sought ideal plastic filling material. The peculiarly desirable feature of the silicated cements is their translucency, which closely simulates that of tooth structure, in appearance, and their high

resistance to the solvent action of the buccal fluids. The extensive use now made of the inlay methods and the improvements in tooth filling cements has had a marked effect in reducing the use of gold foil as a filling material, and while accurate figures are wanting, it is probably a safe conjecture that the average number of gold fillings done is to-day not over 50% of the average number performed ten years ago. The change represents the elimination of a large amount of operative discomfort both to the patient and to the dentist.

The significant feature which marks the more recent advance in prosthetic dentistry is the broader recognition of the fact that its ideal is not so much that of a mechanic art as it is that of a restorative art related to vital activities. This feature is particularly noticeable in connection with the construction of artificial tooth crowns and crown-and-bridge work. Abundant evidence has accumulated to show that badly constructed mechanisms of this character are a fruitful source of disease action in the living tissues with which they are related. Recognition of this fact has led to the more rational designing, construction and application of these prosthetic appliances, so that the intelligent and skilled operator is now able to make these restorations so that they are not only free from disease-producing defects, but completely and satisfactorily fulfil their purpose as restorers of impaired masticatory function. A marked advance may also be noted in the artistic reproduction of lost dentures, a result attained by the systematic study of the principles of physiognomy and the factors entering into the harmonious balancing of the several expressional features of the countenance, of which the dental apparatus constitutes a most important part.

The importance of correct alignment and of normal occlusion of the teeth is not only generally recognised, but is claiming the attention of a large body of specialists who devote their time and energies exclusively to that important department of dentistry. Apart altogether from the question of unsightliness, investigation has shown that malposition and malocclusion of the teeth interfere seriously with the efficiency of the masticating mechanism; they interfere with bodily health by preventing oral cleanliness, by inducing mouth breathing by preventing proper oxygenation of the blood, by causing nose and throat troubles, and by inducing a variety of nervous and nutritive disorders. The demand is now justified that malpositions of the teeth shall be corrected on hygienic grounds for the same, or even stronger, reasons that apply to the correction of visual defects.

Dentistry has altogether passed beyond the stage where it may be properly regarded as an art of handicraft. The mouth and its contained organs and tissues not only present for study and treatment a variety of disease conditions all of which are important in themselves and not a few of which are a serious menace to health and even life itself, but, because of their close nutritive, vascular and nervous relations with the rest of the body, frequently contain the first indications of ill health and general disease and enable it to be diagnosed in an unmistakable way. Because of these vital relationships the education of the modern dentist includes the study of all the fundamental medical sciences that form the basis of the science of healing, and the training now required of the student corresponds in plan to that required of the medical specialist.

(EDWARD C. KIRK.)

OSTEOPATHY

Note.—The distinctive school and system of medicine to which this name has been given has become so prominent in recent years that an authoritative statement of its principles and claims appears desirable. This is contributed in the following article by a leading American osteopathist.—ED.

Osteopathy passed its thirty-eighth birthday in June 1912. It is the science of the prevention and treatment of diseases of the human body, based upon the recognition of the human body as a vital mechanism, a living machine, which, given wholesome physical and mental environment, good food, proper exercise, pure air and pure water, will be healthy, *i.e.* will function properly, so long as all the cells and parts of that vital mechanism are in normal adjustment. Osteopathy teaches that structural derangement of the body is the predisposing cause of disease. Faulty mechanism causes functional perversion of the vascular and nervous systems, weakening the powers of resistance of the body, producing congestion either general or local, thus making the body subject to climatic changes, unhygienic and unsanitary surroundings, and a hospitable medium for the invasion and propagation of germs.

Dr. Still, the founder of osteopathy, says, "A disturbed artery marks the beginning to an hour and minute when disease begins to sow its seeds of destruction in the human body. The rule of the artery must be absolute, universal and unobstructed, or disease will be the result." Osteopathy teaches that a cure is induced and effected by the correction of these derangements, thus permitting a free exercise of the auto-protective and recuperative powers of the mechanism itself. It recognises the mechanical, rather

than the chemical, as a primary factor in etiology. Integrity of mechanical structure determines the fullness, the completeness of function. If a machine is complete in its structure, and the structural relation of all its parts is perfect, it performs its function in a perfect manner; if, however, it is not plumb, if some of its parts are not properly adjusted, it will not function properly, it will not perform its proper work as a machine. So it is with the human body. If the structural relations of the various cells, tissues, and parts of this vital mechanism are in perfect harmony, and if there be an unobstructed supply of blood, lymph and nerve to all these cells and tissues, then the purposes for which these cells, tissues and parts are designed will be carried out, *i.e.* function will be normal; but if the structure be perverted in any manner, then the function must also be perverted. This structural perversion is the basic cause of functional disturbance or disease—a distinctive and fundamental principle of osteopathy.

Centuries old is the idea that man is a machine, and that his operations are dependent upon mechanical laws; but to Dr. A. T. Still, the founder of osteopathy, is due the honour of recognising the unity of the body, and the law that any derangement of its structure is followed by disordered function or disease, and that the vital mechanism, through a force inherent in protoplasm, possesses the auto-protective power to restore the normal function, without chemical, electrical or any other artificial stimulation, as soon as complete alignment and adjustment have been made.

These derangements of the body are technically known as "lesions." A lesion is defined as "any structural perversion which by pressure (or irritation) produces or maintains functional perversion." All the tissues of the body are subject to such perversions. They are produced by both external and internal forces. Those of the former variety are the result of mechanical violence, such as falls, blows, strains, ill-fitting clothing and the like, and temperature changes. Those of the internal variety result from postural influences, abuse of function, and nutritional disturbances. When the body is closely studied, the wonder is not that lesions are produced and that some persist, but that when the strains, exposures and abuses to which the mechanism is subjected are considered, there are not more produced.

One of the gross, very frequent, and more palpable and easily distinguishable lesions is that of the sacro-iliac articulation. It is very productive of functional perversions of the sciatic nerve, pelvic viscera, and the body equilibrium. Prior to Dr. Still's founding of osteopathy in 1874, anatomists described this as an immovable joint. Ever since then he has recognised and corrected this lesion. It was among his very first citations and teachings as an example of the osteopathic lesion. Only within the last decade has it been recognised by other schools of medical practice.

The more frequent, and consequently the more important lesions are those of the bony, muscular and ligamentous tissues. Owing to their intimate mechanical relation with the nervous and vascular systems, these tissues along the area of the spinal column are the ones most subject to lesions. Clinical experience also proves that a very large majority of lesions are found in the region of the spine. Hence the importance of maintaining the integrity of the spinal area, both as a prophylactic and a curative measure. As contributive factors in the etiology of disease osteopathy recognises climate, germs, abuse of function, unhygienic and unsanitary surroundings, etc.

Osteopathic diagnosis means but one thing: find the *cause*. Its diagnosis includes the complete examination of the entire body and its excretions. Symptoms are noted, and all chemical, microscopic, hygienic, sanitary, and other findings are studied, to aid in determining the existing condition of tissue, viscera and function. Of supreme importance, however, is the physical examination to discover existing lesions. In this respect osteopathy stands alone among schools of medicine.

Osteopathic therapeutics has to do with but one thing, the removal of the cause. To attain that end it may require the employment of one or more of many means. It may and usually does consist of the specific adjustment of the lesion, the structural perversion, which frees the remedial, antitoxic, and auto-protective resources of the organism itself, and permits its maximum exhibition of physiological recuperative and

reparative processes; or it may consist of correcting hygienic, dietetic, environmental and psychic conditions; or surgery for fractures, lacerations, abnormal growths, or organs so diseased as to be dangerous to life; or it may be antidotes for poisons, and other dangerous substances physiologically extraneous to the body. In osteopathic therapeutics the fundamental principle is "Find the lesion, repair it and let it alone."

Some confusion has arisen in the minds of those unfamiliar with osteopathic practice as to the exact meaning of osteopathic treatment. It consists solely of specific physical correction of structural maladjustments, or lesions. This is done by manual adjustment of the particular tissues involved in the lesion, and no others. This corrective work is of the highest technical order, and presupposes an absolute knowledge of the tissues involved and their mechanical relations, collectively, and one with another. Some have confused it with massage. For this confusion there is no justification. The principles of osteopathy are as different from those of massage, as the principles of surgery are different from those of massage. Nor does it mean simply "bonesetting." Correction of bony lesions is a part of the treatment, and is a large and very important part. But osteopathy is broader than that. Whatever the cause, osteopathy tries to remove it. If abuse of function is a contributive factor, that must be corrected. If there are unsanitary surroundings, they must be removed, etc.

Osteopathic prevention or prophylaxis comprises systemic examination for incipient lesions, and their correction before function becomes disordered; individual hygiene and right-living; public education in the correct use of the body to avoid structural injury, and in sanitation and all conditions conducive to favorable environment of life. It is a complete system of the healing art.

Osteopathy teaches the self-sufficiency of the normal vital mechanism. In other than normal conditions this principle powerfully manifests itself; the hypertrophy of the heart muscle in valvular insufficiency, the healing of a wound, the recovery of the body from "light attack" diseases without any treatment, are all instances of the self-sufficiency of the body to repair pathological conditions, traumatic and otherwise. Every healed wound, every hunch back, every particle of cicatricial tissue, every adhesion, is but a mute witness of the self-sufficiency of the mechanism, of the efforts of nature to heal disease, and they bear further witness that it was only due to the severe and persistent impairment of the mechanism of the body that complete repair was not effected. The more intensive the study of the minute mechanics and functioning of the body, the clearer becomes the law of its self-sufficiency.

The discovery of opsonins and antibodies and their efficacy, together with that of the thyroid and other glandular preparations, is a mark of gradual recognition and acknowledgment of the self-sufficiency of the body, when normalised and mechanically stimulated to the maximum exhibition of its reparative and auto-protective processes. One of the missions of osteopathy is so to normalise and stimulate the vital mechanism that it will manufacture in all necessary abundance its normal supporting and protecting chemical compounds absolutely pure and sterile.

The discoverer of the principles of osteopathy, Dr. Andrew Taylor Still, of Kirksville, Mo., was born August 6, 1827. He was a practising allopathic physician at the beginning of the American Civil War. He served as an officer during that struggle, but at the close of the war returned to his home in the territory of Kansas and resumed the practice of his profession. He had served as a member of the territorial legislature in 1857-58. Being blest with an insatiably inquisitive mind, an indomitable spirit of perseverance and independent thought, he accepted no statement as true without its proofs. Gradually his confidence in the efficacy of drugs as a means of healing weakened, and his faith in the inherent curative power of the body strengthened, until June 22, 1874, when he publicly announced that he would henceforth discard the use of drugs as a curative measure, and would dedicate the remainder of his life to aiding nature in the alleviation of disease by the mechanical readjustment of the disordered body. The immediate result was the loss of his entire practice, and the estrangement of friends and relatives. For years he pursued his chosen path alone,

but gradually the results began to count. Success beget success. Patients came from afar, and the practice of osteopathy became known throughout the land.

Could he impart his knowledge, his power to others, was the question asked by all. The answer was the opening of the "American School of Osteopathy" in the autumn of 1892. There are now over five thousand graduate practitioners of osteopathy, located in the United States, Canada, British Isles, France, Germany, Mexico, Japan, India, Italy, Sweden, Argentina, South Africa, Cuba, Porto Rico and Hawaii. The following eight colleges in the United States are devoted to the teaching of its principles:—The American School of Osteopathy, Kirksville, Mo.; The Philadelphia College of Osteopathy, Philadelphia; The Still College of Osteopathy, Des Moines, Ia.; The Pacific College of Osteopathy, and The Los Angeles College of Osteopathy, Los Angeles, Cal.; The Littlejohn College of Osteopathy, Chicago, Ill.; The Central College of Osteopathy, Kansas City, Mo.; and The Massachusetts College of Osteopathy, Boston. All these colleges are recognised by the American Osteopathic Association. The student enrolment is second only to that of the allopathic colleges. The curricula of the osteopathic colleges embrace all the subjects taught in the other medical schools except *materia medica*. Osteopathy is recognised and regulated by law in forty states of the United States. The other states, through court decisions or exemptions in the laws, make its practice legal. There is an Osteopathic Association in every state of the Union, a national organisation, the American Osteopathic Association, associations in the provinces of Canada, and also a British Osteopathic Association. Ten or twelve magazines and periodicals are published by the profession, notably the *Journal of the American Osteopathic Association*, *Journal of Osteopathy*, *Osteopathic Physician*, *Osteopathic Health*, *Osteopathic Herald*, *Osteopath*, *Western Osteopath*, and *Bulletin*.

Much excellent experimental research is being done by members of the profession under the direction of the A. T. Still Research Institute located at Chicago. The work is chiefly along the line of osteopathic fundamentals and similar subjects, such as the production of lesions; the study of perverted function and pathological conditions resulting therefrom; the correction of the produced lesions; and the study of the results following that. These experiments, through clinical observations and post-mortem dissections on various animals, have demonstrated, among other things, that when a spinal lesion is produced, pathological changes in the tissues of the various viscera involved result, for example in that of the stomach, kidney, liver, intestines, pancreas; and that abnormal functioning of these viscera also results, such as diarrhea, constipation, glycosuria, increased susceptibility to infection, etc. Further, the experiments have demonstrated that the correction of the produced lesion is followed by a return to normal functioning. The produced lesions also show profound pathological changes in the vascular mechanism of the posterior ganglion, the cells of the grey matter of the cord, and the sympathetic ganglia, all of which affected their functioning.

Experiments have also been made to determine the effect of osteopathic treatment upon the opsonic index, showing that the increase varied from 6.6 to 21.7 per cent, and that this increase began at once and continued from three to five hours. The experiments were followed by no untoward results.

The clinical use of radiography in practice has demonstrated the existence of bony lesions prior to osteopathic treatment for their correction, and then their non-existence following such correction.

SECTION III. ART AND LITERATURE

ENGLISH LITERATURE¹

In literature as in politics and arms the tendency in all old civilizations is to repose an undue faith in the achievements of ancestors and to harp with an uncritical accent upon the great Elizabethans and great Victorians. Discernment of the new elements in English imaginative literature is confined to a narrowing circle of organs of opinion. There is nothing more difficult at the present than for the great mass of readers to discover what competent judges consider to be the really vital literature of our time. Fortunately there are still some book advocates whose love of literature prevents them praising anything they know to be bad. It is by the diligent pursuit of these alone that the booklover may learn to discover the new corn in ear.

To this higher criticism in Great Britain the weekly "Literary Supplement" of the London *Times* has in the course of its ten years of existence established itself as on the whole the surest guide. A file of the "Supplement" supplies a *corpus* of English criticism without a rival in any contemporary literature, and of this periodical alone among its literary rivals today it may be said with certainty *vires acquirit eundo*. Young as it is, the "Literary Supplement" is a veteran among those very few English organs which make any claim to stimulate cultivated opinion by means of new ideas and vivid writing, e.g. *The Nation*, *The New Age* (1908), *The English Review* (1909), *The Round Table* (1910), *The Eye-Witness* (1911), *The New Witness* (1912). Increasingly difficult to please, the journal readers of today are correspondingly fatigued no less by the literary barrenness and denudation of ideas of the older journals, perpetually masticating the dogmas of a dowdy age, than by their newborn reticence in domestic criticism and their lack of tonic quality in matters of national concern.²

Belles Lettres.—The tendencies in England during the past two or three years have not been at all clearly marked. There has been no severance in continuity—the general aspect of the ripples on the stream has nevertheless insensibly changed.

The Irish movement has found certainly no authorised exponent, but a chronicler of candour with a gift of revelation that almost if not quite amounts to genius, in Mr. George Moore.³ His two incontinently communicative volumes *Hail* and *Farewell* exhibit a movement which among all the doublings and turnings of the human harlequinade is perhaps the most interesting of the present day. Mr. W. B. Yeats,⁴ who, inspired by his Egeria, Lady Gregory, was believed to incarnate the Irish movement, in Mr. Moore's pages takes on the semblance of a corvine prophet, seriously immersed in poetical incantations over a caldron from which genuine poetic wreaths are dispersed from Ireland; and a rival protagonist to the movement has been found in J. Millington Synge (1871–1909), the dramatist of *Shadows of the Glen*, *Riders to the Sea* and *The Playboy of the Western World*, whose *Poems and Translations* (issued in 1910) exhibit a quality of vivid energy and life comparable to that of A. E. Housman's *Shropshire Lad*. The best of his poems as of his prose connect with the peasant life of the Aran Islands. Reality and joy are at their highest in "Beg-Innish," but some of the ballads have rarely been surpassed since ballad-making became an anachronism. Vivid personal record, local patriotism, the homing instinct, folk sentiment, the desolation of wild glen and mountain earth, and the spume of mist and rain in the mild island climate breathe through these poetic emanations—*The Shadowy Waters* of Yeats, *The Wild Earth* of Padraic Colum, the dialect poems of Moira O'Neill, the *Deirdre* poems of Yeats, Synge, Herbert

¹ See *E. B.* ix, 607 *et seq.*

² It has yet to be seen whether the newly constituted Academic Committee, brought into being in 1910–11 in connection with the reorganisation of the Royal Society of Literature (previously a body of no particular importance) will establish its influence as a critical authority. It began boldly by awarding in 1911 to Mr. W. De la Mare, and in 1912 to Mr. John Masefield, the first two annual prizes of £100 (founded by the Princesse de Polignac) for the best original work of the previous year.

Trench (b. 1865) and "A.E." (George W. Russell), a mystical poet and patriot who is in a sense the hero of George Moore's wonderful impressionist portrait group.

A remarkable feature of much of this verse is that although written in English it derives its inspiration from Gaelic themes and often reproduces the dialect of speakers who have retained the expiring habit of thinking in Gaelic. The whole movement fits in with a latent conviction, parallel to that of the Ossianic and Chatterton period, initiated by Gray, that vital poetry must be sought among the solitary places and primitive folk of the earth, that legendary lore must be re-explored and romance redeemed from old crones at the spinning wheel or a remote provincial peasantry crooning over old-world poetry by a peat fire. The poetic idiom of England, it was held, showed signs of being exhausted. New fountains were in request which might peradventure be discovered in old Irish. Literature was sick of the polished speech of the academies and needed refreshment to be sought in a renewed contact with mother earth, nature, primitive people and prehistoric fragments like those exhumed by Irish mediaevalists such as Dr. Kuno Meyer. Mr. George Moore commits himself to the movement with the ardour of an agnostic realist turned Catholic neophyte, and chronicles his sensations in the confessions of a literary Rousseau in whose regenerate conception Art and Nature have become mystically reconciled—only to be confronted in the end with a terrible dilemma: Ireland stood revealed as the proper cradle for this rebirth of letters, but Ireland was Catholic in the modern narrow, post-Tridentine sense, and Catholic dogma was antipathetic to literature. Catholic Ireland must be regarded as stony ground.

Meanwhile the poetic soil of England has exhibited an unexpected richness. The daring of Synge in delineating the live human soul has been at least equalled by Mr. John Masefield (author of that intense drama of *Nan*), whose strangely imaginative yet realistic poems, contributed to the *English Review*, have renewed the faith of the most sceptical in the compelling power of poetry. Putting aside the folk-song, chanty or lyric, in which his earlier experiments at verse were mostly made, Mr. Masefield (b. 1875) has astonished every one by the powerful thrust of his narrative, a narrative thrown in the unlikely medium of the old eighteenth century rhyming heroic to which he has lent a vitality wholly unexpected in poems such as "The Everlasting Mercy," "The Widow in the By-Street" and "Dauber." In lyric spontaneity and charm, again, these last years have found nothing to surpass the bird-like lyrics of Mr. H. Davies, "the super-tramp," unless it be in the delicate, spritish and faerie songs and poems of Mr. Walter Dela Mare (b. 1873). His intonation in his *Songs of Childhood* and *The Listeners* and other *Poems* has a bitter sweet of this writer's unaccountable own, haunting and strangely original, but the mould is essentially of folk origin. The workings of his fancy are to be seen in their richest luxuriance in the singular and delightful fantasy known as "The Mullah Mulgars," in which are embedded some perfect little nuggets of enchanted verse. Katharine Tynan and Lascelles Abercrombie have increased their poetic reputations in *New Poems* and *Emblems of Love*. Sidney Roysse Lysaght has given a fine "Jean Christophe" type of poem in *Horizons and Landmarks*, characterised by real beauty of retrospective picturing. Maurice Baring (b. 1874), the clever parodist, has produced some pensive *Collected Poems*, French perhaps in their inspiration, but of sincerity and beauty. Mr. Sturge Moore has not quite sustained his claim to a massive simplicity in *A Sicilian Idyll*. A poet emerges from the *Fifty Poems* of John Freeman. The grave satirist and studious social reformer John Galsworthy (b. 1867), though, having established himself as novelist (*The Man of Property*, 1906; *The Country House*, 1907; *Fraternity*, 1909), he has concentrated his best attention lately on the drama (*The Silver Box*, 1906; *Strife*, 1909; *Justice*, 1910), has also aspired to lyric honours and has written one or two stanzas of rare beauty, almost lost it is true in pallid speculations, to gladden the heart of the anthologist. Mr. Henry Newbolt,¹ in *Songs of Memory and Hope*, and Mr. Alfred Noyes (b. 1880) in his *Collected Poems*, have on the whole well sustained their positions as foremost among writers of ballads and of patriotic, heroic, occasional and rhetorical verse. Mr. Hilaire Belloc (b. 1870),

¹ B. 1862; see *E. B.* xix, 463. Digitized by Microsoft®

as sparing in verse as prolific in prose, strikes the lyre now of Tyrtæus, now of Theocritus, and again of Martial, in his slender but memorable tome of *Verses*. The issue of a collective edition of Mr. Rudyard Kipling's¹ poems has awakened many glorious echoes. Mr. Gosse's *Collected Poems* has stirred some memories. Mr. Thomas Hardy² in his *Time's Laughing Stocks* has assured the world of a depth of reflection and a stock of vigour and modernity of feeling as yet wholly unclouded and un eclipsed. A splendid anthology of *Victorian Verse* has been chosen by Sir A. T. Quiller-Couch,³ the new Literature Professor at Cambridge.

In imaginative prose the place of honour falls to George Meredith's posthumous work, a fragment merely of his long incubated novel *Celt and Saxon*, in which Meredith⁴ groups many of his standing ideas on the racial contrasts of the Anglo-Celtic family. The story is one of several that he had planned at a much earlier period of his career; it embodied much of an earlier design to write a study of the activities of the modern journalist and publicist in the great days of journalistic independence as illustrated by such a type as Frederick Greenwood.⁵ Several stories had simultaneously been on the stocks. Lack of sympathy with his public had led to their being discarded. *Celt and Saxon* remains, a trumpet through which Meredith executes some of his finest and most characteristic fantasias, but not in any sense a finished example of his art. Of far greater value as a legacy to posterity are the two volumes of *Meredith's Letters*, edited by his son. These exhibit for the first time in its full grandeur the splendour of a noble mind struggling through adversity towards expression of that aristocratic philosophy of living which seems likely to form the main substance of Meredith's contribution to literature. The high literary ideals and ambitions enshrined in the vibrating prose of these letters constitutes them the first and most majestic literary monument of the new age. Next to them in historic and documentary interest one might be inclined to place the strangely revelatory *Note-books* of Samuel Butler (1835-1902),⁶ a "philosophical writer" whose *Way of All Flesh* has perhaps made more way in the minds of thoughtful people during the last decade than any other work of fiction. Butler's mind is peculiarly, and one might almost say exclusively English, and there is often in his style something reminiscent of the hammer and, at times, of the tinctack. But the saw-like rasp of his observation has penetrated the wooden complacency of the nation, and the sound of it is heard in the most unexpected places.

Since Mr. Hardy has refrained from the laying on of hands in fiction, the primacy has fallen upon two writers whose closeness in age, ambition, energy, writing power and friendly rivalry is likely to impress the future. After passing through a period of extraordinary imaginative fertility culminating in 1910 respectively in *The New Machiavelli* and *Clayhanger*, Mr. H. G. Wells⁷ and Mr. Arnold Bennett (b. 1867) have in 1911-12 produced interim novels, the former writer *Marriage* and the latter writer *Hilda Lessways*. Mind as usual is more conspicuous in the work of the first, method in that of the second; yet both novels, dictated though they may have been in a measure by the necessity *de reculer pour mieux sauter*, are representative of their writers and of the full-blooded and realistic manner which holds its own far better in England than elsewhere in Europe. Mr. Bennett's wonderful *Old Wives Tale* (1908), following as it did a rapid succession of sketches of the romance underlying the life of the midland pottery district (his "Five Towns"), made his work the chief new interest to novel-readers during 1909-11. Other established favourites in literary fiction such as Rudyard Kipling, Mrs. Humphry Ward,⁸ Mr. Galsworthy, Henry James,⁹ Joseph Conrad,¹⁰ R. S. Hichens (b. 1864), De Morgan,¹¹ Anthony Hope¹² and Maurice Hewlett¹³ have done nothing notably to add to their reputation.

Founded by Ford Madox Hueffer (b. 1873)—a versatile and inventive writer, author of a *tour de force* of historical picturing in fiction entitled *Ladies whose Bright Eyes*, dealing with the England of Edward II—the *English Review* has discovered and brought into notice (under Mr. Austin Harrison's editorship in its later period) some short story writers of exceptional accomplishment and force, among them Richard Middleton (*The Ghost Ship*, and *The Day before Yesterday*), a writer whose unhappy end cut short prematurely a career of unmistakable promise and partial achievement. A writer of philosophic originality in fiction has also been revealed in the person of Prof. L. P. Jacks (b. 1866; editor of the *Hibbert Journal*), whose *Mad Shepherds* disclosed a power of discernment beneath the surface comparable to that of Mark Rutherford¹ and Thomas Hardy. Work of singular promise has been published by J. P. Beresford, author of *Mr. Perrin and Mr. Traill*, and by Mr. Compton Mackenzie, whose *Carnival* was one of the most commented on novels of 1912. Mr. Farnol, Mr. Oliver Onions, Mr. "George Birmingham" and Mr. De Vere Stackpole have also done distinguished work in the variant avenues of fiction, the level of which has been maintained steadily without much to stimulate prophecy or to provoke astonishment. The tendency most worthy of remark upon the confines of the novel proper has been the unceasingly sincere and sympathetic interpretation of the life, thought and habit of the predominant poor. The country peasant has found a loyal and constant spokesman in Mr. George Bourne, who has completed the series of *Bettesworth* books, and Mr. W. H. Hudson, whose *Shepherd's Life* has impressed his many admirers as perhaps the truest and most attaching of all his exquisite prose pastorals. The longshore fisherman has discovered a spokesman of shrewd vigour and outspokenness in Mr. Stephen Reynolds (b. 1881), whose *Poor Man's House* is one of the outstanding books. Mr. Pett Ridge² and Mr. Barry Pain,³ whose work retains all its old vivacity, have also found recruits in the observation of struggling city workers and outcasts, in Mr. Harold Begbie (b. 1871), Mr. Neil Lyons, and Mr. Robert Halifax. The studies of these social observers and poignant reporters merit attention. Excellent prose, at times brilliant, rejoices the honorable minority of essay readers in the collective work of H. Belloc (*This and That*), E. V. Lucas (*London Lavender*), G. S. Street, H. W. Nevinson, and G. K. Chesterton.⁴ That arch-anthologist Mr. Lucas has done an anthology of his own writings, modestly entitled *A Little of Everything*.

The English critics of the past few years have not been much marked because little observed by public opinion. But their work has been of a high order and has lost little, perhaps gained in certain respects, by the fact that it is done in demi-obscurity. Of the older school who combine synthetic and analytic methods, Sir Sidney Colvin,⁵ J. W. Mackail (b. 1859), Augustine Birrell,⁶ Herbert Paul (b. 1853), Edward Dowden,⁷ remain on the active list along with Mr. Edmund Gosse,⁸ who has put forth a fine blossom in his *Portraits and Sketches*, enshrining a kit-cat of Swinburne which has a rare quality of humanism and literary experience. Like Andrew Lang,⁹ he is at his best when displaying his capacities as a featherweight. Of the polyphonic writers of the period Lang will probably rank first, and his loss has been felt as almost a personal one by hundreds of refined readers. There was certainly too much of the rainbow about his literary palette in later days. At his best he wrote English prose of the purest and most flawless. But a capricious literary fairy presided at his christening, who decreed that whenever he laboured, researched, documented and dogmatised he should be mediocre, but that whenever he improvised in careless mood, pearls, real pearls should drop from his pen. His two last efforts, his *History of English Literature* and *Shakespeare-Bacon*, are not among the most prosperous productions of this fascinating polymath. A great loss has ensued to this branch of English letters by the health-enforced silence of Arthur Symons,¹⁰ the first of adepts in literary impressionism, though his place may be partially

filled by able disciples and students of pure literature such as Edward Thomas (on Hearn, Swinburne and Borrow), Arthur Ransome (on E. A. Poe) and Darrell Figgis. Systematic criticism of the motived, scientific school has not made very much headway, though works of erudition, enthusiasm and co-ordinated speculation have been completed by Prof. W. J. Courthope¹ (*History of English Poetry*) and Prof. George Saintsbury² (*English Prosody and Prose Rhythm*). Prof. Oliver Elton (b. 1861) has achieved a book of arduous critical chronicling on the English Literary period, 1780-1830, and Sir Sidney Lee³ has successfully continued his researches into the cross currents of French and English literature in his book on *England and the French Renaissance*. Prof. Sir Walter Raleigh, in his two short studies on Johnson and Halifax, has confirmed his unique position as a humorous professor who is at the same time a scholar and a wit. Specially good work either editorial, biographical or commentary has been done on Herrick (De-lattre), Suckling, Thomas Deloney, Ruskin, Morris, Swift, T. L. Peacock, Scott, Goldsmith, Boswell, Borrow and George Gissing (*The Private Life of Henry Maitland* by Morley Roberts is a pastel of G. G.). Some valuable monograph series have been set on foot to chronicle the fluctuating fame of recent reputations (Secker's *Critical Studies*, Constable's *Modern Biographies*), and some suggestive chapters and papers have been contributed to the *Cambridge History of English Literature*, which has now been brought down to Dr. Johnson, and to collected papers by the *English Association*.

History.—In history and biography the years 1910-12 have seen a good many important works already well under way brought a stage or two nearer completion. The Hon. J. W. Fortescue (b. 1859) thus brought his monumental history of the *British Army* down to the verge of the Peninsular War, in other words to within eight years of its concluding point, and he accompanied it by a volume of hardly less importance, vindicating the *Statesmen of the Great War*. His championship of Portland, Perceval and Castlereagh, which goes far to destroy the *ex parte* indictment of Napier, receives valuable confirmation in the *History of the Peninsular War* by Prof. C. W. Oman (b. 1860), whose fourth volume brings the narrative down to Salamanca. Sir George Trevelyan⁴ completed his *History of the American Revolution* in a fourth volume, the scene of which is laid mainly in the court and capital of England; it brings the writer home from America to the commerce of the contemporaries of Fox and North, a subject in which he has few rivals and certainly no superiors. This last volume takes us back by a most happy reversion to the author of *The Early History of Charles James Fox*. Sir George's historically gifted son, Mr. G. M. Trevelyan (b. 1876), has added another excellent volume to his series on Garibaldi,—Ney's successor to the proud title "bravest of the brave." His history of *Garibaldi and the Making of Italy* may not quite achieve the vital interest of the history of *Garibaldi and the Thousand*, but this is owing to no declension of style, but merely to the fact that the subject is inferior in dramatic interest. Here, at any rate, there is little justification for the prehistoric lament "*Les grands talents vieillissent, rien ne se présente pour les remplacer*." Another work of signal historical value is the completion or continuation of Gardiner's *Protectorate* by his old ally, Prof. C. H. Firth,⁵ who brings the narrative down from 1657 to the death of Cromwell. Mr. Firth writes no less minutely, but interprets history in a wider sense than his predecessor. He exhibits, some may complain, a certain lack of temperament, but his two volumes are worthy in every way of an historical erudition and equipment second to that of no living historian. Since death has removed the four Academic historians, Sorel, Vandal, Houssaye and Monod, and the great Philadelphian, H. C. Lea, it may be doubted whether any universities are so happily provided in this respect as are Oxford and Cambridge. Pursuing his former Byzantine explorations, Prof. J. B. Bury⁶ of Cambridge has produced his *History of the Eastern Empire* from Irene to Basil I, a work of absolutely the highest rank both as regards research and presentation. Another Oxford historian, in the very front rank, Mr. Herbert Fisher (b. 1865), not content with an able edition of his kinsman

⁶ B. 1861; see *E. B.* iv, 867.

F. H. Maitland's Posthumous Papers and Studies, has also produced a valuable monograph on *Democracy in Europe* and a priceless little memoir of the great *Napoleon*. The editor of the *Historical Review*, Dr. R. Lane Poole (b. 1857), has produced a work of much erudition in his *History of the Exchequer* in the twelfth century. A solid crown has been added to the series of somewhat unequal posthumous studies by Lord Acton by the issue of the Lectures on the *French Revolution*. The *Esprit frondeur* in contemporary history is well represented in Mr. Wilfrid Scawen Blunt's¹ uncompromising *Secret History of the English Occupation of Egypt*. Two *succès d'estime* in historical biography have been achieved by Lord Rosebery² and Mr. Holland Rose (b. 1855) in their respective lives of *Chatham* and *Pitt*. For different reasons they seem unlikely to occupy a place among the greatest of biographies, but both fill important gaps and are invaluable to the historian. The life of *Chatham* is in the strict sense preliminary only; it closes with the year 1756. Holland Rose's first volume exhibits Pitt as intendant, the second as pilot. Mr. D. A. Winstanley has done a promising book on *Chatham and the Whig Opposition*. A word of recognition is due to Miss Kate Norgate's work on *The Minority of Henry III*, in which she continues the destructive criticism of the baronial party commenced in her book on *John Lackland*, and to the completion and continuation respectively of Longmans' *Political History* (12 vols.) and Methuën's *English History* (5 vols. completed out of 7). Scotland has suffered a heavy blow in the loss of her accomplished historian, Andrew Lang. England has experienced a doubtful gain in the accession of Mr. Rudyard Kipling to the ranks of her historians (*History of England*, 1911, with C. R. L. Fletcher).

In biography proper some notable volumes have appeared, almost overwhelmed, it is true, by the enormous multiplication of mechanically made Lives. The two volumes of Mr. Monypenny's *Life of Disraeli*, Wilfrid Ward's *Life of Newman*, and Sir E. T. Cook's *Life of Ruskin*, are destined, it must be supposed, to occupy positions on the highest plane in a form of literature which many people regard as the most interesting of all. Mr. Monypenny's first volume hardly obtained the credit due to it, but the second shows that his selection as Disraeli's official biographer was entirely justified. The qualities of concentration, brevity and self-effacement are rare in modern biography, and the author's premature death in 1912 has left a difficult task to the writer who shall complete his work. More even than the *Life of Disraeli*, the *Life of Newman* had been discounted by anticipatory speculation. It is a noble and conscientious monument of biographic piety, though it cannot be said that the Newman legend has gathered quite so much brightness from it as in the corresponding case of the *Life of Disraeli*. Sir E. T. Cook's *Life of Ruskin* is a splendidly able, judicious and enduring estimate of a great Victorian, whose fame, like Gladstone's, is at present in a trough of depression, consequent upon a range of contemporary activity and influence almost too varied to be coherent. The only other cognate work which can claim to rival these in documentary value and standard quality is Mr. Aylmer Maude's *Life of Tolstoi*.

Two biographies of great brilliance, which derive a unique interest from the temperament of their writers, are Mr. Hilaire Belloc's *Marie Antoinette* and Mr. Walter Sichel's *Sheridan*. The first is an interpretation of the revolutionary, democratic and military forces of 1789 concentrated upon the prismatic personality of Marie Antoinette; the second a *suprême* of the social aspects of England in the penultimate phase of aristocracy, grafted upon a new valuation of the sentimental and Pierrot-like character of Richard Brinsley Sheridan. The causticity and candour, which supply the differentiating quality of the hardiest stock of autobiography, are well illustrated in Goldwin Smith's *Reminiscences* and Sir William Butler's *Autobiography*: well too, though more diffusely, in the *Reminiscences* of H. M. Hyndman, and of Oscar Browning. A passing tribute should further be paid to three interesting revelations of personality; the first strictly historical, Mr. Snead Cox's *Life of Cardinal Vaughan*; the second partly imaginative, Miss Marie Hay's *Winter Queen* (Elizabeth of Bohemia); the third largely autobiographical, Mrs. Mills's *Life of Frederic Shields*, the artist (1833-1911), a "human document" of curious

¹ B. 1840; see *E. B.* iv, 93.

² B. 1847; see *E. B.* xxiii, 731.

interest, accompanied by a series of reproductions of his pictures which draw new attention to his originality and power. The centenaries of Browning, Thackeray and Dickens can hardly be said to have elicited much authorship of permanent value. Mr. Hall Griffin's *Early Life of Browning* is a laborious enumeration and itinerary without very much illumination; Mr. Chesterton's *Introductions to Dickens* are in part a working over of material which found its most savoury expression in his *Life of Charles Dickens*. A valuable portrait of Dickens as editor has been disclosed in the *Letters* faithfully edited by Mr. Lehmann; an effervescence of curiosity respecting the mystery of Dickens's last unfinished novel *Edwin Drood* has found interesting expression in speculations by Prof. Henry Jackson, Cuming Walters, Chesterton, Andrew Lang, William Archer and Sir W. Robertson Nicoll.

General.—The simultaneous publication of the 28 volumes of the 11th edition of the *Encyclopaedia Britannica* early in 1911, under the aegis of the Cambridge University Press, stands out as a unique event in the literary history of the last two years, on which it would be unbecoming here to dwell further. Much literary energy and research has also been concentrated upon such standard works of reference as the second supplement (for 1900–11) to the *Dictionary of National Biography*, the progress of the great Oxford *New English Dictionary* (still incomplete), Hastings's *Encyclopaedia of Religion and Ethics*, the revised edition of "G.E.C.'s" valuable historical *Peerage*, and important subject-indexes such as those of the British Museum and London Library.

Among the reprint series of the day *Everyman's Library* has steadily extended its titles towards the promised goal of one thousand, most of them judiciously chosen. It has found a serious rival in enterprise in *Nelson's Shilling Library*, comprising for the most part more recent books, the majority of them still protected by copyright; this shilling library has also incorporated in its list a number of French and German books of standard value.

Of more original interest than these is the new series of miniature monographs known as the *Home University Library*. The title is not particularly happy in these days when a university is brought to almost every door, and the editors of the series, Gilbert Murray, Herbert Fisher and Prof. J. Arthur Thomson, are hardly self-taught prodigies of home-culture. But the series is cleverly conceived, and the volumes both well-informed and remarkable for lucid exposition. One of the most promising literary signs, indeed, in England is the steadily increasing excellence both of such small manuals and also of the larger standard works of reference upon which the general staff of the world's activity has so often to put its reliance.

Among the general tendencies of the commerce of books the comparative absence of really good books about books and their authors has been hardly less marked than the excessive duplication and reduplication of colour topographies, anthologies, nature and open-air books, books of maxims, books on education and military science, expanded centenary articles and heavily padded memoirs, many of these last by complete amateurs, most of them useless and nearly all of them quite superfluous. Book society, like that of the *beau monde*, has increased beyond self-knowledge. The publishers are probably right in maintaining that the career of more than half the books now issued is made, not by the ability of the authors, but by the vague appetite for new books stimulated if not created by their own cleverness in tuning the public. As the tendency of the age is certainly not to increase the amount of time devoted to reading, the position of the printed book approximates more and more to that of the periodical. Books tend to become less and less carefully differentiated and assessed, less cherished, and a good deal more transitory both in their appeal and their impact than they were a quarter of a century ago. (THOMAS SECCOMBE.)

The Press.—In London journalism (see *E. B.* xix, 557–563) two important recent changes are to be noted. In August 1912 Mr. G. E. Buckle (b. 1854) retired from the editorship of the *Times*, which he had held since 1884, and was succeeded by Mr. Geoffrey Robinson (b. 1874), a Fellow of All Souls, Oxford, who had joined the staff a year or so before, after having been editor of the *Johannesburg Star* in South Africa, where he had originally gone in 1901 as private secretary to Lord Milner. In this connection reference may also be made

to the enterprise of the *Times*, under Lord Northcliffe's ownership, in various new directions, and notably in its publication in September 1912, in celebration of its 40,000 number, of a remarkable "Printing" supplement, dealing in a series of expert contributions with the history of journalism, typography, and everything else that goes to the making of a newspaper, and again in December of an equally elaborate "Shipping" supplement. The other important change was Mr. J. L. Garvin's transference to the editorial chair of the *Pall Mall Gazette*, while still holding that of the (Sunday) *Observer*, both papers being owned by Mr. Astor. Mr. Garvin (b. 1868), who first became known in London as a leader-writer on the *Daily Telegraph*, had in recent years come to occupy a unique place among Unionist journalists; a brilliant and inexhaustible writer, one of the inspirers and best exponents of Mr. Chamberlain's Tariff Reform policy, and deep in the councils of the leaders of the party, he had made the *Observer* the contemporary "Thunderer" of the Press; and in taking the *Pall Mall* as his week-day organ he gave new vitality to this evening journal, which showed signs of enterprise in every direction under his editorship. The amalgamation in May 1912 of the *Daily News* and *Morning Leader*, the two Liberal half-penny morning dailies, both owned by Mr. Cadbury, may also be noted.

Shakespeare, and the Elizabethan Drama.

During 1909-12 great activity has been shown in ransacking archives, public and private, in pursuit of matter bearing upon dramatic history which might have escaped the scrutiny of earlier investigators, such as Malone, Collier and Halliwell-Phillips. A considerable share in this enterprise has been taken by European and American scholars, more scientifically trained than those of England in the methods of research. One of the most successful contributors has been Prof. A. Feuillerat of Rennes University, who has just published in the *Shakespeare Jahrbuch* for 1912 a set of valuable documents from Loseley Hall, telling the story of a Blackfriars theatre earlier than that built by James Burbage, the existence of which has only been dimly suspected. This theatre was in use from 1577 to 1584 and was managed first by the Masters of the Children of the Chapel Royal, and afterwards by the playwright John Lyly under the patronage of the Earl of Oxford. Much new light has also been thrown upon the history of the Elizabethan and Stuart organisations of actors by Mr. J. T. Murray of Harvard, who in his *English Dramatic Companies* (1910) has brought together for the first time, in many cases direct from municipal records, a mass of notices bearing upon the tours of the companies in the summer or plague times, and their entertainment in the provincial towns which they visited. But the most untiring archivist has been Prof. C. W. Wallace of Nebraska University, who has ranged widely in the Record Office, and is now pouring forth an apparently inexhaustible stream of new material, largely derived from the records of the extinct Court of Requests, which had a special mission to compose the differences of players in their capacity as servants of the royal household. Prof. Wallace's researches have centred round the boy companies, and in a quite recent work, *The Evolution of the English Drama up to Shakespeare* (1912), he has been able to supplement Prof. Feuillerat's Blackfriars discoveries, and also to furnish much fresh information with regard to the Tudor and earlier Elizabethan court drama. He has also earned the gratitude of scholars by publishing in the *Nebraska University Studies* for 1909 and 1910 the original documents on which his newspaper and magazine articles making known new facts about Shakespeare and the stage were based. Unfortunately, Prof. Wallace's judgment as an historian is not equal to his *flair* and perseverance as a researcher, and while the learned world has appreciated his documents, it has too often found it necessary to repudiate the inferences with which they have been garnished.

English students, however, have not been altogether unmindful of their duties to the archives. A good piece of work has been done by Mr. Ernest Law in *Some Supposed Shakespeare Forgeries* (1911). Here he reviews the evidence for and against the authenticity of the lists of plays presented at court during the winters of 1604 and 1611 as published by Peter Cunningham in 1842, and comes to the important conclusion that, in spite of the scepticism aroused by Cunningham's shady character, the documents are genuine. His view is accepted by competent palaeographers, and he has been able to maintain it against a vigorous and detailed criticism in the pages of the *Athenaeum*.

The rehabilitation of the lists restores confidence in the evidence which they furnish as to the court performances of some of Shakespeare's plays, but it does not affect the approximate dates assigned to those plays in the article on "Shakespeare" in the *Encyclopaedia Britannica*,¹ since it was assumed in that article that, even if the lists were forgeries, they probably rested upon genuine originals. Several original documents have also been published in the *Collections* of the Malone Society, which was founded in 1907 for the express purpose of assisting the study of the drama, and has continued to produce an annual output of volumes. This society has also printed from the manuscripts accurate texts of many important documents for which scholars have hitherto had to rely, not without fear and trembling, on the versions of J. P. Collier.

The new material described above, while illuminating as to the conditions in which Shakespeare's work was done, adds practically nothing that bears upon his personality. In this direction there is but little to record. Dr. Paul Wislicenus in *Shakespeares Totenmaske* (1910) and *Dokumente zu Shakespeares Totenmaske* (1911) has revived the old controversy with regard to the so-called Kesselstatt "death-mask," but has not succeeded in bridging the evidential hiatus which separates that interesting work of art from any claim to be an authentic presentment of the poet's features. Some attention has also been called to the theatrical tradition preserved by Aubrey with regard to Shakespeare's private life. The Malone Society in its *Collections* for 1911 has published a facsimile of Aubrey's original memorandum, together with a critical notice which renders possible some correction of the references to the subject in the *Encyclopaedia Britannica*. Two main points emerge. One is that the reading of Aubrey's statement, first made known a good many years ago, and since overlooked, is not quite accurate. What Aubrey learnt of Shakespeare was not that, "if invited to court, he was in pain." The word "court" is a mistake for "writ," quite intelligible on a hasty reading of the manuscript, and the tradition really is that Shakespeare was thought "the more to be admired because he was not a company keeper, lived in Shoreditch, would not be debauched, and if invited to, writ he was in pain." The amended version is no less favourable to the decency of Shakespeare's demeanour and perhaps makes him out a little less churlish in his attitude towards a royal command. The other point is that the passage, from its place on a page of rough notes not wholly devoted to Shakespeare, might conceivably refer to John Fletcher, who is also dealt with on the page. But the probability is still that it refers to Shakespeare. Aubrey's informant was evidently not John Lacy, who first came to London long after Shakespeare, but an actor of an older generation, William Beeston, whose father, Christopher Beeston, had been a "fellow" of Shakespeare in the Chamberlain's company, and who himself, as a boy, might well have known the poet.

The most notable contribution to the critical study of Shakespeare has been that of Prof. A. C. Bradley, whose *Oxford Lectures on Poetry* (1909) and subsequent British Academy lecture on *Coriolanus* have confirmed the high reputation won by his *Shakespearean Tragedy*. Mr. John Masefield's *William Shakespeare* (1911) has the interest which always belongs to the interpretation of one poet by another. A courageous attempt at a complete *Shakespeare Bibliography* (1911) has been made by Mr. W. Jaggard; and an acute and searching study of the bibliographical problems surrounding the early editions of the plays is to be found in *Shakespeare Folios and Quartos* (1909) by Mr. A. W. Pollard of the British Museum. It is Mr. Pollard's avowed object to bring about a more optimistic judgment than has sometimes prevailed with regard to the circumstances in which the early editions and particularly the Folio of 1623 came into existence, and to the probabilities that the texts handed down in them represent a reasonable approximation to what Shakespeare actually wrote. In this task, with the aid of a wide knowledge of seventeenth century printing methods, he is fairly successful, although he perhaps rather exaggerates the extent of the antecedent pessimism which he sets out to vanquish. In a fascinating chapter, which sets out the results of earlier investigations by himself and Dr. W. W. Greg, he tells the almost romantic story of the train of bib-

¹ E. B. xxiv, 772 *et seq.*

liographical reasoning which established the position that some of the Shakespeare quartos, which bear the dates 1600 and 1608 on their title pages, were really printed in 1619, and form part of an endeavour, earlier than that of 1623, to produce a collective edition of some at least of the plays. This is of course a discovery with which the critical editor of Shakespeare, no less than the bibliographer, must make his account. Following up the same train of research, Dr. Greg in an edition (1910) of the First Quarto of *The Merry Wives of Windsor* has produced some interesting speculations as to how that piratical text may have come into being, probably with the aid of a blackleg actor who played the part of the Host.

The structure of the Elizabethan theatre and the methods of staging plays upon its boards continue to be the subjects of minute investigation. But the ground has by now been fairly covered, and there is not likely, so far as existing material is concerned, to be much to add to the exhaustive monographs of V. E. Albright, *The Shakesperian Stage* (1909) and B. Neuendorff, *Die englische Volksbühne im Zeitalter Shakespeares* (1910). These are of American and German origin respectively; the most important recent English contribution to the solution of the problems involved is to be found in the erudite and well-reasoned papers by Mr. W. J. Lawrence collected in his *The Elizabethan Playhouse and Other Studies* (1912). The mounting of plays at court has been treated, on the basis of the accounts of the Revels office which he edited in 1908, by Prof. Feuillerat in *Le Bureau des Menus-Plaisirs et la Mise en Scène a la Cour d'Elizabeth* (1910); and a cognate subject by M. Paul Reyher in *Les Masques Anglais* (1909), wherein the importance of the part played by Inigo Jones in the spectacular development of the masque under the Stuarts is very fully established.

Two comprehensive works on the history of English drama in its literary aspect have appeared. One is the first part of the fourth volume of Prof. Creizenach's monumental *Geschichte des neueren Dramas* (1909), which is wholly concerned with England and covers the period 1570-1593. The other consists of a number of chapters by various writers forming volumes v and vi of the *Cambridge History of English Literature*, issued together in 1910. These range from the origins of the drama to 1642 and are supplemented by three chapters on the Restoration drama in volume viii, issued in 1912. As might be expected from the method adopted, the treatment lacks continuity, but several of the chapters and of the bibliographies by which they are accompanied are of individual value. Amongst special monographs Prof. Feuillerat's *John Lyly* (1910) and Miss M. L. Hunt's *Thomas Dekker* (1911) call for mention. The critical editing of texts has made some progress. The long desired edition of Ben Jonson by Prof. Herford and Mr. Percy Simpson has not yet made its appearance, and editions of Dekker and of Thomas Heywood are still to seek. But Dr. Waller's 10 volume reprint of the Second Folio of Beaumont and Fletcher reached completion in 1912, and the fourth volume of the more elaborate "Variorum" edition supervised by Mr. A. H. Bullen is on the point of issue. Mr. C. F. Tucker Brooke has published a useful text of Marlowe (1910), preparatory to a full edition; Mr. R. W. Bond, a volume of *Early Plays from the Italian* (1911); and Prof. J. W. Cunliffe, a volume of *Early English Classical Tragedies* (1912). Particularly welcome is the first volume of an edition of George Chapman's plays (1910) by Prof. T. M. Parrott of Princeton University. Little has been done for mediaeval dramatic texts; but Dr. Karl Young has contributed some valuable versions of liturgical plays to the *Publications of the Modern Language Association of America* and other periodicals. The careful facsimile reprints of plays issued by the Malone Society under the editorship of Dr. W. W. Greg continue to appear in annual instalments. Two of the series, *The Second Maiden's Tragedy* (1909) and *Sir Thomas More* (1911) are not strictly reprints, but are of singular interest as being attempts to exhaust the resources of typography in reproducing the palaeographical peculiarities of complicated manuscripts, upon which several hands have been at work. These texts, with Dr. Greg's introductory notes, render possible some estimate of the extent and methods of official censorship as exercised by Edmund Tilney and Sir George Buck; and that of *Sir Thomas More* also affords opportunity for the reopening of the old controversy as to whether one of the passages

inserted into the original manuscript is or is not the composition, and perhaps even in the handwriting, of Shakespeare. Some useful reprints, together with illustrative matter bearing on the English drama, have also appeared in the *Materialien zur Kunde des älteren Englischen Dramas*, edited by Prof. W. Bang of Louvain.

(E. K. CHAMBERS.)

BRITISH COLONIAL LITERATURE

Australian.—Australia's beginning was from a literary standpoint unfortunate. The primitive aborigines had no history and no legendary lore which, finding expression through some of the first colonists, might have added to the world's stock of romance. The exploring of the continent—the siege of the Blue Mountains with their baffling natural fortifications, the conquest of the great fastnesses of the sun on the dry inland plains—might have inspired an epic, but no one of the explorers nor of their contemporaries attempted more than a bare record. The sordid convict era inspired one book,—*For the Term of His Natural Life*, by Marcus Clarke,—which is made notable by its subject rather than its treatment. The bushranging era inspired another,—*Robbery Under Arms*, by “Rolf Boldrewood” (T. A. Browne, b. London, 1826),—of which the same may be said. Those are the two master works of early Australian letters. Yet neither is distinctively Australian in the sense of showing a different outlook on life, or a different sense of literary values, to that of the average contemporary English writer. The same may be said of the poems of Adam Lindsay Gordon, who wrote in Australia of Australian subjects from the standpoint of an English squire.

To-day, with less notable books to cite, the observer may see the beginnings of a characteristic Australian literature. The people—bred from the wilder and more enterprising of English, Scottish and Irish stock, responding to the influence of the bountiful, sometimes fierce, sunshine, and conditions of life which are singularly free from any bonds of convention and are singularly levelling of social conditions—begin to depart from the home type. They are gay and debonair, whilst a little inclined to be cynical, irreverent and vainglorious; enduring and brave, even to the point of being somewhat ruthless. The qualities of these new people, the Australians, begin to show in their literature, which is as yet more impressive in quantity than in quality. There are at least one hundred minor poets of some skill and originality of thought in Australia (with less than five million inhabitants), and nearly that number of prose writers of some distinction—all showing to the close observer some signs to distinguish them from writers of the same class in Great Britain and in America. A hedonistic joy in life, a disrespect for authority, a wit tinged with cruelty, a freakish humour founded on wild exaggeration—those are the qualities which outcrop most often in exploring the fields of contemporary Australian literature. There is to be found, too, a tinge of mystic melancholy, a sense of bitterness—a loving bitterness—inspired by the harsh realities of life in the “Bush” where Nature makes great demands on human endurance before permitting her conquest, but enslaves her wooers by her very cruelty.

This modern Australian literature owes very much to one man, Mr. J. F. Archibald (b. Vic., 1858). He was of partly Scottish, partly Irish, partly French forbears, with a touch of Semitic blood. Editor for a quarter of a century of a notable Australian paper, he made it his mission to encourage young Australians to write of the life that was peculiar to Australia. He was a wit with a fine *flair* for a phrase; a sentimental cynic; and passionately Australian. Mainly under his aegis there came forward a young school of writers which included Mr. Henry Lawson (b. N.S.W., 1867), who has given in short stories and verse faithful, sometimes terrible, glimpses of the “Bush;” Mr. A. B. (“Banjo”) Paterson (b. N.S.W., 1864), a singer of the racketty horsey life of Australian sheep stations; Mr. Louis Becke (b. N.S.W., 1857), who pictures South Sea Island life; Mr. A. H. Davis (“Steele Rudd”) (b. Queensland, 1868), who writes broadly comic and yet sympathetic studies of life on the small farms of Australia; Mr. Roderic Quinn (b. N.S.W., 1860), and the late Victor Daley (both of Irish extraction and giving in their verse two different and yet both characteristically Australian modifications of Celtic melancholy); Mr. Edwin J. Brady (b. N.S.W., 1869), writer of sea-songs; Miss Ethel

Turner (b. England, 1872), a graceful novelist of Australian childhood; Mr. Bernard O'Dowd (b. Vic., 1866); Mrs. Barbara Baynton, Mrs. Mary Gaunt and many others who make the Australian literature of to-day. Some of these owed much, some little, directly to Mr. Archibald and his newspaper. But without a doubt he was the chief founder of a new Australian literary movement.

Australian letters to-day suffer from diffused energy. There are numberless writers of some ability, but no commanding figures. The future holds out a hope of Australian works of the first rank, inspired perhaps by the "Bush"—the mysterious Neolithic-age forests, hills and plains, perhaps by the giant work of the early explorers, perhaps by the extremely fluid social conditions of a young country full of self-confidence as it grapples with the old, old problems of civilisation.

Australia has a vigorous newspaper press. In all the state capitals there are fine journals, and those of Sydney and Melbourne rival in wealth and influence the great dailies of England. The *Argus* (editor, Mr. E. S. Cunningham) and the *Age* (editor, Mr. G. F. H. Schuler) are the chief Melbourne dailies; the *Morning Herald* (editor, Mr. T. W. Heney) and the *Daily Telegraph* (editor, Mr. F. W. Ward), the chief Sydney dailies. (FRANK FOX.)

*English-Canadian*¹—The outstanding feature in any survey of Canadian literature during the last few years must be its serious and practical tone. A decade ago one was constantly coming upon new books of verse and fiction by Canadian writers. To-day we find in their place books of history, biography and travel, essays in which instruction is the dominant motive, and scores of works on every branch of the great modern subject of economics. Canada takes herself seriously in the twentieth century; she faces gigantic problems, relating to her own very rapid development, to the relations of the two radically different races that constitute the bulk of her population, to the assimilation of alien groups, to her future place in the British Empire, and her attitude toward other countries. To questions such as these the best thought of many of her most able students has been turned during the last few years, and the result embodied in several notable books. Of these one may mention Macphail's *Essays in Politics* (1909), Denison's *Struggle for Imperial Unity* (1909), Ewart's *Kingdom of Canada* (1908), and *The Kingdom Papers* (1911), Robinson's *Canada and Canadian Defence* (1910), Porritt's *Revolt in Canada against the New Feudalism* (1911), and, among many important articles in the reviews, Dr. Crozier's "A Warning to Canada" (*Fortnightly*, Sept. 1911).

The publication in 1911 of an *Index and Dictionary of Canadian History* completed the series of biographies known as the *Makers of Canada*. Shortt's *Sydenham* (1908) and Parkin's *Macdonald* (1908), in this series, Saunders' *Three Premiers of Nova Scotia* (1909), and the admirable reprint of Howe's *Speeches and Public Letters* (1909), are all vitally important to the student of Canadian political history.

The memorable celebration of the Tercentenary of the founding of Quebec brought in its train, with a flood of purely ephemeral stuff, several books of permanent value. First of these is the *King's Book of Quebec* (1911), edited by the Dominion archivist (Dr. Arthur Doughty), and Colonel William Wood, author of several important Canadian historical works. Another book that should be mentioned is Tracy's *Tercentenary History of Canada* (1908), a very readable and well-balanced history, in three volumes. Doughty's *Cradle of New France* (1908), Bradley's *The Making of Canada* (1908), Lucas's *History of Canada 1763-1812* (1909), following his *Canadian War of 1812* (1906), and Griffith's *Dominion of Canada* (1911), are all the work of well-informed scholars.

Of agencies which, each in its own way, are making for the development of intellectual life and scholarship in Canada, none is more important than the Dominion Archives, the Royal Society of Canada, the Champlain Society, and the *University Magazine*. The Archives perform a triple service, in collecting and safeguarding the manuscript treasures of Canada, in affording facilities for research to students, and in publishing selected documents from its collections. A list of the papers published in recent volumes of Transactions of the Royal Society would afford ample proof of the praiseworthy activities of its members. The Champlain Society, with headquarters at Toronto,

¹ See *E. B.* v, 165 et seq.

devotes itself to the publication of important works bearing upon Canadian history, and the reprinting of old works in the same field. Wood's *Logs of the Conquest of Canada* (1909), Ganong's new edition of Denys' *Gaspesia* (1908), Munro's *Documents relating to the Seigneurial Tenure in Canada* (1908), and Tyrrell's edition of Hearne's *Journey from Prince of Wales's Fort to the Northern Ocean* (1911), are admirable examples of Canadian scholarship. The establishment of the *University Magazine*, under the control of three of the principal Canadian universities, has afforded a medium, hitherto lacking, for the discussion of Canadian problems by Canadian writers in a Canadian review. Not the least important element in the success of the magazine has been the personality of its brilliant editor, Dr. Andrew Macphail.

As regards purely imaginative literature, the output in Canada within the last few years contains little worthy of record. The older Canadian poets and novelists have been comparatively silent; and it remains only to mention the work of two new writers, both women, Miss L. M. Montgomery, whose novels of life in the little "garden province" of Prince Edward Island are deservedly popular, and Miss Marjory Pickthall, who has published, though not yet in book form, a number of charmingly musical verses.

(L. J. BURPEE.)

*French-Canadian.*¹—French-Canadian literature received a decided stimulus from the *École Littéraire de Montréal*, a self-constituted academy of young authors which exercised most influence during its formative period, between 1895 and 1900. Poetry became less local in theme, expression and the point of view. Good homespun verse is written still; but with a difference. Albert Ferland (b. 1872) is faithful to the older gods and the country of the *habitant* in *Le Canada Chanté* (1908 *et seq.*). Louis Joseph Doucet (b. 1874) follows the changing seasons with more wistful questionings in *La Chanson du Passant* (1908) and *La Jonchée Nouvelle* (1910). His pronounced love of animals marks him off from most of his compatriots, who are like the rest of the Latin world in this respect. In *Les Blessures* (1912) Jean Charbonneau (b. 1876) sings one long dirge over the minor poets who have to live in contact with the grosser side of commercial Canada. *Émile Nelligan et son œuvre* (1903) commemorates a boy whose astonishing poetic genius suffered the total eclipse of insanity at the age of nineteen. Half Irish, half French-Canadian, Nelligan (b. 1882) expressed the yearnings of an Old-World symbolist in Parnassian French. He had a wonderful intuition for the musical suggestiveness of words; and his carefully wrought poems, no less than his abrupt, weird snatches, are full of that haunting sense which only comes with haunting sound. *L'Âme Solitaire* (1907) is the aeolian harp that Albert Lozeau (b. 1878) set in his sick-room window for so many years. It is a little vague; but contains the promise of better things to come, when the poet can interpret a wider world with more developed powers. In *Le Paon d'Émail* (1911) Paul Morin (b. 1886) leaves the New World for the Old, like his model, Heredia. He heaps up a superabundance of sumptuous material, wanders into frequent preciosities, and lacks Heredia's master art of concentration. But both he and his poetry are young enough to grow into what may yet be truly great.

The whole drama of French-Canadian history was summed up in the Quebec Tercentenary Pageant of 1908. The excellently apt libretto—*Pageants du Tricentenaire de Québec*—was by Ernest Myrand (b. 1854), author of several qualifying works—*Une Fête de Noël sous Jacques Cartier* (1888), *Noëls Anciens de la Nouvelle France* (1898), *Phips devant Québec* (1893), and *Frontenac et ses Amis* (1902). The history of the whole Tercentenary was admirably written by a brilliant scholar, the Abbé Camille Roy (b. 1870), in *Les Fêtes du Troisième Centenaire de Québec* (1911).

Sir A. B. Routhier (b. 1839), author of several books of travel and a noted *conférencier* has written the principal novel of recent years, *Le Centurion: roman des temps messianiques* (1909). The action moves through the very difficult medium of letters from contemporary witnesses. But it moves well; and the great trial scene is full of legal insight and dramatic feeling. Hector Bernier (b. 1886) writes an equally ardent Christian *apologia* in *Au Large de l'Écueil* (1912); though he and his work are vastly different from

¹ See E. B. v, 167-8. Digitized by Microsoft®

Le Centurion and its author. He is young, his scene is Quebec, and his time to-day. If he would argue less he would convince more; and perhaps he might then rise into true art with a story that tells its own tale.

Le Père Beaudé (b. 1870), a Dominican whose *nom de plume* is Henri d'Arles, writes remarkably keen and beautifully expressed appreciations of aesthetic subjects in *Propos d'Art* (1903), *Pastels* (1905), and *L'Âme Antique* (1907).

The death of Sir James Le Moine (1825-1912) was a loss to both French-Canadian and Anglo-Canadian literature of the commemorative kind. Historical writings have been too numerous even for the barest mention. A *Review of Historical Publications relating to Canada* is issued annually by the University of Toronto.

The chief new works on French-Canadian literature, to be added to the *Histoire de la Littérature Canadienne* (1874) of Edmond Lareau (1848-1890), are the *Études* (1904) and *Nouvelles Études* (1907) of Charles ab der Halden, a Frenchman (b. 1872). The local peculiarities of the language have engaged the attention of many scholars. In addition to the handy little *Glossaire franco-canadien* (1880) of Oscar Dunn (1844-1885), a much larger and more important volume has been produced by N. E. Dionne (b. 1848) in *Le Parler Populaire des Canadiens-Français* (1909); and a still larger work is now in course of publication through the *Bulletin du Parler Français au Canada*. (W. Wood.)

AMERICAN LITERATURE

American literature continues to impress "by its mass rather than its details." The sheer bulk of output increases steadily from year to year; but Americans are appreciably raising that high level of "average workmanship" from which William Dean Howells expects so much. To less sanguine observers, less will seem to be promised by the multiplication of literary craftsmen. The dishcartening thing to them will be the vast number of books now published which are almost good or fairly good. It remains to be seen whether America will prove what the world hitherto has not been able to prove—that works of genius are more likely to spring from a soil of enlightened mediocrity than from the wayside.

Unless in the field of dramatic writing, little fresh vigour has manifested itself between 1909 and 1913. A number of the older figures have passed from the stage. Most notable of them was Samuel Langhorne Clemens ("Mark Twain") (1835-1910), chief exponent of the American joke, and possessor of a strain of genius which never quite adequately expressed itself. William Vaughn Moody (1869-1910) was among the handful of genuine poets whom the America of later years may justly claim, and was by way of becoming a dramatist of unusual power. Sydney Porter ("O. Henry") (1867-1910) was the most versatile of recent American short story writers and humorists. David Graham Phillips (1867-1911) had a rude force and a conscious but sincere Americanism which differentiated him from the mob of novelists who write with skill. By the death of Thomas Wentworth Higginson (1823-1911) America lost the last important survivor of the New England group which half a century ago gave American literature its first wide recognition abroad.

Colonel Higginson carried into this century the tradition and practice of the familiar essay. The *Atlantic Monthly*, in which most of his work was printed, is now almost the only surviving repository of that obsolescent form. In the hands of Agnes Repplier (b. 1857) and Samuel McChord Crothers (b. 1857) it has lost nothing of its flexibility and inherent charm, but it has lost its wider audience for the moment, at least. Frank Moore Colby (b. 1865) is the wittiest of American writers of those little leaders which, on their smaller scale, retain something of the function of the familiar essay. Mr. Howells still contributes informal papers to the "Easy Chair" of *Harper's Magazine*. In the more formal and extended essay William Crary Brownell (b. 1851) and Paul Elmer More (1864) are preeminent. Whatever may be true of the light essay, there is no doubt of the steady demand for careful criticism. In such work the lifting of the average quality is of undoubted importance, and it is a hopeful sign that among the rank and file of newspaper reviewers there is a growing tendency to take their work seriously.

¹ See *E. B.* i, 831 *et seq.* Digitized by Microsoft®

The influence of the newspaper on popular forms of literature is increasing. The Sunday supplement has developed into a Sunday magazine which is issued in connection with a very large number of newspapers all over the country. The standards of Sunday journalism have become the standards of the cheaper magazines, so that the distinction now is hardly more than that the magazines are published monthly instead of weekly, and are of greater bulk. The methods of the newspaper "story" are imposing themselves upon the special articles and fiction of American magazines as a whole. A cheapening of the national sense of humour through the coarse ministrations of the comic supplement may be held responsible in part for the small amount of genuinely humorous writing now being done in America. One humorist of the first order, Finley Peter Dunne ("Mr. Dooley") (b. 1857), continues to hit off the foibles of the hour, and to scrutinize its idols, with unflinching keenness and kindness.

In poetry as in other forms of expression "workmanship" improves. The younger performers are prone to experiment with odd metres, which they manage with ingenuity. Two of the older singers have been heard from, but with increasing faintness, "Joaquin Miller" (Cincinnatus Heine Miller) (1841-1913), and J. Whitcomb Riley (b. 1854). The latter published two new books of verse in 1911. Edith Matilda Thomas (b. 1854) has not exhausted her pure if slender vein of song, and among younger women, Josephine Preston Peabody and Anna Hempstead Branch have each re-expressed, in recent books of verse, a genuine and delicate lyrical power. In *The Town Down the River* (1910) Edward Arlington Robinson (b. 1869), perhaps more indisputably a poet than any of his generation, shows increased strength. Percy Mackaye (b. 1875), with a true poetic impulse, betrays in his later verse the effects of divided allegiance; he is determined to be a playwright against nature, which meant him for a singer.

In fiction the activity is very great. Every season outdoes its predecessor in the actual number of novels issued. With barely one or two exceptions, the best of them have been by authors already known. Margaret Deland (b. 1857) still adds to her delightful group of "Old Chester" stories, which have a place of their own in the American fiction of the past quarter-century.

Other writers of *genre* stories, Ruth McEnery Stuart with her tales of the South, Mary Noailles Murfree ("Charles Egbert Craddock") (b. 1850), the earliest interpreter of the mountain whites, Mary Hallock Foote (b. 1847) and Owen Wister (b. 1860), exponents of the Western miner and ranchman: these and other story-tellers of their generation are still doing strong and characteristic work. Volumes of both prose and verse from Henry van Dyke (b. 1852) and Silas Weir Mitchell (b. 1829) bear witness to the continued productiveness of two writers who have been sure of their audience for a generation. Robert Herrick (b. 1868) is a novelist of powers which he has not yet succeeded in getting under full control. In his latest stories there is still a wealth of unassimilated material: he writes too much and too often. This is in direct contrast to his contemporary, Winston Churchill (b. 1871), who restricts himself to a novel every two years, and whose work, crude at first, has shown a steady growth in quality as well as a steady improvement in form. The recent novels of Meredith Nicholson (b. 1866) and of Mary Johnston (b. 1870) have also shown a striking advance in power. Miss Johnston's Civil War stories, written from the Southern point of view, while not free from exuberance of manner, have a panoramic quality which gives them a place of their own in the literature dealing with that period. The art of Mary Stanbery Watts (b. 1868) is of finer texture, and her *Nathan Burke* (1910) is a war-time story likely to outlast Miss Johnston's more emotional narratives. Among all the novels of recent date by new writers none stands out more distinctly as of merit, both in substance and in form, than *The Squirrel-Cage* (1911) of Dorothy Canfield.

In Sydney Porter ("O. Henry") (1867-1910) America lost her acknowledged virtuoso of that most popular of American literary forms, the short story. His range and versatility were remarkable, and his handling of the chosen form had much of the precision and orderliness which belong to the playwright rather than the writer of narrative. Among his chief successors are Jack London (b. 1876) and Edna Ferber.

A general accession of interest in the art of the playwright as something to be studied in the printed page as well as in the theatre, is a striking development of the hour. A few years ago it was a rare thing for a play to be printed, at least until it had achieved exceptional good fortune on the boards. Now the public is interested to apply the test of reading alongside the test of hearing and seeing. American publishers are putting forth not only translations of the best European plays, but issues of new American dramatic efforts. Not only the best plays of Clyde Fitch (1865-1909) and Augustus Thomas (b. 1859) have been printed, but numerous plays by younger playwrights, like (to cite a single example) "The Nigger," by Edward Sheldon. This new tendency to publish plays does not indicate a return to the "closet drama," but a new realisation that a good play is not merely a "show," but a very important form of literature. The very large number of persons in America who are now trying to write plays, and even trying to learn how to write them, is a sign of awakening. Already a number of young playwrights have made notable progress towards a drama of sincerity and power.

Literature of the solidier (and not necessarily less imaginative) types is also finding an increased audience. Publishers say that there is a growing demand for books of biography and history for "summer reading." The autumn of 1912, for example, saw the completion of John Bigelow's (1817-1911) *Retrospections of an Active Life*; Mark Twain's *Biography* (by Albert Bigelow Paine, b. 1861), the life of George Palmer Putnam, by George Haven Putnam (b. 1844); and *Personal Traits of Abraham Lincoln*, by Helen Nicolay (b. 1866); books of considerable merit dealing with special periods of American history, or with special aspects of her development, have been many of late. It is noteworthy that American scholars in general are following the example of the late John Fiske and the late William James in cultivating a style such as to give their work a chance of survival as literature.

(HENRY WALCOTT BOYNTON.)

FRENCH LITERATURE

There are periods that pass and leave little changed in the literature of a nation, and others which are a veritable springtime full of burgeons and new voices. Since 1909 the progress of the Idealist Renaissance in France has changed the character of its literature. Zola and the Goncourts—the names of a dozen years ago—are as though they had not been. If the refined and philosophic scepticism of the seventies linger with a few great writers—Anatole France, Jules Lemaître, Pierre Loti, Henri de Regnier—we see no young men on their track. Always in France the spirit of Racine has warred with the spirit of Rabelais, or, to put things on a lower level, the art of Octave Feuillet has contradicted the art of Zola. To-day the classics and the idealists have come to the front. Ten years ago literature was positive, objective, and, if we may say so, visual; for that phrase of Gautier's: "Je suis un homme pour qui le monde visible existe," was still the motto of the hour. The younger men are writers for whom the invisible world exists and occupy themselves chiefly with the interior sphere. The other day, M. René Boylesve expressed very happily this change of front to a reporter of the *Revue des Français* (Sept. 25, 1912). He said "In my young days I used to visit Alphonse Daudet whom I greatly admired. He encouraged me, and we would talk of literature. He used to say gently, 'I have never described anything that I have not seen.' I felt he was offering me a piece of advice, discreetly, and I used to go away incapable of writing anything for long afterwards, since at every turn I caught myself on the point of describing things I had never seen"—such things for instance as emotion, beliefs, traditions, opinions, the moral atmosphere of a society. And M. Boylesve showed the journalist the plan or scenario for a novel lying on his writing table—no project of a plot, no list of personages, but a sequence of maxims and reflections. "Take care of the moral atmosphere," he would say, "and the characters will take care of themselves." So soon as he begins to write he forgets his notes, which transpose themselves into persons and actions, but all his care is to invent the moral world which brings them forth, just as Daudet would proceed from a description of physical reality to the spirit within.

¹ See *E. B.* xi, 110 *et seq.* Digitized by Microsoft®

There is something English in the talent of M. Boylesve (b. 1867), something that recalls at times the minute interior art of George Eliot or Mr. Galsworthy—precise small touches disengage the character of a soul, of a society. In the last three or four years M. Boylesve has risen to one of the highest places in the fiction of France. Continuing *La jeune fille bien élevée*, his last novel, *Madeleine, jeune femme* (1912) is the story of a pure minded solitary girl, convent bred, pious, quietly reared in a small town of Touraine, suddenly cast by her marriage with a rising architect of Paris into that vortex of contractors, speculators, moneymakers and pleasure hunters which eddied round the great exhibition of 1889. The refined and sensible Madeleine passes unscathed among the booths of Vanity Fair. But by a friendly hearth (the one spot which recalls the peaceful surroundings of her early years) she meets a man of letters, a student of subtle moral problems, a lover of Pascal, an inhabitant of her own intellectual world. And almost without a struggle Madeleine succumbs—succumbs morally, we hasten to add, and in the very secret of her soul, for in the world of fact she never succumbs at all and her aureole of virtue effectually protects her. M. Boylesve is a traditionalist, a lover of the ancient faiths and disciplines of France, a lover perhaps rather than a believer. Yet if Madeleine is saved it is not, he seems to say, the beautiful quality of her soul that saved her, but the regularity and nobleness of her early education; and to make the example clearer, he sets face to face with Madeleine a charming madcap, a child of nature, Pipette Voulasne, without a bad instinct in her composition, but without a principle, a faith, or an ideal. Pipette is marked out for Fate, and here no sudden angel intervenes. M. Boylesve loves to show us the neat well ordered world of civilized society but in his magic mirror the figures that move therein become sometimes transparent and reveal behind them the great primitive forces, never completely disciplined, which drop into our neatest systems some soul irreducibly irregular, a grain of sand throwing all things out of gear. All his novels are “une invitation à réfléchir sur la vie.”

The art of M. Boylesve has made a strong impression on the young; among those who walk in his traces we may mention M. René Behaine, M. Alphonse de Chateaubriand, and M. André Lafon, to whom was awarded in the summer of 1912 the first Grand Prix de Littérature (£400), recently inaugurated by the French Academy.

Still more important than M. René Boylesve is M. Maurice Barrès (b. 1862), his elder by a few years. Boylesve was one of the young writers (with Hugues Rebell, René Ménéard and Charles Maurras) who collaborated on *La Cocarde*, the odd little review which Barrès edited in 1894 and 1895, a review which was at once Boulangist and socialist, patriotic and individualist, military and literary; in brief, as Barrès defined it, the production “d’un groupe d’hommes passionnés pour le développement historique de notre pays.” *La Cocarde* was not long lived, but its authority and inspiration, promulgated by a band of thoughtful young writers, with an ideal and a discipline of their own to propose to a somewhat disorganized literature, was enduring. *La Cocarde* was to the literature of the early twentieth century in France all that *The Germ* had been to Mid-Victorian England.

The sentiment of national traditionalism, which these writers elaborated, has proved the finest, the most stimulating tonic to French literature. Their shibboleth: “Nôtre terre, nos morts,” is the pass-word of modern letters. The sense of responsibility, the dream of order, the feeling for continuity, the belief in the persistence and perpetuity of an ideal, are motives which inspire most of the principal writers of the present day in France. The *Colette Baudoche* (1909) of Maurice Barrès is one of the evangels of this doctrine, written with an ease, a measure, a liberty and grace which form a little masterpiece. It is one of those books (romantic by their sentiment and classic by the simple purity of their form) which outline schools and their gospels. We may place it on the shelf near *Paul et Virginie*, *The Sorrows of Werther*, or *The Vicar of Wakefield*.

This local life, this “regionalism” which the traditionalists offer as a remedy to the excessive importance of Paris, has its evident danger,—the dispersion of national feeling, the dissociation of the provinces. It is an evil against which they propose to guard by the restoration of the Catholic Church and the cult of great men. In two short studies

(*L'Angoisse de Pascal*, 1910; *Il Greco*, 1912) Barrès has written in praise of natures with whom his own has obscure but intimate affinities. The great figures of history are the natural educators of a nation, its intercessors, its patrons and its patterns: A Pascal or a Corneille is surely more to France than St. Denis. In *Il Greco* the writer inquires into the secret of the spiritual life. Il Greco is emphatically a painter for whom the invisible world exists. His faults, his voluntary distortion of the human figure, the flame-like fragility and aspiration of his personages are not repugnant to M. Barrès, who maintains that an artist may sacrifice the detail of external truth in view of obtaining a greater intensity of emotional expression; he esteems such aberrations to be fortunate errors if they prove a condition of the utterance of certain spiritual states. Il Greco, like Blake, takes a poet's licence with anatomy, but he admits us to a mystical world of rushing spirits, of flooding light, of joy and fire, a world of adoration, bliss, eternal space. And so he has the praise of M. Barrès, who is far removed from the doctrines of Naturalists. In the last weeks of 1912 M. Barrès completed a new novel, *La Colline Inspirée*. We may mention in the wake of M. Barrès, the brothers Tharaud, novelists distinguished for a literary style singularly pure, firm and brilliant; the fanciful and ingenious critic and romancer, André Beaunier, and that profound and singular young genius, Mademoiselle Marie Lenéru.

Another modern Plutarch (who, like M. Barrès, seeks to propose to his contemporaries, in the Lives of Great Men, a discipline and an ideal) is M. Romain Rolland (b. 1866), the author of studies of Beethoven (1903) and Michael Angelo (1906), which reveal his intense and dreamy genius, but especially known for his biography of an imaginary German musician, *Jean Christophe*; it is, in fact, a biography rather than a romance. *Jean Christophe*, a huge novel in successive books (the first, *L'Aube*, published in 1904), as long as *Clarissa Harlowe* or *War and Peace*, is perhaps the most remarkable work of contemporary fiction, as well known in Italy, almost as well known in Germany and England, as in France. A singular moral fervour, a rare imagination, an extraordinary alternation of sarcasm, rancour, revolt and tenderness breathe from the pages of this disconcerting book. M. Rolland is the Rousseau of our times, and he has the defects of his model: a negligence and diffuseness in the style, alternating with chapters so beautiful and touching that we may rank them with the best contemporary work; a lack of proportion and measure; an irritating spleen; sometimes a shrill-voiced cholera almost shrewish in its denunciation, its polemics. But there is a greatness in M. Rolland's outlook, a penetrating quality in his insight, which is his own peculiar gift. No great question leaves him incurious. What is genius? Why does its production so often dislocate and jangle the nature which gives out the spark? In what degree is that creative force a thing distinct from the personality that harbours it? What is that dualism in the mind—partly a trained intelligence, partly the capricious play of a free unconscious instinct? What is that simultaneous working of intuition and understanding which goes to produce a masterpiece? No psychologist, we think, has noted these questions more finely than M. Rolland in the volume of *Jean Christophe* entitled *La Révolte* (1906). And what tenderness he brings to describe the ephemeral beauty of a girl's life who dies young, an Antoinette or a Sabine; all the pathos of human destiny is there. With how intense a passion, a rancour, a fatality, he treats the overmastering force of love in *Le Buisson Ardent*. There is something of the wild tragedy of *Tristan and Isolde* in this episode (and here, we feel, his musician, who in his childhood reminded us of Beethoven, resembles Richard Wagner). At every turn our author treats the difficult problem of the artist's relation to his environment. Jean Christophe knows what it is to be one single cell, aching with individuality, in the national body of which, *volens volens*, he forms a part; and he knows the attraction, too, which draws together the members that form a whole. He has learned the two great lessons: revolt, which strives and creates; acceptance, which assimilates and transforms. At the end of 1912 the final volume of *Jean Christophe*,—the tenth,—closed on a note of peace this contemporary epic.

M. André Gide (b. 1869) is a very different artist, narrow but exquisite. "Le goût exquis craint le trop en tout." These words of Fénelon's rise into our mind whenever

we open a book by M. Gide. Of all of them the best is *La Porte Etroite* (1909), the story of a rare soul drawn into the abyss of the mystical life "as waters are by whirlpools suck'd and drawn," through a mistrust of the excess, the vulgarity, the transitoriness of mortal happiness. There are natures which need the liberty, the solitude, the rapt interminable progression and ideal refuge of the inner life. They are, as Sainte-Beuve put it, marked with "la griffe de l'archange." Alissa has only to stretch out her hand to take her happiness. A sort of disgust of reality, a dread of disenchantment, paralyzes her:

"Enough, no more . . .
'Tis not so sweet now as it was before!"

Alissa was one of those Jansenists whom Ninon de l'Enclos mocked as "les précieuses de l'amour." M. André Gide, like M. Maeterlinck, like M. Barrès, like M. Boylesve, like most of the considerable writers of his generation, has entered religion through the gate of symbolism. He is a mystic rather than a dogmatist, a well-wisher to religion rather than a believer. Their last word is not said. The current which has borne them already so far from their starting point may land them within a chosen fold, but so far they are champions of the faith (M. Maeterlinck is an avowed materialist, M. Gide of Protestant origin, but M. Boylesve and M. Barrès are formidable Catholic champions) "jusqu'à la foi, exclusivement," like those pious *improfessi*, those God-fearing *metuentes*, who in the primitive Church, though neither Jew nor Christian, ran the risks and fought the battles of Paul and Peter.

There is a vast difference between their novels—even between a book so avowedly orthodox as *Madeleine, jeune femme* and the real thoroughgoing religious novel written out of a fervour of faith, with the imagination of an apostle, perhaps the rarest and most difficult form of art. The last two years, however, have brought us several even of these; and we speak of real works of art, not merely tracts for the times. Of these the noblest is by a poet, Charles de Pomairols (b. 1848), who has been called the Wordsworth of contemporary France. *Ascension* (1910) has all the defects of a poet's prose, but also a natural idealism, an air of noble reverie, a dreamy wandering grace, singularly poignant and fresh. Often in reading the volume we lay it down and think: how Pater, how Turgénieff, how Meredith would have appreciated this penetrating languour. But it is certain that the ordinary novel reader would be bored. (A second novel of M. de Pomairols, *Le Repentir*, 1912, does not reach quite this high level.) There is more fire, more force, more grip in an extraordinary book of a young writer, M. Emile Baumann (*L'Immolé*, 1909). We may also mention *La Barrière*, by M. René Bazin (1910), *Leur Royaume*, by M. Robert Valléry-Radot (1910), and *La Cité des Lampes* by "Claude Silve" (1912). The last name veils the identity of Mademoiselle de Lévis-Mirepoix, the daughter of the Duke.

We have shown that the principal trend of French literature in 1910-12 has been towards a Renaissance of idealism and indeed in great part toward a Catholic Revival, but this is not saying that the writers of yesterday have abandoned their positions or that they have ceased to produce; one of them indeed has produced a masterpiece. But we have preferred to indicate the present state of things and the promise of to-morrow, and to draw attention to the new writers who, with every season, are coming to the front.

And having performed our duty towards literary history, we may own that, for interest and charm, few of these newer books can compete with certain productions of the old stagers. Pierre Loti (see *E. B.* xvii, 19) has seldom written a finer page than the concluding passage of *Le Pèlerin d'Angkor* (1912). M. Jules Lemaitre (see *E. B.* xvi, 408), resuming the rôle of critic, has given us, following his *Rousseau* (1907), a *Racine* (1908), a *Fénelon* (1910), a *Chateaubriand* (1912). All of these are interesting and valuable, and the *Racine* especially is full of charm. In describing Rousseau, Fénelon and Chateaubriand (the three great Romantics *avant la lettre*), the critic's habit is piquant. He sets his author on a pillory, vituperates his story, attributes to his evil influence the degeneracy of France, then softens, as he tells his story; discovers him to be charming after all; crowns him with new plucked laurels, till, on the last page, author and critic

kiss again with tears. If M. Lemaître has struck forth no new line, developed no new faculty, at least he has lost nothing of his wayward originality. But M. Anatole France (see *E. B.* x, 775) has gone on from strength to strength. He has never produced a more brilliant book than *Les Dieux ont soif*, which, in its neat light form, is a psychology of the French Revolution—a psychology in action, with no visible apparatus of historical or philosophical knowledge but singularly penetrating and illuminative. Age has weakened none of the charming and redoubtable arts of the author of *l'Orme du Mail*. He is terrible or delightful, gay or sinister, exquisite or harshly, tragically moving, turn by turn. The same unparalleled style, supple, opulent, exact and sober, adorns the same philosophy—as the loveliest flower may hide the brink of an abyss. For the mind of M. France is full of contempt for human nature, derision of human destiny, and a sombre cynical satisfaction in contemplating lust and frenzy and horror. It is not unlike the mind of Swift. And yet M. France has looked on life and has seen that it was good. Like his philosopher Maurice Brotteaux, “il admire la nature en plusieurs de ses parties, et spécialement dans la mécanique céleste et dans l’amour physique.” He might also add that he admires the complication of the human character, and finds a secret pleasure in verifying its paradoxes and disharmonies. His Évariste Gamelin will recall to the reader familiar with the history of the times that strange figure of François Sergent, most candid of mortals, most ferocious of revolutionaries, an implacable Jacobin, a delicate artist, who organised the September massacres and also the picture gallery of the Louvre, and who, all his life, was the faithful and devoted lover of one woman. But instead of the honest Mme. Sergent, Anatole France has given his Jacobin, for a vis-à-vis, a woman whose wiles, whose frailties, whose successive sincerities, remind us of the beautiful wife of Greuze, the daughter of the printseller.

Somewhere at the feet of M. France (children of nature and not grace), opposite to that band of idealists of whom we have already spoken, we must place a group of unconventional young writers whose extreme right would include the delightful poet Francis Jammes (whose *Georgiques Chrétiennes* have the charm of Pan, on his pipe, mimicking the church-bells), while their extreme left extended to the gifted Charles Louis Philippe, who died prematurely at the very opening of the period under consideration. There is Madame Marcelle Tinayre, who has never quite recaptured her first delicate mastery in *La Maison du Pêché*, yet who in *L'Ombre de l'Amour* shows a sombre magnificence of style, and a violent poignant beauty of her own; there is Colette Willy, the actress, whose *Vagabonde* is a brilliant study of the eccentric sphere of the music halls; there is Marguerite Audoux, the dressmaker, whose *Marie Claire* was so astonishing a revelation of idyllic charm, primitive grace and exquisite poignancy. Before the prose of a Marguerite Audoux, as before the painting of her friend Madame Marval, the skilled artist, suddenly humbled, remembers a theory dear to Browning that the real man of genius should rise untaught. Their ignorance at all events is bliss.

And somewhere we must place the literary manifestations of the drama, too various to co-ordinate. We must note the metamorphosis which, in *Le Tribun*, has made of M. Paul Bourget (see *E. B.* iv, 331), a successful playwright; we must recall the brilliant reception given to Rostand's theatrical fairy tale of *Chantecler* (see *E. B.* xxiii, 754); we must direct the reader to M. Charles Péguy's ample and powerful *Mystère de Jeanne d'Arc* (the English reader may imagine Walt Whitman turned a Christian mystic, and endowed with ten thousand-fold his original flux of words), and we must point out the original talent of Mademoiselle Marie Lenéru in her *Affranchis*. All these four writers join at different points the camp of the idealists. (MARY DUCLAUX.)

GERMAN LITERATURE

There is a peculiarly incalculable element in the German literary movement of the last generation; in spite of its being guided and preached at to an excessive degree by the critics, it has persisted, time and again, in freeing itself from their leading-strings, and

¹ See *E. B.* xi, 783 et seq.

going its own way. This has been more than ever the case during the past few years. Germany rose into prominence as a power which had to be reckoned with in literary Europe, towards the end of the eighties of the last century. The first phase of the literary revival resulted from a combination of three powerful forces in European literature: the French naturalistic movement, the influence of the Russian novel of Tolstoi and Dostoievsky, and the drama of ideas on a realistic basis which came from Scandinavia. But no sooner had an amalgamation of these three outside forces been effected, and Germany had begun to evolve a literature of her own from the union, than the wind of popular favour changed. The phase of undiluted realism gave place to a movement analogous to the symbolistic movement in France, but more deeply immersed in mysticism than the French movement. With daring originality, the young quondam realists introduced, side by side with the most painstaking and even sordid descriptions of actuality, elements of faery lore, of idealism and symbolism, which resulted in the most fantastic and incongruous combinations. But now it may be said that realism is virtually a thing of the past in Germany.

As time goes on, the significance of the work of Friedrich Nietzsche for the literary achievement of modern Germany becomes ever plainer. One can no longer regard this influence as restricted to the unfettering of individualism noticeable in the lyric poetry of the eighties and nineties. Nietzsche appears now rather as a force which is keeping German literature in touch with the needs and demands of the actual life of the present and is preventing it—as has so often happened in the past, when a healthy realism became a dead letter in Germany—losing itself in the clouds of an unworldly idealism.

The modern lyric has shown no abatement of its quest for new and original expression. And although neither Richard Dehmel nor Stefan George—no doubt the two most original of modern German singers in widely different fields—has added to his laurels in these years, younger men like Max Dauthendey (b. 1867), Rainer Maria Rilke (b. 1875) and Alfred Mombert (b. 1872), have been establishing their claims to a place in literary history. In epic poetry, the importance of the Swiss writer Carl Spitteler (b. 1845), as one of the strong talents of his time, is now very generally recognised, more especially since the republication in 1909 of his remarkable poem *Olympische Frühling* in a revised form. With the death of Detlev von Liliencron (July 22, 1909), the modern German lyric lost its first master; and with that of Otto Julius Bierbaum (Feb. 1, 1910) the leading spirit in that lighter phase of the modern lyric, which came to Germany with the French *cabaret*, the so-called “Überbrettl.” Further losses have been Martin Greif (Hermann Frey) (March 29, 1911), and, in other than lyric poetry, Wilhelm Busch (Jan. 9, 1908) and Julius Wolff (June 30, 1910).

With the waning of Dostoievsky's influence and that of naturalism generally, the German novel has fallen back once more into an experimental stage. It is here, perhaps, that the decentralizing tendencies have most surely made themselves felt, the so-called “Los von Berlin” movement. The novel has entered the service of that “Heimatkunst” of which the Alsatian writer, Fritz Lienhart (b. 1865), has been the most persistent advocate; it has fled to the country and the dialect; the novel of the large city has given place to that of the province, and the gain in variety and poetic strength has been undeniable. But along with this movement, there has also gone a tendency towards idealizing symbolism, similar to what has taken place in drama. This is to be seen notably in the work of the more promising younger writers, such as Hermann Hesse (b. 1877), who is restricting himself more and more to the short story, Emil Strauss (b. 1866), and Bernard Kellermann (b. 1879); while a distinctly novel note in the fiction of the day has been struck by Hanns Heinz Ewers (b. 1871), a former contributor to the literature of the “Überbrettl,” who, with his *Der Zaubrerlehrling* (1910), harks back to the manner of E. A. T. Hoffmann, and is influenced by Baudelaire. Of the writers of established reputation, Gustav Frenssen (b. 1863) has published one novel, *Klaus Hinrich Baas* (1909), which, however, rather justifies our doubts as to whether the author of *Jörn Uhl* has any higher poetic mission to fulfil towards his generation. Thomas Mann (b. 1875) has produced only one novel, *Königliche Hoheit* (1909), which

is hardly worthy of the author of *Buddenbrooks*, while Hermann Sudermann (b. 1859) has remained faithful to the French realism of his earlier period in his *Das hohe Lied* (1908), and the short stories of the volume *Die indische Lilie* (1911). Gerhart Hauptmann (b. 1862) has also in the last few years turned seriously to the novel and published two books, *Der Narr in Christo, Emanuel Quint* (1911), a powerful reproduction of the gospel story in modern Silesian surroundings, and *Atlantis* (1912), a novel of little distinctive literary quality. New novels by Jakob Wassermann (b. 1873; *Die Masken Erwin Rainers*, 1910), and by Arthur Schnitzler (b. 1862; *Der Weg ins Freie*, 1908), show no conspicuous advance on these writers' earlier work; and the same is true of the recent work of the leading German women writers, Clara Viebig (b. 1860; *Kinder der Eifel*, 1909); Helene Böhlau (b. 1859; *Isebies*, 1911); Gabriele Reuter (b. 1859; *Das Tränenhaus*, 1909). Death has thinned considerably the ranks of the older generation of novel-writers. Hans Hoffmann died on July 11, 1909; Hermann Heiberg on February 16, 1910; Wilhelm Raabe on November 15, 1910; Friedrich Spielhagen on February 25, 1911; Adolf Wilbrandt on June 10, 1911; Wilhelm Jensen on November 24, 1911; Felix Dahn on January 3, 1912. A promising talent in fiction has also been lost by the death of Wilhelm Holzamer (1870-1907).

The drama remains, as it has always been, the most interesting feature of recent German literature, and the one which reflects most faithfully the movement of ideas. In many ways the chief dramatic writer of the period, Gerhart Hauptmann, is representative of his time. In his work we see precisely that experimental spirit, that want of a definite poetic policy, and one might also add, of strong, dominating ideas, which is so characteristic of contemporary German literature. Since 1909 Hauptmann has hardly added to his reputation as a dramatist; he has written *Kaiser Karls Geisel* (1908), *Griselda* (1909), *Die Ratten* (1910), the latter in his earlier realistic manner, and *Gabriel Schillings Flucht* (1912), a weak and ineffectual play. These books cannot for a moment compare in incisive power with his early works. Hermann Sudermann, who was Hauptmann's brother-in-arms in the early days of the literary revival, has less to his credit: *Strandkinder* (1909), and a poetic play, *Der Bettler von Syrakus* (1912). The latter fails, however, to rise much above the iambic "drama of ideas," as it was cultivated by Adolf Wilbrandt in the earlier generation. But the last few years have brought a new group of dramatic writers to the front. The leading spirit here is Hugo von Hofmannsthal, who is mainly responsible for the movement which has as its object a renaissance of the works and forms of older literatures. One cannot, however, ascribe a like success to his latest original works, *Christines Heimreise* (1911) and *Der Rosenkavalier* (1911), to the latter of which Richard Strauss has written the music. Arthur Schnitzler has added to his reputation with the fine historical play, *Der junge Medardus* (1910), and with a modern drama in his old manner, *Das weite Land* (1911); Hermann Bahr (b. 1863) has become one of the popular dramatists of the day with his *Das Konzert* (1909); and Karl Schönherr, a native of Tirol, has won a no less striking popular success with his tragedy, *Glaube und Heimat* (1910), the broad popular pathos of which is, however, more in evidence than higher literary qualities. The most promising developments of the drama in these years have taken two forms, the first a kind of modern romanticism in classic form, to some extent influenced by Hofmannsthal, and the second, ironic and satiric. To the first group belongs the work of Ernst Hardt (b. 1876), author of *Tantris der Narr*, which received the Schiller Prize in 1908, without altogether meriting so high an honour, and of *Gudrun* (1911); further, that of the gifted and promising young dramatist Herbert Eulenberg (b. 1876); but it remains to be seen whether this return to a poetic drama of a traditional type will escape the shallows on which such attempts usually come to grief in Germany. Meanwhile, the most prominent new man in the drama of to-day is a representative of the second form of innovation. This is Frank Wedekind (b. 1864), whose work has in these years been advancing rapidly in popular favour. Wedekind is the most notable product of the "Überbrettel" movement, with which he was formerly closely associated. He is grotesque rather than realistic, a dealer in irony and paradox, a fighter against the disease of excessive "liter-

arism" in the theatre. But here, too, it remains for the future to show whether Wedekind's work has itself enough of the enduring qualities of literature to maintain its place; his latest plays, *Oaha* (1908), *Musik* (1908) and *Der Stein der Weisen* (1909), hardly, it must be confessed, justify very high hopes. By death the German drama has lost in these years A. L'Arronge (May 26, 1908), Ernst von Wildenbruch (Jan. 15, 1909) and Arthur Fitger (June 28, 1909).

(J. G. ROBERTSON.)

ITALIAN LITERATURE

Italian literature has not been very prolific during the last few years, and while a certain amount of good work has been produced, few books have appeared that are likely to hold their own in the first rank. In the field of fiction the two most important novels are the *Leila* of Antonio Fogazzaro (d. 1911), and the *Forse che si forse che no* of Gabriele D'Annunzio (b. 1863, see *E. B.* ii, 78). The latter carries on the author's studies of the psychologically abnormal and of sensual passion, but in style and descriptive power it shows us D'Annunzio at his best; it is a novel of ultra-modern life in which motoring and aviation loom large. The novel of local colour, concerned rather with the *ambiente* than with character drawing or plot, maintains its popularity; Grazia Deledda, the talented Sardinian authoress, has brought out several new volumes belonging to this class of fiction, such as *Il nostro padrone*, *Sine al confine*, etc., in which the primitive customs and interesting life of her native island are admirably rendered. The chief fault of her tales is their almost unrelieved gloom and sadness, a defect common, however, to a large part of modern Italy's literary output. It is therefore with relief that we turn to the reasoned optimism of Luigi Sicilian's *Giovanni Francisca*, a novel of Calabrian life, in which the virtues and attractive qualities of the people of Calabria are set forth as well as their faults; the conclusion is full of hope. Dora Melegari, one of the leading personalities of the Italian feminist movement and author of several novels, volumes of memoirs, literary criticism, etc., both in French and in Italian, has in *La città del giglio*—the second of the series *Le tre capitali*—produced a picture of life in Florence at the time when it was the capital of Italy; she has drawn the political and social *milieu* of the time as well as her characters with a steady hand and charm of style which make us look forward with interest to the appearance of her next volume on Rome. A young authoress who writes with an agreeable and straightforward simplicity and with a high moral purpose is "Paola Stafenda" (Lina Trigona), whose first novel *La dritta via* appeared in 1910.

In poetry no new writers have risen to fame, but some well known poets continue to produce. D'Annunzio has been inspired by the Turco-Italian war to write ten poems collected in the volume *Canzoni della gesta d'oltremare*, which contain some of his most admirable verse. Although at times unduly involved and too full of allusions to obscure episodes, his poetry rises to a greater height of lyrical beauty and genuine inspiration than anything which he has yet produced. The muse of Ada Negri (b. 1870; see *E. B.* xix, 343) has become less melancholy and less bitter now that her life has been happier, and in *Maternità*, a collection of songs of motherhood, she takes a more cheerful view of life than she did in her earlier poems. Dialect fills an important place in modern Italian literature, for it still holds its own among the people, and many poets have chosen that medium of expression. Cesare Pascarella, the *Romanesco* poet, and one of Italy's greatest writers, has produced very little of late, but his new cycle on the Risorgimento, which his friends have been privileged to hear recited, will it is hoped soon appear. "Trilussa" (Carlo Alberto Salustri), who writes in the same dialect, has published several volumes of satires and fables, in the style of G. G. Belli, but his work is inferior to that of Pascarella. The Neapolitan dramatist Roberto Bracco has brought out some good verse in his native Neapolitan dialect, in which he paints the character of the

¹ See *E. B.* xiv, 897 *et seq.*

Neapolitan people, sometimes wild, noisy and *scapigliato*, but often melancholy in its love songs. Another Neapolitan, Salvatori Di Giacomo, after a long silence, is beginning to write once more, and his poetry often contains high lyrical qualities.

Political movements in Italy have usually had literary beginnings, and Italian Nationalism, which arose as a reaction against the predominance of socialism and internationalist anti-patriotic ideas and proclaimed the necessity of a greater faith in Italy and of a more virile policy, has as its advocates a number of brilliant and enthusiastic young writers. The most remarkable of them is undoubtedly Enrico Corradini, the precursor and apostle of the movement; his two novels *La patria lontana* and *La guerra lontana*, although not without artistic faults, are vigorous, effective and sound, and inspired by lofty patriotism. His more recent books on the campaign in Tripoli are also remarkable. Such writers as "Giulio De Franzi" (Luigi Federzoni), Goffred Bellonci, Maurizio Maraviglia, also play an active part in the movement.

Of the other more purely literary and artistic movements none seem likely to make their mark on contemporary thought. The "Futurists," of whom F. T. Marinetti is the chief exponent, while professing to create a new literature, a new art and new music, are hardly to be taken seriously, while the same may be said of the shrieking and somewhat bumptious group of writers who centre around Giovanni Prezzolini and his organ *La voce*, and wish to reform the world by substituting invective for argument.

Journalism continues to make great strides; the modern sensational style, with "scare" headings, etc. has been generally adopted, but the papers are larger, fuller of news and better written than before, and have an ever increasing circulation. Many of the most eminent authors, university professors, scientists and statesmen contribute to their columns. Among the best Italian journalists Luigi Barzini of the Milan *Corriere della sera* occupies a high place, and his vivid articles and telegrams from many lands where wars, revolutions and other exciting events occur, will always be read with interest. "Rastignac" (Vincenzo Morella) of the Rome *Tribuna* is one of the best known leader writers, and Enrico Scarfoglio, proprietor of the Naples *Mattino*, is also a very clever journalist. Giuseppe Bevione, for some years London correspondent of the Turin *Stampa*, is one of the most serious of the younger newspaper men. Plenty of literary talent gathers round the Rome *Giornale d'Italia*, to which the above-mentioned Nationalist writers contribute, as well as Diego Angeli, the art critic, translator of Shakespeare, novelist, and satirist of society's shortcomings, whose witty and slightly malicious articles delight the readers of the same paper. Another writer *de omnibus rebus et de quibusdam aliis* is Ugo Ojetti.

Little has appeared worthy of note on the Italian stage. The one real success of the last few years is Sem Benelli's brilliant historical tragi-comedy *La Cena delle beffe*. D'Annunzio has written two new plays—*Fedra*, an attempted revival of the classical drama, and *Il Martirio di San Sebastiano*, originally written and produced in French; but although both contain many beautiful passages they are lacking, like the author's other tragedies, in dramatic quality. The most characteristic productions of the modern Italian stage are the dialect plays, which are associated with the various dialect companies touring about the country.

(LUIGI VILLARI.)

DUTCH LITERATURE¹

The stagnation, if not decline, of Dutch literature after the flourishing period of 1880-1890 must for a great part be ascribed to the fact that criticism came too strongly to the fore, and the discussion of literary method and ideals took the place of original production. Moreover, naturalism, introduced into Holland through Zola's powerful influence, had triumphed too much, and when the reaction came no definite path lay clear. In this way there came a certain anarchy in feeling and in thinking, and only in the last few years has imagination begun to occupy a prominent place in Dutch literature. The discord between what used to be congenial minds was made apparent by the constant appearance of new periodicals. So by the side of the *Nieuwe Gids*, the *Twee-*

¹ See E. B. viii, 719 et seq. Digitized by Microsoft

maandlijksch Tijdschrift was published (1894), which in 1902 changed its name to *De Twintigste Eeuw*, and was combined in 1909 with the *Nieuwe Gids*. On the other hand Albert Verweij (b. 1865) had already left the latter in 1905, and founded *De Beweging*, in which a large place was given to poetry, and naturalism was not admitted at all. Already in 1903 *Groot Nederland* had been started, strictly limited to literary work, whereas in *Onze Eeuw* science and politics were also treated. *Van Onzen Tijd* (1901, a weekly since 1910) became the paper of the younger Roman Catholic authors, *Ons Tijdschrift* (1897) that of the younger Calvinists, *Stemmen* (1911) that of the Orthodox Calvinists; the *Nederlandsche Spectator* stopped in 1908, but *Elsevier's Geïllustreerd Maandschrift* was rejuvenated under the editorship of Herman Robbers (b. 1868).

Among the poets of the last few years were some of great promise, but many were mainly imitative and showed little originality. Against these Frederik van Eeden's articles about *Literary language* (1902) were directed, by the side of which must be mentioned Adama van Scheltema's book *The Foundations of a New Poetry* (1907). Van Eeden (b. 1860) followed up his *Dante and Beatrice* (1908) with the second part of *Het Lied van Schijn en Wezen* (the Song of Illusion and Reality, Part I, 1895, Part II 1910). Albert Verweij (b. 1865) whose poetry is too obscure ever to become popular, published *Het Blanke Heelal* (*The Lucid Universe*, 1908), the dramatic poem *Cola Rienzi* (1910) and a volume of poems called *The Feast of Life* (1911). The poetess Helène Swarth (b. 1859) added to her previous volumes *Pale Skies* (1909), *Gossamer* (1910), *Evening-clouds* (1911), together with two poems in dramatic form *Dolorosa* and *Mara* (1911). Herman Gorter (b. 1864) published the long socialistic poem *Pan* (1912), and the socialistic poetess Henriette Roland Holst-van der Schalk (b. 1866) gave utterance to her feelings in *The New Birth* (1903), *Upward Roads* (1907) and especially in the lyrical tragedy *The Rebels* (1910). There must also be mentioned *Tom's Diary* (1910) by Willem Levinus Penning (b. 1840), which contains fine poems, reminding us of Staring and Potgieter, *Forgotten Songs* (1910) and *Carmina* (1912) by P. C. Boutens (b. 1870), *From Silence and Strife* (1909) by C. S. Adama van Scheltema (b. 1877), *Poems* (1911), by A. Roland Holst and *Moods* (1910) by J. Reyneke van Stuwe (b. 1874).

Much more distinctly than in the case of poetry, the want of a definite school is felt in Dutch prose literature, so that the most diverse tendencies find expression. In the flood of novels only a few can be pointed out which will probably attract more than temporary attention. Frederik van Eeden published a series of lectures under the title of *The Joyous World* (1903), followed by the novels *The Bride of the Night* (1909) and the fictitious *Reminiscences of Vico Muralto*, while in 1912 his *Sirius* and *Siderius* appeared, as the first part of a trilogy. L. van Deyssel's (b. 1864) *From the Life of Frank Rozelaer* (1911) contains philosophical contemplations besides beautiful descriptions of nature and fine psychological analysis. Weirdly phantastic are *The Strange Adventures of Zebedeus* (1910) by J. van Looy (b. 1855). Cyriel Buysse (b. 1859) maintained his literary reputation by publishing *The Full Life* (1908), *I remember* (1909), *The Donkey* (1910) and *Moods* (1911); J. de Meester (b. 1860) published a volume of stories, called *Light Lines* (1900) and G. H. J. van Hulzen (b. 1860) the two novels *Love's Intermezzo* (1910) and *The Nest of our dear Lord* (1911). G. F. Haspels (b. 1864) wrote *Under the Brandaris* (1908), *Penance* (1910) and *The Town at the Ferry* (1912); J. Eigenhuis (b. 1866) *Growth* and *The rough Farm* (1911) and also four shorter stories called *From the Village by the Sea*; Herman Robbers *The Happy Family* (1909), with the sequel *One by one* (1910); Israel Querido (b. 1873) was most successful with a novel about the diamond-cutters' world, *The Course of Life* (1901), but was guilty of great realistic exaggeration in *Human Woe* (1903), while *The Jordaan* (the name of a poor quarter in Amsterdam, 1912) the first part of a cycle of novels about the life of the poor classes in Amsterdam, is judged very differently by different people but is widely read. Stories of which the scene is laid in the Indies are those of Fenna de Meyier, *Under the Indian Sun*, and the novels *When the Sennahs are in Flower* by Mrs. Overduyn-Heyligers, and *Deep Currents* by J. E. Jaspers.

The most prolific of Dutch writers is still Louis Couperus (b. 1863); his novel *On the*

Road of Joy (1908) was followed by the volumes of sketches and stories called *About myself and others* (1910), *Ancient Stories of Gods and Emperors, Poets and Hetairs* (1911), *Short Arabesks* (1911), *The Swallows flown down* (1911) and *Ancient Tourism* (1912), a travelling story from old Egypt.

Amongst women novelists J. Reyneke van Stuwe (b. 1874) is still very productive. She has published *Behind the World* (1908), *Free Power* (1909), *The Illusion of the dead* (1910), *The Children of House Ter Aar* (1911) and *Mater Triumphatrix* (1911), the latter as the third volume of the series "Poor Woman." Next to her must be mentioned Margo Antink (b. 1869), who in collaboration with her husband Carel Scharten wrote *A House full of People* (1908) and *Foreign Rulers* (1911); Ina Boudier-Bakker (b. 1875) to whom we owe the beautiful books *Poverty* (1909), *The Withered Plant* (1910) and *Blossom* (1912); Anna van Gogh-Kaulback, the author of *Mother, Tides* (1911), *For Two Lives* (1912); and Anna de Savornin Lohman (b. 1868), who wrote *Reminiscences* and *For the Honour of God* with the sequel *From Christian Circles* (1911).

Very few Dutch dramas have been written of late years that lay claim to something more than transitory value. The public was much interested in Frederik van Eeden's social-satiric dramas: *Ysbrand* and *The Promised Land* (1908). Ina Boudier-Bakker's *The Highest Law* (1907) met with great success, as was also the case with Marcellus Emants' *The Power of Dullness* and *Odours* (1909) and with Willem Schürmann's *Forty* and *The Violiers* (1911). Excelling all these, however, especially as regards the technical qualities of his plays, there is Herman Heyermans, though his dramas are far from being of equal value. He put on the stage *The Rising Sun*, *The Sleeping Beauty* (1909), *Beschuit met Muisjes* (a rusk with aniseed comfits, the customary delicacy when a child is born; 1910) and *Glück Auf* (1911), the latter a stirring picture of the misery and dangers of the mine-workers' trade.

(H. ZONDERVAN.)

BELGIAN LITERATURE

Maurice Maeterlinck's play *L'Oiseau Bleu* (1911) is the outstanding contribution of Belgian French literature during 1910-12. It was first performed at Moscow, then in London (translated as *The Blue Bird*) and later in Paris and New York. The writer's poetic imagination and serene philosophy have contributed to make his play intensely popular. Emile Verhaeren's tragedy *Hélène de Sparte* was published first in German, translated by Stephan Zweig, then in Russian, and appeared in French, in 1912, when it was performed in Paris. Verhaeren's forcible and rather rugged style is perhaps not absolutely suited to the subject he treats. His new poems, however, *Les Rythmes souverains* (1910), *Les Villes à pignons* (1910), *Les Fleures du Soir* (1911), *Les Blés monants* (1912) and *Les Plaines* (1911), are as intense in feeling and vitality as his earlier work. In *Les Libertins d'Anvers, Légende et Histoire des Loïstes*, Georges Eekhoud has told the story of the heretic sects in Antwerp in the XVI century. In this book, Eekhoud, according to his custom, exalts his native city in her vices as well as in her virtues. A tragedy in four acts by Camille Lemonnier, *Edénic*, set to music by Léon du Bois, was performed in Antwerp in 1912 with great success. The poem, written in blank verse, has all the charm of Lemonnier's vivid imagination and forcible style. Albert Giraud's *La Frise empourprée* (1912) is a collection of poems, in which their author remains faithful to the Parnassian tradition. Iwan Gilkin published in 1911, poems called *La Nuit*, the first of three volumes, of which the others will be called *L'Aube* and *La Lumière*. Grégoire Le Roy, in his collection of poems called *Le Rouet et la Besace*, illustrated by himself, deals with the sufferings of the poor. "Jean Dominique" (pseudonym of Mlle. Marie Closset), whose last volume of poems is called *Le puits d'Azur* (1912), is undoubtedly

¹ See E. B. iii, 680.

edly one of the most gifted of contemporary women writers. Her verses, written in classical form, are full of the most poignant sensibility. Mlle. Closset is a teacher and lives in Brussels. Amongst other contemporary French authors in Belgium, the following may be mentioned: Louis Delattre (*Petits contes en sabots, La parfum des buis*); Blanche Rousseau (*Le Rabaga*); Louis Dumont-Wilden (*La Belgique illustrée*, and, in collaboration with L. Sougenet, *La Victoire des vaincus*); Franz Hellens (*Les clartés latentes*); Jean de Bosschier (*Dolorine et les ombres*). The best new Belgian plays include *Kaatje* by Paul Spaak, *Les Étapes* and *Les Liens* by Gustave van Zype, and *Le mariage de Mlle. Beulemans*, by Fonson and Wicheler, a picture of the life of the lower middle class in Brussels.

In Flemish literature there has been marked activity. Stijn Streuvels, a nephew of Guido Gezelle, and by profession a baker at Avelghem, a village in Flanders, has made a considerable reputation both in Belgium and in Holland. His descriptions of rural life are both poetic and realistic, and he has been compared to Tolstoi, whose psychological subtleties and epic amplitude Streuvels however does not possess. His style is of rare perfection, and this remark applies to the whole of the modern Flemish school of writers. Streuvel's last work is *Het glorieryke Licht* ("The glorious light").

Cyriel Buysse may be called the Flemish Maupassant. He is a realist. His works, which deal with the life of the people both in towns and in the country and, to a lesser degree, with that of the middle classes, form a complete picture of Flemish life. Buysse is passionate, robust, full of revolt and of pity, very human. His *De vrootyke thoct* ("The joyous expedition"), *Stemmingen* ("Impressions"), and, in collaboration with Virginie Loveling, a popular woman author, *Levensleer* ("Education through life"), appeared between 1910 and 1912.

Maurice Sabbe (*De Nood der Bariseele's*; "The plight of the Bariseeles"), whose writings deal exclusively with Bruges, and E. Vermeulen (*Herwording*; "Renaissance") who deals with the life of the peasants in West Flanders, may also be mentioned as well known contemporary Flemish writers.

René De Clercq and Karel van de Woestijne are the most typical Flemish poets of the present generation. René De Clercq proceeds directly from the inspiration of Guido Gezelle (1830-1899). His poems are essentially popular, vigorous, full of life and good spirits, although through these one feels his tenderness, his pity for the misery of the Flemish peasants. A volume of *Gedichten* ("Poems") is his latest work. Karel van de Woestijne has a more complex personality. His poems are very varied in feeling, sometimes simple and direct, at other times complicated, full of metaphors. His sphere is that of the soul, and for him things are real in so far only as they partake of the spiritual life. It is necessary to add that there are contrasts in van de Woestijne's nature which he does not always dominate and which give a certain want of harmony to his works. His last volume, containing prose essays on Flemish painters and writers, is *Kunst en Leven in Vlaanderen* ("Art and life in Flanders"). His last volume of poems is *De gulden Schadem* ("The golden shadow"). (LALLA VANDERVELDE.)

DANISH LITERATURE¹

No great new literary work or new literary name of surpassing merit can be said to have come forward during the period since 1908. Danish literature has, however, lost one of its most distinguished representatives, Herman Joachim Bang (1857-1912), who died suddenly in a train on January 29, 1912, while he was on a lecturing tour in the United States. The body was brought home for burial in Copenhagen. Among the later works of Bang were *De uden Faedreland* (Those without Country), 1905, and *Masker og Mennesker* (Masks and Men), 1910, a volume of theatrical and dramatical essays. The death of Vilhelm Bergsøe (1835-1911) also occurred during this period.

The trend of Danish literature has been a continued revolt against realism, and a return to nature with works more redolent of the soil and of the national characteristics. Side by side with the revival of romantic literature in a modern form has been a growing

¹ See E. B. viii, 39 et seq.

interest in historical works and memoirs, the chief among them being a series of biographical memoirs—at present some twenty volumes—dealing with Danish life in town and country, in camp or at court, at various periods from 1600 to 1870. While Henrik Pontoppidan (b. 1857) has been silent since he completed his great novel of eight volumes, *Lykke-Per*, he has found a competitor in the same field in Martin Andersen-Nexö (b. 1869), whose *Pelle Erobreren* (Pelle the Conqueror), still incomplete, secured for this author a place in the first rank among the popular writers of Denmark.

The agricultural labourers of Denmark, for whom the high schools, the agricultural colleges, intended especially for them, and the small-holding movement have proved a boon in more than one sense, have found two authors, who in poetry and prose describe their struggle for existence on the Jutland heaths or on the newly acquired state small-holding. Jeppe Aakjaer (b. 1866) bids fair to become a second Steen Steensen Blicher (see *E. B.* viii, 42) both in his prose in the Jutland patois, and in his poetry. His *Rugens Sange* (Songs of Rye)—a volume of poetry showing him to be a true disciple of Robert Burns, some of whose songs have been translated by Aakjaer—have become popular in wide circles and several of them have been set to music.

Johan Skjoldborg (b. 1861), formerly a village school teacher, has found favour by his novels on life among the small-holders. A many-sided writer of great freshness and originality has appeared in Johannes V. Jensen (b. 1873), whom enthusiasts compare with Kipling. His rapid output includes such prominent works as *Myths*, of which the fourth volume appeared in 1912, *Stories of Himmerland*, the author's native district in Jutland, a series completed in 1910; *Braeen* (The Glacier), a novel dealing with neolithic man, and stories of the Far East.

Valdemar Rordam (b. 1872) has followed the great success of *Den Gamle Kaptajn* (The Old Captain), a cycle of songs in three volumes dealing with various episodes of the disastrous war of 1864, by similar works appealing to Danish patriotism to look to the defence of the country, e.g. *Luft og Land* (Air and Land) 1910. Prominent among the playwrights besides Gustav Wied (b. 1858), whose *Satyrspil* (Satiric Plays) and novels show a tendency to humour of a very coarse type, are Hjalmar Bergström (b. 1868), and Baron Palle Adam Vilhelm Rosenkrantz (b. 1867). The voluminous literary output of the latter includes several successful plays, detective stories with plots well spun, and some historical novels dealing with the Tudor Period, e.g. *Anne Boleyn*.

Karl Larsen (b. 1860) has temporarily forsaken novels and plays for other literary work. His *Under vor sidste Krig* (During our Last War), a psychological study of war during its various phases, based on the numerous letters and diaries placed at the disposal of the author, proved a great success in Denmark and in Germany, and in 1910 was followed by *Danske Nybyggere* (Danish Colonists), also based on letters telling of their struggles on the prairies and backwoods of the United States a generation or more ago. *Det Tabte Land*, 1911 (The Lost Country, i.e. Sleswick), has been the principal work of J. J. Jørgensen (b. 1866) during the last four years. The leading woman writer of the period has been Mrs. Karin Michaëlis (b. 1872)—now Mrs. Stangeland. Her much discussed work *Den farlige Alder* (The Dangerous Age) ran into eight editions in 1910. This study of the life of woman at the age of forty was quickly translated into French, German and English, and has been followed by a continuation, *Elsie Lindtner* (1912).

Sophus Michaëlis (b. 1865) struck out a new line by his dramas relating to the French Revolution or to Napoleon, *Et Revolutionsbryllup* (A Wedding under the Revolution), and *St. Helena* (1911), and also by *Den evige Søvn* (Eternal Sleep), a romance of the retreat from Moscow.

The celebrated critic Georg. Morris Cohen Brandes (b. 1842) celebrated his 70th birthday on the fourth of February 1912. Besides the complete works of Brandes a volume of his essays and newspaper articles has been published in book form, *Fra mange Tider og Lande* (From Many Ages and Countries) 1910. A younger literary critic and historian, Professor Vilhelm Andersen (b. 1864) has commenced the publication of *Tide og Typer af dansk Aands Historie* (Periods and types from the history of Danish Culture), a work on a large scale, the first volume of which was published in 1909. A series of excel-

lent studies of various phases of medieval life has been completed by Professor Valdemar Vedel (b. 1865); and Axel Olrik (b. 1864) has finished his work on the heroic age of Denmark, the northern lore and legend of the Eddas, Beowulf, etc.

Among Danish historians Professor Troels Frederik Lund (b. 1840) brought out in 1910-12 four volumes of historical essays, some of them new, dealing with the renaissance period of Denmark and other European countries, a companion to his standard work on the history of Denmark and Norway during the sixteenth century. Edvard Holm (b. 1833) has once more returned to the field of historical study in his two volumes on the foreign history of Denmark and Norway 1800-14 (1912), based on the latest researches of the Napoleonic period. The question of Sleswick has found an impartial historian in M. Mackeprang, *Nordslesvig 1864-1909* (1910), and H. Rosendal has also published two volumes on the history of this Duchy in ancient and modern times.

(W. R. PRIOR.)

NORWEGIAN LITERATURE¹

The first decade of the twentieth century will forever be memorable in Norwegian literature for the passing away of the four great classics of the preceding epoch: Ibsen, Björnson, Lie and Kielland. Since their death Knut Hamsun (b. 1859), Hans Kinck (b. 1865) and Gunnar Heiberg (b. 1857), are the leading literary figures, the two former chiefly as novelists, the latter as a dramatist. Of the generation of authors who entered literature during the nineties and a little earlier few others can be said to have made permanent reputations. After the constitutional crisis of 1905 economic and social problems came to the forefront in Norwegian public life, and the new ideas became prominent in the field of fiction. Johan Falkberget (b. 1879), originally a miner, introduced the modern industrial worker into Norwegian literature, painting with great talent, especially in *Black Mountains* (1907) and *Blasting of Rocks* (1908), the life of the miners and of the lumberers, with a striking background of natural scenery. Kristofer Uppdal (b. 1878), writing in the *landsmaal* (the composite dialect of the peasants), describes in *The Dance through the Mists* (1911) the hard life of the navvies, which he knows from personal experience, while Oskar Braaten (b. 1881) in *The Factory and its Surroundings* (1910), also in the *landsmaal*, sketches the conditions of the industrial workers in a factory district in the neighbourhood of Christiania. Broader in their conceptions of life and its phenomena than these authors are Eilert Bjerke (b. 1887), whose *Free Birds* is one of the most powerful works in recent Norwegian literature, and Rolf Hjort Schøyen (b. 1887), who in his *Masquerade* (1910) indulges in whims and striking thoughts in an exuberant style; and their older contemporary Sigmund Rein (b. 1873), in his fine novel *Wanderings* (1910), has shown marked literary power. The chief contemporary lyric poets are Herman Wildenvey (b. 1886), who especially in his *Poems* (1908) and his *Round-Abouts* (1910) displays a troubadour talent, highly appreciated, and Olaf Bull (b. 1882), whose first volume of *Poems* (1911) is remarkable for beauty and maturity.

One of the most characteristic features in Norwegian literature within the last ten years is the growing tendency in the direction of developing a particular county or district literature, as it were, nearly each county getting an author of its own familiar with its life and manners, its way of thinking, and its special dialect, through which the whole composition takes a peculiar colour. The most important of these authors are Jacob Bull (b. 1853), of Österdalen, with his *Eline Vaugen* (1907), Andreas Haukland (b. 1873), of North Norway, with his *Settlers* (1907), and Ove Arthur Ansteinsøn (b. 1884), of the midland counties round Lake Mjösen, with his *Ener Tuve* (1910). Among the *landsmaal* representatives of the county literature Jens Tvedt ranks highest with his sketches from West Norway country life. His most characteristic works are *Madli under the Apple-tree* (1900) and its continuation *God's Reward* (1906). The chief *maal*-lyrist is Anders Hovden (b. 1860). Among the novelists mention may be made of B. Lie (b. 1868), whose best work is *Against Superior Odds* (1907).

The psychology of Woman has become an element of importance in recent Norwegian literature, especially as analysed by female authors. Ragnhild Jölsen (1875-1908) in her

¹ See *E. B.* xix, 817, 818.

Rikka Gran (1904), Regine Norman (b. 1867) in her *Krabvaag* (1905), and Sigrid Undset (b. 1882) in her *Jenny* (1911), are conspicuous in this respect.

Norwegian memoir literature, which up to a comparatively recent date was rather poor, has been greatly enriched within the last few years, the posthumous letters of Björnson (*Aulestad-Brve*) to his daughter Mrs. Ibsen, and of Kielland to his daughter Mrs. Krag, being among the chief contributions. Besides these may be mentioned several memoirs by Professor Yngvar Nielsen, the historian, the last one being *Under the Reign of Oscar II*, (1912). Sigurd Ibsen (b. 1859), with his *Human Quintessence* (1911), stands in the first rank of Norwegian essayists. Professor Gerhard Gran (b. 1856), whose great work on *Rousseau* (Vol. I, 1910; Vol. II, 1911) has been translated into English, is the leading literary critic of Norway. Hjalmar Christensen (b. 1869) formerly best known in the field of criticism, has lately shown remarkable gifts as an original author in *A Life* (1910) and *Sheriff's Farm* (1911).

H. J. Haffner's *Norsk Bokfortegnelse, 1901-1910* (1912) gives a complete list of all books published in Norway within the period. (S. C. HAMMER.)

SPANISH LITERATURE¹

Few new names of importance occur in the record of Spanish literature for the last six years. In drama, poetry, fiction and literary criticism, there is abundant work indicating high average talent, but only in poetry are fresh tendencies revealed. The novel methods introduced by French and German poets between 1885 and 1900 were tardily adopted in Spain, and owe their present vogue to Spanish poets born on the other side of the Atlantic.

Poetry.—Francisco Villaespesa (b. 1877), whose literary career began before 1905, has become one of the most striking personalities in modern Spanish poetry. With a delicate tact he has contributed to the renovation of rhythmical forms; his verse renders an exquisite vision of the world, and his unaffected diction, while judiciously assimilating innovations, preserves its individuality, its vividness and rich colouring—qualities displayed to advantage in *Bajo la Lluvia* (1910) and *El Espejo Encantado* (1911). The copious verses of Juan R. Jiménez (b. 1881), reveal a sad lucidity of soul. This Andalusian Amiel—a recluse to whom the tumultuous struggle of modern life is abhorrent—produces effects of evocation by means of suggestive half-tones which enable him, through the medium of landscape, to impart the intimate minutiae of his brooding melancholy. This faculty is eminently manifest in *Arias Tristes* (1903) and in the triple series of *Elegias* (1908-09-10). Prominent among the newcomers is Antonio Machado (b. 1875), a poet of austere imagination, placid and yet informed by the spirit of modernity, as may be seen in *Soledades* (1903) and *Campos de Castilla* (1911), in the latter of which certain *Proverbios y Cantares* recall the philosophic mood of Omar Khayyám. The representative of an earlier school, Eduardo Marquina (b. 1877), is distinguished for force and facility, and he handles blank verse with a ductile power rare in Spanish. The works most characteristic of his talent are the *Églogas* and *Elegias*: his latest productions—*Doña María la Brava* (1909), *En Flandes se ha puesto el sol* (1910) and *El Rey Trovador* (1912)—are dramatic poems dealing with historical themes.

Drama.—Though Jacinto Benavente (b. 1866) produces more frugally than in his first period, his supremacy as a dramatist is uncontested. His fine observation and mastery of scenic effect are undiminished in *Los Intereses Creados* (1907), wherein the great game of sordid motives is portrayed with engaging fidelity, and in *Señora Ama* (1908) the author has achieved a legitimate triumph. An acquisition to the theatre is Gregorio Martínez Sierra (b. 1881), who, in *La Sombra del Padre* (1910) has given a somewhat diffuse but effective study of inadaptability; still more deservedly successful, *Canción de Cuna* (1911) is an original effort which bespeaks shrewd observation of convent life, and interprets with almost feminine insight elusive and concentrated motives. Less subtle in analysis, Manuel Linares Rivas (b. 1866) fascinates his public by virtue of his technical dexterity and the Gallic vivacity of his dialogue: *María Victoria* will

¹See E. B. xxv, 578 et seq.

probably outlive his other pieces. The brothers, Serafín Alvarez Quintero (b. 1871) and Joaquín Alvarez Quintero (b. 1873), have fulfilled their early promise: in *El Genio Alegre* their collaboration has contrived a masterpiece which depicts with seductive exactitude the joy of life in an Andalusian atmosphere.

Fiction.—The most conspicuous novelist of the day is Felipe Trigo (b. 1868), a physician whose autobiographical reminiscences enhance the value of *El Médico Rural*. He recounts the course of criminal passion with an unsentimental, scientific precision unprecedented in Spanish literature, and he writes with a profusion of detail which has laid him open to the charge of licentiousness. Though deliberately incorrect at times, his style is plastic, and he can evoke a landscape in terms of pellucid beauty. *La Sed de Amar* (1903), *Sor Demonio* (1908) and *El Médico Rural* (1911) are among his most popular books. Ricardo León (b. 1877) has captivated the public with *Casta de Hidalgos* (1908) and *Alcalá de los Zegries* (1910); racy of the soil, fastidious, intentionally archaic at times, his limpid phrasing tends to become monotonously symmetrical. Abounding in ideas, Pío Baroja (b. 1872) works on a large scale, not in single volumes, but in trilogies, the ample scope of which is implied by such titles as *La Raza*, *La Tierra Basca*, *El Mar* and *Las Ciudades*. His attempt to dissimulate his emotions produces a momentary impression of cynicism: his diction is metallic, harsh and rigid.

Literary History.—Scholarship and literary history have lost their foremost representative in Marcelino Menéndez y Pelayo (1856–1912), who leaves behind a vast body of useful work, unfortunately incomplete. His successor as Director of the National Library is Francisco Rodríguez Marín (b. 1855), whose biographies of Barahona de Soto (1903) and Pedro Espinosa (1907) are authoritative. The death of Joaquín Costa (1846–1911) deprives Spain of a patriot, an orator and a courageous thinker, who alienated the upholders of secular tradition by his propaganda to induce Spain to enter into the current of European culture.

Journalism.—The talents of several admirable writers are absorbed by journalism: thus Miguel de Unamuno y Jugo (b. 1864) employs an alert intelligence well adapted to discuss questions that press for an early solution; José María Martínez Ruiz (b. 1876), best known by his pseudonym of "Azorín," portrays certain phases of Spanish culture with rare felicity, knowledge and picturesque conciseness; José Ortega Gasset discusses with the stimulating freshness of a trained dialectician, the ideas and theories which bid fair to affect mankind in the near future. (B. SANIN CANO.)

PORTUGUESE LITERATURE¹

During the past five years Portugal has been passing through a revolutionary period, and the prevailing unrest has been disastrous to letters. A decline had already set in during the closing years of the 19th century and became evident to all at the beginning of the present. Among the poets and prose writers who shed lustre on the reign of King Carlos, João de Deus, Antonio Nobre and Eça de Queiroz died, while Ramalho Ortigão, Guerra Junqueiro, Gomes Leal and Fialho d'Almeida produced nothing comparable to their earlier work. Their successors, lacking faith and high inspiration, have attempted no sustained flights. The destructive theories preached throughout the last thirty years hastened and have accompanied the national decadence, which is reflected in an anarchy of thought and a profound pessimism. Certain Republicans have striven to react against the disease by announcing a new gospel, but as it consists of French radical ideals without a sound philosophical or moral basis, they have but added to the confusion. Others of their co-religionists have entered public life and become lost to letters. Political journalism, being the easiest road to fame and fortune, largely absorbs the energies of the younger writers, and never was the press so intellectually sterile. The Revolution has raised no echo in literature, for the pamphlets it has suggested are without value, save as historical documents.

Were it not for Brazil, where twenty millions speak the language of Camoens, the output of imaginative books, other than poor romances and commonplace verse, would

¹ See *E. B.* xxii, 155 *et seq.*

have nearly ceased. The new edition of the writings of Fialho d'Almeida is destined principally for the former colony, and the *Jornal do Commercio* of Rio de Janeiro has opened its columns to men who under existing conditions could hope for neither an audience nor a reward at home. Madam Vaz de Carvalho, the leading contributor to that paper, has been joined by the Count de Sabugosa, whose recent articles have been published in book form under the title of *Donas de Tempos Idos*.

The popular editions of Garrett, Herculano, Rebello da Silva, Camillo Castello Branco and Castilho, recently issued or in course of issue, are mainly for American consumption, though the middle classes in Portugal read more than they did. Unfortunately they usually prefer modern French books to their own, while a narrow species of "freethought" turns them from the old classics, products of a society essentially Catholic. It is to be feared that the new orthography, decreed in 1911, will in time increase the difficulty of studying the authors of the great period, the 16th century.

In order to acquaint the nation with its famous men a biographical series has been inaugurated with lives of D. João de Castro and Gil Vicente. The last is by General Brito Rebello, an authority on the subject and editor of the best text of Mendes Pinto.

While Corrêa d'Oliveira and Lopes Vieira have not materially added to their reputation as poets, the latter has made himself the apostle of an interesting Vicentian revival. His editions of the *Barca do Inferno* and *Mofina Mendes* were admirably staged and played, and drew public attention to Gil Vicente, whose *Autos*, previous to the celebration in 1902 of the 4th centenary of his first piece, had been known only to students. Julio Dantas, Director of the Conservatoire, has revived there the best of the old comedies, among the authors represented being Camoens, D. Francisco Manuel and Antonio José da Silva. His charming one-act piece, *Roses all the Year Round*, was given in London in the spring of 1912, the first version from the Portuguese seen on English boards.

The death of D. João da Camara has left only two playwrights of account, Marcellino de Mesquita and Julio Dantas, and the romance has sunk into extreme naturalism with Abel Botelho. But if creative writing in nearly all departments has died, criticism has shown a marked advance in power. To the quality of insight found in Moniz Barreto are added impartiality and a sense of proportion in the case of Fidelino de Figueiredo who is in touch with the best work of his foreign *confrères*. The psychology of Camillo Castello Branco has been discussed in some remarkable monographs, and a study on the expression of anger in literature by Dr. Henrique de Vilhena has received deserved commendation abroad.

Fortunato de Almeida brought out in the summer of 1912 the second volume of a useful compilation, *Historia da Igreja em Portugal*, and Dr. Gama Barros had in the press the third volume of his *Historia da Administração Publica em Portugal*.

Two good omens for the future are the activity displayed by the Academy of Sciences thanks largely to Colonel Christovam Ayres, historian of the Portuguese army and secretary of the Class of *Belles Lettres*, and the creation of an Historical Society. The Academy has issued some unpublished letters of D. Francisco Manuel de Mello, and has in the press the parish registers of the Church of Santa Cruz in Lisbon, which cover the years 1536 to 1628. This will mark a new departure in Portugal. It has also reproduced, under the editorship of the Romance scholar, Madam Michaëlis de Vasconcellos, an autograph MS. of some lyrics of Sa de Miranda, and has a long list of publications projected for the fourth centenary of the capture of Ceuta in 1915. The Society of Historical Studies issues a *Quarterly Review*, and is doing good work.

Another important new *Review* is that of Coimbra University, which is giving (*inter alia*) a full and excellent biography of the epic poet Braz Garcia de Mascarenhas. The directors include Dr. Mendes dos Remedios, who has recently added to his classical reprints one of the *Chronica do Infante Santo*. From Coimbra comes also a new edition of the *Cancioneiro de Resende*, which the rarity of the Stuttgart edition made necessary. The sciences of folk lore and philology flourish exceedingly, and the *Revista Lusitana* continues under the editorship of the distinguished scholar Dr. Leite de Vasconcellos, whose *Licoes da Philologia Portuguesa* (1911) are beyond praise. (EDGAR PRESTAGE.)

RUSSIAN LITERATURE¹

During the last few years, especially since the revolutionary upheaval of 1905, Russian literature has immensely increased in quantity and proportionately declined in quality. If judged by extent of output only, it would appear to be in a most flourishing condition. From the point of view of material profit to the producers and the publishers, this could hardly fail to be the case when we consider the influences now at work in educating the Russian masses and thus continually increasing the number of actual and potential readers. As soon as restraint is removed, and the necessity of instruction is once admitted for a vast population like that of Russia, most of whom have hitherto been shut off from the advantages of printing, the reading public is sure to grow with leaps and bounds, there as well as elsewhere.

The pecuniary prospects of literature and the press generally in Russia are as brilliant to-day as they were hopeless and despairing in the more or less recent past. Even British capital has begun to seek profitable investment in Russian literary enterprises. Book illustrators are also reaping the benefit of a parallel development of their particular art. All this, however, does not seem to improve the literary quality and character of the production, in which, on the contrary, there is a noticeable deterioration, and, with one or two exceptions, the great bulk of it is no doubt destined to be soon forgotten. The better class of Russian readers are tired of the group of inferior pessimists and minor poets, who, having been flushed up on the tide of revolution, have done nothing else but probe the social and political vices of the nation. The growing disgust for the new style of revolutionary and erotic literature was intensified by the tragic death of Count Tolstoy, which reminded the Russians of the enormous contrast between the works of the modern favourites and the masterpieces of Tolstoy and his early contemporaries. There was consequently a revival of interest in Tolstoy's writings and a plentiful supply of posthumous Tolstoy literature, which threw into the shade modern celebrities like Maxim Gorki, and Leon Andreyeff. As one critic expressed it, the appearance of each volume of Tolstoy's literary legacy was like a day of glorious sunshine in a long period of depressing gloom. Two volumes of fresh stories, which were not published during the Count's lifetime, probably because of his change of views on art and fiction in general, made their appearance in 1911, including "A Living Corpse," "The Devil," "Father Serge," and "The False Coupon." This Tolstoy literature was further enriched by the reminiscences of the widowed Countess, by the notes of the Count's former secretary, N. Goosieff, and by Tolstoy's letters covering the period 1848-1910, edited by P. A. Sergeyenko.

Amongst the remarkable literary productions of 1910-11 were *Our Crime* by Radionoff, an act of indictment against the intelligent classes of Russian society for their indifference to the brutalisation of the lower orders, and *Alexander the First*, an historical novel by D. Merezhkovsky, published in the *Russkaya Mysl*. This new work of Merezhkovsky's is the result of a careful study, based on documentary evidence, of the enigmatical personality of the Imperial "Emancipator of Europe" and of the strange legend concerning his death. Another historical romance was published in the *Historical Viestnik* under the title of *Kolychevskaya Votchina* by V. Kilshtet, treating of the epoch from the emancipation of the serfs and the Polish insurrection down to the end of the reign of Alexander II. Attention may also be directed to *Two Lives* and *Days of Sedition*, pictures of the downfall of Russian society, by Von Wiesen; the dramatic poems *Bekh Ulla* and *Bab*, with reference to religious movements in Persia, by Mrs. J. Grinevskaya; a love story, *The Garnet Bracelet*, by A. Kuprin; and *Altar of Victory* by V. Brusoff.

A great many descriptive accounts, memoirs and documents were published in 1911-12 in connection with the celebration of the centenary of the national war against Napoleon's invasion and the battle of Borodino. In 1910 the interesting announcement was made that an unpublished work by the great novelist Turgéniev, called *Life for*

¹ See *E. B.* xxiii, 914 *et seq.*

Art, had been handed over for safe keeping to the Russian Academy of Sciences with the request to withhold it from publication for some time to come. Maxim Gorki began to write again, but without any of his former success. In 1911 he continued his story of *Matvey Kozhemiakin*, which belongs to the usual kind of "Liberation," i.e. revolutionary, fiction. Leon Andreyeff produced a symbolical tragedy called *Ocean*, of rather inferior quality, and also *Sashka Zhaguleff*, an attempt to idealise the leader of a gang of brigands.

A great deal of serious historical matter has been published in Russia during the last 3 or 4 years, amongst which the following deserve to be noticed: *Archives of the Brothers Turgéniev*, edited by the Academy of Sciences; *Alexander the Second*, by the late S. Tatischeff; researches of Professor Kaptereff regarding the lives and doings of *The Patriarch Nikon and the Tsar Alexey Michailovich*; *Population of Russia in the time of Peter the Great*, by M. Klochkoff; *History of Russia in the XIX Century*, by Professor Pokrovsky; *History of Musical Development in Russia*, by M. Ivanoff; translation from the French of several new works by Vlaishevsky; *History of Russian Public Opinion*, by Ivanov Razoomnik; *History of Finland*, by Borodkin; *Tsar Ivan Shuisky*, by Professor Platonoff; 13 volumes of *History of the Russo-Japanese War*, compiled officially; and *Russia for the Russians*, by General Kuropatkin. It may be said indeed that, during recent years, more value has been attached in Russia to historical work than to purely imaginative literature.

(G. DOBSON.)

CLASSICAL LITERATURE AND SCHOLARSHIP¹

The losses sustained of late through the death of distinguished classical scholars have been severe. A special tribute is due to the memory of S. H. Butcher and Andrew Lang, two leading Homerists and literary critics; of A. W. Verrall, a notable interpreter of Greek drama; of J. Adam, an accomplished writer on Greek philosophy and religion; of W. W. Goodwin, the well-known grammarian and archaeologist. Fr. Susemihl will be remembered as a learned critic of later Greek literature and philosophy; L. Friedländer as an authority on Roman society and manners; L. Traube as an expert in palaeography; Fr. Bücheler and H. Wölfflin as distinguished philologists and collaborators on the *Thesaurus Linguae Latinae*.

On the other hand proof is not lacking of the vitality of classical scholarship. Discussion on the aims and methods of classical teaching has been brisker than ever, and good results may be expected in particular from the meetings of the classical section at the Imperial Conference of Teachers' Associations, held in London in July 1912. The number of classical societies is steadily increasing. A new Society for the Promotion of Roman Studies has recently been formed in London as a complement to the Hellenic Society, and it can hardly fail to achieve a similar success in promoting classical scholarship.

New Texts.—Classical literature continues to be enriched with papyri recovered from the soil of Egypt. Drs. Grenfell and Hunt have followed up their previous successes by bringing to light some 400 lines of Callimachus' *Altra* and meliambic poems,² and an equal length of a Satyric play of Sophocles entitled the *Ἰχνευραί*.³ This last-named piece, which dramatises the epic of the infant Hermes' pranks, affords some valuable evidence on the character and structure of Satyric dramas. To Dr. Hunt we further owe the publication of some new scholia on Homer,⁴ and of numerous fragments of minor Greek writers.⁵ A complete text of the new passages from Menander's *Ἐργάρις* has been provided by their discoverer, Dr. Lefebvre;⁶ and the recently discovered rem-

¹ See generally E. B. articles enumerated in Index volume, p. 932.

² *The Oxyrhynchus Papyri*, vol. vii (London, 1910).

³ *Ibid.*, vol. ix (1912).

⁴ *Ibid.*, vol. viii (1911).

⁵ *Catalogue of the Greek Papyri in the John Rylands Library*, vol. i (Manchester, 1911).

⁶ *Catalogue général des antiquités égyptiennes du Musée du Caire*. Papyrus de Ménandre (Cairo, 1911).

nants of Alcaeus, Sappho and Corinna have been collected in a critical text by J. M. Edmonds.¹

Editions and commentaries.—In the preparation of new editions Greek writers have of late received most attention. Theognis' poems have found a new interpreter in Prof. Hudson Williams,² who contends that they are a miscellaneous collection by various pre-Alexandrine writers, and that Theognis was their editor rather than their author. The dramatists are represented by a posthumous work of the late W. G. Headlam on Aeschylus' Agamemnon,³ the choicest part of which is a highly finished translation into rhyming English metres; and by Mr. B. B. Rogers' editions of the *Acharnians*, *Knights* and *Lysistrata* of Aristophanes,⁴ whose English renderings follow the original Greek metres. Of the Greek historians Herodotus and the new author from Oxyrhynchus have been the chief objects of study. The former has received an up-to-date historical commentary by Messrs. How and Wells;⁵ the latter has been annotated in an authoritative manner by Ed. Meyer.⁶ Among the new works on Greek philosophy we may note a separate edition and translation of the fragments of Heraclitus by Diels.⁷ The study of Greek literary critics has been pushed forward actively. The *Poetics* of Aristotle are presented in quite a new light by Prof. Margoliouth,⁸ who argues that the obscurities of the text are for the most part intentional. This remarkable thesis is based on a comparison of Aristotle's avowedly technical treatises, and on a study of the Syriac and Latin translations. Another elaborate piece of work is contained in Prof. Rhys Roberts' edition of the treatise *On Composition* by Dionysius of Halicarnassus.⁹ Of the new editions of Latin authors it may suffice to mention a greatly improved text of Ammianus Marcellinus by Mr. C. U. Clark,¹⁰ and a revised issue of Dr. Rice Holmes' authoritative commentary on Caesar's *Bellum Gallicum*.¹¹

Translations.—The wide diffusion of interest in the ancient classics is clearly betokened by the greatly increased number of translations into various modern languages. In addition to the works of this kind mentioned in the previous paragraph, special attention is due to the Loeb Classical Library of texts and translations,¹² the Oxford Library of Translations¹³ and the Oxford Translation of Aristotle.¹⁴ In each of these cases the versions have been prepared by thoroughly competent scholars. Interest also attaches to Prof. Gilbert Murray's free renderings of Sophocles' *Oedipus Tyrannus* and Euripides' *Iphigenia in Tauris*,¹⁵ and to Prof. Platt's translation of Aeschylus' *Agamemnon* into biblical English¹⁶—a promising experiment. We may also welcome Mr. Cyril Bailey's¹⁷ new and more accurate version of Lucretius.

Criticism.—The "Homeric question" has again become a fruitful source of controversy. The main question at issue is whether the poems in their present form represent the work of one man. The "unitarians" have been mainly engaged in detailed criticism of their opponents' theories;¹⁸ the "separatists" have replied by revising their arguments

and adding fresh ones.¹ A less contentious but perhaps more promising topic has been dealt with by Mr. Chadwick in his comparison of the Homeric poems and the Teutonic sagas, and of the respective societies of which they were the product.²

The accepted theories concerning the rise of the Greek drama have been vigorously assailed by Prof. Ridgeway,³ who traces its origin back to funeral rites established in Greece long before the advent of Dionysus. A partial reply to this view has been put forward by Prof. Gilbert Murray,⁴ who contends that the structure at any rate of the Attic tragedies contains features peculiar to the Dionysiac cults. Of recent treatises on particular plays special attention is due to the late Prof. Verrall's essay on the *Bacchae* of Euripides,⁵ which he represents as an objective study in the workings of religious faith, betraying neither sympathy nor aversion. Dramatic technique is the subject of a work by Stählin,⁶ who discusses the part assigned by Greek playwrights to oracles in the construction of their plots.

Among Greek philosophers Plato continues to be the chief object of study. His relations to Socrates⁷ have been presented in a new light by Prof. Burnet, who contends that the doctrine of Ideas was taken over by him from his master, and developed rather than created in his hands. Another attractive and bold theory is mooted by Prof. Stewart,⁸ viz. that Plato's Ideas fulfilled a double function, being at once laws of thought and objects of imaginative contemplation. A more severely logical trend of thought is ascribed to Plato by Ritter, who has carefully re-examined the crucial passages in the Dialogues.⁹ The same scholar has also begun a more extensive but popular work on Plato,¹⁰ and a similar study of Plato as a humanist and leader of thought is contained in a posthumous collection of essays by Prof. Adam.¹¹ Aristotelian scholarship has of late been less productive, but an up-to-date criticism of the master's treatises on natural science has been provided by Mr. Lones.¹² The collection of minor works by the late Prof. Zeller¹³ comprises articles covering the whole range of Greek philosophy.

The Latin authors have been discussed profitably if not copiously. Sir A. Geikie's book on the *Love of Nature among the Romans*¹⁴ is full of acute observations, and should help readers of the Latin classics to appreciate many of their finer points. Another substantial addition to Latin scholarship has been made by Prof. Arnold, whose researches on Roman stoicism¹⁵ serve to place this branch of study on a thoroughly scientific basis. Of ancient historians the new author from Oxyrhynchus continues to attract most attention. His personality remains uncertain, in spite of a vigorous attempt by Ed. Meyer¹⁶ to identify him with Theopompus; but the general trustworthiness of his work is now acknowledged in most quarters. A substantial new contribution concerning Thucydides has been made by Dr. Grundy,¹⁷ who accumulates proof that his History was a composite piece of work.

Grammar.—Pioneer work is being accomplished by Prof. Bennett in his exhaustive treatise on the *Syntax of Early Latin*.¹ Attention is also due to Prof. Gildersleeve's *Syntax of Classical Greek*,² which proceeds by inductive methods and avoids theoretic speculation. From Prof. Sonnenschein's pen we have an ingenious attempt to classify all subjunctive usages under a single head,³ and a new primer⁴ which applies a standard terminology recently established by a joint committee of British teaching associations.⁵

Palaeography.—The materials for the study of palaeography have been increased by the publication of facsimiles of several notable MSS., e.g. the Palatine Anthology of Greek Verse,⁶ the Verona palimpsest of Gaius,⁷ and the Codex Theodosianus.⁸ The output of modern manuals has meanwhile kept pace with this growth of materials. Gardthausen's standard text-book of Greek palaeography is being issued in a revised edition, of which the Introduction has recently appeared.⁹ A similar service is being rendered for Latin palaeography by the publication of the late Prof. Traube's authoritative studies on that subject.¹⁰

History.—The outlines of Greek and Roman history have been sketched in a summary but highly suggestive form in a joint volume by U. Wilamowitz-Moellendorf and Niese,¹¹ of which Wilamowitz' section on Greek history contains many new touches. A large work on post-Alexandrine Greece is being carried out by Kaerst,¹² whose second volume (1912) deals mainly with the general features of Hellenistic statecraft. The history of the Roman Republic has been rewritten, with some new suggestions as to detail, in a three-volume work by Mr. Hëitland.¹³ The Roman Empire is discussed in a series of stylish but sketchy essays by v. Domaszewski,¹⁴ and in a discursive yet stimulating disquisition by Dr. Bussell.¹⁵

Athenian history in its constitutional aspect is treated at length in a monograph by de Sanctis, which combines sound learning with venturesome speculation.¹⁶ Later Athenian history is dealt with in a series of acute researches by Kahrstedt, mostly on topics of the fourth century. Hellenistic Athens is the subject of an important book by Prof. Ferguson,¹⁷ whose information is largely derived from inscriptions skilfully interpreted. The outlines of Spartan history are retraced on an ingenious if not always convincing scheme by Mr. Dickins.¹⁸ Many new contributions have also been made to the study of the Hellenistic states. Chief among these are Jouguet's volume on the municipal government of Egypt under the Ptolemies and the Caesars,¹⁹ and Zucker's essay on jurisdiction in the same country.²⁰

The opening chapters of Roman History have been rewritten by Modestov²¹ and T. E. Peet,²² who have put to account the accumulations of archaeological evidence in order to

²² *The Stone and Bronze Ages of Italy* (Oxford, 1909).

compose a coherent narrative of Italy's prehistoric development. Mr. Peet's book should become a standard work. The earliest literary records of Rome have been re-examined by Soltau,¹ who upholds their substantial accuracy against radical critics. The later age of the Republic has not been a prolific field of research, but attention is due to the third volume of Jullian's *History of Gaul*,² which describes the Roman conquest under Julius Caesar from the point of view of Caesar's victims. A useful companion to the history of the late Republic will be found in Mr. Hardy's excellent edition of the chief extant statutes of this period.³ Among the numerous treatises on the Roman Empire special interest attaches to Lord Cromer's studies in *Ancient and Modern Imperialism*,⁴ which is based on wide reading as well as first-hand experience. The conquest of Britain is illustrated by Mr. Macdonald's useful book *The Roman Wall in Scotland*,⁵ and a convenient summary of recent exploration of the South German frontier forms part of the late Prof. Pelham's *Essays*.⁶

The private life of the Greeks and Romans is described afresh in the light of recent archaeological discoveries in Blümner's *Technologie und Terminologie der Gewerbe und Künste bei Griechen und Römern*.⁷ Archaeological evidence also figures largely in Mr. Norman Gardiner's learned and practical treatise on *Greek Athletic Sports and Festivals*,⁸ which should long remain a standard authority. Roman society is accurately portrayed in Mr. Warde Fowler's⁹ and Prof. Tucker's¹⁰ new manuals.

Ancient economics have been discussed of late with unusual zeal. Beside Mr. Zimmern's book (quoted above) we may notice a luminous essay by Ed. Meyer,¹¹ which emphasises the high level of economic development attained by the Greeks and Romans. The part played by capitalism is also insisted upon, perhaps rather unduly, in Dr. Grundy's ingenious disquisition on slavery in Greece.¹² Special problems of economics are discussed in Francotte's *Finances des Cités grecques*,¹³ in Rostowzew's learned treatise on land tenure under the Hellenistic kings and Roman emperors,¹⁴ and in a masterly monograph by Preisigke on the banking system in Ptolemaic Egypt.¹⁵

Law.—Two substantial contributions to this subject need to be recorded. Mr. Strachan-Davidson's *Problems of Roman Criminal Law*¹⁶ is a supplementary treatise to Mommsen's *Strafrecht*; Mr. Phillipson's *International Law and Custom of Ancient Greece and Rome*¹⁷ is a promising enterprise in a little explored field of studies.

Religion.—Some suggestive speculations have been made by Miss Jane Harrison¹⁸ on the fundamental contrast between the "Olympian" and "pre-Olympian" gods of Greece, and by Mr. Cornford¹⁹ on the fusion of religion with early Greek philosophy. A more categorical result is attained by Dr. Farnell in his book on "Greece and Babylon,"²⁰ which denies any connection between the cults of these two countries. The development of religious belief among the Romans is traced with much insight and sympathy by Mr. Warde Fowler.²¹ The survival of primitive beliefs and rites in Greece and Rome,

and the reaction of riper thought upon them, is discussed from divers standpoints in a series of stimulating essays by Oxford students of anthropology.¹

General.—A new survey of ancient culture, containing brief but comprehensive monographs on the various branches of classical study, has been commenced under the supervision of Profs. Gercke and Norden.² A brief résumé of Roman culture is contained in a new *Companion to Latin Studies*, edited by Sir J. E. Sandys.³

(M. O. B. CASPARI.)

PALAEOGRAPHY⁴

The largest field in which palaeographical discoveries are to be expected at this present time and, indeed, in the future is that of papyrology. The vast possibilities that ancient sites in Egypt offer for the recovery of the lost remains of Greek literature has been demonstrated by the prolific results which have already rewarded excavation. In other countries, which have been so thoroughly searched, it is only occasionally that an early vellum codex, accidentally hidden or temporarily overlooked, may be recognised and brought to notice by some travelling scholar or by the compilation of a new catalogue in some neglected library. But instances of such finds have been so rare that, when they do occur, they come as a surprise.

In Egypt, since the great successes achieved a few years ago, when large hoards of papyri, notably such as the Oxyrhynchus collection, were recovered, there has been something of a lull in respect of new discoveries. A period of digestion has set in, resulting in the output of an ever-growing number of papyrological publications. Not that the flow of material has actually ceased, for excavations of greater or less extent still continue to feed public and private collections of Europe and America. In this connection, evidence of the increasing number of local museums and libraries that, following the fashion, lay themselves out for securing a share in the spoils is to be found in the many useful publications which they issue describing their treasures.

In England the scholars who devote themselves to the study of papyri have not been idle during the past three years. The publication of the *Oxyrhynchus Papyri* by the Egypt Exploration Fund has gone on steadily under the editorship of Dr. A. S. Hunt, each year contributing its tale of new classical and other fragments, of more or less importance, and its series of non-literary cursive documents. In Part vii, 1910, among new discoveries there are considerable fragments of Callimachus; in Part viii, 1911, some remains of the cynic poet Cercidas; and in Part ix, 1912, a large portion of the *Ichneutae*, a satyric drama of Sophocles. To Dr. Hunt likewise is owing the commencement of the catalogue of the Greek papyri in the John Rylands Library at Manchester, the first volume being published in 1911. In that library we may notice in passing the existence of a large portion of an uncial MS. of the *Odyssey* as early as the fourth century. But the most important publication of cursive papyri is the fourth volume of the British Museum catalogue of papyri, 1910, edited by Mr. H. J. Bell. In this volume is described the collection of documents from Aphroditopolis (Kom Ishgau), which have the advantage of being, not a miscellaneous gathering, but a compact group from one locality and representing a limited period at the end of the seventh and beginning of the eighth centuries, and of providing, in official correspondence and documents relating to the financial administration of the district, a valuable insight into the methods of the earlier years of the Arab government of Egypt, while Greek officials were still employed there.

Outside England such well-established periodical publications as the *Griechische Urkunden* of the Berlin Museum and the *Berliner Klassikertexte* in Germany, and the *Papiri Florentini* in Italy have made their natural progress; and great activity has been shown in the launching or prosecution of catalogues or descriptions of collections at

⁴ See *E. B.* xx, 566 *et seq.*

Heidelberg, Leipzig, Giessen, Hamburg, Strassburg, Lille, Geneva and Cairo, as well as by the Italian Society "per la ricerca dei papiri greci e latini in Egitto." Among facsimiles issued specially with an educational object, Dr. W. Schubart's *Papyri Graecae Berolinenses*, published in 1911, a useful and representative selection of specimens from the earliest dates to the eighth century, which is issued at a very moderate price, is much to be commended.

The study of papyri has also now advanced to the stage when the material, accumulated and published in the busy years since the new discoveries lent it such an impetus, can be utilised for works of generalisation. Dr. G. Milligan's *Selections from the Greek Papyri*, 1910, composed of texts drawn from the publications of the British Museum and the Egypt Exploration Fund, and from Berlin, Paris, and other places, and provided with translations and notes, is a book principally intended for students of the New Testament, but it also serves the purpose of an introduction to the study of papyri. But the most important publication that has appeared in this direction is the *Grundzüge und Chrestomathie der Papyrskunde* which Professors Mitteis and Wilcken have just completed: this is a great work comprising 550 texts of historical and social interest and nearly 400 legal texts, with exhaustive apparatus of descriptive and explanatory matter.

In the domain of general palaeography 1912 has witnessed the completion of the First Series of the Facsimiles of the New Palaeographical Society, consisting of 250 plates drawn from MSS. in Greek and Latin and modern languages, the work of the ten years' existence of the Society, which will forthwith enter on a second series. After a long interval of more than thirty years since its first appearance, Professor Gardthausen has commenced the issue of a second edition of his *Griechische Palaeographie*. The Clarendon Press, Oxford, has published (1912) an *Introduction to Greek and Latin Palaeography* by Sir E. M. Thompson, an enlarged work on the lines of his Handbook. The valuable *Vorlesungen und Abhandlungen* of the late Ludwig Traube are slowly appearing in a collected form, two parts having been issued in 1909 and 1911. Among students prosecuting researches in special branches of palaeography, Professor W. M. Lindsay of St. Andrew's, following up his treatise on *Contractions in early Latin minuscule MSS.* which appeared in 1908, has turned his attention to the Insular MSS., especially noting their systems of abbreviation and contraction, and has produced his *Early Irish Minuscule Script*, 1910, and *Early Welsh Script*, 1912. Dr. E. A. Loew has contributed to the Bavarian Academy a valuable *Contribution to the History of Early Latin Minuscule and to the dating of Visigothic MSS.*, 1910.

Among publications of facsimiles, a second edition has appeared of Steffens' *Latينية Palaeographie*, 1909; followed by a collection of *Proben aus griechischen Handschriften und Urkunden*, 1912. The Vatican collections have been represented by the *Specimina Codicum Graecorum Vaticanorum* of Franchi de' Cavalieri and Lietzmann, 1910, and the *Specimina Codicum Latinorum Vaticanorum* of Ehrle and Liebart, 1912, both useful works of limited extent and very moderate in price. Of wider scope is Staerk's book on the Latin MSS. of the fifth to the thirteenth centuries in the Imperial Library of St. Petersburg, 1910.

The production of facsimiles of entire MSS. has grown to such an extent as to have become a feature in palaeographical publications. In 1909 were issued the New Testament volume of the Codex Alexandrinus, ed. F. G. Kenyon; the Graeco-Latin Codex Boernerianus of the Pauline Epistles at Dresden, ed. A. Reichardt; the palimpsest Gaius of Verona, ed. A. Spagnolo; the *Etymologiae* of Isidore at Toledo, ed. R. Beer; and the Paris Theodosian Codex, ed. H. Omont. In 1910, the MS. of Deuteronomy and Joshua of the sixth century, belonging to Mr. C. L. Freer of Detroit (one of the few uncial Biblical MSS. recovered within the last few years), ed. H. A. Sanders; the Tibullus of Wolfenbüttel, ed. F. Leo; and the Roman and Leiden MSS. of Ordericus Vitalis and Robert of Torigni, ed. J. Lair. In 1911, the New Testament portion of the Codex Sinaiticus at St. Petersburg, ed. K. Lake; the *Anthologia Palatina*, from the Heidelberg and Paris MSS., ed. C. Preisendanz; the recently recovered papyrus of Me-

nader at Cairo, ed. G. Lefebvre; the Wolfenbüttel Propertius, ed. T. Birt; and a further instalment of the great Florentine *Pandects* of Justinian.

*Illuminated MSS.*¹—An instructive book, *Illuminated Manuscripts*, has been written by Mr. J. A. Herbert (Methuen), 1911, dealing with the different mediæval schools and their productions. Besides this, a fair number of reproductions of choice MSS. have been published during the last few years. Three codices of the Byzantine School were issued in 1909. The first is the Vatican MS. of the *Topographia Christiana* of Cosmas Indicopleustes, of the ninth century, ed. C. Stornajolo, the paintings in a broad illustrative style; the second is the Octateuch of Smyrna, containing from three to four hundred miniatures of conventional type, of the twelfth century, ed. D. C. Hesselning; the third is a Syriac Gospel Lectionary of the twelfth or thirteenth century, from Malatia on the Euphrates, now at Paris, illustrated with a series of miniatures of conventional art, the subjects being replicas of those in similar MSS. of Greek origin, ed. H. Omont.

In England three famous MSS. have been dealt with. The Benedictional of St. Æthelwold, Bishop of Winchester, the most important extant example of Anglo-Saxon art, of the later part of the tenth century, the property of the Duke of Devonshire, has been reproduced for the Roxburgh Club, ed. G. F. Warner and H. A. Wilson, 1910; for the same club the wonderful Apocalypse of Trinity College, Cambridge, of about A.D. 1230, perhaps executed at St. Alban's, has been edited by Dr. M. R. James, 1909; and the MS. known as Queen Mary's Psalter, one of the most precious volumes in the Royal Collection of the British Museum, and of extreme artistic value, not only for its illuminated miniatures, but also for its wonderful series of tinted outline drawings of the best English art of the early years of the fourteenth century, has been brought out by the Trustees, ed. Sir G. F. Warner, 1912.

French illumination has been represented by several reproductions. The miniatures and initials of the two Bibles of Charles le Chauve in the Bibliothèque Nationale have been issued by H. Omont, 1911. The Psalter of St. Louis and Blanche of Castile, of the thirteenth century, one of the choice MSS. of the Arsenal Library, Paris, ed. H. Martin, appeared in 1909; a section of the Bible Moralisée, from a MS. in the Bodleian Library of the thirteenth century, ed. Count A. de Laborde, in 1911; the Book of Hours of Jean Pucelle, of the fourteenth century, belonging to Baron M. de Rothschild, ed. L. Dilisle, in 1910; the *Livre de la Chasse* of Gaston Phébus, Comte de Foix, from a MS. in the Bibliothèque Nationale, of the early fifteenth century, ed. C. Couderc, in 1909; the Arsenal *Cas des noblis hommes et femmes* from Boccaccio, which belonged to John the Fearless of Burgundy, of the early fifteenth century, ed. H. Martin, in 1911; the Breviary of Philip the Good of Burgundy, now in the Royal Library at Brussels, of the first half of the 15th cent., ed. J. Van den Gheyn, in 1909; and the Munich Boccaccio, of the school of Jean Fouquet, c. A.D. 1458, ed. Count P. Durrieu, in 1909.

Of the Flemish school are the following: The *Chronicques et conquestes de Charlemagne* with upwards of a hundred miniatures by Jean le Tavernier of Oudenarde, A.D. 1460, and the *Histoire de Charles Martel* with a like number of miniatures by Loyset Liédet, A.D. 1463-1465, both MSS. in the Royal Library of Brussels, ed. J. Van den Gheyn, 1909 and 1910; and the completion of the Grimani Breviary of Venice, in the Leiden series, 1910. The reproduction in honour of Sir G. F. Warner of the miniatures and borders of a Flemish Book of Hours in the British Museum (Add. MS., 24098), of the beginning of the sixteenth century, may also be mentioned.

Only two examples of Italian art have to be recorded: the *Romulëon*, a MS. in the Arsenal of Paris, with miniatures of the late fifteenth century, ed. H. Martin, 1909; and the Psalter of Paul III, A.D. 1542, with miniatures and initials attributed to Vincenzo Raimondo, in the Bibliothèque Nationale, ed. L. Dorez, 1909.

(E. MAUNDE THOMPSON.)

DRAMA¹

For those who watch the course of events in the theatrical world from a dispassionate standpoint, the history of drama, in England specially, during the last few years is full of interesting and significant points. On the whole, the general tendency must be admitted to be both promising and healthy. Indeed, as compared with previous periods of dramatic history, it would seem that a new spirit has come over English Drama—a little vague and chaotic perhaps in character, and not thoroughly understood even by contemporary students, but, nevertheless, presenting several important features.

The New Realism.—The new spirit tends distinctly in the direction of greater simplicity, and a sincerer realism. It is now being claimed for the British stage that it should represent British life as it is actually lived, and give us faithful transcripts of real existence indeed of the melodramatic structures of romance. From this point of view it is interesting to observe the success of two pieces, "Bunty Pulls the Strings" at the Haymarket, London,—a success, both dramatic and pecuniary—and "Hindle Wakes," performed by the Manchester Repertory Theatre, which was without doubt an artistic success. "Bunty Pulls the Strings," by Graham Moffat, has enjoyed a vast amount of popularity, not because it tells an exciting story, but because it reveals with admirable veracity the daily life of Scotsmen and Scotswomen. In "Hindle Wakes," by Mr. Stanley Houghton, we deal with a veritable slice of life, "*une tranche de la vie*," taken from the experience of Lancashire folk. It is a singularly faithful transcript, in which the *dramatis personae* are obviously modelled on life types, and the story has all the more trenchant force because we are certain that it represents a definite experience, and not a more or less imaginative creation. If we contrast plays of this description with some of the conventional dramas produced at the leading London theatres, we observe that, in however tentative a form, a divergence in ideals is taking place between the so-called commercial theatre and those who are aiming at other and more artistic ends. The commercial theatre is regulated by the box office. The younger school of dramatic writers aim at truth—sometimes in very uncompromising fashion. The contrast in aims and dramatic methods is easily illustrated if we put side by side a melodramatic piece like "Bella Donna"—to which reference will presently be made—in the St. James's Theatre, and either of the two plays just referred to, "Bunty" or "Hindle Wakes." The first is a drama more than a little artificial and conventional; the two latter aim at simple veracity. There is a similar contrast to be found between two other interesting non-commercial plays—"Rutherford and Son," by Miss K. G. Sowerby, and "The New Sin," by Mr. B. Macdonald Hastings, as compared with pieces like "The Perplexed Husband," by Mr. Alfred Sutro, or "Jelfs," by Mr. H. A. Vachell. The last class of dramas is, at present, favoured by theatrical managers, who, naturally enough, guide their policy by the records of their "booking" and the demand of the libraries. The other class represents a newer movement which, indeed, is not indigenous to London but comes largely from the provinces. For a curious feature of the present situation is that London is no longer the dramatic capital of England. Some of the most interesting recent plays have either come from the provinces, or been acted by private societies for the benefit of special audiences.

Irish Players and Others.—Thus, during the last two years, the metropolis has constantly been invaded by groups of players belonging, as Matthew Arnold would say, not to "the centre" but to the circumference. Early in February 1912 Mr. Rutherford Mayne brought out "The Drone" at the Royalty Theatre, in order to prove that the drama is alive in Belfast as well as in Dublin. In June the Abbey Theatre company, whose business it has been for some time past to recommend native Irish drama, played at the Court Theatre not only some old accepted favourites, but some new studies of life. Mr. Synge's "Playboy of the Western World," which has had a mixed reception in the land of its birth, as well as in England and America, has now become tolerably familiar

¹ See E. B. viii, 475-546.

in London. Besides this and Mr. Yeats' dramatic poem "Countess Cathleen," the Abbey Theatre company produced Mr. Lennox Robinson's "Patriot," Mr. T. C. Murray's "Maurice Harte," Mr. William Boyle's "Family Failing" and Lady Gregory's clever little farce "The Bogie Men." Miss Horniman's well-known company from Manchester also made its appearance at the Coronet Theatre, and has since established its position as one of the best and smartest of companies which has ever visited London. It is to Miss Horniman that we owe "Hindle Wakes," by Mr. Stanley Houghton, to which reference has already been made, and a second piece by the same author, entitled "The Younger Generation." There were also one or two sincere and capable artists engaged in these ventures, whose names deserve mention—Miss Sara Allgood and Mr. Arthur Sinclair, of the Abbey Theatre, Miss Irene Rooke and Miss Goodall, of the Manchester company.

Repertory Theatres.—We have already touched the fringe of one of the great modern movements of our time in England—the rise of the Repertory Theatre. In the old days—only known by the verbose reminiscences of actors long past their prime—stock companies used to be an admirable training school for young aspirants to the stage. Then came a period in which the provincial towns only received with gloomy acquiescence the theatrical successes of the Metropolis represented by touring companies of often mediocre excellence. Nowadays many provincial centres have started their own theatre, and have supported companies of their own. For instance, there are repertory theatres at Dublin, Manchester, Glasgow and Liverpool, and the movement is making headway in many directions and by many methods. Birmingham, for instance, was actively at work in 1912 preparing for its repertory theatre shortly to be opened. Leeds was securing a local guarantee for an experiment of the same kind. Bradford has founded a Playgoers Society, with somewhat similar objects, while Edinburgh, Bolton, Stockport, Sheffield, and other towns are showing much activity in the same direction. Movements of this kind cannot fail to be beneficial to the cause of drama, and they apparently justify the assertion already made that London, which, of course, has no repertory theatre, has ceased to be, in any true sense of the word, the dramatic capital of England. What is, however, often forgotten in this reference is the patent fact that London has a population drawn not only from many classes, but from many countries—a floating cosmopolitan population which, perhaps naturally, looks upon the theatre solely as a place for whiling away a few idle hours after dinner, and which, therefore, is inclined to prefer a musical comedy, or even the turns at a music hall, to sterner and more indigestible dramatic fare.

The Censorship.—One other feature of general interest to every English Drama may be added to those already mentioned. For some time past there has existed a certain impatience with the control which the Lord Chamberlain has exercised through the dramatic censorship on the production of plays. A Parliamentary committee appointed for the purpose of examining into this matter sat for a considerable time, with Mr. Herbert Samuel, afterwards Postmaster General, as chairman, but its recommendations remain a dead letter. Meanwhile, certain changes have occurred. Lord Sandhurst became Lord Chamberlain, with Sir Douglas Dawson as the chief of his staff. Mr. G. A. Redford, who undoubtedly made some mistakes, has retired from the office of Reader of Plays, and the vacant post has been given to Mr. Charles Brookfield, a clever and talented man who has been more identified with the lighter than the serious drama, and who is the author of a well-known piece of somewhat dubious ethical tendency called "Dear Old Charley." After the lapse of a few weeks an assessor was appointed in the person of Mr. Ernest Bendall, who had been for years a dramatic critic. The reorganised office has, on the whole, worked smoothly, and the friction between drama and censor, notorious in recent years, has become inconsiderable. There are two cases, however, in which some injustice probably was done to leading authors of distinction. Mr. Eden Phillpotts' play "The Secret Woman" was refused a licence, whereupon twenty-four authors issued a public protest and the play was performed six times in the afternoons, under the management of Mr. Granville Barker. Mr. Israel Zangwill's play "The

Next Religion," which suffered a similar fate, was twice privately performed by the New Players at the London Pavilion. On the whole, however, it would be true to say that a wider toleration has sprung up, or, perhaps, a greater amount of tact has been exhibited in the Lord Chamberlain's office. One important change that has been made seems likely to work well. In order to put music halls and theatres on the same footing, so far as dramatic representation was concerned, the Lord Chamberlain decided to issue Stage Play licences to the music halls under his jurisdiction, a much needed reform which has given a great opportunity for the production of short and telling dramatic episodes at all the leading "variety" houses.

Recent Plays in London.—As we survey the various productions in the London theatres for the last two years we are struck with their prodigal variety. It may be very difficult to say precisely what kind of play an English audience instinctively prefers, but it seems on the whole likely, if we judge by much past experience in English dramatic history, that the English people like a touch of melodrama, that they are wedded to the old idea that virtue must be shown to prosper and vice to fail, and that in consequence new forms of realism have not as good a chance with them as the varieties of sentimental idealism. Confronted, however, as we are by a vast mass of material, our only plan will be to divide it, so far as it is possible, into groups, marking, at the same time, the relative success or failure of the various ventures.

Let us take the Shakespearian drama first. The great home of Shakespearian drama in London is, of course, His Majesty's Theatre, and it has been the good fortune of Sir Herbert Tree to prove that Shakespeare, so far from spelling bankruptcy, brings material gains to the booking office. "Henry VIII" was brought out with no little success, the part of the burly monarch being sustained by Mr. Arthur Bouchier, whilst Sir Herbert Tree, following the example of Sir Henry Irving, kept for himself the rôle of Cardinal Wolsey. "Macbeth" was another venture, which did not, however, enjoy the same prosperity. In the case of "Othello," which had a run for some time at His Majesty's, it was generally recognised that the young actress, Miss Phyllis Terry, as Desdemona, earned well-deserved laurels, while Mr. Laurence Irving as Iago gave, at all events, an interesting and a refreshingly youthful rendering of the part. Sir Herbert Tree's Othello had, undoubtedly, good moments. In the autumn of 1911 Mr. Fred Terry produced "Romeo and Juliet" at the New Theatre. He was himself to have appeared in the part of Mercutio, but was, unfortunately, incapacitated by illness, and principal honours were won by his daughter Miss Phyllis Terry in an extremely able and promising performance of Juliet. The only other item in our Shakespearian list to which we need refer is the recent production of "The Winter's Tale" at the Savoy Theatre, by Mr. Granville Barker. Probably no piece of modern times has given rise to a greater amount of controversy, for Mr. Barker boldly challenged traditional methods and produced a spirited version of the play which had a kind of pre-Raphaelite, or perhaps, Post-Impressionist effect, both in design and in execution. Its chief features were, first the performance of the whole play as Shakespeare wrote it, with the exception of some eight lines; second, a great rapidity of utterance in the delivery of the speeches, which for many theatregoers afforded a welcome change from the stately and dilatory phrasing of the conventional method; and, thirdly, the rearrangement of the stage, which brought it back nearer to the conditions of the Elizabethan playhouse. Thus, for instance, there was what is technically known as an "apron" in front of the regular stage, enabling a number of scenes to be enacted before a curtain hiding the main stage. In the general effect produced, it was possible to discern several contributory influences. Mr. Granville Barker very cleverly made use of a good deal of modern experience. Some debt was incurred to Professor Max Reinhardt, something was due also to the exertions of Mr. William Poel and his Elizabethan enterprises. But, perhaps, the main influence came from the Russian ballet and M. Leon Bakst. Mr. Granville Barker carried his policy a step further in the production of "Twelfth Night," a very beautiful and noteworthy spectacle, admirably acted by Miss Lillah McCarthy, Mr. Henry Ainley, Mr. Leo Quartermaine and others.

A characteristic feature of the London seasons of 1911 and 1912 was the success of spectacular exhibitions, designed on oriental lines. Thus, for instance, we had "Kismet" at the Garrick Theatre, an eastern fantasy by Mr. E. Knoblauch which had a very lengthy run, "Sumurûn" and "The Miracle," due to the constructive imagination of Max Reinhardt, while the Russian ballet not only introduced such artists in dancing as Karsavina, Pavlova, Nijinsky and Novikoff, but revealed extraordinary cleverness on the part of the producer, Bakst, in his handling, for example, of "Schéhérazade." When "King Oedipus" was enacted at Covent Garden, with Mr. Martin Harvey in the principal part, it was a reproduction in most respects of the Max Reinhardt version in Berlin, and especially struck English audiences by its bold and free manipulation of large crowds, forming both chorus and populace in the arena. Other Greek plays produced were the "Iphigenia in Tauris" at the Kingsway Theatre and at Bradfield College, and the "Medea" at the Kingsway Theatre. To this list may be added "A Venetian Night" produced by Max Reinhardt at the Palace Theatre. Some of these productions were not a little exotic in character, which gave them a touch of the eccentric and the bizarre. At all events they gave an opportunity for the "producer" of the show, who is becoming a most important figure in all modern theatrical history.

Theatrical Successes.—We must return to plays of a more ordinary type. In this department the outstanding successes have been undoubtedly "Buntz Pulls the Strings," by Graham Moffat, "Fanny's First Play," by Bernard Shaw, and "Milestones," by E. Knoblauch and Arnold Bennett. If "Fanny's First Play" revealed Bernard Shaw at his best, it is also true to say that no single play in London has been more unanimously praised by every class of theatregoers than "Milestones." The idea of the piece was to take a single family through three distinct phases of its career, and exhibit the prejudices inseparable from each stage in turn. The family in question was engaged on ship-building enterprises, and we had presented to us in turn the obstinate belief of the grandfather in wooden ships, succeeded by the faith of the father in iron ships, and followed in due course by the son's acceptance of the value of steel in naval construction. The two authors had woven a very interesting story round this framework, and as the figures were well drawn, and typical in each case of their own period, the piece has enjoyed the largest measure of popularity. A popular success has also attended the production at His Majesty's Theatre of Louis N. Parker's "Drake." It is a version of the life of the great Elizabethan seaman, and, although mainly spectacular in character, it yet has two acts of strongly dramatic interest, which, quite apart from its general popularity, appeal on the score of patriotism and national pride in the British navy. The St. James's Theatre has been remarkable for three pieces, all more or less melodramatic in their nature. "The Witness for the Defence," by A. E. W. Mason, was succeeded by "Bella Donna," founded on a novel by Mr. Robert Hichens, and dramatised both by the author and Mr. J. B. Fagan, in which both Mrs. Patrick Campbell and Sir George Alexander won an undoubted triumph. The third piece at this theatre is entitled "The Turning Point," based on "La Flambée" of M. Henry Kistemaekers. We must pass more quickly over other dramatic ventures. Mr. Arnold Bennett's "The Honeymoon" had, perhaps, not as much success as it deserved, but Mr. Haddon Chambers' comedy "Passers-by" ran for a long time, thanks to Mr. Gerald du Maurier, and "The Perplexed Husband" of Mr. Alfred Sutro also kept the boards for many weeks. Sir Arthur Pinero has been represented by three plays in the period under consideration—"Preserving Mr. Panmure," the oddly named "Mind the Paint Girl," and a short play "The Widow of Wasdale Head," besides a successful revival of "The Amazons." Miss Marie Tempest, thanks to a most engaging personality, managed to make a success both of Mr. Anthony Wharton's "At the Barn" and Mr. Harold Chapin's "Art and Opportunity." Mr. Henry Arthur Jones' "The Ogre" did not hit the popular taste, but Mr. Henry Hubert Davies, the clever and ingenious author of "The Mollusc," seems once again to have secured a popular verdict by his rather thin piece entitled "Doormats." The titles of other plays may be rapidly run through, as, for instance, "The Easiest Way," by Eugene Walter, in which Miss Sarah Brooke had a "star" part; "The Five Frank-

forters," translated from the German of Karl Roessler; "Jelfs," by H. A. Vachell; "The Bear Leaders," by R. C. Carton; "Lady Patricia," by Rudolph Besier; "The Butterfly on the Wheel," a melodramatic version of a trial for divorce, by Messrs. Hemmerde and Neilson; "Little Miss Llewelyn," founded on the Belgian play "Le Mariage de Mdlle. Beulesmans"; "A Scrape of the Pen," by Graham Moffat, author of the evergreen "Bunty"; "Rebecca of Sunnybrook Farm," by Kate Douglas Wiggin; and "The Great John Ganton," which gave the American actor Mr. George Fawcett an opportunity for a singularly vivid piece of characterisation. "Everywoman" at Drury Lane requires a line to itself, because of its peculiar character. Instead of bringing out its usual melodrama, Drury Lane produced in 1912 a kind of modern morality play, in which "Everywoman," a name for the eternal womanly, is shown surrounded by youth, beauty, flattery, wealth, and other personified abstractions, and scolded from time to time by "Nobody," who acts the part of chorus to the piece. It was written by a young English author, Walter G. Browne, but he died before its production could take place in America, and the English version, transplanted from the United States, was made by Stephen Phillips working on the original material of the author. One of the most curious of recent productions was the triple bill (Nov. 1912) at the Duke of York's Theatre, consisting of three items, "Overruled" by Bernard Shaw, "The Widow of Wasdale Head" by Arthur Pinero, and "Rosalind" by J. M. Barrie. Mr. Barrie was the only one of the three authors who kept up his reputation. Mr. Bernard Shaw's piece (called "a demonstration") dealt in cynical and garrulous fashion with the old question of philandering with friends' wives, and Mr. Pinero's play, though called a fantasy, was singularly devoid of imaginative and fantastic elements. Mr. Galsworthy has been represented by a new piece "The Eldest Son" at the Kingsway Theatre, which is mainly a study of country house morality.

Needless to say, there has been the usual number of new musical comedies, of which it is only necessary to recall the names—"Princess Caprice," "Grass Widows," "The Girl in the Taxi," "The Sunshine Girl," "Gipsy Love," "The Dancing Mistress,"—all more or less of the accustomed type.

English Actresses and Actors.—Before leaving the English stage, it may be interesting to mention the names of those contemporary players whose success has been most conspicuous in 1911 and 1912. Of the younger actresses there can be no question that most mark has been made by Miss Phyllis Neilson Terry and Miss Marie Löhr, though they are of very different types. Miss Neilson Terry is better in romance and tragedy, and her chief honours were gained in the parts of Juliet, Desdemona, and Queen Elizabeth in "Drake." Miss Marie Löhr is a born comédienne, with a light pleasant youthful touch which stood her in good stead in such pieces as Pinero's "Mind the Paint Girl," the same author's "Preserving Mr. Panmure" and Mr. H. H. Davies' "Doormats." Mrs. Patrick Campbell still remains the most picturesque and accomplished actress on the English stage. Her technique is never perfect, but she has magnificent moments, and her intuitions are always right. Once more she proved her powers in Mr. Robert Hichens' "Bella Donna,"—on the whole a very remarkable performance on the part of the heroine. Miss Lillah McCarthy's successes have been gained as Jocasta in King Oedipus, as Iphigeneia in Euripides' play, and more recently as Hermione in "The Winter's Tale" and "Viola" in "Twelfth Night." Miss Alexandra Carlisle has taken a great step forward in her representation of "Everywoman" at Drury Lane, and Miss Irene Vanbrugh revealed once more the extent of her charm as a comedy actress in Mr. Barrie's play "Rosalind."

It would be true, however, to say that the English stage is not so richly endowed with actresses as it is with actors. Rarely in its history has the theatre possessed so many capable male artists. We need only mention here the names of those who are steadily winning fame by careful and intelligent work. Probably the actor with the largest following is Mr. Gerald du Maurier, who has attained a wonderful degree of popularity with his audiences, and often finds himself able to carry through an indifferent play to success by virtue of his personality. Mr. Dennis Eadie is one of the cleverest actors in

England, versatile and ready in resource. Mr. Henry Ainley is, perhaps, the best romantic actor; his recent performances as Leontes in "The Winter's Tale" and Malvolio in "Twelfth Night" confirmed once more the judgment passed on him by many critics. To this list of younger artists may be added the name of Mr. Robert Loraine. It need hardly be added that both Sir Herbert Tree and Sir George Alexander have retained the position which they have won by many years of conscientious work. Mr. Forbes Robertson, in some respects the most distinguished of English actors, has been absent from London, and so too has Mr. H. B. Irving, both having had successful tours far from home; while Mr. Frank Benson has continued his strenuous work at Stratford and in the provinces.

The American Stage.—Turning to the American stage, we find that it still retains some of those features which have marked it for some time past. In many respects it is crude, immature and imitative, and, as before, depends largely on the successes of the English stage. Nevertheless, it would be true to say that a few authors of independence and originality have arisen, and that the general level of American acting has decidedly improved. There are a number of good character actors, although the supply of *jeunes premiers* is decidedly scanty. Here we need only refer to some of the more conspicuous events of the past two years.

A good deal of interest was taken in the New Theatre, subsidized by wealthy private guarantors, which was opened with a great flourish of trumpets in New York. Built originally as an opera-house regardless of expense, it was found to be sadly deficient in acoustic properties for the purpose of drama, and to be much too large for the presentation of comedies and domestic pieces. Under Mr. Ames as producer and Mr. E. Hamilton Bell as art-manager, some excellent work was done in presenting and staging new pieces which otherwise would hardly have had a chance in America; but the experiment of providing continual novelty and avoiding "runs" gradually broke down, and the enterprise came to an end in the summer of 1911. The building was changed by the Lieblers into the Century Theatre, and modifications of the original structure were made, to adapt it for more ordinary requirements. Among other general events of theatrical interest we may mention that the Old Bowery Theatre was sold at auction, and that Miss Ellen Terry's lectures on Shakespearian heroines were everywhere received with the greatest enthusiasm.

Of new dramas produced perhaps the most original were "As a Man Thinks," by Augustus Thomas, "The Woman," by William C. de Mille, "The Return of Peter Grimm," by David Belasco, "The Price," by George Broadhurst, and "Bought and Paid For," by the same author. The oddly named "Get-Rich-Quick Wallingford" enjoyed much popularity at the Gaiety, and has since been given in London. "Everywoman," originally produced at the Herald Square, a modern moralist play by Walter Browne, has already successfully traversed the Atlantic, and perhaps the same good fortune will attend Mr. Louis Parker's play "Disraeli," in which Mr. George Arliss has won in New York such conspicuous success. "The Garden of Allah," by Robert Hichens, gave a fine opportunity for Mr. Lewis Waller, who has also been seen in "The Butterfly on the Wheel," "Discovering America" and "Henry V." "The Piper," Mr. F. R. Benson's Stratford prize play, by Josephine Preston Peabody, was produced in the New Theatre and greatly praised as literature, though its dramatic value was less evident. In "Thais," founded on the novel of Anatole France, Miss Constance Collier earned a considerable reputation, and Miss Ethel Barrymore won well-deserved praise in a production of Mr. A. E. W. Mason's "The Witness for the Defence." "Kismet," "Nobody's Daughter," "Passers-By," "A Single Man," "The Twelve Pound Look" and "The Perplexed Husband," were other plays borrowed from the English stage; but "The Master of the House" by Edgar James, which came out at the 30th Street Theatre, revealed a good deal of native American talent. It may be added that, when the Irish Players appeared in New York, Mr. Synge's piece "Playboy of the Western World" aroused as much opposition in America as it had done in Ireland, especially from Irish critics who denounced it as a libel on the Celtic character. Apart from this drama,

however, the company produced several plays of interest by Yeats, Lady Gregory, Bernard Shaw, and others. Mr. John Drew is still to the fore as an American actor of rich attainments, especially in comedy.

The French Stage.—On the whole the French stage, within recent months, does not appear to be in so flourishing a condition as it has been in past years, and, indeed, it seems a little deficient in vitality as compared with the English stage. We notice a greater readiness to accept foreign importations, and a greater leniency of judgment in estimating their merits. Thus, for instance, so thoroughly an English book as *Pickwick* was adapted under the title “Monsieur Pickwick,” and produced at the Athénée with some success. “Kismet,” too, has been transplanted from England and America to Paris, under the care of M. Guityry. Of authors well-known in the French dramatic world we may mention Pierre Wolff, Paul Bourget, Henri Lavedan, George de Porto-Riche, and Henry Bernstein. From the last named writer have come two pieces—“Après Moi,” and “L’Assaut,” together with a revival of “Le Détour,” all more or less successful. Paul Bourget’s Drama “Le Tribun” saw the light at the Vaudeville Theatre, and in conjunction with M. Beaunier, M. Bourget also produced “La Crise.” M. Alfred Capus has been represented by “Les Favorites” at the Variétés, and those two capital comedians, De Flers and De Caillavet, have delighted the Parisian public with “Primerose,” “Papa,” and still later with “L’Habit Vert.” Gabriel Trarieux’s “La Brebis Perdue,” Henri Lavedan’s “Gout du Vice,” Pierre Wolff’s “L’amour Défendu,” and George de Porto-Riche’s “Vieil Homme,” were all fairly successful productions, whilst Henry Kistemaekers’ “La Flambée,” which came out at the Porte St. Martin, has since been seen in its English version at the St. James’s Theatre. A very peculiar and powerful Hungarian play entitled “Le Typhon,” and written by Lengyell, which came out in Paris, has already been adapted and produced by Mr. Laurence Irving in the English provinces, although it has not yet appeared in London. Another adaptation is “The Little Café,” from M. Tristan Bernard’s enormously successful farce “Le Petit Café,” at the Palais Royal. Perhaps in Paris the most popular contemporary dramatist is Sacha Guityry, who made his fame in “Le Beau Mariage,” and has certainly confirmed it in his most amusing recent piece “La Prise de Berg-op-Zoom.” Towards the end of 1912 Paul Hervieu’s “Bagatelle” was successfully produced at the Théâtre Français, Georges Duhamel’s “Dans l’Ombre des Statues” at the Odéon, Henri Bataille’s “Les Flambeaux” at the Porte St. Martin, and Brieux’s “La Femme Seule” at the Gymnase (Dec. 22). Madame Sarah Bernhardt’s success in “Lucrezia Borgia,” and in “Elizabeth Reine d’Angleterre,” was confirmed by the extraordinarily warm welcome accorded to her when she appeared at the London Coliseum.

(W. L. COURTNEY.)

PROGRESS OF THE CINEMA THEATRE

Though it is now nearly twenty years since R. W. Paul and others first evolved the cinematograph¹ from Edison’s kinoscope, and though numerous patents relating to it have been granted in Great Britain and elsewhere, the machine remains essentially the same as it was then, and it is only in matters of detail that great improvement has been made. The film is now standardised and is $1\frac{3}{4}$ " in width, bearing 16 pictures, each $1" \times \frac{3}{4}"$, to the foot and having eight sprocket holes, four on each side, to every picture. The projector mechanism has been modified, the intermittent movement of the film being now usually effected on a “maltese cross” or Geneva stop principle instead of by the old cam or “dog” motion; and this has led to greatly increased steadiness of picture, as the film is positively locked except when the pictures are being changed. Another advantage from its use is that the change from one picture to the next is reduced to less than one-fifth of the whole cycle, thus minimising the “flicker.” This has also been reduced by modifying the shutter, which now has three blades, instead of one, as formerly, of which one serves to cut off the light while the change is effected and the other two increase the frequency of the alternations of light and darkness thus rendering them less

¹ See *E. B.* vi, 374.

noticeable. The intensity of the light is of course increased to preserve the brilliancy of the picture. Minor improvements have also been devised in the nature of the screen on which the image is thrown, in the rapidity of the lenses fitted, and in the arc lamp which is always used to illuminate the film pictures, until, at the present time, films in good condition properly projected by the most modern apparatus worked by a first-rate operator show pictures which leave little to be desired as regards brilliancy, steadiness and freedom from flicker.

The camera in which the negative film is taken, from which all the subsequent prints are made, is practically the same mechanism as is used in a projector, but it is placed in a light tight box. The lens used in taking is an extremely rapid one of the highest quality so that the utmost detail may be secured. The pictures are invariably taken at 16 per second, or one foot of film, and the necessary alteration of the exposure is made by stopping down the lens. This taking speed is never altered, as the films are always projected at this speed and thus a natural effect of motion is always secured. If the film is projected faster than it was taken the effect is very hurried, and if slower an opposite but equally unreal effect is attained.

The films after exposure are mounted on frames (holding from 150 to 300 feet), developed, fixed and washed in large tanks, and then wound on drums about 4-5 feet in diameter and dried by being rapidly revolved in warm dry air. The positives are then printed from these in a special printing machine in which the positive is successively exposed to light behind the negative pictures. It is developed, fixed, washed and dried in the same way as the negative, and is then ready for the market. One or two of the largest French film manufacturers produce their positives by means of automatic machinery, but this has not yet been generally adopted.

In the early days, the subjects of the films were of the simplest possible character, scenery taken from a moving train, a woman washing a baby, boys bathing and so forth: but they have become more and more complex until at the present time no expense is spared to render the pictures correct in every detail. The actors are dressed with every attention to historical accuracy and the plays are in many cases acted in the places where the scenes depicted actually took place, large numbers of people being continually employed by all the film companies in preparing, rehearsing, and acting the various scenes depicted. A French firm employed 2,500 people to act a film of "The Siege of Calais," and an American company spent £20,000 and employed sixty actors for months in Palestine to act "From Manger to Cross."

The business has developed into an enormous one all over the world, and has reached its highest development in the United States. There the most insignificant villages have their picture "show," and more than five million people go to see the plays every day, at least £26,000,000 being taken at the doors in a single year. In England, though the progress has not been so rapid, the business is an important one. There were over 4,000 theatres licensed in Great Britain for pictures in 1912. Each of these shows 5,000 to 6,000 feet a day, so that over 20,000,000 feet are projected every day. The life of a film is only six weeks in constant running, so that over 3,000,000 feet come in and go out of circulation every week. As this film is supplied by the manufacturers at an average price of 3½d. it follows that a large amount of capital is invested in this business, even though it has not yet reached its fullest development. All the countries of Continental Europe have adopted the new form of entertainment.

The most important countries for manufacturing the film are in order France, the United States, Italy, Great Britain and Germany. In the early stages, England had a monopoly of this branch of the business, but this was lost partly because climatic conditions were unsuitable and partly because the fear that the craze would be a transient one frightened capitalists. There is now no doubt that this form of entertainment will continue to attract: there were 90 picture theatres licensed in London in 1909, but in 1912 there were over 400. It attracts audiences partly from those who previously never went to places of amusement at all and partly from music-hall and theatregoers. It has recently been shown that the seven leading London music-halls made on the average

£3,000 less profit in 1911-12 than they did in the preceding 12 months, and a similar drop would be shown in the theatre receipts if the figures were available. Many of the local theatres and halls in the London suburbs have either closed or been converted into picture palaces. Unfortunately the cinema theatres have shown less desire to use their opportunities for high-class educational purposes, and more to provide simply sensational entertainments, than they did three years ago. Then it was the custom to include at least one educational picture in each programme; it might be the growth of some well known flower, or perhaps the circulation of the blood, or a tour round some foreign city, or the manufacture of a familiar article, while now it is the exception to find such a film included. A wearisome round of pictures are exhibited, farces based on crude practical jokes, and melodramas mixed with maudlin sentimentality; the only leaven is an occasional historical play.

The cause of this failure to take advantage of the enormous educative possibilities of the cinematograph is twofold. Firstly, the majority of the leading film manufacturers are self-made men who have made all their money out of the business; and secondly, until lately it was fashionable to ridicule the cinematograph picture. The fact that the leading actors and actresses of Europe, for instance, Sir H. Beerbohm Tree and Madame Sarah Bernhardt, have not considered it beneath their dignity to act before the film camera shows that the second no longer applies. Time no doubt will remedy the first, and when the men arrive who will raise the tone of electric theatres in the same way as the late Sir Edward Moss and others have done for that of the music halls, the cinematograph will become a great influence for the public good.

There is a great field open too for the use of film pictures as an aid to teaching. Children are always more interested in the concrete than they are in the abstract; lessons in geography, history, natural science, etc., so illustrated, would interest and instruct them to a far greater extent than mere text-book teaching, and knowledge so acquired would be much more likely to be retained. The inflammability of the film has, however, up till now prevented any serious move being made in this direction. The Home Office and County Council regulations in England have rendered electric theatres very free from danger; but it would be difficult to apply these rules to schools. Children are highly susceptible to panic, and a fire-and-smoke-proof operating box would be a necessity, especially as school teachers could hardly be expected to be expert operators and so would be more likely to fire the film. The London County Council and others, however, have recently taken steps to consider how these difficulties can be overcome.

Many attempts have been made to make a non-inflammable celluloid film, but so far without success. Films have been made with tanned gelatine as a basis instead of celluloid, and inventors have also endeavoured to denitrate the nitrocellulose from which celluloid is manufactured; but in both cases the film has lost transparency and also strength. This is one of the problems awaiting solution. Another is that of obtaining a film in natural colours. G. A. Smith and Chas. Urban in their Kinemacolor process show very beautiful colour effects; but the film is not in itself coloured and so must be shown by special apparatus. Relying as it does on persistence of vision, much higher running speed than usually employed is required and considerably more light. The ideal colour film should consist of a series of pictures, each a complete colour rendering of the subject in itself; so that the film could be exhibited on any machine at the normal speed. No film fulfilling these conditions has yet been produced on the market, but of the numerous inventors who are investigating colour cinematography one, at least, is working on these lines and the problem should shortly be solved.

Another problem is the synchronising of the gramophone and cinematograph. This had been done but with very partial success, but late in 1912 seemed to have been successfully accomplished by Thomas A. Edison.

The one thing certain is that ten years ago the moving picture was an object of ridicule, yet to-day it has effected a revolution in the world's amusement; and its influence will continue to increase as more theatres are opened and better programmes are produced.

MUSIC¹

The more recent developments of music have been concerned with performance rather than creation and invention. The truth is that, with the death of Wagner, an end came to a long period of inventive development in the art—the period, in fact, of developed music which may be said to have begun with Bach and ended with Wagner and Brahms. It is probable that to future historians this period will be known as the “equal temperament period,” in which music was universally written on the basis of the whole-toned scale. The general tendency of music of the post-Wagner period has been to search for some new scale or tonal basis and consequently to express this in terms which at first seemed strange to ears trained to the old scale. With Wagner a certain period of composition may be said to have ended, and a new period of performance and interpretation to have begun; and it is that period which, in its turn, seems to have come to its own development and close in the last year or two—probably to give birth, in its turn, to a new period of original composition.

Whether this turn out to be true or not the expectation of it seems to be logical. A long and fertile period of creative production means almost certainly that less time and care can be devoted to interpretation and performance; there are more works claiming a hearing than can easily be heard; and musicians are more engaged in the business of presenting the new works than in perfecting their renderings of the old. In time, therefore, the actual technique of interpretation falls short of the demands made upon it; attention is drawn to it; and with the pause in the tide of production comes greater leisure to study the technique of performance and the consequent development in that branch of the art. The link between two such periods is curiously represented in the person of Wagner, who found that existing means of interpretation were not sufficient for the adequate performance of his own works, and he had therefore to evolve for himself a new orchestral technique by means of which his scores could be made intelligible to the world. He may be said to have invented the modern art of conducting—an art which arose entirely from his own works. Wagner had by long and patient study of Beethoven, Mozart and Weber, arrived at the conclusion that the orchestral works of the great masters had hardly ever been properly heard, and his essay on conducting marked an epoch in the history of music. But when his own scores came to be examined, they were pronounced unplayable. By the old methods, moreover, they *were* unplayable, and ghastly indeed must have been some of the performances of opera orchestras in Germany at their first rehearsal of his scores. No amount of merely beating one, two, three, four in a bar could produce melody and harmony out of the chaos presented by the score. The thing seemed hopeless. Like every creator or originator, Wagner had to begin at the beginning and form the tools with which his work was to be done. Liszt and von Bülow, the greatest contemporary masters of the technique of the pianoforte, were the first to realise that there was at least a possibility of the performance of Wagner's works; they had learned from him how to conduct Beethoven, and the knowledge thus gained was applied to the interpretation of his own scores. And after them he trained a whole band of disciples in the interpretation of his operas—Richter, Seidl, Levi, Richard Strauss, Mottl, Weingartner, and Nikisch were the chief of them; all these became great exponents of the new art of conducting. These men had many varieties of quality and talent, but it will be seen that one thing was common to the equipment of all of them: they were all trained in the interpretation of one set of works—Wagner's own operas. And that fact gives us the key to the new art of conducting as compared with the old art of beating time; for they had these scores absolutely in their heads. They lived with them; their lives were spent in rehearsing and copying and drilling until every note was as much their own as if they had themselves composed the score; thus when they came to conduct they were not merely reading the music of the printed page a bar in advance of the orchestra; they were leading the orchestra in something that was within themselves, something that came from their own inner being.

¹See *E. B.* xix, 72 *et. seq.*; and articles enumerated on p. 885 of Index Volume.

They knew every note of the part, often knew it better than the player himself; and if he stumbled or made a mistake they could sing the right note for him through all the maze of other parts.

The interpretation of the Wagnerian scores was also a great training ground for conductors in the actual instrumental technique of the orchestra; and in the extension of this, and the first modern definition of it in the form of an authoritative monograph, the work of Hector Berlioz is pre-eminent. It was of old the invariable excuse of the lazy orchestral player to pronounce a passage presenting any unusual difficulties "unplayable," and the ignorant conductor, hesitating to contradict the player on a matter concerning the technique of his own instrument, was obliged to accept his verdict. But Berlioz and the disciples of Wagner changed all that. They armed themselves with an exact knowledge of what was and what was not possible for every instrument in the orchestra; they were careful not to write anything physically impossible. They thus abolished a great piece of bluff with which orchestral players had hitherto been able to oppose the exacting conductor; for composers had often written without any regard to the construction of the instrument employed, had even written notes which did not exist on the instrument; so that the conductor who should have demanded their execution would have been laughed at by his band, which would not fail to take advantage of this state of affairs when presented with a passage which was merely difficult and not impossible. But under the new régime the conductors very often knew as much about the technique of the instrument as did the players themselves; they were firm in demanding the execution of passages which were only difficult because they were unusual; and the natural pride of the artist, responding to the challenge, was found equal to the new demands. The old phrase "I can't do impossibilities," or "I can't play notes that are not on the instrument" gave way to "If the instrument can play it, I can play it."

The first result of this was a great increase in the efficiency of orchestral players, who began to find that their work was not a mere dull, slovenly, and rhythmic scraping and blowing, but a new and intricate art in which their artistic pride was challenged, a task arduous indeed and involving hitherto unheard-of labour and study, but rewarded, as all true artistic labour is, by the new interest and intrinsic joy found in the doing of the work. Thus the conductors improved the orchestras; the orchestras reacted on the conductors; the public found new pleasure in listening to orchestral performances; composers found a limitless field of possibilities in orchestration, and the whole art of music, borne high on this great wave, was swept forward to a new stage in its development.

This aspect of the matter is enlarged upon here because, as has already been said, the last three years have seen the culmination of the period of musical interpretation. The technique of orchestral playing has become so perfect that it seems almost impossible to carry it farther. Instruments have been improved, and families of instruments completed, and a first class orchestra of to-day is really an association of *virtuosi*, each of them a master of his own instrument. It is the period of style. Even the student of to-day is a master of orchestral resources that would have astounded Berlioz, and has an astonishing facility in using and blending them.

In the other great branch of interpretative music, the pianoforte has been mechanically developed along with the manual technique of the pianist to a point which leaves little if any room for further development. Even mechanical players, the universal use of which is one of the features of the day which cannot be ignored, have been so wonderfully perfected that they have brought practically the whole range of pianoforte music within the grasp of the ordinary uninstructed person. This has had the immediate effect of removing many of the barriers within which the art of music was enclosed, and of making it less and less a cult for the initiated and more and more a possession of the world at large. The benefit of this is obvious; obvious also is the unfortunate defect which it shares with all short cuts and with attempts to provide by rough and ready means high pleasures which can only be attained in perfection by a path of long and consistent study.

We stand now as regards symphonic and orchestral music at the threshold of a new

period. The interpretative technique having been developed beyond the needs of what may be called classical music, a new school is springing up, the art of which seeks to take full advantage of the new resources thus afforded.

So far as one can judge in what is necessarily a transition period the centre of creative musical life seems to be shifting westward. The long and glorious annals of modern German music came to an end with Wagner and Brahms. The promise of an important Russian school heralded by Tschaiĥovsky has so far not been fulfilled. The first signs of a new life in music appeared in France, principally in the works of Debussy, Ravel, and others of their school, but it appears to have died down again or dissipated itself into a morbid and precious trifling with the exquisite interpretation of things not worth interpreting. A little later a new and promising school of composition sprang up in England, more solid in its basis than that of France and at first not so exquisite in technical mastery; but it has during the last three years developed to a point which has left the French trifling far behind and promises to broaden into a creative art of first rate importance. Such names as Granville Bantock, Joseph Holbrooke, Cyril Scott, Hamilton Harty, William Wallace, Hinton, Ethel Smyth, Vaughan Williams, York Bowen, Delius, Dale, Gardiner, Grainger, and von Holst, represent the most modern group of this English school, while composers like Stanford, Parry, Cowen, Mackenzie, Coleridge-Taylor, Walford Davies, Somervell, Hamish MacCunn, Edward German, and Hurlstone represent a type of music not so ultra modern but still full of an increasing freedom, while yet retaining enough of the old classical forms to take a stronger hold of the conservative public than is possible with the newer music. The work of Elgar can hardly be separated from either group; in a sense it belongs to both. The high degree of excellence attained by English orchestras has had much to do with the development of symphonic music; and the services of the two most eminent English conductors, Sir Henry Wood and Mr. Landon Ronald, have greatly stimulated and helped it.

The new development of music, arising from its perfection of the means of interpretation, is as yet hardly definite enough in its direction for us to predict with any certainty the course likely to be taken in its stream, but enough has happened in the last year or so to make clear the general lines on which composers of the new school are proceeding. The most striking characteristic which is common to them all is a great freedom of form. The classical form of the sonata and symphony has been expanded and modified almost beyond recognition. The modern composer does not, when he sets about a work, confine himself within the limits of form which have hitherto been characteristic of the greatest music. He seeks to interpret mood rather than to achieve structure or outline; in the slang of the arts he is more concerned with "atmosphere" than with construction. And here also comes in another striking quality in the new music. There were, roughly, three elements in the old music: rhythm, melody and harmony. To these has now been added a fourth, which for want of a better English term one must call colour. Tone colour is arrived at by the use of the different sound qualities of the different instruments; and the perfection of modern instruments, and the high degree of virtuosity achieved by their players, have greatly extended the resources of the composer. In the old music instruments were used more with regard to their compass than to their tone colour. Melody was assigned to such instruments as violins, oboes, and clarinets, on account of the facility of executing rapid passages upon them, and of their considerable compass in the higher scales. To the less agile instruments such as horns, trombones, and the lower strings, were assigned the task of filling in the harmonies, while drums and even trumpets were used as instruments of percussion to accent the rhythm. The modern tendency of music is to change all this. Melody, once almost a monopoly amongst the instruments named, has been distributed amongst all the instruments of the orchestra, even kettle-drums. The dream of Berlioz that every family of instruments should form a complete orchestra in itself has now been realized, with the result that by using their distribution of tone qualities, either separately, or blended one with another, the modern composer has on his palette a series of gradations of tone which correspond with the colours on a painter's palette. And it is this new use of colour, this

making of sound for the sake of its quality, quite apart from melody or harmony, that is one of the most striking developments in recent music. It enormously extends the range of music in the expression of emotion, and, in the establishment of what is called "atmosphere," it carries the art as a means of human expression to lengths which have never before been attained and which neither language, nor painting, nor any other means of expression can find corresponding terms to describe. Music is getting farther and farther away from the expressing of intellectual ideas, and is more and more dedicated to the expressing of pure emotion.

With the emancipation from form, and as a consequence of it, has come emancipation also from the old harmonic laws. The principles of thorough bass on which music was written until the end of the nineteenth century are gradually being abandoned, and the long reign of tonic and dominant harmony is coming to an end. And as the ear becomes educated to these new forms, one discovers that principles which seemed to be immutable, like the laws of nature, may be abandoned not only without distress to the musical sense, but with positive increase to its gratification. As an illustration take the following close in the key of F major.

Up till quite recently no ear would have tolerated or found finality in anything but the tonic chord of F. But the modern composer would, if it suited him, without any hesitation write the passage thus, leaving the leading note unresolved:

Anything more impossible under the old ideas than an unresolved leading note in the final chord could not be imagined; yet if the chord as it has been written here be held on an organ or any other tone-sustaining instrument and listened to attentively, it will be found that it comes to a quite natural close; that there is no essential unrest or desire for completion; and that as a final chord it has only a darker, more complex, more mysterious quality than a plain common sense chord of F major. The truth is, that the modern ear treats all notes as harmonies or overtones of some fundamental which is possibly not physically heard; and that the increase in the harmonic range of modern music is simply due to the fact that our ears have become educated to imagine and reconcile a far wider series of these harmonics than were the ears of an earlier generation.

Although, as has been said, the most immediate promising school of new composition is the English, the work of this school is almost entirely confined to instrumental and symphonic music which no modern school or opera has developed. The works of the popular Italian composers such as Mascagni, Leoncavallo, and Puccini make a great appeal to the public which frequent fashionable opera houses; but so far as real artistic progress is concerned they are almost negligible. Their appeal is spectacular and sensational rather than artistic. From every point of view they are a retrogression from the position attained by Wagner. The characteristics of the recent successes in this school are absurdity of plot, crude delineation of character, and careful subordination to the

requirements of the *prima donna* and the star tenor, and sufficient opportunity for spectacular mounting to make them acceptable to the managers of metropolitan opera houses. If the few attempts made at modern English opera have been negligible, it is no doubt partly due to the difficulties against which English composers have still to contend in getting a hearing for elaborate works; and if the demand for English opera continues to meet with little or no response, it is because the public at large has not really as yet developed a serious taste for opera.

Many experiments have been made in running a season of opera in English at popular prices, but they are almost always financially unsuccessful, although they meet with enough encouragement from the public to foster the hope that in this respect also the musical sense of England will continue to develop. The most conspicuous experiment in this direction was made by Mr. Oscar Hammerstein, who, at the cost of £200,000 built and equipped the London Opera House, a handsome and luxurious building situated in Kingsway. Here he conducted three seasons of grand opera, but failing to secure the necessary support he abandoned the enterprise in the spring of 1912. His failure has been variously explained, but it was chiefly due to his attempt to combine two quite opposite interests, due to his imperfect knowledge of London social conditions. He tried on the one hand to rival Covent Garden and to attract part at least of the fashionable audience to whom the opera is a social function, and also to attract the musical public which has learnt to demand a high standard of performance and repertoire. The standard of performance in Mr. Hammerstein's house was excellent, but the judgment shown in the selection of the repertoire was hopelessly at fault. Money was poured out on the lavish mounting of old-fashioned and obsolete operas which had never been really alive, and are more than dead to-day. Mr. Hammerstein was artistically in this respect some half a century behind the time. The fashionable world failed to support him; as a result, his project was abandoned and his opera house converted into a Cinematograph theatre. The enterprise of Mr. Thomas Beecham met with far more artistic, but no greater financial success, although by his seasons of modern opera (and his productions included the works of Richard Strauss) he proved that there was a steady popular support for opera in English at popular prices.

A quite new development in the presentation of opera is worth mentioning, as it may indicate a certain movement of popular taste. It is the performance of short operas in full on the music-hall stage. Mascagni conducted his *Cavalleria Rusticana* nightly at the London Hippodrome for a long season, and other short works adequately performed with a full chorus and orchestra have also found a place in recent variety programmes. But none of these conditions are at all likely to help in the development for which all musicians are eagerly looking, a truly modern art of opera. The works of Strauss, of which much was expected, have not succeeded in filling this want. It is just possible that with the development of spectacular dancing and the great impulse given to the new conception of scenic decoration by Gordon Craig and Prof. Reinhardt, the new opera may emerge, as did the old, from the dance and the ballet. (FILSON YOUNG.)

PAINTING¹ SCULPTURE² AND ARCHITECTURE³

Painting.—On November 8, 1910 there was opened at the Grafton Galleries in London an exhibition which has exercised the most far-reaching influence upon every phase of artistic activity in England. The movement illustrated by that exhibition has been an active force in France, and indeed all over Europe, for some years, although it had only sent a faint echo across the Channel, where it was given the somewhat vague and meaningless name of "Post-Impressionism"—in preference to "Synthesisism" and other terms suggested for it. This Post-Impressionism is a revolt against the tyranny exercised by realistic representation over the art of the later nineteenth century, just as earlier in the century

Post-Impressionism.

¹ See *E. B.* xx, 459 *et seq.* and allied articles enumerated in Index Volume p. 886.

² See *E. B.* xxiv, 488 *et seq.* and allied articles enumerated in Index Volume p. 887.

³ See *E. B.* ii, 369 *et seq.* and allied articles enumerated in Index Volume p. 884.

Realism had been a revolt against the tyranny of academic classicism. Post-Impressionism derives from Impressionism (see *E. B.* xiv, 343) and is at the same time the negation of Impressionist principles. It is an art of expression rather than of impression. It derives from Manet's mass-impressionism, which had already done much towards eliminating chiaroscuro and simplifying the planes in pictorial work. It also derives from Monet's colour-impressionism with its analysis of light into the constituent spectral colours and insistence on colour vibration as the principal factor in the painter's art.

In the hands of such neo-impressionists as Signac, Seurat and Cross, Monet's application of the discoveries of spectral analysis had become purely scientific and mechanical, their canvases being filled with a system of round dots or square touches of identical shape and regular intervals. The first Post-Impressionists shrank from the imitative objectivity of these Neo-Impressionists, and used colour and form as symbols for the expression of their personal emotions. One of the best definitions of Post-Impressionism is "a new recognition of the principle that objects cannot be depicted as they exist in reality, but only as they appeal to the spirit of the individual; that their emotional significance — the bond that links man to his surroundings — can be expressed only by a full confession of personal experience."

The three founders of the new movement — the dominant personalities whose achievement stands out from the bulk of eccentric, incompetent and often absurd productions of the lesser men who sailed under the same flag — were Paul Cézanne (1839-1906), Paul Gauguin (1848-1903), and Vincent Van Gogh (1833-1890).

Cézanne, born in 1839 at Aix in Provence, the son of a prosperous banker, was educated for the law, but felt strongly drawn towards art and was allowed to enter the Académie Suisse in Paris in 1862. Having failed to gain access to the École des Beaux-Arts he had for a time to work in his father's bank; but he eventually returned to Paris and art, the influences to which he submitted being those of Courbet, Manet and Pissarro. An allowance from his father enabled him to follow his passionate love of art without having to depend on the very remote chance of selling his pictures. He worked with real passion, struggling with all his might to arrive at "the coherent architectural effect of the masterpieces of primitive art," and caring little for what became of the pictures upon which he had spent his fiery energy. But it was only on rare occasions that he was able to express his ideals. He was insufficiently trained, and remained to the end heavy and clumsy in his manipulation of the brush. Cézanne took part in the Communist rising of 1871. He died at Aix on September 22, 1906. The character of Lantier in Zola's "L'Oeuvre" was partly drawn from Cézanne.

Paul Gauguin was born in Paris in 1848, the son of a Breton father and a Creole mother. It was only at the age of thirty, after having been a cabin-boy and a bank clerk, that under the influence of Pissarro, Degas and Cézanne he took to painting, his early work being closely akin to that of Pissarro. His whole temperament made it impossible for him to live and work in Paris. He went first to Brittany, then to Martinique (in 1887), whence he only returned to go with Vincent Van Gogh to the South of France, where the two collaborated until Van Gogh after a murderous attack on his friend was removed to a lunatic asylum. In 1891 Gauguin finally broke away from Europe and civilisation and went to Tahiti, where he took a native wife and lived the primitive life of the natives, interrupted only by a few visits to his native France, until he died on May 9, 1903.

In the primitive surroundings of the South Sea Islands he endeavoured, with a good deal of success, to regain something of the decorative grandeur and expressive simplicity of primitive art. That the barbarous splendour of his colour has great decorative value, and that there is a certain archaic monumentality in his design, cannot be denied. Yet it is equally certain that with him, too, the achievement fell frequently short of the intention. Although trained in the Impressionist School, Gauguin, in his later work, has nothing in common with its practice. His colouring

is conventional and arbitrary, his outline heavy and emphatic, his treatment of the human form synthetically simplified.

Vincent Van Gogh, who is in many ways the most interesting figure of this group, was born at Groot Zundert, in Holland, in 1853, the son of a Lutheran clergyman. He began life as a salesman at Goupil & Co.'s, the well known art dealers, then went to England as a teacher, and returned to Holland in 1877 to study theology. Impatient of the narrowness of the school teaching, and impelled by real religious ardour, he took up missionary work among the rough miners at Boringe in Belgium. It was in this milieu that he began to practice drawing, and on his return to his parents in 1881 he was sent to his brother-in-law Anton Mauve to receive instruction in painting. His passionate impulsiveness and restlessness made him again impatient to work independently, but four years later, recognising the disadvantages of insufficient training, he submitted himself — for a few months only — to the discipline of the Antwerp Academy.

In 1886 he went to Paris, where he entered the circle of the Impressionists and became friendly with Gauguin. In the next year Van Gogh went to Provence, and induced Gauguin to join him at Arles for the purpose of collaboration. The two artists, united only by their revolutionary tendencies, were wholly at variance in their disposition. Frequent quarrels between them reached their climax when Van Gogh attacked Gauguin with a razor and subsequently in a fit of remorse mutilated himself and was taken to a lunatic asylum. He had many lucid intervals and continued to paint with unabated enthusiasm. In 1890 he was taken charge of by Dr. Gachet, at Anvers-sur-Oise, in whose garden he shot himself on July 28, 1890.

Van Gogh's undisciplined, erratic, tragic life is reflected in his art. Of his absolute sincerity, of the intensity of his emotions, there can be no doubt. That his frenzied brushwork, his furious hatchet strokes of paint, his concentration upon the essential significance conveyed to him by each subject, served their purpose is equally certain. But not only are his paintings marred by an absolute contempt of surface quality and of what is commonly called beauty, but both his conception and his execution frequently, and especially in his later work, suggest an unhinged mind. His insanity in itself is no excuse for condemning his best work, which has qualities that entitle Van Gogh to a position among the great artists of the nineteenth century.

In the art of Cézanne, Gauguin and Van Gogh, who have already been called the "old masters" of the new movement, is to be found the germ of all the later developments. It is extremely difficult to draw a line of division between those recent attempts that are based on the confusion of art with science, but which are nevertheless the outcome of honest conviction, and those which are either the expression of insanity or at least abnormality, or those which owe their origin to mere *fumisterie* and sensationalism. What they all have in common is contempt of mere representation of natural facts. At the second Post-Impressionist exhibition, held in London at the Grafton Galleries in 1912, Henri Matisse and P. Picasso represented the extremes to which art may be led by the application of these new principles. Matisse, an artist of immense ability, endowed with a rare sense of rhythm in line and colour, can scarcely be taken seriously in his grotesque contortions and simplifications. He tried to look upon nature with the unsophisticated eyes of a child, and his paintings, whilst betraying the experienced hand that simulates incapacity, too often succeed in suggesting the achievement of the nursery.

Picasso, the head of the so-called "Cubist" school, has in his latest phase cut entirely adrift from anything that approaches recognisable representation. His recent pictures are merely indescribably tangled geometrical diagrams.

Cubism. Cubism is supposed to be based on searching for the volume of objects and to "render unspeakable cosmic sympathies perceptible"; but it is really the outcome of an absolute misconception of the function of art. Even if it be taken for granted that the advanced Post-Impressionists are sincere and actually feel the emotions they try to express, this alone does not constitute art. The purpose of a work

**The later
Post-Impres-
sionists.**

of art is not only to express, but to communicate emotion, and the mathematical science of cubism cannot possibly communicate any emotion.

The Italian Futurist movement, at the head of which are the painters Boccioni and Severini, is an outcome of Post-Impressionism and Cubism, although the Futurists themselves profess to regard even Cubism as antiquated and academic.

The Futurists.

An exhibition held by the Futurists in London in the Spring of 1912 achieved a *succès de scandale* and evoked an outburst of derision and indignation, the public refusing to take these artists seriously. Like Cubism, Futurism fails because it is too scientific, and in addition too literary, to have any close connection with pictorial art, the appeal of which must depend upon visual evidence.

Post-Impressionism, leaving aside its more extravagant recent offshoots, is really an attempt to approach the art ideal of the Far East, with its contempt for literal representation, its insistence on rhythm and on the spiritual significance that underlie the outward appearance of nature. But the refinements of a calligraphic style of expression are essential for the attainment of this end; and Post-Impressionism was bound to fail, because it had adopted the coarse technical language of Impressionism. It is for this reason that the real importance of Post-Impressionism lies not in its actual achievement but in its stimulating effect upon all recent art. In England, where the Grafton Gallery exhibition followed close upon an exhibition of Early Chinese painting at the British Museum in 1910, this effect was far-reaching and wholesome. Evidences of new vitality, of a more lively emphasis of structure, design and colour, immediately appeared at all exhibitions, and even at that stronghold of tradition, the Royal Academy. Artists like Augustus John, a masterly draughtsman and a painter gifted with a rare sense of decorative and expressive design, and Prof. C. J. Holmes, remarkable for the structural emphasis of his mountain landscapes, had already independently moved in the same direction as the French Post-Impressionists, without falling into their glaring faults. But in the last few years Post-Impressionism has taken firm root among British artists, the most notable group being the painters and illustrators connected with the magazine *Rhythm* (Peplow, Fergusson, Anne Estelle Rice, etc.), and the so-called "Camden Town group," to whom, under the guidance of Mr. Roger Fry, is due the decoration of the London Borough Polytechnic.

Whilst modern art has been feverishly searching for new channels of expression, the attention of the wealthy picture-buyers has been more than ever centred in the masterpieces of the great dead. During 1911 and 1912 scarcely a month was allowed to pass without bringing news of the further depletion of England's artistic heritage to swell the collections of American museums and financiers. The passing of Rembrandt's masterpiece "The Mill" from Lord Lansdowne's collection to that of Mr. Widener, in Philadelphia, was deplored in England as a national loss, for which the acquisition by the National Gallery of the Castle Howard Mabuse, "The Adoration of the Magi," was scarcely sufficient compensation. Still, Mabuse's famous picture is a work of eminent importance, since it marks in brilliant fashion the close of the great period of Flemish art which was so gloriously initiated by the brothers Van Eyck's "Adoration of the Lamb" at St. Bavon, in Ghent.

A feeling of consternation, akin only to that which was experienced by the whole civilised world on the occasion of the collapse of the Venice Campanile, was caused by the news, in August 1911, that Leonardo da Vinci's portrait of Mona Lisa, known as "La Gioconda," had been stolen from the Salon Carré at the Louvre. The whole world shares the loss of this unique masterpiece, of the recovery of which there is but little hope.

The Mona Lisa theft.

On the occasion of the International Exhibition at Rome in 1911, British art, both ancient and modern, scored a distinct triumph, the British section meeting with general approval and admiration. This section was arranged by the newly created Exhibition Department of the Board of Trade. The building, the design for which is an adaptation of the façade of St. Paul's by Mr. Lutyens, is to be used as the permanent headquarters of the proposed British School in Rome.

The Rome Exhibition.

Extensive structural alterations have been effected during the years 1911 and 1912 at the National Gallery in London, the west wing being considerably extended and the east wing rebuilt. The additional space thus provided has made it possible to re-arrange the vast collection in a more satisfactory manner, and to find place for the numerous recent additions to the National Gallery without having to overcrowd the walls. The National Gallery now compares favourably with the best arranged public galleries of the world.

Sculpture.—The revulsion from academism, realism and impressionism has in the art of sculpture led to a movement that has much in common with Post-Impressionism in painting. This movement is far more widespread on the Continent of Europe than in England. The dominating feature of its main current is a return to archaic massiveness and simplicity, which is particularly noticeable in the recent monumental sculpture of Germany and Austria. In France little encouragement has been officially given to this archaistic art, which harps back upon ancient Egypt, Assyria and Cnossus, and which, with all its affectation of primitive rude strength, has not sufficient real vitality and sincerity to exercise a permanent influence, although its more eccentric manifestations naturally attract considerable attention at exhibitions. Maillol and Bourdelle are the most gifted sculptors of this synthetic archaistic group. The grotesque plastic contortions and malformations of Henri Matisse are so obviously produced with the intention to startle and shock, that they do not deserve serious consideration.

Strangely enough it was left to one of the very few English Post-Impressionists — for Jacob Epstein, though Russian by birth, lives and works in England and is generally counted as an English artist — to shock French officialdom to such an extent by his Oscar Wilde tomb for the Père Lachaise cemetery, that steps were actually taken to prevent the unveiling of the monument, which, not without good reason, was considered unfit for exposure to public view.

Perhaps the most important event connected with the sculpture of 1911-1912 was the completion of Stevens's Wellington Monument in St. Paul's Cathedral. After a miserable history of blundering extending over 45 years the screens were removed from round the completed memorial on January 24, 1912. It will be remembered that Alfred Stevens (*E. B.* xxxv, 905) died leaving the work completed with the exception of the bronze equestrian statue that surmounts the whole. Fortunately he had prepared a model for this, and Mr. John Tweed, who was commissioned to complete the work, has followed and developed the suggestions of the great sculptor. The result is, however, hardly as happy as could be wished. The Renaissance style of horse is in keeping with the rest of the monument; but the figure of the Duke is perched high upon the horse's withers, and the little stumpy legs are drawn up, making the figure of ill proportions and unpleasing gesture. The light moreover is too bad properly to illuminate the monument. It is significant of the heightened interest now taken in sculpture, that attempts are being made to discover and preserve the scattered works of Stevens. During November and December 1911 and January 1912 an exhibition of his paintings and drawings was held at the Tate Gallery; and on November 15, 1911 Sir William Richmond, on behalf of the Stevens Memorial Committee, presented to the trustees a bust of Stevens by Professor Edouard Lantéri. A cast of Stevens's magnificent chimney piece at Dorchester House has also been placed in the Tate Gallery. The interest in Stevens has been largely promoted by the labours of the Memorial Committee, and more especially by the inspiration of the late Alphonse Legros.

The revolutionary influence of Auguste Rodin has become more marked during the last three years, and the publication of several books dealing with the work of this sculptor has stimulated the desire to break away from traditional orthodoxy. This movement has been felt both in Europe and America, and though due in part to the influence of the great French sculptor, it must be regarded as the outcome of the general state of unrest and upheaval which

The National Gallery.

Post-Impressionism.

The Wellington Memorial.

Rodin's influence.

has marked the early years of this century. With the loosening of authority and discipline has grown the desire for individual expression; and, except in a few instances of men of strong character and genuine ability, the movement has fostered a disregard of technique and often of those fundamental principles which cannot be dissociated from the making of good sculpture. Roughly the position of sculpture may be regarded as of three factions: the steady and often uninspired though financially successful academic; the revolutionary and frequently chaotic, making appeal to journalistic exploitation; and those few artists of intelligence who have in their strong individualism been misunderstood by the lesser intelligences.

In a letter to the *Times* April 5, 1910, Professor Waldstein replied to those few utilitarians who would devote subscribed funds to the building of refuges and to the assistance of hospitals in preference to the embellishment of cities with sculptural monuments. This letter would appear to typify the general feeling for public statuary and the appreciation, both public and private, of good modern sculpture. In England the last two years have seen great advance in general demand. As a case in point it is worth noting that no fewer than four memorials were proposed in connection with the loss of the "Titanic," and subscription lists opened within three months after the disaster.

Foremost amongst recent European monuments are the important memorial to Victor Emanuel in Rome (inaugurated in 1911), that of Queen Victoria by Sir Thomas Brock in front of Buckingham Palace, and the Quadriga by Captain Adrian Jones placed in 1912 on Burton's arch on Constitution Hill, London. While these three works must be identified with the academic school, the Memorial at Buckingham Palace reveals the influence of that unhealthy searching for swirling lines that made its appearance in the schools a decade ago. These works are in no way calculated to have influence upon modern sculpture.

The original design by Bertram Mackennal for the King Edward Memorial, which was adopted March 1911 (but subsequently abandoned), and the model for which was exhibited in the Royal Academy 1912, revealed little that is personal in conception, and though Mr. Mackennal is one of the least academic amongst eminent British sculptors, his work must find its place between that which bears the influence of Alfred Stevens and that which bears the impress of the so-called "art nouveau." More than a touch of this "art nouveau" feeling is to be found in Sir George Frampton's recently erected "Peter Pan" monument in Kensington Gardens.

The sculpture at the National Gallery of British Art received a valuable addition through the presentation by Mr. and Mrs. E. Sadler of Havard Thomas' statue "Lycidas," whilst the same artist's "Thyrsis," which was the most remarkable statue of the Royal Academy of 1912, was acquired by the Felton Bequest Committee for the National Gallery of Melbourne, Australia, a rare instance of sound judgment on the part of a collective body. Havard Thomas belongs neither to the Academic school nor to any strictly modern movement. His art is based on a sound understanding of the best Greek tradition and distinguished by the greatest perfection of tooling.

Great bodies are ever slow of movement. This borne in mind, no surprise can be evoked by the predilection shown for the academic work by those elected to represent the public taste. Academism will never die. It may be modified and altogether changed, but it will always represent the art of the preceding generation. Having the public to serve, and the public having learnt to admire the work of their previous generation, the representative of public taste finds no security except in buying that which has been improved upon. The outcome of this public buying — purchasing by committee — is the prolongation as far as possible of the life of a decrepit art, and consequently almost every public monument represents the art of the age preceding that of its erection.

France, the traditional pioneer of all things new and revolutionary, countenanced Auguste Rodin, and Rodin being a Frenchman, the British official mind has accepted

Memorial art.

Gallery art.

him. Setting aside the political nature of such invitations as might be inspired by the Foreign Office, a debt is due in the case of Rodin to those whose initiative, through the National Art Collections Fund, has secured for London a bronze cast of "The Burghers of Calais," which is to be erected in Westminster. Rodin has in addition been commissioned to execute a memorial to Whistler for Chelsea.

Nowhere has Rodin won greater admiration than in America. In the last two years the change has been remarkable. G. Borglum, the greatest sculptor perhaps that America has produced (though Saint-Gaudens would usually be ranked *American sculpture.* above him), and himself a disciple of the French master, has been to a great extent the leading spirit of revolt. But unlike England, where only that is accepted which has borne the test of time, America has no apron strings of tradition to hold to, and with youthful enthusiasm the work of Rodin has been bought for most of the important galleries throughout the United States.

The influence is immediate, but not altogether received with understanding. The exhibitions at the Pennsylvania Academy at Philadelphia have included some fine small works and many that are unintelligible. The New York Academy, which must rank second to Philadelphia, is no better. Here have been shown works in marble and bronze that ape the general appearance of Rodin's work, but show much ignorance of the art of sculpture and a lack of ordinary culture. The tightness and hard appearance of much American work must be ascribed to the employment of plasticine, a modelling paste of an oily nature, that does not require the constant damping necessary to clay, but which has none of the freedom and looseness which clay affords.

Architecture.—In present-day English architecture it is exceedingly difficult to differentiate between the efforts which have been purely individual and spontaneous in their inception and those which have been inspired and brought about by something of a general movement, however sluggish or ephemeral. This is due to the lack of any cult or fashion such as the genuine or emotional and hysterical secessions and movements in the related arts. There has been, and in some of the Continental European cities there is still, a movement akin to Post-Impressionism; but in England it has never taken root and is already practically dead. As in painting and sculpture, it took the shape of a return to severe archaic simplicity. The British Medical Association building in the Strand is the most typical of the few examples in London.

Perhaps the most encouraging feature of recent development has been the shedding of much of the affectation of the archaic and a return to the classical examples of the ornamental, if not always of the structural, in the art of building. In this respect England seems to have only followed the example of the various capital communities on the European Continent. Paris and Vienna, after discarding the academic and searching vainly for a synthetic basis of design, have returned to the classical forms of their forbears with perhaps a fuller understanding of their application. Berlin and Munich, with their heavier handling of the same themes, have developed a romantic manner of expression which is distantly, yet quite evidently, related to the great period of the South German principalities, such as Würzburg, Carlsruhe, etc. The influence set in motion by such achievements as the Kursaal and environment at Wiesbaden, the Law Courts at Munich, and Reichstag and other buildings in Berlin, and the Opera House in Stuttgart, has overborne the secessionist protest whilst taking some suggestions from the life which was undoubtedly inherent in so much, and to this extent at least it is now clear that it is indebted. The evolution and development of modern comfort and convenience, and the added intricacy involved, have brought the modern architect in his search for suggestion to a livelier appreciation and a more catholic view of much of the later Renaissance.

The plastic treatment of classical forms, at one time decried like other art expressions of the period, is now being absorbed by the European architect to the full in his distraction at having to treat a complexity of inward utilitarianism with façades of any grace. "Baroque" has ceased to be a byword for all that is licentious and ungoverned in fancy, and the best examples are fast being recognised as peculiarly fit and purpose-

ful, as one might have expected from those materialists who devised them. The Jesuit Churches of Venice and Vienna, the pleasure houses of the Romans and the palaces of Louis XIV. and Charles II., have an austerity and reticence until recently unsuspected, and it is modern complexity of life that has called for a style so adaptable. It may be in addition that the lighter spirit now pervading the Protestant countries has evoked a free and more demonstrative manner of expression, and the literary motive so much in evidence in modern music, and the didactic element in the plastic arts have their equivalent in a freer expression in architecture, with its details of sculpture and decoration.

In English and American architecture the "grand manner" quoted by Reynolds was a motive which was bound to recur. The recent researches made in the early eighteenth century and the period just before are in the art of architecture likely to have full effect. The works by Professor Reginald Blomfield (who succeeded Leonard Stokes as President of the Royal Institute of British Architects) and W. H. Ward in this field have been notable influences. The great draughtsmen, such as Marot and Le Pautre, are now as familiar to us as Piranesi. Their fantasies, though so seldom materialised, yet proved a mine of wealth for those in search of new motives. The wealth of invention which never degenerated into the bizarre has placed the French School of the Baroque first as an influence in this revival. Already in America, where architects have for so long been obsessed with the sophistry of the Ecole des Beaux-Arts, one can see the influence of this earlier and more elastic manner, founded perhaps on a desire for the expression of a more racial character, as much as to escape from what was rapidly becoming a formula.

The lack of scholarly training characteristic of the last generation in English architecture is still the deterring factor in the progress which has here been outlined, but the evidence of a definite trend is apparent even in the unaccomplished efforts of recent years. It is true that public works of the importance of the new approach to Buckingham Palace, the New London County Hall now in progress, the very large commercial buildings in London such as Whiteley's new premises and the West-End establishments rebuilt, all show a wavering spirit and a tentative handling of the themes drawn upon from the sources described. Yet there is underlying them a distinct flavour of the early eighteenth century or late seventeenth century spirit, and an attempt to embody the strength of handling characteristic of the masters of these periods.

London buildings such as the new Hall built by the Wesleyan body at Westminster, the new Automobile Club, the Christian Scientists' Church in Curzon Street, and certain business premises in the West-End of a smaller scale than the large emporiums, show a far less hesitant manner, a complete knowledge of the style and possibilities, combined with discriminating use of modern sculpture.

But enough has been said to show the direction in which the architectural art not only of England but of Europe generally is now moving. France, with her academic leaning strengthened by a revulsion from the lapses of the past ten years, is affected by this freer and more emotional, or perhaps it is better to say sculptural, manner; and her influence is particularly strong in England at present owing to such schools as the one at Liverpool University, the training of which is so largely based on the Beaux-Arts School; whilst the work of certain French architects in London, and especially the interior work of French decorators, is leaving a definite influence which is not to be escaped. We have had the Greek phase, then the Gothic cult, and later the Early Renaissance; but in the present period it seems to be natural to revert to the phase of the Renaissance nearest to us. The afterglow is now more powerful in its appeal than the once brilliant sun of the meridian of its power. Its slanting rays reach out to us, and by their nearness apparently have more power to revivify than the more intense but more distant flame at its zenith.

Considerable public interest was aroused towards the end of 1912 in the designs prepared by Sir Aston Webb, and adopted by the Office of Works, for the refacing of

French influence.

Buckingham Palace. It had long been generally recognised that the old, dingy and rather featureless façade was unworthy of the residence of the British monarch. At the same time, when Sir Aston Webb was asked to prepare his designs, the restrictions and conditions were such that the result was bound to be an unsatisfactory compromise. The design for the new façade, with its raised cornice and balustrade and its rows of pilasters introduced between the windows, is certainly richer and more ornate, but is lacking in clear articulation and in that breadth which, despite all shortcomings, distinguished the original building.

The violent manifestoes issued by the leaders of the Italian Futurist movement, who advocate the wholesale destruction of old buildings, museums and monuments, should not be taken in too literal a sense. They are meant to express nothing more than a patriotic desire that Italy should take her place among modern nations and develop her natural resources, instead of living on the bounty of foreign tourists. That the growing consciousness of power and the spread of a new imperialism are accompanied by respect of the great achievements of Italy in the past is proved by the adherence to the best tradition of the Renaissance in the many fine buildings that have been erected all over Italy in recent years, and in such works as the restoration, or rather rebuilding, of the Campanile in Venice. The decision to undertake the formidable task of rebuilding this tower brick by brick, exactly as it was before the fall, was taken immediately after the catastrophe of July 12, 1902; and the new Campanile, in every way an exact replica of the original building, but on stronger foundations and provided with a passenger lift, was inaugurated on April 25, 1912. Over 1,200,000 twelve-inch bricks, 24,000 cwt. of cement, 58,000 cubic feet of Istrian stone and 1,000 cwt. of iron were used for the gigantic structure, the total cost, including the laborious reconstruction of Sansovini's Loggetta with all its sculptural adornments, being not more than £88,000.

(P. G. KONODY.)

AMERICAN PAINTING AND SCULPTURE

In the conditions promoting the development of these arts in the United States it has become peculiarly necessary to recognise certain civic influences. Large plans for the beautification of great centres like Washington, Chicago and San Francisco, plans embracing new streets and park systems as well as monuments of architecture and sculpture, have reacted upon the ambitions of smaller communities, and out of a national movement for the improvement of taste there have come richer opportunities for artists. This movement has also stimulated the activities of the museums, which have increased in number and are steadily exercising more and more useful functions. The most important of the museums built between 1910 and 1913 is the one at Toledo, Ohio, which was dedicated with a remarkable loan exhibition in January 1912. In addition to the educational work done through their permanent collections of old and modern works of art the museums are more than ever leavening public taste and encouraging native talent by the organisation of special exhibitions. Thus the annual shows at the Carnegie Institute in Pittsburg, the Pennsylvania Academy in Philadelphia, and the Art Institute in Chicago, and the biennial exhibition at the Corcoran Gallery in Washington, have had a profound effect upon painters and sculptors and upon the interest of the people in artistic matters. It is now customary, too, for some exhibitions to be carried about the country, the season from the autumn to the spring being divided up amongst half a dozen of the larger and smaller museums. The result is to widen the artist's audience, multiply the prizes for which he may compete and extend his market.

The Metropolitan Museum of Art in New York, the principal institution of its kind in the United States, has successfully assumed as one of its special tasks the arrangement of those commemorative exhibitions which consecrate in some sort the genius of the country's leading artists. Following its memorial exhibitions of works by Whistler and Saint-Gaudens, it has more recently paid similar tribute to the late

Winslow Homer and has made an important display of early American portrait painters. It has also shared in the development of the international projects which have latterly brought new currents into the artistic atmosphere. It was an exhibition of modern German art at the Metropolitan that led to the holding of a kind of return exhibition of American art in Berlin. The aim of the Hispanic Museum in New York, restricted in its gallery space, has been to present more especially the work of Europeans. It has shown the paintings of the two Spaniards, Joaquin Sorolla and Ignacio Zuloaga, and the sculptures of the Russian Troubetskoy. The Albright Art Gallery in Buffalo brought over in the winter of 1911-12 a collection of modern French paintings which was later exhibited elsewhere in the country, and since then the American-Scandinavian Foundation has made in New York and other cities an exhibition of 150 paintings from Sweden, Norway and Denmark. In the early summer of 1912 Mr. Charles L. Freer of Detroit, who has given his collection of Orientalia and of works by Whistler to the Federal government, showed 175 of his treasures in the National Museum at Washington.

The exhibitions of the National Academy of Design in New York and those which appear with similar regularity in other large cities have testified to an excellent average in American art rather than to the rise of new and original figures. It is in landscape that the school is perhaps most advanced, continuing profitably to study the problems of light which the French Impressionists long ago brought forward, but remaining faithful also to the Barbizon tradition and to that established by the native pioneers and masters, George Inness, Alexander H. Wyant and Homer Martin. On the basis of these varied inspirations the landscape painters express a warmly individualised feeling for nature. Looking at the mass of recent work the inevitable conclusion is that the artists who interpret the sentiment of the American countryside form the contingent that is most sensitive, most skilful, and most legitimately popular. The figure painters producing easel pictures are chiefly contented with the *morceau*, painting from the single model, posed in the studio, works purely decorative in motive; but a few more venturesome artists have followed a realistic trend, seeking their subjects out of doors, in the country and in the streets of cities. Two names may be cited, both from amongst the younger men. George Bellows (b. 1882) has found good material among the ragamuffins of New York and has used it to good purpose. Charles W. Hawthorne (b. 1872), painting the fisher folk of Cape Cod and types of ordinary American life, has lifted himself well above the ruck both in his technique and in the fresh personal force of his work. The only really notable sensation provided by an American painter in the period under review was one due, however, to a veteran, John S. Sargent. The exhibition of his Italian water colours in New York in March, 1912, was a memorable demonstration of the possibilities of the medium in the hands of a brilliant master.

In mural decoration American figure painters have been zealous and effective, rising with authority to the chances offered them by the civic developments already noted. Kenyon Cox and Edwin H. Blashfield are notable amongst those who have produced for public buildings handsome and workmanlike symbolical schemes, faithful to earlier European conventions. Admirable experiments have been made by Frederick D. Marsh (b. 1872) and Everett Shinn (b. 1873) in the free utilisation of subjects available in everyday life. The outstanding achievement in this direction is that of the late Edwin A. Abbey in the Capitol at Harrisburg, Pennsylvania, where he has illustrated the mining and oil industries of the region in an elaborate and impressive series of monumental compositions. It is at Harrisburg, too, against the façade of the same building, that George Grey Barnard, in some colossal groups, has put to his credit the most important of recent American designs in plastic art associated with architecture. Amongst public monuments the statue of William Cullen Bryant in New York, modelled by Herbert Adams, may also be mentioned. Adolph A. Weinman (b. 1870) struck a new and promising note when, in collaboration with the architects, McKim, Mead & White, he produced a polychrome relief for the pediment of the Madison Square Presbyterian Church in New York. In view of the thorough

success of this pediment it is to be expected that colour will ultimately play a larger part than at present in American sculptural decoration.

Women have been extending their scope in the field of American art. They preponderate, as hitherto, amongst the miniaturists, and they are making progress in other spheres. Good sculpture on a large scale has been produced by Janet Scudder, whose fountains have won high appreciation, and by Mary Evelyn B. Longman, whose bronze doors for the Naval Academy at Annapolis marked her as an artist of distinction. The impression left by these doors has since been confirmed by others, also in bronze and on an heroic scale, which she designed and modelled for Wellesley College. There has been a revival of interest in the United States in small sculptures, portrait busts and reliefs of children, studies of animals, paper weights, bowls, and the like, and in the group of artists occupied with these things Abastenia Eberle is conspicuous. She has disclosed an uncommonly attractive talent in picturesque figurines of familiar types. The juniors who have of late won attention in painting are Ellen Emmet (Mrs. Rand), and M. Jean McLane (Mrs. Johansen). Both have proved themselves very adroit and decorative in the making of portraits.

Through death American art has latterly suffered some of the heaviest losses in its history. The list includes John LaFarge (d. 1910), landscape and figure painter, mural decorator, master of the art of stained glass, traveller, lecturer and author; Winslow Homer (d. 1910), perhaps the raciest of all painters of American life and famous for his marines, done on the New England coast; J. Q. A. Ward (d. 1910), who modelled the "Indian Hunter" and one of the noblest of the statues of George Washington, and produced many other important statues of great Americans; Edwin A. Abbey (d. 1911), long renowned as an illustrator in black-and-white and later richly fruitful in historical paintings and mural decorations; Frederick P. Vinton (d. 1911), a strong painter of portraits, and Frank D. Millet (lost in the "Titanic," 1912) who had been a war correspondent, painted subjects from old English life, and at the close of his career was active as a mural decorator, taking his themes from American history.

(ROYAL CORTISSOZ.)

AMERICAN ARCHITECTURE

The public and monumental architecture of the United States increasingly tends to become a mere reflection of the official architecture of France. This tendency has been produced by the increasing number of Americans who have made their professional studies at the Parisian School of Fine Arts. Returning home to practise, these graduates have, by their ability, zeal, and close and efficient organisation, practically extruded all competition, so far as public architecture is concerned. It would at present be hopeless for any architect, in a competition for an important public building, to submit a design in any other than the authorised version of the antique, or of the Italian Revival of the antique. The prevailing tendency has lately been powerfully reinforced in the arrangement of the most costly and important project of public architecture now in course of execution in the United States. This is the construction of three new buildings for the executive departments of the Federal government in Washington, at a total cost of some \$10,000,000. The "style" of these buildings may plausibly be held to be fixed by the style of the existing department buildings, designed between 1835 and 1840, of which two, respectively of the Doric and the Ionic orders, were examples of the Greek Revival at that time prevalent, while the third, in which the Corinthian order was employed, was an example of the Italian Renaissance. At any rate, the condition was imposed upon the competitors that their designs should be "classic." The designs chosen for execution show no architectural features which may not be found in the official buildings of two generations earlier, although the later buildings are much superior in magnitude and costliness.

Public and quasi-public buildings, elsewhere than in the capital, show the same subjection to French academic influences, whether in the compilation of the details of antique architecture or in the modern Parisian variations upon them. Of the former,

the Pennsylvania railway station in New York is perhaps the most noteworthy of recent examples. This edifice is of great area, roughly 450×750 , but of moderate height, except in the central transept, containing the "concourse" and the main waiting-room. The exterior walls are impressive by their great length and breadth, effectively emphasized by the simplicity of the treatment, which consists in a repetition of similar members. In the shorter but architecturally more important front, there are columns of the Tuscan order, forming a colonnade, continuous but for the central and terminal pavillions. Of the features of the interior the main waiting-room is a reproduction, on a considerably enlarged scale, of the *Thermae* of the Baths of Caracalla in Rome, while the structure of the concourse is an undisguised example of modern engineering in iron and glass. The second in importance of recent public buildings in New York is the Public Library. This shares with the Pennsylvania station the unusual advantage of a main frontage of over 400 feet, in each case obtained by closing a street, whereas the street system of New York limits the normal frontage of a building to 200 feet. As in the other case, the unusual length is effectively emphasized, and by similar means. The design of the library is derived from a "project" which obtained the grand prize of the *Beaux Arts* in 1893. Necessarily, it does not proceed from the actual requirements of the building, which are accommodated as best they may be to a preconceived envelope, inasmuch that one of the principal interior divisions is cut by a cornice midway of its height and has no expression at all on the outside. A like inexpressiveness characterizes all the recent public architecture. The architectural feature of the new Court House in Chicago is a colonnade including five of its ten storeys, though these storeys are nowise superior in importance or different in function to the storeys not included. In the recent Education Building of the state of New York at Albany, a colossal colonnade, of which the columns, 65 feet in height, are metallic skeletons surrounded by marble shells, all the storeys are included in the "order," which thus constitutes the entire structure, with the exception of a tall blind attic. Yet interiorly the structure is an "office building," an aggregation of separate and equal cells. This mode of design, abandoning specific expression in favour of the artificial unity of a grandiose architectural mask, allows no scope for individuality, and abandons all hope of a characteristic or national expression in architecture.

In commercial building a national type has perforce been evolved out of the "skeleton construction," developed under the absence in the United States of any restriction of law or custom upon the individual owner of the height to which he may carry his building. In these many-storeyed buildings it is manifestly impossible to apply the formulas or canons of the modern academic interpretation of classic architecture. In one "skyscraper," (the new building of the Western Union Telegraph Co.) now under construction in New York, the architect has indeed undertaken to subdivide a wall of some thirty storeys by a superposition of two classic "orders." More commonly, the architect is content to emphasize, by separateness of material or treatment, the separateness of the beginning, middle and end, of his wall, more or less corresponding to the classic subdivision of base, shaft, and capital, and to garnish the more conspicuous parts of the resulting structure with classic detail. This practice, however, is not invariable. The latest of the very tall commercial buildings of New York (the Woolworth building), thus far the tallest of them, and, next to the Tour Eiffel, the tallest building in the world, rejects the classic subdivision into base, shaft and capital, or at least the classic proportion between these three members, and chooses what may be called, at least in comparison, a Gothic treatment. The metallic skeleton is distinctly felt through the necessary protective envelope, in this case of terra cotta, and the envelope is attenuated to the utmost, in disregard of the accepted classical proportions. The success of the attempt, as of previous attempts at expressional treatment on a less conspicuous and imposing scale, gives some ground for hope that the American "skyscraper" may become a typical work of art, as well as a typical embodiment of the modern commercial spirit.

Meanwhile, the successes of American architects have been mainly in dwellings,

and in dwellings of moderate size and cost rather than in "palatial" erections. This success has been obstructed, in recent years, by the imposition of a fashion of stucco-coating the surfaces of dwelling houses so as to conceal their construction. This equable coating, concealing the articulation of the structure which may be underneath it, is in fact the expression of the construction of concrete, or reinforced concrete, which is one of the modes facilitated by the combination of the increasing demand for fire-proof buildings, and the increasing narrowing of the margin of cost between construction in timber and in fire-proof materials. It cannot be said that construction in concrete has thus far issued in much that is interesting or anything that can fairly be called typical or characteristic. But it has obstructed the development of such a typical construction in its chief rival in incombustible building—that in hollow tile. Hollow tile has for many years been currently in use as the most eligible material for the interior partitions of structures intended to be fire-proof. Of late years it has been extensively employed in the exterior walls, especially of dwellings. In neither case has it been expressively treated, except in a few cases of its internal use. The rule is that it is covered with an equable coat of plaster, so as to conceal material and construction. It is thus impossible to distinguish a house of hollow tile from one of concrete, or from one of which the material to which the coating is applied is a frame of timber or of "wire lath." Necessarily none of these dwellings has the interest of an expressive treatment, and none is of consequence in considering architectural development, though many examples show skill in composition, and all denote a reaction in favour of simplicity. Meanwhile, rural or suburban dwellings, constructed of the familiar building materials, continue to comprise the most interesting examples of architecture in America. Of no mode of domestic building can it be said that it rises to the importance of a "school," unless an exception be made of the country house constructed of rough stone. In this a high degree of success has been attained. Particularly is this the case in the suburbs of Philadelphia, where the architects have been impressed by the remaining stone farm houses and barns of the colonial period, and have refined the design of these to successful, attractive, and distinctive results. The Dutch colonial houses of Long Island and New Jersey have also furnished suggestions to the architects of dwellings, particularly in the neighbourhood of New York. The American derivative of British building of the Georgian period continues, however, to be distinctively known as "Colonial" and to furnish suggestions for the most prevalent mode of domestic architecture. (MONTGOMERY SCHUYLER.)

THE ARTS AND CRAFTS MOVEMENT IN AMERICA

In May 1912, there met in Philadelphia and in Washington two important associations—the National Federation of Arts, organised in 1910, which embraces in its programme both the so-called fine-arts and those included in the term handicraft, and the National League of Handicraft Societies, wholly in the interests of these latter. The League, organised in 1907, now represents about forty arts and crafts societies from all parts of the United States, some having a membership well into the hundreds. Its aim is to form a kind of clearing-house for the movement, and to take up statistical and educational work, not within the scope of any single society. It supports a travelling exhibition of articles of handicraft sent on request to places in which excellent work of this character is not easily seen, and a travelling library of technical and other appropriate books not easily obtained nor so well selected outside of the great cities. The existence of the League indicates a wide-spread interest and the establishment of many societies, a few of which have been strong or enterprising enough to see the advantages of such a union and make the necessary effort to carry it on.

The arts and crafts movement has had two sources in America. It was early preached by Ruskin disciples, students returning from England, but with apparently little direct result at the time. The old Art Academy, however, at 23rd Street and Fourth Avenue, New York, was built under the influence of these teachings. A very practical incentive to craftsmanship was found in the remains of Colonial industries,

— weaving, embroidery and other — not unfamiliar then in many households. The development of the movement was spontaneous and real, although fitful and unorganised; differing in this from that of England, where it was initiated by artists and had a comparatively swift flowering. Societies in England were largely exhibition societies of these artists and their followers; and the industries grew from classes among workmen, or by the deliberate gathering of peasant groups, appreciative of the traditions of beauty and docile to leadership. Their results have done much to encourage leaders in America.

It is to the intelligent and energetic middle classes in America that the movement owes its growth. The artists were, as a rule, the last to be interested in a view of art in no wise exclusive; nor had American artists, as a class, such influence and position as in England. Those who carried on the work, therefore, were for the most part untrained. They at once began to group themselves into societies for mutual encouragement. The society of arts and crafts as here described is peculiar to America. Its form is elastic and suited to varied conditions, from informal meetings of a village group to complete city organisation with sales-rooms and committees.

The first arts and crafts society in America was that of Hull House, Chicago; but the Boston society was formed nearly at the same time, a few months later in the same year, 1897. Societies multiplied rapidly and there is now scarcely a town or village but has its local group. Each began individually and spontaneously, and there was little or no relation, one with another. To bring these together and to record general progress, the League was organised, and ten years after the founding of the first society over twenty societies came together as charter members.

The first effort of an arts and crafts society is usually to establish a sales and exhibition room, and then to have classes. In several instances these latter have developed into a thriving school of craftsmanship. The management of a society is in all cases cooperative, and the work exhibited is individually contributed by members or consigners outside, and sold on a commission. Besides the regular arts and crafts societies there have grown up lately numberless little shops for the sale of handicraft. These, known as gift-shops, are usually in partnership with tea-rooms. They are already a familiar thing in cities, and the summer automobile travel is making them possible upon every country highway. Excellent craftsmanship is constantly in demand on all sides. A craftsman generally belongs to one or several regular societies, and contributes to exhibitions and shops when producing enough to enable him to do so. There is a natural tendency to form groups of workers, occupying adjoining studios; and this is found to be beneficial in every way. Rural groups of this kind, already occurring here and there, tend to multiply, affording a wider range of thought and inspiration.

The industrial village, so characteristic of the English development, is known in America, but with a difference. Deerfield, Massachusetts, will occur to everyone (see *E. B.* vii, 924). But although these have had, at starting, their patrons who made the work possible, the individual worker has been generally independent, and this has always been the aim. Industries more nearly after the English pattern have been tried. The most notable, probably, is that of the Abnake rug. This was a hooked-rug made by the women native to the place, Pequaket, New Hampshire, superintended by Mrs. Albee, who furnished the designs, the material, and marketed the rugs, paying for the work by the square foot. The rug was excellent in kind and quality and sold well, but the enterprise proved too burdensome and has been given up. A similar industry was carried on in Cranberry Island, Maine, and an extensive undertaking is that of Bourne, Mass. At the Sophie Newcomb College, New Orleans, an industry was attempted with the graduate students in pottery and needlework, with excellent results. The difficulties in these efforts, however, seem great, and the American development would seem rather to lie in the line of individual development and association. This is in close harmony with the ideals of the movement and those of democracy, and should result, eventually, in indigenous and vital forms of art-expression.

Semi-commercial industries have also done much to further the art-impulse in

America. The earliest and best known of these is the Rookwood Pottery in Cincinnati (see *E. B.* vi, 373). The Grueby Pottery (South Boston) produced most excellent designs. The Dedham, Massachusetts, tableware enjoys a deserved reputation.

Besides the actual achievements of the arts and crafts movement, it has exerted an influence upon the thought of the time which it is difficult to estimate. Manufacturers, from direct copying, have come to reconstruct and improve their whole manufactured output. Simplicity has been the watchword in house furnishing, to its great improvement. Education, in introducing manual training in the schools, has apprehended the lessons inherent in relating head and hand, and in the new consideration of educational methods all these lessons will not be forgotten. (MIRA BURR EDSON.)

ILLUSTRATIVE PROCESS-WORK¹

The development of the methods of manufacture of the process block has been very rapid. Some twenty years have turned a mere experimental effort into a vast business which has revolutionised the publication of illustrated works of all kinds. Progress at this rate of development was bound to slacken, and at the present moment, owing to causes we need not go into, stagnation has taken the place of development. It seems to be assumed that the process block, as we know it, has arrived at a state of perfection, and such improvements as have been introduced have mainly had for their object the cheapening of production by simplifying and speeding up the methods of working.

The introduction of panchromatic plates, sensitised to a greater range of spectrum colours, has done away with the old tedious system of indirect three-colour negatives, which required nine operations against three by the direct process. These plates have improved results as well as shortened the time of working.

Collodion emulsions have been specially sensitised and speeded up for direct three-colour work, but much has yet to be done in improving colour sensitiveness both in emulsions and dry plates. Especially in the matter of green tones, which are yet so imperfectly reproduced photographically, that in order to maintain a true balance, much handwork in the shape of fine etching is required.

The *Acid Blast Machine* for etching has come very much to the front; the introduction of the Levy machine, named after its American inventor, has shown that better results can be obtained in much shorter time than by the old rocking bath, and it is being largely adopted. For both blast etching and the ordinary rocking acid bath the old method of employing successive rollings up of the metal plate with fatty ink, to form a protective resist, has been superseded by powdering the first ink coating with "Dragons Blood" and heating the plate until the powdered gum melts into and with the ink, thus forming a homogeneous resist which reduces the time required for etching and produces sharper and deeper results.

The use of the *Lumiere Autochrome plates* for three-colour work is also a great advance. Many subjects, especially such as are liable to movement—growing flowers out of doors for example—were impossible so long as the necessity for making three separate negatives existed. The Lumiere plate gives a record of the whole scheme of colour, and the record is so good that it can be used as the original from which the necessary three negatives can be made.

Beyond these matters the most important developments have resulted from experiments upon printing papers, the aim of which has been to find a method for the printing of process blocks upon ordinary paper.

The great drawback to the use of the process block has been the necessity for printing it on a special paper with a prepared surface, a surface coated with a preparation of white clay. This surface, while giving the best result as regards the printing, has rendered the paper inconveniently heavy, liable to cracking and breaking, and is costly to produce. Continued efforts have been made to find a paper which should be free from these drawbacks, but the object seems to have been accomplished not by the invention of a new paper, but by the introduction of a new machine, and a new method of printing.

¹See *E. B.* xxii, 408 *et seq.*

The *Rubber Offset Machine* is being installed somewhat largely in printing establishments. It is an adaptation of lithography, and the principle of it is that, instead of printing from the lithographic stone or metal plate direct onto the paper, the inked print is impressed upon a sheet of rubber, stretched over an intermediary cylinder, and from thence is transferred, or "offsetted," on to the paper, which is carried round the impression cylinder by grippers in the ordinary way.

The offset method can be applied to flat bed machines for printing from stone, but usually the machine is rotary, and prints rapidly, as many as eight thousand impressions per hour being obtained when the machine is mechanically fed. The results are excellent, the finest lines and dots of the process block being reproduced on almost any quality of paper. It is somewhat of an irony that lithography should come to the help of its old enemy the half-tone block. A good deal, however, has still to be done in improving the quality of the inks used for the offsets, in securing rubber which shall be more sympathetic with the inks, and in other directions.

Transfers from process blocks are not so rich and full in colour as could be desired, and successful experiments have been made in the use of intaglio plates for this transfer process. An ordinary half-tone negative is made, from which a positive or transparency is prepared. This positive is etched on copper or zinc in the same way as for a photogravure. A print is pulled from this plate in lithographic ink, which is transferred to the zinc or aluminum plate for printing on the offset machine, and an impression taken therefrom is offsetted on to the rubber sheet, from which it is printed on any quality of paper, with admirable results, the colour from these offsets being rich and velvety similar to those produced by the Rembrandt photogravure work.

Up to the present three-colour work by the offset machine has not been so successful as black and white. The coloured inks are a greater difficulty, and the true register, so necessary for three-colour ink, is far from a certainty. When these difficulties are overcome there will be a vast field of operation open to this new development.

The Mertens Process.—A most interesting application of this use of intaglio gravure with letter press has been made in Germany by Dr. Mertens, who for newspaper work has coupled up his rotary intaglio printing machine with a rotary newspaper machine. The paper from the roll or web first takes the impression from the intaglio plate, passing on to the type machine which prints the letter press from the stereo plates. The two machines work of course at the same rate, and the result is a newspaper in which the illustrations have the rich qualities of photogravure work, produced (it is claimed) at a rate of twelve thousand an hour.

Coupled Up Machines are being applied to the printing of three, four or more coloured work. The machines to the required number of colours are coupled up to one driving shaft, and the sheets pass from one machine to another, all the colours being printed one after another in quick succession, instead of each colour being left some hours to dry before imposing another. The use of dryers in the specially prepared inks permits of a second, third or fourth printing following immediately on the first without producing the muddy effect resulting from the admixture of two colours both equally wet. The invention has greatly extended the possibility of the use of colour blocks for ordinary illustration by reducing the time necessary for the printing of large editions.

An interesting application of the Rembrandt intaglio process is in the direction of colour work. Attempts to print colours on the rotary intaglio machine have not been successful owing to the difficulty of obtaining accurate register on a rotary, but a compromise has been effected in what is known as the Widdop process by printing the colours lithographically from stones or plates over a gravure print. The results are rich, and blend very harmoniously with the soft monochrome of the gravure print. Reproductions of watercolour drawings by this method are particularly successful.

The success of the Rembrandt photogravure process has produced many rivals. Most of them work on the principle of the rotary machine, but an interesting development—not far advanced at the present moment, though full of promise—is that of flat bed machines for printing gravure plates.

The Mezzograph Screen is another attempt to substitute something more interesting and less mechanical than the ordinary cross line screen. It is the invention of Mr. Wheeler, and the feature of it is that although the grain is etched into the glass no pigment is used to fill up the spaces; the screen presents the appearance of finely frosted glass and the breaking up of the image is effected by diffraction caused by each minute grain in the chemically etched screen forming microscopic lenses. It is now used with good results for colour and also for general black and white reproduction.

Posters.—The application of half tone work to posters is of recent development. The production of half tone blocks for colour or black and white of the size required by poster work is a costly matter if they are made from large negatives, and this is only done by important firms. The common method is to enlarge up from small half tone negatives or transparencies, and it is found that in the large poster the coarseness of the grain resulting from the enlargement is not a drawback. When combined with colours applied by lithography or letter press the enlarged half tone key yields admirable results, which are cheap to produce and very effective. These colours are usually drawn on the stone or plate in chalk when they are to be printed by lithography, and the coarseness of the chalk work entirely disguises any rankness that might be apparent in the enlarged key block. (EDWIN BALE.)

SECTION IV. ARCHAEOLOGY AND EXCAVATION

BABYLONIA AND ASSYRIA¹

The three years 1910–1912 have been prolific in discoveries bearing on the history and chronology of Babylonia and Assyria, particularly during the earlier periods. Three dynasties of kings, two in Northern Babylonia, and one in the south, have been recovered, not a single name of which had previously been known; a large gap has been filled in our knowledge of events in the north during the first great period of Semitic supremacy; following on this period, we now for the first time have information of an invasion, and a domination of the whole country, by a foreign Semitic power long settled on its eastern border; and finally a remarkable inscription, discovered and published in 1912, records how this domination was brought to an end, and the way prepared for the later Sumerian supremacy which preceded the rise of Babylon to power. Such an accession of new material has naturally brought with it a series of fresh problems which still await a final solution. These will be briefly stated and a provisional scheme outlined by means of which the new data may be reconciled with the old. The discussion will best be followed by reference to the accompanying *Reconstructed Chart of the Early Babylonian Dynasties*. It should be noted that in the later periods the title “patesi,” as opposed to that of “king,” implied a condition of dependence, but in the earlier periods this distinction was not so marked.

Reconstructed Chart of the Early Babylonian Dynasties.

N. B.—The names of kings recovered in the years 1910–12 are printed in *italics*, those previously known in ordinary type. p.=patesi; k.=king; a comma after a ruler's name indicates that he was succeeded by his son. A dotted line (.....) joins the names of kings who are proved to have been contemporaries; the position of names within parentheses is conjectural. The figures which follow the name of a king represent the number of years he ruled.

The principal source of our new information is an early Babylonian tablet inscribed in the Sumerian language with a list of kings arranged in successive dynasties.¹ The text resembles other documents of its class in giving the length of each king's reign, the number of kings of which each dynasty was composed, and the total length of its duration; in two places, with regard to founders of dynasties, notes are added as to their former occupations before they secured the throne. The figures given throughout the text are consistent with the totals, except in the case of the second dynasty, that of Kish. Here, though the separate reigns of its eight rulers amount to 192 years, the duration of the dynasty is stated to have been 586 years; moreover, out of the 192 years of its existence, the founder of the dynasty, a female wine-seller named Ku-Bau, is stated to have occupied the throne for no less a period than 100 years. Scheil² and Sayce,³ by theories of hiatus and the like, would explain and retain the figures; Peiser boldly emends them to what he considers the scribe meant to write.⁴ Kugler, noting that many of the figures in the list are multiples of 3 or 6, considers the whole of them artificial; and he suggests the chronology is here mixed up with mystical speculations with regard to numbers in the manner of Berossus.⁵ But he has overlooked the fact that certain numbers with their square roots, on which he bases his argument, really occur on a fragment of quite a different tablet, with which the Arab merchant in Bagdad, the former owner of the inscription, had ingeniously attempted to fill in a missing portion of the original text. To Thureau-Dangin, who discusses the missing names of one of the later dynasties, the difficulties in the first half of the text appear inexplicable, and he makes no attempt to disentangle or assimilate its data.⁶

In the chart given above, the known succession of rulers in the South Babylonian city of Lagash has been used as the canon, according to which the new dynasties have been arranged. A fixed point of contact between the dynastic list and the Lagash succession is afforded by the name of Lugal-zaggisi, who was already known as the contemporary and conqueror of Urukagina and in the list is counted as forming the first "Dynasty of Erech," between the dynasties of Kish and Akkad. It is remarkable that among the kings of Opis and Kish, in the first two dynasties of the list, none of the names are included which we know were borne by kings of these two cities during the earlier period of Lagash. It is true that Mesilim and other early kings of Kish are certainly to be placed before the Dynasty of Opis, but this is impossible with the ruler of Kish and Zuzu of Opis, who were defeated by Eannatum. For Peiser's suggestion that Eannatum preceded the Dynasty of Opis⁷ entirely ignores the evidence from Lagash as to the comparatively short period between Eannatum and Urukagina, based on direct succession and on the names of contemporary personages mentioned in official documents.⁸ The hundred years assigned to the reign of Ku-Bau in the list and the strange figure for the duration of her dynasty suggest the possibility that a period of confusion intervened between the dynasties of Opis and Kish; and to such a period it seems not improbable that we may assign Eannatum's contemporaries. From the time of Ur-Ninā to that of Urukagina the activity of these two northern cities was not felt at Lagash except during Eannatum's reign, and none of the recently discovered northern kings succeeded in emulating Mesilim's example by establishing a dual empire. A comparatively successful attempt was made from the south under Lugal-zaggisi, but it was reserved for the Dynasty of Akkad to secure a real hegemony throughout Babylonia.

The important part played by Agade, or Akkad, at this period has long been recognised, and the list affords valuable information as to the kings who composed the

dynasty of that name. It was formerly imagined that Sharru-kin, its founder, as well as Manishtusu and Urumush were kings of Kish, not Akkad, on the strength of their title which was read as "king of Kish" (*shar Kish*). In later periods this title was certainly a general one, "king of the World" (*shar kishshati*),¹ and Hrozný's suggestion² that it always had this meaning is now proved to be correct. The list adds an interesting note that Sharru-kin, or Sargon I. was at first a gardener by profession, and afterwards a cupbearer in the temple of Zamama, before he obtained the throne, thus confirming the Neo-Babylonian tradition of his humble origin. The suggested arrangement of the three missing names in the dynasty (Manish-tusu, Urumush and Narâm-Sin)³ makes it difficult to retain the further late tradition that Narâm-Sin was Sargon's son, but he may well have been a grandson or other near relative. Of the last seven kings of the Akkadian dynasty, as of the five kings who formed the succeeding "Dynasty of Erech," we know nothing beyond their names.

The invasion of Babylonia by the Semitic kingdom of Gutu to the east of the Lower Zâb, which is now attested by the list, is an event of the first importance. The puzzling stele of victory found at Lagash, on which Semites are depicted slaying Semites,⁴ may well commemorate the event. Moreover, we have proof that the invasion was followed by a complete domination of Babylonia for some considerable time. The ceremonial mace-head of Lasirab, King of Gutu, which was found at Sippar, is evidence in point, as also is the still unpublished text of Erridu-pizir, King of Gutu, from Nippur.⁵ From a text recently found at Jökha we also know that Lugal-annatum, patesi of Umma, owed allegiance to Sium, King of Gutu.⁶ To this period we may also probably assign the bronze tablet, recently found at the celebrated Arab town of Samarra on the lower Tigris,⁷ containing a text of Ari-Sen, king of a district in the neighbourhood of Gutu. The end of the Gutian domination came about through the valour of Utu-khegal, King of Erech, who, in a recently found inscription,⁸ records how he overcame "Gutu, the dragon of the mountain," defeating and capturing Tirikân, its king, after having sought the assistance of the great Babylonian gods in their shrines upon his line of march. His success marks the first wave of a Sumerian reaction, and was followed up not long afterwards by the establishment of the powerful Dynasty of Ur.

Of discoveries bearing on the later historical periods, it will be necessary to speak quite briefly. The Semitic tablets discovered from time to time in Cappadocia have long been regarded as evidence of the spread of Babylonian culture northwards and westwards, of which we have such striking evidence during the second millennium in the El-Amarna and Boghaz-Keui documents. The date of the Cappadocian tablets may now be definitely fixed as early as 2300 B.C. by the discovery of one at Kara-Enyuk, to the north-east of Caesarea, bearing a seal-impression of Ibi-Sin, King of Ur.⁹ The circumstances which led to the founding at Larsa of the dynasty of Kudur-Mabug, whose sons gave so much trouble to Sin-mûballidh, and Khammurabi of Babylon, have now been ascertained;¹⁰ and the names of two other petty rulers of the time of the First Babylonian Dynasty have been recovered.¹¹ An attempt has also been made to settle the chronology of this period astronomically,¹² but the texts on which it is based are late and corrupt copies and the result is consequently not conclusive. During the later Assyrian period by far the most important discovery is a long historical text of Sennacherib on

a clay prism acquired by the British Museum.¹ It is dated in the year 694 B.C. and includes records of two campaigns to the north-west in the years 698 and 695 B.C. The former was undertaken to suppress a revolt in the Taurus, and the new text confirms the traditions preserved by Alexander Polyhistor and Abydenus with regard to Sennacherib's conquests in Cilicia and his rebuilding of the city of Tarsus. It also gives new and valuable information on the topography of Nineveh, enumerating the names and positions of its fifteen gates; and it contains the earliest record of the cultivation of cotton, which Sennacherib succeeded in acclimatizing for a time at Nineveh, so that the Assyrians were able to use it for the weaving of garments. The plant was probably not the tree-cotton of India (*Gossypium arboreum*), mentioned by Herodotus, but the annual plant *G. herbaceum*, which, in Sir George Watt's opinion, originated in Arabia, whence it eventually spread northwards to the shores of the Black Sea and the Mediterranean.²

(LEONARD W. KING.)

EGYPT³

In the past three years the study of ancient Egypt has been progressing in every branch, and in Nubia especially large extensions have been made. The results will be most easily referred to if stated in their historical order.

Prehistoric.—The most northern cemetery of the second prehistoric age (s.d. 50–70) was found at Gerzeh about forty miles south of Cairo, and excavated by Mr. Wainwright.⁴ It showed that the various products which are known some hundreds of miles to the south extended also to this region, and that the civilisation was general. The main result was finding iron beads alternately with gold on a necklace: these had certainly been metallic iron (probably native iron), and date between s.d. 53–63, or probably about 6500 B.C. This is by far the oldest wrought iron known, the next being in the IVth Dynasty; another new instance is in the XIIth Dynasty (see below). Another cemetery in the South, at Mahasneh near Abydos, was excavated by Mr. Ayrton⁵; it extended over nearly all the prehistoric civilisation, but did not give any new ideas.

Earliest Dynasties.—Two cemeteries of this period, and the most northerly known, are those of Turah (7 miles S. of Cairo) recorded by Dr. Junker,⁶ and Tarkhan (37 m. S. of Cairo) recorded by Prof. Petrie.⁷ The objects found at Tarkhan have shown much of the civilisation, owing to the perfect condition of the woodwork, baskets and clothing. The general result is that the size of graves and wooden coffins, and amount of copper tools, was greatest in the age of Mena and the kings just before him, and dwindled throughout the Ist Dynasty. This accords with the decay seen in the series of Royal Tombs, and shows that such a change was general. The whole of the burials were contracted in position; and though the prehistoric have head to south, and the historic the head to north, yet no progressive change went on during the three or four centuries examined. At Abydos the Tombs of the Kings have been re-excavated by Dr. Naville,⁸ but no further facts have been obtained, nor was any other tomb found in the area which had already been fully searched by Prof. Petrie in 1901.

In Nubia a thorough clearance of the cemeteries has been in progress in order to secure their contents before the region was submerged by the reservoir. The results published by Dr. Reisner and Mr. Firth⁹ show that the prehistoric civilisation of Egypt extended over Nubia in much the same style, the pottery and the art being

⁸ Griffith, *Archaeological Report*, 1910–11.

⁹ Reisner, *Archaeological Survey of Nubia.*

mainly like that of Egypt, but apparently rather later in historic times, as if the growth originated in Egypt and took some time to pass from tribe to tribe. The intrusive styles found after the XIIth Dynasty in Egypt are now shown to have come down from Nubia.

II-III Dynasties.—A large cemetery between Sakkara and Abusir has been cleared by Mr. Quibell,¹ containing a variety of fine mustabas, including that of Ra-hesi from which came the celebrated wooden panels. This series will clear the development of all this period.

At Medum² the tomb chambers of the nobles Nefermaat and Atet were discovered, and showed that the bodies had been more or less smashed up by the masons before closing the chambers. The pyramid of Snefru was tunnelled, and most important dates found on the stones. These show that the quarrying season was from the 6th to the 11th month of the calendar; as by the inundation this must be from April to October, the period of the shifting calendar in the seasonal year is thus fixed. This proves that somewhere between 1138 and 1683 years passed between the IIIrd and XIIth Dynasties; showing that Manetho's 1198 years cannot be reduced to 3 or 4 centuries as Meyer has proposed.

Chronology.—The discussion of the above result has led to a complete recalculation of the astronomical data by Mr. Knobel,³ fuller than before. The details of the application of this to history, and the explanation of the fact that the year formerly began with Mesore and not with Toth, are given by Prof. Petrie,⁴ with diagrams connecting the years, seasons, Egyptian shifting calendar, and rising of Sothis, so that any question can be at once solved to a single day. The results for the main periods (A) by purely external evidence of a physical nature, and (B) by Manetho are:—

	External	By Manetho
Alexander	332 B.C.	(332) B.C.
XXVI Dynasty begins	664	656
XVIII " "	1587	1603
XIII " "	3366	3293
IV " "	before 4717	4651 to 4822
I " "	5500 to 6300	5420 to 5591

The differences in the lower figures show the range of uncertainty; but as a whole the close agreement is remarkable, and not a single fact in Egyptian history proves any different result, so that there is no conflict of statements to be weighed. The whole data of the Turin Papyrus, Manetho and Herodotus show that the Egyptians from 1500 B.C. down to 200 A.D. used a uniform and consistent chronology, which agrees as closely as possible with external physical data back to the beginning of the kingdom. More pieces have been found of the great historical register, known as the Palermo stone. This was a national record of the reigns to a single day, during the first five dynasties, and it shows the perfection of historical reckoning at that earliest age.

IV-VI Dynasties.—The granite temple near the Sphinx has been cleared in front, and the upper temple which is connected with it has been entirely cleared; both are of Chephren, and are excellently published by Dr. Hölscher.⁵ In restorations of these and other temples it must be remembered that the cultivation was about 20 feet lower, and perhaps a quarter of a mile further away, when they were built. The temples of Menkaura have been cleared by Reisner and fine portrait figures found, but not published.

The temples of Sahura, Neferarkara and Neusera have now been fully described,⁶

and give important examples of the temple sculptures of this age. Some more decrees of the kings of this time have been found at Coptos and published by Weill.¹

XI-XIII Dynasties.—The publication of the funeral temple of king Mentuhotep Neb-hapt-ra by Dr. Naville² has been finished, and gives the only complete plan of such a building in that period. It contained 260 columns and 160 pillars. The temple of the Osirification of King Sankhkere was found on the top of the Theban mountain, and an account published by Petrie.³

The last remains of the Labyrinth have now been excavated. The sculptures show that it was a centre for all the local deities and worship of the Fayum, as well as the funeral temple of Amenemhêt III. Two immense shrines of granite were found here by Petrie with statues of the king in them. The remains are all published.⁴

At the Second Cataract a cemetery of this age was cleared by Dr. Randall-MacIver,⁵ and two new points may be noted here. An iron spear head, of a broad leaf form, was found in a cave tomb with an undisturbed burial containing jewellery, and with three equally undisturbed burials in front of it, all dated to the XIIth or XIIIth Dynasty by the style; this is the earliest iron weapon known. An iron chisel in this cemetery had a pot of Roman date in the same tomb, and so was doubtless a late deposit, especially as it is of the form known in the XXVIth Dynasty. The other notable point is the keeping of fine jewellery of Amenemhêt III. in use for twenty reigns, or much over a century, before burying it in the reign of Noferhotep; it is seldom that such long use of jewellery can be proved. Unhappily it has all been stolen from the Philadelphia Museum.

Nomes.—In connection with this age may be noted the gradual growth of the political divisions of the country:⁶ by this time the division had extended to the 22 nomes of Upper Egypt and 20 nomes in the Delta, which is regarded as the standard, and continued as the religious division of late times. But the ceremonial lists of festivals, and relics of Osiris, have preserved the memory of a division into 13 nomes in prehistoric times, and 16 in the Ist Dynasty; this increased to 42 in the XIIth Dynasty, probably nearly 100 in the XIXth Dynasty, and 60 in Roman times.

XVIII-XX Dynasties.—The geography of the Delta is much debated in reference to the Exodus. A list of towns has been published which is important, though as late as the demotic period. It gives a list of places along the Wadi Tumilat, and the *crux* is that no place is named between Saft-el-Henneh and Pithom, on the strength of which Daressy⁷ proposes that Pithom was near the west end of the valley. Beyond Pithom eastward are mentioned four places named from frogs — which might apply to any part of the valley — and then four places which cannot be identified, before reaching Pihahiroth, then two Migdol fortresses and the Migdol of Baalzephon. As there is some twelve or fifteen miles between the recognised Pithom and Pihahiroth it is possible that the eight places named might be all east of it, or the position of Pithom might have been put earlier in the list as the chief place of the district, and minor places named after it not in strict order of position. Either of these chances seems more probable than the shifting of Pithom from the large fortress and town where it is named, and supposing it to have been where there are no noticeable ruins. In the eastern connection may be noticed a collection of all the Egyptian equivalents of Semitic names by Burchardt⁸; from this it is clear that the value *a* or *aleph* formerly used for the flowering-reed sign is almost the only one used in such equivalents, and *yod* is never used; hence the new value of *i* given to that, and the recent habit of calling it *yod*, is only a philological and not a practical matter. The same is shown by Ranke's comparison of cuneiform versions of Egyptian words; there the reed is often *aleph* or is represented by the termination *-ia*, where it is as likely to be *aleph* as *yod*; never is it rendered by *yod* alone. A revision of the practical rendering at Berlin is

⁸ Burchardt in *All Kanaanäischen Fremdworte*.

therefore needed, apart from theoretical rendering of earlier values; happily the French and many English have kept to the older custom of using *a*, which is the general equivalent. At Thebes the great and priceless series of painted tombs has been gradually put into safer condition. Walls have been built, doors put on, and Mr. Robert Mond has added to his provision for these tombs by supplying a custodian to conserve and photograph the paintings. The risks of vandalism are therefore lessened. The largest Sphinx ever moved has been found by the British School at Memphis; it is of alabaster, 26 feet long, and probably represents Amenhotep III. In Nubia near Amadeh an entire castle of the age of Thothmes III. has been cleared by Randall-MacIver¹; it is not of Egyptian style, but shows the native system. At Abu Simbel a shrine has been found containing the altar and temple furniture in place.

XXV-XXX Dynasties.— Another historical novel of the princelets of the XXVth Dynasty in the Delta has been published by Dr. Spiegelberg,² republishing also the novel of the same period already known. These are most interesting pictures of the social life of the feudal princes of the time, only second in fullness to the late romances of Heliodoros and Achilles Tatius.

The palace of Apries has been found at Memphis by Prof. Petrie;³ it covered two acres, the gateways and dadōs were of stone, and the brick walls were nearly 100 feet high, half filled up by a raised floor. The plan had the same position of quarters as that of the mansions in the XIIth Dynasty. Much armour, a silver and gold furniture ornament, Aramaic labels and Persian seals were found.

At Philae the great temple is ruined as to its unique colouring, and whenever the water rises to the full holding of the dam, the roofs will collapse and the whole be ruined. This barbaric fate was not in the least necessary; Sir John Aird had offered to transport the whole to a higher level above the water, and there would have been no difficulty in doing so. Thanks to the care of Professors Schäfer and Junker all the sculptures of Philae, and other temples that will be injured, have now been completely photographed.

The new railway has opened up the Kharga Oasis, and the American expedition has been clearing and copying the temple of Darius.

A development of the history of Nubia has taken place. Dr. Reisner⁴ summarised it thus: Nubia and Egypt were on one level in the prehistoric age; in the Dynasties Egypt advanced; by the XII–XIIIth Dynasty Nubia had progressed in a native culture; in the XVIII–XXth Egypt occupied Nubia and largely modified it. There is no trace of the Ethiopian XXVth Dynasty. Nubia remained Pagan after Egypt, and remained Christian four centuries after Egypt was Muslim. In the 2nd and 3rd cent. A.D. there was a large invasion of a foreign people.

At Meroe Prof. Garstang⁵ has cleared much of the palace, and gives the history of it thus: From 700 to 300 B.C. there is the sun temple of Aspelut, and the palace; later the temple of Ammon. From 300 B.C. to 100 A.D. there were palaces, and a classical temple with Meroitic Venus figures, pottery, and glass, and the Roman bronze head of Augustus. From 200 to 700 A.D. there is the decay, the invasion by Axumites in 340, and the destruction about 700. Mr. Griffith has also been largely excavating in Nubia, finding the peculiar painted pottery of the Roman age. His great work is a *corpus*⁶ and study of the Meroitic inscriptions, of which he has almost completed the alphabet and obtained many words and phrases; the resolution of the language of it is yet to be settled.

Dr. Randall-MacIver⁷ has also published a splendid output of the Christian Nubian pottery and other remains.

Of the Christian period is a new form of fortress found by Prof. Petrie at Scenas Mandras, south of Helwan, probably due to the Gothic mercenaries settled there. The great Coptic monastery of St. Jeremias at Sakkara with both paintings and sculptures has been now completely cleared and published by Mr. Quibell,¹ and gives an excellent idea of an unaltered early monastery. (W. M. FLINDERS PETRIE.)

PALESTINE AND THE SEMITIC AREA

Prof. Macalister's complete report on his work at Gezer (see *E. B.* xi, 915, "Gezer") appeared in 1912 (London, 3 vols. 4°), giving an admirable account of the excavations. He distinguishes (1) a pre-Semitic period, (2-5) 4 Semitic periods, (6-11) the Persian and subsequent periods down to the present day. The various methods of burial used in Palestine (including that of the Philistines) during all the early periods, are well represented. But the most remarkable discovery is that of the "High Place" or sanctuary. Its site was originally in the middle of the town, and was chosen not because it was already sacred (as so often in the East) but apparently because it was free from the contamination of graves, and also because of its proximity to the caves which were used for religious purposes. Its most striking feature is a row of (at one time ten) upright monoliths, arranged in a slight curve at irregular intervals along the middle of the site, having on one side a double cave, and curious cup-shaped indentations on the surrounding rock. The cult of the upright stone was, however, not the earliest form of worship at Gezer. It seems to have been introduced by the Semites about 2000 or 2500 B.C. From the fact that there is no sort of uniformity in the size of the stones, Prof. Macalister conjectures that the High Place was not built at one time on one plan, but was formed gradually by the additions made by successive "Kings." The rites practised there appear to have been much as described in Isaiah lviii. 5+. They clearly included human sacrifice, especially the sacrifice of the first-born, as shown by the large number of newly born infants buried in jars within the sacred area. Foundation sacrifice was also customary in all the Semitic periods. In some cases the victims were adults but more commonly they were infants, or very young children, who were buried (also in jars) under the corners of houses. Among the very large number of articles of daily use, only two cuneiform tablets were found.

The best account of the German excavations at Jericho (Er-rihâ), begun on January 2, 1908 (see *E. B.* xv, 325, "Jericho"), is that of S. A. Cook in the *P. E. F. Quarterly Statement*, 1910, p. 54. See also the *Mittheil. d. Deutsch. Orient-Gesellschaft*, 1908, No. 39.

In August 1909 a private association began excavations on Mt. Ophel. A preliminary report of the work was published, under the title of *Underground Jerusalem . . .* by H. V. (London, 1911), and also in French. It is understood that the initials represent H. Vincent, the well-known archaeologist of the École Biblique et Archéologique at Jerusalem, whose name is a sufficient guarantee for the value of the account. The names of the persons responsible for the undertaking are, however, not revealed, and an unusual secrecy has been observed about it, giving rise to a number of strange rumours. It seems that the explorers were chiefly interested in the subterranean passages, of which they cleared several, including the Siloam tunnel. Some early pottery was found in the course of these operations, but no inscriptions. Ultimately trouble arose with the natives and local authorities, and the work was stopped, but there seems to be some intention of resuming it. Undoubtedly there is still much to be done.

After the close of the work at Gezer, the Palestine Exploration Fund Committee decided to excavate 'Ain Shams, believed to be the site of the ancient Beth Shemesh. The actual digging began on April 6, 1911 under Dr. Duncan Mackenzie. A preliminary account of the results was given in the Fund's *Quarterly Statement*, 1912, p. 125, and more fully in the Annual for 1911, p. 41. Dr. Mackenzie distinguishes 3 strata: (1) that of the indigenous population, in contact with Canaanites. Towards the end of this period the influence of Egypt (especially under the 18th Dynasty) and of the Aegean begins to appear. Then (about 1200 B.C.) when the Cretan civilisation broke up, the trade routes

¹ Quibell in *Excavations at Sakkara*. by Microsoft®

changed and communication with the Aegean ceased. (2) The stratum of painted Philistine pottery, side by side with native Canaanite work, but with no admixture of imported Aegean ware. The pottery was indeed under Aegean influence, but was made in Palestine by Philistines (1200 to 1100 B.C.). (3) The stratum of Canaanite pottery, with no Philistine admixture. Chamber tombs were introduced from upland Judaea by Israelitish conquerors, who destroyed the Philistine rule but left the Canaanite population as it was. Traces of the conquest are probably to be seen in the burnt débris encumbering the south gate. The city was finally destroyed in the 7th cent. B.C.

Inscriptions.—There have been no discoveries of Phoenician inscriptions of any importance. In Hebrew the newly published material is of little interest. At Gezer Prof. Macalister found some jar-handles inscribed in the usual manner with one word or two, and also a sort of rough calendar, all of which are fully described in his report. The "calendar" (op. cit. ii, p. 24+) consists of 7 lines (and some letters in the margin) scratched on a piece of limestone, $4\frac{1}{4} \times 2\frac{3}{4}$ inches, and seems to be a table of rural occupations month by month, but the interpretation and object of it are alike obscure. An agriculturist would hardly require such a document to remind either himself or his labourers of the ordinary routine of farm-work. Macalister is therefore probably right in suggesting that the stone was inscribed as a *tour de force* by some partly educated peasant who was proud of his knowledge of writing. He dates it, on archaeological grounds, in the 6th century B.C. Others, judging from the forms of the characters, put it as early as the 8th century. But if it was written by a peasant, the ordinary palaeographical criteria will not apply. The writing is very unskilfully done—in fact one letter is unlike any known form—so that it is wisest to accept the archaeological evidence. A very full discussion of the tablet, by H. Vincent, appeared in the *Revue Biblique*, 1909, pp. 243, 493, with a photograph. See also the *P.E.F. Quarterly Statement*, 1909, p. 26.

Much more important is the discovery at Samaria, by Dr. Reisner and the Americans, of early Israelitish remains including some which are inscribed. The official report has not yet appeared, but as a very much exaggerated account was published in Germany, Prof. Kittel made enquiries and printed a short statement of the facts in the *Leipziger Neueste Nachrichten* for January 23, 1911, and the *Theologisches Literaturblatt* for 1911. A summary was also published by Dr. Driver in the *Guardian* for February 10, 1911. The following account is derived from Hölscher's article in the *Mittheilungen d. Deutschen Palästinavereins* for 1911 (p. 22), which is based on Lyon's report in the *Harvard Theological Review* (Jan. 1911) from Reisner's information.

The inscribed material consists of labels serving probably as records of oil and wine received for the royal household. They are mostly in the form of ostraka. The writing is in the old Canaanite alphabet, similar to that of the Moabite and Siloam inscriptions, done with a reed-pen and ink. The ostraka are dated in the year, presumably, of the king's reign. As they were found in the same stratum with a vase bearing the name of Osorkon II (874-853) it is conjectured that the king was Ahab. When the full account of the excavation is published, there may be other grounds for or against this identification. The texts are quite short, and of the following form:

"In the 9th year. From Shaftan. For (or belonging to) Baal-zamar. A jar of old wine."

"In the 10th year. From Yazath. A jar of fine oil. For Ahino'am."

Their chief interest is in the forms of the names. Those compounded with "Baal" are about as numerous as those with יהוה, showing the prevalence of Baal-worship. Also the divine name is always in the form ׀ (never יהוה), and usually at the end of the compound, whereas in the massoretic text of the Old Testament ׀ (or יהוה) is used only to begin a compound (but cf. Ahio) and ׀ (or יהוה) at the end. Palaeographically the find is important as giving perhaps the earliest specimen of Canaanite writing.

The recent discoveries of Aramaic inscriptions (including papyri) have been of the utmost importance. After the publication (in 1906) of the papyri from Assuan, a large number of similar documents were found at Elephantine (whence no doubt the first lot originally came) by Dr. Rubensohn and Dr. Zucker in 1907-08. They were published by Sachau (Leipzig, 1911), and in a shorter form by Ungnad.

The find consists of 62 leaves of papyrus, more or less complete, besides a number of fragments, ostraka and jar-inscriptions. The last are mostly Phoenician names, probably of persons trading with Egypt, not settlers. The papyri, which are mostly dated, cover nearly the whole of the 5th century B.C. Three of the most remarkable were published by Sachau in a preliminary edition in 1907. They contain a detailed description of the Jewish temple at Elephantine, from which it appears that animal sacrifices were offered there. Another document gives directions for the celebration of the Passover in 419 B.C. The relation of these facts to the law of Deuteronomy and their bearing on the question of the date of the book, are still matters of discussion. One of the most startling texts, however, is a list (also dated 419 B.C.) of contributors to the temple funds, in which the sum collected is divided between Yahu (Jehovah) and two other deities Asham-Bethel and 'Anath-Bethel.

Other important documents are fragments of an Aramaic version of the Behistun inscription and of the story of Aḥīkar, to which reference is made in the book of Tobit (i, 21, 22, and xiv, 10). As this papyrus, though not dated, is clearly of the same age as the rest, it shows the story to be very much older than had been supposed. It is evidently of Babylonian origin, so that the Greek tradition that Democritus derived some of his "wisdom" from the Ἀκκάρων στήλη in Babylon is not in itself improbable.

Under Aramaic must perhaps be classed another inscription from Zinjirli, discovered by F. v. Luschan and published by him in the *Mittheilungen aus d. Or. Samml. XIV Ausgrabungen in Sendschirli*, iv, p. 374. See also Lidzbarski, *Ephem.* iii, p. 218. It was erected by Kalammu, king of Ya'di, in the reign of Shalmaneser II (859-829 B.C.), and gives the names of previous kings, with some historical facts about them. The text is, however, extremely difficult and cannot be said to have been fully elucidated yet. Kalammu himself is mentioned in the house-inscription of Bar-rekub, son of Panammu, king of Sam'al (line 17), found in 1891 at Zinjirli, but the passage was misunderstood. His father Ḥayya is no doubt the same as Ḥaian son of Gabbar, king of Sam'al in an inscription of Shalmaneser II.

In this connection must also be mentioned a curious inscription from Ördëk-Burnu about eight miles south of Zinjirli, and therefore belonging to the same cycle as the above. Though written in the Aramaic character, and containing some Semitic words, it is clearly not in a Semitic language. This fact, coupled with the bad condition of the stone, makes the reading very difficult. For the present, all that can be said with certainty as to its contents is that we find the Semitic names Shamash and Rekub-el followed by the Semitic title 𐤍𐤍 (god) as in the other inscriptions of Zinjirli, and that some points seem to indicate, as we should expect, that the language is Cappadocian or Hittite. From the absence of Assyrian influence in the ornamentation, Lidzbarski thinks that it may perhaps belong to the 10th century B.C., though the forms of the characters hardly seem to be so early. The stone is in the Museum at Constantinople. Its text was first published by Peiser (*O. L. Z.*, 1898), and again (1911) by Luschan (op. cit. p. 320) and by Lidzbarski (*Ephem.* iii, p. 192) after a careful re-examination.

In 1903 Pognon found an inscription of Zakir, king of Hamath and La'ash (the Lasha of Gen. x, 19), which he published in his *Inscriptions Sémitiques*, Paris, 1907, p. 156. Cf. also Nöldeke in *Z. A.* 1908, p. 376. The stones were found built into a wall, but their precise situation is (doubtless for good reasons) not yet disclosed. Though the language may be classed as Aramaic, it might perhaps be better described more generally as a Canaanite dialect, since, besides purely Aramaic forms, it uses e.g. the peculiarly Hebrew construction of the "Vau consecutive," and its style in other respects strikingly recalls that of the Old Testament. It relates a war with Bar-hadad son of Hazael (cf. ii. Kings xiii, 3, 24) king of Aram, and his allies (who include the king of Sham'al), in which Zakir was successful. Its date must be early in the 8th century, i.e. less than 100 years after the inscription of Mesha. It is not complete, but Pognon hopes to find the rest of it. The same volume also contains a large number of Syriac inscriptions of minor interest.

(A. E. COWLEY.)

HITTITES¹

New light has been thrown on the Hittites by excavations at Jerablus (Carchemish) begun by the British Museum in 1911, and at Sakjegeuzi, begun by the University of Liverpool in 1908 but not continued after 1912. Also by discovery or re-examination of sporadic monuments, and further study of sites.

The re-excavation of Jerablus, so far as it has gone yet, has resulted in (1) Re-examination of the ground in the lower walled city at the S.W. foot of the Acropolis, where a stairway and several sculptured and inscribed monuments were found 1878-1881. The stairway is now seen to be approached from a courtyard lined with reliefs representing triumphant warriors, divinities, etc., and to be engaged in a block of buildings to left and right which probably represent the palace. Most of the sculptures belong to a comparatively late period (10th or 9th cents. B.C.) and the staircase has been reconstructed. Many sculptured and inscribed fragments (over 100 new texts or parts), proving wholesale destruction, probably after the Assyrian capture (717 B.C.), as well as terra cotta figurines, pottery, etc., have been recovered here or elsewhere. (2) Discovery of a water gate, connected with the above block of buildings and leading to the Euphrates S.E. of the Acropolis. It was lined with reliefs and entered between great inscribed lions. Here also are two periods of construction, and sculpture of two periods, one of Cappadocian character, the later more purely Mesopotamian. (3) Discovery of an Assyrian fortress in crude brick with stone façade on the northern end of the Acropolis. Two important Hittite monuments indicate the presence of an earlier building below. The strata of the Acropolis mound have been tested down to 50 feet below the summit, where lie neolithic implements and painted sherds. Below these again should be more primitive strata. The south end of the Acropolis carried a very massive Syro-Roman temple, whose deep foundations have greatly destroyed earlier remains. (4) Discovery of numerous graves, partly in the Acropolis mound, partly in the surrounding district, especially near Amana, where rises the large mound, Tell el-Ghanim. Most are of later Hittite period; but some, of pot-burial type, are probably of the Cappadocian time. (5) Discovery of isolated Hittite inscriptions and sculptures in the surrounding district. (6) Examination of the remains of the important post-Assyrian city which stood on the site and was inhabited up to Arab times,—perhaps the classical Europus or Oropus.

The results as a whole tend to show that only a small area on the rocky knoll by the Euphrates, which afterwards was raised artificially to make an Acropolis, was inhabited in pre-Hittite times; that there was a Cappadocian Hatti occupation from about the 15th cent. B.C., during which the city was enlarged and fortified, and Hatti art, strongly influenced by Babylonian, was introduced on the top of a native Syrian culture; that some cause produced collapse and reconstruction about 1100-1000 B.C., and the subsequent civilisation, still of Hittite character, owed much to Assyria and acknowledged other gods than the Cappadocian, notably Sandan. The invasion of the Muski about 1100 B.C. was doubtless the cause of the Hatti collapse, and possibly the subsequent reconstruction was also the work of the Muski, who are known to have adopted Hatti writing and art and to have succeeded to Hatti dominion in Eastern Asia Minor. If not, then Carchemish resumed existence as a local capital independent of Cappadocia after 1000 B.C. Reliefs in the palace court seem to commemorate victories over Assyrians, and if so, these must have been won in the interval of Assyrian weakness between Tiglath Pileser I (1100 B.C.) and Ashur-natsirpal (883 B.C.).

The excavations at Sakjegeuzi have resulted in thorough examination of one mound (Jobba) and partial examination of two others, including the largest (Songrus). In the first has been laid bare a large fortified building with chambers inside the wall and inner residence in one angle, approached by a portico with good wall reliefs and architectural sculpture. Egyptian objects date this building to the 9th or 8th century B.C. No Hittite inscriptions have come to light here or elsewhere on the site, though a few small Hittite objects have been found, with pottery ranging from neolithic to so-called

¹ See *E. B.* xiii, 534 *et seq.*

late Hittite. Provisionally it may be said that the site was probably, like Sinjerli (Shamal), not a town of the Hatti at any time, but may have been one of the Kummukh (Com-mageni) who adopted Hatti civilisation.

At Tell Halaf in mid-Mesopotamia excavations were begun by Max Freiherr von Oppenheim in 1912; sculpture, jewellery, etc., are said to have been found. The monuments found in 1902 seem not purely Hittite, and perhaps the site is that of a town of the *Khani* (capital Harran), who may have used Hatti script and arts. This people came successively under Babylonian and Assyrian domination after having held all N. Mesopotamia before the rise of the first Assyrian empire.

The results of the Cornell expedition, published in 1911, have proved inferior to expectation. By finding monuments in the Tokhma Su valley near Darande, the members of the expedition (Charles, Olmstead and Wrench) show connection between known areas of Hittite civilisation in the Gurun-Albistan and Malatia districts; and an inscribed spheroid seal, procured near Kharpuz, suggests that the latter area extended eastwards across Euphrates towards the Vannic borders—which is quite credible. The inscriptions published by the Expedition as from the middle Halys basin, the Kaisariyeh and Ekrek districts, the Tyana neighbourhood, Marsh, Samsat, the Carchemish district and Aleppo, were, with two exceptions, already known, and the new copies of the stones, which in most cases are very badly weathered, are not more authoritative than those previously published. A copy of the great Nishan Tash inscription at Boghazkeui, obtained with great patience and labour, proves the text Hittite, but is too imperfect to place it among legible inscriptions. Hittite texts which have not been buried are usually so weathered that their existence in certain localities is of more scientific significance than their contents will ever be. Hittite history will have to read (if at all) from better preserved stones recovered by excavators.

The late O. Puchstein's posthumous report on the architectural remains at Boghazkeui (1912) is the most important contribution to Hittite archaeology which has appeared recently. It gives authoritative plans and details of the fortifications, as cleared by Winckler's expeditions in 1906-7; of four temples, inclusive of the large building on the W. formerly supposed to be a palace, and of a "palace" on the S.E., etc. For lack of observation (or record) of the relation borne by small finds, e.g. pottery and inscribed tablets, to architectural remains, the age of the latter is not clearly proved.

A fragment of inscription in relief characters, found at Restan (Arethusa) on the middle Orontes by Père Ronzevalle, is the only Hittite monument known in mid-Syria except the Hamah stones. Two new stones have been seen by D. G. Hogarth west of the Sajur, an incised inscription at Ain es-Suda 1 hr W. of Arab Hassan, and a relief at Tell Khalid. Others at villages east of the Sajur, found and recorded by the British excavators of Jerablus, may have come from the latter site; but more probably from local tells. In Asia Minor, beside the Cornell expedition's stones at Tekir Devrent and Egri Keui in the Kaisariyeh district, and at Isbekjur and Kotu Kale near Darende, and their inscribed lion at Ordasu (Malatia), Garstang's stela from Hadji Bey Keui near Marsh (*Ann. Anth. Arch.* iv, p. 126 & pl. 23) is a new discovery. Hittite characters have been newly found on the necks of large jars at Boghazkeui; on a clay tablet, otherwise in cuneiform, from Cappadocia; on a basalt weight at Jerablus; and on numerous seals and sealings, found in all parts of the Hittite area, but chiefly at Boghazkeui, Jerablus and Sakjegeuzi.

The history of Hittite power and civilisation, as supplemented by the Boghazkeui archives, has been well set forth by J. Garstang in his *Land of the Hittites* (1910). The general bearing of recent discovery has been to emphasize the division of Hittite history and remains into two main periods; the first, imperial Hatti rule radiating from Cappadocia; the second, not of Hatti rule but of either Muski empire or Hatti civilisation surviving in small states of Eastern Asia Minor and North Syria (e.g. Tyaniis whose monuments show non-Hittite bearded figures). In the latter period fell the relations of the Hebrew monarchies with "Hittites," who, resigning mid Syria to the Aramaean powers of Damascus and Hamah, ceased to be an imperial power in the 12th cent. B.C. It

should be added that the hostile relations of the Hatti with Assyria began at least as early as the reign of Shalmaneser I at Calah (14th cent. B.C.).

CRETE¹

The principal excavations of Minoan sites in Crete since 1909 have been at Cnossus, at Tyllissus, at Hagia Triada, and at three points near Gournia. At Cnossus, Sir Arthur Evans, assisted by Dr. Duncan Mackenzie, conducted excavations on an extensive scale in 1910. In the palace itself, the difficult work was attempted of placing what remained of the fourth and fifth flights of the grand staircase in their original position. An interesting conclusion follows from the restoration, that the upper landing of the fifth flight does not lead on to the ground floor of the central court, but answers in height to what must have been the first floor of the rooms on the other or western side. It must itself, therefore, have led on to some raised building, probably a terrace, that ran along the eastern side of the court. On the south of the palace, the huge cavity, filled with débris of pottery of the Middle Minoan I. period, which had at first been thought to be a truncated beehive tomb, proved on final excavation to be a cistern or reservoir. It has a circumference of 95 and depth of 56 feet and was apparently supplied with water from springs in the hill itself. To within 9 feet of its floor, where we may imagine was the average water level, it was accessible by a spiral staircase with shallow sloping steps and a low balustrade. It must have been built in Early Minoan times, and filled in when a solid foundation was needed for the Middle Minoan Palace.

Further progress was made with the excavation of the Little Palace, 300 yards to the west of the Theatral Area, and joined to it by a paved road. Two pillar rooms were here found, and two staircases, leading to upper storeys. A fresh piece of Minoan road also came to light, with the ruts of the chariot wheels marked in the stone slabs. The excavation, however, is obviously and dramatically unfinished, and fine Minoan walls run straight into the olive grove on the hillside, while frescoes of Roman houses, high above them, emerge from amid the tree roots. About half way between the Palace and the sea, just north of the "Royal Tomb" at Isopata, were discovered six chamber tombs, whose vases had their colours unfixed, and were clearly made expressly for funeral purposes. Some of these vases were polychrome, not of the Middle Minoan type, but with spirals of brilliant rose red and light blue; others were covered with a resinous black, in imitation of Egyptian alabaster. One of the tombs, about 20 feet square, has been christened by its discoverer, "The Tomb of the Double Axes." On one side of the entrance was a raised stone platform, and in this was cut the pit in which the body itself was laid. On the outer face of this platform, and along the other sides of the tomb, were ledges, clearly intended for sitting on, and perhaps originally furnished with benches. From the back wall jutted out a stone pier, the front of which was carved in low relief into a half column. Near the pillar, and apparently fallen from the platform, lay two thin ritual double-axes, the remains of a bull's head rhyton and one of the bright blue and red jars already described. The axes probably stood, socketted in plaster horns of consecration, at the head of the grave, and the jar was to hold libations poured from the bull's head. The ledges were for the family when taking part in this memorial service. An interesting problem is raised as to whether the tombs may have been reopened at intervals for a repetition of such a service.

No actual excavation was undertaken at Cnossus in 1911 and 1912, but much work has been done, especially on the frescoes. A short article on the light that is

¹ See *E. B.* vii, 421 *et seq.*

thrown by the miniature frescoes on the plan of a shrine in the central court has been published by Sir Arthur Evans in vol. xviii of the *Journal of the Royal Institute of British Architects*, third series, pp. 289-95, and a general study of Minoan Lime Plaster and Fresco Painting by Mr. Noel Heaton in the same vol. pp. 697-710.

At Tyllissus, on a high plateau about eight miles west of Cnossus and four miles from the sea, Dr. Hatzidákis, the senior Ephor of Antiquities in Crete, has continued in three successive seasons the work which he began in 1909. The site proves to contain, not, as was first suggested, a small palace with dependencies round it, but three large noblemen's houses, which lie close together, and are of the same date, but, in the excavator's opinion, are separate unconnected buildings. They may have been built in Middle Minoan III., as they contain pithoi that were commonest at that period, but they were in occupation throughout Late Minoan I. and II. Below them are traces of an Early Minoan settlement, and above them of Late Minoan III. buildings. Of special architectural interest are two rooms, each with two free-standing pillars, like those in the Little Palace at Cnossus; some double axes incised on outer walls; and a great cistern about 10 feet in diameter and 13 in depth, with a narrow stone staircase leading down into it. The most noteworthy of individual finds are a bronze figurine of a square-set male figure 8 inches high with the right hand raised to the forehead in a gesture of adoration and a kilt in the manner of the Petsofá figurines (*Annual of British School at Athens*, ix, pp. 363-4 and Pl. X) but more capacious; a beautifully worked filler (or strainer) of obsidian, about 9 inches high; fragments of miniature frescoes; a bronze ingot like those from Hagia Triada; four magnificent bronze cauldrons with three vertical handles, the largest of them four feet in diameter and 18 inches high; and a clay tablet of the earlier form of the linear script of Cnossus, showing not the familiar two-wheeled chariot, but a four-wheeled waggon.

These excavations had not been published up to the end of 1912, and the above description is due to the kindness of Dr. Hatzidákis, supplementing a personal visit.

At Hagia Triada on the south coast near Phaestus Professor Halbherr of the Italian Mission has conducted excavations in 1910, 1911 and 1912. He has proved that so far from the site containing only a "Royal Villa," as was first held, the Villa or Palace was only the centre of a town. Traces of this have been found dating from the Middle Minoan age, and some buildings of this date were incorporated in the Late Minoan I. Palace. Throughout the latter period both palace and town were prosperous, but at the end of it both were destroyed. The extensive remodelling which we find on the site of both palace and town took place at a date which Prof. Halbherr places in Late Minoan III., though it may be remarked that it would have to be very early in that period. Of the same date is the remarkable "Agora" northeast of the Palace and below it, a large space about 50 yards long, with 8 long chambers, each about 17 feet long by 13 feet broad, opening out from one side of it. The staircases that led to an upper storey still exist, and also the bases of 8 pilasters, about 2 feet nine inches square, running down the length of the Agora; while between them, opposite the doorways of each chamber, have been discovered foundations of the bases of small round columns. There can be no doubt that these are the remains of a covered portico, the second storey of which rested on these alternate columns and pilasters and was reached at either end by the stairways. We seem to have here a covered market place, a portico with shops leading out of it like the famous Laura, or Arcade, of classical times at Samos. On the high ground south of the palace, Prof. Halbherr has found what seems to have been a small sanctuary, with a bench or dais like that of the shrine of the Double Axes at Cnossus (*Annual of British School at Athens*, viii, pp. 95-105). A short notice of some of these excavations appeared in *Ausonia* 1910, p. 36, but the above description is mainly due to a personal visit and further details kindly given by Prof. Halbherr.

In the east of Crete Mr. R. B. Seager, the American explorer, has been conducting several small excavations near his headquarters at Pachyammos. At Sphongará, a few hundred yards from the town of Gournia, and between it and the sea, he discovered

in 1910 156 pithoi, a few of which date from the Middle Minoan I. period, but most from Middle Minoan III. and Late Minoan I. The pithoi rarely contained anything but bones and an occasional seal-stone. The body was trussed up like a fowl, with the knees under the chin and the arms folded tight. It was thrust into the jar head foremost, and the jar was then placed in the ground upside down. Some of the jars were painted, but the greater number were a tall slender type of unpainted jar, with a base so small that they were top heavy and could not stand upright without support. A few Early Minoan burials that were found on the same site, though often disturbed by the later pithoi, were sufficiently preserved to show that they were originally as rich as the great graves of that epoch found by Mr. Seager at Mochlos.

A hill about five miles west of Gournia called Vrokastro, short for Hebraiokastro, or Jews Castle, was excavated in 1910 by Miss Edith Hall and in 1912 by Miss Hall in company with Mr. Seager. In the latter year a settlement was found in the valley below, and seems to have existed there from the Early Minoan age; but the chief remains, dating from Late Minoan III. and the Geometric age, were found on an extraordinarily steep peak overlooking the sea, almost inaccessible except on the south or land side. The chief point of interest is that the transition between Late Minoan III. to Geometric is made without any definite break or direct signs of a racial change.

On the other side of Gournia, south of Kavoussi and just north-east of Vasilikí, there is a steep gorge above the village of Monasteráki. High up on the north side of the gorge itself, called by the appropriate name of Chaos, a narrow and precipitous path leads to some ledges, on which are ruins of ancient walls, called Katalumata. Mr. Seager conducted a small excavation here in 1911, which showed that the spot was used as a place of refuge from the earliest times onwards. The actual remains of the walls seem to be of Late Minoan III. date, but Early Minoan III., Middle Minoan I. and Late Minoan I. potsherds were all found there. These excavations in East Crete have not yet been published, and their description here is due to the kindness of Mr. Seager and a personal visit to the sites.

If we turn to the classical period, the discovery of a 5th century Doric metope of Herakles and the Calydonian boar (*Times* Nov. 16, 1910) on the high ground west of the Little Palace of Knossos promises well for future excavation. Prof. Halbherr has excavated at Lebena, the harbour of Gortyna. At Gortyna itself he has diverted the millstream which flowed by the great inscription of the Laws, discovered in 1884, and is exploring the neighbouring buildings.

Authorities.—The only final publication of Minoan Excavations that appeared during 1910–12 is R. B. Seager's *Explorations in the Island of Mochlos* (American School of Classical Studies at Athens, Boston and New York, 1912). See further G. Karo's introduction to a 2me série of G. Maraghianis's *Photographs of Antiquities Cretoises* (Candie); A. Mosso's *The Dawn of Mediterranean Civilisation* (Tr. Fisher Unwin, 1910); R. Dussaud's *Les Civilisations Préhelléniques* (Paris, 1910); E. Reisinger's *Kretische Vasenmalerei* (Berlin, 1912); and the 3rd and illustrated edition of R. M. Burrows's *The Discoveries in Crete* (J. Murray, 1913). "The Hymn of the Kouretes" discovered at Palaikastro in 1904 has been published by R. C. Bosanquet, G. A. Murray and J. E. Harrison in *Annual of British School at Athens*, Vol. xv. (R. M. BURROWS.)

AEGEAN CIVILISATION¹

Since 1910 there has been much new discovery in the field of ancient Aegean civilisation, and more has been learned about older discoveries, not only in Crete (see above) but also in the Greek islands, on the Greek mainland, and in Asia Minor. Among the Greek Islands, Phylakopi (Melos) has been re-examined by the British Athenian School and a further landward part of the site has been excavated. The distinction of periods and classification of pottery confirm those arrived at by the previous diggers. Some graves containing L.M. III ware have been opened on Leukas by Dörpfeld and held by him to support his theory that here was the Homeric "Ithaca." On the Greek mainland important remains of L.M. frescoes have been found by the German Institute at Tiryns, and the pre-Hellenic Argos, explored by Vollgraf and others, has yielded a local

¹ See *E. B.* i, 245 *et seq.*

variety of the native Boeotian "Minyan" ware. An L.M. III settlement with large painted jars has been found at Pylos, and similar ware has been recovered by the British School from the site of the Menelaum at Sparta. L.M. III graves have been opened on Aegina and similar graves at Thebes by Keramopoulos, together with remains of a building at the last named with frescoes which the discoverer regards as the "House of Cadmus." In the uppermost prehistoric level on several Thessalian sites Wace, Thompson and Tsoundas have found L.M. III ware. In Asia Minor, Wiegand has found a neolithic settlement at Kiliktepé near Miletus, and many L.M. III sherds under later remains on the city site, especially near the shrine at Athena. Macalister, who had found both L.M. III and Cypriote ware, etc., in considerable bulk at Gezer (Philistia), in Syria, has now published his results. There is nothing new of importance from Cyprus, but vessels either of Aegean make or of Egyptian imitation (mostly L.M.) have continued to be found in Egypt as far south as Thebes.

So far as concerns Crete, the general results of these fresh discoveries and of the new study and new publications may thus be summarised. (1) More abundant and varied material for judging E.M. civilisation, which is now seen to have been more advanced, and nearer to M.M. brilliance than was supposed, in several arts, metallurgy, plastic (stone vases) and ceramic; very early trade connections with Egypt and Aegean isles (probably Cyprus also) are demonstrated. (2) Clearer knowledge of the course of Minoan history, beginning with local independent *foci* of civilisation in the centre and east, on which followed successive imperial dominations of Phaestus and Cnossus, the first in M.M. II, the latter in L.M. II. Each of these, at its acme, reduced the E. Crete *foci* to a low ebb, but they revived during L.M. I between the two imperial periods. (3) Surer chronology. The recent tendency of authorities is to protract the Minoan Age to about 1100 B.C. and to bring down also the first destruction of Cnossus and the other Minoan towns far into the 14th century. The coincidence of M.M. II with Egyptian Dyn. XII stands, but the later date (2000-1800 B.C.) is preferred. (4) Increased knowledge of the Dispersion period (L.M. III) in which Cretan civilisation spread to Asia Minor and through Cyprus as far as South Syria on the one hand, and to Sicily, Italy and North Greece on the other; but the chief radiating centre was on the South Greek mainland. (5) Fuller evidence for funerary practices, and better knowledge of the origin and earlier development of the Cretan script, the last thanks to publication of Evans' *Scripta Minoa I*. Outside Crete, discoveries at Tiryns confirm the belief that "Mycenaean" culture, like that of Phylakopi from the Middle Cycladic Age onwards, was due in the main to Minoan Crete; while the excavations in Laconia, Boeotia and Thessaly show that Aegean influence pervaded all Greece up to Thermopylae in L.M. II and III times, but only reached Thessaly late and never greatly affected an indigenous civilisation long established there. Boeotia had also a pre-Mycenaean art, which gave way to Aegean influence earlier and more considerably. The chief lesson from Miletus is that the site had none but few and rude inhabitants till settled from Crete in the Dispersion period (L.M. III); while Gezer has strengthened the hands of those who have maintained that mid and south Syria owed far more to Cyprus and Crete than these islands owed to Syria. Doubts have been raised about the hitherto accepted identifications of the Minoan Cretans with the "Keftiu," and about the supposed early relations of Crete with Egypt; and no clearer light than before has been thrown on the racial character or linguistic affinities of the Aegean peoples, or on the links which connected their civilisation with the archaic Greek.

MISCELLANEOUS SITES OF THE NEARER AND MIDDLE EAST

Cyrene.—(*E. B.* vii, 704). Excavations were begun in 1910 by an American expedition representing the Archaeological Institute of America and the Boston Museum of Fine Arts. The members, led by R. Norton, had great difficulties to contend with owing to the suspicion and indiscipline shown at first by the local tribes; but these had been largely overcome when, in March 1911, the second in command, H. de Cou, was shot by three strangers from the Tolmeita district, sent to murder the leader. The other members of the American party, however, stayed on till May, and were about to return to the site in October in A. V. Armour's yacht, when the outbreak of war between Italy and Turkey in Tripolitana and Cyrenaica foiled their plans. Cyrene became inaccessible from the coast, and the objects discovered by the Americans remained on the spot in the hands of Enver Bey's force. They include two very fine pieces of sculpture, a torso of a dancer or a Victory, and a head of Athena, the first of the earlier part, the other of the later part, of the 4th century B.C. Besides these much sculpture of the Roman period was discovered including a great number of conventional figures for sepulchral use, whose faces were left blank to be painted with features as required. A large deposit of terracottas, mostly representing the city goddess bearing the silphium, was partly cleared, and much pottery etc., chiefly late, was extracted from tombs half robbed in antiquity. The main work of excavation was done on the hill above the Apollo spring, where a large building of uncertain nature and Ptolemaic date was in process of exploration when work stopped. The digging had not penetrated deep enough except in one or two pits to tap early strata and the promising virgin field below the Apollo spring, occupied by the grounds of the Senussi Convent, was not touched.

An important site of the earlier Greek period was discovered at Messa, about five hours S.E. of Cyrene, by the party under J. W. Gregory who in 1908 visited Cyrenaica to inquire (reporting adversely) into its possibilities as a field for the Jewish Territorial Organisation; and it was revisited by R. Norton and also by an Italian expedition under F. Halbherr in 1910.

Didymi.—(*E. B.* viii, 207). The temple has now been disengaged from débris by the German excavators under Th. Wiegand. A small township is found to have encircled it, leaving a clear precinct. Of the earliest shrine some scanty remains have been found at the E. end with a fragment of an archaic inscription. The rest of the remains are Hellenistic in the main, and of Roman date in part. Several inscribed marbles record details about the building, towards which kings and other rich men contributed during a long period (*e.g.* Ptolemy XIV gave 34 elephant tusks to meet the cost of the great central E. door). Other marbles record the treasures deposited in the temple, oracular responses, etc. There were no architectural sculptures beyond heads ornamenting capitals, etc. of columns and the beautiful enrichment of bases at the E. end; and few remains of free sculpture have been found. The main additions to the work done by Pontremoli and Haussoullier have been: (1) discovery of outlying dependencies such as a semicircular terrace for the deposit of offerings and an altar on the E., and a stadium on the S.; (2) clearing of the 122 columns, almost all of which stand at half height or more; (3) clearing of the *pronaos* with its 12 columns and wonderfully preserved W. wall; (4) opening out of the stairs leading to the two subterranean chambers of the *adyton* under the *pronaos*; one of these stairways is perfectly preserved even to its ceiling, decorated with maeander design; (5) clearance of the spacious stairway which leads down to the *cella* at a level six metres below the *pronaos*; (6) discovery of many details of the enrichment of the upper members of the colonnades. There was no *opisthodomos*. The Byzantine castle, into which the *cella* was converted, and spoliation by natives have done much damage; but even as it now stands, this temple is by far the best preserved of the greater Hellenistic buildings. Many dedications to Artemis, who was here associated with Apollo, have come to light; and the sacred way to Panormus has been explored more thoroughly than by Newton (See *Vorläuf. Berichte über die. . . in Milet u. Didyma* . . . *Ausgrabungen* nos. vi, vii, 1910, 1911, by Th. Wiegand).

Miletus.—(*E. B.* xviii, 443). The excavations carried out by Messrs. Wiegand,

Pernice and Knackfuss for the Berlin Museum are now virtually at an end. Little prior to the destruction of the city in 944 B.C. has come to light; but a primitive settlement has been located on Kiliktepé, S. of the later walls. This has rude constructions of small stones and graves yielding implements of obsidian and other stone, and painted pottery (red on black). Though neolithic in character these graves can hardly be very early in time since Greek geometric sherds were found in them. Much pottery of L.M. III (or Sub-Minoan) character has been found elsewhere on the site. Immediately above this stratum begin Ionian remains; a small part of the archaic city with its wall has been revealed at Kalabaktepé not far from the position of the early Athena temple. The sherds here found are not later than the opening of the 5th century. A few graves of the archaic period have been opened near by. The rest of the discoveries are of the Hellenistic and Roman ages. The Hellenistic city was planned gridiron-wise, like neighbouring Priene, but with a slightly larger insular unit (170 feet in length as compared with 160). The south market, a vast square with halls and porticoes, was the last important site cleared. It was rebuilt and rearranged in the 1st century B.C. A temple of Serapis, some heroa, the stadium, and the baths, built at the expense of the empress Faustina, have also been explored. In the last was found a fine recumbent statue of the River Maeander. On the whole not much interesting sculpture has come to light and the inscriptions are disappointingly late; but a good deal of light has been thrown on local history in Hellenistic and Roman times, and on local cults. It appears that Miletus had no existence until settled by fugitive Cretans not long before 1000 B.C.

Sardis.—(*E. B.* xxiv, 217). Systematic excavations were begun in 1910 by an expedition from Princeton University led by H. C. Butler. The main field of operations was the so-called Temple of Cybele or Cybebe, which is now proved by numerous inscriptions to have been called a temple of Artemis from the 6th century onwards. Clearance has proceeded systematically from the W. end by the removal of débris layer by layer. The *opisthodomos* was found to be the most ruined portion; but its north wall stands to a height of 2 metres and bears the greater part of an important Greek inscription, a mortgage deed of unique character drawn up at the end of the 4th century B.C., whereby specified lands, etc., were secured to the temple in consideration of a loan made from the treasury to a certain Mnesimachus who held the greater part of his real estate from a king, presumably Antigonus. This chamber with the *cella* had been converted into a cistern in late Roman times. The eastern end, protected by the talus of the hillside, proved in better preservation. Here two columns still stand to their full height, and many others to half height; but most, if not all, had been restored, probably after the great earthquake of 17 A.D., and many details, e.g. fluting, were never executed. Three varieties of Ionic architecture were employed in the external and internal colonnades. The temple was one of the very largest in the Greek world. No architectural sculptures, but many beautifully carved bases of columns have come to light, and in the joints of the central cult-statue pedestal—a survival apparently from a primitive temple—a considerable find of unused coins was made; the majority, of Hellenistic time, may have formed part of a foundation deposit, inserted at a time of reconstruction; one, of Croesus, found much lower down, must belong to a more original deposit. Greek inscriptions on the pedestals of statues of priestesses were found, and also texts in Lydian script and language, one with an Aramaic bilingual. The whole plan of the temple, which was pseudo-dipteral, has been recovered with certainty. A great many tombs, mostly used more than once in different periods, have been opened, and fine jewellery, intaglios, bronzes, terracottas and pottery have been found. The excavation is still proceeding and it is hoped that the whole agora, as well as other parts of the earliest city, may be explored. (*See Amer. Journ. of Archaeology*, 1910-12). (D. G. HOGARTH.)

ARCHAEOLOGY OF OTHER GREEK SITES

In Greece Proper, during 1910-12, continuous progress has been made in archaeological research, either by fresh discoveries or through the re-examination of previously known monuments, which is frequently due to the influence of new excavations.

Athens.—In Athens itself (*E. B.* ii, 832 *et seq.*), and in connection with the Parthenon (*E. B.* xx, 869) and Pheidias (*E. B.* xxi, 361) fresh facts have come to light. Mr. Hill, the director of the American School at Athens, has re-examined the foundations of the earlier Parthenon and shown that previous reconstructions of it were wrong. It was a temple with sixteen columns on the sides and six at the ends instead of nineteen and eight. This is proved by re-measuring the foundations themselves which form part of those of the later Parthenon, and by the discovery of several marble blocks built into the north wall of the Acropolis on which the curved lines drawn to guide the masons in putting the columns in position are still visible. Further evidence derived from papyri and inscriptions tells us that Pheidias made the Zeus at Olympia after the completion of the Parthenon at Athens. Also since the records of the payments for the making of the pediments of the Parthenon continue after the date of his exile, it appears that he, although their designer, cannot have taken part in their completion, which was probably left to his pupils. Excavations on the Pnyx have shown that the supporting wall of the theatral area in front of the *bema* or platform dates from the fourth century. Consequently the problem of where and how the Athenian Assembly met during the fifth century remains unsolved. At the Dipylon cemetery excavations have shown that the graves were in family groups, each being enclosed by a high boundary wall. The tops of the platforms within these walls stood about six feet above the level of the roadway and consequently the marble grave reliefs, many of which are still *in situ*, were meant to be seen from below. This cemetery was in use during the fourth century, but nearer the city gates is a series of monuments erected over the graves of men who were given public funerals, and these date from the latter part of the fifth century. During the excavations many potsherds that had been used for voting during ostracism were found. Thirty of them bear the name of Thucydides, the son of Melesias, who was exiled in 442 B.C. and is well known as an opponent of Pericles.

Olympia.—At Olympia (*E. B.* xx, 93) the results of recent excavations have been surprising. It has been shown that underneath the centre of the shrine of classical times lie the ruins of a prehistoric Olympia. This extended below the Heraeum, the Pelopium, the Metroum, and the terrace on which the treasuries stood. This was a small village of the later bronze age and is marked by the presence of ellipsoid houses. One of these was in fact found during the original excavations and called the Altar of Zeus. Above the prehistoric stratum comes another of the Dipylon age which is characterised by numbers of small votive offerings in bronze similar to those found in the earlier excavations. Finally the third or uppermost stratum is the classical Olympia which we know. This discovery is typical as showing how much the science of excavation has progressed and emphasizes the necessity of the careful examination of the stratification of a site.

Corfu (*E. B.* vii, 145).—At Corfu (the ancient Corcyra) the chance find of a sculptured slab has led to excavations which have resulted in the discovery of practically the whole of the pedimental sculptures of a temple of the sixth century. Eight of the eleven slabs have been found; for, as is the case with nearly all early pedimental groups, the sculpture is in high relief. In the centre is a great Gorgon over six feet high with snakes on her hair and about her waist. On either side is a figure on a much smaller scale; on her left a nude youth, probably Chrysaor, and on her right her offspring Pegasus. The next places on the right and left are occupied by two great panthers with their heads *en face*, but with their bodies in profile. They separate the central group from the smaller scenes which fill the angles. On the left is a fallen warrior. His opponent was probably represented on a slab which is missing, and between this gap and the panther is a slab with an altar and an enthroned goddess. On the right the two corner slabs are lost, but that next to the panther is occupied by a nude Zeus and a giant at whom he is hurling a thunderbolt. The striking feature of the pediment is the great size of the Gorgon and of the panthers compared with that of the other figures. At a distance the group must have appeared merely as a Gorgon supported on either side by a panther. This composition bears a strong resemblance to one of the favourite motifs of Minoan art, as shown for instance by the Lion Gate at Mycenae, and goes to confirm the theory, which is

daily gaining ground, that archaic Greek art was merely a renaissance of Minoan. Of the temple itself little or nothing has been found beyond the altar, but further excavations may give better results.

The Homeric Ithaca.—In the Island of Leukas (Santa Maura; *E. B.* xxiv, 189) Dörpfeld has been excavating in the hope of proving that it was the Homeric Ithaca. In a cave in the south of the island painted neolithic pottery has been found which has a distant resemblance to the painted prehistoric wares of Apulia and Thessaly. In the plain of Nidri where Dörpfeld places the city of Odysseus plentiful remains of habitation of the later bronze age have been found. The pottery, with the exception of a few imported Mycenaean and Minyan sherds, is of local fabric and resembles the local wares from Pylos, Cephallenia and Olympia. It is also to be noted that late Mycenaean ware was found in connection with these local wares at the first two sites. Further it is similar to some early pottery found in Acarnania at Stratus. Apparently this corner of north-western Greece had a local bronze age culture which was influenced towards the end of the late Minoan period by the imported Mycenaean culture. At Nidri two important groups of tombs have been found. One consisted of cist graves within a rectangular enclosure. They contained pottery, bronze weapons and flint arrowheads, and apparently date from the same period as the shaft graves at Mycenae and the cist graves of the fourth prehistoric period in Thessaly. The other group consisted of burnt interments. The ashes were placed in large stone jars surrounded by circular enclosures of stone, perhaps once the bases of tumuli. The best grave, that of a woman, yielded seven vases, a necklace of gold beads, a silver bracelet, and a bronze tool.

Corinth (*E. B.* vii, 148).—At Corinth the main results of the American excavations go to show that the fountain houses of Peirene and Glauce probably date back to the age of the tyrants in the sixth century. This is of great interest, for we know that the tyrants of Athens, Samos and Megara about the same time busied themselves in improving the water supplies of the cities under their rule. Some scanty remains of the prehistoric period have been found round the hill on which stands the temple of Apollo. The painted pottery found here is remarkable, for it is of the North Greek style and belongs to the second and third prehistoric periods in Thessaly. Amongst these sherds are a few of a style which extends as far north as the banks of the Danube near Belgrade, where it is plentiful.

Delos (*E. B.* vii, 971).—At Delos the systematic progress of the French excavations under Holleaux has produced important results. The clearing of the streets and houses, many of which are in an excellent state of preservation, has made this once desolate site a Hellenic Pompeii. The wall paintings and mosaic floors of the houses are of great interest, while the details of their plans and the fact that the better houses had upper storeys may go far to solve some of the problems connected with Greek domestic architecture. To the north of the Apollo temple the so-called Temple of the Seven has been brought to light with seven bases for cult statues in the *cella*. To this temple, which is frequently mentioned in inscriptions as the Temple of the Athenians, belong the fine acroteria now at Athens, which were formerly attributed to the Temple of Apollo. To judge by its stylistic likeness to the Parthenon and the temple at Bassae it probably dates from the fifth century. The Asclepion has been cleared and a headless cult statue, perhaps that executed by Scopas, has been found. Further fresh research shows that what was originally called the older Artemisium is really the later. On the east of the valley of the Inopus the sanctuary of the foreign gods has now been completely excavated. This comprised two sections, one for Egyptian deities such as Isis, Anubis and Serapis, and another for Syrian divinities. The former, it seems, was built on the site of an earlier temple dedicated to a goddess. Not far off an older sanctuary of the Egyptian deities was found, apparently of the third century. These shrines throw much valuable light on the introduction and adoption of Oriental cults by the Greeks.

Thessaly, Phocis, Boeotia, Macedonia.—In Thessaly great advances have been made in our archaeological knowledge. At Pagasae a large number of painted grave stelae of marble which date from the third and second centuries were found built into the foun-

dations of towers of the city wall which had apparently been strengthened in the first century. They are the first good examples of Greek painting found on Greek soil, and their technique is especially interesting as illustrating the encaustic method. But as art they cannot rank high, for they are the productions of an industry rather than of an art. As in marble grave reliefs so also in these painted stelae the same motives constantly recur. The drawing in many cases is inaccurate, and in only one instance is there any attempt at atmosphere. Another important find is that of some silver plate and gold jewellery in a tomb at Metropolis. This belongs to the Hellenistic and Roman periods. The heavy gold necklaces and bracelets set with large stones display ostentatious vulgarity rather than good taste, but some of the work on the silver plate is exquisite. Further all over Thessaly careful exploration has brought to light a large number of new inscriptions which are an earnest of what yet remains to be found.

But more important than these, the recent Greek, Bavarian and British excavations in Thessaly, Phocis and Boeotia have given us a far clearer picture of the condition of the country in prehistoric times. The principal sites are: in Boeotia and Phocis, Orchomenus, Chaeroneia, Dhrakhmani and Aya Marina; in Thessaly, Lianokladhi, Dhimini, Sesklo, Tsangli, Marmariani, Rakhmani, and Zerelia. The period of time occupied by this prehistoric civilisation has been divided into four periods. The first two are neolithic, though bronze may have been known as an import, the third is chalcolithic, and the fourth is of the full bronze age and comes to an end at the close of the third Late Minoan age. In the first period throughout the region mentioned there was a uniform neolithic culture characterised by an abundance of well made pottery decorated with elaborate red designs on a white ground. In the second period the region is split in two, and Thessaly north of Mount Othrys remains isolated, and the standard of culture as illustrated by the pottery gradually degenerates during the succeeding periods, though there is some progress in technical skill shown by the change from stone to bronze, and at the end from bronze to iron. In the second period the pottery shows kinship with that found in Moldavia and the adjoining districts, and in a more distant way, as mentioned above, with that found in Leukas and Apulia. The prehistoric remains of Macedonia and Thrace (Bulgaria) should provide a connecting link between Thessaly and the Danubian area and there are indications that such may eventually be found. In the third period the pottery is related to that so common in prehistoric sites in Servia, which as noticed above is found in Greece as far south as Corinth. In the fourth period there are for the first time definite signs of a connection with the Minoan civilisation of the south, for in this period Minyan and Mycenaean (L. M. II and III) pottery are found imported into Thessaly, implying that not till then did the north come within the orbit of Cretan culture. Another sign of connection with the south is provided by the cist tombs which are common in Thessaly in this period and from their contents belong to the same date as the shaft graves at Mycenae and the Leukas tombs. At the end of this period there seems to have been an infiltration of influence from the north as shown by the resemblance between some Thessalian finds and those from an early iron age cemetery on Lake Ostrovo in Macedonia. These may well indicate the general direction whence came the invaders who overthrew the domination of the Minoan civilisation in Greece.

But in Phocis and Boeotia after the end of the first neolithic age a different state of affairs prevailed. The culture of the south spread northwards and settled in the land, but apparently without entirely displacing the old local culture. This southern culture seems to have originated mainly in the Argolid and to have been allied to that in the Cyclades. It is characterised by a kind of pottery known to archaeologists as Urfinnis, the name given to it by its German discoverers. This advance northward took place during the Middle Minoan age and may have been influenced by pressure from still farther south. This in its turn in the area in question gave way to another phase of civilisation which is marked by a peculiar grey wheel-made class of pottery known as Minyan. The main centre of this culture seems to have been Orchomenus, but the pottery in question has a wide range, being found in Thessaly, the Troad, Attica, Melos,

and the Argolid and Leukas. Finally at the beginning of the Late Minoan age the Mycenaean or Cretan civilisation became dominant in the Argolid, and then spread northwards, becoming supreme first in Boeotia and Phocis and later in Thessaly. Apparently a backward and isolated Thessaly acted as a barrier behind which the Minoan civilisation was able to reach its high state of development undisturbed. It was not till the bearers of the Minoan culture had themselves removed this barrier by trade or conquest that the way was opened for the hardy tribes of the north to overrun and plunder the seats of an old established and wealthy civilisation.

In Macedonia itself, the country where we must look for the solution of some of the problems indicated in the last paragraph, much exploratory work has been done. Many prehistoric sites have been noted, and it is to be hoped that their excavation will not be long delayed. We shall then be able to link up the prehistoric culture of northern Greece with that of Servia and Bulgaria, where many important finds have already been made. There are indications that the prehistoric folk of Thessaly were akin to the early inhabitants of those countries, and this gives special point to the Greek legends of Thracians in Thessaly and Phocis. Macedonia is rich also in remains of the classical period. The French excavations in the island of Thasos have laid bare a large temple on the acropolis, the city gates which were decorated with archaic reliefs, and the shrine of Artemis Polo. Some important pieces of archaic sculpture have also been found. Near Salonica a tumulus has been opened and found to contain a vaulted chamber tomb with double doors of marble and wood, the latter being remarkable for their fine bronze ornaments. The tomb dates from the Hellenistic age, but unfortunately it had been robbed in antiquity. Many new inscriptions have been found in various places. The most interesting is a decree of the emperor Trajan, fixing the boundary between Macedonia and Thessaly. In the course of the decree it is stated that it is based on a previous decision of King Amyntas III, the father of Philip II, which was found inscribed in the market place of Doliche. Another important regal inscription dated to the thirty-sixth year of King Antigonos Gonatas contains three letters of his son Demetrius, then apparently acting as regent for his aged father, sent to the governor of the city of Berrhoea.

(A. J. B. WACE.)

CYPRUS ARCHAEOLOGY

Since the close of the survey of Cypriote archaeology, in the *E. B.* (vii, 697 *et seq.*) nothing of the first importance has been either discovered or published. A new Antiquity Law, passed in 1905, has had the effect of restricting facilities for legitimate excavation; but the Berlin Academy of Sciences has examined a site at Rantidi near Old Paphos. Reports which appeared in the press in 1910-11 are exaggerated,¹ and have been in part contradicted by the excavator;² but there is as yet no official statement of the results. The earlier German excavations are also still unpublished.

The general bearing of earlier work in Cyprus on the history of the island itself and of adjacent mainlands is discussed afresh in Eduard Meyer's *Geschichte des Alterthums* (2nd ed.) vol. i, 2, § 498-500; by D. Fimmen, *Zeit u. Dauer der Kretisch-Mykenischen Kultur* (Leipzig, 1909); by R. von Lichtenberg, *Mitth. d. Vorderasiatischen Gesellschaft*, 1906 and 1911, and more popularly by M. Ohnefalsch-Richter, *Contemporary Review*, Nov., Dec., 1912.

Cypriote objects figure largely in the British Museum's *Catalogue of Terracottas* (1903), of *Jewellery* (1911) and of *Vases* (vol. i, part 2, *Cypriote, Etruscan*, etc.). The pottery from the British Museum's excavations at Enkomi is discussed in detail by F. Poulsen, *Jahrbuch d. Archaeol. Institute*, xxvi (1911), and the origins of the Mycenaean style of pottery in Cyprus and elsewhere by E. J. Forsdyke, *Journ. Hellenic Studies*, xxxi, p. 110. The vast Cesnola Collection in the Metropolitan Museum of Art in New York has been rearranged: uncertainty as to the circumstances of discovery does not affect the genuineness, value, or technical interest of its numerous masterpieces;³ a handbook is in preparation.

¹ In 1910: *Phone tes Kyprou*, June 25; *Patris*, June 23, 26; *Tägliche Rundschau*, July 6, 7; *Hellenic Herald*, July; *Times*, July 27, Aug. 27, Oct. 18, Nov. 12. In 1911: *Times*, Sept. 11.

² *Berlin Philol. Wochenschrift*, February 14, 1911.

³ *Bulletin. Met. Mus. Art*, June and Sept. 1909, Oct. 1910 (interim reports by J.L. Myres).

Special problems of archaeology are discussed as follows:—(1) the date and affinities of the well-known silver bowls of "mixed oriental" style by F. Studniczka,¹ who thinks them all alike Phoenician, and by F. von Bissing,² who claims the Berlin bowl as a genuinely Egyptian work of the New Empire, and emphasises the early date and Egyptian affinities of the rest of the series: (2) a peculiar form of spear, called *sigynna* by the Cypriote Greeks, is identified, and dated by J. L. Myres,³ who also discussed (3) an unusual fibula from the same Early Iron Age culture.⁴ (4) The influence of Cyprus on Palestine both before and during the Philistine occupation (1200–1000 B.C.) is well illustrated (for the Palestine Exploration Fund), by R. A. S. Macalister.⁵

After long neglect the Government Museum of Antiquities at Nicosia has been provided with a new building and a trained curator. Illicit excavation and needless damage to antiquities are still far too frequent; but in 1911 a joint memorial on this subject from the principal learned societies of Great Britain received a favourable reply from the Colonial Secretary. The mediaeval buildings are inspected and maintained in as good condition as financial limits allow; and a collection of architectural fragments and movable monuments has been begun. (J. L. MYRES.)

NEW LIGHT ON GREEK ART⁶

During the last four or five years there has been a great deal of activity in the fresh study of Greek monuments, their classification, and their restoration.

Period I, Before B.C. 480.—One of the most pleasing discoveries of recent times is due to Dr. Premerstein, who has succeeded in better reading the inscriptions on the bases of the two archaic nude figures found at Delphi, and usually supposed to be Apollos (*E. B.* xii, 480, fig. 76). They are now proved to be, what M. Homolle had from the first conjectured that they might be, the very statues of Cleobis and Biton dedicated at Delphi by the Argives after they had dragged their mother's chariot. Everyone will remember the delicious tale as told by Solon in Herodotus.

The British excavations at Sparta have revealed to us the history of art at that city. The results are recorded in the *Annual of the British School at Athens*. It appears that in the archaic age Sparta, though never the home of a great art, was not unresponsive of the art influences which flowed from Ionia. The city is even supposed to have carried on a considerable export of painted pottery; and objects in ivory and bronze are not inferior to those of other Greek cities. The rising power of Sparta strangled art, as it strangled all humanism, in the times when Athens was greatest.

At Athens there are not many new statues; but the piecing together of the abundant fragments of the early monuments of the city which have been unearthed in the diggings of the latter part of the last century has occupied the full attention of distinguished German savants. The very archaic temples of limestone, with their uncouth sculptural adornments, have been elaborately published by Wiegand and others; while Schrader has devoted his attention to the sculptural remains of the times immediately before the Persian wars, horsemen, dedicated female figures and the like. Wolters and others have begun the publication of the vase fragments found among the debris left by the destroying Persians. In this connection must be mentioned Mr. Guy Dickins' recent *Catalogue of the Sculpture of the Acropolis Museum*.

Period II, B.C. 480–400.—Among ancient sculptors who have recently come to be better understood we must especially mention Myron. His *Discobolus* and *Marsyas* have long been familiar to us in Roman copies. Recently a new torso of the *Discobolus*, in some respects superior to any known, has made its appearance. And the *Marsyas* is no longer a detached figure, as the *Athena* belonging to the same group (*Athena* throwing away the flutes, *Marsyas* picking them up) has been identified in a statue of a girlish *Athena* in the Museum of Frankfurt. This figure has a singular charm: the archaic severity of the head, the simplicity of the drapery, and a wonderful expression of girlish freshness are together captivating. This restoration has been generally

⁵ *Excavations at Gezer*, 3 vols. 1912.

⁶ See *E. B.* xii, 470 *et seq.* Digitized by Microsoft®

accepted, and the group added to the stock of received masterpieces. Less certainty attaches to an attempt of Dr. Amelung to constitute out of the Medici torso of Athena at Paris and a head which can be shown to belong to the same type, a new restoration of the Athena Lemnia of Pheidias. These reconstructions afford an excellent exercise for the talents of archaeologists, but they must stand the test of time and criticism before they can be worked into the tissue of the history of Greek art.

A work of a very different kind is the publication by Mr. Arthur Smith, for the Trustees of the British Museum, of new and splendid volumes giving precise representations and detailed discussions of the sculpture of the Parthenon. This was a work quite due: equally due is a complete publication of the sculpture of the Mausoleum, which is to be Mr. Smith's next task.

A great controversy has arisen over some reliefs now acquired by the museum at Boston, U. S. A., which evidently correspond in size and arrangement to the beautiful set of reliefs in the Ludovisi Gallery, which represent (as is supposed) the birth of Aphrodite, with two Hours to receive her and two votaries seated at the sides. The main subject of the new reliefs is the weighing of two human souls—or destinies—by a winged Eros, while a draped lady or goddess sits on either side awaiting the result of the weighing. All these reliefs are supposed by Studniczka, who has published them in the *Jahrbuch* of the German Institute for 1911, to come from the same altar. He supposes the weighing scene to represent the contest of Aphrodite and Persephone for the person of the young Adonis. The puzzle is a fascinating one. Certain differences in the style of the two sets of reliefs have caused some archaeologists to doubt whether they belong to the same monument; or at all events whether they were executed at the same time. They belong precisely to that period of art, when archaic style is bursting its swaddling-bands, which appeals to the intelligence as well as to the aesthetic faculty.

Period III, B.C. 400-300.—Under this head we may range what is alike for its abundance and its importance among the most remarkable discoveries of recent times. At Pagasae in Thessaly Mr. Arbanitopoulos has succeeded in extracting from a tower, into which they had been built in ancient times, a large number of grave monuments which are now set out in the museum at Volo. These stelae are decorated with subjects similar to those used in the great Athenian cemetery of the Ceramicus; but instead of the decoration being sculptural (in relief) it is painted. Painted stelae are not unknown at Athens and elsewhere; but in such abundance they have not been found before. We have here painted groups of seated men and women, scenes of farewell and the like; and they are of the period of the great painters of Greece, painting probably touching its highest point with Apelles in the age of Alexander the Great. Thus the stelae of Pagasae claim attention. But few of them are as yet published,¹ and from the examples thus made known it is clear that they are the work of very poor artists. This is confirmed by those who have seen the museum at Volo. Greek painting seems always to elude the student.

Period IV, B.C. 300-50.—Our knowledge of the Hellenistic age of Greek art has progressed more rapidly than that of earlier periods. A number of books and papers by Schreiber, Strzygowski and other writers have fairly embarked us on the search for the bridges leading from the art of the great period of Greece to that of the Roman age. We can here only mention a few works of this period which have been the subject of fruitful investigation. We ought perhaps to place first a statue now in the Terme Museum at Rome which has exercised a fascination upon visitors to the eternal city, the Girl of Antium. Disclosed by a landslip at Antium, and bought for a great price by the Italian Government, the Girl not only has the charm arising from freshness of design and originality, but she also offers the archaeologist great difficulty in attribution. On a tray she bears a laurel twig, a scroll and a small box. It is impossible to detail the various interpretations of the figure which have been suggested. One point, as the writer is convinced from a careful inspection, is quite clear. The girl is a girl, and not, as some have fancied, a boy in girl's raiment. This suggestion is singularly in-

¹ See Arbanitopoulos, *Description of the Painted Stelae at Pagasae* (Greek), 1909.

appropriate: every part of the body as well as the total impression which it produces is thoroughly girlish. She is an attendant at a sacrifice, or entrusted with some religious function to which with naïve simplicity she devotes her whole attention.

To Mr. Guy Dickins we owe an important series of papers in which he has not only studied the remains of the colossal group at Lycosura, consisting of Demeter, Persephone, Artemis and Anytus, but succeeded in restoring the design of the group, a restoration more recently confirmed by the evidence of a coin of Arcadia which reproduces the group. These figures were by Damophon of Messene, and Mr. Dickins has conclusively fixed the date of the artist, who used to be given to the fourth century, to the early part of the second century B.C. Such fixed points are of the greatest value. The date also of the Laocoon has been by Danish archaeologists fixed, on the testimony of inscriptions, to about B.C. 50-30, just before the time of the Aeneid, thus settling for all time a memorable controversy.

The Hellenistic age has many attractions to the researcher, and presents a vast range of interesting problems. From the artistic point of view, new lights could scarcely be more illuminating than that offered by the recent appearance of statue after statue from the workshop of Aphrodisias in Asia Minor, which seems to have supplied Italy, under the earlier emperors, with original types of the Greek deities. This school can best be studied in the magnificent Ny-Carlsberg Museum of Sculpture, presented to the city of Copenhagen by Mr. Jacobsen.

A few of the many important books on Greek art which have appeared in the last few years may be mentioned. Among the most valuable are the volumes on archaic Greek art which form part of the great *Histoire de l'art dans l'antiquité* of Messrs. Perrot and Chipiez. We have here a more detailed general account of early architecture, sculpture and vases than has before appeared; and M. Perrot's work is marked by conspicuous good sense and moderation. Another valuable French work is Collignon's *Statues funéraires dans l'art grec*, a book which goes over the whole history of sculpture in Greece. In English we have some important new works, such as the great work on the Parthenon, already mentioned; Walters' *Art of the Greeks*; Mr. E. Gardner's *Six Greek Sculptors*, and the Catalogue of the Sculpture of the Museum of the Capitol, a work of great research and much value, edited by Mr. Stuart Jones. In the very important and much neglected province of Greek portrait sculpture we have Hekler's *Greek and Roman Portraits*, the numerous plates of which bring for the first time ancient portraits within the ken of people of moderate means. The notable work of Furtwängler and Reichhold on *Greek Vases* makes it possible to study these admirable works of art outside the galleries of museums.

(P. GARDNER.)

PROTECTION OF ANCIENT MONUMENTS¹

United Kingdom.—The question of the protection of monuments has come prominently before the general public in England during 1910-1912. This is due partly to the action of antiquarian societies and the great publicity given by the press when any monument is reported to be for sale or demolition, partly to the activity shown by the Office of Works and Mr. C. R. Peers, the official Inspector of Ancient Monuments, in making known the provisions of existing legislation, and partly to the interest roused by the publications of the Royal Commissions in England, Scotland and Wales.

Inventories with full descriptions and illustrations have been published by these Commissions of the Monuments of Hertfordshire and South Buckinghamshire in England; Berwickshire, Caithness, Sutherlandshire and Wigtownshire in Scotland; and Montgomeryshire and Flintshire in Wales; and the number and interest of the monuments there described have been a surprise to all but the most experienced archaeologists. On the whole, the enquiries show that, with few exceptions, architectural monuments of known interest receive careful treatment and that a far greater number suffer from ignorant restoration than from neglect.

From the English Inventories, evidence was adduced in 1912 before a Joint Committee of both Houses of Parliament, showing that 95% of the ecclesiastical monuments in Hertfordshire and South Buckinghamshire were in "good" or "fair" structural condition, while 5% were in bad condition or in ruins; of the secular monuments (including barns and cottages) 88% were in good condition while 12% were in bad condi-

¹ See *E. B.* xviii, 796 *et seq.* Digitized by Microsoft®

tion or ruinous; and of the earthworks 52% were in "good" or "fair" condition while 48% were in "bad" condition. All the monuments to which these figures refer were of a date anterior to 1700.

The Scottish report on Wigtownshire calls attention to the damage that is being done to prehistoric monuments, more especially cairns, by the removal of the stones of which they are composed for road metal, and also to the obliteration of original structures by the practice of utilising the sites of such monuments for the disposal of pebbles and boulders gathered from the fields.

In Wales special attention is called in the Report on Flintshire to the fate pending for the ruins of Diserth Castle, which ultimately must be blown to pieces with the advance of quarrying operations on the hill on which it stands.

For each county visited, the three Commissions append a list of those monuments which in their opinion are most worthy of preservation, and when complete the country will be fully seised of the nature and number of its ancient monuments and will be able to form some idea of their comparative value. In the meantime, the Office of Works has appointed a special staff to deal with the monuments brought under its charge, and is collecting from county councils and learned societies a preliminary list of the monuments in each county to form a basis for its work under the existing Monuments Acts. Further, a Bill for the consolidation and amendment of these Acts has lately been under the consideration of a Committee of Parliament, and it seems probable that some system of local correspondents will be established together with Advisory Boards for England, Scotland and Wales to assist the First Commissioner of Works in the problems connected with the acceptance and care of the monuments brought under his charge. The joint Committee recommends that monuments placed under the guardianship of the Commissioners of Works or the council of a county or county borough or the equivalent authorities in Scotland, should be exempt from liability for probate or death duties, and suggests that cathedral churches should be included within the scope of the Bill. Amendments are also suggested giving power to local authorities to regulate the display of advertisements, and power to the advisory boards to give gratuitous advice as to maintenance and repair, to owners of ancient monuments who invite their assistance. In the Bill the expression "monument" is interpreted to mean "any immovable monument, in the widest sense of the word, whose preservation is desirable in the interests of the public on account of its importance in the history of the country, the history of civilisation, or the history of architecture or art, or on account of its aesthetic value. And it may include any earthwork, excavation, structure or erection as well as any prehistoric or historic work of craftsmanship or art made or apparently made or excavated in the United Kingdom the preservation of which is a matter of public interest by reason of the historic, architectural, traditional, artistic or archaeological interest attaching thereto, or to any remains thereof, and the expression 'monument' may include the site of any such monument, structure or erection, and any part of the adjoining land which may be reasonably required for the purpose of fencing, covering in or otherwise preserving from injury the monument, structure or erection, and it may also include the means of access thereto."

With regard to "chattels," which are not included in the Bill, the Committee was of opinion that such movable property as plate and other articles of historic and artistic interest as belong either to a municipal corporation or to the Established Church should be subject to protection similar to that extended under the Bill to fixed objects.

The following monuments were voluntarily placed under the Office of Works during the year ended March 31, 1912: Old Machar Cathedral (ruined parts), Aberdeen, Aberdeenshire; Gateway Tower, Chester Castle, Cheshire; Richard III's Tower, the curtain walls, etc., Carlisle Castle, Cumberland; Blackfriars' Church (remains), St. Andrews, Fifeshire; Weobley Castle, Gower, Glamorganshire; St. Martin's Church, Haddington, Haddingtonshire; Kirby Muxloe Castle, Leicestershire; Maclellan's Castle, Kirkcudbrightshire; the Bishop's and Earl's Palaces, Kirkwall, Orkney; the Old Church, Westray, Orkney; the Old Bridge, Stirling, Stirlingshire. In all the Office

of Works has charge of 53 ancient monuments and historic buildings in England and Wales, and 62 in Scotland.

Apart from State action, the committee for the survey of the Memorials of Greater London has published volumes on Bromley-by-Bow, Chelsea, and Lincoln's Inn Fields; and the National Trust holds properties amounting to 3,400 acres and 13 structures of historic or architectural interest.

Austria-Hungary.—The Central Commission of the Austrian Government for the preservation of Historical Buildings, Monuments, etc., was reorganised under new statutes to which the Imperial assent was given on July 31, 1911. Under these the Commission's sphere was extended to all monuments whose preservation is desirable in the interests of the public, whether on account of their importance in the history of the country, the history of civilisation, the history of art, or by reason of their aesthetic value. Separate arrangements are made for the care of written memorials, but all questions of "Heimatschutz," e.g. preservation of scenery, etc., so far as these are connected with the preservation of monuments, are dealt with by this Central Commission, which also supervises excavations and has charge of such prehistoric monuments as have not already been placed in the State Museums.

The Commission consists of a Chief Commissioner, a Chairman and Vice-Chairman appointed by the Emperor, an Advisory Board of Monuments of 50 members, and an office for State Monuments. Its headquarters are at Vienna. A History of Art Institute and possibly also institutes for prehistoric and numismatic research are projected in connection with it. For the separate kingdoms and countries of the Empire, local conservators are appointed who are civil servants versed in the history of art, technically trained and possessing legal knowledge. Further, the Chief Commissioner has power to appoint honorary wardens of monuments and correspondents with the duty of assisting local conservators. These conservators are under the Central Commission, which in its turn is under the control of the Ministry for Public Worship and Education.

Bavaria.—The entire care of the national monuments in Bavaria rests with the General-Konservatorium der Kunstdenkmäler und Altertümer Bayerns, which is placed directly under the Ministry of Education. The General-Konservatorium is composed of specialists in prehistoric archaeology (the term "prehistoric" covering the whole period up to A.D. 700), specialists in the later history of art, and practical artists experienced in the work of restoration. By a law of July 6, 1908 national monuments were placed under legal protection and a penalty imposed for all damage done to them. The provisions of the law are extremely drastic with regard to the preservation of all prehistoric objects, though they only apply to such as are pronounced "remarkable" in the case of periods later than the Merovingian. Thus the right of the landowner to excavate or explore for monuments on his own estate is dependent on the permission of the administrative authorities of the district, and further, anyone who desires for any purpose whatever to disturb the ground in a place where monuments may be expected to be concealed must obtain leave from the same authorities before he can begin work. The General-Konservatorium, however, is free from any such restrictions, and is merely obliged to give notice to the district authorities of any investigations which it is going to undertake on its own account. Honorary local correspondents keep the General-Konservatorium informed of the condition of all historical monuments within their districts, and here the term "historical monument" is interpreted in a large sense and includes not only churches, fortifications, city gates, towers, castles and town walls, but even cottages, small chapels, fountains, old bridges, wayside calvaries and pillories. Great weight is also laid on the local associations, and a cottage may be saved because it is an integral part of a beautiful or typical landscape.

In addition to the above, the property of the Church is subject to the supervision of the State, and most districts have regulations of their own concerning the erection of new and the restoration of old buildings. Thus at Würzburg, the local by-law makes the employment of red roofing tiles obligatory "so as not to interfere with the beauty of the landscape by the erection of differently-coloured roofs."

Belgium.—The State refers all matters concerning the restoration and preservation of monuments (*i.e.* religious or secular buildings possessing a special value from an architectural or artistic point of view) either to the Department of Bridges and Highways (a branch of the Ministry of Agricultural and Public Works) or to private architects, or to the Department and private architects in association. The expenses incurred in connection with cathedral churches, episcopal residences and diocesan seminaries, are included in the annual budget of the provincial councils. Recommendations by parochial councils which would result in altering the style or character of monuments must be submitted for the approval of the permanent committee of the provincial council and the sanction of the Sovereign. The Royal Commission for Monuments (founded in 1835) superintends the preservation of monuments and examines plans for their restoration. Each province and each commune can make appropriations for the restoration of monuments, and the Department of Fine Arts disposes annually of a sum of £5,000 for the restoration of secular and £8,000 for the restoration of religious buildings classified as monuments. Works of art in churches may not be removed without the sanction of the Crown or the public authorities designated for the purpose; and a communal law of 1836, laying down special regulations with regard to architectural monuments, has been extended with a view to preventing the alienation of any works of art belonging not only to the communes, but also to vestries and other public institutions, without the sanction of the Government.

Denmark.—The protection of antiquities and monuments of the prehistoric period is under the supervision of the First Division of the Danish National Museum, which receives for this purpose an annual grant from the budget. Full compensation is paid for treasure trove, and the Museum considers that further legislation would be detrimental to the excellent relations subsisting between itself and the rural population. National monuments of a secular character, such as old castles and ruins, etc., of historic interest, are not protected by special laws nor has the State any right of supervision. But ecclesiastical buildings are subject to a law of February 19, 1861 enacting "that every church shall be maintained, both as regards interior and exterior, in a manner corresponding to its original style and that restorations shall be carried out in that style." Further, by the same law, cathedrals and other important churches are placed under the supervision of a special council, consisting of two architects and an archaeologist, and the duty of an annual inspection is imposed on the dean and two master craftsmen. All important questions of repairs and alterations, including the treatment of frescoes, are referred to the inspectors of royal buildings and to the authorities of the National Museum.

France.—A bill was at the end of 1912 before the Council of Ministers amending the existing legislation. Some discontent is expressed with the present system, owing to the fact that local authorities have been known to allow interesting buildings to fall into disrepair in the hope that the State may be induced to take them over as "monuments historiques" and thus save the locality the cost of their upkeep and repair.

Netherlands.—There are no laws on this subject in the Netherlands, but the Communal authorities have been requested to notify the Ministry of the Interior in due time of any proposed demolition, reconstruction or restoration of ancient monuments, town-halls, churches, towers, castles, gates, interesting façades, etc., in order that it may be possible to reproduce them or take their dimensions.

Russia.—The number of buildings now standing, erected before 1650, which are neither churches, monasteries nor fortifications, is insignificant. Legally, the care of the historical buildings is entrusted to the Academy of Fine Arts, a dependency of the Ministry of the Court, but as practically speaking all the ancient monuments are in the hands of the Ministries either of the Interior, War or Holy Synod, the control of the academy is nominal. Of recent years there has been a great revival of interest, and a society has been founded on the lines of the English Society for the Protection of Ancient Buildings, but immensely more wealthy and influential; a bill was before a Committee in the Duma at the end of 1912, proposing that a Commission controlling

the preservation of ancient monuments should be formed, consisting of 18 members, five to be recognised experts and 13 representatives of government departments.

Saxony.—In 1894 a Royal Commission was appointed for the preservation of monuments. This body consists of a Councillor of the Ministry of the Interior who acts as chairman; two members nominated by the Evangelical Lutheran Consistory; two experts entrusted with the duty of cataloguing artistic monuments; and a member selected by the Antiquarian Association of Saxony. The Commission is in direct communication with the 28 administrative districts of Saxony, and is empowered to issue instructions to their officials. It deals with enquiries addressed to it by the Ministries and the Evangelical Lutheran Consistory with regard to the destruction, preservation and restoration of artistic monuments. The existing national monuments are subject to its supervision, and it gives advice as to their protection. It issues instructions with regard to continuing the work of cataloguing, and has published reports on general questions dealing with the care of antiquities, and three small volumes of advice with regard to the preservation of objects made of wood, metal, ivory, earthenware, glass and textiles, the preservation of pictures in oils and distemper and the preservation of prints.

In addition, the territorial offices of public works are expected to acquire, as far as possible, precise knowledge as to the existence and condition of ancient buildings and monuments of historical and artistic interest situated in their districts, and to notify the Commission when the buildings and monuments in question are in any way endangered. The same officials are also required, when repair or restoration of such buildings is undertaken, to make drawings of inscriptions, dates, masons' marks, etc., and to display the greatest care in preserving these from destruction by scraping or from disfigurement by paint or plaster; and further, they must report immediately when the demolition of a public building of artistic or historic importance is contemplated. The Commission also has local agents of its own. The Evangelical Lutheran Consistory has also taken steps to prevent the alienation of ecclesiastical monuments, and has instructed its subordinates to use experts in all additions to or restorations of ecclesiastical buildings or to apply to the Association for Ecclesiastical Art. The Saxon Government has established a "Denkmalarchiv," or collection of records relating to monuments, designed to serve scientific as well as practical purposes. In 1909 a law was enacted "against the disfigurement of urban and rural landscapes," in which wide powers are given to the police to prohibit advertisements and even new buildings in streets where their presence would be a disfigurement.

Spain.—The preservation of ancient monuments is at present a part of the work of the Ministry of Public Instruction and Fine Arts. There is no law on the subject, though a number of Royal orders and decrees have been issued. In subordination to the Ministry there exists in each Spanish province a "Provincial Commission of Historic and Artistic Monuments," whose chief duty is to make recommendations to the Government as to what ancient buildings, etc., lying in their provinces, shall receive the title of "national monuments." After such a recommendation, the Government consults with the Royal Academies of History and of Fine Arts, and if accepted, the building becomes a national monument and its preservation a direct charge on the State.

Sweden.—There have been provisions for the preservation of monuments of antiquity in Sweden since the early part of the 17th century, and all carved stones, ancient graves and treasure, have been since then regarded as, in a manner, State property, or at least under the direct protection of the State. This protection has since been extended to old church monuments and to vestments of the pre-Reformation era, as well as to the fabrics of ruined churches, such as exist in abundance in Gotland. It is probable that a new law will soon be passed making it impossible for the owners of old church treasures to sell them without direct State authorisation. At present they have to be offered to the State before sale, but there is no guarantee against their sale. The law of 1867 provides that "all monuments preserving the memory of the Fatherland's inhabitants in ancient times are put under the protection of the law, so that they cannot be altered, injured or destroyed by the owner of the land under other conditions than those speci-

fied." The definition of ancient monuments includes everything which is of such antiquity that it cannot be regarded any more as belonging to any particular owner, and embraces all kinds of sepulchral monuments, sites of old towns, ruined churches and walls, etc. If the site is already in use for agriculture, the owner must not dig down further than he or his predecessors have done without special permission. If the construction of any public work is expected to interfere with any existing monument the authorities must be informed so that a competent person may be sent to examine the work "without undue interference." Destruction of monuments is punishable by fine. All ancient objects must be brought to the Historical Museum to be valued. Monuments, painted or otherwise, in churches must not be disturbed or injured without leave of the proper authorities. An inventory must be taken of Church property, which, if required, may be periodically examined by the Royal Antiquary (an office which dates back to the time of Gustavus Adolphus) or his deputy.

United States.—An Act of Congress was approved on the June 8, 1906 for the preservation of American antiquities. Under it the President is authorised, in his discretion, to declare by public proclamation historic landmarks, historic and prehistoric structures and other objects of historic or scientific interest that are situated upon the lands owned or controlled by the Government, to be national monuments. If such objects are situated upon a bonâ fide unperfected claim or held in private ownership, the tract, or so much thereof as may be necessary for the proper care and management of the object, may be relinquished to the Government, and the Secretary of the Interior is authorised to accept the relinquishment of such tract on behalf of the United States. Permits for the examination of ruins, etc., under their jurisdiction may be granted by the Secretaries of the Interior, Agriculture and War, to competent institutions, provided that the enquiry is undertaken for the benefit of reputable museums, universities, etc., with a view to increasing the knowledge of such objects, and that the "finds" shall be handed over for permanent preservation in public museums. The Secretary of the Interior reports that the only practical work carried out by his Department for the preservation of ruins, etc., has been in the Mesa Verde National Park, Colorado.

Conclusion.—It is evident that there is no lack of regulations in civilised countries for the preservation of ancient monuments. But in despite of them not a few memorials, both chattels and structures, disappear yearly owing to preventable causes; they perish by neglect, or they are sold and removed from their original surroundings, or it may be that they lose their character owing to ignorant restoration. In England the public conscience has been shocked by proposals to remove the mantelpieces at Tattershall Castle and the Globe room from the Reindeer Inn, and demands have been made for State interference. But the Inspector of Ancient Monuments is very near the truth when he declares in his annual report (1912) that "the ultimate protectors of national antiquities are the people themselves." The State indeed is powerless to preserve monuments except within a limited sphere without the sanction of an educated public opinion. Such dangers as the deadening of the public conscience due to the feeling that someone else is or should be responsible for the care of monuments, the tacit assumption by many that any monuments but those adjudged to be of "national" value may safely be allowed to decay or be sold out of the country, the encouragement towards careless treatment if it is felt that the State will more readily accept responsibility for monuments that are in a bad condition, and the power of arresting natural architectural development, are real dangers inherent in State action; and, unless particular care is taken to guard against them, largely counterbalance the value of the State's good example in selected cases and its ability to use the public purse freely on great occasions.

See Inventories issued by the Royal Commissions on Ancient and Historical Monuments for England, Scotland and Wales; Reports from H. M. Representatives abroad showing the systems adopted in certain foreign countries (Cd. 6200; 1912); Report of the Inspector of Ancient Monuments for the year ending March 31, 1912; Report from the Joint Select Committee of the House of Lords and the House of Commons on the Ancient Monuments Consolidation and Amendment Bill, etc. (Nov. 1912).

(X.)

SECTION V. PHILOSOPHY, EDUCATION AND RELIGION

PHILOSOPHY¹

Any sketch of the general march of Philosophy during 1910-12 is bound to be, in the main, impressionistic. The ground covered by the philosophical sciences is so vast that any one writer can see only a small portion of it in clear perspective; and even within the partial field where he is most at home, he may well find it hard to catch the real drift of tendencies which have not yet fully disclosed their ultimate scope. It is clear that the next generation or so will see some striking developments in Western philosophy, but the movements from which most may be reasonably expected are yet too undeveloped to admit of confident prophecy as to the precise direction they are likely to take in the near future. There seems to be at this moment no one type of philosophical thought which promises to be dominant even for the next few decades. The general impression one derives from the recent literature of the subject is rather that the day for the dominance of the main stream of thought by any single tendency is temporarily over, and that in the most immediate future, at any rate, philosophy is likely to witness a struggle for existence between two or three types of doctrine, each of which will presumably become seriously modified as it develops itself in conflict with its rivals.

There have been few outward signs lately of definite breach with the traditions of the opening years of the century. No startlingly new figure has appeared above the horizon, though we have to chronicle the deaths of at least three distinguished representatives of already established types of thought, William James, Shadworth Hodgson, and Alfred Fouillée. In Shadworth Hodgson there has passed away from the scene perhaps the last survivor of the classic "British" succession of thinkers, whose characteristic method in philosophy was the direct psychological analysis of the given "moment of experience" as distinct from metaphysical or epistemological enquiry into the "transcendental" implications of Being or of Thought. His philosophy seems likely to be the last attempt to develop a system in entire independence of the influence of Kant's "Copernican revolution," unless, indeed the recent work of Prof. S. Alexander should prove capable of development into something like a system. William James's work in general philosophy is of too recent a

**William
James.**

date to pass a judgment upon it with any confidence of anticipating the final verdict of history. To the present writer it appears to exhibit three distinct strains, none too closely connected with one another: (1) a fundamental *metaphysical* pluralism, (2) a radical empiricism in *method*, (3) the adoption in *logic* of a purely utilitarian theory of truth and falsehood. It is this peculiar view of truth as "that which works," or "that which produces practically useful results" which, from its apparently paradoxical character, has made the principal sensation among James's contemporaries for the moment, and from which he has chosen the name ("pragmatism") for his type of thought, but it is open to question whether his abiding place in the history of philosophy will not depend primarily on his brilliant defence of pluralism against the singularism of philosophies of the "one substance" and "absolutist" types. His reaction against the type of speculation which denies substantial reality to finite individuals, by resolving them into phases, appearances, or predicates of a single all-inclusive individual, is equally manifest in schemes of thought so different from his own and from one another as those of Dr. Rashdall, Dr. McTaggart, Prof. Varisco, and the "new realists" of Great Britain and the United States. None of these thinkers, in fact, would accept the view that unqualified empiricism is the sole method of philosophical enquiry, and most of them would hardly acknowledge it as a valid method at all. Nor do any of them adopt the special theory which identifies truth with fertility in "practical" consequences (see particularly for a criticism of this view, the fifth essay in Mr. Bertrand Russell's *Philosophical Essays*, 1910). The disappearance from Continental journals of philosophy of the discussions of "Pragmatism,"

¹ See generally the *E. B.* articles enumerated in Index Volume, p. 939.

which were singularly numerous two or three years ago, seems to indicate that in Europe at large "Pragmatism" and its off-shoots, as distinguished from the more general return to Pluralism, is regarded as a movement which has already "done its do," and taken its place side by side with other manifestations of dissatisfaction with a purely intellectualistic attitude in Philosophy.¹ Its former place as the champion of a positively anti-intellectualist interpretation has passed to the doctrine of M. Bergson.

The outstanding event of recent years, as far as philosophy is concerned, has certainly been the rapid rise of Bergson to a European reputation. Of the three works which constitute together the full exposition of his interpretation of *Bergson's* experience, so far as it has yet been carried by the author, *Les Données Immédiates de la Conscience* had been published as long ago as 1889, *Matière et Mémoire* in 1896, and *L'Évolution Créatrice* had reached a fourth edition in 1908, but the author's ideas can hardly be said to have attracted universal attention much before 1910. The English translations, *Time and Free Will*, *Matter and Memory*, and *Creative Evolution* all belong to 1910-11. A great amount of work in various European languages has appeared in exposition or criticism of Bergson's special tenets. Special reference may perhaps be made to H. W. Carr's *Henri Bergson, The Philosophy of Change* (1911), and J. McNellar Stewart's *A Critical Exposition of Bergson's Philosophy* (1912). Without attempting to pronounce on the permanent value of Bergson's ideas, it may at least be said that his works contain the most systematic and brilliant exposition of Irrationalism since Schopenhauer, and that his presentation has the advantage of exhibiting the irrationalist position unencumbered by the temperamental pessimism with which Schopenhauer entangles it.

Bergson's main doctrine may perhaps be briefly summarised as follows. The human intellect is itself a product of evolution, a tool fashioned by natural selection for the purpose of enabling mankind to find their way about among the inanimate bodies which make up their physical surroundings. Hence the crowning achievement of the intellect is the creation of the science of geometry, which therefore furnishes the ideal model to which human science in general is everywhere striving to approximate. The aim of all sciences is to become exact sciences, *i.e.*, sciences of number and measure. But the only magnitudes which we can measure directly are straight lines. Consequently all measurement of other magnitudes has to be effected by artifices which enable us to substitute lengths for the various "intensive" magnitudes (lapses of duration, degrees of temperature, electric charges, and the like), which meet us in the "real world" of actual life. In particular, the measurement of time only becomes possible by the artifice of representing the real duration through which we live by the image of a line on which we can measure off different lengths. This device, though indispensable to science, inevitably falsifies the facts of living experience. For it gives rise to the belief in a "Newtonian" time, which is homogeneous, like the straight line, and "flows equably," whereas the "real duration" of experience, which is the very stuff of which our inner life of feeling and conation is made, is non-homogeneous and "flows" with very varying rapidity according as we are well or ill, interested or bored, pleased or pained, and the like. From the initial substitution of the unreal "uniform" time of science for the infinitely varying "real duration" out of which the processes of life and-consciousness are made further arise all the illusions characteristic of a mechanical and statical theory of the universe. It is our tendency to envisage time under the form of a line, which leads to the belief in permanent "substances" or things as the bearers or supports of change, and further conducts us to the notion of a rigid determinism by producing the illusion that what happens in the various moments of time is all completely "given" at once, as all the points on a straight line are given simultaneously. This again leads to a radically false conception of "evolution." It creates the belief that nothing radically new is ever produced in the evolutionary process;

¹ For an attempt to write the full history of the conflict between rationalistic and anti-rationalistic types of philosophical thought during the last few years, see A. Aliotta's *La Reazione Idealistica contro la Scienza*, Palermo, 1912.

whatever emerges in the course of the process, on a determinist theory, must be already completely contained in its antecedent conditions, and adequate knowledge of those conditions must enable you to say beforehand exactly what will emerge from them. Hence for science, which to be true to its geometrical ideal must be strictly mechanical, the whole process of evolution can be nothing but the rearrangement, according to mechanical law, of self-same and permanent units. Real life, as we know it at first hand in the act of living it, is of a wholly different kind. It is a single continuous process of becoming, in which there is no permanent substratum; it presents us at every moment with the emergence of the qualitatively new, fresh qualities, fresh adaptations to environment, which could never have been anticipated, from any knowledge of what had gone before, until they had actually emerged. You cannot expect to know the direction this *élan vital*, as Bergson names the impulse which Schopenhauer had called the "will to live," will take until it has been actually taken; life is thus essentially contingent. (It follows, of course, that determinism is false as regards that special manifestation of the *élan vital* which we call will, or choice. To speak of our decisions as necessitated or determined by our past is virtually to think of them as already made for us before we make them.) Instinctive or impulsive activity is thus but a manifestation of the forward-going *élan vital*, the tendency of the process which is life to exhibit itself in ever newer forms. Science is the inevitably unsuccessful attempt of the intellect to reconstruct the process in "geometrical" form by reversing its sense. It looks back at a process which has culminated in the appearance of something new (e.g. a new modification of an animal species), notes what the earlier stages of the process have been, and then assumes that it could have predicted from a knowledge of antecedent conditions the new manifestation of the *élan vital* with which it had, in fact, to be already acquainted before it could think of the antecedent events as conditions of *this* result. Hence, if philosophy is to understand life, its method must be the reverse of that of the scientific intellect. It must renounce the intellect and its logic, which latter is indeed merely the abstract schematism of the "geometrical" procedure, and surrender itself without reserve to the intuitions and presages which attend on complete immersion in the stream of the *élan vital*.

It may perhaps be suggested that the real test of Bergson's ability to construct an irrationalist Philosophy on this basis must be sought in the success with which it can be applied to the interpretation of the spiritual life of humanity, a task with which Bergson has not as yet grappled. Meanwhile there appear to be some reasons for doubting whether the foundations of his thought are themselves securely laid. The condemnation of the intellect is based upon the assumption that because it is a "product of evolution" it can have no function but that of enabling us to find our way about among *things*; this is why geometry, which deals with the "surfaces of solid things," is declared to be its highest achievement, and why it is denied all value for the interpretation of life. But it might reasonably be contended that from the dawn of time men have had to occupy themselves at least as much with reaching a common understanding of one another as with learning their way about among "solid bodies," and that we should therefore expect an intellect which is a "product of evolution" to be competent to deal with life as well as with the surfaces of solid bodies. Again it is plain that the alleged necessity for science of a spatial schematism which inevitably misrepresents the facts of "real duration" depends entirely on the results of the one chapter (*Données Immédiates de la Conscience*, C.1) which expounds the author's peculiar theory of measurable magnitudes. Now this chapter bears evident marks of hasty construction. The author seems to have forgotten that even in geometry straight lines are not the only measurable magnitudes. It is indispensable that we should be able to measure angles, a consideration which of itself should have given the author pause. In fact the whole treatment of the distinction between "extensive" and "intensive" magnitudes upon which so much depends for Bergson's development of his theory, is, as it stands, at least perfunctory. Again the very language employed to distinguish "real duration" from the unreal time of science, *viz.* that the portions

of real duration flow with varying *rapidity*, seems to imply that these varying rapidities are comparable with one another and consequently that "Newtonian" time has, after all, the significance for real life which Bergson refuses to allow. Thus it can hardly be said that Bergson has been successful in showing that logic and the intellect need to be sacrificed by a Philosophy which recognises the reality of contingency and moral freedom, and the origination of the genuinely moral in the course of "evolution."

There has been much discussion in philosophical quarters of Bergson's place in the classification of philosophers. William James, in his latest works, claimed him as a Pragmatist, and it has been maintained on the Continent of Europe that his doctrine is not only a form, but the one really coherent form of Pragmatism. There is, of course, a real affinity between Bergson and the Pragmatists, which rests on their common distrust of the intellect. On the other hand, whereas Pragmatism, at least in its inception, made it a fundamental point to insist on a pluralistic theory of the world, Bergson's doctrine of the *élan vital* is definitely singularist. Thus he touches Bradley on one side of his doctrine as closely as he touches James on the other. In fact the complaints which Pragmatists used to make a few years ago of the miraculous feats ascribed by "idealists" to the Absolute might be easily urged *totidem verbis* against the *élan vital*. According to another view Bergson is most correctly described as a "mystic," though he can hardly be called so if the word is used with any precision. Mysticism is primarily not a peculiar way of thinking but a peculiar way of being. What the great mystics of the past have aimed at is first and foremost a transformation of human character by which it becomes responsive to stimuli from a "transcendental" world, inaccessible to ordinary perception. Since no such transcendental world is recognised in the Bergsonian scheme, it seems merely misleading to speak of his philosophy as Mysticism.

A second feature of recent philosophy has been, in Great Britain and America, the rise of the so-called "new realism." This also may be regarded as a conscious re-

**The New
Realism.**

action against the idealistic doctrines of the last generation which go back for their inspiration to Fichte and Hegel, but it is a reaction which is in many ways the direct antithesis of the movement represented by Bergson.

The New Realism, though it manifests itself in a great variety of forms, is in all its various guises definitely intellectualistic. This is shown by the general dissatisfaction of its representatives with the Kantian strain in the thought of their older contemporaries. What is particularly objected to, as the source of "idealistic" or "mentalist" fallacies, is the Kantian view that both sense, in virtue of the pure forms of intuition, and thought, in virtue of its scheme of categories, are in part constitutive of the objects they apprehend. The tendency common to all the writers who may be fairly classed together as typical of the latest forms of realism is to regard both sense and thought as simply apprehensive of data which do not depend on the percipient mind either for their existence or for their apprehended qualities and relations. The degree of consistency with which this doctrine is held varies with its individual representatives, but, thought out consistently, it plainly tends in the direction of ultra-intellectualism, since it leads to the view that the specific task of philosophy is simply to apprehend as completely as possible objects and relations which exist and have the characters and relations which they are discovered by science to have quite independently of the perceiving or knowing mind. On the psychological side this tendency shows itself in its extreme form in the doctrine that known relations between objects are purely non-mental, but the "work of the mind," as T. H. Green had taught. The function of the intellect is not to create relations between its objects, but simply to discover what the relations between them are. On this point there seems to be general agreement between such writers as Alexander, Russell, and Moore in England, Woodbridge and Fullerton in America, and Courat in France. It is a natural development of the same view that the attempt should be made to deny the existence of what are commonly called "presentations," and to hold that in sense perception we have only two distinguishable factors, an extra-mental presented thing and the process of apprehending it. Presentations, *i.e.* mental contents, which psychologists have usually regarded as immediate objects of cognition from which

we may go on to infer propositions about the extra-mental things which are the exciting causes, are then dismissed as unnecessary fictions. This is the point of view adopted by Prof. Alexander, according to whom there are, strictly speaking, neither contents of cognition nor cognitive states or processes. The contents of the mind consist solely of conations of various types, and the universe is thus reduced to conative tendencies and the objects in which they terminate and find their satisfaction.¹

This extreme view that presentations have no existence is not shared by all the writers who exhibit the realistic tendency. Mr. G. E. Moore and Mr. Bertrand Russell both appear to admit their existence. Thus in the latest statement of his general philosophical position (*The Problems of Philosophy*, Home University Library), Mr. Russell maintains that apart from the general predicates of things and the relations between them, which are universal and must not be said to exist, what we know is composed of minds, physical things, and sense-data, *i.e.* what are more usually spoken of as sense-qualities, red, sweet, salt, and the like. Sense-data are neither mental (processes of consciousness) nor physical. We are acquainted directly with our own minds and also with sense-data. But we have no acquaintance either with physical things or with minds other than our own. Any knowledge we have of the minds of others or of physical things is merely knowledge of *description*, and its possibility depends on the truth that things with which we have no acquaintance can be indirectly known if it is possible to describe them in terms of sense-data with which we have acquaintance. Since Mr. Russell accepts the familiar arguments against the physical reality of sensible qualities, it follows on his theory that we have no acquaintance with physical things. I know a physical thing only by inference, as *e.g.* "the cause of such-and-such a definite group of sense-data." This is a description obtained by a combination of sense-data which I know at first hand by acquaintance with the universals "the" and "cause of," and with these universals I have also immediate acquaintance. My acquaintance with the meaning of "the" secures that the otherwise unknown physical thing signified by the descriptive phrase shall be strictly individual. Thus my knowledge through sense-data of physical objects is like the knowledge I have *e.g.* about the "magnates of the Education Department," when I know that there is such a body, and what it does, but have never met any of its members. For science the most important point in the theory of knowledge is that we can be directly acquainted with relations and universals, though these entities do not properly exist. Immediate knowledge of this kind is what we mean by *a priori* knowledge, *i.e.* knowledge which does not involve awareness of any proposition about what actually exists. As the principles of inference are among the relations with which we have acquaintance *a priori*, we are able to have a derivative *a priori* knowledge of all truths which are deduced by correct inference from *a priori* principles with which we are directly acquainted. This covers the whole domain of the sciences of logic and pure mathematics, as, contrary to the Kantian opinion, all pure mathematics can be shown to consist of propositions deduced logically from premises which involve only logical concepts and relations with which we are directly acquainted. It is added that we must also include under *a priori* knowledge our direct acquaintance with the relative intrinsic worth of various goods. This is why there can be a science of Ethics. The chief special work of the particular type of realism represented by Mr. Russell and his associates has been done, in close connection with the earlier work of mathematicians like Peano and Frege, in the field of mathematical logic, with a view to the exhibition of pure mathematics as a vast body of deductions from the principles of the logic of relations, first treated with due elaboration in the third volume of E. Schröder's *Algebra der Logik* (1895), and applied with particular thoroughness to Arithmetic in Frege's *Grundgesetze der Arithmetik* (1893-1903). The unfinished *magnum opus* of Messrs. Whitehead and Russell, *Principia Mathematica* (vols. 1 and 2, 1910-12), represents the latest and fullest development of logic as a calculus of relations.

¹ See the continued controversy between Prof. Alexander and Prof. Stout as to the reality of presentations in the *Proceedings of the Aristotelian Society*, vols. for 1908-09 to 1911-12, and articles on the same subject in *Mind* for the same years.

The most brilliant general account of the principles and methods of the mathematical logicians is, perhaps, that of Couturat (*Principes des Mathématiques*, 1905).

Messrs. Moore and Russell have also made some application of their doctrine to Ethics (see G. E. Moore, *Principia Ethica*, 1903; *Ethics*, in Home University Library, 1912; and Russell, *Philosophical Essays*, 1910), but without any very satisfactory results. From their point of view the principal business of Ethics is to discover true propositions about the relative intrinsic worth of different "goods." As both writers assume that there are a plurality of such propositions, and that each of them is known *a priori* independently of the others, the impression they leave upon a reader not previously committed to their theory is that they have really no better standard for determining the worth of various goods than their own personal preferences. It is characteristic of both writers that they assume without serious enquiry that conduct can only be good in a derivative sense as leading to the production of some good other than itself. Hence, though both reject the older forms of Utilitarianism as ascribing a fictitious worth to pleasure, their own doctrine is itself utilitarian in its general character. Beyond discovering true propositions concerning the relative worth of goods, Ethics seeks to furnish rules of right conduct, *i.e.* conduct which produces good results, but these rules are always of the most rough-and-ready sort and constantly require modification to suit special cases. Hence the ground is left open in practice for an enormous development of reflective casuistry. Messrs. Moore and Russell have furnished us with some acute observations on the relative goodness of various objects, but because of their refusal to look at human life as a whole they cannot be said to have advanced the study of Ethics as an interpretation of life. In their ethical writings, slender as they are in bulk, one cannot see the wood for the trees; they are too much occupied with the search for true propositions about "goods" to develop a satisfactory theory of "the good."

Besides the Irrationalism of Bergson and the atomistic intellectualism of the new realists, one may mention as characteristic of the present day a third tendency, which is powerfully represented in contemporary philosophy, and holds in some respects a middle place between the former two. This is the revival of philosophical Theism, in connection with which important work has been done, especially by Prof. James Ward, Dr. Rashdall and Prof. Bernardino Varisco. Ward and Varisco agree in refusing to accept the unfavourable verdict of Pragmatism and Bergson on the worth of the intellect in philosophy, and are so far pronounced rationalists as to require of any philosophical theory of the world that it should be able to justify itself before the bar of reason; neither is, however, an "intellectualist," since neither ascribes to cognition a primacy in importance for the philosophical interpretation of the world over feeling and conation, and both admit, like Kant, our right to believe what we cannot demonstrate, provided that such belief, if accepted, would form the natural completion of the conceptions to which strictly logical analysis of the contents of science points. Both hold in common with Bergson and the Pragmatists the reality of contingency and the production of the genuinely "new," but both deny that there is anything irrational or repugnant to the intellect in these conceptions. Ward's views find their latest development in his *Realm of Ends* (1911), Varisco's are expounded in *I Massimi Problemi* (1910) and *Conosci te stesso* (1912). Both thinkers show very markedly the influence of Lotze, whose final results in the main agree with theirs; Ward is, on the whole, Kantian, Varisco Leibnitzian in manner.

Ward's starting point is afforded by the contrast between the unity which thought demands of its world and the apparent plurality which meets us in the world of sense perception. The problem which Philosophy has to solve is, according to him, on what lines the world of experience can be thought of as one without our ceasing to recognise that it is also truly many. The history of the post-Kantian "idealist" schools has demonstrated that the problem is insoluble if we attack it from the side of the "one." Since the world of perception is not primarily given to us as one but as many, we have to start from its given multiplicity and work toward such a final conception of its unity of plan as our data will permit. Ward

**Revival of
Theism.**

**James
Ward.**

thus begins by a tentative inquiry how far the metaphysical assumptions of Pluralism will allow us to recognise the experience-world as exhibiting unity. This leads him, *inter alia*, to a brilliant criticism of the concepts of mechanism and "evolution" as they figure in singularist philosophies. The result of the criticism is much that of Bergson's critique of the "geometrical" bias ascribed by him to the intellect. A mechanistic Monism must reduce "evolution" to a process by which things unfold what has all along been in them in an "incapsulated" form; but the process known to genuine science by the unhappy name of evolution is really more properly "epigenesis," the growth of the qualitatively new, and therefore unpredictable, out of the old. Starting with an original pure Pluralism which resolves the course of things into interactions between agents, each of whom is independent of any other, we can see that a pluralistic universe would develop a tendency to unity in the very process by which its members establish a *modus vivendi* among themselves, but it is uncertain whether such a tendency would give us the amount of unity we presuppose in the real world when we assume the validity for it of general laws, and it certainly does not warrant our ascribing to it such a unity as would justify the belief that the universe is such as to permit the realisation of our moral and spiritual ideals. *If*, however, the Pluralist should modify his hypothesis by regarding one member of his universe as a God from whom the rest derive their real but dependent existence, we could find in the existence of such a God good ground for faith in the persistence of spiritual life after bodily death, and the final victory of good over evil; the alleged difficulties of Theism, in particular the alleged impossibility of reconciling the goodness of God with the presence of evil in His world, have no conclusive force. Thus we are free, as Kant held, to exercise a reasonable faith in God and in immortality; and such a faith, while meeting the demands of morality and religion, involves no breach with the intellect, as it amounts only to a further step along the road which the Pluralist is forced to tread in accounting for the presence of even so much unity of plan and order as he has to admit in the visible world.

Varisco reaches a very similar position as the result of a polemic against the empiricist metaphysics of the ordinary Comtist. He begins with an analysis of the actual moment of sense perception. The objects apprehended in such perception stand at once in two sets of relations. On the one hand, they are connected in various ways with one another, and as so connected they form a system which lies open to the perception not only of the special "I" who speak of apprehending them, but to the perception of innumerable other beings, each of whom can equally say "I apprehend" them. Considered from this point of view the system of sense-data and their interconnections may be said to form the common perceived world of mankind at large. But also a given sense-datum which I apprehend is, at the moment of its apprehension, present along with experiences (feelings, conations), which are intimate and private to me and directly accessible to no other being which calls itself "I." In this sense the perceived objects may be said to be *my* objects. Thus there is a sense in which the whole world of fact to which the individual has to adjust himself in action is inseparably bound up with the individual's inner life. Varisco develops this idea in a way which may remind us strongly of T. H. Green, but is at least equally reminiscent of Leibnitz, the one great philosopher whom Green persistently misunderstood. It is fatal to the empiricist theories which regard the "external world" as simply given in sensation, that the world reveals itself to science as a complicated network of relations between terms, and neither the universals which pervade it nor some at least of the terms they connect are sense-data. The universals are apprehended by thought, and the self to which they are known, the only thing which we apprehend directly as it is, is also no sense-datum. It is our immediate non-sensuous apprehension of the self which owns its "states" that supplies us with our standard of real Being. Hence Varisco is led to postulate as indispensable factors in the scheme of the universe not only the sense-data and the system of relations between them, but the plurality of persons whose sense-data they are and whose thought apprehends their complicated relations. From these considerations follows the reality of freedom and contingency.

For each individual has its unique qualitative character, by which it is distinguished from every other, and the course of phenomenal events thus depends on two factors, the unique characters of individuals and the universal relations between them, and the former factor is obviously incalculable with certainty just because it is what is not common to two or more individuals. Hence the actual course of things is only partly calculable, and this admission of contingency, or spontaneity in the individual, involves no breach with the principle that it is for Philosophy to satisfy our intellectual demands. We may call the element of spontaneity a-logical (since logic is concerned solely with the universal laws of interconnection and interaction), but not irrational.

At this point arises the supreme issue for a philosophical interpretation of the universe, an issue which is one of value or worth. The question is whether we regard the principle of organisation in the universe as immanent, and manifesting itself in an endless succession of individuals which are all transitory, or whether we are to think of it as itself a transcendent individual, and of the finite individuals in which it exhibits itself as permanent factors in the universe. In the former case, the values of the individuals will be all relative, and there will be no meaning in attaching value or purpose to the world-order itself, as it is only the individual which properly has either; in the second case, there will be a meaning in regarding the values we ascribe to human personalities as absolute, and we shall be able to ascribe value and purpose to the universe as a whole, no less than to its various members. Varisco's view is that Philosophy as such cannot decide this issue between an impersonal immanent principle of order and "the traditional Christian conception of God." Our decision will turn upon the intensity of our faith in the correspondence between the order of facts and our spiritual ideals. His own preference is for the Christian solution, as an expression of personal faith.

In the sphere of Ethics, the attention of philosophers of all schools seems to be more concentrated now on the inquiry into the presuppositions and methods of science than on the interpretation of our inner life. *Erkenntnistheorie* is at present more

Ethics. in the fashion than "discourses on conduct." This is, as has always been the case, specially true of the work of the Neo-Kantians, who are always with us as a testimony to the exceptional eminence of Kant in modern thought. Special notice is perhaps due to the important volume, *Substanzbegriff und Funktionsbegriff* (1910), by the distinguished Neo-Kantian writer, E. Cassirer, which is specially valuable for its insight into the real character of the universals, or laws, of exact physical science, and for its criticism of the work done on the philosophy of mathematics by distinguished "new realists." In the sphere of "philosophy of religion" one may perhaps give special commendation to Evelyn Underhill's brilliant attempt to make a thorough study of the meaning and worth of the mystic "way of life" (*Mysticism*, 1910), as well as to the important and elaborate restatement of the principles of "idealism," with special application to the problems of religion, by Prof. Bosanquet in his *Principles of Individuality and Value* (the Gifford Lectures at Edinburgh for 1911) and its sequel, *The Value and Destiny of the Individual* (Gifford Lectures, 1912).

Some note should be made of the remarkable vitality exhibited by the Thomist philosophy as pursued particularly at Paris and Louvain. The achievements of Neo-

Thomism. Thomism in adapting itself to the criticism of scientific methods and principles and in contributing to the positive advance of such studies as Anthropology and Experimental Psychology, have chiefly to be studied in the year-books of the centres where it is cultivated, such as e.g. the newly founded *Annales de l'Institut Supérieur de la Philosophie* (tom. 1, Louvain, 1912), but we may perhaps mention as a work of general interest to students, Prof. Sertillanges' *S. Thomas d'Aquin* (Paris, 1910, in the series of *Les Grands Philosophes*.)

The interest in the historical study of the great ancient and modern philosophers continues to be maintained. It is worth noting that 1912 has seen the publication of the first two volumes of another handsome edition of Kant under the general editorship of E. Cassirer, following hard on reissues (published by Meiner, of Leipzig) of the principal works of Fichte (6 vols. 1911-12), Schelling (3 vols.), and Hegel (12 vols).

British interest in Hegel has been exhibited by the appearance of Dr. M'Taggart's *Commentary on Hegel's Logic* (1910) and Prof. J. Baillie's translation of the *Phenomenology of Mind* (1910). In the history of ancient Philosophy the main interest, as for some years past, has lain in the study of Plato, who seems at last to be receiving the minute and careful attention which scholars in the last half of the nineteenth century reserved chiefly for Aristotle. As indications of the revived interest in Platonism may be mentioned the two publications of the veteran Constantin Ritter, *Neue Untersuchungen über Platon* (1910) and *Platon, sein Leben, seine Schriften, seine Lehre* (vol. 1, 1910); G. Werner, *Aristotle et l'Idéalisme Platonicienne* (1910); J. Adam, *The Vitality of Platonism* (1911); to which the present writer may be pardoned if he adds A. E. Taylor, *Varia Socratica* (Series 1, 1911). The steady progress made with the Oxford complete translation of Aristotle continues to make it easier for the English-speaking student to enter into the thought of the second great philosopher of antiquity. (A. E. TAYLOR.)

EDUCATION¹

THE MONTESSORI SYSTEM

In connection with the theory of education the chief point of new interest during 1910-12 has been the attention aroused by Dr. Maria Montessori's work in Italy. It is not too much to say that, since Froebel, no such stimulus has been given to a revolution in the elements of educational method as her success in connection with the *Case dei Bambini* in Rome; and the Montessori system has given a new direction to the whole "Kindergarten" idea. In *The Montessori Method* (trans. Anne E. George, 1912) Dr. Montessori has now published a full account of her own principles and experiments, excellent short accounts of which were given by Miss Josephine Tozier in the *Fortnightly Review* for August 1911 and *McClure's Magazine* for May 1911 (see also *A Montessori Mother*, by Mrs. Dorothy Canfield Fisher, New York, 1912); the Board of Education in England, in October 1912, issued a Special Report on the subject by Mr. E. G. A. Holmes. From these the main points of interest are here summarised.

Maria Montessori (b. 1870) came to the study of educational theory after a thorough training in practical medicine. She was the first woman to whom (in 1894) the University of Rome gave the degree of M.D., and as assistant doctor in the "psychiatry" clinic at the university she had become specially interested in the question of the treatment of the feeble-minded. At the Pedagogic Congress at Turin in 1898 she gave an address on this subject, which led the Italian Minister of Education, Signor Barcelli, to ask her to give a series of lectures to teachers in Rome; the result was the foundation of a new school for feeble-minded children, the Scuola Ortofrenica, of which she was made directress. Her ideas as to the proper way of awakening a defective intelligence had been founded on a study of what Dr. Itard, physician to the Institution for the Deaf and Dumb in Paris, had attempted early in the 19th century in the case of the much-discussed "wild boy of Aveyron," and particularly of the later work of Edouard Séguin (1812-1880), author of the *Traitement des idiots* (1846), who opened in 1839 the first school for idiots in France, and who in 1850 made his home in America and there did so much for the education of defective children. In carrying on Séguin's principles at the Scuola Ortofrenica for the two years that she was directress, Dr. Montessori had such remarkable success that it was borne in upon her that something must be wrong with the methods of education ordinarily applied to normal children. Idiots sent to her from the asylums were being taught to read and write so that they passed just as good examinations as pupils of the same age in the public-schools; and, as she says, "while everyone was admiring the progress of my idiots, I was wondering what could keep the normal children on so low a plane." The reason, in her opinion, was clear; the children from the asylums, under her treatment, had been helped in their psychic development, while

¹ See *E. B.* viii, 951 *et seq.* and allied articles enumerated in Index Volume, p. 894. For progress in various national systems, see under country-headings in the Local Part of the YEAR-BOOK.

the normal children, taught by ordinary methods, were retarded. If the same methods were applied to good material that were successful with bad, much better results ought to be attainable; and she determined to investigate the whole subject afresh.

In 1900 she left the Scuola Ortofrenica, and turned her attention definitely away from the question of the feeble-minded to that of the normal child-mind and its development. She returned to the University of Rome as a student of philosophy, and devoted herself to experimental psychology, then in its infancy at the Italian universities, at the same time making a prolonged and careful study of the actual practice of teaching at the primary schools. The result of several years of child-study and practical pedagogy was to establish her conviction that the master-principle in any proper system is "self-education,"—that the work of mental growth must be done by the child itself, according to its own direct initiative and inclination, not in mechanical obedience to dogmatic dictation from a teacher; and she set herself to devise new methods for making the child-mind shape its own channels instead of the teacher telling the pupil what to do.

After six or seven years of enquiry and study, a unique opportunity arose in Rome for putting her theories into practice. During the building "boom" at the end of the 1880's, a whole new quarter of apartment houses had been run up by speculators outside the Porta San Lorenzo. It was from the first a complete fiasco, the houses failing altogether to attract the superior class of tenants for which they were intended; and the district gradually developed into the worst of slums, the flats being farmed out room by room to the poorest families, so that at last a serious condition of insanitary overcrowding had resulted, which seriously engaged the attention of social reformers. In order to remedy this evil, an association was started on philanthropic lines, the Istituto Romano di Bene Stabili, with Signor Edoardo Talamo as director-general. It bought up a large part of the San Lorenzo quarter, and reorganized it in 1906 in separate and convenient working-class tenements, with proper air-space; prizes being instituted for the best-kept dwellings. A novel part of the scheme was the provision of infant-schools (*Case dei Bambini*) for the children of each block, the supervision of which was entrusted to Dr. Montessori; the first of these being opened in January 1907. These "Houses of Childhood" for children between 3 and 7 are themselves a very interesting social experiment, apart from the new methods of teaching which Dr. Montessori introduced. They provide a *crèche* and something more, taking the children off their mothers' hands during working hours. Each school has a directress living in the block which it serves and in touch with the parents, who can at any time come and see how the children are getting on; and it is thus part of the home life.

The Montessori system of education was first put in practice in these tenement schools, under teachers following Dr. Montessori's methods.¹ Its fundamental aim and object is self-education by the pupils themselves. There are no timetables, no set lessons, no classes. There are no rewards or punishments of the ordinary kind. The pleasure of succeeding and getting things right is the only incentive. "Each child," says Mr. Holmes, "is doing what, for the time being, pleases him best. When he is admitted to the school, he sees small groups of children playing at various 'games,' and he joins the group which happens to take his fancy. Then and there his education begins. All kinds of interesting 'occupations' are going on, and wherever he goes he will get help and guidance from the teachers. If he gets tired of playing at this thing, he goes off and plays at that. But he is never idle, for whatever he does interests him." "The children are provided with light and comfortable chairs, which are easily moved about. There are also rugs, laid on the floor, for them to sit, kneel or recline upon, should they prefer those attitudes. Low and light tables are provided in abundance, but there is also plenty of open floor-space, and many of the 'occupations' are carried on on the floor." An extensive variety of apparatus, elaborately devised by Dr. Montessori, is provided for the educational games by which the children are stimulated to acquire knowledge; and this "didactic material" constitutes a distinctive part of the originality of the system, which can only be roughly indicated in a verbal description.

¹ At the end of 1912 they were no longer under her direct supervision.

The first stage is to develop the senses of touch, sight and hearing; this is done both by games of various sorts and by guiding the attention systematically to the association of things, names and ideas. When a child washes its hands, for instance, it is given first cold and then hot water, and led to observe and understand the difference; the distinction of rough and smooth is emphasized by the provision of different qualities of cards for fingering and sorting. In each case the teacher gets the child to know the word, "hot," "cold," "rough," "smooth," and thus the knowledge of language is extended in all directions ("high," "low," "thick," "thin," "round," "oval," etc.) before any question of writing or reading arises. Ideas of form and colour are given precision by games with blocks, cylinders, etc., of varying sizes, to be fitted into frames, or with shades of silk to be arranged to match; touch is practiced by playing the games blindfold; hearing by playing in the dark, and by games with stones of different weights to be rattled and arranged in size according to the sound, and so forth. Skill and neatness in the use of the fingers and movement of limbs are stimulated, partly by the mobility of the light furniture, which the children learn to re-arrange for their own comfort, and partly by games at tying and untying, hooks and eyes, dressing and undressing, waiting on one another at table, washing up, and so on. All such occupations are preliminary to writing and reading, but lead naturally up to both.

Writing comes essentially before reading, on the Montessori system, in any proper sense of "reading." Emery-paper letters gummed on cards are provided, with which the child is familiarised by games of hide-and-seek etc., so that, without any active teaching of the alphabet, he not only knows them by sight and by name, but also by feeling. He learns how to imitate them, partly by a touch-game of passing the fingers over the paper letter, thus making the actual motion of writing, and partly by playing at pencilling and colouring with specially devised cards on which an outline is given. The child thus learns to write before he knows that "writing" is what he is learning; the sounds and the shapes of the letters being known, it is a natural transition to build up the letters and their sounds into words. On this point Mr. Holmes says: "The usual interval between the first preparation for, and the accomplishment of, writing, is about a month and a half in the case of children of four years of age. When the period of preparation is over the average child finds that he can write any simple word, using ink almost from the beginning. After three months most of the children write a good hand; and those who have been writing for six months are as a rule quite on a par with children of the third elementary class in the public schools, *i.e.* schools for older children."

The next thing is for the child to "read"—not merely to retranslate into sound a word he has translated into symbol, which goes with the acquisition of "writing," but to extract a previously unknown idea from written or printed symbols of the same sort not put together by himself. It is found however—at any rate in so easy and phonetically-spelt a language as Italian—that, after what has gone before, this is very quickly learnt. Numbers of words, already well-known to the children, are written on cards, and various games are played in identifying them with their objects; and from single words the children pass to phrases and sentences, the teacher writing on the blackboard, for instance, questions or orders which form part of a game. The success of this method, by all accounts, is extraordinary. Miss Tozier gives an example of one boy of only $3\frac{1}{2}$, who "without realising that he has yet done anything more than play" could read and write both in English and Italian. This was a child of Dr. Montessori's American friend, the Marchesa Ranieri di Sorbello, whose case may perhaps be thought exceptional; but Mr. Holmes appears to be satisfied that on the Montessori system there is nothing more extraordinary, and no more strain involved, in such young children learning to read and write than in their having learnt to walk and talk. Arithmetic is similarly introduced to the children's minds by the employment of counting-games, in which an apparatus of striped poles, counters, etc., is used.

The detailed application of the Montessori system has not gone, so far, beyond the infantile curriculum, though Mr. Holmes insists that "the principle is applicable to children of all ages, and will bear its best fruits in the higher classes," and Dr. Montessori

herself has recently started a class for older children. Her energies have naturally been devoted in the main to establishing her fundamental principle, and recruiting teachers to carry out her ideas in that part of the educational sphere where their success has already been so remarkable. In the light of what has been proved with children from 3 to 7, she claims that "the old-time teacher, who wore herself out in maintaining the discipline of immobility, and who wasted her breath in loud and continual discourse," must pass away. "For this teacher we have substituted the *didactic material*, which contains within itself the control of errors and which makes auto-education possible to each child. The teacher has thus become a *director* of the spontaneous work of the children. She is now a *passive force*, a *silent presence*." What this change means is indicated as follows by Mr. Holmes: "The function of discipline, in a school of the conventional type, is to shut down and sit upon the safety valve of 'naughtiness' which the children's spontaneous energies, when wantonly repressed, instinctively try to use. In a school in which the energies of the children are constantly and happily employed, that safety-valve has never to be used, and the need for repressive discipline ceases to be felt. In a Montessori school each child is given the maximum of freedom that is compatible with his not hurting or incommoding others; and so long as he is busily and suitably employed, he is not likely to hurt or incommode others, or make himself a nuisance to the school as a whole. . . . The first impulse of the ordinary teacher is to tell a child how to do something which he has never attempted before. The second is to rush to the child's aid when, having been allowed to try his hand at something new, he is confronted by some difficulty and is in doubt as to his next step. The third is to correct his mistakes for him, instead of leaving him to correct them by himself. The Montessori teacher must keep all these impulses under complete control. When a child in a Montessori school is going to make his first attempt at a given problem, he is left to his own devices."

The Montessori system is undoubtedly a distinct step forward, on Froebelian lines, in the history of educational method. Dr. Montessori, in Mr. Holmes's words, has "rediscovered" Froebel's master principle; and by giving practical effect in a highly original way to some of the most solid conclusions of modern experimental psychology she has shown that, properly handled, the normal child will respond to an impulse towards growth from within, with a readiness commonly unsuspected. What has still to be discovered is to what extent the Montessori system requires exceptional capacity in the teacher, and how far the teaching profession is capable of supplying (or being content to supply) the "passive force" and "silent presence" which the system postulates. It is worth noting that Mr. Holmes, who inspected five schools where the Montessori system was supposed to be employed, found that in one of them the work was anything but satisfactory: "the Directrice had got hold of some details of Dr. Montessori's method without having any sympathy with or understanding of her principle, and the results were so comically bad that a frank abandonment of the whole system was obviously the only remedy for the more glaring defects of the school." Unfortunately the suggested new type of teacher does not as yet grow on every bush.

According to Mr. Holmes, a Montessori infant school is somewhat costly both to build and to run. "Instead of 9 square feet per child, at least 15 ought to be allowed if the children are to have the freedom of movement which the system demands, for the amount of floor-space ought to be as large as the space which is covered with chairs and tables. The apparatus is costly and demands much storage room; and the cupboards should be so arranged that the children can have easy access to them. The staff ought to be large and a majority thoroughly trained. A teacher of great ability and wide experience tells me that under the Montessori system no teacher can do justice to more than about 20 children." He adds however, that compensation would, he thinks, be found in the schools for older children if the system were also introduced there: "my experience has convinced me that where children are trained to educate themselves the number of children per teacher may be steadily increased as we ascend the school."

THE CARE OF THE MENTALLY DEFICIENT

One of the most pressing needs in social and educational reform in all countries that are organised on modern lines is the proper separation of the "mentally deficient" from those who are normal on the one hand and those who are already provided for as "lunatics" on the other, and the taking of consistent steps by the state for their treatment, both in their own interests and in those of Society. An important step forward was taken by the Government in England in 1912 by the introduction of the Mental Deficiency Bill, which, though not passed that year owing to parliamentary time not permitting, was sufficiently discussed to become to some extent a model for future legislation; and its main provisions are therefore worth noting. It was the result of the report (Aug. 1908) of a Royal Commission which had sat from 1904; and its need in one country alone may be gauged from the fact that, according to this report, there were in England and Wales 149,628 mentally defective persons in addition to certified lunatics, and that nearly half of them were in an unprovided condition and a standing menace to public safety. The mischief done by leaving this class of people at liberty to propagate has received general recognition, and it is well-known that the absence of any proper supervision results in some of the worst sorts of crime. To put them in prison after the offences are committed is to shut the stable-door when the horse has been stolen; moreover prison is not the right place for defectives. Neither however is a lunatic asylum the right place for people who are not actually insane, while it is quite unfitting to mix them with the sane people in workhouses under the poor law. Special homes are required for what is a special class, and it was the object of the Government to organise such institutions, compulsion being put on local authorities for this purpose.

The bill was introduced by the Home Secretary on May 16, 1912, and its second reading was carried on July 19 by a large majority. It was then referred to a standing committee, and subjected to much valuable criticism; but on November 21st Mr. McKenna had to announce that time would not suffice to pass it before the end of the session. It was agreed however to finish the discussion on the more important clauses, so that a new bill might be introduced in 1913.

As introduced, the bill consisted of 66 clauses, in 4 Parts. It set up a new Commission as a central authority under the Home Office, "Commissioners for the care of the mentally defective," not exceeding 6, one to be a woman; they were to be independent of the Commissioners in Lunacy, and have nothing to do with the insane or idiots who were under the Lunacy Commissioners, though a possible future amalgamation was contemplated. They were to have general control over the arrangements made for "defectives," supervising the local authorities, providing and inspecting institutions, and administering Parliamentary grants. Subject to them, there were to be local authorities in the shape of committees of the county and county borough councils, who should deal directly with all defectives within their districts, in carrying out the provisions of the Act, but their expenditure was to be met by government grants to the extent of a half to two-thirds. Machinery was provided for having the feeble-minded medically certified before a judicial authority; and among other provisions clause 49 made it a criminal misdemeanour to marry with a congenitally defective person.

The bill did not interfere with the feeble-minded who were properly cared for in their own homes; its operation was confined to those defectives who are described in clause 16:

- (a) who are found wandering about neglected, or cruelly treated;
- (b) who are charged with the commission of any crime, or are undergoing imprisonment or penal servitude or detention in a place of detention or a reformatory, or industrial school, or an inebriate reformatory;
- (c) who are habitual drunkards within the meaning of the Inebriate Acts 1879-1900;
- (d) in whose case, being children discharged on attaining the age of 16 for a special school or class established under the elementary Education Act 1899, such notice has been given by the local education authority as is hereinafter mentioned;
- (e) in whose case it is desirable in the interests of the community that they be deprived of the opportunity of procreating children;
- (f) in whose case such other circumstances exist as may be specified in any order made

by the Secretary of State as being circumstances which make it desirable that they should be subject to be dealt with under this Act.

The following were to be deemed "defectives" within the meaning of the Act (as originally introduced):

(a) Idiots; *i.e.* persons so deeply defective in mind from birth or from an early age as to be unable to guard themselves against common physical dangers;

(b) Imbeciles; *i.e.* persons who are capable of guarding themselves against common physical dangers, but who are incapable of earning their own living by reason of mental defect existing from birth or from an early age;

(c) Feeble-minded persons; *i.e.* persons who may be capable of earning their own living under favourable circumstances, but are incapable, through mental defect existing from birth or from an early age—

(i) of competing on equal terms with their normal fellows, or

(ii) of managing themselves and their affairs with ordinary prudence;

(d) Moral imbeciles; *i.e.* persons who from an early age display some mental defect coupled with vicious or criminal propensities on which punishment has little or no deterrent effect;

(e) Mentally infirm persons; *i.e.* persons who, through mental infirmity arising from age or the decay of their faculties, are incapable of managing themselves or their affairs.

In Committee however some of these definitions were altered after discussion, and the following were the revised definitions under the headings *b* and *c*:

Imbeciles.—Persons in whose case there exists from birth or from an early age mental defectiveness not amounting to idiocy, yet so pronounced that they are incapable of managing themselves or their affairs, or, in the case of children, of being taught to do so.

Feeble-minded.—Persons in whose case there exists from birth or from an early age mental defectiveness not amounting to imbecility, yet so pronounced that they require care, supervision, and control for their protection or for the protection of others, or, in the case of children, of receiving proper benefit from the instruction in ordinary schools.

In the case of (d), "moral imbeciles," the word "permanent" was introduced before "mental defect." It was agreed to omit class (e), *i.e.* "mentally infirm" altogether, the case of senile decay appearing to be one which was not *ejusdem generis*.

The only opposition to the bill in any moment came from a section of Liberals, led by Mr. Wedgwood, who denounced it as an invasion of individual liberty, and as giving a dangerous power to so-called medical specialists or cranks on "eugenics" to shut up people whom they arbitrarily considered to be "wanting." It was objected also that it would be to the interest of all connected with the new institutions, which would be run for profit, to keep them full. But it appears unlikely that the safeguards provided under a system of government inspection would not be ample to prevent misuse of the new powers provided for benefiting both the defectives and the community; and the announcement that the bill was to be dropped, even temporarily, created widespread disappointment.

(HUGH CHISHOLM.)

THE BLIND¹

The last census figures for the blind in several important countries, including the United Kingdom, France, Germany, Austria-Hungary, Russia, Italy, Spain, Canada and the United States (where the census was found to be inaccurate), were not available up to the end of 1912: and the following statistics are the latest then procurable.

Country.	Census Year.	No. of Blind.	Country.	Census Year.	No. of Blind.
Belgium	1910	3,223	Holland	1909	2,710
Bulgaria	1905	5,319	Indian Empire	1911	443,653
Chile	1907	2,601	Norway	1910	2,097
Denmark	1911	1,395	Prussia	1910	20,953
Egypt	1907	148,280	(European) Russia	1897	247,900
(One eye only)		363,702	South Africa	1911	6,550
			Sweden	1900	3,413
		511,982	New Zealand	1911	482
Finland	1900	3,229	United States	1910	61,500
German Empire	1910	45,000			(approx.)
		(approx.)

Belgium.—8 schools; 6 workshops. Most of the blind work in their families. Education is not compulsory, but facilities are given by the government to send children to institutions. The state and provinces pay 600 francs a year for any child between 6 and 18 *sô* sent. The law of 1891 regulates the manner of payment, and the freedom of parents in choosing an institution.

Denmark.—2 schools; 4 workshops. Education is not compulsory. The schools are supported by the state, the workshops by private associations. On leaving school at 18 or 20 pupils are apprenticed to a seeing master for 3 years, the institution paying 300 kronen, and young musicians are given further training for 3 or 4 years; they are furnished with tools or musical instruments, and looked after by different societies. Since 1901, to counteract *ophthalmia neonatorum*, midwives are ordered to use the Credé method, and blindness from this cause has decreased.

France.—30 schools; 11 workshops. One school is national, and five departmental, the rest private, receiving pupils with bursaries from departments and communes. The "Institution Nationale des Jeunes Aveugles" gives assistance in obtaining situations, and so does the "Association Valentin Haüy" of Paris. The law of 1909 provided compulsory assistance up to 16, and two new laws are being proposed. *Ophthalmia neon.* is decreasing in many *mairies*; notices are distributed pointing out its danger and the need of immediate treatment.

Norway.—2 schools. Education is compulsory, and schools receive state aid. There is a Union for assisting the blind. Midwives are instructed to treat antiseptically for *ophth. neon.*

Sweden.—6 schools; 4 workshops. By act of 1896, education is compulsory up to 14. Four schools are state-supported. On leaving school, pupils receive grant of tools; and the state gives 25,000 kronen to an Association for After-care. *Ophth. neon.* is decreasing; the Credé method is prescribed by law in maternity hospitals and is in general use.

Switzerland.—3 schools; 7 workshops. All institutions are private except the school at Zürich. Special Associations have been created in cantons which have no schools or workshops. The new Civil Code prescribes that all abnormal persons if teachable shall receive instruction, but all cantons are not yet able to carry out this provision. Each canton has special legislation covering *ophth. neon.* In Vaud, where the strictest measures have been taken for over 40 years, it has almost disappeared.

Austria-Hungary.—17 schools; 2 workshops in Austria; 6 schools, 4 workshops in Hungary. Also 11 Homes, partly workshops. Instruction is compulsory between 6 and 14. The Austrian Ministry of Instruction provides annually 17,000 crowns for the blind; and the "Imperial Royal Institution" has its own funds under state administration. Four schools are supported by Austrian provinces, and one by city of Vienna, while others receive small grants. In Hungary 2 schools are partly state-supported; and the Society for the Relief of the Blind in Budapest receives 8,000 crowns from the city. *Ophth. neon.* is a notifiable disease, and pamphlets about it are largely circulated.

German Empire.—According to *Taschenbuch für Blinderlehrer 1912*, there are 33 institutions, providing instruction for 2,763 persons. In Saxony, it may be noticed, the school in Dresden has been moved to Altendorf, a suburb of Chemnitz, where a colony of 300 blind and 500 feeble-minded are housed in 40 associated buildings. This combination of the blind and the feeble-minded is much to be deplored.

Russia.—32 schools; 7 workshops. The schools are supported to the extent of 5 per cent by the state, and 25 per cent by municipal grants, besides invested funds.

Egypt.—4 schools; helped by State and municipal funds. A Society for After-care has been formed at Cairo. Ophthalmologic hospitals have been created, fixed and ambulatory.

United Kingdom.—A new impetus has been given to the education of the blind in the United Kingdom, by Triennial Conferences of all those who are interested in their welfare, and the founding of "The College of Teachers of the Blind" in 1908.

Previous to 1902, conferences had been convened at irregular intervals; but in that year the Gardner Trust arranged for one to be held in London, and since that date important gatherings have taken place in Edinburgh, Manchester and Exeter. An important result of the Edinburgh Conference was the appointment of a National Employment Committee to discuss means of providing more work for those who had received manual training. It is estimated the workshops in the United Kingdom supply places for about 3,210, and there are large numbers who would gladly work if more accommodation were provided. The National Employment Committee drafted a bill, which, if passed, will make it the duty of borough and county councils to provide adequate and suitable provision for the technical training and employment of needy blind persons over sixteen years of age who are capable of receiving instruction.

The College of Teachers was founded in 1908, to raise the status of teachers of the

blind, and give them an opportunity of submitting their qualifications to the judgment of an accredited body, for the purpose of examination. The College is recognised by the Board of Education, and certificates are issued to successful candidates. Each year the executive committee choose a board of examiners from those who are recognised experts in teaching the blind. The College of Teachers has raised its standard of examination each year, and soon the children in all schools for the blind will receive an education equal, or superior, to that given to normal pupils in elementary schools.

The progress in musical education is shown by the increasing number of students who take advanced musical examinations. Since 1909 two have received the Degree of Bachelor of Music at Durham, and five have taken the first musical examination preparatory to this degree. Seven have received their diplomas as Fellows, and fourteen as Associates of the Royal College of Organists. Seven have passed the licentiate examination of the Royal Academy of Music in pianoforte playing.

A notable change in recent years has been the separation of the children of school age, from the adults employed in workshops on the same premises. In several instances this has meant the removal of the school from its contracted city quarters where there were no playgrounds, to large open sites in the country. The "School for the Indigent Blind," established in Southwark in 1799, has been removed to fine new buildings with ample grounds at Leatherhead, while the workshops for adults remained in London. The Elementary Department of the "Bristol School of Industry" was removed to new premises at Westbury-on-Trim in 1911. In Manchester and Birmingham it was found more convenient to remove the adult inmates to the country, and remodel the existing premises for the Elementary Department.

The counties of Norfolk, Suffolk and Cambridge opened a new School for the Blind and Deaf-Mutes at Gorleston in 1912.

The Kindergarten Branch of the Birmingham Institution at Harborne, and the Staffordshire Council School at Stoke-on-Trent, have erected shelters for open-air classes.

On account of the Employers' Liability Act, it is undesirable that any child who is to be regarded as weak-sighted rather than as blind, should be educated in a blind school. It is also a waste of time for such children to learn to read and write by the Braille system. Therefore, the London County Council have established experimental classes for children suffering from high myopia, the teaching being carried on jointly by the staff of the elementary schools and a special teacher. In the special class, the reading, writing and arithmetic are taught by means of large characters, written on a blackboard which runs round the classroom. The lid of each desk forms a smaller blackboard on which the children write their exercises, holding the chalk at arm's length. For oral teaching, they join with the normal children in the elementary schools; their manual training is given partly by the special teacher, and partly in the centres for cooking, carpentering, etc. of the Council Schools. In the scheme of work provided in these experimental classes, all work likely to be detrimental to the eye is eliminated.

There are at present 39 schools for blind children in England and Wales certified by the Board of Education, with accommodation for 2,355; the total number of day schools on the register for the year ending July 31, 1911, was 550.

The British and Foreign Blind Association has done new and valuable work since Mr. Henry Stainsby was appointed Secretary General in 1908. Mr. Stainsby was connected with the Birmingham Institution for the Blind for 28 years, as Secretary and General Manager. He brought to the work in London a comprehensive knowledge of the needs of the blind, an indefatigable zeal, and great organising and business capabilities. He has introduced many improvements in the method of printing books, which have largely increased the output. Formerly each page was damped before printing, and the drying process was cumbersome and lengthy. The books are now printed on specially made paper, which softens as it comes in contact with the electrically heated plates, and quickly hardens as it leaves them. When the first copy of the English Bible was printed in Braille (39 large foolscap volumes) every dot of the 6,000,000 letters was punched by hand on metal plates, but these plates are now produced by stereotype machines. The printing presses are driven by an electric motor, and the embossed plates open and close automatically to receive the paper. By the new method 6,000 pages can be embossed per hour, as against 320 by the old.

Mr. H. M. Taylor, M.A., F.R.S., Fellow of Trinity College, Cambridge, a member of the Executive Committee, has established a fund for the production of scientific books; each book is profusely illustrated by diagrams prepared under Mr. Taylor's supervision. The cost of a set of plates for one book averages £30 which shows the great expense incurred in producing books for the special needs of the blind. The recent publications include works on Astronomy, Botany, Geology, Physiology, Psychology, Chemistry, Electricity, Magnetism, Heat, Mechanics, and Acoustics. The Association issues four embossed Magazines, (Progress, a Literary Journal, a Musical Magazine, and Comrades for the Juveniles); the books, pamphlets, magazines, and papers published in 1911 amounted to 150,189.

In this connection must be mentioned the great increase in the circulation of books by

the "Incorporated National Lending Library." It now comprises between 15,000 and 16,000 volumes of general literature in Braille and Moon, and over 3,000 pieces of music. There is an Esperanto Section containing 221 volumes, as well as books in foreign languages. About 1,300 volumes are added annually, most of them transcribed by some 500 voluntary writers. During the last three years there has been a 20 per cent increase of individual subscriptions, and periodical consignments of books are sent to 34 Public Libraries, and to 48 Institutions. The postage on embossed books has been reduced in the United Kingdom, and the Postmaster General has promised to bring the matter of international reduction before the next conference of Postal Authorities at Madrid.

Between 1906 and 1908, seven Unions were formed of the existing Institutions, Societies, and Agencies for the Blind, in England and Wales. The Unions undertake to promote the general welfare of the blind, to enlist fresh sympathy on their behalf, and to befriend them in every possible way, so that no blind person shall be left uncared for. An important feature of their work has been the increased attention given to the prevention of blindness.

Ophthalmia neonatorum has been added to the list of notifiable diseases, and notification has been made compulsory in 29 metropolitan boroughs, 59 other boroughs, and 125 rural and urban districts—a total of 213, representing a population of 11,469,652. It is hoped that this notification will soon be compulsory throughout the United Kingdom. In 1908 Dr. Walker of Liverpool instituted the plan of at once removing the infant whose eyes were affected and the mother to a hospital. In 2½ years time, out of 434 cases of ophthalmia neonatorum that were treated, only seven became blind. In the potteries district of Staffordshire, as soon as notice is given, a nurse is appointed to visit the infant in the home. During nine months' experience, out of 75 cases, only 2 per cent became blind. If like results follow in all the boroughs where notification is compulsory, the number of blind children in the United Kingdom will rapidly decrease.

United States.—In America liberal provision has been made for many years for the elementary and secondary training of every blind child; including schools for the coloured, there are 45, and in some large cities the public schools have departments for blind children. The efforts of the newly appointed state commissions have been chiefly directed to registering the adult blind, and as far as possible providing employment for them. An active propaganda for the prevention of blindness has been started. In December 1910 a National Association for the Conservation of Eyesight was founded. Its aims are (1) the prevention of infantile blindness, (2) the prevention of blindness from industrial and other accidents, and from disease, (3) the conservation of vision through improved hygiene during school life and in industrial occupations. The presence at the first Conference of leading ophthalmologists, physicians, social workers, statisticians, representatives of civic and labour organisations, illuminating engineers, and representatives of Institutions and Societies for the Blind, give proof of its wide practical usefulness. The Russell Sage Foundation has made an appropriation for this field of work, and appointed an able secretary to organise committees throughout the United States. In many public schools labels are posted in all text-books giving directions for the care of the eyes in reading. The Massachusetts legislature has passed a bill empowering the State Board of Health to investigate industrial eye diseases, and to enforce the use of safety devices. It will not be long before other state legislatures do likewise.

The large city schools are removing to the country. The Pennsylvania School, opened in Philadelphia in 1833, has new buildings at Overbrook, and its grounds comprise 21 acres. The Perkins Institution at Boston, famous for the long continuance of Dr. S. G. Howe as its Director, has erected new buildings costing \$1,019,000 in a suburb of Boston, where 37 acres bordering on the Charles River were purchased. The Maryland School has been moved from Baltimore to a site in the country covering 92 acres. A new feature is the opening of homes for blind babies in Massachusetts, New Jersey, New York and Arizona.

Canada.—In Canada there are 3 schools, and a new one for the Protestant blind of the province of Quebec was opened in 1912. The building and grounds have cost \$100,000, and the money has been raised mainly by the efforts of Mr. Philip Layton, a graduate of the Royal Normal College for the Blind, Upper Norwood, England. (F. J. CAMPBELL.)

THE DEAF AND DUMB¹

The British Registrar General stated in October 1912 that the tabulation of statistics relating to deaf and dumb persons, as returned at the 1911 census, would not be complet-

¹ See E. B. vii, 88o *et seq.* Digitized by Microsoft

ed for some considerable time. It is therefore impossible to make any comparative statement as to the increase or decrease in the numbers of deaf people in the United Kingdom since 1901. But even if these figures were available, they might prove of little value, as the wording of the census question relating to deafness varies each decade, and in the last form was couched in language which will probably render it valueless. The information asked at the 1911 census was: "If any person included in this schedule is totally deaf, or deaf and dumb, state the infirmity opposite the person's name, and the age at which he or she became afflicted." Now total deafness, whether acquired or congenital, is comparatively rare, and even among the so-called "deaf and dumb" it is generally recognised that there are from 15 per cent to 25 per cent with a "useful" amount of hearing. The returns can only be misleading, unless indeed a supplementary enquiry be held, such as that conducted by the United States Census Bureau in 1906, in which a special schedule was sent to the 29,544 persons returned as "deaf" in the first enquiry, and further particulars in the form of replies to specific queries asked for. Mr. B. St. John Ackers, member of the Royal Commission on the education of the blind and deaf, and Chairman of the International Statistics Committee (on the Deaf), has pointed out¹ that "Statistics to have their full value, should not only be full, accurate and reliable, but should be on the same plan in all countries. This should apply both to census and school statistics." With this end in view, a "Form of Inquiry" has been compiled for adoption in all countries represented on the International Committee, and was issued at the end of 1912 to all the School Medical Officers in Great Britain. In this way it is hoped that better information may be secured.

The Report of the Chief Medical Officer to the Board of Education in England for 1910-11 gives the following figures: number of children examined in 23 educational areas, 122,854; percentage with slight defect in hearing, 2.7; marked defect 1.3; number of schools in England and Wales for the deaf, 48, with accommodation for 4,183 children, and average attendance 3,514. In Scotland there were 12 schools with accommodation for 1,014 children, and 714 pupils; in Ireland 4 schools with accommodation for 580, and 525 pupils.

From an inquiry into the training of 947 deaf children in six typical schools the report finds that 70 per cent are taught by the oral method, 10 per cent by mixed or combined systems, 10 per cent by pure manual alphabet, and 10 per cent by manual alphabet and gesture. The report states that about 80 per cent of the deaf children are normal mentally, and a comparison of the figures of the various schools and institutions shows that about two-thirds are being educated in residential schools, chiefly managed by private committees, and one-third are being educated in day schools managed entirely by the local authorities.

The most recent American return (*The Volta Review*, Feb. 1912) gives the following figures: number of schools for the deaf 148; total pupils 12,588; number taught speech 9,302 (73.9 per cent); taught wholly or chiefly by the "Oral" method 8,119 (64.5 per cent); taught by the Auricular method 158 (1.25 per cent).

In the opinion of the Chief Medical Officer in England, "the degree of knowledge, skill and tact possessed and exercised by the teacher are factors which do more to make or mar success in the case of the deaf than in the case of ordinary children;" and teachers of the deaf appear to have recognised the supreme importance of periodically reviewing the methods and plans for ameliorating the lot of the deaf child. The biennial conferences of the National Association of Teachers of the Deaf have focussed the attention of teachers and workers on behalf of the deaf on the necessity for advance in certain directions. The International Conference held in Edinburgh in 1907 was attended by representatives from the British Colonies and all countries where education of the deaf is properly organised, and at this gathering a full review was made of the methods adopted for dealing with the education of the deaf. In 1911 a very important conference was held at Manchester, under the presidency of Lord Sheffield, when resolutions were adopted: (a) in favour of provision for the higher education of the deaf; (b) the training of teachers for the deaf; (c) the compulsory education of the deaf in Ireland; (d) the modification of the questions concerning deafness in the next census schedule; (e) increased government grants to schools for the deaf; (f) the segregation of the feeble-minded deaf; and (g) the earlier compulsory education of deaf children.

An entirely new feature in the education of the deaf during the past three years has

¹ Report of the Manchester Conference on the Education of the Deaf, 1911.

been the establishment of classes for "hard-of-hearing" children at Glasgow, Bristol, Tottenham and London. The children admitted to these schools are too deaf to be dealt with even if placed in the front row of an ordinary class, yet they possess too much hearing and speech to warrant their inclusion in a class with the ordinary deaf child. They are therefore placed in these special classes or schools, and taught on "Oral" lines, utilising what residual hearing power they possess, and at the same time supplementing it by "lip-reading." As statistics in connection with all phases of deafness become more complete there will be a great extension in the provision for the education of this class of child, and this may lead to a more complete system of classification of children who are "educationally" deaf, *i.e.* too deaf to be taught with hearing children.

This question of classification received a great impetus from the discussion of the Danish system at the International Conference in 1907, and it is to some such modification of English methods that those interested in the education of the deaf look for a cessation of the war of systems. Steps in this direction have been made by the segregation of all backward and physically and mentally deaf children, from the L.C.C. Schools for the Deaf to the residential school at Homerton (London), and also by the establishment of "Clyne House School" for the backward deaf of the Manchester Institution. At Homerton the combination of other defects, such as total or partial blindness, with deafness, presents unique conditions for the study of psychological problems in conjunction with physiological abnormalities.

In February 1911 Mr. Macleod Yearsley, aurist to the London County Council, wrote a series of articles in the *Lancet* dealing with the conditions of the education of the deaf in London, and in making suggestions for classification for education on a physiological basis he strongly supported the feeling among teachers of the deaf in favour of "Earlier education," and recommended that Kindergarten Schools should be established to which deaf children from the age of three years upwards could be sent, and that by means of play, prattle about games, toys, and similar matters of infantile interest, the hereditary tendency to speech should be retained, and the habit of speech should be developed and utilised from these early years onwards. A reference to these articles in the "Educational Supplement" of the *London Times* (April-October 1911) led to a long correspondence, in the course of which the whole question of "systems" was again discussed by the Rev. Arnold Payne, Dr. Kerr Love and others.

In Great Britain the Elementary Education (Blind and Deaf Children) Act, 1893, makes the education of the deaf *compulsory* at seven, though grants are paid on their education from the age of five, when it is optional for local authorities to send such children to school, and provision for dealing with them has already been made at Manchester (where an Infant School and Home has been opened in connection with the Institution) at Fitzroy Square, at Moseley Road Deaf School, Birmingham, and under the L.C.C.; and other developments of the same kind are in contemplation at Doncaster and other places, following on the lines of the experimental schools at Boston, Chicago and Philadelphia.

The establishment in London in 1911 of "The National Bureau for Promoting the General Welfare of the Deaf" was a step of the greatest importance. The famous "Volta Bureau," established in Washington, D.C., by Dr. Graham Bell, with the money he received from the "Volta" prize for the invention of the telephone, is well known, and it is confidently expected that this National Bureau, founded through the generosity of Mr. Leo Bonn, will do for Great Britain even more than its American predecessor. Full particulars of the 60 schools and institutions for the deaf, the 60 or 70 missions to the adult deaf, and the 15 or 16 large organisations, all interested in the advancement of the deaf in various ways, have been filed at the Bureau, and the Council consists of representatives of every organisation working on behalf of this afflicted class, both in child and adult life. The main objects of the Bureau are (1) (Centralisation) to get into touch with and promote co-operation between all existing agencies; (2) (Information) to collect, classify, and disseminate information; (3) (Investigation) to promote investigation. Already statistics and particulars are being prepared relating to all branches of work among the deaf for publication, in a form easily accessible, and when public bodies and private individuals realise that complete and accurate information on all matters connected with the deaf may be obtained through the Bureau, it will become a "clearing house" for this branch of effort.

In a letter sent out to institutions and schools for the deaf in Great Britain, Dr. J. Kerr Love, Aural Surgeon to the Glasgow Infirmary, states: "By a curious coincidence the writer

has been asked by the two great bureaux which exist for promoting the welfare of the deaf, the American Volta Bureau, and the English National Bureau, to take up the question of the prevention of deafness. The requests came within a few weeks of each other, and were entirely unconnected. Only one conclusion can be drawn from this coincidence, *i.e.* that the time is ripe for the consideration of this large and important subject." In response to this request Dr. Kerr Love has given a series of lectures in London on the subject of the prevention of deafness, and the same subject has been dealt with in two articles by Mr. Macleod Yearsley in the *Lancet* (July 20 and 27, 1912). (F. G. BARNES.)

RELIGION

CHURCH OF ENGLAND AND ANGLICAN COMMUNION

Welsh Church Commission.—The Royal Commission appointed in 1906 to "inquire into the origin, nature, amount and application of the temporalities, endowments and other properties of the Church of England in Wales and Monmouthshire, and into the provision made and work done by the churches of all denominations in Wales and Monmouthshire for the spiritual welfare of the people and the extent to which the people avail themselves of such provision," did not report until December 1910. It then presented majority and minority reports. The former was signed by seven of the nine Commissioners, five of whom gave a qualified adhesion to some of the opinions of their colleagues. The Commission received a mass of evidence as to the finances and the numerical following of the Church as compared with the Nonconformist bodies. The statistics presented on behalf of the Church showed that the actual number of communions made at Easter rose from 134,000 in 1905-06 to 144,000 in 1908-09 and that the total number of persons upon all the Welsh communicant rolls was, in the latter year, 193,000. These returns were based upon lists for each parish, with the name and address of each communicant. The Nonconformist lists of "full members" gave the Congregationalists 175,000, the Calvinistic Methodists 170,000, the Baptists 143,000, the Wesleyans 40,000 and the smaller Protestant denominations 19,000 among them. Other figures prepared on behalf of the Church showed that in every diocese in Wales there had for many years past been a constant and substantial increase in infant baptisms, confirmations, and Sunday-school scholars, and that in most cases the numbers had grown in a larger proportion than the population, the inference being that the Church was expanding by conversions from Nonconformity. In the diocese of Bangor, where the population decreased, the Church communicants increased. The Commission found that the Church in Wales provided 1,546 churches and mission-rooms, with seating accommodation for 458,917. The officiating clergy numbered 1,597—968 incumbents, 561 curates and 68 others. There were 2,303 English services, 1,103 Welsh services, and 228 bilingual services every Sunday. The seating accommodation provided by the Church in Wales was 22.8 per cent of the population, a fraction above the percentage for England and Wales together. The accommodation in the Nonconformist places of worship provided for more than double the total of Nonconformist adherents; the chapel-building debt of the Calvinistic Methodists amounted in 1906 to £668,000, and of the Congregationalists to £318,000. On the other hand the Church accommodation failed to keep pace with the increase of the population. Between 1831 and 1906 the population increased 91 per cent, but Church sittings by only 71 per cent. Resident clergy, however, grew by 111 per cent and regular Sunday services by 176 per cent. Much controversy arose as to the accuracy of the figures presented on the one side or the other, but in the end it appeared to be clear that the Church of England was numerically the largest single religious body in Wales. The Commission found the total gross endowments of benefices in Wales in 1906 to be £242,669. (A Parliamentary Return issued in November 1912 showed it to be then £260,037.) Of this sum £135,980 is income of endowments believed to have been in existence in 1703; £37,344 is income derived from Queen Anne's Bounty; £49,669 is income derived from the Eucharistical Commissioners; £19,672 comes from private gifts since 1703. In 1905-06 voluntary contributions were £48,972 towards clerical stipends; £62,261 for church expenses or church maintenance; £68,853 for church building and burial grounds.

Welsh Disestablishment.—Without waiting for this report the Government in 1909 brought in a bill for the disestablishment and disendowment of the church in the four Welsh dioceses and the county of Monmouth, generally similar in its provisions to the bill of 1895, but withdrew it after the first reading. The date after which private benefactions were to be exempt from the operation of the measure was fixed at 1662, instead of 1703 as in the former bills. It was argued on the side of the Church that the bill would take away eighteen-and-sixpence in the pound of the endowments. These funds were to be used for the provision of libraries, technical institutes, public halls, hospitals, dispensaries, convalescent homes, etc., for which no provision is made from public funds. In April 1912 a fresh disestablishment and disendowment bill was introduced which admittedly took away thirteen-and-fourpence in the pound of the endowments. Under this measure the vested interests of incumbents were preserved for their lives, instead of during their tenure of office, and the Ecclesiastical Commissioners and Queen Anne's Bounty were empowered to continue paying to the Welsh Church their existing allowances of £68,600 a year, which the bill of 1909 forbade them to do. A representative body was to be formed to receive and administer the whole of the property left to the church. The parliamentary proceedings in connection with the bill are dealt with elsewhere (Part II. UNITED KINGDOM: *History*).

Prayer-book Revision.—The Royal Letters of Business first issued in 1906 and since renewed to the two Convocations enjoining them to consider "the desirability and the form and contents of a new rubric regulating the vesture of the ministers of the Church at the times of their ministrations, and also of any modification of the existing law relating to the conduct of divine service, and to the ornaments and fittings of churches" were still under consideration at the end of 1912. The proceedings under these injunctions are necessarily slow and complicated. Each of the four Houses of Convocation has appointed a committee to draw up proposals, each of which has to be debated in public session; the two primates have, moreover, undertaken that the proposals finally accepted by the Convocations of the Clergy shall be submitted in the end to the Representative Church Council, which consists of the four Houses of Convocation and the two Houses of Laymen. Thus six bodies, four of them with powers of legislation dependent upon Parliamentary sanction, and two which have no power to do anything but debate, have to accept every proposed emendation of the Prayer-book. Many of these emendations are merely verbal; others raise questions the most sharply controverted between sections of opinion in the Church. The recommendations reached by the Convocations can therefore be regarded only as provisional, since alterations supported by the whole body of the Church must necessarily be regarded by Parliament with far greater respect than those upon which there is acute controversy. The sharpest of these controversies has raged round the Athanasian Creed, of which a new translation, prepared at the request of the Archbishop of Canterbury, was published in 1909. In the same year Canterbury Lower House resolved that the Creed should be retained in the Prayer-book without the existing rubric, and that provision should be made for its use without the warning clauses. York Lower House decided that no change ought to be made in the use of the *Quicumque Vult*. York Upper House, on the other hand, favours the retention of the Creed in the Prayer-book but desires that it should no longer be recited in public worship, and that if its public use be continued it should be obligatory only on Trinity Sunday. The question of vestments has caused an almost equally definite division of opinion. In 1909 the York Upper House recommended that the bishop should have power, under safeguards, and in parishes where it was thought desirable, to sanction the use of alternative vestments in the Holy Communion, provided that they should all be white, and in 1912 the House voted equally for and against this arrangement, the Archbishop of York refraining from giving a casting vote in favour on the ground that the final step had not been reached. The Committee of York Lower House has also reported in favour of alternative vestments, but without limitation of colour. York Upper House has decided in favour of a book supplementary to the Prayer-book containing alternative lessons and psalms, forms of prayer and thanksgivings for

special occasions, and alternative and additional forms of service, the Communion Office to remain untouched. Upon another much controverted question, the Communion of the Sick, Canterbury Lower House decided that it should be lawful for the priest to set apart at the public Communion a sufficiency of the consecrated elements for the communion on the same day of such sick persons as may not desire a separate celebration. Canterbury Lower House decided in 1911 that while it is undesirable to alter the Ornaments Rubric, provision ought to be made for a diversity of use as regards the wearing of vestments at the Holy Communion. In November 1912 the Lower House of both Convocations refused to modify the question put to deacons at their ordination, "Do you unfeignedly believe all the Canonical Scriptures of the Old and New Testaments?" In one or other of the four Houses of Convocation numerous minor amendments in the Prayer-book have been approved. Many of them have been hotly contested, both of the extreme wings in the Church being opposed to revision, either entirely or save within very narrow limits. The High Church party has issued a "Declaration" setting out an "irreducible minimum" of demands, which comprise the preservation of the Ornaments Rubric and the Athanasian Creed, and the Rubric requiring that no person shall be admitted to communion who is unconfirmed or is not desirous of being confirmed. Other demands are the restoration of the unbroken Canon, the provision of a form for the anointing of the sick, the sanctioning of continuous reservation and direct prayer for the dead. The Archbishop of Canterbury has appointed a committee of liturgical experts to advise on proposed alterations in the Prayer-book. Canterbury Lower House in 1912 approved the retention of the existing course of the Psalter, but later asked the Primate to procure an "authoritative revision of the Psalter for use in Church." In Canada a Committee of General Synod has been appointed to consider "Prayer-book adaptation and enrichment;" in South Africa various experimental modifications of the Prayer-book are in use; the Churches of China and Japan are also contemplating revision.

The Scottish Revision.—Meanwhile the Church in Scotland has actually revised its Prayer-book. In 1910 the Episcopal Synod prepared a revised Scottish Communion Office, and in the same year the Consultative Council on Church Legislation prepared a schedule of permissible additions to and deviations from the Book of Common Prayer. After extensive discussion the new and revised forms were finally sanctioned and came into operation in a permissive form in 1912. In the Communion Office according to both the English and the Scottish rite, either of which may be used in Scotland, the Commandments may be omitted, and replaced by Our Lord's brief Summary of the Law. The Collects for the King may also be omitted. When there are many communicants the words of administration may be said once, the first half of the words only being recited to each person. New Proper Prefaces have been provided for festivals which hitherto lacked them, and for marriages and funerals. Proper Lessons are prescribed for the Evensong of Festivals, and other special occasions. Considerable freedom is accorded in the use of the Psalter, and there is now power, with the bishop's consent, to omit the Litany altogether on the three great festivals. The concluding portions may be omitted at other times, but on the other hand new suffrages have been added for the King's forces, for Missions and for Parliament. A variety of additional prayers for special needs have been added, together with commemorations of the dead. In the Marriage Service the exhortation has been altered and abbreviated, and there are alternative Lessons in the Burial Service. A committee has been appointed to consider the propriety of a thorough revision of the Psalter and Lectionary.

Reform of Church Finance.—The chaotic condition of the finances of the Church of England, the overlapping and waste of effort resulting from innumerable more or less isolated endeavours to accomplish a given end, the existence of many Societies with aims and policies of their own, led in 1909 to the appointment of the Archbishops' Committee on Church Finance. After more than two years inquiry and deliberation this Committee reported in 1911. The key-note of the report is the recommendation that the diocese and not the parish should be the unit of Church life and that respon-

sibility for the work of the Church should be brought home to every member. Among many instances of overlapping and lack of organisation mentioned by the Committee perhaps the most striking is the fact that there are over eighty separate societies seeking to provide for the needs of poor clergy. They insist that the underpayment of the clergy and the lack of provision for their superannuation discourages recruits for Holy Orders and that the laity have withheld support from Church funds on account of the lack of business-like administration. They further point out the singular circumstance that, since the Church of England has no corporate existence, it is unable to hold property; there may be, and are, innumerable parochial and diocesan funds, and a vast number of voluntary societies all of which have a legal existence, whereas the Church itself, *quâ* Church, has none. The Committee recommended that there should be an Incorporated Board of Finance in every diocese, elected by and affiliated to the Diocesan Conference, with a permanent secretariat. This Board is to arrange a system for the assessment of every parish according to its means and population in such a way that every individual is brought under contribution. There would be a Central Incorporated Board of Finance, attached to which would be a Central Building Loan Fund, on the lines of the Funds already existing in two or three dioceses; a Council of Maintenance of the Clergy; a Central Pensions Council, and a Central Advisory Council of Training for the Ministry (the last-named was established by both Convocations in November 1912). These general provisions include arrangements for recruiting and training ordination candidates who are unable in whole or in part to provide the cost of their own education; for maintaining the ministry by the endowment and augmentation of benefices etc.; for the provision of clergy pensions of not less than £100 per annum, especially for those invalidated after twenty years' work in Great Britain; for providing for the widows and children of the clergy and making grants to clergy in difficulties through misfortune; for the erection of new churches and other parochial buildings, and the repair of those already existing. These recommendations have been discussed by the Representative Church Council, the Houses of Laymen, the Diocesan Conferences and other deliberative assemblies, and have, on the whole, been received favourably; the least popular provision is that for the assessment of parishes. In many Dioceses preliminary, and in some extensive, steps have been taken towards carrying out the proposals.

Increase of the Episcopate.—During the last four years the movement for the division of unwieldy dioceses has acquired increased momentum. It is proposed to divide the Diocese of Oxford into three portions, roughly co-extensive with the three counties—Oxford, Berkshire and Buckinghamshire—of which it mainly consists, with new see-towns at Reading for Berkshire and at Aylesbury for Buckinghamshire. Steps are being taken to secure an endowment for a Diocese of Coventry, taken out of the straggling See of Worcester, which has already been relieved of Birmingham and its immediate district. It is hoped to create a third new Midland diocese, with its seat at Stoke-on-Trent or Stafford, for the relief of Lichfield, with an ultimate further division of that diocese by the erection of Shropshire into a See of Shrewsbury. Further North preparations for separating Sheffield and its district from York are well advanced. The division of the Diocese of Winchester, rendered exceptionally difficult by the impossibility of a bishop with a reduced income living at Farnham Castle, is under consideration. The rearrangement of the East Anglian sees, under which Suffolk will be taken from Norwich and Essex from St. Albans, is almost ready to take effect. These plans are, however, hampered by the failure of Parliament to pass the Bishops' Bill, a measure enabling new dioceses to be created by Order in Council without the necessity for an application to legislation in each case. Meanwhile the increasing necessity for episcopal supervision is being clumsily and inadequately met by the creation of additional suffragan-bishops, which are now almost as numerous as substantive dioceses. Thus the three dioceses of which Greater London consists—London, St. Albans and Southwark—have among them eight suffragans. Between 1909 and 1912 five suffragan bishoprics were created: Lewes (Chichester); Stafford (Lichfield); Taunton (Bath & Wells); Willesden (London); and Whalley (Manchester).

The Church in the Empire and Abroad.—During the last four years there has been great activity in the Church of Canada, in consequence of the enormous influx of English settlers, especially into the North-West Provinces. The first service of the English Church in what is now the Dominion was held at Annapolis Royal in 1710, and the bicentenary was marked by the opening of a new Cathedral at Halifax, Nova Scotia. To meet the strain of a rapidly growing population unable to provide for its own spiritual needs the Archbishops' Western Canada Fund was established in 1910 for the provision of men and money to meet these needs, and the Rev. W. G. Boyd, one of the chaplains of the Archbishop of Canterbury, went out at once with five clergy and four laymen, and others have followed. On the whole, however, the response both in men and money has been disappointing. In 1912 a Mission of Help was sent to the Province of Rupert's Land. In 1911 British Columbia was erected into a Province, and in October 1912 it was decided that instead of one Province for the whole of Canada east of Manitoba, a new Ecclesiastical Province of Ontario should be formed, to include the Dioceses of Ottawa, Algoma, Huron, Niagara, Ontario and Toronto. There are consequently now four Canadian Provinces. In Australia the serious "Question of the Nexus" arose in 1912. Distinguished counsel have stated their opinion that the Church in Australia is an integral part of the Church of, and in, England and that it is bound by the judgments of the Judicial Committee of the Privy Council. A powerful movement in the direction of independence has been set on foot, but considerable opposition has been manifested to any disturbance of the *status quo*. A more local yet important disturbance of harmony was caused by a question of vestments at Sydney in 1910. The only churches in that city in which vestments were used were St. James's and Christ Church, and the incumbencies of both fell vacant within a few months of each other. The Archbishop of Sydney refused to institute any clergyman who declined to give an undertaking not to use, or allow to be used "the chasuble or other vestment in any church under his charge until, in the judgment of the Archbishop of Sydney for the time being, they have become legal." In each case this requirement caused a long delay in making an appointment, and the incident produced a serious division of opinion in the Diocese. The first portion of Brisbane Cathedral, which when completed will have cost some £200,000, was consecrated in 1910. A Mission of Help was sent from England to New Zealand in 1911. In India the most important subject which has engaged the attention of the Church is the position of the Eurastians, whose education has been greatly neglected. Roman Catholic and Nonconformist schools have provided for large numbers of what is now called the Domiciled English Community, and it is thought desirable that this leakage should be reduced. Accordingly special funds are being raised for improving and strengthening the Anglican schools in the great centres of population. In consequence of the intended removal of the capital to Delhi the Provincial Synod of Calcutta has prepared a memorandum suggesting the formation of two new Archbishopsrics—one of Madras to include the Sees of Madras, Tinnevely, Travencore, and Colombo; and another of Delhi to include Delhi, Lahore, Lucknow, Bombay and Nagpur. In 1912 a native priest was, for the first time, raised to the Episcopate, the Rev. V. S. Azariah being appointed assistant bishop of Madras. In South Africa a new Diocese of George, taken out of the Sees of Capetown and Grahamstown, was created in 1911, and in 1912 the Diocese of Kimberley and Kuruman, taken out of the Diocese of Bloemfontein, was formed; in 1912 Khartum Cathedral was consecrated. In 1909 the Missionary Church in China constituted itself under the title of "The Holy Catholic Church of China," and in 1912 the Church in Japan took a similar step.

Miscellaneous Events.—During the period under review two important events, one affecting the discipline, and the other the doctrine of the Church of England, have occurred. The first turned upon the interpretation of the Deceased Wife's Sister Marriage Act of 1907, and led to the suits of *Banister v. Thompson*. The plaintiff married his sister-in-law in Canada, where he had no domicile, under the Colonial Act before the passing of the English Act and was refused communion by his vicar, the defendant. The Court of Arches found in 1908 that the passing of the Act of 1907 validated the

marriage as a civil contract, and that therefore the parties could not be repelled as "notorious evil livers," to use the language of the Rubric which the defendant held to justify his refusal. The High Court by a majority upheld this decision, which was endorsed by the Court of Appeal, and confirmed by the House of Lords in June 1912. In 1911 the Rev. J. M. Thompson, Fellow, Tutor and Dean of Divinity of Magdalen College, Oxford, published *Miracles in the New Testament*, which produced an animated controversy. In the result the Bishop of Winchester, as Visitor of the College, withdrew Mr. Thompson's licence as Dean of Divinity on the ground that the book denied the articles of the Creed affirming the Incarnation and the Resurrection. In 1911 the Church of England took part in the undenominational World Missionary Conference at Edinburgh. The Standing Committee of the S.P.G. decided in 1908 not to be officially represented at the Conference, but reversed its attitude in 1910. In reply to a remonstrance from a large number of the members the Committee affirmed its determination "to uphold in all parts of the mission field the principles, order, discipline, doctrine and sacraments of the Church." In 1908 the Rt. Rev. A. H. Mathew was consecrated by the Old Catholic Church of Holland as Bishop for the Old Catholics in England, and at first much sympathy was expressed among those members of the Church of England who had long been anxious for an Anglican-Old Catholic *entente*; but when Dr. Mathew a year or two later declared against the validity of English Orders the budding understanding died a sudden and violent death. The movement for inter-communion with the Swedish Church had a happier issue. In 1911 a committee appointed in accordance with the desire of the Lambeth Conference of 1908 reported that the Church of Sweden was a true Episcopal church and recommended the admission of its members to communion at English altars. The Church Congress kept its Jubilee in 1910 at Cambridge, the place of its birth. One of the most important results of the Lambeth Conference of 1908 has been an increased interest in the spread and efficiency of Sunday Schools, and the Bishop of London in 1911 established a Sunday School Council and appointed a Director of Sunday Schools. When this example has been generally followed it is reasonably believed that the Sunday Schools of the Church, which in many places are conducted upon old-fashioned and ineffective lines, will become valuable aids to the spread of Churchmanship. The dissatisfaction of the unbeneficed clergy with their status generally, and especially with their exclusion from representation in, or the right to vote for, the Convocations has led to an organised attempt to obtain these things, and to make curates diocesan rather than parochial officers. During the past four years the magnificent undertaking of building a cathedral at Liverpool—only the second Anglican cathedral erected in England since the Reformation, the first being Truro—has made substantial progress. The lady chapel was consecrated in 1910, and other large portions of the work are in hand. Winchester Cathedral, which in 1906 was found to be in imminent danger owing to the insecurity of its foundations, has been completely underpinned and, in effect, floated upon a bed of concrete, at a cost of £115,000. The work was completed and Thanksgiving services held in 1912. The important church of Selby Abbey, which was almost completely burned in 1906, has been rebuilt and was reopened in 1909; additions have since been made which have practically restored it to its pristine condition.

(J. PENDEREL-BRODHURST.)

THE ROMAN CATHOLIC CHURCH, 1910-1912

1910.—The death of King Edward VII in 1910 revived, and in an acute form, the old controversy in England about the Royal Declaration, with its antiquated terms of vituperation against Roman Catholic beliefs. At first it seemed that the Roman Catholic demand for remedial legislation would have to be met by the same plea which had proved fatal to the hopes of Cardinal Vaughan in 1901. At that time Lord Chancellor Halsbury in reply to a question put to him by the Catholic Peers, explained that only Parliament could modify the Declaration, and that the making of the Declaration was a condition precedent to legislation. The Bill of Rights required that the Declaration should be made either at the

**British
accession
oath.**

Coronation or "on the first day of the meeting of the first Parliament next after his or her coming to the Crown." In this reply it was assumed that the Parliament which met on February 14, 1901 was the first Parliament in the reign of King Edward. In 1910 a different view prevailed. It was successfully contended that the last Parliament elected under King Edward, and sitting at the time of his death, continued to be a Parliament of the old reign, and therefore was not "the first Parliament next after" the accession of George V. There was, therefore, plenty of time to amend, or to abolish, the Declaration. On their side the Roman Catholic body did all they could to facilitate legislation by making it clear they had no wish in any way to weaken the existing securities for the Protestant succession. All they asked was that the fundamental doctrines of their faith should no longer be selected for special repudiation by the sovereign. In these circumstances, Mr. Asquith had no difficulty in inducing the House of Commons to substitute a new formula, by which the king simply declared himself a faithful Protestant, prepared to uphold the Protestant succession. A bill giving effect to this change was passed on August 3, 1910.

In September 1910, for the first time, the International Eucharistic Congress was held in the New World. As the most Catholic city in the British Empire, Montreal made great efforts to welcome the Papal Delegate, Cardinal Vincent Vanutelli. The national, provincial and municipal authorities all worked together for the success of the greatest Roman Catholic demonstration ever held in Canada, or indeed in the American hemisphere. The culminating scene was the mass said by the Cardinal Legate in the open air, at an altar built on the slopes of Mount Royal. The next day a vast procession, headed by the Cardinal Legate carrying the sacred host, passed through the streets of the festooned city to the same spot. It is estimated that 50,000 people, including the Canadian Prime Minister and other members of the Government, and representatives of every phase of the public life in Canada, walked in the procession three and a half miles to the mountain side, where a crowd of 200,000 men and women were waiting the Benediction of the blessed sacrament. The success of the Congress from the Roman Catholic standpoint is sufficiently attested by the emotional declaration of the Archbishop of Montreal, Monseigneur Bruchesi, at its close: "To me it seems like a dream, for the like of that demonstration ending to-night was never seen before, and probably never will be seen again in this or in any other country." Unfortunately some of the speeches and sermons were of a rather flamboyant nature, so that a good deal of anti-Catholic feeling was aroused.

On August 8, 1910 an important decree of the Sacred Congregation of the Sacraments was issued in Rome, fixing the age at which children are to make their first communion. A child must begin to go to confession and communion when it begins to use its reason, that is "about its seventh year, or later, or even sooner." The decree goes on to prescribe frequent communion for children in these words: "Those who have charge of children must take the utmost care that after their first communion the said children should approach the holy table very often, and if it be possible, even daily."

The solemn consecration of Westminster Cathedral in London took place on Tuesday, June 28, 1910. At the beginning of the year the debt on the Cathedral had been £7,340, and this had to be paid off before the building could be consecrated. A special appeal was made to the Roman Catholic public, and before the end of April it was cleared off.

In Belgium, the elections in May 1910 for half the Chamber kept the Catholic party in power. They lost one seat at Nivelles, but returned with a majority of six. As in Belgian election. Belgium there are no such things as by-elections, this majority though small was sufficient.

In August 1910 Pius X, in a letter addressed to the archbishops and bishops of France, condemned the principles which underlay the teaching of the organisation known as *Le Sillon*. Founded about 1898 by M. Marc Sangnier, *Le Sillon* represented a democratic movement at once social, political and religious. Described as "more

advanced than Socialism," it at once made a strong appeal to the Roman Catholic masses, and soon spread over France. The Archbishop of Albi, writing in its defence, claimed that it represented an effort to "break down the prejudices which separate the majority of Republicans from Catholicism, to overcome the anti-clericalism which claims a monopoly of democratic zeal, and to destroy the association of ideas which in France seems to identify social progress with irreligion." But the extreme democratic theories advocated by some of the members of *Le Sillon*, and their indifference to ecclesiastical authority, soon got the organisation into difficulties. Cardinal Andrieu, the Archbishop of Bordeaux, being specially emphatic in his warnings. It was accused of substituting a vague philanthropy for religion, and the service of Man for the service of God, and teaching that all forms of government should be condemned which are not directly dependent upon the people. Pius X called upon the leaders of the movement to stand aside and to give place to the bishops. Its members were invited to group themselves in diocesan associations. "For the moment these diocesan groups will be independent of each other; and to mark clearly their break with the errors of the past, they will take the name of Catholic *Sillons*, and each of their members will add the word *Catholic* to his title of *Sillonist*." The founder of *Le Sillon* a few days later announced his withdrawal from the direction of the movement.

1911.—At the beginning of 1911 the Sacred College of Cardinals had only forty-six members, and the work which devolved upon the Cardinals living in *Curia* had become very heavy. Seventeen new cardinals were created at a consistory held in Rome in October. As had been generally anticipated in England the red hat came back to Westminster, and on the 27th of November Cardinal Bourne became Titular of S. Pudenziana, one of the most venerable of all the sanctuaries of Rome. The other new cardinals were Archbishop Farley of New York, and Archbishop O'Connell of Boston, and Monseigneur Falconio, Apostolic Delegate at Washington, who though Italian by birth is a naturalised American citizen; Archbishop Cos y Macheo of Valladolid, Archbishop Amette of Paris, Archbishop Dubillard of Chambery, Bishop Cabrières of Montpellier, and Father Billot the Jesuit Professor of Dogma at the Gregorian University in Rome, Archbishop Nagl of Vienna, and Archbishop Bauer of Olmutz; Holland received a representative after a long interval in the person of Father Van Rossum; the diplomatic service of the Holy See supplied two names to the list—those of Monseigneur Vico, the nuncio at Madrid, and Monseigneur Granito di Belmonte, formerly nuncio in Vienna and more recently the envoy of the Pope to the Coronation of King George V; finally three members of the Roman Curia, Monseigneur Bisleti, for many years Maestro di Camera and Majordomo, Monseigneur Lugari, one of the assessors of the Holy Office, and Monseigneur Pompili, secretary of the Congregation of the Council. Before the consistory the proportion of Italian to non-Italian cardinals was 28 to 18, after it the proportion became 33 to 30.

The consistory was made memorable in the history of the Church by reason of the oath taken by each of the new cardinals pledging himself to disregard the right of veto over the election of the Pope claimed by the Catholic Powers, and commonly believed to have been successfully used by Austria to exclude Cardinal Rampolla from the Papacy. The oath repudiated in emphatic terms the interference of lay Powers.

In October 1911 two new ecclesiastical provinces were created by the Holy See in Great Britain, those of Liverpool and Birmingham. Something of the sort had long been expected. The province of Westminster, under an archbishop with fifteen suffragans, was an anomaly in the Church. Under the new arrangement the dioceses of Northampton, Nottingham, Portsmouth and Southwark are grouped with Westminster; with Liverpool go Hexham and Newcastle, Leeds, Middlesbrough and Salford as suffragan sees; while with Birmingham are associated the sees of Clifton, Menevia, Newport, Plymouth and Shrewsbury. At the same time the Holy See was careful in several ways to safeguard the position of pre-eminence which had so long belonged to the see of Westminster. Its archbishop is the permanent president at all meetings of the whole hierarchy, and it rests with him to summon such

**Le Sillon

sees.**

meetings. He takes precedence of the other archbishops, and is entitled to the use of the pallium and the throne, and to have the archiepiscopal cross carried before him in all parts of England and Wales. Finally to the archbishop of Westminster is entrusted the duty of representing the wishes of the whole hierarchy whenever it is necessary to approach the civil authority. To the archbishops of Birmingham and Liverpool were given all the rights and privileges ordinarily belonging to metropolitans.

By a decree of April 20, 1911 the Portuguese Government declared the separation of the Church from the State. After confiscating ecclesiastical property to an estimated value of several millions, the Republican Government handed over the control of public worship to associations of laymen. Priests were declared ineligible. It was made illegal to read a bishop's pastoral in church, or to publish it in any way without the previous permission of the Government. Processions were interdicted, and the clergy forbidden to wear their cassocks in the streets. Young ecclesiastics before they begin to study theology are required by the new law to attend the public lycées, in which the text books and the professors are selected by the Government. Finally no priest is allowed to exercise his functions if he holds a degree in any sacred science conferred by a university founded by the Holy See. In an Encyclical Letter addressed to all the bishops throughout the world in communion with the Holy See, and dated the 24th of May, Pius X protested against this violation of the Concordat, and at the same time congratulated the Portuguese bishops on their faithfulness under trial and their constancy under persecution.

In the United States the Golden Jubilee of Cardinal Gibbons' priesthood, and the Silver Jubilee of his episcopate, were celebrated in Baltimore in June 1911, with almost national rejoicings. Among those present to do honour to the occasion were President Taft, Vice President Sherman, Mr. Roosevelt, the Governor of Maryland, the Chief Justice of the United States, the British Ambassador, the Speaker, a score of Senators and three times that number of Congressmen.

The Sacred Consistorial Congregation at Rome, at a general meeting held on February 23, 1911, considered the doubt whether the decree "Maxima Cura" issued in August of the previous year, applied to Great Britain and North America. The answer in both cases was in the affirmative. The effect of the decree is to abolish the distinction between permanent and removable rectors. No rector of a parish or mission is any longer liable to be removed from his post *ad nutum episcopi*. The hands of the bishops however are strengthened in the case of those who were formerly known as permanent or missionary rectors. The decree sets out nine causes which may justify administrative removal. Each case is to be considered by the bishop and two examiners who are to be chosen jointly by the bishop and the chapter. An appeal from this disciplinary council lies to a court consisting of the ordinary, and two parish priest consultors, who must be different from the two examiners previously engaged in the case.

In July 1911 a *Motu Proprio* was issued in Rome limiting the number of the week-day holidays of obligation throughout the church to eight—Christmas Day, the Circumcision, Epiphany, Ascension, Immaculate Conception, Assumption, SS. Peter and Paul, and All Saints. The result, as far as England is concerned, is to reduce the number of holidays of obligation by one. The feast of the Immaculate Conception was never a holiday of obligation in England, and the feast of Corpus Christi ceases to be one. In the same way the feast of St. Patrick ceases to be a holiday of obligation in Ireland.

1912.—In view of the fact that, at both the general elections in January 1910 and December 1910, the members returned to the British House of Commons represented a majority in favour of denominational education (the Irish members and the Unionists being in agreement in this respect), the Catholic body had some reason to expect a cessation of Liberal Nonconformist hostility in regard to their schools. The old attacks, however, were renewed this year under cover of a bill introduced by Sir George Marks,

**Separation
in Portugal.**

Gibbons'
Jubilee.**

**"Maxima
Cura"
decree.**

**Church
holidays.**

which sought to suppress denominational schools in single-school areas. Under the bill, in those areas the only schools to be recognised for maintenance from public funds were to be the Council schools, in which teachers were to be appointed without regard to their religion. To facilitate the change, denominational schools were allowed to be taken over in consideration of a capital sum or annual rental. In that case, certain hours might be set aside for the giving of denominational instruction, provided that it was not given by the teachers of the school. The bill passed its second reading on the 8th of March, and received the support of a section of the Nationalist members. From the English Roman Catholics the bill met with uncompromising opposition from the outset. At their annual meeting in Low Week the English bishops endorsed a resolution passed a few days before by the Catholic Education Council, in which the bill was condemned as "fundamentally unjust" inasmuch as "it seeks to deprive our children in certain districts of the distinctive education we have provided for them; it would prevent the establishment of Catholic schools in the so-called single-school areas, with Catholic education where they may be sufficient numbers to warrant it; and it again seems to create a position of privilege for Cowper-Temple education." The resolution ended with a declaration that the bill should be "strenuously opposed." The bill was referred to a standing committee but its fate was already sealed. When the word "Where" at the beginning of the first clause had been passed, the whole bill was abandoned.

To the state of feeling aroused by the Home Rule controversy, specially in the North of Ireland, must be attributed the very unusual attention paid by the British public to two Papal documents, the *Quantavis diligentia*, commonly spoken of as the *Motu Proprio*, and the *Ne Temere*. The former was in fact a very harmless document setting at rest a point which had long been in dispute among canonists with regard to an old Decree of 1869, by which Catholics were censured who caused clerics to appear before the civil courts *praeter canonicas dispositiones*. The point in dispute was whether the prohibition applied to the individual plaintiff or to the legislative and judicial authorities. Owing to a misunderstanding of the Latin text, it was announced in some of the Dublin papers that the Pope had forbidden Catholics to bring a priest before the civil courts "without a canonical dispensation." But *praeter canonicas dispositiones* means only "contrary to the provisions of canon law." In other words, Catholics are required before bringing a priest into court, to comply with the rules laid down by canon law. It is not necessary here to consider in detail what those rules are, because the decree of 1869 does not apply either to the British Isles or the United States. To put the matter briefly: in the few countries to which the decree applies, an aggrieved Catholic is required, before bringing a priest into a secular court, to approach the bishop, and so try to get the dispute settled amicably. If the bishop cannot bring about a friendly settlement, he is bound to allow the case to go into the civil court. But the decree, which in 1912 was forty-three years old, applies only to countries in which the *privilegium fori*—the ancient custom by which the clergy were tried in their own courts—still prevails. That state of things has not existed in the British Islands since the Reformation.

The *Ne Temere* decree, on the other hand, raised serious issues affecting every country in the world, except Germany, and certainly was among the causes which contributed to the defeat of Sir Wilfrid Laurier's government in Canada, at the general election in September 1911. The object of this decree, which came in force throughout the Catholic world on Easter Sunday 1908, was to unify the canon law relating to marriage. Its effect was to simplify, and in some important ways to make less stringent, the legislation of the Council of Trent against clandestine marriages. Henceforth a marriage which is Catholic or mixed must be celebrated in the presence of the parish priest, or the ordinary, of the place where the ceremony is performed, and in the presence of two witnesses. This rule has no application to marriages contracted by non-Catholics between themselves, but a Catholic must be married in accordance with the Catholic form, whether the other contracting

Proprio
decree.**

**"Ne
Temere"
decree.**

party be a Catholic or not. The essential difference between the new law and the old, between the legislation of Trent and the *Ne Temere*, is that, while the former made it necessary that every marriage should be contracted in the presence of the parish priest of one of the parties, the latter requires the presence of the parish priest of the place in which the marriage is solemnised. In the famous Hebert case in Canada, the marriage of two Catholics who had been married in the Province of Quebec by a Protestant clergyman was declared void, first by an ecclesiastical tribunal, and then by a civil court. The marriage was in any case canonically void, because the law of the Council of Trent, requiring the presence of the parish priest of one of the parties, prevails in Quebec, and had not been complied with. The decision in the civil court was based upon the belief that, upon the issues raised, the law of the Church and that of the State are identical. The case was still in November 1912 waiting the decision of the Superior Court in Montreal on appeal. The *Ne Temere* had nothing to do with this case one way or the other. But the public controversies to which the Papal Decree had given rise had inflamed public opinion, and the Hebert case became a party watch-word. While the Liberals were still in power in Canada great pressure was brought to bear upon Sir Wilfrid Laurier to induce him to bring in a bill in the Federal Parliament imposing a uniform marriage law in all the provinces. It would have meant a struggle full of peril for the peace of the Dominion, and Sir Wilfrid Laurier refused to consider the question, on the ground that in the opinion of the minister of Justice, Sir Allen Aylesworth, the legislation asked for would be *ultra vires* of the Dominion Parliament. After the election, when Mr. Borden had taken office, the new minister of Justice, Mr. Doherty, being faced with the same problem, gave the same answer, that questions concerning the solemnisation of marriage fell under the exclusive jurisdiction of the provincial legislatures. That ought to have been decisive, but opinion ran high, and the hand of the new Government was forced when a private member in the Parliament at Ottawa introduced a bill on his own account. It was then decided to take the opinion of the Supreme Court of Canada as to whether or not the proposed legislation would be within the jurisdiction of the Federal Parliament. Four out of five of the Canadian judges held that the proposed legislation in the Dominion Parliament was *ultra vires*. As soon as the decision of the Supreme Court of Canada was known, it was at once resolved to carry the case to the supreme arbitrament of the Judicial Committee of the Privy Council. The importance which all parties in Canada attached to the immediate settlement of these vexed issues may be measured by the urgency of the steps which were taken to speed the case across the Atlantic. The Supreme Court gave its decision on the 17th of June, and on the 22nd of July the case was being argued before the Privy Council in London. The bill was declared on July 29 to be *ultra vires*. Though the *Ne Temere* was freely invoked during the argument, it was not directly in issue. It was, however, the probably unfounded fear that the Papal decree might be incorporated with the civil law of Quebec which gave a theological colour to the whole discussion.

The elections for the German Reichstag in February 1912 found the Catholic party, the Centre, in a position of great disadvantage. The Borromeo Encyclical and the "Motu Proprio," *Quantavis diligentia*, had been used to create a cloud of prejudice. Then the high price of food, largely due to the prolonged drought, was attributed by the Socialists to the Protectionist policy of the Centre. They came back 93 strong, having lost nine seats; in fact, every party paid tribute to the Socialists. In the Rhineland the Centre polled 19,000 more votes than in 1907. Taking the country as a whole, the Catholic poll showed a falling of something like 100,000 votes. This loss, however, is seen to be more apparent than real, when we note the number of cases in which the Centre abstained from setting up its own candidates, in order to avoid "false second ballots." It is estimated that between 250,000 and 300,000 votes were in this way given by the Centre to their allies of the Right.

In Belgium the Catholic party, which had been in power continuously for twenty-eight years, were in some apprehension as to their prospects at the general election in

June 1912. They had long held office, and their majority in the Chamber was only six. The Liberals and the Socialists had formed a working alliance, with a programme which declared war against the denominational schools, and sought to amend the electoral law by the abolition of the plural votes hitherto allowed in respect of paternity, education and financial position. An additional element of uncertainty was due to the fact that owing to the increase of the population there were twenty new seats to be contested. In the result the Catholic party were again returned to power, with a majority over the *Cartel* of sixteen. The fact that the Liberals had identified themselves so closely with the Socialists during the struggle, seems to have driven a good many moderate Liberals into the Ministerial camp. Certainly the political constancy which granted a new vote of confidence after nearly thirty years of office is a phenomenon new in the history of democracy.

(J. G. SNEAD-COX.)

THE FREE CHURCHES¹

Doctrinal.—The disquietude caused a few years ago by what is known as the "New Theology" movement has very largely passed away. At the meetings of the Congregational Union in Nottingham in October 1911, Dr. Forsyth and the Rev. R. J. Campbell, who had figured most prominently in the controversy, appeared on the same platform. Theologically the Free Churches may now be said to be marking time, though a good deal of constructive activity is going on beneath the surface. The attacks on the historicity of Jesus put forward by Dr. Arthur Dréws in Germany and his translators and sympathisers in England, have been met with thoroughness and skill, especially by Dr. Estlin Carpenter, principal of Manchester College, Oxford. To the doctrine of the person of Christ a noteworthy contribution has just been made by Dr. H. R. Mackintosh of Edinburgh, and his book may be taken as presenting generally the position taken up by all except a comparatively small left wing of Free Church divines. The question of miracles, brought into prominence by a book written by the Rev. J. M. Thompson (Dean of Divinity at Magdalen Coll., Oxford), has furnished a theme for frequent discussion, but neither it nor Dr. Schäfer's pronouncements on the origin of life (British Association, Dundee 1912) have ruffled the waters to any extent. There is no disposition among those churches that dispense with formal creeds to introduce anything of the kind, and where confessions are already in existence the tendency is to modify and adjust them, or to regard them as declaratory rather than binding. Thus the English Presbyterian Church at its General Assembly in May 1912 had before it the statement of Church principles made at the ordination of ministers and the form of the questions put to the candidate. These have been re-drafted so as to lay greater emphasis on the minister's message and less on his theory, and the proposals are now before the different presbyteries in the country. On the other hand the proposed union of the Methodists, Presbyterians and Congregationalists of Canada into one great church which shall more effectively grapple with the problem of the rapidly opening West and North-West, involves the last named denomination in a creed, which many churches of the order will accept for the sake of union, while others will prefer to retain their independence, feeling that the price is too high.

Union and Federation.—The movement in Canada just referred to had a certain quickening through the remarkable co-operation recently agreed upon by the theological colleges of Montreal. Certain influential laymen were struck by the anomaly that three institutions were doing practically the same work within a stone's throw of each other, with comparatively small classes and at the cost of an over-burdened staff. They laid

¹ The expression "Free Churches" is not strictly correct, but it is difficult to find a better one for the various Christian denominations outside the Roman Catholic Church and the Anglican Communion. In Ireland there is no Established Church; in Scotland the Established Church is of the Presbyterian polity. For churches in America, see under "United States" in Part II of the YEAR-BOOK.

Apart from the Year Books of the several Churches, the *Free Church Year Book*, published annually in April, and the *Scottish Church and University Almanac*, are commended to those wishing further information.

before the governing bodies a scheme by which all but the purely denominational work should be taken in common, thus giving the members of the professoriate time and opportunity for specializing, and bringing the students of the three churches into closer fellowship with each other. Not only so, but the Episcopal College when approached fully and gladly entered into the scheme, which was launched in October 1912 and seems full of promise. It is possible that the same line will be followed in England, at least among the Free Churches, before long. Already in the theological faculties of Manchester, London and Wales there is a certain amount of co-operation; but there are isolated colleges of most of the denominations in different parts of the country that cannot do the best possible work under present conditions.

There is no sign on the horizon of any new organic union of churches in England. The directions from which such may be expected sooner or later to appear are of course the three great Methodist Churches (Wesleyan, Primitive and United) on the one hand, and Baptists and Congregationalists on the other. For the present however, and probably for several years to come the aim will be closer federation rather than the merging of denominations in larger units. Meanwhile there is a great deal of over-lapping in the smaller towns and in the villages which makes for weakness and is a cause of grave anxiety to the leaders of the denominations.

In Scotland friendly consultations have for some time past taken place between the Established Church and the United Free Church. These two communions embrace nine-tenths, if not more, of the church-members in the northern kingdom and thoughtful men on both sides have long been anxious for closer fellowship in the face of decreasing rural populations and the increasingly serious problems of the large towns. Holding the same standards of faith and church order these two great wings of Presbyterianism have practically everything in common except their views on the relation between Church and State. It is not easy to see how this gulf will be bridged, but it is not so wide as that which exists in England between the Established (Episcopal) Church and the Free Churches, for there is a large measure of intercommunion regularly practised in Scotland. Wisdom and mutual forbearance may, however, be able to accomplish an understanding which may ultimately lead to union. Meanwhile, it should be noted that many leaders in the United Free Church will not readily agree to any scheme which would ostracise or disparage such comparatively small Scottish churches as the Baptist, Methodist and Congregational.

Relations with the Anglican Church.—It may fairly be said that in spite of the acute tension raised here and there by the question of Welsh Disestablishment and the celebration of the Ejection of 1662 there is on the whole a growth of sympathetic and amicable feeling between the Anglican and the Free Churches and no small amount of co-operation. British Nonconformists still believe that they are entitled to more real recognition at state festivals and would value further instances of the fellowship exemplified at the installation of the Prince of Wales at Carnarvon in July 1911. The few cases of intolerance and bigotry on the part of individual clergymen are more than offset by courtesy and kindness on the part of others. In the academic world churchmen of all denominations work together in harmony and full trust on the Theological Boards of the newer universities, and the proposals emanating from Oxford (passed on Dec. 3, 1912), Cambridge (passed on Nov. 22, 1912) and Durham, that their degrees in divinity should be no longer restricted to Anglican clergy or laymen have been warmly appreciated. The placing of a Bunyan memorial window in Westminster Abbey and its joint dedication by the Dean and representatives of the Free Churches is one of the happy signs of the time. And if Lord Halifax can persuade other High Churchmen to agree with him that the word "churches" may safely be applied to the non-conforming communities, headway will be made. Interchange of pulpits is not yet in sight, but there seems a growing inclination among Anglicans to regard modern diocesan episcopacy as the *bene esse* rather than the *esse* of a church. Meanwhile there are abundant opportunities for united service which do not entail the slightest abandonment of conviction and principle on either side, and three lines of approach are touched upon in different parts of this

article. In the mission field, in theological study, and in social service there is already manifest a degree of co-operation and fellowship which are of the highest promise for the consummation of a unity that is not to be confounded with uniformity.

Sustentation Funds.—One of the signs of the times is the attempt made by the three churches of the independent order in England to raise central funds for increasing the stipends of the more poorly paid ministry. Congregationalists and Baptists are each aiming at £250,000 for this purpose; the former after three years have raised £205,000; the latter in one year £70,000. The Unitarians aim at £50,000, of which nearly £40,000 has been promised. The proposals vary, but what is intended is roughly speaking that every fully-recognised minister may receive not less than £150 per annum in town churches or £120 in rural districts. The Presbyterians of course have long had their Sustentation Fund and the various Methodist churches, where the organisation is akin to the Presbyterian order though the terminology is different, are able to secure greater equality of income among their ministers than is possible in communions where the pastor is chosen by the local church without reference to synodal or presbyteral authority. Some of the much cherished traditional independency will perforce disappear as these augmentation funds come into practice, for behind the question of grants-in-aid lies that of an efficient ministry, and no help is likely to be given in the case of men whose ability does not commend itself to the central authority, however well satisfied the local church may be with its choice. In this way there seems to be the beginning of an approximation to the Presbyterian system of church government. Many Unitarian churches still bear the name Presbyterian, and not a few now called Congregational used to bear it.

Other Denominational Activities.—Two great ecumenical conferences were held in 1911, both in America. The Baptists met at Philadelphia in June; one of the most striking features of the gathering was the presence of a group of ministers from Russia and South-East Europe where the Baptist cause is making phenomenal headway. The Methodists of all shades met in Toronto in October. Another noteworthy Methodist event is the opening of the new Wesleyan Church House in Westminster (October 1912), a remarkable addition to ecclesiastical architecture and already taking its place as the headquarters and focus of the multiple organisation of the Connection. It is an outcome of the Million Guinea Fund raised at the beginning of the century and is a monument of the unwearying care and ability of Sir Robert Perks.

The Congregationalists, and to a less extent the Baptists, Presbyterians and Unitarians, have been celebrating the 250th anniversary of the Act of Uniformity and the consequent ejection of 2,000 ministers in 1662. Here and there the occasion was used somewhat aggressively against the Anglican Church, but on the whole attention was drawn to the positive lessons of the ejection, fidelity to conscience and the dawn of the modern idea of a free church in a free state. In this connection may be mentioned a notable crop of sound historical research in which most of the Free Churches have taken part and which contrasts favourably with the comparatively uninformed productions of past generations. For Elizabethan Puritanism and Separatism we have the work of Mr. Champlin Burrage, while Rev. W. Pierce has done much to clear up the Marprelate mystery, Rev. Ives Cater that attaching to Robert Browne, and Rev. W. H. Burgess has investigated anew the story of John Smith, 'the Se-Baptist.' As regards the 17th century the Rev. B. Nightingale has pointed the way to a very necessary revision of Calamy's story of the ejected ministers and brought to light many facts respecting Cumberland and Westmorland, and Prof. Lyon Turner has made a special study of the indulgences granted in 1672. Mr. W. C. Braithwaite has written a standard history of early Quakerism in England, and Dr. Rufus Jones has performed a similar service for America. Rev. H. W. Clark is engaged on a comprehensive history of Nonconformity, of which the first volume has appeared.

Statistics of Membership.—The Free Churches in the United Kingdom are not having a happy time with their figures, and for some years most of them, especially Baptists and Wesleyan Methodists, have had to lament a decline of numerical strength. The

Welsh Revival of 1904-5 brought into the churches an immense number of recruits whose stability has been in inverse ratio to their enthusiasm, and many of them have fallen away. This accounts for the greater part of the decrease, but there are other causes. Emigration has something to do with it, and also the movement from the rural to the urban districts. People change their residence more often than they did and are not always careful to transfer their church membership. Often there is not a church of their own order in the new locality, and where there is they hesitate to incur the responsibilities attaching to membership. The increase of Sunday pleasure and the general "spirit of the age" have also to be taken into account. In the Wesleyan Methodist Church possibly the regulations concerning attendance at class-meeting may have alienated a number of adherents. The exact definition of what should constitute membership in the Wesleyan Church has been a matter of repeated discussion in district synods and in Conference for some years past, and proposals to make the class meeting a more elastic exercise that shall be adaptable to different sections of the members have found much favour.

The Table of Free Church membership in England and Wales may be found of interest, though it must be remembered that such statistics can only be approximate. The meaning of the term "members" varies in the different denominations, and it has also been impossible to include in it any figures for the many unattached missions and evangelistic agencies.

Statistics of the Evangelical Free Churches of England and Wales.
(From the Free Church Year Book, 1912.)

	Sitting Accommodation.	Members.	Ministers in charge.	Local & Lay Preachers.	Sunday School Teachers.	Sunday School Scholars & Bible Class Members.

	8,130,494	2,143,991	9,275	53,864	403,636	3,383,076

a This is inclusive of members on probation.

b 304 churches have not sent any returns.

c Includes teachers.

The Salvation Army has some 9,000 halls with seating accommodation for about 500,000, and employs 16,000 officers. But they give no returns as to adherents. The Unitarians have some 375 churches (seating 100,000) and about the same number of ministers, with a membership of say 45,000 and about 40,000 Sunday scholars.

The following figures give some idea of relative strength in *Scotland*:—

	Ministers & Evangelists.	Churches & Halls.	Church Members.	Sunday Scholars.
Church of Scotland	1,741	1,643	714,915	230,967
United Free Church	1,700	1,603	504,672	235,929
Free Church	190	189
Episcopal Church	350	410	54,000	..
Congregationalists	210	218	36,214	35,519

There are also minor Presbyterian churches, e.g. original Seceders, and Reformed Presbyterians, and the Baptist, Wesleyan and Primitive Methodist churches are represented especially in the larger cities.

In *Ireland* the (disestablished) Episcopal Church claims about 600,000 of the population,

the Presbyterians 450,000, the Methodists 65,000. Congregationalists and Baptists are very thinly represented.

Wales.—In view of the discussion on Welsh Disestablishment it may be convenient to set out the figures supplied to the recent Royal Commission on the basis of the 1901 census:—Communicants of the Anglican Church, 193,081; Members of Congregational Churches, 175,147; Members of Calvinistic Methodist Churches, 170,617; Members of Baptist Churches, 143,835; Members of Wesleyan Churches, 40,811; Members of smaller denominations, 19,870; Roman Catholics, 64,800. There are 4865 Free Church ministers, 1,597 Anglican clergy; 611,083 nonconformist Sunday scholars and 168,786 Anglican.

Free Church Commission.—In view of the decrease in membership and of other problems of related but more general interest, e.g. the relation of the Free Churches to the spiritual and other needs of the present day, a commission of inquiry has been arranged which is representative of every shade of Free Church polity. The initial step was taken by Rev. F. B. Meyer, and his plan of a number of boards each charged with some definite task after the fashion of the Edinburgh Missionary Conference of 1910 was approved at the annual meeting of the National Free Church Council at Cheltenham in March 1912. These boards have now been constituted and will consider such questions as (1) the Free Church message, (2) the ministry and its training—including lay and feminine agencies, (3) the Institutional Church, (4) overlapping and co-operation (5) auxiliary agencies, (6) the laws of spiritual revival, (7) relationship to other churches. At the head of the whole investigation is Dr. J. Scott Lidgett, and there is every reason to believe that the enquiry will result in such a body of evidence and opinion that will enable the conference and the churches which it represents to arrive at a cool and reasoned appraisal of the situation, and to formulate some definite lines of action. The task in hand is much more than a question of "Why people do not attend church;" it is a consideration of the place and function of the church in modern civilisation.

Public Activities.—The Free Churches are keenly alive to current sociological problems and every denomination has its Social Service Union or Association. These organisations work largely through study circles in individual churches and through conferences, and have produced some pertinent literary contributions. This is especially true of the Wesleyan Methodist Union. Some of the best known University Settlements in London are directly connected with the Free Churches, e.g. the Leysian Mission and the Bermondsey Settlement (Wesleyan), and Mansfield House in Canning Town (Congregational). In Manchester and Bradford too the students of theological colleges engage in settlement work, and the various Institutional Churches (*E. B.* xiv, 650) and Central Missions may also claim to be working along kindred lines. Incidentally this branch of endeavour is proving a remarkable factor in drawing together churches separated in creed and polity. A very significant gathering of all the Social Service Unions was held at Swanwick in June 1912, when representatives of the Free Churches met Unitarians, Anglicans and Roman Catholics in mutual confidence and friendship. The churches have been accused of callousness in standing apart from social questions, and of futile inexperience when they have attempted to intervene. Continued study and conference along the line indicated above should help to remove both these reproaches, while it must always be remembered that the function of the churches is to quicken conscience and sympathy rather than to frame programmes.

Separate churches have also been concerned directly with special problems. The Congregational Union has drawn together in Conference a number of employers and employés to discuss the question of labour unrest, and the Society of Friends has been concerned with the problem of religion and business, which was raised in a somewhat acute form by the connection of some leading members of the Society with newspapers that publish betting news. The Free Churches as a whole have given hearty support to all movements for securing a weekly rest-day for all workers, and for the ending of the rubber atrocities on the Congo and in the Putumayo. They have also done their part in the endeavour to suppress the white slave traffic; and it was largely due to the efforts of the Rev. F. B. Meyer, who enlisted the support of the Archbishop of Canterbury and other leaders, that the proposed prize-fight between Johnson and Wells at Earl's Court, London, in September 1911 was abandoned.

Foreign Missions.—The World Conference on Foreign Missions which met at Edinburgh in June 1910 (*E. B.* xviii, 598d) did much to educate and stimulate the Free Churches as well as the Anglican in this important department of their activities. Its work is being made permanent by a Continuation Committee and by the International Review of Missions, a quarterly periodical of high merit. In many churches small study circles have been established for the regular and systematic discussion of the different missionary fields and problems. It cannot however be said that there has been any considerable increase in subscriptions for foreign evangelistic enterprise, and most of the societies have to declare a succession of deficits in their budgets. They are all alive to the importance of the hour in China, and in India, even in the South Seas where, with the advent of the trader, problems unknown a generation ago are causing some perplexity. In Africa it is difficult to say how far Christianity is holding its own against Islam. South America is another field to which increased attention is being paid, and there will be not only a Roman Catholic but a Protestant mission to the Indians of the Putumayo. We may also note the effort of the Wesleyan Methodist church to raise £250,000 in celebration of the centenary of its Missionary Society. For the rest it is pleasant to record the comity that exists among the different Christian Churches on the mission field itself. One of the missionary events of 1913 will be the 100th anniversary of the birth of David Livingstone.

Some Personal Changes.—The Salvation Army mourns its founder William Booth, who died in 1912, and is now under the command of "General" Bramwell Booth, who was appointed to that office by his father's will. A good many changes in "divisional commanderships" have followed. It is significant that the memorial to the late "General" is to take the form of an institute or institutes where officers shall be more efficiently trained for public service than hitherto.

The Rev. Dr. Jowett after fifteen years ministry in Birmingham has become pastor of Fifth Avenue Presbyterian Church in New York. The pulpit of the Metropolitan Tabernacle in London, on the other hand, so long associated with the name of C. H. Spurgeon, is now filled by an American, Dr. A. C. Dixon. Another well-known American preacher, Dr. Leonard Broughton, is at Newman Hall's Church in Westminster Bridge Road. In the academic world, the late Dr. Fairbairn has been succeeded at Mansfield College, Oxford, by Dr. W. B. Selbie (1910), formerly minister at Cambridge. That college has also appointed to its chair of New Testament studies Dr. James Moffatt, formerly United Free Church minister at Broughty Ferry. Dr. Campbell Morgan of Westminster Chapel has combined (1911) with his pastorate the presidency of the Countess of Huntingdon's Institution, Cheshunt College, Cambridge, where new buildings are being erected.

Allied Organisations in the United Kingdom.—The *Brotherhood* movement, in some places known as the P.S.A., continues to attract large numbers of men on Sunday afternoons for brief and bright services where addresses are given on Bible subjects or on themes of current interest from the Christian point of view. Much stress is laid on the obligations of Christian citizenship. The movement has extended to the mainland of Europe and is having remarkable success in Canada. Similar meetings for women are in many churches held on Monday evenings. The *Adult Schools*, a much older institution and one in which Friends have been particularly active, are rather hampered by the lack of suitable local leaders and class teachers, but exercise a very potent influence through the men who meet usually on Sunday mornings about 9 o'clock. *Sunday Schools* have suffered in the number of scholars mainly through Anglican aggression, but the quality of the work done is rapidly improving, as better methods of grading and instruction are introduced. All the churches are increasingly alive to the importance of this branch of their work; the difficulty is to get teachers who are as intellectually equipped for their task as those of the day school are. *Boys' Brigades* have perhaps suffered temporarily through the Boy Scout movement.

The *Y. M. C. A.* has been more vigorous of late years and is trying to emulate the success of the American Association. Excellent new premises have been opened in London, and there, as in Leeds, Manchester and Edinburgh, "lightning campaigns" have been organised with fair success with a view to clearing off debts in ten or twelve days.

The Student Christian Movement is one of the most vital Christian agencies in existence and affords a happy meeting ground for the educated youth of all the churches. It has widened its earlier scope, when it was chiefly concerned with foreign missionary aims, and

is now placing alongside those as of equal prominence, the claims of social service at home.

The British and Foreign Bible Society and the *Religious Tract Society* are the willing handmaids of all the churches. The chief event of moment is the celebration by the former in March 1911 of the 300th anniversary of the issue of the English Authorised Version. With regard to the question of Bible revision a number of Free Church scholars issued a manifesto in October 1912 stating that in their opinion the time was not ripe in view of the work yet to be done in getting an approximately true text of the original Hebrew and in utilizing recent linguistic discoveries affecting New Testament Greek. A number of them also joined with representative Anglican scholars in a public protest against the issuing of the revised Bible of 1881-85 without the revisers' marginal readings. (A. J. GRIEVE.)

SECTION VI. LAW AND JUSTICE

"In the mechanism of modern states," says Sir Henry Maine, "the capital fact is the energy of the legislatures." In the British Empire alone there are 60 legislatures busy at work: in the United States some 50: besides the legislatures of foreign countries—Austria has at least a dozen. Looked at superficially the legislative output of these parliaments or legislative councils appears what Cromwell called "a Godless jumble:" but to the philosophic eye, in those multifarious acts and ordinances each several community is writing its history, recording its aspirations and ideals so far as they fall within the sphere of practical politics, readjusting its life to the changed and changing conditions of its environment and national development. There is no more faithful reflection of a people's life in its many sided activities than the pages of its statute-book.

Surveying the field of legislation during 1909-1913 in the light of this reflection, what are the subjects which we find more especially occupying the minds of the nations at the present moment? Pre-eminent among them are the status of the worker, and the amelioration of his condition, the care of children—the rising generation as *spes gentis*, the prevention as distinguished from the punishment of crime, the health of the community in all its many aspects, the control of the drink traffic, the protection of public morals, marriage and divorce, the segregation and guardianship of the feeble-minded, the assimilation of commercial law, the encouragement of agriculture, the organization of trades and professions, and immigration.

Immigration.—To take the last first, one of the rights possessed by the supreme power in every state is, says Chief Justice Griffith of the Australian Commonwealth (*Yen v. Christie*), "the right to refuse to permit an alien to enter that state and to annex what conditions it pleases to the permission to enter it and to expel or deport home from the state at pleasure." This power of self-protection a large number of states have been freely exercising of late. It is obviously in vain a nation doing all it can to promote the physical, mental, moral and spiritual welfare of its citizens, if a stream of "undesirables"—the pauper, the feeble-minded, the criminal, the diseased, the drunken, the illiterate—is constantly flowing into the state, to weaken or contaminate it.

United States legislation probably makes the high-water mark in this policy. It prohibits admission of all idiots, imbeciles, feeble-minded persons, epileptics, insane persons, paupers, persons likely to become a public charge, professional beggars, persons afflicted with tuberculosis or with a loathsome or dangerous contagious disease, or any persons certified by the examining surgeon as mentally or physically defective, if such defect is of a kind to disable them from earning a livelihood, as well as polygamists and anarchists. The duty is cast on the master of a vessel bringing an alien into the United States of furnishing the immigration officer of the port with information as to the character, antecedents and position of the alien. By way of checking the "white slave" traffic foreign prostitutes may be deported.

In Australia the determination to keep out the undesirable settler has shown no sign of abating. British Honduras has been providing for the expulsion of aliens convicted of felony or other penal offence. The question of immigration and naturalization is still being agitated between Japan and the United States.

Concurrently with this policy of keeping out undesirables there is a strong desire among the young countries—illustrated by the South Australian Act of 1911—to encourage immigrants of the right sort.

Public Morals.—*Quid leges sine moribus?* New Zealand, impressed with this truth, has recently passed an Act to repress effectually the publication, sale and distribution of indecent and offensive literature. "Indecent document" in the Act has a very wide meaning, and includes any "book, newspaper, picture, photograph, print or writing or anything having imprinted, written or otherwise exhibited thereon; any indecent word, statement, picture, illustration or representation." In Holland an Act has been passed to combat immorality. Immoral pamphlets and pictures are not to be disseminated. Drugs or instruments for preventing conception are not to be sold or advertised. There are rigorous measures for suppressing the "white slave" traffic, and houses of ill-fame are absolutely prohibited. A drastic act against the "white slave" traffic has just been passed too in England.

In New Brunswick an Act has been passed providing that no cinematograph, moving-picture machine, or other similar apparatus, is to exhibit any films which have not been stamped by the board of censors. Manitoba has also been providing for the licensing and regulation of moving pictures. Grenada now requires the licence of the governor for cinematograph performances. In Austria the whole subject of cinematographs is being reported upon by a Government commission. Meanwhile in England the manufacturers have agreed on a censor—entirely unofficial—for their films, and have secured Mr. Redford (formerly official censor of plays) in this capacity.

Gambling is one of the most deeply rooted instincts of human nature. It is pre-eminently the vice of this age, and against it, in all its Protean forms, Legislatures seem to strive in vain. A number of the states of the American Union have passed laws to stop betting on horse-races, and some have gone great lengths, notably California. An Act of that state provides that any person who engages in pool selling or book-making, or keeps or occupies a building or place or stand upon any public or private grounds within the state for that purpose, or for the recording or registering of bets or wagers upon the result of any trial or contest of skill, speed or power of endurance of man or beast, or between man or beast or upon the result of any lot, chance, casualty or unknown or consequent event whatsoever, shall be punishable by imprisonment for thirty days without the option of a fine. This is drastic indeed.

In Holland not only have all gambling houses been prohibited, but the prohibition extends to "the offering to the public the opportunity of participating in gambling."

Western Australia, like the Transvaal, has been sanctioning the use of the totalisator—as, presumably, the least objectionable form of betting.

The state of Virginia has made it a misdemeanour to swear over the telephone or to abuse a person or his female relations in such a way as to lead to a breach of the peace.

Marriage and Divorce.—The so-called feminist movement has exercised and is exercising a very unsettling effect on marriage, divorce and the matrimonial relations generally. In particular equality is claimed for wives in regard to the grounds of divorce. In England, as things stand, a husband can be grossly unfaithful to his wife, but so long as he does not add cruelty or desertion to adultery she is without any redress. This is a grievance against which women may fairly protest. But there is another of equally long standing, the denial of the remedy of divorce to those wives or husbands who are too poor to pay the costs of a suit in the divorce court: a state of things which Mr. Justice Maule years ago satirised in a strain of exquisite irony. And there is yet a third, that the grounds of divorce as they stand in England to-day are too narrow and need enlargement. All these grievances or alleged grievances have been the subject of very careful consideration in England by a strong Royal Commission on Divorce under the chairmanship of Lord Gorell. Some 386 witnesses were examined, and never were more varied or conflicting ideas expressed on any subject.

The report of the commission appeared on November 11, 1912, and it fully recognised, by a majority of 9 commissioners to 3, that the above grievances were well founded. Its recommendations were briefly as follows: the placing of men and women on an equal footing as regards divorce; the decentralization of sittings for hearing divorce cases so as to enable persons of limited means to obtain redress; the addition of five new

grounds of divorce, (a) desertion for three years, (b) cruelty, (c) incurable insanity, (d) habitual drunkenness, (e) imprisonment under commuted death sentence. A serious factor in the situation has been the large number of judicial separations—rising in one year to over 7000—granted by magistrates under the Married Women's (Protection) Act. The commissioners recommend the entire abolition of this jurisdiction.

Three distinguished members of the commission, the Archbishop of York, Sir William Anson and Sir Lewis Dibdin, presented a minority report, dissenting strongly, in particular, from any enlargement of the existing grounds of divorce. Adultery alone they think ought to constitute a ground for dissolution, and they point to America as an object lesson, where facilities of divorce have so "cheapened" marriage that there are now in the states 86 divorces to every 100,000 inhabitants. This danger of "cheapening" marriage by facilitating divorce is what emerges most strikingly from the whole controversy. It is a danger not confined to the United Kingdom. Nearly all foreign nations recognize it (see Burge, *Colonial and Foreign Law*, 2nd ed., Vol. iii), not necessarily on the sacramental view of marriage but for the sound practical reason that marriage forms the basis of family life. The state is founded on the "hearthstone." If the marriage bond is to be relaxed or dissolved, it ought only to be for reasons which make the married life of the spouses intolerable or defeat the ends of marriage.

Western Australia, legislating on lines similar to those of New South Wales and Victoria, has provided for divorce of either husband or wife in case of adultery or desertion for five years, or in case either is an habitual drunkard, or in case of imprisonment or confinement in a lunatic asylum for certain specified periods. Panama has also passed a law authorising divorce *a vinculo*, and making mutual consent with certain qualifications a ground, and also habitual adultery on the husband's part.

A very difficult question of the respective jurisdiction of state and church in relation to marriage arose in the English case of *Thompson v. Dibdin* (1912; A.C. 533), where a man had married his deceased wife's sister and the clergyman of their parish church repelled them from holy communion as "persons of notorious evil life." The House of Lords held that since the passing of the Deceased Wife's Sister Marriage Act 1907, it was impossible so to brand persons whose union was directly sanctioned by the Act. But the attitude of a very large number of Churchmen is still summed up in the Archbishop of York's words—"No trespassing on the spiritual discipline of the Church."

On the whole the proportion of divorces to the sum total of married life is remarkably small among the European nations. The most dangerous period for matrimonial happiness is from 10 to 20 years after marriage; next to that, 5 to 10 years after. As the age for marriage grows later the ratio of divorce decreases. Romance must reckon with this fact as best it can. A significant feature in Germany is the growing number of divorces granted on the ground of mutual agreement. Children are evidently the best preventive of divorce. In more than half the cases in England there were no children: and the more the children the fewer the divorces. Husbands come for a dissolution of marriage much more frequently than wives. On the other hand petitions for judicial separation and restitution of conjugal rights are nearly all presented by wives. Magisterial separations in England under the Summary Jurisdiction (Married Women's) Act 1895, s. 5, have declined to 4819—even then a large number.

Public Health.—For a long time past now, ever since Disraeli uttered his famous epigram—' *sanitas sanitatum omnia sanitas*, ' states and municipalities have been busying themselves with questions of health, and still are. A decent environment for every citizen is now a postulate of political science. Pure water, light open spaces, proper drainage—much has been accomplished in these matters but much remains to be done. Workers' dwellings for instance¹ closely associated with the tuberculosis question—have been too long neglected in England, though both political parties are committed to deal with the question. Here as in so many other matters New Zealand has been leading. In the Workers' Dwellings Act of 1910 the legislature of New Zealand has provided for the setting aside of land as sites for workers' dwellings, and for the erection,

¹ See *E. B.* xiii, 814 *et seq.*, "Housing."

improvement and enlargement of such dwellings thereon. The dwellings are not to exceed £100 in capital value, and may be let on a weekly tenancy or lease or sold, the purchase money in that case to be partly equal instalments spread over 25 years. The Act is administered by a superintendent acting under the authority of the Minister of Labour, and for each land district there is established a board of control.

Western Australia has also been passing an Act to enable workers of limited means to provide themselves with homes by state advances.

Closely associated with workers' dwellings is the town planning movement. Narrow streets and crooked alleys are a *damnosa hereditas* in Europe from the walled town of the Middle Ages, with no room to expand. The general idea of the movement is to safeguard the inhabitants of towns from being pent up in overcrowded, sunless and insanitary areas, and it is significant of the sense of the importance of healthy surroundings that the movement has spread with extraordinary rapidity. Italy led the way, and has been followed by Germany, Sweden, New Zealand, the Transvaal, the Orange River Colony, Southern Nigeria and Great Britain. In Germany the Act contemplates the remodelling of cities already in existence. This is not so with the English Act, except so far as it may be said to apply to areas condemned as unfit for human habitation. Another characteristic of the English Act is that it provides for compensation being paid to any person whose property is injuriously affected by a town planning scheme; and when the scheme enhances the value of property the local authority may recover half such increased value. The subject will be found fully discussed in two articles contributed to the *Journal of Comparative Legislation* (Nos. xxiv and xxv) by Mr. R. E. Willcocks. A Town Planning Conference was held in October 1911 under the auspices of the Royal Institute of British Architects, and the results are published in a volume of *Transactions* full of valuable information on the subject. British Columbia has been enacting sanitary regulations for lumber camps, mining camps, saw mills, railway construction camps, and other places of labour, to prevent nuisances and the outbreak of disease.

Queensland has passed an Act in very stringent terms against adulteration or false descriptions of food or drugs. All packages must be labelled with the description, weight and contents of the food and the name and address of the maker. All milk sellers must have licences. Precautions are taken that only pure beer shall be sold. New Brunswick has also legislated against adulteration.

An International Liquor Conference was held at Brussels in 1911, to secure united action by the Powers as to the supply of drink to natives. Unfortunately no agreement was reached, but pending such agreement the British Secretary of State for the Colonies has directed that distilling apparatus is not to be imported into the West African colonies and the zone of prohibition in Nigeria has been extended 3000 square miles. Illicit stills have been suppressed in Ceylon. The duty on imported spirits has been raised to the very high point of 5s.6d. per gallon in Sierra Leone, the Gold Coast and Southern Nigeria. Heavy duties have also been imposed in Hong-Kong and in Malaya.

In all parts of the United States temperance legislation has been making great strides. Newfoundland, British Columbia, Grenada, Papua, Western Australia, British Honduras, Basutoland, British Guiana, Manitoba, and the United Kingdom also, have all in different ways been regulating and restricting liquor licences.

In England a bill has been introduced, backed by several eminent statesmen, to lessen drinking by levelling up the public house to something of the standard of the Continental *café*. The idea is to encourage certain improvements—space, comfort, cleanliness, sanitary conveniences, the supply of food, provision of chairs and tables in lieu of bars, together with accommodation for lawful games, papers, music, gardens and any other reasonable recreations.

Canada has followed up her campaign against drugs by a £50 fine on any person who makes or deals in drugs—meaning thereby opium, cocaine or any salts thereof—except for scientific or medical purposes. Patent medicines have been made the subject of inquiry by a Select Committee in England. Queensland has enacted that toys and wall-papers are not to be sold containing arsenic, lead or antimony.

In America the states of Mississippi, New Jersey, Virginia and Massachusetts have all entered upon an anti-tuberculosis crusade; so have Saskatchewan and Newfoundland. The provision for sanatoria under the National Insurance Act is part of a similar movement in the United Kingdom.

The Eugenics Congress in London in 1912—attended by no less than 500 delegates—was a striking manifestation of the consensus of the nations that the subject of race improvement needed to be scientifically treated, by the encouragement of fine families and the elimination of the unfit. The ideals of the eugenicists are excellent, but the matters they touch are still very much in the domain of theory, and hardly ripe for legislation. "At present," as Major Leonard Darwin, the President of the Congress, said, "the most urgent need is for more knowledge." That sums up the situation. In the United States however a beginning has been made. Marriage by epileptics and feeble-minded persons has been forbidden in some states, and in about one-third of the states of the Union marriages between first cousins are also banned. A number of states—Indiana, New York, Connecticut, California, Iowa, Utah, Nevada, New Jersey and Washington—have gone further and passed laws for the sterilization of certain classes of defectives and degenerates, such as habitual criminals, confirmed drunkards, epileptics and drug habitués. It is only in Indiana and California however that the law has been actively enforced. In the former state, which led the way in this heroic remedy, about 125 compulsory operations have been performed in two years. The operation is said to have no effect practically on sex instincts and little on sex habits. A different method of dealing with the unfit and one less open to controversy is that illustrated in the Mental Deficiency Bill which was before the British Parliament in 1912 (see under EDUCATION, in Section V. of the YEAR-BOOK). A Defectives Act very similar in its provisions has already been passed in New Zealand. The decline of the birth rate among the classes with whom children should be most abundant, the blighting of the harvest of human life, is a fitting text for the eugenicist, full of solemn warning to society. But it is much to be feared that private selfishness will thwart his best efforts in the cause of race improvement. The maternity provisions in the British National Insurance Act may perhaps do something to check what has been called the "tragedy of spoiled babies." Spain has been securing the better protection of infant life by providing for the care of pregnant women, nurse agencies and proper milk supply.

The Worker and the State.—Undoubtedly the most striking social phenomenon of late has been the pervading Labour unrest. "Underneath all this unrest," as the Archbishop of York truly said, "is the movement of a true and right ambition to better the conditions of individual life," to secure a fairer distribution of the proceeds of industry. To solve this problem Australia has been trying the compulsory submission of industrial disputes to courts of arbitration. These courts have to do what is "fair and reasonable," and incidentally to determine what is "fair and reasonable" in relation to a living wage. The decisions of the courts are discussed in an interesting article by Professor Harrison Moore in the *Journal of Comparative Legislation*, No. xxvi. It must be sufficient here to say that the "fair and reasonable" in relation to the living wage is defined as "the normal needs of the average employee regarded as a human being living in a civilised community." This definition has been accepted generally in Australia without any serious adverse criticism. The living wage is there regarded as "sacrosanct." In England the fixing of a minimum wage in the coal industry by the Coal-Mines Act of 1912 makes a precedent which is pretty sure to be followed in other industries. Saskatchewan has been establishing a Labour Bureau in connection with its department of Agriculture. This Board has very wide functions—to collect and publish information and statistics relating not only to employment, wages and the hours of labour in the province, but to strikes, co-operative trade unions, labour organisations, the relations of capital and labour, in fact the whole commercial, industrial and sanitary conditions surrounding the working man.

The Shops Act of 1912 in the United Kingdom, providing that "every shop shall, save as otherwise provided by this Act, be closed for the service of customers not later

than one o'clock in the afternoon on one day in every week," is a welcome boon to that numerous and hard worked class the shop assistants of the country. South Australia has been passing a similar Act, the times fixed for closing being one o'clock on Saturday, nine o'clock on Friday, and six on other days. In Western Australia Wednesday has been made the early closing day, and Saturday the late day. Trinidad and Tobago have fixed a nine-hours day for shop assistants, with a half holiday once a week. In Manitoba, children under twelve are not to be employed between nine in the evening and six in the morning; anyone employing a child under sixteen in any occupation likely to be injurious to life, limbs, health, education or morals, is liable to a fine of \$50. In New York no minor under sixteen is allowed to work in any mercantile establishment more than fifty-four hours a week. The *International Bulletin of Labour Legislation*, issued quarterly, shows in a striking way how much has been done and is being done to protect the worker from injury by deleterious trades and from excessive hours of labour.

By the National Insurance Act some 75 per cent of the adult male population of the British Isles and nearly 25 per cent of the women will be insured in a contributory scheme against sickness and disablement. For the first time in its history the United Kingdom finds itself organised to face the risks of disease and misadventure. Much criticism has of course been directed against the details of the scheme, some of it well-founded. The marvel is that such a vast and complicated scheme should have been launched and should have started working with comparative smoothness. Experience will disclose the minor imperfections of the Act, and they can be rectified by an amending Act. In the meantime the Act may be described as the most solid experiment for the social betterment of the British working-classes which the last half-century has witnessed. An instructive comparison of the English with the German scheme by Dr. E. J. Schuster will be found in No. xxv of the *Journal of Comparative Legislation*, p. 30. Switzerland has been establishing a similar system of national insurance.

In the British crown colonies and protectorates recruiting of native labour for other colonies has been forbidden. It has been found that migration led to the dissolution of family and tribal ties, and often to the demoralization of the emigrant. In Mauritius the introduction of indentured labour from India has been abolished. The cost of the immigration of coolie labourers in the West Indies is now being put upon the employers, and also the cost of repatriation. Newfoundland has been prohibiting contracts with Eskimos or Mountaineer Indians to leave the colony for service anywhere except service such as fishing, hunting or exploring in the Canadian Labrador. South Africa requires native labour agents to be licensed, and regulates contracts for native labour. Australia has also passed a measure for the protection of aboriginals and half-castes.

Much dissatisfaction was caused in British labour circles by the decision of the House of Lords in what is known as the Osborne Judgment. Briefly the effect of that judgment was that a rule which purports to confer on any trade union under the Act of 1871 a power to levy contributions on members for the purpose of securing parliamentary representation, whether it be an original rule of the union or a rule subsequently introduced by amendment, is *ultra vires* and void. The result of this decision was of course to reduce Trade Unions to impotency for political purposes, and as it was only by political pressure that the interests of the workers could be protected and furthered, the restriction imposed by the judgment on the legitimate activities and aspirations of Trade Unions as Labour organizations seemed unreasonable and unfair. The Government has introduced a bill for the purpose of legalising—subject to certain conditions—payments made by a Trade Union for any lawful objects or purposes for the time being authorised under its constitution, including of course payments made for political purposes. Such a power, it may be said, operates unjustly towards a dissentient minority of members, but it must be remembered that they join the Union with their eyes open, with notice, that is, of its constitution and the possible application of the funds to political objects with which they are not in sympathy. Such coercion of a minority by a majority is a normal incident of the management of corporate undertakings.

Children and the State.—Nothing is more striking in the legislation of all civilised nations to-day than the concentration on the child—the care that the youthful citizen shall not be corrupted by drink or tobacco or indecent publications, shall not be sent, if he or she does wrong, to prison or herded with common criminals, shall not drudge in factories, or hawk articles in the street or be exploited for public entertainments, shall be protected against cruelty and outrage, shall have free meals at school if underfed, and be sent to foster-homes if neglected. The recent Children Act of the United Kingdom, familiarly known as the Children's Charter (see *E. B.* vi, 138, 139), is a notable instance in point. The system of children's courts—that is, courts where charges against children and young persons are tried separately,—spread with remarkable rapidity all over the British Empire, the United States and many foreign countries. So too the prohibition against the passing of the death sentence on young persons. A kind-hearted judge under the old law, when people could be hanged for stealing to the value of a shilling, was passing sentence of death on a girl who had taken a bit of ribbon out of her mistress's wardrobe, when the poor girl fainted. "How dreadful! Tell her I don't mean it," said the kind-hearted judge, "will nobody tell her that I don't mean it?" Such scenes are to be no longer possible. Not that one any longer imagines the youthful mind to be the sheet of white paper postulated by Locke on which anything may be written. Heredity has already written there in its own invisible ink.

By a recent Manitoba Act, advertisements dealing with the adoption, boarding out, or care of any infants under the age of thirteen months have to be accompanied by a recommendation, signed by the advertiser with his or her name and address, and this memorandum has to be forwarded to the Superintendent of Neglected Children,—a salutary preventive against the abuses of baby-farming. Kentucky now punishes any person who directly promotes or contributes to conditions which render any child dependent, neglected or delinquent. Difficulties often arise—they did notably in Dr. Barnardo's case—from parents, who have surrendered their children to the charge of a philanthropic society, wanting to get them back. Manitoba has met this difficulty by providing a Children's Superintendent. No surrender by a parent can be made without the consent of the Superintendent, but when once made it is final.

Commercial Law.—One of the resolutions passed at the British Imperial Conference 1911 affirmed the desirability of securing greater uniformity in the company laws of the Empire, and well it might. In Canada there are no less than eleven different systems of company law contained in 67-Acts and Ordinances. In South Africa there are 16 dealing with company law. In Australia there are 54 Acts, but an important step towards assimilation has been taken by the Victorian Consolidation Act, which practically adopts the whole of the English law on the subject of companies. Further progress towards uniformity has also been made by the Acts recently passed in the Transvaal, and in British Columbia. In the United Kingdom the number of companies registered shows on the latest available returns the same steady increase. The total number for 1911 was 6444. The most remarkable feature however was the large proportion of the companies registered as "private companies," no less than 5194 being of this description. In addition 16,860 companies were converted from public into private companies. The superior attraction of the private company lies in the fact that it is exempt from the obligation of filing a balance sheet under s. 26 of the Companies Act 1908 with the Registrar of Companies. The British trader likes to keep his affairs to himself. The neglect of the Limited Partnerships Act, as compared with the popularity of the private company, is also very striking. The number registered in the United Kingdom in 1908 was 144. By 1911 it had dwindled to 77. There can be no question that as between the two kinds of organisation, the limited partnership and the private company, the latter is incomparably the safer, the simpler and the more efficient.

The company wreckage is still unfortunately very large. Taking together British companies that liquidated and that were struck off the register as defunct, the number for 1911 was 4353. This is more than ought to be, with all allowance for the enterprise of promoters and the sanguineness of human nature. 

It has long been an anomaly that foreign companies should be allowed to trade in the United Kingdom without disclosing anything as to their constitution and financial resources. This has been rectified by s. 274 of the Companies Act 1908, requiring from these alien immigrant companies the filing of a copy of that constitution, a list of their directors and the name of a person to accept service. If the foreign company is limited, further requirements are made. One hundred and ten foreign companies complied with these conditions in 1911. A large number of the British dominions and colonies are adopting similar precautions. Argentina has recently done the same. In connection with this subject a very serious situation has arisen in Egypt owing to the attitude of the Mixed Courts there as to English companies. An English Company which is carrying on business in Egypt may efficiently be treated by a Mixed Court as 'null and non-existent.' The question was very fully considered in all its bearings by the Judicial Adviser to the Khedive in his Annual Report, and will be found reproduced in No. xxv of the *Journal of Comparative Legislation*, p. 85.

The unification of the law of bills of exchange has been engaging the attention lately of English business men and lawyers, and the Board of Trade has consulted the Institute of Bankers on the subject. The view of the Council of the Institute is that whilst any fundamental alteration in the general legal principles or customary usages underlying the existing law in the United Kingdom would not be acceptable either to the bankers or the mercantile community of this country, many existing differences between the laws of various countries could be adjusted by international agreement.

At the Hague Conference on Bills of Exchange a draft uniform code on the subject was accepted by the delegates of more than 30 nations. This draft code approximates more nearly to English law than to any existing continental code. The reconciliation of the English point of view with the continental is discussed in a paper contributed to the *Journal of Comparative Legislation* (No. xxiii, p. 143) by Dr. E. J. Schuster, one of the highest authorities on the subject, and also by Sir M. Chalmers in No. xxiv of the same *Journal*. Profit-sharing as a mode of reconciling the interests of Capital and Labour has been a good deal discussed, and many schemes have proved to have worked successfully. The system merits special attention from companies, for there can be no doubt that shareholders are becoming more and more mere dividend-drawers, and too negligent of their obligations as principals in the business to their employees.

In connection with commercial law it is noteworthy that the United States has created a Commerce Court with jurisdiction over all matters relating to inter-state commerce.

Criminal Law.—The old ideas of criminal law have been undergoing of late years a rapid and complete transformation. The very foundations of the old system seem to be crumbling away. The idea of retribution or vengeance, so long the animating principle, is fading into the background and is giving place to a desire to reform rather than punish the criminal. He, it is felt, is not so much to blame as heredity and his environment, and for that society is largely responsible. Of course society must be protected. That principle remains unshaken, but does society benefit under our present system? "As a matter of fact," says Professor Willoughby, "so far as regards the reformatory idea there would probably be a consensus of opinion that, upon the whole, criminal law as it has actually been administered in the past was far more corrupting than elevating to the individual punished. Prisoners are for the most part composed of the feeble-minded, physical weaklings, vagrants, casual offenders, habitual criminals. For all but the last class—the hardened in crime—prison is a failure. The modern tendency is therefore to discriminate. For the young, for first offenders, for the weak, for those who are yet undepraved and can be reclaimed to honest citizenship, it provides such agencies as the industrial school, the reformatory, the Borstal institution.¹ But for those who have adopted crime as a profession and are really irreclaimable, the main principle is and must be the protection of the community, and in pursuance of that policy the Prevention of Crimes Act was recently passed in England. Under this Act those who have been convicted of crime and who are persistently leading a dishonest or criminal life may,

See *E. B.* xv, 613 *et seq.*, "Juvenile Offenders." *son*

upon being sentenced to penal servitude for a fresh offence, be further sentenced to preventive detention for a period not exceeding ten years, to take effect after the determination of the sentence of penal servitude. Convicts undergoing preventive detention are confined in prisons set apart for the purpose, with some amelioration of the usual prison treatment. In 1910—the latest year for which statistics are available—178 convicts were dealt with under this preventive system. Similar provisions have been introduced by amendment into the criminal code of Western Australia: and the Union of South Africa has adopted a similar line of legislation.

A treatment of criminals which has found much favour in the United States is that of the "indeterminate sentence." This is strictly a misnomer—there is no "indeterminate sentence" in the sense of a sentence without a limit, a maximum or a minimum. The "indeterminate sentence" is used as a catch-phrase to indicate opposition to the "retributory" element in the punishment of crime. It is for making, not the guilt of the criminal but his potentiality for reformation the test for the duration of his punishment, in other words it stands for the individualisation of punishment, and it entrusts the power of judging the potentiality of reformation not to the judiciary but to boards of parole. But, as Sir Ruggles Brise has justly remarked, there is fixed in human nature a moral indignation against the perpetrator of an anti-social act which demands punishment when there is full responsibility for the deed, and it is a fallacy to call such a healthy moral sentiment a desire for vengeance or confound it with the old idea of expiation.

The Probation system is closely allied to that of the indeterminate sentence, but it is differentiated in this respect that it dispenses with imprisonment altogether. The system has spread with remarkable rapidity. Started in Massachusetts in 1875, it has extended to about three-fourths of the States of the United States of America, to Great Britain, Germany, Hungary, Canada, Austria and New Zealand. It saves the offender from the stigma of imprisonment, his family from loss of wages, and the public from the expense of his support. Japan has lately adopted the system and applies it freely—whenever there is a chance of bettering the offender without sending him to a state penitentiary. Trinidad and Tobago have recognised its wisdom.

An International Penitentiary Congress is to be held in London in 1915, and the result of its discussions will be awaited with much interest.

Everywhere there are complaints as to the increase of young criminals. In Italy, for instance, in Naples, Rome, Genoa and Milan, the juvenile offenders are 32 per cent of the total convicted. Between the ages of 18 and 21, offenders are nearly twice as numerous as between 40 and 50. In this case want of education may be the cause—half of these juvenile criminals could neither read nor write: in other cases education itself, it is to be feared, may be the cause—perverted to the purposes of roguery. In Egypt the number of juvenile offenders has increased, but the greater vigilance of the authorities may have something to do with the rise in the statistics. In England and Wales the total number of juvenile offenders for the last year for which statistics are available was 34,087—nearly all, it may be remarked, boys or youths. The proportion of girls was only 1899—some six per cent. Juvenile offences fall mainly under a few heads—petty thefts, acts of mischief, disorderly behaviour, begging and loitering. Of these 34,087 youthful offenders only 90, it is satisfactory to find, were sent to prison: 1143 were sent to reformatories, 1562 were ordered whipping: but the large majority were fined, such fine to be paid by the parent or guardian. This is an excellent device, for it visits on parents and guardians the just consequences of their neglect.

The codification of the English criminal law is still afar off, but like the codification of the English civil law it is proceeding piecemeal. The consolidation of the law of perjury by an Act of 1911 was an excellent piece of work, and a bill has been introduced to consolidate and simplify the perplexed law of forgery. The agitation against capital punishment seems to have died out for the time, both in the United States and in the British dominions and colonies.

Licences.—A very noticeable feature of recent years has been the growth of the licence system. A great many states have adopted this method of securing control over the

conduct of acts and undertakings in lieu of special legislation, and it has much to recommend it for the state can thus fix the terms of its sanction. The control of the liquor trade is of course an old example of the use of licensing: so is the control of public entertainments: but in recent times the licence has been used for an infinite variety of matters—to carry or sell firearms, to use the totalisator, to sell milk, to deal in coco-nuts and nutmegs, to run a cinematograph show, to act as a private detective, to buy gold, to deal in offensive weapons, to recruit labour, to sell morphine injection needles, for a salmon cannery or salmon curing establishment.

Analogous to this system is the growing organisation of professions and trades. Acts are being passed everywhere to protect the public and the professions against unqualified persons practising, ignorant pretenders, quacks and charlatans. Thus chartered accountants are being organised in Ontario, medical men in Quebec and New Brunswick, dentists in New Zealand, pharmacists in Saskatchewan, veterinary surgeons in Western Australia, and a movement is on foot to do the same for architects in England.

Newspapers.—The arch mischief-maker is a newspaper when unscrupulously conducted. Sierra Leone has recognised this, and provided a penalty for publishing statements which are “misleading or calculated to do harm on matters of public interest or importance.” Some such provision might not be amiss elsewhere in restraint of the sensational newspaper press. Uganda has devised another check on enterprising journalism. The proprietor of every newspaper started in the Protectorate must give a bond for 3000 rupees, to meet any fine that may be imposed for criminal libel.

Agriculture.—This is the age of the ubiquitous microbe. We are quite used to waging a perpetual war with it in the human body, but we have only awakened slowly to the malignant potency of plant pests in the domain of agriculture. Now we are realising it, and the result is a large amount of legislation throughout the British Empire, in Canada, South and East Africa, Australia, the West Indies, Mauritius, the Seychelles, British Guiana, Nova Scotia. The Union of South Africa has prohibited importation of exotic products; precautions have been taken to prevent the spread of infection from plants, and notification of plant-disease is required. South Australia has been dealing with the phylloxera in its vineyards. Bees too have come in for attention in St. Lucia, Bechuanaland, Jamaica, Nova Scotia and Newfoundland; also noxious weeds. Canada has been legislating for the inspection of seeds to secure that the germs of such noxious weeds are not included. Great care is also being taken to secure the purity of dairy products, and the non-adulteration of fertilizers and foodstuffs. The prevention of cattle disease has been engaging the attention of many American states. Rural industries are being encouraged, homesteads and small holdings made easy of acquisition on periodical payments, in the United Kingdom, Canada, Australia and New Zealand.

A book full of instruction on the subject is the *Annuaire International de Legislation Agricole*, published by the Institut International d'Agriculture at Rome.

Native Law and Custom.—The value of the historical method in jurisprudence has long declared itself, and as it has made itself felt we are awakening to the importance of native law and custom as the origin of juridical ideas and as a side-light on their development. The awakening has come not a moment too soon, for with the spread of civilization these primitive customs with their rudimentary notions of justice are fast fading like a dissolving view. Mr. R. W. Hamilton, a Judge in British East Africa, has done excellent service in collecting some of the native customs there, and very curious many of them are. The fundamental ideas amongst most of the native tribes in East Africa regarding family relationships are: (1) that individual members of a family form the wealth and strength of the united family; (2) that the females cannot inherit and cannot dispose of property; (3) that females are themselves property to be bought and sold in marriage, to be assigned in payment of debt and to be owned and inherited by their male relations. In fact the female members of a man's family are as much a part of his property as his cattle, and often the most important source of his income. “Given” says Mr. Hamilton, “this conception of society in the minds of primitive savages whose

crimes are commonly the instinctive crimes of passion, it naturally follows that such offences as murder and rape are regarded by them in a very different light from that in which we look at them. Murder is regarded as a loss of strength caused to the family of the person murdered, which may be compensated by the murderer replacing the murdered man with others. Rape of an unmarried woman is regarded as so much loss caused to her owner in the price procurable for her in the marriage market." In short they are looked on as offences not against the person but against property. The idea of a crime against society has no place in the native mind.

In Mr. Northcote Thomas's "*Marriage Customs of the Edo-speaking Peoples of Nigeria*" he cites a curious parallel to Jacob serving his father-in-law Laban for Rachel. In addition to payment for a bride he says: "when the bride is young the suitor does a certain amount of work on the farm of his future father-in-law and helps him in such tasks as house-building."

In Albania the system of accepting money payment for homicide is still in full force (see Miss Durham's book *High Albania*). In a case of misadventure or manslaughter the £14 which is the standard tariff will as a rule be accepted: but when bad blood is aroused—in a case of honour or vital interests—the tender of cash is rejected and the tribes enter upon a long blood feud. It might be supposed that such a feud could only end with extermination, but there is a limit, though somewhat undefined. Thus, the Kastratione and Hoti tribes being at feud, a Kastratione accompanied Miss Durham as guide to the enemy's country. "All drank healths with him," she says, "he was the honoured guest and they discussed pleasantly how many 'bloods' would be required before peace could be made. The house-master was quite frank: five was the number he thought necessary. And the Kastran thought that five would satisfy them too." What is so curious is the absolute reverence of these untamed mountaineers for law co-existing with these bloodthirsty feuds: but the anomaly vanishes on a moment's reflection. The vendetta is to them the law—a family or social duty of primary obligation as it was to Hamlet the Dane.

Witchcraft is still a potent force among the native tribes of Africa. Laws and magistrates are powerless to stamp it out. One of the latest criminal cases in the East Africa Protectorate arose out of the elders of a tribe in solemn conclave having clubbed and stoned a witch-doctor.

Ancient Monuments.—There is a growing sense of the importance of protecting ancient monuments and national works of art before it is too late. The natural beauties of a country are being protected, and they run less risk of being spoilt than historic or architectural buildings or ruins. Austria, France, Holland, Germany, Italy and the United States have all legislated on the subject, and in the United Kingdom the Ancient Monuments Act 1910, c.3. enables the Commissioners of Works to accept the ownership of any "structure, erection or monument of historical or architectural interest or any remains thereof." Two more English Bills on the subject are pending, one of which proposes that all ancient monuments,—sites as well as artistic treasures—should be put under the protection of Government by being officially scheduled. In the meantime the Union of South Africa has provided for the preservation of Bushman relics in the shape of drawings or paintings on stone: while Spain has been creating a "centre" of historical studies for the scientific study of Spanish history. Cyprus has also been protecting its unique classical antiquities.

Administration of Justice.—At the annual meeting in London of the Law Society in 1912, the address of the President was chiefly occupied with the decline of British litigation and its causes. Such decline, it should be premised, is confined to the High Court. In the County Court the volume of litigation has increased and is increasing. For the decline in the High Court several causes are assigned—delay, uncertainty, costs; but these are nothing new. For centuries all these causes have been operating as deterrents. The true reason seems rather to be a decline in the litigious spirit of the old times. There is more of a disposition to-day to admit that the rights of the matter are partly on one side and partly on the other, and to compromise them accordingly, instead of fighting

them out to the bitter end. There is nothing to regret in this—no denial of justice, though the lawyers may suffer in pocket. But this and other problems will, it is to be hoped, be solved by the lately appointed Royal Commission on the administration of justice. The existing English procedure in civil cases leaves much to be desired. There are too many interlocutory proceedings, too many appeals, a want of uniformity. Why should proceedings commence sometimes with a writ, sometimes with an originating summons? Expert witnesses are an enormous expense to the parties, and generally contradict one another. Why should not the Court have a list of assessors—engineers, merchants, doctors, architects, chemists and others whom it can summon to its aid, just as it now does Brethren of the Trinity House in Admiralty cases, and Bishops or other Church dignitaries in ecclesiastical cases?

Hearing in Camerâ.—The English divorce case of *Scott v. Scott* in 1912 raised an interesting new question as to the effect of an order for hearing *in camerâ*. A lady instituted a suit for nullity of marriage. The case was ordered to be heard *in camerâ*, and in the result the Court made a decree on the ground of the husband's impotence. The ex-wife thereupon—to show that she was the aggrieved party—sent a transcript of the shorthand notes taken at the hearing to her father and sister. For this alleged violation of the secrecy of the hearing a motion was made to commit her for contempt, and Mr. Justice Bargrave Deane held that the publication did constitute a gross contempt. The lady appealed, and was met by a preliminary objection that the order was in a "criminal matter" and not appealable. The case was heard before the full Court of Appeal, with the result that four Judges held the preliminary objection good: two dissented, and of the latter one—Lord Justice Fletcher Moulton (now Lord Moulton)—delivered a very striking judgment. In his opinion the order related to the hearing and the hearing only, and when that was concluded its effect was at an end. There was therefore no contempt by the lady in what had been done, and he pointed out the danger to the administration of justice if the Court—the guardian of the liberty of the subject—itself encroached on that liberty. Hearing *in camerâ*, it must be remembered, is ordered not only to avoid the scandal of indecent evidence being given in public, but because such evidence often cannot be obtained at all except in private.

Recent Legal Literature.—A book of great value now nearing completion is *The Commercial Laws of the World*. Here we have the *Lex Mercatoria* grown into a library of fifteen massive volumes, the mustard-seed into a tree overshadowing the whole earth.

In Professor Maitland's *Collected Papers* we have had another book of remarkable interest, the gleanings of the rich harvest of F. W. Maitland's genius. Maitland—as his editor Mr. Fisher well says—was not only "a great discoverer in history," but an "incomparable populariser of his own and other men's knowledge."

A notable work is the 2nd edition of Burge's *Colonial and Foreign Law*, under the editorship of Mr. Justice Wood Renton and Mr. G. G. Phillimore. The scope and thoroughness of this work is illustrated in the latest volume, which is entirely devoted to marriage and divorce and contains a detailed survey of the law-systems of nearly all civilized nations. The voluminous *Laws of England*, proceeding under the auspices of Lord Halsbury, is a notable achievement for comprehensiveness and accuracy; and second editions of the *Encyclopaedia of the Laws of England* and the *Encyclopaedia of Scots Law* show the appreciation which those works have met with. A work of remarkable erudition is Buckland's *Roman Law of Slavery*, and with it may be coupled the Master of Balliol's *Criminal Law of Rome*.

The Great Jurists of the World, appearing under the auspices of the Society of Comparative Legislation, is a collection of articles contributed to the *Journal of the Society* by a number of distinguished lawyers. It should help to form the basis of a history of jurisprudence—a history teaching by examples.

A new departure which promises well is the establishment at Berlin of an International Institute for a Bibliography of Jurisprudence. The Institute will deal not only with books but with periodical literature. A great amount of valuable work is in these days buried and lost in periodicals and fugitive pamphlets, such as Sir Erle Richards's recent Lecture on the "Sovereignty of the Air," or Sir John Macdonell's "Historical Trials."

In connection with legal bibliography, a good idea comes from New York in the shape of a *Guide to German Law*. Popularly it may be described as "German Law and where to find it." It is the first of a series, admirably planned and ably executed, designed to constitute a library of comparative law.

Local Legislation.—The main currents of the past year or two in law and legislation having been indicated, a brief notice may be added of some of the special matters with which individual nations have been concerning themselves. Reference should be made, in this connection, to the accounts of separate countries in Part II of the YEAR-BOOK, notably in the case of the various states of the United States.

Austria.—Austria has lately been celebrating the centenary of its Civil Code. An interesting account of its history is given by Dr. Tisch. Divorce law in Austria, which is founded on the Code, still retains, Dr. Tisch says, the "confessional or ecclesiastical basis." In the case of Catholics, or even where one spouse only is a Catholic, the bond of marriage can only be dissolved by death. Where both spouses are non-Catholics the marriage may be dissolved by mutual consent if an insuperable disinclination is proved before the tribunal, or on complaint of one of the spouses for certain matrimonial offences.

A Code for Domestic Service in Vienna has lately been enacted by the Austrian Parliaments, defining concisely the respective rights of master and servant, mistress and maid.

The regulation of the Bar in Austria is also before the House of Deputies. The object is to prevent overcrowding by exacting higher qualifications and to prevent retired Judges swelling the competition.

Belgium.—Belgium has amended the whole of its Maritime Commercial Code.

Brazil.—Legislation here has been mainly concerned with bankruptcy and negotiable instruments. A copyright law has also been passed in favour of foreign authors, giving them the same privileges as native authors.

France.—France has been establishing old age pensions for workmen and peasants. Regulations have also been made for the health and safety of miners. Another law facilitates the acquisition of small rural holdings by allowing the agricultural banks to spread their advances over a period not exceeding fifteen years.

The growing importance of comparative law is illustrated in the fact that France has created an office of foreign legislation and international law. The full text of the decree will be found in No. xxv of the *Journal of Comparative Legislation*, p. 175.

Germany.—Germany has completed her scheme for compulsory insurance of workers. A new scheme of similar insurance for persons such as clerks with a higher scale of income is now being formulated.

In the matter of copyright, Germany, while adopting with a number of useful innovations the modifications of the Bern Convention of 1908, has not seen its way to lengthen the period of protection to 50 years as the British Copyright Act 1911 has done.

Another noticeable statute is that extending the liability of the Imperial Exchequer for breaches of duty on the part of Imperial officials.

In England a person keeping an animal not *ferae naturae* is only liable for its mischief if he had reason to know that it is savage. This is expressed in popular language by saying that a dog is entitled to its first bite. This "scienter" doctrine is too lax owing to the difficulty of proving knowledge. In Germany on the other hand the law was too strict. A person keeping an animal was liable for all damage caused by it. Under a new law a person keeping a domesticated animal for purposes of his profession or trade or of his maintenance, is not liable for any damage caused by such animal if in keeping watch over it he has used reasonable diligence or if the damage could not have been avoided by the use of reasonable diligence. This is fair. But the protection, it may be noted, is not extended to animals kept for sport or otherwise.

India.—The Indian Councils Act has made great changes in the constitution and functions of the Legislative Councils (see Sir C. Ilbert in *Journal of Comp. Leg.*, No. xxiv), and the Press Act has been passed to check the licence of some native newspapers.

Italy.—The state has been taking over all life insurance business.

Japan.—Hardly anything in the development of nations, has been more remarkable than the rapid transformation in Japan of the old régime into the new: but with all its innovations it would be misleading to say, as it has been said, that Japan in its new Civil Code has "thrown over its whole existing legal system." Sir Henry Maine has noted in his *Ancient Law* the remarkable persistency among the Romans of the *patria potestas*. No less remarkable is its sway in Japan under what is called "the power of the family head." It still dominates all rival legal conceptions. In the political sphere this is illustrated in the Japanese fidelity for 2550 years to the Imperial dynasty as head of the great family of the state—the supreme *pater familias*. But it is "pretty to observe," as Mr. Pepsys would say, how this doctrine of the *patria potestas*—this *imperium in imperio*—is, under the influence of modern ideas, passing through the same changes as in ancient Rome. Roman opinion tempered by degrees that strange domestic despotism, and there were duties attaching to the patriarchal head, such as the moral obligation to provide for all members of the family out of the common fund, which balanced the rights. In modern Japan the old feudal absoluteness of the family head has gone; the Japanese Court of Appeal has decided that his powers are to be exercised "only for the best interests of, and when necessary for the administration of, the house," and "if injustices are alleged the Court is to investigate them and set aside, if neces-

sary, any unfair exclusion of a member by the family." If a family head abuses his powers, such powers may be suspended. In short, the rights incident to the *patria potestas* are fading while its duties are emerging into clearer relief.

Some other matters may be noticed: An old age pension scheme has been passed, the age being fixed at 70. Selling intoxicating liquors to a minor has been made punishable. Horse racing has lately been prohibited,—the Government, which had at one time authorised it in the hope of improving the horse, being convinced that it was productive of more evil than good to the community. A censorship has also been established over the irresponsible newspaper, by requiring the publishers to make a deposit varying in amount with the population of the place where it is published.

Russia.—A new extradition law is one of the features of recent Russian legislation. The new law does not affect the provisions of existing treaties, but lays it down that subsequent treaties must be concluded on the basis of this law. To constitute an extraditable crime, it must be one punishable by imprisonment in both the countries in treaty. Extradition may be granted not only for the crimes enumerated in the treaty but for other crimes. It may be granted where the crime was committed for a political purpose. A Russian subject cannot be extradited. An interesting account of the new copyright law in Russia is given in No. xxvi of the *Journal of Comparative Legislation*.

Spain.—Spain has been legislating quite in the eugenist spirit for the good of babies,—providing for nurse agencies, homes for infants, milk supply, and in the same interest, regulating the work of women and children. It has been establishing a tribunal for the settlement of civil disputes between employers and employees. A usury law has also been passed making void all contracts of loan stipulating for a rate of interest notably higher than the normal value of the money and manifestly disproportionate.

Switzerland.—The new Civil Code has recently come into operation. It is based on the German Civil Code, but with original features of its own. The framers, for example, have preferred to leave much to the Judge, and where the text of the Code fails as a precise guide its spirit is to prevail. In default of this the judge is to be guided by custom or the rule which he would if legislating have adopted.

United States.—One of the most noticeable features in the United States is the effort to secure uniform legislation among the states. The evils of the existing diversity are notorious and are specially felt in the case of commercial laws. The first of these proposed American uniform Commercial Acts deals with the law of negotiable instruments. Others will be the Sales Act, the Bills of Lading Act, the Uniform Desertion Act, the Uniform Divorce Act the Uniform Boiler Inspection Act.

(EDWARD MANSON.)

THE BRITISH LAW OF ARTISTIC COPYRIGHT

On July 1, 1912, there came into operation an entirely new British Copyright Act. Mr. Sydney Buxton's Imperial Copyright Bill (the general terms of which were given in the article "Copyright" in *E. B.* vii, 128, 129) became law in 1911. The passing of this Act not only consolidated and amended the British law of Literary Copyright, on the lines there indicated, but has entirely altered the conditions of Artistic Copyright and repealed the previous Acts dealing with it; the statement of law on that subject as set forth in *E. B.* vii, 125 *et seq.* no longer therefore holds good, and we shall state here what the law now is. The changes effected by the Act were very great, the chief being the unification of the law in regard to every branch of the Fine Arts, the abolition of all formalities for securing copyright to the artist such as registration or the signing of works or documents of any kind, the extension of the term of copyright for all forms of art, the inclusion of architecture, and the return of the copyright to the legal representatives of an artist twenty-five years after his death.

Scope.—The application of the Act extends to the whole of the British Dominions except when specially restricted to the United Kingdom, but to be effective in the self-governing Dominions—Australia, Canada, New Zealand, South Africa, Newfoundland—the legislature of the Dominions must declare the Act to be in force either with or without modifications relating to procedure and remedies which the Dominions are at liberty to make. British possessions which are not self-governing Dominions have the same liberty to modify the Act or to adopt it as it stands. An order in Council may also extend the operation of the Act to Protectorates—as Cyprus—and to foreign countries. The old law protected all works of art produced in any part of the British Dominions, but it only protected them in the United Kingdom. British works of art appear to have had no protection in the self-governing Dominions and possessions unless under special local provision, or unless, as illustrations to a book, they were protected as being parts of a book under the Literary Copyright Act of 1842, which unlike the Fine Arts Act extended its scope to the British Dominions.

Rights.—There is copyright in every original work of art, but if the work is published it

must be first published in some part of the British Dominions to which the Act extends, and if unpublished the author must, at the date of the making of the work, be a British subject or resident within such part of the British Dominions as aforesaid. If the making of the work has extended over a considerable time it is only necessary that the author should have been for a substantial part of that time a British subject or resident or domiciled within the British Dominions or a foreign country to which the Act extends.

The change made by the new Act affects paintings, drawings and photographs to this extent. Publication did not affect copyright which existed from the making of the work, and which was protected by common law right, so long as it remained unpublished. On publication the copyright became subject to the terms of copyright enacted by the 1862 Act. The new law abolishes common law protection entirely, but gives protection for unpublished works; under the statute an unpublished engraving retains its copyright so long as it remains unpublished, but it becomes amenable to the terms provided for posthumous works if published after the author's death.

"Copyright" means the sole right to produce or reproduce the works or any substantial part thereof in any material form whatsoever, and to publish the work; it includes also the right to dramatise a work of art in the form of a living picture or otherwise. "Publication" means the issue of copies to the public. The exhibition of a work is not publication, nor is the construction of a work of architecture, nor the issue of photographs or engravings of works of sculpture or architecture.

Under the old law engravings and sculpture acquired statutory copyright on publication, by the addition of the name of the proprietor and the date of publication on each original or copy issued to the public.

In paintings, drawings and photographs there was statutory copyright from the making and quite apart from publication, but registration was necessary prior to any action at law in defence of copyright. Registration is now abolished.

Architecture is introduced into a copyright Act for the first time, and solely at the instigation of the Berlin Convention. It is very uncertain how it will act or what is protected, and its inclusion was by no means unanimously desired by architects. But the protection of architectural designs has been put in operation abroad, and certain claims have been dealt with. The use of the expressions "architectural drawings" and "drawings of architecture" seems to have caused some little confusion, but perhaps unnecessarily. An "architectural drawing or plan" may be taken to be a constructional drawing made by the architect for the use of the builder. A "drawing of architecture" may be made by anybody of a building already constructed, and while showing the superficial character of the building would not be in any sense a constructive drawing.

Infringement is the doing without the consent of the owner of the copyright anything, the sole right to do which belongs under the Act to the owner of the copyright. The following acts are exceptions:

(A) Any fair dealing with a work for purposes of private study, criticism or review is not an infringement.

(B) An artist who has disposed of his copyright in a work may use any mould, cast, sketch, plan, model or study, made for the purpose of the work, provided he does not thereby repeat or imitate the main design of the work.

(C) Paintings, drawings, engravings or photographs may be made and published of a work of sculpture or artistic craftsmanship permanently situated in a public place or building, or of an architectural work if they are not in the nature of architectural drawings or plans.

(D) Photographs may be made of paintings, drawings or engravings, situated in a public place or building, maintained in part or entirely by public funds, unless the copyright in them is private property.

Infringement is committed by anyone who sells, lets for hire, offers for sale or hire by way of trade, or widely distributes or exhibits in public, or imports for sale or hire into any part of the British Dominions, any work which to his knowledge infringes copyright.

These exceptions clear up points to which no reference was made in the old Acts, though some of them were assumed to be permissible, such as the use by the artist of his sketches and studies, and the making of complete copies of works for purposes of private study. "Fair dealing" is a new element which may have to be defined by the Law Courts.

Terms of Copyright.—Copyright endures for the life of the author and fifty years after his death. But the Act renders it impossible for an artist to dispose of his copyright for more than his life and twenty-five years after his death. No matter what agreement he may make to the contrary, twenty-five years after his death the copyright returns to his legal personal representatives as part of his estate.

A provision is made whereby in the case of a work which has been published, it is possible, twenty-five years after the death of the author or in the case of an engraving thirty years, for any person to reproduce and publish the work, on giving notice of his intention and on payment of a royalty of 10 per cent on the published price in respect of copies sold, the notice and the payment of royalties to be regulated by the Board of Trade.

Photographs have copyright for fifty years from the date of making the negative.

The change in the duration of the term of copyright is one of the most important effected by the Act. Under the old law the terms were for engravings 28 years; for sculpture 14 years, with a possible additional 14; for paintings, drawings and photographs, the life of the author and 7 years after his death. The term of life and 50 years was decided upon to enable Great Britain to fall into line with the other countries of Europe, the great majority of these already having accepted this term.

Ownership of copyright.—The author of the work is the first owner of its copyright. There are two exceptions:—

(A) A person giving a commission for valuable consideration for a portrait, an engraving or a photograph, is the first owner of the copyright therein; (B) Where a work is made by a person in the employment under a contract of service of some other person the copyright belongs to the employer.

This is without doubt as regards the painter and draughtsman the most important change made by the Act. Under the old law it was necessary for the mere existence of a copyright in a painting or drawing that on the first sale of the work a document be prepared stating to whom the copyright should belong. If it remained with the artist the document had to be signed by the purchaser, if it passed with the work to the purchaser it had to be signed by the artist, and in the event of no agreement in this form being made on the first sale the copyright ceased to exist, and the work could be reproduced by any one able to gain access to it for this purpose. The photographer came under the same law, but as the copyright in a photograph lies in the negative which is very seldom sold, the photographer was but slightly affected. Up to the date of sale the copyright was protected by common law. The passing of copyright to a person giving a commission is now restricted to the case of a portrait, an engraving or photograph; previously it passed without agreement in all cases of commission of a painting, drawing or photograph, but not of an engraving or sculpture.

Licenses.—The owner of a copyright may assign his rights wholly or partially either for the whole term of his copyright or any portion of it, and may grant any interest in his rights by license. These grants must be in writing signed by the owner of copyright.

There was some doubt under the old law as to the right of a copyright owner to split up and part with portions of his right, *i.e.* whether he could grant a right to one person to reproduce his work in black and white, and to another in colour or to use it for post-cards, while the right to make a large coloured Christmas supplement went to another. It is clear under the new Act that he may also grant licences for a time or for the whole term of his copyright. It also does away with the provision in respect to the sculpture copyright that it could only pass by deed signed and sealed and by the attestation of witnesses, and also with the necessity in the case of an engraving copyright to have the written agreement attested by credible witnesses.

Civil Remedies.—When copyright has been infringed, the owner, except in the case of an infringing work of architecture, is entitled to an injunction or interdict, to damages and to an account of sales. In the case of a work of architecture the construction of the alleged infringing building cannot be stopped by injunction. Infringing copies of a work, except a work of architecture, are deemed to be the property of the owner of copyright. When proceedings are taken against an infringer who alleges in his defence that he did not know of the existence of copyright in the work, the onus of proof that he did not know and had not reasonable means of making himself aware of its existence lies on the infringer.

An action in respect of infringement of copyright must be begun within three years after the infringement.

If a work is signed or the authorship otherwise indicated on the work in the usual manner, it is presumed that the person whose name is signed or so indicated is the author of the work. If the work is published the name of the publisher, if the name of the author is not given, is accepted as *prima facie* proof of ownership of copyright. The great change effected in the law is the doing away entirely with registration, which was formerly necessary as *prima facie* proof of copyright in the case of paintings, drawings and photographs.

The innocent infringer was unknown under the old law. Absence of knowledge was no defence. The common law protected copyright from infringement, as it protected property from trespass. The limitation of time for the beginning of action was practically the six years prescribed by the statute of limitations.

Summary Remedies.—Any person who knowingly infringes copyright is liable on conviction to a fine not exceeding forty shillings for every copy dealt with, but not exceeding fifty pounds in respect of the same transaction. On a second offence the infringer is liable to imprisonment, with or without hard labour, for a term not exceeding two months. Infringing copies made outside the United Kingdom and imported may be stopped at the port of entrance on notice being given in writing to the commissioners of Customs and Excise.

Clauses 7 and 8 of the 1862 Fine Arts Copyright Act remain operative under the new law. They impose penalties for (1) the fraudulent signing of paintings, drawings and photographs, with names or signs misleading as to authorship; (2) the fraudulent publishing or selling such fraudulently signed works; (3) the fraudulent putting forth copies of works, as original works by the author of those from which the copies have been made; (4) the

alteration of works after they have passed from the author's possession, and the putting forth such altered works as the original unaltered works of the author or copies of such altered works, as copies of the original unaltered works, without the author's consent. The penalty for these offences is a fine of ten pounds, or a sum not exceeding double the full price at which all such fraudulent works have been sold or offered for sale. This penalty is contingent upon the author whose name has been fraudulently signed or work altered, etc. having been living within twenty years of the committal of the offence.

Joint Authorship.—The copyright in a work executed by two or more artists subsists during the life of the author who first dies and for a term of fifty years after his death, or during the life of the author who dies last, whichever period is the longer.

Designs.—The Act does not apply to designs capable of registration under the Patents and Designs Act 1907, that is to say designs which are intended to be multiplied by an industrial process.

Posthumous Works.—In the case of an engraving in which copyright subsists remaining unpublished at the time of the author's death, copyright remains until publication and for fifty years thereafter.

Existing Copyright.—Where any person at the time of the coming into operation of the Act was entitled to any copyright, he became from that date entitled to the substituted rights provided by the Act as if it had been in existence at the date when the work was made; but if the author of a work has assigned his rights entirely or partially for the whole term of his rights, then at the date when but for the passing of the new Act the right would have expired, the substituted right conferred by the Act passes to the author and the interest of the assign terminates; but the assignee is entitled at his option to (1) an assignment of the further rights on a consideration to be agreed, or (2) without such assignment to continue publication as before subject to the payment of a royalty to be agreed. Failing agreement, the terms in both cases must be settled by arbitration.

Common Law Right.—All protection at common law ceases to exist, and no right can be claimed other than those provided under the Act, or by any other act which may be in force. (EDWIN BALE.)

SECTION VII. ENGINEERING AND INDUSTRY

AERONAUTICS¹

Since 1910 Aeronautics has definitely taken its rank among the sciences. Though precise knowledge is meagre as yet, the fundamental principles which determine the laws of air-resistance and the properties of the air in motion, on the proper utilisation and application whereof aerial navigation is based, have once and for all been laid down in their broader aspects. Whereas, therefore, even in 1910 the design of an aeroplane proceeded largely by guess-work and its construction by rule of thumb, to-day the science of aerodynamics, founded partly on theoretical considerations and partly on the data derived from extensive experiment and research, is sufficiently exact to enable the qualities and capabilities of an aeroplane of given design to be forecast with accuracy. Within this short space of time the aeronautical engineer, formerly content merely to produce a machine that would fly, has already begun to design aircraft with a given object, which has led to a marked differentiation of types.

If vast strides have been made in the science of aerodynamics, the kindred aspects of the science of meteorology have made little progress. From the point of view of

Meteorology.

aerial navigation the great general movements of the atmosphere, and their causes have little immediate interest, whereas the structure of the wind is of vital importance. Since the publication of Langley's *Internal Work of the Wind*, this branch of meteorology has remained almost stationary, but in the year 1912 there was established at South Farnborough a new branch of the (British) Meteorological Office, acting in conjunction with the Advisory Committee on Aeronautics and the Royal Aircraft Factory, the chief function of which, in addition to supplying weather forecasts for the use of military aviators, is to carry on research work in what may be

¹ See *E. B.* i, 260 *et seq.* ("Aeronautics"), and x, 502, *et seq.* ("Flight and Flying").

termed "gust-meteorology." This work has already led to valuable results, more especially in recording the sudden deflections of the wind from the horizontal, and the relatively small area of gusts. Observations have also confirmed Langley's exposition of the structure of the wind as consisting of a series of rapidly succeeding gusts and lulls of approximately equal intensity; on rare occasions, however, a sudden increase or drop in the velocity of the wind may be sustained for several minutes, a phenomenon which has been held to explain one form at any rate of the aerial disturbances encountered by aviators and known as "holes in the air."

Recent aerodynamical research has largely substantiated in practice the former theories of air-resistance based on the general laws of fluid motion. In broad terms the resistance of the air has been proved to vary directly as the area of the surface opposed to it (with the necessary reservations regarding the shape of the surface), and as the square of the velocity of motion. The coefficient of air-resistance has further been laid down with accuracy; this coefficient, denoted by the symbol K in the case of a flat square plate placed normally to the wind, has a value of 0.075 in metric units, and of 0.00143 in British units (lbs., sq. ft.; ft. per. sec.). The fundamental equation of air-resistance (making due correction for the density of the air) therefore reads $R = KSV^2$. The variation due to the shape of the body is, however, very considerable; thus, in the case of a well-designed, curved aeroplane wing, the coefficient rises from 0.075 to 0.4, and even more—a result due to the curve or camber of the wing and its large span. On the other hand, by adopting a shape approximating as nearly as possible to a perfect "stream-line" form, it is possible to reduce resistance to a very low figure, and this is now taken full advantage of in the design of all parts whose resistance to motion through the air impedes progress, as in the case of the hull of a dirigible, or the vertical struts of an aeroplane. Broadly speaking, therefore, recent research has led to a considerable increase of that portion of air resistance which, in the case of an aeroplane, is converted into the lifting force, and an important reduction of the detrimental portion of resistance, usually termed the "drift." Further experiment must lead to improvement of the ratio of the lift to the drift and involve corresponding modifications of design, which are already clearly foreshadowed.

The research work which constitutes the present basis of the science of aerodynamics has been carried out at various laboratories founded and supported either by private generosity and enterprise, or by the public funds. The chief of these aerodynamical laboratories are those of M. Eiffel in Paris, the Aero-Technical Institute founded by M. Deutsch at St. Cyr, the military laboratory at Chalais-Meudon, Dr. Riabouchinsky's institute at Koutchino in Russia, the laboratory of the University of Göttingen directed by Dr. Prandtl, and the new aeronautical branch of the British National Physical Laboratory at Teddington. The work of this latter institution, which was established in 1910, has given particularly valuable results, due both to its exceptionally fine and complete equipment, and to the fact that its experiments are largely initiated and controlled by the Advisory Committee for Aeronautics, a body appointed by the British government under the presidency of Lord Rayleigh, in 1910, whose reports are annually published in the form of a blue book. The equipment of this laboratory may serve as the general example of the methods whereby aeronautical research work is nowadays carried out. The principal part of the installation consists of two large wind tunnels in which scale models of the objects to be tested are suspended in a current of air drawn through the tunnel by an electric fan. Special care is taken to prevent the formation of eddies, pulsations and other forms of turbulence, and the speed of the air-current can be accurately regulated up to 50 ft. per second. The wind-tunnel is used to determine the air-resistance and pressure distribution on bodies of various shapes, from the hulls of dirigibles to the smallest portions of the structure of an aeroplane. A water channel, on a similar principle, provides the means for studying and photographing the flow of fluids past different forms of bodies. In a separate building is mounted a large whirling arm for testing models of propellers. In addition the equipment comprises machinery for testing the materials employed.

Aero-dynamics.

Provision for research.

Recent experiments having shown that the results of tests on scale models may be applied, in accordance with the known law of correspondence, to full-size machines, the work of the laboratory has become increasingly valuable and rendered superfluous the hazardous and often inconclusive experiments with full-size machines in flight.

While scientific experiment and research work have played a part of inestimable value in the development of aeronautics in general and of aviation in particular, this development has also called forth a new branch of engineering. In Great Britain the aeronautical engineering profession is represented by the Aeronautical Society, which grants Associate-Fellowship and Fellowship degrees of proficiency.

While both the aeroplane and the dirigible have made vast progress in recent years, the balloon, from its very nature, has reached the limit of its development and lost some of its popularity in the face of the advance of the other forms of aerial navigation. From the military point of view it has been supplanted by motor-driven aircraft. For purposes of sport, however, the balloon remains in favour, stimulated to a great extent by the balloon races held in many countries. The following figures, representing the cubic feet of gas consumed for balloon ascents during the years 1909, 1910 and 1911, in the four principal countries, reflect with fair accuracy the position of ballooning during recent times.

	1909.	1910.	1911.
Belgium	7,720,000	7,200,000	7,590,000
France	28,600,000	17,400,000	27,290,000
Germany	44,500,000	76,900,000	72,260,000
Great Britain	7,690,000	5,860,000	5,650,000

The chief sporting event of the year, the International Gordon-Bennett Balloon Race, in 1912 produced two new world's records. The race started from Stuttgart on October 27th, and was won by M. Bienaimé, a French representative, who landed in Russia after having covered 1,360 miles; M. Leblanc, the second French representative, also beating the former record by covering 1,243 miles.

Some few years ago, in the face of questionable results and repeated disasters, it was commonly thought that the dirigible, too, had attained the limit of its development and utility. But in recent years progress has been enormous in this direction.

Dirigibles. It is difficult to explain the reasons of this progress, save on the score of improvements in detail and in structural methods, based largely on accumulated experience. The one factor which, no doubt, has been chiefly responsible for the slow development of the dirigible has been that of expense. From its very nature, this type of aircraft is enormously costly, not only in the primary cost of materials, but in upkeep and by reason of the elaborate accommodation required for its harbourage. While an aeroplane is practically independent of a fixed base, a dirigible requires vast halls for shelter, since, once on the ground, it becomes, in default of suitable harbourage, the prey of the least gust of wind. Nevertheless, the enormous progress realized with this type of aircraft, and its indubitable advantages, which an aeroplane can never possess, have rendered it a military instrument of potent value.

The three types of dirigibles which have always existed have been developed, each according to its special nature and purpose, to a high degree of efficiency during recent years. Their classification is based on their structural nature: the rigid, in which the hull consists of a rigid wood or metal skeleton, wherein the gas envelopes are contained; the non-rigid, forming in effect an elongated motor-driven balloon, comprising no rigid members or frameworks of any kind; the semi-rigid, a type intermediate between the previous two, in which the lower part of the hull is strengthened by a rigid framework forming the point from which the car is suspended and to which the organs of direction and control are attached. The latter type, however, is tending to disappear and to become absorbed in that termed non-rigid. The relative advantages of the three types are expressed in their denominations. The two aims pursued by designers are speed and lifting-power. The former object demands considerable structural strength to resist the high air pressure exerted upon the hull at high speeds. The rigid type of craft,

consisting of a rigid indeformable framework, possesses a considerable degree of strength, moreover, the cars containing the engines, the propellers and the controlling organs, can be rigidly attached to the hull and in close proximity thereto; so that the rigid dirigible realises most nearly that ideal condition wherein the centres of resistance and propulsion coincide. On the other hand, the rigid framework implies a great increase in weight; hence a rigid dirigible must necessarily be of large size. Again, it can only be deflated slowly, so that in case of accident or involuntary landing, it always stands in danger of destruction by the wind. Lastly, being incapable of being transported, it can only act from a fixed base. The non-rigid type, on the other hand, while it can be easily deflated and transported, is of inferior structural strength and efficiency, for its gas-containing hull is constituted by fabric—the shape being maintained by keeping the gas under a pressure in excess of that of the surrounding atmosphere—while the propelling plant and controlling surfaces must be situated in or near the car.

The rigid dirigible, which owes its development chiefly to Count von Zeppelin, has realised the more important progress. The last Zeppelin dirigible built before the end of 1912, and acquired by the German navy, possessed a volume of 776,000 cubic feet divided into 18 gas compartments; its length was 525 feet, its diameter 49 feet; driven by three motors developing 510 total horse-power, it was capable of a speed of 52 miles an hour, and carried a useful load of approximately 7 tons, sufficient to provide fuel for 96 hours. The framework of the Zeppelins is constituted by aluminium girder work. In the Schütte-Lanz dirigible, and in the recent French dirigible built to the designs of M. Spiess, the skeleton is built up of wood. As passenger craft, the two Zeppelin dirigibles owned by a private German company, rendered an excellent account of themselves during the year 1912, making over 300 ascents and carrying about 5,000 passengers.

Both the French and German armies possess a considerable fleet of dirigibles, the numbers of efficient vessels being, at the end of 1912:

	Rigid.	Semi-Rigid.	Non-Rigid.	Total.
Germany	5	3	5	13
France	1	3	8	12

In addition both countries possess several privately-owned airships, available for emergency service, which bring the German and French fleets up to 25 and 21 units respectively. Further, both countries possess a large number of permanent airship stations, situated principally in strategical centres. During manoeuvres of recent years, and during the Tripolitan war in 1911-12, military dirigibles took part with good results and demonstrated their special adaptability for night-work, for detailed observation over long distances, and for maintaining uninterrupted communication with their base by means of wireless telegraphy. In Great Britain progress has been comparatively slow. Three small dirigibles built at the Royal Aircraft Factory for experimental purposes have only proved partially successful, while the rigid dirigible constructed for the Navy at Barrow was wrecked by the wind in 1911 on its first appearance in the open. These failures were followed by the British Government ordering, for the use of the Navy, a German dirigible of the Parseval system and a French dirigible of the Astra-Torres type, towards the end of 1912.

The wonderful progress in aviation during the last two years, and its transition from the experimental to the practical stage has been due principally to the improved aerodynamical knowledge resulting from scientific research work previously alluded to, and, though in lesser degree, to the increased skill and experience of aeroplane pilots. In essential principles no radical alteration has taken place since the days of Wilbur and Orville Wright, and the early French experimenters. By the side of improvements in details of design, highly improved methods of construction have contributed to increase the efficiency, reliability and safety of the aeroplane to a vast extent.

Most noteworthy of modern technical features in aviation are the gradual introduction of steel where wood was the constructional material a most exclusively used a few years ago, the substitution of a long covered-in body, forming the back-bone of the

aeroplane and enclosing both the engine and the passengers, for the simple open framework of former days, and a considerable improvement in stability. In consequence, the aeroplane in which the propeller revolved in the rear of the planes has been largely replaced by the type known as the "tractor," in which the engine, mounted in the bow of the body, drives by direct transmission a propeller rotating in front of the planes. Generally speaking, the above features apply both to monoplanes and to biplanes, the former type consisting of a single plane or pair of outstretched wings, whereas in the latter two lifting planes are superposed and interconnected by struts. The relative advantages of these two main types are chiefly constructional; the girder shape of the framework rendering the structure stronger in the biplane, and leading to its general employment where heavy weights have to be carried. In the case of a monoplane, the wings are stayed by means of steel wires or cables attached to the landing chassis and to an overhead staymast, an arrangement which, while reducing head resistance, presents obvious engineering difficulties of a constructional nature. The controlling surfaces are usually situated in the tail, fixed to the after end of the body; they consist of an ordinary vertical rudder for steering in a horizontal plane, and of a horizontal rudder or "elevator" for steering upwards and downwards and for maintaining longitudinal balance. Lateral stability is usually controlled either by the process originated by the brothers Wright and known as "warping" the planes, *i.e.* twisting their rear outer extremities to produce an increase in lift on the lowered side and to reduce the lift on the raised side, or by the equivalent means of operating balancing flaps attached to the rear edge of the planes or mounted in between them.

Two further distinctive features mark the recent development of aviation: the vastly increased reliability of the aeroplane motor and the evolution of the hydro-aeroplane,

Motors. by which is denoted a craft able to rise from and alight upon the surface of the water. Two distinct types of aeroplane motors have been created, the rotary air-cooled engine and the water-cooled stationary type, of which the former, generally speaking, is most effective for comparatively low powers, while the latter is usually employed for the heavy passenger-carrying class of aeroplanes. The power developed ranges from 25 h.p. in a small school machine to 140 h.p. in a racing aeroplane, or one designed for extended flights. These motors, with the exception of the rotary type, show little difference from the average motor-car engine, save only in a considerable reduction in the weight, which ranges from 2 to 6 lbs. per horse-power.

The hydro-aeroplane owed its first development to the American, Glenn Curtiss, who equipped his aeroplanes with floats as early as 1910. Two main types have already been evolved, though with countless modifications. In the first the only feature

Hydro-aeroplanes. that distinguishes the marine type from that destined for use on land, is the substitution of one or more floats for the ordinary landing chassis, though this is sometimes retained in the shape of disappearing wheels. The second class, variously termed "flying-boat" and "air-boat," consists essentially of a long boat-shaped hull, wherein the passengers' seats are contained, and on which the planes are built up in the form of a superstructure. This latter type of craft seems destined to a greater sphere of utility than the former, by reason of its being better able to withstand the battering of waves and the shock of alighting on rough water. General technical opinion foresees a greater future for the marine aeroplane than for the terrestrial type, owing to the fact that it can be used in the colonies and in undeveloped countries where suitable alighting grounds are scarce; while, on the other hand, it would solve the difficulty and danger of alighting in a heavy high-speed aeroplane.

In the sport of aviation, as evidenced in the record of performances during the last two years, progress has been startlingly rapid. The year 1911 was marked by the organisation of a series of long-distance cross-country races, among the most noteworthy being those from Paris to Madrid, won by J. Védérines; from Paris to Rome, won by A. Beaumont; the so-called European circuit, which extended over 1000 miles through France, Belgium, Holland and England with Paris as the starting and finishing point; and the 1000 miles circuit of

Britain which was won by A. Beaumont, who beat J. Védérines by one hour in 22½ hours' net flying time. In the same year the International Gordon-Bennett Aviation Cup was won by C. Weymann on a 100-h.p. Nieuport monoplane at a speed of 78 m.p.h. In 1912 the same race was won by J. Védérines on a 140-h.p. Deperdussin monoplane at 105½ m.p.h., which formed the world's speed record at the end of 1912.

In other respects performances have been no less remarkable. On December 11, 1912, at Tunis, R. Garros created a world's altitude record by ascending to 19,000 feet. On September 11th of the same year, G. Fourny established the latest record for a continuous flight, by covering 627 miles in 13 h. 17 min. The longest flight across-country on a single day was made by P. Daucourt, who flew from Valenciennes to Biarritz, a distance of 530 miles, on October 27, 1912. A new British duration record was established on October 24, 1912 by H. G. Hawker, who, piloting a Sopwith biplane, remained in the air for 8 h. 23 min.

But the significance of these achievements fades before the truly wonderful development in the aeroplane from a military point of view. In 1912 aviation was definitely introduced, as a new arm, into the establishment of all the great armies.

Use in war. The first impetus to this movement was given by France, where aeroplanes have been employed in the army manoeuvres for several years past. Under the aerial law passed in March 1912, the aviation establishment of the French army numbered, at the end of 1912, a total of 344 effective aeroplanes divided into 43 sections, distributed on a territorial basis, 234 efficient pilots, an equivalent number of trained observers and 2,200 men. Since then, the number of army aeroplanes has been considerably increased as a result of a popular subscription which realised over £100,000 in twelve months. The French budget for the same year included a vote of £880,000 for military aviation.

In Great Britain an effective forward step, on similar lines, was made in 1912 by the creation of the Royal Flying Corps. This body forms a separate entity from either of the two services, from both of which its members are recruited. It comprises a Military Wing and a Naval Wing, each divided into sections of 8 aeroplanes. The chief training centre is situated at the Central Flying School at Upavon, and its main depot at the Royal Aircraft Factory at Farnborough. At the end of 1912, the establishment of the Military Wing consisted of one airship and kite section, and three aeroplane sections, the *personnel* and material of which, however, were not complete. Greater progress had then already been achieved by the Naval Wing, which had at the end of the year established flying stations on the Isle of Sheppey, at Rosyth and in the Humber. In 1912 the aeroplane was first employed in actual warfare, by the Italians in Tripoli and by the Balkan states and the Turkish army in the Balkan war. In both cases, however, though valuable services were rendered, the results were somewhat inconclusive, owing to the absence of serious opposition in the first case and lack of organisation in the second.

That the aeroplane will be called upon to play a part of ever-increasing importance in warfare of the future is no longer open to doubt; but for the present its function appears to be confined to scouting and reconnaissance, both tactical and strategical, experiments with bomb-dropping having proved ineffectual hitherto.

The active and industrial development of aviation is clearly shown in the following list of aeroplane pilots at the end of the years 1910, 1911 and 1912, the figures for the latter year being approximate only:

	1910.	1911.	1912.
France	272	561	1200
Germany	49	144	350
Great Britain	55	169	400
Italy	32	92	200
United States	22	82	180

Military pilots are not, however, in all cases included in the above list.

(J. H. LEDEBOER).

SHIPS AND SHIPBUILDING¹

Prosperity and disaster combined to make the years 1910-12 very notable in the annals of British shipbuilding. The output of Merchant Ships in the United Kingdom in 1911 reached 1,803,844 tons—almost double that of 1908; and of this total, 1,400,000 tons were for United Kingdom owners, 60,000 for British Colonial, and 344,000 tons for foreign owners, as shown in Column 2 of Table I. In addition 695,300 tons of shipping were sold abroad. The world's output in 1911 exceeded 2½ millions, as in Col. 3. Glasgow, Newcastle and Sunderland districts each reported more than Germany; Greenock and Belfast more than the United States; Middlesbrough and Hartlepool more than France. Notwithstanding large additions the total tonnage (Col. 5) increases but slowly, as the annual reduction due to vessels being broken up, lost, etc., amounts to about 900,000 tons, including 350,000 tons British Shipping. Table I also shows the relation between Merchant and War shipbuilding in 1911, Col. 6 the amount launched in each country, and Col. 7 the portion thereof for foreign owners.

Table I. *Shipping² of Various Countries (in thousands of tons).*

	Ownership of U. K. output in 1911	World's output in 1911	World's Shipping in 1912		Warships built in 1911

Other Countries	44	11	1,980	1,612	1	..
Total	1,804	2,650	30,316	44,600	769	76

The United States output fell to 172,000 tons in 1911. The amount building fell from 130,000 tons in June 1910 to 97,000 tons in June 1911, but increased to 215,000 tons by October 1912, due to the construction of vessels to engage in traffic through the Panama Canal. The last three years have seen rapid increases in Germany: the total for 1911—255,532 tons—was however still 63,000 tons less than the record made for that country in 1906. The tonnage under construction rose to 467,700 tons in October 1912 (see also Count Reventlow, *Cassier's Mag.*, December 1911). The output of France in thousands of tons has been as follows: (1892) 17; (1902) 192; (1906) 35; (1910) 81; (1911) 125; but since March 1911 building has remained fairly steady at about 120,000 tons. The output of Holland continues to increase; in October 1912 she

¹ See *E. B.* xxiv, 867 *et seq.* ²The statistics are based on Lloyd's Register of Shipping.

had 103,000 tons building, a number of vessels being equipped with I. C. engines, using suction gas and light and heavy oil fuels.

Lloyd's Register shows that in 1912 there were 11 British, 35 German, 11 American, and 20 other vessels of over 10,000 tons, and on September 30th 36 such vessels were being built in the United Kingdom. The largest British vessel afloat in 1912 was the "Olympic," 852.5 ft. long, 92.5 ft. beam, 45,300 tons gross, 52,300 tons displ. at 34 ft. 7 in. draught, 55,000 H.P. and 22½ knots speed (for description and drawings see *Shipbuilder*, 1911); but "Aquitania," building by John Brown & Co. of Clydebank for the Cunard Co., "Britannic," building by Harland & Wolff for the White Star Co., "Imperator" and two similar vessels building at Hamburg, are all larger still (see Sir William White on "Maximum Dimensions of Ships," Am. Soc. N. A.; and Foster King, Int. Mar. Congress, 1911). Among German ships, the "Imperator" (Hamburg-American line), launched May 23, 1912, is 881 feet long, 96 feet beam, 65 ft. depth, about 51,000 tons gross, has accommodation for over 4,000 passengers and 1,200 crew, is fitted with Parsons turbines of 60,000 H.P., driving 4 screws at 185 revs. per min., and a speed of 22½ knots is expected. One vessel of 35,000 tons and five of 16-19,000 tons are also being built in Germany. The largest Dutch vessel (being built at Belfast for Holland-Amerika Line) is 740 ft. long, 32,500 tons, has combination T. and R. engines for 17 knots, and will carry 3,600 passengers. The same firm has in hand the "Ceramic" of 18,000 tons for the White Star Australian service. The "France," the largest French vessel (Comp. Gen. Transatlantique) is 689 ft. long, 75.6 ft. beam, 53.4 ft. depth, 23,666 tons gross, has turbines of 45,000 H.P., for 24 knots speed, carries 1926 passengers and a crew of 600, and is now the fastest foreign vessel on the Atlantic. The Austrian-built "Kaiser Franz Josef I," 477.5 ft. long, 12,567 tons, 13,000 H.P., 19 knots, carrying 2,000 passengers, is the largest Austrian vessel. The largest Spanish vessel, the "Reina Victoria Eugenia," built by Swan, Hunter & Co., is 480 ft. long, 61 ft. beam, 32.7 ft. depth, 10,000 tons gross, 10,000 H.P., 17½ knots speed. The Allan liners "Alsatian" and "Calgarian," being built for the Canadian Atlantic service, are 570 ft. long, 18,250 tons, and 21,000 H.P. for 18 knots sea speed. The "Empress of Russia," and "Empress of Asia," built by Fairfield for the Can. Pac. service between Vancouver and Japan, are 590 ft. long, 68 ft. beam, 46 ft. depth, 15,000 tons gross, 20 knots trial and 18½ knots sea speed, carry 1,100 passengers and 475 crew, and will replace the original "Empress" vessels of 6,000 tons in that service. The "Niagara," built by John Brown & Co., for the Union Shipping Co. of New Zealand for service between Vancouver and Australia, is 522 ft. long, 66 ft. beam, 37½ ft. depth, 13,500 tons, 12,000 H.P., carries 667 passengers and a large cargo. The Japanese liner "Shinyo Maru," of 13,377 tons and 18,500 H.P., turbines as well as hull built in Japan, has been completed (sister vessel to "Tenyo Maru," see *E. B.* xxiv, 887, and *I. N. A.* 1911).

The "Medina" (P. & O.), which on her first voyage (November 1911) took King George and Queen Mary to India for the Durbar, is 12,358 tons and 18½ knots speed. The "Balmoral Castle" (Union Castle line), which took the Duke of Connaught to the Cape on her first voyage in 1911, is 13,361 tons and of 18 knots speed. The "Cape Finisterre," 14,503 tons, 17 knots, of the Hamburg-South Amerika Line; the "Arlanza," 14,760 tons, 16 knots, of the Royal Mail Fleet; the "Orama," 12,927 tons, 18 knots, of the Orient Fleet; and the "Cameronia," 10,063 tons, 17 knots, of the Anchor Line, are other examples of the new ships of increased size and power recently added to other well known lines and in most cases still larger vessels are on order.

The "City of Detroit," 6,061 tons gross, the largest Great Lake passenger boat (see *Int. Mar. Eng.* October 1912), is similar in type to the "City of Cleveland" (*E. B.* xxiv, 883). The "Col. J. M. Schoonmaker" of 8,603 tons, 617 ft. long over all, 64.2 ft. beam, 34.2 ft. depth, 2,600 H.P., launched in 1912, carrying 13,200 tons at 10 knots, and her sister vessel are the largest Lake freighters yet built.

Recently a great demand has arisen for vessels to carry oil in bulk, and 90 such vessels, exceeding 500,000 tons gross, were being built in November 1912, nearly all under the survey of *Lloyd's Register*, about ¾rds being for British owners and four for the

British Admiralty. Ten of them are about 525 ft. long, 66 ft. beam, 34 ft. depth, 10,000 tons gross, 15,000 tons D.W.; seventeen are being built in the U.S.A. The "Gulfoil," built by the New York S.B. Co., is 392 ft. long, 51 ft. beam, 30 ft. depth, 5,188 tons gross, constructed on the longitudinal system and fitted with T. E. engines for 10 knots. (For details see Montgomerie, *Cassier's Mag.*, December 1911.)

Propulsion.—The total Horse Power of machinery afloat is about 26,000,000. The adoption of the turbine has been much more general for naval (7,200,000 H.P.¹) than for commercial vessels (1,300,000 H.P.), but 15 vessels of 100,000¹ H.P. have now been built (chiefly commercial) having high speed turbines and mechanical gearing. This system has proved to be convenient and efficient in cargo steamers ("Vespasian"; *I.N.A.* 1911), also in light high speed vessels of the cross-Channel type, as in the "Hantonia" and "Normannia," built for the S.W. Railway Co.'s service between Southampton and Havre, which showed an economy of about 20 per cent compared with that Company's direct turbine ships "Caesaria" and "Sarnia" built a year before (Prof. Biles, *I.N.A.* 1912). Increasing numbers of vessels are being fitted with a combination of reciprocating engines and turbines: the "Laurentic," "Olympic," "Niagara" and "Arlanza" are fitted with three, the "Rochambeau" (see *Engrg.*, Nov. 22, 1912) and "Britannic" with four propellers; the large Spanish liner "Reina Victoria Eugenia" will also have four, while the sister "Infanta de Borbon," built by Denny, will have three screws and will thus afford an interesting comparison; all these vessels have reciprocating engines on two shafts.

In the "Aquitania," "Imperator," "France," "Empress of Russia," and some other large high powered vessels, turbines are fitted on four shafts; a high-pressure turbine is fitted on each wing shaft, the steam passing to an intermediate turbine on the opposite wing shaft and thence to a low pressure turbine on one of the inner shafts, thus giving three expansions.

The American navy is carrying out a great experiment in propulsion in three large colliers, each of about 20,000 tons displacement, 6,000 H.P., 14 knots speed, 12,000 tons cargo. The "Jupiter" has one Curtis turbo-generator, 2,000 revs., giving alternating currents at 2,200 volts, and motors driving two propeller shafts at 110 revs., reported engine weight 156 tons, compared with 280 tons in the "Cyclops," which has two reciprocating engines. The "Neptune" has steam turbines and Westinghouse floating frame mechanical gearing (*Engineering*, August 23d and September 20th 1912). See also Mavor, *Brit. Assoc.* 1911-12; Emmet, *Am. Inst. Elec. Engrs.* 1911; Durnall, *I.N.A.* 1910 and Soc. of Engrs. November 1912; and Catterson-Smith, *Liverpool Eng. Soc.* 1912, concerning proposals for Electric Ship Propulsion. Increasing numbers of vessels, including U.S. battleship "Nevada" and one of the 6,000 H.P. Japanese cruisers, are being fitted with Brown-Curtis turbines, and the Rateau, Zoelly and German turbines are making good progress in European countries.

Great advances are being made by connecting a high speed turbine to a slow running propeller by means of the Föttinger transformer, up to 18,000 H.P. (Föttinger, *I.N.A.* 1912), very great savings in space, weight, and fuel consumption being obtained as with mechanical gearing, but with an efficiency of about 90% compared with 98% for Parsons's gearing. The economy and convenience of the turbine for all classes of vessels has now been well established. Sir Charles Parsons has stated (*I.N.A.* 1912) that with oil-fired boilers, superheated steam (see Yarrow, *I.N.A.* 1912), and a proper arrangement of mechanical gearing, the consumption of fuel can be brought down to .6 lbs. per I.H.P. per hour, compared with .44 for I. C. Engines. "The Unaflo Steam Engine" (Constable & Co.) describes a new type of reciprocating engine invented by Prof. Stumpf of Charlottenberg and fitted up to 1,000 H. P. in small vessels.

The use of oil for fuel under boilers continues to increase (the latest U.S. battleships will burn oil only), and the development of the I. C. engine for ship use is proceeding very rapidly (see Milton, *I.N.A.* 1912). *Lloyd's Register* reports that, in Sept. 1912, 34 vessels were being built with I.C. engines, 23 being above 2,000 tons gross.

¹ These figures refer to Parsons turbines only.

For modern developments of the Marine Steam Engine, and comparative possibilities of I.C. engines, see Hamilton on "Steamship Propulsion," *Liverpool Eng. Soc.*, 1911; Hall-Brown, *Inst. Eng. and Ship. Scotland*, 1911; Anderson, *American Soc. N. A.*, 1911; Rosenthal, *Brit. Assoc.*, 1911; Orde, Parsons, and others, *N. E. Coast Instn.*, 1912; Dr. Diesel, *Inst. M. E.*, 1912; and Sir Chas. Parsons's address to N. E. Coast Instn., October 12, 1912.

The *Motor Ship* of September 26, 1912 published a list of 32 vessels then under construction in which heavy oil (Diesel) engines were being fitted, the aggregate H.P. being 59,600 and average 1870; 17 were single-acting, four-stroke reversible; 9 were single-acting two-stroke reversible; three were of Junker's type; two were single-acting four-stroke non-reversible; and one only double-acting,—a two stroke M.A.N. engine for a Woermann liner by Messrs. Blöhm and Voss (See *Engineer*, October 11, 1912). The non-reversing engines are for the "Tynemount" (see Mavor, *Brit. Assoc.*, 1911 and 1912) of 600 H.P., and 9 knots, having electric transmission gear giving 80 revolutions of the propeller for 400 revs. of the engines, and a shallow draught vessel of 1,300 H.P. for service on the Congo, in which the engines run at 280 revs. and Föttinger transformers are fitted to drive the propellers at 440 revs., giving the boat a speed of 15½ knots. The largest engines named are of 6,000 H.P., and are for a twin screw vessel of 8,000 tons gross and 16 knots speed to be built by Barclay, Curle & Co.

Motors of various powers have been fitted as auxiliaries in numbers of sailing vessels; the large French sailing vessel "France" of 6,500 tons D. W. capacity, has I.C. engines of 1,800 H.P. and twin screws for 10 knots. Motors are being fitted in rapidly increasing numbers of river steamers (see *Syren and Shipping*, August 21, 1912), river tugs (see *Motor Boat*, March 9, 1911), lifeboats (see *Int. Com. Eng.*, October 2, 1912), fishing craft of all descriptions (see *Report of Fishery Board for Scotland*, 1912), as well as in small coasting vessels, of which eighteen are being built in Scotland for one firm—the Coasting Motor Shipping Co. *Lloyd's Register* of 1912 includes 61 yachts of 3,733 tons having I.C. engines, and indicates a falling off in the building of large steam yachts.

Table II contains some particulars of a few of the earliest motor ships fitted with Diesel Engines of various types:—

Table II.

No.	Name	Tons Gross	Total B.H.P.	Speed Knots	No. of Screws	Cylinders		Stroke of Cycle
						No.	Power	
1	Toiler	1,659	360	6.0	2	8	45	Two
2	Vulcanus	1,179	500	8.5	1	6	85	Four
3	Selandia	4,964	3,500	10.5	2	16	220	Four
4	Eavestone	1,770	850	10.5	1	4	212	Two
5	Monte Penedo	5,400	1,700	10.5	2	8	212	Two
6	15,000 ton tank vessel	10,000	3,500	9.5	2	12	291	Two
7	7,200 ton tank vessel	5,000	2,200	11.0	2	8	276	Two
8	Rolandseck	2,500	1,500	11.5	1	6	250	Two
9	1,500 ton tank vessel	1,200	370	6.25	1	6	62	Two

Notes. (1) First motor ship to cross the Atlantic, built by Swan, Hunter & Co. for Canadian Lakes; *Polar* (Swedish) engines; estimated saving on machinery, 60 tons; fuel about 2 tons a day instead of 8 (see also *Engineering*, May 5, 1911; similar engines 520 H.P. in Calgary, and 1600 H.P. in tanker building by Caledon Co.) (2) First seagoing motor vessel regularly employed in European waters, built in Holland for Anglo-Saxon Petroleum Co. *Werkspoor* (Dutch) engines. (Larger engines of same type in "Juno," "Emanuel Nobel," "Loudon," "Eburna" and "Jules Henry;" and smaller in "Sembilan," "San Antonio" and "Cornelis"). (3) First large ocean-going motor vessel, built at Copenhagen, Burmeister and Wain (Danish) engines. Sister vessels—"Jutlandia," first British-built ocean-going motor vessel, and "Fionia," purchased by Hamburg-American Co. renamed "Christian X" in honour of King of Denmark, and the first motor ship to arrive in New York. (4) First British owned ocean-going motor vessel, built by Sir Raylton Dixon & Co. for Furness, Withy & Co. *Carels* (Belgian) machinery, reported to be 68 tons less than if steam, and fuel for 30 days 120 tons oil instead of 450 tons coal, gain of a knot speed (see also *Engineer*, Oct. 25, 1912). Similar engines 750 H.P. in "Fordonian." (5) Built at Hamburg, *Sulzer* (Swiss) engines, total engine room weights 160 tons or less than half for steam engines, fuel consumption about one third, engine room complement half for steam machinery (see *Int.*

Mar. Eng., Oct. 1912). (6) The largest oil tanker yet built, to carry 15,000 tons D. W., *Krupp* (German) engines, 527 ft. long, 66 ft. beam (see also *Engineering*, April 19, 1912). (7) To carry 7200 tons D. W. building by Frerichs & Co., Germany, for British owners—the Petroleum Steamship Co. The *Junkers* (German) engines are of peculiar construction, two pistons in each cylinder, the fuel being ignited between them (*Junkers, German Soc. N. A.*, 1911, and *Int. Mar. Eng.*, July 1912). (8) Cargo boat for Hansa line. *Tecklenborg-Carels* Engines, largest I. C. Engine yet afloat, viz. 1500 B.H.P., cylinders 19½ inch diam., 35" stroke, 115 revs. on one shaft. (9) To carry 1500 tons. First American Diesel-engined commercial vessel. *M.A.N.* (German) engines. Ship constructed by Staten Island Shipbldg. Co., and engines by the New London Ship and Engine Co. of Groton, Conn. (see *Motor ship*, June 6, 1912).

Suction gas plants have been installed in two small experimental vessels, the "Electric Arc," in conjunction with electric drive (see *Shipping World*, January 3, 1912), and "Holzapfel I," in conjunction with Föttinger transformers (see *Holzapfel, I.N.A.* 1912). In both cases after a period of trial the plant has been removed. An auxiliary surveying vessel launched by Napier and Miller in 1912 is fitted with suction gas plant and a six cylinder 225 B.H.P. gas engine. In *Gas and Oil Power*, October 3, 1912, an account is given of a 100 H.P. engine by Mr. A. M. Low which runs on solid coal direct; and the case for alcohol fuel is stated in "The Motor," August 27, 1912.

Many firms are perfecting the Diesel engine for marine purposes (see *Engineer*, October 18, 1912, for German), and others are using Gas turbines to obtain the advantages of the low consumption of the I. C. engines without reverting to reciprocating machinery (see Dugald Clerk and Hans Holzwarth, *Brit. Assoc.* 1912).

Improvements.—For a review of 50 years progress see Dr. Thearle, *I.N.A.* 1912. Recent methods for ensuring sufficient strength with increased cargo capacity or speed comprise (1) a development of longitudinal construction, (2) raising the middle portions of the ship on arches, (3) forming fore and aft ridges in the side.

Details of (1) were given by Mr. J. W. Isherwood, *I.N.A.* 1908. Clearer holds, greater strength and a saving of about 10% of weight of structure, are obtained, as well as decreased cost of building. The system has been adopted for three-fourths of the tank vessels now building, as well as for many other types of vessels in Europe and U.S.A. (see Cleveland, *Marine Review*, September 1912; also *Standard*, October 23, 1912). The system had been adopted in 43 vessels of 176,000 tons by June 1910, rapidly increasing to about 250 vessels of 1,200,000 tons by December 1912. (2) The "Arch" system of construction was described by Mr. Maxwell Ballard at the Institute of Naval Architects in 1911 (see also *Shipping World*, April 27, 1910). Three vessels of 1,500–2,000 tons each have been already built on this system, and two others were under construction at the end of 1912. (3) The "Monitoria," built in 1909–10, was the first vessel built with "corrugated sides" and gave the name to the system (see papers by Mr. Haver, *N. E. Coast Inst.* 1910 and 1911, and Captain MacIlwaine, *R. U.S. Inst.* 1912). Four vessels of the type were afloat at the end of 1912, and three others under construction, all of about 3,000 tons D.W. capacity.

Anti-rolling tanks (see *E. B.* xxiv, 938; Watts, *I.N.A.* 1883–5; and Frahm, *I.N.A.* 1911) are now being fitted in many large liners and war ships. Large chambers built on opposite sides of the ship are about half filled with water, a transverse water channel connecting the lower parts of the tanks, and air pipes the upper parts. Valves in the air pipes regulate the movement so as to prevent synchronism with wave periods and consequent rolling. Tanks were so fitted in the "Inflexible" and other warships of very large metacentric height 30 years ago, and proved very useful, but the practice has not been continued in later war vessels where smaller metacentric height is practicable (see also "Effect of Bilge Keels on Rolling," Messrs. Idle & Baker, *I.N.A.* 1912; and "Applied Stability of Ships," Heck, *Inst. Mar. Engrs.* Oct. 1912).

Increasing attention is being given to the study of Naval Architecture and Marine Engineering in Germany and America as well as in England. Chiefly owing to the advocacy of Sir W. H. White and the generosity of Mr. A. F. Yarrow, a national experimental tank has in England been provided at Bushey. There is evidence of increased power of adaptability of designers to produce vessels specially fitted for the trades on

which they ply, and of greater readiness on the part of the Classification Societies to regard such designs on their merits without too hard and fast adherence to well worn rules. It is a compliment to Great Britain that the Austrian Veritas Society has arranged with *Lloyd's Register* to adopt their Rules for building ships in their entirety, and that authorised translations in French and German have become necessary.

The "Titanic" Disaster.—Notwithstanding great progress recent years have been notable for serious disasters, such as the disappearance of the "Waratah" in 1909, the wrecks of the "Delhi" and "Oravia" and the sinking of the "Oceana" in 1912, but the foundering of the "Titanic" in mid-ocean on April 15, 1912, after collision with an iceberg, when out of 2,224 persons on board only 711 were saved, has eclipsed all previous experiences, and has led to much searching of heart as to means of providing better security. Enquiries were conducted in New York under Senator W. A. Smith of Michigan, and in London under Lord Mersey sitting as Wreck Commissioner with five experts as assessors. In both cases recommendations were made that liners should have boats for all, regular boat drill, more efficient Wireless Telegraphy arrangements, and improved sub-division in construction. Lord Mersey's Report covers 74 pages and deals exhaustively with all the circumstances, as well as the details of the "Titanic;" it showed that six out of fifteen of the main compartments of the vessel were damaged, that the ship filled and went gradually down by the head without capsizing, and recommended (a) improvements as above, (b) supervision of ship designs. The recommendations (a) were generally endorsed by the Merchant Shipping Advisory Committee of the Board of Trade, who did not however concur in (b). The Board of Trade appointed two committees,—one (Bulkheads), with Dr. Denny of Dumbarton as chairman, to consider the best means of improving the subdivision of new ships, the second (Boats and Davits), with Professor Biles as chairman, to consider questions relating to design and handling of boats, supply of motor boats, &c. The Board of Trade also laid draft rules before Parliament (Parl. paper Cd. 6402 of 1912), requiring (1) great increases in the numbers and capacity of boats to be carried by all classes of passenger vessels, and (2) the submission of the designs of new ships for examination of stability, proposed subdivision &c.; and the Board also took steps to secure international agreement as to Wireless Telegraphy and all questions affecting safety at sea. The draft rules went considerably beyond the recommendation of the Advisory Committee, and met with very serious opposition from many quarters, but many steamship companies proceeded even before official action was taken to supply boats for all on board their vessels, while the White Star Company announced that improved subdivision would be built into the "Britannic," and that the "Olympic" would be similarly improved.

The collision between the "Olympic" and H.M.S. "Hawke" in Spithead on September 20, 1911 led to a legal inquiry before the Admiralty Court which showed that the interaction (due to "suction") between two vessels passing each other was much greater than was generally known (see Taylor, *Am. Soc. N.A.* 1909; also Gibson and Thompson, *Brit. Assoc.* 1912). The President, Sir Samuel Evans, found that the cause of the collision was the faulty navigation of the "Olympic" by her pilot in going dangerously near the "Hawke." On the Government's case for damages, he entered judgment however for the owners of the "Olympic," since the pilot was solely responsible, and their plea of "compulsory pilotage" was therefore a good defence. Both parties appealed against the findings.

Warships.—The introduction of the Dreadnought design and the development from this vessel to the "Neptune," in which the broadside guns are placed *en echelon* so that both pairs of midship guns may fire on either broadside, and then to the Orion, in which all the heavy guns are placed on the middle line with a good arc of training on each side, were fully discussed by Sir Philip Watts in *E. B.* xxiv (art. "Ship"). This arrangement has been adopted in all the U. S. ships, and in other navies it has been closely followed. Particulars of the later vessels of the Orion type—the "King George V" &c. as well as of recent foreign vessels, are given in Table III. Table IV shows the several vessels grouped according to Class. The "Invincible" has remained as

the standard type for battle cruisers; higher speeds, heavier guns and better armour protection, entailing larger dimensions (Table V). With the growth in the sea keeping power of destroyers, and the increase in range, speed and power of torpedoes, more powerful anti-torpedo guns have become necessary in battleships and battle cruisers.

On August 1, 1912, Mr. E. H. Tennyson D'Eyncourt succeeded Sir Philip Watts as Director of Naval Construction in the British Admiralty. His predecessors in the office had been educated in the Dockyard Schools and trained in the Dockyards and at the Royal School of Naval Architecture or the Royal Naval College. Mr. D'Eyncourt was educated at Charterhouse, and trained at Elswick Shipyard and the Royal Naval College, Greenwich; and he had very extensive experience in warship design and building at Fairfield and Elswick (see *Shipbuilder*, October 1912). Sir Philip Watts's connection with the Admiralty was however not entirely severed, as he was retained as Adviser to the Board on Naval Construction. During the 11 years 1902-12 he was responsible for the design and construction of no less than 180 fighting vessels (battleships, cruisers, destroyers and submarines), aggregating about 1,350,000 tons displacement, 4,250,000 Horse Power and £117,000,000 cost,—besides a large number of Fleet Auxiliaries and small craft of very great variety and interest. Certain characteristic features are found in practically all these vessels; all the guns are fought on the weather decks, the vessels have high forecastles, no poops, and no topsides, so that the silhouette of the T.B.D., the unprotected cruiser, the battle cruiser and the battleship herself have the same general features, while in the preceding designs the torpedo boats and destroyers had low forecastles, the cruisers had topsides and poops, the battleships had topsides and no forecastles, and battleships and cruisers carried much of their armament on the main deck. All classes are also notable for great advances in speed.

The progress of other than British battleships and battle cruisers may be gathered

Table III. Particulars of Typical Battleships.

Name of Ship.	Launched.	Tons.	H.P.	Speed Knots.	Guns.	Side Armour.	Remarks.
Dreadnought (British)	1906	17,900	23,000	21.5	10-12" 24-12 pdr	11"	Cost £1,813,000
King George V (British)	1911	23,600	31,000	21.0	10-13.5" 16-4"	12"	Total cost £1,961,000. Hull, engines and all incidental charges £893,000.

SHIPS AND SHIPBUILDING

from Tables III, IV and V. The triple turret has been extensively adopted in Italy, Austria and Russia, and is under experiment in America, while France is proposing turrets to carry four 12 inch guns in each, but turrets containing more than two heavy guns have not yet found favour in Great Britain.

*Launched but not complete. **Not yet launched. ***Not yet laid down (Dec. 1912).

The Armoured Cruisers "Edgar Quinet" and "Waldeck Rousseau" (*E. B.* xxiv, 912) have been completed by *France*. The "Giorgios Averoff" of 9956 tons, 24 knots, 7 inch armour, four 9.2 inch, eight 7.5 inch guns, &c., has been completed by Orlando of Leghorn, and another vessel of 19,500 tons has been ordered of the Vulcan Yard, for *Greece*. *Germany* has completed several cruisers of the "Augsburg" type (*E. B.* xxiv, 911) but new vessels will probably be of 5,000 tons and 27 knots and carry 4.1 inch guns of improved type. A number of vessels of the "Dartmouth" type (*E. B.* xxiv, 909), including the "Melbourne" and "Sydney" for *Australia*, have been built in Great Britain, and the sister vessel "Brisbane" is being built at Sydney, but eight light armoured vessels of a new type are now being built for the British Navy. *Italy* is completing scouts of the "Quarto" type (*E. B.* xxiv, 913).

¹ For Australian Govt. ² Presented by New Zealand Govt.

Destroyers are being built in great numbers by the various Powers. Particulars of several are given in Table VI. The "Parramatta" and "Yarra" were built to Prof. Biles's design and steamed out to Australia; a sister vessel "Warrego" was built at Fairfield, taken to pieces, sent out by steamer and put together in Australia, where three similar vessels, "Derwent," "Swan" and "Torrens," are being built.

The Engineer of December 1911 gives photos of the German U.S. Recent boats are fitted with wireless telegraphy, armed with small disappearing guns, and are capable of long sea voyages in any weather without escort. British boats "E, 1" to "E, 16" are being built to Admiralty design. (See Sir P. Watts's paper, *I.N.A.* 1912.)

Diesel Engines for Warships.—Russia has built several river gunboats of 600 to 950 tons propelled by heavy oil engines of 1000 H.P. Germany has fitted experimental engines in an old torpedo boat, and also in a small tender named "Mentor" which has two Krupp engines of 350 H.P. each. Holland is building gunboats—"Brinio"—of 540 tons with two Werkspoor engines of 600 H.P. each, to give 16 knots. The British destroyer "Hardy" is to be fitted with two Thornycroft engines for economical cruising, in combination with steam turbines for high speed. In England the First Lord of the Admiralty, Mr. Winston Churchill, has informed Parliament that "oil as a fuel offers enormous advantages to ships of all kinds and particularly to the smallest kind;" and a Royal Commission was appointed in 1912, with Lord Fisher as Chairman, "to report on the means of supply and storage of Liquid Fuel in peace and war and its application to warship engines whether directly or by Internal Combustion."
(J. H. NARBETH.)

INTERNAL-COMBUSTION ENGINES ¹

Considerable progress has been made during 1910-13 in the development of the various types of internal-combustion engines, more particularly in the smaller petrol engines for motor-cycles, motor-cars, and aeroplanes, and in oil engines (Diesel) for land and marine purposes. At the same time, the large gas engine using producer gas or blast-furnace gas has been increasing its reputation for reliability and economy, and is daily finding new applications where formerly steam-power plants were used.

Petrol Engines.—The classic racing competitions in England, France, and America have given an invaluable impetus to the improvement of the smaller petrol engines for cycles and cars. In England particularly, the racing-track at Brooklands enables manufacturers in the course of a few hours to subject their engines to a more crucial test for endurance than could be obtained by months of trial on the road. Such engines in everyday use are working normally at a small fraction of their maximum power, the full power only being called upon for short periods when climbing steep hills. Hence the value of (say) an hour's run on a racing track in a race or an attempt at record-breaking.

The motor-cycle industry in Great Britain and America is expanding by leaps and
¹ See *E. B.* xi, 495 *et seq.* ("Gas Engine"), and xx, 35 *et seq.* ("Oil Engine").

bounds. For motor-cycles an air-cooled four-cycle single-cylinder engine of $3\frac{1}{2}$ H.P. (not exceeding 500 cubic centimetres cylinder capacity) is the type most widely used. Such an engine as made by Rudge Whitworth Ltd., bore 85 mm., stroke 88 mm., has given 8.4 brake H.P. at a speed of 3,060 revolutions per minute, in a bench-test of 87 minutes' duration. The corresponding mean effective pressure on the piston, calculated from the brake H.P. is 69 lbs. per square inch. Twin-cylinder engines are also much in favour; while water-cooling and the two-stroke cycle are used on many motor-cycle engines. England and America are pre-eminent in the motor-cycle industry. In France, the home of the motor-car, its use of the motor-cycle is not so widespread as in England. In Germany, Belgium, and Switzerland, excellent motor-cycle engines are manufactured.

In motor-car engines, the four-cylinder water-cooled type¹ is pre-eminent. As an example of modern performances of such engines, that of a 15 H. P. engine, $3\frac{1}{8}$ inch bore, $4\frac{1}{4}$ inch stroke, by Crossley Motors Ltd., may be noted. The brake-tests show 40 H.P. at 2,400 revolutions per minute, 16 H.P. at 800 revolutions per minute, the corresponding M.E.P.'s. on the piston calculated from the B.H.P. being respectively 90 and 108 lbs. per sq. in.

The sleeve-valve engine² is made by a few firms, but there are no signs of its wider adoption by engine makers in place of the usual poppet-valve engine.

An interesting petrol engine, designed by Dr. A. M. Low, has been recently made by F. E. Baker, Ltd., the object being to obtain more power from an engine of given cylinder capacity. The principal feature in the Low engine is that petrol vapour under high pressure is injected into the cylinder, in which a charge of fresh air has previously been compressed. Liquid petrol is pumped into an annular jacket surrounding the cylinder, when the engine has been warmed up the petrol is vapourised, and the pressure in the jacket rises to 1,000–1,500 lbs. per sq. in. A valve controls the rate as well as the period of admission of the vapour, which burns immediately it mixes with the air. This double control has the effect of rendering the engine extremely flexible, that is, it runs smoothly under all conditions of speed and load. The engine made is of single-cylinder, four-cycle type, 78 mm. bore, 104 mm. stroke, 499 c.c. capacity, and is rated at 15 H.P.

Commercial motor-vehicles are coming daily into wider use. In London the number of motor-buses running in 1912 was over 2,000, and is still being increased almost daily. They provide facilities for passenger carrying which previously did not exist, and are gradually changing the character of the street traffic. The motor-bus has established itself in successful competition with the electric tramway; in fact it may be said to have given a halt to any further considerable extensions of tramway systems. The growth of the motor-car industry is phenomenal. One American firm alone, The Ford Company, is said to have prepared for an output of 200,000 cars for the year 1913.

Gas Engines.—Great activity is manifest in the production of large gas engines. Germany led the way, and a few American makers, e. g. the Allis Chalmers Company, Milwaukee, and the Snow Steam Pump Company, Buffalo, were early in the field; but until a few years ago, British makers kept aloof from the production of large gas engines. The Lilleshall Co., Ltd., Oakengates, Shropshire, however, have supplied for a railway electric power station, near Yokohama, Japan, four engines of the Nürnberg type each rated at 2,130 brake H.P. when running at 94 revolutions per min. Each cylinder is 1,200 mm. ($47\frac{1}{4}$ in.) bore, 1,300 mm. ($51\frac{1}{8}$ in.) stroke. This type was first developed by the Maschinen-Fabrik Augsburg-Nürnberg A.G. and is now made by numerous licensees in various countries. It works on the four-stroke cycle, is double-acting, has water-cooled pistons and piston rods, and is usually made when space permits with two cylinders in tandem. There are thus two effective strokes for each revolution of the crank-shaft. In contradistinction to the usual practice in gas engines of moderate power, the cylinder, with its water-jacket casing and the valve pockets, is made in one casting. The design of the cylinder casting is such that there are no abrupt changes of form, and the water space between the inner and outer cylinders is ample. The old trouble of cracking of castings, exposed on one side to the heat of combustion of the gaseous fuel and on the other side to the cooling action of the water, has been successfully overcome in the sizes of engines made up to the present. For successful design of large gas engines, such castings should be of as simple and symmetrical form as possible. The large gas engines of modified Oechelhäuser type,³ made by W. Beardmore & Co., Ltd., Glasgow, have their long cylinders in which two barrel-pistons work, made each of three plain-flanged pipes, the middle piece being short and forming, when the two pistons are closest together, the combustion chamber. Separate annular castings for the inlet and exhaust boxes sur-

¹ See *E. B.* xx, 38, fig. 5.

² See *E. B.* xx, 39 fig. 6.

³ See *E. B.* xi, 500.

round the ports in the cylinder, which are uncovered by the piston barrels when furthest apart. The cylinder and annular exhaust box are immersed in a water-tank.

Messrs. Mather & Platt, Ltd., Manchester, have recently made "Duplex" gas engines up to 500 B.H.P. on a modified Koerting-Clerk type¹ with no valve-gear, and the type seems to be suitable for gas engines of very large power. The whole cylinder-unit, consisting of a pair of equal side-by-side cylinders, presents extremely simple forms of single-walled castings particularly suitable for use in gas engines. It is made up of two U-tube castings placed end to end, the inlet and exhaust ports being at the joints, while flanges on the cylinders some distance from the joint retain between them the inlet and exhaust boxes. The cylinder-unit is placed in a water-tank. Each piston uncovers the cylinder port at both ends of its stroke, as in the Koerting-Clerk type. The two cranks are set nearly parallel, one having a slight angular lead so that the exhaust port is uncovered before the inlet port. When both ports are uncovered the charge of air and gas from the pump displaces the exhaust gases before it, the gases in the inlet cylinder passing through the connecting passage to the exhaust cylinder and thence through the exhaust port.

The cheapest fuel for gas engines is the gas given off from iron blast furnaces and from coke-ovens, formerly a waste product. In Germany and America blast furnaces and rolling mills for the production of steel plates and rolled sections are usually associated in the same or neighbouring works; hence the extensive use of large gas engines. In Great Britain the same conditions do not hold to the same extent, but the continual endeavour to reduce costs of production will compel the rearrangement of iron and steel works, so that large gas engines may profitably utilise the tremendous power now running to waste.²

Oil Engines.—The most rapid progress is being made in the application of the Diesel engine³ for stationary and marine power-plants. Fishing-boats, barges, yachts, and large ocean-going ships are now running successfully with Diesel oil engines. The large marine oil engines have usually 4, 6, or 8 vertical cylinders, working either on the two-stroke or four-stroke cycle. The pistons are usually air-cooled; starting and reversing is effected by a supply of compressed air at a pressure of 250–400 lbs. per sq. in. The "Selandia," built by Burmeister & Wain, Copenhagen, and the "Jutlandia," built by Barclay, Curle & Co., Ltd., Glasgow, are sister ships of 5,000 tonnage, 7,500 tons carrying capacity, with a service speed of 12 knots. The propelling machinery consists of twin screws, each shaft being driven by an eight-cylinder single-acting four-stroke cycle engine. Each cylinder is 20.87 in. bore, 28.74 in. stroke. The indicated horse power is 2,500 at a speed of 140 revolutions per min. The Werkspoor Works, Amsterdam; the Augsburg-Nürnberg Works; Sulzer Bros., Winterthur, and many other firms in Germany, Italy, and England are also building marine oil engines of large power.

For marine propulsion, the Diesel oil engine offers considerable advantages as compared with steam turbines and boilers. The boiler space is saved, and the oil fuel-tanks can be arranged in positions that cannot be used for cargo, whereas coal-bunkers occupy space that might otherwise be available for cargo. A separate set of steam turbines is required for reversing, while for naval purposes in which the maximum power of the machinery is only required for short periods, a third set of "cruising" turbines is usually installed, on account of the low economy of steam turbines running at less than full power. One set of Diesel engines can perform all three functions; the fuel-injection valve-gear being arranged to admit the oil spray during a longer or shorter period of the piston's stroke, giving full or low power as required, while the valve-gear for reversing is an integral part of the engine, just as with piston steam engines.

Fuel for Oil Engines.—The growth in the demand for oil fuel, from the volatile petrol to the heavy residue left after distillation of the purer grades from the crude petroleum, due to the motor-car industry and the development of the Diesel engine, has been more rapid than the increase of the supplies; the effect being that at present the prices of all grades of oil fuel are nearly double what they stood at three years ago. The future of the internal-combustion-engine industry in all its branches depends largely on an adequate supply of cheap fuel. The high prices have stimulated the production of oil fuel from hitherto neglected sources. Creosote oil, a by-product in the manufacture of coke, is being used in

¹ See *E. B.* xi, 499.

² See *E. B.* xi, 497–8.

³ See *E. B.* xx, 43

Diesel engines. In Germany alone, the output during 1912 was estimated to be 450,000 tons, the average price 45s. per ton. 3,000 new coke-ovens were installed in 1912, and for 1915 in Germany alone the estimated output of creosote oil is 900,000 tons. These figures, large as they seem, are small in comparison with the total amount of coal now used for steamship propulsion. The evolution of a successful internal-combustion engine using coal power as fuel may be another great step in the forward progress of power production.

(ARCHIBALD SHARP.)

STEAM BOILERS¹

There has been very little change in 1909-13 in the design or construction of the various types of steam boilers used. Modifications have been due either to the use of somewhat higher steam pressures or to the more general application of superheating.
