The increase of steam pressures is more noticeable in marine practice than in other cases. At the present time many marine boilers are being made to work at pressures of from 215 lbs. to 225 lbs. per square inch, supplying steam to quadruple expansion engines. Where triple expansion engines are used the most common pressure is 180 lbs. per square inch. The strength necessary for the extra pressure is generally obtained by using thicker plates for the shells and more closely pitched stays for the combustion chambers. In numerous boilers for large ocean liners, where the question of weight to be carried assumes an exceptional importance, steel plates having a tensile strength of from 35 to 38 tons per sq. in. have been used for the cylindrical shells, whereas that of ordinary boiler shell plates is from 28 to 32 tons per sq. in.

An improvement has been introduced by one firm of steel plate makers, who now roll long plates having two different thicknesses, the two end portions being thinner than the part near the middle of the length. The variation of thickness is made gradual over a space of about six inches. The thicker portion can be arranged in position and in dimensions with precision. Such plates can be made in widths up to, but not exceeding seven feet. They are used for the wrapper plates of the combustion chambers of marine boilers, the thin parts being employed for the sides of the chambers, which are supported by numerous screwed stays, whilst the thick central portions form the bottoms of the chambers which are unstayed.

The use of superheated steam has become more frequent in marine and stationary work, but more especially so in locomotive boilers. In practically all cases the superheaters are formed of pairs of headers made of cast steel, connected together by numerous steel tubes which form the superheating surfaces. One header of each pair is connected by a steam pipe with the stop valve on the boiler, and when in use the saturated steam from the boiler enters this header, then traverses the small superheating tubes and passes into the other, whence it is conducted through suitable steam pipes to the engine.

The steam pipe arrangements are sometimes made so that all the steam must pass through the superheaters; in other designs regulating valves are provided which permit of any desired proportion of the steam passing through the superheater, the remainder being mixed with the superheated steam before passing to the engine. This plan permits of the temperature of the steam entering the cylinders being regulated through a certain range so that the temperature which experience shows to be most advantageous can be used. About 600° F. is generally considered to give the best result.

In locomotives the regulation of the temperature of the steam is effected by more or less throttling the passage of the heated furnace gases in their passage across the superheating tubes. It is customary to use only iron or steel for the superheated steam pipes to the exclusion of copper. It is also necessary to fit a safety valve to the superheater if the arrangement permits of its being shut off from the boiler at any time.

In the *E. B.* article, figures 11 and 12, superheaters are shown of the types used and in the positions adopted with stationary boilers of the Babcock and Wilcox and of the Stirling types. In some marine boilers the superheaters are fitted in the uptakes, where they are exposed to the heat of the products of combustion after the gases have left the ordinary boiler tubes. In such cases as the temperatures to which the superheating surfaces are exposed are not very high only a low degree of superheat is possible. The

¹ See *E. B.* iv, 141 *et seq.*

superheater most frequently fitted in marine boilers is, however, that known as the "Schmidt" superheater. This is a modification of the Schmidt superheater so generally employed on the Continent of Europe, for locomotive boilers, which is also now being introduced for the same purpose into England.

In the marine type, the pairs of headers are placed in the smoke boxes of the boilers. The superheating tubes are of small diameter and are made of seamless steel. They are formed in a series of hair-pin loops, each loop being placed in one of the smoke tubes of the boiler, extending to within about nine inches of the fire box end. The arrangement is such that each of the series consists of 4, 5 or 6 loops according to the design of the boiler, the total number employed being sufficient to provide each of the smoke tubes with its superheating tube. In a two furnace boiler only one pair of headers is used, placed in front of the space between the nests of tubes, and the superheating tubes are symmetrically placed on both sides of the headers. In three furnace boilers two pairs of headers are used, and the superheater tubes are more closely placed on one side of the header than on the other to suit the arrangement of the smoke tubes.

For use in smoke tubes $2\frac{1}{2}$ inches outside diameter the superheating tubes are made 18 mm. outside diameter and $2\frac{1}{2}$ mm. thick. Where $3\frac{1}{4}$ inch smoke tubes are used the superheater tubes are 23 mm. outside diameter and are 3 mm. thick. The total superheating surface is usually about two fifths of the heating surface of the boiler proper.

The employment of this form of superheater makes very little difference in the design of the boiler, with the exception that the ratio of heating surface to grate surface is somewhat less than where no superheating is employed.

In locomotive boilers the design has to be considerably modified. Many of the usual upper small tubes are replaced by three rows of large tubes which are generally from $4\frac{1}{2}$ inches to $5\frac{1}{2}$ inches in diameter for the greater portion of their length, reduced about $\frac{1}{2}$ inch in diameter for about 10 inches at the firebox end to permit of better water circulation over the tube plate. In each of these large tubes one section of the superheater is placed. This consists of a long seamless steel tube shaped as a four-fold bend. The two ends of the tube are bent upwards and are expanded into one rectangular flange which by means of one central stud and nut is secured to the header. In this case one header only is used, placed in the smoke box. It is made of cast iron of the special quality used for cylinders, and is formed with two passages, one serving as the inlet for the saturated steam and the other as the outlet for the superheated steam.

The practice with locomotive boilers is to make the superheating tubes with about one fifth of the total heating surface of the boiler. The damper retards or entirely cuts off the flow of furnace gases past the superheating tubes when there is little or no demand for steam from the boiler. Whenever the Schmidt superheater is used arrangements are made for keeping the superheating tubes and the enclosing smoke tubes free from soot and scoriae by means of a steam jet from a flexible tube. (J. T. MILTON.)

ELECTRICAL ENGINEERING¹

I. ELECTRICAL MEASUREMENTS

The importance of exact measurement in all electrical work has led to great attention being paid to improvements in methods for measuring electric currents, voltages, and power, especially in connection with alternating currents of low and high frequency. The direct reading potentiometer has been of such use in all direct current measurement that the invention of a similar instrument for alternate current work has long been desired. This has now been provided in Dr. Drysdale's alternate potentiometer.

This instrument consists of an ordinary direct current potentiometer, but has an electro-dynamometer in series with the slide wire to adjust an alternating current to the same root-mean-square value as the direct current, which makes a known fall of potential down a certain length of the wire. In addition to the usual resistances for regulating this current, the alternating current is supplied through a phase-shifting transformer, which enables its phase to be varied through 180° . If then it is desired to measure an alternating current voltage, which may be reduced in any required ratio by a transformer, this voltage is balanced against the fall in voltage down the slide wire which is produced when the slide wire is traversed by an alternating current taken from the same source so as to have the same frequency. To do this the phase as well as the strength of the alternating current in the slide wire must be capable of adjustment. The balance is determined by using a vibration galvanometer in place of the movable coil galvanometer employed with direct currents. The absolute value of the fall in potential down known lengths of the slide wire is obtained in the usual way by a direct current and the aid of a standard Weston cell. Hence if we

¹ See *E. B.* articles referred to under *PHYSICS: Electricity* in Index Volume, p. 940.

always work with one standard value of either direct or alternating current the slide wire can be graduated to show voltages directly from either alternating or continuous currents. By the use of an appropriate vibration galvanometer of the Tinsley type the Drysdale potentiometer may be used for measuring alternating voltages even up to a frequency of 1,000 p. p. s. It is therefore extremely useful in telephonic measurements. By the use of low resistance inductionless shunts it can measure large alternating currents.

Another recent alternating current instrument of considerable utility is the iron cored wattmeter of Dr. Sumpner.

In this instrument an electromagnet of laminated iron is wound over with coils of thick wire of low resistance. These coils are connected as a shunt across the terminals of the appliance in which the power is to be measured. The field of the magnet is therefore proportional to the time integral of the voltage when the terminals are connected to an alternating current supply. In the field of this magnet moves a pivotted coil with index needle, the coil taking current from an air core transformer the primary circuit of which is in series with the power absorbing circuit. Hence the secondary current in the coil varies as the time rate of change of the main current. The coil is constrained by a controlling spring and its deflections are then proportional to the mean value of the field of the magnet and the current in the coil. When the frequency of these is the same this mean product is proportional to the mean product of the voltage drop across the terminals and the current in the power absorbing circuit and therefore to the power taken up by it. Hence the instrument can be graduated to read power directly and can be arranged to read very small powers.

Another recently devised arrangement for alternating current measurement is the capacity bridge of Fleming and Dyke, by means of which the capacity of condensers having considerable leakance can be measured and the leakance or conductivity determined at the same time for alternating currents.

It consists of three condensers connected like the arms of a Wheatstone's Bridge. Two of these condensers (C_3, C_4) are simple adjustable air condensers and the third (C_2) has in series with it a variable resistance R_2 . The fourth arm of the bridge consists of the leaky condenser to be measured. In the bridge circuit a telephone is inserted and the conjugate points are connected to an alternator giving a simple sine curve electromotive force. The adjustment consists in varying the capacities and resistance until silence is produced in the telephone. The capacity C of the condenser under test is then given by the expression

$$C = \frac{C_2 C_3}{C_4} \frac{1}{(1+x^2)}, \text{ and its conductivity } S \text{ by the expression } S = pCx, \text{ where } x = pC_2R_2, p =$$

$2\pi n$ and n is the frequency. By the use of this appliance the above named investigators have examined the conductivity of numerous dielectrics for alternating currents of telephonic frequency and proved that the conductivity is in general greater than the direct current conductivity and is a linear function of the frequency n of the form $S = A + Bn$.

2. ELECTROCHEMISTRY AND ELECTROMETALLURGY

The applications of the thermal and chemical properties of an electric current in industrial manufacture have become very extensive of late. Many products of great commercial value can now be prepared electrically in virtue of the high temperatures attainable which could not otherwise be produced. A good example is the substance called carborundum, which is a carbide of silicon first prepared by E. G. Acheson in 1891. It is extremely hard and now largely used as a substitute for emery in grinding wheels and polishing. It is produced at Niagara Falls by passing a current through a mixture of sand coke and sawdust which is thereby raised to a temperature of 1950°C . The chemical reaction is, $\text{SiO}_2 + 3\text{C} = 2\text{CO} + \text{SiC}$. The carbon monoxide escapes and is burnt outside the furnace. More than 3,000 tons of this are made annually at Niagara. Acheson also prepares in the same manner graphite from coal (anthracite) and various lubricating materials are in turn made from this graphite. All forms of carbon pass into graphite at a sufficiently high temperature. Over 2,000 tons of graphite per annum are now produced at Niagara Falls by this electrical process, and Acheson has discovered methods of manufacturing not only the hard graphite suitable for electrodes, crucibles and other objects, but a soft oleaginous graphite for making lubricants.

Another extremely large electrothermal industry, in fact one of the largest, is the manufacture of calcium carbide by electrically heating to a very high temperature lime and pure coke or coal. The chemical reaction is $\text{CaO} + 3\text{C} = \text{CaC}_2 + \text{CO}$. The calcium

carbide is employed for the production of acetylene gas for illumination which it yields by treatment with water reproducing calcium hydrate $\text{CaC}_2 + 2\text{H}_2\text{O} = \text{CaH}_2\text{O}_2 + \text{C}_2\text{H}_2$.

Another large use of calcium carbide is in the manufacture of calcium cyanamide or nitrolime, which is produced when nitrogen gas is passed over calcium carbide at a high temperature. This substance is used as a fertiliser for soils. The manufacture of calcium carbide is carried out on a large scale at Odde in Norway, where 23,000 horse power are taken from the river Tyse and used for creating electric current. Air is liquefied and the nitrogen gas separated from the oxygen and used for the production of nitrolime. In 1910 the total production of calcium carbide amounted to nearly 250,000 tons, and some 15,000 tons were used for making nitrolime. An industry of immense importance which is wholly dependent on the cheap supply of electric energy is the manufacture of aluminium from cryolite and bauxite. The modern process of aluminium production is the result of the work of Hall in America and Héroult in France. The mineral cryolite is a double fluoride of aluminium and sodium. If it is crushed and mixed with powdered fluorspar (calcium fluoride) the mixture can be used and in the liquid state dissolves alumina. In the manufacturing process the alumina is prepared from bauxite, a crude aluminium hydrate. A mixture of cryolite, fluorspar and pure alumina is placed in an iron crucible lined with graphite and melted. When fluid a graphite electrode is placed in the mixture and made the anode by which an electric current is passed through the liquid. The alumina is decomposed and metallic aluminium is deposited at the bottom of the crucible. The success of the process depends on the fact that molten metallic aluminium has a greater density than the fused electrolyte, and hence falls to the bottom and is protected from oxidation. If the voltage used per cell is not more than 5 or 6 volts the alumina alone is electrolysed and the cryolite and fluorspar remain unaltered. This process is now carried out on a large scale at Niagara Falls, and also at the extensive works of the British Aluminium Company at Loch Leven in Scotland and at the Falls of the Foyers on Loch Ness, where 30,000 horse power are utilised for this purpose. By proper adjustment of the current the heat created keeps the charge of salts fluid, and the pots only need aluminic hydrate to be added at intervals and the pure metallic aluminium to be drawn off at the bottom. At Niagara each pot has a current of 7,000 to 10,000 amperes passed through it at about 5 volts, or takes nearly 60 H.P., and produces 112 lbs. of aluminium per day. This process has now killed all other chemical processes and reduced the price of the metal to something near 1s. 10d. a lb., with an annual output of nearly 15,000 tons.

Another very large industry dependent on the electric furnace is the production of ferro-alloys. Metallurgists have discovered the remarkable change in properties produced in carbon steel by the addition of a small fracture of 1 per cent of certain other metals such as chromium, vanadium, tungsten, or nickel. Thus 0.6 per cent of vanadium added to ordinary steel nearly doubles its tensile strength and resistance to vibration. If chromium is added, the chrome-vanadium steel has most valuable properties in resisting shock and is largely used for motor car axles. In the manufacture of such steel the small percentage of special metal is best added in the form of an iron alloy. The manufacture of these ferro-alloys of iron, tungsten, nickel, vanadium, etc., is now conducted in electric furnaces on an immense scale at the Girod works at Ugines in France and elsewhere, also the preparation of an alloy called ferro-silicon used for imparting special qualities to cast iron and steel.

Another electro industry of vast importance is the manufacture of nitric acid from the nitrogen of the air. A few years ago Sir W. Crookes drew attention to the approaching exhaustion of natural fertilizers such as guano and the natural nitrates, and the necessity for making them from atmospheric nitrogen to maintain the world's supply of wheat. This is now carried out on an immense scale in Norway and Switzerland by hydroelectric power. One process, as worked out by Birkeland and Eyde and Schön-herr, depends on the fact that when air is blown through an electric arc nitric oxide (NO) is produced, and this can take up oxygen from the air and form nitrogen peroxide (NO₂), which by action on water produces nitric acid. In the Birkeland-Eyde process a power-

ful alternating current arc is formed between two water cooled electrodes with high voltage. This arc is spread out into a flat disk of flame by a magnetic field at right angles, and the arc itself is formed in a flat-furnace chamber. Air is blown through the chamber, and the issuing gases are allowed to take up oxygen in a reaction chamber and then conducted up towers filled with lumps of quartz down which water trickles. The nitrous fumes produce nitric acid, which is concentrated and neutralised with either soda or lime water, this producing sodic or calcic nitrate. This artificial nitrate has now obtained a sale as a fertiliser. At Notodden in Norway the process is conducted on a large scale, water power amounting to 30,000 H.P. or upwards being used for generating the electric currents. Each arc furnace takes 700 kilowatts through which 25,000 litres of air pass per minute, the whole plant being capable of 1,500 kilograms of 100 per cent nitric acid per day. This factory has been open since 1905. In the apparatus of Schönherr used by the Badische Anilinfabrik an arc is formed in a tubular furnace between metallic electrodes, and air is sent up the tube with a whirling motion which keeps the arc in the centre line. Each tube absorbs 1,000 H.P. The Badische Anilinfabrik has combined with the Birkeland-Eyde Company, and altogether some 400,000 h.p. will shortly be utilised in Norway in the fixation of nitrogen.

3. RAILWAY ELECTRIFICATION AND POWER TRANSMISSION

The great progress made in the generation of electric currents on a large scale is shown in the immense number of Power Stations now existing in the world, partly hydroelectric or deriving their energy from water power, and partly coal-steam electric stations.

The hydroelectric stations have obtained much their greatest development in Canada, Switzerland, Norway, Sweden, Italy, the United States, and other countries where water power is abundant. The hydraulic arrangements depend essentially on whether a low or high fall of water is available. If a high fall is utilised the power station may be located at the lower level and the water brought down to it by large iron tubes from an upper reservoir or lake. In this case the water motors, Pelton wheels or turbines, are placed at the base of the fall pipes and discharge the water into a river or channel. In other cases, such as Niagara, the turbines are placed at the foot of the penstocks and a long shaft extends up to the power house at a higher level. The dynamos are in all cases direct coupled to the water motors and may be direct current dynamos or single or polyphase alternators. The cost of such a hydroelectric installation varies very much according to the preliminary engineering work necessary to utilise the water, also with the size of the water motor units and whether the fall of water is low or high. In round numbers it may vary from £25 per horse power of output for low falls to £5 with high falls. An increase in the size of unit tends to economy. In the latest additions to Niagara Falls power house the sizes of turbines installed are from 10,000 to 12,000 H.P., whereas the earlier units were 5,000 H.P. size.

The chief item of cost in connection with distribution of power electrically is the transmission line. The reduced cost of aluminium has now made it economical to employ that metal for conductors, since its specific gravity is one third that of copper and its electrical conductivity only half as much again. The improvements made in high tension oil switches and the control of large high tension currents, as well as in the construction of transformers for raising voltage, have rendered it possible to transmit at voltages such as 60,000 or even 100,000 volts and thus economise in the size of conductors for a given power. Thus the transmission of power from Niagara to Auburn, 163 miles, is carried out at 69,000 volts by 3-phase currents over two lines, one of aluminium on wooden poles and one of copper on steel towers. In California the Great Western Power Company have carried out a scheme for the transmission of power electrically at a pressure of 100,000 volts over a distance of several hundred miles. The Southern Power Company in the United States now distribute at 100,000 volts over a distance of 164 miles. A line from Cook Falls in Michigan to Battle Creek, 190 miles, is now operated at 135,000 volts, the power transmitted being 10,000 H.P. or more. The Ontario Hydroelectric Commission recently placed contracts for 300 miles of 110,000 volt transmission line. In Europe there is at least one 110,000 volt transmission line in Saxony, the station being a steam-coal station in contiguity to a colliery, the owners of which have agreed to supply power up to 12,000 kilowatts for 30 years. The transmission

line is of copper, and in the course of the run rivers and railways are crossed. Hence the engineering difficulties of electric transmission of power at 100,000 volts over distances of 100 or 200 miles are now largely overcome. In Great Britain with a few exceptions a transmission pressure of 6000 volts is now usual in large coal-steam supply stations. It is transmitted as two or three phase alternating current and may be then transformed down to low pressure alternating or to 500-600 volt direct current for traction purposes.

A good example of a recent coal-steam electric power station is the Dunstan Power Station at Dunstan-on-Tyne for supply of power in Northumberland and Durham. The station is laid out for 6 generating units of 10,000 kilowatt capacity, 3 of which have been already installed. The engine units are steam turbines of the A.E.G. impulse type and Brown-Boveri-Parsons type, and drive alternators giving a three phase current at 5,750 volts and 40 periods. The feature of the station is the care with which the switchboard gear has been designed. This is contained in a separate fire-proof house 150 yards away from the engine room, and contains the oil switches and controlling gear for governing the distribution. The boilers are provided with automatic stokers and the steam is superheated to 570° F. It is intended to supply electric energy at low rates for metallurgical and chemical operations.

The problem of railway electrification for other than short suburban railways and with the aim in view of main line electrification is now attracting the attention of engineers. There are four competitive systems—

1. The low pressure direct current (D.C.) system, working at 500-600 volts.
2. The high pressure D.C. system working at 1,200-2,000 volts.
3. The single phase alternating system.
4. The polyphase (3-phase) alternating system.

System 1 has abundantly proved its applicability for electric urban traction and short urban or interurban railway lines, as for instance in the Metropolitan Railway (London) and in innumerable cases in urban and interurban tram lines all over the world. The low voltage used limits the economical use to a few miles unless coupled with the employment of transformer stations. Thus in the case of the Metropolitan Railway the energy is transmitted by alternating current at 5,000 or 6,000 volts from the generating station to transformer stations along the line and there changed to D.C. current at 500 volts.

The great contest at present is between the single phase alternating system and the direct current system. Single phase traction motors having commutators, called respectively compensated series and compensated repulsion motors, have now been invented, and these can be accelerated and reversed with the same ease as continuous current motors. The A. C. motors are, however, about half as large again as the D.C. motors for the same power output and the switching arrangements are heavier, and the motor has generally to be associated with a transformer. One difficulty with the A.C. motor is the sparking at starting; but the advantage of being able to transmit and pick up current from the overhead trolley wire at high voltage and transform down on the locomotive to low voltage is very great.

Several railways are now operated with single phase line voltages of 11,000 volts at 25 periods per second; for example the Rock Island Southern Railroad 52 miles, Denver and Interurban Railroad 55 miles, and the Hoosac Tunnel on the Boston and Maine Railroad, and also the New York, New Haven and Hartford Railroad, all in the United States. The single phase system has also been adopted in England for the electrified section of the London and Brighton Railway, London Bridge to Victoria, and for the Heysham-Morcambe line of the Midland Railway. In Germany engineering opinion inclines to the single phase system. The Prussian Chamber of Deputies has recently voted two million marks for electrifying the Bitterfeld-Dessau railway, and this is part of a scheme for electrifying a large number of German state railways with the single phase alternating system. On the other hand some railways in the United States which installed this system have now changed over to the high tension direct current system (1,200 volts). There are some 10 or 12 lines electrified on this latter system in the United States, the largest of which (60 miles) is the Washington, Baltimore and Annapolis Railroad. The capital costs are said to be slightly less than for the 600 volt D.C. system and the operating difficulties are no greater. In Italy and parts of Switzerland the three phase alternating current system seems to be preferred. The success of the Valtellina line on this system, and that of several similar north Italian lines, has encouraged an extension, and a Parliamentary appropriation of 12 million pounds sterling has been made for electrification of Italian main line railways on the 3-phase system. The greater complications of the overhead line involving a double trolley wire and those of the arrangements for speed regulation have been arguments against the 3-phase system.

The future of railway electrification lies between the single phase alternating and high tension direct current systems for main line work. The horse-power output per ton of electrical equipment has been estimated at 11 H.P. for D.C. as against 6 H.P. for A.C. motors. The operating costs for A.C. systems are certainly higher than for D.C. For suburban lines and in competition with electric tramways railway electrification is necessary and advantageous, but for long main lines steam locomotion will continue to hold its own.

4. ELECTRIC LAMPS AND ELECTRIC LIGHTING

Notable improvements have recently been made in the metallic filament electric lamps, in the flame arc lamp, and in the application of electric lamps to street lighting.

The metallic filament glow lamp made with drawn tungsten wire is now rapidly replacing the carbon filament lamp. In 1907 this lamp had hardly begun to affect the sales of carbon lamps, but in the United States in 1912 the sales of carbon lamps had fallen off to 52 per cent of the total, and that of metallic filament lamps correspondingly increased. Of these latter 25 per cent were tungsten, only about 3 per cent tantalum, and about 19 per cent the gem or metallised carbon filament lamps. The original process of manufacture of tungsten lamps was to provide the metal in a finely divided condition, bind it with starch, sugar or camphor, squirt into a thread and then volatilise and burn out the binder, leaving a metallic filament composed of tungsten granules sintered together. The modern process is to draw down through diamond dies a wire of tungsten alloyed with some other metal as fine as .001 inch diameter and to wind this on a frame which is inserted in the bulb. Lamps are thus made taking only 1 watt per candle.

The metallic filament lamp requires a more perfect vacuum than the carbon lamp or else blackening of the bulb soon takes place. A considerably larger percentage of the total power supplied is converted into light by the metallic filament. The carbon filament radiates 2.9 per cent of its total energy consumption as light, the osmium 5.2 per cent, the tantalum 6.5 per cent and the tungsten 7.5 per cent. This improved efficiency is due to higher temperature, but a greater percentage of ultra violet radiation which affects some eyes unpleasantly. The metallic filament lamp has, however, by its reduced energy consumption increased the demand for electric lighting. It has also given economy in street lighting by incandescent lamps, as it has, in addition to increased efficiency, an excellent life and therefore renewals are not large. The wire lamp has destroyed the domestic use of lamps such as the Nernst, which are not instantly illuminated on switching on.

In addition to improvements in metallic filament or wire lamps a good deal of work has been done in endeavouring to utilise vapour lamps.

The mercury vapour lamp consists of a glass or quartz tube provided with two electrodes highly exhausted but containing a little mercury. The lamp is started by tilting it so that the two electrodes are connected together for an instant by liquid mercury and the current then flashes through it and continues to travel in the mercury vapour, when the tube is again tilted back into an inclined position. The vapour is rendered incandescent and glows with a greenish light giving light at about 4 candles (mean spherical) per watt. The colour of the light is, however, a great disadvantage, and efforts to improve it by alloying the mercury with other metals have not yet been very successful. Another vacuum tube lamp is the Moore Lamp consisting of a long glass tube containing rarefied air or CO₂. The particular improvement consists in a device by which the increase in the vacuum due to working is made to admit a little more air or gas. This automatic valve is essential to success. The use of neon as a gas for filling vacuum tube lamps is recommended on account of the high luminosity and low dielectric strength of the gas when traversed by a current.

In out-door lighting the use of flame arc lamps has now become very general. The carbons are impregnated with certain salts such as fluoride of calcium and sodium, which give great luminosity and a reddish yellow colour to the light. The efficiency is increased to about 4 to 5 candles (mean hemispherical illumination) per watt.

The question of effective street lighting and its cost has given rise to great discussion. The open plain carbon arc lamp is unable to hold its own with high pressure gas illumination, but the flame street arc lamp taking 360 watts and giving a mean hemispherical illumination of 2,200 candles costs about £14 per annum for energy and maintenance, and its colour gives an effective illumination for main streets.

The proper use of electric light and of illuminants generally has recently attracted much attention, and "Illuminating Engineering" has almost become a separate branch of electrotechnics. This is more necessary now that artificial light of greatly increased intensity is demanded and its safe and economical use has to be considered.

5. ELECTRIC HEATING APPLIANCES AND FURNACES

The power of an electric current to produce heat is now utilised technically in electric heating for domestic purposes, e.g. cooking, house warming and water boiling, and also in manufacturing processes in electric furnaces of various kinds. There are two ways in

which such heat can be generated, *viz.* by passing the current through a high resistance wire in some enclosure from which heat does not readily escape, and also by using the current to make an electric arc in some enclosed space.

The first method, called "resistance heating," is alone used for domestic heating. The simplest form of electric heater is a so-called radiator comprising an ornamental frame carrying several large electric lamps or else some coils of wire through which the current passes. If lamps are used it is called a luminous radiator, and if coils of wire a non-luminous heater or convector. If one electric unit (costing generally 1d.) of electric energy is passed through such a radiator it creates 3,400 British thermal units (B.Th.U.) of heat, or enough heat to raise 18 pints of water from 60° F. to 212° F. The complete combustion of 1 lb. of good coal liberates 12,000 to 14,000 B.Th.U., but only a small fraction of the total calorific energy of coal is sent out into a room by a coal fire. Hence on the mere basis of fuel cost electric heating cannot compete with coal fires, yet in indirect advantages it can do so, especially if the electric energy is supplied at 0.5d. per unit. In the case of electric cooking two classes of apparatus are in use. In one, each utensil, say a kettle or saucepan, has a resistance wire contained in a double bottom or embedded in the sides. By means of a flexible wire and plug it is connected to the electric supply circuit, and the heat generated in the wire is imparted to the contained water or other liquid. In the same way an electric oven of this type has coils of resistance wire embedded in the sides and bottom. A good electric kettle so made can impart to the water 90 or 95 per cent of the heat created by the electric energy given to it. Thus about 60 watt-hours would be required to raise 1 pint of water from 60° F. to boiling, costing at 1d. per unit $\frac{1}{75}$ th of a penny for the operation. Similar arrangements on a larger scale, as in the Therol heater, are used for heating bath water, etc.

In the alternative arrangement an insulated resistance wire is embedded in a closed flat plate of iron, and the passage of a current through the wire raises the plate to a high temperature. Ordinary kettles or saucepans with flat bottoms are then placed on this hot plate and cooking done in them. The "hot plate system" is somewhat less economical in energy consumption, but much more convenient in practice, as each cooking vessel does not require an electric connection. In the Berry "Tricity" system the oven is a light polished sheet metal box which has two hot plates applied to apertures at the top and bottom. Electric cooking by this method is cleanly and better than gas cooking in that the meat, poultry, etc. do not lose nearly as much weight in cooking as by gas or coal and preserve a better flavour. Everything that can be cooked by gas or coal can be cooked as well or better by electricity. With electric energy at 1d. per unit the cost of electric cooking is not greater than gas cooking with gas at 2s. 6d. per thousand cubic feet. The convenience and comfort to the cook is, however, far greater. Where electric energy is supplied at 0.5d. per unit the advantage lies with electric cooking in every way.

Turning to larger operations we find that electric furnaces have now come into use in many branches of metallurgy, especially in steel and iron manufacture. There are several types of such furnace. Sir W. Siemens was the first to construct in 1879 an arc furnace for smelting iron, consisting of a crucible having one carbon electrode passing through its bottom and another which passed through the lid. Nearly 20 years later the matter was again taken up in 1898 by Major Stassano, who invented one of the earliest large electric arc furnaces, consisting of an iron cupola lined with fire clay in the interior of which a large electric arc was formed between carbon electrodes. Lumps of steel placed on the hearth were melted by the radiant heat so that the steel itself was not contaminated by the carbon.

Another form of arc furnace has been invented by Paul Héroult. It consists of an iron basin on trunnions, having a lining of refractory material and a cover through which pass two massive carbon electrodes. When the furnace is filled with a charge of pig or scrap iron, lime, and oxide of tar, the carbons are brought down on to it and a powerful arc formed between them which melts the charge and oxidizes the impurities, sulphur, phosphorus, carbon, etc. and finally converts the mass into liquid steel which is drawn off. An arc furnace of this type invented by Paul Girod has only one carbon electrode passing through the lid, the other electrode being one or more water cooled steel plugs inserted in the bottom of the furnace. An arc furnace for smelting iron ore and producing pig iron has been devised by the French firm Keller Leclux & Cie, in which the reduction of haematite iron ore by coke can be carried out electrically. In all these arc furnaces there is a considerable combustion or loss of the carbon electrodes, and to some extent carbon is introduced into the charge. Hence their chief use is in the preparation of a material from scrap or pig iron which is approximately free from sulphur, phosphorus and carbon, and can be subsequently refined into a high class of steel.

A form of electric furnace without electrodes was originally devised by S. Z. Ferranti, called an induction furnace. It consists of a closed rectangular ring of laminated iron having wound round it at one part a magnetising coil through which an alternating current is passed. This ring is embraced by a circular annular trough formed of refractory material, in fact a sort of groove in a mass of brick and fire clay. This trough is filled either with scrap iron or with crude liquid steel. It forms the secondary circuit of a transformer of which the iron

ring is the core and the coil the primary. Hence powerful currents are induced in the material placed in the trough, thereby heating it. Various forms of this induction furnace have been designed by F. A. Kjellin and by the firm Hermann Röchling & Co. (called the Röchling-Rodenhauser furnace), in which induced heating is combined with direct resistance heating by passing an external electric current through the charge. By means of the induction furnace and by suitable admixtures of fluxes (lime) and oxidising agents (iron ore) crude steel or scrap can be refined into a high grade of steel. For laboratory purposes forms of resistance furnace have been devised by Heraeus, which consist of a porcelain tube wound round with a platinum strip and enveloped over this with a non-conducting covering. When a current is passed through the strip the tube is soon brought to a red heat. Crucible and muffle furnaces are similarly made. Small arc furnaces in which an arc is formed between two carbon electrodes included between two massive blocks of lime or dolomite are used in chemical laboratories. The scientific work of H. Moissan was done with one of this type.

Electric heating and metallurgical processes can be conducted in some cases by passing a powerful electric current through the materials operated upon. The heat so produced effects some desired chemical change. In other cases a crucible may be packed round with high resistance material such as "kryptol," through which an electric current is passed and heat thereby produced. The great advantage of such electric heating is that the heat can be produced exactly where it is required and there are no products of combustion.

In the case of electric arc furnaces there is a necessary loss of heat through the electrodes. The rules for the most economical size have been discussed by C. Hering and A. E. Kennelly. Electric arc furnaces are used extensively in France at La Praz and Ugines for producing ferro-alloys, whilst induction furnaces are largely employed in steel manufacture.

6. TELEPHONY

In the last few years considerable attention has been paid to the theory of the propagation of electric currents along wires and cables, especially with reference to the rapidly alternating currents employed in telephony. The necessity for this arose from the costly nature of long telephone lines and cables, and the importance of being able to predict the performance of such a line from its specification before construction.

The mathematical theory has chiefly been developed by O. Heaviside, M. I. Pupin, A. E. Kennelly, G. A. Campbell and others, and has been put into a form intelligible to practical engineers by A. E. Kennelly and J. A. Fleming. The electric current which flows in a telephone cable when transmitting speech is a very complex ebb and flow of electricity. In accordance with Fourier's theorem this motion can be analysed into the sum of a number of simple harmonic motions of various amplitudes and frequencies in the ratio 1 : 2 : 3 etc. These are called the harmonics of the current. That which gives the sound its meaning to the ear when transmitted telephonically is the wave form of this variable current. This depends upon the relative amplitude and phase of the harmonics. In an ordinary telephone wire or cable the harmonic oscillations of high frequency travel faster than those of low frequency, especially if the cable has much electrical capacity. Also the higher harmonics are more rapidly degraded or attenuated in amplitude than the lower. Hence after travelling a certain distance the wave form of the current becomes distorted so much that when it flows through the receiving telephone it no longer reproduces the sound uttered to the transmitter. Heaviside showed that this distortion depended upon the relation of the resistance, capacity, inductance, and leakance of the line, and that if a line were constructed in which the product of the capacity and resistance per mile was equal to the product of inductance and leakance in homologous units the line would be distortionless. It is always found that for ordinary lines the first named product is larger than the second.

The practical problem of making a telephone cable more or less distortionless was found to depend upon the possibility of increasing considerably the quality called its inductance, which is in other words the electric inertia of the line, or the quality in virtue of which electric currents when created in it tend to persist and not die away instantly. This can be done by "loading" the line or inserting in it coils of wire of high inductance. It can also be achieved by winding over the telephone line with iron wire, which process is called uniform loading. The first method was proposed and worked out by M. I. Pupin, who showed that if the loading coils were placed at such distances that 8 or 9 of them were covered by one wave length of the current in the line

the effect was practically the same as if the added inductance were uniformly distributed. In subterranean lines the loading coils used are rings of iron wire wound with insulated copper wire, and are placed a mile or two apart. The difficulties of introducing the coils into a submarine telephone cable have only recently been overcome. A coil-loaded cable about 9 miles long was laid in 1906 by Messrs. Siemens and Halske across Lake Constance, and its improved telephonic qualities stimulated a larger experiment.

In 1910 Messrs. Siemens Bros. made and laid for the British Post Office a coil-loaded cable across the English Channel. This cable contains two complete telephone circuits, each loaded with coils placed 1 nautical mile apart. This cable enables very excellent telephonic speech to be maintained between London and Paris; and in a paper on "Submarine Cables for Long Distance Telephone Circuits" (see *Journal Inst. Elec. Eng.*, 1911, vol. 46, p. 309) Major O'Meara stated that with suitably heavy land lines of copper conductors, 800 lbs. to the mile, conversation through it between London and Astrakhan on the Caspian Sea would be possible. A similar loaded cable has since been laid by Messrs. Siemens Bros. between England and Belgium. In this last cable a very great advance has been made in the quality of the gutta percha used for insulation. In connection with the transmission of telephonic speech the ratio of the leakage (S) of the dielectric to its capacity (C) has a great influence. The ratio of S/C for most gutta percha is a number near 120, but Messrs. Siemens have reduced the value to 12 for the Anglo-Belgian cable. In the Anglo-French the loading coils have an inductance of 100 millihenrys and are placed 1 nautical mile apart, and the value of S/C is 115. In the Anglo-Belgian the coils have an inductance of 100 mh. and are also spaced 1 nautical mile apart. The attenuation constant for the loaded cable is nearly 0.018.

In addition to coil-loaded or Pupinised cables much work has been done with cables uniformly loaded by winding them over with iron wire as carried out by Krarup in Denmark. Many cables of Krarup type have been employed in Germany, and telephonic engineers differ in opinion as to the relative advantages of cables of the Pupin and Krarup type in respect to efficiency and cost, but evidence seems to show that for equal efficiency the Pupin method is cheaper. In any case an improvement from 10 per cent to 100 per cent or more can be obtained by uniform loading and more by coil loading in the speech transmitting qualities. The problem of loading cables for short lengths of 20 to 50 miles may be considered as solved, and the advantage established.

Another important advance in practical telephony is the introduction of the Automatic Exchange system. In the manual method an operator (generally a girl) is required at the central exchange to take from a caller his number and that of the desired correspondent and connect the two wires by a flexible conductor with end plugs. The delays and difficulties involved in this human element have led to the introduction of automatic exchanges. Each customer has on his telephone a dial or indicator with pointer which he sets successively to the integers, say four, composing the number of the person he desires to call up. Each subscriber is connected to the exchange by a double wire ending in a so-called 1st selector switch, and the first movement of his index connects him to a group of wires the numbers of which lie in that particular thousand. The next movement of his index needle connects him to a 2d selector switch which picks out a connection with a group of wires corresponding to the hundreds in the number called, and this in turn operates a 3d selector switch which connects to the subscriber desired. The power to work the switches is obtained from local accumulators and the whole operation takes only a few seconds. The advantages of the automatic system are that the selector switches can be housed in basements or underground rooms unsuitable for manual operators. The automatic system which has come into most general use is the Strowger system. Although new to England, it has been for some years in use in the United States very successfully. In Los Angeles there are 47,000 subscribers in automatic connection; in Chicago 30,000, and in San Francisco 25,000. The first exchange of this type set up by the General Post Office in England was installed at Epsom, the second at the General Post Office itself. Leeds is to have the third, and probably Portsmouth and Brighton will soon be provided with automatic exchanges. The automatic system

lessens the cost of working and provides a more speedy interconnection. It can be combined with some manual interconnection in a semiautomatic system. Complete improved Strowger automatic systems are at work in Hildesheim, Altenburg, Munich, Graz and Krakow, and a semiautomatic is being prepared for Amsterdam.

7. WIRELESS TELEGRAPHY AND TELEPHONY

In the increasingly important department of wireless telegraphy great progress has been made by G. Marconi in overcoming the difficulties of long distance radiotelegraphy so as to maintain an efficient commercial service. Although some radiotelegraphic work is carried on¹ by means of the Poulsen arc generator, up to the end of 1912 by far the greater part of all the wireless telegraphy in the world was conducted by the spark system, employing intermittent condenser discharges to create long electromagnetic waves. It has been found that for the accomplishment of long distances high antennae or aerial wires are necessary, and in the principal long distance stations the height of the masts or towers which carry these radiating wires is being increased. In Paris the Eiffel Tower is used as a support for antenna wires nearly 1,000 feet in height, and at Poldhu and elsewhere the Marconi Company employ masts 400 feet high. In these wires powerful oscillatory electric currents are set up by the intermittent discharges of large condensers, either air condensers (Marconi) or else glass plate condensers.

Great improvements have been made in the form of spark gap used. Marconi employs as a spark gap a rapidly revolving disk with studs on it to create several hundred discharges per second in the form of a spark called a musical quenched spark. In Germany a type of discharger due to M. Wien is employed, consisting of flat metal plates in close proximity, which has the property of instantly arresting the electric arc which tends to form between the plates. In the recent forms of spark transmitter producing a quenched spark, the effect is to impart to the antenna wires a sudden electrical impulse which sets up in them free electrical vibrations. These impulses are repeated several hundred times a second, and result in the radiation from the antenna of corresponding groups of electric waves. The signals are made by interrupting these intermittent wave trains into long or short groups in accordance with the dash and dot Morse code signals. At the receiving end these waves are picked up or absorbed by a receiving antenna and caused to create similar oscillations in a circuit comprising an adjustable condenser and inductance coil. The signals are mostly read by ear by a telephone receiver, which has placed in series with it a rectifier or valve to convert the rapid electrical oscillations into gushes of electricity in one direction. These gushes coming at the rate of the spark frequency in the transmitter give rise to a musical note which is interrupted into long and short sound interpretable as Morse code signals.

Much research has been carried out to discover and explain the action of these oscillation rectifiers. It has been found that certain crystals such as carborundum, an artificial carbide of silicon, conduct electricity better in one direction, and also that a contact between a metal or carbon point and certain metallic sulphides has a similar property. Thus a plumbago point lightly pressed against a surface of galena (lead sulphide) will rectify; also a gold point against a surface of pyrites (iron disulphide). By using a very sensitive galvanometer in series with a crystal of carborundum the radiotelegraphic signals can be photographed on paper slip. The action of these rectifying contacts does not appear to be thermoelectric, and the full reason for the asymmetrical conductivity has not yet been found. Prof. G. W. Pierce discovered that a copper point pressed against a surface of molybdenite is a very excellent oscillation rectifier.

As regards long distance radiotelegraphy Marconi has had in operation for some years stations conducting transatlantic communications, one at Clifden near Galway in Ireland, communicating with one at Glace Bay in Nova Scotia or with one at Cape Cod

¹ Before the Select Committee of the British House of Commons in November 1912 evidence was given of further results of work between San Francisco and Honolulu. But here it is only possible to deal with the situation as known up to that time. See also under Part I, Sect. i., "Extension of Telegraphic Communication."

in Massachusetts, and also long distance stations in Italy near Pisa and in South America. The scientific explanation of this long distance radiotelegraphy is even now imperfect. It is tolerably certain that if the earth were a metallic sphere and destitute of any atmosphere long distance wireless telegraphy on it would not be possible. Mr. Marconi not only sends electric waves across the Atlantic but has received signals in South America from his station in Ireland, a distance of 6,000 miles. The problem then is to explain how these electric waves travel one quarter of the way round the earth. The waves used in such work are from 2 to 4 miles in wave length and can undoubtedly bend or be diffracted like light rays to some extent round obstacles. The researches of several mathematicians such as Lord Rayleigh, M. Henri Poincaré, Prof. Macdonald and Dr. Nicholson, have, however, shown that diffraction alone will not account for such long distance radiotelegraphy. One attempt to explain it has been advanced by Prof. A. Sommerfeld. He has shown that in the case of a Hertzian oscillator placed at the boundary of two media of different dielectric constant and conductivity, such as the earth and the air, there are surface electric waves which follow round the surface irrespective of curvature. Another theory is put forward by Dr. Eccles. He has given reasons for believing that in a medium such as the upper atmosphere, which is in a state of ionisation due no doubt to the absorption of ultra violet light from sunlight, a long electric wave travels faster than in ordinary un-ionised air. Hence his view is that the upper portion of the wave front advances faster than the lower when radiation takes place from an ordinary vertical antenna. The electric ray may therefore bend to some extent round the curvature of the earth.

Another question of great importance is the reason for the longer distances which can be covered by radiotelegraphic communication at night than in the day with certain wave lengths. This is in some way connected with the greater ionisation of the air by sunlight during the day. It can be shown that it is not due to mere conductivity imparted to the air by the ionisation, at least unless this is far greater at high levels than at any altitude at which it has yet been measured. It is probably due to the deflection either upwards or downwards of the electric radiation in virtue of the difference in the velocity of the wave at various levels in the atmosphere. For the waves as used for inter-ship and shore communication the range is about 3 times greater by night than by day, but by the use of a longer wave this difference can be reduced. There are also curious differences in the greater facility of transmission North-South than East-West.

Another matter to which much attention has been paid is the invention of high frequency generators for the production of undamped oscillations especially required for the achievement of wireless telephony. The inventions of Goldschmidt for multiplying up frequency by the use of a polyphase alternator are important. Duddell and Fessenden have also devised high frequency alternators.

The problem of wireless telephony requires not only means for producing persistent trains of electric waves but a microphone or means for modulating them in accordance with the wave form of the speaking voice. Such large current microphones have been devised by Q. Majorana, W. Dubilier, E. Ruhmer and V. Poulsen, and by their aid speech has been transmitted for two or three hundred miles without wires. R. A. Fessenden has transmitted speech in this manner from Brant Rock to New York City, U.S.A., 200 miles; Poulsen from Lyngby to Esbjerg in Denmark, 200 miles; Lieuts. Colin and Jeance and M. Mercier from Paris to Finisterre, 300 miles; Majorana from Monte Mario to Porto Danzig in Italy. More recently speech has been transmitted radiotelephonically between Monte Mario and a wireless station on Maddalena Island, 160 miles. The apparatus for conducting it generally involves a Poulsen arc generator or some modification for producing undamped electric oscillations. It has not yet been adopted to work as a practical method of intercommunication like wireless telegraphy by ordinary operators. The invention of a simple efficient high frequency alternator producing electric oscillations or some equivalent device is a necessary preliminary to the establishment of wireless telephony on a commercial basis.

A reversion to the older system of magnetic induction telegraphy has been lately

introduced under the name of the "Railophone" for effecting telephonic communication with moving railway trains. It is based on inventions by Von Kramer and Gisbert Kapp. (J. A. FLEMING.)

MILITARY ENGINEERING

I. HEAVY FIELD AND SIEGE ORDNANCE EQUIPMENTS¹

Since the introduction of quick-firing field guns, it was to be foreseen that inventors would apply the same principles of construction to equipments of heavy field and siege artillery. In fact there now exist several equipments which have common characteristics, *i. e.* the long recoil of the gun on the mounting, the reduction if not suppression of movement of the sights, and the simplification of loading and laying.

Heavy Field Armaments.—The size and weight of heavy field equipments have not been limited to a train in which the gun travels on its firing carriage attached to a limber, but have developed to such an extent that a train may necessarily be comprised of more than one carriage, the gun being dismounted for travelling and not merely drawn further back on the trail for the balance of the load. With a gun so much heavier and more powerful the application of the principle of the long recoil is faced with some difficulty—the length of the recoil when the gun is in the neighbourhood of the horizontal being necessarily very considerable in order to obtain the desired stability. With howitzers also the application of the principles which have given such a happy solution for the field gun is full of serious difficulties, of which the chief is the necessity of obtaining angles of elevation of 40° to 45° . The height of the trunnions is limited by considerations of stability and weight of equipment, and with this limitation a long recoil at high angles of elevation would cause the breech to foul the ground.

Two solutions present themselves: (1) to arrange trunnions at the rear end of the cradle, as near the breech of the piece as possible; (2) to arrange a variable recoil. Krupp favours the first, with springs compensating for preponderance; such springs, however, cause uncertainty and unevenness in laying for elevation, as they vary in tension. Ehrhardt favours the second. Cockerill has tried to combine the advantages of both but not quite satisfactorily. Schneider, while constructing with the variable recoil, has made an original application of the rear trunnions.

Schneider 15 cm. Gun.—With this carriage the expression "variable recoil" is not exactly accurate. In reality the buffer is disposed in a manner to give a long recoil of a fixed length at all angles between maximum depression and 14° elevation; and a reduced recoil, also of fixed length, at all angles between 20° elevation and maximum elevation. Between 14° and 20° elevation the recoil is variable. Two steel valve keys are fixed to the buffer cylinder and engaged in slots in the piston. Their height varies, modifying at each instant the holes for the passage of the liquid. Their breadth being constant but less than that of the slots in the piston allows of a slight rotary movement to the piston. At high angles of elevation the liquid escapes through the slots only and the recoil is reduced. But when the angle decreases, holes in the head of the piston open, and the length of recoil increases. To obtain this effect, on the piston rod and against the piston itself is mounted a disc, with slots of exactly the same breadth as the valve keys, so that the disc cannot turn. There are holes in this disc, which according to the position of the piston, either do not correspond with the holes in the piston, so producing a reduced recoil; or partially correspond, with intermediate variable recoils; or entirely correspond, with a long recoil. The position of the piston is controlled through a rack and a toothed sector on a lever, the lever being worked by a bar actuated by a roller moving in two arcs of different radii concentric with the trunnions and connected to one another. For travelling the train consists of two carriages; the gun is raised out of its firing carriage by a screw and wound off by means of a windlass on to a four-wheeled block carriage; the mounting with cradle complete is attached to a limber, forming the first carriage of the train, of which the block carriage forms the second.

Schneider 120 mm. Howitzer.—There are three models of howitzers built by Schneider: light (105 mm.), medium (120 mm.) and heavy (150 mm.), of which the 120 mm. may be taken as typical. The piece rests in a saddle which recoils with it; the buffer cylinder and recuperator form part of the saddle. The buffer allows of a variable recoil, regulated by variation of the holes for the passage of the liquid. The piston is attached to the cradle and the cylinder is pulled off it on recoil. The recuperator takes the form of a cylinder connected with air reservoirs, the air being compressed during recoil and, reasserting itself,

¹ See *E. B.* xx, 223 *et seq.*

runs the gun up again into the firing position. The general arrangement of the cradle and carriage is very similar to that of the field gun carriage, but the cradle is extended some distance further to the rear to ensure equilibrium about the trunnions which can thus be brought nearer to the breech of the piece. This extension of the cradle also protects the breech mechanism, preventing elevation beyond the point when the gun would strike the ground on recoil, and also gives a longer sliding surface and support to the saddle.

Howitzers travel on their firing carriages, the heavier being drawn back on the trail and anchored to the traversing lever after the buffer has been disconnected.

Heavy Siege Armaments.—The same principles are again introduced as far as possible in these equipments. And the principle of the long recoil, with siege equipments, must conduce to modifications, the advantages resulting being numerous. In the first place it affects the obviation of the platform, or at least its simplification in such a manner that the work preparatory to coming into action may become insignificant in comparison with what it used to be. In the second place, with equal weights the power of the piece can be increased in large enough proportion whereby can be obtained increase of effective range, accuracy of fire and finally striking effect.

Schneider 28 cm. Mortar.—The mounting for this piece is designed to be brought into action on a platform rapidly laid, and also to form, for transport, carriages of such a weight as to allow of animal draught. The saddle forms two large buffer cylinders with the recuperator between them. The recuperator is of the compressed air type. The general arrangement of the cradle is similar to that of the howitzers described. The carriage is built up of plates and is arranged so that the cradle trunnions are carried on springs until the actual moment of firing, when the shock of discharge compresses the springs, bringing the weight down so as to be taken in the trunnion holes. The carriage lies with the fore part on a spring pivot on the platform. The hind part is carried by two rollers lying between the carriage sides and mounted on springs, so that on firing the carriage is supported directly on the platform. The platform is of the shape of a rectangular box with a pivot to receive the carriage, and lies upon a plough-shaped spade which holds up the recoil of the whole system. It is necessary to dig a hole for the reception of the box part of the platform and the spade. For travelling the equipment forms four separate carriages, each consisting of a limber with a false trail attached to that part of the mounting which, carried on an axle, forms the after part of the carriage. The parts are dismantled by means of hydraulic jacks or a capstan, each part being lowered on to its own axle.

Garrison Mountings.—The types of mountings for coast defences have not varied. But a new design has been manufactured by Cockerill and adopted by Belgium.

The design is of a completely shielded embrasure mounting. It consists of three principal parts: the trunnion ring with the hydraulic buffer; the carriage brackets; the frame. The gun slides in a trunnion ring of which the trunnions are pivotted about a horizontal centre line of the embrasure. The recuperator consists of springs carried inside the buffer cylinder. Metal segments mounted on the trunnion ring take up exactly the spherical form of the embrasure, and are held up to their work by springs, allowing of slight movement radially so as not to affect the laying of the gun. Projections on the trunnion ring form clutches attached to the carriage brackets, which thereby take the shock of recoil and also act as arcs for elevating. The carriage brackets are firmly connected together and pivotted on the frame about a vertical centre line of the embrasure. The frame closes the embrasure and is securely anchored. The gun is balanced by means of a spiral spring contained in a cylinder situated under the mounting, variation in the tension of the spring and the displacing moment at different angles of elevation being corrected by means of a fusee. Laying is arranged by means of a telescope supported on the left carriage bracket and laid through a small window in the frame, the axes about which the telescope can be moved being horizontal and vertical centre lines of the window.

(F. M. RICKARD, Captain, R.A.)

II. FIELD ARTILLERY MATERIAL¹

Field Guns.—With the exception of Italy, the principal European States had completed their armament with quick-firing field guns by the year 1906, and only slight changes have since been made in their equipment. In the case of Italy, the 75A semi-quick-firing gun was superseded in 1906 by a Krupp 14.3 pr. of the standard Krupp type, and 600 of these guns were issued. The total number of field guns required by the Italian artillery on mobilisation is 1,746, and it was proposed to make up this number by re-mounting the 75A guns on quick-firing carriages. It was found, however, that these guns were so badly eroded by the nitro-glycerine powder (filite) used in Italy as to be

¹ See generally *E. B.* xx 218 *et seq.*

not worth converting, and competitive trials were therefore held in 1911-12 to select a new gun. The three guns selected for the competition were a Krupp, a Schneider, and the Deport gun. The latter was preferred, and 600 of these guns have been ordered, to be manufactured in Italy, leaving some 500 guns still to be provided. Of these 500, some will be replaced by light field howitzers and some by heavy field guns.

The Deport gun is the invention of Colonel Deport, of the Forges de Chatillon, the designer of the present French service gun. The carriage is on a novel principle, known as the "scissors trail." The trail is in two halves, hinged to the axletree, and capable of being opened out at an angle of about 60° when the gun is brought into action. In place of the ordinary spade, the point of each half of the trail is nailed to the ground by a stout steel spike, driven down by a hammer. This wide anchorage renders the carriage unusually stable, and allows the gun, upon its vertical pivot, to be pointed nearly 30° on either side of the central line. Moreover since this construction leaves an open space between the two halves of the trail, it allows the breech to be depressed, so that the muzzle can be elevated to 45° above the horizontal plane. Three advantages are claimed for this "enlarged field of fire;" in the first place, targets in widely divergent directions can be engaged without shifting the carriage; in the second place, air-craft can be engaged without the necessity for a special gun; and in the third place, the gun can be used as a howitzer, for vertical fire, by withdrawing a portion of the charge. The recoil gear is of novel design, known as compound recoil gear; the gun recoils 14 inches in its cradle, and the cradle is mounted on a pedestal which recoils 40 inches on the lower cradle. The breech action is the Nordenfeldt eccentric screw, as used in the French service gun; it is, however, fitted with semi-automatic gear which throws open the breech and ejects the cartridge case during the recoil. The breech then remains open till the fresh cartridge is introduced, when it is closed automatically by a spring. The gun itself, in the Italian Deport equipment, is exactly similar to the Krupp gun already in the service, firing the same ammunition and giving the same ballistics.

The Greek Artillery.—A competition between French and German makers was held in Greece in 1907, as the result of which the Greek authorities ordered 30 four-gun batteries from Messrs. Schneider of Creusôt. This gun is a 14.3 pr. with compressed air gear, generally similar to the Spanish Schneider gun.

South America.—The Argentine Government held competitive trials between Krupp, Schneider and Vickers-Maxim guns in 1908. The committee expressed a slight preference for the Schneider gun, but for financial and political reasons the order was given to Krupp. The gun selected is a light Krupp 13 pr. In the following year the Chilean Government ordered field guns from Krupp, without competition; the Chilean gun is very similar to the Rumanian Krupp.

Field Howitzers.—Field artillery with modern shielded guns suffer very little from the shrapnel fire of field guns, while the increasing employment of the concealed position renders it difficult to make direct hits upon the guns or wagons with high-explosive shell. The result has been the development of the field howitzer, whose shrapnel bullets, descending at angles of from 45° to 30° to the horizontal plane, are effective against men behind gun-shields. All the great nations are introducing these weapons; but the only two Powers whose armament is completed are England and Germany.

The English Field Howitzer.—The details are secret, but it is a 35 pr. quick-firer, designed by the Coventry ordnance works. It has variable recoil, the length being automatically reduced at high elevations by valves which increase the resistance in the buffer, to prevent the breech from striking the ground. It has a full shield giving good overhead cover, and has the panorama all-round sight. The weight behind the team is somewhat less than that of the 18 pr. field gun. This howitzer is said to be far more accurate than any produced on the Continent, possibly owing to the excellence of the ammunition.

The German Light Field Howitzer.—The German army have for some years past had a 6-inch heavy howitzer and a 4.2-inch light field howitzer. The latter weapon has now been replaced by a 4.2-inch quick-firer, firing a 31-lb. "Universal" shell. It is of the Krupp pattern, with the trunnions at the rear end of the cradle, allowing of long recoil at all angles of elevation. The weight in action, with 4-millimetre hooded shield, is 22½ cwt.

Heavy Field Guns.—The principal Continental armies are now equipped with heavy 6-inch howitzers, firing 90 lb. shell, and ranging 3 to 4 miles. In some cases, as with the French Rimailho howitzer, the gun itself travels on a separate wagon, in order to lighten the carriage and to enable the battery to move at a trot. The modern tendency is to supplement these heavy howitzers by heavy field guns, throwing a 60-lb. shell over 6 miles; but financial considerations have prevented their introduction on any large

scale. In Austria a 9-inch howitzer, firing a 250-lb. shell, was recently made available as a field weapon, the equipment being mounted on three motor lorries.

Mountain Guns.—In view of the prospect of a war in Central or Southern Europe, where fighting must largely be in mountainous country, the importance of quick-firing mountain guns has been generally recognised: yet the greater powers have been very slow to introduce them. The principal modern development in the construction of mountain guns is the system of weighing the gun with a removable jacket, carried separately, in order to reduce the recoil and so to enable a more powerful shell to be fired. This system is used in the Schneider-Danglis gun, adopted by Russia and Greece.

The breech ring, carrying the breech-block, is prolonged forward into a loose jacket surrounding the gun, and secured to it by a bayonet joint; this enables the weight of the shell to be increased to 14.3 lbs., with a muzzle velocity of 1,150 fs. This gun forms 6 mule loads with shield. Other nations use lighter guns; thus Serbia and Bulgaria have 11 pr. Schneider guns, and Turkey a 12 pr. Krupp.

Balloon Guns.—Guns for the armament of dirigible balloons have been designed, but none had in 1912 been constructed. The nearest approach to such a weapon is the machine gun carried on top of the structure of the latest military Zeppelin, and the bomb-launching tubes of the Italian semi-rigid dirigible launched in 1912 at Milan. Guns for the attack of dirigibles from the ground have not yet been manufactured on any large scale, as it still appears doubtful whether the military dirigible will not be superseded by the aeroplane, at which the fire of land guns would be no more effective than snipe-shooting with a rifle. The standard pattern of field guns for the attack of balloons is the Krupp high-velocity 12 pr; this gun has differential recoil, rear trunnions, and semi-automatic breech action, and fires a high-explosive shell which leaves a smoke-trail behind it, and has a sensitive fuze designed to act on the envelope of a balloon. Messrs. Ehrhardt have a similar gun, which however fires universal shell in place of high explosive shell. Messrs. Schneider of Creusôt have proceeded on different lines, and have built a 1.47-inch pom-pom mounted on a motor car, producing effect rather by the number than by the individual efficiency of the projectiles fired from it.

Ammunition.—During the last few years the combined shrapnel and common shell, or "universal" shell, has attracted much attention, especially since its adoption in 1910 as the sole projectile for the new German light field howitzer. The best known pattern of this projectile is manufactured by Ehrhardt. It consists of a shrapnel with separate high-explosive head; when burst in air as a time shrapnel the shrapnel portion acts in the ordinary way, while the head flies forward and acts as a percussion high-explosive shell on its own account. When burst on impact, the head detonates, and the detonation is also communicated to the explosive (trinitrotoluol) in which the bullets are packed. Experiments conducted in Austria and elsewhere have shown that the head of the shell alone produces good destructive effect on a shielded gun, while the shrapnel effect, as compared with ordinary shrapnel, is in proportion to the weight of bullets. Since ordinary shrapnel contains 50 per cent of its weight of bullets, while the latest patterns of universal shell contain about 43 per cent, the new projectile entails a loss of 14 bullets in a hundred, or 14 per cent of shrapnel effect. This consideration, together with the extra expense, has so far stood in the way of its general introduction.

Stores and Appliances.—Within the last three years, the increased employment of the concealed position for field artillery has led to the general introduction of sights and appliances for indirect laying. The panorama sight, which enables the gun to be layed on an aiming point to the flank or rear, has been adopted by Great Britain, Austria, Russia, Italy, and several minor States; the battery director, which is similar in principle to a theodolite, has been introduced for measuring target angles, and so enabling the guns to be layed on a target invisible from the battery; and telephones for connecting the observing station with the guns have been issued to batteries and brigades. Thus in Germany every battery has now an observation wagon carrying a ladder which can be set up in the battery, so that the commanding officer can see the target while keeping his guns concealed; and this wagon contains a complete set of telephones and indirect laying stores.

(H. A. BETHELL, Col., R.A.)

III. SMALL ARMS

Since 1909-10 there has been no technical development worth notice in regard to the sword (*E. B.* xxvi, 269 *et seq.*) or bayonet (*E. B.* iii, 557-8); but further progress has been made in regard to rifles and pistols.

Rifle (*E. B.* xxiii, 325 *et seq.*)—In 1911 a new cartridge, known as Mark VII, was introduced for the British service. The bullet has a sharp point like that of the German "S" bullet. Its weight is 174 grains as compared with the 215 grains of the round-nosed bullet, and its core is a compound one, the rear portion being a cylinder of lead while the front portion is a cone of aluminium. While reducing the weight, the length of the bullet has thus been kept the same as that of the Mark VI bullet, and a change of magazine has been avoided, while the surface which bears on the bore is kept long enough to ensure accuracy. The propellant is cordite, but the modified form of that explosive is used in which the proportion of nitro-glycerine is much diminished and the heat produced by its ignition is thus considerably reduced. The charge, which is in tubular form, has been increased in weight by about 25 per cent. This increase, and the reduction in the weight of the bullet, have led to an increased velocity of about 400 foot seconds, and to a consequent lowering of the trajectory. The battlesight range, covering a man 5 ft. 3 ins. high, is now about 675 yards as against 500 yards with the Mark VI cartridge, and the vertex of the 800 yards trajectory is 9 ft. as against 13 ft.

The introduction of this cartridge has necessitated the re-sighting of the rifles, the shape of the ramp of the backsight being altered and a new dial plate fitted. The opportunity has been taken to issue rifles having a "U" notch in the backsight and a blade foresight, a combination much superior to the "V" and barley-corn of the old sight. The action is unchanged, but a bridge charger guide is fitted in place of the sliding charger guide on the bolt-head. The breech has not been strengthened to withstand the higher pressure though the bridge charger guide does something towards strengthening the body.

No nation has undertaken re-armament since the issue of the Japanese 38th year rifle in 1907, but all the military powers except Austria and Italy have adopted a high velocity cartridge, and this has necessitated re-sighting, which has in all cases been a more complicated and costly process than in the case of the British rifle.

No trustworthy automatic rifle has yet made its appearance. Rumours of the adoption of a rifle of the kind by Continental European powers are probably due to a confusion of ideas, the "rifle" referred to being really a rifle-shaped portable machine gun. Military opinion in all nations is agreed that the disadvantages of an automatic rifle outweigh its advantages, and the possession of one would be a constant anxiety owing to its liability to fail, though the increased rate of fire possible at a critical moment, averaging perhaps 20 to 25 rounds a minute, and the diminution of fatigue to the firer would be notable gains. The distribution of ammunition to men in the firing line would tend to become a more difficult problem than ever, and the allowance of ammunition for peace training would have to be increased materially if an automatic rifle were adopted.

The title of "Portable Machine Guns" has been given to a type of weapon which, though rifle-shaped and fired from the shoulder with a forked support for the muzzle, is too heavy to be carried and used by the already heavily loaded infantry soldier. It occupies a position between the machine gun and the automatic rifle. Such guns are fed with ammunition by hoppers, magazines or flat clips, either device holding about 25 rounds. A considerable volume of fire can be produced by these guns, but as the provision for cooling the barrel, owing to considerations of weight, cannot be thoroughly efficient, the duration of fire is somewhat limited.

Several types of portable machine-guns are in existence or under trial, the best known being the Madsen or Rexer, recoil-operated and fed by hoppers, and the Hotchkiss (known in the United States as the Benet-Mercie), gas-operated and fed by flat clips. The former was used considerably and with effect by the Russian cavalry in Manchuria, but seems likely to be displaced by the Hotchkiss, which has been adopted by the United States and is being studied by several European powers. Both these guns can be operated by one man, though a more continuous fire can be obtained, particularly with the Hotchkiss, if two men are employed, one to supply ammunition and the other to fire. The Madsen weighs 18 lbs. and the Hotchkiss 26 lbs. Both can be adapted to fire any small-arm cartridge.

The Lewis gun recently produced in the United States belongs to this family, though more cumbersome. It weighs 25½ lbs., is gas-operated, and is fed by a drum-shaped hopper.

A weapon of this type seems admirably fitted for carriage on a motor-cycle, when it would be easy to arrange for an adequate supply of ammunition. For other arms the provision of a sufficient supply of ammunition presents considerable difficulties.

The question of which is the best military rifle was raised in Great Britain in 1912 in both Houses of Parliament during the discussion of the Army Estimates. The broad points which decide the value of a rifle for military purposes are (1) accuracy, (2) good ballistics, (3) handiness, and (4) reliability under all the accidents and stresses of active service. With the round-nosed type of ammunition accuracy and ballistics were practically identical with all the rifles in use. The introduction of the pointed bullet has modified the situation as regards accuracy, because the portion of the barrel which serves as a guide to the bullet as it passes from the cartridge case to the rifling was designed for a round-nosed bullet, and cannot do its work so effectively with a pointed one, and as regards ballistics because some nations have not been able, and some have not thought it desirable, to go as far in the matter of flatness of trajectory as others. Accuracy with the German, United States, and British Mark VII cartridges is about equal to that obtained with the old type of ammunition, but all other nations are faced with diminished accuracy, though the old standard is being approached as light is thrown on the details of manufacture by experience. Ballistics, so far as the design is concerned, depend on the strength of the action and the capacity of the chamber.

In the Lee-Enfield rifle, between the point where the stress is applied and the point where it is taken by the body of the rifle, is interposed a hollow cylinder in the shape of the bolt, which is liable to compression. The amount of stress which can be safely applied is thus limited. In non-British rifles the locking lugs are part of the front end of the bolt and the shock is thus transferred directly to the rifle and not through the intermediary of the bolt. The chamber capacity of the rifle again is small, the design having been made for a cartridge containing a compressed pellet of black powder. It is thus not sufficient to allow of any large increase in the amount of the charge while still retaining the proportion of air space which is necessary with a smokeless propellant if pressures are to be kept within reasonable limits. It has therefore not been possible to obtain a lower trajectory than one giving a height of 9 ft. over 800 yards as against the 6 ft. of the German cartridge for the same distance. The cartridges of other nations using a pointed bullet lie between these two extremes. At long ranges a heavy bullet, such as the British or French, behaves better than a light one such as the German.

In the matter of handiness the Short Lee-Enfield is good. Its length and balance give it a great advantage for snaphooting, while its being cased in wood throughout enables it to be handled even when the barrel is heated by continuous firing. The shortness of the rifle is in some quarters held to be a disadvantage for bayonet fighting, but a short handy weapon may well be better than a long unwieldy one.

As regards reliability the only charge which can be brought against the British rifle is that the butt is liable to work loose owing to the stock being in two parts. In the pattern now in use however this tendency has been overcome.

Pistol (*E. B.* xxi, 654 *et seq.*)—The bullet now used in revolver cartridges is a heavy leaden one with a head so slightly convex as to be almost flat. This construction distributes the shock of impact over a greater area, and the man-stopping qualities of the bullet are thus much increased.

The automatic pistols produced till quite recently have been of small calibre and therefore deficient in stopping power. The Colt Company have however now produced one of .45" calibre, and Messrs. Webley and Scott one of .455" calibre, which are satisfactory in this respect. Both have a "grip" safety, consisting of a lever in the butt, pressure on which is necessary before the firing mechanism can be operated by the trigger. The lever is thus in the firing position only when the butt is gripped.

Sights (*E. B.* xxv, 65 *et seq.*)—The aperture backsight, preferably in conjunction with a blade foresight, is now recognised as being the best sighting device for small arms. To be most effective the aperture should be placed in such position on the rifle that it is as close as possible to the firer's eye while not being close enough to strike his

face when the rifle recoils on firing. The sight radius is thus increased and greater ease and accuracy of alignment are consequently secured. Again, the fact that the firer looks through the aperture and has not to focus his eye for anything nearer than the foresight removes the main cause of the eye-strain felt with the open sight. The method of aiming is easier to learn than that with the open sight, while, if the aperture is large and is not surrounded with a mass of metal it is effective when the light is bad or the target indistinct. The system has of course long been in use for sporting rifles, but the only military rifle at present equipped with it is that of the United States. Its application to that rifle is however so defective that all the advantages named above seem to be lost.

(G. BROWNE, Major.)

IV. NAVAL ORDNANCE CONSTRUCTION¹

During the past few years, nearly every maritime nation has been making great efforts to increase the power of its naval armament. Larger ships with greater speed and heavier guns have been built, and the progress made even in two or three years has been considerable. The Dreadnought type has developed into the "super-Dreadnought." Some authorities contemplate still larger ships, whilst others think the risk of putting so many eggs into one basket too great, and that therefore smaller vessels, but more of them, are what would suit existing conditions best. Both admit, however, that the armament should be made as powerful as circumstances allow.

The power of the armament depends on four factors: (1) the calibre and weight of the projectile; (2) the initial velocity; (3) the maximum weight of the bursting charge which can be exploded behind the armour of a hostile vessel; and (4) the number of guns; but various considerations arise in connection with these, which must be taken into account.

The diameter of the bore of the gun is governed to a great extent by the thickness of armour borne by the rival ship; this armour, owing to its weight, is however strictly limited both as regards thickness and extent; in consequence the thick plating is confined to a belt along the water line, to the protection of the ammunition hoists, the necessary working gear of the guns, and of the guns and gun's crew.

Of late years, much has been done to increase the resistance of armour, and to this must be added the difficulty of obtaining direct hits in action, owing to the target being almost always an oblique one. Moreover, improvements have enabled the range of torpedoes to be greatly increased, and this has helped to increase the probable battle ranges from the 3,000 or 4,000 yards of a few years ago to 8,000 yards or perhaps more. Even with the aid of telescope sights and the modern devices applied to the sighting gear for correcting for wear of gun, for temperature, for wind etc., much experience and practice are required to ensure hitting the target at these distant ranges.

It is now well known that in the Russo-Japanese war the thick belt armour was never perforated in any of the Russian or Japanese vessels, even at the short ranges of 3,000 metres to which the Japanese finally closed at the battle of Tsushima; this remarkable fact was no doubt due to the projectiles striking the armour obliquely and not at right angles. Had the firing been direct, no difficulty would have been experienced in perforating the armour on the latest built ship at this short range, and still less difficulty with the armour of the older ships.

Until recently, too, it was generally taken as an axiom that armour would be attacked by a gun of a calibre somewhere near its thickness, and armour was tested from this point of view; thus a 9-inch plate would be tested by a 9.2-inch gun and a 6-inch plate by a 6-inch gun. After all, the actual perforation of the armour of a ship would not, in all probability, seriously damage any vital structure unless the projectile was provided with a large bursting charge of high explosive which could be detonated behind the armour. The real damage to the Russian ships was done, not by armour piercing projectiles from the heavy guns, but by the incessant rain of high explosive shell from the Japanese secondary armament of 6-inch guns. These were fired at the unarmoured portions of the Russian ships, and, bursting with terrible effect within, greatly damaged the ship

¹ See *E. B.* xx, 189-218, 230-235.

and completely demoralised the crew. With this significant result before them, authorities have not been slow to recognise that the bursting of very few large high explosive shells behind the armour might speedily decide an engagement.

Supposing for the moment that the calibre of the gun was approximately equal to the thickness of the plate, it is evident that as the quality of the armour improved the perforating energy of the projectile had to be increased, and, as the fighting range became more distant, a higher initial velocity was required. Both these conditions operate in the same direction, *i.e.* in an increase in the muzzle velocity of the gun. Moreover, some authorities were manifestly reluctant to increase the calibre on account of questions of interchangeability, and the additional weight to be accommodated.

For these reasons, the muzzle velocity of heavy guns up to and including 12 inches diameter has had to be considerably increased by (a) making the gun longer, (b) increasing the weight of the charge; and as it is generally admitted that the length of the gun bore should not exceed 50-calibres, but should be shorter if possible owing to the tendency to vibration and a consequent loss of accuracy of long guns on firing, the gun maker has to face an augmentation in the weight of the charge. This, however, he endeavours to keep as small as possible, by increasing the chamber pressure and making the gun and projectile stronger to withstand it.

The addition to the weight of the charge, to the chamber pressure, and to the length of the gun, all tend to increase erosion and to shorten the life of the gun. Speaking broadly, the erosion of equally proportioned guns is, for similar velocities, dependent on some function of the calibre, and the high velocities until recently demanded may be regarded as responsible for the comparatively short life of the guns designed to produce these velocities. Naturally, the life of the gun, *i.e.* the number of full rounds it is capable of firing before it is worn out, has a most important bearing on its efficiency, especially at the present time when many rounds are fired annually for exercise purposes.

It has therefore been necessary to consider some means of increasing the life of the gun, of ensuring perforation of improved armour at fighting ranges of 8,000 yards, and of bursting behind that armour a high explosive shell containing a powerful bursting charge. These conditions were met in the British Navy by the introduction in 1910 of the 13.5-inch gun. This gun, with a moderate velocity, has, owing to its heavy projectile, a considerable surplus of perforating energy over that of the high velocity 12-inch gun at the fighting range of 8,000 yards, and this surplus increases with the range. The 13.5-inch gun with its comparatively low velocity requires a charge no larger than that of the 12-inch gun, and in consequence this gun can fire from $2\frac{1}{2}$ to 3 times the number of rounds that the 12-inch gun is capable of firing. As first designed, the weight of the projectile was exactly the same as that for the 13.5-inch B.L. gun of 1885, *viz.* 1,250 lbs.; recently, however, a tendency to increase the relative weight of the projectile has set in, on account of the larger bursting charge which they may be made to contain, and in accordance with this the projectile has been increased in weight to 1,400 lbs.

Formerly, it was supposed that the length of projectile which could be relied on to give accurate results was limited to about 4 calibres, and that any increase in its weight simply implied thicker walls and a smaller bursting charge; but recent experiments with heavy guns give accurate results with projectiles up to 5.5 calibres in length. One argument against a relatively high weight of projectile therefore vanishes.

It is not to be supposed that the calibre of the gun will be limited to 13.5 inches. Germany and the United States are already manufacturing 14-inch guns, and the Japanese Government, besides constructing guns of this calibre, are also acquiring in England a number of similar guns. Other nations are following this powerful lead, and signs have not been wanting of further developments.

Gun power has also been increased by improvements in the shape of the head of the projectile. Until two or three years ago, the radius of the ogive had been 2 calibres, but experiments with pointed bullets having a radius of head of from 6 to 8 calibres had shown that the sharper form of head gave, owing to the reduced air resistance, higher remaining velocities at all ranges; and consequently for any given range a much flatter

trajectory was ensured. Experiments were then carried out with gun projectiles in order to obtain similar advantages, and it was found that the remaining velocity increased with the radius of the head, but that the accuracy became less if the point was unduly acute. A radius of head of about 4 calibres was finally decided upon as giving the advantage of increased remaining velocity, or longer range with good accuracy.

The perforating power of the armour piercing projectile has been much increased by the introduction of the cap. The cap as first introduced was solid with a flat nose of considerable thickness in front of the actual point of the shell. Lately this thickness has been greatly reduced, but in order to preserve the external form of the large radius ogive the cap is provided with a hollow point.

By the use of a higher grade of steel, the thickness of the walls of armour piercing shell can be slightly reduced; thus the internal capacity of the projectile is increased and a larger bursting charge of high explosive can be used.

The high explosive bursting charge for the various kinds of projectiles has also increased in weight, so that modern shells are more powerful than those of older types. In these a bursting charge of lyddite, *i.e.* melted picric acid, was employed. This material, although a most powerful explosive, has certain drawbacks, of which the following may be mentioned: it requires a somewhat high temperature to melt it for the purpose of running it into the shells, and it readily forms dangerous combinations with certain metallic salts should these be present; great care has therefore to be observed to prevent any possibility of their presence. An alternative chemical substance "trinitrotoluol" has come into favour; this melts at a very much lower temperature, and has the further advantage of not forming dangerous compounds as picric acid does. On the other hand, it is more inert, so that a powerful exploder is required to properly detonate it; but this inertness is otherwise an advantage in as much as it enables an armour piercing shell filled with trinitrotoluol to perforate armour, even at a striking velocity of over 2,000 f.s., without exploding the shell. Thus, with a well designed fuze and exploder, it is possible to burst the shell after it has passed through the armour into the interior of the ship.

(A. G. HADCOCK.)

V. ARMOUR-PLATE¹

Progress of Manufacture.—Improvements in armour-plate manufacture, with a view to increasing the resisting power of plates, are the jealously guarded secrets of the manufacturers and their respective Governments. As far as can be ascertained, however, there have been no further developments during the last two or three years comparable in importance with those introduced in the past by Harvey or Krupp. Minor improvements have no doubt been made, and the actual quality of an average plate is probably better than it was three or four years ago; but, relative to the attack, it is doubtful whether any progress has been made in the resisting power of armour.

It is claimed, however, that in the United States, at least, a considerable advance has been made in the case of the thinner plates, up to 3 or 4 inches in thickness, including those used for decks, splinter-proofs, roofs of turrets, conning towers, etc., by the adoption of a nickel-chrome-vanadium steel subjected to a special heat treatment. In view of the possibilities of aerial attack, the importance of horizontal armour, especially in the form of light over-head cover, is greater than ever, and for this reason alone any development in the resisting power of thin plates is to be welcomed. In the case of the thicker plates no definite advance of any importance has been reported, except in the matter of surface flaking when struck, which is said by Rear Admiral N.C. Twining, the Chief of the United States Bureau of Ordnance, to have been very greatly reduced in recent years (see *Scientific American*, December 9, 1911).

In the above remarks, no account has been taken of the Simpson process, which would seem to be still in the experimental stage. The process is one of welding together steel plates of varying hardness by means of copper. As described in the *Times* (London) of March 29, 1911, the weld is effected as follows. The plates to be united are placed,

¹ See *E. B.* ii, 578 *et seq.*

with a layer of copper between, in a mixture of carbon, brown sugar and water of the consistency of compressed snow, and the whole mass is heated to a temperature of $2,000^{\circ}$ F., when the copper melts away into the adjacent steel, forming a perfect weld. The advantage to be gained by such a process is obvious. One of the limitations of the cementation process is that the carbon, upon which the hardness of the face mainly depends, only penetrates to a depth of about one inch and, consequently, there is a difficulty, in the thicker plates, of getting the best relation of thickness between hard face and tough back. By the Simpson process—if successful—it would be possible to obtain any desired relation between the two and to use any class of steel which might be preferred. Further it would appear possible to employ one or more intermediate layers, if it should be found desirable, to prevent too abrupt a change in the character of the steel. The possibilities of the process depend upon the soundness of the weld—the point in which the earlier compound plates failed.

An interesting account of the Krupp process as carried out at Essen was given in *Engineering* of August 16, 1912. It is noteworthy as giving the approximate temperatures of the various stages, including the differential heat. The account differs in some details from earlier descriptions, notably in the use of illuminating gas instead of solid carbon in the cementation process and in the method of the final chill.

Modifications in Thickness etc., of Plates.—The increased power of the attack, which, apart from the tendency to adopt heavier primary guns, is due partly to improvements in the projectile and cap, considered merely as perforating or punching tools, and partly to increased ranging power due to the elongated form of head now universally adopted, is having the inevitable effect, in the absence of any revolutionary change in the character of plates, of increasing the maximum thickness of the main armour; and it has been stated that in the U.S. battleship "Nevada" the maximum belt thickness is to be $13\frac{1}{2}$ inches as against the 11 inches of the "Wyoming" and her foreign contemporaries, while armour of as much as 18 inches thick is to be used on the port plates of the 3-gun turrets. During 1911 trials are known to have been carried out in the United States with 18-inch plates. On the other hand there would appear to be a tendency in America to drop light vertical armour for the protection of the secondary armament on the ground that it merely serves as an effective shell burster. In the latest British battleships it is reported that light armour for the secondary guns is reverted to.

Another modern feature of interest is the use of plates of varying thickness vertically, for belt armour. There is thus no marked line of cleavage, as formerly, between the thicker and thinner horizontal layers of the belt.

The use of cast steel—such as Hadfield's "Era" steel—for gun shields, armoured tubes etc., is increasing. Its resisting value is high, a recent example of a 2.7-inch plate showing a figure of merit well over 2 against capped 4-inch armour-piercing shell.

This class of material is specially adapted to cases where a monolithic form is desirable, and enables the thickness to be graduated in the most economical way to suit the exposure of the various faces to attack.

In connection with the penetration of armour, a point of considerable interest,—whether, as is usually held, the projectile remains sensibly at a tangent to the trajectory during flight, or whether, as has been occasionally maintained by certain ballistic heretics, it remains parallel to the initial direction of projection,—has recently been discussed (see *Scientific American*, August 10 and 17, 1912) by Admiral Twining, who shows both theoretically and from actual firing trials at long ranges against armour that the orthodox theory is correct. The importance of the point is obvious when we consider that no projectile could withstand the cross breaking strain to which it would be subjected on impact, at any but very close ranges, if it retained its original direction, so that the employment of projectiles specially designed to perforate armour would be a sheer waste of money.

Caps.—Complete agreement as to the exact way in which the cap assists penetration has not yet been arrived at. All authorities concur in attributing great importance to the lateral support which it affords to the point on impact above a certain velocity, which varies in all probability with the particular plate and projectile involved (there is a general agreement that the minimum velocity to render the cap effective varies from about 1,600 to 1,800 f.s.): but while some, following Trésidder (see the latter's lecture,

April 8, 1908, before the Institution of Naval Architects), think this the main if not the sole function of the cap; others, such as Chladek and Bahn, attribute considerable importance to its (supposed) action in breaking up or otherwise weakening the hard surface layers of the plate before the undamaged point impinges upon them. Those, now-a-days in the majority, who hold the view of Tresidder, naturally use all the weight available in giving lateral support to the cap and put little or no metal in front of the point. Those, on the other hand, who believe that the cap can weaken the plate before the actual impact of the projectile itself, will place some of the metal of the cap in front of the point. From the point of view of external ballistics it is desirable that the external contour of the projectile should be continued to the point, and this is against the flat ended cap suggested by Tresidder. This difficulty can however be met by using a hollow cap with the bulk of the metal giving lateral support to the point and practically flush with it, but with what may be termed a false head to give it a suitable ogival outline, as for example in the Firth cap shown on page 291 of Brassey's *Naval Annual* (1912). (W. E. EDWARDS.)

MINING¹

So far as mining processes and operations are concerned, the principal new developments in the last few years have been connected with coal mining,² and reference is chiefly made in the following sections to that industry.

LEGISLATION.—The passage of the Coal-Mines Act, 1911, which came into force, as regards the bulk of its provisions, on July 1, 1912, has been the event of outstanding recent importance in the British coal-mining industry. It introduces radical changes in the control and management of coal-mines, and has entailed considerable alterations in the mechanical equipment and methods of working collieries. In France, new coal-mines regulations became operative on February 25, 1912. New Belgian regulations were issued in December 1910 in regard to travelling roads and shafts. A new Coal-Mines Regulation Act was passed in British Columbia during 1911, and a movement was on foot in 1912 to consolidate the various Provincial Acts in Canada relating to coal-mining. The United States Bureau of Mines was established by Act of Congress on July 1, 1910, its purpose being to investigate methods of mining. The headquarters of the Bureau are at Washington, and the mining experiment station is situated at Pittsburg with an experimental mine at Bruceton, Pa., and six mine-safety stations and seven mine-rescue cars distributed one in each of the principal coalfields.

COAL SUPPLY.—The three years 1910–12 have been notable for the deepening interest that has been shown in regard to the question of coal resources. During 1912 the Royal Commission on Conservation appointed by the Canadian Government issued voluminous reports (see also *An Investigation of the Coals of Canada*, Ottawa, 1912, in 6 vols.), and similar enquiries have been prosecuted in the United States, under the auspices of the Geological Survey and the Bureau of Mines.

In British Columbia, at the headwaters of the Skeena river in what is termed the Groundhog Mountain area, enormous deposits of anthracitic coal have been located, a conservative estimate placing the resources of the coalfield at 3,072,000,000 tons; other smaller basins have also been prospected. The development of the Rocky Mountain Coalfields—in British Columbia, Alberta and Manitoba—has proceeded apace. D. B. Dowling has estimated that the known areas in Canada underlain by workable coal beds (excluding the Skeena district) cover little short of 30,000 sq. m. and contain a total of 172,057,000,000 tons, sub-divided as follows: Nova Scotia, 6,250,000,000 tons; New Brunswick, 155,000,000 tons; Manitoba, 330,000,000 tons; Saskatchewan, 20,000,000,000 tons; Alberta, 104,932,000,000 tons; British Columbia, 38,976,000,000 tons; Yukon, 914,000,000 tons; Mackenzie District, 500,000,000 tons. Further prospecting has taken place in Alaska, but transport difficulties have still to be overcome, and the same consideration delays the utilisation of the deposits in Siberia and China, in which the existence of enormous quantities of high-class coal is established. In Victoria, Australia,

¹ See *E. B.* xviii, 528 *et seq.*, and allied articles. ² See *E. B.* vi, 579 *et seq.*

whose known coal supplies have previously been of a lignitic character, large deposits of good coal have been discovered in the Powlett River district, and pits have been established under government direction; these are now producing quantities of coal.

On the Continent of Europe, further knowledge has been derived by borings of the extent and character of the deposits in the French and German Lorraine. In Belgium a number of shafts were in 1912 nearing completion in the Campine region in the Limburg province, and borings in Hainault had succeeded in locating coal at workable depths, to the south of the Eifelian fault, the boundary of the existing coalfields. Dutch state enterprise has been extended in the Netherlands Limburg, by the discovery of further areas on the banks of the Meuse.

In Great Britain some of the new large collieries sunk in the S.E. portion of the South Yorkshire coalfield have reached the stage of active work, of which mention may be made of Maltby, Edlington, Bentley, Bulcroft and Askern; sinking operations also were in 1912 either in progress or contemplated at Rossington, Barnborough, Thorne, Hatfield, Barnby-upon-Don, Kelham, South Carr, Harworth, Howden and Thurcroft. When in full operation, they should add some 12,000,000 tons per annum to the existing output of the coalfield or about five per cent to the national output. Developments have also been in progress in South Staffordshire to the west of the boundary fault, Warwickshire, Fifeshire, the Lothians, Monmouthshire, Kent and South-East Durham.

The table shows the world's output of coal during 1910 (figures for 1909 and 1908 being given in certain cases as the latest procurable):

World's Coal Output, 1910.

Coal		Coal	
Country	(Metric tons)	Country	(Metric tons)
British Empire	311,613,510	Holland	1,292,289
Great Britain and Ireland	268,676,528	Dutch East Indies	535,226
Australia	9,915,602	Italy	562,153
British Borneo	165,281	Japan	15,681,324
Canada	11,710,993	Formosa	231,641
India	12,240,744	Korea	73,932
New Zealand	2,232,624	Mexico (1909)	919,338
Rhodesia	163,355	Peru	307,320
South Africa	6,508,383	Philippine Islands	27,000
United States	455,045,249	Portugal	8,149
Austria-Hungary	47,943,109	Rumania (1908)	160,783
Bosnia and Herzegovina	706,659	Russia	24,026,000
Belgium	23,916,560	Servia	276,815
Brazil (est.)	15,000	Spain (1909)	4,125,894
Bulgaria (1909)	227,362	Spitzbergen (1909)	2,316
Chile (1909)	898,971	Sweden	302,786
China (est.)	13,190,000	Switzerland (est.)	2,600
France	38,349,942	Turkey (1908)	702,722

German Empire	222,375,076	Total for the World	1,164,019,777
Greece	1,500		

COAL-CUTTING MACHINERY.—At the time the Eight Hours Act of 1908 (*E. B.* xvi, 18b) was under discussion in England it was persistently claimed that a great mitigation for the loss of output due to the restriction of the hours of labour would be forthcoming in the more general use of coal-cutting machinery. This anticipation has not been borne out; the application of machinery in Great Britain increases but slowly, the governing factors continuing to be the condition and lie of the strata and the relative cost of hand labour. The principal developments have been in the direction of improved design and mechanical efficiency.

Coal-cutting machines may be broadly divided into two classes—percussive and rotary machines—and there is a tendency to employ increased numbers of the former type, especially of the small character similar to the caulking hammer. Continued efforts have been made to produce a satisfactory electrical machine of the puncher type, but so far without conspicuous success. In America the pneumelectric puncher has been

used to some extent; in this machine the actual reciprocating motion is produced mechanically by an electric motor, and is transmitted by compressed air to the percussive tool, the whole apparatus being practically self-contained. The Ingersoll-Rand Company produce a similar machine. The percussive coal-cutter has gained from the development of the rock drill, and several of the modern machines, such as the Hardy, Ingersoll and Siskol, embody economical improvements in valve construction.

A novelty has been introduced in the United States in the shape of the Hoadley-Knight coal-cutter. This machine, which is of the tunnelling or breast type, comprises swinging cutters rotating with great rapidity. The rotation is effected by electricity, whilst the swinging and feeding movements are directed and controlled by hydraulic means. The machine is especially designed for the getting of coking or gas coal in which the size of the product is not a consideration.

At the mines of the United States Coal & Coke Co., Gary, W. Va., a system of pneumatic transport has been tested: a machine cuts out the entire thickness of the seam, removing the coal as it is cut to the outside by means of currents of air at high velocity.

A concomitant of the increased use of coal cutting machinery has been the more extensive adoption of coal face conveyors.

MECHANICAL VENTILATORS.—The principal changes in the British Coal-Mines Act relating to methods of ventilation are the compulsory provision of an adequate ventilating system on the surface, with, after January 1, 1913, means for reversing the air current. A revolution in construction has taken place in colliery fans, the principal features of which are the great reduction in diameter, the adoption of high-speed engines, a quick-running electric motor, and the use of short peripheral blades, in place of long blades attached to the boss shaft. Another development has been the increase in the number of blades, several of the modern quick-running fans having no less than 60, as compared with about ten in the older type of fan. The modern inlet is nearly equal to the external diameter of the fan, giving a free entry of air into the centre of the fan. In the new fans the scoop blade is adopted; in the Bumsted and Chandler fan, however, the extremities of the blade are curved backwards from the direction of rotation. Examples of the modern type are the Sirocco and Barclay fans, and the former has given the high manometric efficiency of 0.9.

Reversing fans have been in use for some time in the American coalfields; their use in Great Britain is comparatively recent. A simple method is so to arrange the fan that it can either exhaust from or blow into the shaft at which it is located; or drifts may be so arranged that the fan may exhaust either from the upcast shaft or from the downcast shaft, by means of a kind of damper. As a modification a stand-by fan is connected to the downcast shaft, which is started when a reversal of the air current is desired. The other fan at the same time is stopped. In France small helicoidal fans have been employed, driven by the shaft of an electric motor.

SHAFT-SINKING.—A steady extension has recently been witnessed of the patent processes of sinking shafts through water bearing and shifting strata. In the main these processes may be classified under three headings: (1) the drop-shaft system, as represented by the Kind-Chaudron process, the principal feature of which is the use of telescopic tubing; (2) the freezing system, developed from the Poetsch process; and (3) the cementation process, originally applied by Portier at Bethune, in the Pas-de-Calais, and developed by Lombois, Saclier, François, Gevers-Orban, and others.

As regards the drop-shaft system the most notable example in recent years is perhaps that at the Astley Green Colliery, near Manchester, when a depth of 3,000 ft. was attained (See Pilkington & Wood, *Trans. Inst. Min. Eng.*, Vol. 39, p. 529).

With the freezing system, for the development of which Messrs. Gebhardt & Koenig have been largely responsible, much greater depths have been reached than was at one time considered possible. Thus in the Campine coalfield, where the freezing process has been adopted in seven of the eight shafts, the depth of frozen section has varied from 1,180 to 1,590 ft.; at Beeringen, where the latter depth was reached, 37 boreholes were necessary in order to secure an uninterrupted circumference of frozen strata, and altogether eleven miles of tubing were employed. In England the freezing system has been applied in seven instances—in

the Durham and South Yorkshire coalfields. At Bullcroft Main it was found possible to deal with running water and at Easington with sea water and tidal variations in level.

It is in the cementation system that the greatest improvements have been made. It would seem to have certain advantages in cost, while the preliminary estimates are more likely to be accurate. At the Viktoria Colliery, in Westphalia, the cost was £150 per yd. of depth. The system, as now applied, may be sub-divided into (1) the "systematic" process, in which liquid cement is injected into surrounding boreholes from the surface, much as in the case of the freezing system, with the object of filling up fissures and water-logged cavities in the strata, the pressure being varied according to the necessities; (2) the "methodical" process, in which the pressure is automatically regulated by the pressure of the water; and (3) the "progressive" process, in which the ordinary drop-shaft system is pursued, fissures being filled with cement injected under pressure by means of inclined advance boreholes driven from the shaft bottom.

In addition to the freezing system, mention may be made of the Stockfish system, which is a combination of percussion and flushing, the flushing liquid being of sufficient density to keep out of the shaft any quicksand or loose rock liable to cave in. An installation at the Diergardt Colliery is described by Krecke (*Glückauf*, No. 14, 1912). In this system, as in the Hognigmann system, which has also been applied in Germany, and in the Kind-Chaudron system, improvements in the boring trepan have been effected.

By the ordinary methods some exceptionally rapid work has been done in the more recently opened shafts, although, generally speaking, the increasing difficulties of depth and strata militate against speed in sinking. At the Askern Main Colliery, near Doncaster, a shaft of 23 ft. 6 in. in diameter (total excavation) in the middle coal measures was sunk 29 yds. 1 ft. in 7 days, at a labour cost of £9.0s.3½d. per yd.

For preliminary protection from surface water, use has been made (as at Bentley and Hatfield Main) of interlocking channel steel piling with satisfactory results.

In the equipment of finished shafts, which now range up to 22 ft. diameter finished, increased use is being made of concrete.

THE USE OF ELECTRICITY.—The most profound change in mining since the opening of the present century has been the extension of the use of electricity. It has found its principal application for haulage, pumping, ventilation, signalling and shot firing, but its employment for lighting and winding is also steadily growing, and the "All-electric Colliery" is now an accomplished fact. New British regulations governing the installation and use of electricity in mines have been issued by the Home Office as provided for by the Coal-Mines Act (Section 60) which also prohibits the use of electricity underground—telephone or signalling wires and approved handlamps excepted—wherever the percentage of inflammable gas in the air is found to exceed 1¼. Taken generally, the main object and intention of the new British rules is to make armouring compulsory in the future, although in some cases exempted until 1920. The new French regulations also impose special restrictions on electric installations.

The liability of the electric spark to ignite firedamp has formed the subject of many experiments, but they have failed to establish the precise limits of safety. E. Lemaire (*Ann. Mines Belgique*, 1911, Vol. xvi, p. 321) has shown that explosive mixtures of air and firedamp can be ignited by the finest filaments provided their temperature be sufficiently high and quite independent of any break of contact spark. Such experiments have enforced the use of strong globes with air-tight joints.

THE COAL DUST QUESTION.—During recent years there has been much investigation of the part played by coal dust in colliery explosions. These investigations, which have been attended by research on many collateral subjects, have been conducted at a number of centres, by means both of large-scale experiments in galleries and also of laboratory tests. The testing stations are now for the most part under the control of the Governments of the various countries concerned, but were started through the enterprise of the mine-owners. In England the gallery erected by the Mining Association of Great Britain at Altofts, in Yorkshire, has been transferred to the Home Office, and reconstructed on a new site at Eskmeals, Cumberland. The Mining Association in 1910 published their first record of experiments; in 1912 the committee in charge of the experiments at Eskmeals issued two reports, as well as an outline of the scheme upon which it was proposed to conduct future investigations. In France the experimental station at Liévin, erected by the Comité Central des Houillères de France in 1907 and extended in 1909, has been the scene of further researches; under the direction of J.

Taffanel, which form the subject of several reports. An experimental mine has now been secured by the French Government at Commentry. In the United States, in addition to the existing installation at Pittsburg, a drift at Bruceton, Pa., has been equipped for experimental purposes, under the charge of the Bureau of Mines. It remains to mention the gallery erected in 1908 at Babitz, near Segengottes, by the Vienna Permanent Firedamp Committee, and the Frameries testing station of the Belgian *Comité de Grisou*, since transferred to the neighbourhood of Charleroi, at which some important results have been achieved by Victor Watteyne and his collaborators.

In the first instance the experiments at the large galleries were principally devoted to demonstrating the inflammability and explosibility of mixtures of coal dust with air and to testing the adequacy of certain suggested remedies such as water, deliquescent substances, and inert dust, and the arrangement of the same in zones, barriers, collapsible troughs, etc. The possibility of producing a coal dust explosion in the absence of fire-damp may be said to have been firmly established in 1910. Latterly research has been principally devoted to establishing the conditions that promote or hinder the full development of explosions, as well as ascertaining their real nature. Amongst the points considered have been the velocity, pressure, and temperature of explosion waves, the relative inflammability of various dusts and their behaviour under certain conditions.

One of the results of the British experiments has been to show conclusively that the relative ignition temperatures of a series of coal dusts have no fixed relationship to the percentage of volatile matter as usually determined. In determining the chemical constitution of coal, the chemist has hitherto relied upon two different modes of procedure, viz: (1) the action of solvents, and (2) fractional distillation. The method of fractional distillation, as recently applied by Burgess and Wheeler, has afforded valuable results which have led those authors to a definite conclusion as to the nature of coal. They maintain that all coals contain at least two different types of compounds of different degrees of ease of decomposition. They regard coal as a conglomerate consisting of cellulose degradation products embedded in a cement of altered resins and gums. It is, in their view, the latter which first distils by heat, yielding mainly the paraffin hydrocarbons. The cellulose products are decomposed later, and, at a higher temperature, yield proportionally large quantities of hydrogen. In the second Eskmeals report strong evidence is adduced to show that the paraffin-yielding constituents are identical with Bedson's pyridine extract, for it is proved that in the series investigated there is a marked, although not rigid, relation between the ignition temperature of coal dusts and the percentage that can be extracted by pyridine. Taffanel, Floch and Durr, describing certain investigations undertaken at Liévin upon the oxidation and distillation of coal dusts, found that at 700 degrees all the ethylene and four-fifths of the methane had already been expelled. These gases are also those which possess the greater heat of combustion, that for ethylene being given by Taffanel as 341 calories, methane 213, hydrogen 58, and carbon 68. It is interesting also to note that these same gases which are most readily distilled from coal dust have the lowest "limit" value for inflammability in air. As in other distillations the *produits de tête* differ markedly from the *produits de queue*, and the danger of coal dust is vastly enhanced by the fact that the early distillates are the more readily inflammable.

The present feeling is that in stone dust lies the principal hope of a remedy. W. E. Garforth, in delivering his presidential address before the Institution of Mining Engineers on June 6, 1912, expressed the opinion that the dangers of explosion of coal dust from electrical causes could be completely counteracted by the vigorous application of this remedy. Investigations have shown that suitable diluents exist which satisfy the considerations of health, efficiency and economy. At Altofts the cost of stone-dusting was $\frac{1}{10}$ d. per ton raised.

At the Clarence colliery, where an explosion occurred on September 3, 1912, the collapsible *arrêts-barrages* (arresting barriers), proposed by Taffanel, failed to arrest the course of the explosion, in the one instance in which they have been put to a test under actual working conditions. This failure however may have been due to the improper application of the barriers, to the presence of fire-damp, or to the exceptional slowness of the explosion.

RESCUE APPLIANCES—The organisation of rescue operations has made great advances since 1910. In 1910 the Mines-Accidents (Rescue and Aid) Act was passed in England, providing for the organisation and equipment of rescue brigades at all collieries and the erection of private and central rescue stations. An order was finally promulgated in 1912 defining the requirements under these heads. In the meantime central rescue stations have been erected or are in course of erection in all the British coalfields, and valuable services in the direction of recovery work have been rendered by the trained brigades at Darran, Hulton, Bignall Hill and Cadeby.

In the United States rescue stations have been established by the United States Bureau of Mines at Urbana, Illinois; Knoxville, Tennessee; Seattle, Washington; McAlester, Oklahoma; Birmingham, Alabama; and Pittsburg, Pennsylvania. In extension of these stations are seven mine-safety cars. In 1911 over 100,000 miners attended lectures and demonstrations, and over 7,000 received training in mine rescue and first-aid work in addition to the arrangements made by independent companies.

The principal types of apparatus in use at the present time are the following: oxygen regenerative appliances,—Draeger, "Proto" (or Fleuss), "Meco" (or "Westfalia"), Tissot, and "Weg;" liquid air appliances,—"Aerolith" (or Suess) and Claude. An investigation in the Rhenish-Westphalian districts under the mine regulations of May 1, 1912, showed that 847 portable sets of apparatus were in use, of which 381 were of the Draeger type, and 449 of the Westfalia type. Broadly, the improvements in apparatus have taken the form of modifications in design accommodating them to the convenience of the wearer; increased attention has been paid to the effects of heat, and in the "Proto" apparatus experience at the Howe Bridge station has resulted in the addition of an emergency by-pass arrangement, which may be used for cooling the air in the breathing bag. Lung-governing valves have also been introduced similar to that first employed by Garforth in the "Weg" apparatus, used at Altofts and Cowdenbeath.

In the liquid air appliances, a new feature is the use of regenerative purifiers. At Newcastle a new liquid air apparatus, entitled the aerophor, has been developed by W. C. Blackett, which is able to supply air to persons in distress, independent of the wearer. In this apparatus, which is a development of the Suess or Aerolith apparatus, the pack and breathing bag are united and the pack is built to fit across a man's loins. There is a by-pass between the liquid air pack and the mouthpiece, and the regenerative properties of the purifier have been improved (*Colliery Guardian*, August 16, 1912).

At the Singles colliery in the south of France safety chambers have been provided as places of refuge for men in the event of explosions. Similar steps have been taken in Austria, and it may be noted that the Herrn Draeger, of Lübeck, have proposed the construction of such chambers, equipped with purifying materials.

LIGHTING.—In the illumination of the working face in collieries the chief development has been the increased adoption of portable electric lamps. The provision of these is now compulsory in connection with rescue operations in Great Britain, and there is a growing tendency to employ them for all purposes, where other means exist for detecting firedamp or at pits where this consideration is of lessened importance. One reason for this change is the restriction placed upon the use of flame safety lamps by recent legislation, which by their indifferent lighting capacity impose heavy burdens upon the worker.

According to the British Coal-Mines Act 1911, locked safety lamps are to be used in any seam in which the air in the return airway is found normally to contain more than $\frac{1}{2}$ per cent of inflammable gas, and, with certain exceptions, in any seam in which an explosion of gas has occurred. At the same time an official test for safety lamps has been instituted, and the government experimental station at Eskmeals in Cumberland is equipped with appliances for this purpose. Towards the end of 1912, new regulations for lamps were issued by the Home Office. According to Article 146 of the French regulations, safety lamps must conform to one of the types approved by the Minister of Public Works. Spirit lamps may only be furnished with internal igniters of approved design. The igniting bands must be disposed so that only one re-light can be made at a single time, and must be composed of substances that are inflammable but not explosive. In British mines the use of internal igniting apparatus in connection with spirit safety lamps is limited by law from disciplinary considerations, but in Continental mines their use has extended considerably.

Some important researches were communicated in 1912 by J. S. Haldane and T. Lister Llewellyn, to the South Staffordshire Institution of Mining Engineers (*Trans. Inst. Min. Eng.*, Vol. xlv, p. 267). Their experiments were designed with the view of producing a vitiation of the atmosphere similar to what occurs in the ordinary working of a mine. The result showed that every diminution of 0.1 per cent in the oxygen present lowered the illuminating power of a safety lamp, burning a mixture of colza oil and paraffin, by as much as 3.5 per cent; and the striking fact is deduced that with the oxygen reduced to 19.0 per cent, the minimum percentage allowed by the Coal-Mines Act for purposes of ordinary work in the pit, the light would be diminished by 70 per cent, under the conditions of the experiment. It has been found that for every increase of 1 per cent in the moisture of the air the illumination of the standard pentane lamp and also of the Hefner amylacetate lamp falls off by 6.25 per cent, and the light from a spermaceti candle falls off by 5 per cent. The authors also call attention to the confusion which has arisen through attributing to carbon dioxide the premier rôle in producing dimness of illumination. In their view it is only the variation in true oxygen percentage that matters in a practical sense, and how this percentage is diminished is of small importance, although it is true that added carbon dioxide does produce rather more effect than added nitrogen.

A point which has not yet been covered by the above experiments is the relative behaviour of various kinds of illuminants. Burrell and Seibert (U.S. Bureau of Mines, Technical Paper 13, 1911) found that there was a remarkable difference in the composition of the residual air that extinguished the flame of a Wolf spirit lamp as compared with that of an acetylene lamp. Thus, acetylene will apparently only cease to burn in an atmosphere containing as much as 6.3 per cent of carbon dioxide and as little as 11.7 per cent of oxygen, whereas 3 per cent of carbon dioxide and 16.5 per cent of oxygen marked the limiting composition of air capable of supporting combustion of a Wolf lamp. The general use of acetylene lamps in coal-mines is frequently asserted to be impracticable; but this scarcely agrees with the experience recently recorded in a Spanish mine, where a Tombelaine acetylene lamp has been found to work satisfactorily in a very fiery pit, and also to be capable of being used as an efficient gas detector.

One result of these experiments is to point more strongly to the fact that the only satisfactory solution of the illumination problem in mines will ultimately prove to be the electric lamp, which is free at least from the deterioration arising from atmospheric influences. If ever a means is found whereby the electric lamp can be adapted to the detection and accurate estimation of firedamp, it will be at once established par excellence as the miner's lamp. A handsome prize has now been offered by the German mine-owners with a view to the invention of some satisfactory device of this nature.

In May 1911 the British Home Office announced a prize of £1,000 for the best electric lamp suitable for miners. The judges (Messrs. C. H. Merz and C. E. Rhodes) awarded the first prize of £600 to the "Ceag" lamp sent in by F. Farber, of Dortmund. In the "Ceag" lamp the bulb is protected by spiral springs so arranged that the circuit is broken when the surrounding dome glass is shattered.

An important feature of the work of Haldane and Llewellyn is its relation to the prevalence of miners' nystagmus. A paper on this subject was read before the Royal Society by Dr. Llewellyn, who is the first Tyndall Research Mining Student. He concludes that, whilst the disease is one of extreme complexity and one in which many factors are at work; the chief factor is strain caused by deficient light, and that the most important preventive measure is improvement in the lighting power of the miner's lamp. This view was adopted by the Ophthalmological Congress at Oxford 1912.

An interesting new safety lamp of great power, the Goulet incandescent lamp, has been tried at the Frameries Station, in which an Auër mantle is raised to incandescence by the flame of a mixture of air and benzine.

WINDING.—The use of electricity for winding purposes has made rapid progress during the last three years, and is now being applied to plants of much higher capacity. There are, broadly speaking, two systems, using in the one case an alternating-current

motor, either geared or direct-coupled to the drum shaft, with rheostatic control, and, in the other, a direct-current motor, on the Ward-Leonard system, with the use of a fly-wheel accumulator. The field of the former has been greatly extended by the introduction of efficient and durable machine-cut helical gearing.

The Brown-Boveri system, installed at the Heinitz Colliery, Upper Silesia, comprises the conjunction of high-pressure turbine, Ward-Leonard generator and A.C. generator, the turbine having considerable-overload capacity by means of relay-operated by-passes if necessary, the A.C. generator supplying the general load of the colliery or as much of it as it can, and the Ward-Leonard generator the winding-engine. Another system is the series system, due to Prof. Thury.

The three-phase commutator motor has also been advocated for work of this description. Two types of such motor are obtainable—the series motor and the double-repulsion motor. In both cases speed regulation is obtained by brush displacement.

In 1911 a valuable report was issued of trials carried out by a joint committee appointed by the German Engineers' Association, the Dortmund Mining Association, and German Boiler Inspection Association (*Glückauf*, Nos. 42 to 52, 1911). The trials were carried out with the electric winding plants at the Deutscher Kaiser, Rheinelbe, Mathias Stinnes and Emscher-Lippe collieries; and with the steam plants at Schürbank and Charlottenburg, Julia, Helene and Amalie and Wilhelmine Victoria collieries. The report states that on general principles the working of a steam engine is the more satisfactory, as the mean net load approaches that for which it was built; and therefore the smaller the load the lower the efficiency. The electrical winder however adapts itself better than the steam engine to reductions in the net load. It cannot be deduced from the different values obtained that any given type or either of the forms of energy is unconditionally the best in general. In deciding which method of winding is to be preferred, the prime cost, depreciation and upkeep, must be borne in mind, as well as the consumption of steam or energy; and, in addition, how the method fits in with the general working conditions of the colliery.

At the Great Western colliery the Westinghouse winder on the converter-equaliser system is capable of raising $2\frac{1}{2}$ tons of coal from a depth of 1110 ft. in $37\frac{1}{2}$ secs. at a speed of 70 winds or 175 tons per hour. The maximum shaft speed is 40 ft. per second and at full work the winder requires 4.8 units per wind.

Considerable improvements have been effected in the steam winding-engine, and the large compound condensing engines installed within recent years represent a high efficiency. A notable economy has been obtained from the utilisation of exhaust steam in mixed pressure turbines, with or without accumulators on the Rateau principle: examples of such installations are to be seen at the Hulton, Maypole, New Hucknall and other collieries. They are very suitable for driving large compressed air plants in connection with coal-cutting machines, where it is not desirable to take electricity to the face of the coal. Tests at the Königsborn mine at Unna-Königsborn in the Dortmund district have shown that when working with low-pressure steam having an initial pressure of 1.2 atmosphere and a final pressure of 0.1 atmosphere, $2\frac{1}{2}$ lbs. of steam are used for every cubic metre of free air compressed; and $1\frac{1}{2}$ lb. when working with fresh steam having an initial pressure of 7 atmospheres and the same final pressure of 0.1 atmosphere. At Penallta colliery in South Wales, the sinking engines were fitted with throttle valves on the high and low pressure cylinders, to obtain a starting torque equal to a pair of engines without the admission of live steam into the low-pressure cylinders. The engines were designed to wind from a depth of 800 yds. in 45 secs.

The provisions in the British Coal-Mines Act in regard to shafts and winding have entailed considerable alterations in the equipment at many collieries. After the beginning of 1913 every vertical shaft is to be provided with a detaching hook, and where more than 100 yds. in depth, with an effective automatic contrivance to prevent overwinding. Detaching hooks have been in common use at British collieries for many years; overwinding controllers, however, have been employed in but few instances, although many of the largest Continental mines are equipped with them. Generally speaking, these gears are mechanical contrivances which automatically cut off steam and apply the brakes when the limits of speed are exceeded at certain points in the shaft, or in cases where the engineman starts his engine the wrong way in the shaft. During 1912 numbers of these gears were invented. Some of the best known of those used in British mines are the Barclay, Whitmore, Wilde & Petrie, "Visor," Shaw, Wallace, Jackson & Staley, "Profile," Melling, Futers Dalglish, Walker and Inglis controllers. In France the principal types are the Reumaux, Sohm & Burg devices.

The same section of the Coal-Mines Act provides for the use of guides in sinking shafts, and of "keps" at the surface, the periodical capping and limited employment of winding ropes and the equipment of cages with catches, covered tops, gates and hand bars.

The new French regulations draw a distinction in the testing of winding ropes, in respect of the numbers wound at a single journey. Where more than four persons are wound in the shaft at the same time the ratio between the resistance to rupture by tension and the total load must at least correspond to the factor of safety. The rope is to be discarded when the loss of resistance exceeds 30 per cent of its original value, and no winding rope may be used for a load greater than one sixth of its breaking strain, if of wire, or one fourth if of hemp.

According to the French regulations, safety catches, for holding the cage in the shaft, in the event of a breakage of the winding rope, are compulsory, in this respect differing from British practice. Many British inventors have during the past few years endeavoured to provide a satisfactory catch, but the rope and rail guides almost universal at British collieries are not suitable, and there is a considerable prejudice against the use of such appliances, especially under the exacting conditions met with at many of the new collieries. Several of the recently-opened shafts in Yorkshire and Nottinghamshire are equipped with four-decker cages, capable of raising 70 men. On the Continent the practice is to sink a greater number of shafts in proportion to the mineral area and the engines are designed for lower duties.

At the Maltby colliery steel rail guides have been fitted across the centre of the shaft, owing to the depth and increased demands of the loads. The cost per yd. was £6.17s.8d.

At modern collieries the use of hydraulic lifts at pit tops and bottoms is now general.

BLASTING EXPLOSIVES.—On May 21, 1912 the Home Secretary issued in England a new order regarding the use and storage of explosives in coal-mines. The main features of the order are the more detailed restrictions respecting the use of explosives in mines, the standardisation of cartridges, regulation of the size of rock-drill bits, precautions to be taken in the case of miss-fires, special stringent provisions for fiery mines, and regulations in the case of sinking operations. After March 31, 1913, the standardisation of cartridge diameters is made imperative. The sizes of drill bits are also specified, and this is provided for by the regulation that the drill bit must afford a clearance exceeding the diameter of the cartridge for which the hole is intended. The standard sizes of the cartridges are to be $\frac{7}{8}$, $\frac{1}{8}$, $\frac{11}{8}$, $\frac{1}{8}$, $\frac{1}{8}$ inches, and the drill bits for each size must not be less in diameter than $\frac{1}{8}$ in. in excess. The diameter of a drill bit for the smallest permitted size of cartridge must not be less than 1 in.

In Belgium and France further tests have been carried out with a view to establishing the safe limit-charges of explosives under varying conditions.

The United States Government has for some time past conducted experiments at their testing station at Pittsburg, in order to discover which of the many grades of short-flame explosives possess the qualities that render an explosive most effective and least dangerous for mining coal. As a result a "permissible" list has been issued.

A new type of instantaneous fuze has recently been introduced known as "Cordeau Detonant," or, "Cordeau Bickford," consisting of a core of trinitrotoluol enclosed in a lead sheath, which has a speed about 15,000 feet per second. This requires a detonator to initiate the explosion, but is sufficiently powerful in its action to induce detonation in a cartridge through which it is threaded. It is largely used for certain experimental work as a standard for comparing the speed of detonation of other explosives.

DEEP MINING.—Of all physical causes that underlie the development of mining the question of depth may be said to be the most important and far-reaching. Its influence upon the operations of winding and pumping, the methods of working, the transmission of energy, ventilation, and last, but not least, the support of the surface, is of ever-increasing gravity. The question of temperature is of particular importance. A differentiation in the conditions of labour where abnormal temperatures are encountered is a feature of recent industrial mining legislation, and in this respect the earlier example of Germany has been followed by Belgium and France. By the new French regulations work is prohibited in places where the temperature reaches 35 degrees C. on the dry thermometer or 30 degrees C. wet bulb reading, but any temperature exceeding 25 degrees C. wet bulb is considered high.

Some valuable records are given by G. J. Young as to the conditions encountered on the Comstock lode ("Ventilating System at the Comstock Mines, Nevada," *Trans. Amer. Inst. of Min. Eng.*, Vol. 41, p. 3, 1910). He finds that moderately high temperatures from 95 to 105 degrees F., with moderate humidities from 50 to 70 per cent relative humidity and with air currents of velocities from 200 to 300 feet per minute, do not prevent work nor are particularly uncomfortable. A higher temperature, from 110 to 115 degrees, with high humidity and moderate velocity air-currents, very greatly impairs efficiency, and a still higher air-velocity, under the same conditions, renders work more bearable, though miners cannot work very long at one time. A moderately high temperature, from 95 to 105 degrees in a saturated atmosphere with no current, becomes very trying. Prolonged exposure with much exertion is dangerous. A moderate tem-

perature from 90 to 98 degrees, and saturated air currents of a velocity of from 400 to 500 feet per minute, with more or less vitiated air, are conditions which are very trying, and give a low labour efficiency. Vitiated air will impair labour efficiency to a greater extent than a high temperature.

Observations made with the object of determining the rate of increment of temperature with depth have shown considerable divergence in different places. The following results of temperature observations (quoted in the Report of the New Zealand Royal Commission on Mines, 1912) show the depth in feet required in various localities for an increase of 1 deg. F.: Comstock, U.S.A., 33; Witwatersrand, Transvaal, 208; British collieries (mean), 64; Bendigo, Victoria, 77; Ballarat, Victoria, 80; Thames, New Zealand, 43.5; Waihi, New Zealand (approx.) 32.8. In a valuable paper by J. Whitehouse and W. L. Wotherspoon (*Jour. Chem. Met. & Min. Soc. of S.A.*, May 1911) the mean temperature rise in the deep level mines on the Rand is given as 1 deg. F. for 253.9 ft.

Efforts have been made to counteract high temperatures in mines, by compressed air refrigerators, water-injectors and increased ventilation. Dr. Dietz (*Oest. Z. f. Berg. u. Hüttenwesen*, 1911, Vol. lix, p. 430) advocates the thorough cooling of a small portion of the incoming air and then mixing it with the remainder. He uses for this purpose a refrigerating-engine, air turbine, turbo-compressor, and a steam-turbine.

Prof. Jacob Koenigsberger, of Freiberg, while conducting investigations regarding the depth of the boreholes, found that the increase in temperature does not take place uniformly, but that it proceeds much more rapidly in boreholes sunk in the neighbourhood of ore deposits, the reason being presumably that, owing to certain chemical processes, heat is constantly generated there. In the vicinity of coal measures the temperature increased by one degree for every 26 to 30 metres. The change was particularly rapid near mineral oil deposits, where every 8 or 11 metres of increased depth advanced the temperature by 1 degree. Prof. Koenigsberger draws from his observations the conclusion that from the change in the temperature of boreholes the occurrence of coal or mineral oil within 200 metres of the bore may be prognosticated. (See also Koenigsberger and Mühlberg, *Trans. Inst. Min. Eng.*, Vol. 39, p. 617, 1910).

A borehole at Czuchow in Austria, for the purpose of proving coal, in 1909 reached the great depth of 7,350 ft.

VENTILATION.—Ventilation questions have during the past two or three years engaged much attention, especially in view of the requirements of recent enactments in regard to the quantity and character of the mine air. The Coal-Mines Act, 1911 (Section 29 (3)) for the first time in Great Britain provides for a definite standard of ventilation; *i.e.*, a place shall not contain less than 19 per cent of oxygen or more than 1¼ per cent of CO₂, whilst the samples taken in an intake airway must not show an average percentage of inflammable gas exceeding one quarter. There are exemptions from the former provision in the case of mines liable to spontaneous combustion. The Act also provides for the classification of mines according to the amount of inflammable and noxious gases in the main return airway, thus paving the way for a system of division, as followed in France and Belgium, for limiting the use of certain types of illuminants and explosives. In France and Belgium the system has been extended so as to provide a classification in which due consideration is given to the dual factors of firedamp and coal dust.

According to the new French regulations a percentage of more than 2 per cent of gas is to be considered dangerous in a working place. The permissible limit in headings is 1.5 per cent measured in the return, and 1 per cent in the return from other working places, but the regulations are more elastic than those now in force in Great Britain.

With the tightening up of the restrictions and the new requirements as to the qualification of officials, increased attention has been paid to the apparatus for measuring and testing the atmosphere of the mine. Briefly, the apparatus used for the detection of firedamp may be classified as follows: (1) Instruments depending on the comparative rates of diffusion of methane and air. (2) Instruments dependent on specific gravity. (3) The observation of the glowing appearance of a platinum wire rendered incandescent by electricity. (4) Instruments depending on the fact that the electrical resistance of

a platinum wire increases in the presence of methane. (5) The safety lamp. (6) Chemical analysis. The feeling at present is that the only reliable indicators are the safety lamp for routine observations, and chemical analysis for the more elaborate calculations. Numerous ingenious appliances however have been devised of late to provide an efficient substitute.

The apparatus invented by Philip and Steele (*Journ. Society of Chemical Industry*, Vol. 30, p. 867, 1911) depends on the sensitiveness of a relay containing iron, and as the hysteresis lag in the iron tends to reduce the sensitiveness of the instrument, this lag is removed or reduced either by mechanically vibrating the relay, or by passing intermittent pulsating currents through it, superimposed on its normal currents. Somewhat similar apparatus have been devised in the Holmes-Alderson gas-detecting apparatus and the Holmes-Ralph portable electric lamp (G. J. Ralph, *Trans. Inst. Min. Eng.*, Vol. 40, p. 282, and vol. 42, p. 201). In actual practice however it has been found that such apparatus, which depend upon the conductivity of platinum, have given less satisfactory results in a normal firedamp mixture than in coal gas or petroleum vapour. The "interferometer," devised by Professor Haber of Karlsruhe, and Dr Lowe of the firm of Carl Zeiss, of Jena, depends upon the refraction of light in firedamp and other media. The apparatus is in daily use at Gelsenkirchen for the examination of gases passing out of the upcast.

Several devices have been introduced with the view of increasing the sensitiveness of the ordinary safety lamp. Of these mention may be made of the Cunyngname and Cadman device by which the cap on a safety lamp is converted from an indistinct blue to a distinct orange yellow by introducing a little asbestos paper soaked in carbonate of soda into the flame (*Trans. Inst. Min. Eng.*, vol. 39, p. 13). Briggs has also proposed the use of a copper loop (*Trans. Inst. Min. Eng.*, vol. 43, p. 64).

Turning now to the more accurate determinations obtained from chemical analysis, it may be observed that J. S. Haldane has recently designed an apparatus for estimating percentages of firedamp, in which the potash solution is dispensed with, the percentage of firedamp being given simply by the contraction on combustion (*Colliery Guardian*, Sept. 27, 1912). In the United States a modified Orsat apparatus has been employed by Burrell and Seibert (U.S. Bureau of Mines, Technical Paper 13, 1911) for use in connection with mine fires, with which, it is stated, CO_2 , CO and CH_4 can be determined within about 0.2 per cent.

New views have quite recently been advanced by physiologists as to the influence of oxygen and CO_2 upon human life, and it has been urged by Leonard Hill and Harger amongst others that the existing standards might be varied without dangerously affecting health, even when due consideration has been given to alterations in barometric pressure. The object is to produce an atmosphere in which the liability to firedamp explosions and fires would be reduced, owing to the incompatibility of the media. Objections raised, apart from the suspected dangers to health, are, the effect upon lighting, and the difficulty of obtaining CO_2 free from dangerous quantities of CO, if introduced in the form of flue gas as proposed. Harger claims to have obviated the latter difficulty by the use of small gas engines. The former difficulty may be overcome in specific cases by the use of acetylene lamps or portable electric lamps. The value of inert gas as a means of combatting fires has been recognised, and it was used in the recovery operations following the Cadeby explosion (1912), which was due to the existence of gob fires. In the United States the influence of carbon dioxide on the explosibility of mine gases has been investigated, primarily for the purpose of determining the practicability of introducing carbon dioxide into mine workings to extinguish fires and prevent explosions. The results have led to the following conclusions. (1) Carbon dioxide, owing to its higher specific heat, is more effective than nitrogen in preventing explosions. (2) The addition of 25 parts (by volume) of CO_2 to 75 parts of the most explosive mixture of methane and air renders the mixture non-explosive. (3) When carbon monoxide is introduced in place of oxygen, 7 per cent of CO_2 is sufficient to prevent explosion.

The rapidity with which coal absorbs oxygen has been shown by Porter and Ovitz (U.S. Bureau of Mines, Technical Paper 2, 1911). Ten kilograms (22 lbs.) of coal from Connellsville absorbed during first day after mining nearly one-half the oxygen in 10 litres of air. Slightly more than one-tenth as much carbon dioxide was produced as would have been produced had all the oxygen absorbed combined with carbon to form

carbon dioxide. Burrell and Seibert (*id.*, Technical Paper 13, 1911) find that oxygen is absorbed by the coal in mines. Samples of gases collected by the same authors near a fire, where the coal was intensely hot and the oxygen content of the mine atmosphere was only 2 per cent contained 1.5 per cent of CO.

Our knowledge of the composition of "blackdamp" has been greatly extended by the researches of Haldane. In a paper on "A Flame-Test for the estimation of Oxygen and Blackdamp in Naked Light Mines" (*Trans. Inst. Min. Eng.*, Vol. 41, p. 455), he describes a series of laboratory experiments with an apparatus consisting of a glass tube and thin tapers. When a lighted taper is held inside the tube, the flame is extinguished by the draught so produced at a point lower down or higher up the tube, according to the percentage of oxygen. The tube is graduated to indicate various percentages of oxygen and blackdamp.

R. Nowicki (*Oesterreichische Zeitschrift für Berg-und Hüttenwesen*, 1911, p. 587) describes an apparatus for detecting CO, using palladium chloride. Many, however, prefer the use of animals to chemical tests, and G. A. Burrell (U.S. Bur. Mines Tech. Paper 11, 1912) gives a preference to canaries as against mice.

(ALLAN GREENWELL; HUBERT GREENWELL.)

METALLURGY

The period 1900-12 has not been marked by any great or revolutionary development in either metallurgical science or practice; or rather, if any of the developments which have taken place should be destined to carry important changes in their train, no striking signs of such changes have as yet become visible. In general terms progress here, as in most industries, has been in the direction of increased production, increased economy of labour, and more efficient utilisation of raw materials and of by-products, and in some cases this has led to the installation of plant on an astonishingly large scale. In other directions, the systematic and scientific exploration of the available materials and their products has led to the evolution of new and valuable materials, principally in the form of novel alloys. The developments of metallurgical practice in reference to the several groups of metals may be more conveniently considered before dealing with the scientific aspects of metallurgy in general.

Iron and Steel (*E. B.* xiv, 801 *et seq.*).—Ore resources are being further developed, and the beginnings of iron and steel industries have been made both in South America and Australia. Progress has also been made in the utilisation of finely divided ores and such materials as blast-furnace flue-dust by improved methods of briquetting; in the Schumacher process the addition of a small percentage of magnesium chloride solution to the flue-dust serves to release a latent power of setting, while in the Dwight-Lloyd system the material is sintered by mixing it with finely-divided carbon which is caused to burn, thus partially reducing the ore and producing a porous sintered mass.

In blast-furnace practice, the use of thin-lined and water-cooled furnaces has increased, while the drying of the blast is becoming universal. For this purpose several new methods have been used, including refrigeration by the use of ammonia without the intervention of brine, and the use of calcium chloride as a drying agent. The latter is used for six or eight hours and is then regenerated by drying in the heat of the flue-gases. The former process has been used in Wales and the latter in Luxemburg, while at one Belgian plant the use of blast enriched with oxygen has been tried, and if the price of oxygen can be further reduced this may prove to be an important improvement. In this connection the use of an oxy-acetylene torch for burning out tapping holes may also be mentioned. The utilisation of blast-furnace gases has been pushed further, so that these furnaces now constitute important sources of power; the use of the gas in open-hearth furnaces has been contemplated, but its calorific value is too low to allow of its use alone. Mixed with producer gas or with gas from coke-ovens, however, success has been attained. Quite recently the utilisation of the waste heat of blast-furnace slag has been accomplished by running the molten slag into water and allowing it to generate steam for driving turbine engines.

In steel-making, the general progress of the open-hearth processes as compared with the Bessemer is the most prominent feature, especially as regards the basic open-hearth process. In America even for rail-manufacture the open-hearth has largely supplanted the converter. The open-hearth furnaces themselves are steadily increasing in size, the 50 and 75 ton furnaces of previous years being replaced by 100-ton units. This increase in size is accompanied by devices for prolonging the life of the furnace, principally by the more extensive use of water-cooling and the introduction of removable furnace ports. The importance of maintaining the shape and position of the ports having been recognised, water-cooling has been employed; on the other hand the use of removable ports makes the life of the furnace independent of the life of the ports. Thus a basic open-hearth furnace which formerly had a life of 350 to 500 heats now runs up to 1,000 heats with three changes of ports.

Rolling-mill practice (*E. B.* xxiii, 468) has developed concurrently with the development of the furnaces; in America particularly, the tendency for obtaining very large outputs by installing plant of great power and speed has been strongly marked. The rolling-mill installed at Gary, Indiana, may be taken as an example. This mill is driven by a 6500 horse power electric motor working on a circuit at 6000 volts three-phase current at 25 cycles; a 12-inch ingot can be broken down in this mill and rolled into a $\frac{1}{2}$ -inch plate in 22 passes in approximately two minutes. It is however doubtful whether the market can dispose of the enormous full-power output of these very large mills, and the question of the quality of the resulting products is also a serious one. It is claimed, however, that there is now a strong tendency for American steel-makers to pay greater attention to the quality of their products than has hitherto been the case. The serious troubles experienced with steel rail fractures in recent years have no doubt produced some such effect. The mill just referred to is typical also of the tendency towards the increased use of electric motors for driving rolling mills.

An important feature in recent development in siderurgical practice is the steady progress of the electric furnace. At Tröllhattan in Sweden electric iron ore smelting has been in continuous use and it is claimed that under the favourable conditions as to water-power which prevail there the process is profitable. More frequently the electric furnace is employed simply for refining or rather "super-refining" steel which has been roughly freed from its impurities either in the converter or the open hearth. For this purpose one or two American steel works have installed combined open-hearth and electric furnaces, in which the steel is first "roughed down" under gas heating and electric heating is employed only for the final stages. The use of electrically melted steel for the production of steel castings has developed considerably and a steel foundry working entirely with Stassano electric furnaces has recently been put down in England. The advantages of "electric" steel in regard to freedom from gases, oxides, etc. are now widely admitted, but excessive and ludicrous claims on behalf of this material are still put forward at times. An interesting special use for the electric furnace has recently been found in melting the ferro-manganese or ferro-silicon prior to its addition to the molten steel in the ladle or the furnace; considerable advantages are claimed for the practice of making these additions in the molten state.

The difficulties experienced with steel rails in America and elsewhere have drawn attention to the question of soundness of ingots and the effect of blow-holes. In regard to the latter Stead has shown that deep-seated blow-holes certainly, and even superficial ones probably, weld up completely when the ingot is rolled, provided that the holes are not associated with sulphide enclosures. Hadfield, on the other hand, regards complete freedom from blow-holes as essential and prefers a steel which settles well and "pipes," but he counteracts the piping tendency by supplying the ingot during cooling with hot liquid steel from a "feeding head" placed on top of the ingot-mould, in which the steel is kept molten by a layer of charcoal kept in active combustion by the aid of an air-blast. Talbot, again, consolidates his ingots by giving them a few passes through the cogging-mill while their interior is still liquid, thus claiming to produce in a simple and inexpensive manner the same results as the Harmet compression process. Goldschmidt claims that soundness may be insured by the introduction of a cartridge of thermit into the bottom of the solidifying ingot, and quotes examples from an extensive practical trial in support of his claim.

The use of alloy and "special" steels has extended very considerably, notably in the case of steels to which vanadium and titanium have been added during manufacture. In the case of vanadium this has become possible by the fact that the price of vanadium alloys at one point dropped to one half of the former figure, and the use of vanadium steels has increased considerably. The use of "titanium steels" has however increased — particularly in America — more widely than that of any other special steel. American metallurgists regard

titanium as a "cleansing" addition which removes oxygen, nitrogen and other impurities, rather than as an actual alloying element. The value of titanium was first established in the case of rails, but its use has since extended to other classes of steel. As regards alloy steels proper, the use of nickel, nickel-chrome and chrome-vanadium steels has extended, chiefly through the growth of the automobile industry. The use of manganese steel and of nickel steel rails has also been tried.

The question of the corrosion of iron and steel has continued to receive much attention; apart from the general controversy between the "electrolytic" and the chemical (carbonic acid) theories of corrosion, the electrolytic theory has received a serious check from the researches of Heyn, who has shown that while the existence of local cells determines the rapidity with which corrosion commences, it does not affect the ultimate rate of corrosion. In America a new material, known under the name of American ingot iron or "open-hearth iron," has been produced for the purpose of resisting corrosion; it is claimed that this metal is the nearest practical approach to chemically pure iron and that it resists corrosion better than mild steel. The material, however, has an appreciable content of copper — it is even suggested that copper is intentionally added to it, and that its non-corrodibility is due to the copper. The addition of copper to steel for this purpose has also been introduced. Some progress has also been made in the production of actually acid-resisting varieties of cast-iron, such as the high silicon iron of Jouve and the material known as "tant-iron." The use of approximately pure silicon metal for this purpose is also contemplated.

The subject of the cementation of iron and steel has received much attention, the most notable advances being probably those made by Giollitti and his collaborators at Turin: by the use of charcoal and a mixture of carbon dioxide and carbon-monoxide gases under pressure in a furnace where both temperature and pressure can be varied, these workers obtain a wide power of regulating both the intensity and depth of cementation and also the width of the transition zone between carburised and non-carburised material.

Copper (*E. B.* vii, 102 *et seq.*).—The most marked feature in the metallurgy of copper during the past three years has been the great development of basic converting, causing a radical change in equipment, durability and tonnage of converters and in general practice. Even standard shells of the older type have been re-lined with basic material. Apart from this feature, progress has also been made in the handling of ores; as regards transport, troughed conveyor belting has proved eminently successful as compared with the electric car even for distances of four miles. The use of fine ores, flue-dust etc. has also been advanced, so that ores for the blast-furnaces are now generally screened so that the coarse charge can be worked at a higher rate. One interesting development is that of blowing fine material into the converter through the twyers by means of a jet of air at higher pressure than the blast. In the treatment of metallic copper itself, the use of boron sub-oxide has been introduced. Boric anhydride is reduced by metallic magnesium, yielding magnesium borate, and boron sub-oxide. The latter acts as a very satisfactory reducing agent on the copper and for castings intended for electrical purposes removes oxygen so well that conductivities up to 97.5 per cent have been obtained. The use of the boron sub-oxide to replace "poling" has also been tried, but although the results are satisfactory there are practical difficulties on the ground of expense and attack on the furnaces.

Among the alloys of copper, Monel metal — a natural alloy of copper and nickel — has received extended use owing to the remarkable combination of strength with resistance to corrosion which it presents. It has been used for screw propellers in battleships (U.S.S. "Dakota") and for roofing large buildings (Pennsylvania terminal in New York). A remarkable test at 1000° F. has shown the alloy to retain 80 per cent of its normal strength. The alloys of copper with aluminium and manganese have also been studied very closely (Ninth Report, Alloys Research Committee); one of these attains, in the form of rolled and drawn rod, a tensile strength of 52 tons per sq. in. with 10 per cent elongation on two inches. These alloys are remarkable for their resistance to corrosion and to abrasion. Another special "bronze" is that of "Rubel," which contains 58 per cent of copper, 41 per cent zinc, and 1 per cent chromium, and possesses remarkable mechanical properties.

Aluminium (*E. B.* i, 767 *et seq.*).—The production of this metal has increased and a steady improvement in quality is being obtained; when the metal is excessively pure, however, difficulties arise in working it. Its uses have developed considerably, principally in the direction of cooking utensils and of large tanks for breweries and similar purposes. The latter development has been facilitated by the established success of methods of joining aluminium sheets by autogenous welding. Extruded aluminium shapes, as well as the sheet metal, are also extensively used in carriage construction.

Light alloys of aluminium have received much attention and marked progress has been made. In the Ninth Report to the Alloy Research Committee the alloys of aluminium with manganese and with copper plus manganese have been studied. Derived from the best of these alloys is the metal known as duralumin, developed in Germany by Wilm; this alloy contains from 3 to 4 per cent of copper and from $\frac{1}{2}$ to $1\frac{1}{2}$ per cent of manganese together with $\frac{1}{2}$ per cent of magnesium. This latter addition gives the alloy the remarkable property of undergoing a gradual spontaneous hardening after suitable heating and quenching—at first the mechanical properties are unchanged, but in the course of four days the tensile strength is doubled while the ductility is only slightly affected. In this hardened condition the alloy combines mechanical properties similar to those of mild steel with a specific gravity slightly less than 3, but these properties are destroyed by even moderate heating. This alloy was used in the construction of the ill-fated British naval air-ship of the rigid type at Barrow-in-Furness. Quite recently a detailed study of the alloys of aluminium with zinc and with zinc plus copper has been published in the Tenth Report to the Alloys Research Committee. One of the alloys there described, containing 25 per cent of zinc and 3 per cent of copper, attains mechanical properties similar to those of steel or of duralumin but entirely without any special quenching or other heat-treatment; this alloy, however, has a specific gravity slightly higher than duralumin (3.25). The demand for materials combining strength with lightness arising from aeronautical construction has given a fresh impetus to the study of light alloys, and further important developments are to be anticipated.

Gold and Silver, Platinum etc.—Apart from the general tendency towards perfection in detail, resulting in greater efficiency and increased output, few remarkable developments are to be recorded with regard to the precious metals. The cyanide process (*E. B.* xii, 199) has received increased application, and is becoming standardised to some extent. A novel proposal was that of Clancy to replace the expensive alkaline cyanides by the cheap product of atmospheric nitrogen fixation, calcium cyanamide, coupled with the application of electrolysis. No large practical developments of the process appear to have taken place as yet. Efforts are being made to render the cyanidation process truly continuous, but the resulting gain is somewhat doubtful. On the other hand the method of agitating slimes by means of air-jets is now wide-spread and successful. The treatment of sulphide ores by this process is also receiving greater attention, and as the chemistry of the process is better understood simplifications have become possible.

In regard to the metallurgy of the remaining metals similar general tendencies have manifested themselves, and only a few special matters need be referred to here.

In connection with the use of lead for accumulator plates, or for any purpose where large reacting surface area is desirable, the process invented by Hannover for producing porous metals becomes of importance. Hannover utilises the fusibility of the eutectic alloys by casting an alloy consisting for instance of lead and tin in such a way that the metal consists of lead crystals whose interstices are filled up by eutectic; at a suitable temperature this eutectic is fluid and can be expelled by such means as centrifuging, when porous lead is left behind. Lead, tin, and especially zinc as required for the cyanide process, can now be obtained in the form of "ribbon metal" produced by allowing a jet of the molten metal to fall upon a rapidly rotating cooled iron drum; the metal runs off as a continuous flat ribbon. By the use of very wide jets, sheet-metals can be produced in the same way. More remarkable still is the process of Schoop, in which a jet of molten metal meets a jet of high-pressure gas and is atomised so as to form a metallic cloud. This finely-divided metal can be sprayed upon any object which it is desired to coat and yields a strong coherent deposit which can be made either to adhere firmly to the matrix or to leave it in the form of a cast. The metallic spray does not burn or injure even delicate articles, so that silk or wax can be readily coated. Quite recently it has been found that finely-divided solid metal (powder) can be similarly made to adhere and to cohere by a spraying process.

In regard to zinc, the efforts at electric smelting are still being continued in Sweden, and although it is considered in most quarters that the process is still in an experimental stage, definite success, particularly in the production of spelter of high purity, is claimed. Extremely pure spelter, said to be of electrolytic origin, is at present produced in small quantities in England, but the demand for very pure zinc appears to be increasing. Efforts to meet it are taking the direction of improved methods of refining, and although much secrecy is observed, it is probable that vacuum processes of distillation are being introduced.

Some reference must also be made to the advance in the metallurgy of the very refractory metals, such as chromium, molybdenum and tungsten. The latter metal is now produced in approximate purity by the electric furnace, and for the purpose of electric incandescent lamps drawn tungsten wire is now used in place of the agglomerated filaments formerly employed. Both tungsten and molybdenum find increased uses in "high speed" tool steels, while chromium is finding a wider application in the production of new alloys. Among these an alloy of nickel, with chromium and manganese, known as "nichrome," has achieved

considerable success as an electric resistance heater at high temperature; the newest grade of this alloy is claimed to withstand continuous heating at 1100°C . An alloy of chromium and cobalt is described as having a white colour and being practically incorrodible, being unattacked even by nitric acid. It is said to have the hardness of steel and to take a cutting edge. Its incorrodibility indicates that the material would be particularly useful for such purposes as fruit knives and table cutlery. Its use for razors is also suggested, but it remains to be ascertained whether it shares the tendency of modern high-speed tool steels to produce undesirable symptoms in any small wounds inflicted.

Physics and Physical Chemistry.—The period under review has been particularly rich in scientific investigations on metals and alloys which come under the heading of "Metallography" in the wider sense of that word, but this sense has now become so wide that "Physical Metallurgy" is a preferable name for the rapidly expanding science, which now embraces the study of all the physical properties as well as the physico-chemical relations of metals and alloys. Typical of this development is the existence, since 1911, of an "International Journal of Metallography" published in Berlin, and the rapid rise of the Institute of Metals, founded in England in 1910. The wide-spread activity in this subject is also typified by the fact that, in a report on progress presented by Heyn to the International Association for Testing Materials, references are given to over 500 papers bearing dates later than 1909.

The equilibrium diagram of the iron-carbon system has been the subject of continued research and controversy on minor points, but the main features of the diagram are now accepted by all except a few extremists. Among researches bearing upon it the work of Gutowsky may be mentioned which indicates the necessity of revising the position of the "solidus" curve for the low-carbon end of the diagram. Rosenhain and Humfrey have demonstrated the existence of a relatively hard modification of iron above the critical points, while Baykoff has shown by means of etching with gaseous hydrochloric acid at high temperatures that steel is a homogeneous solid solution at those temperatures, as required by the accepted diagram. Controversy and difficulty still centre around the true relations of graphite and cementite, and the names of Ruff and Goecke, Ruer and Iljyn and Hanemann are associated with important work on this question. Another important step in the metallography of steel is denoted by the adoption, at the recent New York Congress of the International Association for Testing Materials, of a uniform nomenclature for the microscopic constituents of iron and steel. The fact that Howe and Sauveur have been able to prepare such a report indicates that a substantial agreement has now been reached by the majority of the world's leading experts. Increased attention has also been given to the foreign bodies, such as slag, sulphides and silicates of manganese and iron etc., which are met with in steel. Recent research is summarised in a report to the above-named Congress by Rosenhain.

Copper and its alloys have received much attention. In the copper-zinc series (brass) Carpenter has drawn attention to a thermal point at 470°C . and has demonstrated its nature, as a decomposition of the β into the α and γ phases, in an elaborate series of papers. The constitution of copper-arsenic alloys (Hudson) and of the phosphor-bronzes (Law) has also been studied. The Ninth Report to the Alloys Research Committee of the Institution of Mechanical Engineers (London) contains an elaborate study of the ternary group of alloys of copper with aluminium and manganese, and a detailed metallographic study of portions of the system (Rosenhain and Lantsberry). This attack on the problem of the constitution of ternary systems of alloys is typical of a very large amount of work which has been undertaken, principally in Germany, during the past two years. Most of this work, however, although of great interest as yielding a first rough idea of the constitutions of these systems, must be regarded as strictly preliminary, since the methods and apparatus used are in many cases inadequate for the complete study of such complex problems. The manner in which early investigations of alloys are apt to be inaccurate has recently been illustrated in the aluminium-zinc system, where a research carried out with the greatest available refinements has led to a complete revision of the formerly accepted diagram (Rosenhain and Archbutt).

Many other fields of enquiry which have begun to yield important results can only

be mentioned. These include the study of the gases dissolved or occluded in metals and removed by heating or even melting in vacuo, of the behaviour of metals in high vacua, especially in the light of the theory of an amorphous inter-crystalline cement in metals, of the magnetic properties of alloys, both of iron and of copper-aluminium-manganese, and of the electrical resistance of alloys and its variations with temperature.

For these and allied researches reference should be made to the original publications, many of which exist only in foreign languages. In English, many original papers, and abstracts of many others, including most of the more important foreign ones, will be found in the *Journal of the Iron and Steel Institute*, the *Journal of the Institute of Metals*, the *Proceedings of the Faraday Society* and of the *Institution of Mechanical Engineers*, and in the pages of *Science Abstracts*, devoted to physical chemistry. In French the *Revue de Métallurgie*, and in German *Stahl u. Eisen*, *Metallurgie*, and the *Internationale Zeitschrift für Metallographie*, may be consulted, as well as the more recent text-books upon this subject.

(W. ROSENHAIN.)

SOLID, LIQUID AND GASEOUS FUELS¹

1. *Solid Fuel.*

Coal.—In the middle of the 19th century a large amount of scientific work was done concerning the composition of coal, and the view was held by many observers that the variations in the properties of coals were dependent as much upon the character of the vegetable matter from which they had been formed as upon the conditions of formation. These views however were more or less lost sight of until the last couple of years, when they have again been brought to the front, and are now shown to give a far more satisfactory explanation of many obscure points with regard to the thermal value and chemical decomposition of coal than was possible before. In 1911 M. J. Burgess and R. V. Wheeler published the results of a series of experiments on the distillation of coal at various temperatures, which led them to conclude that coal contained two types of compounds of different degrees of ease of decomposition, the one a degraded product of cellulose, the other derived from the gums and resins of the coal plants, and that the character of the coal is determined by the proportion in which these two types exist in coal.

V. Lewes puts forward the general theory of the formation and composition of coal as follows. Carbon is practically non-existent in the primary rocks constituting the crust of the globe; hence all the free carbon and compounds containing carbon that we now find have been produced by secondary actions from carbon dioxide in the atmosphere, the amount present showing that the atmosphere in times prior to the carboniferous period consisted of a high percentage of carbon dioxide, nitrogen, oxygen, and water vapour. Human life under these conditions was impossible, but as the crust of the cooling globe reached a sufficiently low temperature, a vegetable life of a low order started and grew with a luxuriance and rapidity that could never again be equalled, owing to the conditions of moist heat and plentiful carbon dioxide. As the vegetation grew it absorbed the carbon dioxide and moisture, and under the influence of the sun's rays built up the plant structure and evolved oxygen, thus in the course of geological ages creating an atmosphere fitted for lower forms of animal life, which gradually became of a higher order as the necessary oxygen increased in percentage. Owing to the paucity and dilution of oxygen in the earlier periods, decay, as we now know it, could take place only to a very limited extent, and this, with the rapidly growing flora of the carboniferous period, gave rise to the enormous vegetable deposits and drifts from which eventually all fuel was formed.

All the plants of which there are fossilised records in our Coal Measures consisted of sedges and reeds, tree ferns, club mosses or lycopodia, and trees akin to the pine; but in these prehistoric days the conditions of growth were such that the plants grew with a succulent freedom and rapidity since unknown, and this later rendered their tissues an easy prey to fermentation—an action which left only the more resistant unchanged. The work of Morris, Carruthers, Fleming and Huxley has shown that the bituminous

¹ See. *E. B.* xi, 274 *et seq.*

matter in coal is derived largely from the spores of fossil mosses akin to the lycopodia, and spores of this character, from the giant growths of the carboniferous period, together with the more resistant portion of plants akin to the pine, are the substances which have best resisted the actions taking place during the ages that have elapsed in the formation of coal.

The vegetable matter consisted chiefly of a basis of celluloses and lignose, together with the extractive matters rich in resin, and as these were unable to undergo rapid decay owing to the low oxygen content of the air, fermentation became the chief factor of change, and, the mass being overlaid gradually by sedimentary and other deposits, pressure and heat added their forces to the actions taking place, the celluloses and lignose becoming converted into humus bodies, having the general percentage composition—carbon 63, hydrogen, 5 oxygen 32. During these periods the resins—which have the general composition: carbon 79, hydrogen 11, oxygen 10—underwent but little change, but in the long ages that have passed some of the resin bodies have been converted into such hydrocarbons as retene and hexahydrides, while the humus bodies have undergone general degradation, resulting when completed in residual carbon. All these constituents are found agglomerated in the coal—the humus bodies and residual carbon being luted by the resin bodies and hydrocarbons, the properties of the coal being dependent upon the proportions in which they are present.

The lignites or tertiary coals, being of younger age, were formed at a period when the air contained a higher percentage of oxygen, so that direct oxidation played a more important part, and as the resins are the bodies most affected by this they were reduced in quantity, but the great difference between the lignite and true coal is that the humus bodies have undergone a minimum of degradation, so that the free carbon is lower than in any other class, while the humus bodies still retain their attraction for water, which is always present in considerable quantity in the Tertiary coal.

During the formation of coal the gases evolved are carbon dioxide, methane and water, and where the roof of the seam has been impermeable to gas, methane is found occluded in the coal together with some carbon dioxide, but the bulk of the latter gas has dissolved under pressure in water and formed bicarbonates in the sedimentary deposits, and has then helped in such other changes as the dolomiting of limestone.

Many classifications of coal have been suggested, some based on their chemical, some on their physical, and others on their coking properties. Of the latter, the most generally adopted is that of Gruner, in which he tabulates bituminous coals into five classes. Although M. Schondorff, F. Muck, and others have shown that it is not applicable to all kinds of coal, still this criticism applies to all classifications that have been proposed.

		Carbon.	Hydrogen.	Oxygen.
1. Dry coal	Long flame and non-coking	75-80	4.3-5.5	13.0-18.5
2. Fat gas coal	Coke porous and brittle	80-85	5.0-5.8	10.0-13.2
3. Semi-fat or furnace coal	Good coke, but porous	84-89	5.0-5.5	5.5-10.0
4. Coking coal	Best coke	89-91	4.5-5.5	4.5-5.5
5. Lean coals and anthracite	Non-coking	90-93	3.0-4.3	3.0-4.5

This arrangement shows not only the coking properties, but also the changes in composition which the coal undergoes, the concentration of carbon, and reduction in highly oxidised bodies. In the first class there are the dry coals, yielding large volumes of gas and liquid products on distillation; and these—as might be expected—most resemble the lignites, and share with them the property of non-coking or binding together of the residue on carbonisation. This is due to the fact that the humus-like bodies are still present in much larger quantities than the resinic compounds and hydrocarbons; and as on distillation they leave no binding material in the residue, the resinic bodies cannot supply enough to give more than a friable mass. In the second class of coals, altered conditions of temperature, pressure and time have led to further decompositions of the humus bodies, and, the resinic constituents and hydrocarbons having increased in ratio by concentration, a point is reached at which coking takes place, although not of a really satisfactory character. In the third class, the action has continued with further concentration of the resin bodies, hydrocarbons

and residuum, with the result that the former bodies are so increased in comparison to the humus and residuum that a good coke results, although rather too porous and bulky. In the fourth class, the proportion of resin and hydrocarbon bodies has reached the right ratio as compared with the humus and residuum, and the best coking coal is obtained. Bituminous coals of the kind classified by Gruner may therefore be looked upon as an agglomerate of humus and the degradation products of these bodies down to carbon, luted and protected by resin bodies and their derivatives; steam coal and anthracite as the degradation products of humus which has nearly completed its decomposition owing to the small quantity of resin bodies in the original vegetation; cannel coal as consisting mainly of resin bodies, derived from accumulations of seed spores which, having been brought down by streams, have mixed with sedimentary earthy matter, and are therefore often high in ash.

Such a theory has an important bearing upon the consideration of the thermal value of coal as well as its other properties, as it is manifestly the ratio of the coal constituents and not the percentage of the elements in the coal that governs these. In all attempts to calculate the calorific value from the percentage composition it is found that, with coals poor in oxygen, such as steam coal or anthracite, there is a very fair agreement between the calculated value and the value as determined in a bomb calorimeter, but that directly the coal contains much over 5 per cent of oxygen, the value as determined rapidly rises above that calculated.

This is due to the humus bodies in the coal still retaining the endothermic character of the cellulose and lignose from which they were derived, and it is found that whilst the calculated heat values for the carbon, resin bodies and hydrocarbons in the coal are in close agreement with the determined values, an artificially prepared pure humus will have its calorific value as determined 16 or 17 per cent higher than when calculated from its percentage composition. It is clear therefore that direct determination in a bomb calorimeter is the only accurate method for determining the thermal value of coal.

The proportions of the constituents in the coal also govern the nature of the products when it is subjected to carbonisation. The humus bodies during carbonisation yield a large proportion of the gaseous products, and under the influence of heat show no sign of melting, but begin to break up at about 300° C. The decomposition becomes more rapid as the temperature rises. Water distils over in the early stages; the tar is thin and poor in quantity, and the gases up to 600° C. consist of hydrogen, methane and carbon dioxide, with smaller quantities of carbon monoxide and traces of other saturated hydrocarbons. The decomposition can be completed below 800° C.; but if the temperature is run up to 1000° C. the carbon dioxide is reduced in quantity by the action on it of the red hot carbon. Carbon monoxide increases correspondingly, whilst hydrogen and methane are still evolved.

The decomposition of the humus is also largely affected by the rate of heating. If slowly heated, a large proportion of the oxygen is given off in combination with hydrogen as water vapour; whilst if quickly raised in temperature, more combines with carbon to form carbon dioxide and monoxide. The residue shows no sign of caking, whilst, like the naturally formed residue—mother of coal—it requires a large proportion of cementing material to make the particles cohere. The resin bodies and hydrocarbons which form the cementing portion in the coal melt between 300° and 320° C.; and if a coarsely powdered sample of the coal becomes pasty or semi-fluid at this temperature, it is a strong inference that the coal will coke on carbonisation—a fact noted by C. Anderson. About these temperatures also the resin bodies and hydrocarbons begin to decompose.

The resin bodies at low temperature yield saturated hydrocarbons, unsaturated, chiefly hexahydrides or naphthenes, together with some oxygenated compounds; whilst the hydrocarbons yield paraffins and liquid products—all these primary constituents undergoing further decomposition at slightly higher temperatures. The liquids produced begin to distil out as tar vapours, and leave behind with the residuum pitch, which at 500° C. forms a mass already well coked together if the residuum from the humus is not too great. The coke formed is soft; but if the heat be raised to 1000° C., the pitch residue undergoes further decomposition, yielding gas and leaving carbon, which binds the mass into a hard coke.

Coke and "smokeless" fuels.—The efforts of the Smoke Abatement Society in England have led to many attempts being made to introduce smokeless fuels like coke for domestic consumption, and there is no doubt that if a fuel of the character of "Coalite"—easy to light and burning with a bright cheerful combustion—could be produced economically and sold at a reasonable price, it would not only command an enormous sale, but, in conjunction with gas fires, would go far to solve the problem of smoke prevention. The combustion of bituminous coal as a national domestic fuel brings in its train consequences so objectionable that every effort should be made to bring about a more rational state of things.

In order to overcome the trouble of smoke whilst using solid fuel, many forms of grate have been suggested, the most successful of them being dependent upon the principle of

feeding fresh fuel to the bottom of the fire instead of to the top, so that as the tar, hydrocarbon vapours and steam distil out from the coal, they have to pass through a mass of incandescent carbon above, which decomposes the complex tar vapours into simple hydrocarbons. These are then completely burnt up on reaching the fresh air supply at the top of the fuel. The fact however that any special form of grate would require the removal of the old type and introduction of the new, has been sufficient to prevent any success in this direction, and what is really needed to make smoke prevention a practical possibility is the introduction of a fuel which could be treated in every way like coal, which would be as easy to ignite, would burn with a cheerful flame, and would in reality commence its combustion just at that period when, in a fire, the smoke has ceased and the fire has burnt clear.

"Coalite" was a fuel which fulfilled these conditions exactly, and consisted of coal carbonised at 420° C. instead of at 1000° C.; it was in fact a half-coked coal of uniform composition, with enough volatile matter left in it to give it the needed properties. For various reasons, unconnected with the nature of the fuel itself, coalite has not so far proved a commercial success; but it has convinced everyone who has used it that it is infinitely superior as a fuel to any bituminous coal, and has created such a demand for a smokeless fuel that some imitations, which differ from gas coke only in name, have been able to find a market. The best known of these is "Coalexld," made by mixing a very small proportion of alkaline nitrates with the coal before carbonisation. These evolving small traces of oxygen on their decomposition give small areas of high temperature during destructive distillation, and so give a slight increase in the gas yield. Another is made by cooling the hot coke when it is drawn from the retort by smothering it with a layer of coke breeze, instead of quenching it by water in the usual way, and is known as "Charco." Both these cokes contain about the same amount of volatile matter as ordinary coke made from the same coal.

Ordinary gas coke is not a popular domestic fuel; it is often over-quenched at the gas-works and sent out too wet, whilst its ignition point, if made at a high temperature, is nearly double that of coal, so that it is difficult to light and gives a dull fire, unless the chimney draught is exceptionally strong. With the introduction of continuous carbonisation in vertical retorts (see under GAS MANUFACTURE) the quality shows distinct improvement in dryness, and it would be easy for the gas manager so to regulate the heat of carbonisation as to leave 3 or 4 per cent of volatile matter in the coke to fit it for domestic use.

Peat.—The vast area of the recorded peat bogs existing in the world, which in Great Britain alone amounts to 800,000 acres, and the fact that dry peat, especially in the form of briquettes, is a pleasant and efficient form of fuel, have led to many attempts being made to utilise this enormous store of latent energy. So far all attempts to solve the problem have been commercial failures, as the mass of raw peat existing in the bogs contains approximately 90 per cent of its weight of water, most of it so held in a condition of feeble combination that it cannot be pressed out mechanically, whilst if heat is employed to drive it off, as much is needed as remains in the residual solid, and the attempt ends in a loss equivalent to the money expended on labour.

In countries where coal has been abnormally expensive and the climatic conditions good, cutting and stacking the peat in such a way as to allow air-drying to reduce the moisture to about 50 per cent, and then driving off some more of the remaining moisture by artificial heat and briquetting the product with 10 to 20 per cent of moisture still in it, has yielded small profits, but the enormous area needed for the air-drying, the amount of labour needed to cut the peat, and the fact that it is possible to do so only for a few months in the year, have prevented anything like commercial success, whilst in most countries the humid climate of the peat districts renders such a process impossible.

In 1906 Dr. M. Ekenberg discovered that peat, consisting as it does of partially decomposed vegetable matter, contains cells which are filled with and coated by a slimy substance, which he called hydrocellulose, and that this jelly-like compound held the water in such a way that mechanical drying of the peat by pressure was not possible, but that when heated to 150–200° C. the slime became "hydrolised" and went into solution, and that the peat so treated could be made to part with its water under hydraulic pressure. Starting from this point the Ekenberg process of "wet carbonisation" was elaborated, and works have been erected on a peat bog near Dumfries, the working of which has been designed to obviate both the climatic and labour difficulties.

In this process the peat is mixed with sufficient water to render it fluid enough to pump through tubes, and with a dry bog extra water would have to be added; at Dumfries however the bog is sufficiently wet for the purpose. The peat is dug by an ordinary mechanical digger of the type used in civil engineering operations, mounted on a pontoon which floats in the

space excavated by it on the bog. This digger raises the material into a disintegrator of special design, whence it is pumped through pipe lines to the works.

The power required at the peat getting station is supplied by generating electric current in the works and transmitting it to the plant at the bog. The peat pulp is then passed through the carboniser, which may consist of an arrangement of two concentric tubes, such as is found in the Nichlausse boiler, heated in a gas furnace. The raw peat is pumped continuously into the space between the outer and inner tube, and the carbonised peat, flowing back in the reverse direction through the inner tube, thus parts with its heat to the entering raw pulp. Under the pressure existing in the carbonising plant the pulp passes into the filter presses, which squeeze out much of the water, leaving the peat in a condition ready to go into the producer for ammonia recovery, or, after further drying by the waste heat of the gases from the producer, to the briquetting press.

One of the chief points in the process is that double the quantity of peat is treated that is required as briquettes, one half being taken as press cake, and used in producers of the Crossley type for conversion into producer gas, which, after the ammonia in the gas has been absorbed by sulphuric acid, is then partly employed in a battery of gas engines to give the necessary power for working all the apparatus used and bringing the peat from the bog, and also for supplying the heat for drying the remaining half of the peat that is to be briquetted, down to about 5 per cent of moisture.

Peat contains nitrogen in amounts which vary from 1 to 3 per cent, and theoretically for every one per cent of nitrogen present it should be possible to obtain 105 lbs. of ammonium sulphate per ton, but in practice with gas producers of the Crossley type about 75 to 80 per cent of this quantity is recovered.

The calorific value of the peat blocks made in the briquetting press is about 5,490 calories or 9,882 B Th U, and as the amounts which can be carbonised for ammonia recovery or can be briquetted are very elastic, the output can be arranged to meet local requirements. This process is undoubtedly far more promising than any that have been before attempted.

2. *Liquid Fuel.*

During 1911 and 1912 the use of liquid fuel has again received an impetus from the successful results obtained with it in practically all the naval services in the world. The American Government are safeguarding the supply for naval purposes by taking control over an area of the Californian oil fields, which will be held in reserve. In Great Britain the shortage of fuel oil supply, due largely to difficulties in transport, will probably disappear when the large number of new tank vessels now building are completed, and these will allow of the utilisation of the large supplies of fuel oil which will be available from Mexico, the Dutch East Indies and Burma, as well as from Texas and California. The price of liquid fuel limits its use to a great extent, as it is only where the advantages to be gained by its employment are so great as to overshadow the question of cost that it can possibly compete in Great Britain with coal, and the factor which prevents its adoption in very many directions is the impossibility of getting any guarantee as to constant supply. Freight rates have recently been so high as to make the price of the oil in England almost prohibitive, and the question is whether the carriage can be so reduced as to bring the price down. The great hope of the fuel oil market at the end of 1912 rested in the enormous demand for petrol, which during the next few years promises to lead to the development of all possible sources of oil; after the portion possible to use for motor-car fuels has been distilled off, the residuum, which is the portion of the oil available for fuel purposes, will be correspondingly large; but it must be remembered that in most of the countries on which Great Britain relies for oil supply the use of liquid fuel is advancing rapidly. In America, Russia, Austria and other countries producing oil or close to the oil fields, liquid fuel is now replacing solid fuels in the locomotives on the Government lines, as well as for manufacturing and other purposes, so that the supply from these sources for export is only what is left over after the home consumption has been satisfied. This of course does not apply to the Indian and Mexican fields, from which large supplies of fuel will probably be available.

Oil Fuel Burners.—Most of the earlier burners used for the consumption of oil in place of coal in marine boilers rely on the principle of injecting the oil as a fine spray into the furnace by means of steam, air or pressure. These burners answered well when the combustion space was large, but where a considerable amount of oil had to be burnt in a small space their action of driving forward the oil supplied rendered the passage of the burning oil through the combustion space too rapid to allow of complete combustion, and large quantities

of smoke were formed. Further trouble arose because steam had to be supplied, and as on a Service vessel this would mean extra boilers this was a great drawback.

Of the burners which sprayed the oil under pressure without the use of either steam or air, the Korting and Swensson had already proved successful in many cases, but a great improvement was introduced by I. I. Kermode, who designed a burner in which the oil under pressure issued from the nozzle in a swirling cone of mist, the particles not being driven straight forward as in other types by the spraying, and the rate at which it traverses the combustion space is thus reduced. Air injection for the oil, although on theoretical grounds it might be expected to be the most advantageous, has never found much favour for marine work, as auxiliary power has to be provided to drive the pumps for the air compression, but where an intense temperature is required it has been used largely, and especially in furnace work on land has proved very successful. One of the most successful forms of burner for this purpose has also been designed by Kermode and may be used with either steam or air.

At the present time the use of liquid fuel direct in the internal combustion engine has occupied a large amount of attention, and the Diesel engine has already shown itself well adapted for marine use where the power required has not been very high. The successful installations in the tank steamer "Vulcanus" and in the "Selandia" have demonstrated its great possibilities, whilst the fact that one B.H.P. can be obtained with a consumption of something like 0.45 of a pound of liquid fuel of much the same character as that used for burning under a boiler gives very high economy in its employment.

The first British destroyer fitted with Diesel engines for propulsion was the "Hardy," launched in October 1912, in which, for full speed, turbines fed with steam from boilers fired with oil fuel are used, whilst the Diesel engines are employed for cruising speeds, at which the turbine shows a marked falling off in efficiency.

In Germany, where there is a heavy import tax upon oil, the use of tar and tar oils in the Diesel engine has attracted considerable attention, and for the last ten years tar and creosote oils have been satisfactorily used. The troubles that at first arose with tar oils were that the pipes and nozzles of the burners were found to become choked with muddy deposits of solid hydrocarbons, consisting mainly of naphthalene, which formed a crust also at the mouths of the burners. These deposits made the working of the feed pumps difficult, and the solid hydrocarbons increased the temperature of ignition. The crude tar oils varied in composition and quality with differences in the temperature of carbonisation, even when the same coal had been used, which necessitated constant alteration in the feed and air adjustments of the engine. Of recent years, however, improved methods of fractionation and refining the tar oil, together with careful selection of the material, have ensured a supply of fuel of constant and regular quality, without the drawbacks incidental to the use of crude tar oils.

3. Gaseous Fuel.

The most important development in the use of gas as fuel that has taken place since the invention by Bunsen of the atmospheric burner promises to arise from the so-called principle of "surface combustion." Although a mixture of hydrogen and oxygen in the proportions in which they combine to form water has an ignition point of about 550° C. at ordinary atmospheric pressure, yet the two gases will combine in contact with certain metals at lower temperatures, but the rate of combination is so slowed down that the ignition point may never be reached. This power of inducing combination between gases at comparatively low temperatures has been known to be possessed by metals of the platinum group, since Sir Humphry Davy first established the fact in 1816, whilst Dulong and Thénard afterwards proved that all solid bodies possess in varying degrees the power of accelerating combustion below the ignition point. It is only within recent years that the study of this phenomenon has been revived by the researches of Professor W. A. Bone, and the phenomenon of surface combustion is now receiving a considerable amount of attention, and promises to lead to most important commercial developments.

If a mixture of coal gas and air in the explosive ratio of 1 to 6 be directed on to the surface of red hot nickel gauze or incandescent fireclay and asbestos, it is found that the acceleration of the combustion is not confined to low temperatures only, but flameless combustion ensues on the incandescent refractory surface, producing there a more intense combustion, with the result that the material is raised to a high degree of incandescence, and a much greater proportion of the heat energy of the gaseous mixture is converted into radiant heat.

There are two possible conditions under which gaseous combustion may take place—the first, homogeneous combustion, in which the velocity of the chemical change is

dependent on the order of the reaction, and combustion occurs equally throughout the system as a whole, and secondly, heterogeneous combustion, in which the combustion takes place in layers immediately in contact with a hot surface. This second condition constitutes what is known as "surface combustion," and is governed by the rate of combustion, the diffusion factors of the components of the gaseous mixture and the products of combustion, the effect of the "activity" of the refractory surface, the physical texture of the surface, and the retarding effect of films of inert gas.

The "activity" of a given surface can be varied by special treatment within wide limits; but the nature of the causes of the variation is still somewhat obscure. For instance, using a mixture of hydrogen or carbon monoxide with oxygen in conjunction with a non-oxidisable metal or non-reducible oxide, if the surface be previously treated by contact with the combustible gas, the "activity" of the surface is considerably stimulated, whereas if treated with oxygen it is diminished. The activity of a surface also increases rapidly with rise of temperature, the difference in activity possessed by various substances being reduced until at bright incandescence it disappears.

Diaphragm Process.—If an explosive gaseous mixture be forced under pressure through a porous refractory incandescent body, combustion in a greatly accelerated form takes place within the pores, and the heat developed by this combustion keeps the surface in a state of incandescence without the formation of flame.

This principle may be employed in two ways. The first is to fit a slab of porous refractory material in the front of a fuel chamber into which the gas and air, in proportions necessary to give complete combustion, are forced under the pressure necessary to drive them through the porous plate; the mixture is then ignited on the outer surface, which rapidly becomes heated, and the mixture burns within the pores of the slab and close to its exterior surface, which being raised to incandescence emits great radiant heat. The degree of porosity and size of the pores of the slabs can be arranged to suit the quality of the gas, fine pores being used with rich gases, whilst a coarser grade is necessary with gases of low calorific power, the pressure also being regulated to ensure the rate of flow of the gas being sufficiently high to prevent any risk of back-firing or explosion. This method of applying the principle is generally known as the Diaphragm process, and as, being flameless, the slab can be fixed in any position, it can be used to throw the radiant heat on the surface of evaporating liquids, for the concentration of acids, and for many forms of industrial and domestic heating.

Granular Bed Process.—The second method, known as the Granular bed process, consists in making a granular mass of the refractory material, and blowing the mixed gases on to it or through it under pressure, so that the combustion takes place on the surface of the granules, and a temperature of 2,000° C. can be obtained. The granules can be packed into tubes directly immersed in water for steam raising, into the space round crucibles in processes for the melting of metals, or formed into a bed for furnace work. In a special form of boiler designed for this process an efficiency of 95 per cent has been attained, that steam can be raised from cold in 20 minutes, and that the normal evaporation is 20 lbs. per square foot of combustion surface per hour, which can be increased to 30 with a slight loss in efficiency.

Gas Stoves.—Ever since Bunsen in the middle of the last century gave to the world his atmospheric burner, the use of gas for heating and power has progressed more and more, until nearly as much gas is now used for these purposes as for illumination.

The earlier forms of gas stove had many defects which created a strong prejudice in the minds of the public against them, more especially as custom and comfort had created a firm affection for the open coal fire. In the modern gas stoves however due regard has been paid to overcoming the drawbacks found with the older forms, and their improved efficiency together with the absence of smell, &c, have resulted in a steadily growing popularity.

The greatest objection raised against the use of gas for domestic heating is that of cost. If the open fire and the gas stove be compared on the price of fuel and the number of heat units present, the use of gas is shown to be about five times as costly as coal but if the question of efficiency be taken into consideration, the difference between the two methods of warming is found to be but slight. With a coal fire in an open grate only about one fifth of the heat units are utilised in warming a room, whereas with a modern gas stove nearly four times as great an efficiency can be obtained. Moreover, in favour of gas one can place cleanliness, absence of dust and labour, and convenience of lighting and extinction.

Heating by radiation is the only true and hygienic method of warming a room, as in this way the temperature of the air is not directly raised, but the walls, furniture and other solid bodies in the room absorb the radiated heat and in turn slowly give off a portion of this heat to the air around them; consequently the walls &c are at a higher temperature than the air. If however the room be heated by hot water pipes, steam or any other such system, the temperature is raised by convection; the air around the pipes or radiator is heated, expands and sets up convection currents until the whole mass of the air is at the one tempera-

ture. The solid bodies in the room however are not raised in temperature to the same extent, with the result that a sensation of chill is experienced by a person sitting near a wall, owing to the heat of the body passing by radiation to the wall.

In the modern gas fire a large percentage of the heat is converted into radiant heat, and the convection heat is reduced to a minimum, whilst the efficiency has been so improved that a large proportion of the heat in the gas is utilised. Provided that the stove be fitted in a proper manner the ventilation of the room is effected quite as thoroughly as with open coal fire, but to do this the space between the stove and the fireplace must not be filled in with a sheet of metal, as was the old accepted procedure, but the exit pipe should be carried for some little distance up the chimney, when the outrush of hot gases will be drawn up with them, by a sort of injector action, and nearly as large a volume of air can be withdrawn from the room as with an open fire.

Hygienic Effect of Gas Heating.—Careful researches have demonstrated that the use of gas in incandescent burners and stoves is by no means detrimental to health, but is a valuable adjunct to ventilation, owing to increased circulation of the air.

In the old forms of gas stove convected heat was relied on for raising the temperature of a room, but this decreased the percentage of humidity to such an extent as to produce rapid evaporation from the plants and occupants in the room, the results being drooping in the former and discomfort to the latter. This is always the case where convected heat is the sole method of warming, but if a combination of the two systems be adopted it will be found very useful in the case of large spaces where enough radiant heat could not be given by an open grate, or gas stove. With a factory or schoolroom, for instance, radiators or hot water pipes could be fixed below the windows and inlet ventilators, and in this way the entering current of air would be warmed up two or three degrees, and the fire would then be able to complete its work of warming the solids in the room by radiation in a much shorter time.

(VIVIAN B. LEWES.)

ILLUMINATING GAS MANUFACTURE¹

In no large industry have such fundamental changes taken place during the past few years as in coal gas manufacture, a complete revolution of the old ideas upon the carbonisation of coal having led to the introduction in Great Britain of vertical retort processes, while on the European Continent and in America carbonisation in bulk or chamber processes have made rapid headway.

The beginning of the present form of vertical retort, in which gravity is brought into full play to aid the filling and discharging of the retort, was in 1902, when at the Exeter gasworks a retort on this principle was erected and worked by T. Settle and W. A. Padfield, and in the same year vertical retorts began to be experimented on in Germany, by Dr. J. Bueb who by 1904 had got a good-sized installation at Mariendorf working successfully. In July 1903 however Messrs. H. W. Woodall and A. M. Duckham had patented in England a form of vertical retort on a totally different principle to the German retort, inasmuch as they embodied the principle of working continuously, so rendering possible the uniform treatment of coal during carbonisation, instead of putting in a full charge of coal, carbonising, drawing the coke and recharging, as is done in the Continental type of vertical.

Messrs. William Young and S. Glover in 1905 patented a continuous vertical process, which differed from the Woodall-Duckham. In the latter the principle is adopted of a continuous column of carbonising material, the inlet of fresh coal at the top being dependent on the withdrawal of coke from the bottom, the retort being so proportioned with regard to time and temperature that the carbonisation of the coal was completed by the time the bottom was reached; whilst in the Young and Glover system the discharge of coke was independent of the coke feed, and a space was left in the top of the retort above the coal so as to form a chamber in passing through which tar vapour might be gasified and fixed by radiant heat: in this respect resembling the procedure adopted by Settle and Padfield.

In 1909 the Glover-West retort took the place of the Young and Glover, a cooling chamber for the coke being constructed at the bottom of the retort, and the heat utilised for raising the temperature of the secondary air supply to the flues, whilst the empty space at the top of the retort was done away with, and the coke-withdrawal made to govern the feed, thus reverting to the principle introduced by Woodall and Duckham.

¹ See *E. B.* xi, 483 *et seq.*

The transition from the experimental to the practical stage proved fatal to the Settle-Padfield system, whilst the Young and Glover became merged in the Glover-West process, but since 1909 the three remaining systems have been working continuously, and with later improvements are so successful that there is no doubt as to their gradually largely supplanting the older forms of retort in English practice.

The German intermittent verticals, or Dessau retorts, have been at work at Sunderland since 1909, where at the Ayres Quay works there is an installation of a bench of six beds of ten retorts each. The retorts are 13 feet $1\frac{1}{2}$ inches high, tapering from 9 inches by 22 $\frac{1}{2}$ inches at the top to 13 $\frac{3}{4}$ by 27 $\frac{1}{4}$ inches at the bottom. The bench carbonises 400 tons of coal per week, and yields between 12,000 and 13,000 cubic feet of gas per ton. The coal is charged into the retorts from an overhead hopper, each taking a little under half a ton, which requires twelve hours for complete carbonising, and during the last two hours steam is passed at a slow rate through the charge, partly to increase the volume of gas, and partly to prevent any sticking of the charge due to carbon deposited on the inner face of the retort, which might interfere with the discharge of the coke when the bottom door of the retort was opened. The use of steam naturally increases the amount of fuel used in the carbonisation, this amounting to 13.96 per cent of the weight of coal carbonised when no steam is used, and rising to 17.8 per cent when steam is employed, the average of fuel used being about 15 per cent.

Of the two continuous processes, the Woodall-Duckham has been the longest at work, and there are numerous installations in Great Britain and other countries. The retorts are 25 feet in height with a sufficient taper to ensure the slip of the charge. The time occupied in the travel of the coal from the hopper to the coke extractor at the bottom of the retort is seven or eight hours. The coke is removed by an extractor, actuated by a ratchet and pawl arrangement on a grooved wheel, and driven by a rocking shaft, and the coke then falls into a watersealed hopper, which is large enough to take the amount drawn out during three revolutions of the extractor, or about three hours' discharge. The coke can be quenched, if necessary, by a small spray of water in the storage hopper, but the amount of water is limited, so that the coke is ejected in practically a dry state and at a temperature of 140° F. The passage of the coal through the retort is governed by the speed of the extractor, the supply of coal at the top of the retort being arranged to keep the retort full, with the exception of a small space at the top where the gas is led off, and which can be regulated in size by a sliding partition. The top of the built-up retort is closed by an iron casting carrying the coal feed, the gas exit pipe, and the sliding partition. The coal feed is a gas-tight hopper fixed eccentrically to the retort and closed by a gas-tight valve, through which the hopper can be filled from another store hopper above. This operation takes a very short time and is necessary only once in three hours, the size of the lower hopper being so calculated as to hold the coal to give the charge of coke removed by the three revolutions of the extractor at the bottom of the retort.

In any process where automatic and continuous action is arranged for, the working parts of the apparatus are apt to become rather complex, but in spite of the objections raised from time to time against continuous carbonisation, the system is an established success, being at work also in America and on the European Continent.

The other process based on the continuous carbonisation of coal is the Glover-West. In this system an economy is obtained by utilising the heat from the cooling hopper for the coke to regenerate the air for the secondary combustion in the flues, this making a slight decrease in the fuel consumption, which is given as 10.3 per cent. Complete installations have been at work for some time at St. Helens and at Droydsden, the latter consisting of two settings of eight retorts, each setting being subdivided into two sections of four retorts, for convenience in working. The output of the plant is rated at 500,000 cubic feet of gas per twenty-four hours.

The retorts are 20 feet long, oval in section, and with a slightly increasing taper from the top to the bottom. The coke falls into a cast iron chamber at the bottom of the retorts, and round it the secondary air supply is led. Beneath the coke chamber is the extractor, a slowly revolving vertical screw, driven from a small gas engine by means of an arrangement of levers and ratchet wheels. The coke is discharged into a bottom hopper, from which it is removed about every two hours. The top of the retort is similar to that of the Woodall-Duckham, being provided with the coal feeding hopper, gas exit pipe, and partition.

Extended experience with these systems has shown that in spite of their apparent complexity, they work smoothly and noiselessly, with complete absence of smoke and steam, which is in sharp contrast with the old methods of carbonisation. The wear and tear, also, are very small. A great advantage of the process is the uniformity in composition of the gas, whereas in the old horizontal retorts the composition of the gas evolved at the commencement and at the end of the carbonisation varied enormously, and uniformity in composition was left to the mixture of the gas from many benches in the holder.

Intermediate between the old processes of carbonisation and coke oven recovery plant comes what is known as "chamber carbonisation." By this method charges of three to

eight tons of coal can be dealt with at a time, and it has met with considerable success, especially on the European Continent, where a number of installations have been erected.

The first chamber setting was erected in 1901 at the Munich works by H. Ries and E. Schilling, who converted an old setting for inclined retorts by building into it three chambers, each taking a charge of one ton of coal, the floors of the chambers being at an angle of 35° to facilitate charging and discharging. This plant was so successful that the chambers were enlarged, and later on in 1906 an installation of fifteen chambers in groups of three per setting was erected. Each chamber takes a charge of two and a half to three tons, and the carbonisation is continued for 24 hours. A regards results, Dr. Bunte in 1907 reported that he obtained 11,342 cubic feet per ton of Saar coal, having a gross calorific value of 626 B Th U per cubic foot.

The success of the Munich plant was followed by the erection of a larger installation at Hamburg. The chambers consisted of ten settings of three chambers each, the chambers being 24.6 feet long by 7.4 feet high, the width varying from 1 foot 8 inches in the outside chambers to 2 feet in the central chamber. Carbonisation takes 24 hours, and the capacity of the three chambers is 17.5 tons. A still larger installation of twelve settings of three chambers each was erected at Moosach, the length of the chamber being increased to 28.7 feet. At many other places on the European Continent chamber ovens were erected by H. Koppers, A. Klönne and Knoch, and the Koppers system is now to be tried at Birmingham. Horizontal, vertical and inclined chambers have all been tried, and each has its advocates, but the tendency seems to be to revert to the horizontal chamber with mechanical coke pusher.

The great advantage of chamber carbonisation is that it reduces the cost of handling and labour, and it has been stated that a labour charge of 9d. has been reduced to $\frac{3}{4}$ d.; on the other hand the candle power of the gas is below the English standard, although the calorific value is satisfactory, and the initial cost of erection is very high.

Mr. Charles Carpenter, at the South Metropolitan gas works in London, carried out some experiments with ordinary horizontal retorts by filling them full of coal, as had been suggested by Kunath in 1885, instead of only partially filling them, an operation which became a possibility only with the perfecting of charging and discharging machinery. He found that a considerable improvement was effected in the make and quality of the gas as well as in the tar. This is no doubt largely due to the elimination of the large space that was left above the charge of coal in the old practice, which led to the degradation of the gas and tar vapours owing to contact with the red hot crown of the retort, and the fully charged horizontal is being adopted at many works not yet prepared to instal verticals.

All the various systems of carbonisation in general use—fully charged horizontal retorts, intermittent vertical retorts, and continuous carbonisation retorts—show but little variation in the amount of gas they yield per ton of coal carbonised, but if the fuel consumption be taken for comparison, the continuous vertical retorts show a decided gain, the following figures giving the amount of fuel consumed per 100 lbs. of coal carbonised:—

Horizontal.	Intermittent vertical.	Continuous Woodall-Duckham.	Carbonisation Glover-West.
14	15	12.1	10.3

The low figure obtained in the Glover-West system is accounted for by the regeneration of the secondary air supply by the waste heat from the coke.

The continuous vertical retort also has other minor advantages. In the ordinary gas-works practice and with intermittent vertical installations the surrounding air is periodically rendered offensive by outbursts of steam and smoke from the charging and discharging of the retorts and the quenching of the coke, but in the continuous vertical there is none of this annoyance; the plant works with perfect cleanliness and absence of nuisance, whilst the coke, owing to being cooled before exposure to the air, requires no spraying with water. The quality of the coke and tar and the yield of ammonium sulphate also are improved, so that continuous carbonisation in vertical retorts offers the most advantages.

The great improvements in gas and residuals alike brought about by the introduction of the vertical retort and the fully charged horizontal are due to the elimination of the over-decomposition of the hydrocarbon gases and vapours that used to take place with the old practice of only about half filling a horizontal retort with the charge of coal to be carbonised. Under these conditions, as the heat began to penetrate the charge, the gas that was evolved passed up into the empty space in the crown of the retort, and was there subjected to radiant heat from the retort walls, which are at a temperature of upwards of 1000° C., and also to contact with them, the latter being destructive to the more easily decomposed hydrocarbons, breaking them up into simpler hydrocarbons, hydrogen and free carbon, the latter forming deposits of retort carbon on the interior of the crown of the retort and soot, found as free carbon in the tar. As the heat penetrates the carbonising mass, the outer portion of the charge becomes redhot coke, and the gas distilling from the inner core has to force its escape through this, so that not only contact but catalytic action of the carbon surface adds to the destruction of the hydrocarbons; as this action increases with the thickness of the red

hot envelope of coke the gas gets poorer and poorer as the carbonisation proceeds, so that for the last hour during which gas is coming off it is practically non-luminous.

In the vertical retort and full horizontal the space above the coal is done away with, and as the heat penetrates the charge, gas, tar, vapour and steam distil inwards from the exterior portions, and the vapours condensing in front of the zone of heat form a pasty tube through the cool coal core of which the gases escape without undue degradation to the mouthpiece. In this way about two thirds of the charge is distilled under conditions favourable to the formation of good gas and tar, whilst a larger proportion of ammonia escapes destruction, but as soon as the central core gets tar-logged the remaining gas and vapour are forced back through the red hot column of coke and undergo complete degradation.

During the last few years no very marked improvements have taken place in the purification of coal gas, but a very interesting revival of an old process under new conditions has taken place at the Cheltenham gasworks, which may prove of great value.

Coal liming. About thirty years ago the Cooper process of mixing lime with the coal before carbonisation, in order to increase the yield of ammonia, was extensively tried, but abandoned on account of the increase in ash it gave in the coke. J. Paterson and Twycross have now tried moistening the surface of the coal after crushing with a small steam jet, and dusting 2 per cent of lime over it, which adheres uniformly to the moistened surface, and shows a marked result not only in the amount of ammonia obtained, but in the purification of the gas from bisulphide of carbon, the sulphur compounds other than sulphuretted hydrogen being reduced to 20 grains per 100 cubic feet, instead of being double that amount, whilst the increase in the ash of the coke is practically negligible.

Attempts are also being made to introduce direct processes for the recovery of the ammonia as sulphate, by washing the gas after removal of the tar with dilute sulphuric acid, as is

done in some coke oven plants, whilst a very interesting system of recovering the ammonia as sulphate and at the same time utilising the sulphur of the

Burkheiser's process. sulphuretted hydrogen in the crude gas is also under trial. This is known as W. Burkheiser's process, and consists of removing the tar and passing the gas with the ammonia and sulphuretted hydrogen in it through porous hydrated ferric oxide warmed to 60° C., which removes the whole of the sulphuretted hydrogen, but not ammonia; when the purifier is saturated with sulphide, a current of air and steam is led through it, the sulphur burns, forming sulphur di- and tri-oxide, mixed with the residual nitrogen of the air: these gases are then passed in small quantities into the gas containing ammonia flowing from another purifier of the same kind, and the sulphate and sulphite of ammonia so formed is washed out of the gas in a scrubber with a dilute solution of ammonium sulphate, which is used until concentrated, when a mixture of two thirds ammonium sulphate and one third ammonium sulphite crystallises out.

(VIVIAN B. LEWES.)

THE COAL-TAR INDUSTRY¹

The history of coal-tar and its utilisation has undergone an interesting phase during the past few years. It is well known that the quality and value of coal-tar is as dependent upon the temperature at which the coal is carbonised as upon the character of the coal, whilst the amount of heating and contact with red hot surfaces that the tar vapours are subjected to after their formation also influences its composition; as a result the tar has shown distinct changes with every alteration in gas manufacture, these changes affecting the amounts of the products that can be obtained from it on distillation.

These changes are best seen by the percentage fractions obtained from the tar:—

Period	1820 to 1850.	1850 to 1898.	1898 to 1911.
Process of carbonisation	Iron retorts.	Fireclay retorts.	Fireclay retorts.
Temperature of carbonisation	800°C.	1,000°C.	1,050°C.
Yield of gas, cubic feet per ton	9,000	10,500	11,500
Composition of tar by weight			
Ammoniacal liquor	1.04	1.02	0.383
Crude naphtha	3.73	3.45	0.995
Light oils	4.47	2.59	0.567
Creosote oil	27.29	27.33	19.440
Anthracene oil	18.13	13.77	12.280
Pitch	41.80	47.67	64.080
Specific gravity of tar	1.140	1.154	1.206

¹ See *E. B.* vi, 595 *et seq.* Digitized by Microsoft®

The results show that higher temperatures seriously diminished the amount of the more volatile distillates upon which the value of the tar largely depends.

In the first few years of this century the reduction in England of the Parliamentary standard of illuminating value, and the introduction of the No. 2. standard Argand as a test burner, led to a further pressing of temperatures in order to obtain a large volume of gas, and brought about such a deterioration in the quality of the tar that the market price fell to $\frac{3}{4}$ d. a gallon; and had it not been for the enormous demand for tar that arose at this period for preparing the surface of roads tar would have fallen probably still lower, as it contained the minimum of valuable products and anything up to 30 per cent of free carbon, which deteriorated the pitch.

Luckily for those industries that are dependent upon tar products, a marked improvement in the quality of the tar has taken place with the introduction of vertical retorts, fully-charged horizontals and chamber carbonisation (see under GAS MANUFACTURE), as is shown by the following analyses:—

	Dessau verticals.	Continuous Verticals.
Specific gravity	1.113	1.074
Free carbon	4.0	3.1
Distillate up to 170° C.	13.0	9.1
" " 270° C.	24.0	25.7
" " 350° C.	9.0	24.9
Pitch	50.0	46.0

Road Tarring.—The use of tar for road surfaces now occupies so much attention that a short description of the methods employed will be of interest.

The tar used should be coal-tar, either from gas-works or coke ovens, and should be partially distilled before use, in order to get rid of water and volatile oils; the specific gravity should be 1.2 to 1.25 and high temperature tar, containing much naphthalene and free carbon, should be avoided, as these bodies have no binding effect and lead to disintegration.

Crude tar should never be used for surface work; the complaints which arise from the contamination of water in streams, &c. from tar-treated roads nearly all arise from this source, as the trace of water and ammoniacal liquor together with the volatile oils prevent rapid drying, and if rain falls shortly after the tar has been used, slight emulsifying of the surface takes place, and the water that flows into the gutters and streams becomes contaminated and shows itself by films on the water. The presence of water in the crude tar is also a serious drawback, because the porous road material absorbs water more quickly than tar, and this weakens the adhesion of the tar and leads to crumbling of the surface. Where partially distilled tar cannot be obtained, the best way to prepare the crude tar is to heat it in coppers to a temperature of 65° C. (150° F.) for several hours, when most of the water will be driven off, but great care must be taken in doing this, as if the temperature rises above this point frothing over of the tar and ignition from the fire below is very apt to take place.

There are three methods by which the tar may be used in preparing the surface of the road:—(1) Simply tarring the surface, as is done in most rural districts; (2) Making the surface of the road with tar macadam; (3) Grouting the macadam whilst making the road with tar. The first method is the one employed to the largest extent, and depends for its success on choosing a period of dry weather to carry it out; the surface of the road must be dry and all dust removed, the tar is then run on, preferably hot, from a tank on wheels with any form of sprayer that will give an even distribution, or it may be applied by hand, which allows of more attention being paid to local conditions in the road surface, and sand or stone screenings may be dusted sparingly over the surface of the tar, and all excess swept off when the tar sets. The advantages of this system are low cost, suppression of dust, increased life of roadway, economy in watering and good surface, whilst the disadvantages are that it gives a slippery road for horses with frost, and if the tar contains too much free carbon and naphthalene, a black mud in wet weather. The second system consists in mixing the macadam with the prepared tar before making the road. Limestones absorb a very much larger proportion of tar than granites and make a more adherent mass when rolled, but granite road metal can be used quite successfully. The procedure is to grade the road metal roughly into 2½, 1½ and ½ inch sizes: these are well dried and are mixed with the prepared tar and made up into heaps that are allowed to stand for a week or ten days, and a layer of the 2½ inch metal is put down and rolled, the operation is repeated with the 1½ inch metal, and the surface is made of the ½ inch size. The third or "grouting" system is to put down the macadam in the usual way, but dry, and after light rolling, to mix hot prepared tar with sand and float it over the surface, brushing the grout into the interstices of the macadam, and lightly sifting a little screening over the surface. The great demand for coal-tar for this purpose has created a shortage in the supply, but the improvement in price will probably lead to a rapid extension in the use of coke oven recovery plant, thousands of tons of tar being burnt to waste annually in the beehive coke ovens, which still are used in the North of England to a very great extent.

GAS LIGHTING¹

The incandescent gas mantle, both in its upright and inverted forms, has made steady headway during the past few years, and the great increase in light that can be obtained by increase of the pressure under which the gas is supplied to the burner has been taken advantage of in constructing lamps for the illumination of large spaces.

The most important outcome of the last few years with regard to gas lighting is the change of opinion that is gradually taking place with regard to its hygienic effect on the air of enclosed spaces. When the electric light was first introduced as a domestic illuminant, the fact that it took no oxygen from the air and gave off no products of combustion led to the assumption that it must be more healthful in a dwelling room than gas, which not only abstracted oxygen but evolved as products of combustion water vapour and carbon dioxide, the amount of which latter gas in the air of a room had always been taken by the sanitary authorities as an indication of its hygienic condition. The researches of Dr. S. Rideal and others have shown conclusively however that the air in the breathing zone of an inhabited room lighted by the incandescent gas mantle is always fresher and less oppressive than with electric incandescent burners, and that the increase in carbon dioxide and humidity which one would expect is not to be found, whilst a large decrease in the organic matter takes place. This is explained by the fact that the uprush of heated air and products from the burner draws up the emanations from the skin and lungs of the occupants, charring and sterilising any germs and organic matter that are present, and, reaching the ceiling at a temperature 12° C. higher than when electric light is used, diffuses so rapidly through the plaster as to draw in fresh air below the door of the room, and whilst so diffusing filters off the carbonised organic matter and dust on the surface of the plaster, so giving the blackening that is always found above a gas burner, which is often erroneously attributed to imperfect combustion.

Air movement, coolness, humidity, and reduction in the mass action of pathogenic bacteria, are now recognised as being of far greater importance to health than the chemical purity of the air, and the convection currents and change of air set up by the heat of the incandescent gas burner lead, it is held, to a fulfilment of these requirements far better than the electric light.

(VIVIAN B. LEWES.)

OIL LIGHTING²

There has been but little change in either the construction of oil lamps or the use of oil for lighting during the past few years, and the production of a successful lamp using ordinary lamp oil and an incandescent mantle still awaits solution.

In lighting by oil gas a marked improvement has been made by Messrs. Pintsch in railway carriage lamps. Attempts were made for many years to devise oil gas burners fitted for use with incandescent mantles, but whilst upright mantles only were available no great success was achieved, as the shaking of the train rapidly destroyed them, and no anti-vibration device seemed to have any effect in preventing this. When however the inverted mantle was introduced, it was found that the method of suspending it by its steatite base from lugs on the burner nozzle rendered it far more resistant to shock, whilst in case of the mantle breaking the fabric was suspended in a fine platinum wire basket, which kept it in position until it could be renewed. Using the ordinary Pintsch compressed oil gas in small inverted atmospheric burners, a consumption of 0.6 of a cubic foot per hour gives with the mantle a light of 24 candle power, or three times the amount of light for half the gas consumption with small flat flame burners.

An interesting development of compressed oil gas for portable use, buoys, motor lamps, etc., is the introduction on the European continent of what is known as "Blau gas." When ordinary oil gas is compressed, as in a Pintsch cylinder, a considerable amount of liquid hydrocarbons, which were present in the gas as vapours, separate out, the liquid consisting of benzene, toluene, hexane, heptane, etc., and the gas suffers considerable reduction in illuminating power. The gas thus freed from vapours contains hydrogen, methane of little or no illuminating power, and the higher gaseous

¹ See *E. B.* xvi, 655 *et seq.*

² See *E. B.* xvi, 651 *et seq.*

members of the paraffin and ethylene series, such as ethane, propane, butane, ethylene, propylene, etc., of high illuminating power, and by cooling and compressing these under high pressure in a steel cylinder they are liquefied, whilst the hydrogen and methane remain gaseous and pass on. This liquid gasifies entirely when the valve of the cylinder is opened, and constitutes the "Blau gas," and is largely used when high light values are needed from jets or flat flame burners.

Of late years there has been a great influx of so-called "air-gas" or "petrol air gas" machines on the market, intended for the lighting of country houses where coal gas or electricity is not available. In nearly all these the principle first introduced by Hooker of adding only enough petrol vapour to the air to make it combustible and not enough to make it explosive, has been adopted, so that any leakage of the gas, instead of forming an explosive mixture as would be the case with coal gas, becomes non-combustible from over-dilution. The principle of all the machines is to evaporate a given weight of petrol into a definite volume of air, and to bring this about a large number of automatic devices are employed, driven by water power, hot air engines or falling weights. The "gas" so formed consists of a mixture of about 98 per cent of air with 2 per cent petrol vapour, and burns in specially constructed burners as a non-luminous flame which is used with an incandescent mantle. A gallon of petrol in a good machine will make from 1400 to 1500 cubic feet of "gas," having a heating value of between 80 and 90 B Th U per cubic foot.

(VIVIAN B. LEWES.)

ACETYLENE¹

The progress of the past two years in the use of acetylene has been chiefly in the direction of oxy-acetylene welding and cutting. As an illuminant, the number of new installations in Great Britain keeps a steady average. In other countries, where central installations for the lighting of small towns and villages are more often met with, the increase is more marked. Welding and cutting by means of the oxy-acetylene blowpipe, however, is advancing with great rapidity, America leading the way both in quantity and quality of the work done; Germany occupies the second place, France the third, and the United Kingdom a bad fourth. A school of acetylene welding has however been started in England, and more rapid progress is expected.

A noticeable feature is that in France and Germany nearly two-thirds of the oxy-acetylene welding done is in manufacturing work, while in America the extreme value of the process for rapid repairs has been fully realised, and nearly three-quarters of the work done is of that character. The size of the work which can now be undertaken has enormously increased with extended knowledge of the requirements, and two examples will suffice to indicate the saving that can be effected by the rapidity with which the work is done. A section of the frame of a steam hammer, weighing about four tons, was fractured, and by means of the oxy-acetylene torch new metal was filled into the break, the whole of the welding completed, and the section delivered within 48 hours. The "Commonwealth," a large passenger steamer, was in collision with a warship and had her bows badly crumpled up, but by the oxy-acetylene cutting torch the damaged portion was removed, the repairs executed, and service resumed within a week.

In the early days of welding by the oxy-acetylene blowpipe many cases occurred which seemed to point to the steel being rendered hard and brittle in the neighbourhood of the heated portion. Investigation however has shown that this is due to careless adjustment of the ratio of acetylene to oxygen in the blowpipe flame, which with any excess of acetylene increased the carbon in the steel and so hardened it, and that if a properly designed and adjusted blowpipe is used the tensile strength of test pieces cut from a plate with the oxy-acetylene flame is higher than when sheared. Some recent Austrian experiments on two mild steels however show that when a chrome nickel steel, hardened for armour plate, is cut by the flame a softening of the steel takes place, this being most noticeable close to the cut and gradually diminishing as the distance became greater, whilst a nickel steel, unhardened, was perfectly unaffected.

The American Naval Department was one of the first to adopt the oxy-acetylene process, and in building one of the recent battleships expended over \$70,000 in welding and cutting by it. The system has also been adopted widely at many European ports, and at Marseilles, Genoa and Antwerp has been in use for several years. The use of acetylene dissolved in acetone under pressure, the acetone being contained in porous material packed into strong steel cylinders, has largely extended the scope of autogenous soldering, as both acetylene

¹ See *E. B. i*, 137 *et seq.*

and oxygen under pressure can be obtained in portable cylinders, and repairs executed in the confined space of a ship's hold or even in the boilers themselves.

The trade in cylinders of dissolved acetylene has, as might be expected, expanded rapidly both in Great Britain and elsewhere, this being due partly to the advance in oxy-acetylene welding, but more largely to the enormous increase in the number of motor-vehicles, the headlights from which are most conveniently supplied with acetylene from a cylinder of dissolved gas, which does away with the trouble incidental to a portable generator.

Another direction in which the use of acetylene has made enormous strides in America is for self-starters for motor-cars, of which some fifteen different kinds are in use in the United States. In one class of self-starters the pressure existing in the acetylene cylinder is used to force a charge of gas and air into the explosion cylinders of the motor engine, where it is fired by the spark and starts the engine, the "Disco" automatic self-starter being one of the best of this class; while the "Prest-O-Starter" may be taken as the type of a second class, in which low pressures only are used, the mixture of gas and air being pumped into the cylinders in proper firing order.

In 1896 it was shown that when acetylene is passed through a red hot tube it undergoes instantaneous decomposition with deposition of carbon and liberation of hydrogen, the carbon being rendered incandescent by the exothermic decomposition, and that the temperature at which this takes place could be raised by dilution with hydrogen; when this was done the acetylene underwent condensation into benzene and other hydrocarbons. R. Meyer has now repeated these observations on a larger scale. The apparatus consisted essentially of two vertical tubes, electrically heated, and a mixture of acetylene and hydrogen was passed slowly through them, the temperature being so arranged that separation of carbon was to a large extent avoided. The first tube was heated to 650° C., and the second to 800° C., when it was found that a quantity of a light brown tarry liquid was formed, and that the gases leaving the apparatus contained methane. In some cases the yield of liquid was about 60 per cent of the weight of acetylene used, and contained nearly 20 per cent of its weight of benzene. Other hydrocarbons identified were toluene, naphthalene, anthracene, indene, diphenyl, fluorene, pyrene and chrysenes; and further experiments with acetylene and hydrocyanic acid confirmed Sir W. Ramsay's observations that these bodies condensed to form pyridine bases.

A considerable amount of work has been done in utilising calcium carbide for the fixation of atmospheric nitrogen. In order to do this crushed calcium carbide is heated to a temperature of 800-1000° C. in an electric furnace, and nitrogen, generally obtained by liquifying air by the Linde process and allowing the nitrogen to distil off, is then passed through the red hot mass and converts the calcium carbide into calcium cyanamide, CaCN₂. This is now recognised as an extremely valuable manurial matter, as it slowly evolves ammonia under the influence of moisture, according to the equation: CaCN₂+3 H₂O=CaCO₃+2 NH₃. There is a large installation at Odda, in which 196 electric furnaces are employed, and about 30 tons of calcium cyanamide, containing 18 per cent of nitrogen, made per 24 hours, whilst the world's production for the past year amounts to nearly 200,000 tons.

(VIVIAN B. LEWES.)

THE PETROLEUM INDUSTRY¹

The winning of petroleum in regions of proved productivity, and, concurrently, the discovery of new sources of supply, are being greatly stimulated by the rapidly increasing employment of oil fuel for power purposes, both as a substitute for solid fuel in steam-raising, and through the medium of the internal-combustion engine.

Since its inception half a century ago the petroleum industry has advanced to a position of great importance, mainly in supplying a cheap, convenient and efficient light, and an excellent lubricant for machinery. During the past few years it has also furnished the motor-spirit which drives our automobiles, motor boats, submarines, hydroplanes and aeroplanes. Now, however, it is entering upon a new era, in becoming a great fuel industry, and its further expansion promises to be far more rapid, for it is evident that if there is to be any large substitution of oil for coal as a source of power the output of oil will have to be greatly increased. At present the world's production of petroleum does not amount to much more than 5 per cent of the output of coal, even allowing for the higher calorific value of the liquid combustible. The general employment of motor-spirit has, of itself, contributed largely to the present profitable character of the business, though the high price at which this product is now sold is leading to the use of distillates of higher specific gravity and lower volatility, of which a far larger percent-

¹ See *E. B.* xxi, 316 *et seq.*

age can be obtained from the crude oil. Probably the owner of the private motor car will always prefer to have the product which he has been accustomed to use, even if he has to pay a high price for it, but for use in public-service and commercial motor vehicles an increasing substitution of the less volatile product may be looked for, and it is desirable that this should be so, for the supply of motor-spirit may otherwise become inadequate to meet the increasing demands, though at present the United States and the Dutch East Indies, which are the chief sources, show no signs of failure in this respect.

In regard to the industrial use of oil for power purposes it is instructive to consider the remarkable changes which have been effected in the United States within very recent years by the provision of liquid fuel. As was pointed out by Dr. David T. Day, in an instructive article published in *The Times* (London) for June 28, 1912, the supply of oil fuel has been a potent factor in State development. It has made Oklahoma a state abundant in prosperous cities, and has developed the railroads and manufacturing industries of Texas. In Louisiana it has made the sugar industry ready for the free list, and corresponding changes are in progress in Illinois and further west in Wyoming. Oil fuel has completely revolutionised California, so that the state is in the midst of a startlingly rapid transformation from a mining and agricultural community to a manufacturing centre, and the keynote of the Panama-Pacific Exposition of 1915 in San Francisco, originally intended to be a tribute to the extension of commerce through the opening of the Panama Canal, will be the change of San Francisco from a future Liverpool to a future Birmingham.

For marine purposes, as well as in industrial establishments, the most potent factor in the replacement of coal by oil is, however, unquestionably the Diesel engine, which possesses great economic advantages over other types of internal-combustion engines. Not only can a much greater amount of power be obtained with this engine from a given quantity of oil, but in addition the less volatile hydrocarbons of which petroleum is chiefly composed, and even the crude oil itself, can be used with it.

For use on railroads the Diesel engine has not, as yet, been substituted for the steam locomotive, but the employment of oil fuel, which for many years has been common in Southern Russia, has been extended to other countries, especially the United States.

According to the figures compiled by Redwood and Eastlake, the world's production of crude petroleum amounted in 1909 to 40,070,832 metric tons, and in 1910 to 43,986,531 metric tons, while in 1911 (from Day's figures) it was 46,526,334 metric tons. Details of the production in different areas for 1909 and 1910 (Redwood and Eastlake), and 1911 (Day), are shown in Table A.

It will be observed that the United States continues to occupy a predominant position in the industry, having contributed in 1911 no less than 63.8 per cent of the world's output, the next in order being Russia, with 19.16 per cent of the total. During 1911 the production of Mexico increased so largely as to bring that country into the third place, and as soon as there are adequate transport facilities the increase will probably be far greater. Other countries of very considerable commercial importance in the industry are the Dutch East Indies, Rumania and Galicia. To the aggregate output of the United States, California contributed far more largely than any other state, and may be expected to provide sufficient oil for the industrial needs of the whole Pacific slope for many years to come. The similar requirements of the Atlantic coast will probably be met by the importation of the surplus production of Mexico.

The older oil-fields of Russia, in the Baku region, which in the past have produced immense quantities of oil from a comparatively small area, are showing signs of exhaustion, but other districts are being actively exploited with highly promising results. In the Ural Caspian region, lying east and west of the Ural river, there are over 30,000 square miles of territory, where already some very productive wells have been drilled, and a large proportion of which may prove to be richly petroliferous. The island of Cheleken has also become commercially important as a source of oil. The sanguine anticipations expressed in regard to the Maikop oil-field have not been fulfilled, but its prospects will be better understood when we know the results of the deep-drilling

operations recently in progress. Attention has also been directed to exploratory work on the Taman Peninsula.

Among other countries which may be confidently expected to add largely to the world's supplies of petroleum in the near future is Persia, where there is an immense area of presumably petroliferous lands, a portion of which has already been proved by the test of the drill to be highly productive. Drilling operations in Egypt, on the Gulf of Suez, have also been attended with results which are regarded as sufficiently promising to justify the provision of a large capital for the development of the industry. The island of Trinidad is being systematically examined, and sufficient has been done to lead to the belief that large stores of oil exist there; in 1911 it produced 17,071 metric tons. Among other potential sources of supply which have attracted the notice of the prospector are Turkey (Mesopotamia), New Zealand, New Brunswick, Newfoundland, Canada (north-west), Alaska, Venezuela, Barbados, Madagascar, China, Argentina, Algeria, Nigeria, Colombia, Ecuador and Bolivia. There are also sources of oil in the bituminous shale deposits of France, Servia, Spain, South America, New South Wales, New Zealand, New Brunswick, Nova Scotia and Newfoundland. (BOVERTON REDWOOD.)

AGRICULTURE

PROGRESS OF SCIENTIFIC RESEARCH

During recent years notable advances have been made in agricultural science and especially in the application of chemistry and biology to agricultural practice.

The perennial question of the source of the combined nitrogen utilised by vegetation has received fresh light from the discovery by Beijerinck of a group of bacteria living free in soil and water and possessing the power of bringing the free nitrogen of the atmosphere into combination. These organisms, known as *Azotobacter*, are powerful oxidisers of carbohydrate material, from which process they derive the energy necessary to effect the fixation of the nitrogen, and they have been identified in cultivated and virgin soils from all parts of the world. They are however only practically effective in soils containing carbonate of lime, though they have been found in all the steppe soils where black soil rich in nitrogen

The question of nitrogen.

has accumulated to a considerable depth, such soils for example as are found in Manitoba, the Russian steppes, and the Pampas of South America. Despite the fixing action of the bacteria associated with the leguminous plants it has always been difficult to regard the enormous accumulation of nitrogen in virgin soils as the result only of past vegetation, since the higher plants are only capable of taking already combined nitrogen from the soil and restoring it again as they die down. When, however, the vegetation falls back to the soil carbohydrates are added which have been manufactured by the green leaf from the carbon dioxide of the atmosphere by the help of light, and it is by the subsequent oxidation of this non-nitrogenous material by *Azotobacter* that free nitrogen is drawn into combination and the stock in the soil is added to.

The examination at Rothamsted, England, of the soil of a wheat field under arable cultivation for more than half a century shows a steady decline in nitrogen content approximately equivalent to the removals in crop, any recuperative actions at work being only sufficient to balance casual losses by drainage, weeds, etc. A portion of the wheat field was, however, allowed to go to waste some thirty years ago, and became covered with a natural vegetation of weeds and grasses, which are never cut but allowed to die down each year *in situ*. The soil of this portion was found to have gained nitrogen at the rate of nearly 100 lbs. per acre per annum, the greater proportion of which must have been fixed by *Azotobacter* working on the carbonaceous matter of the dead vegetation. With this clue we can interpret the accumulation of nitrogen in virgin soils carrying a grassy vegetation; similarly forest soils which annually receive carbonaceous matter from the fall of the leaf become enriched in nitrogen, though in both cases the process will only be effective if the soil contains carbonate of lime. Again when land is laid down to grass for a period there will be a regeneration of the nitrogen stock by the action of *Azotobacter*, utilising the carbonaceous matter in the roots and stubble of the grass.

The last decade has also seen the resources of agriculture enriched by two new nitrogenous fertilisers in which the nitrogen is derived from the atmosphere by artificial means. Sir William Crookes had drawn attention to the possibilities of the fixation of nitrogen by means of the electric spark, but the process only attained commercial realisation through the methods devised by Birkeland & Eyle, now worked on an enormous scale at Notodden in Norway. In this process an alternating current of about 5,000 volts, derived from water power, is set to form an arc between U-shaped copper electrodes, water cooled. The arc is spread out into a broad flat flame by means of a powerful magnetic field, and through it is blown a current of air at gentle pressure. The issuing air at a temperature of 600–700° C. contains about 1 per cent of nitric oxide, which after cooling combines with more oxygen from the air and is dissolved out by water and finally by milk of lime. The final products are nitric acid and nitrate of lime, which latter with about 13 per cent of combined nitrogen is now being sold as a fertiliser. The lime base gives it certain advantages over nitrate of soda on heavy soils deficient in lime, and as the nitrogen is equally effective unit for unit, nitrate of lime forms a valuable addition to the stock of nitrogenous fertilisers.

The other fertiliser depends upon a different principle, the combination of nitrogen with bodies of a metallic nature to form compounds which will give rise to ammonia on decomposition with water. A metal is not, however, the starting point but calcium carbide, now manufactured on an enormous scale for the generation of acetylene. At a temperature of about 700° C. it combines with free nitrogen to form calcium cyanamide, which by the action of water becomes converted into calcium carbonate and free ammonia. The process is now extensively carried out in conjunction with various calcium carbide works situated where water power is available, as at Odde in Sweden, in Savoy, and at Piano d'Orte near Rome. The roughly ground carbide is heated in tubes through which is passed pure nitrogen obtained by the fractional distillation of liquefied air. The product contains 18–20 per cent of combined nitrogen with about 20 per cent of free lime; it is sold under the name of nitrolim or kalk-stickstoff and forms an effective nitrogenous fertiliser, especially valuable on soils poor in lime.

Rothamsted experiments.

Artificial fertilisers

Another series of investigations that may have considerable outcome in practice deal with the results of the partial sterilisation of soil. Various observers had noticed from time to time that a soil which had been heated to the temperature of boiling water was thereby markedly more productive than before. A similar increase of fertility follows treatment with volatile antiseptics such as chloroform, toluene, etc. Russell & Hutchinson, working in the Rothamsted Laboratory, arrived at an unexpected solution of the problem. They found that the increased productivity was due to the rapid rate at which the soil developed ammonia after the treatment; the ammonia did not change further to nitrates because the nitrifying organisms had been destroyed, but the plants utilised the ammonia directly. The treatment moreover did not completely sterilise the soil; a small number of organisms, capable of decomposing the nitrogenous residues in the soil into ammonia, are left and multiply with great rapidity, until within a few weeks the numbers of bacteria within the soil are far in excess of those prevailing in the untreated soil. These bacteria account for the increased production of ammonia and therefore fertility of the treated soil. Further investigation led to the conclusion that normal soil contains agencies restricting the development of bacteria and therefore the rate of ammonia production and consequent fertility, which negative agencies are wholly removed by the heating and treatment with antiseptics, and these agencies were identified as protozoa, amoebae, etc., living in the soil, large organisms which feed upon living bacteria. They are killed off by the partial sterilisation, and on the removal of this check the bacteria are enabled to increase their numbers to an extent previously impossible, thus raising the rate of production of plant food from the otherwise unavailable nitrogenous material in the soil. It has been found practicable to apply these principles with commercial success to the treatment of greenhouse soils, which rapidly degenerate and have to be replaced because the conditions of warmth and moisture are especially favourable to the development of protozoa. Again the soil of sewage farms rapidly deteriorates and becomes ineffective towards the purification of sewage from the same causes, but can be restored to its proper character by partially burning the soil or treatment with antiseptics. Much progress has not been made with the treatment of ordinary farm land, as heating is out of the question; the desideratum is a cheap antiseptic of the right degree of volatility.

The rediscovery and extension of the Mendelian theories of inheritance have placed the question of breeding new varieties of domesticated animals and plants upon a new basis, inasmuch as they offer a method by which the attainment of a particular desired result can be foreseen. While animals present certain special difficulties because of the complexity of the factors involved in such characters as meat, milk or wool, plants are simpler, and considerable progress has been made in the application of breeding on Mendelian lines to the production of new varieties of cereals, which afford particularly easy material for work because they are naturally self fertilised. The English and West European varieties of wheat for example are distinguished by their capacity for heavy cropping, but they do not command the higher range of prices because flour made from them is not "strong," *i.e.* it does not make large loaves and is starchy rather than nitrogenous in comparison with the wheats grown in the east of Europe, Manitoba, Kansas, etc. Some of the latter wheats preserve a considerable measure of their strength and high nitrogen content on English soils, but the yield is too low to enable them to be profitable even at the higher price per bushel. Biffen at Cambridge has shown that this high nitrogen content and strength is a Mendelian character that segregates in the offspring of cross-bred parents, and has succeeded in breeding one or two varieties which combine to a marked degree the cropping powers of the English wheats and the strength of other varieties, and one at least of these new cross-breeds is now being grown commercially in England. Other experiments that promise success on a working scale deal with the breeding of wheats proof against rust, a disease which seriously affects the yield of wheat in many of the warmer countries and may indeed prohibit their growth, as over much of S. Africa. A rust-proof species had been found, and though its miserable yield deprives it of all commercial value it transmits its

**Sterilisation
of soil.**

**Mendelism
and cereals**

immunity on Mendelian lines when crossed with other varieties; hence by suitable crossing and selection a rust-resistant variety yielding normal crops has been obtained. Another line of attack has led to considerable improvement among existing races of cereals, and that is the process of selection of "pure lines" associated with Nilsen and the experimental station of Svalof in Sweden. If a field of any variety be examined, putting aside accidental admixtures, a considerable range of variation will be observed in such characters as the length of ear, the stiffness of the straw, the size of the grains, etc., etc. The majority of these differences are due to accidents of nutrition and are not inherited, but by selecting a number of ears from plants possessing the desired characteristics and growing the corn from each separately a few will be found to transmit the variation, and by raising a stock of seed from the best a permanent improvement in the variety can be effected. Moreover such a pure strain will be found to possess a great uniformity in the time of ripening and similar factors, which alone may make it of more value than the composite out of which it originated. The success of such breeding along pure lines is in marked contrast to the failure of many attempts to improve crops by mass selection, *i.e.*, by picking out a large number of the best ears or the heaviest corns and raising a stock of seed from this aggregate. So large a proportion of the improved material owes its character to nutrition alone and falls back in the next generation, that the resulting mixture of strains is very slightly better than the unselected mass.

The scientific advance in the theory of the nutrition of animals has been of too technical a nature for discussion here, especially as it has resulted in no modifications of practice; but the advent of a new and valuable feeding stuff into Europe may be noted. This is the soya bean, which has been long grown for both human and cattle food in China and Japan. At the close of the Russo-Japanese war, when Manchuria was opened up to Japanese traders, it was found that large quantities of this bean were obtainable, and the firm of Mitsui embarked on its importation into Europe. The bean contains up to 17 per cent of a neutral tasteless oil, valuable for food, soap making and other purposes to which vegetable oils are applied, and this oil is extracted by pressure in the usual way. The residual cake forms a valuable food for all classes of stock, containing about 6 per cent of oil and over 40 per cent of proteins. Its advent has been particularly fortunate in that it occurred at a time when linseed cake, for which it is almost an equivalent, was rising to an exceptional price.

*Soya
bean.*

(A. D. HALL.)

AGRICULTURAL ORGANISATION IN THE UNITED KINGDOM

The increasing demand for state assistance for agricultural research and education, improvement of live stock, furtherance of co-operation, etc., led Mr. Lloyd George, as Chancellor of the Exchequer, to introduce the Development Act in 1909, under which a Commission was appointed to make recommendations to the Treasury of grants for the promotion of rural industries. The grants are to be made either to a government department or to a university or other association not trading for profit, and a sum in the first instance of £2,500,000 has been set aside for the purposes of the Commission. Under this Act schemes have already been approved and grants made for the furtherance of research and education, for the promotion of co-operation, for the improvement of live stock and horses, for experiments in the cultivation of tobacco, flax, hemp, etc., etc.

Up to 1911 the Board of Agriculture was charged with the administration of agricultural affairs in England, Scotland and Wales. In 1911 a separate Board was created for Scotland, to which were transferred the duties appertaining to the old Board as regards Scotland, higher agricultural education, and the administration of a scheme of land purchase for the creation of small holdings. To this Scotch Board of Agriculture an annual grant of £200,000 is made.

Owing to the increased grants derived from the Development Commission the organisation of agricultural education and research has been considerably advanced of late years in the United Kingdom, and very shortly it will possess a complete system

making provision for all grades of instruction. The schemes to which effect is now being given deal with research, higher and intermediate agricultural education. Provision for research is being made by the foundation of a number of institutes, as a rule attached to a university, each dealing with one branch of agricultural science.

As regards higher agricultural education, England and Wales are divided into 12 provinces in each of which an Agricultural College or Department of a University is located, where long courses of instruction are given leading to a degree or diploma in agriculture. These colleges receive grants from the Board of Agriculture of about £1000 each for education, and in addition grants of £1000 each to provide a staff available for advisory work and local investigation within its area, together with a further grant for a Live Stock officer charged with the organisation of certain schemes for the improvement of live stock.

As regards intermediate agricultural education, all forms of agricultural education below the colleges were formerly under the supervision of the Board of Education, the county being the unit of area and the County Council the authority, but in 1911 the control was transferred to the Board of Agriculture, who administer a grant from the Development Commissioners for the setting up of Farm Institutes. A farm institute may be established by a single county or a group of counties and may take the form of a Farm School receiving pupils for a year or less, a winter school giving short courses of instruction in the winter months, or an institute serving as a centre for short courses of instruction in special subjects and for the itinerant lecturers employed in the county. Travelling dairy schools and similar practical instruction also form part of the programme of the institutes.

In Scotland the whole of the agricultural education is supervised by the Scotch Board of Agriculture, and is carried out under Colleges of Agriculture, associated with the Universities of Edinburgh, Glasgow and Aberdeen. These colleges possess in addition to their resident staff, which gives instruction leading up to the degree of B. Sc., a large extension staff of whom one or more is resident in each county included in the province appropriated to the college. These instructors give lectures, conduct experiments and generally advise the farmers within their area. Many of the primary schools have developed a strong agricultural side to their teaching but no farm institutes exist in Scotland.

The provision of agricultural education in Ireland is administered by the Department of Agriculture, working as regards intermediate and lower education in conjunction with the County Councils. A three years' course of instruction in agriculture and the applied sciences is given at the Royal College of Science, Dublin, and a one year's course of a more immediately practical character at the Albert Agricultural College, Glasnevin, to both of which institutions the Department grant scholarships. The Munster Institute, Cork, and the Ulster Dairy School provide instruction in dairy work and creamery management, while at Athenry, Co. Galway, Ballyhaise, Co. Cavan, and Clonakilty, Co. Cork, are agricultural stations at which short courses of instruction, chiefly practical, are annually given. In addition the Department maintains a service of itinerant instructors in agriculture working in conjunction with the county councils.

The most notable movement of late years has been the revival of interest in small holdings. The returning prosperity of the agricultural industry consequent on the rising prices of farm produce became noticeable about 1904-05; a demand began to spring up for farms, until about 1908 it was rare to find farms in hand in any parts of the country, and a year or two later so numerous were the enquiries that increased rents could be obtained for all land that fell vacant. In 1910 rents were in some cases raised to the sitting tenants, and despite the fact that 1911 and 1912 proved bad seasons in certain parts of the country, there are still more applicants for farms than can be satisfied and rents are everywhere rising. This demand for land on the part of working men resulted in 1907 in the passing of the Small-Holdings Act, amending the previous Act of 1892. The new Act gave county councils the power not only to buy land and resell it to small holders but to take land on lease and let it on such terms as would repay the councils for their expenditure. The county councils were given compulsory powers for both purchase and hiring of land and a number of commissioners were appointed to stimulate and assist the councils, the Board of Agriculture being given powers to put the Act in operation wherever it was found that the county council was backward. Under this Act a large number of statutory small holdings have been created, the success of which cannot as yet be estimated, though there is evidence that the expenses incurred by a public body in purchase, division, the erection of buildings, etc., are burdening the holdings with rents that are difficult to earn. Under the operations of this Act holdings of between 1 and 50 acres, which had fallen to their lowest number in 1908, increased from 287,176 to 292,488 in 1911. The Small

Small Holdings.

Holdings Act with its compulsory powers, followed by the Finance Act of 1910, created a feeling of distrust among owners of land, which with the rising values due to the returning prosperity of agriculture, prompted an unprecedented number of estate sales. During 1910 and 1911 the sales both of large and small estates went on in increasing volume, and many tenants found themselves in the difficult position of having either to give up their farms, which they had worked up into a profitable condition from their previous depressed state, or to find the capital for their purchase. Many cases of hardship occurred, until there was a call for legislation, and a Departmental Committee which reported in 1912 was appointed to consider the advisability of state assistance towards enabling sitting tenants to purchase their holdings.

During the period of depression the British farmer may be said to have emancipated himself from the covenants as to the course of cropping that proved so characteristic a feature of the old agreements, whether for a lease or for a yearly tenancy.

Cropping. Freedom of cropping and sale has been rendered possible by the introduction of artificial manures and imported feeding stuffs, which enable the farmer to restore to the farm the elements of fertility which are being sold away in the crops. Under the old four course rotation all that was lost to the land was the nitrogen, phosphoric acid and potash contained in the corn and meat sold, and the losses of the first named element were replaced by the nitrogen of the atmosphere brought into combination during the growth of the clover crop; the roots, the hay and the straw, which make the chief demands upon the soil, were all returned, and under such a conservative system of farming the fertility of the land could be maintained almost indefinitely, though the level of production attained was not high. The sale of the so-called recuperative or green crops, or even the introduction of additional corn crops into the rotation, disturbed this equilibrium, and the losses had to be repaired by imported fertility as manure or food. Still it can hardly be said that the British farmer was emancipated from his old restrictions because of any increased appreciation of the scientific issues involved; in the bad times he became able to make what bargain he pleased and could force his landlord to accept any scheme of cropping that would yield a profit.

The old fashioned farming on which the covenants were based assumed that the crops were taken out of the soil; modern intensive farming only uses the soil as a medium to transform certain raw materials, manures and feeding stuffs, into saleable produce. Big crops do not in practice prove exhausting to the land, because they can only be attained by getting the soil into high condition and supplying an overplus of manure. The last decade having been a period of advancing prices has encouraged British farmers to raise the fertility of their land and aim at systems of cropping that would ensure larger returns per acre. It cannot be said that any new rotations have been introduced, for the underlying principles are of course not subject to change, but such systems as permit of more than two years corn in four, or the introduction of a paying crop like potatoes, or the reduction of the labour bill, have resulted in widespread modifications. For instance the five course shift—roots, barley, seeds, wheat, barley or oats—nowadays more characteristic of Norfolk than the rotation called “the Norfolk,” has become very general, or even a six course, like wheat, oats, roots, oats, wheat, seeds, found in the maritime plain of West Sussex, is now regularly followed because thereby the land yields two saleable crops in three years. As examples of cropping dictated by the potato crop we may instance a characteristic East Lothian rotation—potatoes, wheat, seeds, potatoes, turnips, barley, or a Lincolnshire one—potatoes, oats, wheat, with seeds every seventh year. On the other hand we find in Scotland a tendency to increase the duration of the grass in the rotation; as prices fell and labour grew more costly it became common to leave the seeds down for two or three years, the five or six shift. Indeed the longer system has been forced upon many farmers by the increasing trouble with “finger and toe” in the turnips, which, however, becomes greatly reduced during the comparatively long rest from cruciferous plants the land obtains when laid down to grass. Near large cities, where market gardening prevails or where there is a demand for hay and straw, and root crops and green meat for the town

dairies, farmers have often lost any idea of rotations; they consult their convenience and the promise of the market entirely, though cleaning the land and arrangement of labour necessitate some alternation of green and straw crops. With the need for heavy manuring the necessity for a sequence of crops largely disappears; near Penzance for example farmers have for forty years grown year by year a crop of early potatoes followed by one of broccoli, and on the Ayrshire coast early potatoes are similarly repeated on the same land and followed up by some sort of catch crop to be eaten off by sheep.

The intensive-growers of market garden and other produce in the neighbourhood of the large towns are beginning to find their operations curtailed by the rapidly increasing difficulty of getting town manure. For example near London one great market gardening district is the strip of light Lower Greensand that is found in Bedfordshire by Sandy and Biggleswade; another lies upon the thin Bagshot Sands and the alluvials derived from them in Surrey; another upon the equally poor sands of the Eocene in North Kent; all soils naturally of the poorest quality but easy to work early and grateful when liberally supplied with dung. The potato growers on the gravels of Hertfordshire, which Arthur Young described as "the jaws of a wolf," and the hop growers of Kent, are equally dependent upon London manure, as the Lancashire and Cheshire potato growers look to the Lancashire towns and the Ayrshire men to Glasgow. But the advent of the motor-car, particularly its displacement of horses in omnibuses, trams, and the vans of the big carrying companies, has already enormously reduced the amount of manure produced; London manure for example, which six or seven years ago could be bought at 1s. a ton on rail or on barge, has now risen to over 4s.6d., and become of much inferior quality. At the same time the town market for straw and hay has declined, so that considerable changes in the farming methods near the large towns are inevitable. It is difficult to see how the market gardeners can easily replace the dung they are losing; on the light soils an abundant supply of humus is as essential as the fertilising elements that are also supplied by farmyard manure. Failing the latter the only alternative method of obtaining humus is to turn in green crops, but the market gardener cannot as a rule afford to leave his land idle even for the time in which to grow a catch crop like mustard or tares.¹

It cannot be said that any new staple crops have been introduced into the United Kingdom. Some considerable experiments, have, however, been made in the direction of reintroducing tobacco, experiments mainly conducted in Ireland and owing their substantial progress chiefly to Sir Nugent Everard of Randles-town. Tobacco was at one time grown freely in England, Scotland and Ireland, but the cultivation was put down, partly in the interests of the Virginia settlement and partly because of political objections to the excise that had to be applied as an equivalent to the customs duty. Permission having been obtained from the Treasury, who granted a bounty of £50 an acre and an excise rebate of 2d. per lb. of manufactured tobacco, experiments began in 1904, and 124 acres were in 1912 under crop in Ireland. Corresponding experiments did not begin in England until 1911, 39 acres being so cropped in 1912. It has been demonstrated that certain grades of smoking tobacco, particularly a Virginian variety known as Blue Prior, will grow with great vigour in the British Isles, crops as large as 1600 lbs. per acre of merchantable tobacco having been obtained, but it has not yet been demonstrated that the culture will succeed on a commercial scale without any bounty. Further experiments extending to 150 acres in Ireland and about the same area in England have been sanctioned.

Considerable interest has been aroused in the question of whether the sugar beet crop can be given a footing in British agriculture, largely through the efforts of Mr. Sigmund Stein, who for many years has organised the growth of trial plots of sugar beet in various parts of the kingdom, and by the analysis of the roots had demonstrated that crops can be grown as large as or larger than those obtained on the Continent, and

¹In view of the decline in the supply of manure, the chief engineer to the London County Council suggested in December 1912 that attention should be directed to the utilisation of the London sewage, which at present is simply carried out to sea and destroyed.

of equal richness and purity. During 1909 and 1910 crops on a commercial scale were grown in East Anglia and exported to Holland for manufacture, but owing to the large amount of capital required for a modern factory none of the projected undertakings was able to make a start. The Government were precluded from extending any assistance so long as they were bound by the provisions of the Brussels Convention, but in 1912 a branch of a Dutch company established a factory at Cantley in Norfolk. It may be taken as established that profitable crops may be grown in England at prices equivalent to those paid by the Continental factories. The question is whether the manufacturing process can be conducted cheaply enough to make the industry profitable.

growing.**

(A. D. HALL.)

DRY FARMING

The term "Dry Farming" has come into use to meet the need for a descriptive name for that type of farming which has been developed without irrigation in semi-arid regions where irrigation is desirable but impracticable. No infallible rule can be laid down as to the range of annual precipitation which will include the dry farming regions and delimit them from humid regions on the one hand, and from arid regions on the other. It is however fairly well recognised that, in most parts of the United States and Canada, the minimum requirement for dry farming is represented by about 12 inches annual precipitation, and that 20 inches or more is sufficient, when properly distributed, for crop production, on most soils of the Middle West, by ordinary methods of humid agriculture.

For several years past annual international congresses have been held in the western states of the United States in the interest of the dry farming movement. The 5th congress, held at Spokane, Wash., October 3-6, 1910, was attended by 1,200 delegates and the 6th, held at Colorado Springs, Colo., October 16-20, 1911 and presided over by President J. H. Worst of North Dakota Agricultural College, was even more satisfactory. The seventh was held at Lethbridge,¹ Alberta, Canada, October 21-25, 1912 and was attended by delegates from 15 nations. W. R. Motherwell, minister of agriculture for Saskatchewan, was chosen president for the ensuing year and resolutions were adopted favouring the raising of a fund of \$1,000,000 for the purpose of maintaining permanent headquarters and inaugurating a world-wide propaganda. Oklahoma City, Okla., was selected as the place for holding the 1913 congress. An important part of the work of the U.S. department of agriculture and of many state agriculture experiment stations in 1912 related to the subject of dry farming.

The most distinctive feature of dry farming, as compared with other types of farming, is that it recognises the conservation and utilisation of moisture as the aim and end of all agricultural practices having to do with soil preparation and crop production. Even the problems involved in the quality of the crop produced, and the maintenance of soil fertility, which are of major importance in most systems of agriculture, assume a minor importance in dry farming. It is more important that a variety be selected that is reasonably certain to grow and produce a moderate crop of fair quality under semi-arid conditions than to select one that might produce a superior quality and quantity of crop if climatic conditions happened to be favourable, but would fail to produce any crop under adverse conditions. The problems of soil fertility under dry farming conditions are relatively simple as compared with those of humid agriculture. Dry farming soils are usually rich, especially in the mineral elements of plant food, for the reason that they have been formed under arid or semi-arid conditions which, instead of leaching out the soluble salts formed from the disintegration of rock material, have caused an accumulation of these salts near the surface. The same climatic conditions which have produced these fertile soils will tend to preserve these salts under dry farming methods, which take from the soil but small quantities of mineral plant food for the production of the moderate crops usually produced. The

¹ *Dry Farming and Rural Homes* (founded 1906), the official bulletin of the congress, is published monthly at Lethbridge, Alberta.

deterioration in the soil under dry farming is therefore likely to be mainly in the loss of the organic matter. In most virgin dry farming soils the organic matter is low in quantity but high in nitrogen content, and it may be rapidly destroyed under faulty methods of farming, particularly where bare fallow is frequently practiced, and where the amount of organic matter which is restored by plowing under some portion of the crops grown is small. Here occurs another contrast between dry farming and humid farming. The main object usually sought in increasing the organic matter in soils of the humid regions is to provide nitrogen, while under dry farming the main purpose is to improve the physical condition of the soil in its relation to water, with the addition of nitrogen as a secondary consideration.

Many attempts have been made to elaborate some general system of dry farming that would meet all conditions. Such attempts could be made only by those with an entirely inadequate conception of the magnitude and complexity of the problems involved and the diversity of soil and climatic conditions to be encountered, or by those having some ulterior motives in promulgating such theories. The soils of the dry farming regions range from the lightest sands and silts to the heaviest clays, and the annual precipitation from severe drought to humid conditions. Even in years of normal precipitation the daily distribution of the rainfall in relation to the stage of development of the crop and the character of the soil may under some combinations of these factors result in the production of an abundant crop, and in others a total failure. Practically every detail of dry farming practice must be predicated upon the particular combination of soil, climatic and economic conditions with which the farmer is confronted at the time, nor can he disregard the conditions that are likely to exist at some future time. For instance, some have advocated early deep fall plowing as an invariable practice. Some soils under some climatic conditions are in such conditions at that time of year as to make deep plowing, and in some instances even shallow plowing, utterly impracticable. The dry farmer must then look forward and attempt to form an opinion as to what combination of conditions is likely to exist during the following spring, and to calculate how much spring plowing he can do with his available teams before seeding time. He may come to the conclusion that he must disk some of his land without plowing at all, and it is not impossible that he may get his best crop on his disked land. A few years ago the "dust mulch" was recommended by many as the only proper means of conserving moisture. Practical farmers, however, soon discovered that on some soils the heavy winds would remove the entire "dust mulch" and not only ruin the field from which it was blown but in some instances the adjoining fields upon which it was deposited. Such have been the results of many attempts to maintain a dust mulch on the wind-swept prairies of the Great Plains. At Nephi, Utah, during the summer of 1900 a different result was obtained on a summer tilled field which was supposed to be in ideal condition, being covered with a fine "dust mulch." A heavy, beating rain of 2.5 inches occurred and it quickly reduced the dust mulch to a pasty impervious covering, which allowed but 20% of the rainfall to be absorbed, while on an adjacent stubble field 40% of the rainfall was absorbed. Similar results have been noted in many other instances. It has been found that both of the above mentioned difficulties can usually be avoided either by leaving the land unplowed and protected by the stubble of the previous crop during the fall and winter, or, if plowed, by keeping the surface, until seeded, in an uneven or cloddy condition. Subsoiling or very deep plowing is now being very strongly recommended by some, but many experiments on a great variety of soils and under varying climatic conditions have shown that frequently as good and sometimes better crops can be grown on shallow plowing, or even on land that has been disked but not plowed since the previous crop was harvested. This practice is particularly applicable where small grain is to follow a crop of corn. Alternate cropping and summer tillage is a favorite practice in some dry farming districts, especially in Utah and Eastern Oregon and Washington and in some of the Canadian provinces, but dry farmers are learning that a properly planned system of crop rotation in which corn or some other inter-

tilled crop alternates with untilled crops of grain gives better returns than alternate cropping and summer tillage in many localities. The occasional plowing under of a green manure crop in such a rotation has been found very useful in many instances.

From the above considerations we deduce the following general rules concerning the practice of dry farming:

(1) While some very successful dry farming has been done on heavy clay soils, a sandy loam soil which is naturally receptive to precipitation, which can be made sufficiently retentive by proper methods of tilling, through which soil water moves freely, which yields up readily to the plant a large proportion of its water, and which affords a favorable medium for an extensive root development, will usually give better results.

(2) In the selection of strains, varieties and species of crop plants, choose those which have become adapted to semi-arid conditions, giving preference, other things being equal, to the smaller and earlier maturing strains.

(3) Practice thin seeding—from one-quarter to one-half the amount commonly used in humid regions.

(4) Having selected crops which will grow and which can be profitably utilised, work them into a rotation which will, so far as possible, allow an alternation of inter-tilled crops with untilled crops, and will insure some return of organic matter to the soil at frequent intervals.

(5) Study the soil, the climate, and the crops, and adopt such methods of tillage as will insure the most complete utilisation of the precipitation, bearing in mind that the dry farmer is dealing with an ever-changing combination of factors, and that no invariable rules or systems ever have, or ever can be, formulated that will be of any assistance to him unless he learns by careful observation on his own farm to know the problems involved, and can, as they arise from day to day, intelligently adapt available means to desired ends in their solution.¹ (ELLERY CHANNING CHILCOTT.)

THE DAIRY INDUSTRY²

The most notable features in the recent development of the dairy industry, as exemplified especially in America, are as follows:—the marvelous increase in the demand for cream for ice cream manufacture: the revolutionary changes in methods of pasteurizing and handling milk for city distribution, together with the attention given to milk problems by municipal authorities: the development of the centralised creamery, receiving and handling hand-separator cream from a large territory as distinguished from the cooperative creamery dependent upon a comparatively restricted community; the testing of pure bred dairy cows for yearly production under the supervision of state agricultural experiment stations; the organisation of cooperative associations for ascertaining the production and cost of feeding dairy cows, and the organisation of communities with a view to predominance of single dairy breed in that community, with its advantage of large numbers of high class animals of one breed; and lastly, a growing recognition of the impossibility of taxing fraud out of the sale of oleomargarine, and an increasing demand for legislation requiring oleomargarine to be sold on its own merits as such.

Ice Cream.—In the United States ice cream has changed from an occasional luxury to being a common beverage or confection sold at every corner drug store, and a regular dish on the public and private dinner table; and this has taken ice cream making from the domain of the cook and the chef to the factory, where the cream and flavouring material are mixed in great vats, then conducted by pipes to power driven freezers, frozen by mechanically chilled brine and stored in hardening rooms held

¹ See the articles "Dry-Land Farming in the Great Plains Area" and "Some Misconceptions Concerning Dry Farming," by E. C. Chilcott, in the *Year-Books* for 1907 and 1911 of the U.S. Department of Agriculture; *A Study of Cultivation Methods and Crop Rotation for the Great Plains Area* (Bulletin No. 187, Bureau of Plant Industry, 1910), by the same author; and J. A. Widstoe, *Dry Farming* (1911).

² See *E. B.* vii, 737 *et seq.*

at zero to five degrees above by mechanical refrigeration so that ice is not used until the ice cream is packed in tubs for delivery.

The hand driven quart ice and salt freezer has been superseded by batteries of a score or more of 10 gallon, often individually electric driven, brine freezers. It was estimated that 138,000,000 gallons of ice cream were made in the United States in 1911-12, representing over 150 millions of dollars paid by the consumers.

Market Milk.—In cities of any size the milk man who delivers the milk produced by his own cows within driving distance of town has been displaced by the distributor, who buys milk by the car or even train load from the country as many as 400 miles distant, and employs wagons in many cases to the number of 500 and over to distribute it to the consumer. An increasingly large proportion of this milk is pasteurized before distribution to guard against dissemination of disease and to prolong keeping quality. Recent investigation has convinced the thoughtful student of the problem that flash pasteurization, heating to 165 degrees momentarily and immediate cooling, ordinarily fails to remove the danger of disease due to bacteria. This method is rapidly being superseded by the "holding system," *i.e.* heating to a temperature of 145 to 150 degrees for from twenty minutes to half an hour, then cooling and bottling or bottling hot and cooling in the delivery container. Establishments equipped to pasteurize two to three hundred thousand quarts of milk, and to wash and fill as many bottles within a few hours each day, are to be found now in every large American city.

"*Certified Milk*" is milk produced under such conditions of cleanliness of cows, barns, attendants, freedom from disease, promptness in cooling and delivery, that in America the milk commission or the county medical society will "certify" to the public that the milk meets the bacterial and sanitary standard established for a milk suitable for infant food. The making of machinery for the bottling of milk, washing of bottles, pasteurization of milk and freezing of ice cream and manufacture of butter on a large scale has recently assumed gigantic proportions.

Butter Making.—The demand for milk and cream for retail delivery and ice cream manufacture has stopped the creamery butter-making in most territories tributary by railroad to the large cities, especially in the eastern United States. The centrifugal hand-separator is now found on a large proportion of the farms where butter is made, and has made possible the recent development of the centraliser creamery, each of which receives cream produced and separated on several thousand farms within two or three hundred miles radius, in many instances superseding the skimming stations to which the farmer hauled his milk and cream and from which he took home the skim milk.

Moisture Test.—The establishment in America of a Federal maximum moisture content of 16% for butter has brought to the front the moisture test, and made possible its convenient determination.

Artificial Buttermilk.—The writings of Metchnikoff on the influence of lactic acid bacteria in prolonging life by lessening the putrefactive fermentation in the intestine has stimulated the production of artificial buttermilk under such trade names as Fermillac, Heltho, Vitalc, Bacillac, Zoulak and others. They are made from skim-milk, or that with a low fat content, soured to the point of coagulation of the casein by the lactic acid produced by a combination of pure cultures of lactic acid forming bacteria, such as *Bacterium lacticum* and *Bacillus bulgaricus*, after which it is thoroughly agitated to break up the curd and make a smooth product.

Feeding Standards.—German scientists first promulgated the idea of supplying the animal body with the required constituents in definite proportion and in terms of composition of the feed, *i.e.* protein, carbohydrates and starch. Under the direction of Dr. H. P. Armsby of the Pennsylvania State College, and in co-operation with the United States department of agriculture, was built the first respiration calorimeter for accurately determining the disposition of food eaten by animals, by recording and analysing all ingo and outgo of air, food, water and excreta. This work has resulted in a method of indicating the relative value of foods and standards of daily requirements in terms of net energy (*i.e.* power to do work) after deducting from total energy of feeds

that lost in faeces, urine and gas voided, and that required for mastication and digestion of food. A short method of computing rations to supply the daily need of dairy cows has been outlined.¹

Production Records.—Recent advances in the price of feed and labour have rendered unprofitable the cow producing a low yield of milk and butter fat, and have stimulated interest in the securing of accurate data as to actual production by individual cows, through the Advanced Registry, local cooperative test associations and private records. The elimination of unprofitable cows and the increased consumption of dairy products have stimulated the demand for profitable cows until prices are from 50 to 150% higher than five years ago.

Advanced Registry Testing of pure bred dairy cows is the result of a demand for accurate, impartial knowledge of the year's production of milk and butter fat by individual cows. The agricultural experiment stations of most American states send a representative to see the milk from each cow weighed for two days per month, and determine its fat content, which with the owner's daily record furnishes the basis of milk yield for the month's estimate of butter fat production. Compared with the average production per cow for the United States of less than 150 pounds of butter fat in one year, the highest individual records in each of the leading breeds are significant:—Holstein cow, Banostine Belle De Kol, 27,404.4 lbs. milk, 1058.34 lbs. fat; Jersey cow, Jacoba Irene, 17,253.0 lbs. milk, 952.95 lbs. fat; Guernsey cow, Spotswood Daisy Pearl, 18,602.8 lbs. milk, 957.38 lbs. fat; Ayrshire cow, Netherhall Brownie 9th, 18,110.0 lbs. milk, 820.91 lbs. fat.

Mechanical Milkers.—Scarcity and high price of labour has stimulated a demand for the mechanical milker. The Burrell, Lawrence, Kennedy and Sharples mechanical milkers seem now to have reached a degree of efficiency where it may be said that they will milk most cows as well as or better than the average man, though not as well as the best hand milker, while a few cows cannot be milked thoroughly by either machine. They require more intelligent attention to operate and clean than the common labourer ordinarily is competent to give, though within the reach of the better grade of farm labour; they are usually most successful in the hands of the intelligent farm owner who operates his own machine instead of depending on employés.

National Dairy Show.—In America a National Annual Exposition of the dairy industry has become firmly established in Chicago. The show of 1912 brought together nearly 1,000 of the finest dairy cattle, every kind of mechanical device from stable fixtures to pasteurizer, churns and laboratory equipment, and attractive displays of butter, cheese, milk and cream from many states. Commercial demonstration of latest methods of bottle washing, pasteurization and bottling of milk for retail delivery and making of butter, occupied much space, as did the United States government demonstration of feeding methods with profitable and unprofitable dairy cows and municipal exhibits of the influence of bad housing, poor milk and preventable diseases on infant mortality in great cities. Visitors were present from every section of the United States, Canada and England.

(H. E. VAN NORMAN.)

POULTRY FARMING

Within the last few years the abandonment of a number of the largest spectacular poultry farms in America has had a marked effect upon the general attitude there toward large poultry projects. People are not so ready to engage in them, or to take reports of quick successes on a large scale at their face value. The public is learning to discriminate as qualified observers acquainted with the history of various enterprises of this kind have always done, between the real and the fictitious successes. There are many large poultry farms in the United States and the number may greatly increase, but too many of those kept prominently before the public as practical poultry farms have used the publicity that could be thus secured to advertise something that they had to sell, not to consumers of poultry produce but to producers.

¹ Bulletin No. 114, Pennsylvania Experiment Station.

The lines in which operations on a large scale have been undoubtedly successful for long periods are the growing of ducks for the market, and sale of exhibition and breeding fowls. Duck growing has been developed on a very large scale on independent farms. Several of these for many years have produced about 50,000 ducks a year. One grower who operates two large farms some miles apart produces from 70,000 to 80,000 ducks a year. Farms producing from 10,000 to 15,000 ducks a year are much more numerous than those making a larger output. The successful farms are all operated by owners who have built up from small beginnings. The plants established on a large scale at the start, as investments, invariably fail.

The larger plants doing a business in exhibition and stock fowls grow only a part (sometimes a small part) of the birds that they sell. This is a necessary condition because selling ability and judicious advertising develop a demand far greater than can be supplied from the stock grown upon one farm. This class of poultry cannot be crowded but must have ample range. So as the business grows the breeder usually puts out as much stock as possible on other farms, and often also buys stock from smaller breeders. The latter practice leads to some abuses, but on the whole is to the advantage of all concerned. Very large plants of this type are not numerous.

By far the greater number of poultry farms of all types are small, requiring the services of only one or two men. The plants for growing roasting chickens are on this scale, or smaller. Only a few of these have an annual output exceeding 2,000 or 3,000 chickens. The special egg farms of Petaluma, California, are on about the same scale. In the roaster growing section of Massachusetts and on the egg farms of Petaluma troubles due to carrying large stocks of fowls continuously on small areas of land are increasing. The same condition is apparent on many of the scattered farms. This and the gradual increase of interest in poultry among general farmers and those residents of towns who have room to keep poultry constantly tend to restrict the growth of exclusive poultry farms. With variations due to differences in customs and economic conditions in different countries, the conditions of poultry production are much the same the world over. With the decline of confidence in mammoth poultry projects an unusual interest arose, as if in reaction, in methods of keeping small flocks of fowls in very close confinement. This plan was exploited largely by the sale of books, each of which described a "system" devised by its author, whereby a very small number of fowls might be made enormously profitable. Such ideas had often before been exploited in a small way. At this time skillful advertising on a very large scale enabled some of the promoters to realise very large profits. In America, where the movement started, it made quite a sensation for several years. In England it was at first ridiculed as characteristically American, but before long English promoters were exploiting similar ideas. The interest in these highly intensive methods still continues, but greatly abated. The indications are that the net result of the movement will be to add many recruits to the number of poultry keepers who use more rational methods.

Production and Distribution.—The increased production of poultry and eggs in all progressive countries is marked. Statistics for the United States attract most attention because of the magnitude of the totals, and the impression is often conveyed that progress is more rapid there than elsewhere. A more correct view is that most progressive movements acquire an initial impetus more easily in America than elsewhere. Comparisons of production in the United States with that of different European countries does not fairly represent progress in Europe. Comparing Europe as a whole with the United States and Canada there is a remarkable parallelism. In Europe England has been the principal market for the surplus of the Continental countries, just as in America the New England and Middle States have furnished a market for the surplus of the West and South. The general history of the extension of interest in poultry culture in recent times on either continent is in nearly all essential particulars very like the history of development on the other. In the United States as a whole production and consumption have been very evenly balanced; but within the United States too there have been backward regions—just as there have been in Europe.

The tariff on imports restricting movement of poultry produce from Canada to the natural market in the States for a time prevented the development of poultry culture in Canada. It was well advanced in Ontario but backward in other parts of the Dominion. Efforts to build up an export trade with England had the unexpected result of stimulating home consumption to such an extent that, although production greatly increased, the surplus which could be profitably exported dwindled to exceedingly small proportions.

In England and Scotland the question of future supplies of poultry produce has become important, because it has long seemed plain that without some concerted effort for a general increase of production on farms the falling off in imports would not be offset by increased production at home. Within the last year the figures for the census of poultry on the farms of Great Britain, taken in June 1908, have been published. These show a total of 36,728,000 head of poultry of all kinds, divided as follows: fowls, 32,356,000; ducks, 2,963,000; geese, 712,000; turkeys, 697,000. "Statistician," writing in the *Illustrated Poultry Record*, August 1912, observes that the number of fowls is almost precisely one to the acre of cultivated land in Great Britain, and that an average of three fowls per acre might be kept without the displacement of any other crop.

In Germany the consumption of poultry and eggs is increasing much faster than the home production. The increased demands of Central and Western Europe have especially stimulated production in Russia, and it seems apparent that that country will soon occupy a position in poultry production in Europe like that of the agricultural regions of the West in America.

The figures for the number and values of poultry in the United States as obtained in the census of 1910 were also issued during 1912. Those showing egg production have not yet appeared. According to this census the number of fowls of all kinds has increased from 250,624,038 in 1900 to 295,880,190 in 1910, an increase of 18.5%; and the values have increased from \$85,807,818 to \$154,663,220, an increase of 80.2%. The increase in population in this period was 21%. It would appear that the poultry population had not increased as fast as the human population, but as the rules of enumeration of poultry in 1900 and 1910 were not the same, close comparison is not possible. The conditions under which the enumerations of poultry have been made are not favourable to accuracy, and as no account is taken of the poultry not on farms it is apparent that a great deal of poultry is not enumerated. In Buffalo, N. Y., a canvass made by a local poultry association discovered that there were over 5,000 persons keeping poultry within the bounds of this city of 423,000 population. The ratio for all cities and towns would undoubtedly be found higher than this.

With progress general and the total of supplies well maintained, the years 1911 and 1912 have been poor years in poultry production both in Europe and America. The increased numbers of those giving special attention to poultry account for the fact that there has not been a reduction of products over wide areas. Climatic conditions are commonly considered the fundamental cause of the poorer winter egg yields and bad hatches in the spring. Unseasonable and extremely changeable weather affects egg production unfavourably and impairs the vitality of the breeding stock. Lessened yield was in part made up by higher prices for market products, but these seasons were very discouraging to novices. In America the year 1912 is likely to be memorable as a year of hard times for breeders of exhibition poultry, manufacturers of and dealers in poultrymen's supplies, and poultry journals. There was some depression in Europe, but it was most severe in America where all lines dependent upon advertising have been greatly overdone. The close of the year gave many indications of improvement, but it is the consensus of opinion that healthy conditions will not be fully re-established until the elimination of weak concerns and the natural increase of business bring about a more even balance of supply and demand in these lines.

Education.—The most important factor in poultry culture at the present time is the educational movement. This includes not only the work of instruction at colleges

and schools, and the work of experiment stations, but the work of government departments, of poultry associations of many different types, and even of associations of other kinds which are in various ways engaged in education. This movement began to take definite form when poultry courses were introduced into colleges and schools, and to show continuous growth soon after the first such course was established in America, in 1898. It did not, however, make strong headway until near the end of the last decade, and even then many believed that it would soon decline. Within the last few years the permanence of this movement has become assured. Nearly all states and provinces in the United States and Canada now provide instruction in poultry culture at their agricultural colleges, and there are poultry departments at many secondary agricultural schools and industrial schools. Some privately endowed universities are preparing to establish poultry departments. In a number of states poultry culture is taught in special high schools and in a few some instruction in the subject is given in all schools of certain grades. It is generally recognised that this is the branch of animal husbandry best adapted to school work. The wider introduction of practical courses halts for want of qualified instructors and suitable text-books. In other parts of the world the movement is not so marked, yet in nearly every country where poultry production is an important interest beginnings have been made,—in some cases earlier than in America. It will not be long before opportunities for instruction in the subject in all progressive countries are nearly equal.

The most notable events in the educational field in 1912 were the organisation at London of the International Association of Poultry Instructors and Investigators, and the completion of the administration building of the Department of Poultry Husbandry of the New York State Agricultural College at Cornell University, erected at a cost of \$90,000. The reports of experimental work with poultry which in recent years have attracted most attention are those on the inheritance of egg production from the Maine experiment station, and those on white diarrhea in chicks from the Connecticut experiment station. In these experiments popular interest in the subjects allowed a concentration and continuity of effort which are not often permitted to Station workers.

Another example of the results of concentration of force has been given in the work of the United States department of agriculture for the improvement of commercial eggs. This work developed several years ago from investigations of the bureau of chemistry in connection with problems of legislation relating to cold storage. The department of agriculture has used both the bureau of chemistry and the poultry experts of the bureau of animal industry in it. It has been found that there is an annual loss, estimated at \$45,000,000, due to improper handling of eggs, especially in hot weather. Through both the bureaus mentioned a campaign of education to check this loss is carried on by the department.

Current Discussion.—The matters of greatest fundamental importance to poultry keepers which have been prominently discussed in recent years and especially within the past year, without definite results, are:—the fox question, efficient organisation of poultry interests, and international standards for exhibition poultry. The fox question has become more acute in England because of the general increase of interest in poultry on farms, and the special increase due to the recent multiplication of small holdings. In America it has not had much attention except in Massachusetts. In England the Poultry Club, and in America the American Poultry Association are subjects of constant controversy because of their alleged failure to adapt themselves to the needs of the poultry interests which they are respectively to represent. The discussion of international standards has been rather a question of Anglo-American standards. The absurdity of having different standards for the same breed in different countries is on all sides admitted, but as they exist the possible effects of changes of standards upon business have to be considered. While there does not appear to be any prospect of immediate action, interest in this question is significant as an indication of the tendency to standardise poultry culture throughout the world. (J. H. ROBINSON.)

HORTICULTURE¹

The most important event during 1912 in the horticultural world was the great international Exhibition held in the grounds of the Chelsea Hospital, London, from May 22nd to May 30th. The exhibition embraced every phase and every department of modern horticulture with the important exception of market gardening, which, however, was represented in some fine exhibits from Belgium and Holland. As an exhibition of the marvellous skill possessed by the British gardener in bringing fruits, flowers and vegetables to the highest perfection, nothing has ever been seen like it before. The exhibits were divided into eleven main groups and four hundred and twenty-eight different classes. A large area under canvas contained the more tender stove and greenhouse plants from all parts of the globe, as well as roses, carnations, orchids, aroids, crotons, dracænas, palms, ferns, begonias, foliage plants, hardy herbaceous perennials and alpinæ, choice fruits and vegetables, etc.

Rock Gardening.—Although specimens of rock gardening have become a feature at exhibitions of late years, no one had any conception of the marvellous popularity of this kind of gardening until the International Exhibition at Chelsea. Several acres were devoted to rock gardens, and hundreds of pounds were spent in their formation. Thousands flocked to admire the rockeries and the charming alpinæ growing in them, and it was evident that other classes of plants were for once put in the background by the public. At last people are beginning to recognise that it is possible to beautify with appropriate vegetation any piece of land, whether large or small in area. Indeed, it is possible to make quite a charming rock garden in the back-yard of the humblest suburban dwelling, providing one has taste and a certain amount of knowledge of the right kind of plants.

Wall Gardening.—This is of even more recent development than rock gardening, of which, however, it is a variety. It consists in building loose walls with slabs or boulders of stone, filling up the central space between the outside walls with soil, and then filling the outer spaces with plants that naturally flourish in the chinks and crevices of walls. The tops of the walls are, of course, also furnished with suitable flowering subjects, and a quite new garden may be given an ancient appearance by the judicious erection of a wall garden.

Water Gardening.—This may be looked upon as a modern adjunct to the rock garden, and has become very popular during the past few years. At exhibitions, by means of water-tight tarpaulins and a stream of artfully concealed water from the "tap," some exquisite water gardens have been made and have attracted much admiration. A great trade is now done in the beautiful hardy hybrid water-lilies of various shades, and in other water-loving plants that have hitherto been sadly neglected. Closely associated with the water garden is the bog garden, and many plants that love swampy or marshy soil are now grown on the margins of the water garden.

Moraine Gardening.—This is a still more modern phase of rock gardening. It indicates a style of growing alpine plants amidst rocky débris as seen at the foot of glaciers, etc., on the Alps. To make a moraine garden, the natural soil is deported, and its place is taken by a mixture of rock, sand, loam, peat, chalk, lime, etc., so that plants which naturally flourish in one or other of these "soils" may be accommodated as near as possible to their natural surroundings. Moraine gardens are made on slopes or terraces, and the gritty or rocky soil is prevented from being washed down by having the bottom of each slope or terrace shored up with larger boulders of rock. While stagnant water would be fatal, there must however be a good supply of moisture, the idea being to secure a kind of subterranean trickling as from the melting of ice during the summer months.

Japanese Gardening.—This name has now become attached to a particular style of gardening in which an attempt is made to reproduce the peculiarities of Japanese landscape gardening. Thousands of dwarfed specimens of conifers, oaks, maples, etc., are

¹See generally *E. B.* xiii, 741 *et seq.*

exported annually from Japan, and are employed in the formation of Japanese gardens in England and elsewhere. In landscape gardening eastern and western ideas are quite dissimilar. The western idea is to clothe the landscape with vegetation suitable to its aspect, altitude, soil, undulations, etc. In the Japanese style Nature is copied in such a way that plants from the mountain tops are never planted in the plains or valleys, and vice versa. In a small garden, therefore, everything is dwarfed to such a degree to represent as it were in scale, trees, shrubs, buildings, etc., reduced to corresponding dimensions. Hence pigmy trees, the miniature bridges of bamboo, the stone lanterns, the kiosks, the rivulets, rocks, and other objects on the landscape are all arranged to accentuate the governing idea. Deciduous trees are rarely used, the principal exception being in favour of the double flowered cherries, and the wistaria—both conspicuous objects in Japanese gardens. Water or bog plants like the Japanese iris (*Kämpferi*), the water lilies, the lotus, etc., are much in evidence in and at the sides of streams and lakes, while clumps of bamboos give a luxuriant and subtropical effect.

Advance of the American Carnation.—Notwithstanding the many admirers of the hardy border and the Malmaison carnations, these sections are becoming more and more eclipsed by the American or perpetual-flowering varieties. These are now grown in hundreds of thousands and are actually pushing out other crops that have long held a place in the high esteem of cultivators. From a purely market point of view, the American carnation has signed the death warrant of the orchid, many kinds of which had just begun to be grown rather extensively for the floral trade. The extraordinary popularity of the American carnation is due to the ease with which it may be cultivated, its long stems and the beautiful shape of the blossoms, its many shades of delicate colour, its delicious fragrance, its cheapness, and to the fact that it blooms profusely during what in England are the worst months of the year, from October to April (but also during the summer months) and that it may be, and is, used for such a great variety of floral decorative purposes. At present it stands without a rival in these respects; added to which is the fact that the colours always seem pleasing under any condition of light, natural or artificial.

Development of the Dahlia.—In addition to the older sections like the singles, the show, fancy, pompon and cactus varieties, the last year or two have seen the rise of quite new forms—or what are claimed as new, for it is probable that they, or something like them, may have been seen by the first dahlia raisers nearly a century ago, but were discarded because they did not conform to the hard and fast outlines that were regarded as ideals in those days. The “cactus” dahlia is still perhaps the most popular of all sections, but even it is undergoing a change from the original types that were so fashionable a few years ago. Now there is the “miniature” or “pompon” cactus dahlia, in which the blooms, although retaining the perfect “cactus” shape, are much smaller, about 3 inches across, and are borne on long stiffish stems in great profusion. The plants are also much dwarfer than the ordinary kinds, being only about 3 feet high. They flower profusely and embrace every shade of colour almost, except blue.

Another new section of the dahlia is that known as the “collarette.” The flowers resemble those of the ordinary single varieties in general appearance, but they differ conspicuously in having a secondary row or “collarette” of small forked petals interposed between the large outer ray florets and the small tubular ones in the centre or disc. The little petals forming the collarette are usually distinct in colour from the others. The “giant-flowered” dahlias with huge double flowers, and the “paeony-flowered” dahlias, having very large single blooms, are both making headway in popular favour, as newer and better forms are being developed.

Evolution of the Gladiolus.—Since the appearance of the first hybrid gladiolus in 1837, under the name of *gandavensis*, gardeners have worked unceasingly to evolve other new strains. At first the work was slow and spasmodic, and the second hybrid of note, the still popular scarlet-flowered *brenchleyensis*, did not appear till 1848. The Lemoinei hybrids were put into commerce in 1875, and were followed in 1882 by the Childsi section, and in 1889 by the Nanceianus group. Since that time British, Conti-

mental and American raisers have been busily engaged in mixing up the bloods of these different groups, all of which originated in the first place from South African species, far inferior to their descendants in size, shape, colouring and vigour. At first only a few well-defined colours appeared, but now there seems to be no limit to the shades and blendings, and hundreds of exquisitely tinted varieties are in cultivation. It was not, however, until 1911 that experts came to the decision that the time was ripe to establish a special society to encourage the more extended cultivation of the gladiolus, and to arrange and classify in some systematic manner the varieties already known, as well as to improve still further the various strains. In America a gladiolus society has been established some time, and growers are taking the keenest interest in this lovely bulbous plant, in conjunction with British and Continental holders of stock. To give some idea of the trade or the developing craze for the gladiolus, it may be mentioned that a Dutch grower recently gave £1,666 for two corms (bulbs) of a variety with yellow flowers called "Glory of Nordwijk," and there is no doubt that we shall soon be in the midst of a great gladiolus boom. At present the best white-flowered varieties include Albion, Europa, Duchess of Wellington, Prof. Hauber, and l'Immaculée. The finest yellow-flowered forms are Sulphur King, Golden Measure, Goldfinder; in addition to which there are many other lovely varieties.

Herbaceous Phloxes.—Amongst purely hardy flowers perhaps there is none making such progress of late years as the herbaceous phloxes. These plants now have thousands of admirers against dozens not many years back. The ubiquitous hand of the hybridist and cross-breeder is seen in these days among all classes of plants, and the phlox has readily responded to his art. There are now some magnificent varieties in cultivation. The colours vary from the purest white, as in Frau Anthony Buchner and Frau von Lasberg, and the pink, mauve, heliotrope, and the violet-purple of Le Mahdi, to the fine scarlet of G. A. Strohleim and Baron von Dedem. These belong to the "decussata" section and flower in the late summer and during the autumn; the earlier and dwarfer varieties belong to the "suffruticosa" section. Both groups are handsome, and when grown in rich and deeply dug soil they produce immense trusses of blossom.

Exportations of British-grown Apples.—The excellence of the British apple is at last beginning to make itself felt thousands of miles away from home. For many years the British grower has seen the large and increasing importations of apples from the United States, British Columbia, Canada, Australia, Tasmania, etc., and was beginning to think, not unnaturally, that his home markets were about to be swamped. Now, however, owing to the increasing prosperity of South Africa and Buenos Aires in South America, exportations of British apples are being made to these far-off climes. At present the industry is only in its infancy, but it is hoped that the solidity and flavour of the British apple, both due no doubt to a much maligned climate, will enable it to travel long distances and hold its own against all comers.

The season of 1912 completely upset long cherished views as to the necessity of a hot dry summer being essential for the development of high and rich colours in apples. Notwithstanding the cold and excessive wet, the fact remains that apples were, if anything, better coloured than they were in the hot season of 1911, while the flavour is quite up to the standard. Other plants besides apple trees have been remarkable for their more than usually rich colouring, and the Virginian creeper may be cited as a particularly fine example. It is possible that the rains of 1912 were much needed after 1911 to give the soil a thorough good soaking, to liberate those earth salts that go to produce richness of colour.

Potato Growing in America.—According to the latest official returns, 3,689,000 acres of potatoes were grown in the United States in 1912, and the estimated yield is put at 108 bushels per acre, that is, 2 tons 14 cwt. if a bushel is reckoned at 56 lbs. In America this is considered a "bumper" crop, and "much above the average." The total crop for the United States in 1912 is estimated at 398 millions of bushels, that is 9,950,000 tons. The price is estimated at 25 cents a bushel, or at the rate of just over £2 per ton. The gross yield is therefore at the rate of about £5.10s.0d. per acre—such a curiously low

figure that the foreigner may wonder how it is possible to pay for labour, rent, manure, etc., and still yield a profit to the American grower. Against the American figures it may be stated that the British potato average works out at 6 tons to the acre, and the average price at £3 per ton, making a gross revenue of £18 per acre, against the American £5.10s. od. Under proper and intelligent cultural conditions it is possible to obtain from 15 to 20 tons of potatoes to the acre. Evidently there is much to be learnt from modern scientific methods by practical potato-growers on both sides of the Atlantic, but especially in the United States.

Sterilisation of the Soil.—Amongst large growers of plants under glass this question is often discussed, and several carry out experiments in various ways to prove the advantages or otherwise of "sterilising" the soil, the object chiefly in view being to destroy eelworms and those bacteria that are said to be injurious to vegetation. To secure immunity from these evils, the soil is roasted in iron pipes or trays over a furnace fire, the heat of which is calculated to destroy the organisms referred to, as well as the seeds of weeds and the grubs of more conspicuous insect pests. Some cultivators attach great importance to the sterilisation of the soil for some of their crops, while others look upon the process as a fad, and not worth the time and trouble and expense of doing it. It is possible that when a soil is overdosed with rich organic manures, as it often is under glass, eelworms and injurious bacteria develop as a result of the soil becoming sour. Therefore, when heated, a good deal of the unnecessary organic material is driven off by combustion, and the soil is once more reduced to a clean and healthy condition, and will grow plants to perfection.

Some interesting examples of soil sterilisation were exhibited at the International Exhibition at Chelsea from the Rothamsted Experimental Farm. Eight specimens of tomato plants were grown in pots, the soil in which had been "sterilised" in various ways. The agents used were petrol, phenol, pyridene, formaldehyde, toluole, and calcium sulphide, in addition to which one pot contained steam-heated soil, and one unheated soil. The plants treated with phenol and toluole were very poor indeed. There was little to choose between those treated with formaldehyde, calcium sulphide, and steam; and although the weakest plant of all was in the untreated soil, the outstanding fact was that there was not a good tomato plant among them all. (JOHN WEATHERS.)

BEE-KEEPING¹

Such rapid progress has been made in bee-keeping during the last sixty years, that it is not surprising to find that the advance has been maintained during 1909-12. In Great Britain the most efficient means of advance, both in the art and science, have resulted from the institution of the British Bee-keepers' Association, 38 years ago. Among its objects were, the advocating of more humane and intelligent treatment of the honey-bee; the improvement and advancement of bee-culture; and the increase of the home supply of wholesome honey. The purposes thus set forth have been strictly kept in view, and have been successfully brought out. Help and advice have been given in the formation of county associations of bee-keepers, and forty-four of these are at the present time in affiliation with the parent association. Encouragement has been given to increasing the number of persons keeping bees, for although it is computed by the best authorities that there are over 90,000 bee-keepers in the British Isles, the honey imports from abroad, amounting in value to more than £30,000 per annum, show that the home production is not equal to the demand. The low price of the foreign product proves the superior quality obtained from British bees. The passing of the Small Holdings Act has opened a new field for bee-keeping.

The value of the industry has now been recognised by the British Government, which has made a grant to the British Bee-keepers' Association for the purpose of establishing an experimental apiary, where courses of lectures, illustrated by practical manipulation of hives containing bees, are given out of doors during the summer months. In winter the lectures are indoors, and are illustrated with suitable lantern slides. In addition

¹ See *E. B.* iii, 628 *et seq.* *Digitized by Microsoft®*

scientific lectures by specialists are given from time to time. The Government also make a grant for pioneer work and promoting bee associations, which the British Beekeepers' Association is able to do by sending its certificated experts and lecturers all over the country. Thirty-six county councils also make small grants in aid of technical instruction in bee-keeping, ten of them at their own agricultural colleges.

On the practical side progress has been made in queen rearing, and, by the adoption of Mendelian methods, bees have been improved both as regards hardiness and working qualities. The principal improvements in appliances have been for making old combs render a better quality and a larger quantity of wax.

The value of bees in the pollination of fruit blossoms is now fully recognised, and the importance of having a sufficient number of them for this purpose has been brought prominently before the public, owing to a serious epidemic which has destroyed not only whole colonies of bees, but has also devastated entire districts, causing fruit growers anxiety with respect to their future crops. The United States of America, Canada, New Zealand and many other countries have legislated with respect to the control of bee diseases, and the British Government, realising the necessity for similar action, have introduced in Parliament a "Bee Diseases Bill" which it is hoped will enable them to cope with the two diseases which have caused such mortality among bees.

Respecting the disease known as "foul brood," recent investigations by Dr. White have shown that in one of the two forms of the disease, viz. the one known as "foul smelling" in which *Bacillus alvei* is usually present, the cause of the disease is not this microbe, as has hitherto been supposed, but one of several others found associated with it, to which Dr. White has given the name of *Bacillus pluton*.

An epidemic disease broke out in the Isle of Wight in 1906, about which little was known up to 1909. Since then it has spread to the mainland, and has caused great losses of bees in many districts. The cause of the malady has been under investigation by the Board of Agriculture and Fisheries, and a full report has been recently issued, showing what has been done and the nature of the disease. European bacteriologists have also been investigating the cause of the great mortality among bees in various parts of the continent, and Dr. Zander in Bavaria, who made a very careful study of bees suffering from "infectious dysentery" in June 1907, discovered as the infecting agent a protozoal parasite to which he gave the name of *Nosema apis*. His findings have been confirmed by other scientists in Germany and Switzerland, and in England it has been found by Dr. Graham-Smith and others associated with him that the same parasite is the cause of "Isle of Wight" disease, which is now called *Microsporidiosis*, since *Nosema apis* is a member of the group named the *Microsporidia*. Drs. Fantham and Porter had already observed a protozoan in the digestive tract of some bees obtained from the Isle of Wight in 1906, and in subsequent years *Nosema apis* was found in bees from Hampshire, Surrey, Middlesex, Cambridgeshire and Hertfordshire. By feeding experiments they were able to reproduce the fatal disease, both in bees and in wasps.

The life history of *Nosema apis* shows that it proceeds from a tiny germ which issues from the resistant spore, and gives rise to uninucleate daughter forms known as planonts, because of their migrating or wandering habit. They increase by division, and when they have penetrated between the epithelial cells, they may remain there in a resting condition for some time, or penetrate the gut direct from the lumen or from between the epithelial cells. The parasite is now called a meront, and is at first uninucleate. It has now entered upon the feeding stage, rapidly increases in size and multiplies by fission, ultimately forming spores. The main alimentary tract of the bee, particularly the chyle stomach and intestine, are the chief parts affected, although *Nosema* may occasionally be found in other organs.

The disease is one of the adult bees, larvae and young bees remaining healthy. The queen also appears to be exempt and is frequently found as the last survivor of a colony. Bees suffering from the disease appear heavy and disinclined to move, the wings are frequently dislocated, and the abdomens swollen. They lose their power of flight, large numbers drop on the ground, and as the bees are unable to rise it is not long before they perish. The disease is infectious, and is introduced into healthy colonies by infected foragers, or infected foods. Affected bees void excrements which contain the spores, while on the wing. Infected water grossly contaminated with excrement, and honey present in the hives in which bees have died, are stated to be the most important infected foods.

The introduction of the parasite into the hive is not necessarily followed by the appearance of the disease, and some stocks remain healthy while the infected bees are gradually eliminated. At present no remedy is known, and it is recommended that where a stock exhibits a heavy continuous mortality, it should be destroyed, as it never completely recovers and is a continual and serious source of danger.

All dead bees should be picked up and burnt and the ground disinfected. Hives that have contained diseased bees should likewise be disinfected.

Nosema has also been found in humble-bees and wasps, but it is not yet conclusive that it belongs to the species *Nosema apis*. New light has been thrown on the life history of humble-bees and their parasites by Mr. Sladen, who has succeeded in domesticating, and keeping under observation, species of *Bombus* in artificial domiciles, to which queens were attracted.

The following are the most important works which have appeared during the last three years bearing on the subject: Dr. E. Zander's *Der Bau der Biene*, and *Die Krankheiten und Schädlinge der erwachsenen Bienen*; T. W. Cowan's *Wax Craft, all about beeswax, its history, production, adulteration and commercial value*; The *Report on the Isle of Wight disease*, by Dr. Graham-Smith and others, issued by the Board of Agriculture & Fisheries; and F. W. L. Sladen's *The Humble-Bee, its life-history and how to domesticate it*. (THOS. WM. COWAN.)

THE FUR INDUSTRY¹

So far as concerns the preparation of fur skins for the market, there is nothing new of importance since 1910. One great change however has occurred in the primary conditions of the fur supply. In connection with the great importance and necessity of enforcing close seasons and restrictions to prevent the total extermination of fur-bearing animals, a notable event has taken place as the result of the International Fur Seal Conference between the United States, Great Britain, Japan and Russia which was in session at Washington from May 11 to July 7, 1911.

The conference concluded its labours on the latter date by the signature of a convention, which was ratified and went into effect on December 15, 1911, and is to continue in force for a period of fifteen years from that date and thereafter until terminated by twelve months written notice given by one or more of the parties to all of the others. This convention was for the preservation and protection of the fur seals and sea otter, which frequent the waters of the North Pacific ocean, its essential object being to stop pelagic sealing, which was an international question. "Pelagic sealing" means "the killing and capturing fur seals at sea," which had long prevailed in spite of the constant and earnest efforts on the part of the United States Government to have it discontinued.

The Pribiloff Islands, which are the natural home and breeding places of the fur seals, were in former years leased by the United States to companies, who had the right to engage in taking fur seals on these islands. These leases expired by limitation on April 30, 1910, and it was found advisable to abandon the former system of leasing, the Government of the United States taking over entire control of the islands and the seal herds. It appeared that the seal herds on the islands have been reduced to such an extent that their early extinction had to be looked for unless measures for their preservation were adopted. A herd numbering 375,000 twelve years ago was reduced to 135,000, and it was estimated that the breeding of seals had been reduced in the same period of time from 130,000 to 56,000. The rapid depletion of these herds was undoubtedly to be ascribed to the practice of pelagic sealing, and by the convention signed by the four countries above named pelagic sealing is prohibited for 15 years from December 1911.

The countries who were until recently engaged in this wasteful and indiscriminate slaughter of fur seals have been induced after difficult and protracted negotiations to agree to abandon pelagic sealing on condition that they shall receive compensating interest in the skins taken by the United States Government on land.

In killing seals at sea all ages and sexes are killed indiscriminately, and a great waste thus takes place, as many, upon being shot, sink and are lost before the hunters can reach them; in fact it is well known that of all killed fully one half are lost.

The seals leave the islands in the autumn and make a most wonderful migration; it

¹ See E. B. xi, 346 *et seq.* Digitized by Microsoft®

goes on for nine months in the year and covers about 2,000 miles. The seal gets all its food in the open sea at great distances from land. It resorts to the land only to bring forth and nourish its young to self-dependence. It is resident for this purpose on certain islands in Bering Sea from May to November. The mother seal goes 150 to 200 miles from the rookeries to find her food, leaving her young behind, returning to nurse it, and again going away to feed. With the storms of winter all classes of animals leave the islands and make a long migration down through the Pacific ocean to the latitude of Southern California, the farthest point south reached by the fur seals about the month of January, when the course of their migration turns again northward along the western coast of Alaska, ending at the Pribiloff Islands sometime in the month of July.

It has been the custom of the Indians of the north-west coast of America from the earliest times to go out in their canoes a day's journey to hunt with the spear stragglers from the migrating herd on its northward journey. It was a precarious business and the number of animals taken was unimportant. In 1879 however sailing vessels began to be used to take the Indians and their canoes out to the main body of the herd and to enable them to follow its course. This new form of sealing was very successful. The fleet grew in numbers and the catch multiplied until it reached the total of 140,000 skins in a single season. The operation of the fleet gradually extended over the entire migration route of the seals and included their summer feeding grounds in Bering Sea. Until very recently at least the pelagic fleet contained about thirty vessels manned by about twelve hundred men using about three hundred boats. The sealers knew in general the locality of the fur seals at different periods of the year; the migration route has been determined by the logs of the various pelagic sealing vessels that have taken fur seals at various times of the year throughout that great course.

Between 1883 and 1897 a total of 304,713 skins of seals killed at sea were marketed, and undoubtedly an equal number were lost. The moment the mother seals left the islands the sealers were after them, and a mother seal, in order to get her food with which to suckle her young, was obliged to run the gauntlet of the vessels. The destruction of the mother seal meant the starvation of the offspring on shore, and uncounted thousands of young seals have perished on the islands from that cause. The males being reduced in numbers by land killing, the females predominated in the herd as found at sea. On land the young males are forced to herd by themselves through fear of the adult males. They can be readily distinguished and handled without disturbance to the breeding herd. At sea the sexes cannot be distinguished. On the spring migration the mother seal is heavy with young, and hence less swift in her movements. On the summer feeding grounds she must feed regularly and heavily through necessity of nourishing her young, and as a result the pelagic catch is made up chiefly of the breeding females. From 1879 to the present time this hunting of gravid and nursing females has gone steadily on, with the consequence that the herd of fur seals belonging to the United States has been reduced enormously.

This decline of the seal herd was established for the United States Government in 1898 by a commission of scientific experts. It was pointed out that only by the establishment of an international game law for the high seas which should protect the female fur seal,—in other words the abolition of pelagic sealing—could the herd be preserved and restored. The property involved is a very important one. With regard to the practice of killing bachelor seals for the natives' food it was decided that this should not be abandoned unless a cogent reason presents itself. No harm to the herd can result from the killing of surplus males. No benefit to the herd could accrue from the maturing of males unnecessary for purposes of reproduction, which when of adult age would have no female consorts, but which by incessant and furious fighting would destroy or cripple the breeding bulls and themselves as well.

Since signing this convention, the United States Government has passed a new measure with regard to killing fur seals on the islands, and has decided on a close season for five years from 1913. The section of the bill giving effect to the convention has therefore been amended to read as follows:

"That from and after the approval of this act all killing of fur seals on the Pribiloff Islands or anywhere within the jurisdiction of the United States in Alaska shall be suspended for a period of five years, and shall be and is hereby declared to be unlawful, and all punishments and penalties heretofore enacted for the illegal killing of fur seals shall be applicable and inflicted upon offenders under this section; provided that this prohibition shall not apply to the annual killing on the Pribiloff Islands of such male seals as are needed to supply food, clothing and boat skins for the natives on the islands, as is provided for in article 11 of the said convention. The skins of all seals so used for food shall be preserved and annually sold by the Government and proceeds of such annual sales shall be covered into the treasury of the United States."

With regard to fur seals killed on the islands, so-called "Alaska fur seals," it is interesting to note that from 1870, when the Alaska Commercial Company took charge of the islands under a lease for 20 years, 100,000 skins were taken annually.

With regard to the future of the so-called "South Sea seals," taken in the Southern Pacific and Indian oceans, it was reported in 1912 that the fleet which had been sailing from Halifax regularly for 27 years would abandon the enterprise in the coming season and that no ships would proceed to these regions, probably for several years.

Silver Fox.—During the last few years considerable progress has been made in the rearing of these animals in captivity in the United States and Canada. The fur has been found to compare favourably with those trapped and the skins are bringing very good prices.

Russian Sable.—In order to preserve the Siberian sable from entire extermination, the Russian Government passed a law in 1912 prohibiting sable hunting and trapping from February 14, 1913, to October 28, 1916, provision being also made for making it illegal between February 1 and October 15 in subsequent years. It is doubtful, however, whether this action will be sufficiently effective to attain its object, as there are great possibilities in a vast country like Russia for smuggling the fur and exporting under an assumed name.

Chinchilla.—These animals are becoming so scarce that the Government of Bolivia has prohibited the exportation and killing of chinchilla. In Chile killing is also forbidden for a period of two years, but in spite of these restrictions the killing still goes on and the catch is smuggled out of the country. The collection of bastard chinchillas has been as high as 360,000 per year; the real chinchillas as high as 10,000 and chinchillonas 18,000. In 1905 a total of 220,000 skins were exported from Bolivia alone; in 1906 123,000; in 1907 58,000; and in 1908 38,000. In 1911 the collection was as follows:—Bastard chinchilla 30,000; Real chinchilla 1,200; Chinchillonas 2,400.

Australian Opossum.—The number of these animals has also been considerably reduced of late, and in consequence the Governments of New South Wales, Queensland and Western Australia have passed a law for a temporary close season, the duration of which, however, is uncertain. (S. POLITZER.)

THE COTTON INDUSTRY AND TRADE¹

The Cotton Industry.—It was declared some years ago that the world's cotton spinning spindles were in excess of the world's requirements. But, in consequence of the fall in real cost of production, which is constantly taking place as a result of progress, combined with the development of backward places, the demand for cotton goods steadily expands, for they are the cheapest of textiles and, therefore, the first to feel the effects of advancing civilisation. Hence, considerable additions have been made to the world's facilities for spinning of late years, as the following figures show:

Spinning Spindles in Millions.			Spinning Spindles in Millions.	
	1908	1911	1908	1911
Great Britain	52.8	54.5	Portugal . .	.45
Germany . .	9.9	10.5	Holland . .	.40
France . .	6.7	7.3	Sweden . .	.39
Russia . .	7.9	8.7	Norway . .	.07
India . .	5.5	6.3	Denmark . .	.08
Austria . .	4.0	4.6	United States .	27.8
Italy . .	4.2	4.6	Canada . .	.80
Spain . .	1.9	1.9	Other Countries	1.0
Japan . .	1.6	2.1		
Switzerland .	1.5	1.5	Total . .	128.9
Belgium . .	1.2	1.3		137.3

These figures are rough estimates only, but they are put forward with the authority of the International Committee of Master Cotton Spinners' and Manufacturers' Association, and are founded to some extent on collected statistics.

¹ See *E. B.* vii, 256 *et seq.* Digitized by Microsoft®

It is notable that, while spinning spindles would seem to have advanced in the world by more than 6 per cent between 1908 and 1911, those in the United Kingdom only advanced by a trifle over 3 per cent. This result was however to be expected. In the course of the industrialising of the world, textile industries less developed than the famous Lancashire industry have been rapidly improving and increasingly satisfying home demands in the countries where they are placed, while spinning mills have been appearing in other countries where until recent times spinning was unknown. There is no reason to apprehend that the hand of the Lancashire operative is losing its cunning, or that slackness of management is preventing costs in English mills from being as low as they might; and it is beyond question that Lancashire still continues to enjoy differential advantages for the prosecution of the cotton industry. A cheap substitute for her climate is yet to seek; and nowhere else is an approach to be found to the systematic arrangement of her industry around marketing centres, in consequence of which a high degree of business specialism is rendered possible and the locking up in raw material of a great deal of capital is avoided. How great Lancashire's gain is with respect to the latter point, is indicated by the mill stocks of cotton. The average mill stocks in bales per 1,000 spindles held on the 31st of August in the five years 1907-11 amounted to: Great Britain 6.6, Germany 35, France 24, Russia 65, India 93, Japan 192, United States 26. Russian bales are mostly of about 300 lbs.; American of 500 lbs.

It is remarkable that the cotton industry in the land from which most cotton comes must hold mill stocks four times as great as those held in the British industry which is divided from its supplies by the mighty Atlantic. One leading reason is that the American industry does not approach the Lancashire industry in completeness as an organic whole, and that the former is not peculiarly well placed with respect to means of transportation. The chief port of Lancashire, Liverpool, and, one might add, the secondary port of Manchester,¹ lie so close to the spinning districts, and are so well connected with them by rail, that supplies of cotton can be obtained on the shortest notice as they cannot elsewhere; and Lancashire's cotton market is so highly organised, with its expert dealers and brokers and its system of 'futures,' that spinners can easily make arrangements for cotton to flow into their mills as they require it. Reservoirs of cotton, so to speak, need not be maintained in Lancashire mills. We may see in Lancashire, as nowhere else in the world as yet, cotton supplies travelling to the various mills according to almost immediate requirements, much as the blood in the body flows to the parts where it is needed, when it is needed, and in the proportion in which it is needed.

It must be remembered, moreover, when the number of spinning spindles in the United Kingdom is compared with the numbers elsewhere, that a year's working of an English spindle represents on an average a greater value than a year's working of any foreign spindle, because English spinning, as a whole, is becoming finer and the value of the fine work is greater than of the coarse work. Thus in the five years 1907-11 the average consumption of cotton per spindle in different countries was:

Gr. Brit.	Germany.	France.	Russia.	India.	Japan.	U. S. A.
71	173	137	250	371	685	170

England has been steadily driven into undertaking more fine spinning (for which she enjoys special advantages) by foreign competition. It goes without saying that early attempts at spinning are made on the coarser and easier work.

It is impossible to put forward figures showing recent increases in looms, but they certainly still continue to increase enormously. In Lancashire and contiguous districts cotton looms were augmented by nearly 40 per cent between 1884 and 1911, despite the extension of manufacturing in other countries; and it will be realised that countries which embark on the production of cotton textiles invariably begin with manufacturing

¹ The total imports of cotton into the United Kingdom amounted to (1907) 2387 million lbs., (1909) 2189 million lbs.; and (1911) 2207 million lbs. The amount shipped direct to Manchester via the Ship Canal was (1907) 300 million lbs., (1909) 340 million lbs., and (1911) 350 million lbs. Nearly half the cotton consigned direct to Manchester came from Egypt.

(as weaving is technically termed) and then pass on to spinning. It is notable, as regards manufacturing, that there are still no signs of an extensive adoption of the automatic loom in Lancashire, though its success in America appears to be assured. It is hardly conceivable that the main explanation is any lack of enterprise on the part of Lancashire manufacturers. The main explanation is far more likely to be (as is commonly alleged in Lancashire) that the automatic loom is not—at any rate, under the conditions now prevailing—suited to the character of the bulk of the British output.

The results of the British census of 1911 with respect to occupations are not yet available; but, in considering the changes in numbers employed in the cotton industry in the United Kingdom, we have factory inspectors' returns to fall back upon. These show as follows:—

Cotton Operatives in the United Kingdom in Thousands.

	Half-timers.	Under 18.	Over 18.	Males.	Females.	Total.
1896	29.5	121	382	204	329	533
1901	21.0	115	387	194	329	523
1904	17.7	109	396	196	327	523
1907	19.1	131	426	218	359	577

The advance since 1904 is substantial and bears out the view that recent years have witnessed an accelerated growth of the British cotton industry. The inspectors' returns for 1907 are corroborated by the returns made for the census of production, which reveal a total of 560,500 wage earners occupied, on an average, on the last Wednesdays of January, April, July and October. Of these 560,500 wage earners about 14,000 were at work in Scotland. The returns of the census of production show that the number of salaried persons engaged in the cotton industry in the United Kingdom was 12,400.

Among the operatives the proportion of males to females has remained about the same, males being in each period between 37 and 38 per cent of the total. Under 18 the proportion of males is less; which is, of course, to be explained by the fact that many women give up factory work when they marry. The augmentation of numbers between 1904 and 1907 is naturally most marked among those under 18. This does not necessarily mean that the young are substantially displacing adults; for, as a rule, when an industry suddenly requires more labour, the bulk of the new recruits are of the plastic age. Those already in the industry get promoted younger than they would have been otherwise, and fresh labour, new to the industry, tends to take the places vacated at the bottom.

The Cotton Trade.—In 1908 the cotton trade of the world was thrown into a state of collapse; for by that time the trade boom of the previous years had worked itself out and reaction had set in, particularly in the United States, where a severe financial crisis occurred in the autumn of 1907. From this collapse, however, the cotton trade had by 1912 recovered entirely, with the result, as regards the United Kingdom, that the high figure of exports of cotton goods in 1907 was actually surpassed in 1911 (and again in 1912). The fact must be allowed for that all over the world the general level of prices has been rising, so that values for 1911 must be somewhat reduced to bring them into relation with those for 1907; but they still show an appreciable excess. The following figures represent approximately the recent foreign cotton trade of the four leading countries:

Foreign Trade in Cotton Goods in Million Pounds Sterling.

	United Kingdom.		United States.		Germany.		France.	
	Imports less re-exports.	Exports of home manufacture.	Imports less re-exports.	Exports of home manufacture.	Special imports.	Special exports.	Special imports.	Special exports.
1904-6 (average)	6.2	91	10.6	7.9 ¹	5.8	19.8	2.7	10.8
1907	6.8	110	14.5	5.7	10.7	23.9	3.7	14.8
1908	7.7	95	13.3	4.6	7.4	19.7	3.0	11.6
1909	7.3	93	12.3	6.0	8.2	18.9	2.9	13.7
1910	8.5	106	13.0	6.0	9.1	21.7	3.5	13.7
1911	9.0	120	13.1	7.4	8.6	23.4	3.4	14.0

¹ The pinnacle was reached in 1906 in America with exports over £10,000,000.

In connection with the varying trade of the world, it is worthy of mention that it is usual in the British cotton industry for short time to be agreed upon when margins be-

tween the prices of the product and the cost of material droop and show no sign of immediate recovery, the operatives, as a rule, readily falling in with the arrangement. The same policy is practised in countries other than England, but an attempt made in the late depression to secure concerted action throughout the world failed. The method of short time, when judiciously applied, is generally favourable to the interests of operatives as well as employers, as it causes under-employment to be spread over the industry, instead of unemployment being concentrated on a section of the working-class.

Since the issue in 1909 of the report relating to the cotton industry of the British census of production (taken in 1907), it has become possible to arrive at something more than intelligent guesses with regard to Great Britain's annual consumption of its own products. Taking the estimates put forward by the director of the census of productions, based on these returns, instead of the returns themselves, so as to avoid such sources of error as duplication, and placing side by side with them export returns for the same year, we have:—Yarn spun, 1826 million lbs. (£98,000,000, including about £1,700,000 for dyeing); Yarn exported, 241 million lbs. (£15,250,000). So the proportion exported is about 13 per cent in quantity and 16 per cent in value. But the value of yarn exported includes the profits of the exporter. Consequently its value when it left the spinner would have been about £14,600,000 if these profits amounted on an average to 5 per cent. This is 14.5 per cent of the value of the total output; as compared with an export in quantity just over 13 per cent. The discrepancy seems only natural in view of the known fact that the yarns exported contain a large proportion of the fine counts, in which Lancashire far excels its competitors.

Coming to piece goods, we find an output of 7091 million yards (value £95,000,000, including £12,000,000 for bleaching, dyeing and finishing), and an export of 6298 million yards (£81,000,000). The exports were nearly 89 per cent in quantity and about 85 per cent in value. But the export values include merchants' expenses and profits, and if we allow about 5 per cent for these we get a percentage of export in value of about 81. The probable explanation of the discrepancy between the quantity and value percentages of export is that the average value of the goods retained for home consumption is much higher than that of the exports. A large proportion of the exports are unbleached and unprinted, and the average quality of exported prints is pretty certain to be below that of prints for home use. Admittedly, there are sources of error connected with the census of production and with the collection of export figures; but they are not likely to have vitiated the results seriously.

Cotton Supplies.—The question of cotton supplies continues to agitate the English spinning world. It is still felt that dependence on the American supply is too great, and it is feared that the output of long staple cotton in America is much nearer its limit than the output of other kinds. Peculiar apprehension has been excited as regards the conditions of cotton-growing in Egypt. It is maintained that the yield of the plants is falling in quantity and quality. The yield of kantars (1 kantar = 98 lbs.) per feddan (1 feddan = 1 1/10th acres) was on an average 5.29 in the period 1896–1901, 4.55 in 1901–06 and 4.24 in 1906–11, according to statistics published by the Egyptian survey department. It is contended that the cause of the fall includes some or all of the following: (1) careless seed selection; (2) over-cropping, as a result of the reduction of customary rotation from three years to two, and also of the squeezing of the plants together; (3) insect pests; and (4) the water-logging of the soil. Some authorities are particularly insistent as to the gravity of the fourth case. Information was laid before a cotton commission in 1909–10 which reported in due course, made twenty-six recommendations and nominated a committee with a view to the carrying out of its recommendations. The committee had not met up to the time of the visit of Mr. Arno Schmidt (the secretary of the International Cotton Federation) to Egypt in 1911; but he states that he was informed by Lord Kitchener of an intention to institute a permanent cotton committee to take up the whole matter. Since then a committee to investigate the ravages of the cotton worm has been appointed. The question of the Egyptian supply is a serious one for England at the present time, for it has been estimated that of some twenty-one million spindles which are dealing exclusively with Egyptian cotton fifteen millions are in England—there are supposed to be no more than one million and a half in Germany, about one million and a half in France, and in no other country as many as a million. But the matter will become an increasingly important one to countries other than England as they push their way further into fine spinning.

The British Cotton Growing Association, which is specially concerned with the question of increasing cotton supplies, has now almost raised the capital of £500,000

which it first set out to obtain. In addition several subsidiary companies, in which the Association is interested, have been formed, some with the Association's assistance. Such are the British Cotton Ginning Co. Ltd. (capital £100,000), British East Africa Corporation Ltd. (capital £200,000), Sudan Plantations Syndicate Ltd. (capital £250,000), East African Cotton Co. (1911) Ltd. (capital £35,000), Rhodesia Cotton Co. Ltd. (capital £30,000), and Ernest Thorne Ltd. Barbadoes (capital £10,000). The table appended shows the amount of cotton which has come forward from new fields in the British Empire to which the Association has given its attention.

Cotton Grown in New Fields in the British Empire; Bales of 400 lbs.

	1906	1907.	1909.	1911.
Sierra Leone	150	100
Gold Coast	200	250	200	100
Lagos	6,000	9,500	12,100	5,800
Southern Nigeria	150	250	300	300
Northern Nigeria	1,000	1,500	400	600
Total West Africa	7,500	11,600	13,000	6,800
Uganda	500	2,000	5,100	20,000
British East Africa	200	200	300	500
Nyasaland	2,200	2,300	2,400	5,000
Rhodesia	100	200	400	300
Total East Africa	3,000	4,700	8,200	25,800
West Indies	5,500	6,500	6,400	6,500
Sind	1,000	1,800	2,000	500
Sundries	200	300	500	700
Sudan				21,000
Total	17,200	24,900	30,100	61,300

The present total is only a minute fraction of the world's crop, but it is approaching one and a half per cent of the imports into the United Kingdom; and, though the amount of cotton raised from the new fields is relatively small, it is absolutely large and is increasing by substantial percentages. High expectations have been formed of the possibilities of the Sudan. The total amount of cotton which passed through the hands of the Association (apart from that sold through other channels) in 1908 and the three succeeding years was respectively, in bales and in value:—(1908) 17,700 (£224,900), (1909) 20,000 (£225,100), (1910) 21,400 (£296,200), (1911) 27,700 (£373,600). (S. J. CHAPMAN.)

LINEN AND LINEN MANUFACTURE¹

As indicated by the British Board of Trade returns, the linen trade is in a comparatively healthy state, and there has been a large increase in the number of acres in Ireland devoted to flax growing. This increase is due mainly to the gradual increase within the last few years, and the rapid rise in 1910, in the price of the better qualities of flax. A glance at the average prices of flax in pounds per ton as supplied by the Flax Supply Association, indicates that the cultivation of flax may prove remunerative.

Year.	Belgian.	Irish.	Dutch.	Russian.
1902	£64	£50	£49	£37
1905	67	56	52	35
1908	69	48	56	30
1909	68	61	58	32
1910	73	80	60	36
1911	87	64	63	44

A rapid rise in the price of flax may be a healthy sign from an agricultural point of view, but it often checks not only the production of yarn but also that of cloth. It is all the more satisfactory to find that the trade has assumed such large dimensions.

The following table indicates the approximate number of acres under flax cultivation in the principal flax growing centres:

¹ See *E. B.* xvi, 724 *et seq.*; x, 484 *et seq.*

THE JUTE INDUSTRY

Country.	1906.	1907.	1908.	1909.	1910.	1911.
Russia including Caucasasia and Poland	4,294,000	4,368,000	4,190,000	4,090,000	4,739,000	
Austria-Hungary	227,000	203,000	169,000	152,000	135,000	
France	68,000	63,000	71,000	51,000	54,000	
Belgium	52,000	56,000	51,000	39,000		
Ireland	55,000	60,000	47,000	38,000	46,000	67,000
Holland	38,000	42,000	36,000	25,000	29,000	39,000

Within the last decade there has been a considerable development in the manufacture of linen cloths intended to be embellished by some form of hemstitch or embroidery. Although this type of cloth does not, as a rule, require a large weight of flax, it nevertheless creates a demand for the finer qualities, and moreover provides work for a considerable number of operatives in the fine spinning departments, and in those departments where hemstitching and embroidery are performed. This branch of the trade is now a very extensive one, the work being done mostly by mechanical means. Handkerchiefs, table covers, bed spreads, and small fancy cloths of all descriptions are adorned more or less by this method. A considerable amount of labour may be expended in comparatively short lengths of material, and hence a mere statement of the number of yards of cloth manufactured may not be a proper criterion of the extent of the trade. Nevertheless, along with other developments in the finer end of the trade, the British exports of linen goods show a satisfactory record.

British Exports of Linen Goods.

Description.	1906.	1907.	1908.	1909.	1910.	1911.
Weight of linen yarn in pounds	14,978,200	16,442,000	13,705,000	13,532,000	18,548,000	18,003,000
Length in yards of linen piece goods, plain, bleached, or unbleached	173,334,200	166,363,600	132,987,100	197,536,000	195,091,000	163,680,700
Length in yards of linen piece goods, checked, dyed or printed; also damask and diaper	13,372,100	14,264,500	14,067,200	23,147,000	21,626,400	16,675,800
Length in yards of sail-cloth	4,251,400	4,379,000	3,939,600	3,250,000	3,850,600	3,658,900
Total length in yards of all kinds of linen cloth	190,957,700	184,999,100	151,893,900	223,934,800	220,568,000	194,014,800
Weight in pounds of linen thread for sewing	2,181,100	2,381,700	2,233,700	2,263,800	2,738,000	2,505,400

The improvements in methods of manufacture which are mentioned with reference to Jute are applicable to flax machinery, and to all others where similar conditions obtain in regard to the roving, spinning, and twisting of long vegetable fibres.

Numerous attempts have been made from time to time to introduce quicker, and if possible more satisfactory methods of bleaching flax; and a new method, which claims to be a simple and inexpensive chemical process of preparing flax straw for spinning, is the invention of Dr. R. R. Roberts, of Washington. It is stated that in this new process five hours are quite sufficient for the purpose, and that since the material is under complete control during the operation, there is no danger of the fibre suffering from ineffective treatment. The fibre bleached by this process has, we understand, been spun into yarn and woven into cloth for use as table cloths, napkins, towels, and similar articles, and compares well with Russian flax. (T. WOODHOUSE.)

JUTE AND JUTE MANUFACTURE¹

The state of the jute trade during 1910 and 1911 was not very satisfactory. During 1912 however a great improvement took place, and towards the end of the year mills and factories were everywhere as busy as possible. The following table indicates the respective Dundee prices per ton of jute, per spyn^dle² of weft, and per yard of cloth which were ruling in the middle of October in the years 1907-12.

¹ See *E. B.* xv, 603.

² A "spyn^dle" is a length of yarn equal to 14,400 yards; not to be confused with "spindle," the rod used in spinning.

Class.	1907.		1908.		1909.		1910.		1911.		1912.

Daisee 2	19	15	17	15	15	0	17	0	21	0	24	0
Mixed Cuttings	7	0	4	0	4	10	11	10	14	0	13	10
8 lbs. per spynkle weft in cop	1s.9½d.		1s.6½d.		1s.6d.		1s.8¼d.		2s.0d.		2s.6d.	
11 porter 40 inches 10½ ounce Hessian	2s.7½d.		2s.1d.		2s.0d.		2s.1d.		2s.4d.		3s.2d.	

The fluctuation in the price of the raw material is often influenced by the size of the crop, but in spite of a forecast of practically a 10,000,000 bales crop, the prices for 1912 were very high. New uses are continually being found for the jute fibre, so that the whole of the large crop is not available for what were originally the few typical types of simple yarns and fabrics. The crop in 1906 was a record one, but the figures compiled by Messrs. W. F. Souter & Co. show that this has been exceeded since:

	1906.	1907.	1908.	1909.	1910.	1911.	1912.
Acres	3,336,400	3,974,300	2,856,700	2,876,600	2,842,600	3,106,400	3,353,800
Est. crop in bales	8,736,220	9,867,000	6,360,800	7,295,580	8,032,000	8,339,000	9,621,800

A good idea of the expansion of the jute trade in various countries can be gathered from the estimated consumptions in 1906 and 1912:

Country.	Bales per annum.		Country.	Bales per annum.	
	1906-07.	1912-13.		1906-07.	1912-13.
Scotland	1,250,000	1,300,000	Norway and Sweden	62,500	60,000
England	20,000	20,000	Russia	180,000	230,000
Ireland	25,000	25,000	Holland	25,000	30,000
France	475,000	620,000	Spain	90,000	150,000
Belgium	120,000	150,000	Italy	160,000	250,000
Germany	750,000	800,000	America	600,000	600,000
Austria and Bohemia	262,000	320,000	India	4,400,000	4,900,000

The figures shows clearly that over half the total jute is used in India. Although the expansion in India was checked somewhat a few years ago, the new factory act has probably been the cause of many extensions which have been, and are still being made in that country. In 1906, there were 26,799 looms and 520,980 spindles for jute, whereas at present there are over 32,700 looms and 650,000 spindles.

Within the last few years there has been a development in the spinning of finer jute yarns in the Dundee district, and it is hoped that this development will lead to a corresponding movement in the manufacture of cloths from these yarns. They are used already for cloths intended for ladies' hats, and might well be adopted for other articles of clothing.

A new textile thread, or at least a combination of paper and fibre, termed "textilose," has recently been introduced for uses similar to those in vogue for jute yarns. So far as cloth is concerned, it appears to be used only for coarse sacking.

In the methods of spinning and weaving jute, improvements are constantly being introduced with the object of consuming less power, of improving the quality of the work and of facilitating the operations generally so as to increase production.

A circular loom, on an entirely new principle, has been invented by Mr. C. Whalley of Clitheroe, but has not yet been tried, so far as we know, for the manufacture of jute fabrics. Ball bearings have been used for a small number of spinning spindles, but the expense of a really satisfactory arrangement of this kind appears to stand in the way of a general adoption. A great improvement, and one which results in the saving of from 30 per cent to 40 per cent horse power, has resulted from the introduction of the Boyd and Phillips patent automatic tension cylinder, or the fixed tension cylinder to spinning frames. The former maintains an equal tension on the driving bands under all varying atmospheric conditions, and at the same time leads the driving side of the band off the spindle whorl almost perpendicularly to the axis of the spindle; the fixed cylinder performs the same function of directing the bands at right angles to the spindle, and it is this desirable condition which accounts for the great saving in power. A spindle drive is now being introduced which dispenses with the use of a guide cylinder. It consists of a solid drawn tube of small diameter suitably supported in ball bearings, and rotating at about 1000 revolutions per minute. The bands pass direct from the tube to the spindle whorls. Since the driving tube is mounted on radial arms and balanced by hanging weights, it also acts as a tension cylinder and thereby maintains an equal and uniform tension on the bands.

For a considerable number of years endeavours have been made to simplify the method of imparting the necessary drag to the spinning bobbin as it is being filled. The latest invention, and one which appears to justify all that is claimed for it is that by Mr. J. M. Mallock, termed the "Turbo-Drag." It consists of an annular disc of thin steel, in the inside of which are flexible vanes. Its underside is provided with a renewable leather washer which rests on the bobbin board, while a loose leaden ring on the top supplies just the amount of weight which is essential for the empty bobbin. The drag is driven by the bobbin, to which it acts as a carrier, and as the bobbin is filled a uniform tension is maintained on the yarn by the combined action of plane friction (due to weight of drag, bobbin, and yarn), the air resistance induced by the vanes, and the increase of plane friction caused by the weight of the column of air in motion. There is no side pressure on the bobbin such as is always caused by the temper band and weight, hence the bobbin and spindle run more smoothly. With this drag the spinner is free to give her whole attention to the yarn since the tension or drag is applied automatically—this is a distinct advantage and one which is sure to appeal to employers of labour. The turbo-drag is capable of being utilised on all frames which are used for the roving, spinning or twisting of long vegetable fibres.

Another recent invention is an electrical rove stop motion by Mr. P. Sharp. The apparatus is ingenious, and successful, as the rove is arrested immediately the yarn breaks. It has been in operation for some time in America, and is being experimented with in one or two Dundee jute mills. (T. WOODHOUSE.)

ROPE AND ROPE MANUFACTURE ¹

Recent changes in rope manufacture are of only minor importance. As in all other trades involving mechanical processes there have been various slight improvements in the machines employed. The price of the raw materials used has shown the same tendency as other fibres to rise, and, in consequence, attempts have been made to use larger quantities of the cheaper fibres. All sizes of ropes and twines from one inch downwards are now made of jute, and these are quite satisfactory where great strength is not essential, but the best ropes are made from the superior fibres.

The introduction of jute ropes and twines has caused a great development in the twisting of these yarns. In addition to being used alone, the twisted yarns are extensively used in connection with cables for all kinds of electrical purposes.

A new form of driving rope, made from 8 strands of sisal or similar fibre, is now being manufactured by plaiting—a process somewhat similar to that employed in the manufacture of box cords and the like. In some cases each of the 8 strands is composed of a large number of individual threads, whereas another style consists of 8 strands, each of which is in the form of a smaller rope. Although driving by means of ropes has been, and is still a very successful method, its position is being seriously threatened by the electrical method. Both the group drive and the individual drive by electrical motors appear to be making satisfactory progress. (T. WOODHOUSE.)

WOOL AND WOOL MANUFACTURE ²

Sheep and Wool.—In the British Home Wool Industry a freer interchange of opinion among sheep breeders has resulted since 1909-10 in a more perfect adaptation of the animal to its environment, or rather the development of the various sheep districts to their utmost capacity through the introduction of the breeds yielding the most profit. Thus the rounded short grassed downs of the southern counties are now frequently

¹ See *E. B.* xxiii, 713 et seq. ² See *E. B.* xxviii, 805 et seq.

stocked with the Cheviot breed of sheep reared in a similar environment on the hills bordering England and Scotland; while the heavier sheep of the Down class have made more headway for crossing purposes in the richer pasturage lands of the northern counties. With wool fetching a better price more attention has been given by the farmer to its growing and "get-up," to the benefit of both himself and the manufacturer.

Reference must here be made to the attempts of the Wool Section of the Bradford Chamber of Commerce to impress upon both home and colonial wool growers the necessity for greater care in the packing of wool in order that the "vegetable fibre difficulty" may be eliminated. After experimenting with various wool packs the Chamber has made definite recommendations, and it seems probable that in the near future wool packed as recommended will fetch top price at the wool sales. The Chamber has also faced the difficulty of grey hairs in otherwise white fleeces, and has made certain recommendations to sheep breeders which may help to clear flocks of this defect.

In Australia also some most interesting questions have been decided. Years ago the question of shipping wool in the "greasy" as opposed to the "scoured" state was hotly debated in the press, and a perusal of the correspondence on the matter left one absolutely in the dark as to which was the better method. Actually there was never a doubt, with few exceptions shipping in the grease being distinctly preferable. The question of the value of the Vermont breed in Australia has been fought out on very similar lines, and although from the correspondence of a few years ago in the Australian press it was impossible to decide for or against the Vermont, the past few years have shown that the Vermont is practically doomed so far as Australia is concerned. In the drought of 1902 the inability of the breed to withstand heat and dryness was only too painfully in evidence; but it has needed the experience of the past three or four years in washing, combing, spinning and manufacturing Vermont wools to bring the matter to a climax. Bradford, after trying to institute a coating trade based upon low and strong qualities of merino wools, has had a sudden awakening, and now demands nothing lower for these fabrics than a 64's or preferably a 70's quality. This has been the deciding factor, and so it comes about that the tendency of to-day is to grow a finer rather than a coarser merino, and for this purpose the Vermont strain is practically useless.

The following particulars taken from the *Textile Mercury* still show a result in favour of growing the "strong" merino, but a slight rise of price in the "fine" and a downward tendency in the "strong" would leave the advantage with the "fine."

	s.	d.
<i>Fine</i> (7½ lb.)—¾ lb. locks at 4d. per lb.	0	3
1½ lb. bellies and 2nd pieces at 8d. per lb.	1	0
¾ lb. 1st pieces at 10d. per lb.	0	7½
4½ lb. fleece at 1s. 2½d. per lb.	5	5½
Total weight, 7½ lb. Value	7	4
<i>Medium</i> (10 lb.)—1 lb. locks at 3d. per lb.	0	3
2 lb. bellies and 2nd pieces at 7d.	1	2
1 lb. 1st pieces at 9d.	0	9
6 lb. fleece at 1s. 1d.	6	6
Total weight, 10 lb. Value	8	8
<i>Strong</i> (11 lb.)—1 lb. locks at 3d.	0	3
2 lb. bellies and 2nd pieces at 6½d.	7	1
1½ lb. 1st pieces at 8½d.	1	0¾
6½ lb. fleece at 1s. 0½d.	6	9¾
Total weight, 11 lb. Value	9	2½

Another most noticeable feature in the Australian flocks is the wonderful increase in numbers. The maintenance of the prices paid for the leading Australian brands in view of the large increase in wool shipments can only be explained by the vastly increased demand by a more numerous and wealthier world population for better clothing.

Wherever sheep are reared as wool-producing rather than mutton-producing animals, at least some endeavour is made to improve the fleece in one or more of its characteristics. Of late some attention has been paid to the breeding of uni-fleeced sheep, *i.e.* sheep producing wool of one or two qualities only, as distinct from the five or six qualities frequently to be found even on well-bred sheep. This tendency is usually in evidence wherever attempts are being made to improve the merino or other breeds.

Attempts have been made to improve the breed of sheep in South Africa and in the West Indies. The connection of both these localities with Australia in the early days of Australian colonization adds interest to the recent importations of Australian merinos from accredited Australian stocks, and in the near future these localities may forward to Europe considerable quantities of the finer qualities of merino so much in demand.

Professor T. B. Wood, on the Cambridge University Farm, has applied Mendelism to sheep breeding; an endeavour being made to reshuffle the Shropshire and Merino characteristics and select the combination Merino wool and Shropshire carcass. By October 1912 Professor Wood had the third generation of the cross, showing marked segregation in wool characteristics. The effect of environment on the wool of Merino sheep kept for some years in England is also being investigated.

This attempt has stimulated other wool growers to work upon Mendelian lines and it is more than probable that in the near future much better control of flocks will result.

Wool Washing Processes.—In the preparation of wool for the subsequent manufacturing processes perhaps the most noticeable event since 1909–10 has been the *débâcle* attendant upon the attempt of a Bradford firm to introduce the solvent method of wool scouring on a large scale. Although the case was never proved against the firm in question the Bradford Beck explosion so clearly showed the dangers attendant upon the use of any of the volatile agents that on their own initiative the firm referred to gave up the attempt and dismantled their machines. This failure is to be regretted from more than one point of view. The solvent method is so useful for dealing with "tar-lots" and various stains on wools that its suppression almost amounts to the elimination of such special lots from the market.

From time to time new methods of scouring, or revivals of old methods, keep appearing. Solvent earths appear, disappear and re-appear again. Upon the whole it appears impossible to improve upon the emulsion method, especially if suitable emulsifying agents and well thought-out machines are employed. The most recent emulsifying agent introduced is "Sapon," for which the following advantages are claimed. (1.) The scoured wool dyes better. (2.) While dirt, etc. is cleared away the "wool-wax" is left in and gives the wool a most desirable "handle" and "lustre." (3.) There is no liberating of free caustic alkali and consequently no production of sticky, insoluble soap on the wool fibre. (4.) Economy in the scouring agent. (5.) Washing at 96° to 100° F. and consequently no clotting of blood carrying anthrax and a consequent minimising of liability of the workers to contract anthrax. Up to the present "Sapon" has proved its worth from the economical and efficiency point of view for the longer wools, but it has yet to prove its value for the shorter merino wools.

Attempts are being made to treat "wool-combers suds, washwaters" etc. Several methods have been or are being tried, and although it can not be said that any one has proved a marked success it seems probable that in the near future much will be done towards the purification of certain of the Yorkshire rivers from these deleterious substances and that this may be effected along with a substantial financial gain.

Wool Preparing Processes.—The efficiency of carding engines has recently been improved by designing the framework to come close up to the revolving rollers, with driving wheels and pulleys on the outside. This arrangement is more efficient owing to the absence of varying air currents towards the ends of the carding rollers. The hot-air backwasher has firmly established itself in the worsted industry, humouring the wool more and producing a better yield and a better "top" than that produced on the old ironing type of machine. Attempts continue to be made to improve the Noble comb, but little headway is to be recorded. The attempt to place three or four small circles within the large circle has not met with marked success, while mechanical dabbers to supplant the ordinary dabbing brush have been tried again and again and apparently found wanting, although there is one type making some headway. French combing has established itself for special types of work, but for bulk lots the Noble comb is still holding its own.

Spinning Processes.—French drawing and mule spinning are claiming increased attention in Yorkshire, and as a result drawers and spinners upon the ordinary English machines are being forced to study and if possible extend the capacities of their machines to meet the demand for soft spun yarn. A Yorkshire machine-making firm has put a useful gill box (the O.P.S.) upon the market for dealing with short fibred material to advantage, and various combinations of French and cone drawing-boxes are being tried in connection with ring and cap spinning and twisting.

The most interesting development to be noted in the woollen trade is the attempt which is being made to introduce a continuous frame spinner in place of the woollen mule. Some remarkable yarns are being produced on this machine, and it seems probable that for at least a section of the trade the mule will be superseded by this simpler and quicker spinner.

Perhaps the most important development to note with reference to both cap and flyer spinning is the marked development of the self-doffing mechanism. Three years ago the self-doffing machine was considered a questionable advantage; to-day, owing in England to the shortage of half-time labourers, and also to certain incidental advantages, it is being adopted as the only possible solution to the difficulties by which the spinner is surrounded. The Arnold-Forster self-doffing flyer frame led the way and is now closely followed by Lister's, Prince Smith's and others for the flyer frame, and by Prince Smith and Hall and Stall self-doffers for the cap frame. When the self-doffer was first suggested its mechanical advantages were considered nil, and it has needed some years of experience to find out that there was undoubtedly are such advantages. The latest cap frame doffer for example is so designed that there is no nicking of bobbins and no wearing away of cap spindles, and there are other advantages which are slowly being realised. Strange to say, "cap-doffing," which for some time after the introduction of "flyer-doffing" was considered impossible, is now the simpler of the two, and further has not necessitated that change in the construction of the frame which is noticeable in the flyer-frame. The ring and mule self-doffers have yet to appear, but the demand for them seems inevitable.

Various attempts have been made to increase the production of wool spinning machines by the adoption of a variable drive. At present each machine is driven at the speed which will just yield a satisfactory result when the machine is spinning at its worst, say when the yarn is being wound upon the thin part of the bobbin or tube. Under the new arrangement the speed is not changed for this portion of this spin but the machine is automatically speeded up for the easier part. Possibly the extra expense of the variable speed motors has militated against any wide adoption of this method of increasing production.

The winding of yarn on to bobbins, tubes or spools seems unimportant, but the International Winder has proved its value; for by its means layer after layer of yarn can be so closely laid that about double the length can be got on to the spool or bobbin as compared with ordinary winding. Thus when such spools or bobbin come to be woven there are but half the stoppages for reshuttling, with a consequent greater production.

Reference should here be made to the difficulties often to be faced due to the electrification of wool while passing through the various machines. Two main systems to meet this difficulty have been tried. The most successful method seems to be to introduce humidity into the atmosphere and thus carry off the electricity. The other method is to employ a neutraliser throwing a continuous stream of the opposite sort of electricity into the electrified wool. The use of radium has also been suggested, but is too expensive.

Warping, Weaving, etc. Processes.—In the weaving section some few improvements are to be noted. The Scotch Warping Mill and the Warpers' Beam Systems are undoubtedly taking the place of the old upright mill, and more perfectly tensioned warps result. The tedious operations of drawing and twisting or tying-in have naturally claimed the attention of the inventor, and all these operations are being systematically and seriously attacked. The ease with which the Barber warp-tying-in and the automatic warp drawing-in machines work is a revelation in mechanical possibilities.

The most interesting loom development to note is an automatic shuttling mechanism introduced by Messrs. Robert Hall & Sons, Bury. The warpstop motion, shuttling mechanism, etc. is so connected up to the lighting up of the loom that the moment anything goes wrong and it stops, in come the lights; the moment the loom is put to rights and set running, down go the lights and the loom does its work in an economical darkness.

In both automatic and ordinary looms a marked extension of the warp-stop mechanism is to be noted. Such a mechanism ensures greater perfection in the resultant pieces.

A shuttle-box control mechanism has been put on the market by two firms. Traps or double-shuttling are here obviated by the empty box controlling the picking.

The question of mechanical as against electrical driving of looms has been strongly fought. More electrical driving is certainly being introduced, but, upon the whole, under special circumstances only. It seems probable that if current can be supplied at $\frac{1}{4}$ d. (.25d.) per unit then electrical driving is as cheap as mechanical driving. Both the group and individual drive systems are advocated, but the group system seems to be gaining.

Dyeing and Finishing Processes.—In the dyeing industry marked advance seems to have been made in the dyeing of "tops" or wool in the combed state. Regularity of the dye has been considered an impossibility until quite recently, but the latest machines have certainly suggested the possibility of success. The Permutet water-softening apparatus is worthy of note, a good water supply being a desideratum both for scouring and dyeing.

In the designing section of the industry the two most noticeable features are the development of the worsted tweed trade—no doubt largely due to the introduction of the hobbleskirt—and artificial silk. In 1912 tons of artificial silk were being employed in the Yorkshire manufacturing district alone, and the manufacturing firms were months behindhand with deliveries.

(A. F. BARKER.)

NEW FIBRES¹

Through the "fibres" of the organic world mankind exhibits in a striking way his direct dependence upon natural products, both for the useful and the decorative and aesthetic elements of his life. It is in such regions of activity that we become aware that the arts have antedated "Science" by centuries, and moreover that our modern Science is contributing no few factors of primary importance. It might be presumed that the application of scientific investigation to the wealth of material presented by the organic world would certainly lead to the selection and industrial application of fibres outside the range of staple materials of natural empirical selection. The presumption however is not justified by the facts, and there are few elements of material and fundamental novelty in the present development of the textile and allied industries.

The only noteworthy exception is in the *artificial fibres*, which are chemical transformation products of the natural celluloses. These are manufactured in a large variety of dimensions, from a "monofil" of 0.5 mm. diameter, to a unit thread of 0.5 mgr. per metre. The "artificial silks" are assemblages of the finer units, suitably twisted. The world's production of these yarns has steadily grown, and is advancing to 10,000 tons per annum. Hitherto, the artificial silks have not seriously competed with, or displaced, the true silks: they have rather made for themselves new applications. With increasing perfection of the product, however, the situation may be different. The industrial applications of cellulose derivatives have followed the lines of development indicated in *E. B.* v, 609. The viscose process is supplanting the nitrocellulose, and to a certain extent the cupr-ammonium process, for the production of artificial fibres. The acetates of cellulose are in certain directions supplanting the nitrate for films, and massive solids. The pure cellulose sheet or film in continuous length has developed into an important industry, and the product is on the market as "Cellophane."

The production of *Phormium* fibre (New Zealand "flax") is again engaging the attention of the colonial authorities, and the New Zealand Government offers prize money to the amount of £12,000 to inventors who shall improve the yield or quality of the fibre, or cheapen the production by utilisation of wastes or by-products.

In papermakers' raw materials there are supplies of new fibrous products on the market. The most important is the *cotton hull fibre*. Cotton hulls are the envelopes of the cotton seed, and they retain a residual proportion of cotton fibre, which escapes the ginning process of separation of the textile cotton from the seed. The treatment of the waste hulls, after removal of the endosperms for the purposes of oil and feeding cake manufacture, has been the subject of various inventions for the separation and concentration of the fibre (see Beadle & Stevens, *J. Soc. Chem. Ind.* 28, 1015). The machines invented by De Segundo (English Patent 3268 and 11,137 of 1908) effect a very complete separation of the fibre from shell residues, giving a raw material of 85 per cent cellulose concentration, and on a low rate of working costs. By this process a supply of 5000 tons of fibre per annum is already rendered available for European consumption, and bought at "rag" cellulose prices.

Bamboo has long been recognised as a potential source of papermakers' half-stuffs and cellulose. An important report has recently been published by Mr. W. Raitt, describing investigations carried out for the Forest Research Institute at Dehra Dun. This report puts the cost of production of unbleached bamboo pulp as £6. 5s. od. per ton (in India). It is also to be noted that a bamboo half stuff is offering in the London market, and the present available supply is stated to be 1000 tons per annum. This is produced in Tongking, where work has been started on a unit plant of 10 tons per day capacity. The undertaking is an Anglo-American capitalisation, and is projected for a possible extension to 100 tons a day.

Papyrus (Cyperus).—The massive reed growth on the Nile river is attracting attention as a possible source of paper-making cellulose. Practical investigations under the auspices of Sudan Industries Ltd., and Sudd Fuel (Suddite) Ltd., have established the

¹ See *E. B.* x, 309 et seq. Digitized by Microsoft

industrial value of the compressed material in briquette form as a fuel: large shipments of the raw material to England have been worked up into paper, and the results establish an all round utility as a papermaking material. It remains to establish the important question of steady supply in convenient form for economical freights, and minimum rates of sale in European markets. (C. F. CROSS.)

SECTION VIII

SPORT AND GAMES

Internationalism.—In explaining the aspirations of his country towards sea-power, the new German Ambassador to England, Prince Lichnovsky, remarked at the end of 1912 that Germany had already adopted British manners, dress and sports. The assimilation of these and other features of social life throughout the portion of the world that affects the European form of civilisation is, of course, mainly the consequence of extended international intercourse and the growth of towns and commerce. It is a commonplace observation that nowadays the inhabitants of great cities in Europe and the countries colonised by Europeans are superficially very much alike; and it could easily be shown that their uniformity is no longer confined to appearances. But in the matter of sports and games, which reflect, besides modifying, character, other influences than the mere imitation of fashion have to be recognised.

In Great Britain it may be asserted that the passion for outdoor recreation is essentially hedonistic. While publicists, preachers and philosophers have for many years kept up a fierce controversy, the natural practice has been little, if at all, influenced by the questions whether games in moderation or excess waste the time and pervert the energies of school-boys or squires; whether physical culture is better advanced on the cricket ground or in the gymnasium; whether University oarsmen for the most part die prematurely of cardiac hypertrophy; whether the prevalence of football absorbs enthusiasm which ought to be given to national defence. There are, of course, thoughtful, unprejudiced and experienced educationalists who advocate athletic games as a necessary part of juvenile training, and are able to command practical assent to their views; while there are many thousands of sportsmen and players of games who are convinced by their experience of the immense utility of their favourite diversions. But on the whole it must be confessed that the general adoption during the last half-century of rural amusements by the British urban population has been caused, not by a conscious desire for culture, but simply by a desire for enjoyment; while the main retarding force has been a fast-decaying puritanism. The thing is first done and afterwards defended. At this point both the practice and the defence are seriously reinforced by the imitation of foreign nations. And it would seem that in their case the movement is to a considerable extent deliberately undertaken from a conviction that their own educational methods can be advantageously supplemented by a selection from the recreative customs of their neighbours. While increasing recognition is paid to the value of physical culture and curative exercise, it is now also understood that in sports of most kinds the senses are sharpened, and a mental as well as bodily kind of alertness and dexterity fostered. Further, the element of competition,—together with that conflict with the luck of a contest, which to the Anglo-Saxon race has so much to do with the pleasure of games,—is admitted to be in a high degree formative of character. In short, games and sports are in times of peace more or less useful substitutes for the normal military struggle for existence by which the nations have reached their present development.

Whether as an effect, as a cause, or as a concomitant of this new attitude on the part of the nations, the modern Olympic Games must be taken into account. They have certainly accelerated the growth of internationalism in sport. The celebration of the games in London in 1908 was practically the first revelation to some European peoples of a national opportunity. They found that they possessed champions worthy to stand up in an international arena; and thus was originated a new competitive

patriotism, a kind of national consciousness, similar to that which is generated by warfare, though of much less intensity. At Stockholm, in 1912, international rivalry was even more vivid. The conviction that the credit of a state could be served by success in the Games had become so firmly established that Government subventions were granted to some of the competing teams, while others were assisted by public subscription or donations from wealthy patriots.

That international sport will occupy a still more important place in the future, provided that the general peace of the world is maintained, may be confidently asserted. At present the obstacles to free and universal sporting intercourse are considerable, but they are not entirely insuperable. One of the greatest difficulties to be overcome is the establishment of an international code—perhaps necessitating international legislative conferences. It is only necessary to instance the defects of the fencing, rifle-shooting and wrestling contests at Stockholm in order to show what has to be accomplished in this direction. There also remain the vestiges of political barriers to be obliterated before French and German, Russian and Finnish, Austrian and Bohemian teams, for example, can freely engage in matches at such games as hockey and football.

At Olympic meetings hitherto the strictly athletic part of the programme has been the simplest to arrange and the most favoured, as well as the most conspicuously successful. Of what are called games in the limited sense of the word the most cosmopolitan, because most independent of different geographical conditions, are lawn-tennis, golf and football of the Association type. Both golf and lawn-tennis are finely adapted for the recreation of townsmen of sedentary occupations and restricted leisure. Association football, besides being simple, inexpensive and easily learned (though giving scope for great skill and speed), is assisted in its extension by attractiveness as a popular spectacle; since it affords the excitement of a combat to the spectators while demanding the smallest amount of practical comprehension of its technique. It would be tedious to catalogue the places where the game is played—let it suffice to mention that it has recently taken root in the United States, it pervades South America, and has been played by native Asiatic teams in Jerusalem, besides affording a moment of patriotic and ungrudged triumph to a Calcutta crowd when a native eleven defeated a British regiment. Similarly, it may be recalled that lawnt-ennis flourishes in St. Petersburg and in the Spanish Peninsula; that a journey across Africa has actually been described in the guise of a golfing tour; that a course has been laid out at Kabul for the Amir of Afghanistan. Both golf and lawn-tennis, in spite of the peculiar demands of foursomes and doubles, are essentially games for the individual. International competition in these games is accordingly carried on largely through the private enterprise of players who compete in the open tournaments and championships of foreign countries. But lawn-tennis matches, besides the Davis Cup contest, have recently taken place between teams representing London, Berlin and Paris; and the Dulwich Covered Court Club has received a visit from a Bremen team. In football, as in cricket, what are termed international matches are almost exclusively played by teams belonging to different sections of Great Britain, with occasional interchanges of visits between British and Colonial teams. But the Football Association has for some years chosen amateur elevens for matches with several Continental countries and English clubs have undertaken tours in the United States, Canada, South Africa, France, Belgium, Holland, Germany, Austria and Bohemia. The one Continental European country which enters largely into competitions in many kinds of sport with Britain is France, but Belgian rowing has been exemplified with great effect at Henley. Particulars of international contests in many sports and games will be found under the separate headings below.

The new movement towards competitive athletic games has been more highly exemplified in France than elsewhere. Though French athletes were not as numerous or as prominent at the Stockholm Olympic Games as might have been expected, the progress made in running on the track and across country has been sufficiently shown

in matches between English and French clubs, and in the performances of French teams in the international cross country championships. French lawn-tennis players are capable of holding their own with All England champions on grass courts, and on hard courts have the advantage. But it is especially in Rugby football that the new French athletic spirit is most impressively declared. *A priori* no game seemed less likely to become acclimatised on the French side of the English Channel. A few years back, when the Parisian clubs, Stade Français and Racing Club de France, took up this form of football, the deficiency of school training, the want of personal dexterity, and the apparent ineptitude of the players for concerted play were the most obvious features of their matches. A sufficiency of courage and something more than a sufficiency of combativeness did not seem to hold out great promise for the future. Nowadays, Rugby football is popular throughout the country, and the Southern towns, Bordeaux, Nantes, Bayonne, Toulouse, Tarbes and Lyons, possess very strong clubs, backed by a local enthusiasm which is indicated by the large crowds of spectators at their matches. English club fiftens even of the highest reputation no longer play French teams in France with confident assurance of victory; international matches with the picked teams of France are considered to require the full force at the Rugby Union's disposal; a strong Scotland team has actually been defeated. In football is exemplified the modern French earnestness, the striving towards efficiency, the consciousness of the necessity for sustained national effort and sacrifice, that the present military phase of development has produced. But further, the practice of the game has already developed a genuine sporting love of it. Something like the old spirit of the knightly tournament is now discernible in the play of French fiftens; the delight in a fierce and headlong onset and the concentrated endeavour towards victory are now tempered by an appreciation of the technique of the game. Accordingly the self-possession and mutual reliance on which the concert of a team depends have been evolved, and a game is more likely to be won when the whole sum of enjoyment is not staked on victory. Probably the favour in which boxing is now regarded in France may be attributed to the national change of temperament. The acceptance of professional pugilism came about in spite of a fatal accident in the ring which might have been expected to prejudice the sport in the eyes of the public. The ordinary Continental European attitude towards boxing is such that no amateur contests were held at Stockholm in 1912 because of a doubt as to their legality. Pugilism is now so attractive that a sum of more than 100,000 francs has been produced in Paris at one of Carpentier's matches. Boxing in the army and in amateur circles is also prospering under the impetus of a popular taste which is perhaps now at its climax.

Athletics—or competitive running, jumping and throwing—may be classified as lying between ordinary ball games and gymnastics. The readiness with which the athletic part of the Olympic programme was taken up by the Scandinavian nations was due to their excellent gymnastic discipline, based on the methods of P. H. Ling.¹ This system, though it has made its way into all countries, is still cultivated more extensively and in higher perfection in Sweden than elsewhere; but an excellent gymnastic drill of the same type is used in Italy. It is significant of the expression of national feeling by the way of physical culture that the Bohemian *Sokol* societies, whose object is to preserve Slav-nationalism, make a peculiar mass-drill the chief feature of their meetings. Nothing was more striking in the results of the Olympic competitions than the progress made in athletics by the Swedes and Finns, the latter excelling especially in wrestling and feats of strength. The Swedish National Union, subsidised by the state, is a great federation of clubs, having for its aim the enlisting of all adult citizens in an athletic discipline. Swedish citizens are encouraged to qualify for bronze, silver and gold badges by passing tests in five groups of exercises, which include jumping, running, swimming, fencing, weight, discus and javelin throwing, bicycling, skating and ski-running. There is no other country in which so near an approach is made to the old Spartan regimen. Hockey, football and lawn tennis are

¹ See *E. B.* xvi, 728.

also flourishing in Sweden, and not only are Swedish yachtsmen now famous, but considerable progress has been made in designing yachts of the smaller classes.

It would not be impossible to construct a scale of the nations arranged according to the degree in which active popular interest was taken in the despatch of competitors to the Olympic Games. This list would in no way represent the total amount of each country's devotion to athletic games, and, if Sweden were placed at the head of the table, Britain would occupy a low place. In Belgium, for instance, a taste for sport is very prevalent, but, as in England, it is not corporately manifested. It will probably, however, find its opportunity at the Ghent Exhibition. In America the doctrine of physical culture inspires a large amount of organised endeavour; the Athletic Union co-operates with the clubs in encouraging the systematic study of athletics; and it is supported by public interest, and, on occasion, by private munificence.

Olympic Results 1912.—The Olympic Games were carried out in Stockholm in July 1912 during exceptionally hot weather. Although the resources at the disposal of the Swedish committee did not admit of so large a programme as had been undertaken in London in 1908, the whole festival was exceedingly successful. In regard to the presentation of internationalism, the Swedish capital had the advantage of not being so large as to engulf its visitors; and the spectacle of diverse nationalities was therefore most impressive. The stadium and its ornamentation were of striking and beautiful design and were situated in picturesque environment. There were several points in which the arrangements showed an advance on those of 1908, and though there were a few failures in the management of the competitions—partly through unavoidable defects in the programme, the conditions and the judging—very little cause was given for dissatisfaction. One of the most noteworthy innovations was the electrical timing of the foot-races; and in view of the extraordinary speed attained by the runners, it should be recognised that the use of mechanical apparatus for this purpose can hardly have favourably misrepresented their performances in comparison with the old way of time-keeping with a stop-watch. The foot-races, on account of the facility with which they are exhibited in a stadium, once again were invested with a larger importance than they ordinarily attain in public esteem. By far the best results in this part of the games were secured by the United States contingent, who were also prominent in what are called field events, but not without strong rivalry from Sweden and Finland.

Comparison of the aggregate number of points gained during the whole series of contests by different nations is of no great utility, for the reasons that success in a team competition counts no more than the victory of an individual in a single race, and that the Olympic programme includes contests which are not in vogue in all the competing nations, while omitting others like cricket, baseball, Rugby football and (at Stockholm) boxing, on which hundreds of thousands of sportsmen concentrate their energies. There are slight discrepancies in the published returns, but it is substantially accurate to state that, three points being counted for a winner or winning team, two for a second place, and one for a third, the United States team gained 85 points in athletics and 45 in all other events; Sweden scored 30 points in athletics and 130 in other events; Great Britain 15 points in athletics, or rather foot-races, and 61 in other events. The British Dominions scored 13, and 29 points; Finland 29, and 23 points. That Sweden was able to make the best total was mainly attributable to ability to undertake a greater number of competitions and to place in the field a greater number of competitors than any other country on account of the locality of the Games; but largely also to organised preparation. The United States had better results in proportion to the number of entries, and actually held the lead until the yacht races at the close of the meeting. These races, from geographical and other considerations, were practically limited to a very few countries. The Americans took no part in rowing or football, and sent in but one competitor for the gymnastics; the British were not represented in open-air lawn-tennis, the javelin, the discus and the weight—events which have never interested Englishmen,—the athletic decathlon and pentath-

lon, certain of the shooting, wrestling and gymnastic competitions, etc. It is curious that while little or no public support was extended to the British Olympic Committee, and while the state of athletics in Great Britain furnished hardly any hope for success in the races, disappointment was loudly expressed by the British press and public when the anticipated results duly came to pass. The Swedish successes were widely distributed, points being gained especially in some of the less universally practised forms of athletics, in Swedish gymnastics, horse-riding, cycling, shooting, driving, wrestling and yachting. Finland, who came fourth in the order of aggregate with 52 points, profited by the assistance of the greatest long-distance runner of modern times (Kolehmainen), and did well in discus-throwing and wrestling. Germany gained 47 points; Australasia, Canada and South Africa 42—South Africa producing the winner of the much-esteemed Marathon race as well as the second man, and the winner of the curious cycling road-race. France scored only 31 points; Austria-Hungary 22; Denmark 19; Norway 16; Italy 13; Belgium 11; Russia 6; Greece 4; Holland 3. Entries were sent in, but no successes were obtained, by Iceland, Switzerland, Portugal, Luxemburg, Monaco, Servia, Egypt, Turkey, Argentina, Chile and Japan.

In the following sections on the progress of particular sports and games¹ in 1911-12, they are taken for convenience in alphabetical order, with the exception of the final section on American sport.

Angling.

Within the last few years there has been one remarkable development in the field of salmon investigation. It has been discovered, or rather re-discovered (for Anthony von Leeuwenhoek late in the seventeenth century was the first to suggest it—a fact which seems to have escaped notice until it was lately pointed out by Dr. W. J. Turrell in *The Field*), that it is possible to tell a fish's age from the markings of its scales. This has proved to be easier with salmon than most fish, and the results obtained by investigations have been noteworthy. Messrs. H. W. Johnston and W. L. Calderwood in Scotland, Mr. J. Arthur Hutton and Dr. H. Turnbull in England, and Dr. Knut Dahl in Norway are the workers to whom the new knowledge of salmon is chiefly owed. Mr. P. D. Malloch of the Tay Salmon Fisheries Company has also done good service, and much interesting information is to be found in his book (see below), though some of his conclusions do not find general acceptance with other observers. The result of salmon scale reading, briefly put, is the following view of the fish's life history. The parr usually stays two years in the river (in Norway the river-period is sometimes longer, a fact which may be accounted for by differences of climate); after running down to sea as a smolt the fish spends at least a year in salt water and it may spend two, three, or even four years there, ascending a river again for the purpose of spawning as a three-year-old, four-year-old, five-year-old or six-year-old, as the case may be. This quite upsets the old idea that a grilse might return after only a few months in the sea. Another old idea must also be relinquished, that salmon spawn every year of their lives. All the data so far obtained go to prove that most of them spawn only once. A proportion (which has yet to be clearly determined) may spawn a second time; at present the data seem to show that this proportion is not more than 10 per cent. A very few may spawn three times in their lives, but so far fish bearing evidence of three spawning seasons on their scales have been very rare indeed. There is obviously a good deal more to be learned, but the main facts cited may be considered proved. When the investigation has gone somewhat further, doubtless fresh problems of a practical nature, such as the treatment of kelts, will arise, but the time for them and for new legislation based on the new knowledge has hardly arrived yet.

In other fields of the angler's interest perhaps the most interesting is a revival of wet-fly fishing on chalk streams. The practice as now carried on is really a development from the dry-fly; and those who practise the method go a step further than dry-fly men by imitating the nymphs of the Ephemeridae and using them under the surface. The book by Mr. Skues mentioned below is the chief authority for the method.

¹ See the corresponding *E. B.* headings for general accounts up to 1910.

The following is a selection of recent angling literature worth noting.

Dr. W. J. Turrell's *Ancient Angling Authors* (London, 1910) dealing with angling literature down to the end of the eighteenth century, is a carefully compiled and useful book. Dr. H. M. Hall's *Idylls of Fishermen* (New York, 1912), a study of "piscatory eclogue" literature (of which there is a considerable mass, dating from Theocritus onwards), is the first attempt to deal with it at all fully.

On Salmon and trout-fishing A. H. Chaytor's *Letters to a Salmon Fisher's Sons* (London, 1910) is an excellent book of practical instruction. H. Lamond's *The Gentle Art* (London, 1911) contains useful chapters on legal and economic questions. G. E. M. Skues, in *Minor Tactics of the Chalk Stream* (London, 1910), deals with the use of wet-fly on dry-fly streams; with this may be mentioned F. M. Halford's *Modern Development of the Dry-Fly* (London, 1911). L. West's *The Natural Fly and its Imitation* (St. Helens, 1912), is perhaps the best book on practical fishing entomology since Ronald's; it contains excellent coloured plates.

H. T. Sheringham's *Coarse Fishing* (London, 1912) and C. O. Minchin's *Sea Fishing* (London, 1911) are excellent on their respective subjects.

C. Tate Regan's *British Fresh Water Fishes* (London, 1911), W. L. Calderwood's *Salmon Rivers and Lochs of Scotland* (London, 1909), and *Life of the Salmon* (London, 1907), P. I. Malloch's *Life History of the Salmon, etc.* (London, 1910), J. Arthur Hutton's *Salmon Scales* (London, 1909) and *Salmon Scale Examination* (London, 1910), and Dr. Knut Dahl's *Age and Growth of Salmon and Trout in Norway* (edited by J. Arthur Hutton and H. T. Sheringham, and published in English by the Salmon and Trout Association, 1911), all deal more or less with the new science of salmon scale reading. Important papers on this subject by Mr. H. W. Johnston are also to be found in the twenty-third, twenty-fourth, twenty-fifth, and twenty-eighth Annual Reports on Scottish Salmon Fisheries. Dr. Francis Ward's *Marvels of Fish Life* (London, 1911) is a remarkable study of fish as observed under water both with the eye and the camera. Dr. J. de Bellesme's *La Pisciculture en France* (Paris, 1910), is a study of French fish culture, with particular reference to the work of the Trocadéro Aquarium.

Archery.

In spite of much unfavourable weather several fine scores were made in England in 1912 by both ladies and gentlemen. The most notable was that of Mr. H. P. Nesham at the Southern Counties Meeting in September, when in the double York Round he obtained 1,067 with 223 hits. This is the highest score made since 1868 when the late Mr. H. A. Ford at Leamington scored 1,087 with 219 hits, and, except by Mr. Ford, it has never been beaten at any public meeting. The championships were shot for at the Grand National Meeting at Cheltenham and won by Miss Q. Newall with 716 and Mr. R. Brooks-King with 829. In 1911 Miss Q. Newall at the Grand National Meeting, where she won the ladies' championship, scored 803. Mr. W. Dod, who won the gentlemen's championship, scored 885. Flight shooting is now rarely practised, but a fine shot of 463 yds. was made by Mr. Ingo Simon in 1912 with a Turkish bow.

The opportunity may be taken here to correct the *E. B.* article on "Archery" in some particulars. The bow now used by men is from 6 ft. 1 in. to 6 ft. 4 in. in length; a lady's bow ranges from 5 ft. 6 in. to 5 ft. 8 in., measured between the nocks; these lengths according in the one case with an arrow of 27 in. to 28 in. and in the other with an arrow of 25 in. to 26 in. Exceptionally long arms may render necessary an arrow an inch longer and a corresponding addition of one or two inches to the bow. The "weight" of a bow is the number of pounds required, when appended to the string, to draw to the head an arrow of 28 in. for a man's bow or 25 in. for a lady's. The weight of men's bows varies from 36 lbs. to 58 lbs., of ladies' from 18 lbs. to 30 lbs., the lighter weights being sufficient for beginners. Bows are styled "self" or "backed" according as they are made of one wood or of two or more glued together. "Self bows," if of yew, are usually made of two pieces joined by a double fish splice at the handle: as it is difficult to find a piece of this wood (incomparably the best) of sufficient length while free from knots. If made of lance they are invariably of a single piece. "Backed bows" may be of yew, backed either with the same wood or with hickory; or alternatively of washaba or of ruby, lance, or other woods backed with hickory; the back being the flat side of the bow, and the "belly" the rounded side. Three woods are sometimes employed, a thin strip of fustic being interposed between a belly of yew and a back of hickory. There should be an inflexible centre of about 21 inches, whence the bow should taper gradually towards each end. It should be straight the back true, and, when strung, the string should appear to cut the belly into two equal parts. Self yew bows are the best. They are light in the hand, the sweetest to pull, and have the best cast; but they require careful handling. They are also expensive, costing from £5 to £15, and they are liable to "crysals," or tiny cracks, which gradually spread until the bow breaks. A yew backed yew, which is next in merit, can be bought for £5 and is somewhat less liable to crysals. Between the others there is little to choose, provided that they are properly made, and not "reflexed," as

they are said to be when the ends bend outward; for these jar the hand. Their price varies from 25s. to 3 guineas. The string for a man's bow should be from 6 in. to 6 $\frac{3}{4}$ in. from the back of the bow when strung, for a lady's from 5 $\frac{1}{4}$ in. to 6 in., according to the length of the bow. The nock of arrows—it is never called the "notch"—should not be "cut square" but rounded. The feathers must be wing and not body feathers, which are quite useless. They should be from the same wing, i. e. right or left, about 1 $\frac{1}{2}$ in. long and tapering to the front from a depth of $\frac{1}{2}$ in. at the nock. If balloon-shaped, their greatest depth should be at one third of their length from the nock-end.

With regard to target scoring and handicapping it should be noted that a St. George's Round has never been shot at a public meeting, or, indeed, at any meeting held within the last 60 years. Handicapping by the loss of rings has been obsolete for more than 35 years, nor is there any system which can rightly be called handicapping by points. Handicapping is now carried out either by dividing the archers into classes according to their powers, or by deducting percentages from their scores for previous successes.

As regards the history of archery, some corrections may also be made. The bow was used in war at a later date than 1860, viz. by the Japanese against the English at Surni Nosake, September 5, 1864. Nor did the Armada year see the last appearance of the English archer. A company of archers was raised for the expedition to the island of Rhé in 1627. There were archers among the Russian troops in the Crimea. Again, the relation of Finsbury Archers, the Hon. Artillery Company and the Royal Toxophilite Society requires restatement. In July 1676, William Wood, Marshal of the Finsbury Archers, was sent round with a paper, signed by Sir E. Hungerford and others, setting forth that the "officers and others of the Society of Archers, within the cities of London and Westminster" have determined "that the bearer shall have a silver badge and bear the same as Marshall to the Queen's Majesty's Regiment of Archers." The names of the subscribers were appended (Guildhall MSS. 193). Consequently this badge or shield had no connection with Oxford. The Finsbury Archers became extinct about 1761, but the Royal Toxophilite Society was not founded until 1781, when Mr. P. Constable, the last captain of the Finsbury Archers, joined it and handed to it the shield and other valuables. There was, therefore, no combination of the two clubs in 1841. It is incorrect to assert that the Finsbury Archers were not connected with the Hon. Artillery Company. They were connected, and under their powers shot over the Finsbury Fields up to 1657. The Archers' Division of the Hon. Artillery Company was formed by members of the Royal Toxophilite Society in 1784.

It may also be mentioned that "the Championship" is not recognised as a term belonging *par excellence* to any of the public meetings; and that the list of public meetings should include the Southern Counties Meeting. The Crystal Palace meeting became extinct in 1902.

*Athletics.*¹

It was to be expected that under the impulse of the Olympic Games prodigies of natural speed and strength would be forthcoming from several nations. On the other hand, while general improvement and an increase in the number of prominent athletes might be counted upon, the actual displacement of records, being apparently a matter of increasing difficulty, was considered improbable. In the course of the Olympic Games at Stockholm, and of the trial contests held in the United States, a number of feats were accomplished surpassing the best performances of exceptional and reputedly unapproachable athletes of former years. For example, if any record could be considered unassailable it was the high jump of 6 ft. 5 $\frac{3}{8}$ in. of M. Sweeney of New York, and in another category, the long distance times of A. Shrubbs and W. G. George seemed scarcely likely to be equalled. It was, however, precisely these records, together with the wonderful half-mile running of Lunghi, that were eclipsed either at Stockholm or in preliminary contests among American aspirants to Olympic medals. Systematic study and training in the United States, together with the large resources of athletic ability made available by the popularity of inter-club, inter-school, and inter-university contests, have considerably enlarged the athletic horizon. At Stockholm the United States team, admirably organised and disciplined, carried off a considerable majority of the athletic medals. In many cases the struggle for the first two or three places was confined to the members of this team, and in several instances the failure of the expected winner did not impair the American chances of victory. On the other hand Finland, besides doing well in feats of strength, produced the most remarkable long-distance runner of modern times in H. Kolehmainen; and yet even he, in the most memorable race of the meeting over a course of 5,000 metres, was barely able to beat the French

¹ See also under "United States" below.

runner, J. Bouin, after running at his side for the whole of the distance. In the shorter races the Americans fully maintained their reputation for sprinting ability, and practically had the issue at their mercy, although W. R. Applegarth for Great Britain showed exceptional speed. In the subsequent English meetings of the year this runner achieved further distinction. On the whole, the British competitors, who had shown little or no promise at their preliminary trials, acquitted themselves better than had been expected. The ill fortune of G. R. L. Anderson, who might possibly have won the 120 yards hurdle race, but fell when well placed towards the end of the final heat, was compensated by the victory of A. N. S. Jackson in the 1,500 metres. A high jump of 6 ft. 4 in. was accomplished by A. W. Richards, U.S.A., and a long jump of 24 ft. 11 $\frac{1}{4}$ in. by Gutterston, U.S.A., and excellent performances were shown in the weight-putting and the throwing of the discus, javelin and hammer, as well as in the hurdle race. Although the American team gained so large a proportion of the Olympic medals, athletic ability of an exceptionally high order was forthcoming from several other countries. The German runner, H. Braun, like the Frenchman Bouin, was unfortunate in meeting men of phenomenal speed: Sweden and Finland produced many fine athletes, and Canada, besides producing the winner of the 10,000 metres walking race, Goulding, did very well in the long jump and the hammer. In the Marathon race two South Africans, McArthur and Gitsham, finished first and second, showing but wonderful endurance of the topical heat.

The previous best performances on record were excelled at Stockholm in the 800 metres (J. E. Meredith, U.S.A., 1 min. 51 $\frac{9}{10}$ th sec.) and the 5,000 metres (H. Kolehmainen, Finland, 14 min. 36 $\frac{3}{5}$ ths sec.) Meredith ran on and beat the half-mile record in 1 min. 52 $\frac{1}{2}$ sec.; and Kolehmainen ran 3 miles in 14 min. 13 sec.—or 4 sec. less than A. Shrubbs's previously unbeaten time—in the course of his great exploit. Perhaps, however, the most wonderful of the Olympic victors was James Thorpe, an Indian from Oklahoma, who easily won the pentathlon and decathlon. His long jump was 23 ft. 2 in., his high jump 6 ft., and he cleared 10 ft. 9 in. in the pole jump, besides running 400 metres in 51.2 $\frac{2}{5}$ ths sec., 100 metres in 11.1 $\frac{1}{5}$ th sec., 1,500 metres in 4 min. 40 sec., and 110 metres over hurdles in 15.3 $\frac{3}{5}$ ths sec., and throwing the javelin 155 ft.

Other amateur record performances, accomplished in the past two years, may be mentioned here. In the pole jump, M. S. Wright has done 13 ft. 2 $\frac{1}{4}$ in. In the high jump, G. Horine has done 6 ft. 8 in. in the American Olympic trials. J. P. Jones at Cambridge, Mass., in May 1911 ran a mile in 4 min. 15 $\frac{3}{4}$ sec. or nearly 1 $\frac{1}{2}$ sec. faster than the British amateur record established in 1902; and A. Kiviat at Harvard in June 1912 covered 1500 metres in 3 min. 55 $\frac{3}{4}$ sec. The hammer was thrown 187 ft. 4 in. by M. J. McGrath (afterwards Olympic winner) in 1911. The Swedish javelin thrower, C. Lemming, in September 1912 established the amateur record at 205 $\frac{1}{2}$ ft. for the right hand and 146 ft. 4 in. for the left. At Herne Hill on May 20, 1911, H. V. L. Ross walked 11 miles in 1 hr. 25 min. 48 sec., and surpassed all records from this distance to 17 miles (2 hr. 18 min. 29 $\frac{3}{4}$ sec.); S. C. A. Schofield walked 22 miles in 3 hr. 9 min. 48 $\frac{3}{4}$ sec., and 25 miles in 3 hr. 37 min. 6 $\frac{3}{4}$ sec. At Kennington Oval in September 1912, W. R. Applegarth ran 200 yards in 19 $\frac{3}{4}$ sec., and at Stamford Bridge a few days later the same runner covered 220 yds. in 21 $\frac{1}{4}$ sec.

The Amateur Athletic Championships of 1911 in England were undistinguished, but in 1912 H. Braun in the half mile, W. R. Applegarth in the 220 yds., G. H. Patching in the 100 yds., E. Owen in the mile, G. R. L. Anderson in the hurdle race, contributed to make the meeting one of more than average quality. An international university match took place in 1911 at Queen's Club, West Kensington, between a team from Harvard and Yale, and another from Oxford and Cambridge. The Englishmen won by 5 events to 4. Cambridge won 6 events to 4 against Oxford in 1911, but the contest of 1912 resulted for the third time in the history of this annual engagement in a draw, each side winning 5 events.

*Aviation.*¹

With the advance of mechanical efficiency there came about in 1911 a transition from closed aerodrome contests to cross country races. The Gordon-Bennett race was the only important one held under the old conditions, and it was won at Eastchurch by Weyman for the United States. The European Circuit—1,125 miles of flight, which included a start and finish at Paris and halts at Liège, Antwerp, Brussels, Calais, London and Calais *en route*—was won by André Beaumont, with Garros second. The

¹ See also "Aeronautics," p. 339 *et seq.*

circuit-of-Britain race was also won by Beaumont, this time from Védrières, the total distance being about 1,000 miles. In 1912 the principal events were the various military aeroplane tests organised by the French, German and British War Departments. The Gordon-Bennett race held at Chicago was won by Védrières for France at a mean speed of 105 miles per hour. Legagneux put the altitude record up to 18,767 feet. The hydro-aeroplane has been considerably developed, and a number of competitions for it have been organised.

Badminton.

A steady, if not very great, increase in the number of clubs and players has been accompanied by a corresponding rise in the general level of proficiency. In the tactics of the players no change is observable. Success has attended what is called the "back and front" game in mixed doubles; but this depends on the ability of the lady to defend the net, and of her partner by means of great activity to take charge of the whole of the back of the court. The mixed doubles championship of the Badminton Association were gained in this manner by Mr. G. A. Thomas and Miss Larminie in 1911, and by Mr. E. Hawthorn and Miss Hogarth in 1912.

In 1911 Mr. G. A. Sautter won the singles; Messrs. P. D. Fitton and E. Hawthorn the doubles; Miss C. Douglass and Miss Orr the ladies' doubles. In 1912 Mr. F. Chesterton won the singles; Messrs. G. A. Thomas and H. N. Merritt the doubles; Miss Cundall and Miss Gowenlock the ladies' doubles. Miss Larminie (Mrs. Tragett) in both years won the ladies' singles.

For *Baseball* see under "United States" below.

Billiards.

Since the prohibition of consecutive spot hazards and the push stroke, English professionals have relied chiefly upon the top-of-the-table game. An innovation, however, was introduced in 1911 by George Gray, a young Australian, who repeatedly made huge breaks by means of a series of losing hazards from the red ball. In all, he scored twenty-four breaks of four figures, of which the highest was 2,106. Gray invariably declined to play matches with ivory balls, and these breaks were not made under Billiard Association rules. H. W. Stevenson, though not at his best during this season, beat M. Inman twice for the championship of the Billiards Control Club.

In January 1912 George Gray met Stevenson and defeated him in two games out of three of 18,000 up. M. Inman beat T. Reece for the Billiards Control championship.

H. A. O. Lonsdale did not defend his title of amateur champion, and the cup reverted in 1911 to H. C. Verr. An alteration was made in the arrangements, the champions of England, Ireland, Scotland and Wales meeting in competition in the finals.

H. C. Verr beat Major Fleming by only seven points in 3,000 for the amateur championship in 1912. The influence of Gray's example was plainly perceptible in this competition in the use made of the losing hazard. A break of 1016 made by Stevenson in October 1912, in the course of a match with W. Cook, is the highest yet recorded as having been achieved without series of spot strokes, anchor cannons, or long successions of losing hazards.

Bowls.

In the summer of 1912 a visit to England was made by a representative team from New South Wales, which won 30 matches out of 54 played. They were very strong on fast greens in sunny weather, but were unable to do themselves justice, when, during the latter part of their tour, rainy days and dull grounds became the rule rather than the exception. In the international matches Scotland won against Ireland and England, and England lost also to Ireland. A large extension of bowls as a club game; and of club and county matches, has recently been noticeable.

Boxing and Pugilism.¹

Though boxing is cultivated in many English public schools, and has been encouraged in the British army and navy, with the result that it is more generally practised and appreciated at present than ever before, the standard of skill in England would appear to have fallen rather than risen in the past few years. The same thing is true of pro-

¹ See also under "United States" below.

fessional pugilists. English bantam and feather-weights have fairly held their own, but for weights above 9 st. America and France dispute precedence. The progress of boxing in France is worthy of particular attention. French pugilists were at first trained by Lavigne, the American light-weight champion, who defeated Burge at the National Sporting Club, and later by Erne, also an American. The style of these men can be traced in their pupils, of whom Carpentier and Ledoux have been most prominent. Carpentier (b. 1894) is one of the most promising boxers of the day. In spite of his youth, he defeated the English middle-weight champion, J. Sullivan, in two rounds at Monte Carlo, and easily accounted for two of the best English welter-weights, S. Burns and Joseph. But he lost to F. Klaus at Dieppe in the spring 1912, and in October to Papke in a fight for the middle-weight championship. He is a boxer of polished style, but not perhaps equal to some of his American rivals in in-fighting and hard hitting. Ledoux is a sturdy bantam-weight who has both stamina and hitting power. After losing to Stanley, the English champion, he took his revenge decisively. Pugilism is now much in vogue in France and may be said to have completely displaced the savate (*la boxe Française*). In England Bombardier Wells, a man of a remarkable reach of some 80 inches, holds a heavy-weight championship and the Lonsdale belt. He was not, however, regarded in 1912 as comparable to the heavy weights of the past, such as Jackson, Sullivan, Corbett and Fitzsimmons. His victory over Storbeck, a South African, who in 1909 very easily won the amateur championship, is the chief basis of his reputation. On the other hand, in J. Driscoll of Cardiff, Great Britain is believed to possess the most skilful boxer of the day. He has won the Lonsdale belt for feather-weights three times in succession, and has gained convincing victories in America, but failed in an ill-advised attempt to beat the light-weight champion, F. Welsh, who, when insufficiently trained, was defeated by Matt. Wells, an amateur ex-champion. This result was reversed in November 1912. Stanley (b. 1882) retains the bantam championship, chiefly by his height and reach and the facility with which he is trained for a combat. Whatever else may be said of the heavy-weight champion of the world, the negro, Jack Johnson, he is well qualified by physique, skill and quickness to compare with any boxer of the past; but another American negro, Langford, who in Australia twice beat McVea without being hit, though at a disadvantage of 2½ st. and 4 inches of stature, is perhaps even more wonderful as a boxer pure and simple.

Boxing has certainly suffered from the American use of rough tactics and clinching, as well as by the price which is demanded by champions for their appearance in the ring. Stipulations are made for a certain sum to be paid win or lose. In a match at Sydney, Burns, the loser, received £6,000, and Johnson, the victor, £1,100. Difficulty has also been found in obtaining the services of qualified referees. In the reaction provoked by excessive clinching, what is called the "clean break" has been enforced in Australia and America, with the effect of preventing quite legitimate in-fighting.

The Amateur Boxing Association championships were won in 1911 by W. W. Allen (bantam weights) H. Bavers (feather weights), A. Spenceley (light weights), W. Child (middle weights) W. Hazell (heavy weights). Allen regained his title in 1912; the other winners in the same order of weights were G. R. Baker, R. Marriott, E. V. Chandler, R. Smith.

Bridge.

A modification of the trick values in auction bridge has recently come into general use. The new values are as follows: spades 2; clubs 6; diamonds 7; hearts 8; "lilies" (or royal spades) 9; no trumps 10. The advantages of this method are that (1) speculative declarations of no trumps are discouraged, (2) the preponderating value of red suits is diminished, (3) a situation is brought about in which the declaring side is placed at a disadvantage. On the other hand it is objected that in the bidding the strength and nature of the hands are often so thoroughly disclosed as to detract from the interest of the play.

Chess.

While the number of chess players and of professionals entitled to the rank of masters increases continually and international tournaments are becoming common events, no very exact proportion exists between the demand for prize competitions and professional

exhibitions and the supply. As a rule European tournaments receive so many applications from candidates that a selection is with difficulty made for the masters' contests, and supplementary classes are frequently included in the programme. On the other hand, in England, though amateur talent abounds and opportunities for using first class play are eagerly welcomed, professional chess is by no means abundant.

Next to the veteran Blackburne, Burn is the most prominent English master. France is not nowadays represented in masters' tournaments; but Russia is prolific of players of every degree, and so are the Dual Monarchy and Germany. But it is the "modern school" fathered by Steinitz, adopted by Dr. Tarrasch, and brought to perfection by Dr. Lasker, the present champion, which has for some years been predominant. It is characterised by academic soundness rather than brilliancy. In the indecisive matches between Lasker and Schlechter, and between Schlechter and Tarrasch, the players permitted themselves no variety of opening or of tactics, but were content with playing variations based on preliminary analysis, and with avoiding enterprise or complications in the middle game, unless forced upon them in some cases by exigencies of the battle. Of the younger masters, Rubinstein, who has been conspicuously successful, has also of late years made sound position play his principal aim. Masters adhering to the romantic style (Morphy's), like the late Tchigorin, and to a modification tempered to modern demands, like Janowsky, Mieses, Spielmann and Marshall—in fact, masters with an individuality of style and a capacity for producing interesting games—save the game from degenerating into dull academic precision. Janowsky, though he did not do himself justice in his match with the champion, is, at his best, a player of commanding personality and exceptional strategic power; Mieses is distinguished by enterprise and tactical cleverness over the board; Spielmann is capable of producing specimens of both soundness and brilliancy; Marshall's daring verges on recklessness, while on a high level of all round efficiency; Niemzovitch has displayed considerable ingenuity and originality.

At the San Sebastian tournament in 1911, J. R. Capablanca, a young player from Havana, already famous, having beaten Marshall in a set match, accepted the place originally reserved for Dr. Lasker, and won the chief prize from the leading players of the day. His style, though at times tempered to the exigencies of the score sheet, was brilliant enough to cause him to be hailed as a new Morphy. It was hoped that he might be able to play a match for the championship; but hitherto Dr. Lasker has declined his challenge under the plea of having been insulted by Capablanca in the wording of a counter proposition to some clauses of the conditions proposed for the match. In the meantime Dr. Lasker has accepted Rubinstein's challenge, who of late has achieved several successes at San Sebastian, Postyén and in the Russian Championship Tournament. Teichmann won the Carlsbad Tournament of 1911 in grand style, while Niemzovitch and Spielmann ran Rubinstein at San Sebastian very close. Of younger masters Russia may boast a bevy, of whom Alechin is the best, while young Breyer of Budapest promises to take high rank among the masters of the day.

Coaching and Driving.

Undoubtedly the advent of the motor-car has caused a great diminution in the number of horses kept solely for driving. In London, in every continental European town, and in the cities of the United States, mechanical traction has practically taken the place of the horse. But motor-cars are still beyond the reach of the countryman who drives a gig, and of the small suburban tradesman who sends out his wares in a horse-drawn vehicle. In Great Britain few people now breed harness horses, except those of the hackney breed, the best of which are of considerable value, not only for the show ring, but because there still exists a small and wealthy public which will pay highly for possession of the smart stepper. The breeding and exhibiting of harness horses possessed of high action both in England and America is now quite a business, but it is confined to a not very large number of enthusiasts, and is in no way a national affair. In the United States there are the trotters, and the standard bred horses, and both these breeds are in a flourishing condition, and not in the least likely to undergo a slump.

The pastime of driving, as is only natural with the motor-car so much to the fore, is in the hands of a few; but in London and its neighbourhood there has been, in the last four or five years, a considerable revival of four-in-hand driving, due in a great degree to the institution of the International Horse Show at Olympia, and to the establishing of the Coaching Marathons and Corinthian Cups. These contests, one of which attracted as many as twenty teams, have shown that the coach horses of the present day are better and more valuable animals than those of past generations, and that the art of driving four horses has by no means been impaired. Indeed the good "whip" of the present day has to contend with increased traffic everywhere, and with such fresh varieties of road users as the traction engine, the tramcar, the motor bus and the taxicab. Yet the driver of horses can hold his

own; and this also applies to those who have charge of the public coaches, in which direction there has been some revival both in Great Britain and the United States. All over the world the best harness horses are better and more valuable than they have ever been before, though it is certain that in most countries their numbers are decreasing.

Coursing.

Competition between greyhounds of different countries is attended with almost insuperable difficulties. Australians from time to time have sent dogs to the Waterloo Cup, meeting with but little success—perhaps through the effect of the long sea voyage. Coursing has become popular in France. The French Greyhound Club has leased a fine ground at Tremblay near Paris, where many meetings are held every year. Having purchased some of the best English blood for breeding purposes, French coursers are naturally anxious to send dogs to Altcar, and have more than once approached the Board of Agriculture and Fisheries in England with a view to the relaxation of the quarantine regulations. On the other hand English greyhounds are frequently sent abroad, even to countries as distant as Argentina, where many meetings have been held; and it is very rarely that they do not prove their superiority. In France for instance the majority of the stakes have been won by English bred dogs. Nevertheless some British breeders believe that the dogs now produced, while possessing speed, are deficient in stamina; and one breeder at least has decided to make the experiment of crossing with the Afghan hound, a slow animal remarkable for staying powers. One of this breed was imported by Lieut. M. H. Lucas, of the Indian Army (37th Lancers), who bought him from a caravan of Afghans passing through Zhob, Baluchistan. The dog is now at the stud in Northumberland, and the career of his produce will be watched with much interest. The pre-eminence of the English greyhound has been proved in Hungary, where coursing, or at least the pursuit of the hare with greyhounds, has been practised from time immemorial. The typical Hungarian dog was undoubtedly slow, but he was endowed with wonderful courage; and before the National Coursing Clubs (England) rules were adopted, the most sought after greyhound was the one that could bring his hare down, no matter what obstacles he might be called upon to negotiate. Since those days the Hungarian coursers have imported many English dogs; and the result has been highly interesting for the reason that few stakes are won but by an English bred dog, or one possessing English blood. Coursing has also been taken up in Russia with the support of the Grand Duke Nicholas, on whose estate at Perchino, about 200 miles south of Moscow, meetings are regularly held.

No other coursing event of importance in the world is held under such conditions as the Russian Waterloo Cup. After the snows have disappeared the sun exerts such power that coursing during the day is out of the question. It is therefore necessary that a start should be made at about two o'clock in the morning, or as soon as there is sufficient light; and as a rule eighty courses are decided before nine o'clock. In 1911 Dendromys, the winner of the Barbican Cup in England, was purchased by the Grand Duke Nicholas, and he was beaten in the final by Flower Glen, also English bred. In 1912 Bachelor's Ball II, a prominent performer in England, and runner up for the Barbican Cup, was secured by Count Chermétëff, and won the Russian Waterloo Cup, defeating Thekan in the last round. Thekan was bred in Russia, but is by Prince Plausible who ran second for the Waterloo Cup at Altcar in 1905. The borzois are frequently tested in Russia with hares. It has been held by many authorities that the English greyhound would beat the borzois if entered to wolves, being certainly much the quicker, while possessing quite as much courage; but the Russian dog has a great advantage in weight. In addition to the stakes for greyhounds, at the last meeting held in Russia by the Grand Duke Nicholas there were several events for borzois.

Considerable interest was attached to the English Waterloo Cup both in 1911 and 1912 owing to the fact that puppies played so important a part. In 1911 the winner and runner up were in their first season, Sir R. W. B. Jardine's Jaberwock, by Bachelor's Acre from Forrester's Favour, beating Mr. P. Storey's Silk and Scarlet, by Earl's Court from Gay Feather, in the final; and in 1912 Mr. E. L. Townshend's Tide Time, by Friendly Foe from Fast Waves, beat another puppy in Mr. F. Alexander's Adversary, by Glenfield from Alternative.

Cricket.

For more than two years past public attention has been concentrated on international cricket. The visit of a South African team to Australia in 1910-11 served as

a prelude to the so-called triangular tournament of 1912, and in the meantime an English team under the management of the Marylebone Cricket Club carried through a wonderfully successful tour in Australia in 1911-12.

The South Africans in Australia hardly did as well as had been expected. Their strength was considered to lie chiefly in their bowling, but they were disappointed by the inability of A. E. Vogler, on whom much reliance was placed, to do justice to his reputation. On the other hand they found Australian batting in its prime. In eleven-a-side matches as many as fifteen Australian batsmen averaged more than 30 runs an innings against the South Africans, and eleven of them more than 40 runs. The most formidable were V. T. Trumper, who exceeded 75 runs an innings and in Test matches averaged 94.57, W. Bardsley, W. W. Armstrong, C. Kelleway, C. G. Macartney and V. S. Ransford. The Australian bowling was of no very high quality, though W. J. Whitty was very consistent, and H. V. Hordern, who was able to match the South African "googly" bowling with a similar style, had a great share in winning two Test matches. For the South Africans, G. A. Faulkner, besides bowling well, batted with wonderful certainty, failing in none of the Test matches to make at least 100 runs in the two innings. The South Africans won the third Test match by 38 runs at Adelaide, but they lost the remaining four; and they were also beaten once by Victoria and twice by New South Wales. Three of the twenty-two matches were drawn.

The tour of the M.C.C. team was extraordinarily successful. Of 18 eleven-a-side matches the first Test match, played at Sydney, alone was lost; four were drawn and 18, including four Test matches, were won. The strength of the English team was found principally in the bowling of Barnes and F. R. Foster. Both these bowlers are above medium pace and of great accuracy. Barnes has a fine command of the leg break with the other break as a variation, and Foster, while often causing the ball to swerve in the air, has a remarkably quick rise from the pitch, and on that account is well suited by fast wickets. The batting of Hobbs, Rhodes, Woolley, G. Gunn and J. W. Hearne contributed much to the success of their side, while J. W. H. T. Douglas, who acted as captain, was of value both as a resolute and patient batsman and as a fast bowler of great precision and a mastery of the swerve. Douglas, who took up the captaincy on P. F. Warner being incapacitated early in the tour by serious illness, distinguished himself by his correct judgment and his unflinching presence of mind in the important matches. The batting of Hobbs has never been excelled in Anglo-Australian contests. Invariably sent in first, he played innings of 187, 178 and 126 not out in Test matches. His first-wicket partnership with Rhodes in the fourth match at Melbourne amounted to 323 runs—the greatest first-wicket partnership for a Test match—and the whole innings aggregated 589. The fifth match was won after the English team had been 144 runs in arrears on the first innings. The Australian bowling again seemed to be less dangerous than in previous years; but H. V. Hordern was always formidable. He had a principal hand in winning the first match for Australia and took five wickets in each innings of the last match.

At the end of 1910 a team sent to South Africa by the M.C.C. won two and lost three Test matches. In spite of the brilliancy of Hobbs, the batting was weak on the whole, and it could not cope with the bowling of G. A. Faulkner and Vogler, who took 65 out of 85 wickets. Faulkner was also by far the best of the South African batsmen, having an average of 60.55 runs in the Test matches to the 67.37 of Hobbs.

In consequence of the exceptionally bad weather of the summer of 1912 the Triangular Tournament in England was a complete failure. From the first the South African team was unlucky, several players, and notably Faulkner, being at one time or other more or less incapacitated, while they also seemed to be more adversely affected by the slow wickets than their opponents. They were without the assistance of Vogler. On the other hand Australia was unable to send to England a representative team. A dispute in which several of the foremost players were at variance with the Australian Board of Control prevented the inclusion in the party of Trumper, Hill, Armstrong, and Ransford. The weather, however, did not permit a convincing trial of strength between the English and Australian teams. Of three matches arranged only one was finished; and that one was much interrupted by rain, being concluded with difficulty in four days at the Oval on a treacherous wicket. It was decisively won by England, who had the advantage of greater experience of such conditions and bowling much better suited to them. England defeated South Africa at Lords, Leeds and the Oval, and Australia had two easy victories at Manchester and Lords. Throughout this series of matches sudden spells of successful bowling were surprisingly common. In more than one of these Pegler (South Africa) was concerned; and it was curious that his periods of effectiveness would occur without any apparent cause when the batting had for some time been more or less dominant. In the first match between South Africa and Australia at Manchester, J. T. Matthews (Australia) performed the "hat trick" in both innings—an unprecedented feat: Pegler took six England wickets at Leeds for 16 runs when 308 had been scored for four wickets: G. R. Hazlitt (Australia) against England at the Oval closed an innings in which five wickets were down for 170 for the addition of 5 runs.

A team of Indians visited England in 1911 and played 14 matches, losing ten, but beating Leicestershire and Lincolnshire. Lord Hawke took a team to Argentina in 1911-12.

A new method of deciding the English County Championship was tried in 1911, and although not giving general satisfaction was retained in 1912. With the idea of discouraging the players from aiming at drawn matches, five points were given for a win, and three points (with one point to the losing side) for a first-innings victory. This purely arbitrary mode of reckoning, which had for some time been the rule of the minor counties, assisted Warwickshire to win the championship in 1911, but they probably also profited by having no matches with some of the strongest counties. The fast wickets were favourable to several of the Warwickshire batsmen, and still more to the bowling of F. R. Foster and Field. Kent would have been first according to the old reckoning; Middlesex were third, and Lancashire fourth. In 1912 the wet wickets were adverse to Warwickshire, but suited Northamptonshire, whose eleven showed great improvement in batting. This county was second to Yorkshire, who had a strong team, several of their younger professionals assisting materially in their success. Kent took the third place and Lancashire the fourth.

The Jam Sahib of Nawanager (Ranjitsinjhi) played in several county and other first class matches in 1912, and showed that he had lost little or nothing of his old skill in batting. Oxford beat Cambridge in 1911 through the excellence of P. R. LeCouteur's slow bowling, which was of varied style but was classed as belonging to the "googly" order. Cambridge won a very close match in 1912 largely by the fine all-round play and captaincy of E. L. Kidd. Eton in both years won against Harrow.

Good fast bowling is scarcer than ever in first-class cricket. Many bowlers have cultivated the delivery of the swerve, the ball being so held that the seam, while rotating vertically, lies a little to the right or left of the line from bowler to wicket. The "googly" has made little progress, though it was effectively used by H. V. Hordern in Australia. The plan of bowling at the leg stump, or even at the batsman's legs, originated by Hirst, has been perfected by other left-handed bowlers, notably Dean and F. R. Foster. In batting, back play and on-side hitting are prevalent, and the right foot is shifted without compunction. In consequence of these developments the setting of the field has transcended all the old customs, and positions are assigned for which the game has no vocabulary.

Croquet.

One of the causes to which the decline—amounting almost to extinction—of croquet was attributed some thirty years back, was the modification of the conditions of the game to suit the requirements of the most skilful players. When the $3\frac{3}{4}$ in. hoops were introduced the game became too difficult to be popular. The same difficulty has been reasserting itself. For many years the Croquet Association has been continually revising its laws to meet the increasing skill of the foremost players—nowadays by no means a small class. The small hoops no longer constitute any serious obstacle to the making of long breaks. In spite of the provision of "baulks," in order to secure an open shot for a player as soon as his opponent has finished a turn, it is realised that the player who first gets possession of the balls has the chances overwhelmingly in his favour. The laws committee of the Croquet Association has been discussing several proposals for making the game more difficult. The most favoured of these are: (1) playing with either ball of the side; (2) the reintroduction of a cage in the middle of the ground; (3) the turn to cease if any ball is sent off the ground after the first croquet has been made. The tactics of croquet have undergone but little change of late, except that the best exponents (and there is nothing which now shows the quality of a player more than the way the balls are left at the finish of a turn) almost invariably go out for a break, thus following the example of the present champion, Mr. C. L. O'Callaghan,—and that the art of "peeling"—especially in handicaps—is greatly on the increase.

The principal competitions of 1911 and 1912 resulted as follows:—Open championship, (1911) E. Whitaker, (1912) C. L. O'Callaghan; ladies' championship, (1911) Miss E. Reid, (1912) Miss Simcon; gentlemen's gold medal, (1911, 1912) C. L. O'Callaghan; ladies' gold medal, (1911) Miss N. S. L. Gilchrist, (1912) Lady Julian Parr; champion cup, (1911) H. Maxwell Browne, (1912) P. D. Matthews; ladies' champion cup, (1911) Mrs. R. C. J. Beaton, (1912) Miss D. M. Standing.

Curling.

The winter of 1910-11 was soft; that of 1911-12, after beginning badly, later afforded excellent sport. During the latter part of January and the first week of February 1912 there was unique activity both in Scotland and Switzerland; and at the same time the Scottish team in Canada reached the climax of their tour at Winnipeg.

In Scotland, for the second time since 1903, it was possible to hold the Grand Match.

Though it was necessary to wait till the ice was five inches thick before announcing this event, and though considerable notice had to be given, yet the ice held long enough to enable 2,000 players to take part at Carsbreck on February 2. As usual the South beat the North. The International Match (England v. Scotland), fixed a day too late, was spoilt by the weather. It had not been played in the open since 1907. The rinks, or at least their skips, were deliberately selected, making the match genuinely representative, a place in the team having hitherto depended on inclination to enter and luck in the ballot. After several English victories (including 1911), Scotland won in 1912 at Craigielands Loch by an average of six shots a rink, over 24 rinks. Curling facilities have been multiplied not only by the use of sprinkled asphalt rinks but by the opening of ice-palaces in Edinburgh and Aberdeen.

In Switzerland, curling has increased in popularity, it being possible to play in milder weather than suits most other winter sports. The centre of chief activity has moved from the Engadine to the Oberland, partly because of Grindelwald's victories in the Jackson Cup in 1911-12 necessitating the competition being held at Grindelwald (instead of Davos or St. Moritz) until they lose it. In the International Bonsel Mr. McGeoch's Manchester rink won in 1911 and 1912.

During their tour in Canada the Scottish touring team lost by 16, 47, 61 and 31 shots on six rinks in their four international matches—an average of six shots a rink.

Cycling.

Interest in bicycle racing was maintained with difficulty during 1911, despite the continued increase in the use of the bicycle for utility and recreation. The World's Championships held at Rome early in June resulted in the Englishmen, Bailey and Meredith, winning the one kilometre and 100 kilometres amateur contests, and Ellegard winning the kilometre professional race. In 1912 the World's Championships held at Chicago resolved themselves practically into duels between American and French professionals, out of which Kramer, the United States representative, emerged successful. The fact that the cycling contest at the Olympic Games was a road race gave a great fillip to that form of the sport and led to quite unexpected results. As the leading road-racing country England was looked upon as the inevitable winner, but anticipations were entirely falsified, for Lewis, a South African, accomplished the fastest time, and the Swedish team (Friborg, Malm and Persson) placed their country first. The race, however, was greatly influenced by the order of the draw for places.

Motor cycling made great progress in 1911, but mostly in Great Britain, Germany being a fair second. The only international events of sporting importance were the Tourist trophy races held by the Auto Cycle Union of Great Britain in the Isle of Man on June 30th and July 3rd. On the former date Evans won the junior event for engines of less than about 3 H.P., and on the latter Godfrey won the senior race in which the power practically was limited to about 4 H.P. The expansion of motor cycling in 1912 was much more rapid, and general and international contests are likely to be multiplied. The chief sporting events, however, were again the Tourist Trophy races in the Isle of Man. The junior event was won by Bashall and the senior by Applebee. The chief mechanical development of the year was the evolution of the cycle-car—a four-wheeled motor cycle, which formed the feature of the London Olympic Motor Cycle Show in November 1912.

Fencing.

For the advancement of international intercourse it is desirable, as recent events have demonstrated, that an effort should be made to assimilate both the rules and the accepted canons of foil and epic fencing as practised in different European contests. For instance, the rule as to the "target" adopted by the Swedish committee was regarded in France as so unsatisfactory that, by way of protest, no French team was sent to Stockholm for the Olympic contests, nor in fact was France even represented in the épée and sabre competitions. The Italians also declined the épée matches because the longer weapon which they affect was not admissible. In the French rules the upper part of the sword arm is assailable. The new rule adopted by the Amateur Fencing Association, but not yet applied to the foils championship, counts hits on the upper part of the sword arm, if in the judge's opinion it has intercepted the point when this would otherwise have reached the chest. Under the Swedish Olympic rule the sword arm was

completely excluded, except that the jury could count a hit on the head, arm, or hand as valid, if the recipient had effaced the target by adopting an ungainly or irregular position, or, instead of making a parry, covered the target with head, arm or hand. Much of the fencing at Stockholm was open to the charge of being rough and ungainly. The gold medals were won as follows: individual foils, N. Nadi, Italy; individual épée, P. Anspach, Belgium; individual sabre, Fuchs, Hungary. The épée team contest was won by Belgium, with Great Britain second, and Holland third, the sabre team by Hungary with Austria second and Holland third.

The Grande Semaine of 1911 was held in Rouen instead of Paris. France retained the International Cup by beating Belgium (24-18) and Great Britain (26-12). In the Ostend week Great Britain beat Holland (15-14), but lost to Belgium (16-11) and France (17-11). A representative British team for the first time took part in the sabre contest and did well, losing to Bohemia, who took the first place (5-4), Holland (5-3), and Belgium (4-2). No British team could be sent to the Grande Semaine of 1912 on account of the Olympic Games. France beat Belgium for the International Cup (22-18); Baron de Eynde carried off the épée championship, and Lieut. Perrodin the sabre championship. With the épée at Ostend France beat Belgium (16-11) and Great Britain (22-5). With the sabre Belgium defeated France and Italy; and France defeated Italy. M. Gravier, France, was first with the épée; M. Hennet, Belgium, with the sabre.

The British amateur foils championship fell in 1911 to E. M. Amphlett, in 1912 to P. G. Doyne, after a tie with G. R. Alexander, R. M. P. Willoughby and P. M. Davson. The amateur épée champion of 1911 was J. P. Blake, in 1912 the title fell to R. Montgomerie. W. Hammond, sabre champion of 1911, was replaced in 1912 by Captain C. Van der Byl. Miss G. Daniell won the ladies' championship in 1911 and 1912, after fighting off with Miss J. Johnstone in 1911 and with the Misses C. A. Walker and A. B. Walker in 1912.

*Football.*¹

The Rugby Game.—Although no distinct new phase has lately been observable in the manner in which Rugby football is played, the method of attack by means of concerted runs by half-backs and three quarter-backs becomes yearly more indubitably stereotyped. The play of the forwards is subordinated to this leading idea. Even when the ground and the weather make the passing of the ball extremely difficult, while enhancing the effectiveness of dribbling, the same style of play is generally attempted and often with some success. On the other hand, as the counter moves are better understood, the attack has been varied by the artifice of kicking across the ground, and the forwards get some opportunity of using their skill in dribbling in the scrambling play thus brought about. So much depends on the first possession of the ball in the scrummage, whether for the purpose of heeling or wheeling, that various tricks and manoeuvres have been attempted. By an improvement on the tactics of the famous New Zealand team, the forwards on forming a scrummage sometimes bring up a man suddenly into their front row on the side nearest to the player who is about to put the ball in play. This forward, being unobstructed, is said to gain the "loose head," and is at an advantage in getting the ball with his feet. In order to check this trick, the International Board has declared that the ball is not fairly in a scrummage until it has passed a player on each side. It follows that the leading row of forwards must contain at least two, if not three players, though no rule exists to this effect; also that the outside forward who has the first chance of playing the ball may be penalised, if he does so, for preventing the ball from being fairly placed in the scrummage. This consequence, though logical, is not universally accepted. By new legislation penalties have been enacted for wilful knocks-on and throws-forward, and for wilful throws into touch.

The Rugby game, though exceedingly popular in some districts, has lost ground in the west of England, and even in South Wales, through the rivalry of Association football. Its progress in France, however, has been unchecked. Early in 1911, a French team for the first time was victorious in an international match, beating Scotland in Paris. French players are remarkable for impetuosity, speed and quickness in starting, which last quality makes them strong in defence. In the same season Wales beat England, Ireland, Scotland and France; Ireland beat England, Scotland and France; England at Twickenham beat Scotland and France. In 1912 all the international matches that took place in the United Kingdom

¹ See also under "United States" below.

were won by the fifteen playing in its own country. England defeated Wales and Ireland, but narrowly lost to Scotland. Ireland beat Scotland and Wales, and Wales beat Scotland. In no match was France victorious. The University match went in favour of Oxford in 1910 and 1911, the disablement of a Cambridge three-quarter-back; B. R. Lewis, apparently turning the scale in the first match. Cambridge won by 2 goals to a try in 1912. Rugby football was omitted from the Olympic programme at Stockholm. A strong South African team began a tour in Great Britain in the autumn of 1912. After gaining several decisive victories over counties the South Africans lost to Newport, were with great difficulty victorious over Llanelli, the United Services and London, beat both the universities, were narrowly beaten at Twickenham by another London fifteen and easily beat Scotland at Edinburgh, avenging the defeat sustained by the South African team in 1906. They next gained their most decisive victory at Dublin, securing 36 points against Ireland, and beat Wales by a try at Cardiff, but lost to Swansea by the same margin.

Association Football.—The wide dissemination of Association football not only in Europe but also in the other continents is illustrated by the fact that a tour was undertaken in Brazil in 1910 by the Corinthian F. C. and another in North America in 1911-12. There are now many clubs in Argentina, Uruguay, Brazil and Chile. Amateur international football has been affected by a dissension among English clubs dating from 1907. In consequence of the Football Association insisting upon the admission of professional clubs (so-called) to the district associations, a large number of amateur clubs, including the University College, and public schools clubs, seceded to form the Amateur Football Association. The officers of the army, while sympathising with the seceders, considered it advisable for the sake of regimental football to retain their connection with the Football Association. But in 1911-12 they used their influence to promote a reconciliation. A conference was held at which the delegates of the two associations only failed to arrive at an agreement because the older body would not accept an arrangement by which the younger could receive the adherence of newly-formed amateur clubs. The Federation Internationale de Football Associations, commanding the support of most of the countries of Europe, including the Football Association, is necessarily cut off from intercourse with the Amateur Football Association. This, however, is in alliance with the Bohemian Football Association and with many French clubs belonging to the Union de Sociétés Françaises de Sports Athlétiques.

International matches played by England with other countries are no longer representative of English amateur football. The A. F. A., although allowed a representative on the British Olympic Council, was debarred from sending an eleven to the Olympic Games. Nevertheless an amateur team organised by the Football Association was able to win the Olympic trophy, beating Denmark in the final round by four goals to two, after easier victories over Finland and Hungary. The Holland eleven gained the third place. The matches were played in very hot weather in July. The playing strength of the English Football Association is largely professional, and therefore cannot be exhibited in contests with continental players, though occasional visits to the continent have been paid by professional teams. The amateur elevens of the Football Association won matches with Wales, Belgium, France and Holland in 1910-11, but lost to Ireland and could only draw with Germany. In 1911-12, besides their victories at the Olympic Games, they defeated Ireland, Wales, Denmark, Holland and Belgium. The Amateur Football Association teams were consistently victorious, beating Wales and France in both seasons and in October 1911 winning a close match with Bohemia in Prague by 2 goals to 1. The full representative elevens of the Football Association defeated Ireland and Wales in 1911 and drew with Scotland. Ireland lost to Wales and Scotland, and Scotland drew with Wales. In 1912 England and Scotland again played an indecisive match, but both beat Wales and Ireland; Wales lost three matches. As an entertainment professional football is as popular as ever. More than 127,000 spectators attended the England *v.* Scotland match of 1912 in Glasgow. The Football Association Cup was won in 1911 by Bradford City after a drawn match with Newcastle United; in 1912 by Barnsley after a drawn match with West Bromwich Albion. The championship of the Football League was carried off by Manchester United in 1911, by Blackburn Rovers in 1912. The principal trophy of the Amateur Football Association was won in 1911 by the Old Malvernians, in 1912 by Oxford City. The Arthur Dunn Cup for public school clubs fell to the Old Reptonians in 1911 and to the Old Malvernians in 1912. Oxford won the University match in 1911 somewhat unexpectedly, but lost to Cambridge in 1912. No substantial alteration has been made in the laws of the game or in the tactics of the players, except that the goal keeper in Football Association matches is now prohibited from using his hands outside the space called the penalty area.

Golf.

By the introduction of the rubber-cored ball a phase in the evolution of golf was initiated which cannot yet be safely said to have culminated. The ingenuity of inventors has supplied balls with heavy cores of various materials, and these are tightly bound with rubber thread and an outer casing of gutta percha. A small ball of high specific gravity combined with great elasticity is now in general use, and is of course found particularly advantageous in a strong adverse wind. Not only have clubs and courses been modified to meet the development of the ball, but attempts have been made to obtain a reversion to the "guttery" or at least the adoption of a standard ball for important competitions. A memorial addressed to the committee managing the British amateur championship in 1912, though signed by a large number of leading players, failed to effect a reform, because the committee did not consider itself to be competent to pass what amounted to a legislative measure. There is a consensus among the most authoritative professionals, as well as amateurs, concerning this question. It is held that the new ball does not sufficiently penalise, and, in fact, does not invariably penalise to any extent the not quite perfectly delivered stroke. In this way it directly impairs the game as a test of skill. Indirectly, the action of luck is favoured by the elaborate hazards with which courses are often embellished, and the somewhat fantastic slopes given to putting greens in order that they may not be too easy. It is further argued by Vardon and other teachers that an undesirable kind of stroke is fostered by a ball which when driven low and "pulled" can be made to travel a great distance after pitching. On the other hand, it can hardly be maintained that the worse player is enabled habitually to defeat the better; and it is undeniable that the majority of golfers would be reluctant to abandon a ball which appears to flatter their skill. The rubber-cored ball indeed may be credited with much of the universal popularity of golf. In America the wonderfully rapid spread of the game has induced municipalities to lay out public courses, of which the long course in Jackson Park, Chicago—one of four belonging to the city—may be taken as an instance.

International intercourse is encouraged by open championships. After winning the British amateur championship in 1911, Mr. Harold Hilton successfully essayed to carry off the amateur championship of the United States. He was less fortunate in 1912, when the competition took place in very hot weather and Mr. J. D. Travers won. The American open Tournament was gained in both years by J. J. M'Dermott. The French amateur championship was captured by Hon. M. Scott, M. Castel being the foremost native competitor; but in spite of an invasion of British champions—Ray, Vardon, Taylor and Braid among them—a French player, Jean Gassiat of Chantilly, was first in the professional championship of 1912 at La Boulie, with a score of 289 for four rounds of the course. A competition at Baden Baden, for which the title of championship of Germany was assumed, attracted a number of British and French professionals, and ended in Taylor beating Ray after a tie. H. Vardon was the British champion of 1911, E. Ray of 1912; and Vardon in the latter year beat Ray in the final round of the *News of the World* competition. Mr. John Ball supplanted Mr. Hilton as amateur champion, winning the title at Westward Ho in 1912 for the eighth time in his unparalleled career. The ladies' championship, which fell to Miss D. Campbell in 1911, was won at Turnberry in the following year by Miss Gladys Ravenscroft.

Of the many noteworthy additions which have been made to the literature of the game it must suffice to mention *The Royal and Ancient Game of Golf*, by H. H. Hilton and Gordon G. Smith (1912); *The Book of the Links*, edited by Martin Sutton (1912); *How to Play Golf* by Harry Vardon (1912); *The New Book of Golf*, edited by Horace G. Hutchinson (1912).

Hockey.

Scarcely a year passes without some small alteration in the laws of hockey, if it be only the regulation of flag posts, which are now obligatory. They must be four feet in height, and must be placed at the centre points of the side-lines and at the corners of the ground, one yard outside the line. In the "bully" each player must strike the ground on his own side of the ball and his opponent's stick alternately. Some latitude has been extended to the goalkeeper, who, except in a penalty bully, is allowed to kick the ball within the circle and is not penalised, if, when he has stopped the ball with his hand, it rebounds so as not to fall perpendicularly to the ground. It is no longer necessary in stopping a corner hit for an attacking player to make the ball absolutely motionless.

Though hockey is largely played in several European countries it was excluded from the Olympic Games at Stockholm. To repair the omission a tournament was held at Hamburg in October 1912, but this was only partially successful; as but four teams took part in it. An English team found strong opponents in a German team but defeated it, besides easily accounting for an Austrian contingent. In 1911 England beat Wales (7-0), Scotland (5-0), France (4-0) and drew with Ireland (2-2). In 1912 England beat Wales (6-3), Ireland (10-3) and France (9-1), but lost to Scotland (1-2). Though Scotland defeated England for the first time, Ireland beat Scotland (1-0) and Wales drew with Scotland (2-2). Cambridge won the University match in 1911 (4-1) but lost in 1912 (1-3).

Ice Hockey, so popular in Canada, is increasingly played on the Continent of Europe. In 1909-10 a team composed of Canadians at Oxford took part in a tournament at Les Avants, and they have since made an annual tour through Europe during the Christmas vacation, visiting Belgium, Germany, Bohemia, Austria, Switzerland, France. On their last tour they noticed a vast improvement in the standard of play. In December 1911 and December 1912 Cambridge teams beat Oxford teams at Mürren by 2-0 and 1-0 respectively. International tournaments are frequently held at Swiss winter resorts, but the contesting teams are rarely representative.

Horse Racing.

The most important changes which have occurred in connection with international turf matters of late are the suppression of racing in nearly every part of the United States (see under "United States" below), and the extraordinary rise in the value of blood stock in the Argentine Republic. Doubtless there was room for improvement as regards the great meetings formerly held in the Northern States of America; and it is generally thought that some of the laws forbidding the meetings may be rescinded at an early date. Meantime there has been a fall in the value of thoroughbred stock in the United States, and valuable English and French stallions which had been sent to America at big prices not many years ago have now been brought back to Europe; while a fair number of American bred yearlings are also imported to England and sold by auction at Newmarket every year. The breeding industry in the United States is quickly dying out, but would be even more quickly resumed if racing were once more legalised. In the Argentine Republic four-figure yearlings are even more common than they are at Doncaster; and yet in September 1912 Messrs. Tattersall sold by auction, at the annual Doncaster sales, yearlings of the value of £110,000. In every part of Europe the value of the highest class of stallions has enormously increased; and now the possessor of a really great performer can always be sure of £30,000 and more if he desires to sell. In other respects the English turf is pursuing the even tenour of its way. Every year there are more runners, and more money to be run for; and, though it is only occasionally that horses of the very highest class are forthcoming, it is probable that the average standard of excellence is thoroughly maintained. On the continent of Europe, and especially in France, Germany, and Austria, the thoroughbred flourishes, and racing becomes more popular everywhere; but whereas in France there is every encouragement for the long distance runner, the tendency in England is towards the development of speed, and important long distance races are by no means numerous.

The form of the most prominent horses on the English turf during the season of 1911 was more consistent than in 1912. In the first place, Sunstar, by Sundridge-Doris, held his own against the best of the three-year-olds; and it is probable that he would have won the three leading events of the year but for breaking down after taking the Epsom Derby. He carried off the honours in the Two Thousand Guineas and the most important race of the year at Epsom, after which he was sent to the stud, much to the regret of his owner, who was justified in the hope that the colt would win the so-called "triple crown." In consequence of Sunstar's inability to compete in the St. Leger, this race at Doncaster was deprived of much of its usual interest, and Mr. T. Pilkington's Prince Palatine, by Persimmon-Lady Lightfoot, won easily from what was undoubtedly a mediocre field of opponents. A noteworthy incident in connection with the leading three-year-olds of 1911 was that Stedfast, the second in the Epsom Derby, and Prince Palatine, the winner of the Doncaster St. Leger, should have provided some of the most interesting racing of 1912. As a matter of fact, the meetings of Stedfast and Prince Palatine were the leading features of the season; and it was a moot point which was the better four-year-old. The exciting racing provided by these two horses was very welcome, especially as the three-year-olds in 1912 ran in so inconsistent a manner that in no case was any outstanding merit shown. Tagalie, a grey filly by Cyllene-Tagale, after securing the first place in the One Thousand Guineas, won the Epsom Derby,

a performance which led many excellent judges to the belief that she was likely to prove an exceptionally smart racehorse; but she failed unaccountably in the Oaks, a race, after her Derby victory, considered to be at her mercy. It was remarkable that in the Derby Tagalie led all the way and won with such ease that stamina was considered to be her strong point; yet in the Oaks she led for a part of the course and then failed to stay, finishing last. Tagalie also ran in a very disappointing manner in the St. Leger, which was won by Tracery, who had finished third to her in the Derby. It may be mentioned that Tracery was bred in America, as also was Sweeper II, the winner of the Two Thousand Guineas. The former was, however, of English parentage. During the season of 1912 as many as eight owners won over £10,000 each in stakes, Mr. T. Pilkington, mainly by the aid of Prince Palatine, heading the list with £20,822 and Lord Derby coming second with £17,333.

Hunting.

British fox hunting still holds its own, in spite of such modern developments as barbed wire, increase of railways, excessive pheasant rearing, and the greater cost of maintenance of hunt establishments. In some districts the scene of operations of various hunts has been curtailed, owing to the expansion of the country towns, to the institution of small holdings near the towns, and to the fact that coal mining has greatly extended. But nevertheless every part of the country where hunting is possible has its pack of hounds, whether they be foxhounds, staghounds, harriers or beagles, and everywhere there are more people hunting every year, while the great expansion in the size of the fields is chiefly caused by the ever-increasing number of ladies who hunt. In this connection it can truthfully be said that there are a dozen lady foxhunters for every one that followed hounds a generation ago. Foxes are more plentiful than formerly; hounds are faster; and much of the hunting, especially in the most famous countries, is carried on at a higher speed than formerly. This means that hounds are taken from one covert to another at a canter, that there is no dawdling between the hunts, and that—at times—hounds are unable to do justice to their own hunting powers, because of the crowd pressing on from behind.

Great Britain still takes the lead in foxhunting, but many hunt clubs have been established in the United States in recent years; there are in France over 300 hunts, the quarry for which is deer, wolf, hare, and occasionally fox; and in the British colonies and in India hunting is carried on wherever it is possible. The price of the best English foxhounds has risen enormously, and good hunters are only to be secured at high figures.

Lacrosse.

It is generally held that the use of the lighter crosse with less rigid strings, introduced by Canadian teams into England a few years back, has made lacrosse a less difficult game to acquire and has improved the general quality of team play. In the north of England several clubs have attained a high standard of attack play: but defence seems to have slightly deteriorated, mainly through the disuse of the body check; and this may tell against English sides when international matches are undertaken.

The north of England is still uniformly superior to the south. The North and South match in 1911 and 1912 produced the identical score of 16 goals to 7. The Stockport Club, having won in both years the Northern Flags, beat Lee in the Club Championship by 15-5 and 18-8, and the County Championship was twice taken by Cheshire. The runners up to Stockport in 1911 were the Old Hulmeians, who lost only after a tie; in 1912 Albert Park were beaten in the final by 7 goals to 3. For the Southern Flags Oxford University fought out the final match with Lee in 1911, and West London reached the final in 1912. The University match of 1911 was won by Cambridge at 8-3; in 1912 Oxford won at 9-4.

The competitions among the professional clubs of Canada ended in Vancouver winning the Minto Cup in 1911 after having beaten the holders (New Westminster) and the champions of eastern Canada (the Tecumseh team). In 1912 New Westminster regained the Cup, defeating Vancouver and Victoria, and then easily answering the challenge of Cornwall. The Manx Cup for amateur lacrosse is held by the Vancouver Athletics, who in 1911 beat Toronto Juniors, and in 1912 defeated Winnipeg (champions of the north-west) and St. Catherine (champions of the east).

Lawn-Tennis.¹

In the countries where good turf is not generally available lawn-tennis is satisfactorily cultivated on hard courts. The covered court form of the game was recognised by

¹ See also under "United States" below.

inclusion in the Olympic programme in 1908; and the existence of a good covered court in Stockholm enabled similar competitions to be carried out in 1912. Further, an open covered court championship has been instituted in Paris. French and German players, who are now able to hold their own with British champions on grass, have proved themselves superior in the hard court.

In Paris, O. Froitzheim carried off the French championship in singles, and (with O. Kreuzer) the doubles: A. H. Gobert took the Olympic medals at Stockholm in singles and doubles, partnered by M. Germot, although the British champion, A. F. Wilding, competed, as the representative of New Zealand. Gobert visited London and won the Covered Court Championship in 1911 and 1912. In the former year he was also victorious in doubles with M. J. G. Ritchie, but in 1912 A. F. Wilding and S. N. Doust took the doubles championship. On the other hand, though Gobert and Decugis carried off the British doubles championship in 1911 at Wimbledon, no other successes fell to foreign competitors, the singles championship being retained by A. F. Wilding, who was again victorious in 1912, when C. P. Dixon and H. Roper Barrett won the doubles.

The grass championships at the Olympic Games were fixed for a date which conflicted with the All England tournament, and the latter was preferred even by most of the leading foreign players. The medals were accordingly captured by Winslow (singles) and Winslow and Kitson (doubles), representing South Africa. Another international test of play on grass was afforded by the preliminary round of the Davis Cup, in which the English team beat the French in the summer of 1912 at Folkestone. But in two matches between England and Germany in 1912 each team was successful on its own ground, the English match being played on turf and the German on an artificial surface. In the previous winter Australasia, represented by N. E. Brookes, R. W. Heath and A. W. Dunlop, had retained the Cup by beating an American team at Christchurch, New Zealand. England unexpectedly regained the Davis Cup at Melbourne on November 28-30, 1912. C. P. Dixon and J. C. Parke beat R. W. Heath and N. E. Brookes respectively on the first day, and on the third Parke beat Heath but Dixon lost to Brookes. The Australian pair Brookes and Dunlop beat Bramish and Parke; so that England won by the odd match. A team enlisted by the Drive L.T.C. (Fulham) made a tour in South Africa in 1910-11 and won two out of the three Test matches. A mixed team of men and ladies sailed from England for South Africa in the following winter and played three test matches, but unexpectedly lost one of them. The university matches of 1912 went in favour of Cambridge; in 1911 Oxford won the singles and Cambridge the doubles. A young Russian player, Count Saumarakoff-Elston, gained distinction by defeating C. Setterwall, the Swedish champion in the Olympic tournament, and made a close match with Kreuzer, a German player of the first rank. Many hard courts for autumn and spring play have been recently constructed in England and a new covered court is used for winter play at Dulwich. The difficulty of enforcing the foot-fault rule is still receiving attention. At an International Congress held in Paris in October 1912 preliminary measures were taken for a common understanding with regard to international championships.

The American lawn-tennis championships were won as follows:—men's singles: 1911, W. A. Larned; 1912, M. E. McLoughlin; ladies' singles: 1911, Miss H. Hotchkiss; 1912, Miss M. Browne; men's doubles: 1911 R. D. Little and G. F. Touchard; 1912, M. E. McLoughlin and Thomas C. Bundy.

Motoring.

The sport of motor racing, as distinguished from the competition of manufacturers in races for testing mechanical qualities, is best seen in France and America.

The chief French event of 1911 was the Light Car Race competed over the Dieppe circuit on June 25. The distance was 387 miles, and the contest was won by Bablot from Boillot at an average speed of about 55 miles per hour. In America some serious accidents caused a considerable restriction of high-powered racing. The principal event there—the Vanderbilt Cup—was won by Mulford. In 1912 the revival of the French Grand Prix race and its fusion with the Small Car Contest—the Coupe de l'Auto—formed the chief event of the season. The Grand Prix was a race without any limitations of engine power, and was won by Boillot on a car of 175 H.P. from Wagner on a still larger car. Behind the pair came three small cars of 12-16 H.P. driven by Regal, Resta, and Medinger. The winner's speed was 70 miles per hour, while Regal and Resta, who were first and second in the Coupe de l'Auto, averaged about 66. In America Hunery drove a 200 H.P. car at a speed equal to 141 miles per hour. The American Grand Prix was won by C. Bragg, and the Vanderbilt Cup Race by Ralph de Palma.

Mountaineering.

For the purpose of Swiss Alpine climbing, never were two successive summer seasons more unlike than those of 1911 and 1912. The latter was perhaps the very worst within the memory of the oldest climber and the former was certainly the finest.

1911 will always be remembered for four great climbs carried out by Messrs. G. Winthrop Young and H. C. Jones. Mr. Todhunter joined these on the new route up the Grepon. Altogether this victorious party carried out six new expeditions, of which the Grepon marks the high water mark of rock climbing, though the two ridges of the Jorasses are only a little less severe. The Jorasses had previously been climbed by its south face, and the first object of this party was to find a route up the terrific wall that stoops down to the Col des Hironnelles. The ascent of this ridge was proved to be utterly impossible, but the descent was accomplished by an ingenious and daring combination of fixed ropes and pitons. On this climb Joseph Knubel was the leading guide and Laurent Croux represented Courmayeur. The same party climbed for the first time the west ridge which had defied so many previous assaults. On this occasion Knubel was the only guide. Not content with this triumph Young, Jones, the famous Austrian climber Dr. Blodig, and Knubel defeated one of the last virgin ridges on Mont Blanc, the great Brouillard *arête*. And finally this unconquered party, with Todhunter in place of Dr. Blodig and an extra guide, Brocherel, forced a new direct route up the great northern face of the Grepon. The Grepon by the ordinary route is as hard as most climbs in the Alps or elsewhere, and it is scarcely a peak on which to look for variation routes. "Knubel's ascent of the last mentioned slab," wrote Mr. Jones, "relying solely on an axe with its point inserted into a minute crack as hand-hold and merely on friction for the rest, is one of the most remarkable climbing feats I know of." As a member of the Alpine Club remarked after Mr. Jones had finished reading his paper, this kind of climbing can only be appreciated by about a dozen British mountaineers, and can be eclipsed by no living cragsman. The only other climb yet made which can be mentioned in the same category with these achievements was Dr. Piacenza's desperate ascent of the Matterhorn by the Furggen *arête*.

Other interesting new ascents of 1911 may be mentioned; the direct ascent of the Jungfrau from the Jungfraujoch by Herr Weber with the guide Schlunegar of Wengen, and the first passage of the Gletcherjoch by Dr. O. K. Williamson. This climb roused some comment, as Dr. Williamson introduced a practice which was first made use of in Welsh gullies. He climbed the pass from the easy side, and let down a rope on the top of the difficult section to facilitate the traverse of the pass on another day.

Beyond the Alps Captain Corry and Lieut. Squires did some interesting new climbs in the Himalaya, of which the North Peak of Kolahoi was perhaps the finest; and in the Andes Dr. Helbling made the first ascent of a virgin peak over twenty thousand feet in height.

The winter of 1911-12 was as disappointing as the summer was satisfactory. British climbers, as usual, did very little, and such ascents as were recorded fell to foreign mountaineers. The Alpine Ski Club claimed the three ascents made by British ski-runners, and one of these, the Lauterbrunnen Breithorn, was probably a first winter ascent. It was climbed at the end of January by Mr. Edward Tennant and Mr. Arnold Lunn.

The summer of 1912 was remarkable for persistent bad weather. The indefatigable Mr. Young climbed the last of the Dames Anglais, and Messrs. Mallory, Pope, and Portman made without guides a fine variation ascent of the Dent Blanche, perhaps the finest guideless climb as yet accomplished. The season was marred by an accident in which the brilliant young Cambridge professor and expert climber, Mr. H. C. Jones, was killed with his wife and the guide Truffer on Mont Rouge de Peuteret, not as originally stated on the Aiguille Blanche de Peuteret. Mont Rouge is not a difficult mountain, and the climb was well within the powers of Mrs. Jones. Truffer came away with a detached boulder, and the whole party were dragged from holds and killed. An unroped Austrian climber ahead escaped.

At the end of the season Hugh Pope (perhaps the finest rockclimber known) was killed on the Pic du Midi d'Ossau. He was climbing alone, and death was caused by rotten rock. The search party organised by Mr. Young found his body after a day's search.

Polo.

A noteworthy change in connection with polo in 1912 was the definite adoption by the Hurlingham authorities, who make the rules and govern the game in Great Britain, of the system of playing without penalty for offside, and with eight periods of seven and a half minutes each instead of six of ten. This system had been given an exhaustive trial the year before, but the change in the rules is directly traceable to the influence of the Meadow Brook team in 1909, when the International Cup, which for twenty-three years had rested on the English side of the Atlantic, was regained by the Americans. English players then learned that there were possibilities of the development of greater pace and greater accuracy of hitting, without real loss of combination, in the less restricted American game; and the victory of Mr. Whitney's team and their success in retaining the trophy against the challenge of the Hurlingham team under Captain Lloyd in 1911 have otherwise been far-reaching. In the United States, indeed, polo has received a decided stimulus, and there has been a marked increase of players and clubs, especially

in the army. In 1912 new clubs were formed at Cincinnati, Lexington, and Islip (Long Island), among other places; and even American ladies have taken to playing polo. In England there has been a notable accession to the list of provincial clubs by the formation of the V.W.H. (Swindon), which had the rare success of winning the County Cup in its first season. In France a new club has been started at Le Touquet, sixteen miles from Boulogne; the Austrian Jockey Club, in order to encourage the game, has laid down a new ground in the centre of the racecourse at Kottlingbrunn, near Vienna; and among the most recent additions to clubs and grounds in India is that made by the Maharajah of Gwalior at his "rains" station of Sipri. Polo is now played in almost every European colony in Asia and Africa. It has spread to Northern Nigeria, Morocco, Rhodesia, Abyssinia, Arabia; and each year it finds fresh security in such countries as Canada, Australia, New Zealand, South Africa, and Argentina.

The most pronounced feature of the London polo season of 1912 was the success of the Old Cantabs in winning the Champion Cup at Hurlingham and the Open and King's Coronation Cups at Ranelagh; and no surprise was occasioned when the Duke of Westminster, undertaking the organisation of the challenging team to visit America in 1913, invited Mr. Walter Buckmaster (the captain of the Old Cantabs) and Mr. F. M. Freake and Captain George Bellville (members of the side) to accompany him. Captain Leslie Cheape, who ranks, with Mr. Buckmaster, highest in the official handicap list of British players, Captain R. G. Ritson, and Captain Hardress Lloyd, were also among the players invited.

As regards the international polo matches in 1911 it may be recalled that America (represented by the brothers L. and M. Waterbury, Mr. H. P. Whitney and Mr. D. Milburn) beat England (Captain Leslie Cheape, Mr. Noel Edwards, Captain Hardress Lloyd, and Captain Herbert Wilson) by $4\frac{1}{2}$ goals to 3 in the first match, and by $4\frac{1}{2}$ goals to $3\frac{1}{2}$ in the second. Many who witnessed those two games were convinced that, if the Englishmen had had half a-dozen more first-class ponies, their narrow defeat might have been turned into a narrow victory. England's goals were all scored by Mr. Edwards. In spite of the fact that several of the leading players were away in America during the major portion of the London season, English polo in 1911 was highly successful. A feature of the season was the brilliant success, to begin with, of the Royal Horse Guards (Captains G. V. S. Bowlby, Harold Brassey, and Lord A. Innes-Ker and Mr. J. F. Harrison). They won the Whitney Cup at Roehampton and the Open Cup at Ranelagh; but by trying themselves and their ponies too highly they fell between two stools, just losing the Inter-Regimental Cup to an admittedly inferior team of the 4th Dragoon Guards, and the Champion Cup to a splendidly mounted Eaton combination comprising Messrs. C. P. and P. W. Nickalls and G. A. and C. D. Miller. The King's Coronation Cup went to a powerful side representing the Indian Polo Association (Captains L. St. C. Cheape, Shah Mirza Beg, R. G. Ritson and V. N. Lockett). Another interesting feature of the London season of 1911 was the playing of King Alfonso of Spain at Hurlingham, and of the Crown Prince of Germany at Roehampton.

Rackets.

Having taken measures to limit the ever-growing size of the racket ball, the Tennis, Rackets and Fives Association has recently made a few amendments in the laws of the game. A ball which in the course of a rally passes over without touching the cross-bars of the roof remains in play. A player's right to try to return a ball which he has missed at the first attempt is expressly recognised, but he may not claim a "let." In important matches an umpire is deputed to call the footfaults.

A match for the championship of the world was played in April and May 1911 at Queen's and Prince's clubs by Jamsitji of Bombay, the holder since 1903, and C. Williams, the Harrow school professional, and was easily won by Williams. The English amateur championships were won as follows:—singles, (1911) E. M. Baerlein, (1912) B. S. Foster; doubles, (1911) B. S. Foster and the Hon. C. N. Bruce, (1912) H. W. Leatham and H. A. Denison. The Public Schools Challenge Cup was won by Rugby (C. T. B. Simpson and W. H. Clark) in 1911, and by Charterhouse (G. A. Wright and C. A. Leatham) in 1912. In both years Cambridge won the University matches—singles and doubles.

Rowing.¹

International interest in oarsmanship has been considerably stimulated by the success of Belgian crews in the races for the Grand Challenge Cup at Henley. In May 1911, an eight drawn from past and present members of Jesus College, Cambridge, defeated at Ghent a combined crew of the Ghent clubs, Sport Nautique and Club

¹ See also under "United States" below.

Nautique, over a course of 2,111 metres. The winners' time of 6 m. 43 s. was estimated as equivalent to 6 m. 55 s. or 7 m. on a calm day at Henley. The English victory was made the occasion of an extraordinary ovation by the Belgians. The winning crew was composed of E. C. Henty, H. J. Shields, C. Hudson, H. E. Swanston, S. Hudson, H. M. Goldsmith, G. E. Fairbairn, T. M. Crowe (str.) and C. A. Skinner (cox).

In the University Boat Race of 1911 Oxford won by 2½ lengths in record time: 18 m. 29 s. Cambridge also beat the old record, 18 m. 47 s., held by Oxford, 1893, and Cambridge, 1900. The names of the crews were:—*Oxford*: C. E. Tinné, L. G. Wormald, R. E. Burgess, E. Millington Drake, C. W. B. Littlejohn, A. S. Garton, D. Mackinnon, R. C. Bourne (str.) and H. B. Wells (cox); *Cambridge*: S. E. Swan, P. V. G. Van der Byl, F. E. Hellyer, C. F. Burnand, R. le Blanc Smith, J. B. Rosher, G. E. Fairbairn, R. W. M. Arbuthnot (str.) and C. A. Skinner (cox). The contest of 1912 took an unprecedented course, necessitating two races. In the original race both crews sank, and though Oxford re-embarked and reached the winning post, the umpire, Mr. F. I. Pitman, in the exercise of his discretion, declined to award them the victory. A second race was rowed two days later in almost equally rough weather and resulted in a victory for Oxford by six lengths in 22 m. 5 s. It was R. C. Bourne's fourth year of stroking the winning screw, a record unparalleled in the history of the race. The crews were:—*Oxford*: F. A. H. Pitman, C. E. Tinné, L. G. Wormald, D. D. Horsfall, A. H. M. Wedderburn, H. F. R. Wiggins, C. W. B. Littlejohn, R. C. Bourne (str.) and H. B. Wells (cox); *Cambridge*: R. W. M. Arbuthnot, D. C. Collins, H. M. Heyland, R. S. Shove, J. H. Goldsmith, R. le Blanc Smith, L. S. Lloyd, S. E. Swann (str.) and C. A. Skinner (cox).

At Henley Regatta both in 1911 and 1912 the standard of oarsmanship was high. In the latter year the width of the course was reduced by ten feet, and the additional outside margin was located on the Bucks shore, with the object of equalising the value of the two stations by moving the boats to leeward of a "bushes" wind. The King and Queen visited the regatta and the Queen distributed the prizes. The most noteworthy feature of the racing was the capture of the Grand Challenge Cup by an Australian eight. The following is a list of Henley results:—Grand Challenge Cup, (1911) Magdalen, (1912) Sidney R. C., N.S.W.; Ladies' Plate, (1911 and 1912) Eton; Thames Cup, (1911) First Trinity, (1912) Rowing Club de Paris; Steward's Cup, (1911) Thames R. C., (1912) New Coll.; Visitors' Cup, (1911) Third Trinity, (1912) Christchurch; Wyfolds Cup, (1911) Pembroke, Cam., (1912) Queen's, Cam.; Silver Goblets, (1911) J. Beresford and A. H. Cloutte (Thames R. C.), (1912) Bruce Logan and C. G. Wright (Thames R. C.); Diamond Sculls, (1911) W. D. Kinnear, (1912) E. W. Powell. Of the Wingfield Sculls, W. D. Kinnear remains the holder.

The professional sculling championship of the world returned to England after many years through the victory in 1912 on the Thames of E. Barry over R. Arnst, who had beaten him in 1910 on the Zambesi. In 1911 R. Arnst defeated H. Pearce on the Paramatta. Barry was challenged by Durnan, a Canadian, but easily defeated him on October 14, 1912 over the Putney-Mortlake course. Barry had twice rowed successfully in 1911 for the professional sculling championship of England.

At the Olympic regatta in Stockholm, over a course of 2000 metres, a Leander eight took the chief honours, defeating their Henley conquerors, the Sydney crew. England was less successful in the fours, rowed with coxswains, the Ludwigshafen Club being victorious; but Kinnear secured the Olympic trophy for sculling without great difficulty.

Shooting.

Game Shooting.—The report of the British Grouse Disease Inquiry Committee, published in 1911, furnishes an important addition to the knowledge necessary for the proper management of a grouse moor. The committee, appointed in 1905, was never empowered to draw public money, but its members gave voluntary work through six seasons, and succeeded in tracing beyond reasonable doubt the origin of the mysterious disease which at intervals has decimated the stock of grouse on many moors.

This grouse disease is due to a threadworm, *Trichostrongylus pergandis*, with which all grouse are infected. Healthy grouse in a year free from disease throw off the attack, but there is a point at which infection becomes too strong for the bird, and it succumbs. The predisposing cause to an outbreak of disease is a shortage during the winter and spring months in the supply of the young heather shoots which form the staple food supply of the grouse. At the end of a good shooting season it may happen that too many grouse are left on the moor in proportion to the heather supply. The grouse become crowded, the larvae of the threadworms accumulate from the droppings of the grouse on the patches of heather left uncovered by snow where the birds must congregate for food. These patches become intensely infected, and the tips to which the larvae find their way are eaten by the grouse. These, when weakened by insufficient food, are unable to throw off the aggravated infection. The remedies are prophylactic:—(1) reduction of the stock by harder shooting, (2) increase of food supply by burning old heather, (3) extensive draining, since the threadworm flourishes

in damp soil. It remains to be seen whether, the cause being known, the disease can be checked with certainty.

Some progress has also been made in the study of the parasitic diseases of pheasants, especially coccidiosis, which often ravages the rearing-grounds. Experiments have been tried in the administration of drugs by which the coccidia are apparently to some extent repressed and the young pheasants are fortified and made sufficiently resistant to survive the attacks. If further trial confirm these expedients one of the chief difficulties in the artificial rearing of pheasants will be considerably diminished.

Rifle Shooting, etc.—To a considerable extent the shooting competitions at the Olympic festival at Stockholm were dominated by the conditions, which were more favourable to some of the national teams than to others. In the military rifle shooting the United States team took the first place. They not only possessed the best weapon, but were the only team to use aperture sights. Great Britain was placed second and Sweden third. The team shooting with any rifle was at the 300 metres range, and this produced the result that Sweden, Norway and Denmark occupied in this order the leading places. However Paul Colas (France) took the gold medals for the individual score both in the 600 metres military rifle and the 300 metres any rifle competition. The 300 metres military rifle individual competition was won by A. Prokopp, Hungary. In the miniature rifle matches no range of more than 50 metres was employed. At this range the United Kingdom team of four were first with a total of 762 out of a possible 800, P. J. Lessimore making the fine score of 192. Sweden won the 25 metres disappearing target competition, with the United Kingdom only 8 points behind. The individual prizes fell to F. W. Hird, U.S.A., in the 50 metres, and Lieut. Carlberg, Sweden, in the 25 metres. The United States carried off the honours in the pistol and revolver shooting, winning the 50 yards team and individual contests. A. P. Lane took two gold medals, the second being in the duelling matches, in which Sweden was first in the team event. Sweden swept the board in the running deer competitions. The standardisation of rules is an essential preliminary if international contests are to be a perfect test.

At Bisley the chief trophy for the military rifle, the King's prize, was carried off in 1911 by Private W. J. Clifford, with a total score of 319; in 1912 the winner was A. G. Fulton, the son of a previous victor, and, although but 24 years of age a marksman of great experience in important matches, having gained a place in representative British teams and regularly made his way into the last hundred for the prize which he at last secured. Mr. M. Blood took the grand aggregate (Hopton Challenge Cup) in 1911; in 1912 it was captured by Corporal Mortimer (Canada) by the aid of the .280 Ross rifle, a remarkable weapon produced by a Canadian factory under the initiative of a well-known Scottish landowner.

Clay Bird and Pigeon Shooting.—The rules at Stockholm were not adverse to the chances of the British team, except in so far as the permission of a heavy shot charge may have handicapped competitors unable to use it. They were beaten for the first place by the United States team, but J. R. Graham, one of the members, made the best individual score of 96 birds out of 100. The shooting was of a very high standard.

The Clay Bird Shooting Association champion is W. Ellicott, who is also well known for his skill with the rifle at the running deer range, and is probably both with gun and rifle the best all-round shot in the United Kingdom. In 1911 A. Maunder, who had twice previously held the championship, regained it with a score of 34 points out of a possible 35. The Pigeon Shooting Grand Prix du Casino at Monte Carlo fell to an Englishman, F. Moore of Newmarket, in 1911 after a most exciting contest: in 1912 M. Des Chaux was the winner.

Skating.

The winter of 1910-11 was unfavourable to skating throughout Europe. In England it was impossible to hold any of the speed championships. But it saw a notable extension of artificial ice facilities in the opening of the Manchester Ice Palace, with a skating surface of 100 ft. by 140 ft., enabling the National Skating Association to revive the championships in the English style of figure skating, abandoned since 1904. Ice palaces have since been opened in Edinburgh and Aberdeen.

The international style of figure skating continues to make progress on the continent of Europe, especially in Germany and among English visitors to the Engadine and habitués of artificial rinks. A short but hard frost in February 1912 allowed the English

Speed Championships, both amateur and professional, to take place, a new record (4 min. 44 $\frac{4}{5}$ sec.), being set up in the latter by Greenhall. An open race for amateurs and professionals over a straight course of a mile was held in 1912 for the first time in thirty-one years, with the remarkable result that all the competitors, amateur and professional, beat George ("Fish") Smart's record of 3 min. made in 1881, F. W. Dix claiming the new record in 2 min. 27 $\frac{1}{5}$ sec. The speed skating championships of the world produced two new records, *viz.*, 500 metres in 44 $\frac{1}{5}$ sec. and 10,000 metres in 17 min. 46 $\frac{3}{10}$ sec. Oscar Mathiesen being the winner. Roller-skating has not maintained its sudden access of popularity, but has left a residue of increased proficiency. Practice on rollers is gaining recognition as useful for the ice skater when ice is wanting.

The winners of the principal championships of 1911-12 were as follows:—

Speed Skating.—English amateur championship (1 $\frac{1}{4}$ miles with three turns): 1912, F. W. Dix. English professional championship (same course): 1912, Sidney Greenhall. Both the winners were the holders. One mile straight-away: 1912, F. W. Dix. World's championships: 1911, N. Strunnikoff, all four distances (500, 1500, 5000 and 10,000 metres); 1912, Oscar Mathiesen, all four distances. European championships: 1911, N. Strunnikoff; 1912, O. Mathiesen.

Figure Skating.—English championships, English style:—Single skater's challenge cup, 1911 A. J. Davidson, 1912 H. M. Morris. Combined skating: 1911 Combined Figure Skating Club team (A. J. Davidson, F. G. Fedden, H. M. Morris, R. Moxon), 1912 Wimbledon S. C. team (A. J. Davidson, F. G. Fedden, H. M. Morris, M. Teichmann). Pairs: 1912, Miss D. R. Jameson and A. J. Davidson. English championships, International style:—singles, 1911 Mrs. Greenhough Smith, 1912 A. Cumming. Pairs (a new championship trophy presented by Mr. and Mrs. Johnson), 1911 Miss Harrison and Mr. G. B. Krabbé, 1912 Miss Harrison and Mr. Basil Williams. World's championship:—1911 V. Salchow, 1912 Fritz Kächler. European championship:—1911 P. Thorén, 1912 Gösta Sandhal. Ladies' championship:—1911 Frl. L. Kronberger, 1912 Frl. Opika von Méray Horváth. Pairs championship:—1911 Frl. L. Eilers and W. Jakobsson, 1912 Mr. and Mrs. Johnson.

Roller Skating.—Amateur English championship (International style):—1911, W. Stanton; 1912, D. Resta. (English style): 1911 and 1912, R. S. Hewett.

Ski-ing.

As a competitive sport, running on ski is extensively practised in central Europe during the winter, especially in the Alps, the Black Forest, and Tirol, where there are many clubs, and several international open meetings are held. In the neighbourhood of Christiania the older and more famous meetings have for some years been carried out with difficulty, the weather having been on the whole exceptionally unfavourable. Ski-ing is now the favourite amusement of visitors to Alpine winter resorts, and has increased in importance as a valuable aid to winter mountaineering. Its military value is recognised by the nations that have Alpine frontiers, as well as by Norway and Sweden. The practical side of the exercise has also been illustrated by Amundsen's successful rush to the South Pole.

Owing to the varying nature of the ground and of the condition of the snow, no purpose can be served by attempting to compare the times in which long distance races have been run. Jumping records are almost equally devoid of significance, as no standard angle of declivity is recognised. But it may be mentioned that in the early part of 1912 the longest "standing jump"—*i.e.* jump in which the competitor kept his feet after landing—yet recorded was accomplished at Modum, Norway, by Gunnar Andersen, of Lyn, Christiania. The distance was 47 metres.

Swimming.

After the lapse of thirty-six years the feat of swimming from Dover to Calais, accomplished by Capt. Matthew Webb, was repeated on September 4 and 5, 1911 by T. W. Burgess, an Englishman resident in Paris. For some years frequent attempts had been made in vain by numerous swimmers. Burgess was fortunate in obtaining calm weather, but he was hampered by the tide in such a way as to be carried back over the Varne sand; and his course, including a large loop, was thus considerably longer than Webb's. As his time (22 hrs. 35 min.) was but little inferior, his exploit must be considered equal to that of his precursor.

As a competitive sport, swimming has been brought to a high pitch by the Australians, who are favoured by their climate, and by Americans. Of the former, J. G.

Longworthy has shown great speed at distances from 100 yards to a mile, and he is not unlikely to accomplish unprecedented performances. A Canadian, G. R. Hodgson, who won the 1,500 metres race at the Olympic Games of 1912, is a swimmer of at least equal promise. At this meeting an Hawaiian, D. P. Kahanamoku, won the 100 metres decisively, in time approaching the unparalleled performance of C. M. Daniels (U.S.A.). Great Britain unexpectedly found a young champion in J. G. Hatfield of Middlesbrough, who, profiting by the example of Kahanamoku, exhibited sudden improvement and almost succeeded in beating Hodgson. Since that time, Hatfield has beaten several records. In Great Britain swimming has made great progress in the public schools of all grades, and some degree of proficiency is attained by almost all the pupils. A satisfactory account of the present state of swimming whether as a sport or as a desirable accomplishment is to be found in *The Complete Swimmer*, by Frank Sachs (Methuen).

In the past two seasons new records have been made for the following distances:—

- 400 metres (free) by J. G. Hatfield (England); time, 5 min. 21 $\frac{3}{4}$ sec.; Shoreditch Baths, September 28, 1912.
- 500 metres (free) by J. G. Hatfield (England); time, 6 min. 56 $\frac{1}{4}$ sec.; Weston Super Mare, August 6, 1912.
- 400 metres (breast) by W. Bathe (Germany); time, 6 min. 29 $\frac{3}{4}$ sec.; Stockholm, July 1912.
- 1500 metres (free) by G. R. Hodgson (Canada); time, 22 min.; Stockholm, July 1912.
- 100 metres (breast) by E. Toldi; time, 1 min. 20 sec.; Budapest, September 17, 1911.
- 200 yards (breast) by E. Toldi; time, 2 min. 39 $\frac{3}{4}$ sec.; Budapest, August 20, 1912.
- 100 metres (back) by A. Barony; time, 1 min. 18 $\frac{1}{4}$ sec.; Budapest, July 17, 1911.
- 400 metres (back) by S. Wendelin, time, 6 min. 38 $\frac{3}{4}$ sec.; Budapest, August 5, 1911.

Tennis.

A match for the world's championship in 1912 between G. F. Covey and "Punch" Fairs (holder) ended in favour of the former, who had been defeated by the same opponent two years previously. The amateur championship in 1911 was won by the Hon. N. S. Lytton, but in 1912 he was defeated by E. M. Baerlein. The M.C.C. gold and silver prizes were taken in both years by E. H. Miles and Major Cooper-Key. Oxford won the University matches in both seasons, and was represented by the Hon. J. N. Manners and Hon. W. H. Grenfell; in the singles by the Hon. J. N. Manners.

Tobogganing.

At St. Moritz, tobogganing has been somewhat overshadowed by the many other diversions of the place and especially by ski-kjöring. In Switzerland generally it has given way to bob-sleighing. The Cresta run has been modified, the banks being built far higher and steeper than formerly, with the result that tobogganers, especially beginners, can make faster times. Throughout the two winters, 1910-11 and 1911-12, the record for full bob-sleighs on the Schatz Alp course at Davos was continually being beaten. Herr Lüders on Torpedo frequently gained and regained the record, and finally retained it at 3 min. 13 sec. (March 15, 1912). A special prize is offered for a bob-sleigh taking under 3 minutes.

Grand National:—1911, Captain Webb Bowen; 1912, Mr. E. O. Quicke. Symonds Cup:—V. Antoinetti (1911 and 1912). Manchester Bowl:—1911, Christmas Daisy (H. M. Jameson); 1912, Vereina II (Th. Hew). Coupe de France:—1911, Vereina II (Th. Hew); 1912, Taffy (C. A. Longcroft).

*Wrestling.*¹

To the necessarily limited programme of the Olympic Games at Stockholm in 1912 the Graeco-Roman style of wrestling was alone admitted, as having the best claims to be cosmopolitan. The contests, however, proved unsatisfactory. It is the defect of this style that it encourages passive resistance; and when a bout lasted for eleven hours and it was considered necessary to allow intervals for rest and refreshment, it was felt that something like a *reductio ad absurdum* had been reached. This fiasco, however, was due in some degree to the intentional omission by the Swedish committee of a time limit such as had been enforced at the London Games of 1908. Some of the members

¹ See also under "United States" below.

of the jury withdrew, and a protest meeting was held by the competitors. The first prizes were won by Saarela, Koskelo and Wäre of Finland, with C. E. Johansson of Sweden, Ahlgren, and Böling of Finland receiving second prizes for the incomplete final round above-mentioned. A German, a Hungarian, and a Russian reached the prize list, which was otherwise confined to Finns and Swedes.

Professional wrestlers have assisted towards the present eclipse of this style. Gotch, the American champion, was victorious by a hold which gave his antagonist the choice of surrender or permanent injury. In a public match Gama, an Indian, and Zbysco, a Galician, helped to discredit wrestling as a popular spectacle by remaining on the mat for three hours and doing nothing. In Lancashire and Cumberland wrestling is still cultivated, and is seen at its best at the Grasmere and similar Fell meetings.

Yachting.

The progress of international yacht racing in European waters in the last few years has been considerable. The International Rule for yacht measurement and rating was introduced in England on January 1, 1907, and in all European countries on January 1, 1908. Since its introduction up to 1912 about 650 yachts have been built to the classes which race under the rule. 176 of the vessels have been constructed under the survey of Lloyd's Register of British and Foreign Shipping; 112 of this number have been built in Great Britain and 64 have been built abroad. The remainder, about 474, have been built in Germany, Norway, Sweden, France, Denmark, Spain, Russia and Finland under the survey of foreign classification societies.

In 1911 the first great European International regatta was held at Spithead; there were 19 events, of which Great Britain won 9, Germany 4, Spain 4, and Norway 2. 13 of the events were won by yachts of British design, and 6 by yachts of foreign design.

In 1912 the second European International regatta was held at Kiel. 24 events were sailed; German-owned yachts won 11, British 8, and Norway, Austria, Russia, Spain, and Belgium one each. 15 of the events were won by yachts of British design, 9 by yachts designed abroad.

All the yachts of the international classes of 23 metres (75.4 feet) and under have been single-masted vessels, and those from 23 metres down to 8 metres have been cutter-rigged. Those smaller than 8 metres have usually carried a triangular form of lugsail. The most successful designers of the cutters have been Fife, Mylne, and Nicholson (British), and Anker (Norwegian); and of small lugsail vessels, in addition to the designers already named, Morgan (Giles, Glen-Coats, Laws, and Linton Hope (British)). Notable racing cutters have been "Shamrock" (Fife) 23 metres, "Octavia" (Mylne) 19 metres, "Mariquita" (Fife) 19 metres; and Nicholson in 1912 designed a splendid all round sea-going cutter in the 15-metre class named "Istria."

The racing in Class A above 23 metres has been carried on by schooners, yawls having gone out of favour. Since the visit of an American schooner, the "Westward" (Herreshoff), to Europe in 1910, which was most successful, the German schooners have been the best in European waters; "Germania," and the German Emperor's yacht, "Meteor," both designed by Max Oertz, winning all the prizes in their class at the International regattas of 1911 and 1912.

(A. W. BROWNE.)

SPORT IN THE UNITED STATES.

Sport in America is constantly undergoing changes of more or less importance. This may be due in part to the nature of the amalgamated race or it may be due to the fact that sport has had such a short life in the United States as thus far to have no strong traditions. Every game is played by the letter of the rule, and the rules must therefore be exact; and with this exactness comes a pressing necessity for completeness that would hardly be recognised in England, where tradition governs so strongly. For this reason a brief summary of the changes that have affected American sports since 1909-10 will aid the reader in understanding the general situation in the United States.

Football.—The sport of American intercollegiate football has developed quite materially in method and rules in the last two or three years. First, the periods of play from two halves of thirty-five minutes each, separated by an intermission, have been altered into four periods of fifteen minutes each with an intermission of one minute between the first and second and third and fourth periods and an intermission of fifteen minutes between the second and third periods. The field of play has also been quite materially altered. The actual distance between the goal lines instead of 330 ft. as formerly is now only 300 ft., but there is an additional end zone at each end extending 30 feet back from the goal line, in which a man may

legally receive a forward pass. It can really be said therefore that the middle line of the field is no longer the 55-yard line but the 50-yard line. Furthermore, a change in the rules has been made that makes the 20-yard line the limit of kick-out instead of the 25-yard line. Hence, the two lines that are marked more heavily than the rest on the field are now the 50-yard line and the 20-yard line instead of as formerly the 55-yard line and the 25-yard line. The longitudinal lines of marking on the field have also been practically eliminated as they are now of no particular service. The latitudinal lines remain to mark the distance gained and lost. The scoring has also been altered; a touchdown counted five points and the conversion of this touchdown into a goal added one point more, a field kick goal counted four; now a touchdown counts six and its conversion one point, so that a goal and touchdown together count seven and a goal from the field counts only three.

The method of play has also been somewhat altered, owing to certain changes in the rules. It has recently been enacted that a side shall have four trials to advance the ball the required distance of ten yards instead of three as formerly and this has increased the value of the running game. The restrictions upon the forward pass have also been rendered less severe. A man may now pass the ball so that it crosses the line of scrimmage at any point and he may make the pass as long or as short as he wishes provided he stands at least five yards back of the scrimmage line when he makes the pass. The onside kick has been entirely eliminated. The number of officials, formerly four, has been changed to three, but these three have so much to do that it is not improbable that there may be a return to the old method. However, the number of officials now stands at three, the referee, umpire and linesman. With all these alterations the play is more interesting and exciting and tends to an increase of scoring possibilities as well as giving an opportunity for the exercise of greater generalship. On the whole it is safe to say that the rules have been improved from the standpoint of player and spectator.

The contests of greatest interest in 1912 were, as usual in recent years, those between the three Eastern universities of Harvard, Princeton and Yale. On November 2 at Cambridge Harvard defeated Princeton, 16 to 6; on November 16 at Princeton, Yale and Princeton played a drawn game, 6 to 6; and on November 23 at New Haven, Harvard defeated Yale, 20 to 0. On November 28 the University of Pennsylvania defeated Cornell 7 to 2.

Association or Soccer football is being encouraged in the United States and has the support of many athletic directors throughout the colleges. It does not attract the large crowds but is popular as a pastime among those who do not care for the perhaps longer and more arduous training of the intercollegiate. It has added one more to the list of sports that help to attract out of doors during the fall and early winter months the student who otherwise would employ his time possibly in a less satisfactory manner. Rugby as such is not played in the United States except by two of the Pacific Coast universities.

Baseball.—In baseball the rules have not been materially altered, nor has the game taken on such distinct divergence as has football. The commanding feature of the baseball situation is that the public interest has not only been maintained, but has increased; and the attention given to the World's Series, that is, the annual contest between the winners of the American League pennant and the National League pennant, consisting of the winning of four games out of seven, has become a matter of national interest.

The series of 1911 was exciting, and ended in the victory of the Philadelphia American League Club over the New York National League Club. The series of 1912 was probably the closest ever known in a series of this nature, the Boston American League Club finally winning out in the concluding game of the series after each team had won three games. Public interest in intercollegiate games is also keen. In 1912, on June 13, Princeton defeated Yale at New York by a score of 19 to 6 and won the series between these two universities. Princeton was easily first among all the college teams, winning 21 out of 29 games played with other colleges in 1912. On June 19 Yale defeated Harvard at Cambridge 9 to 6, thus winning the deciding game in the series between these two universities.

Boxing.—Boxing interest saw its height at the time of the Johnson-Jeffries match at Reno, Nev., July 4, 1910, but the permitting of the sport in New York state under a certain board of commissioners has led in the last year or two to considerable development of interest in the so-called athletic-club promotions. On the whole, however, the meteoric career of "Jack" Johnson (the negro champion) has been typical of the ups-and-downs of the pugilistic profession in America.

Rowing.—Intercollegiate boat racing in the United States is represented by two principal regattas, the one at Poughkeepsie on the Hudson river and the other at New London on the Thames. Although Cornell at Poughkeepsie and Harvard at New London have now been monotonously winning for some years there has appeared no diminution of interest, and the crowd in the yachts assemble at the courses just the same, rendering the spectacle as brilliant as ever. There has continued the everlasting and apparently unending discussion of the merits of various strokes, but the subject seems to be one upon which opinions must always differ. Great respect is had in America for the theory as well as the practice of English rowing, and occasionally representatives of American rowing interests have, as in 1912, visited the English crews and compared notes. Whether the two schools are coming gradually more nearly together is a question. It is more than likely that constant alteration will

continue, although at times emphatically denied, and that after all the most successful crews will always be those whose stroke, boat and physique are best correlated.

Apart from intercollegiate rowing, an annual regatta is held of amateur oarsmen in which crews and boats of many kinds from singles to eight oars are represented and which is gradually gaining in importance and quality. In 1912 the Harvard-Yale race at New London, Conn., June 21, was won by Harvard by about 5 lengths. At the Poughkeepsie meet on June 29, in which for the first time the Far West was represented (by a crew from Leland Stanford Jr., University), all the races were easily won by Cornell.

Athletics.—At the Olympic Games of 1912 (July 6-15) in Stockholm, Sweden, many records were broken. In the event of perhaps greatest interest, the 800 metres run, the record was broken by the winner J. E. Meredith (1 min. 51.9 sec.) and by the second and third contestants, all of whom were Americans. America was first in 16 out of a total of 31 events and scored 85 out of 184 points. The intercollegiate games, held at Philadelphia on June 1, 1912, were won by the University of Pennsylvania with a score of 28 points. Five new records were established.

Cricket.—Cricket in certain quarters, notably the environs of Philadelphia and in some of the schools like Haverford, has kept up a specific interest among those devoted to the sport, but has not spread to any great extent. The Germantown (Pa.) Cricket Club visited England and Ireland in 1911; they won five games, lost five, and three were a draw.

Lawn-Tennis.—Lawn-tennis has more than held its own, and although the Davis cup matches have not proved sufficiently stimulating to draw new blood into tennis ranks in sufficient quantity to build up young players to take the place of the old, the general spreading interest in the game has been fully maintained. The chief events of 1912 were the winning of the national doubles title by Maurice E. McLoughlin and Thomas C. Bundy, both of California, in a challenge match with Raymond D. Little and Gustave F. Touchard at Newport, R. I., August 21; and the winning of the singles championship by McLoughlin on August 26; and the winning of the women's championships in singles by Miss Mary Browne, also a Californian, at Philadelphia, June 15. An important change made in 1912 was that the holder of the championship in singles was to be required to play through the championship tournament, instead of merely playing, in a "challenge" round, the winner of this tournament. W. A. Larned, who had won the championship in 1911 (and in several previous years), was prevented by his health from playing in the 1912 tournament. The year was notable on account of the success, for the first time, of the Western players.

Polo.—Polo holds its own, even though the cost of equipment is high and the game, in consequence, confined peculiarly to people of large means. Popular interest was greatly stimulated in the spring of 1911, by the international matches between the American Meadow Brook Club and the English Hurlingham Club, at Westbury, New York. The Americans won two closely contested matches, the score being $4\frac{1}{2}$ to 3, and $4\frac{1}{2}$ to $3\frac{1}{2}$.

Horseracing.—Horseracing has been placed in an anomalous position in the United States in the last few years owing to legislation. The truth of the matter is that in order to stop the pool room betting, which certainly was a detriment to the youth who were exposed to its influence and temptations, legislation piled up to such an extent as to affect the interest on the track and the owners. As probably betting has never yet been entirely dissociated from horseracing the attempt to carry through this divorce proved as usual to have unexpected results and one of these has been the cutting down very materially of the interest in this sport.

Wrestling.—In wrestling the important fact has been the still further victories of Frank Gotch, his decisive defeat of the Russian, George Hackenschmidt, at Chicago, Sept. 4, 1911, and his final retirement to his farm. The sport itself has been kept up very well in the colleges, although there have been some defections from the Intercollegiate League.

PART II. LOCAL

SECTION I. THE BRITISH EMPIRE

ENGLISH POLITICAL HISTORY¹

I. *The Crown.*

King Edward VII died on May 6, 1910, and was succeeded on the throne by his only surviving son as George V, whose consort Queen Mary, by the Regency Act 1910, was at once nominated to be regent in the event of a demise of the Crown before the next in succession arrived at the age of eighteen. As their eldest son, Prince Edward, was born on June 23, 1894, a Regency Act was a temporary constitutional necessity; but he was created Prince of Wales on his sixteenth birthday, and, before attaining his majority in 1912, he had completed his naval education at Osborne and Dartmouth (gazetted midshipman June 22, 1911, and appointed to the "Hindustan" for a three months' cruise ending October 26th). The young Prince then returned to private studies, paying a visit in the summer of 1912 to Paris, with his tutor, Mr. Hansell, as guest of the Marquis de Breteuil, and in the October term he went into residence at Oxford, as a commoner of Magdalen. The new Civil List for the Crown, as approved by Parliament in 1910, was fixed at £470,000 a year, but Parliament was not asked to provide for the Prince of Wales, his income from the Duchy of Cornwall (£87,000) being sufficient.

An important change, which had been mooted but not proceeded with when King Edward came to the throne, was made at King George's accession, in the alteration of the Sovereign's declaration respecting his religion, the terms of which, as provided in 1689 by the Bill of Rights, had long been resented by Roman Catholics. After other unsatisfactory suggestions had been made, the Accession Declaration Act of 1910 finally substituted a short and simple formula for the more detailed "no-Popery" manifesto which, it was generally agreed, was no longer needed. The following were the new terms provided:—

"I (name of Sovereign) do solemnly and sincerely in the presence of God, profess, testify and declare that I am a faithful Protestant, and that I will, according to the true intent of the enactments which secure the Protestant succession to the Throne of my Realm, uphold and maintain the said enactments to the best of my powers according to Law."

At his first opening of Parliament, according to the practice, King George made this declaration, and the whole question was removed from further controversy.

At the death of so active, popular, and influential a sovereign as Edward VII, in the midst of grave parliamentary difficulties and a condition of social-economic unrest which was soon to be fertile in industrial conflict, the country was fortunate at any rate in this, that the Throne had already established itself in the hearts of the people, as a central and unifying force, distinct from all party considerations. The Royal Family, without exception, were known to be active in all that their position enabled them to do for the furtherance of the public welfare; all classes of the community recognised the value of this factor in English social life, and took a proud and affectionate interest in the manifest determination both of the Throne and of individual members of the Royal Family to do their duty and to justify the public trust. The first two years of the new reign made in this respect an auspicious start, and it was soon realised that the consolidation of the Monarchy, begun under Queen Victoria and so remarkably continued under Edward VII, was being effectually carried on, with high ideals and in an earnest spirit, under the Sailor-King, whose exhortation "Wake up, England," in his speech at the Guildhall when returning from his Colonial tour as Prince of Wales in 1901, had already made history as a general signal to the nation. At King Edward's death there were some who thought that, under his succes-

¹For the course of events immediately preceding this narrative see *Encyclopædia Britannica*, Arts. ENGLISH HISTORY (vol. ix, pp. 532, 533), EDWARD VII (vol. viii), GEORGE V (vol. xi), ASQUITH, H. H. (vol. ii), LLOYD GEORGE, D. (vol. xvi), BALFOUR, A. J. (vol. iii), CHAMBERLAIN, J. (vol. v), PARLIAMENT (vol. xx), and BRITISH EMPIRE (vol. iv).

sor, the country would have a Court of more severity, less inclined to display, less sympathetic towards the joyous side of life,—high-minded and worthy indeed, but rather dull. In so far as such doubts represented a fear that the new King and Queen, whose pure and happy domestic life was universally recognised and respected, would not enter into the amusements of the people and play a Royal part in the social life of the country, it was soon falsified and disappeared. As Prince of Wales, George V had indeed shown no particular interest in horse-racing and some other kinds of national sport and amusement, though he was known to be one of the best shots in the country; but as King, he and his Consort, after the period of mourning was over, at once removed any misconception in this respect. Not only did they follow King Edward's example in attending race-meetings (the Royal training-stables entering horses for the principal races) and patronising the theatres, but in the summer of 1912 for the first time a state visit was paid to a London music-hall (the Palace) and to Henley Regatta, and the King went to Lord's on the occasion of the Test-match between the Australian and South African cricketers, and had the teams presented to him: so that the tradition of Royal interest in national sport and games was amply sustained.

The national inclination for pageantry and display, which King Edward had done so much to gratify, found in King George and Queen Mary sovereigns who were ready, at any cost of personal sacrifice and fatigue, to go even further in making public ceremony, on appropriate occasions, the magnificent expression of important acts of State. The Coronation at Westminster Abbey on June 22, 1911, a solemnity of unparalleled grandeur, attended by representatives from all parts of the Empire and other countries, for which London was decorated as it never had been before, was followed on June 23 by a Royal procession through the streets both north and south of the Thames, on June 24th by a great Naval Review at Spithead, on June 26th by a gala performance at the Opera, on the 27th by a Royal garden-party at Buckingham Palace in the afternoon and a gala performance at His Majesty's Theatre in the evening, on the 28th by a Royal visit to the Agricultural Show at Norwich, on the 29th by a thanksgiving service at St. Paul's and a luncheon at the Guildhall, on the 30th by an entertainment at the Crystal Palace given by their Majesties to 100,000 London Elementary school children, and by the King's presentation of medals at Buckingham Palace to 500 Indian and 1400 Colonial soldiers. On July 3rd the King reviewed 17,000 officers of the Territorial Army in Windsor Park, and on July 4th, 30,000 Boy Scouts gathered there from all parts of the country.

In order to complete the public assumption of Royal authority throughout the United Kingdom, the King and Queen, with the Prince of Wales and Princess Mary, then made State visits to Ireland (July 7th–12th), Wales (July 13th) and Scotland (July 17th–21st). The fact that the Dublin Corporation refused to vote an Address, and that the leaders of the Nationalist party, as usual, held aloof, while "Sinn Fein" even got up local demonstrations against any celebration of the new reign, only detracted in a very slight degree from what the King himself described as the "spontaneous and hearty loyalty" of his reception in Ireland. When the Royal party drove on July 8th from Kingstown to Dublin Castle they had a great popular welcome from cheering crowds all the way; and in the course of the day the new College of Science was inaugurated, and visits were made to Trinity College and to the Phoenix Park races. On Sunday the 9th their Majesties attended Service in St. Patrick's Cathedral, and in the afternoon paid a visit to Maynooth College. On the 10th the King held a *levée* and received loyal addresses from deputations sent from various parts of the country, a special address of welcome from 165,000 Irish women being also presented to the Queen; in the afternoon their Majesties went to Leopardstown races, and in the evening gave a State banquet at Dublin Castle. On the morning of the 11th the King reviewed over 16,000 troops in Phoenix Park, in the afternoon their Majesties gave a garden-party at the Viceregal Lodge, and in the evening they held a Court at the Castle. On leaving Dublin next day the King gave £1,000 for the relief of the poor, and the occasion was also taken by Lord Iveagh to distribute £50,000 among the Dublin hospitals.

The Royal visit to Wales had for its central object the Investiture of the Prince of Wales at Carnarvon Castle on July 13th, a magnificent ceremony and an imposing demonstration of Welsh nationalist sentiment, in the arrangements for which Mr. Lloyd George, who had been appointed Constable of Carnarvon Castle, had from the first taken a leading part. In the course of the proceedings a national address was presented to the young Prince by Sir John Rhys, Mr. Abraham, M.P., and the Archdruid; the Prince made part of his replies in Welsh; and in the religious services two Welsh Nonconformist ministers were associated with the two Anglican bishops. The whole affair was a great success. On July 14th, the King and Queen visited Bangor for the opening of the new buildings of the University College of North Wales; and on July 15 they visited Aberystwyth and laid the foundation of the new National Library of Wales.

From Wales the Royal party went to Edinburgh, where on July 17th a great procession escorted them to Holyrood Palace. Here again ancient Scottish ceremony and modern Scottish sentiment were duly observed and encouraged. A *levée* and a state banquet were held on the 18th; on the 19th the King and Queen assisted at the dedication of the new chapel of the Order of the Thistle in St. Giles's Cathedral, and the King laid the foundation stone of the new City Hall; and on the 20th reviews of troops and boy scouts were held in the King's Park, and a garden-party was given at Holyrood. On the 21st the Royal party returned to London, after having brought the whole of the United Kingdom more closely within the ambit of the Coronation festivities by their personal presence in all its capital cities.

But there still remained an important extension of the whole principle of the recognition of Imperial sovereignty, in the visit paid by their Majesties to India and the Coronation ceremonies at the ancient capital of Delhi. At the time of King Edward's death the native unrest in India had become a source of considerable political anxiety, and it was his successor's own idea that the personal presence of the King-Emperor, for the first time as such on Indian soil, and the compliment paid to his Indian subjects by his being crowned Emperor in their midst; would give new life-blood to all the elements that made for loyalty to the British connection and for Anglo-Indian co-operation in the great work of administering India under the British Crown. The announcement that the King would go in person to India for this purpose, and that, instead of sending a representative, as had been done in the case of King Edward, he and his consort would themselves be crowned at a Royal Durbar, was made in the autumn of 1910. It was understood that the King's decision was assented to at this time by his ministers with considerable hesitation, and when the Indian unrest continued to show itself during 1911 doubts were freely expressed as to its being prudent. Prophets of evil, as the time drew nearer to November 11th, when the King and Queen were to leave England, were numerous; but the King's own courage and prescience were fully justified by the event, and the history of the Empire has included no more epoch-making act of State than was involved in all its circumstances. Embarking from Portsmouth on the P. & O. steamship "Medina," and attended by Lord Crewe, the Secretary of State for India, and a numerous suite, with an escort of men-of-war, the Royal party arrived at Bombay on December 2nd (see INDIA), and were not back in London till February 5, 1911.

From a political point of view the most remarkable part of the proceedings in connection with the Delhi Durbar was the Royal announcement of certain changes in the Indian administrative system (see under INDIA). In celebration of the Coronation itself various boons were granted, measures of relief and release for certain classes of debtors and prisoners, a large preliminary outlay towards a new scheme for the extension of popular education, extra pay to certain classes of native officers and civil servants, and the inclusion of native officers and men among those eligible for the award of the Victoria Cross. But all such concessions were overshadowed by the fact that occasion was taken for a public assertion of Royal power and authority in respect of the government of India, by the King's announcement that

The changes in India.

in future Delhi would replace Calcutta as the Capital, and that Lord Curzon's partition of Bengal, which had led to so much contention but which not long since had been described even by ministers in Parliament as *res judicata*, would be annulled, Bengal becoming a presidency, Behar, Chota Nagpur and Orissa being placed under a lieutenant-governor, and Assam being restored to a chief-commissionership. Not a word of this impending *coup d'état* had leaked out, though now the despatches of the Indian Government recommending it (August 25, 1911) and of the Secretary of State sanctioning it (November 1) were published. Without making any communication to Parliament, and without giving any opportunity for discussion—for when once royally announced in this way, the step, by common consent of all parties in England, was irrevocable, however much it might be criticised—an English Radical Ministry had deliberately utilised the King-Emperor's position and *prestige* to carry out a great autocratic act of State policy, which otherwise certainly could not have been accomplished without considerable friction. So far as concerned the restoration of Delhi, the ancient centre of the Mahomedan Empire, as the capital, the announcement was undoubtedly an appropriate and effective accompaniment of the inauguration of a new Emperor, a dramatic exhibition of monarchical will; and it was made in a magnificent spirit, characteristic of Oriental ideas. Nobody outside the inner ring of the King's advisers, not even among important Anglo-Indian officials, had guessed at such a proposal; yet it had obvious advantages, both sentimental and administrative. Besides gratifying the Mahomedans and others to whom Delhi had immemorial associations with Indian Imperialism, whereas Calcutta represented rather the traditions of "John Company," it not only moved the seat of government away from the rather disturbing influences of Bengal politics, but also provided a central railway position, from which the annual migration to Simla in the hot weather could be made more conveniently and at half the cost. This latter point, combined with profit from the enhanced value of land available for building sites, could be off-set against the lavish outlay (estimated at £4,000,000) required to bring the new capital into existence. Bengal and the Hindus meanwhile were consoled for the removal of the Indian Government from Calcutta by the rearrangements made in partial satisfaction at all events of the opposition to Lord Curzon's partition of the province. From a political point of view this was the part of the announcement specially open to criticism, and to Lord Curzon himself it came as a personal rebuff of the bitterest kind; but though the opposing views were well expressed by him and others in subsequent debates in Parliament, the deed was done; in India the King's word had settled it. No single act of Government in the history of the British constitutional monarchy had ever exhibited so promptly the latent resources of the Throne as an extra-parliamentary factor in Imperial administration. That a Radical Ministry, supposed to stand for "democratic" methods and the responsibility of the House of Commons, should have had resort to the machinery of autocracy, was surprising, however, to a good many of their democratic supporters.

By a curious coincidence, just at the time of the Indian Durbar, the P. & O. liner "Delhi," with the Princess Royal (the King's sister), her husband the Duke of Fife, and their daughters, Princesses Alexandra and Maud, on board, was wrecked in a gale off Cape Spartel on the Morocco Coast (December 13th) and became a total loss; and the boat in which the Royal passengers were taken to shore was upset in the surf, so that they had a somewhat trying experience. It was hoped that the party had escaped with nothing worse than a wetting and a shock, but after going on to Egypt, whither they were bound for the Princess Royal's health, the Duke of Fife fell seriously ill with pneumonia and he died at Assuan on January 29th. His elder daughter now became Duchess of Fife in her own right. He and the Duke of Argyll (husband of the King's aunt, Princess Louise) had been made Knights of the Garter at the Coronation; and his death removed from the Royal circle a Scottish noble of high character and patriotism, esteemed by all who knew him.

In any survey of contemporary English history it is only proper to dwell first on matters directly connected with the Crown and Royal Family, because of the interest

*Death of
the Duke of
Fife.*

attaching not only to the opening of a new reign but to the increasing importance of the activities of the Throne under modern conditions of British social and political life. Much inevitably depends on the extent to which popular respect and affection surround the whole Royal Family, and also on the amount of assistance available for the Sovereign, in the varied and exacting functions which the Throne is expected to perform, from others among its members. In these respects King George was able to benefit from a continuous growth of mutual confidence, on the part of the Royal Family and the public at large. In his mother, Queen Alexandra, and his consort, Queen Mary, the national affection had always been unchangingly concentrated; and his aunts, King Edward's sisters, Princess Christian, Princess Louise (Duchess of Argyll) and Princess Henry of Battenberg, remained, as they had long been, active and popular figures in English social life. His one surviving uncle, the Duke of Connaught, a man admired and respected throughout the British Army and indeed among all classes, not only for his distinguished ability but also for his *camaraderie* and good sense, was still able and willing to take an important and most useful part in public life; he went in October, 1910, to South Africa with great success to open the Union Parliament on the King's behalf, and in 1911 was appointed to succeed Earl Grey as Viceroy of Canada, where he and the Duchess quickly made themselves popular, and their charming daughter, Princess Patricia, not less so. The Duke of Connaught's son, Prince Arthur of Connaught, was meanwhile chosen by the King to be his representative on several important missions to foreign countries, and was appointed one of the four councillors of State (the others being the Archbishop of Canterbury, Lord Chancellor Loreburn and Viscount Morley of Blackburn) empowered to transact business in the King's stead while absent on the Royal visit to India. With such supporters among the Royal Family, the work of the Throne was ably assisted; nor was the support confined only to these. Queen Mary's brother, Prince Francis of Teck, a gallant officer whose death on October 22, 1910, cut short a career of much promise, had thrown himself into social service at home by becoming chairman of the Middlesex Hospital, and his brother, Prince Alexander, followed his example. It was generally recognised as being the pride of English Royalty to use their position for public ends and to spare no effort on behalf of national causes.

But the character of the Sovereign himself is necessarily the central factor in the realisation of those potentialities for social and political influence which have become so marked in the democratic development of the British Monarchy. At the very outset of his reign King George found it necessary to vindicate his personal character against certain remarkable aspersions, and in doing so he gave a proof of his own confidence in the public, which had excellent effect. It is now purely a curious episode in the history of scandal-mongering that, at the time when he came to the Throne, in spite of the genuine liking which existed in all classes for King Edward's sailor son, stories were current in various quarters, founded on irresponsible gossip, in the first place that he was addicted to drink, and in the second—a still more serious matter—that he had been secretly married before his marriage with the Queen and that this earlier wife was alive though for dynastic purposes the union was ignored. Even while King Edward was alive reports somehow became prevalent that the Prince of Wales drank too much. At "Grand night" at one of the Inns of Court the Prince bluntly told the Treasurer who was his host that people said so, and asked him how to get the impression removed, a question more easily asked than answered. Those more immediately in the Prince's *entourage* know that it was nonsense, but the more such things are denied the more publicity they generally get. When King George came to the Throne however it became desirable that the progress of this lie should be checked, and the Dean of Norwich in July, 1910, by the King's desire, spoke out plainly with excellent effect. Right-minded people felt moreover that a King who was prepared to abandon the usual reticence in such a matter had a straightforward way of acting which was preferable to the arts of diplomacy.

Reports with reference to the second allegation had indeed been spread at the time

of the King's marriage to Princess Mary of Teck, as she then was, in 1893, and had then been contradicted at Queen Victoria's desire, by Canon Dalton, in private letters to various people of influence; but gossip continued to make free with the story, and it was revived, to the King's natural annoyance, and with the danger of public misconception and ill-feeling if it were not finally disproved, in 1910. Nothing however is more difficult to deal with than private scandal for which nobody in particular can be made responsible. It was hoped that the further public contradictions authoritatively given by the Dean of Norwich in his speech in July, by Mr. Stead in the *Review of Reviews* for that month, and by Sir Arthur Bigge in *Reynolds' Newspaper* (October 30, 1910), would put an end to it; but it was repeated in a definite way by a certain Edward Mylius in November and December 1910, in a "republican" paper called the *Liberator*, published in Paris and circulated in England under the auspices of the Indian revolutionary Krishnavarma. In this the writer declared that the King, when a midshipman, had in 1890 married at Malta a daughter of Admiral Sir Michael Culme-Seymour; his subsequent marriage in 1893 was therefore bigamous and shameful, and the Church, by conniving at it, had been guilty of subordinating its own principles to reasons of State. Copies of the *Liberator* were seized by the police, and Mylius was arrested and on February 1, 1911, tried for criminal libel before the Lord Chief Justice and a special jury. Evidence was given by Sir M. Culme-Seymour and others absolutely contradicting the whole fabrication. The Admiral had no daughter whom the King could have married in 1890; one of his daughters died unmarried in 1895 without ever knowing him, the other (Mrs. Napier) had not met him between 1879 and 1898; the King was not at Malta between 1888 and 1901; the Maltese registers were produced and contained no record of any such marriage. Mylius refused to give evidence, his claim that the King ought to appear as a witness to be cross-examined by him being overruled; and the jury promptly found him guilty. He was sentenced to the maximum penalty of a year's imprisonment; and the Attorney-General then read a statement signed by the King that he had never been married to anyone but the Queen and that he would have attended in person to give evidence if the law officers of the Crown had not insisted that it would be unconstitutional for him to do so.

The whole affair caused naturally a great sensation, but again the effect was excellent, and the straightforward action taken by the King—for it was known that the Government doubted the expediency of bringing the matter into Court—confirmed public opinion as to the character of the new occupant of the Throne. He had insisted on having the truth told, and was not prepared to forgo his rights as a man simply because, as a King, he was above the law. That was not his idea of kingship. Good thus came of evil, and enhanced confidence in the Throne, which was strengthened, in all but one rather doubtful respect to be mentioned later, by the public work of King George and Queen Mary in 1911 and 1912. They were not content with the scenic side of Royalty; they were anxious to show their interest in all national activities and to enter sympathetically into the lives of the working-classes. While they mingled graciously with society at Court and at country house-parties, Queen Mary made herself equally at home in taking tea with a Welsh miner's wife (June 27, 1912) after the Royal visit to the Dowlais steel-works at Merthyr, and during a tour through the industrial districts of Yorkshire King George went down the Elsecar Colliery (July 9) and showed himself no less handy in wielding a pick than at bringing down the grouse on a Scotch moor. Moreover Royal visits were made to Harrow School on Speech Day in July, 1912, and to Winchester just afterwards to celebrate the restoration of the cathedral; the King took an active part in various public functions, notably in laying the foundation of the new London County Council offices on the Embankment (March 9, 1912), and opening the Immingham Dock near Grimsby (July 22, 1912); and in the first two years of his reign he had made the Royal presence felt far and wide.

The doubtful exception already alluded to was in respect of the use of the Royal prerogative in passing the Parliament Act in 1911. The parliamentary aspects of this revolution in English constitutional procedure will be considered later, but the public

intervention in party politics which it involved on the part of the King marks a distinct step in the history of the Throne itself, and one which affects the whole system of English parliamentary government. Whatever were the necessities of the case from the point of view of the Liberal party, there can be no question that, politically, the successful use of the Royal prerogative in overcoming the resistance of the House of Lords to the Parliament Bill brought the Crown itself into open conflict with the passionate desires and convictions of a very large section of the community,—a minority indeed, so far as its representatives in the House of Commons were concerned, but a minority even then which, in the country at large, stood for nearly as many people as the majority. Under a sense of constitutional obligation, brought about by what the Opposition leaders indignantly denounced as ministerial trickery, the Crown lent itself to the last resort open to the party in office for forcing its demands through Parliament, by assenting to Mr. Asquith's demand that, if necessary, enough new peers should be created to vote down the resistance of the Upper House to a measure which practically wiped it out as an effective part of the machinery of legislation. Those who considered the use of the prerogative for such a purpose, and in such circumstances, a constitutional outrage, agreed in putting the responsibility on the Government and not on the King, who acted on the advice of his ministers; but this view, though undeniably correct, only emphasizes the fact that the King was made to appear to act simply as a ministerial puppet. The independent authority of the Throne, as a factor in the Constitution standing outside party politics, was to that extent publicly weakened, and it was only because all parties agreed in deploring such a result and desiring to minimize the effect of the action ostensibly taken by the Crown, that its bearing on the Constitutional position of the Monarchy was slurred over as much as possible. The question whether so drastic an assertion of ministerial power was justified depends, of course, for its answer on the point of view taken as to the merits of the Parliament Bill itself and the importance of passing it as introduced, without the amendments carried in the House of Lords; and from the point of view of the Liberal party the Government, no doubt was driven to the use of the last weapon in its armoury, unless it was to admit that the preceding steps taken, and apparently sanctioned by the results of two general elections, were to be stultified. But no competent observer of the working of British political machinery can deny that the use of the Royal prerogative for so violent a party purpose disclosed the subordination of the Sovereign to the Parliamentary Executive in all its nakedness, in a way which was directly contrary to the development of constitutional theory and practice concerning the functions of the Crown during the reigns of Queen Victoria and King Edward. With a less popular Sovereign on the Throne, and in circumstances less favourable to British pride and affection for the institution of Monarchy, such a disclosure would have been a more serious danger.

As it was, while the Opposition levelled their denunciations at the ministry, and the Government justified themselves by the absence of any alternative, it was generally recognised that since the Lords' rejection of the budget in 1909 the whole course of domestic politics had been quasi-revolutionary. In the prolonged crisis in parliamentary affairs, complicated by acute industrial unrest, which continued during 1910, 1911 and 1912, the political conflict in the United Kingdom was being waged under conditions dominated by the peculiar and almost unprecedented relations between parties, and the situation was such that the moderating influence of the Crown had practically no scope for its exercise. It was known at the time of King Edward's death that he had been gravely disquieted at the course which the constitutional crisis was taking; and though there was a strong hope that the parties might embrace the opportunity of the beginning of a new reign to settle their differences by some sort of agreement, it was perfectly clear that, if the dead-lock went on, King George himself must inevitably be placed in a position of serious embarrassment. When the conference of 1910 broke down, and when immediately afterwards the second general election of that year gave the Liberal Government once more a majority, matters had to take their own course. The politicians on both sides, and their

The Royal prerogative.

The State and the Crown.

supporters in the country behind them, had created the problem, and its solution still remained for them to find. Between them, wherever the fault might lie, they had sown the whirlwind, and it must carry them where it blew. Meanwhile the Crown, outside domestic politics, remained by universal consent an Imperial and social factor of all the more potential value because of the warring of political factions. The consolidation of the Empire was making steady progress irrespectively of the political situation in the United Kingdom; and King George, though not the personal force in European diplomacy and statemanship that King Edward had been, was known throughout its length and breadth as no English Sovereign had ever been before. In spite of all the political difficulties in the mother country, the British Throne represented in his person a centre of Imperial authority, to which other peoples and Parliaments than those of the United Kingdom contributed: and whenever opportunity should serve for a judicious exercise of this authority, the extent of its influence, both on domestic and on international affairs, would not be limited by constitutional theories affecting the British Isles alone.

II. *The Empire.*

“English” history to-day cannot indeed be written without reference to the British Empire, as a unit greater than is represented by “home” (*i.e.* English, Welsh, Scottish and Irish) politics. The course of domestic affairs in the other British Dominions and Colonies is however dealt with in other sections of the *Progress of Imperialism. Year-Book*, and here it is only necessary to refer to certain matters of common Imperial interest, which are also part of the recent history of affairs in the mother country as the centre of the Empire. The Imperial “idea,” to which Mr. Chamberlain’s administration of the Colonial Office and the emergency of the Boer War had given such a pronounced impetus, has progressed during these later years with rapid strides, both in Great Britain and the Dominions. It has done so irrespectively of English domestic politics, in consequence of the increasing consciousness in all quarters that the different parts of the Empire have a common interest in the maintenance of British power, and that this is only possible by mutual support. The persistent advocacy of the fiscal policy of Tariff Reform and Colonial Preference by the Unionist party in the mother country, and their agreement in this respect with the trade policy of the statesmen of the Dominions, has undoubtedly done much, directly and indirectly, to popularise the idea of closer union; but on these lines no advance was possible while an English government, committed to “Free Trade,”¹ was in office.

Since 1909 however the question of Imperial Defence has become acute, in consequence of the rapid increase of the German navy and its manifest challenge to British sea-power. This new external pressure, and the strain it involved on the resources of the mother country at a point where the security of the outlying British Dominions was immediately affected, concentrated attention throughout the Empire on the problem of a fuller co-operation for Imperial defence; and during 1911 and 1912 this aspect of Imperial consolidation brought the statesmen of the Empire increasingly into closer touch over a problem which raised no differences of political principle. The most remarkable incident during the Imperial Conference, which reassembled in London in 1911, was the confidential discussion of British international policy, at which the Colonial representatives were addressed by Sir Edward Grey with a detailed account of the situation in foreign affairs. For the first time, it was felt, the Empire as a whole had been taken into the counsels of the statesmen of the mother country, in order that a common understanding might prevail. A naval defence scheme was adopted, providing for the maintenance of the various naval services and forces under the control of their respective governments, but for making the training and discipline uniform with those of the fleet of the United Kingdom and for arranging an interchange of officers and men, while in war-time the colonial ships placed at the disposal of the Crown would be under the British Admiralty. The movement for increasing the Colonial naval forces, and combining their provision with the idea of

¹ See *E. B.* xi, 88 *et seq.*

an Imperial Navy acting as a single unit, was also notably forwarded by the visit to England of the Canadian Premier, Mr. Borden, with other Canadian ministers, in 1912, for the purpose of discussing the whole subject with the home government and the Committee of Imperial Defence. The public speeches made by Mr. Borden and his colleagues during this visit, and the references made to it by Mr. Asquith in the House of Commons, showed that, in this department of administrative policy at any rate, the goal of Imperial federation was appreciably nearer.

In connection with the Imperial Conference of 1911 it may also be noted that resolutions were adopted by it in favour of: (1) an Imperial Naturalisation Act, based on a scheme to be agreed upon, but still undefined, for conferring an uniform British citizenship throughout the Empire, (2) the appointment (carried out in 1912) of a Royal Commission, representing the whole Empire, to investigate and report on its natural resources, and the possibility of their development, (3) the establishment of a chain of British State-owned wireless telegraphic stations within the Empire (proposed under the Marconi agreement of 1912). A somewhat elaborate scheme proposed by Sir Joseph Ward for setting up an Imperial House of Representatives for Defence, and an Imperial Council of State, was withdrawn by him, after both Mr. Asquith and various Colonial ministers had criticised it adversely.

Other questions at the Conference of 1911.

British citizenship throughout the Empire, (2) the appointment (carried out in 1912) of a Royal Commission, representing the whole Empire, to investigate and report on its natural resources, and the possibility of their development, (3) the establishment of a chain of British State-owned wireless telegraphic stations within the Empire (proposed under the Marconi agreement of 1912). A somewhat elaborate scheme proposed by Sir Joseph Ward for setting up an Imperial House of Representatives for Defence, and an Imperial Council of State, was withdrawn by him, after both Mr. Asquith and various Colonial ministers had criticised it adversely.

III. Domestic Politics.

The history of domestic British politics in 1911 and 1912 was dominated by the state of the parties resulting from the general election which was precipitated in December 1910 when the private conference between the Liberal and Unionist leaders on the constitutional crisis broke down.¹ On the eve of the election, at a great meeting in the Albert Hall, Mr. Balfour introduced a new issue on the Unionist side by advocating a Referendum on great constitutional questions, and declaring that he was prepared to refer Tariff Reform to the people by this method if the other side would do the same for Irish Home Rule. It was believed in some Unionist quarters that this declaration in favour of a Referendum on Tariff Reform (which was generally discussed without any question of its depending on the willingness of the Government to adopt the Referendum for Home Rule) would help to secure support among Unionist critics of the Tariff Reform policy; but it came too late in the day for that purpose, and was not much to the taste of the more ardent Tariff Reformers. Mr. Austen Chamberlain, for one, at once expressed his view of the difficulty of taking a Referendum on a question of finance; and after the elections the idea of qualifying the Tariff Reform issue by coupling it with a pledge not to proceed without a Referendum practically disappeared from the Unionist platform, though suggestions for its revival were occasionally made by Unionists who thought Tariff Reform unpopular.² Its failure for electioneering purposes helped indeed to increase the criticism which was already rife in certain Unionist circles against Mr. Balfour's leadership. On the other hand the use of the Referendum for putting large constitutional changes before the electorate, and for thus solving the problem of conflicts between the two Houses of Parliament, was increasingly advocated on the Unionist side. A bill for this purpose, brought by Lord Balfour of Burleigh before the House of Lords in March 1911, made no actual headway, but the proposal, in one shape or another, became part of the Unionist alternative to the Parliament Bill. The Government, on their side, concentrated all their efforts on an appeal to the electorate to give them a majority for the Parliament Bill, as an essential preliminary to any Liberal legislation; and the result showed that the short interval since the general election of January 1910 had made practically no difference in the balance of party power. The distribution of seats, and

¹ See *E. B.* xx, 846, 847.

² On November 14, 1912, at the meeting of the National Unionist Association in the Albert Hall, at which Mr. Bonar Law and Lord Lansdowne both spoke, Lord Lansdowne specifically declared that the Unionist leaders regarded the proposal for a Referendum on Tariff Reform as abandoned. But see further below, *ad fin.*

the strength of parties, may be shown best in tabular form (Table A). Party gains are shown in Table B.

Allowing for the recount at Exeter, and the by-election at Cheltenham (April 28th) resulting from a successful petition, the new Parliament opened in 1911 with a Ministerial majority of 122, the coalition of Liberals (270), Labour Party (42) and Irish Nationalists (84), numbering 396, and the Unionists 274. The precise balance of voting strength in the electorate cannot be stated, owing to the fact that 71 Unionist and 88 Ministerial seats were not contested; the Unionist votes recorded were 2,426,681 and Ministerialist 2,807,753; but if an allowance is made for the uncontested seats, the Ministerialist majority might be taken at between 240,000 and 350,000. In England alone the Unionists had a majority of 17 seats (241 to 224).

It may be convenient here to notice the results of the subsequent by-elections which for various reasons became necessary during 1911 and 1912. While the Parliament Bill was still the main issue, no change was made in the position of the parties, but afterwards the Unionists won three seats in 1911 at Oldham (Nov. 13th), South Somersetshire (Nov. 21st) and North Ayrshire (Dec. 20th), and in 1912 gained further successes at South Manchester (Nov. 5th), Crewe (July 26th), North-West Manchester (Aug. 8th), Midlothian (Sept. 10th), and Bow and Bromley¹ (Nov. 26th). This improvement in their position was marked still more by their gains in voting strength, which became particularly noticeable when the Insurance Act of 1911 was

¹ At Bow and Bromley, though the Unionist won a seat, the defeated candidate Mr. Lansbury was not actually standing as a supporter of the Government. He had resigned in order to vindicate his independence as a supporter of woman's suffrage, and the issues were consequently "mixed."

added to the issues before the electorate. Between February 1911 and November 25, 1912, (before the Bow & Bromley contest, which may here be ignored), in 30 straight contests between Unionist and Liberal candidates (including Cheltenham) they obtained a net advantage of 20,156 votes over the Liberals as compared with those given at the general election, the Unionists gaining 21,835 in 24 constituencies as against a Liberal gain of 1,677 in 6; and in 11 three-cornered contests, where a Labour candidate also stood, they obtained an advantage of 15,757 over the Liberals (as apart from Labour), gaining 21,069 in 10 Elections as against 5,312 in 1 (Hanley). So that, in the aggregate, the Unionists, in 41 contests, improved their position, as compared with the Liberals, by 35,813 votes. The figures showing the differences from the previous pollings (and including Bow & Bromley) are given in Table C.

Table B. Seats Representing Party Gains at General Election of December 1910

<i>By Ministerialists (29)</i>	<i>By Unionists (27)</i>	
Bedford.	Ashton-under-Lyne.

b. Reversed at by-election after petition.	d. Reversed subsequently on recount.	f. From Labour.

The Ministerialists, while representing a good many different shades of opinion, included a number of men of marked individual ability and parliamentary influence.

Leading men of the coalition. In the Cabinet, Mr. Asquith¹ (Prime Minister; b. 1852), Mr. Lloyd George² (Chancellor of the Exchequer; b. 1863), Mr. Winston Churchill³ (Home Secretary from Feb. 1910 till Oct. 1911, and then First Lord of the Admiralty; b. 1874), Sir E. Grey⁴ (Foreign Secretary since 1905; b. 1862), and Mr. R. B. Haldane,⁵ who was created a Peer as Viscount Haldane in March 1911 (War Minister from 1905 till July 1912, and then Lord Chancellor; b. 1856), stood out first and foremost in dominating the manoeuvres of the party. Mr. Asquith, Sir E. Grey, and Mr. Haldane, with Lord Crewe (Sec. of State for India since Nov. 1910), Lord Morley (Lord President of his Council since Nov. 1910) and Lord Chancellor Loreburn (who occupied the Wool-sack till July 1912) in the Upper House, gave a solidity to the Liberal counsels which was matched with the adventurous electioneering policy carried on by Mr. Lloyd George and Mr. Churchill along paths of their own.

†No Labour candidate at last general election.

*Unionist gain from Liberal.

(a) No Unionist candidate. Ind. candidate polled 2,913 votes.

(b) Liberal gain from Labour

(c) Socialist candidate polled 134 votes.

(d) No contest in December 1910. Figures compared with January 1910.

(e) Independent Socialist and Woman's Suffrage candidate polled 3,291, or 1,024 less than he had polled in December 1910 when standing as a Socialist member of the Labour party with official Liberal support.

Behind them in the House of Commons the most prominent members of the Ministry holding major offices were: Mr. Birrell¹ (Irish Secretary since 1907; b. 1850); Mr. John Burns² (President Local Government Board since 1905; b. 1858), Mr. Sydney Buxton (President Board of Trade since Feb. 1910; Postmaster-general 1905-1910; b. 1853);

¹ E. B. iii, 989.

² *Ibid.*, iv, 855.

Mr. L. V. Harcourt¹ (Colonial Secretary since Nov. 1910; b. 1863); Mr. Reginald McKenna (First Lord of the Admiralty from 1908 till Oct. 1911, and then Home Secretary; b. 1863); Mr. J. A. Pease (Chancellor of the Duchy of Lancaster from 1910 till October 1911, then Education Minister; formerly Chief Whip 1908-1910; b. 1860); Mr. Walter Runciman (Education Minister from 1908 till Oct. 1911, then President Board of Agriculture; b. 1870); and Mr. Herbert Samuel (Postmaster General; previously Chancellor of the Duchy, 1909-Feb. 1910; b. 1870). Mr. Charles Hobhouse (b. 1862), who was Financial Secretary to the Treasury from 1908 to October 1911, then became Chancellor of the Duchy of Lancaster; Colonel John Seely (b. 1868), who, having seceded from the Unionist party with Mr. Churchill, was Under-Secretary first for the Colonies (1908-March 1911) and then for War, succeeded Lord Haldane as War Minister in July 1912; and Mr. T. M'Kinnon Wood (b. 1855), formerly Progressive Leader on the London County Council, having been Under-Secretary for Education (1908), Under-Secretary for Foreign Affairs (1908-Oct. 1911) and then Financial Secretary to the Treasury, became Secretary for Scotland in succession to Lord Pentland (who resigned and was appointed Governor of Madras) in 1912; while Sir Rufus Isaacs (Attorney-General since March 1910; b. 1860) was included in the Cabinet of 1912. Sir John Simon (Solicitor-General since Mar. 1910; b. 1873) had also come to the front as a politician of marked capacity.

Minor offices were filled by Mr. C. F. G. Masterman (Under-Secretary for Home Office since 1909; b. 1873), Mr. E. S. Montagu (Under-Secretary for India since Feb. 1910; b. 1879), Dr. T. J. Macnamara (Financial Secretary for the Admiralty since 1908; b. 1861), Mr. F. D. Acland (Under-Secretary for Foreign Affairs from Oct. 1911; previously Financial Secretary to War Office 1908-Feb. 1910; b. 1874), Mr. J. M. Robertson (b. 1856; Under-Secretary for the Board of Trade from Oct. 1911, in succession to Mr. H. J. Tennant, b. 1865, appointed Financial Secretary for War), Mr. C. Trevelyan (Under-Secretary for Education since 1908; b. 1870), Mr. G. Lambert (Civil Lord of the Admiralty since 1905; b. 1866), and Mr. J. Herbert Lewis (Under-Secretary to Local Government Board since 1909; b. 1858). The Master of Elibank (b. 1870) was a popular and efficient Chief Whip (since Feb. 1910), and among the Junior Whips were Mr. P. H. Illingworth (his successor in August 1912; b. 1869), Mr. W. W. Benn (b. 1877), Mr. Gulland (b. 1864), and the Hon. F. E. Guest (b. 1875).

Among the Liberal rank and file the men who figured most prominently in independent initiative or criticism were Sir A. Mond (b. 1868), Mr. Chiozza Money (b. 1870), Mr. J. C. Wedgwood (b. 1872), Mr. P. Morrell (b. 1870), Mr. Ellis Griffith (b. 1860), Mr. A. Ponsonby (b. 1871), Mr. R. Harcourt (b. 1878), the Hon. Neil Primrose² (b. 1882), Mr. E. Crawshay-Williams (b. 1879), Mr. J. F. L. Brunner (b. 1865), Mr. Silvester Horne (the well-known Nonconformist minister; b. 1865), Mr. A. J. Sherwell (b. 1863), Sir A. B. Markham (b. 1866), Sir W. P. Byles (b. 1839), Sir J. H. Yoxall (b. 1857), and Mr. T. Lough (Secretary to the Board of Education, 1905-8; b. 1850); while Mr. Horatio Bottomley (b. 1860), elected as a Liberal, but acting as an independent critic of an "unbusinesslike" parliamentary *régime*, pursued an impracticable but lively career until he resigned, having become a bankrupt, in 1912.

Among the Labour party, led by Mr. J. Ramsay Macdonald (b. 1866), the most notable figures were Mr. J. Keir Hardie (b. 1856), Mr. G. N. Barnes (b. 1859), Mr. W. Crooks (b. 1852), Mr. Philip Snowden (b. 1864), Mr. G. Lansbury (b. 1859), Mr. W. Thorne (b. 1857), Mr. F. W. Jowett (b. 1864), Mr. C. W. Bowerman (b. 1851), Mr. W. Brace (b. 1865), and Mr. W. E. Harvey (b. 1852).

Mr. John Redmond³ (b. 1851), as leader of the Irish Nationalists, found his most effective parliamentary support in Mr. John Dillon⁴ (b. 1851), Mr. J. G. Swift MacNeill (b. 1849), and Mr. T. P. O'Connor (b. 1848), though Mr. Joseph Devlin (b. 1872) was an even more active force in the organisation of the party; Mr. William O'Brien (b. 1852), and Mr. T. M. Healy (b. 1855), meanwhile providing independent criticism from

¹ *E. B.* xii, 940.

² *Ibid.*, xxiii, 734.

Digitized by *M. J. B.*, xxii, 968.

⁴ *Ibid.*, viii, 273.

the point of view of Irish Nationalists who were not satisfied that all was well with the Government policy.

In the Upper House Liberalism had but a small following, but was actively represented under Lord Crewe's leadership, by Lord Morley,² Lord Loreburn (Lord Chancellor since 1905; formerly, as Sir Robert Reid, Attorney-General 1894, and M.P. since 1886; b. 1846), Lord Pentland (Secretary for Scotland, 1905-1912; till 1909, as Capt. John Sinclair, M.P. for Fortarshire; b. 1869), Lord Beauchamp (Lord Pres. of Council June-Nov. 1910, then First Commissioner of Works; b. 1872), Lord Burghclere (formerly, as Mr. Herbert Gardner M.P., Pres. of Bd. of Agriculture, 1892-1895; b. 1847), Lord Lucas (Under-Sec. for Colonies March-Oct. 1911, then Sec. for Agriculture; b. 1876), Lord Welby (till 1894 the chief official of the Treasury; b. 1832), Lord Sheffield³ (b. 1839), Lord Weardale (till 1905 Mr. Philip Stanhope, M.P.; b. 1847), Lord St. Davids (till 1908 Mr. J. W. Philipps, M.P.; b. 1860), and Lord Ashby St. Ledgers (till 1910 Capt. the Hon. Ivor Guest, M.P., eldest son of Lord Wimborne; b. 1873). Lord Rosebery⁴ (b. 1848), continued to plough a lonely furrow, and Lord Courtney of Penwith⁵ (b. 1832), to play the part of a political Aristides. In 1911 the Liberal Peers were reinforced by the elevation of Lord Haldane in March, and of Mr. Alfred Emmott as Lord Emmott (b. 1858; Chairman of Committees in the Commons since 1906) in October, the latter being appointed Under-Secretary for the Colonies.

On the Unionist side, Mr. Balfour⁶ (b. 1848) had no rival as a parliamentary figure, but the party was sore with unsuccess, and the personal affection and admiration with which he was regarded were balanced by misgivings among the rank and file and in the country as to his capacity to lead them out of it. No other *Leading men on the Unionist side.* Unionist leader however was prepared to be put in competition with him, and he was loyally supported in the House of Commons by ex-Ministers in Mr. Austen Chamberlain⁷ (b. 1863), Mr. Walter Long⁸ (b. 1854), Mr. Bonar Law (b. 1858), Mr. H. Chaplin⁹ (b. 1841), Mr. G. Wyndham¹⁰ (b. 1863), Mr. A. Lyttelton¹¹ (b. 1857), Sir R. B. Finlay (b. 1842; formerly Attorney-General), Sir E. Carson (ex-Solicitor-General, and leader of the Irish Unionists; b. 1854), Sir W. R. Anson¹² (b. 1843), Mr. J. H. Campbell (formerly Solicitor-General for Ireland; b. 1851), Mr. E. G. Pretyman (who had come prominently forward in 1909 as a critic of the new land taxes; b. 1859), and Mr. W. Hayes Fisher (fresh from leading the Unionists or "Municipal Reformers" on the London County Council; b. 1853).

In Mr. F. E. Smith, K.C. (b. 1872), who had made a rapid and brilliant success both at the Bar and in politics, the party had an indefatigable worker and an audacious orator, now taking a place in the front rank corresponding more or less to that of Mr. Churchill on the other side; and a variety of political talent or experience was actively represented by Sir F. G. Banbury (b. 1850), Mr. G. Cave (b. 1856), Mr. H. E. Duke (b. 1855), Mr. J. G. Butcher (b. 1852), Sir Gilbert Parker¹³ (b. 1862), Mr. Charles Bathurst (b. 1867), Mr. A. H. Lee (b. 1868), Lord Hugh Cecil¹⁴ (b. 1869), Lord Charles Beresford (b. 1846), Mr. E. A. Goulding (b. 1863), Sir A. Griffith-Boscawen (b. 1865), Mr. H. Stavelly Hill (b. 1865), Mr. J. W. Hills (b. 1867), Mr. H. J. Mackinder (b. 1861), Mr. F. Cassel (b. 1869), Mr. B. E. Peto (b. 1862), Mr. L. Worthington Evans (b. 1868), Mr. H. Page Croft (b. 1881), Mr. George Sandys (b. 1875), Major Archer Shee (b. 1873), Mr. A. Burgoyne (b. 1880), Mr. W. Ormsby-Gore (b. 1885), Mr. W. W. Astor (b. 1879), Lord Winterton (b. 1883), Lord Castlereagh (b. 1878), Lord Ronaldshay (b. 1876), Lord Tullibardine (b. 1871), Lord Wolmer (b. 1887), and Lord Helmsley (b. 1887). The Irish Unionists included Mr. W. Moore (b. 1864), Sir J. B. Lonsdale (b. 1849), Capt. J. Craig (b. 1871), and Mr. W. Mitchell Thompson (b. 1877).

With Sir Alexander Acland-Hood (b. 1854) as Chief Whip—retiring with a peerage as Lord St. Audries in 1911—were principally associated Lord Balcarras (b. 1871), who

succeeded him in the post, Mr. H. W. Forster (b. 1866), and Mr. H. Pike Pease (b. 1867); and as the result of a rearrangement of the machinery of the Conservative Central Office in 1911 (carried still further by the fusion in 1912 of the Conservative and Liberal Unionist organisations under Mr. John Boraston as "Chief Agent"),¹ Mr. A. H. Steel Maitland, M.P. (b. 1876) was made "Chief Organizer" of the party, independently of the work of parliamentary "whipping."²

In the House of Lords Lord Lansdowne³ (b. 1845) was the recognised Unionist leader, actively supported by such ex-Ministers as Lord Halsbury⁴ (b. 1825), Lord Londonderry⁵ (b. 1852), Lord Curzon⁶ (b. 1859), Lord Midleton⁷ (b. 1856), Lord Selborne⁸ (b. 1859), Lord Cawdor (1847-1911; First Lord of the Admiralty 1905), Lord Salisbury⁹ (b. 1861), Lord St. Aldwyn¹⁰ (b. 1837), Lord Balfour of Burleigh¹¹ (b. 1849), Lord Amptill¹² (b. 1869), Lord Derby¹³ (b. 1865), Lord Onslow¹⁴ (1854-1911), and the Dukes of Norfolk¹⁵ (b. 1847) and Marlborough¹⁶ (b. 1871; formerly Colonial Under-Secretary). Lord Avebury¹⁷ (b. 1834), Lord Cromer¹⁸ (b. 1841), and Lord Milner¹⁹ (b. 1854), were other important figures on the same side; and among Unionist peers of marked political talent and influence were Lord Ridley (b. 1874; Chairman of the Tariff Reform League), Lord Malmesbury²⁰ (b. 1872), Lord Willoughby de Broke²¹ (b. 1860), and Lord Newton (b. 1857).

Among the members who were returned to the new House of Commons subsequently to the general election, the most notable personalities on the Liberal side were Baron de Forest (b. 1879) for North-West Ham (July 1911), Mr. W. G. C. Gladstone (b. 1885) for Kilmarnock Burghs (Sept. 1911), Mr. S. O. Buckmaster (b. 1861) for the Keighley division of Yorks (Oct. 1911), Mr. Hemmerde (b. 1871) for North-West Norfolk (May 1912), and Mr. R. L. Outhwaite (b. 1869) for Hanley (July 1912); in the Ministry itself Mr. C. F. Masterman (b. 1873) was returned in July 1911 for South-West Bethel Green, after being unseated on petition for North-West Ham. On the Unionist side, the ablest of the Tariff Reform leaders, Mr. Bonar Law, who had been defeated for North-West Manchester at the general election, was returned for Bootle in March 1911; and other important additions to the Parliamentary *personnel* were represented by the return of Sir J. Larmor (b. 1837) for Cambridge University (Feb. 1911), Mr. W. Joynson-Hicks (b. 1865) for Brentford, Mr. L. S. Amery (b. 1873) for South Birmingham, Mr. Ronald McNeill (b. 1861) for the St. Augustine's division of Kent (July 1911), Lord Robert Cecil (b. 1864) for Hitchin (Nov. 1911), and Mr. W. A. S. Hewins (b. 1865) for Hereford (March 8, 1912). Mr. T. M. Healy, defeated as an Independent Irish Nationalist at the general election, was in July 1911 provided with a seat for North-East Cork, by the retirement of Mr. Moreton Frewen.

The Unionists were now united, after all the troubles over the Tariff Reform movement which started in 1903, by the common bond of resistance to the Radical-Socialist programme of their opponents. The Unionist Free Traders had been compelled by the course of events,—especially as in their opinion the Liberal

Government had under Mr. Lloyd George's guidance pursued an economic policy disastrous to the essentials of Free Trade,—to accept the fact that Tariff Reform and Colonial Preference now stood officially in the forefront of the constructive programme of the party. In the House of Commons itself, when it met in February 1911, Lord Hugh Cecil remained solitary as an Unionist Free Trader, in the peculiar conditions attaching to his seat for Oxford University. The precise form which the Tariff Reform policy would take if the party were returned to power,—whether the "food taxes"

¹ Mr. Percival Hughes, who had been "Chief Agent" on the Conservative side since 1907, resigned in January 1912. Mr. Boraston had been Liberal Unionist "Chief Agent" for some years.

could be modified or dropped, whether the idea of a Referendum should be persisted in,—was debated in some quarters, according to varieties of opinion on electioneering tactics; but it was sufficient for the moment for those Unionist politicians who had opposed it altogether, or still wavered as to details, to wait events. The solidarity of the party in opposition, in the immediate crisis, was of more immediate importance. On the other hand, while recognising this fact, the convinced Tariff Reformers were satisfied, from their point of view, with the progress of their movement. The party leaders and the party organisation were now identified with the whole policy, and its acceptance by Unionist candidates was therefore a matter of party loyalty. In the constituencies it was making continued headway, the winning back of eight seats in Lancashire at the general election indicating that an impression was being made on the industrial North of England. Above all, the general idea inspiring Mr. Joseph Chamberlain's proposals,—the federalisation of the British Empire and its closer union for fiscal as well as other purposes,—was taking more definite shape in the common political consciousness. While a protective national economic policy was advocated by the Tariff Reformers as an essential condition of the improvement of industrial and social conditions at home,—and on those lines they were prepared to go considerable lengths to meet the demands of Labour,—its most active supporters had always in their mind its bearing on the policy of Imperialism. Faced with the inevitability of large constitutional and social reforms, a new constructive spirit had come to dominate the party, changing the whole outlook for democratic Conservatism, under the guidance of this vision of systematised Imperial unity. Fighting as they must to defeat the Coalition Government if possible, in order to preserve the integrity of the Imperial Parliament, menaced by Irish Home Rule, and the check of an effective Second Chamber upon Radical-Socialist legislation, put in jeopardy by the Parliament Bill, the most influential Unionist politicians and publicists were looking anxiously to the wider Imperial issues beyond the solution of immediate domestic problems. It would be unjust to the more Imperially minded individuals on the Liberal side to claim a monopoly in this respect for the Tariff Reform Unionists, but Liberal and Labour politicians and publicists were naturally engrossed with the purely domestic issues represented in their own party programmes. It was the predominant characteristic of all the Unionist activity, both at this stage and afterwards, that it centred round the Imperialist policy which was the end in view. The immediate danger to the cause of Imperial commercial unity which was threatened by the reciprocity treaty between Canada and the United States was therefore a matter of special concern, hailed as it was on the Liberal side as according with the Free-Trade fiscal policy. Grave as the position was for Conservatism and Unionism in English parliamentary politics, in Imperial politics as viewed by supporters of Tariff Reform and Colonial Preference this seemed even a more momentous development. Meanwhile hopes were still entertained that, either by agreement between the parties or through the failure of the Ministry to obtain the King's consent to actual coercion of the House of Lords, the immediate constitutional crisis might be solved or the Government forced to resign or once more dissolve in circumstances more favourable than before to a Unionist success at the polls. After the last two elections further defence of an unreformed House of Lords was out of the question.

It was clear from the first that the Government could rely on the support of the Irish Nationalist party. The passing of the Parliament Bill was an essential preliminary to the successful accomplishment of Home Rule, and it had been Mr. Redmond's policy ever since the elections of January 1910 to press the destruction of the peers' veto to its final issue for that purpose. The only doubtful element in the coalition was the Labour party,¹ whose parliamentary independence—partly as directly representing the Socialist movement, partly as representing the economic policy of the trade unions, and partly as advocating equally against Tory or Liberal "capitalists" and against the whole public of "consumers" the claims of the wage-earning classes as such,—was shown in the promotion of third-party candi-

¹ See *E. B.* xvi, 28.

dates at some of the by-elections. Its parliamentary programme included a "Right to Work" Bill which the Liberal party could no more support than the Unionist, whatever individual members of either might do; and at the present moment, having successfully extorted the Trade Disputes Act from parliament in 1906, it was set on obtaining from the Government a bill for reversing the "Osborne judgment,"² and freeing the employment of trade union funds for political purposes. The fact however that the "independence" of the Labour party was dominated by reluctance to put Liberalism in a minority, in so far as it stood for causes with which the Labour party also identified itself,—Free Trade, the Parliament Bill, Irish Home Rule and Welsh Disestablishment,—made its parliamentary position more or less of a sham, and one over the manoeuvring of which the Government's Whips had the upper hand. The result was that the idea which had begun to prevail in 1906 that the power of the Labour party in Parliament (as distinct from the Labour "movement" outside) was likely to have a rapid growth was considerably modified. The industrial troubles of 1911 and 1912, notably the railway strike, the coal strike, and the London dock strike (see IV below), were seen to be beyond their guidance or control,—they were indeed largely the consequence of a widespread feeling, shown in outbreaks of "syndicalism," that the Labour members in parliament were impotent, because their action was subject to their maintaining the Liberal Government in power. Moreover the wind was taken out of their sails by the extreme radicalism of Mr. Lloyd George and other Liberal electioneers, whose object naturally was to show that Liberalism could do all that Labour wanted. On the other hand, a considerable section of the Liberal party was either apprehensive of the alliance of Labour and Socialism or jealous of surrendering to the Labour party seats which were considered to be within the Liberal preserve. Between the claims of Liberalism and Labour, the Liberal party managers were unable to avoid friction in the constituencies as this situation developed; and though the Whips kept a majority for the Government together against every sort of Unionist attack up to the adjournment of Parliament in August 1912, the possibilities of a serious breach between Liberalism and Labour were towards the end of that period clearly shown in the by-election at Hanley (July 13th), where a Liberal displaced a Labour member, followed by that at Crewe (July 26th), where the Unionist candidate was returned in a three-cornered fight, and still further in the rivalry of Labour and Liberal candidates for Midlothian (Sept. 10th), resulting in a Unionist victory. In this last instance the local Liberals flatly declined to accept the Master of Elibank's suggestion—made just when he was retiring from the post of Chief Government Whip and was taking a peerage as Lord Murray,—that they should support the Labour nominee. But this particular weakness within the Coalition majority was of no advantage to the Unionists while the Parliament Bill was still under discussion. For their immediate purposes in 1911 the Government had complete control of the parliamentary machine when they started afresh after the general election, and they went "full steam ahead."

On February 6, 1911, the first Parliament of George V was opened, and its preliminary stages in the way of amendments to the address were soon over. On February 9th, an Opposition Tariff Reform amendment, moved by Mr. Austen Chamberlain, was defeated by 102 votes, and on February 15th, an anti-Home Rule amendment was defeated by 113. On February 21st, the Parliament Bill² was reintroduced in the House of Commons, and had a first-reading majority of 124 next day; and the second reading, moved on February 27th, was carried by a majority of 125 on March 2d. The Committee stage lasted from April 3d, with an interval for Easter from the 12th to the 18th, till May 3d; on May 8th, Mr. Asquith carried a motion to devote only four more parliamentary days to the Bill, and on the 15th the third reading was carried by a majority of 362 to 241, and the Bill was sent up to the House of Lords. A few trivial changes had been accepted in its wording, but all the substantial amendments proposed by the Opposition had been negatived; and the one attempt from within the Coalition to modify the Bill—a Labour party amendment

The Parliament Bill in the House of Commons.

¹ E. B. xxvii, 143.

² *Ibid.*, xx, 846, 847.

to omit the words in the preamble, pledging the Government to set up a reformed Second Chamber at all,—was rejected (May 2d) by 218 to 47, Mr. Asquith declaring that the Government regarded it as an obligation, if time permitted, to propose a scheme for reconstituting the Upper House within the lifetime of the existing Parliament. This and other similar assurances subsequently gave occasion for passionate accusations of breach of faith from the Opposition, when in 1912 the Government proceeded with their legislative programme and left the reform of the House of Lords alone.

Every attempt of the Opposition to modify the operation of the Parliament Bill was met by dogged resistance. In the view of the Government it was a simple measure for destroying a veto upon the deliberate demands of the elected House, and therefore of the people, which had been shown to be inconsistent with modern parliamentary government, and for making impossible another rejection of a Budget; it gave statutory validity to what in their opinion was in any case the constitutional theory and practice, and was the minimum that the Liberal party could accept in the shape of fair play for their measures. The principal demand of the Opposition, put forward in a number of different amendments, that important new measures, especially constitutional changes like Irish Home Rule, should not become law, if rejected by the House of Lords, until they had been submitted to the judgment of the country either by a special Referendum or at a general election, was of no avail. The Coalition, by its very composition, was in office, as the Opposition were only too well aware, in order to try to pass Home Rule in spite of the Unionist majority in the House of Lords. This was the essence of the political situation, and no arguments, however excellent, about the "horrid arbitrariness" of a House of Commons and its not really having the voice of the people behind it for such measures, were likely to be listened to. The Government's reply was that the country, in giving them a majority for the Parliament Bill, knew quite well what it would be used for, and that the two years' interval it allowed for delay, in which the feeling of the country would have scope for expression, was an ample safeguard against the passing of legislation to which the people were really opposed.

Meanwhile the alternative policy of the Unionist party was being made clearer in the more congenial atmosphere of the Upper House. On February 22d Lord Lansdowne gave notice of a Bill for reforming its constitution, which was read a first time on May 8th and a second time on May 22d. The whole principle of this scheme of reform was that, while the composition of the Upper House would be changed and put on a representative basis, in accordance with the policy of Lord Rosebery's resolutions in 1910,¹ its powers would remain as they were. Under it, the reconstituted House would consist (except for Royal Princes) of "Lords of Parliament," summoned as such and not because of any hereditary title; 100 would be elected by the hereditary peers from such among their number as were qualified, under a schedule to the Bill, by having held various public positions or ranks in the public services; 120 would be elected to represent different districts of the United Kingdom by colleges of electors consisting of the members of the House of Commons for the constituencies within those districts; 100 would be appointed by the Crown (*i.e.* the Ministry) so as to represent the proportional strength of parties in the House of Commons; 7 would be "spiritual Lords," *i.e.* the two archbishops and 5 bishops to be elected by the Anglican Episcopate; and 16 would be peers who had held high judicial office. Except for the law lords, who would sit for life, and the spiritual lords who would sit while they occupied their sees, the lords of parliament would sit for twelve years, subject to one-fourth in each class (selected by ballot) retiring every third year. Peers who were not "lords of parliament" would be eligible for the House of Commons, but the creation of new hereditary peerages for commoners other than past or present Cabinet ministers was to be limited to five a year. In Lord Lansdowne's view, such a reform of the constitution of the Upper House, which followed on the lines of suggestions already thrown out by Lord Curzon and Lord Selborne, would provide a representative Senate, of which the existing Unionist party preponderance would no longer be characteristic.

¹ *E. B.* xx, 847.

The second reading of the Bill was begun on May 15th, and on May 22d was carried without a division after debates which had disclosed considerable differences of opinion on the Unionist side. It was then quietly put on the shelf. The fact was that, as long as the Government flatly declined to accept any reconstruction of the Upper House as a substitute for the Parliament Bill, any such proposals were mere beating of the air. The actual scheme excited no particular interest on the Unionist side, and was assailed by Liberals on the ground that, according to their calculations, while pretending to be representative, it would simply stereotype a Tory majority. It was a well-meant effort on the part of the Unionist leaders to show that a basis existed for agreement between the parties, so far as concerned the willingness of the House of Lords to accept reforms; but a good many Unionists, and a good many peers, thought that it was a mistake in tactics. On the day after it was read a second time, the second reading of the Parliament Bill was taken (May 23d), and the real issue had to be faced; but the approach of the Coronation, and the prevalence of a feeling that, in spite of bellicose utterances in the Liberal Press as to the creation of 500 new peers for swamping opposition, the Government might still be forced to a compromise and could not possibly pursue their demands to the bitter end, made the debate still only a manoeuvre for position, and Lord Lansdowne decided not to divide against the Bill but to propose amendments in Committee.

The real fight only began when the Coronation was over. The Committee stage of the Parliament Bill lasted from June 28th to July 6th, and, in spite of warnings from Lord Morley that the Government would refuse, in the House of Commons, to accept them, Lord Cromer's amendment (June 28th) substituting a Joint Committee for the Speaker in deciding what a "Money Bill" was, and Lord Lansdowne's amendment (July 5th), providing for a Referendum in specific cases of measures attacking the existence of the Crown, the Protestant succession, or the establishment of National Parliaments with legislative powers in Ireland, Scotland, Wales or England, were carried by large majorities. On July 20th the Bill, so amended, was read a third time without a division, Lord Lansdowne declaring that the principal amendments were "so essential that we should certainly not be prepared to recede from them so long as we remain free agents." Lord Halsbury went still further: "but for the existence of the amendments, he would have himself moved the rejection of the Bill on third reading, and unless those amendments were accepted in substance, in meaning, and in operation, he would never consent without a division to the passing of the Bill."

The next day the Government exploded their bombshell. It had been a complete mystery up to this moment whether Mr. Asquith had obtained from the King a definite assent to the use of the Royal Prerogative for creating peers in sufficient numbers to give a Government majority in the House of Lords, and the question whether such a course could possibly be resorted to had been freely discussed from the time when the Parliament Bill was first proposed. All doubts were now set at rest. On July 21st, a letter from Mr. Asquith to Mr. Balfour in the following terms, written the day before, was published:—

I think it courteous and right; before any public decisions are announced, to let you know how we regard the political situation. When the Parliament Bill, in the form which it has now assumed, returns to the House of Commons, we shall be compelled to ask that House to disagree with the Lords' amendments. In the circumstances, should the necessity arise, the Government will advise the King to exercise his prerogative to secure the passing into law of the Bill in substantially the same form in which it left the House of Commons, and His Majesty has been pleased to signify that he will consider it his duty to accept and act on that advice.

In the subsequent debates in both Houses of Parliament (Aug. 7th and 8th) on votes of censure moved by the Unionist leaders, the course taken by the Government was more fully explained, though with a decided economy of information, due to reluctance on both sides to bring the action of the Crown into political controversy. It appeared that the Cabinet had presented a Memorandum to the King on November 15, 1910, before the general election, as follows:—

His Majesty's ministers cannot take the responsibility of advising a dissolution unless

they may understand that in the event of the policy of the Government being approved by an adequate majority in the new House of Commons, His Majesty will be ready to exercise his constitutional powers, which may involve the prerogative of creating peers, if needed, to secure that effect shall be given to the decision of the country. His Majesty's ministers are fully alive to the importance of keeping the name of the King out of the sphere of party and electoral controversy. They take upon themselves, as is their duty, the entire and exclusive responsibility for the policy which they will place before the electorate. His Majesty will doubtless agree that it would be inadvisable in the interests of the State that any communication of the intentions of the Crown should be made public unless and until the actual occasion should arise.

The King had felt that he had no alternative except to assent, though he did so, as Lord Crewe now stated (as was understood) on his behalf, "with natural and legitimate reluctance." The Government, according to their own view, had hoped that, as the result of the general election, the Parliament Bill would be allowed to pass without amendments which would be fatal to its purpose, and therefore without a disclosure of the confidential understanding which all the time existed as to the use of the Prerogative, but this was no longer possible; and the only question now was whether the threat was to be sufficient by itself, or whether, by continued resistance, the Government should be forced to carry it into effect.

On this point a serious division of opinion at once was shown in the Unionist party. It was clear that, in the House of Commons, the Lords' amendments would be summarily rejected by the Coalition majority, and any further development of the political crisis depended on what would happen in the House of Lords when the Bill was sent back to it. A hurried meeting of Unionist Peers was held immediately (July 21st) at Lansdowne House, at which Lord Lansdowne informed them that the Government had told the Opposition leaders that their intention was not to send the Bill up from the House of Commons unless an assurance was given that it would be passed, the assumption being that, failing this assurance, peers would at once be created in sufficient numbers for the purpose; and it was freely stated in the Liberal Press that the Government Whips had a list ready of persons who were prepared to accept peerages on condition that they voted for the Liberal programme. A state of extreme exasperation prevailed, but a considerable majority of Unionist peers agreed with Lord Lansdowne's view that, if this creation of peers was proceeded with, not only would the Parliament Bill be passed, but even such opportunities as it left open for subsequent resistance to Home Rule and similar measures would be nullified; the only prudent course, in the interest either of the Unionist party or of the peerage, was to sink further opposition, now that they were no longer "free agents." On the other hand a minority, whose view was strongly expressed by Lord Halsbury, the veteran ex-Lord Chancellor, bitterly opposed such a surrender; in their view they did not cease to be "free agents" until they were actually out-voted, and it was in this sense that they had understood Lord Lansdowne's use of the phrase on the third reading, and only on that condition that they had not rejected the Bill then; they still regarded the Government threat as a piece of bluff, which could not be carried into action; but even if it was not bluff, and a large number of new Liberal peers were actually created, such a violent course would bring ridicule and disaster on the Liberal party, and would make the country realise, as nothing else apparently could, the revolution that was contemplated. Moreover, from experience in the past, it was well within what might be expected that, when the 500 eligible magnates who were willing to take Liberal peerages had voted for the Parliament Bill, they would take a more independent view of their position so far as Home Rule and other measures were concerned. When the Government had finally shot their bolt, and by creating the new peers had reconstituted the existing House of Lords in such a way as to destroy the Liberal contention that it was simply a Tory preserve, it would, formally at all events, be actually strengthened as part of the constitutional machinery. It was impossible to suppose that, even in so wholesale a creation, the class of men whom Mr. Asquith was prepared to nominate for the purpose would be different from those who in recent years had been added, quite acceptably, to the House of Lords by Liberal initiation in considerable numbers, and who had in many cases come round there to a different

way of thinking.¹ A further argument was that if a creation of peers was avoided now, it would not prevent exactly the same situation arising if and when the House of Lords subsequently rejected a Home Rule Bill; the best thing therefore was to get the whole business over at once, and exhaust the credit which had been opened by the Ministry; matters had already gone too far for the House of Lords any longer to act as safeguard against single-chamber government.

Between these opposing views of the situation, a cleavage in the Unionist ranks was at once manifest, among the peers, the party in the House of Commons, the rank and file in the country, and in the Press. Mr. Balfour decided to "stand or fall" with Lord Lansdowne's advice, and they were followed by much the larger numbers; but public interest centred in the outcome of what was known as the "Die-Hard" movement, which was actively organised under Lord Halsbury's leadership and initiated at a largely attended and enthusiastic dinner in his honour at the Hotel Cecil on July 26th, at which Lord Selborne presided, supported by Lord Salisbury, Lord Milner, the Dukes of Northumberland, Marlborough, Bedford and Somerset, Mr. Austen Chamberlain, Mr. George Wyndham, Sir Edward Carson, Lord Hugh Cecil, Mr. F. E. Smith, Lord Willoughby de Broke, and other prominent men. How many peers would follow the lead given by Lord Halsbury and vote against the unamended Bill when it was again sent up was still uncertain, but as Lord Lansdowne and the bulk of those who accepted his advice were only prepared to desist from further opposition and would not assist the Government affirmatively by voting for a measure they detested just as much as the "Die-Hards," it was impossible for him to give Mr. Asquith the assurance he had demanded. A period of extreme tension and uncertainty followed. On July 24th, when Mr. Asquith was to move in the House of Commons that the Lords' amendments be disagreed with, he was howled down from the Unionist benches, amid a scene of great disorder in which Lord Hugh Cecil and Mr. F. E. Smith were specially prominent, and the Speaker was eventually obliged to adjourn the House; further disorder took place next day when Lord Hugh Cecil was howled down by the Ministerialists, and it was not till August 8th that, with Mr. Winston Churchill leading the House in the absence of Mr. Asquith, who was suffering from laryngitis, the motion for disagreeing with the Lords' amendments was carried by 321 to 215, after the Government had agreed to introduce a few minor changes. Meanwhile Mr. Balfour had endeavoured to placate the whole of the Unionist party by moving a vote of censure (Aug. 7th), which was rejected by 365 to 246, and in the House of Lords a similar vote of censure moved by Lord Curzon (Aug. 8th), was carried by 282 to 68; but the "Die-Hard" movement had gone on unflinchingly, and an active canvass had been in progress, both on the Unionist and the Liberal sides, with a view of ascertaining how the division might go if the Bill came again before the House of Lords under existing conditions.

The uncertainty whether the "Die-Hards" would outnumber the Liberal peers, if Lord Lansdowne's supporters simply abstained, as he advised them to do, made the situation very difficult, both for the Government and also for those Unionist peers who thought that a wholesale creation of new Liberal peerages would be worse even than the passing of the Bill without it. On the one hand, a considerable section of Radical opinion was in favour of settling the whole question, including the future of the Radical programme, by immediately making enough peers to ensure a Liberal majority; on the other, a section of Unionist peers, led by Lord Cromer and Lord St. Aldwyn, were considering whether, to avoid this, they should vote for the Bill, had as it was, while others, passionately resenting this suggestion, declared that if it were acted on they would desert Lord Lansdowne and join the "Die-Hards." Amid the confusion on both sides and the increasing bitterness of feeling among the Unionists, it was believed that Lord Knollys, the King's private secretary, who was in constant communication with Down-

¹ It is worth noting in this connection that between 1868 (when modern Liberalism and Conservatism practically started as organised parties) and October 1912, the new peerages created by Liberal Governments numbered 164 and those created by Conservative Governments 149. Mr. Asquith alone had created 52 new peers up to October 1912 since he became Premier in 1908. See also *E. B.* xxiii, 112.

ing Street, was counselling the avoidance of an extreme course as long as it could possibly be avoided, for the sake of the Crown.

On August 3d it was known that the Government meant to take the risk of sending the Bill up, without any actual assurance of the result, and the debate on the question of the Lords' acquiescing took place on August 9th and 10th. In answer to Lord Rosebery, Lord Morley made the precise statement that if the Bill was defeated "His Majesty would assent to a creation of peers sufficient in number to guard against any combination of the different parties in Opposition by which the Parliamentary Bill might again be exposed to defeat;" and this declaration had a marked effect on the result. Up to the last moment the figures on the two sides were in doubt, but the division showed 131 in favour of passing the Bill, and only 114 for insisting on the amendments, and the Government had won the day by the help of enough votes from peers who usually acted with the Opposition to counterbalance the "Die-Hards." Thirty-seven Unionist peers, the two archbishops, and eleven bishops, voted with the Liberals; but Lord Halsbury's followers were more than had been expected, several peers, including the Duke of Norfolk, joining them in protest against the action of the Unionists who helped to carry the Bill. Lord Cromer, who had been active in getting Unionist peers to support the Bill on the ground that only in this way could the damage likely to accrue from a creation of new peerages be avoided, was absent through illness; and Lord Curzon's was eventually the most powerful influence exerted in this direction, his action being all the more hateful to the "Die-Hards" because earlier in the year he had been specially prominent in counselling resistance to the Bill at all costs.

The Parliamentary Bill thus became an Act and duly received the Royal assent; and a statutory enactment defining the relations between the two Houses of Parliament was substituted for an unwritten British Constitution. As compared with the original form in which it was introduced,¹ various small drafting alterations were made, including an improved definition of a "Money Bill," and a more definite exclusion of Private Bills from the scope of the measure; but the only changes of any substantial importance were the following. (1) A provision by which

The Bill as passed.

the Speaker, before giving his certificate (to be endorsed on every Money Bill sent up to the House of Lords) that a Bill is a Money Bill, "shall consult, if practicable, two members to be appointed from the Chairman's panel at the beginning of such session by the Committee of Selection." This was the final result of various unsuccessful Unionist amendments for modifying the original provision by which the Speaker alone was to be the judge of whether a Bill was a Money Bill; in the House of Commons, Mr. Cave (April 8, 1911) had proposed that a Joint Committee of both Houses with the Speaker as Chairman should decide, and in the House of Lords (July 6th) Lord Peel's grave warning, as an ex-Speaker, against the danger of making the Speaker the sole arbiter, though unsuccessful in its support of Lord Cromer's proposal for a Joint Committee, induced the Government to move an amendment of their own, which, as amended by Mr. J. F. Hope from the Unionist side, was adopted on August 8th. (2) Provisions excluding from any Public Bills, as to which the Lords' consent would not be required after being sent up in three successive sessions, "a Bill containing any provision to extend the maximum duration of Parliament beyond five years" (an exclusion originally proposed unsuccessfully in the House of Commons by Mr. Cassel on April 20th, and carried in the House of Lords by Lord Avebury), and also "any Bill for confirming a Provisional Order." (3) A provision altering the limits of the two years which must have elapsed during the three successive sessions to "between the date of the second reading in the first of those sessions of the Bill in the House of Commons and the date on which it passes the House of Commons in the third of those sessions." This was a Government modification of a Unionist amendment proposed in the House of Commons by Mr. Goldman (May 1st). (4) A provision requiring a certificate signed by the Speaker, stating that the provisions of the Act in this respect had been complied with, to be endorsed on any Bill so presented to the King for his assent notwithstanding

¹ See *E. B.* xx, 846, 847.

the opposition of the House of Lords. (5) A provision that "in every Bill so presented to the King, the words of the enactment shall be as follows:—'Be it enacted by the King's most excellent Majesty, by and with the advice and consent of the Commons of this present Parliament assembled, in accordance with the provisions of the Parliament Act, and by authority of the same, as follows.'" This had substantially been proposed unsuccessfully in Unionist amendments, in the House of Commons by Mr. L. Hardy on May 1st, and in the House of Lords by Lord Camperdown on July 6th.

In all vital respects the Parliament Act remained as originally introduced in 1910. While its preamble declared that reform of the House of Lords itself still remained a task for the future, the supremacy of the House of Commons, both for purposes of finance and for public legislation, was definitely enacted. If the House of Lords obstructed and rejected the Bills passed by the Commons, it could now only do so for two years if the Commons persisted, and at the end of that time a Government in control of the Lower House could pass its measures into law with the Royal assent without the Upper House having any further voice in the matter. The power of forcing an appeal to the electorate, which the House of Lords had hitherto had for all practical purposes, unless a Bill they rejected was dropped, was taken away; and what was virtually single-chamber government was thus established. It became possible for the first time, without any parliamentary check on a party in power, to pass measures into law simply because a majority in the House of Commons (which might be quite unrepresentative of public opinion) could be secured for them. On the Liberal side it had been contended throughout that, when a Tory majority had control of the House of Commons, this was really the condition of affairs before, since the House of Lords always supported Tory measures; the cases however could only be considered parallel on the assumption that there was some fair correspondence in the character of the legislation proposed by the two sides when either was in power. While the Act, on the face of it, made the Government masters of the situation, it was recognised, on the other hand, by people who looked a little ahead, that in parliamentary practice it did not make things quite so easy. In order that its provisions should apply, to the extent of Bills becoming law over the resistance of the Lords, these Bills had to be sent up in time for two years to elapse during the same Parliament, and during these two years they had to be sent up again and again without being changed from their original form. As the duration of Parliament was cut down to five (practically four) years, this meant that nothing not sent up in the first year or two would benefit by the Act; and apart from that, it would be difficult to avoid changes in Bills sent up year after year. Even as regards "Money Bills" which the House of Lords was now to have no power of rejecting at all, the prospect was uncertain. The Budget of 1909, the rejection of which was the cause of the whole revolution, was probably considered a Money Bill by most Radical politicians; but the Speaker (Mr. J. W. Lowther) upset any such calculations in December 1911, by ruling, in answer to a question, that the Budget of that year was not a Money Bill within the Parliament Act—a *fortiori* therefore neither was that of 1909.

On the very day that saw the triumph of the Parliament Bill (Aug. 10th), yet another great alteration was being made in the essential conditions of parliamentary

life. Following an invitation already given by Mr. Lloyd George, a resolution was carried in the House of Commons, by 256 votes to 158, providing "for the payment of a salary at the rate of £400 a year to every member of the House, excluding any member who is for the time being in receipt of a salary as an officer of the House or as a minister, or as an officer of His Majesty's Household." Most of the Unionists were opposed to the proposal, and a good many Liberals did not like it, but the Government had determined to introduce payment of members as a way out of the difficulty they were in with the Labour party, owing to the Osborne Judgment having made illegal the payment of salaries to working-class members out of Trade Union funds.¹ To legislate in the way the Labour party demanded,

¹ *Ibid.*, xxvii, 143.

so as directly to reverse the Osborne Judgment, was impossible, though the Government was prepared with a Bill—unsatisfactory to the Labour party and not proceeded with, a second edition being introduced in 1912—for enabling Trade Unions to make special provision for voluntary political funds, separately from the general funds to which every member of the Union had to contribute; but it was hoped that payment of all M.P.'s out of public money would do away with the particular grievance of the Labour members. This was not however in fact the result, and the demand for a complete legislative reversal of the Osborne Judgment persisted. In the country generally a good deal of disgust was felt at the calm way in which M.P.'s had voted themselves £400 a year, and a number of individual members, who were far too well-off to want the subsidy, did their best to refuse it. But the deed was done; provision was made in the Budget; and a new temptation was held out for the multiplication of parliamentary candidates among persons to whom £400 a year would be useful.

Meanwhile the National Insurance Bill, introduced by Mr. Lloyd George on May 4, 1911, had introduced new issues into the political conflict, even when the constitutional crisis was at its height. This elaborate measure, in 87 Clauses, covered two distinct subjects, one being National Health insurance, under newly constituted Insurance Commissioners for England, Wales, Scotland and Ireland (with a joint Committee, formed from among them, for adjusting common affairs), assisted in each case by an Advisory Committee, with County and County borough Committees for local administration, and the other Unemployment Insurance, directly under the Board of Trade. As the latter excited comparatively little criticism, it may be dealt with first.

(1) Unemployment Insurance, administered largely through the Labour Exchanges, was limited to begin with to certain trades—building, construction of works (railroads, dock, etc.), shipbuilding, mechanical engineering, ironfounding, construction of vehicles, and saw-milling—but with power for the Board of Trade to extend the scheme to others. Workmen in these trades (others than foremen, clerks, indentured apprentices, and persons under sixteen) would be entitled under various restrictions to unemployment benefit (up to a standard of 7 s. a week for not more than fifteen weeks a year, starting at the second week of unemployment), out of an Unemployment Fund formed by each workman compulsorily contributing 2½d. a week (paid by employer and deducted from wages), employers 2½d. a week per man, and the State adding an amount equal to a third of their total contribution.

(2) For National Health purposes, compulsory insurance was imposed on all persons (between 16 and 70) under contracts of service, with certain exceptions (including those employed otherwise than in manual labour, and paid over £160 a year, or possessing £26 a year from property), provision being also made for certain classes of employed persons not compulsorily insured to come into the scheme as voluntary contributors. Under the compulsory insurance (except for certain lower rates) male contributors were to pay 4d. a week, female 3d. (employers making the payments and deducting them from wages), and employers 3d. for each male or female employed (special stamps for each amount having to be affixed to cards for this purpose), the State adding to the National Health Insurance Fund so constituted an amount (two-ninths in the case of men, and a quarter in the case of women, of the cost of benefits and administration) which was reckoned to work out at 2d. a week per head. The benefits primarily secured were (1) free medical treatment at home, (2) sanatorium treatment for tuberculosis and other diseases specified by the Local Government Board, for which special arrangements were made, the Government allocating £1,500,000 for the building of sanatoria, (3) payment during sickness of 10s. a week for men and 7s. 6d. for women up to 26 weeks, (4) subsequent payment during disablement of 5s. a week, and (5) maternity bonus of 30s. to women (including wives of insured persons) on confinement; provisions being made for granting these benefits (medical attendance, sickness, and maternity benefits not till six months, disablement not till two years after payments started) or modifying and extending them as funds permitted. The agencies for

administering the benefits were made (1) "approved societies" *i.e.* the Friendly Societies, trade unions and such similar bodies as the Insurance Commissioners approved, the intention of the Government being to have as many as possible of the insured included as members of "approved societies," (2) the Post Offices, which would deal with those who would not join societies or whom societies would not admit, and who thus became "deposit contributors." The Local Health Committees, among their other duties (including the administration of sanatorium benefit) were left to arrange for the service of medical practitioners for insured persons, preparing lists of doctors from among whom the patients were to have their own choice, payment to the doctors from the general fund being estimated for at the rate of 6s. (including cost of drugs) per head per annum. This feature of the Bill, as explained by Mr. Lloyd George, quickly aroused the opposition of the doctors, who were organised under the British Medical Association to refuse their services unless a larger payment was made; and as a body the doctors stood out for better terms, month after month going by without any settlement being arrived at, even after the Act came into operation. As medical "benefits" under the Act became due on January 15, 1913, it became a question for the Government whether, if no terms could be arranged, a regular State Medical Service would not have to be started; but this would take time to organise, and meanwhile it would be poor consolation to the prospective beneficiaries under the Act for the Government merely to hand them over the money proposed for the doctors and to leave them to make the best of it. On October 23, 1912, Mr. Lloyd George announced the Government's "final" offer to increase the capitation fee to 9s. (including drugs and extras), representing a further increase in the remuneration of doctors by £1,650,000; but on November 10th. the offer was rejected by an overwhelming majority of the profession at a representative meeting of the British Medical Association, and negotiations began again. (See below *ad fin.*)

The second reading of the Insurance Bill, debate on which began on May 24, 1911, was carried without a division on May 29th, and the Committee stage went on intermittently from July 5th to August 4th, when, with the discussion on the 17th clause finished, Mr. Lloyd George was still able to regard the Opposition as favourably disposed towards the Bill and co-operating, by useful criticism, in giving shape to what was necessarily a very complicated measure. Its remaining stages were then left over for the Autumn Session, which began on October 24th. But in the interval opposition had been growing, and the political situation in other respects was such that genuine co-operation with anything proposed by the Government was hardly possible if party capital could be made for the Unionists by what was unpopular in its programme. Not only were the doctors in full revolt against the terms the Bill proposed for their remuneration, but the working classes themselves were found to dislike exceedingly being taxed in such a direct way for benefits they were not able to appreciate. Mr. Lloyd George, ever an ardent electioneer, however sincere he might be as a social reformer, exasperated the Unionist party, sore enough already at his success with the Budget of 1909 and the electioneering use made of the grant of Old Age Pensions, by his description of the Bill as giving the working classes "ninepence for fourpence;" but there was no doubt about the fourpence being a first charge on wages, and the man who paid it was perhaps only providing ninepence for somebody else,—this being the essence of any insurance scheme,—and was not so much impressed by the prospect of benefits as by the compulsory character of the contributions. Among domestic servants the scheme was cordially disliked. Though the Bill was planned so as to involve financial co-operation between the State and the Friendly Societies, there was considerable uncertainty as to how far a great many of the latter, especially the smaller local societies, would reap advantage rather than loss. The whole scheme, in spite of the excellence of its intentions, was seen to raise a number of new social and economic problems, the solution of which nobody could foresee, either before it became law or afterwards; and public discussion concentrated on the difficulties and objections. It was inevitable therefore that, so far as the political

**Progress in
Parliament.**

aspects of the Bill were concerned, the attitude of the Opposition should be affected by the discovery of its wide unpopularity. They had originally welcomed it in principle, but they represented, for organised political purposes, a growing body of hostile criticism as to details, and criticism which, in the circumstances, was becoming more and more incompatible with parliamentary support.

The result was decidedly unfortunate for a scheme which aimed at accomplishing so important a work of social reform. The Government had its programme for 1912 full, subject to the way being cleared by the Parliament Act, by the political necessity of proceeding with Home Rule and Welsh Disestablishment; and Mr. Lloyd George, whose influence on the parliamentary tactics of the Coalition was now supreme, determined to force the Insurance Bill through before 1912 ended. When the House of Commons resumed on October 24th Mr. Asquith carried a time-table resolution for closing the remainder of its stages; and by this drastic method the Bill passed through Committee on November 21st and was read a third time on December 6th. Under such conditions the opportunity for effective Opposition criticism and amendment was so limited that very little was possible, in spite of the activity of Mr. Worthington Evans and other Unionist members, and towards the end it became a question whether the Unionist leaders would actually divide against the third reading, a course to which they were openly challenged by Mr. Lloyd George. Instead of this, an Opposition front bench amendment was moved by Mr. H. W. Forster, proposing that the Bill should be postponed for further discussion, and this was defeated by 320 to 223, the third reading then being carried in a division in which the Opposition as a whole took no part, 21 members recording their votes against it. On December 11th the Bill was read a second time in the House of Lords, and after various Government amendments had been inserted in Committee on December 14th it was passed and received the Royal assent next day when Parliament was prorogued.

During all this time, both inside and outside Parliament, opinion as to the scheme and its prospects had become more clearly crystallised. While Mr. Lloyd George and his supporters proclaimed it to be the most beneficial reform ever conceived in the interest of the working-classes, and taunted the Opposition with attempting to destroy it, the Unionists dwelt on the injury done by forcing through a measure which ought to have been more carefully considered before it became law, and threw the responsibility on the Liberal party for everything that was objectionable and unworkable in it. The by-elections showed that its unpopularity was continually growing; and under the arrangement made in the Act that the Insurance commissioners should during 1912 make regulations as to details, nobody knew yet what procedure would be adopted to overcome countless points of difficulty which under the Act itself remained quite unsettled. The medical profession, without whose co-operation, so far as could be seen, the Act would not work at all, continued to refuse it unless they were given better terms, to which Mr. Lloyd George was still unable to agree; "passive resistance" was being organised on their behalf by the British Medical Association, and threatened in various other directions. As time went on, the middle only grew worse, and when the Act came into effect in the autumn of 1912 most of its problems were still unsolved.

As a measure of social reform indeed the Insurance Act was undoubtedly one which ought to be of great value when in full operation; and, as usual in Great Britain, in spite of general discontent, most people combined to carry the Act out. Speaking on October 12, 1912, Mr. Lloyd George was able to boast that, whereas the original actuarial calculations led to the expectation that 12 million stamps on the average would be fixed to cards every week, this number had been regularly and continuously exceeded, and had that week reached over 15 million. In spite of all objections and much talk about resistance among employers and employed, though the benefits were not yet forthcoming and complete uncertainty existed as to the action of the medical profession, payment was being made for insuring between 13 and 14 millions of people against sickness and 2½ millions against unemployment. As a piece of Liberal electioneering,

on the other hand, despite desperate oratorical efforts on Mr. Lloyd George's part and assiduous lecturing by his emissaries throughout the country on its advantages to the working classes, it was for the present a complete failure; and its unpopularity became the most prominent feature in the political life of the country, with the result of a marked improvement in the Unionist position. During the debate on the address, early in 1912, the leader (Mr. Bonar Law) of the Unionist party, being asked in debate by Mr. Asquith whether he would repeal it if he came into office, hastily replied "Certainly!"—afterwards explaining that he meant "withdraw for amendment." It was considered at first by the Liberal Press (and even by many Unionists at the time) that he had made a *faux pas*; but as a matter of fact the unpopularity of the Act was such that the Liberals found it impossible to make any lasting capital out of the indiscretion.

Another piece of social legislation which caused considerable local irritation was the Shop Act, quickly passed in the autumn session, which many shopkeepers found to work very inconveniently. It limited the hours of shop assistants to 60 (with one half-holiday) a week, regulated the overtime permissible, and while providing for Sunday closing gave power to local authorities, with the approval of two-thirds of the shops affected, to decide the closing hours on other days.

The Shop Act, 1911.

It was, however, not only the stimulus given by the antagonism of the country to the Insurance Act that was causing a revival of Unionist confidence after the defeat over the Parliament Act. During the autumn session the Unionist party had started afresh under a new leader in the House of Commons. The

Mr. Balfour's resignation.

"Die-Hard" revolt had been a fresh illustration of the dissatisfaction within the party at the way it had been led by Mr. Balfour for some time past. If the Parliament Bill had actually been defeated in the House of Lords by the "Die-Hards" it was an open secret that both Lord Lansdowne and Mr. Balfour had intended to retire from their positions at the head of the party, and it was largely the dislike of acting disloyally by them that confined the open revolt to a comparatively small section. Exasperation at the result, however, was general; and though, when the crisis was over, Unionist concentration was obviously dictated by all the circumstances, Mr. Balfour's authority had been seriously shaken. He himself did his best to smooth matters over, declaring in a public speech (Haddington, Oct. 7th) that the question of the Peers' tactics was now a dead issue, of no more practical importance than the controversy as to the identity of Junius; and the "Die-Hards," though they started a Halsbury Club and kept their organisation in being, protested at the same time that the differences within the party were ended with the cause of them, and that they only meant to work for the common good. But after some weeks of reflection, when the hubbub was all over, Mr. Balfour made up his mind that the right moment had arrived for him to retire from the leadership, though not from Parliament, in view of the arduous political struggles still impending, and the unlikelihood of his being strong enough in health, should the Unionists again return to power, to conduct a Ministry. Since 1891 he had led his party in the House of Commons, and at sixty-three it was time for him to make way for others. It would be better, he thought, to get a new leader into harness at once, so that he might be ready for the responsibility of office. His announcement to this effect was made on November 8th, at a hastily convened meeting in the City of London, and he made it clear that the step was irrevocable. For a few days the question of who would succeed him was uncertain. Mr. Austen Chamberlain, not only as principal leader of the Tariff Reformers and one whose very name would, on his father's account, be most representative of the Imperialist movement, but as ex-Chancellor of the Exchequer and officially Mr. Balfour's deputy on the Opposition Front Bench, had apparently the strongest claim; but, as a Liberal Unionist, his selection was opposed by many Conservatives, who considered Mr. Walter Long a better choice; and Mr. Long's great popularity among all sections was much in his favour. It became clear to the partisans of both that if either were proposed, and votes were taken, it would only emphasise the division of opinion and create friction between their supporters, whereas unanimity was the first consideration.

It was found that Mr. Austen Chamberlain and Mr. Long were both prepared to stand aside in favour of Mr. Bonar Law,¹ nominally a Conservative and at the same time a strong Tariff Reformer; and on their joint proposal he was quickly adopted, as leader in the House of Commons (Lord Lansdowne continuing to be leader in the House of Lords), at a party meeting on November 13th. Their sacrifice of personal ambition to the party interest, and their loyal pledges of co-operation with the new leader, who himself enjoyed the admiration of all sections, set an example which did much to promote fresh confidence within the party; and Mr. Bonar Law had no sooner become leader than there were signs of improved Unionist prospects in the constituencies. In intellectual range, subtlety of exposition and criticism, and political experience, Mr. Balfour had, admittedly, no rival on either side, but he still remained in the fighting rank, ready to devote himself to the Unionist cause as much as anybody. His retirement from the formal responsibilities of leadership gave freer play to the respect and admiration felt for him personally as a public man, while relieving the party of the accumulation of doubt as to his policy and tactics, which, rightly or wrongly, had led to undercurrents of dissension. To the plain man his detached and philosophical outlook on public affairs had been rather too lofty; to be "had" or tricked, as the party was openly taunted by its opponents, over the Budget of 1909 or the Parliament Bill of 1911, simply meant that its leader had failed in astuteness; ardent Tariff Reformers, enthusiastic for Mr. Chamberlain's policy and pining for Mr. Chamberlain's aggressive tactics, felt that Mr. Balfour's balancing support of their proposals was unpractical and was confined to economic generalities. He was perhaps "too much of a gentleman" as well as "too little of a business man" for the situation. Mr. Bonar Law, on the other hand, was more of the Chamberlain type,—a successful man of business, the clearest and most convincing platform exponent of Tariff Reform, a speaker who was accustomed to calling a spade a spade. Though he had never sat in a Cabinet he had for several years been regarded by his party as one of their principal leaders. If Mr. Balfour, for his own reasons, had not decided to retire, it is certain that, however vocal the malcontents were,—and the *National Review* and *Morning Post* had for some time been in open mutiny,—the party as a whole, and all his colleagues, would have remained loyal to his leadership; but as things were, it is equally certain that the change was regarded on all sides as marking an epoch in the fortunes of the Unionist party. With the selection of Mr. Bonar Law to lead them in the House of Commons came a new spirit of hope and zeal. He made an excellent start with his first public speeches after becoming leader, notably with a general attack on the Government at the Albert Hall on January 26, 1912.

At the same time the result of the Canadian elections at the end of September, and the defeat of Sir Wilfrid Laurier's American Reciprocity proposals, had delighted the Unionists and given them fresh confidence for the future of Imperialism. Canada had shown that she meant to keep her place in the Empire, and that antagonism to the prospect of becoming simply an annexe to the United States was more powerful than the temptation to secure immediate commercial advantages from Reciprocity. Up to the last the result of the Canadian elections had been very uncertain, and the Tariff Reformers in England, who had been thoroughly depressed and disheartened by the idea that, if reciprocity between Canada and the United States were established, their hopes for Imperial commercial union would be frustrated, had in Mr. Borden's success a legitimate triumph for their own views of Imperial policy. Imperial patriotism in Canada had averted the greatest danger yet

**Reciprocity
in Canada.**

¹ The Rt. Hon. Andrew Bonar Law was born in New Brunswick, Canada, on September 16, 1858, his father being a Presbyterian minister, and his mother a native of Glasgow. He was sent to school in Glasgow, and went into the business of his mother's family there, William Kidston & Sons, iron merchants, from which he retired with a fortune. He entered Parliament for the Blackfriars division of Glasgow in 1900, but did not contest the seat in 1906, being then returned for Dulwich, where he sat till December 1910, when he stood unsuccessfully in Manchester. In March 1911 he was returned for Bootle. From 1902 to 1906 he was Under-Secretary for Trade.

threatened, in spite of the support given by the Liberal government at home and the British Ambassador at Washington. Every platform rang with Unionist rejoicings, and the Canadian victory put new heart into the Tariff Reform propaganda.

On yet another question of Imperial moment a rebuff was given to the Ministerial policy. Throughout 1911 the decision of the Government to ratify the Declaration of

The Naval Prize Bill. London had led to a prolonged agitation. Most of the Unionist party, together with a strong body of naval opinion, were actively opposed to it, their argument being that under its provisions the advantages of British supremacy at sea in war time would be seriously diminished. The Government succeeded however (June 1, 1911) in obtaining the support of the Imperial Conference, considerable weight attaching to Sir E. Grey's view that adhesion to the Declaration would be advantageous in Great Britain's foreign relations and to the cause of peace. As Parliament had no direct control over the action of the Government in the matter of ratification, political opposition centered on the Naval Prize Bill which was introduced to carry out the provisions of the Declaration of London, the second reading being taken on July 3d. So much headway was made in arousing antagonism to the Declaration itself that when the third reading of the Naval Prize Bill came on in the House of Commons on December 7th the Government only managed to get a majority of 47; and the House of Lords promptly rejected the Bill.

The Government were meanwhile being perpetually worn and worried by the militant agitation for Women's Suffrage and by the difficulty of dealing with any legisla-

The Franchise question. tion on the subject when the Cabinet was divided. The Prime Minister himself was avowedly opposed to Women's Suffrage altogether, and among other Ministers Lord Loreburn and Mr. Lewis Harcourt shared his

views. On the other hand, Mr. Lloyd George, while professing himself a strong supporter of the cause, which was also advocated by Sir. E. Grey and Lord Haldane, objected to any Bill which was not thoroughly "democratic;" and because the "militants" regarded his attitude as obstructing the particular measure which they had in view and held him responsible for a Government Bill not being introduced as they desired, he was pestered as much as if he had actually been an open opponent like Mr. Asquith. The so-called "Conciliation" Bill, introduced by Sir G. Kemp, which assimilated the parliamentary to the municipal franchise for women and would give votes to about a million, had been read a second time in the House of Commons on May 5, 1911, Mr. Asquith himself pairing against it while Mr. Lloyd George and other Ministers supported it; and as there was no time for proceeding with the Bill in 1911 the Government promised to give it "facilities" in the following year. But while the various sections of supporters of Women's Suffrage disputed about its prospects, and the "militants" raged together, Mr. Asquith suddenly gave a new turn on November 7th by announcing the intention of the Government to add to its programme a Franchise Reform Bill on the lines of Manhood Suffrage. In answer to a deputation of Woman Suffragists on November 17th he declared that, while he was personally opposed to Women's Suffrage altogether, this Bill would be so drawn as to admit of amendment to include women on certain terms; and if an amendment, which the Government as such would not oppose, were carried, the Government would then adopt it. They would also, as had been promised, give facilities for the Conciliation Bill.

It had been generally supposed that the Government would take advantage of the passing of the Parliament Act to reintroduce the Bill against Plural Voting which the Lords had rejected in 1906, but this larger measure was totally unexpected, and the announcement was widely construed simply as a device for "dishing" Women's Suffrage. It was at once denounced for that reason by the "militants," who began to make more trouble than ever. Their proceedings are chronicled elsewhere. So far as Parliament is concerned it is sufficient here to note that from this moment the internal divisions within the Cabinet on the subject of Women's Suffrage, and the necessity of taking administrative action against "militant" violence, remained a source of constant difficulty. When eventually, on March 28, 1912, the Conciliation Bill was rejected

by 222 to 208, owing to disgust at "militant" tactics, the prospect of legislative action rested entirely with the question of an amendment of the Government Franchise Bill, which was read a first time on June 17, 1912, by 274 to 50, and a second time on July 12th, by 290 to 218. In other respects this Bill, which abolished plural voting and University representation, made six months' residence by adult males the only qualification for votes, and did away with existing restrictions as to registration, handing it over for automatic action by the Municipal Authorities, excited comparatively little public interest. There did not seem likely to be time, even if there were inclination, to pass it into law before the session ended. The Unionists, while objecting to details, opposed it mainly on the old ground that Redistribution should accompany Reform; while the Liberal rank and file, who for their own electioneering purposes were principally anxious to destroy the plural vote, felt that a simpler measure with that object would have sufficed. A Bill, to abolish plural voting, introduced by a private member, Mr. Baker, was read a second time on March 1, 1912, and it was thought that the Government might well adopt this if their own Bill had to be dropped.

Mr. Asquith's introduction of the Franchise Bill was, however, not the only parliamentary result of the continued blocking of the movement for Women's Suffrage. A desire to prove that measures demanded in the interest of women were not neglected in the House of Commons, gave useful support to Mr. A. H. Lee's Bill, aimed at the so-called "White Slave Traffic," which in June, 1912, was adopted as a Government measure. Its object was to give power to any constable to arrest "procurers" summarily on good cause of suspicion without having to delay to get a warrant, to strengthen the law dealing with brothel-keepers and make landlords of such houses liable for their illegal use, to make the law as to solicitation apply to men as well as women, and to penalise more effectually men who lived on the earnings of immorality. The Bill was read a second time and then referred to a Standing Committee, where it met with a good deal of criticism, resulting in some of its provisions being weakened, the power of summary arrest, in particular, being altered so that it could only be exercised by special officers not below the rank of sergeant. The movement, however, outside Parliament was too powerful to be denied, and in October the Home Secretary promised a deputation of the Bill's supporters to use the Government influence to pass it with the original and more drastic provisions restored. The whole subject had aroused much public attention during 1912 in England as well as in America, and it was widely felt that everything ought to be done, at any risk, to deny facilities in England for carrying on what had become an international traffic in women for purposes of prostitution, accompanied by systematic fraud and outrage which the existing law was powerless to stop. In accordance with the Home Secretary's advice, the House of Commons agreed, on the Report stage, to restore the Bill to its original more stringent form. By a considerable majority, flogging was made the penalty under Clause 2 for a second offence on the part of male procurers, and by a narrow division was extended also to a first offence against the advice of the Government; under Clause 6 flogging was made a penalty for the second offence, but the proposal to extend it to a first offence was defeated. On November 12th the bill was read a third time without discussion. On December 9, it passed the Lords, with minor amendments, in its most drastic shape; and on December 11 it became law, coming into operation at once.

The main problem however before the Government when Parliament met on February 14, 1912, was Irish Home Rule, with Welsh Disestablishment and Disendowment in a secondary place. The latter measure, keenly as it was opposed in the interests of the Church of England, may be dismissed in a comparatively short statement. The general scheme of the Bill, which was introduced by Mr. McKenna on April 23d, had been already explained by him in a speech at the Queen's Hall, London, on January 28th. Its main interest lay naturally in the financial provisions, and their effect may be shown as follows. The income of the Welsh dioceses in 1906 was £556,000 (£206,000 representing voluntary contributions,

which would be unaffected), and of the £260,000 derived from endowments the Bill would take away £172,500, representing (according to the Liberal view) national property; but this reduction would only be gradually effected in about forty years by the Welsh Commissioners appointed to manage the transfer,—existing interests being maintained and existing incumbents being paid their present stipends,—so that in that time the Church would have the chance of making good the loss of income by increased voluntary contributions. The disestablished Church was given power to set up a representative body, which might be incorporated by charter; and to this body the Welsh Commissioners would hand over the cathedrals, episcopal palaces, churches and parsonages, and also the modern endowments—and such part of the glebe as was not considered to be part of the ancient endowments—to which the Church as such was strictly entitled; as a dividing line the date of 1662 was taken as that after which property of uncertain origin now owned by the Church might be regarded as her own. The funds which by degrees would be taken from the Church were to be applied partly to charitable and public purposes by being handed over to the County Councils and partly to the colleges of the University of Wales (library, etc.).

The rather moderate extent of the disendowment thus proposed was somewhat of a surprise. Extreme Liberationists had to console themselves with the prospect of a success for the principle of disestablishment rather than any considerable acquisition of Church property for secular purposes. On the other hand, from a Church point of view, the smallness of the operation on its financial side made the whole transaction seem one of peculiar meanness; for a paltry result, the work of the Church—admittedly now well done, as had been proved before the Welsh Church Commission, whatever its shortcomings in the past—was to be crippled and hampered. Defenders of the Church, notably the Bishops of St. David's and St. Asaph's and Lord Hugh Cecil, could point with cogent force to the fact that the Church was the largest single religious body in Wales, and the only one which was represented in every parish by a regular organisation. Their argument for its being better entitled than any other denomination to be the national Welsh Church, and administer as such the "national" property it had so long possessed, represented one side of the case against the Bill. The ecclesiastical indivisibility of Wales and England was a more fundamental objection, the Welsh dioceses being from the Church point of view an integral part of the Church of England. The case for the Government, granted the principle of disestablishment at all, was however fairly simple. Their precedent was the case of the Irish Church in 1869: it was equally a part of the Church of England, and disestablishment and disendowment had done it good rather than harm. The answer to those who contended that the Church really was the national Church of Wales was that the Welsh people thought otherwise; at election after election, almost unanimously so far as political representation showed, they demanded the change as an act of justice. On the first reading of the Bill (April 25), which was carried by means of the closure by 331 to 253, Mr. Lloyd George emphasised this point in a somewhat rhetorical plea for the right of his own nationality to have the religion it chose and not to be nationally misrepresented by a Church which, however well it worked, was English and not Welsh. On May 13th the second reading opened with a slashing criticism from Mr. F. E. Smith, but on the 16th it was carried by the closure by 348 to 267, and the Bill was then hung up till the late autumn. Its introduction satisfied the Welsh party, but otherwise it excited no real parliamentary enthusiasm. In recent years disestablishment had ceased to interest any large section of Liberal politicians; and the Bill, while alienating many Liberal Churchmen and rallying to defence of the Church numbers of voters who are normally indifferent to ordinary political issues, was not of a nature to help Liberal or Labour electioneering outside Wales itself.

In making an Irish Home Rule Bill their chief measure in 1912 the Government were more fortunate in one respect than Mr. Gladstone had been in 1886 and 1893, when the whole Irish question was still associated in Great Britain with the prejudice and hostility aroused by the agrarian war, with all its incidents of cattle-maiming

and boycotting, the "plan of campaign," the Phoenix Park murders and dynamiting outrages, the downfall of Parnell and the split in the Nationalist ranks. A new generation had grown up, to whom all this was ancient history, with no special *Home Rule* application to the existing conditions. Ireland for years had been peaceful and growing in prosperity; the Unionist Government had given her both local government and the Land Purchase Act; and the idea of Home Rule (as apart from the forgotten Home Rule Bills) was now familiar, simply as one of the standing issues of party politics. Lord Rosebery's defection had not prevented Sir Henry Campbell-Bannerman from inscribing it again in 1905 on the banner of the Liberal Party; and though the Liberals then came into power, independently of the Nationalist vote, under a pledge not to introduce a Home Rule Bill during the 1905-1910 Parliament, Mr. Asquith had been quite explicit in saying, when the elections of January 1910 were taken, that if he got a majority this self-denying ordinance would be at an end. On the Unionist side the attitude of the Liberal party in this respect was indeed severely criticised; and it was true that at the elections of December 1910 neither Mr. Asquith nor his colleagues in the Cabinet made Home Rule a direct issue either in their election addresses or in their speeches. On the contrary, when the Unionists warned the electorate that in voting for the Parliament Bill they were voting also for Home Rule, they were constantly told that this was only a "bogey." But the fact remained that, in spite of Unionist efforts and in conformity with what, from a Liberal point of view, was quite sufficient intimation that Home Rule was an integral part of the Liberal programme, a majority for the Parliament Bill had been returned; and within the coalition majority the Irish Nationalists held the balance of power. The Unionists taunted Mr. Asquith with being in office simply by the will of Mr. Redmond, and continued throughout the controversy to deny any Liberal mandate for Home Rule at all; but the parliamentary majority was the solid fact of the situation. Mr. Redmond, for his part, had been perfectly frank about the conditions of his support; on September 27, 1910, for example (to give only one instance out of many), at a moment when it was still uncertain to what lengths the Liberal Cabinet would go in framing a Home Rule Bill, he was reported as saying in a speech at Buffalo, U.S.A., "I believe the leaders of the Liberals are sincerely friendly to Home Rule, but, sincere or not, we have the power and will make them toe the line." Undoubtedly the Nationalists could have turned the Government out if it did not "toe the line;" but this would have done their cause no good. The strength of their position, for making a good bargain over the terms of the Bill, was really based on the willingness of the Liberal and Labour parties to concede, in all essentials, the Nationalist demand, representing as it did not only a solid vote from three-quarters of Ireland but also an important body of Irish opinion in America and the British Colonies. Apart altogether from the older arguments for Home Rule, the Liberals justified their policy by the success attending their grant of self-government to the Transvaal, and by the congestion of business in the Imperial Parliament, which in any case made it desirable to move in the direction of devolution. An Irish Parliament and executive of the colonial type for purely Irish affairs, subordinate to the Imperial Parliament, would not only satisfy the Irish claim but might be the beginning of a federal scheme for the whole of the United Kingdom. Arguing on these lines,—and Mr. Redmond carefully put the Irish case no higher in his speeches before British audiences—it was much easier in 1910 and 1911 for supporters of the Government than it was in 1886 and 1893 to scout Unionist objections to the principle of Home Rule; they could even appeal to Unionist arguments in favour of an Imperial federal constitution. Whether the Bill to be introduced would reconcile Imperial interests and those of the United Kingdom with its proposals for Irish government had still to be seen; but meanwhile its consideration was approached this time under conditions more favourable than formerly. English Liberal Nonconformists were not now so much agitated about Home Rule meaning Rome Rule; and public opinion in Great Britain generally had become rather apathetic about Ireland altogether, being to a large extent out of touch with its problems. It was only in Ulster that the passionate resistance of a generation before was as yet reawakened.

Mr. Asquith introduced the Government of Ireland Bill in the House of Commons on April 11, 1912. He laid particular stress on its being intended to be the first step towards Parliamentary devolution and a system of federalised parliaments within the British Isles, and on its maintaining the supremacy of the Imperial Parliament at Westminster over the new Irish Parliament equally with any that might later be set up in other divisions of the Kingdom. The essence of the Bill was that in Ireland an Irish Parliament and Irish Executive should be responsible for exclusively Irish affairs. Instead of saying precisely what these affairs were, the Bill specified what were the Imperial affairs which the Irish Government could not deal with, including certain Irish matters (Clause 2) "reserved" to the Imperial Government. There would be two Houses,—an elected House of Representatives of 164 members (of whom, on the existing basis, 39 would probably be Unionists); and a nominated Senate of 40 members, on which Mr. Redmond's view was that there would thus be the opportunity to secure the inclusion of Irish public men of eminence, without reference to their party colour. In case of a conflict between the two Houses they would sit and vote together. For Imperial purposes Ireland would still be represented at Westminster, but only by 42 members, subject to a special provision (Clause 26) for increasing this number in case the question of altering the financial relations should arise at some future time, and purely for that purpose. The acts of the Irish Parliament would be subject to veto or postponement by the Imperial Executive or Parliament, disputes as to their validity being adjudicated on first by the Irish Court of Appeal and secondly by the Privy Council. It might not enact privilege or disability, endowment or deprivation, for any form of religion, or make any religious belief or ceremony necessary to the validity of marriage. Irish taxes would be settled by the Irish Parliament but would continue to be collected (together with such Imperial taxes as remained) by the Imperial Government, and an annual sum corresponding to the cost of Irish services at the time of the passing of the Act would be "transferred" to the Irish Exchequer under the administration of a Joint Exchequer Committee, together with a grant beginning at £500,000, to be reduced as circumstances permitted; practically this meant an annual subsidy of £2,000,000 from the Imperial Exchequer. The "transferred sum" would provide a security on which the Irish Government could raise loans. The financing of Old Age Pensions, National Insurance, the Post Office Savings Bank, and the Royal Irish Constabulary, was reserved temporarily to the Imperial Exchequer, but the Irish Post Office (with the patronage attaching to it) was made a separate service under Irish administration. The powers given to the Irish Parliament to deal with Customs and Excise as well as other taxation contemplated the setting up of Irish custom-houses independently of Great Britain, and (within certain limits) the possibility of varying duties as between goods imported into Ireland or into Great Britain; and as the collection was to be made by the Imperial Government, and allowances for the Irish levy to be made to the Irish by the Imperial Exchequer, the procedure was necessarily rather complicated. The finance of the Bill was indeed admittedly and necessarily provisional, complete data being unavailable, in spite of the Government's having had the advice of a Committee of financial experts, whose report however was not disclosed. For 1912-13 it was estimated that the revenue derived from, and the expenditure incurred in, Ireland would be as follows, showing a deficit of £1,515,000.

Revenue.	£	Expenditure.	£
Customs	3,230,000	Not separately specified	5,462,000
Excise	3,320,000	Post Office	1,600,000
Income Tax	1,512,000	Old Age Pensions	2,664,000
Estate Duties	939,000	Charges for Land Purchase	761,000
Stamps	347,000	Nat. Insurance and Labour Exchanges	191,500
Miscellaneous	137,000	Royal Irish Constabulary	1,377,500
Post Office.	1,354,000	Collection of Revenue	298,000
Total	10,839,000	Total	12,354,000

In the next ten or fifteen years, it was contemplated, the charges for Land Purchase might well increase by £450,000, and for National Insurance by £300,000, while the cost of Old Age Pensions within twenty years might decrease by £200,000; thus a normal increase might be expected in the deficit, bringing it up to over £2,000,000. In arranging for Ireland to manage her own finances, England was bound to give her a fair start and not to expect to score by the change; and the subsidy now proposed was estimated accordingly. As against this, it was claimed on the Nationalist side that since 1817 Ireland had altogether contributed about £330,000,000 to what was strictly Imperial expenditure, so that she was justified now in getting even a larger subsidy back towards internal expenditure, the scale of which had been imposed according to English and not Irish ideas. According to the new system proposed under the Bill it was calculated that under Home Rule the first year's finances would work out as follows, in the Irish and (on Irish account) the Imperial Budgets:—

<i>Irish Revenue.</i>		<i>Irish Expenditure.</i>	
	£		£
Transferred Sum . . .	6,127,000	Not separately specified	5,462,000
Post Office	1,354,000	Post Office	1,600,000
Fee Stamps	81,000		
		Surplus	7,062,000
			500,000
Total	£7,562,000	Total	£7,562,000
<i>Imperial Revenue.</i>		<i>Imperial Expenditure.</i>	
	£		£
Irish Revenue, (ex- cluding Post Of- fice and Fee Stamps)	9,404,000	Transferred Sum	6,127,000
Deficit	2,015,000	Old Age Pensions	2,664,000
		Nat. Insurance & Labour Exchange	191,500
		Land Purchase Charges	761,000
		Constabulary	1,377,500
		Collection	298,000
Total	£11,419,000	Total	£11,419,000

For convenience a summary of the Bill is here given, clause by clause, omitting details as to the financial adjustment between the Irish and Imperial Exchequers.

Précis of Government of Ireland Bill, 1912.

(1) Sets up Irish Parliament, with two Houses; a Senate and a House of Commons. Supreme power of Imperial Parliament however to remain undiminished over all persons, matters and things, within H. M.'s dominions.

(2) Irish Parliament shall have power to make laws for the peace, order and good government of Ireland, but only in respect of matters exclusively relating to Ireland or some part thereof. It cannot legislate concerning the Crown, peace or war, army or navy, treaties or foreign relations, dignities and titles, treason, naturalization, foreign trade (except for taxation), quarantine, navigation, lighthouses, etc., coinage, weights and measures, trade marks, copyright and patents; nor on any "reserved matters," including the subject-matter of the Land Purchase Act, Old Age Pensions Act, and National Insurance Act, the collection of taxes, the Royal Irish Constabulary, the Post Office Savings Banks, and Trustee Savings Banks, Friendly Societies, or Irish Public Loans up to date of the Act. Any laws in contravention of these limitations to be void. [In Committee, the question of Trinity College, Dublin, was added to the "reserved" matters.]

(3) Irish Parliament shall not make any law so as, either directly or indirectly, to establish or endow any religion or prohibit its free exercise, or give a preference or advantage, disability or disadvantage, to any religious belief or status, or make any religious belief or ceremony a condition of the validity of marriage. Any law in contravention of this limitation to be void.

(4) Executive power in Ireland to continue vested in the King. As regards Irish services, the Lord Lieutenant or other chief executive officers approved in his place shall exercise any prerogative or executive power which may be delegated by the King; this power being exercised through such Irish departments as the Irish Parliament by its own Act may establish, and officers (*i.e.* ministers) to administer these departments being appointed by the Lord Lieutenant and holding office during his pleasure. Ministers must be members of the Irish Privy Council, and of the Irish Parliament (if in office longer than six months).

(5) After six years a transfer of the management of the Royal Irish Constabulary shall be made to the Irish Government. Also, if the Irish Parliament so resolves, the public

services connected with Old Age Pensions, National Insurance, Labour Exchanges, and (after ten years) Post Office Savings Banks, Trustee Savings Banks, and Friendly Societies.

(6) Irish Parliament must meet once a year at least.

(7) Lord Lieutenant shall give or withhold Royal assent to Bills passed by both Irish Houses of Parliament, but (1) shall comply with any instructions given by His Majesty (*i.e.* the Imperial Government) in respect of such Bill, and (2) if so directed shall postpone assent during the King's pleasure.

(8) The Irish Senate shall consist of 40 members, the first 40 being nominated by the Lord Lieutenant on the advice of the Imperial Government, and subsequent members being nominated by him on the advice of the Irish Executive. They shall sit for eight years, one-fourth (selected by lot as provided in Clause 42) retiring every second year. [This was altered in Committee; see below.]

(9) The Irish House of Commons shall consist of 164 members, returned (as to the Imperial House of Commons) by the following constituencies (1st Schedule): *Boroughs*: Dublin 11, Belfast 14, Londonderry 2, Cork 4, Limerick 2, Waterford 1; *University*: Dublin 2; *Counties*: Ulster 43, Leinster 30, Munster 30, Connaught 25. It is limited to a duration of five years. After three years from the passing of this Act the Irish Parliament may alter the qualification of electors, mode of election, constituencies and distribution of members among them, but not the number.

(10) Money Bills shall only originate in House of Commons after recommendation by Lord Lieutenant (*i.e.* proposal by an Irish minister). Senate may neither reject nor amend a Money Bill, and may not amend any bill so as to increase taxation.

(11) If Senate rejects or fails to pass a Bill sent up by House of Commons, or amends it in a way the latter will not agree to, and the House of Commons next session repeats the Bill and the Senate repeats its action, the Lord Lieutenant may convene a joint sitting of both Houses; they shall vote together and a majority shall prevail.

(12) Peers (Irish or otherwise) are qualified to become members of either House. Ministers who are members of one House may also sit and speak, but not vote, in the other. Irish Parliamentary powers, privileges and immunities, to be as defined by Irish Act, but otherwise the same as at Westminster and no greater.

(13) Instead of the existing Irish representatives in the Imperial Parliament, 42 Irish members shall be returned to Westminster for the following constituencies, under the election laws and qualifications of the United Kingdom, unalterable by Irish Parliament:—*Boroughs*: Dublin 3, Belfast 4, Cork 1; *Counties*: Ulster 11, Leinster 8, Munster 9, Connaught 6.

(14) There shall be an Irish Exchequer and Irish Consolidated Fund, separate from those of the United Kingdom, but the proceeds of all Irish taxes shall be paid into the Imperial Exchequer, and out of the Imperial Consolidated Fund a "transferred sum" is annually to be paid to the Irish Exchequer. This "transferred sum" is composed of (a) an amount, to be determined by a Joint Exchequer Board (see Clause 16 *et seq.*), representing the net cost of Irish services to the Imperial Exchequer at the time of the passing of this Act, (b) a sum of £500,000, to be reduced eventually to £200,000 by annual diminutions of £50,000 beginning after the third year, (c) a sum equal to the proceeds, as determined by the Joint Exchequer Board, of any new Irish taxes imposed by the Irish Parliament. The Irish Parliament shall provide for the cost of Irish services within its own sphere of action, existing charges on the Imperial Consolidated Fund ceasing together with advances from the Public Works Loan Commissioners or Local Loan Fund.

(15) The Irish Parliament may vary (add to, [reduce]¹ or discontinue) any Imperial tax (except certain stamp duties) as regards the Irish levy, and may impose in Ireland any independent tax substantially different (in the opinion of the Joint Exchequer Board) from Imperial ones, but subject to certain limitations. It may not impose a customs duty (export or import) unless there is also an Imperial customs duty on that article; it may not levy a customs duty exceeding a corresponding excise duty; and (Clause 17, S.3) no Imperial customs duty (except on beer and spirits), nor income tax nor death duties, may be increased by more than ten per cent.

(16-25) In these financial clauses detailed provision is made for adjusting Irish and Imperial customs duties and other financial relations, under the control of a Joint Exchequer Board, consisting of a Chairman appointed by the Imperial Government, two nominees of the Imperial Treasury and two of the Irish Treasury.

(26) If in any three successive years the Joint Exchequer Board reports that the proceeds of Irish taxation and of any revenue to which Ireland is entitled exceed the "transferred sum," a revision of the whole financial arrangement is to be taken up by the Imperial Parliament. For this purpose alone the Irish representation at Westminster, as provided for in Clause 13, is then to be modified; "there shall be summoned such number of members of the Irish House of Commons as will make the representatives of Ireland in the Commons House of Parliament of the United Kingdom equivalent to the representatives of Great Britain on the basis of population."

¹ This was afterwards eliminated, see below.

(27) Irish judges shall in future be appointed by the Lord Lieutenant.

(28) For appeals to the House of Lords appeals shall be substituted to the Judicial Committee of the Privy Council.

(29, 30) Questions raised by the Lord Lieutenant or a Secretary of State as to Irish Acts being *ultra vires* shall be determined by the Judicial Committee of the Privy Council, to whom also shall be appeals on such points raised by decisions of the Irish Court of Appeal; and similar appeals shall lie to the latter from the Irish Courts.

(31) The Lord Lieutenant may be any British subject, irrespective of religious belief. His term of office shall be six years, and he shall be paid by the Imperial Exchequer, a deduction for this purpose of £5,000 per annum being made from the "transferred sum."

(32-36) Provision is made in these Clauses for safeguarding the interests of existing Irish judges and administrative officials, under the direction of a Civil Service Committee, consisting of a chairman nominated by the Lord Chief Justice of England, a nominee of the Imperial Treasury and a nominee of the Irish Ministry.

(37) Provision is also made for maintaining the existing interests of the Dublin Metropolitan Police and Royal Irish Constabulary.

(38-41) General provisions, including that the Irish Parliament cannot repeal or alter this act, or any other that the Imperial Parliament extends hereafter to Ireland.

(42-46) For the purpose of effecting the transition to a Home Rule system in Ireland, provision is made for details to be settled by Orders in Council.

(47) Definitions.

Even before the introduction of the Bill it had been seen that the greatest practical difficulty in the way of Home Rule, irrespective of controversy over particular details in the scheme, would be the attitude of Unionist Ulster. Under Sir Edward Carson's leadership, opposition was already being organised in 1911, on behalf of the North of Ireland Protestants and Orangemen, which, it was openly avowed, would if necessary go to extreme lengths, even to a refusal to recognise a Parliament in Dublin¹ and to the setting up of a separate "provisional government." The anxiety of the Government to counter this movement as far as possible had been shown early in the session by the announcement that Mr. Winston Churchill was going over to Belfast to speak on February 8th in the Ulster Hall, and violent opposition to the proceeding was at once taken in hand there. It was considered on the Unionist side that for the son of Lord Randolph Churchill, who had said that "Ulster would fight and Ulster would be right," to preach Home Rule in a place associated with the campaign against it, was an outrage; and the leaders of the Ulster Unionist Council took steps to make the delivery of his speech in the Ulster Hall impossible. Eventually its engagement for the purpose was cancelled, and it seemed for the moment that the prospects of rioting and bloodshed if Mr. Churchill appeared in Belfast at all were so serious that the Government would be obliged to keep him away. Mr. Churchill however was not to be daunted. Arrangements were made for the speech to be delivered in a pavilion in a field outside the city, and for troops to be drafted there in large numbers for the maintenance of order. The apparent denial of free speech at all on the Ulster Unionist side was severely commented upon elsewhere, and justified with some misgivings by English sympathisers, but when the leaders had been successful in defeating the plan for holding a Home Rule meeting in the Ulster Hall they went no further. Mr. Churchill duly arrived and made his speech with characteristic courage, dwelling particularly on the safeguards which the Home Rule Bill would contain against anything to which Ulster could object; but the city was in a ferment of dangerous antagonism and he had to be smuggled away afterwards to avoid the hostility of the crowd. Actual rioting was avoided, and peace was kept between Nationalists and Loyalists, at the cost of £2,730 for the expense of the troops engaged, the Ulster leaders having eventually devoted themselves to keeping their supporters well in hand; but the whole incident was an unpleasant revelation of the rebellious spirit that was being aroused. A little later (April 9th) Mr. Bonar Law was present at a great anti-Home Rule demonstration at Belfast, the special note of which was a solemn pledge of Loyalist resistance.

The Liberal Press in England made light of these warnings, but the organisation of

¹ The anniversary of "Craigavon Day," September 23, 1911, when Sir E. Carson was acclaimed the Ulster leader, and the Declaration of Ulster was published to the above effect, was publicly celebrated in 1912.

opposition in Ulster went steadily on. As controlled by the Irish Unionist leaders for a single purpose—to meet the situation arising if the Home Rule Bill became law—it was formally independent of actual parliamentary tactics, and therefore of the action of the Unionist party under Mr. Bonar Law's guidance; but **Unionist attitude.** Unionist opposition in Parliament and in the constituencies was inevitably concerned with what might take place in Ulster. Mr. Bonar Law, at a Unionist meeting at Blenheim on July 27th, gave emphatic expression to the view he took of its meaning; which he was severely reproved by Mr. Asquith for repeating in the House of Commons on August 5th, while Mr. Churchill on August 10th again took him to task in a published letter to which Mr. Law made a spirited reply (Aug. 12th). He and his party were bound to side with the Unionists of Ulster. As Mr. Bonar Law put the case, if the Ulstermen were forced into open defiance of a measure passed under the Parliament Act without further appeal to the electorate, and by the dictation of a Nationalist vote which had in their view always been disloyal to the Empire, any attempt to coerce Ulster could only mean civil war, and this could not be confined to Ireland; it was incredible that the Government should contemplate the coercion of Ulster by British bayonets, but if they went to that length the situation would be intolerable,—ministers would be “lynched in London.” Here was indeed the root of the Home Rule difficulty. Many Liberals hoped to find relief by proposing to leave Ulster out of the Home Rule Bill, at least temporarily, altogether; but Mr. Agar Robartes's amendment to this effect in Committee (July 18), after some ambiguous enquiries from the Government whether Ulster would be satisfied if it were adopted, was rejected by 320 to 252; the Nationalists could not do without the richest part of Ireland.

Criticism in Parliament meanwhile had gone on, for the present, along more or less stereotyped lines. On April 23rd an Irish National Convention in Dublin, with Mr.

Progress of the Bill.

Redmond presiding, accepted the Bill, and the doubts as to whether Irish Nationalists might disagree over it, and it might be snuffed out like the Irish Councils Bill in 1907, were dissipated. On July 19th Mr. Asquith addressed an enthusiastic meeting in Dublin, and was received with fervour as the first English Prime Minister who had had a welcome there in Nationalist circles. The first reading of the Bill was carried in the House of Commons on April 16th by 360 votes to 266, and the second reading (April 30th) was carried on May 4th by 372 to 271. The Committee stage began on June 11th, and on July 3rd the first clause had gone through; discussion was then suspended till the autumn. On the Unionist side the objections to any scheme for a separate Irish Parliament and Executive were fortified by criticisms of special features in the new Bill itself—the finance, the proposal for Irish representatives to remain at Westminster, the separation of Post Offices and Custom-houses, but these subjects had still to be further discussed when Parliament adjourned in August. On the Liberal side a good many members disliked the provision for the nomination of an Irish Senate, and this question arose in Committee on Clause 1, but Mr. Dickinson's amendment to exclude it was rejected (June 19th) by 288 to 199.

The real opposition meanwhile went on in Ulster, not in Parliament. Serious rioting between Protestants and Catholics in the Belfast ship-yards during July showed the tension there; and on September 14th a free fight between partisans of both sides, in the course of a football match at Belfast at which 10,000 people were present, resulted in injuries to about 100, revolvers and knives being used. Active preparations were on foot for a series of Unionist demonstrations in Ulster, beginning at Enniskillen on September 18th, and leading up to the signing on September 28th of a Solemn Covenant, pledging resistance to Home Rule. The perplexity on the Liberal side in face of Ulster's determination was shown by a speech of Mr. Churchill's at Dundee on September 12th, in which he suggested, purely on his own account, that, to secure a federal system of government for the United Kingdom,—to which Home Rule for Ireland, however, was an essential preliminary,—it might be desirable to grant separate legislatures to large homogeneous areas in England like Lancashire, Yorkshire, the Midlands, and London; he would not shrink from the

The Solemn Covenant.

creation of ten or twelve such English bodies, all subordinate to the Imperial Parliament. The obvious comment on this suggestion was that Unionist and Protestant Ulster was as much entitled to stand alone in Ireland as Lancashire in England; Mr. Churchill's speculation was effectively criticised by Mr. Balfour at Haddington on October 9th, the scheme being described as "the application of decimal fractions to the United Kingdom." What Unionist Ulster demanded was to remain under the Imperial Parliament and not be at the mercy of a National Executive and Parliament in Dublin.

The text of the Solemn Covenant, promulgated by the Ulster Unionist Council, was as follows:—

Being convinced in our consciences that Home Rule would be disastrous to the material well-being of Ulster as well as of the whole of Ireland, subversive of our civil and religious freedom, destructive of our citizenship, and perilous to the unity of the Empire, we, whose names are underwritten, men of Ulster, loyal subjects of His Gracious Majesty King George V, humbly relying on the God Whom our fathers in days of stress and trial confidently trusted, hereby pledge ourselves in Solemn Covenant throughout this our time of threatened calamity to stand by one another in defending, for ourselves and our children, our cherished position of equal citizenship in the United Kingdom, and in using all means which may be found necessary to defeat the present conspiracy to set up a Home Rule Parliament in Ireland; and, in the event of such a Parliament being forced upon us, we further solemnly and mutually pledge ourselves to refuse to recognise its authority. In sure confidence that God will defend the right, we hereto subscribe our names, and, further, we individually declare that we have not already signed this Covenant.

Sir Edward Carson signed first, on September 28th, at the head of a great gathering in Belfast. And when, just afterwards, he crossed with Mr. F. E. Smith to Liverpool, he had a remarkable ovation, violent speeches being made by sympathisers with the cause of Ulster,¹ in favour of supporting her resistance by force of arms. It was announced later that the total signatures to the Covenant were:—*Ulster*, men 218,206, women 228,991; *Outside Ulster*, men 19,162, women 5,955.

Parliament met again for the autumn session on October 7th, and the political conflict was once more transferred to the House of Commons. The effect of the Ulster demonstrations on the Government, up to this point, was not specially terrifying; and Mr. Asquith, speaking at Ladybank on October 5th, dealt somewhat scornfully with Sir Edward Carson's movement and the Unionist attitude towards it. The Government, he intimated, were ready to consider any proposals for safeguarding Ulster, but Ulster had nothing to suggest—she simply would not allow Ireland to have what the other four-fifths of Ireland demanded. It was impossible for the Government to give way to intimidation, prompted by the spirit of Orange ascendancy; they meant to go on with their Bill. On October 10th he introduced in the House of Commons a series of resolutions for completing the various stages of discussion on it by Christmas under the closure. Including the time already occupied, fifty days (to which two were added a few days later) were, on this scheme, to be devoted to debate. An Opposition amendment, proposed by Mr. Bonar Law, was defeated by 323 to 232. The operation of the guillotine, combined with the "Kangaroo" system by which the Chairman of Committees was left to choose which among the various amendments proposed should be discussed in the time available, made the resumption of the Committee stage simply a question of whether the Government could maintain their majorities; any effective debate was obviously impossible, and Mr. Bonar Law bluntly declared that the Government might just as well have moved that the Bill should be passed without further delay. On the other hand it was equally true that, without

¹ It must be remembered, of course, that "Ulster," as an Irish political unit, does not mean the whole province, but only the N.E. portion, comprising the five counties of Antrim, Armagh, Down, Londonderry and Tyrone, with the cities of Belfast and Londonderry. As a geographical unit Ulster has a population (1911) of 1,581,696, but the N.E. portion by itself has 1,188,695. Out of the latter total, those of 16 years old and over were 387,241 males and 438,774 females. As the census classification showed that 33.1 per cent of the population in this N.E. area was Roman Catholic, the number of adult male Protestants in Ulster who might be expected to sign the Covenant was not much in excess of those who actually did so.

such a time-limit, the Opposition would have protracted the debates till Doomsday; the Government had no option in the matter if they were to send the Bill up to the House of Lords during that session, as they must, in order to obtain the benefit of the terms of the Parliament Act. Even if the Home Rule Bill were to be passed through the House of Commons by January, the Government programme was overloaded, for they had announced their intention also to pass the Welsh Disestablishment Bill, the Franchise Bill and other measures, before the session ended.

Meanwhile, with Mr. Lloyd George's active encouragement, yet another political issue had been made prominent during the autumn throughout the constituencies, in the shape of an organised agitation for land-tenure reform and increased taxation of land-owners, promoted more particularly by a section of the Radical party who had long been advocates of the single-tax theory on Henry George's lines (see *E. B.* xi, 747). The Budget of 1909, with its provisions for effecting a complete valuation of the land, paved the way for such a movement, and the land-reformers saw their opportunity now for pushing their views and preparing for legislation. The unpopularity of the Insurance Act made it opportune moreover for Mr. Lloyd George's section of the party to try to divert electioneering attention on the Radical side to something more attractive, and at the summer and autumn by-elections the new land campaign was made a leading feature by Radical candidates, notably by Mr. Outhwaite at Hanley. Intense exasperation was created on the Conservative side, representing as it did to so large an extent the landed interests of the country, by the organisation of an unofficial Committee of Inquiry under Mr. Lloyd George's auspices, with the authority of the Cabinet, in order to obtain evidence of various sorts of agrarian grievances in furtherance of a Radical policy. It was objected that any such enquiry for Government purposes should be by an impartial Royal Commission, which would act publicly and responsibly, and not by an unofficial body acting surreptitiously and in the interest of a partisan movement. Mr. Asquith, on behalf of the Government, repudiated entirely any sympathy with the single-tax theory, and insisted that any new land policy adopted by the Cabinet would be announced by them when the proper time came. But it was clear that, so far as Mr. Lloyd George was concerned, the next move forward in the direction of Radical social reform would be for "freeing the land," and that active preparations were being made by him with this object.

An important change in the Home Rule Bill was made when on October 30th the discussion in Committee reached clause 8, concerning the composition of the Irish Senate. It was suddenly announced by Mr. Asquith that, while the proposed nomination of the first Senators by the Imperial Government would be adhered to, the Government had decided to abandon the idea of their successors being nominated by the Irish Government. Instead of this, the method would be substituted of election by the voters in the four Irish provinces, taken as units, on a plan of proportional representation, each elector having a "transferable" vote.¹ The term of office for Senators would be five years, and all would retire together at the end of the fifth year so that the elections might then be taken; casual vacancies being filled by substitutes sitting only for the unexpired term, to be nominated if the vacancy is that of a nominated Senator, and elected if of an elected. The next day (October 31st) the revised clause was introduced and carried. Mr. Asquith insisted that it would be an additional safeguard for the Unionist and Protestant minority in Ireland, but Mr. Bonar Law regarded it as worthless for any such purpose, and Mr. Healy frankly declared that in his opinion the Irish Unionists would have been better off with the method of nomination. Mr. Redmond, while accepting the Government's decision, expressed much the same view. The fact was that the whole idea of a nominated Senate was distasteful to most of the Liberal party, and it seemed a favourable opportunity for putting the experiment of proportional representation, which had recently made many converts, into practice. The Government refused however to adopt proportional representation for the Irish House of

¹ See *E. B.* xxiii, 115c.

Commons. They also resisted the proposal, made in an amendment moved on November 5th by Mr. Snowden, to make the local government register and not the parliamentary the basis of elections to the Irish Parliament and thus include women voters. The defeat of this amendment, by 314 to 141, through Government and Nationalist pressure, caused considerable irritation among the more active supporters of women's suffrage, but the case against it was strong; if this was purely an Irish question it was one which, it was contended, the Irish Parliament itself should decide, while, if a decision was to be taken on the general question of women's suffrage for the whole kingdom, the proper occasion would arise when the Government's Franchise Bill came on.

On Friday November 8th a further step was taken to expedite the work of the session by the introduction of a "guillotine" time-table for the Welsh Church Bill.

Government defeat and its result. Mr. Asquith moved a resolution allocating 14 days to the Committee stage, 2 to Report, and one to third reading. So short a shrift excited much bitterness on the Opposition benches, and it was hotly debated, the discussion that day being adjourned; and on the following Monday (Nov. 11th) the whole situation in the House of Commons was changed by an unforeseen event. The Resolution required as a preliminary to discussion of the financial clauses of the Home Rule Bill was in its Report stage, having been carried in Committee by a majority of 120, and Sir F. Banbury now moved an amendment without notice, providing that the total payment from the Imperial to the Irish exchequer in any one year should not exceed £2,500,000. It was early in the afternoon, and the Government Whips had not realised that the Unionists were in unaccustomed force and had temporarily a majority in the House; but on a division the Government was defeated, the amendment being carried by 228 to 206. Mr. Asquith immediately moved the adjournment of the House in order to consider what action should be taken, but the idea of resignation was scouted at once; and next day it was announced that the Cabinet had decided to move a resolution rescinding the vote "notwithstanding anything in any Standing Order," and providing (so as to regularise further proceedings under the time-table, which was entirely upset by the incident) that the next day on which business was taken on the Home Rule Bill should count as the "16th allotted day," though, as previously fixed, the 16th day was November 11th; when this had been done, they proposed to reintroduce their financial resolution and proceed as though nothing had happened. On Wednesday the 13th Mr. Asquith accordingly moved to this effect, arguing that all the circumstances showed that the defeat of the Government had not been a genuine one and that they were not called upon to pay any attention to it. This proposal to rescind the vote and set up the resolution afresh was, however, as the Speaker agreed in reply to Unionist objections, absolutely unprecedented in Parliamentary procedure. It had always been held, and was laid down by Erskine May, that no question or Bill could be brought up in the House that was substantially the same as one on which judgment had already been expressed in the current session; and when the Speaker nevertheless ruled that Mr. Asquith's motion, though unprecedented, was in order, Opposition exasperation became intensified to a point beyond control. After Mr. Bonar Law had argued the case at length, and had moved the adjournment of the debate, which Mr. Asquith curtly declined to accept, a state of organised disorder prevented any further proceedings. With the approval of their leaders, the Opposition showed their resentment by keeping up a chorus of cries of "Adjourn," and refusing to allow any continuance of business. The Speaker at last took the only course open to him and adjourned the House. There seemed likely to be renewal of the same scene next day, since the Opposition were determined not to allow what in their view was a defiance of the "common law" of Parliament. Before the House met however on the 14th, calmer counsels prevailed owing to the exercise of the Speaker's influence. At the opening of the sitting he suggested that, if more time were given for reflection, a less objectionable way might be found for regularising the proceedings. Mr. Asquith promptly accepted this suggestion, and moved that the House should adjourn for the purpose till Monday the 18th. As Mr. Bonar Law concurred, this course was accordingly adopted, and the

anticipated storm was avoided. The air had previously been cleared to some extent by amends being made by Mr. Ronald McNeill for the most violent incident in the disorder of the previous evening. In the heat of the moment he had thrown a book at Mr. Winston Churchill which struck him a severe blow on the face; but he now offered a handsome apology, which was equally handsomely accepted.

The Liberal Press was inclined to treat the opposition to Mr. Asquith's motion as purely factious, and the organised disorder as a further mark of deterioration in parliamentary manners. But the historian of Parliament cannot well take this simple view. The defeat of the Government was certainly an accident, but it was the sort of accident that happens when a number of nominal supporters are not personally enthusiastic for the particular cause involved, or are being tired out by excessive demands on their attendance. The opinion of a high independent Liberal authority on procedure, Mr. James Caldwell, ex-M. P. and formerly Chairman of Committees, was moreover that Mr. Asquith's proposal for meeting the new situation was "clearly out of order" (*Times*, Nov. 16th), although not so ruled by the Speaker. Owing to the critical state of foreign affairs, consequent on the situation in the Balkan war, a change of government, as Mr. Bonar Law frankly admitted, was not at this moment desirable; and if the Government chose to ignore what was formally a parliamentary defeat their normal majority was still available. But the Opposition were naturally not prepared to forgo what, according to the practice and precedent of Parliament, was a legitimate opportunity for impeding the execution of the Government's programme of legislation for the session; and they gained their point. On Monday the 18th Mr. Asquith made an amended proposal, which was agreed to without further discussion, that the financial resolution should simply be negatived that day and the Committee stage on the financial clauses of the Home Rule Bill set up afresh on the 19th by the introduction of an amended resolution, the report stage of which would be taken on the 20th, so that the next "allotted day" (the 17th day under the time-table) would be on Thursday November 21st. This course was accordingly pursued.

The loss of a full week led to some questioning as to either the Welsh Church Bill or the Franchise Bill being dropped, but any such intention was firmly denied by Ministers. The only immediate victim to the necessity for lightening the ship was the Mental Deficiency Bill, an important social reform which a section of Radical members, in the supposed interests of individual liberty, were hotly opposing in Standing Committee; the Home Secretary on the 19th announced that the hope of carrying this measure through must now be abandoned, though it would be reintroduced next session with the improvements suggested by the examination it had already received. Mr. Asquith, speaking at Nottingham at the annual meeting of the National Liberal Federation on November 22d, declared that the Government intended to pass Home Rule, Welsh Disestablishment, and Franchise Reform, before the prorogation. He vigorously denied that there was any justification for the Opposition contention that a majority obtained at the last general election for the Parliament Bill should not be used to carry these Liberal measures, to the introduction of which the destruction of the Lords' veto was well known to be a preliminary. The meeting was memorable for the appearance of Mr. Redmond side by side with Mr. Asquith, this being the first time that a Nationalist leader had been on a National Liberal Federation platform; and he made a speech insisting on the solidarity between the Irish and Liberal parties, and the cordial agreement of the Nationalists with the Government programme.

After the scare in the Government ranks caused by the misadventure of November 11th and its immediate consequences, the resumption of proceedings on the financial clauses of the Home Rule Bill saw their normal majority well kept up, and the guillotine fell with merciless regularity. Faced with a hostile and unreformed House of Lords, whose certain antagonism could only be defeated by sending the Bill up in time to obtain the benefit of the Parliament Act, the Coalition were compelled to restrict discussion in the House of Commons; and it might well be thought on their side that at this stage, since in any case the Parliament

**Home Rule
Finance.**

Act involved nearly two years' delay, it was futile to attempt to examine every detail in a scheme which was approved in principle, but which still had a long fight before it. On the other hand it was incontestable that, for a measure of such profound importance, supposing it to be one that might come into operation as it left the House of Commons, the discussion of the various difficult and obscure aspects of the new financial relations proposed between Ireland and Great Britain was entirely inadequate. The Insurance Act had been an unfortunate example of the results of insufficiently considered legislation, but here too clause after clause was carried, undiscussed, under the closure, full of complicated provisions, the working of which very few of the rank-and-file in Parliament even pretended to understand. The present scheme was totally different from anything proposed in Mr. Gladstone's Bills of 1886 and 1893; yet the one thing certain in 1912 was that if those Bills had become law their financial arrangements would have hopelessly broken down. And now the new proposals, fraught with revolutionary consequences alike to the finance of Ireland and of Great Britain, were being forced through with even less consideration. It was only natural that the Opposition should remain restive under conditions which made serious criticism impossible, if only because there was no time for ministers to reply in more than a perfunctory way. Mr. Herbert Samuel, Sir Rufus Isaacs, and Sir John Simon, for the Government, defended the finance of the Bill with marked ability, so far as time served; but the fact remained that on a single evening (Nov. 26th), after the guillotine had cut short a discussion on clause 15 which left it quite uncertain to what extent it enabled a protectionist system to be set up in Ireland, clauses 16, 17, 18, 19, 20 and 21 were then passed, with various amendments introduced by the Government itself, altogether undiscussed, most of the time available being consumed simply by taking division after division. Sir Edward Carson hotly denounced the whole proceedings as the gravest public scandal in the whole history of Parliament. On behalf of the Government it was contended that it was absurd to suppose that any Irish administration would be so foolish as to adopt the means which Mr. Amery and other Unionist speakers suggested that the Bill opened to them for introducing a protectionist policy. One variation only from the original draft of the Bill was proposed by the Government, in deference to remonstrances from their own supporters; under clause 15 the power to reduce an Imperial tax was omitted. But the Opposition amendments, proposing to reserve all power over Customs and Excise to the Imperial Government, and to prohibit the giving of direct or indirect bounties, were stoutly resisted. Mr. Bonar Law summed up the Opposition view by declaring that the Bill undoubtedly enabled the Irish administration to set up the worst form of Protection, namely bounties, and that the Government were really giving in to the demands of their Nationalist allies while professing to be the champions of Free Trade principles. Mr. Samuel, on his side, taunted the Opposition with being advocates of Protection yet dwelling on the objection to a protectionist system in Ireland. Thus each party retorted on the other. But the clauses passed under the closure, with only the slightest consideration by Parliament of the effects of its own legislation. For any judicial examination in debate, reflecting the careful conclusions of the House of Commons, was substituted the opinion of the ministers in charge of the Bill, alike as to the powers it gave and the way those powers were likely to be used. Just as the Insurance Act had left all sorts of obscure questions to be settled by the Commissioners, so the Home Rule Bill left some of the thorniest problems of the financial relations with Ireland to be solved by the proposed Joint Exchequer Board, an entirely new official body, whose real status was highly questionable; and clause 22 providing for this, with the remaining financial clauses, 23, 24 and 25, were duly guillotined on November 27th. During 18 allotted days since the beginning of the Committee stage, 78 lines of the 25 clauses passed had been discussed and 534 lines undiscussed, while 48 amendments had been discussed and 771 ignored; on the financial clauses alone (14 to 25), 30½ lines had been discussed, and 260½ lines passed without discussion, the amendments discussed numbering 12 and undiscussed 210. Eventually, under the guillotine, the Bill passed its third reading on January 17, 1913.

When Parliament adjourned for Christmas, from December 20th till December 30th, the two chief Government Bills, for Irish Home Rule and Welsh Church Disestablishment, were well on their way through the House of Commons. The Committee stage of the Home Rule Bill had ended on December 12th, clauses 26-48 and the final schedules having been carried since December 2nd by the operation of the guillotine without any concession to Unionist criticisms. The Committee stage had lasted altogether 36 days, including the 25 provided under the time-table; two clauses (1 and 37) had been fully discussed, and 22 partly discussed, while 24 had received no discussion at all (6, 10, 12, 16, 18, 19, 20, 21, 23, 25, 28, 30, 32, 34, 35, 36, 39, 40, 41, 44, 45, 46, 47, 48). Seven days' discussion was reserved for the Report stage. For the Welsh Church Bill the time-table resolution had been carried on November 28th, at the end of an all-night sitting, after a "reasoned amendment," proposed by Mr. Lyttleton on behalf of the Opposition, had been defeated by 295 to 221; but the government agreed to give 16 days, instead of the 14 originally proposed, to the Committee stage, which began on December 5th. The discussions were marked throughout by much bitterness of feeling on the part of the defenders of the Church, among whom Lord Robert Cecil was specially prominent, but they were notable also for some important expressions of the desire of Liberal Churchmen to make the disendowment proposals less harsh than what the Welsh Nonconformists considered to be in accordance with their rightful demands. On December 5th clause 1 was carried by 298 votes to 179, and clause 2 by 279 to 183, while clause 3 was carried on December 6th by 259 to 145; but on December 13th clause 4 was only carried by 269 to 202, after an amendment moved by Mr. France and seconded by Mr. Gladstone (both Liberals), for leaving the Church all its endowments except tithe-rent-charge (thus proposing to reduce its funds by £126,000 a year instead of £173,000), had been rejected by 265 to 215, the majority of 50 including 68 Irish Nationalists. And after clauses 5, 6 and 7 had been carried on December 16th and 17th by normal Coalition majorities, a concession was made on clause 8, the government accepting (Dec. 18th) amendments proposed by Sir Ryland Adkins and Mr. Atherley Jones (both Liberals), by which, much to the disgust of the Welsh members, the Church would retain possession of the Queen Anne's Bounty funds and property (see *E. B.* xxii, 729, 730). On another amendment, proposed by Mr. Ormsby Gore (Conservative), for keeping all the glebe as Church property, the government majority fell (Dec. 19th) to 55, the figures being 277 to 222; and clause 8 was only carried by 284 to 221. The fact that the majorities in both these cases were smaller than the number of Irish Nationalists voting with the Government showed that there was a good deal of sympathy with the Opposition among some sections of Liberals.

The actual proceedings in the House of Commons were being followed however with marked apathy in the country. Everybody felt that the real struggle had to come in 1913. During the whole of December the critical state of European affairs monopolised public interest; and the party conflict took a secondary place when larger issues were at stake. Mr. Asquith and Sir Edward Grey, by common consent, were making British influence a powerful factor for peace in the settlement of the Balkan crisis. The Administration was strengthened for the moment simply by the fact that it represented the whole nation in the councils of Europe. Meanwhile trade was booming, and in some other respects also the position of the Government was more favourable than it had seemed likely to be a few months earlier. Since the Bolton by-election on November 23rd, when the Liberal candidate had surprised his own party by retaining the seat with only a slightly diminished majority, the Liberal Press had taken a much more confident tone about the Coalition prospects. Moreover, in the middle of December, a flurry started in the Unionist ranks over a contentious question of electioneering tactics, which did much to assist a revival of Liberal confidence. Since Mr. Bonar Law had become the Unionist leader there had been, to all appearance, a concentration among all his followers on Fiscal Reform and Imperial Preference as the corner-stone of their constructive policy, and little had been heard of any wavering as to the principle of including low taxes on foreign wheat and other food-

**Revival of
Liberal
confidence.**

stuffs so as to give a preference to colonial imports. But the question of going to another election at all on a programme including food-taxes was now raised again on what started purely as a side issue. It was thought by the leaders of the party that the time had come when an explicit declaration should be made that Mr. Balfour's proposal, before the general election of December 1910, to submit the first Tariff Reform Budget after the Unionists returned to office to a Referendum, was no longer the party policy; and Lord Lansdowne accordingly made a statement to that effect at the Albert Hall on November 14th. No sooner had it been made than an agitation arose in certain Unionist quarters, especially in Lancashire, where it was contended that harm would be done to their electoral prospects by dropping the proposal; and the cry was taken up in circles where the food-taxes had always been disliked, with the result that pressure was put on Mr. Bonar Law to make a definite pronouncement on the whole scheme of Imperial Preference. This he did at Ashton-under-Lyne on December 16th, but without the effect that was presumably intended.

A large part of Mr. Bonar Law's speech was devoted to combating the claims of the Radical party that they were the peculiar friends of the working classes; on the contrary he insisted that the party now in power were occupied mainly in work of destruction, and that the real social needs of the community could only be met by a Unionist government. After criticising Mr. Lloyd George for offering what were only quack remedies, and declaring that the most important question of the day, so far as the industrial class was concerned, was to raise the level of wages throughout the country, which Tariff Reform would help to do, he proceeded to explain at length the main lines of the Tariff Reform programme, and particularly its relation to the policy of Imperial Preference. He repudiated the allegation that Tariff-Reform was simply old-fashioned Protectionism. It was not proposed to bolster up industries which were not naturally suited to the country, or to enable manufacturers to secure an artificial monopoly. Tariff Reform involved the imposition of duties smaller than in any other country, and its object was to give British workmen a preference in the home market over their foreign competitors. Similarly the object of Imperial Preference was to unite the Empire on lines of trade, and to secure for the United Kingdom the largest possible advantage in the British oversea markets. It was in connection simply with Colonial Preference that food duties were included in the Unionist programme, and he adhered to that policy in spite of all the misrepresentations to which it lent itself. "For nine years we have kept the flag flying, and if there is any sincerity in political life at all, this is not the time, and I am not the man, to haul down that flag." But he wanted to make clear exactly what this meant; and here Mr. Law announced a new departure which to some extent appeared inconsistent with his previous utterance:

"If our countrymen entrust us with power, we do not intend to impose food duties. What we intend to do is to call a conference of the Colonies to consider the whole question of preferential trade, and the question whether or not food duties will be imposed will not arise until those negotiations are completed. . . . We do not wish to impose them. They are not proposed by us for the sake of Protection, and there is no Protection in them. They are proposed solely for the sake of Preference, and if when the conference takes place the Colonies do not want them—I will put it far stronger than that, unless the Colonies regard them as essential for Preference—then also the food duties will not be imposed. All that we ask is that our countrymen should give us authority to enter into that negotiation, with power to impose certain low duties on foodstuffs, and within strict limits which will never be increased. . . . I hope it will be possible, and I think it may be possible, that if any readjustment is necessary it will only be a duty on wheat. I hope so, but I do not think it would be reasonable to ask the Colonies to meet us if our power of negotiation were limited. . . . If the Colonies do not think those duties necessary for Preference, they will never be imposed; if they do think them necessary, then I for one do not believe that the people of this country would not be ready to make that readjustment which is necessary to effect the purpose."

As regards the Referendum, Mr. Law repeated Lord Lansdowne's declaration, and justified it on the ground that a pledge to submit the result of the negotiations with the colonies to a Referendum in the United Kingdom would not be fair to the colonies.

Next morning this speech had a "mixed" reception both in the Unionist Press and

in the party. The *Daily Mail* took it quite plainly as meaning that no food taxes would be proposed at all, and approved of their being dropped. The *Times*, admiring "the spirit, but not the letter," objected to making the taxation of the United

**Unionist
internal
dissensions.** Kingdom appear in any shape to depend on the decision of the colonies; the responsibility must be with the electors of the United Kingdom. In Lancashire and Yorkshire, and also in Ireland and Scotland, some important

Unionist papers openly mutinied against the abandonment of the Referendum. Uncertainty as to what Mr. Law really meant—an unusual thing in his case—led to a revival, in the clubs and in the House of Commons, as well as in the Press, of the same sort of expression of hostile sectional views that had made Mr. Balfour's leadership so difficult between 1903 and 1906. There were "alarums and excursions" for several days. Mr. Garvin, in the *Pall Mall Gazette* and *Observer*, violently accused the *Times* and *Daily Mail* of leading a movement for repudiating the idea of food duties altogether, and fulminated against all and sundry who should split the party and betray the cause of Imperial Preference. Nothing that those papers had actually said really warranted any such invective, though the *Times*, both through its parliamentary correspondent and in its second leading-article on the subject (Dec. 19th), encouraged the view that the majority of Unionists were averse from food taxes and would prefer to see Mr. Balfour's Referendum policy maintained, and that the section in favour of food taxes, though in control of the party "machine," was really a small minority. By giving currency to the report that the larger section was composed of followers of Mr. Walter Long and the smaller of those of Mr. Austen Chamberlain,—an analysis of the situation which was much too simple and very far from correct,—the *Times* moreover gave some ground for suspicion and irritation on the part of those who had always advocated the "whole policy." But, while criticizing Mr. Bonar Law's suggestion that it would rest with colonial opinion to decide whether food taxes should be imposed, the *Times* had been quite firm in supporting Imperial Preference, including the possibility of new food duties; its real objection was to laying down any scheme of taxation in advance of precise knowledge of the conditions which might exist when a Unionist government should return to power. Nor was there theoretically any weakening in the *Daily Mail*, so far as the general policy of Tariff Reform was concerned: on the contrary, on December 24th it announced that "the *Daily Mail* is frankly Protectionist, and is a firm believer in Imperial Preference," but it was "not over-enamoured of food taxes" and "hopeful that the Dominions do not wish Great Britain to tax corn." As consideration became cooler, it was recognised that nobody wanted to do anything that was not in the interest of a united party. Mr. F. E. Smith, speaking at Dudley on December 20th, declared that the whole Unionist front bench in the House of Commons adopted the views expressed by Mr. Law, and that he had never meant that the decision as to food duties would be left to the colonies; all that he meant was that the decision must depend on what the colonies wanted. A duty on wheat, which seemed a vital matter in 1903, might be much less so now; and while Mr. Law had taken the straightforward course of saying that the electors must leave the matter open for negotiation, the indications were that the colonies themselves would not ask for any measure which could be represented, even untruthfully, as likely to raise the cost of living to the working-classes in Great Britain. Mr. Austen Chamberlain also wrote a letter to a correspondent on December 23rd, expressing a general agreement with Mr. Bonar Law.¹

While this lively interlude was providing sport for the Free Trade party, the penultimate act of another drama, of more direct import to Liberalism, was also drawing to its close. On December 19th the result of the poll was published which had been taken among the medical profession, as to whether they would accept Mr. Lloyd George's latest terms for ordinary medical service under the Insurance Act, outside the special

¹ Eventually, as the result of a memorial from the bulk of the Unionist M.P.'s, Mr. Bonar Law, on January 14, stated in a letter that he and Lord Lansdowne, while remaining leaders of the party, were willing to agree that food duties should not be imposed without the approval of the electorate at a subsequent general election.

terms made for the treatment of tuberculosis, which had already been accepted. Out of a total vote of 13,731 only 2,422 were in favour of accepting, 11,309 being for rejection, an adverse majority of considerably more than 4 to 1. On December 20th the representative meeting of the British Medical Association was held, to consider what action its members should take in view of the voting, and by 182 votes to 21 a resolution was passed rejecting the Government proposal and advising the profession to decline service under the Act. In the previous February practically the whole profession—at all events 27,400 doctors—had signed an undertaking to stand together by the policy to be decided upon by the British Medical Association, and if they held to their pledge this meant a complete breakdown in the provisions of the National Insurance Act for medical benefit, which were to become operative on January 15, 1913. On the other hand, a scheme for an alternative policy was coupled with this flat refusal of Mr. Lloyd George's own proposals. It was recommended that the profession should express its willingness to treat insured persons, under arrangements to be made between local committees of doctors and the insured or their representatives (*i.e.* the approved societies) for a minimum capitation rate of 8s.6d., inclusive of drugs, or a minimum fee of 2s.6d. a visit, on condition that each insured person should have free choice of doctor and that the doctor should consent to act. Under this plan the doctors would not be dictated to by the lay insurance committees, but the financial terms would be practically the same that Mr. Lloyd George had last offered. It was promptly announced that the Government could not fall in with this proposal, which would involve handing over public money without public control; and the question now was whether there would be sufficient breaking-away from the pledges given to the British Medical Association for the insurance committees to be able to secure their panels of doctors in accordance with the regulations under the Act. Only about half of the 27,000 doctors who had ranged themselves with the Association in February had actually taken the trouble to go to the poll in December, and though this was generally believed not to indicate in itself any corresponding failure in the solidarity of the profession, there were now signs of a good deal of independent action in certain localities, and notably in Scotland. Already in November a few doctors who thought it a public duty to fall in with the Government scheme had started a new organisation in opposition to the British Medical Association, called the National Insurance Practitioners Association; and its influence, backed by Government support, was being exerted in the same direction. On Jan. 2, 1913 Mr. Lloyd George, addressing the Advisory Committee, took a sanguine view of this situation, and declared that some 8,000 doctors were available. Nevertheless the strike now proclaimed against the Insurance Act by the recognised leaders of the medical profession was a very awkward fact for the Liberal party to reckon with. The year thus ended with the promise of a full crop of domestic political difficulties to be harvested in 1913.

(HUGH CHISHOLM.)

IV. *The Labour "Unrest."*

Allusion has already been made to the complications attending the political situation during 1911 and 1912 on account of the industrial unrest, which had taken a peculiarly acute and dangerous form. Though trade generally was busy, and "unemployment," which had been a serious problem only a little while previously, steadily diminished,¹ the demand of the wage-earning classes for a proportionately larger share of the good things of life—better pay and less work for it—had become more articulate and more organised than had been known before. Socialist—and particularly "Syndicalist"—theories had for some time been getting a strong hold of the younger generation of trade-unionists; and a growing sense of the impotence of the Labour members in Parliament, added to increasing suspicion that Liberals and Tories alike were in league with the "money power," encouraged the idea that "direct action" by means of strikes was

¹ The only official figures for "unemployed" issued by the Board of Trade are for the trade unions. In these the percentage of unemployment, which was 9 in 1908 and 1909 fell to 5 in 1910 and 3 in 1911. For the first eleven months of 1912 it was as follows: January 2.7, February 2.6, March 11.3 (coal strike), April 3.6, May 2.7, June 2.5, July 2.6, August 2.2, September 2.1, October 2.0, November 1.8.

the only way of successfully asserting the claims of the operatives to a larger share of the profits of industry. The fact that wages, under existing agreements, practically remained stationary, while the cost of living, owing to higher prices, was going up, gave a solid basis for discontent. The result was seen, not only in numerous local conflicts between Capital and Labour, of which it is unnecessary to give a detailed account, but in three more extended "general" strikes, which aimed at holding up whole industries throughout the country and compelling parliamentary intervention. These were the Railway Men's Strike of 1911, and the Coal-miners' and Transport Workers' Strikes of 1912. A narrative of each of these is given below, in which allusion is made to the political incidents concerned with them. One outcome of the Railway Strike, and of the general unrest of which it was a symptom, was an addition made by the Government to the official machinery applicable at the Board of Trade to the working of the Conciliation Act of 1906. In October 1911 an Industrial Council, representative of employers and workmen, was instituted, as a permanent body for considering and inquiring into matters referred to them concerning trade disputes, and for taking suitable action (but without any compulsory powers) on the same lines as the Conciliation Boards already adopted in particular industries. As Chairman of this Industrial Council, and "Chief Industrial Commissioner," the Government chose Sir George Askwith (b. 1861), head of the Labour department of the Board of Trade, who had just been knighted in recognition of the valuable work he had done in effecting peace in recent industrial conflicts. But during 1912 at all events the deliberations of the new Industrial Council were not specially productive.

From a public point of view the worst feature of the industrial conflicts during 1911 and 1912 was the spirit of lawlessness so repeatedly shown in acts of violence and intimidation, and the apparent inadequacy of the law (partly owing to the Trade Disputes Act) to vindicate the "right to work" on the part of willing labourers outside the ranks of the unions. With a view to supplementing the protection available in the shape of the police and the military—limited as this might be by the unwillingness of the executive government to do more than appeared absolutely necessary in taking a side against strikers who were also voters, and even actually political supporters—various arrangements were made in 1911 for enrolling volunteers in private organisations for the purpose: but so far this movement has not had any important practical result. In spite of constant criticism on points of temporary difficulty both from employers and in Parliament and in the Unionist Press, the measures taken by the Government in calling out troops and supporting the local authorities were substantially effective. The complete failure of the Transport Workers' strike of May-August 1912, following on the disappointing results of both the railway strike and coal strike, showed that when society as a whole was threatened, it could and would protect itself, and that the security of existing social order was the first consideration for the executive Government, however much it wished to be neutral in disputes between employers and employed. The necessity of using troops, however, as well as police, in such circumstances, has led to great bitterness on the part of the strikers and their sympathisers in Parliament; and in certain socialist quarters attempts have been made to put pressure upon soldiers themselves not to assist Capital against Labour and thus fight against their own class. In March 1912 the Government prosecuted a journalist named Bowman, together with the two printers of a paper called *The Syndicalist*, for the publication of an article inciting soldiers to mutiny by telling them not to shoot at strikers if ordered to do so; they were found guilty at the Old Bailey, and sentences of nine and six months' hard labour was passed (March 22nd). On March 19th too, for making a speech to the same effect, Mr. Tom Mann, the well-known Labour agitator, was arrested on a warrant issued by the Salford magistrates, and he was found guilty at the Manchester assizes on May 9th and sentenced to six months' imprisonment (reduced to two months by the Home Secretary.)

The year 1912 also saw the fruition of an enterprise long discussed at Trade Union Congresses, namely, the starting in England of a daily paper directly representing Labour. On October 8th the first number of the *Daily Citizen* was published, under the

control of a board of directors appointed on behalf of the trade unions, the parliamentary Labour party and the Independent Labour party. Heretofore the principal organ of the movement—and particularly its socialistic side—had been the weekly *Labour Leader*; but the direct financing and control of a regular daily, combining the supply of general news with the attempt to forward Labour interests in particular, in competition with existing dailies, was a much more ambitious experiment, the results of which remained to be seen.

The Railway Strike of 1911.—For the first time in the history of English labour troubles a “national” strike was precipitated in 1911, and private war was made on the whole community by the members of the railway unions. In 1907 there had been a violent agitation among members of the Amalgamated Society of Railway Servants for better wages and shorter hours, and, towards this end, for “recognition” of their Trade Union by the railway companies, which had been steadily refused by all except the North Eastern Company (after an arbitration in 1897). This struggle had gone on for many months, the companies insisting that their finances would not permit of any concessions, till in October 1907 a ballot of the Union was taken and preparations were made for a general railway strike. This was only averted on November 6th, as the result of negotiations carried on by Mr. Lloyd George as President of the Board of Trade, by an agreement between both sides to accept a scheme of conciliation and arbitration proposed by him. Under this scheme¹ sectional boards were set up for each company, composed of representatives of employers and employed, to deal with disputes about hours and wages; a Central Conciliation Board, also representing both sides, was set up to adjudicate on points on which the sectional boards did not agree: and a final appeal was provided to a single arbitrator to be appointed by the Speaker and Master of the Rolls or one of them. The agreement to abide by this scheme was to remain in force for six years and then be terminable by either side on a year’s notice.

Mr. Lloyd George was thought to have been highly successful in bringing it about, and it was hoped that a permanent remedy had been found for the unrest in the railway world. The companies had gone a very long way to meet the demands of the Union owing to the pressure put on them by the Government to accept the scheme. The actual working of the Conciliation Boards however proved as time went on very disappointing to the railway men; and the movement for shorter hours and better wages, persistently pressed by the forward party in the Union and associated with the socialist propaganda throughout the Labour world, came to a head again in 1911. Strikes had been going on in Liverpool, Manchester, London and elsewhere, among various other classes of transport workers,—seamen, dockers and carters. In London a violent dock strike was only terminated early in August by an award of Sir Albert Rollit, increasing wages; and a carmen’s strike, which had been accompanied by serious disorder and had driven the Government to order troops from Aldershot, was brought to an end with considerable difficulty at the same time by the intervention of the Board of Trade, the men securing concessions both as to hours and wages. At Liverpool a protracted dock strike had driven the shipowners on August 3rd to agree to “recognise” the Dockers Union and make other concessions; but a number of strikers refused to go back to work; and the shipowners then announced a general lock-out to begin on August 14th. The answer of the Dockers Strike Committee, led by Mr. Tom Mann, was to call on all transport workers to assist them by striking in sympathy, and wild scenes of rioting resulted, requiring the assistance of troops to assist the Liverpool police. The general unrest now spread in an active form to the railway men too.

For some time past the discontent at the working of the Conciliation scheme had led to talk of a general railway strike; the Trade Union agitators were spoiling for a fight and the companies were preparing for emergencies. At Liverpool the goods porters at the Lancashire and Yorkshire stations struck on August 5th because of the delay in dealing with their grievances, and at other stations the men came out in sympathy. On August 15th, the joint executives of the four railwaymen’s Unions,—Amalgamated So-

¹ See generally *E. B. ii, 331 et seq.* by Microsoft®

ciety of Railway Servants, Associated Society of Locomotive Engineers and Firemen, General Railway Workers' Union, and Signalmen's and Pointsmen's Union—decided to order a general strike unless in twenty-four hours the companies agreed to meet them and discuss terms. The Companies at once refused to do so, or to admit that the Conciliation scheme of 1907 could be thrown over in this way. The leaders of the men on the other hand contended that the spirit, if not the letter, of the agreement of 1907 had never been carried out, and that they must have direct recognition of their unions. Matters were now at a deadlock. However conciliatory the Government might be to Labour, its attitude was necessarily dictated, in the first place by the duty, in the event of a strike, of securing the transport of food and mails, the safety of property, and other public interests threatened, and secondly by its own responsibility for the agreement of 1907 which the railway men were openly intending to break. The machinery of the Board of Trade was set to work to try to bring both sides together and to delay the rupture, but meanwhile the companies, who engaged to provide for a restricted service by means of their non-union employés, were guaranteed military protection, and preparations were made for placing soldiers along the lines, at the stations and elsewhere for this purpose.

On August 17th Mr. Asquith had an interview with the men's representatives, and offered a Royal Commission to inquire into the working of the Conciliation Scheme, but at the same time he warned them gravely and firmly that the Government could not allow the railway service of the country to be paralysed. Resenting the tone of his speech, and suspicious of a Royal Commission as simply a means of shelving the whole matter—though it was explained too late that Mr. Asquith really meant a Commission of three to sit and report at once—they refused this offer and ordered the strike, which began next day in spite of continued efforts by Mr. Lloyd George (Mr. Asquith having left further action to him) to overcome what seemed to be a misunderstanding. As the result of his explanations to the men's leaders negotiations still went on; a vote of censure on the Government which the Labour Party at first decided to move in the House of Commons was not proceeded with; and instead of Parliament being adjourned on August 18th until the autumn session as had been arranged, it was decided to meet again on August 22nd in order to deal with the situation. Meanwhile the strike was in actual operation for practically two whole days and did not terminate till August 20th. On Saturday (19th) however a settlement was effected late at night, as the result of a conference at the Board of Trade between representatives of the companies and the men, Mr. Ramsay Macdonald, Mr. Lloyd George, Mr. Sydney Buxton, Sir H. Llewellyn Smith and Mr. G. R. Askwith. It was agreed that a Special Commission should at once investigate the working of the Conciliation Scheme and report quickly what changes were desirable, and that the trade-union leaders should persuade the men to return to work, the strikers being reinstated. There was some difficulty in certain districts in getting the men to go back at once, but the crisis was now substantially at an end, victory being claimed for the strikers at a mass-meeting in Hyde Park on Sunday. When Parliament met on the 22nd Mr. Asquith explained what had been done, and gave the names of the Special Commissioners,—Sir David Harrel (Chairman), Sir Thomas Ratcliffe Ellis, Mr. C. G. Beale, Mr. A. Henderson, M.P. and Mr. John Burnett; and though Mr. Keir Hardie and a few supporters insisted on a division against adjourning for the parliamentary holiday and attacked the Government for taking sides against the strikers—a charge warmly resented by Mr. Lloyd George,—the general feeling was that a bad business was over as well as was possible.

The Special Commission started work on August 23rd and took evidence from both sides up to October 3rd, its report being issued on October 20th. It was unanimously recommended that the Conciliation Scheme should be amended in various ways, the central board being abolished and any differences within the sectional boards being settled by an independent chairman chosen from a panel drawn up by the Board of Trade; Trade Union "recognition" by the companies was not directly conceded—the Commissioners pointed out that the companies could not permit intervention on the subject

of discipline and management,—but some satisfaction was given in this direction by a recommendation that the men should have anybody they wanted (*e.g.* a Trade Union official and not actually an employé) on the sectional boards as their secretary and advocate. Meanwhile however, though the men were back at work, there was still much unrest, and the Labour party and Trade Union leaders were by no means satisfied with the result of the Commission. When they accepted its appointment there was a general impression, shared in by the Government, that both sides had agreed to accept its findings, but on the men's side this was now denied, and threats of a renewal of the strike were made unless the companies agreed to specific demands for shorter hours and higher wages on a minimum scale. The union leaders decided to take a ballot in December on the question whether the findings of the Commission should be accepted or another strike for "recognition" started; and when the report of the Commission came up for discussion in the House of Commons on November 22nd the situation was still a very difficult one. A resolution was moved by Mr. Lloyd George asking the Government to bring about a further meeting between the representatives to the agreement of August 19th; but this was only carried after a contentious debate displaying obstinacy on both sides, Mr. Ramsay MacDonald insisting that the men had not agreed to accept the Report and that "recognition" was indispensable, while the view of the companies was that the Government ought to hold the Report as binding on both parties. It was not till December 11th that, after a good deal of diplomacy on the part of the Board of Trade officials, a compromise was arrived at as the result of further conferences. A few days before, the ballot of the members of the unions had been taken, but the result was not made public, and now both parties agreed to accept the Report of the Commission as a basis for modifying the future working of the Conciliation Scheme, the "recognition" of the unions being accepted to the extent of allowing the men to have their Trade-Union Secretary as adviser. Matters were gradually arranged for continuing the conciliation boards on this amended scheme, and various concessions as to wages and hours were also made by the companies, which helped to keep the peace with the unions during 1912; though discontent with their conditions of labour still continued among various classes of workers.

As regards the strike itself, while in actual operation, the state of the railways during those two or three days was unprecedented. Some 220,000 men altogether, about a third of the workers, were out, and traffic was much restricted, the worst dislocation being in the North of England, round Liverpool and Manchester. Troops were employed freely to guard the lines and give protection against violence, and in consequence there were only certain particularly disturbed districts where serious mischief occurred. On August 19th an attack was made by rioters on a train at Llanelly, and the soldiers had to shoot, two men being killed, while an explosion due to the mob setting fire to some trucks containing gunpowder resulted in five more deaths; and at Liverpool on the 15th two men were shot in a riot. The employment of the military was furiously denounced by the Labour agitators, but the intimidation practised against non-unionists and the danger of extended sabotage were such that, on the whole, the comparative peaceableness of the stoppage, which occurred in a summer of unexampled heat, was rather remarkable. To a great extent, and particularly on the lines nearer London, this was due to the fact that a large proportion of the union-men who went out (a certain number remaining loyal to the Companies) only did so because they dared not disobey the union orders.

Simply on the issue as to more generous treatment of the railway-workers there was a fairly widespread sympathy on the part of the public with the men, and it was against the method employed by their leaders for asserting their claims that public indignation was aroused. It is too early to estimate whether any substantial success was gained by the strike in improving the position of the men. One definite advantage was however secured for the railway unions as such; their membership before the strike had been steadily declining, and during the subsequent months they were joined by large numbers of men who had previously remained outside.

The Knox Case, 1912.—In December 1912 a serious strike took place on the North Eastern railway over the case of Driver Knox, leading temporarily to a complete local dislocation of traffic and much injury to industry. Knox, who was a main-line driver, had been arrested at Newcastle on October 26 for being drunk and disorderly and assaulting the police, and when brought before the magistrates was fined five shillings for being drunk, though the charge of assault was dismissed. He was off duty at the time, but the company naturally took a serious view of such a conviction in the case of a man who was liable to be responsible for the safety of a passenger-train, and he was reduced in rank to that of driver of a pilot-engine only. He had apparently thought that no notice would be taken by the company, and had paid the fine and not appealed against the conviction; but when he was reduced in rank he protested that he had been wrongly convicted, and his case was taken up by the local branches of the men's union at Newcastle, Gateshead and elsewhere, their claim being that the company had no right to take cognisance of a man's action when off duty. Their demand that Knox should be reinstated was refused on public grounds by the company, and on December 6 the men decided to strike. The situation was altogether anomalous, since the strike was carried out without the sanction of the officials of the union, without legal notice, and contrary to the agreement made with the company for referring all disputes to a conciliation board; but by December 8 thousands of railwaymen at Newcastle, Gateshead, South Shields and other neighbouring centres had gone out, and the whole service was disorganised. It quickly became apparent that a settlement depended on whether Knox's conviction for drunkenness represented a serious offence or not. As matters stood the company were bound to treat it as one, but if he could show that an error had been committed they were prepared to reinstate him. For this purpose an appeal was made by Knox to the Home Office, and on the 10th of December the Home Secretary sent Mr. Chester Jones, one of the London police magistrates, to Newcastle to hold an official enquiry. He began to take evidence on the 12th, and issued his report on the 14th. It was shown that Knox was not quite sober on the occasion in question, and had been refused admission to a tramcar, with the result that an altercation took place, in which he had been roughly handled by the police; but the evidence was by no means satisfactory, and Mr. Chester Jones, in the circumstances, came to the conclusion, on the main point at issue, that Knox was not really either "drunk or disorderly" or "drunk and incapable" or even "drunk at all in the police-court sense." This being so, the Home Secretary announced that Knox would be granted a free pardon; and as this result wiped all the proceedings out the company immediately reinstated him. It was agreed that the strikers should resume their old places, which they had forfeited by their breach of agreement, on paying a week's wages as a fine, while the company paid compensation to the new men they had taken on during the strike; and on these terms the whole affair came to an end on December 16 with a minimum of further dissatisfaction.

The National Coal Strike of 1912.—In December 1912 a strike began at the Cambrian Combine Collieries (of which Mr. D. A. Thomas was managing director), owing to the failure of the two referees (representing owners and men) appointed by the South Wales Conciliation Board to agree upon a tonnage price for the working of a seam at the Ely Pit, which had till then been worked on day-work. The rates offered by the owners were denounced by the strike committee as a "starvation" wage; but the strike was really a forward move on the part of the younger extremists among the men, who had obtained the upper hand and were influenced by socialistic doctrines. A general lock-out of the men working in other seams in the Ely Pit was the masters' reply. The Welsh socialists then sent delegates to enlist sympathy among the English and Scottish miners elsewhere, and to try to bring about a general strike; but the leaders of the Miners' Federation of Great Britain were not prepared to support the action of the Ely Pit strike committee, and financial support was withdrawn, so that the strike collapsed. But the propaganda which started in connection with it had an influence on what followed.

ENGLISH COAL STRIKE

For some little while the Miners' Federation had been putting a claim before the owners in the Federated area for the fixing of definite rates of payment in the case of "abnormal places," where the men were unable to earn an average day's wage for no fault of their own. The reasonableness of some such step could not be altogether denied, but the difficulty was to agree on satisfactory terms, and no conclusion had been arrived at. At the Southport Conference of Miners' Delegates in October 1911 the demand that, in abnormal places, a miner's remuneration should be made up to the district rate was given a different form, a claim now being made for an all-round minimum. The following resolution, proposed by the executive, was unanimously passed:—

That the Federation take immediate steps to secure an individual minimum wage for all men and boys working in mines in the area of the Federation, without any reference to the working places being abnormal. In the event of the employers refusing to agree to this, the 21st rule to be put into operation to demand assent.

The delegates were instructed to report the result of their negotiations with the employers at a second Conference on November 14th. At this conference, at which they reported their failure to obtain the minimum wage, an adjournment was resolved on (by 336,000 votes to 238,000) for future negotiations; and on December 21st, the situation remaining the same, it was resolved that a ballot should be taken on January 10th–12th, 1912, on the question "Are you in favour of giving notice to establish the principle of a minimum wage for every man and boy working in the mines of Great Britain?" A resolution was also passed "that each district send to Mr. Ashton [General Secretary of the Miners' Federation] a tabulated statement of what it desires to be its minimum wage, and that the Executive Committee of the Federation meet to consider the statements and report to a National Conference in Birmingham on January 18, 1912."

The result of the ballot, as declared at the Birmingham Conference, showed 445,801 votes for giving notice, 115,721 against,—majority 330,080, South Wales alone giving a majority of 85,107 for stopping work. And on February 2, 1912, after considerable discussion of the minimum rates asked for, the following schedule was approved:—

	District Demand		Rate Approved			District Demand		Rate Approved	
	s.	d.	s.	d.		s.	d.	s.	d.
Yorkshire	8		7	6	Bristol	6		4	11
Lancashire	7		7		Cumberland	6	6	6	6
Midlands	5	6-7 1/2	6	7	Scotland	6		6	
Derbyshire	8		7 1/2	7 6	South Wales	8		7 1/2	7 6
Nottinghamshire	8		7	6	Northumberland	6	6 9	6	7 2
North Wales	7		6		Durham	6	1 1/4	6	1 1/4
Leicestershire	7 1/2		7	2	Forest of Dean	6		5	10
South Derbyshire	6	-7 6	6	6	Cleveland	6		5	10
Somersetshire	6		4	11					

The coal-owners met on February 7th, and the Welsh owners then refused to discuss the minimum wage and retired from the conference. This made a strike inevitable, since the miners were not prepared to settle with any but the whole Federated area, and notices were given accordingly, the public being faced with a prospect of a complete cessation of coal supplies. The Prime Minister on February 20th invited both sides to meet him to discuss means of averting a national stoppage, and their representatives met him on February 22nd, but to no purpose; and on February 26th the first miners went on strike at Alfreton, the rest soon following; in spite of the announcement that the principle of a minimum wage was now adopted by the Government and that they would take steps to give it Parliamentary sanction unless an agreement were arrived at. On this point a split occurred between the coal-owners, those of Durham and the Federated districts being prepared to fall in with the proposal of the Government, and the others refusing. On March 1st over a million coal-miners were out (Yorks and N. Midlands, 235,000; S. Wales 220,000; Scotland 130,000; Northumberland, 120,000; Durham, 110,000; Midlands and South, 105,000; N. Wales, 70,000; N. and E. Lancs. 45,000), and during the whole month the country was convulsed by the calamity.

At last, after the Government had made a further unsuccessful attempt, by a conference, to bring owners and miners to agreement, on March 19th Mr. Asquith introduced in the House of Commons a Minimum Wage Bill as their last resort. It provided that, in the coal industry, every contract for employment should involve the payment of a minimum rate, to be settled for each district by a joint board set up under the auspices of the Board of Trade. The Bill was read a second time on March 21st, after a motion for its rejection by Mr. Balfour, on behalf of the Opposition, had been defeated by 348 votes to 225, and it had passed both Houses on March 28th. Having made their protest against a piece of revolutionary legislation which introduced so novel and far-reaching a principle into industrial economics, the Unionists left the responsibility to the Government, and the only Parliamentary difficulty was caused by the Labour party, who fought for the inclusion of a precise definition of the minimum in the shape of 5s. a day for adults and 2s. for boys; as the Government refused this and insisted on the rates being fixed by the district boards, the Labour party opposed the third reading, which, however, was carried by 213 to 48. There was acute dissatisfaction among the miners at the failure of the Labour party to get their own minimum schedule of rates adopted, and for a time the result was doubtful; but it was decided to take a ballot (April 1st) on the question of returning to work, and though a majority still voted for staying out (244,011 to 201,013) it was not large enough (two-thirds being required by the rules) and the abstentions were significant.

The fact was, the funds were exhausted and the men had had enough of the struggle. The conclusion of Sir A. Markham, the Liberal M.P. and coalowner, writing in the *Quarterly Review* for April 1912, is probably the verdict of history; he considered that "the ground of attack was ill-chosen; the men should have stood to their original demand, the payment on account of abnormal places or losses due to bad management. If in addition they had asked for an increase of wages equivalent to 10% on the basis rates, to meet the increased cost of living, they would have occupied strong ground. The great mass of men came out to obtain higher wages, and for no other reason; and when they voted for the formula 'minimum wage' nine-tenths did not know what they were voting for." The result, as the year went on and the minimum rates were settled, not without friction, was a profound disgust among the coal-miners generally with the operation of the new Act, which was found to do very little to increase the amount paid in wages; but it had done its work for the moment, the crisis being over. In October moreover an agreement was arrived at between representatives of miners and coal-owners of the English Federated area, by which about 400,000 workers would at once receive an advance of a shilling a week in wages. This was the outcome of discussions before a Conciliation Board, which had been in existence for some years and was now renewed for a further period; and this addition of about £1,000,000 a year to the wage-fund was worth more than all the haggling about minimum rates.

The Transport-workers' Strike of 1912.—In connection with the opening phases of the railway strike of 1911, allusion has already been made to the sporadic strikes of other sections of "transport workers" earlier in that year; and the general dock strike which began in London on May 20, 1912, was really the concluding phase of the unrest which had only been partially quieted during the previous August. First the lightermen came out, and then a "sympathetic" strike involved all the other unions of transport workers connected with the Port of London. The nominal reason for the lightermen ceasing work was their objection to one man employed as a watchman having no "Federation ticket;" he belonged to the Foremen's Society, a union not affiliated to the Transport-workers' Federation, but refused to join the Lightermen's Society, which was so affiliated, and when the lightermen demanded his dismissal, on the ground that they would work only with men who belonged to the Federation, his employers naturally refused. This was however in reality only the culmination of a number of "grievances" put forward by the men, who complained of being victimised under the terms of the existing agreements. Unsuccessful negotiations had for some time been going on between their secretary Mr. Gosling (himself actually a member of the Port of London Authority)

and the Board of Trade, with a view to pressure being put on the employers; and the declaration of a strike on May 20th for the reason given was prompted by the hope that the hands of the Government would be forced. In taking this step the lightermen relied on their privileged position in the Port of London. Their Society held an old licence from the Watermen's Company, whose functions were transferred in 1908 to the new Port of London Authority, and the law was that unlicensed men should not be employed so long as licensed men were available, so that, apart from the difficulty of obtaining substitutes in an emergency, the employers, as they knew, would have to reinstate them when the strike was over. (One result of the strike was that the Port of London Authority took steps to get this law altered.)

The Federation of Transport Workers now took up the Lightermen's cause, and in doing so put forward a further grievance on behalf of the Carters' Union, by whom an agreement had been made with the Master Carters' Association when the strike of the previous August was settled. The complaint was that one firm which had joined the Association had dismissed their union men, contrary to the terms accepted, and had resigned from the Association when it called them to account, so that the agreement was useless. The Union demanded accordingly that all employers in the Port should be obliged to belong to a Masters' Federation, which would have power to guarantee the carrying out of agreements. As no concession on this point was forthcoming, notice of a general strike of all members of the Transport Workers' Federation was given.

The Government at once took action by appointing Sir Edward Clarke, K.C., to hold an enquiry on May 24th, in order that the issues, which at the moment were decidedly confused, might be somewhat better defined, and in the hope of checking the development of the conflict. He sat to hear evidence from both sides at Fishmongers' Hall, and made his report on May 28th to the effect that, while the lightermen were wrong in supposing that the award of the previous August meant that none but members of their Federation should be employed, and they themselves had broken their agreement by striking without recourse to arbitration, still there were several points on which the Transport Workers had legitimate grievances, owing to the employers not having carried out certain terms of their agreements also. The Government on May 29th suggested a conference between the two sides, which was however declined by the shipowners, who insisted that the only point really at issue was the lightermen's breach of agreement in suspending work and thus dislocating the whole business of the Port. Meanwhile a general strike of transport-workers was in progress at the docks, some 80,000 men being affected, and the whole food supply of London was threatened; but the shipowners actively engaged "free" labourers in spite of trade union picketing and intimidation, and day by day managed more efficiently to get their ships unloaded. Public discussion, influenced by Sir Edward Clarke's report, and its criticism of both sides, centred round the apparent necessity of providing, alike for masters and men, some guarantee against breaches of agreements; and Mr. Lloyd George, who in Mr. Asquith's temporary absence in the Mediterranean dominated the Government policy, made proposals, which he explained in the House of Commons on June 5th, for a Joint Conciliation Board, combined with pecuniary guarantees on both sides. Mr. Gosling, on behalf of the Transport Workers, gave a general assent to this suggestion, but the employers and the Port of London Authority (with Lord Devonport,—formerly Mr. Hudson Kearley, a well-known Liberal M.P.—as chairman), after careful consideration, rejected it on June 10th. It was pointed out by them that there was no proper basis, under the conditions prevailing at the docks, for such a Board, the trades concerned being very different and the employers (some of whom were foreign firms) themselves being competitors; the Port of London Authority moreover was a statutory body, with distinct obligations and responsibilities, and could not well enter into such an arrangement, any more than a Government Department could—the Post Office, for instance—with the men in its employment. This was not a case of a strike against some individual firm which had given legitimate cause of offence, but a general strike against the whole Port, on the part of a heterogeneous body of workmen, most of whom had no actual quarrel

with their employers, and who had stopped work in defiance of existing agreements. Negotiations now broke down altogether, and the leaders of the Transport Workers' Federation declared a "national" strike and tried to call out all its allied members at other ports as well as London. But though some 30,000 men responded altogether at Manchester, Southampton, Bristol, Plymouth and Swansea, this appeal for a "national" strike was a thorough failure; the railway unions had had enough fighting the year before and the seamen and firemen, as a body, were not prepared to come out. Scenes of violence were of daily occurrence between unionists and free labourers at the London docks, and in the East End, where the cessation of employment was causing great distress, it became necessary to cancel the King's intended visit to open the Royal Albert dock on June 17th; but by June 18th it was clear that the Port of London Authority and the employers, aided by police protection (which Mr. McKenna, the Home Secretary, provided however somewhat grudgingly), had the strikers well beaten, having obtained a sufficient supply of labour for the handling of cargo. From this point the strike degenerated into sheer anarchism, under the leadership of Mr. Ben Tillett, the Secretary of the Dockers' Union, whose revolutionary and inflammatory speeches—and especially a passionate prayer uttered by him for Lord Devonport's death—disgusted not only the public but also the Labour party in Parliament, and embarrassed their attempts to get the Government to intervene. Serious conflicts occurred, in which revolvers were used in self-defence by the free labourers, notably on July 24th and on July 31st, but by degrees the Strike Committee realised that their efforts were in vain. They recommended a return to work on July 27th, but a mass-meeting in Hyde Park next day refused to comply with this advice, and it was not for a week later that all pretence at continuing the strike was abandoned. On July 31st the lightermen decided to give in, and the riot among the dockers that day was mainly due to their finding that their old places had been filled up and that it no longer rested with them to say whether they were wanted any more or not. On behalf of the employers however and of Lord Devonport, a general assurance had been given that, if the strike were abandoned unconditionally, any outstanding grievances under the old agreements would be inquired into and reinstatement effected as soon as possible for men who had formerly been in regular employment; and, as the Strike Committee and the leaders of the Transport Workers' Federation could hold out no longer, further resistance came to an end.

The real object of the strike, in so far as it aimed at being a "national" one, was to compel Parliament to legislate, as it had done for the coal-miners. In this case however the Labour politicians and their sympathisers were impotent. The discussions in the House of Commons turned mainly on Unionist criticism of the Home Secretary for the apparent disinclination he showed for using force to preserve order and protect the free labourers. On June 12th, Mr. Austen Chamberlain moved a vote of censure on Mr. McKenna, which was rejected however by 337 to 260. On July 1st Mr. O'Grady (Labour M.P. for East Leeds) moved a resolution "that it was expedient that the representatives of the Employers and Working Men's organisations involved in the dispute should meet with a view of arriving at a settlement," and Mr. Asquith (who had now returned to England) left the matter to the House, saying that he himself would not vote on it, as he did not think Government intervention would be justifiable or expedient. Mr. Bonar Law, for the Unionists, having expressed his surprise that in those circumstances Mr. Asquith did not oppose the resolution, moved as an amendment "that this House regrets the continuance of the strike and the consequent suffering, and approves of the declaration of the Prime Minister that the constitutional and normal attitude of the Government should be one of complete detachment and neutrality, and is of opinion that the intervention of this House in this instance can serve no useful purpose." The amendment was rejected by 260 to 215, and the resolution was carried by 254 to 188. This was the end however of any Parliamentary action. The strike was already collapsing, and its only political result was to focus public opinion on the desirability of compulsory arbitration, or at any rate some improved machinery of making agreements, once entered into, binding on both sides. (HUGH CHISHOLM.)

*V. United Kingdom Finance, 1905-1913.*¹

The history of English public finance for the period from 1905 to 1912-13 offers many aspects of interest and importance. The Salisbury-Balfour administrations of 1895-1905 have been followed by those of Sir Henry Campbell-Bannerman (1905-8), and of Mr. Asquith (1908-), and the transfer of political power is reflected in prominent features of the public finance of these periods.

When Sir Henry Campbell-Bannerman became Prime Minister on December 9, 1905, the financial position was still affected seriously by the events and work of the period just closed. Public expenditure had been growing rapidly, and had reached a total which was substantially higher than the level of 1895, nor did there seem a prospect of any serious reduction. In 1895-6 the total expenditure was £97.7 millions, with grants to local taxation of £7.4 millions—a total of £105.1 millions: in 1905-6 the expenditure was £140.5 plus £9.88 millions to local taxation, or a total of £150.4 millions. The figures just given do not include sums spent on account of capital expenditure, though annuities to meet that expenditure were included in the various estimates. In 1895 there were only three items in this account, *viz.* those for the Imperial Defence and the Barracks Acts of 1888 and 1890 respectively, and for the Telegraph Acts. The total was only £810,000, of which £670,000 was under the Barracks Act. In 1905-6 the sum thus spent was £6.1 millions, but it had been higher for some years; and on these accounts there were pending among the liabilities of the State about £45 millions. (In March 1912 the sum owing under this head had reached £50 millions, but the only item added to those of 1905 was £3 millions, in part payment for the purchase of the National Telephone Company.)

The growth of expenditure from £105 to £150 millions (with extras) in the decade had, however, been more serious than these figures themselves suggest. The South African War broke out in October 1899, and has left its mark on the finances permanently, besides keeping expenditure at a higher level. Large sums were paid toward the war from current revenue, the rest being borrowed in various ways. The borrowings to the end of 1902-3 (March) amounted to about £160 millions, but the direct cost of that War must have exceeded £230,000,000. Internationally, moreover, relations were strained in Europe, leaving a legacy in higher expenditure on the services in time of peace, and British trade was checked in a career which had promised very favourably. The surpluses of 1895 to 1899 gave place to the deficits of the war time for five years (but reappeared before Mr. Balfour left office); and meantime new taxation had been imposed up to 1902-3 to about £75¼ millions, which included additions to the tea, tobacco, beer, and spirit duties, the imposition of taxes on sugar, coal (export), corn and flour, and the raising of the poundage of the Income Tax first by 4d., then by 2d., and then by a penny more (7d. in the £ altogether) to 1s. 3d. The South African War, in short, disorganised finances, and necessarily caused difficulties at home and abroad; nor can its effects cease for some years. On the other hand, it is a surprise to many how remarkably strong the recovery has been since peace was signed at Vereeniging in 1902. To this period also, 1901 and 1902, belongs the Boxer outbreak in China, which involved an expense to the United Kingdom of over £6 millions.

But the South African War does not account for the whole of the growth in expenditure up to 1905-6. The debt service at £28 millions was £3 millions higher and was a war charge. The cost of the Army in 1895-6 was £18.4 and in 1905-6 £28.9 millions; that of the Navy £19.7 and £33.3 millions. All the civil services exhibited a growing cost, and especially the revenue departments which had heavier work in collection; but special mention of the education services is required, which went up from £11 to £16 millions; and of a sum of £6.5 millions in 1901-2, with another of £8 millions in 1902-3 (or £14.5 millions in all), granted to the Transvaal and Orange River Colony to aid reorganisation. This last was virtually a part of the war's expense. It may be added that the revenue during this period was strong,

¹ See *E. B.* ix, 458 *et seq.*

though overwhelmed by war from 1899 to 1902-3, and moved from £100.4 millions in 1895-6 to £153.8 millions in 1905-6. The Corn Duty had been withdrawn, and the Income Tax at 1s. 3d. in war time reduced to 11d. but raised again to 1s. Only the resources of a wealthy country could have borne the strain implied in these facts; and it seems as though the rapidly expanding expenditure which marks the period had been sealed and made permanent by the establishments set up during the War. It was acknowledged at the same time that the Army was in pressing need of reorganisation.

Mr. Asquith succeeded Mr. A. Chamberlain in December 1905 as Chancellor of the Exchequer, and held the office until he became Prime Minister on the resignation of Sir

Growth of Expenditure 1905-1913. Henry Campbell-Bannerman in April 1908, being succeeded in turn by Mr. Lloyd George. The leading feature of the period from 1905-6 to 1912-13 is that for the latter year the total expenditure for revenue was placed at £186.9 millions, to which £900,000 more had to be added for Naval purposes. To this should also be added £2,985,000 on account of capital expenditure; but it is only fair to add that during the whole period such "extra" expenditure was discouraged, and in the case of military and naval outlay the year's expenditure was placed wholly on the estimates. For such a purpose as the undertaking of the National Telephone Company, which was taken over by the Post Office in January 1912, resort was had to borrowed capital, £3 millions being taken in 1911-12, £1.7 millions more in 1912-13, while a much larger sum was due for the undertaking, the total amount being still in dispute at the end of 1912 and subject to decision by an arbitration court.

It will be convenient to deal separately with Mr. Asquith's and Mr. Lloyd George's management of the national finances, though they seem to embody a continuous policy. It will be necessary to draw attention to the way in which £38 millions more were added to the annual expenditure of the United Kingdom between 1905 and 1913, and to emphasize the fact that new state services have been undertaken.

Mr. Asquith was responsible for three budgets, 1906-7, 1907-8 and 1908-9, representing a period of consolidation. Retrenchment had been advocated by him in opposition;

Mr. Asquith's three budgets 1906-7-8. and the expenditure was watched and checked carefully, as was essential after the costly war. The measures taken to this end may be judged by the following facts. From £150.4 in 1905-6 the budget expenditure rose to

£152.3 millions in 1908-9, though it had been below the 1905-6 level meantime. In the interval the Post Office charges rose from £15.9 to £18.1 millions, but were more than covered throughout by revenue. The Army estimates were reduced, though Mr. Haldane was reorganising the whole service, and the cost fell from £28.8 to £26.8 millions. The cost of the Navy, too, was reduced—declining from £33.3 to £32.2 millions in this period; and extras on capital expenditure were discouraged, nothing being added to former commitments. There was a growth indeed in the cost of the Civil Services, from £28.4 to £32.3 millions. The principal causes of this, apart from a normal tendency upward in the expense of administration, were the Education estimates, which showed a growth of about £1 million, and the initiation of the Old Age Pension system at the opening of 1909, toward which £2.1 millions were found necessary ultimately to meet the expense of the quarter from January to March. By this time the expenditure under capital during the year had fallen to £2.6 millions: but the outstanding total under this head was still £51.4 millions.

The revenue fell from £153.8 in 1905-6 to £151.5 millions in 1908-9, but had been as high as £156.5 millions the year before; and, when the circumstances are considered, it was surprising to find that surpluses aggregating £15 millions had been realised from 1904-5 to 1907-8. The result of 1908-9 proved eventually

Fiscal changes. to have been a deficit of £714,000, as receipts were much lower than the estimate. This deficit may be accounted for in part by the changes made during this period in taxation, and on the other hand by the foundation of Old Age Pensions, for which only temporary provision had been made. Mr. Asquith's operations in taxation were important. In 1905-6 Mr. A. Chamberlain had reduced the Tea Duty from 8d. to 6d. per lb., and also some warehousing charges, at a total cost of nearly £2 millions. In

1906-7 Mr. Asquith fixed the Tea Duty at 5d., readjusted the rebate on stripped tobacco, and repealed the export duty on coal at a cost of about £3.8 millions. This was followed in 1907-8 by changes of much interest. Income Tax was at a shilling in the £, at which it had been left by Mr. Chamberlain in 1904-5. Mr. Asquith now fixed the duty on *earned* incomes which do not exceed £2,000 at 9d., provided the taxpayer claims the reduction by September 30th, a concession which was computed to cost £1½ millions. That was balanced, however, by reframing the scale of ascending charges for Estate Duty more severely (£1 per cent up to £500: £10 up to £1 million, and £10 for £1 million and 15 per cent on sums above that when the total exceeds £3 millions), to bring in £1.2 millions to revenue. Several minor concessions were also made on income-tax. The most important budget reform, however, was the power taken to pay the sums hitherto transferred directly to the Local Taxation Account into the Treasury, whence in future there should be paid to local authorities a fixed sum equal to their share in this year (1907-8); by this method an automatic growth of these grants was checked, and the taxation by which the money had been raised accounted for without any interception in the Consolidated Fund. In 1908-9 again reductions of taxation were made. The Sugar Duty of 1901 was reduced to 1s. 10d. a cwt. from 4s. 2d., at a cost of £3.6 millions: the Establishment Licences transferred for collection to County and Borough Councils (which had received them before by transfer from the Treasury), and marine insurance stamps reduced from 3d. to 1d. per cent. The Licences represented a loss of £1,650,000; and when the duty on glucose and on saccharine had been adjusted to the reduced sugar duty, the total concession for the year was computed at £5,450,000. During the three years, therefore, remissions of taxation (including the licences transferred) amounted to £10,500,000, the additions £1.2 millions, or a total reduction of £9.3 millions; but it should be observed that this involved a shifting of a weightier portion to death duties, while duties on tea, coal, and sugar were either reduced or repealed. It may be added that provision was made for an excise duty on tobacco grown in Ireland, and for the transfer of the care of excise duties from the Inland Revenue to the Commissioners of "Customs and Excise."

Mr. Asquith's tenure of the Exchequer was distinguished also for his operations on the National Debt. During the South African War the Sinking Fund had been suspended for two years, but interest on War Loans had been paid; for two other years the sum devoted to the service of the debt had been reduced from £25 to £23 millions. From 1903-4 interest on the War Loans had been included among the permanent burdens on this charge, which was raised first to £27 millions in that year, and to £28 millions in 1905-6. Mr. Asquith, pursuing the reinstatement of credit for the period 1906-9, kept this charge at £28.5, £29 and £28 millions respectively, thus devoting the largest amount recorded to swell the "New" Sinking Fund. The result of this policy may be gathered by the figures of the triennial period 1905-6 to 1907-8 (inclusive). These were years of large surpluses, allocated to the "Old" Sinking Fund, and amounting to nearly £14 millions for the period; and these payments, together with large sums applied from the charge for the debt, coupled with the purely financial operations of the Debt Commissioners, reduced the "dead weight" debt from £755 millions at which it had been left in 1905, to £711.4 in 1908 (March): or a reduction of £43½ millions. On the other hand, the liabilities on capital expenditure had matured, and grown from £41.6 to £50.8 millions; but as the policy by which they were incurred had been reversed by this time, the reduction on the "dead weight" debt was so much gained.

When Mr. Asquith handed over the work of the Exchequer to his successor in April 1908, the financial position had undoubtedly improved very considerably since 1905. At the outset affairs were still in the shadow of the war, and though trade was growing and even buoyant amid the shocks which it had to endure, public credit was low and public expenditure at a high figure. Consols, which had been at 113¼ in May 1897, were 89½ in December 1905 (but in 1903 had been reduced from a 2¾% to a 2½% security). In that situation a policy of caution and re-

Position in 1908.

trenchment was justified. As the revenue was elastic, and the wastage of the war had been great, it was wise to fortify the position by reducing debt and thus to aid, if only to aid, recovery. It is probable that the still expanding imports and exports owed something to this, though they dropped again in 1908, as compared with the bounteous year, 1907. Still, amid undoubtedly great commercial prosperity Consols were only at $83\frac{1}{16}$ in December 1908, and they had been as low as $82\frac{1}{2}$ in prosperous 1907. During the war years, however, the progress of social reform was checked, and while Mr. Asquith was strengthening the finances the demand for amelioration in the condition of the working-classes became insistent. Hence the institution of the Old Age Pension system by Mr. Asquith in 1908, followed by the provision of Labour Exchanges in 1909 and later measures. Mr. Asquith had left £1,200,000 to meet the cost of the Old Age Pensions during the first quarter of 1909, but it was found that £2.1 millions were required.

The Old Age Pensions scheme was designed to supplement the Poor Law by giving pensions to qualified persons of 70 years of age and upwards. As originally passed it did not extend to persons who had been in receipt of poor relief, but after 1910, by an amending Act, they were included. The chief qualification is that a pensioner shall not possess means above £31.10s. a year (or 12s. 1d.

Old Age Pensions.

per week) when a shilling a week will be payable, and a further shilling for every shilling per week by which the means are shown to be less up to 5s. each person, when the means do not exceed £21 a year (or 8s. 1d. per week). A weekly 5s. is the highest pension per person. Up to March 1912 there were about 942,160 who had been awarded a pension; but from the first the number awarded in Ireland was relatively much higher than in other parts of the Kingdom. The total cost has been much higher than the original estimates, and apart altogether from the extension of the Act. The first quarter cost about £2,000,000, the year 1909-10 £8.7 millions; 1910-11 £9.8 millions; 1911-12 £11.7 millions; and 1912-13 about £12.2 millions. It is reckoned that the services rendered by other State departments to the Pension service cost £450,000 in addition. On the other hand, the reduction in the number of paupers receiving poor relief should be set off against this total,—say 200,000 at £17=£3,400,000. This scheme of Old Age Pensions was the first of the Liberal attempts to realise a constructive social reform programme, the effect of which upon the finances will be noticed later.

In April 1908 Mr. Lloyd George went to the Exchequer (though the budget that year was Mr. Asquith's) and the "Social Reform programme" was further developed under him. The season of careful retrenchment was over, and the Pensions Act was the harbinger of a still more important reform, involving increased expenditure. Under the Unemployed Workmen's Act, 1905, the Local

Mr. Lloyd George at the Exchequer.

Government Board had been entrusted with a sum of money annually to be used in relieving distress by assisting to open relief works. For some years that sum was £200,000, but for 1912 it was only £100,000, as unemployment had decreased substantially. This was partly due to the Labour Exchanges Act, 1909. But, apart from the great reform Mr. Lloyd George had in contemplation, which took shape in the National Insurance Act 1911, it was his task, from the first, to finance a Liberal social programme; and this policy left its mark deeply on the revenue and expenditure from 1908-9 to 1912-13. Mr. Asquith had provided only for the first quarter of 1909 for the cost of the Old Age Pensions; and the new Chancellor of the Exchequer had at the outset to find means to defray an expenditure which was a novelty upon the estimates.

The total gross expenditure for 1908-9 was £152.3 millions, that for 1911-12 was £178.5, and the estimates for 1912-13 £186.9 millions, which with a further £900,000 for the Navy and other supplementary demands, brought the total to £188 millions. Nearly £36 millions of the £38 millions of increase since December 1905 fall therefore to be accounted for under the second Chancellorship of the Liberal Administration. Just as £2 millions were for postal purposes in

Growing expenditure, 1908-13.

Mr. Asquith's period, so may £5.8 millions be accounted for, as the Post Office required £23.8 millions in 1912-13, a sum including the administration of the newly acquired telephones. This comparison requires correction on the other hand; for though Mr.

Asquith left the Debt service at £28 millions, in 1912-13 only £24.5 millions were applied to that object. There is also the necessity to replace the £1,650,000 which the transfer of the Establishment Licences involved, which sum was now omitted from the gross expenditure. This would leave about £35½ millions of increased expenditure to be provided for in 1912-13, as compared with 1908-9. For the reduction of the Sinking Fund it was pleaded that Mr. Asquith had provided so largely during the previous three years; but obviously the new expenditure which was decided upon called for a larger free income. As usual, such a transfer as that of the Licences and the suspension of the Sinking Fund disguised and understated the increase of expenditure.

As the Debt, the Consolidated Fund services, grants to local taxation, and such fixed services, show a decreased total, the increased total expenditure must be sought in the supply services for each year. Expenditure under "Capital" does not call for further notice, for with the exception of operations for telegraphs and telephones, that expenditure had not been allowed to continue. Turning to the supply services, the Army took £28.8 in 1905-6; £26.8 in 1908-9, and £27.8 millions in 1912-13. We may look back usefully to 1895, and find that the Army then cost £17.8 millions: The Navy, too, which took £17.5 in 1895, required £33.3 in 1905-6; £32.2 in 1908-9; and £45 millions in 1912-13. The Revenue departments, which cost £3.1 in 1905-6, took £3.3 in 1908-9, and £4.2 millions in 1912-13. The general Civil Services, which took £28.4 in 1905-6, needed £32.3 in 1908-9, and nearly £50 millions in 1912-13. These facts enable us to trace the increased expenditure, and the swift channels in which it ran. Army expenditure is still below that of 1905-6, though £1 million above 1908-9; but since 1895 the cost had increased by over 56%. Naval expenditure is now nearly £12 millions more than 1905-6, and £13 millions higher than in 1908-9; comparing with 1895, it has increased by £27½ millions, or 15% in a little over 17 years. As for the Civil Services and the Revenue departments, together, which cost £31½ millions in 1905-6 and in 1912-13 about £54 millions, we find that as the cost was only £35.6 in 1908-9, some £18½ millions of the increase had been registered since then, and £23 millions or so (about 71 per cent) since 1905-6. If to the £3½ millions taken from the Sinking Fund, and £1.6 millions less for licences placed in the total, we add the increases on Army, Navy, and Civil Services, the additions made from 1908-9 to 1912-13 amount to about £37½ millions.

A further analysis of the £18½ millions added to the cost of the Civil Services, as shown in 1912-13, is required. About £1 million was on account of the Revenue departments, a large portion of which, £530,000, means the Valuation department of the Inland Revenue. Old Age Pensions, £12¼ millions, is however the largest item. National Insurance and Labour Exchanges appear for £2.8 millions (and the cost of medical benefits seemed likely at the end of 1912 to be £1¼ millions more), while Education takes £1½ millions. The rest of the £18½ millions of increased expenditure, about £1.3 millions, may be traced to the various official bureaux.

This analysis of the trend of expenditure during 1908-9 to 1912-13 will serve to exhibit the position as conceived at the opening of this period. The House of Commons had been committed to a large and somewhat indefinite expenditure on Old Age Pensions for which no permanent provision had been made; a further extension of the social programme was in contemplation; there was uneasiness in the international situation, and a prospect of the growth of armaments; administration was becoming more expensive. What steps were taken to adjust the national finance to the national needs?

Expenditure depends largely on policy, and the taxation to meet it is intimately related to that policy. The measures taken to raise revenue in the budget of 1909, afterwards found in the Finance Act of 1910, together with the Constitutional crisis which resulted, will always be famous in English history.

Before giving a summary of the changes made in the revenue laws it may be well, however, to give a brief account of the revenue to the end of this period.

The revenue in 1908-9 was left at £151.5; it was £131.6 in 1909-10, and £203.8 in 1910-11 (both abnormal figures, as explained below); and in 1911-12, £185 millions.

The estimate for 1912-13 amounted to £187.1 millions, the borrowing for capital expenditure being about £2.9 millions, principally for telegraphs and telephones. On 1908-9 there was a budget deficit of £714,000, but on the combined years 1909-10-11 there was a surplus of £5.6 millions, and on 1911-12 a surplus of £6.5 millions. The figures already given show that the relation between revenue and expenditure in 1912-13 was tighter; but trade was favourable, the revenue returns showed much elasticity in certain directions, and yet expenditure, as has been shown, had not ceased to grow. These figures show plainly that this was a critical time, when the due working of the Treasury was much disturbed. An account of Mr. Lloyd George's budget of 1909-10 and its changes in taxation will go far to account for that disturbance, especially as the Budgets of succeeding years made no changes of importance in the revenue laws.

The Finance Bill of 1909 was introduced on May 26th (after the discussions on the Budget statement of April 30th), and was read a third time on November 4th, only to be rejected on the 30th by the Lords, who wished to have it submitted to the country. The budget statement anticipated a total revenue of £162.5 millions, as against £151.5 realised for 1908-9. The actual revenue proved to be £131.6 in 1909, consequent upon the rejection of the Bill by the Lords; for the custom of collecting the Income Tax and tea duty, which are annual taxes, on the authority of a resolution of the House only, had to be suspended,—a custom judicially declared since (Nov. 1912) not to have any legal warrant. Some £30 millions of the huge revenue of 1910-11 was, therefore, arrears of the revenue of 1909-10. After the general election of January 1910, which maintained the government in office, the Finance Bill (1909-10) was reintroduced on April 20th and the Lords agreed to it without amendment on April 29th. There was a second Finance Act of 1910, the ordinary one for the year, but it made no change in revenue laws.

According to Mr. Asquith (May 5th) the budget of 1909 contained proposals adequate for the year, and for the prospective necessities of years to follow, without deviating from the principles and practices of free trade, and without imposing additional burdens upon the necessities of the people. The Chancellor of the Exchequer, too, on the third reading (Nov. 4th) said that the taxes had been arranged to meet the requirements not only of the year, but also of the future. A summary of the provisions for new taxation may now be given, by which it was proposed to increase the revenue, while at the same time £3½ millions were saved by reducing the Sinking Fund by that amount.

Provisions of Finance Bill, 1909-10. *Beer* duty was increased from 8s. to 8s. 3d. per barrel: *Spirits*, home from 11s. to 14s. 9d. per proof gallon, and imported from 11s. 4d. to 15s. 1d.: *Tobacco*, 8d. per lb. added to 3s. with adjustments in Ireland and Scotland, and on cigars, &c.: *Motor Spirit* 3d. per gallon, with certain rebates: *Liquor Licences* were increased, and the whole code reframed. *Motor Car Licences* were also increased, and graduated according to horse-power. *Estate and other inheritance duties* were revised again more severely; especially the scale on Estates exceeding £5,000 in value: Settlement Estate Duty was increased from 1 to 2 per cent, and powers of disposition were amended: the rates of Legacy and Succession duties were made higher. In *Stamps* the duties were doubled on Conveyances and Leases, and on Bearer securities, while those on Contract notes were increased and graduated from 6d. to £1 according to the amount in question. The *Income Tax* was raised from 1s. to 1s. 2d. in the £, and abatements on the income of those resident out of the United Kingdom abolished. A *Super-Tax* of 6d. was imposed on incomes over £5,000, assessable on so much as exceeds £3,000. On the other hand the concession of a rate of 1s. in the £ on *earned incomes* which exceed £2,000 but not £3,000 extended this innovation regarding earned incomes (this in 1910-11 was a concession which involved £87,500): there was an allowance of £10 on the assessment for every child under 16 on incomes between £160 and £500; and additional relief was granted under Schedule A on account of the cost of maintenance, repairs, insurance, &c. The chief novelty of the Budget was the *Land Value Duties*, the provisions respecting which are somewhat complicated with regard to assessment, which also involved a scheme for securing a valua-

tion of all land in the United Kingdom. The principle to be applied was easily stated, but in application is found very complex, while the terms of the Act in these sections are confessedly difficult, not to say obscure. The duties imposed were four, viz. the *Increment Duty* of 20% on the increase in value of the land site; the *Undeveloped Land Duty* of $\frac{1}{2}$ d. in the £ on capital value; the *Reversion Duty* of 10 per cent on benefits accruing at the termination of a Lease; and *Mineral Rights Duty* of 1s. in the £ on mineral rents, way leaves, &c. These land value duties are not payable on agricultural land.

There were some general provisions touching this revenue which deserve notice, such as the instruction that premiums on the grant of new on-liquor licences shall be paid into the Exchequer; that 5% shall be paid to county councils in Ireland on the amount of the duty levied on motor-cars; and that the proceeds of the duties on motor spirits, and on motor-car licences, shall be paid to a fund as a grant (under the Development and Road Improvement Funds Act, 1909) for road improvement. It may be added that when the House of Commons passed the Bill a second time provisions were added to confirm the collection of taxes while the Bill was passing the legislature.

Whatever might be the political objections to the Budget of 1909, it has already been shown that its operation resulted in raising the gross revenue from £151.5 in 1908-9 to £187.1 millions estimated in 1912-13, thus showing a growth of £35.6 millions in the interval. A certain amount of the increase arose, however, from non-tax revenue, £7 millions from Postal Services alone. The tax-revenue in 1908-9 was £125.5; in 1911-12 (a normal year) it was £155 millions; in 1912-13 about £153.8 millions. The only change of substance in 1911-12 was the withdrawal of the 2d. per lb. customs duty on ground cocoa, which involved about £60,000 only; but the tax revenue for 1912-13 showed an expectation of £28.3 millions above 1908-9. A revised estimate in 1909-10 of the anticipated effect of the new taxes gave a total of £12½ millions for that year, and £17.7 millions ultimately, but this last was exclusive of spirits, liquor licences, and the land value duties. A comparison of the differences between the revenue derived from various chief heads in 1908-9, and in 1912-13, will be instructive. Customs yielded more by £4.7: Excise by £4.1: Estate Duties by £7.1: Stamps by £1.7: and Income Tax (including Super Tax which yielded £3 millions in 1911-12) by £10.2 millions. The House Duty also continues to show a growing yield. These are remarkable figures, no doubt, and speak much of the resources of the country. Each of these items, too, when compared with the expectation of 1909, shows a fulfilment of hopes, with the doubtful exception of the Excise, while the changes in Income Tax, estimated to produce an extra £6¼ millions, actually produced £10¼ millions. The Land Value Duties, on the other hand, which were originally estimated to produce £600,000 in the first year (and much more ultimately), proved disappointing, the results being (1910-11) £520,000, (1911-12) £481,000, (1912-13, estimated) £545,000. Much revenue from this source could not be expected indeed, until the land valuation of the whole kingdom, affording a datum for the duties, had been completed, which could not be earlier than 1915. Meanwhile the larger part of the revenue from those land value duties is derived from the Mineral Rights Duty, the yield of the others being small.

Both direct and indirect sources were appealed to for the additions to revenue. The new indirect taxes (tobacco, alcoholic drinks, and liquor licences) contributed £8.8 out of the £28.3 millions by which the revenue of 1912-13 exceeded that of 1908-9. On the direct side there are additions to taxes on property, like the Estate duties, and largely the Stamps, and the half million from Land Value duties, and finally the high rate of 1s. 2d. in the £ on income-tax (coupled with a super-tax) which in 1912-13 yielded over £44 millions. The concrete results of the Budget of 1909-10, which for 1912-13 drew additional revenue of £8.8 millions from indirect, and £10.5 millions from direct taxation, were naturally pointed to in 1912 by Mr. Lloyd George as justifying his policy.

Not unconnected with the incidence of the new taxation were some applications of the revenue to be raised, such as the provision of a *Development Fund*, and of a *Road Improvement Fund*. In 1909 an Act to form Boards, &c., to manage these Funds was

How the sources of revenue were affected.

passed, which directed that a sum of £500,000 should be placed to the credit of the Development Fund annually for four years, beginning with 1910-11; and the Finance Act of 1909-10 transferred a sum equal to the "net proceeds of the duties" on motor spirit, and on licences for motor cars, to the Road Improvement Fund. According to the Act of 1909, £400,000, in addition to the £500,000 granted by that Act was voted to the Development Fund, and the Board in 1910 was made to consist of 8 members instead of five. The

half million was paid into that fund again in 1911-12; but by the Finance Act of 1911, £1½ millions were set aside from surplus revenue to be paid to this fund during the years ending in March 1913, 1914, and 1915. To the Road Improvement Fund was paid in 1910-11 over £860,000, and in 1911-12, £1,209,800. In 1912-13 this fund was estimated to reach £1,225,000. The functions and duties of the Road Board are indicated by its title. As for the Development Fund, that is used for the promotion, by government departments, colleges, institutions, or persons, *not trading for profit*, by means of a grant or a loan, of agriculture, forestry, drainage, harbours, fisheries, transport, stock, and so forth, in many cases by way of experiment. By means of these two Funds about £1½ millions a year are now used so as to benefit property; and that aspect may have to be reconsidered in any reform of local taxation.

The National Insurance Act of 1911, though a measure of great social and financial interest, does not enter into the finances of this period, beyond the appropriation of £2.8 millions in 1912-13.

The *National Debt*, which was left at £711.4 in 1908-9, had been further reduced to £674.7 millions in March, 1912; the total "dead weight" Debt being lower by £36.7 millions. Together with the £43½ millions paid off under Mr. Asquith (including £11.8 millions for 1905-6, as provided in Mr. A. Chamberlain's Budget), this makes a reduction of over £80 millions during seven years.

The disposal of the surpluses of the second period is worth notice. The small deficit left by Mr. Asquith in 1908-9 was followed by the confusion of the finances in 1909-10, at the rejection of the Finance Bill by the Lords, but the conjoint years 1909-10-11 yielded a surplus of £5.6, and 1911-12 yielded £6.5 millions, which strictly should have gone to the "Old" Sinking Fund. From the first of these two, as already stated, £1½ millions were placed to the credit of the Development Fund. Another £1½ millions were used to provide Sanatoria for the treatment of tuberculosis, and £250,000 as a loan to the East African Protectorate. In June 1912 the Chancellor of the Exchequer announced that from the 1911-12 surplus of £6.5 millions nearly £1 million would be required for Naval purposes, and £500,000 would be advanced to Uganda and East Africa as a loan. In this connection also it should be recollected that not only was the action of the "New" Sinking Fund suspended in part in 1909-10, owing to the confusion of that year, but that the Debt Service Charge was reduced from £28 to £24.5 millions.

The political controversies which have centred round "Lloyd George finance" are still too acute for final criticism. To it are attributed by its opponents the largely increased export of British capital and the fall in the value of Consols and other "gilt edged" securities. Whether the incontestable growth of British investments abroad is a good thing or a bad thing for the nation is, however, itself a matter of controversy. The price of Consols, whatever may have been the influence of politics, has undoubtedly been affected by a number of other causes, such as the extension of trustee stocks, and particularly the opportunities offered by a bounding commerce for more remunerative investments. The drop from 113½ in 1897, when the interest was 2½, or even from 89¼ in December 1905, when the interest was 2½ per cent, to 72½ in October 1912, is in itself a serious one. But it points rather to the importance of maintaining the Sinking Fund than to any actual decline in British credit. In so far as the price of Consols is a test of British credit, they compare favourably with any national securities elsewhere. On November 15, 1912, Consols at 2½% were 75½ (equivalent to over 90 at 3%), and German 3% were 76-78.

A few additions may be made here to the record of British obituary already contained in the *E. B.* in respect of the period (1909-10) when the 11th edition was passing through the press.

The deaths of Bishop **Alfred Barry**, formerly primate of Australia (b. 1826; d. at Windsor, April 1, 1910; see *E. B.* iii, 444); General Sir **William Butler**, the Irish soldier and writer (b. 1839; d. in Tipperary, June 7, 1910; see *E. B.* iv, 888); Prof. **J. E. B. Mayor**, the classical scholar (b. 1825; d. at Cambridge, December 1, 1910; see *E. B.* xvii, 937), and Sir **Walter Palmer**, 1st Bart., of "Huntley & Palmer's" (b. 1858; d. in Berkshire, April 16, 1910; see *E. B.* xx, 645), may be noted in connection with the biographical articles referring to them.

In the case of other people referred to in the *E. B.* as then living, the deaths occurred in 1910 of Lieut. **Boyd Alexander**, the African explorer (b. 1873; killed by natives at Nyeri in Wadai, April 2; see *E. B.* i, 353); Col. **Claude Regnier Conder**, R.E., LL.D., the Palestinian geographer and archaeologist (b. 1848; d. February 16; see *E. B.* xi, p. vi); **Reginald Frank Doherty**, the lawn-tennis player (b. 1874; d. in London, December 29; see *E. B.* xvi, 303); Sir **Thomas Drew**, the Irish architect, president of the Royal Hibernian Academy (b. 1838; d. in Dublin, March 13; see *E. B.* ii, 441); Rev. **Hereford Brooke George**, the New College (Oxford) tutor, military historian, geographer and Alpine climber (b. 1838; d. December 15; see *E. B.* xv, 556, "Jungfrau"); **Robert Walker Macbeth**, the Scottish painter (b. 1848; d. in London, November 1; see *E. B.* xx, 500); **Frank Podmore**, the associate of Gurney and Myers in psychical research (b. 1856; d. near Malvern, August 14; see *E. B.* xxii, 15); Admiral Sir **Harry Rawson**, governor of New South Wales 1902-09 (b. 1843; d. in London, November 3; see *E. B.* iii, 738); and Dean **Edward C. Wickham**, of Lincoln, ex-headmaster of Wellington (b. 1834; d. in Switzerland August 18; see *E. B.* xii, 72).

Archbishop **William Dalrymple Maclagan**, who had resigned the archbishopric of York in 1908, died in London on the 19th of September, 1910. Born in Edinburgh in 1826, he had begun life in the army, retiring as lieutenant in 1852 in order to enter the church; and after studying at Cambridge he became a London rector, first at Newington and then at St. Mary Abbott's, Kensington, where his success led to his selection as bishop of Lichfield in 1878. In 1891 he was made archbishop of York. Both as bishop and archbishop, Maclagan did much to stimulate Church work both among the clergy and the laity; in 1899 he sat as assessor with Archbishop Temple of Canterbury when the decision was given against the use of incense and other "ritualistic" practices (see *E. B.* xiv, 352), and though personally a strong High Churchman he loyally upheld the Primate's "opinion" in his diocese.

Mention must be made here too of the death in London, on December 12, 1909, of the eccentric art-collector **George Salting** (b. Australia, 1836), whose name will endure because of his bequest to the nation of his unique treasures, porcelains, etc., now housed in several rooms of the Victoria and Albert Museum.

The premature death in London, on December 29, 1910, of **Samuel Henry Butcher**, the classical scholar and M.P. for Cambridge, calls for a fuller notice. He was the eldest son of Samuel Butcher, classical tutor and lecturer at Trinity College, Dublin, and subsequently Bishop of Meath. Born in Dublin on the 16th of April 1850, he went to Marlborough in 1864 and won an open scholarship for classics at Trinity College, Cambridge, in 1869. In 1870 he won the Bell scholarship at Cambridge, in 1871 the Waddington scholarship, and in 1871 and 1872 the Powis medal. In 1873 he graduated as senior classic and won a Chancellor's medal. He took an assistant mastership at Eton for a year, but returned to Trinity, Cambridge, as fellow and lecturer in classics. On his marriage in 1876 to Rose, daughter of Archbishop Trench of Dublin (see *E. B.* xxvii, 242d), he had to resign his Trinity fellowship, and was then elected tutor and "married fellow" at University College, Oxford. In 1882 he succeeded Prof. Blackie as professor of Greek in the University of Edinburgh. During his tenure of this chair he became widely known, not only as a scholar but as a judicious administrator and educational reformer. He was a member of the royal commission which was appointed after the passing of the Scottish Universities Bill in 1889 to reform the whole academical system in Scotland, and which reported in April 1900. In 1902 Mrs. Butcher died, and two years later he resigned his professorship and went to reside in London. He had been a member of the Royal Commission of 1901 on University Education in Ireland, which produced an abortive report with 8 reservations in 1903; and he was also included on the Royal Commission of 1906. In the latter year, on the death of Sir Richard Jebb, he was chosen as a Unionist to represent the University of Cambridge in Parliament, where his brother J. G. Butcher (b. 1853), a well-known barrister, had sat for many years as Unionist member for York; he made an effective maiden speech on the Irish University Bill and frequently took a valuable part in debate. His grave and thoughtful style and gift of natural eloquence were combined with a charm and sincerity which won him universal respect and affection, no less in public than in private life. He was however, above all, a fine Greek scholar, full of the true spirit of classical learning, with a remarkable

power of literary expression, shown especially in such publications as his *Aspects of the Greek Genius* (1891), *Aristotle's Theory of Poetry and Fine Art* (1895), *Greek Idealism in the Common Things of Life* (1901), *Harvard Lectures on Greek Subjects* (1904), and his prose translation (with Andrew Lang) of the *Odyssey* (1879). In 1907 he was president of the English Classical Association, of which he had been one of the principal founders in 1903. He was also the first president of the Irish Classical Association, and an original member of the British Academy, becoming its president in 1909. In 1908 he was appointed a trustee of the British Museum. Two years later his health began to fail, and he made his last public appearance and delivered his last speech on the 21st of October 1910, at the dinner given to celebrate the publication of the 11th edition of the *Encyclopaedia Britannica* by the Cambridge University Press.

1911

The following persons, of whom separate biographical notices are given in the *E. B.*, died in 1911:

Edwin Austin Abbey (b. 1851, see *E. B.* i, 11), the Anglo-American painter, on August 1, in London. Besides bequests to the Corcoran Art Gallery, Washington, the Boston Art Museum and the British National Gallery, Mr. Abbey left his house in Chelsea, London, after the death of his widow, to the Royal Academy for the use of the president.

William Alexander (b. 1824; see *E. B.* i, 565), Protestant Archbishop of Armagh and Primate of Ireland, at Torquay on September 12. He had resigned his see on January 30, and had been created a G.C.V.O.

The 9th Earl of Carlisle (b. 1844; see *E. B.* v, 341), in London on April 16th.

Edward Dicey (b. 1835; see *E. B.* viii, 178), the publicist, in London on July 7th.

Sir Charles Dilke (b. 1841; see *E. B.* viii, 271), the Liberal statesman and author, in London on January 26th.

Sir Francis Galton (b. 1823; see *E. B.* xi, 427), the anthropologist and founder of "eugenics," at Haslemere on January 17th.

Sir William Gilbert (b. 1836; see *E. B.* xii, 10), author of the *Bab Ballads* and collaborator with Sir Arthur Sullivan in the Savoy operas, on May 29th, being drowned in trying to rescue a lady from a pond in his grounds at Harrow Weald.

Sir Eldon Gorst (b. 1861; see *E. B.* xii, 261), Lord Cromer's successor as British Agent and Consul-general in Egypt, on July 12th, at Castle Combe, Wiltshire. He had resigned his position in Egypt shortly before he died, being succeeded by Lord Kitchener.

Sir Robert Hart (b. 1835; see *E. B.* xiii, 30), long the head of the Chinese Customs, at Great Marlow on September 20th.

Sir Joseph Hooker (b. 1817; see *E. B.* xiii, 671), the eminent botanist, at Sunnysdale on December 10th.

Baron James of Hereford (b. 1829; see *E. B.* xiv, 144), the Liberal Unionist statesman and lawyer, at Epsom on August 18th.

Thomas Rupert Jones (b. 1819; see *E. B.* xv, 500), the geologist and palaeontologist, at Chesham, Bucks, on April 13th.

Alphonse Legros (b. 1837; see *E. B.* xvi, 380; ix, 806), the artist, on December 8.

Sir Alfred Lyall (b. 1835; see *E. B.* xvii, 148), the Anglo-Indian administrator and man of letters, in the Isle of Wight on April 11th.

John Brown Paton (b. 1830; see *E. B.* xx, 930), the Congregationalist divine, on January 26th.

The 1st Baron Northcote (b. 1846; see *E. B.* xiv, 280), Governor-general of Australia 1903-08, at Ashford on December 29th.

The 4th Earl of Onslow (b. 1858; see *E. B.* xx, 113), formerly a Conservative Cabinet Minister, and governor of New Zealand, on October 23.

William Clark Russell (b. 1844; see *E. B.* xxiii, 865), the writer of sea-stories, on November 8th.

Edward Whymper (b. 1840; see *E. B.* xxviii, 617), the artist and Alpine climber, at Chamounix on September 16.

"John Strange Winter" (Mrs. Arthur Stannard; b. 1856; see *E. B.* xxviii, 734), authoress of *Bootles' Baby*, in London on December 13.

The 1st Viscount Wolverhampton (b. 1831; see *E. B.* xxviii, 781), the Liberal statesman, on February 25. He had retired from the Asquith Cabinet early in 1910.

References are also made in the *E. B.* to the following who died in this year:

Hermann Adler (b. 1839; d. July 18), the Chief Rabbi of the United Synagogue, London (see *E. B.* xxvi, 292a).

James Aumonier (b. 1832; d. October 4), the landscape painter (see *E. B.* xx, 501c). His "Sheep Washing" and "Black Mountains" are in the Chantrey Bequest collection at the Tate Gallery.

Charles Frederick Moberly Bell (b. 1847; d. April 5th), the managing director of the *Times* (see *E. B.* xix, 558a). Born in Alexandria, the son of an Egyptian merchant, he was educated in England, but in 1865 went back to Egypt and engaged in business. He

soon began sending occasional correspondence to the *London Times* and from 1875 onwards devoted himself mainly to journalism. By 1880, when he founded the *Egyptian Gazette*, he had become the regular correspondent for the *Times* in Egypt. He also published *Khedives & Pashas* (1884), *Egyptian Finance* (1887), and *From Pharaoh to Fellah* (1888). In 1890 he was summoned to London to take the post of manager (nominally assistant-manager) of the paper, at a time when it had suffered heavy financial losses over the proceedings connected with the Parnell Commissions (*E. B.* xx, 858). From that date he devoted all his masterful energies to the journal he served, and up to his death his was the personality most prominently associated with it in the public eye. When the Times Publishing Company was formed in 1908, and mainly through his personal exertions the financial control passed from the Walter family to Lord Northcliffe, he became managing director.

Sir Rubert William Boyce (b. 1863; d. June 16), the bacteriologist and pathologist (see *E. B.* xx, 779). Born in London, he was educated privately in Rugby and at Paris, and afterwards at University College, London, where he took his M.B. in 1889, and was in 1892 appointed constant-professor of pathology. In 1894 he became professor of pathology in University College, Liverpool, and in 1898 bacteriologist to the Liverpool Corporation. He did much to promote the foundation of Liverpool University in 1902, and the endowment of the four chairs of bio-chemistry, tropical medicine, comparative pathology and medical entomology. He had in 1898 worked with Sir Alfred Jones to establish the Liverpool School of Tropical Medicine, and in 1901 organised a series of expeditions to the tropics to investigate disease. In 1905 he went himself to New Orleans and British Honduras, and in 1910 to West Africa to examine epidemics of yellow fever. He published *Mosquito or Man* (1909), *Health Progress and Administration in the West Indies* (1910), *Yellow Fever and its Prevention* (1911), and many papers for scientific societies. He was knighted in 1906.

Sir Percy William Bunting (b. 1836; d. July 22), editor of the *Contemporary Review* (see *E. B.* iv, 802 b.).

Sir Caspar Purdon Clarke (b. 1846; d. March 29), the art-expert. Educated privately at Sydenham and Boulogne, in 1862 he entered the art schools at South Kensington and was trained as an architect. In 1865 he entered H. M. Office of Works, and in 1867 was attached to the works department of the South Kensington Museum. He travelled extensively for the museum, purchasing objects of art, and at the same time carried on his profession as an architect. In 1883 he became keeper of the India Museum at South Kensington, in 1892 keeper of the art collections at South Kensington, in 1893 assistant director, and in 1896 director. This post he held until 1905, when he became director of the Metropolitan Museum, New York (*E. B.* xix, 614), resigning in 1910. He was knighted in 1902.

Ernest Crofts, R.A. (b. 1847; d. March 19), the historical painter (see *E. B.* xx, 500d). He had been keeper of the Royal Academy since 1898.

John Passmore Edwards (b. 1823; d. April 22), newspaper proprietor and philanthropist. The son of a Cornish carpenter, and mainly self-educated, in 1844 he became London representative in Manchester of the *Sentinel*, an Anti-Corn Law weekly newspaper. A year later he went to London and began lecturing, together with the practice of journalism, starting several small periodicals which in succession failed, until in 1862 he bought the *Building News*, which by 1866 had made a handsome profit. In 1876 he bought the London halfpenny evening newspaper, the *Echo*, and controlled it for 20 years. He was an ardent peace advocate, and supported a number of humanitarian and philanthropic objects, endowing various libraries and other institutions which bore his name, notably the Settlement in Tavistock Place, Bloomsbury. He also founded a Passmore Edwards scholarship at Oxford for the conjoint study of English and classical literature. He published privately an autobiography, *A Few Footprints* (2nd edition, 1906).

Edward Mills Grace (b. 1841, d. May 20) the cricketer. A brother of Dr. W. G. Grace (see *E. B.* xii, 308d), he was a player of first-class cricket for 35 years (see *E. B.* vii, 441). He had been Coroner for West Gloucestershire since 1875.

Lady Hallé (Madame Norman-Neruda), the famous violinist (b. 1839; d. April 15). (see *E. B.* xii, 853b.).

John Lockwood Kipling (b. 1837; d. January 30), the Anglo-Indian artist, curator of the Lahore Museum 1875-93, and father of Mr. Rudyard Kipling (see *E. B.* xv, 825).

Sir Charles Bennet Lawes-Wittewronge, 2nd Bart. (b. 1843; d. October 6), the sculptor (see *E. B.* xxiv, 503b and 506). The only son of Sir John Lawes of Rothamsted (see *E. B.* xvi, 300b) he was educated at Eton and Cambridge, where he was a notable athlete. Subsequently he devoted himself to sculpture, while doing much also to further the scientific side of the Lawes Agricultural Trust, founded by his father, of which he was chairman. In 1882 he was defendant in a famous libel action, brought by another sculptor, Mr. Belt, for a criticism published in *Vanity Fair*, imputing dishonesty to Mr. Belt in taking credit for work done by another man. The question of how much a sculptor may be aided by others in work to which he attaches his name was inconclusively debated through a long and costly trial, and the verdict of the jury, awarding £5,000 damages to the plaintiff, was much discussed at the time.

General Sir Robert Cunliffe Low, G.C.B. (b. 1838; d. August 4), a famous soldier. Entering the Indian army in 1854, he served through the Mutiny. As Director of Transport

he organised the mobilisation of troops for the campaign of 1880-81, including the march from Cabul to Kandahar. After some years of service as Lieutenant he commanded the Chitral Relief Expedition of 1895 (see *E. B.* vi, 252). Retiring in 1905 he was appointed Keeper of the Crown Jewels in 1909.

George Robert Milne Murray, F.R.S. (b. 1858; d. December 16), the well-known botanist, younger brother of A. S. Murray (see *E. B.* xix, 38). As keeper of the Department of Botany at the British Museum his researches were principally devoted to algae and cryptogams, in the pursuit of which he made several voyages, notably in 1901 as scientific director to Capt. R. F. Scott's Antarctic Expedition.

Frederick William Pavy (b. 1829; d. September 19), the well-known physician. He was for years the chief authority in Europe on diabetes (*E. B.* xviii, 62), and wrote various works upon digestion and the metabolism of the carbo-hydrates.

Sir **Herbert Hope Risley** (b. 1851; d. September 30), the Anglo-Indian Civil Servant and anthropologist. His principal work was done in connection with Indian ethnography, the discussion of the caste system, etc., and he published under Government auspices some important volumes of anthropometric data. He had charge of the Indian Census operations of 1901. He was appointed Secretary of the Judicial Department of the India Office in 1910.

General Sir **Frederick Charles Arthur Stephenson, G.C.B.** (b. 1821; d. March 10) Constable of the Tower of London since 1898. He fought in the Crimea, and served in China from 1857 to 1861. From 1883 to 1888 he commanded the army of occupation in Egypt (see *E. B.* ix, 123, 126).

Meredith White Townsend (b. 1831; d. October 21), the well-known journalist. Born in Suffolk, and educated at Ipswich grammar school, in 1848 he went out to India, and four years later became editor of the *Friend of India*, acting also for some years as *Times* correspondent. In 1860 he returned to England, and purchased the weekly *Spectator* (*E. B.* xix, 562). With R. H. Hutton (*E. B.* xiv, 16d) he was joint-editor until 1898, and he was largely instrumental in making it an established success.

Bishop **John Wordsworth** of Salisbury (b. 1843; d. August 16), the classical scholar and divine, son of Dr. Christopher Wordsworth (afterwards Bishop of Lincoln) and grand-nephew of the poet (see *E. B.* xxviii, 825c).

The obituary for 1911 also included the following names of people of public interest, concerning whom brief biographical data are appended:

Sir **John Aird**, 1st Bart., the famous engineer and contractor; d. January 6th. Born in London on the 3rd of December 1833, the only child of John Aird, contractor for gas and water plant, he joined his father's business at eighteen. He was entrusted with the removal of the Crystal Palace buildings for the Great Exhibition of 1851 from Hyde Park and their re-erection at Sydenham, and took part in many large enterprises at home and abroad, such as the Hampton and Staines reservoirs, the water-works of Amsterdam, Copenhagen, Moscow, Bahia, Pará, Calcutta, Simla and Berlin, and later (in the joint firm of Lucas & Aird, afterwards John Aird & Co.), the St. John's Wood Railway, the Hull & Barnsley Railway and Docks, the West Highland Railway and the great Assuan Dam across the Nile (see *E. B.* xiv, 850a). He represented North Paddington in Parliament as a Unionist from 1887 to 1905, and was its first mayor in 1900. In 1901 he was created a baronet.

William George Aston, a well-known authority on Japanese literature; b. 1841; d. Nov. 22nd. He entered the British consular service in Japan in 1864. His Japanese grammars and translations were the first good English books on the subject.

Harold Kyrle Bellew, the actor; d. at Salt Lake City, Utah, November 2. B. in 1855, in Lancashire, he first appeared on the stage in Australia in 1874; and after several London engagements he joined Henry Irving for two years at the Lyceum in 1878. He had the reputation of being the handsomest man on the stage. In 1888, with Mrs. Brown Potter's company, he toured round the world. For the last ten years of his life he had been playing in the United States, in romantic and modern plays.

Sir **Nathan Bodington**, vice-chancellor of Leeds University; b. 1848; d. May 12th. A graduate of Wadham, Oxford, he became a fellow of Oriel, and in 1882 professor of Greek and principal of Yorkshire College, Leeds. It was owing to his efforts that the college was endowed and chartered in 1903 as a university.

Colonel Sir **Edward Ridley Colborne Bradford**, 1st Bart., the Anglo-Indian soldier, and London Police Commissioner; d. May 13th. Born in Buckinghamshire on the 27th of July 1836, and educated at Marlborough, in 1853 he went to India as a cadet in the East India Company's service and joined the 2nd Madras light cavalry. He served with distinction through the Indian Mutiny and till 1863, when he lost an arm in tiger-shooting; he then accepted political offices, serving as political agent, chief of native police, and after 1878, chief commissioner of Ajmere and in control of all relations with the Rajput chiefs. In 1887 he was recalled to the India Office in London, and from 1890 to 1903 he was commissioner of the London Metropolitan Police. He was created a baronet in 1902.

Henry Broadhurst, the English Labour Leader and Liberal politician; d. at Cromer, October 11th. Born at Littlemore, near Oxford on the 13th of April 1840, the son of a stonemason, he was educated at the village school, and at the age of 13 was apprenticed to

his father's trade. He worked at it for nearly twenty years, going to London finally in 1865, where he was employed in the building of the House of Commons. In 1872 he was elected chairman of the mason's committee during a strike, and from that time was prominent as a trade union official. In 1875 he was elected secretary of the parliamentary committee of the trade union congress. He entered parliament in 1880 as Liberal member for Stoke-on-Trent. In 1885 he was elected for the Bordesley division of Birmingham, and in February 1886 was appointed under-secretary to the Home Office, going out with the Gladstone government later in the year. He belonged to the older school of trade unionism and was opposed to such demands as an 8-hours day fixed by law. His moderate policy was defeated at the trade union congress of 1890, and he then resigned his secretaryship. Both in 1892 and 1893 he was unsuccessful in his parliamentary candidatures. In 1892 he was appointed a member of the Royal Commission on Labour, and in 1894 he was elected Liberal member for Leicester, which seat he held until 1906, when he retired from ill health. He published the story of his life in 1901, and a book on *Leasehold Enfranchisement* in conjunction with Lord Loreburn in 1885.

Lady Colin Campbell (*née* Gertrude Elizabeth Blood); d. in London Nov. 11th. In 1886 she obtained a separation from her husband, a son of the duke of Argyll, after a long and painful suit; and subsequently she became well-known as an art critic and journalist.

The 3rd Earl of Cawdor (Frederick Archibald Vaughan Campbell), a prominent Unionist politician; d. at Stackpole Court, Pembrokeshire, February 8th. Born at Windsor on the 13th of February 1847, he was educated at Eton and Christ Church, Oxford. From 1874 to 1885 he was Conservative member for Carnarvonshire, and succeeded to the peerage in 1898. In 1890 he became a director of the Great Western Railway, and chairman in 1895, and in this capacity earned a high reputation for business ability. On the 6th of March 1905 he became First Lord of the Admiralty in Mr. Balfour's cabinet, and held that post till the fall of the government in December. Under him the "Dreadnought" and "Invincible," the first ships of a new class, were laid down, and before leaving office he issued a programme for building four large armoured ships annually. His death deprived the Unionist party of a trusted statesman of whom much was expected. In 1907 he had moved for a select committee to consider the reform of the House of Lords, and he took a strong part in advising that House to reject the Budget in 1909; he was a member of the Conference of party-leaders in 1910, which tried in vain to arrange a compromise on the constitutional question.

Prof. George Chrystal, the eminent mathematician; d. at Edinburgh November 3rd. Born near Aberdeen in 1851, he was second wrangler at Cambridge in 1875, and was appointed successively professor of mathematics at St. Andrews in 1877 and at Edinburgh in 1879, holding the latter post till his death. He was the author of many publications on physical and mathematical subjects, and his researches into the surface oscillations of Scottish lakes won him a royal medal from the Royal Society.

Baron Collins of Kensington (Richard Henn Collins), the jurist and Lord of Appeal, d. at Hove January 3rd. Born in Dublin in 1842, and educated at Trinity College, Dublin, and Downing College, Cambridge, he was called to the English bar in 1867 and joined the northern circuit. He edited the 7th, 8th and 9th editions of Smith's Leading Cases, was made a Q.C. in 1883 and a judge in 1891. In 1897 he became a judge of appeal, in 1901 Master of the Rolls, and in 1907 a lord of appeal (resigning in 1910). In 1899 he represented Great Britain on the tribunal appointed to arbitrate in the boundary dispute between British Guiana and Venezuela; and in 1904 he was chairman of the commission which investigated the case of Adolf Beck (*E. B.* xiv, 287) and resulted in his conviction being annulled.

Canon Robinson Duckworth, the well-known divine; d. at Hawkhurst September 25th. Born at Liverpool in 1834 he took a first-class degree at Oxford in 1857, and became a fellow of Trinity College, where, after being a master at Marlborough, he was tutor from 1860 to 1866. He was then appointed Instructor and Governor to the Duke of Albany (1866-70), and subsequently Chaplain to Queen Victoria (1870). He was admitted into the most domestic Court circles, and accompanied the Prince of Wales (afterwards King Edward VII) on his tour through India. He became a Canon of Westminster in 1875 (succeeding Charles Kingsley) and Sub-Dean in 1895.

Sir Charles Alfred Elliott, the Anglo-Indian administrator; d. at Wimbledon May 28th. Born at Brighton in 1835, and educated at Harrow, he proceeded to Trinity College, Cambridge, but in 1856, when the Indian civil service was first thrown open to public competition, abandoned his Cambridge career and went out as one of the first fifteen members. During the mutiny he was assistant magistrate of Mirsapur. He served at Cawnpore and Oonao, where he published *Chronicles of Oonao*, a collection of folk-lore; he accomplished the settlement of the Hoshangabad district and the Farukhabad district, drawing up a model report of these operations. He administered famine relief at Mysore in 1878, and in 1881 became chief commissioner of Assam. In 1886 he presided over a committee appointed by Lord Dufferin to inquire into Indian public expenditure. From 1890 to 1895 he was lieutenant-governor of Bengal. After his retirement he did valuable work as a member of the education committee of the London County Council.

Sir Hugh Gilzean-Reid, journalist and newspaper proprietor; d. at Hendon November

5th. Born in Aberdeenshire in 1835, he became a journalist, and founded several provincial papers, notably the first existing halfpenny daily, the *North Eastern Daily Gazette*. He was the first president of the Institute of Journalists 1888-90, and the first Liberal member of parliament for Aston Manor 1885-86. He was knighted in 1893.

Sir William Grantham, the well-known judge; d. in London, November 30th. Born in 1835, he came of an old Sussex family, and inherited property in the county. After a successful career at the bar, and in parliament, where he represented East Surrey in the Conservative interest from 1874-85, he was appointed in 1885 judge of the Queen's Bench division of the High Court. He was never at pains to conceal his own views on politics, and after 1906, when he was on the rota of judges for election petitions, his decisions were sharply criticized as biased against the Liberal party, notably in the Great Yarmouth case, which led to a motion of censure in the House of Commons in July 1906. But in certain criminal cases he gained considerable credit, and in the Adolf Beck trial he was one of the first to suspect the mistake as to the prisoner's identity (see *E. B.* xiv, 287). He was chairman of the East Sussex Quarter Sessions, and as a landlord took a practical interest in the housing of the rural labourers. In Parliament he was a strong supporter of the establishment of the Criminal Court of Appeal.

The Very Rev. **Robert Gregory**, Dean of St. Paul's; d. August 2nd. Born at Nottingham in 1819, he was at first intended for business, but subsequently went to C.C.C., Oxford, and was ordained in 1843. In 1851, after holding various country curacies, he became Curate of Lambeth Parish Church, and from 1853-73 was rector of St. Mary's, Lambeth, becoming a Canon of St. Paul's in 1868. In 1890 he became Dean of St. Paul's, and to the end of his long life devoted himself to the service of the metropolitan cathedral. He was a High Churchman, a champion of Church Schools and of religious education, and was a member of the first London School Board.

Sir Henry Harben, a pioneer of industrial life-insurance; b. 1823; d. Dec. 2nd. From 1848 he had been connected with the Prudential Assurance Company, and saw it increase from small beginnings till its income was over 14 millions sterling.

Samuel Henry Jeyes, a well-known journalist; b. 1857; d. in London June 25th. He had been assistant-editor of the *Standard* since 1892, and was the author of a *Life of Mr. Chamberlain* and other books.

Alfred Peter Hillier, Unionist M.P. for Hitchin division of Herts; b. 1858; d. Oct. 24th. Educated as a doctor at Edinburgh, he settled in South Africa in 1878, and became a partner with Dr. (afterwards Sir Starr) Jameson at Kimberley and Johannesburg. He was a member of the Reform Committee in the crisis of 1895-96, and was one of the prisoners at Pretoria. In 1897 he settled in England and devoted himself to finance and politics. He contributed several articles on South African history to the *E. B.*

Sir George Henry Lewis, 1st Bart, the famous solicitor; d. in London December 7th. Born in 1833, and educated at University College, London, he was articled in 1856, and became head of the firm of Lewis & Lewis. He was engaged in a very large number of notable public cases, including the Bravo poisoning case, the Hatton Garden diamond robbery, and the Overend-Gurney and other banking prosecutions. Later he was solicitor for Mr. Parnell and the Irish party in the Parnell Commission (see *E. B.* ix, 579 and xx, 855). Sir George Lewis, who was made a baronet in 1893, was for many years the most prominent man in his profession, and had a unique practice, especially in advising on difficult family affairs; he was the trusted confidential adviser of a host of important people.

Baron Lochee of Gowrie (Edmund Robertson), the jurist and Liberal politician; d. September 13th. Born in Scotland on the 28th of October 1845, and educated at Oxford, he became a fellow of Corpus Christi College in 1872; he was called to the English bar, and became well-known as a jurist, filling the posts of examiner in jurisprudence at Oxford, professor of Roman Law at London University, and Reader in law to the council of legal education. He was Liberal member for Dundee from 1885 until he was raised to the peerage in 1908. In 1892 he became a Civil Lord of the Admiralty, and in 1906 was Secretary to the Admiralty. His writings included a book on *American Home Rule*, and numerous articles on legal and constitutional subjects in the *E. B.*

John Malcolm Forbes Ludlow, the well-known social worker; d. in London October 17th. He was born in 1821, and was called to the bar in 1843. Becoming associated with Kingsley, Hughes and F. D. Maurice, he helped to found the Working Men's College in Great Ormond Street, and was one of the first promoters of the Christian Socialist Movement. From 1875 to 1890 he was Chief-Registrar of Friendly Societies. He was one of the first members and subsequently president of the labour Co-Partnership Society.

The Rev. Dr. **Norman Macleod**, the Scottish divine; d. December 11th. The son of the Rev. John Macleod, D.D., he was born at Morven, Argyre, in 1838. He became one of the leading ministers of the Church of Scotland, always with a slight leaning towards the "High Church" section. Beginning his career as minister of St. Columba's, Glasgow, he was inducted to the first charge of Inverness in 1890, was appointed clerk of the General Assembly of the Church of Scotland (an office in which his statesmanlike abilities were widely recognised), and in 1900 was elected moderator of the General Assembly.

John MacWhirter, the Scottish landscape painter; d. in London January 28th. Born

near Edinburgh in 1839, he began his art training under Robert Scott Lauder, and was elected a member of the Royal Scottish Academy in 1867, an associate of the Royal Academy in 1879 and R.A. in 1893. His *June in the Austrian Tyrol* was bought in 1892 out of the Chantry bequest.

Margaret Macdonald (Mrs. Ramsay Macdonald); b. 1870; d. in London Sept. 8th. A daughter of Dr. J. H. Gladstone (*E. B.* xii, 66), she devoted herself to social work, both before and after her marriage in 1896 to Mr. Ramsay Macdonald, who became leader of the Labour party. She was the first President of the Women's Labour League (1906).

Bishop Francis Paget of Oxford; d. in London August 2nd. The second son of the surgeon Sir James Paget (see *E. B.* 20, 451b), he was born on the 20th of March 1851. His brothers, Sir John R. Paget, K.C., 2nd Bart., the lawyer (b. 1848), the Rt. Rev. Luke Paget, Bishop of Stepney since 1909 (b. 1853), and Stephen Paget, the surgeon and author (b. 1855), all became well-known men. Francis Paget was educated at Shrewsbury and Christ Church, Oxford, where he had a distinguished career, taking first classes in classics, winning the Hertford scholarship (1871) and Chancellor's Latin Verse Prize (1871); he was elected a senior student of Christ Church (1873) and tutor (1876), taking holy orders in 1875. In 1885 he was appointed Regius Professor of Pastoral Theology, and in 1892 succeeded Canon Liddell as Dean of Christ Church. He contributed the essay on the Sacraments to *Lux Mundi*. He became Bishop of Oxford in 1901, and was a Member of the Royal Commission on Ecclesiastical Discipline from 1904-06.

Sir Cuthbert Quilter, 1st Bart., English financier and art collector, d. at Woodbridge, Suffolk, November 18th. He was born in 1841. He made a considerable fortune in business, and took an active interest in scientific agriculture, doing much to reclaim waste lands at Bawdsey, Suffolk, and also in the improvement of horse-breeding (he revived the all but extinct Suffolk "Punch"). He was a great picture-buyer, and acquired a collection of paintings which realised over £87,000 at his death. He sat in Parliament as Liberal Unionist member for Sudbury from 1885 to 1906, and for some years earnestly advocated the passing of a Pure Beer Bill, with the object of restricting the use of substitutes for hops; he himself started a brewery at Woodbridge in order to put his views into practice.

Alberto Randegger, the musical composer and conductor; d. in London December 18th. Born in Trieste in 1832, he had settled in London in 1854 after holding various musical appointments in Italy. Both as an orchestral conductor, and as a teacher of music and singing he held for many years a leading position in London; he published a number of original compositions, and a host of prominent artists were his pupils, either privately or at the Royal Academy (from 1868) and Royal College (from 1896). Besides conducting on various occasions at the Royal Opera, musical festivals and elsewhere, he did much, as conductor of the Carl Rosa company from 1879, towards the popular revival of opera in England.

The Rev. **James Guinness Rogers**, the Congregationalist divine, b. 1822; d. August 20th. He is best remembered for his close association with Dr. Dale in the Liberal-Nonconformist Education and disestablishment campaigns of 1865-75, and for his friendship with Mr. Gladstone and Lord Rosebery, who consulted him as the foremost representative of Nonconformist statesmanship.

"**Lord**" **George Sanger**, the circus-proprietor; b. 1827, murdered at Finchley on Nov. 28th. He had at one time the largest travelling circus in Europe.

Elliot Stock, the Nonconformist publisher, bibliophile, and author; b. 1837; d. March 1st.

Mervyn Herbert Nevil Story-Maskelyne, the mineralogist; d. at Swindon, May 20th. Born in 1823, he was descended on the mother's side from Nevil Maskelyne, the Astronomer Royal. He was Professor of Mineralogy at Oxford from 1865-95, and also the first Keeper of the Minerals at the British Museum, relinquishing that post in 1879. In 1880 he entered Parliament as Liberal member for Cricklade, and represented North Wilts as a Liberal Unionist from 1885-92. He studied especially crystallography, meteorites and gem-stones, and was the author of many scientific papers, and of a book on the Morphology of Crystals.

"**Hesba Stretton**" (Sarah Smith), the authoress; d. near Richmond October 8th. She was born at Church Stretton in 1832, and wrote for *Household Words* under the editorship of Charles Dickens, who became a personal friend. She was well known as the writer of *Jessica's First Prayer* and other religious tales.

Baron Swaythling (Samuel Montagu), the well known financier; d. in London January 12th. He was born at Liverpool on the 21st of December 1832, and came of a Jewish family named Samuel, but afterwards took by royal licence the name of Montagu. Beginning in early life in a very humble way of business, he gradually acquired great wealth by enlarging its scope, and he rose to the head of the most important arbitrage house in the City of London. A strong Liberal in politics, he sat in parliament for the Tower Hamlets from 1885 to 1900; he was a member of the Gold and Silver Commission of 1887-90, being himself a bi-metallist. He was created a baronet in 1894, and raised to the peerage in 1907. Throughout his life he was a zealous promoter of Jewish interests, founding the loan fund of the Jewish Board of Guardians, the Jewish Working Men's Club and several synagogues, and for his work on emigration schemes for the persecuted Russian Jews he made many journeys in Europe and America, succeeding Sir Julian Goldsmid as chairman of the Russo-Jewish committee. He also helped to establish a modern secular school for Jews at Jerusalem in 1875.

Katherine Cecil Thurston, the novelist; d. at Cork September 6th. The daughter of Mr. Paul Madden, she was born at Cork, and in 1901 married Ernest Temple Thurston, the novelist, the marriage being dissolved on her petition in 1910. Her chief publications were *The Circle* (1903), *John Chilcote, M.P.* (1904), *The Fly on the Wheel* (1908).

Sir Samuel Walker, 1st Bart., Lord Chancellor of Ireland; d. at Dublin August 13th. Born in County Westmeath in 1832, he was educated at Trinity College, Dublin, and called to the Bar in 1855. He was Liberal Member for Londonderry from 1884-85, and was appointed Attorney General for Ireland in 1885. From 1892 to 1895 he was Lord Chancellor of Ireland, and again from 1905 till his death.

Robert Spence Watson, a prominent Liberal politician; d. at Gateshead-on-Tyne, March 2nd. Born at Gateshead in 1837, he came of an old Quaker family. He was educated at the Friend's School, York, and London University, and then went into practice as a solicitor; but later he became well-known as an enthusiastic worker for the Liberal cause in politics. Though he never entered Parliament, he had a potent influence in north-country constituencies, and was president of the Newcastle-upon-Tyne Liberal Association (1873-90) and also of the National Liberal Association (1891-1902). He held the honorary degree of LL.D. from St. Andrews and D.C.L. from Durham Universities; and in 1907 the Liberal Government made him a Privy Councillor.

Rosamund Marriott Watson, the authoress; d. December 29th. She was a daughter of Mr. Benjamin Williams Ball, and was born in London in 1863. As Graham Tomson (the surname being that of her first husband) and also after her second marriage to the novelist H. B. Marriott Watson, she published some charming verse, besides books in prose and several anthologies, including a *Selection from the Greek Anthology* (1889) and *Concerning Cats* (1890).

James Galloway Weir, the Liberal politician; b. 1841; d. May 18th. He had been M.P. for Ross and Cromarty since 1892.

Charles J. Wertheimer, the art-dealer and collector; b. 1842, d. April 25th. His fine collection was sold for a large sum after his death.

1912

During 1912 the following persons died, on whom biographical articles are included in the *E. B.*:—

Sir Lawrence Alma-Tadema, the painter; b. 1836; d. at Wiesbaden on the 25th of June. (See *E. B.* i, 712.)

Edward Arber, the Early-English scholar; b. 1836; d. in London, November 23rd. (See *E. B.* ii, 323.)

William Blackwood, the Edinburgh publisher; b. 1836; d. November 10th (see *E. B.* iv, 27); he had edited Blackwood's Magazine since 1879.

William Booth, "General" and founder of the Salvation Army; b. 1829; d. in London on the 20th of August (see *E. B.* iv, 239d; and for the Salvation Army, *E. B.* xxiv, 100d). Towards the close of his life he became blind through cataract, losing the sight of one eye in 1909, and of the other after an operation three months before his death. But he had continued to direct the operations of the army and learned to write without the aid of sight. As late as 1909 he had undertaken his sixth motor-car campaign. His last public appearance was made at the Albert Hall, London, on the 9th of May 1912 at a meeting to celebrate his 83rd birthday.

Sir George Howard Darwin, professor of astronomy and experimental philosophy at Cambridge (see *E. B.* vii, 843d.); b. 1845; d. December 7th. The second son of Charles Darwin, he was 2nd Wrangler and Smith's Prizeman at Cambridge, and was elected to his professorship in 1883. His principal work was on the subject of tides, on which he became the leading authority, and on other physical questions connected with the relation of the earth and moon; and the article "Tide" in the *E. B.* (xxvi, 938 *et seq.*) remains a unique expression of his matured researches on his special subject.

Andrew Martin Fairbairn, the Congregationalist divine, ex-principal of Mansfield College, Oxford; b. 1838; d. in London on the 9th of February. (See *E. B.* x, 129.)

James Gairdner, the archivist and historian; b. 1828; d. at Pinner, on the 4th of November. (See *E. B.* xi, 390.)

George Grossmith, the actor and entertainer; b. 1847; d. at Folkestone on the 1st of March. (See *E. B.* xii, 619.)

Octavia Hill, the social reformer; b. 1838; d. in London on the 13th of August. (See *E. B.* xiii, 465 and 823.)

Andrew Lang, the eminent writer; b. 1844; d. at Banchory, N.B., on the 20th of July. (See *E. B.* xvi, 171.)

Lord Lister, the great surgeon; b. 1828; d. at Walmer on the 10th of February. (See *E. B.* xvi, 777; and for his discoveries in antiseptic surgery, xxvi, 129 *et seq.*)

Justin McCarthy, the Irish politician, historian and novelist; b. 1831; d. at Folkestone on the 24th of April. (See *E. B.* xviii, 200d.)

Lord Peel, ex-speaker of the House of Commons; b. 1829; d. at Sandy, Beds., on the 24th of October. (See *E. B.* xxi, 39d.)

W. S. Penley, the actor; b. 1852; d. November 11th. (See *E. B.* xxi, 99.)

R. Norman Shaw, the architect; b. 1831; d. at Hampstead, November 17th. (See *E. B.* xxiv, 813.)

Walter William Skeat, the philologist; b. 1835; d. at Cambridge on the 6th of October. (See *E. B.* xxiv, 168.)

William Thomas Stead, the journalist; b. 1850; perished in the sinking of the "Titanic" on the 15th of April. (See *E. B.* xxv, 817c.)

Edward O'Connor Terry, the actor; b. 1845; d. in London on the 3rd of April. (See *E. B.* xxvi, 660.)

Sir George Stuart White, the field-marshal; b. 1836; d. in London on the 24th of June. (See *E. B.* xxviii, 599b, and for his Natal Campaign, xxvii, 204a and 205d.)

Biographical notes may be added concerning others who died during the year:—

By the death of **Henry Du Pré Labouchère**, the Radical politician and proprietor of *Truth*, in Florence on the 15th of January, a famous figure passed away. Born in London in 1831, the son of John Labouchère of Broome Hall and nephew of Lord Taunton (*E. B.* xxvi, 453a), he was educated at Eton, and, after spending a short time at Cambridge, entered the diplomatic service in 1854, becoming in 1863 second secretary to the British Embassy at Constantinople. In 1864 he abandoned diplomacy for politics, and in 1865 was elected Liberal member for Windsor, but was unseated on petition. In 1866 he won a by-election for Middlesex, but failed to be re-elected in 1868. In 1880 he again entered the House of Commons as Radical member for Northampton with Mr. Bradlaugh as his colleague, and this seat he retained until his retirement in 1905. He began his journalistic career with the *Daily News*, of which he became part proprietor just before the Franco-German war, and he was himself the author of the *Letters of a Besieged Resident*, sent to it from Paris by balloon post during the siege, addressed to his wife in London. In 1874 he became associated with Edmund Yates on *The World* (see *E. B.* xxviii, 908b); but two years later he started *Truth* as a rival society paper, destined, as he himself said, "to be another and a better *World*." It had a remarkable record in the exposure of shams and organised impostures, especially frauds on the charitable. Many libel actions were brought against it, but in 25 between 1897 and 1907 only 3 verdicts were given definitely against the paper. For many years Mr. Labouchère himself contributed racy articles and notes, and he was to the end popularly identified with *Truth*, though in fact he left the direction in later years first to Mr. Horace Voules and then to Mr. Bennett, and took no active part either in writing or editing. He was a thorough Bohemian, and after his death the whole story of his life connection with *Truth* was very candidly told in a series of admirable articles in its columns. As a politician "Labby" was the chartered jester of the House of Commons, but his pungent and somewhat cynical speeches were the expression of highly independent democratic convictions, deeply opposed to all forms of social privilege or jingo Imperialism. He was a strenuous advocate of the abolition of the House of Lords (see *E. B.* xx, 845d, 846b); at the time of the Parnell Commission (*E. B.* xx, 858d) he had much to do with the unmasking of Pigott; and he was a member of the Inquiry into the Jameson Raid, his hostility to Mr. Chamberlain being as pronounced as against Lord Rosebery when the latter became leader of the Liberal party. He considered himself entitled to office when his party was in power, and was decidedly mortified at not getting it from Mr. Gladstone. In 1868 he had married Miss Henrietta Hodson, a popular actress. After 1903 he lived mainly in Italy, at a villa near Florence, where he died. He left a fortune of some two million sterling to his daughter, who had married a son of the Marquis di Rudini.

Among other people of political prominence the following may be noted:—

The 10th Earl of **Carlisle**, who had succeeded to the title only in 1911; b. 1867; d. January 20th. As Lord Morpeth (*E. B.* v, 341b) he served on the London School Board from 1894 to 1902, and was Unionist member for South Birmingham 1904-11.

Enoch Edwards, the Labour leader and M.P. for Hanley (since 1906); d. at Southport on June 28th. Born at Talk-o'-the-Hill, Staffordshire, in 1852, he was the son of a pitman, and worked as a boy in a coal-mine. He became first treasurer, then secretary of the North Staffordshire Miners' Association, and in 1884 went to Burslem, where he held various municipal posts and finally became mayor. He was also president of the Midland Miners' Association, and latterly president of the Miners' Federation of Great Britain.

George Harwood, cotton manufacturer and member of parliament; d. in London on November 7th. Born at Bolton in 1845, he entered his father's cotton spinning business, while still a student of Owens College, where he worked at classics and political economy until he could take the London M.A. degree. Later he read theology, and in conjunction with Dean Stanley and others founded the Church Reform Union. Under the influence of Bishop Fraser of Manchester he was ordained deacon in 1886, and frequently preached in the north of England though living outwardly the life of a layman. In 1895 he was elected Liberal member for Bolton, and held the seat till his death. He published *The Coming Democracy*, *Essays for the Times*, *Christianity & Common Sense* and other works.

The 1st Baron **Holden** (see *E. B.* xiii, 582d), Liberal M.P. for Bradford 1885, and the Buckrose division of Yorkshire 1892-1900; b. 1833; d. at Bolton Percy on March 25th.

Walter Stowe Bright McLaren, Liberal M.P. for Crewe 1886-95, and 1910-12; son of Duncan McLaren, Lord Provost of Edinburgh, and nephew of John Bright; b. 1853; d. June 29th.

Sir Arthur John Otway, Bart., formerly for many years a Liberal M.P., Chairman of Committee in the House of Commons 1883-85; b. 1822; d. June 8th.

Lord Stalbridge, (cr. 1886), formerly, as Lord Richard Grosvenor, Liberal M. P. 1861-86, and Chief Whip 1880-85; Chairman of the L. & N. W. Railway Company, 1891-1911; b. 1837; d. May 18th.

Lord Wandsworth (Sydney James Stern) cr. 1895, formerly Liberal M.P. for Stowmarket 1891-95; b. 1845; d. February 10th.

John Lloyd Wharton, Conservative M.P. for Ripon division of Yorkshire, 1886-1906; Chairman of N. E. Railway Company; b. 1837; d. July 11th.

Sir George White, Liberal M.P. for West Norfolk, 1900-12; a prominent Nonconformist; b. 1840; d. May 11th.

In the public service the following had played prominent parts:—

Lord Wenlock (the 3rd Baron); b. 1849; d. January 15th. Governor of Madras 1891-96.

The 1st Baron **Stanmore** (cr. 1893); b. 1829, younger son of 4th Earl of Aberdeen; d. January 30th; Governor of Trinidad (1866-70), Mauritius (1871-74), Fiji (1875-80), New Zealand (1880-82), and Ceylon (1883-90).

Allan Octavian Hume, C.B.; b. 1829, son of Joseph Hume (*E. B.* xiii, 884); d. at Norwood July 31st. Entering the Indian Civil Service in 1849, he became Collector of Etawah, and rendered distinguished service during the Mutiny and later against Firoz Shah. Between 1867 and 1871 he carried out the negotiations with the Rajput chiefs for opening road and railway communications through the great belt of mountain and jungle which formerly cut India in two. He was made secretary to the Indian government in the Home department and afterwards in the Revenue and Agricultural departments, but returned to the North-West Provinces as member of the Revenue Board in 1879. In 1882 he retired from the service, and devoted himself to furthering the aspirations of native Indians. The Indian National Congress (see *E. B.* xiv, 417b), which held its first session at Bombay in 1885, owes its existence to his exertions. He was the author of several works on ornithology, and presented his collections of bird skins and eggs to the British Museum.

Sir Richmond Thackeray Ritchie (see *E. B.* xxvi, 716d); b. 1854; d. October 12th. Entering the India Office in 1877, he rose to be Permanent Under-Secretary of State in 1910.

Lt. Col. **Henry Strachey**; b. 1816, brother of Sir Richard Strachey (*E. B.* xxv, 976); d. February 9th. Entering the Indian service in 1835, he made a notable journey in 1846 into Tibet (*E. B.* xxvi, 923d), and in 1847 he was a member of the Cashmere Boundary Commission.

George Strachey, brother of last-named; b. 1829; d. February 25th. Minister at Dresden 1890-97.

Admiral Sir Richard Vesey Hamilton; b. 1829; d. September 18th. Entering the navy at the age of fourteen, he served in Captain Ommanney's Arctic expedition of 1850-51, afterwards joining Captain Kellett (*E. B.* xxi, 946a) and remaining in the Arctic regions for three winters. In 1856 he was promoted to command the gunboat "Haughty" and went to China. He was promoted captain 1862, rear-admiral 1877, vice-admiral 1884, and admiral 1887. From 1885-87 he was commander-in-chief on the China station. In 1889 he was appointed Second Sea Lord of the Admiralty, becoming shortly First Sea Lord. In 1891 he became president of the Royal Naval College at Greenwich, and retired in 1894. He published *Naval Administration* (1896) and edited the *Letters and Papers of Admiral of the Fleet Sir Thomas Byam Martin* (3 vols.)

Admiral of the Fleet Sir Nowell Salmon; b. 1835; d. February 14th. Entering the Navy in 1847, he served with the "Shannon" brigade in the Indian Mutiny, and received the V.C. for bravery at the second relief of Lucknow (1858). He became Commander-in-Chief at the Cape, 1882-85; and Commander-in-Chief at Portsmouth, 1894-97.

Admiral of the Fleet Sir Frederick William Richards; b. 1833; d. September 28th. Entering the navy in 1848 he served at first on the Australian station. In 1855 he was promoted lieutenant, in 1860 commander, and in 1866 captain. From 1870-73 he commanded the Indian troopship "Jumna" and from 1873-77 the "Devastation," the first sea-going turret ship. In 1878, being appointed Commodore and Senior Officer on the West Coast of Africa, he arrived at the Cape of Good Hope only to hear of the disaster at Isandhlwana. He promptly proceeded east and landed with a force of 250 men, who shared in the battle of Ginginhlovo and the relief of Eshowe. In 1881 he was at the battle of Laing's Nek. He became rear-admiral in 1882, and from 1882-85 served as Junior Lord of the Admiralty. From 1885-88 he was Commander-in-Chief of the East Indies Station. In 1888 he was promoted vice-admiral. In 1890 he became Commander-in-Chief on the China station and in 1892 was appointed second Naval Lord of the Admiralty, being Senior Lord from 1893-99. He was promoted Admiral in 1893 and Admiral-of-the-Fleet in 1898.

Major-General Sir John Frederick Maurice; b. 1841; d. January 12th. The eldest son of Frederick Denison Maurice (see *E. B.* xvii, 190); he entered the Royal Artillery in 1861. Seven years later he was appointed Instructor at Sandhurst, and in 1873 went to the Gold

Coast as private secretary to Sir Garnet (Lord) Wolseley. After seeing service in South Africa and in the Egyptian campaign of 1882, he held the post of professor of Military History at the Staff College, and was gazetted a major-general in 1895. It was, however, less on active service than as a student of war and national problems and as a thinker and writer that most of his work was achieved, between 1871, when he was awarded the Wellington prize for his essay on field manoeuvres, and 1906-08, when he brought out the official history of the South African War. His published works include a *Life of his father* (1884), *Hostilities without Declaration of War* (1883), *The Balance of Military Power in Europe* (1888), *National Defence* (1897), *War* (1891), an expansion of his article in the *E. B.* (9th ed.), and the *Diary of Sir John Moore*, with notes. In 1907 he was awarded the Chesney Gold Medal of the Royal United Service Institution for his writings. One of his sons, Hugh Alexander, was killed at Delhi, in a railway accident, on the 22nd of January 1912, ten days after the death of his father.

General Sir Charles John Stanley Gough; b. 1832, grand-nephew of Viscount Gough (*E. B.* xii, 281); d. September 6th. He went to India at the age of sixteen, where he joined the 8th Bengal Cavalry and served through the Punjab campaign of 1848-49. During the Mutiny he and his brother (afterwards General Sir Hugh Gough, keeper of the Crown Jewels) joined the Guide Corps, and took part in many actions, including the relief of Lucknow. He won the Victoria Cross. He served in the Bhutan expedition of 1864, and commanded a cavalry brigade in the Peshawar Valley Field Force during the Afghan War of 1878. He commanded the Hyderabad contingent from 1881-85, and a division of the Bengal Army from 1886-90. He published *The Sikhs and the Sikh Wars* in 1897.

Major-General Sir Frederick Walter Kitchener; b. 1858, brother of Lord Kitchener (*E. B.* xv, 838); d. March 6th. He was with Lord Roberts in the Afghan War of 1878-80. From 1891-96 he was Deputy Assistant Adjutant General for Instruction in India. He accompanied the Dongola expedition of 1896 as director of Transport, and in 1899 filled the same post in Lord Kitchener's march to Khartum (see *E. B.* ix, 130a). He served under Sir Redvers Buller in South Africa, taking part in the relief of Ladysmith. In 1908 he was appointed Governor of Bermuda, where he died.

Religion was represented by the following notable names:—

John Sheepshanks, formerly Bishop of Norwich; b. 1834; d. June 3rd. Educated at the Grammar School, Coventry, and Christ's College, Cambridge, he was ordained in 1857 to a curacy under Dr. Hook, vicar of Leeds; but in 1859 he went out to British Columbia to be chaplain to its bishop and rector of New Westminster. His eight years' work amongst settlers, miners and lumbermen, taught him an unconventionality of outlook and methods which remained with him throughout his clerical career. He published his experiences under the title of *A Bishop in the Rough*. In 1868 he returned to England, and after five years in the Yorkshire parish of Bilton, near Harrogate, he was presented to St. Margaret Anfield, Liverpool, where he came under the notice of Mr. Gladstone, who in 1893 offered him the bishopric of Norwich. He held the see till 1910, when he resigned owing to ill health. Among his other publications were *My Life in Mongolia and Siberia* (1903), *The Pastor in his Parish* (1908), and volumes of sermons and addresses.

Charles William Stubbs, Bishop of Truro; b. 1843; d. May 4th. His father and grandfather were Yorkshire agriculturists, and throughout his life he took a strong interest in the welfare of the agricultural labourer. He published three volumes on the subject, *Village Politics* (1878), *The Land and the Labourers* (1890), and *Christ and Democracy* (1883). He was a strong Liberal with somewhat socialistic views, and was preferred by Mr. Gladstone to the living of Stokenham and Chivelstone in Devon in 1884. In 1887 he was transferred to Liverpool, becoming rector of Wavertree. In 1893 Mr. Gladstone made him dean of Ely. There he remained till 1905 when Sir Henry Campbell-Bannerman made him Bishop of Truro. He was Hulsean Lecturer at Cambridge in 1904, and published his lectures under the title *The Christ in English Poetry* (1905). His other published works include *A Creed for Christian Socialists* (1896) and a *Handbook to Ely Cathedral* (1898).

George William Kitchin, Dean of Durham; b. 1827; d. October 13th. Educated at the Ipswich Grammar School, King's College, London, and Christ Church, Oxford, he graduated in 1850, the only double first-class man of his year, and was ordained in 1852. He became a schoolmaster, but returned to Oxford as tutor at Christ Church in 1863. He undertook the organisation and control of the non-collegiate students, admitted by the University after 1868, becoming their first Censor and holding the office till 1883, when he became Dean of Winchester. In 1894 he was appointed Dean of Durham, becoming also first Warden and then Chancellor of Durham University. He published a *History of France* (1873-77), *Life of Pope Pius II* (1881), and various books on Winchester and Durham.

George Evan Moule, Anglican missionary Bishop in China; b. 1828; d. March 3rd. Having graduated from C.C.C., Cambridge, and taken orders in 1851, he was sent out in 1857 to China by the Church Missionary Society. In 1861 he was joined by his brother the Rev. Arthur E. Moule, and with him worked for over 50 years, at first at Ning-po, but principally at Hang-chow. In 1886 he was consecrated first Bishop of Mid-China, and his work steadily developed till his resignation in 1908. Bishop Moule was a Chinese scholar, and translated the Prayer-book into classical Chinese.

Father **John Gerard**, the Jesuit; b. 1840; d. December 13th. He was educated at Stonyhurst after becoming a Jesuit, spent a great part of his life as a master at his old school. In 1879 he was appointed its Prefect of Studies, but relinquished the post in 1893 to become editor of *The Month*. From 1897 to 1900 he was Provincial of the English Jesuits. He published a refutation of Haeckel in *The Old Riddle and the Newest Answer*, and various other works, notably *The Gunpowder Plot* (see *E. B.* xi, 729a).

John Griffith, the Welsh Congregationalist missionary in China; b. 1831; d. July 25th. He showed his religious bent very early. He was brought up a Congregationalist, and at the age of eight was admitted to full membership of his chapel, and when only 14 he delivered his first sermon at a prayer meeting. At sixteen he became a regular preacher, and was subsequently trained at the Brecon Congregational College for the ministry. In 1853 he offered his services to the London Missionary Society, and after two years' training sailed for Shanghai in 1855. His work in China covered a period of 55 years. In 1861 he went from Shanghai through the provinces of Central China, which he was the first Christian missionary to penetrate, and he claimed that with his colleagues he had established over 100 mission stations in Hu-peh and Hu-nan (see *E. B.* xviii, 596). He acquired an intimate knowledge of the Chinese language and literature, and translated the New Testament and a great part of the old into more than one Chinese dialect. In the Yangtze valley he founded a theological college for native preachers, which bears his name. At the end of 1911 his health finally gave way and he returned to England.

Arthur Wollaston Hutton, Anglican clergyman and author; b. 1849; d. March 25. A scholar of Exeter, Oxford, he took orders in the Church of England in 1872, but under Newman's influence became a Roman Catholic, and from 1876-83 was a member of the Edgbaston Oratorian Community. He changed his views, however, renounced Romanism, and became known as an agnostic and free-thinker; and for some years he was librarian at the National Liberal Club in London. In 1898 he again made a remarkable change, being readmitted to Anglican orders, and from 1903 to his death he was rector of Bow Church, London. His absolute sincerity, strength of conviction, and great intellectual ability and honesty, were recognised by all who knew him. He was the author of a *Life of Manning* (1892), and of several articles in the *E. B.*

Charles Voysey, the Theistic preacher; b. 1828; d. July 20th. Educated at Stockwell Grammar School and St. Edmund Hall, Oxford, he was ordained in the Anglican Church and held various curacies up to 1860, when he became curate of St. Mark's Whitechapel. Thence he was ejected for heterodox doctrine, and he went to St. Mark's, Victoria Docks, and later to Healaugh near Tadcaster, where he was first curate and then vicar. But in 1869 he was summoned before the Chancery Court of the Diocese of York for heterodox teaching, and deprived of his living. He appealed to the Privy Council, but the decision was upheld. He then established a Theistic Church in London, where he continued to preach and teach up to the time of his death.

In the medical world the following were of most interest:—

Sir William Henry Allchin, physician and author; b. 1846; d. February 8th. He was educated at University College, London, where he afterwards became Lecturer on Anatomy and Physiology, then he was principally associated with Westminster Hospital of which he became Senior Physician. He edited a *Manual of Medicine* (1903), to which he contributed articles on his special subject of abdominal diseases. He was Harveian Orator (1903); Bradshaw Lecturer (1901) and Lumleian Lecturer (1905); and was knighted in 1907.

Sir Henry Trentham Butlin, Bart., the surgeon and pathologist; b. 1845; d. January 24th. He received his medical training at St. Bartholomew's Hospital, London, to which he returned after holding posts at the Children's Hospital, Great Ormond Street, and at the West London Hospital; and was successively demonstrator, assistant surgeon (1881), and surgeon from 1892-1902. In 1909 he was elected president of the Royal College of Surgeons. His investigations of cancer led him to the theory that the disease is a parasitic growth formed within and from the tissues of its host, which he announced at a Bradshaw lecture of the Royal College of Surgeons in 1905.

Clinton Thomas Denton, a well-known surgeon and Alpine climber; b. 1850; d. August 26th. Educated at Eton and Trinity College, Cambridge, he was vice-president of the Royal College of Surgeons, senior surgeon to St. George's Hospital, and since 1904 chief surgeon to the Metropolitan Police. He made the first ascent of the Aiguille du Dru, after 18 unsuccessful attempts, and the first ascent of the Rothhorn from the Zermatt side. He also did much exploration in the Caucasus. Besides many works on surgery he published *Above the Snow Line* (1885).

Washington Epps, the homoeopathic physician; b. 1848; d. October 14th. The son of George Napoleon Epps (see *E. B.* ix, 708c), he was for 38 years on the staff of the London Homoeopathic Hospital, and was president of the British Homoeopathic Society.

William Ogle, physician and author; b. 1828; d. April 12th. He took his medical degree at Oxford and became a Fellow of Corpus. In medical circles he was well-known as chief secretary to the Royal Medical and Chirurgical Society, Lecturer on Physiology at St. George's Hospital Medical School; but his permanent fame rests on his remarkable edition of Aristotle's *De Partibus Animalium*, a work of great scholarship and learning.

The following were prominent in the legal profession:—

Sir Gainsford Bruce, Judge of the High Court; b. 1834; d. January 23rd. He graduated at Glasgow University and was called to the bar in 1859. He joined the Northern and afterwards the North-Eastern circuit, and from 1869–82 reported Admiralty and Ecclesiastical cases for the *Law Reports*. His strength lay in Admiralty law, and he made several contributions to its literature; notably *Williams and Bruce's Admiralty Practice*, and the 4th edition of *Maude and Pollock on Shipping*. He was Recorder of Bradford from 1877–92, and successively solicitor-general (1879) and attorney-general (1886) to the County-Palatine of Durham. A Conservative in politics, he represented Holborn in Parliament from 1888 till he was raised to the bench in 1892.

Sir John Compton Lawrence, Judge of the High Court; b. 1832; d. December 5th. Called to the bar in 1859, he became Q.C. in 1877 and Recorder of Derby in 1879. In 1880 he was returned to Parliament as Conservative member for South Lincolnshire, and in 1885 was elected member for the Stamford division. He was made a Judge in 1890, and sat on the Bench for 22 years, retiring March 1912.

Sir Alfred Wills, Judge of the High Court; b. 1828; d. August 10th. He was educated at University College, London, and was called to the bar in 1851. After some years on the Midland and North-Eastern Circuits, he was appointed to a judgeship in the Queen's Bench Division in 1884, and four years later acted as the first *ex-officio* commissioner under the Railway Canal Traffic Act. Very few of his decisions or opinions were reversed upon appeal. His ability for dealing with complicated cases was notably shown in *Cockerton v. London School Board*, the point at issue being the power of the School Board to pay for higher technical education out of the rates. His judgment, adverse to the Board, was affirmed by the Court of Appeal; and in the case of *Sharp v. Wakefield*, when, with Mr. Justice Field, he asserted the unrestricted discretion of licensing justices to refuse, under certain circumstances, to renew a licence, the House of Lords upheld the decision. Sir Alfred Wills was a pioneer of mountaineering (see *E. B.* xviii, 938c; and i, 748d), one of the founders of the Alpine Club in 1858, third president in 1863, and author of several books about climbing and other Swiss experiences. His father's treatise, *Wills on Circumstantial Evidence*, was enlarged and edited by him in book form, and went through several editions.

Lord Stormonth Darling, Judge of the Court of Session in Scotland; b. 1845; d. June 2nd. Educated at Kelso Grammar School and Edinburgh University, he was called to the Scottish bar in 1867. In 1888 he entered the House of Commons as member for the Universities of Edinburgh and St. Andrews, and in the same year became solicitor-general for Scotland. In 1890 he was appointed a Lord of Session.

Thomas Hutchinson Tristram, a well-known ecclesiastical lawyer; b. 1825; d. March 8th. He took his D.C.L. degree in 1854, and became an advocate of Doctors' Commons (see *E. B.* viii, 367). When that body was dissolved in 1857 he continued to practise as counsel, being eventually its last survivor. He was principally known in connection with ritual cases, several times representing Mr. Maekonochie and other clergymen charged with illegal practices (see *E. B.* xiv, 352d, and xvi, 678a), and he appeared for the promoters in the ecclesiastical suit ended by the Lincoln Judgment (*E. B.* xvi, 712c). He was Chancellor of the diocese of London, and also of the dioceses of Hereford, Ripon, Wakefield, and Chichester; and Commissary-General of the Diocese and City of Canterbury. He published *Contentious Probate Practice* (1881).

John Troutbeck, the coroner for Westminster; b. 1861; d. February 29th. The eldest son of the Rev. Dr. Troutbeck, Canon and Precentor of Westminster Abbey, he was educated at Westminster School and Queen's College, Oxford, was admitted a solicitor in 1884, and became coroner for Westminster in 1888. His policy of employing an independent pathologist for *post mortems*, instead of the doctor in attendance, brought him on several occasions into conflict with the medical profession and was objected to by the British Medical Association. But he was master in his own court, and successfully defied opposition.

Sir Raymond West, the Anglo-Indian jurist; b. 1832; d. September 8th. Educated at Queen's College, Galway, he entered the Indian Civil Service in 1856, and during the Mutiny served under the resident magistrate of Belgaum. In 1871 he became a Judge of the High Court of Bombay, and in 1877 a member of the Bombay government. In 1879 he was appointed to the Indian Law Commission. In 1884 he accepted for a time the office of Procureur-General in Egypt, and drew up a report on the French system of criminal procedure as applied to an oriental people. He then returned to India, where he remained till his retirement in 1892. He became reader in Indian Law to the University of Cambridge, holding that post till 1906. He published *The Bombay Code* (3 vols.), and *Hindu Law*, a work which passed through many editions.

One of the magnates of finance passed away in Sir **Julius Charles Wernher**, Bart., the South African millionaire; d. May 21st. He was born at Darmstadt in 1850, entered a banking house in Frankfurt, and early in 1870 came to London as a clerk. On the outbreak of the Franco-German War he returned to Germany to take his place in the army and was present at the fall of Paris. At the end of 1871 he was sent by Mr. Jules Porges, diamond merchant of London and Paris, on a mission to Kimberley. There he remained till 1880, when he was transferred to London as English representative of the firm of Porges and

Wernher, interested not only in diamonds but in the gold mines of South Africa. In 1888, when the Kimberley diamond mines were amalgamated by Cecil Rhodes and Alfred Beit, he became a life governor of the De Beers Corporation. Beit was now a member of his firm, and in 1889, when Porges retired, the name of the firm was changed to Wernher, Beit & Co. (See *E. B.* iii, 659a.) Out of his enormous fortune, Sir J. Wernher, who was created a baronet in 1905, spent large sums on public objects, including education; he gave £10,000 to the National Physical Laboratory, and together with Beit endowed the South African University with £500,000.

A captain of industry died in **Baron Furness** (formerly Sir Christopher Furness), on November 10th. He was born on the 23rd of April 1852, the son of a provision merchant, and entered the family business in 1870. By making a corner in food stuffs, whilst the French fleet was blockading the mouth of the Elbe, he made a profit of over £50,000 for his firm out of the provisioning of ships. In 1877 he left the business and inaugurated the Furness line of steamships, and in 1891 he amalgamated with Withy & Co., iron and steel ship builders, founding the great shipbuilding firm of Furness, Withy & Co. In 1898, with others, he acquired extensive iron and steel works and founded the S. Durham Steel & Iron Co. He had an interest in many other concerns, and was chief proprietor of a Liberal paper, the *North Mail*. In 1908 he established a profit-sharing scheme for his workmen, but in 1910 its continuance was put to the vote and rejected by a majority. In 1891 he was elected Liberal member for the Hartlepoons, but in 1895 he lost the seat, winning it again in 1900. In 1906 he was returned unopposed, and in January 1910 he was elected but unseated on petition. A month later he was raised to the peerage; he had been knighted in 1895.

No fewer than four ex-Lord Mayors of London died during the year, three of whom had sat as Conservatives in the House of Commons:—

Sir Joseph Dimsdale, Bart. (b. 1849; d. August 10th), who came of a Quaker family of bankers, was sheriff of London in 1894, and from 1900–06 was M.P. for the City. In 1901–02, King Edward's coronation year, he was Lord Mayor; and from 1902 till he died he was City Chamberlain.

Sir John Whitaker Ellis, Bart. (b. 1829; d. September 20th), entered as a lad the office of an auctioneer and surveyor, and rose to be a partner and finally head of the firm; he was Lord Mayor in 1881–82, and M.P. for a division of Surrey 1884–92.

Sir Horatio David Davies (b. 1842; d. September 18th), was a London merchant, who in 1889 was elected an Alderman and in 1897–98 was Lord Mayor. From 1895–1906 he was M.P. for Chatham.

Sir James Thomson Ritchie, Bart. (b. 1835; d. September 18th), was the son of a Dundee jute merchant, and carried on the same business in London. His younger brother was Lord Ritchie, the Conservative politician (see *E. B.* xxiii, 376b). He was elected an Alderman in 1891, and became Lord Mayor in 1903–04.

Mechanical science lost the following important representatives:—

Prof. Osborne Reynolds; b. 1842; d. February 21st. He was educated at Cambridge, and in 1868 became professor of Engineering at Owens College, Manchester, holding that post for nearly forty years. He was elected F.R.S. in 1877. He was the author of over 70 papers on mechanics and physics published in the transactions of learned societies, notably *Sub-Mechanics of the Universe*, issued by the Royal Society. (For references to his work see *E. B.* iii, 581c; v, 64a; viii, 783a; xiv, 61c; xxii, 806c; xxv, 444c; xxviii, 428d.)

Prof. Henry Taylor Bovey; b. 1852; d. November 2nd. He was educated at Queens' College, Cambridge, of which he was afterwards a Fellow. Joining the staff of the Mersey Docks and Harbour Board, he became assistant engineer, but in 1887 was appointed Professor of Civil Engineering and Applied Mechanics at McGill University, Montreal. In 1909 he was appointed to be the first Rector of the Imperial College of Science and Technology in London, but ill-health obliged him to resign the post after a few months.

Valuable work in a special branch of science had also been done by the Rev. **Francis Bashforth** (b. 1819; d. February 12th). Second Wrangler in 1843, he became a Fellow of St. John's College, Cambridge; and having taken orders, he was rector of Minting (Lincolnshire) from 1857–1908. His interest in ballistics led him to make a series of experiments between 1864–80, upon which our present knowledge of air-resistance is founded (see *E. B.* iii, 281a). The Bashforth Chronograph for recording the velocity of shot (see *E. B.* vi, 303a), was his invention, and he received a pension from the government and a grant of £2,000 for his work. For some time he was professor of Applied Mathematics to the advanced class of Artillery officers at Woolwich.

Samuel Arthur Saunder, b. 1852, d. December 8th, was one of the leading authorities on Selenography (see *E. B.* xxi, 525a).

A well-known naturalist passed away in **William Bernhard Tegetmeier;** b. 1816; d. November 19th. His special subject was poultry-breeding, on which he wrote in the 9th ed. of the *E. B.*; and for forty years he was the poultry-editor of *The Field*.

Rowland Ward, b. 1848, d. December 28th, author of *Record of Big Game*, was famous all over the world as a taxidermist.

An eminent Scottish ichthyologist and palaeontologist died in **Ramsay Heatley Traquair;** b. 1840; d. November 24th (see *E. B.* xiv, 248b, 249c).

The death also occurred on December 8th of **Henry Dudding**, famous all over the world as a scientific breeder of long-wool sheep and shorthorn cattle (see *E. B.* xxiv, 819d).

In Dr. **Shadworth Holloway Hodgson** (b. 1832; d. June 13th), there passed away an accomplished scholar and metaphysician. Educated at Rugby and Corpus Christi College, Oxford, he devoted himself from 1858 onwards entirely to the study of philosophy, and acquired a remarkable knowledge of the whole field of philosophical literature, ancient and modern. He helped to found the Aristotelian Society of London in 1880, and was its first president. His published works include *Time and Space* (1870), *The Philosophy of Reflection* (1878) and a complete exposition of his philosophy (see *E. B.* xviii, 251d) in *The Metaphysics of Experience* (1898).

English classical scholarship was notably poorer by the death of **Arthur Woollgar Verrall** (b. 1851; d. June 18th). Educated at Wellington, and at Trinity College, Cambridge, he graduated as second classic in 1873 and became a fellow and tutor of his college. He published editions of many classical plays, especially the *Medea*, *Agamemnon* and *Choephoroe*. In 1895 appeared *Euripides the Rationalist*, followed in 1905 and 1910 by editions of most of Euripides' plays. He was an original critic with views of his own, often expounded in the *Classical Review* and other journals. In February 1911 he was appointed to fill the new King Edward VII professorship of Literature at Cambridge, which had been endowed by Sir Harold Harmsworth.

Cambridge University lost also two heads of colleges: the Master of Caius, Dr. **Ernest Stewart Roberts** (b. 1847; d. June 16th); and the Master of Jesus, **Henry Arthur Morgan** (b. 1830; d. September 3rd).

Oxford University lost an able philologist in Dr. **Henry Sweet** (b. 1845; d. April 30th). He was a recognised authority on the subject of phonetics (see *E. B.* xxi, 460-61; ix, 597c), a Readership in Phonetics having been specially created for him in 1901 by the University. His other published works include an *Anglo-Saxon Reader*, a *Student's Dictionary of Anglo-Saxon*, an *English Grammar*, *The History of Language*, and many editions of Old and Middle English Texts.

A widely known anthropologist passed away in **Augustus Henry Keane** (b. 1835; d. February 3rd). A native of Cork, he was educated at Dublin and in Rome for the Roman Catholic priesthood, but he declined to enter the church, and devoted himself to geographical and ethnological research (see *E. B.* i, 442c; ix, 900b; xxii, 678c). He registered and classified almost every known language, and from these data worked out a system of ethnology. He edited Stanford's *Compendium of Geography*, and, besides many papers in the journals of learned societies and in encyclopaedias, published *Man, Past and Present* (1899), *Ethnology* (1896 and later editions), *The Gold of Ophir* (1901), etc. He was professor of Hindustani at University College, London, till 1885.

The literary world has lost also the following:—

James Beresford Atlay, barrister and journalist, author of *Lives of the Victorian Chancellors* and other works; b. 1860; d. November 22nd.

Robert Barr, the novelist; b. 1850; d. October 21st. A native of Glasgow, he was taken to Canada when four years old, and educated at the Normal School, Toronto. He was headmaster of the public school of Windsor, Ont., until 1876, when he joined the editorial staff of the *Detroit Free Press*. He had an adventurous career as a journalist for five years, and in 1881 came to England. In 1892 he started the *Idler* together with Mr. Jerome K. Jerome. He published a number of novels and short stories, the best known being *The Mutable Many* (1897) and *Countess Teklu* (1899).

Capt. **Frank Brinkley**, the well-known authority on Japan; b. 1841; d. at Tokyo, October 28th. Having entered the British army, he went to Japan in 1867 in command of a battery of artillery. In 1871 he became Principal Instructor at the Marine College, Tokyo, under the Japanese government, and henceforth devoted himself to things Japanese. He left the army, married a Japanese lady, and in 1881 founded the *Japan Mail*, of which he was proprietor and editor till his death. He was also correspondent for the London *Times* in Japan. He published *Japan* (1901), *Japan and China* (1903), as well as a Japanese-English Dictionary, and was the author of the article "Japan" in the *E. B.* He held a unique position among foreign residents in Japan, alike as a profound student of its history and art, and as a powerful factor in international politics.

The Rev. **Alfred John Church**, a prolific author; b. 1829; d. April 27th. Educated at Lincoln College, Oxford, he took holy orders, and was assistant master at Merchant Taylors' School for many years; he was professor of Latin at University College, London, from 1880-88. In partnership with the late W. J. Brodribb he translated Tacitus and edited Pliny's Letters, but he is best known by his English re-telling of classical tales and legends for young people (*Stories from Virgil*, *Stories from Homer*, etc.). He wrote much Latin and English verse, and in 1908 published his *Memories of Men and Books*.

George Knottesford Fortescue, Keeper of the Printed Books at the British Museum; b. 1847; d. October 26th. Appointed an assistant in the British Museum Library in 1870, he became Superintendent of the Reading Room in 1884, and in 1886 began a valuable series of subject indexes to the modern works in the library, the last of which appeared in 1911.

Thomas Kirkup, the sociologist and economist; b. 1844; d. May 23rd. Starting as a pupil teacher in the village school at Kirk Yetholm, he proceeded thence to Edinburgh University, and studied later at Göttingen, Berlin, Tübingen, Geneva and Paris. Besides many articles on economic subjects for reviews and encyclopaedias (including "Socialism" in the 9th edition of the *E. B.*) he wrote *An Inquiry into Socialism* (1887), *History of Socialism* (1892), *South Africa, Old and New* (1903), *Progress and the Fiscal Problem* (1905), and *Primer of Socialism* (1908).

Thomas Mackay, economist; b. 1849; d. February 23rd. He was called to the bar but never practised, devoting himself to the study of economics and the English Poor Law, which was the subject of most of his writings.

Sir Frank Thomas Marzials, C.B., civil servant and man of letters; b. 1840; d. February 14th. He entered the War Office in the fifties and became Accountant-General in 1898, retiring in 1904. As one of the editors of the "Great Writers" series, he contributed to it several volumes, and made an English version of the Chronicle of Villehardouin (1908).

William Flavelle Monypenny, the biographer of Lord Beaconsfield; b. 1866; d. November 23rd. Of Ulster birth, and educated at Trinity College, Dublin, and Balliol, Oxford, in 1893 he joined the editorial staff of the *Times*, and early in 1899 became editor of the *Johannesburg Star* in the Transvaal. He played an important part, as a publicist, on the side of the Reform party there, and when war came he joined the Imperial Light Horse and was one of the defenders of Ladysmith. Returning afterwards to his position on the *Star*, he did much to promote Lord Milner's work of reconstruction, but resigned in 1903 owing to his hostility to the introduction of Chinese labour in the mines. He was then entrusted by the *Times* with the task of writing the official biography of Disraeli, and also did other work for that paper, becoming in 1908 a director of the company. Owing to ill-health the first volume of the *Life of Beaconsfield* (intended to be in four or five) only appeared in 1910, and the second shortly before his death.

Edward Williams Byron Nicholson, Bodley's librarian at Oxford; b. 1849; d. March 17th. Educated at Tonbridge and Trinity College, Oxford, in 1873 he became librarian of the London Institution, and in 1877 he founded the International Conference of Librarians and the Library Association. In 1882 he succeeded H. O. Coxe as Bodley's librarian, and did much to bring the library up to date. He published commentaries on the Gospel according to the Hebrews (1879) and St. Matthew (1881), *Keltic Researches* (1904), papers on comparative philology, etc. and wrote the article on Mandeville in the *E. B.*

Dr. Frederic Seebohm, the historian; b. 1833; d. February 6th. He was a native of Bradford and came of a Quaker family. His interest in problems of modern life, social and religious, led him to study the conditions of English rural life in the past, and the religious movements of the Reformation. In his *English Village Community* (1853) he dwelt on the survival of Roman influences in agricultural life; and in his *Tribal Systems in Wales* (1895) he reconstituted a Celtic society from 14th century evidence.

Bram Stoker, the novelist, for many years secretary to Sir Henry Irving; b. 1847; d. April 20th. He was a native of Dublin and was educated there at Trinity College. Besides *Dracula* and other novels, he wrote *Personal Reminiscences of Sir Henry Irving*, a valuable record of the theatrical history of the last quarter of the nineteenth century.

The Rev. **Duncan Crookes Tovey**, biographer and critic; b. 1842; d. September 29th. Educated at Trinity College, Cambridge, in 1868 he became assistant master at Haileybury; in 1871 chaplain to Trinity College; in 1874 assistant master at Eton, and in 1886 rector of Worplesden. He was Clark lecturer in English literature at Cambridge in 1897-98, and published *Gray and His Friends* (1890), an edition of Gray's poems, *The Letters of Thomas Gray* (1900-12), an edition of Thomson's poems, and *Reviews and Essays* (1897). He wrote the articles on Thomson and Gray in the *E. B.*

English music suffered a premature loss by the death of **Samuel Coleridge-Taylor**; b. 1875; d. September 1st. Of Anglo-African parentage, his father being a native of Sierra Leone and his mother an Englishwoman, he was educated at the Royal College of Music, entering as a violinist in 1891. In 1893 he won an open scholarship for composition, and studied for four years under Sir Charles Stanford. In 1898 his cantata *Hiawatha's Wedding Feast* was produced in London with marked success, and was followed by two other cantatas, *The Death of Minnehaha* and *The Departure of Hiawatha* (see *E. B.* xix, 85a). This trilogy was first given complete at the Albert Hall, London, in 1900. *The Blind Girl of Castel Cullé* was given in Leeds in 1901, *Meg Blane* at Sheffield in 1902, and an oratorio, *The Atonement*, at Hereford in 1903. He also produced *Endymion's Dream* and the *Bon Bon* suite (1908-09), and *A Tale of Old Japan* (1911).

In the art-world the following may be mentioned:—

Robert Wiedemann Barrett Browning (b. 1849; d. at Asolo, in Italy, July 8th), the only son of Robert and Elizabeth Barrett Browning (see *E. B.* iv, 668a *et seq.*). He became a painter, studying under M. Heyermans at Antwerp, and in 1875 had his first picture, "The Armourer," exhibited at the Royal Academy. He had other pictures hung in the Paris Salon, and at Paris he also studied sculpture under Rodin. He bought and restored the Palazzo Rezzonico in Venice, where his father died, making it a museum to his parents' memory,

but it was subsequently sold and he lived at Asolo and Florence. His portrait of his father hangs in Balliol College, Oxford.

Eduardo de Martino, the marine painter (b. 1838; d. May 21st). He was a native of Italy, and was educated at the Naval College in Naples. After serving as an officer in the Italian navy until 1867 he went to Brazil, married a Brazilian lady, became a member of the Rio de Janeiro Academy of Fine Arts, and was attached to the Court of Dom Pedro II, Emperor of Brazil, for whom he painted several pictures, besides making a number of sketches during the Paraguayan War. In 1875 he came to England and became marine painter to Queen Victoria.

John Leighton, the designer and illustrator (b. 1822; d. September 15th). The son of a London book-binder, at an early age he began designs for book-covers; in later life he was a prolific designer of book-plates (see *E. B.* iv, 233a), and wrote and illustrated the *Book Plate Annual* from 1894-99. He did much work as a book illustrator in the sixties and seventies, one of his best productions being *The Life of Man Symbolised by the Months of the Year* (1866).

Charles Brinsley Marlay, a well-known art-collector (b. 1831; d. June 18th). He inherited extensive Irish estates from the last Earl of Belvedere, and his sister married the 7th Duke of Rutland. He was a connoisseur of Italian art, and a frequent exhibitor of pictures, porcelains, etc., at the Burlington Fine Arts Club and elsewhere. He bequeathed his collection of all kinds to Cambridge University, together with £80,000 for the Fitzwilliam Museum.

Sir **John Edward Arthur Murray Scott, Bart.**, a trustee of the National Gallery (b. 1847; d. January 17th). The son of an English doctor at Boulogne, he became secretary to Sir Richard Wallace (see *E. B.* xxviii, 277a), heir of the 4th Marquess of Hertford. He helped Sir Richard to organise relief for the sufferers of the siege of Paris in 1870, and after the siege, to transport the treasures of the Hertford Art Collection from Paris to Bethnal Green Museum. It was largely through his influence that Sir Richard Wallace's widow left the collection *en bloc* to the British nation, together with Hertford House (see *E. B.* xix, 62b), and he acted as chairman of the trustees' committee until his death.

English sport lost well-known representatives in **John Moyer Heathcote** (b. 1834; d. July 12th), formerly amateur champion at tennis (see *E. B.* xxvi, 630a, b); and **William Storer** (b. 1868; d. February 28th), the Derbyshire professional wicket-keeper and batsman, who played cricket for England against Australia in 1893 and 1899.

A magnate of the music-hall world died in Sir **Edward Moss** (b. 1852; d. November 25th), who had been the principal pioneer in the changes by which the modern "variety entertainment" has been so successfully established. His first Empire Theatre was opened at Edinburgh in 1877, and gradually others were built elsewhere, till "Moss's Empires" (which became a company under that name) numbered in 1912 over twenty houses, and the business represented a capital of over £2,000,000. He was knighted in 1905.

The deaths of several well-known women must also be recorded:—

Louisa Twining, the social reformer, b. 1820; d. September 25th. In early life she was an artist, and published *Symbols and Emblems of Mediaeval Christian Art* (1852) and *Types and Figures of the Bible* (1854). In 1853, however, she became interested in movements for social reform (see *E. B.* iv, 811a), and began the work in connection with the Poor Law to which she devoted the rest of her life. In March 1861 she helped to establish a home for workhouse girls sent out to service, and in 1864 a Workhouse Visiting Society. In 1867 an act was passed separating infirmaries from workhouses, and after twelve more years of work Miss Twining in 1879 established the Workhouse Infirmary Nursing Association. She was a Poor Law Guardian for Kensington from 1884-90, and for Tonbridge Union from 1893-96. She promoted the opening of Lincoln's Inn Fields to the public, helped to start the Metropolitan and National Association for nursing the poor in their homes, did much to secure the appointment of police matrons, and was president of the Women's Local Government Society. She published *Recollections of Life and Work* (1894), *Workhouse and Pauperism* (1898), and many papers on poor law subjects.

Dr. **Sophia Jex-Blake**, the pioneer lady doctor, b. 1840, died at Mark Cross, Sussex, on the 7th of January. From 1858-61 she was mathematical tutor at Queen's College, London. She subsequently set out on a tour of inspection of girls' education institutions, and in America became a pupil of Dr. Elizabeth Blackwell (*E. B.* xxv, 957d). In 1866 Miss Jex-Blake began a course of study in Boston under Dr. Lucy Sewall. In 1868 she returned to England and applied to the University of London for admission to their medical examinations. Being refused, she returned to the University of Edinburgh and was told that they could not admit one lady only. She got others to join her, and finally in 1869 they were admitted to classes, in 1870 to the hospitals, though here they encountered much riotous hostility from a section of the male students. The university, however, still refused to allow graduation, and after some legal proceedings and much expense Miss Jex-Blake in 1874 went to London, where she took a leading part in establishing the London School of Medicine for women. In 1877 this was associated with the Royal Free Hospital, and in the same year Miss Jex-Blake obtained the M.D. degree of Bern. She was also admitted a

licentiate of the College of Physicians, Dublin, and member in 1880. She began practice in Edinburgh in 1878 and opened a dispensary there for women and children. In 1886 she founded the Edinburgh School of Medicine for Women. She retired in 1899. Besides various medical works she published *American Schools and Colleges* (1886), and *Medical Women* (1872).

Victoria, Lady Welby, b. 1837, died at Harrow on the 29th of March. She was the daughter of the Hon. Charles Stuart-Wortley, brother of the first Lord Wharncliffe, her mother being Lady Emmeline Manners, sister of the 6th and 7th Dukes of Rutland. She was in the household of the Duchess of Kent from 1858-61, and from 1861-63 was maid of honour to Queen Victoria. In 1863 she married Sir William Welby-Gregory, Bart., who died in 1898. She published in 1881 *Links and Clues*, a collection of religious papers. In later life she worked on the subject of significs, or the study of the correct philosophic and scientific use of language. She corresponded with a large circle of scientific men and philosophers, and she published *What is Meaning?, Significs and Language* (1911), and was the author of the article "Significs" in the *E. B.*

Rosa Morison, the educational pioneer; b. 1841; d. February 8th. She was one of the founders of College Hall, Byng Place, as a residence for women students in London; and was vice-principal (her friend Miss Grove being principal) from 1882-1900. In 1883 she was appointed as the first Lady Superintendent of Women Students at University College, a post which she held till her death.

Catherine Marsh; b. 1818; d. December 12th. Author of *Memorials of Captain Hedley Vicars, English Hearts and English Hands*, and well known for her philanthropic work among British navies.

Marian Rebecca Hughes, Mother Superior of St. Thomas's Sisterhood, Holy Trinity Convent, Oxford; b. 1817; d. at Oxford on the 7th of May. She became the first Anglican nun on the 6th of June 1841 (see *E. B.* xxv, 160c). At first she was directed by John Henry Newman, afterwards for fifty years by Edward Bouverie Pusey, who took an active part in establishing Anglican sisterhoods, and finally by Edward King, Bishop of Lincoln. Under her rule the sisterhood prospered; schools were established for girls of all classes, a printing press was set up, and a *Convent Magazine* issued. Much work was also done amongst the poor of Oxford, and memorable service was rendered by the Mother during the cholera epidemic of 1866.

Lady Lindsay, the verse-writer and painter, died in London in August. The daughter of the Rt. Hon. Henry Fitzroy, who married Miss Hannah Mayer de Rothschild, and granddaughter of the 2nd Lord Southampton, she married Sir Coutts Lindsay in 1864, and for 30 years before her death had lived in London or Venice, gathering a circle of friends about her which included G. F. Watts, Alma-Tadema and Browning. She collected a number of fine pictures, some of which she left in the National Gallery. She wrote several volumes of verse, which hardly won the attention they deserved, among them *From a Venetian Balcony*, and *Poems of Love and Death*.

Margaret Hunt, the novelist, b. 1831, widow of the painter A. W. Hunt (*E. B.* xiii, 934), d. in London on November 1st. Her best known book was *Thornicroft's Model*.

Mrs. De Courcy Laffan, the novelist, d. in London on the 5th of September. She married first Surgeon-General Leith Adams and secondly the Rev. R. S. de Courcy Laffan, for some years headmaster of Cheltenham. As Mrs. Leith Adams she published a number of novels, beginning with *Winstowe* (1877) and including *My Land of Beulah* (1880), *Louis Draycott* (1891) and *The Peyton Romance* (1894). She also published two plays in 1906 and a volume of poems in 1907.

Mrs. Stanhope Forbes, the painter, b. 1859; d. at Newlyn, Cornwall, on the 16th of March. A native of Canada, but educated in New York, as Miss Elizabeth Armstrong she became known as an etcher and a painter of the Newlyn School (see *E. B.* xx, 499c). In 1889 she married Mr. Stanhope Forbes, R.A. Many of her pictures were exhibited at the Royal Academy and the Paris Salon, and she was an associate of the Royal Society of Painters in Water Colours.

Emily Soldene, the singer and actress, b. 1840; d. in London on the 8th of April. She appeared in *Genevieve de Brabant*, her special rôle, in 1871, and in *La Fille de Madame Angot* in 1872. Her greatest successes were made in opera-bouffe. She retired from the stage for some thirty years before her death.

Florence St. John, the actress, b. 1854, d. in London on the 30th of January. She went on the stage as a vocalist at the age of fourteen. Her chief early successes were made in light comic opera, notably as Germaine in *Les Cloches de Corneville*, and in *Madame Favart*, and for many years she played leading rôles in musical comedy and burlesque.

Beryl Faber, the actress, d. in London on the 1st of May. She married Mr. Cosmo Hamilton, formerly editor of the *World*, and began her stage career as an amateur. She was the original Clarice in *The Masqueraders* by H. A. Jones (1894) and Ellean in *The Second Mrs. Tanqueray*, and appeared in several of Sir Arthur Pinero's other plays.

Mrs. Lewis Waller (Florence West), the actress; b. 1862; d. November 14th (see *E. B.* xxviii, 283b).

Mention must also be made of the deaths of two well-known personages in "Society":—

The Duchess of **Buccleuch**, d. at Dalkeith, N.B. on the 17th of March. She was the daughter of the 1st Duke of Abercorn, and one of the seven sisters depicted by Disraeli in *Lothaire*. In 1859 Lady Louisa Jane Hamilton married Lord Dalkeith, afterwards 5th Duke of Buccleugh (see *E. B.* iv, 712c). A great lady of the "old school," she was an intimate friend of the Royal family, particularly of Queen Victoria, to whom she was mistress of the robes in 1885–92 and 1895–1901, and was continued in office by Queen Alexandra.

The Countess of **Cork and Orrery**, b. 1828; d. in London on the 10th of October. She was the daughter of the first Marquis of Clanricarde, her mother being a daughter of George Canning. She was married in 1853 to Lord Dungarvan, afterwards 9th Earl of Cork and Orrery, and was the mother of three sons and five daughters. Possessed of great beauty and a brilliant talker, she gathered round her a wide circle of men of letters and politicians, especially among the Whigs, to which party her husband belonged. She was the writer of occasional papers, and of a little volume of verse, *Memories and Thought* (1886).

ENGLAND AND WALES¹

Including General Statistics for the United Kingdom.

Population.—The census of the United Kingdom in 1911, of which tabular details are given below, revealed a greater aggregate increase in England itself during the decade 1901–11 than during that of 1891–1901, but the increase per cent of the population declined. A tendency is suggested towards a state of equilibrium as between urban and rural districts, as was also indicated in the earlier decade. Thirteen administrative counties returned decreased populations in 1901, but these, with the exception of West Suffolk and Westmorland, showed an increase in 1911. In addition to these, Cumberland, Carnarvon and Radnor returned a decrease in 1911 though not in 1901; and among Welsh counties, Cardigan, Montgomeryshire and Merionethshire showed a decrease at both censuses. These counties indicate the existence of three main areas of decreasing or unstable population, a north-western, an East Anglian, and a Welsh area. But the census report points out that in the agricultural counties the "returns of increase for 1901–11 compare favourably in nearly all cases with those recorded in the earlier period," and the fact is particularly noteworthy in Bedfordshire, Lincolnshire and Rutland, Buckinghamshire and Oxfordshire, and Dorset. On considering the chief mining and industrial counties, the argument is found to hold good, excepting in South Wales. A greatly enhanced rate of increase in the industrial area of South Wales causes the rate for the whole of Wales to grow from 13.3 per cent increase in 1901 to 18.1 per cent in 1911. Otherwise, "in Nottinghamshire the rate is fairly steady, moving slightly up; in Northumberland and Durham, Lancashire, Staffordshire and the West Riding of Yorkshire, it is markedly down" (*Geog. Jour.*, xxxviii, 399). The average rate of increase in the population of 98 towns with populations exceeding 50,000 has declined from 15.3 per cent in 1891–01 to 8.7 per cent in 1901–11, and has fallen in all the 15 towns whose population exceeded 200,000, except Portsmouth. "The greatest increase of all is at Southend-on-Sea (pop. 62,723; increase 117.4 per cent); Ilford, Ealing and Acton, Coventry, Wallasey, and King's Norton follow. Three of these towns are on the outer ring of London; Southend is practically so, and Wallasey and King's Norton are also 'ring' towns. The radiation outward from London and other great urban centres is going on; at the same time it is surging over some of the 'ring' towns which were at the height of their growth about 1901. Thus the rate of increase has fallen in Ilford from 277.6 per cent to 89.6 per cent, in East Ham from 193.6 per cent to 39.1 per cent, in Walthamstow from 105.3 per cent to 31 per cent. As to the gross decrease in the County of London, the report puts the matter geographically—"The process of decentralization, which at first affected the inner districts of London only, has gradually affected a much wider area, until in 1901–11 only nine of the twenty-eight Metropolitan boroughs showed an increase of population. These boroughs, which are mainly those furthest removed from the centre, are Hampstead, Hackney, Fulham, Hammersmith, Wandsworth, Camberwell, Greenwich, Lewisham and Woolwich" (*Geog. Jour.* xxxviii, 400).

¹ For earlier information on England, see *E. B.* ix, 408 *et seq.*; for Wales, xxviii, 258 *et seq.*; for general statistics for the United Kingdom, xxvii, 598 *et seq.* See also *E. B.* articles on the counties and towns, and sections in articles on special subjects.

The 1911 census figures for the United Kingdom, showing a combined area of 121,391 square miles and a total population of 45,360,822 (22,010,004 males, 23,350,818 females), with an increase of 9.1 per cent in population since 1901, are analysed in Table I.

Agriculture.—According to returns of 1912, out of a total area of 37,143,953 acres for England and Wales, the average under all crops and grass was 27,169,462, a decrease of 0.3 per cent on the returns for the preceding year. The general Table VIII for the United Kingdom is given for purposes of comparison (increase or decrease per cent on the preceding year following the total acreage in brackets).

Table VIII.

	England and Wales.	Scotland.	Ireland.
Corn Crops . . .	5,924,617(+1.7)	1,230,125(+0.9)	1,265,597(+0.9)
Green Crops . . .	2,500,335(+2.7)	615,361(+1.4)	1,022,128(+0.8)
Clover and Rotation Grasses . . .	2,522,965(-3.3)	1,465,514(-3.0)	2,479,159(-1.3) ¹
Permanent Pasture.	15,834,171(-0.7)	1,496,045(-0.1)	12,418,867(-0.09) ²

Live stock in England and Wales was returned as follows:—horses 1,406,099 (-1.0); cattle 5,841,908 (-1.2); sheep 18,053,584 (-6.6); pigs 2,496,358 (-5.8).

A return published in June 1912 (Census of Production³) relating to the year ending June 4, 1908, sets down the value of the produce of British agriculture at £150,800,000, as shown in Table IX.

Table IX.

	England and Wales.	Scotland.	Great Britain.
Farm Crops ⁴ . . .	£ 40,200,000	£ 6,400,000	£ 46,600,000
Fruit, Flowers and Timber . . .	4,700,000	500,000	5,200,000
Animals . . .	50,800,000	10,600,000	61,400,000

Dairy Produce . . .	25,500,000	4,500,000	30,000,000
Poultry . . .	4,350,000	650,000	5,000,000
Total Sales . . .	£127,650,000	£23,150,000	£150,800,000

¹ Hay area.

² Pasture and mountain grazing.

³ This census was provided for by the Census of Production Act, 1906. It is under the direction of the Board of Trade, and the first census was taken in 1908. The results so far as applying to agriculture were issued by the Board of Agriculture.

⁴ The total value of farm crops grown in 1908 is calculated at £125,000,000, but the portion actually sold realised (as shown in Table IX) £46,600,000, the remainder of the produce being used to feed the stock and maintain the fertility of the land.

A further return of the Census of Production analysed the labour employed on the farms of Great Britain (Table X).

Table X.

	Males.	Females.	Total.
Members of Family	313,000	189,000	502,000
Other Persons	576,000	95,000	671,000
Total permanently employed	889,000	284,000	1,173,000
Temporary Labourers	127,000	40,000	167,000
Occupiers	500,000
Grand Total	1,840,000

The gross output amounted to £90 per head if occupiers are included and temporary labourers excluded. Engines employed in agricultural pursuits numbered 34,450 with a total H.P. of 213,525.

The number of agricultural holdings in the United Kingdom, as returned by the Census of Production, is shown in Table XI.

Table XI.—Agricultural Holdings, 1908.

	1-5 Acres.	5-50 Acres.	50-300 Acres.	Above 300 Acres.
England	79,837	165,265	109,830	14,651
Wales	10,121	31,953	18,034	390
Scotland	18,136	34,601	23,138	2,673
Ireland	61,730	364,549	90,617	

The census of production has rendered available a mass of statistics which have not previously been compiled. Thus it is now possible to view the estimated production of crops in order of their gross value for *Great Britain* in 1908, the principal being shown in Table XII.

Table XII.—Crops, 1908.

	Quantity.	Value in Thou- sands.		Quantity.	Value in Thou- sands.
Turnips and Swedes	Tons 23,768,000	£23,768	Potatoes	Tons 3,918,000	£9,892
Meadow Hay	" 6,213,000	19,106	Barley	Qrs. 6,840,000	9,177
Oats	Qrs. 15,453,000	13,264	Mangold	Tons 8,995,000	7,196
Clover and "Seed Hay"	Tons 3,507,000	12,712	Beans	Qrs. 1,161,000	1,735
Straw	" 7,000,000	12,660	Apples	Tons 224,300	1,490
Wheat	Qrs. 6,567,000	10,370	Peas	Qrs. 765,000	1,130
			Hops	Tons 23,540	1,059
			Strawberries	" 41,450	1,036

Below the tabulated category follow cabbage £760,000; vetches or tares £439,000; nuts and mixed orchard fruits £406,000; plums £357,000; a group of vegetables including artichokes, cucumbers, marrows, etc., £352,000; raspberries £309,000; lucerne £276,000; mixed small fruits £252,000; rye £220,000 and gooseberries £208,000. Between £200,000 and £100,000 follow cherries, rape, rhubarb, carrots, crops under glass, crops for seed, flowers and shrubs, mustard and onions; between £100,000 and £50,000 pears, kohl rabi, black currants, broccoli and cauliflower, celery, red currants and Brussels sprouts; and below the last figure asparagus, parsnips, lettuce, seakale, kale, beetroot (but the subsequent extension of beet cultivation should be borne in mind), buckwheat, maize, and flax.

It is found that the number of cattle slaughtered for meat in Great Britain was 1,489,000; calves 639,000; sheep 7,638,000; lambs 1,915,000, and pigs 4,418,000. The total British supply of meat amounted to 1,051,000 tons, representing an average supply per head of the population of Great Britain of 26.3 lb of beef and veal, 14.5 lb of mutton and lamb, and 17.5 lb of pig-meat (total 58.3 lb), the average of imports in the same year (1908) being 20.44 lb of beef and veal, 11.23 of mutton and lamb, 18.69 of pig-meat (total 50.36 lb).

A "farm-yard census" has also been taken, which so far as concerns birds is summarized in Table XIII, the interesting comparison for Ireland being added. Table XIV gives particulars of dairy produce, and Table XV those of timber.

Table XIII.

	Fowls.	Ducks.	Geese.	Turkeys.
England	25,962,000	2,395,000	494,000	541,000
Wales	2,287,000	274,000	192,000	87,000
Scotland	4,107,000	294,000	26,000	69,000
Ireland	17,664,000	3,477,000	1,838,352	1,051,667

Development Commission.—The Development Commission was instituted in May 1910 under the provision of the Development and Road Improvement Fund Acts of that and the previous year. It consists of eight commissioners appointed for ten years, one (who is eligible for re-appointment) retiring every two years. In the order in which they were to retire, the commissioners were as follows: Mr. H. J. Davies, Sir S. Eardley Wilmot, Mr. M. A. Ennis, Mr. W. S. Haldane, Mr. A. D. Hall, F.R.S., Mr. Sidney Webb, Lord Richard Frederick Cavendish (chairman) and Sir Francis Hopwood (vice-chairman). Mr. Vaughan Nash, who had been private secretary to the Prime Minister, Mr. Asquith, succeeded to the vice-chairmanship in 1912. The function of the Commission is to consider the development of agriculture and other economic resources of the kingdom and to advise the Treasury as to the disposal of grants and loans for purposes connected with agriculture, forestry, reclamation of land, rural transport other than roads, canals, harbours and fisheries. The sums available are partly voted by parliament, partly charged on the consolidated fund, and partly received by way of interest on and repayment of loans, and of profits received (if so provided) on works started by a grant or loan from the Commission.

*Agricultural Progress.*¹—In Norfolk the inception of sugar-beet growing on a consider-

¹ See also "Agriculture" in Part I of the YEAR-BOOK.

able scale is the outstanding agricultural development. A large sugar-beet factory at Cantley, on the banks of the Yare, some ten miles from Norwich, was opened in 1912. Despite the torrential rains in August of that year, samples of Norfolk-grown beet yielded as much as the average yield of roots grown in Holland. Farmers who have at first looked askance at the new venture, have since offered land freely. Beet-sugar experiments have also been made in Kent and Sussex: the Maidstone Farmers' Club reported in 1912 that satisfactory crops could be grown, and in Sussex it was proposed to form a company to develop the industry on condition that 2000 acres should be placed under the crop for five years. A factory has been established at Hayle in Cornwall.

Recently tobacco growing has been inaugurated at Methwold in south-west Norfolk on a soil previously thought valueless, except for game preservation. Some experts are of the opinion that this may turn out to be one of the most promising experiments in East Anglian agriculture. In the protracted drought of 1911 the Methwold tobacco prospered well, but in the wet summer of 1912 it succeeded even better, the sandy, porous soil absorbing rain very quickly.

Heavy losses were sustained by Hampshire agriculturists and market gardeners owing to the dry summer of 1911 and the long continued rains of 1912, but the cultivation of strawberries did well. The fruit is grown at Swanwick and at Sarisbury, and is sent to market a week or more before the Kent crop. In some cases the plantations yielded a profit of £50 an acre, the culture not being confined to small holdings, but carried on extensively on large farms where strawberries have displaced some of the usual crops. The Hampshire County Council purchased 264 acres at Sparsholt near Winchester, for use as a farm school, and have established a system of agricultural scholarships.

Considerable disturbance in the agricultural industries of Cheshire and Shropshire is reported owing to the change in ownership of thousands of acres of agricultural land through owners of great estates putting them on the market.

A wide scheme for the reclamation of waste lands in the north of the Isle of Man, the creation of small holdings, and the development of an export trade in the produce to English markets, has been under consideration.

In the direction of *agricultural education* mention may be made of the extension of facilities by the university of Bristol in adjacent counties. A large technical school with an agricultural department has been established by the Essex Education Committee. The new buildings of the Cheshire Agricultural College and Norris Midworth Museum were opened on July 22, 1912.

Dr. Clement Stephenson, F.R.C.V.S., in February 1912, gave £5000 towards buildings for a new agricultural department at Armstrong College, Newcastle-upon-Tyne.

Mining and Manufactures.—Table XVI shows the total number of persons employed at mines in the four divisions of the United Kingdom in 1911.

Table XVI.—Miners, 1911.

	England.	Scotland.	Wales.	Ireland.	Total.
Number	712,429	147,365	313,838	5,469	1,179,101

Spain	3,134,695	2,057,844	Norway	2,120,689	1,052,560

A national strike of miners lasted from March 1 to April 6, 1912 (see under *History* above). The following report from the northern coal-fields may be taken as an illustration of some of its effects. The Northumberland Miners' Association disbursed in strike pay £156,000, its total funds, including investments from which it had been deriving £4000 annually in interest. The funds of the Durham Miners' Association, amounting to over £400,000, were also seriously depleted. The loss to colliery owners and to trades dependent on coal supplies was enormous. This strike occurred during a period of prosperity. Northumberland miners' wages in August 1912 were 36 per cent above the 1879 basis—the highest recorded for many years previously.

In the week ending July 13, 1912, the King and Queen travelled in the West Riding of Yorkshire to inspect the social and industrial life of the people, including Halifax, Huddersfield, Rotherham, and many colliery centres, among them Cadeby Colliery, Conisborough, which they visited on hearing of a series of explosions which occurred on July 9, 1912, resulting in the loss of 86 lives. Among those killed were Mr. W. H. Pickering, chief inspector of mines for Yorkshire, Mr. H. R. Hewitt, government inspector for Sheffield, and Mr. J. Y. Tickle, government inspector of Doncaster.

A remarkable colliery development has taken place in the Doncaster district in the last two years. Numerous pits have been sunk, and coal has been reached in several of them. Former villages have grown into populous places, and Doncaster is becoming the centre of a large population. Again, the developments which have taken place in the neighbouring north Nottingham coalfield have largely altered the industrial character of that part of the country. Within a radius of five miles of Mansfield eleven collieries have been sunk, and twenty others in the ten-mile limit. The Mansfield colliery itself was responsible for the output of 1,183,876 tons in 1911, an increase of 40,756 tons over the previous year. The beautiful "Dukeries" have been invaded, and in 1912 negotiations were completed for a pit between Warsop and the forest village of Budby, to be known as the Welbeck Colliery. To cope with this advance the Mansfield tramways have been extended, and a new railway, touching that town and Sutton, is in course of construction.

Progress has been made in the Kent coalfield, and four new seams were reported as proved within the boundary of the Kent Coal Concessions, Ltd. in August 1911.

The outlook in the South Wales coal was better towards the close of 1912 than it had been for some time. In 1911 the trade suffered on account of a succession of strikes which probably affected this district more than any other. Thus while there was an increase of shipments of coal from the United Kingdom, there was a decline from South Wales. The details of foreign shipments were as follows:—Cardiff, 16,127,777 tons (dec. 829,979); Newport, 4,324,917 tons (inc. 550,555); Swansea, 2,929,982 tons (inc. 218,788); Port Talbot, 1,650,538 tons (inc. 65,858). The coastwise trade was as follows:—Cardiff, 2,644,520 tons (dec. 222,912); Newport, 689,960 tons (dec. 48,781); Swansea, 272,331 tons (dec. 39,516); Port Talbot, 164,791 tons (dec. 18,350). These decreases are unusual and due entirely to the unrest in the labour world. Their significance may be realized from the fact that the output of one coalfield despite the strike amounted to 50,200,000 tons as compared with 48,699,982 tons in 1910, and that the number of persons employed in one coalfield has risen from 150,394 in 1901 to 213,252 in 1910. The North Wales coal mines have been holding their own, whereas metalliferous mines and slate quarries have been doing badly.

Other Minerals.—Metals were obtained from British ores as in Table XXI.

Table XXI.—British Metals, 1910.

	Iron.	Tin.	Lead.	Zinc.	Copper.	Silver.	Gold.
Quantity	Tons.	Tons.	Tons.	Tons.	Tons.	Oz.	Oz.
	4,975,735	4,797	21,522	4,168	449	136,665	2,427

	17,008,812	738,025	283,194	99,823	27,570	14,058	8,088

Iron.—The production of iron-ore in the chief producing counties of England in 1910 is shown in Table XXII. Wales produced 41,455 tons (percentage of total U.K., 0.3).

Table XXII.—Counties Producing Iron-ore.

	Tons.	Percentage of Total U.K.		Tons.	Percentage of Total U.K.
England	14,471,108	95.0	Northampton	2,649,539	17.4
Cumberland	1,334,751	8.8	Oxford and		
Lancashire	408,090	2.7	Rutland	242,291	1.6
Leicester	560,410	3.7	Stafford	913,006	6.0
Lincolnshire	2,128,161	14.0	Yorkshire	6,198,411	40.7

Salt.—Affecting the Cheshire salt industry, a parliamentary bill was promoted in 1912 by the Cheshire County Council, and other bodies, to restrict the conveyance of brine by pipe from the salt manufacturing areas of Northwich and Winsford to Weston Point, which offers advantages of cheaper transport by Manchester Ship Canal and the combined manufacture of salt and electricity. (At Weston, it was stated, the Salt Union was receiving £15,000 a year from the sale of electricity made by steam going on its way to boil the brine). By the House of Lords' Committee the Bill was rejected. Incidentally there was mentioned a discovery of brine and large deposits of rock salt at Lymm.

Tin.—The steady rise in the already high price of tin has maintained the prosperity of the Cornish mines of established position, while the most noteworthy new progress has been the development of alluvial workings following on the success of this method of operations on the Goss Moors. A large electric power station at Hayle is now supply-

ing current through west Cornwall from Camborne on the east to St. Just, with a branch to Penzance, on the west. The wires are carried across country on overhead standards. At present the chief users are the mines. The whole of the mining schools of Cornwall have been combined in one school of metalliferous mining at Camborne, and the local schools at Redruth, Truro and Penzance are now closed for mining education.

Important developments are anticipated from the recent discovery of radium in the famous hot springs at Bath. A discovery of gold was reported in Jersey in 1911.

Manufacturing Industries. The Midlands.—In all branches of trade in the Birmingham district there has been an improvement during the past two years. The South Staffordshire iron trade has experienced a remarkable revival. The former preference of steel over iron has in many cases disappeared, whereas the open hearth process for steel has also regained favour, to the advantage of this district. In bars, billets and all other classes of semi-raw and finished material there have been repeated advances of selling prices, and during 1912 the price of pigiron moved slowly but steadily upwards. The insufficient supply and high price of coke has seriously handicapped the iron trade during the past year. Ironworkers have received several advances in wages. Foreign competition in bar iron, steel billets, etc., has diminished considerably during 1912.

In the copper, brass and metal trades, there has been constantly increasing activity. By the formation of associations and manufacturers combinations selling prices have been improved. Repeated advances in selling prices were declared in 1912, though without a corresponding increase in profits, owing to the high prices of fuel and raw materials.

The selling prices of metal bedsteads have been increased, through the formation of an alliance embracing all the principal factories.

The cycle and motor trades have increased in prosperity. The trade in bicycles fell off a little in 1911 but revived in 1912, while the popularity of the motor cycle has greatly augmented business. Many motor car manufacturers have turned their attention to vehicles for heavy traffic; others, again, are making special efforts to produce cheap cars in order to meet American competition. The amalgamation of the Daimler Company (Coventry) with the Birmingham Small Arms Company has proved successful.

The Birmingham gun trade has fully recovered its former prosperity. Both the home and the export demand for good sporting guns and rifles have steadily improved. A difficulty is found, however, in obtaining skilled men. Belgian and other foreign competition has been largely met by the designing of cheap machine-made guns with standardised parts. The Gun Trade Technical School has been placed under the Birmingham Education Committee, though it still receives financial support from the guardians of the Proof House.

The jewellery trade of Birmingham has experienced some fluctuations, but the average volume of business tends to increase. Several new factories have been erected.

In the button trade, which has suffered from changes in fashion, employment at the end of 1912 was exceedingly good. All the fancy and miscellaneous trades have been busy.

In all the metal trades wages have been advanced, the advances ranging from 5 to 20 per cent. Strikes have been comparatively few and unimportant. The most notable was that of the Birmingham Small Arms Company's employes in October 1911, which affected over 3,000 persons and lasted four weeks. It was ended by important concessions.

Electrical engineering and trades accessory to it have grown enormously in the Midlands during the past two years, and export business has been unprecedented.

In the saddlery and harness and general leather goods trades of *Walsall*, which was recently in a depressed state, there has been a return to prosperity especially in connexion with the export trade. Prices have advanced considerably, not only on account of demand but also through the very large increase in the cost of leather and other materials. The engineering and hardware trades of the town and neighbourhood have also prospered.

At *Coventry* the watch trade has been exceedingly busy owing to the growing preference for English-made watches. The artificial silk trade is increasing, and the general engineering trades have done well. A large electrical industry appears likely to grow up.

The trade of *Leicester* shows progress, boot and shoe exports being heavier than previously, and hosiery and elastic webbing employing many hands. Large works for general electrical engineering constitute an important new industry in *Northampton*. The growing industries of *Peterborough* include a large shop-fitting factory. In *Nottingham* the tendency of lace-making firms to erect factories in outlying districts has acted as a stimulus to new industries. Blouse and robe-making have become of great importance, engineering and wood-working occupy much labour, and in 1912 there was introduced a new machine for the making of embroidery. It was announced in October 1912 that a large lace-manufacturing business would be removed from Beeston (Notts) to Raab in Hungary, as a result of the effect of hostile tariffs, and that facilities and remission from taxation had been granted by the Hungarian government. Through the activity of the *Derby* Borough Development

Committee, new industries have been introduced there, one of great importance being the manufacture of filament electric lamps. The ironworks' industry at Hawarden Bridge, *Flintshire*, has continued to develop, and connected with it a garden city at Scaland has been partly built and occupied. Another ironworks industry is flourishing at Ellesmere Port, *Cheshire*, where water-transit facilities have also developed corn milling. The population has increased in ten years by 6,091.

Lancashire and Yorkshire.—New cotton mills are building in such centres as Turton, Leigh, Nelson, Hastenlae and Livesey (Blackburn), Haslingden, &c.; while steel works at Partington and salt works at Runcorn are to be included among other industrial developments. The Lancashire cotton trade enjoyed in 1911 its most prosperous year since 1907, and this prosperity was reflected in the iron-founding and engineering industries which are more or less closely allied to the staple industry of the county. At the end of 1911, however, a dispute occurred in the cotton trade which was only brought to a close on January 19, 1912, after a lock-out of the operatives lasting nearly a month.

All the *Sheffield* industries have shown remarkable activity, the volume of trade in the last three years being larger than at almost any previous period. To protect themselves against infringers of trade marks, a special fund of £15,000 has been raised by manufacturers, and several prosecutions have been successfully initiated. A new society called the Sheffield Electro-Metallurgical Society was formed in 1910. Many new mills have been erected at Huddersfield, where the cloth and other trades have been active.

Northern Counties.—Ship-building on the north-east coast from Blyth to the Tees has reached a very high point, 349 vessels of 1,071,743 tons being launched in 1911, compared with 226 vessels of 654,789 tons in 1910. After an interval of five years the "blue riband" for the largest amount of construction by one firm in the United Kingdom came to the Tyne in 1911, this distinction being obtained by Messrs. Swan, Hunter and Wigham-Richardson, whose production aggregated 125,950 tons. New methods of marine propulsion during the period under review include the geared turbine of Sir Charles Parsons, the Diesel oil engine, as exemplified in the Wallsend-built ship "Toiler," and the gas engine vessel "Holzapfel I" built at South Shields. At the close of 1912 Messrs. Swan, Hunter and Wigham-Richardson were building for a Scotch firm a vessel for the Canadian lakes on the new principle of a Diesel engine supplying electrical power.

Naturally, with ship-building so active in 1911, the sister industry of marine engineering was correspondingly brisk. One firm on the Tyne, Messrs. R. J. W. Hawthorn, Leslie and Co., held the record over the Kingdom for the year, their turn-out of engines amounting to 150,200 shaft horse power. Since 1910 the various sections of labour engaged in ship-building have had their wages increased three times, representing 3s. per week per man. Shipyard workers' discharge notes were discontinued at the request of the men in the early part of 1912, and their demand, along with the engineering trades, is for an eight hours' day.

East Anglia, etc.—Among recent industrial developments in this part of England are the establishment of blast furnaces and rolling mills at Scunthorpe, Lincolnshire, and of electric steel furnaces at Braintree, Essex. Among industries recently established at Chelmsford are works of the Marconi Wireless Telegraph Co. and other electrical works, the National Steam Car works, etc. At Rochester large works for the manufacture of cement-making machinery were established by an Anglo-German firm in 1911.

South Wales.—The revival of prosperity in the tin plate trade which began in 1898 continues unchecked. The annual amount paid in wages to South Wales tin plate workers is now about £2,300,000. Of the 569 mills engaged on the manufacture of tin plates in England and Wales 96 per cent are situated in Glamorgan, Carmarthen and Monmouth. In 1911 the Welsh tin plate trade broke all records.

Labour Exchanges.—The system of labour exchanges was inaugurated on February 1, 1910. By the end of 1911 there were 261 exchanges at work, and during that year the number of vacancies notified by employers was 757,109, and the number filled by the exchanges was 589,770. The demand for workers exceeded the supply in the cotton, woollen and worsted trades, as well as, during certain seasons of the year, in the coach-building and engineering trades and the Clyde ship-building industry, while female workers were also found scarce in the clothing and laundry industries.

Fisheries.—The great herring industry at Yarmouth has now a fleet of 1000 boats, principally steam drifters. A Yarmouth boat broke all records in September 1912 with a haul of 320,000 herrings, a catch that realised £520. Not less than 10,000 fishermen are engaged in the Yarmouth fishery. In the season of 1911 the catch at Yarmouth

totalled just upon 550,000,000 herrings, but the catch in 1912 exceeded that and all previous records. Protests have lately been made against the practice of trawling for herrings and the consequent destruction of immature fish; the matter was the subject of a deputation to the president of the Board of Agriculture and Fisheries (Mr. Runciman) in October 1912, and the difficult questions involved may result in legislation and international action. A movement has been started to organize steam trawling on colonial fishing grounds in connection with Grimsby. A new trawling industry was initiated at the port of Blyth at the beginning of 1912. A considerable number of Cornish fishing boats have been fitted with motors, including some of the larger craft engaged on mackerel fishing in the Mount's Bay ports, and new boats for the pilchard and inshore fisheries are being built with these engines along the south coast of Cornwall, especially in the eastern ports, and in Devonshire.

For the English and Welsh fisheries the total weight of wet fish landed in 1911 was 14,418,904 cwt., and the total value £8,051,486, representing an increase in comparison with the previous year of practically 10 per cent in weight, but only 1 per cent in value. The principal fish were—cod 2,562,182 cwt. (£1,291,095); haddock 2,114,287 cwt. (£1,269,432); herring 4,995,976 cwt. (£1,474,065); plaice 986,165 cwt. (£985,098); hake 732,365 cwt. (£564,769); sole 61,817 cwt. (£403,637). The total value of shell-fish was £273,012, making a grand total value for all fish of £8,324,498 (an increase of 3.7 per cent on the average for 1906-10). The principal shell-fish were 4,785,984 crabs (£54,034); 570,174 lobsters (£27,435); 26,358,115 oysters (£79,773). The imports of fish into the United Kingdom decreased by 10 per cent in value in 1911, to £3,906,020, whereas the exports of fresh fish increased by 66 per cent to £1,308,295, and those of cured or salt fish by 15 per cent to £5,118,825.

Commerce.—British trade has had three "record" years in 1910, 1911 and 1912, each surpassing all others before it in the figures for imports and exports. Those for 1911 are analysed below; but the totals for 1912, as disclosed by the final monthly Board of Trade returns issued on January 7, 1913, may first be given. The imports were valued at £744,896,514 (nearly 65 million pounds more than 1911), the British exports at £487,434,092 (over 33 millions more) and re-exports at £111,837,905 (over 9 millions more), the total exports being £599,271,907 (over 42 millions more). It may be useful to show by comparison with previous years the enormous expansion that has taken place, as shown by the import and export figures (in million pounds), in British trade:—

	1912.	1911.	1910.	1907.	1902.	1897.
Imports	744	680	678	645	528	451
Total Exports	599	556	534	517	349	294
British Exports	487	454	430	426	283	234

It will be seen that in fifteen years the exports of purely British products have more than doubled.

During 1912 the principal increases in imports were recorded in the following groups:—grain and flour, +£12,746,268; non-dutiable food and drink (other than meat, grain, and flour), +£3,678,390; tobacco, +£1,088,933; wood and timber, +£2,489,144; raw cotton, +£9,083,446; textile materials other than cotton and wool, +£3,967,054; oil seed, etc., +£2,397,031; hides and undressed skins, +£2,613,386; iron and steel, and their manufactures, +£3,618,654; cutlery and hardware, +£1,717,532; machinery, +£1,052,082; chemicals, dyes, etc., +£1,150,501; leather, excluding boots and shoes, +£2,115,826; railway cars, motor vehicles etc., +£1,351,322. The total increase of £64,738,987 for the year is divided broadly under Raw materials etc. £27,554,672, Articles wholly or mainly manufactured, £19,943,700, Food, Drink and Tobacco, £16,805,989, and miscellaneous, £434,616.

In British exports the chief increases were in the following groups: food and drink (other than grain, flour and meat), +£2,462,572; coal, coke and fuel, +£4,137,420; wool, +£916,474; iron and steel and their manufactures, +£4,898,626; other metals, and their manufactures, +£1,276,613; electrical goods, +£1,550,503; machinery, +£2,201,094; new ships, +£1,368,784; cotton yarns, +£2,164,560; yarns other than cotton, wool and silk, +£1,376,487; apparel, +£1,892,758; chemicals, +£1,019,621; railway cars, motor vehicles etc., +£1,641,546. The total increase of £33,314,704 is divided broadly under Articles wholly or mainly manufactured, £22,996,368, Raw materials and articles mainly unmanufactured, £5,702,023, Food, Drink and Tobacco, £3,652,405, Miscellaneous £963,908.

The increase in trade was reflected also in shipping activity. Ships entered with cargoes exceeded those in 1911 by 4,401,543 tons, and those cleared with cargoes by 2,746,369 tons.

The appointment was announced in April 1912, of a royal commission to inquire into the natural resources and improvement of the trade of the Empire, following upon a resolution passed at the Imperial Conference in May 1911. The following were appointed: for the United Kingdom, Lord Inchcape (Chairman), Sir Edgar Vincent, Sir Charles John Owens, Sir H. Rider Haggard, Mr. Tom Garnett (of Manchester), and Mr. William Lorimer (of Glasgow); for Canada, Mr. George Eulas Foster, minister of trade and customs; for Australia, Mr. Donald Campbell, formerly a member of the legislature of South Australia; for New Zealand, Sir Joseph George Ward, recently prime minister of the Dominion; for South Africa, Sir David de Villiers Graaf, minister of posts and telegraphs; for Newfoundland, Mr. Edgar Bowring, M.L.C.

Import and Export Trade (United Kingdom, 1911).—The total imports into the United Kingdom in 1911 were valued at £680,157,527, an increase of £1,900,503 (+0.27 per cent) on 1910. Of this total, British possessions contributed £171,453,587 (an increase of £815,971 or +0.47 per cent), and foreign countries £508,703,940 (an increase of £1,084,532, or +0.2 per cent). The total exports in 1911 were valued at £556,878,432, an increase of £22,732,615 (+4.082 per cent) on 1910. Of this total, British possessions took £169,745,187 (an increase of £12,289,933, or +7.2 per cent), and foreign countries £387,133,245 (an increase of £10,442,682, or +2.69 per cent). The proportion per head of population of the value of imports into the United Kingdom in 1910 was £15:2:1, and in 1911, £15:0:4; that of exports of native produce only (£430,384,772 in 1910, and £454,119,298 in 1911) was £9:11:8 in 1910 and £10:0:7 in 1911, and that of net imports (i. e. less re-exports) was £12:15:10 in 1910 and £12:15:0 in 1911. Bullion and specie are excluded. Table XXIII shows the trade with British possessions, and Table XXIV with foreign countries.

The imports of gold and silver bullion and specie into the United Kingdom were as follows in 1911, the increase or decrease per cent on 1910 being given in brackets. *Gold*—from British possessions £42,815,915 (+4.7), including Cape of Good Hope and Natal £37,218,665 (+9.1); India £2,245,761 (+1.14); and Australia £1,534,965 (-33.8); from foreign countries £5,877,838 (-64.3), making a total from foreign countries and British possessions of £48,693,753 (-15.1). *Silver*—from British possessions £1,447,957 (-35.1); from foreign countries £12,845,790 (+8.2), including United States of America £11,898,503 (+4.02); making a total of £14,293,747 (+1.37).

Textile Industries.—The imports of raw cotton in 1911 (with increase or decrease on the preceding year) were as follows:—total imports 2,207,088,100 lbs. (+11.88); re-exported 291,180,600 lbs. (+13.6); retained 1,915,907,500 lbs. (+11.6). The United States supplied 1,682,000,000 lbs. (+14.4); Egypt 364,000,000 lbs (+10.6), and British India 79,000,000 lbs. (-26.9).

Wool (sheep, lamb, alpaca and llama) was imported in 1911 to a total of 799,896,221 lbs. (-0.5); 304,525,910 lbs. were re-exported (-9.2); 495,370,311 lbs. were retained (+5.8). Table XXVII shows the countries of origin.

Shipping.—In 1911 the total net tonnage of vessels entered and cleared with cargoes and in ballast at ports of the United Kingdom was as follows, showing increase or decrease per cent on 1910: *Steam*, entered 67,253,999 tons (+3.9), cleared 67,844,960 (+3.7); *Sailing*, entered 1,910,516 (-2.2), cleared 1,899,866 (-2.5); *Total*, entered 69,164,515 (+3.7), cleared 69,744,826 (+3.5). Of these the British vessels alone represented: entered 40,777,476 tons (+2.8), cleared 41,107,978 (+2.3).

The total net tonnage of British vessels with cargoes entered and cleared in ports of foreign countries in 1911 was as follows: entered 21,534,126 tons, cleared 20,237,582. In British ports abroad: entered 7,920,081, cleared 7,856,500.

The principal ports of the U.K., with the tonnage of vessels cleared and entered in 1911, are shown as follows, with the increase or decrease per cent on 1910:—*London*, ent. 11,973,249 (-1.5), cl. 9,004,974 (+0.05); *Liverpool and Birkenhead*, ent. 7,887,719 (+3.9), cl.

6,880,271 (+2.7); *Cardiff* ent. 5,526,426 (+0.04), cl. 8,328,047 (-2.8); *Tyne Ports* (Newcastle, N. and S. Shields), ent. 5,954,498 (+18.5), cl. 6,842,199 (+11.8); *Southampton*, ent. 4,466,314 (+2.8), cl. 4,351,937 (+3.7); *Hull*, ent. 3,534,964 (-5.6), cl. 3,185,290 (-8.2); *Glasgow*, ent. 2,146,512 (+5.3), cl. 3,418,771 (+3.8); *Dover*, ent. 2,068,728 (+15.2), cl. 2,060,391 (+15.5); *Newport*, ent. 1,703,794 (+12.8), cl. 2,292,584 (+8.3); *Blyth*, ent. 1,388,727 (+12), cl. 1,973,867 (+8.3); *Middlesbrough*, ent. 1,597,834 (-5.2), cl. 1,656,530 (+6.9); *Plymouth*, ent. 1,670,446 (+11.9), cl. 1,497,105 (+9.8); *Sunderland*, ent. 1,421,748 (+19), cl. 1,742,937 (+12.9); *Swansea*, ent. 1,251,983 (+24.6), cl. 1,843,624 (+9.9); *Grimsb'y*, ent. 1,446,777 (+9.8), cl. 1,503,095 (+8.7); *Leith*, ent. 1,417,534 (+0.04), cl. 1,448,498 (+0.00); *Manchester*, ent. 1,329,679 (+0.00), cl. 1,095,478 (+1.3); *Bristol*, ent. 1,049,567 (+1.3), cl. 817,398 (+2.7); *Melth*, ent. 908,318 (+7.3), cl. 1,191,052 (+1.3); *Harwich*, ent. 918,123 (+4.6), cl. 867,666 (+4.5); *Grangemouth*, ent. 820,855 (-14.2), cl. 906,283 (-12); *Hartlepool*, ent. 951,849 (+15.1), cl. 730,513 (+19.6); *Goole*, ent. 769,531 (-4.2), cl. 769,962 (-4.5); *Port Talbot*, ent. 590,802 (-1.4), cl. 888,990 (+2.9); *Burntisland*, ent. 529,435 (+7.4), cl. 836,336 (+16.2); *Folkestone*, ent. 646,546 (+82.4), cl. 640,267 (+77); *Newhaven*, ent. 433,786 (+4.9), cl. 423,626 (+5.3); *Bo'ness*, ent. 319,027 (-6.5), cl. 308,569 (-5.7).

Recent Developments at English Ports:—London.—In 1909 the value of the imports into the port of London represented 32.9 per cent, and the exports 18.5 per cent, of the total for the U.K. The Port of London (Registration of Craft) Order Confirmation Act, 1910, authorised the Port of London Authority to impose fees in respect of the registration or licensing of craft on the river Thames. In 1911 the Port Authority decided to construct a new dock estimated to cost £1,400,000, and the King undertook to perform the ceremony of cutting the first sod on July 17, 1912, but this was prevented by the Transport Workers' strike. On February 1, 1911, H.M.S. "Thunderer," the first super-Dreadnought vessel constructed on the Thames, was launched from the yard of the Thames Ironworks Ship-building and Engineering Co.

Mersey.—Important developments of the north end of the Liverpool Dock Estate include the Gladstone Dock at Seaforth, begun in September 1910. It was decided early in 1912 to construct a deep-water approach taking vessels 1,100 feet long. The Gladstone Dock is to be convertible into a graving dock; two branch docks and a half-tide dock, together with a lock 645 feet long, communicating with the Hornby Dock, are included in the scheme, the estimated cost of which is £3,000,000. New works have also been undertaken at Brocklebank Branch Dock, including the extension of quays, railways and sheds. The proposal to construct a bridge between Liverpool and Birkenhead was revived in 1912, but the scheme for the erection of a custom house at the pier head has been abandoned owing to failure of the negotiations for the site. Facilities at the Port of Manchester have been extended at Trafford Park and elsewhere on the canal, and seed-crushing works have been undertaken at Partington and elsewhere. Cornbrook wharf was extended in 1911. The Manchester Cotton Association is actively fostering the import trade in raw cotton.

Dee.—An improved waterway for shipping in the Dee estuary has long been contemplated, and in 1912 a conference of representatives of Flint and Denbigh County Councils, Chester Town Council, Dee Conservancy Board, and other bodies, gave general approval to a scheme for a navigable channel near the Flintshire shore, and agreed to press the Development Commissioners to grant £30,000 towards the estimated cost of £75,000.

Southampton.—Increased size of the Atlantic liners calling at Southampton necessitated the construction of a dock of 16 acres, which was used for the "Titanic." Considerable loss has been sustained by strikes of dockers.

At *Dover*, trials were made in 1910 for the running of trains serving passenger vessels on the Admiralty Pier extension. It was decided in September 1912 to close the western entrance to Dover harbour, with a view to improving the shelter in rough weather, and to extend or duplicate the eastern entrance.

Bristol continues to direct its chief effort to the development of the dock estate owned by the municipality. New traffic has been attracted. The Canadian Steamship Ltd. (Royal Line), established in 1910, has been very successful, particularly in the emigration branch, and large numbers of agriculturists from the west of England have been

settled in Canada. There has also been considerable increase of the imports of frozen meat. The port dues grew from £146,565 in 1911 to £155,284 in 1912. The latter figures are the highest on record, and the trade has doubled since 1882. Grain and provisions continue to be among the chief imports, and petroleum and fruit have been imported in increasing quantities of late. There is still a heavy call on the rates to meet the deficiency in dock revenue, the amount of aid in 1912 being £140,000 compared with £154,000 in 1911. The city's indebtedness considerably exceeds £8,000,000, over £5,750,000 being for docks, after allowing for accumulations in the Sinking Fund.

Humber and Lincolnshire Coast.—At Hull an important addition to the facilities for the coal export trade was made in 1910 by the installation of coaling beds at the Victoria Docks. This method of shipping coal, the appliance for which has a capacity of 600 tons per hour, had not previously been employed in England. The extension of the joint dock was completed in 1912.

The greatest undertaking on the east coast has been the construction by the Great Central Railway of the Immingham Dock, opened by the King on July 22, 1912. Six miles from Grimsby and nine miles nearer the North Sea than Hull, Immingham possesses many advantages, providing free ingress and egress at any state of the tide. The area of the dock property, which is two and a half miles in length and one mile in breadth, is just over 1,000 acres, and the railway sidings and lines extend to 170 miles, being sufficient to take 11,600 waggons carrying upwards of 10,000 tons. The water area is 45 acres. There are eight hydraulic steam hoists capable of shipping 5,600 tons per hour. From Grimsby itself the coal shipments to foreign ports in 1911 exceeded 1,500,000 tons. At Boston dock extension has been taken in hand.

Wrecks.—The number of vessels belonging to the United Kingdom totally lost at sea in 1910 was 319, of 150,142 tons (sailing 195 of 32,547 tons, steam 124 of 117,595 tons).

Communications:—Railways.—Table XXVIII gives particulars for the railways of the United Kingdom in 1911, the figures being also analysed under the three divisions of the kingdom for purposes of comparison.

Table XXVIII.—Railway Statistics, 1911.

	United Kingdom.	England and Wales.	Scotland.	Ireland.
Mileage at the end of year . . .	23,417	16,200	3,815	3,402
Capital paid up (million £) . . .	£1,324	£1,093.2	£185.7	£44.98
Number of passengers (millions) ¹	1,326.3	1,188.2	107.3	30.8
Increase per cent on 1910 . . .	1.4	1.4	2.8	0.29
Tonnage (millions) of minerals and goods	523.57	448.29	68.67	6.62
Increase per cent on 1910 . . .	1.78	1.7	2.0	1.4
Total receipts	£127,199,000	£109,189,000	£13,489,000	£4,511,000
From passengers	£ 53,955,000	£46,308,000	£5,362,000	£2,284,000
Per mile of line open	£2,304	£2,859	£1,405	£671
From goods	£ 63,285,000	£53,921,000	£7,281,000	£2,082,000
Per mile of line open	£2,703	£3,328	£1,909	£612
Total increase per cent	2.6	2.6	3.0	0.8
Working expenses	£78,617,000	£68,252,000	£7,551,000	£2,814,000

The percentage of working expenditure to total receipts was 62 for the whole kingdom, 63 for England and Wales, 56 for Scotland and 62 for Ireland.

The Great Western Railway company, having shortened its route between Birmingham and London by making a new line *via* Aynho, has spent upwards of £2,000,000 in the Birmingham district in widening and improving the line north and south of the city, rebuilding Snow Hill Station and constructing a new passenger station and a large goods station at Moor Street, near the public markets. The London and North-Western Railway company are preparing an important scheme for the improvement of New Street Station, Birmingham, and the extension of the adjoining Queen's Hotel. A new line is projected from Coventry to Arley in conjunction with the Whitacre and Nuneaton branch of the London and North-Western, for the purpose of developing the coalfield in the neighbourhood of Coventry. In connection with recent labour disputes it may be mentioned that the North-Western company

¹ Excluding season-ticket holders.

appointed a "grievance-hearer" (Feb. 1912) to inquire into minor complaints. The extension of a branch line of the Great Northern Railway north of Enfield to Cuffley and beyond, is opening up a new residential district for London. Other railway enterprises include the reopening (April 13, 1911) of the Shropshire and Montgomeryshire Light Railway from Shrewsbury to Llanymynech, after lying derelict for thirty years, and the opening of a line (July 1, 1912) $1\frac{3}{4}$ -miles long, connecting Holywell, Flintshire, with Holywell Junction station on the L. & N. W. line from Chester to Holyhead. An extension of the electrification of part of the Lancashire and Yorkshire railway system was opened in March 1911 between Maghull and Town Green, and a scheme for the electrification of the Manchester, South Junction and Altrincham line is in hand. A bill was promoted in 1912 by local landowners for a railway between Richmond and Reeth in the valley of the Swale, Yorkshire.

Canals, etc.—The final report of the Royal Commission on Canals and Inland Navigation has received much attention in the midlands; and a Midland Waterways Association, representative of all the towns and interests concerned, has been formed to press forward the scheme of the Commission for improved water communication with Hull, Liverpool, London and the Severn ports. A committee has also been formed to promote the restoration of the Warwickshire Avon as a commercial waterway.

London Traffic.—In 1910 the mileage of tramways in London was 139.48. Motor omnibuses have practically superseded the horse omnibus; in 1899 there were five motor omnibuses licensed by the Metropolitan Police, while in 1910 this number swelled to 1,200, and the number has greatly increased since. The streets of London extend to 2,151 miles. In some of these the congestion of traffic is exceedingly severe. The number of accidents and consequent agitation in parliament and elsewhere in the autumn of 1912 drew the serious attention of the Home Office and other authorities to the matter, and it was considered whether statutory powers should be created for the limitation of the number of public vehicles in certain thoroughfares. The recommendation of the Royal Commission on London traffic in favour of a Traffic Board for London was strongly revived, but did not receive the support of the government.

Practically all the drivers of motor cabs in London struck in October-November 1911, and the dispute was settled by an arrangement, the principal points of which were that the drivers should retain "extras," which are chargeable by statute upon passengers, and that "observers," whose duty it was to report to the cab companies any defalcation on the part of the drivers, should be abolished. A further dispute arose in March 1912 with the drivers and two of the companies, and a settlement was only effected on April 15th; and at the end of the year another strike took place.

The Piccadilly, the Baker Street and Waterloo, and the Hampstead "tube" railways were amalgamated as the London Electric Railway Company in 1910, under the control of the Underground Electric Railways Company; the fusion of the latter company with the London General Omnibus Company (which has absorbed a number of competing omnibus companies since the introduction of motor traction) was subsequently arranged, and in November 1912 it was announced that it was intended to amalgamate the Central London and the City and South London "tubes" with the underground system, and the London United Tramways with the Metropolitan Electric Tramways. The chairman of the Underground company is Sir Edgar Speyer.

Road Board.—Under the Development and Road Improvement Act (1909) the Road Board was created for the improvement of roads and the administration of a grant for that purpose, consisting of the proceeds of duties on motor spirit and of part of the duties in respect of carriage licences. The Commissioners appointed in May 1910 were: Sir George S. Gibb (chairman), Lord Pirrie, Lord Kingsburgh (Sir J. W. Macdonald), Lord St. Davids, and Sir Charles D. Rose, Bart. The Board has power to act on its own initiative or through existing highway authorities; and has already carried out much important work, not only in the direction of improving roads but in such other directions as inquiry into the best forms of road-crusts.

One proposal, which has attracted wide attention and was the subject of a conference in February 1912, under the chairman of the Board and including representatives of the Board of Trade and local authorities interested, is that of a new approach to London from the west, extending from Hounslow to the West Cromwell Road, and avoiding among other crowded points the narrow High Street of Brentford. The cost was estimated approximately at

£1,750,000, but alternative schemes are in the field. Mention may also be made of the adaptation of disused portions of the Roman Foss Way in Lincolnshire for modern traffic.

The system of propulsion of electric vehicles without rails, by means of overhead trolleys, has received much attention, and has an example in Leeds, where a public service on this principle was inaugurated in June 1911.

Tramways of the United Kingdom.—The total length of tramways open at the end of 1911 was 2597; the paid-up capital £74,725,440; the gross receipts £13,777,001 (an increase of 5.3 per cent on the preceding year). Working expenses amounted to £8,500,941 (increase 4.5 per cent); net receipts to £5,276,060 (increase 6.6 per cent). The number of passengers carried during the year was 2,907,177,120, an increase of 9.2 per cent.

Post Office.—With the close of the year 1911 the telephone system of the National Telephone Company passed under the control of the Postmaster-General, whose department under this arrangement entered into possession of some 1,500 exchanges and undertook the service of 400,000 subscribers in addition to about 80,000 who were previously served by existing post-office exchanges. With very few exceptions, the company's staff was transferred to the government service, the total *personnel* amounting to about 18,000. The rates were not immediately affected by the change, but public opinion was freely expressed that the efficiency of the service had deteriorated:

The following statistics relate to the year ending March 31, 1912. The total number of letters delivered in the United Kingdom was 3186.8 millions (in England and Wales 2729.8, Scotland 273.8 and Ireland 183.2 millions), an average per head of the population of 75 in England and Wales, 58 in Scotland and 42 in Ireland, or 70 for the whole kingdom. There were also delivered in the Kingdom 1265.5 million newspapers and half-penny packets, 905,500,000 postcards, and 124,254,092 parcels with an average postal rate of 4.84d., providing a revenue of £2,505,068, of which £1,122,605 was paid to railway companies. The length of telegraph lines in 1910-11 was 52,413 miles overhead, 5569 underground and 3314 submarine, but these figures represent lengths of wire of 440,315 miles overhead, 787,553 underground and 10,727 submarine. Telegraph business was transacted at 13,959 postal and other offices, and telegrams numbered 76,029,000 inland (a decrease of 596,000) and 15,585,000 foreign (an increase of 478,000 on the preceding year). Receipts on telegrams and telephones amounted to £5,121,341, including £2,297,953 from inland telegrams and £1,952,537 from telephones (including royalties); expenditure on this department amounted to £6,352,281.

Money orders were issued in 1911-12 to the amount of £35,260,390 in England and Wales, £4,467,975 in Scotland and £2,367,366 in Ireland (total £42,095,731), and postal orders to the amounts of £41,337,000, £4,432,000, and £2,261,000 respectively (total £48,030,000).

The demolition of the old General Post Office in St. Martin's le Grand, London, was undertaken in July 1912. It was hoped to preserve the façade, which is of some architectural interest (*E. B.* xvi, 945b), by its re-erection elsewhere.

Finance (see under "History" above, *ad fin.*) For 1911-12 the total revenue for the United Kingdom was £185,090,286, and the expenditure £178,545,100.

The following were the details of revenue:—*Customs*, £33,649,000; *Excise*, £38,380,000; *Estate Duties*, £25,392,000; *Stamps*, £9,454,000; *Land Tax*, £750,000; *House Duty*, £2,130,000; *Income Tax*, £44,804,000; *Land Value Duties*, £481,000; *Post Office*, £19,650,000; *Telegraphs*, £3,105,000; *Telephones*, £2,945,000; *Crown Lands*, £530,000; *Receipts for Suez Canal shares, etc.*, £1,281,497; *Miscellaneous*, £2,538,789.

The following were the details of heads of expenditure:—*National Debt*, £24,500,000; *Development Fund*, £1,709,859; *To local taxation account*, £9,636,399; *Civil list*, £470,000; *Annuities and Pensions*, £317,745; *Salaries and Allowances*, £56,572; *Courts of Justice*, £523,000; *Miscellaneous*, £325,525; *Army*, £27,649,000; *Navy*, £42,858,000; *Miscellaneous Civil Services*, £46,001,000; *Customs and Excise*, £2,297,000; *Inland Revenue*, £1,654,000; *Post Office* (Telegraphs, etc.), £20,547,000.

The income brought under review for the assessment of income tax was stated as follows, for the year ending April 5, 1911:—Schedule A (ownership of lands, houses, etc.), *England* £233,906,688, *Scotland* £26,944,348, *Ireland* £14,971,877. Sch. B (occupation of lands), *England* £12,282,010, *Scotland* £1,925,858, *Ireland* £3,231,092. Sch. C (interest on securities, etc.), *United Kingdom* £49,562,418. Sch. D (profits from business, professions, etc.), *England* £509,578,244, *Scotland* £57,036,283, *Ireland* £16,697,542. Sch. E (salaries, etc.), *United Kingdom* £119,697,415.

The National Debt on March 21, 1912, consisted of:—*Funded Debt*, £602,200,092; *Terminal Annuities*, £33,044,389; *Unfunded Debt*, £39,500,000; *Other capital liabilities*, £50,061,947. *Total gross liabilities*, £724,806,428.

Parliamentary Electors.—In 1912 the registered number of parliamentary electors

was 7,984,600, or an average of 11,917 per member of parliament (670 seats). They were distributed as follows: (A) England and Wales: *counties* (253 seats), 564,281 owners, 3,106,370 occupiers, 130,302 lodgers, total 3,800,953; *boroughs* (237), 22,986 freemen, freeholders, etc., 2,445,387 occupiers, 185,601 lodgers, total 2,653,974; *universities* (5), 20,816. Total, 6,475,743. (B) Scotland: *counties* (39), 63,884 owners, 372,913 occupiers, 34,116 lodgers, total 470,913; *boroughs* (31), 30,265 freemen, etc., 255,429 occupiers, 32,044 lodgers, total 317,738; *universities* (2), 23,801. Total, 812,452. (C) Ireland: *counties* (85), 8,918 owners, 556,535 occupiers, 4,926 lodgers, total 570,379; *boroughs* (16), 2,535 freemen, etc., 113,803 occupiers, 4,691 lodgers, total, 121,029; *universities* (2), 4,997. Total, 696,405.

Defence.—The cost of imperial defence, in relation to national wealth and income, is summarized in Table XXIX.¹

Table XXIX.

	National wealth.	Per head.	National Income.	Per head.	Expenditure on defence (est. 1912-13).	Per head.
	Million £	£	Million £	£	1,000 £	£. s. d.
England and Wales	13,716	380	1,740	48	65,700
Scotland	1,451	305	173	36	7,300
Ireland	714	163	103	23	Nil.
United Kingdom	15,882	351	2,016	44	73,000	1 12 3
Canada	2,072	288	259	36	2,285	.. 6 5
Australia	1,312	287	164	36	4,775	1 0 0
South Africa	600	100	75	12	843	.. 2 9

India	3,600	10	608	2	20,249	.. 1 3
Crown Colonies, etc.	1,200	..	170	..	1,000
Total	24,986	..	3,332	..	102,440

Navy (see also "Navies" in Part I: sect. i, of the YEAR-BOOK).—The creation of a Naval War Staff was announced in January 1912. Its advisory functions were outlined in an important memorandum by the First Lord of the Admiralty, Mr. Winston Churchill, in which he foreshadowed a scheme of collaboration between the Naval War Staff and the General Staff of the army. Some staff officers were to be appointed immediately, and appointments were to be made subsequently after a special course of training at the War College. At the same time the appointment was announced of Sir Francis Hopwood as additional Civil Lord of the Admiralty to deal with the business and commercial transactions of the Board, the appointment being permanent and non-political. Rear Admiral E. C. T. Troubridge was appointed Chief of the War Staff, Captain G. Ballard Director of the Operations Division, and Captain E. C. Jackson Director of the Intelligence Division.

Admiral-of-the-Fleet Sir A. K. Wilson, formerly First Sea Lord, retired from the active list on March 4, 1912, on attaining the age of seventy. He was succeeded as First Sea Lord, on November 29, 1911, by Admiral Sir Francis Bridgman, whose resignation on the ground of ill-health² was announced on December 6, 1912. He was succeeded

¹ After Mr. Edgar Crammond in the *Nineteenth Century and After* (Aug., 1912).

² The resignation of Sir F. Bridgeman on Dec. 4th was the subject of several questions to Mr. Winston Churchill in the House of Commons, and led to an animated debate on Dec. 20th. Mr. Churchill had originally stated that Sir F. Bridgeman resigned for reasons of health, but, under pressure, admitted that he had himself taken the initiative in asking for the First Sea Lord's resignation; and he was sharply attacked by Lord Charles Beresford, who suggested that Sir F. Bridgeman had been improperly treated, and that he had been removed because he disagreed with Mr. Churchill on questions of naval policy. The full disclosure of the facts on Dec. 20th showed that these charges were untenable. Mr. Churchill had reluctantly been forced to the conclusion that the Admiral's health was not equal to the grave responsibility attaching to his office at a time of severe strain, and he was bound in

by Admiral Prince Louis of Battenberg, who was followed in the office of Second Sea Lord by Vice-admiral Sir J. R. Jellicoe. Among other recent appointments, Admiral the Hon. Sir H. Meux succeeded Admiral Sir A. Moore as Commander-in-Chief of Portsmouth, and Admiral Sir A. Berkeley Milne succeeded Admiral Sir E. Poë as Commander-in-Chief in the Mediterranean (announced in April 1912).

The *personnel* of the Royal Navy for 1912-13 is shown as follows. (1) *Sea Service*: (a) Fleet:—flag officers 28, commissioned officers 4727, subordinate officers 740, warrant officers 2070, petty officers and seamen 97,811, boys (service) 2,601; total 107,977. (b) Coast guard:—commissioned officers 99, chief officers and second mates 205, petty officers and seamen 2796; total 3100. (c) Royal marines:—commissioned officers 420, warrant officers 67, staff sergeants and sergeants 1300, band ranks, buglers and musicians 1708, rank and file 13,296, band boys 272; total 17,063; total for sea service 128,140. (2) Other services 7860. (3) Addition under supplementary estimate 1500. Total *personnel* 137,500.

Army.—In February 1912 a joint Army and Navy School of Aviation was established for the instruction of officers in both services. A British aeronautical service was instituted and designated the Royal Flying Corps, with naval and military sections, and a central flying school on Salisbury Plain administered by the War Office. The Army Aircraft Factory was renamed the Royal Aircraft Factory.

General Sir C. W. H. Douglas succeeded General Sir J. French as Inspector-General of the Home Forces on March 5, 1912.

The following figures show the *personnel* of the Army on October 1, 1911, the numbers wanting to complete the strength being given in brackets where necessary:—(a) Regular Army:—British establishment 176,539 (4271); Indian establishment 77,770 and 1,886 supernumerary; staff and departments, etc., 2474 (106); army reserve 138,531; special reserve 60,931 (30,288). (b) Territorial Force:—officers, N.C.O.'s. and men 264,911 (49,445);¹ permanent staff 2786 (35); reserve 656. The above figures give a total of 724,598. There are also to be added:—militia 1655; reserve 205; militia (Channel Isles, Malta and Bermuda)—permanent staff 178 (1) and militia 5243 (319); volunteers (Bermuda)—permanent staff 4 (1) and volunteer officers and volunteers 225 (89). Grand total 732,108.

Local Affairs and Finance: United Kingdom, 1909-10.—For England and Wales the revenue of local bodies amounted to £168,157,555² and expenditure to £166,104,559; for Scotland to £18,854,650 and £18,918,681 respectively, and for Ireland to £8,752,498 and £8,598,435 respectively. Outstanding local loans in England and Wales amounted to £536,002,529, including £49,529,222 in respect of loans taken over or raised by the Metropolitan Water Board; for Scotland the figure was £65,827,182, including capitalised values of annuities, and for Ireland £22,066,834. Total, £623,896,545.

London Government.—The assessable value in the county of London in 1911 amounted to £44,669,412. The net outstanding debt of central and local bodies on March 31, 1910, was £111,043,088. The central rates for the administrative county (excluding the City of London) for the year ending March 31, 1912, amounted to 5s. 3.995d. in the pound; leaving to be raised locally differential rates in each borough. The amounts of the localised rates varied from 1s. 0.005d. in Westminster (St. James) to 6s. 0.005d. in Poplar; the amount of the total rates varied from 6s. 4d. in Westminster (St. James's) to 11s. 4d. in Poplar. A return published by the London County Council in November 1912, compared the cost of the municipal services in London and six other large cities. The total net cost per head of the population was found to be highest in London £3.3s. 9.5d., against £2.16s. 11.0d. for Manchester; £2.8s. 9.7d. for Leeds; £2.5s. 5.5d. for Liverpool; £2.3s. 6.1d. for Bristol; £2.3s. 2.9d. for Birmingham, and £1.18s. 8.4d. for Sheffield), those circumstances to act as he did, after consulting with the Prime Minister and informing the King, whose sanction had been obtained. After conveying his view to Sir F. Bridge-man in so kind and diplomatic a letter that the gallant Admiral at first failed to realise the situation, he had then put it so bluntly—as Mr. Bonar Law considered, "brutally"—that no misunderstanding was possible. But after the full explanation given by Mr. Churchill it was clear that, if his method was open to criticism, his action was not, and that the attacks on him in other respects were unsupported by any material evidence.

¹ Includes both permanent staff and territorial officers for O.T.C. The Territorial force was stated to include 9236 officers and 252,152 N.C.O.'s and men on October 1, 1912, giving a total of 261,388, and a decrease of 3523 on the total of the previous year.

² Including £22,570,459 of loans and £2,679,183 of other receipts accounted for by the Port of London Authority.

but the cost per £ of assessable value is lowest in London (6s.5.9d., ranging up to 10s.4d. in Leeds). Education is found to cost 6s.7.6d. per head more, and police 3s.10.2d. more in London than the average for the other cities. Higher prices, salaries, wages, and cost of lands and building are adduced as explanations of the higher total cost per head in London.

Alderman Sir David Burnett (an auctioneer and surveyor by profession, was elected Lord Mayor of London on September 28, 1912, in succession to Sir Thomas Boor Crosby. The London Borough Council elections took place on November 1, 1912, and as the result the Municipal Reform party retained the general ascendancy which it had previously held. To a total number of 1362 seats in the 28 borough councils there were returned 1002 Municipal Reformers, 252 Progressives, 33 labour representatives, 15 socialists, 23 independents and 37 non-party members (the borough of Stoke Newington electing a non-party council of 30). The Progressives outnumber Municipal Reformers in the councils of Bethnal Green, Southwark and Battersea, the result in the borough last named constituting a Progressive gain; on the other hand that party lost its previous majority over the Municipal Reformers in Hackney.

Municipal Boundary Alterations, England and Wales.—Among recent changes adopted or proposed in the boundaries or constitution of boroughs, the following may be noticed.

The area of the city of *Bath* was increased at the expense of the county of Somerset by 1767 acres in 1911; a population of 18,454 and a rateable value of £81,043 were thus added.

The *Greater Birmingham* scheme came into operation on November 9, 1911. The effect of the scheme was to include in the city the borough of Aston Manor and the urban district of Erdington (Warwickshire); the urban district of Handsworth, with Perry Barr (Staffordshire); the rural district formed by the parish of Yardley and the greater part of the urban district of King's Norton and Northfield (Worcestershire). Quinton (Worcester) had been absorbed in 1909. The whole of these districts thus became part of the geographical county of Warwick. Birmingham, by this extension, was made the second largest city in the empire, but it only maintained that position until November 1912, when the extension of the boundaries of Glasgow (*q.v.*) raised the Scottish above the midland city. The area of Birmingham was increased from 13,478 acres to 43,601 acres. The population in 1911 was 840,202. Without the added areas it would have been 525,833. The population at the end of 1912 was estimated at about 854,000. The corporation now consists of a Lord Mayor, thirty aldermen and ninety councillors, and the city is divided into 30 wards. The water, gas and electric lighting, and tramway undertakings belong to the corporation. The whole of the city with the exception of Handsworth (which remains in the West Bromwich Union) forms one parish for poor law purposes.

Application has been made for a charter of incorporation for *Buxton*. At *Chesterfield*, or which the Duke of Devonshire was mayor in 1910-11, the borough boundaries have been considerably extended, the area being increased from 1212 to 2611 acres, and the population by some 10,000 to 37,429. A scheme for the extension of the borough of *Dudley* is under consideration. The borough of *Eastbourne* was extended in April 1911, to include part of the parish of Willingdon. A scheme is being promoted for the extension of the borough of *Kidderminster*. By a provisional order granted in May 1912 Roundhay, Seacroft, Shadwell and part of Crossgates have been incorporated in *Leeds*, extending the area of the city by 4670 acres, and adding 7620 to the population, while the rateable value is increased by £56,640. *Northampton* was redivided in 1912 into 12 wards instead of 9, and the number of town councillors was increased from 36 to 48. In 1911, besides being the scene of the coronation review and providing hospitality for ships of foreign navies, *Portsmouth* entertained the British Association, British Pharmaceutical Society, Institute of Auctioneers, National Free Church Council, Co-operative Congress, Incorporate Municipal Electrical Association, South-Eastern and Metropolitan Poor Law Conference, and smaller bodies. It was considered opportune that Portsmouth should be raised to the rank of a city, but the petition was refused. In 1912 *Reading* enlarged its boundaries by including Caversham and part of Tilehurst, in spite of some opposition. Its acreage has been increased from 5876 to 9107 acres, and its population from 75,214 to more than 88,000. The union of *Rochester*, *Chatham* and *Gillingham* as a county borough has been considered. In the census of 1911 *Sheffield* was found to be the largest city in Yorkshire, with a population of 454,603 as compared with 445,568 in Leeds, which had previously held the first position. On April 1, 1912, Tinsley was added to Sheffield, giving an additional area of 685 acres, a population of 5270 and a rateable value of £42,659. A movement is on foot for the incorporation of Stourbridge. In Cheshire the urban district of *Wallasey*, virtually a residential suburb of Liverpool, which since 1901 has increased its population by 24,935 (pop. in 1911, 78,514), was constituted by charter, dated July 27, 1910, a municipal borough, and will become a county borough on April 1, 1913. The borough of *Wallasey* was increased in October 1910

by the addition of the former urban district of Willington Quay and part of the rural district of Tynemouth.

Channel Islands.—The Guernsey States (the legislative body) approved a resolution for the adoption of English weights and measures in 1910 to the exclusion of the old local standards, but a petition for the adoption of British coinage as the only legal currency was rejected in 1911. Major E. O. F. Hamilton, C.B., succeeded the late Major-General R. Auld, C.B., in April 1911 as lieutenant-governor and commander of the troops in Guernsey and Alderney.

Isle of Man.—In April 1911 the Home Secretary appointed a committee to report upon a petition from the House of Keys for reforms in the Manx Government. It was proposed to limit the lieutenant-governorship to a term of years (seven or eight), to extend the powers of the Tynwald, and to constitute the legislative council of four members elected by the Keys, together with the Attorney-General, the Bishop and two judges. The Tynwald, with the approval of the Board of Trade, passed in April 1912 a resolution imposing a duty on passengers entering or leaving the ports of Douglas, Ramsey, Peel, Laxey and Port St. Mary, and devoting the proceeds to the improvements of the ports.

Water Supply.—In London the Metropolitan Water Board (New Works) Act, 1911, authorised the Board to construct new storage reservoirs at Staines, Laleham and Shepperton, new service reservoirs on Horsendon Hill, Greenford, and on Barn Hill, Wembley, and to construct numerous conduits and aqueducts. The Island Barn reservoir, near West Molesley, constructed by the Board, was opened on November 4, 1911.

The corporations of *Derby, Leicester, Nottingham and Sheffield* are jointly responsible for the Derwent Valley Water scheme, of which the cost is estimated at £6,000,000, and which began the impounding of water on January 1, 1912. The first two reservoirs are the Howden and the Derwent, the former having a capacity of 1,886 million gallons and being 14 miles in length, and the latter a capacity of 2,000 millions, with a length of $1\frac{3}{4}$ miles. The proportion of water allotted to Leicester is 35.72 per cent, providing for a daily yield of 9,800,000 gallons, to Derby 25 per cent, to Nottingham 14.28 per cent, and to Sheffield 26 per cent. Derbyshire water has also been laid under contribution for the supply of *Stockport*, a new source at Kinder, Hayfield, being opened on July 11, 1912.

Improvements undertaken in the *Liverpool* water supply system include the construction of a reservoir on Lake Vyrnwy aqueduct near Malpas, and a water-tower (1911) and high level-tank at Woolton Hill. Similarly at *Manchester*, for which water is drawn from Thirlmere in the Lake District, it has been necessary to undertake extension of the works by laying a third conduit from the lake to the city. Works are in progress for a water-supply from the river Alwen in North Wales for *Birkenhead*.

On October 4, 1911, the new *Lincoln* water-supply was inaugurated, being obtained from the red sandstone near the village of Elkesley, Nottinghamshire, 22 miles from the city, at a cost of about £250,000.

Housing and Town-planning.—In *London*, improved communications and the working-class dwellings provided in the outskirts (as at Norbury, Totterdown and White Hart Lane) by the London County Council, have facilitated the eflux of population from the centre to the border of the county. The tenements in dwellings belonging to the London County Council on December 31, 1910, numbered 9,217; the total number of rooms was 25,922 $\frac{1}{2}$; the average rent per week per room was 2s. 10 $\frac{1}{2}$ d. A scheme for the establishment of a garden city on land belonging to King's College, Cambridge, at Ruislip-Northwood, was authorised by the Local Government Board in March 1911, and a plan was adopted after competition. It was proposed to devote two-thirds of the estate of 1,300 acres to building and one-third to open spaces. The extension of the Garden City movement in the neighbourhood of London is also illustrated by the plan adopted in April 1912 for a garden village covering about 1,000 acres at Knebworth; while at Letchworth, the first garden city, 28 factories have been established.

At *Birmingham* town planning schemes have been adopted for Quinton, Harborne, Edgbaston and East Birmingham. In 1911 the town council of *Coventry* adopted a scheme for artisans' dwellings estimated to cost £30,000. *Portsmouth, Winchester and Bournemouth* have adopted town-planning schemes, and at Portsmouth it was found feasible to clear a large slum area and erect model dwellings, without adopting the Housing Act. A garden village has been founded in the Far Cotton district of *Norhampton*, at Hunsbury Hill on the Bouverie estate. In *Liverpool* mention may be made of the laying of the foundation of a housing scheme, the largest of six undertaken by the Liverpool City Council, by the Rt. Hon. John Burns, in November 1910. Housing is provided for 1372 persons. The development of a garden city at Wavertree is in progress, and a number of streets have been

widened in connection with this. The Town Planning Act is in operation at *Sheffield*, and various districts are scheduled, but not yet developed. A new road along the Rivelin Valley some three miles long has been made by the Water Committee of the corporation, and the surplus land on each side is to be developed in accordance with modern town-planning methods. The recent census returns confirm the trade statistics in their evidence of the prosperity of *South Wales* and *Monmouthshire*. The counties of Monmouth and Glamorgan show a higher percentage of increases of population than any other typically commercial and industrial county in England and Wales. Between 1901 and 1911 the increase per cent in Monmouthshire was no less than 32.8, or nearly double that in any English county; Glamorgan makes a good second with 30.3 per cent. It is largely due to the rapid growth of the chief centres of population that the housing conditions are so notoriously bad. The local authorities are now trying to meet the need with municipal housing schemes, but despite improvement in some towns the general conditions remain the worst in Britain. One result is that according to the most recent statistics the infantile mortality rate in Carmarthenshire, 136 per 1000 births, is the highest county rate in England and Wales, despite the fact that the chief industry there is agriculture.

Open Spaces.—In 1912 the London County Council and the City Corporation decided to co-operate with the King Edward VII Memorial Committee with a view to the conversion of the site of the Shadwell Fish Market into an open space for the purpose of a memorial in the East End of London to King Edward VII. On February 19, 1910, twelve additional acres of land adjoining Ruskin Park, Denmark Hill, were thrown open for the use of the public. In the same year the London County Council decided to acquire and preserve the Sir Robert Geffrey's Almshouses in Kingsland Road and certain property in Maria Street. The open space has been laid out and is known as Geffrey's Garden. The Council have also decided to acquire the Grange estate, Kilburn. The estate extends to 8½ acres, 7 of which are laid out as a park.

The break up of large estates in the neighbourhood of Bournemouth, Lympington, Portsmouth, Gosport, and other Hampshire towns, has enabled the public bodies to acquire numerous open spaces, though it is to be regretted that around Bournemouth and in the New Forest the picturesque features have suffered. Near the first-named town, and on the Crown lands, woods have disappeared. A movement was started to make the New Forest a sanctuary like Epping Forest, but was not supported by the Hants County Council.

Loxley Chase (74 acres) has been presented to *Sheffield* as a public park.

Public Buildings and Other Undertakings.—*London.*¹ In October 1912, it was announced that the front of Buckingham Palace was shortly to be refaced in stone from designs by Sir Aston Webb. The Queen Victoria Memorial, in front of the palace, was completed and unveiled by the King on May 16, 1911.

The King laid the foundation stone of a new County Hall, at the south end of Westminster Bridge (Belvedere Road, Lambeth) on March 9, 1912. In the course of excavations on the County Hall site, the remains of a Roman boat were discovered, together with various Roman objects. The boat and objects are preserved at the London Museum, Kensington Palace, opened by the King on March 21, 1912. A stone bearing the inscription "Lambeth Boundary of Pedlar's Acre, 1777," was also unearthed.

Among other new London buildings may be mentioned the premises of the Royal Society of Medicine (Wimpole Street), opened by the King on May 21, 1912; the lecture hall and museum at the Horniman Museum, Forest Hill (Jan. 27, 1912); and the London Opera House in Kingsway (1911). Mr. Oscar Hammerstein of New York, for whom this opera house was built, decided to close it after his season in 1912. Cinematograph theatres are now subject to licence (Cinematograph Act, 1909), and about 250 halls have been licensed in London. The Young Men's Christian Association has opened a new building in Tottenham Court Road, and with the object of disposing of the

¹ Among recent works on London, see:—Sir Walter Besant, *London North of the Thames* (1911); *London South of the Thames* (1912); Sir Laurence Gomme, *The Making of London* (1912); E. Beresford Chancellor, *Annals of Fleet Street* (1912); *Calendar of Letter Books preserved among the archives of the Corporation of the City of London as the Guildhall (A-K)* (circa 1275-1464); The London County Council—Various annual publications; *The Survey of London* (Vol. iii: the Parish of St. Giles in the Fields) (1912); *Indications of Houses of Historical Interest* (parts i to xxxvi).

debt upon it at the outset an attempt was made in January 1912 to raise a fund of £100,000 in 12 days by means of an organised campaign, which was not, however, fully successful. The Port of London Authority adopted in July 1912, a design by Mr. Edwin Cooper for chief offices to be erected in Trinity Square, E.C. In January 1912 the London County Council sold the site at the eastern junction of the Strand and Aldwych to the Commonwealth of Australia, for £379,756, for the erection of offices.

The Corporation of London (Bridges) Act 1911, authorised the Corporation to construct a new bridge over the Thames between Southwark and Blackfriars bridges, to widen St. Paul's Churchyard, and to carry out other improvements in the city of London. The new bridge will be probably known as St. Paul's bridge. On June 1, 1911, the subways constructed to relieve the traffic at the Elephant and Castle were opened for pedestrian traffic, and on October 26, 1912, a tunnel beneath the Thames at Woolwich was opened for foot-passengers.

Other public buildings and municipal enterprises have been reported as under:—

Birmingham.—In July 1912 was opened an extension of the Birmingham Council House upon land on the opposite side of Edmund Street. The scheme, still in progress at the end of the year, has cost upwards of £200,000, out of which £50,000 was provided out of a bequest by the late John Feeney (proprietor of the Birmingham *Daily Post*) for an extension of the Art Gallery. Provision has been made for a museum of Natural History.

Blackpool.—The new promenade known as Princess Parade was opened in 1912, extending from the north pier to Cocker Street: the cost was £25,000.

Cardiff.—The visit of the King and Queen to South Wales in 1911 was an occasion of gratification to Welsh nationalist pride. The King laid the foundation stone in Cardiff of the National Museum, which with the University College and the National Library are the outward signs of a great Welsh renaissance. In two other important respects the right of Wales to be treated as a distinct autonomous unit has been recognised. For the purposes of the Insurance Act Cardiff has been selected as a centre for the principality with its own commissioners and staff; and the Welsh National Memorial Association, which has a fund of more than £200,000 publicly subscribed for a campaign against tuberculosis, has received a royal charter and the full status of a national institution.

Chester.—Municipal progress includes a hydro-electricity scheme (1912) for utilizing by means of turbines the water-power at the Dee Mills for an auxiliary supply of electricity.

Dudley.—The corporation received in 1912 a bequest of £30,000 from the late Mr. Brooke Robinson (formerly M.P. for the borough) for an art gallery or museum.

Hereford.—The city library has been extended by the addition of an art gallery provided by the late Sir Joseph Pulley and Mr. C. T. Pulley, High Sheriff (1912). The Roman site of Dinedor Camp, near the city, has been purchased for a public pleasure ground.

Hertford.—In May 1911 Lord Salisbury offered the castle and grounds at Hertford to the corporation for public use at a nominal rent; and the transfer of the building, in which the municipal offices are established, took place in the following year.

Hull.—An art gallery was opened in 1910 by Mr. T. R. Ferens, M.P., who has largely contributed to its erection and upkeep, and also presented to the town in 1911 twelve almshouses as a memorial to King Edward VII, and a playing field near the East Park. A new museum has been designed to illustrate the shipping and fishing industries.

Leicester.—A great fire in October 1911 destroyed St. George's Church and an important hosiery factory. A scheme has been put forward for a public hall near Victoria Park.

Liverpool.—The cathedral has been enriched by the gift of a reredos by Mr. Mark Wood, from designs of Mr. Gilbert Scott. It was decided in the autumn of 1912 by the cathedral committee to proceed with the building of the first transept. A representative exhibition of the works of Albrecht Dürer was held in the Walker Art Gallery in April 1910. Mr. Andrew Carnegie in August 1911 opened at Sefton Park a library worked by a staff of women.

Manchester.—Mr. Carnegie also in the same year presented £15,000 to Manchester towards the establishment of three branch libraries. A church house, with a hall seating 2,000 persons, was opened in October 1911 by the Archbishop of York.

Middlesbrough.—A transporter bridge across the Tees, erected by the Corporation, was opened by Prince Arthur of Connaught in October 1911.

Northampton.—Among important new buildings are a Carnegie library, costing £15,000, in Abington Street, a theatre, and new buildings for the grammar school (1911).

Norwich.—Serious damage was caused, and much suffering occasioned, by a great rain-storm and floods on August 26, 1912. At Brundall near the city 8.06 in. of rain fell, and more than 7 in. over an oval area including Norwich and the district of the Broads. The damage to communications was enormous. Large relief funds were raised.

Nottingham.—A number of improvements have been carried out in Nottingham, among the most noteworthy being the widening of Carrington Street and Great Friar Gate at a cost of £60,000. A still larger scheme is that in the Carter Street area, estimated to cost £139,000.

Penzance.—By a legacy under the will of the late Prebendary Hedgeland, the Penzance library received in 1911 an addition of 7,000 books.

Plymouth.—In October 1910 a free library, art gallery and museum were opened; they had cost about £25,000, towards which Mr. Andrew Carnegie gave £15,000.

Reading.—The Berkshire County Council has built new offices at Reading, a fine building in the Queen Anne style, near the medieval gateway of the abbey.

Shrewsbury.—A weir has been constructed on the Severn to improve boating; and the Town Council resolved on June 24, 1912, to apply for sanction for a loan of £12,000 to widen the English bridge over that river.

Stoke-on-Trent.—In 1911 the Duke of Sutherland offered Trentham Hall and a large portion of its grounds to the corporation, but the offer was declined. The hall was therefore demolished and its chimney-pieces and other carvings and fittings were sold.

Wakefield.—The County Hall has been extended at a cost of £32,000.

Worcester.—Important street improvements have been effected principally in the widening of The Foregate, High Street. The Corporation has acquired Pitchcroft (including the racecourse) for a public pleasure-ground and has purchased land for a recreation ground.

Ancient Sites and Buildings.—*London.*—In the course of work on the fine Norman western porch of the Temple Church it was found that the carving had been coated over, and it has now been revealed in almost its original state by the removal of the coating.

Rochester.—The restored north aisle of Rochester Cathedral was dedicated on March 10, 1911.

Salisbury.—Old Sarum, the former city of Salisbury, lies buried a mile and a half from the present town, and interesting excavations were made in 1912. The area is in the care of archaeologists, under Col. William Hawley, F.S.A., and the history of the site is gradually coming to light. The most recent excavations reveal a good outline of the south wing of the transept of the great church, and many graves have been met with, most of them very near the surface. Their depths vary considerably, but none seems to be more than three feet, while stone coffins must have been actually on the surface. For the present all the coffins have been covered up to receive attention later, but it is doubtful whether anything definite will be ascertained of the occupants, as the covering stones have in all instances been taken away and doubtless the contents have been interfered with. Other things unearthed include some very fine gargoyles found in the transept cutting. The intention of the excavators in 1912 was to get a general outline of the close and the cathedral, and to open out the entire basement of the building when work was resumed in 1913. It was hoped that the work would be completed by 1915.

Lake House near Salisbury, a fine example of Elizabethan stone architecture, in the occupation of Mr. P. W. Illingworth, M.P., was destroyed by fire on March 29, 1912.

After much public interest had been aroused, *Tattershall* Castle, with its famous carved stone fireplaces, was purchased in 1912 by Earl Curzon of Kedleston. The fireplaces were brought back in June, and Lord Curzon intimated that he intended to restore the mansion to its original condition and make it accessible to the public.

Winchester.—In July 1912 a service was held in Winchester Cathedral, at which the King and Queen were present, to celebrate the completion of the restoration of the cathedral. The eastern arm of the cathedral was practically built over a peat bog upon a raft, which, after eight centuries, subsided, and in 1905 the whole building threatened to collapse. Over £113,000 was raised to meet the cost of restoration. New buttresses were erected, and a diver, working in darkness for six hours a day for six years, and much hampered by subterranean springs, laid a solid bed of concrete under the piers and walls.

Education.—For the year ending July 31, 1911, the total number of pupils in schools comprised under the national system of public elementary and higher elementary education, in England and Wales, was 6,067,075; of these 350,621 were aged 3 to under 5, 1,301,267 aged 5 to under 7, 3,311,756 aged 7 to under 12, 1,096,474 aged 12 to under 15, and 6,957 aged 15 and over. There were 8,046 "Council" elementary schools with accommodation for 3,980,946 pupils; 12,734 "voluntary" elementary schools (maintained by local education authorities) with accommodation for 2,808,795; and 66 "voluntary" elementary schools (not so maintained) with accommodation for 17,799. Also 46 "Council" higher elementary, and 285 other schools, with accommodation for 12,207 and 19,391 respectively; and 1 "voluntary" higher elementary, and 116 other schools, with accommodation for 240 and 12,742 respectively. Of the 12,734 "voluntary" elementary schools, 10,941 (with accommodation for 2,245,143 pupils) were

Church of England, 225 (for 60,322 pupils) Wesleyan, 1,075 (for 375,535) Roman Catholic, and 12 (for 9,863) Jewish. The parliamentary grant for elementary education was £11,445,955, the additional amount provided by rates and borough funds being £11,635,725; for higher elementary the receipts were £1,120,699 from parliamentary grants, and £1,857,955 from rates and borough funds.

It was announced on November 28, 1911, that Sir R. Morant, who had been secretary and chief permanent official of the Board of Education since 1903, had been appointed Chairman of the new Board of Commissioners under the National Insurance Act. He was succeeded at the Board of Education in 1912 by Mr. W. A. Selby Bigge.

On July 2-5, 1912, a congress of the universities of the empire was held in London, under the chairmanship of Lord Rosebery, Lord Curzon, Lord Rayleigh and Lord Strathcona. Fifty-two universities were represented. It was resolved to establish in London a bureau of information concerning the universities of the empire.

In local educational circles some of the principal events of 1910-12 may be noted.

Oxford University.—The question of the continuance of the study of Greek by mathematical and science students has been much discussed, and at a large meeting of Convocation it was decided in the affirmative by a great majority. The preamble of a statute making Greek optional in Responsions was rejected however by 188 votes to 152 at a Congregation on November 22, 1910. The new buildings of Oriel College, provided by the munificence of Cecil Rhodes, were opened on September 28, 1911, and form a new feature of High Street, opposite St. Mary's Church. The Union Society new buildings were opened by Lord Curzon, the Chancellor, on June 1, 1911. He also inaugurated some new buildings at Lady Margaret Hall on October 22, 1910. A new electrical laboratory presented by the Drapers' Company of London was handed over to the University on June 22, 1910. The front of Christ Church has been restored. The Principal of Brasenose, Dr. C. B. Heberden, D.C.L., was elected Vice-Chancellor in 1912 in place of the President of Magdalen, Dr. T. H. Warren, D.C.L. A new financial board for the University has been formed. Mr. Falconer Madan, senior sub-librarian, was recommended in June 1912 by the curators of the Bodleian Library to the office of Bodley's librarian, vacated by the death of Mr. E. B. Nicholson. The Prince of Wales entered Magdalen College as an undergraduate in October 1912.

The millenary of the city of Oxford was celebrated at the beginning of July 1912, when a historical exhibition was collected, the city entertained members of the university and others, and degrees *honoris causâ* were conferred upon the mayor and the town clerk.

Cambridge University.—During 1911 Mrs. Butler, widow of A. J. Butler, Fellow of Trinity College, presented to the library a valuable collection of the early editions of the works of Dante. Mr. E. W. Hunnybun presented his unique collection of drawings of the flowering plants of the British Isles. Mr. J. Willis Clark, late Registry of the University, bequeathed to the library his valuable collections relating to the town, county, colleges and university of Cambridge, including his manuscript collections. Sir Harold Harmsworth's offer to found a professorship in English literature took shape during the Michaelmas term of 1911; in February 1912 Dr. A. W. Verrall was appointed, and on his death Sir A. Quiller Couch, the novelist ("Q"), was chosen professor in October. Following a promised anonymous donation of £125 for ten years towards the stipend of a Reader in Modern History, the readership has been established. A new lecture rooms building was completed and brought into use in the year 1911-12. A munificent offer of the Drapers' Company to provide a physiological laboratory was accepted by the Senate, and the erection of the building was begun; with this is connected a laboratory of experimental psychology.

Other Universities.—In the new buildings of *Birmingham University* at Bournbrook, a statue of King Edward VII (the gift of the pro-vice-chancellor, Alderman F. C. Clayton) has been erected to commemorate the opening of the buildings by his Majesty and Queen Alexandra on July 7, 1909. These buildings include departments of mining and metallurgy, mechanical engineering, chemistry and physics, together with foundries and other plant for experimental purposes on an unusually complete scale, and an experimental mine. There is also a large hall and library, and the buildings (from the designs of Sir Aston Webb and

Mr. Ingress Bell) are surmounted by a lofty clock-tower. Alderman C. G. Beale, Vice-Chancellor of the University, died on September 1, 1912.

The late Mr. H. O. Wills has been succeeded by Lord Haldane as Chancellor of *Bristol University*.

In December 1911 intimation was given of the decision of *Durham University* to admit all students professing the Christian faith to Divinity degrees, hitherto limited to the Church of England.

A large extension of the textile department of *Leeds University* has been made through the generosity of the Clothworkers Company. Sir Nathan Bodington, Vice-Chancellor of the university, died May 12, 1911, at the age of 63. He was succeeded by Professor M. E. Sadler, C.B., the well-known educationalist (b. 1861). Lord Airedale, formerly Mr. Jas. Kitson, one of the governing body of the university and head of the Airedale Foundry, Leeds, died in March 1911. Sir William Hepton, Lord Mayor of Leeds, who was knighted at the opening of the university extension, met with a fatal accident while fishing in France on May 23, 1911. A new training college for teachers has been established at a cost of nearly a quarter of a million.

At *Liverpool University* the foundation stone of a new engineering laboratory was laid on October 22, 1910. The Liverpool School of Tropical Medicine in 1910 offered to the university the endowment of a chair in tropical entomology, and in the following year Professor R. Newstead was appointed from the school to the new Dutton Memorial Chair of Entomology. A new lectureship in education, preparatory for teaching in secondary schools, was filled by Mr. Kenneth Forbes (St. John's College, Oxford) in July 1911. In the same year the cost of building a central hall for the Undergraduates' Union, and of furnishing the Union, was undertaken by Captain Gilmour. Sir William Hartley presented a wireless telegraphic installation for the purpose of experiment and research, in 1912. A plant for tests in connection with the erosion of metals has been established in the metallurgical department; a certificate in architectural design and a diploma in ophthalmic surgery have been instituted.

London.—Under the King's College, London (Transfer) Act, 1908, this college, apart from the faculty of theology, was incorporated in the University of London on January 1, 1910. King's College hospital and medical school were separated from the college in the previous year. King's College for Women became a separate institution, and a site is under consideration for new buildings to include laboratories for a home science department in connection with Queen Mary's hostel for practical training in domestic arts, for which it was announced in February 1912 that £100,000 had been privately subscribed. A further change in the arrangements of King's College took place in June 1911 when King's College School at Wimbledon became a separate corporation.

Proposals have been put forward for the acquisition of a site for London University to the north of the British Museum in Bloomsbury; and Lord Haldane, as chairman of the Royal Commission on university education in London, stated in May 1912 that large sums had been offered by private donors for this purpose; but alternative sites have been considered, and the whole question has given rise to some dispute, the reconstitution of the university being *sub judice* pending the report of the commission.

A building fund of £100,000 was completed in February 1912 for Bedford College for Women, one of the "schools" of London University.

At *Manchester University* a new botanical laboratory was opened in 1911 and a physical laboratory in 1912. The engineering buildings have also been extended. An extension of the Manchester museum was opened on October 30, 1912, providing accommodation for geological, anthropological and Egyptian antiquarian collections.

Sir Charles Eliot, first vice-chancellor of *Sheffield University*, accepted in March 1912 the position of principal of the Hong-Kong University; and in November Mr. H. A. L. Fisher, of New College, Oxford, was selected to succeed him in the office. Sir Frederick T. Mappin, Bart., one of the first pro-chancellors, died in March 1909. He was a generous donor to the university and the Mappin Art Gallery. The University Library erected at a cost of £10,000 by Mr. William Edgar Allen was opened in 1909. He has also given a medicomechanical institute, the first established in England, to work in connection with the hospitals. New buildings, to be used chiefly for the study of mining and non-ferrous metallurgy, were opened in 1912 in connection with the applied science department. The Company of Drapers contributed £15,000 to the cost, and the corporation make an annual grant of £1,000 for ten years. A training college for teachers has been completed and equipped.

University Colleges.—Earl Grey, who returned to Northumberland at the end of October 1911, after several years' governor-generalship of Canada, was shortly afterwards appointed president of *Armstrong College*, Newcastle-upon-Tyne.

At *Brighton* a movement was set on foot in 1911 to establish a university college, and in January 1912 it was proposed to make it a college of the University of London, with courses in the arts, sciences, education and pedagogy at first, and subsequently in medicine and law.

Hartley University College at Southampton, threatened with the withdrawal of the Treasury grants, owing to the lack of the usual support, was able to collect £32,000, partly by

grants from the County Council and Southampton Town Council, for the erection of a college and school of art on Southampton Common.

Educational needs have been met in *Nottingham* by several new schools, and the university college is extending its utility by a mining department and a Byron Chair of Literature, in connection with which the American ambassador (Mr. Whitelaw Reid) paid a visit to the institution in November 1910.

The expansion of the work of University College, *Reading*, is a remarkable feature of the educational work of Berkshire. It has adopted the hostel system, the chief institution being Wantage Hall, built and permanently endowed by the generosity of Lady Wantage of Lockinge. The Rt. Hon. G. W. Palmer and other members of his family have enriched the college with buildings and lands. The college has undertaken the important work of improving agriculture. It has a well-equipped experimental farm at Shinfield, and in 1910 in connection with the Berkshire County Council sent a deputation to visit selected centres of agricultural and horticultural education in the United States and Canada. The college has over 1,000 students. The Berkshire Education Committee has made provision for the instruction of those engaged in agricultural and horticultural work and provided an expert to teach employees on farms. A travelling farriery school has also proved useful.

The opening of the new buildings of the University College of *North Wales*, Bangor, by the King, took place on July 14, 1911.

Among other recent educational developments may be mentioned the addition of a new textile department to the Bradford Technical College, opened by Lord Rotherham on October 25, 1911; a residential school for the blind has been established by the education committee in the same city. The Cheshire County Council's training college for teachers was opened on July 5, 1912. At Shrewsbury School a new speech hall was opened on May 5, 1911, and science buildings on October 20 of the same year. Evesham grammar school, one of the oldest in Worcestershire, opened new buildings in 1911. An anonymous donation has been made (in July, 1912) of £10,000 to the Chancellor of the Exchequer for educational purposes in Wales.

In September 1911 a "strike" of school-boys took place in Newcastle-upon-Tyne and other places in the neighbourhood.

Crime.—The criminal statistics for 1911 show the following figures. *England and Wales*: committed for trial, 13,644 (males, 12,301; females, 1,343); convicted, 11,338. *Scotland*: committed for trial, 1,401 (males, 1,215; females, 186); convicted, 1,122. *Ireland*: committed for trial, 2,114 (males, 1,804; females, 310); convicted, 1,496.

Police numbered in 1911—in England and Wales 51,203, in Scotland 5,654, and in Ireland 11,865.

Paupers.—The number of paupers (exclusive of casual paupers) in receipt of relief in the United Kingdom at comparable periods was as follows: England and Wales (July 1, 1911) 749,777; Scotland (Sept. 15, 1911) 105,478; Ireland (first week of July 1911) 75,317. England and Wales (Jan. 1, 1912) 792,149; Scotland (Jan. 15, 1912) 109,069; Ireland (close of first week of Jan. 1912) 78,652. The proportion of paupers per 10,000 of the population of the United Kingdom in the summer period of 1911 was 205, and in January 1912, 216.

In England and Wales for the year ending March 31, 1911, the total expenditure on relief of the poor by the Guardians and Poor Law authorities amounted to £15,380,420 (London £3,888,684). Of this sum in-maintenance represented £3,600,327 (London, £1,103,433), out-relief £3,300,319 (London, £287,422), and lunatic asylums £2,545,189 (London £505,265), the balance being for salaries, buildings, loan charges, etc.

Old Age Pensions.—The Old Age Pension Act 1908, was modified by a further act of 1911. The pauper disqualification was removed as from January 1, 1911, and poor-law authorities in England and Wales were thereby relieved of the charge of 122,415 paupers in that month. Qualifications for an old age pension include the age of 70 years, the status of a British subject for 20 years previously to the receipt of the pension, and residence in the United Kingdom (subject to certain exceptions) for 12 years out of that period. The pensions are arranged on a sliding scale from 5s. a week for those who possess incomes not exceeding £21 a year down to 1s. a week on incomes over £28.17s.6d. and up to £31.10s.0d. The numbers of pensions payable on March 31, 1912, were—in England 602,441; in Wales 40,083; in Scotland 94,319; in Ireland 205,317, and the proportion of pensioners per thousand of the census population of 1911 in that year was 17.81 in England and Wales, 19.82 in Scotland and 46.86 in Ireland. According to the appropriation amounts for the year ending March 31, 1911, the grant for pensions was £9,820,000, for expenses of pension committees £100,000, while the actual expenditure was—for pensions £9,682,526; for expenses £74,155; for sums irrecoverable £798, and for extra-statutory payments £117—total £9,757,596. The civil

service estimates for pensions for 1911-12 were £12,350,000 and for 1912-13 £12,135,000 (decrease £215,000), the pension committees in addition costing £65,000.

Hospitals, etc.—Memorials to King Edward VII have given an impetus to the building or extension of hospitals, and among other schemes the following have been reported. A new infirmary at Bristol, erected at a cost of £70,000, was opened by the King and Queen on June 28, 1912. The citizens of Birmingham have raised a fund out of which will be provided a new building in Ladywood Road for the Children's Hospital, in addition to a statue of King Edward by Albert Toft, R.A., a native of Birmingham. As a Warwickshire memorial a sanatorium on Binton Hill near Stratford-on-Avon was decided on; the Worcestershire memorial takes the form of an enlargement of the sanatorium for consumptives at Knightwick. The North Wales counties joined the scheme of national sanatoria for the treatment of tuberculosis; the Shropshire memorial took the form of a sanatorium; Cheshire's memorial fund was apportioned to existing hospitals; and Chester and Stockport embarked on infirmary extensions costing respectively £40,000 and £10,000. A subscription was promoted at Leeds to raise £150,000 for the reconstruction and extension of the General Infirmary; and, two-thirds of this sum having been received, the work was started in 1912. This also involves an extensive street improvement, undertaken by the City Council, in the neighbourhood of the Town Hall, clearing away a considerable amount of slum property.

Among other institutions, the erection of a home for consumptives, on a site between the Lickey and the Clent Hills, was started in 1912 at a cost of £14,000 by the Birmingham Hospital Saturday Committee as a memorial of the late Alderman Sir William Cook, who was chairman of the Committee (also of the Health Committee of the Corporation) for many years. To perpetuate the memory of Edwin James Oates, his sisters have presented £10,000 to Halifax towards an open air school and a convalescent home. There was opened at Crewe (Dec. 18, 1911) a railway orphanage built and endowed out of the residue of the estate of the late Mr. F. W. Webb, chief mechanical engineer, L. & N. W. Railway. The Berkshire Hospital has considerably enlarged its building, and now provides 200 beds and is one of the best equipped in the country. The Radcliffe Infirmary at Oxford has also begun some new buildings at a cost of £20,000.

Portsmouth was the first municipality in the United Kingdom to start a tuberculin dispensary (1911), with treatment for out-patients, an open air hospital, and a stock of shelters, disinfecting appliances, etc., lent to patients visited at their own homes, the inclusive cost being £1000 a year.

Davies (Cardiff), Rev. P. H. Ditchfield (Berks.), W. H. Garbutt (Birmingham), Sir G. L. Gomme (London), J. E. Hooper (Norwich), E. Howarth (Sheffield), J. Jamieson (Newcastle-upon-Tyne), P. H. Maggs (Portsmouth), F. W. Parker (Chester), F. P. Pointon (Nottingham), A. E. Reynolds (Salisbury), C. Wells (Bristol). The general statistics have been compiled from official sources by Harold Macfarlane.] (O. J. R. HOWARTH.)

SCOTLAND¹

Population.—The most significant feature in the recent economic development of Scotland is the progress of the country in industrial enterprise and its gradual decline in agricultural activity. The toward trend of the rural population, which has been in progress for many years, is emphasised by the latest census returns. The population of the country in 1911 (details of which are furnished in Tables A and B) was 4,759,445, and of this total (of whom 2,302,865 are males and 2,446,808 females) about 77 per cent live in towns, and 21 per cent in the country. Scotland, like other parts of the United Kingdom, has felt the effect of a slackening birth rate, and in the last census year the number of births registered was smaller than in any year since 1873, the year 1890 excepted, and the birth rate was the lowest recorded since 1885. The total increased population was less than at any census since 1861. The falling birth rate has of course a vital bearing on the comparatively moderate increase of the population generally, but the dwindling of rural communities cannot be wholly attributed either to it, or to the call of the towns. Scotland has suffered seriously within recent years from emigration. In 1911 alone 57,417 passengers of Scottish nationality left Scottish ports, in itself a disquieting enough fact. But in order to appreciate the effect on the country of the drain of emigration, it is necessary to take a more distant view. Going back a period of the years it is found that 354,056 Scottish people left their native shores for permanent residence abroad, and against that there was an immigration of 66,921. In other words, within the period mentioned Scotland was depleted by 287,135 persons. The cities,

of course, have made contributions to the multitude of emigrants, but the effect of emigration has been chiefly felt in the purely agricultural counties. Thus, compared with the census returns of 1901, at which period modern emigration enterprise had scarcely begun, decreases are to be noted (Table A) in the following counties:—Shetland, Orkney, Caithness, Sutherland, Inverness, Elgin or Moray, Forfar, Clackmannan, Argyle, Bute, Berwick, Roxburgh, Kirkcudbright, Wigtown. In those counties the staple occupations of the people are agriculture or fishing. A more cheerful state of things is revealed in the counties which contain the chief cities and towns, and where the people are engaged in industrial pursuits. Thus, Lanarkshire shows an increase of 107,786, Fifeshire 48,804, Dumbartonshire 25,966, and Renfrewshire 45,594. Perhaps the most remarkable increase is in Fifeshire. The "Kingdom" is unique among counties, half of it being almost entirely rural, and the other half chiefly industrial. In East Fifeshire farming and fishing are the principal occupations, and its picturesque parishes and townships have suffered by the exodus of the sturdiest part of the population to other lands, a fact borne out by the decrease in the fishing communities, and the growing difficulty of procuring agricultural labour. The increase of population in Fifeshire is entirely in the West, the seat of coal mining, and the great linoleum manufactures.

The deaths in the eight principal towns of children under one year numbered 5907. The births registered were 44,206, and the aggregate infantile mortality for the year was 134 per thousand. It ranged from 156 in Edinburgh, 139 in Glasgow and Aberdeen, to 112 in Greenock, and 111 in Paisley.

Agriculture.—The land system in Scotland is in some respects peculiar, and the huge estates and large farms on which it is based have proved a severe handicap to the enterprise of an uncommonly capable peasantry. The land agitation, a chequered history of economic struggle, which, particularly in the north, assumed a virulent and often violent form, has not however within recent years shown much vitality. The

problem of the Highland crofter is at least in process of settlement, and the operations of the Congested Districts Board have certainly had beneficial effect. The number of new holdings formed since the establishment of the Board (1898) is 611, while 1068 crofters have obtained enlargement of holdings. The last notable intervention of the Board followed on the dispute between Lady Cathcart and her tenants at Castlebay, part of her Hebridean possessions, which resulted in what was known as the Vatersay Raid (1908). This, the latest crofter rising in the Islands, was at the time somewhat exaggerated, although events proved that the tenants had reason for their action. The inhabitants of Castlebay eke out a slender livelihood, partly by their labour on a peculiarly sullen soil, and partly by fishing. The land is barren and scarcely adequate to maintain one family on each holding. The difficulty arose from "squatters," members of the crofter families, who set up huts on the family crofts. The inevitable congestion followed. Opposite Castlebay is the Island of Vatersay, then occupied by grazing farms. Some of the bolder spirits among the "squatters," the pioneers being three lobster fishermen, descended on Vatersay, erected huts, and proceeded to agricultural activity. There were some exciting encounters between the forces of law and the Vatersay "raiders," culminating in the imprisonment of half a dozen of the latter, who were however released before the expiry of their term of sentence. The Congested Districts Board intervened, purchased the Island of Vatersay, where now is a contented crofter population, and thus the trouble ended. But, while the exertions of the Congested Districts Board and the Crofter Commissioners who fix fair rents have made for crofter contentment, the Highland land problem has not yet reached solution.

There is still considerable heart-burning over the question of deer forests. The latest returns show that of those there are 198 with a total acreage of 3,369,936. The Sutherland "clearances" which resulted in the compulsory emigration of fifteen thousand people within a period of nine years, still rankle in the Highland memory. Doctrinaire land reformers are perhaps inclined to exaggerate the agricultural potentialities of the deer forest. However, the passing of the Smallholders' Act of 1911 will enable the fertility of those sporting estates to be put to the test. This Act, the most important piece of land legislation in Scotland for many years, is a modification of the Pentland Bill, which aroused much controversy. It by no means goes the length of that drastic measure, although it retains its cardinal principle, enabling an agriculturist with small capital to obtain compulsorily a holding of 50 acres, the landlord being compelled to provide house and steading. But although now on the statute book it will be some time before the Act can be operated to any great extent. The leases of large farms will have to run out before the division of acres can be made. When, however, the Act does become operative, it cannot fail to break up the historic land system of the country. Among the smaller cultivators, whose position in Scotland has been peculiarly hard, their few and scattered acres being rented considerably in excess of the acreage of the great farms, the Act has naturally been hailed with satisfaction, nor has much opposition been displayed towards it by the large farmers.

The truth is that farming on an extensive scale is no longer the profitable business it was, either for landlord or tenant. Agricultural rent in Scotland has fallen enormously, the rental of large farms being on an average only half what it was twenty years ago. And this drop, while seriously affecting the land owner, has not benefited the tenant. The development of agricultural science and the growth of foreign competition have rendered farming on an extensive scale a costly, and even a hazardous undertaking, added to which the cost of agricultural labour has greatly advanced. The wages of ploughmen have doubled, and in some cases trebled, and with the flow of emigration and the scarcity of labour in the rural districts, they tend to increase. An important factor in the case is the altered standard of living among the rural population. The cheap and sustaining brose is now a rarity in cottar's house and bothy, and even porridge has ceased to be the staple of the morning meal. On the other hand, much tea is drunk and there is a large consumption of butcher meat, a commodity almost entirely unknown among the Scottish peasantry of the past. Moreover, the Scottish hind has recently

become pervious to the influence of Trade Unionism, and in 1912 a rural Union was started which already numbers thousands of members. That being the condition of things, the Small Landholders' Act makes a timely appearance. It should have the effect of stemming the tide of emigration, checking the migration to the towns, and consequently re-peopling the rural districts. Notwithstanding the disadvantages indicated, the agricultural enterprise of Scotland shows astonishing vitality.¹ The question of afforestation, in which Scotland, like other parts of Great Britain, is far behind other countries, has recently been a subject of agitation, and the Development Commissioners have recommended that grants should be given for the establishment of a central administration area, along with a school of forestry of not fewer than 5000 or more than 10,000 acres. The recommendation has already had practical effect, the Government having agreed to purchase a tract of land in Argyshire.

Trade and Manufactures.—In regard to trade a retrospect of 1910–12 reveals a period of prosperity tempered by the adverse influence of labour disturbances. Scotland is a country of multifarious industries, but the staple of her trade consists of shipbuilding, iron, and coal mining, all of which are interrelated. In the western part of Scotland, of which Glasgow is the centre, shipbuilding is of prime importance, and the measure of activity in the Clyde yards is the truest measure of the industrial prosperity of the district. The Clyde may be described indeed as the industrial pulse of the country, and the prosperity or otherwise of her yards is reflected in the national industry.

In the matter of shipbuilding, the Clyde, of course, dominates Scotland. During 1910–12, there were improvements in the trade on the Forth and Tay, but the increase of tonnage in those districts was infinitesimal when placed alongside the increase on the Clyde. The following table shows the work done by Scottish builders in 1911 and 1912:—

	1912			1911		
	Ves.	Tons	I.H.P.	Ves.	Tons.	I.H.P.
The Clyde	389	640,529	878,326	413	630,583	786,889
The Forth	32	19,054	7,915	31	11,319	9,355
The Tay	28	17,388	10,400	31	17,303	14,770
The Dee, etc.	71	11,217	18,100	82	12,419	23,614
	520	688,188	914,741	557	671,624	834,628

In the kindred branch of marine engineering a feature is the increasing share in the total output of turbines. In the record for Clydebank, a typical yard, the total engineering output in 1911 was 104,550 i.h.p. and of those 71,000 consisted wholly of turbines, and 11,250 of combined turbines and reciprocating engines.

In coal mining² the west of Scotland also continues to lead, although its supremacy in this branch of industry is less secure. The most notable advance in output was in Fifeshire, which in 1911 showed an increased production of 375,000 tons, and the industry in Fifeshire is advancing rapidly and is likely soon to outdistance Glasgow and the west of Scotland in the matter of shipment. The reason is due to the fact that the extensive Fifeshire coalfield is still in process of development, whereas, in Lanarkshire, the coalfield is almost entirely covered with collieries, and there are naturally no new developments. By the application of machinery, however, notably in coal cutting, the capacity of the western mines has been increased. On the other hand, large new pits have recently been sunk in Fifeshire, and their present output will certainly grow enormously. A feature of the Fifeshire shipping trade is the large and increasing exports to South America. The total shipments of coal from Scotland (export and bunker) amounted in 1911 to 1,680,000 tons compared with 1,640,000 tons in the previous year, an improvement of fully 40,000 tons. The increase, however,

¹ The following figures are taken from returns for 1912, with the increase (+) or decrease (–) per cent on the previous year. Acreage under corn crops 1,230,125 (+0.9); under green crops 615,361 (+1.4); clover and rotation grasses 1,465,514 (–3.0); permanent pasture 1,496,045 (–0.1); wheat 62,463 (–1.6); but in 1911 the greatest increase was recorded since 1899); barley 183,477 (+11.7); oats 949,143 (–1.5); turnips and swedes 439,185 (+0.1); potatoes 149,710 (+5.0); total under all crops and grass 4,821,249 (–0.5). Livestock—horses 204,792 (–0.8); cattle 1,178,936 (–1.8); sheep 6,991,667 (–2.4); pigs 159,391 (–6.9).

² Production in 1910: Argyll, Dumfries and District, 444,033 tons; Ayr, 4,018,119; Clackmannan, 495,912; Fife, 8,674,404; Renfrew, 132,756; Dumbaron, 558,381; Linlithgow, 2,059,433; Edinburgh, 2,991,811; Haddington, 1,088,364; Lanark, 17,886,137; Stirling, 3,075,782.

was only about half that which took place in 1910, compared with 1909, and the falling off must be largely attributed to labour troubles. Glasgow and the west of Scotland took good position with an increase of fully 300,000 tons, and in Ayrshire between the ports of Ayr and Troon there was an increase of 150,000 tons. On the other hand the Forth (excluding the Fifeshire ports) made a comparatively poor show. At Grangemouth there was a decrease of 260,000 tons, and although Granton improved its position by 130,000 tons, due largely to an increasing trade with London, Leith showed a falling off of 120,000 tons. While the condition in the Scottish coal trade on the whole is satisfactory an unpleasant factor is to be reckoned with in German competition. At one time Germany constituted one of the best markets for Scotch coal, but now she is entering into active competition.

In the mineral oil industry, whose centre is West Lothian, the prospect is less bright. This is due chiefly to foreign competition, which was severely felt during the past year, with the result that prices of oil products never got a chance. The slackness of the Scottish oil market is best indicated by the drop in profits during 1909-1912. During that period Pumpherson dividend has fallen from 50 per cent to 30 per cent; Tabrax from $7\frac{1}{2}$ per cent to 5 per cent; Oakbank from 10 per cent to 5 per cent; Young's Paraffin Oil Co. and the Broxburn Oil Company paying percentages respectively of $4\frac{1}{2}$ and 10 per cent.

Foreign competition is being felt also in steel manufacture. This is indicated by the action of Scottish makers in introducing rebates (the outstanding feature in recent developments of the industry) with the object of limiting outside competition. It would be premature to judge of its effects, and meantime it has not resulted in any marked improvement, there being a falling off in supplies, particularly to Canada, owing to American manufacturers' prices being lower than those of the home market. A contingent effect of foreign competition is indicated by the continued slackness in locomotive building. The Scottish industry chiefly depended on the foreign market, particularly the East, and the foreign orders are dwindling, although there is a slight improvement in colonial trade.

The three trades already mentioned are the vitals of industrial Scotland. Next to them may be ranked the various branches of textile manufactures. While the woollen trade of the borders has been in a state of almost unexampled prosperity, the jute trade of Dundee during 1911 underwent one of the worst periods in its history, but entirely recovered towards the end of 1912. The linen trade, although satisfactory, has been hard hit by foreign competition, which has been felt in its chief seat, Dunfermline, and the cotton trade has suffered chiefly from the same cause. It is still located principally in the east end of Glasgow, but many of the great mills of Bridgeton, where once it flourished, are now devoted to other enterprises, and stand, pathetic witnesses of a great decline. The thread industry, however, continues a huge industrial asset to the West, the headquarters of the great Coats' combine being in Paisley. Another branch of the textile trade, that of dyeing, has undergone a change. The Combine of a few years ago has resulted in the concentration of the industry, and many of the smaller works at different points in the west of Scotland have been closed. The total value of produce and manufacture from the chief Scottish ports was: Glasgow £29,129,406, Leith £6,875,636, Grangemouth £2,239,581.

A general consideration of the industrial outlook reveals the eastern part of the country as portentous of greatest development, and the increased activity here is almost entirely limited to Fifeshire. That county, in its western area, has grown enormously in industrial importance within recent years. The basis of its prosperity is the wealth and extent of its coalfields, and within the coal area many important manufactures have sprung up, notably linoleum, the staple trade of Kirkcaldy, and now extending to other parts of the "Kingdom." Fifeshire ports also continue to grow in importance, notably Methil, which, with the completion of the new dock will contribute to make the Fifeshire ports of the Forth serious competitors with the west in the export of coal and iron. The establishment of the naval base at Rosyth, in process of construction since 1908, will stimulate industry in the western part of the county, and already in the neighbourhood of the dock a town is developing.

Fishing.—The fishing industry of Scotland has changed greatly in the manner of its pursuit. Formerly, it was interwoven with the work of agriculture, particularly in the Western Highlands, where crofters profitably combined the harvest of the waters with the harvest of the land. Those were in the days of sailing boats, the possession of which was within the reach of thrifty fishermen. The advent of the steam drifter is gradually crushing out the modest sailing boats, and their humble owners, who find it impossible to compete against highly equipped drifters, which generally have behind them powerful capitalist influence. The industry is now largely in the hands of large combines, who own a fleet of drifters, and although the new order has doubtless proved beneficial to the consumer it has been detrimental to the economic welfare of the working fisherman, who has to be content with the position as member of a drifter crew, with little prospect of ever having a boat of his own. The combine system is rapidly spreading. Salmon fishing on the Tay, for example, is now monopolised by wealthy companies, whereas formerly the fishings were distributed among small fishermen. The effect is seen in the changed complexion of Newburgh, whose community until a few years ago was almost entirely engaged in the Tay fishings. It has sunk to a town of little importance in salmon fishing, and such prosperity as it still enjoys is based on the manufacture of linoleum. For administrative purposes the Fisheries Board

of Scotland have divided the Scottish Coast into three districts, namely, (1) the East Coast—Eyemouth, Leith, Anstruther, Montrose, Stonehaven, Aberdeen, Peterhead, Fraserburgh, Banff, Buckie, Findhorn, Cromarty, Helmsdale and Wick. (2) Orkney and Shetland. (3) West Coast—Loch Broom, Skye, Fort William, Loch Fyne, Campbeltown, Rothesay, Greenock, Ballantrae, Stornoway and Barrow. The tonnage of boats belonging to those divisions is as follows: East Coast, 101,721; Orkney and Shetland, 22,517; West Coast, 15,735, a total of 139,973. While the Fishery Board has rendered good service to the industry the undoubted grievances of native fishermen in regard to foreign trawling remains unremedied. The Scottish Board in 1885 obtained statutory powers to close portions of the territorial waters against trawling, and a large area of east coast waters was closed in the interests of scientific experiment. It was found that the closing of those waters gave great satisfaction to both line and drift fishermen, and as the Board were anxious to encourage development of those methods of fishing in preference to beam trawling, they secured further powers under the Herring Fishing Act of 1889, which enabled them to close against all forms of trawling not only the whole territorial waters of the Scotch coast but a large number of areas defined in the Scheduled Act as lying outside the territorial waters, properly so called. Among those scheduled areas were the Moray Firth, and the Firth of Clyde. By international law the power of a state to make regulations with regard to methods of fishing is limited to its territorial waters. There are a number of regulations existing with regard to the fishing boats working in the North Sea, but these regulations have been made under International Conventions, and are to be only obeyed by the subjects of the high contracting states. But apparently Parliament can make regulations which are only obligatory to British fishing vessels. Hence, while the latter cannot trawl within the Firth of Clyde, or the Moray Firth except in a very limited area, foreign trawlers may fish anywhere in the considerable area which lies outside the area known to International Law as Scottish territorial water. Thus Dutch and Norwegian vessels at Fleetwood fish in the Clyde. Some of them are doubtless *bonâ fide* foreign boats, but for the most part they are English vessels registered either in Norway or Holland. Foreign trawlers find it convenient to work Scottish waters and to land their catches in Fleetwood, and they are enabled to do so owing to a flaw in the Herring Fishing Act of 1889. A slight amendment prohibiting the landing of fish in England as well as in Scotland by such vessels, would remedy the difficulty.

The fishing fleet comprises 9889 vessels with an aggregate tonnage of 139,973 and a total value of equipment and fishing gear amounting to £5,000,028, the number of persons employed in the Scottish fishing trade, and industries subsidiary thereto is 92,060, and of those 39,208 man the fleet, the remainder being engaged in operations on shore. Eleven vessels, employing 424 men, 145 of whom are British, are engaged in whaling. In 1911, 730 whales were landed, and the value of the products amounted to £71,223. The outstanding feature is the continued decline in the number of boats, the quantity and value of the gear, and the numbers employed in the industry. The cause of this decline is chiefly due to the replacement of sailing boats by steam and motor driven vessels, but fishing, like agricultural communities have suffered considerably from the drain of emigration. It is difficult to get fishermen to divulge their earnings, but the following figures may be regarded as authentic, relating to a particular Scottish district: Steam trawlers (highest) £1610, (lowest) £900, (average) £1388; Motor Boats (highest) £1610, (lowest) £600, (average) £973; Sailing Boats (highest) £910, (lowest) £120, (average) £412. The output of sailing boats steadily declines, the number of vessels constructed in 1911 being 164, valued at £7940, compared with 193 valued at £8334 in the previous year. The total quantity of fish, exclusive of shell fish, landed in Scotland was 8,709,655 cwt. valued at £3,100,387. Compared with 1910 this shows an increase of 1,286,470 cwt. and an increased value of £211,280, the second highest result on record. In 1911, 1,767,544 barrels of herring were exported, 311,188 being "Crown" branded. The total of cod, ling, and dried fish exported was 104,058 cwt., nearly all to Ireland. The total salmon carried on Scottish railways was 27,390 cwt.

Railways.—The profit earning capacity of the Scottish railways has declined, due in large measure to the development of the tramway enterprise and the increased use of motor cars. Through the industrial parts of the country there is now a complete system of tramway communication, linking districts many miles apart. The extent of the tramway undertaking may be gathered from the fact that the passengers carried in 1911 numbered 276,745,475. The effect on railway enterprise is obvious, and in order to meet the competition the different Railway Companies recently came to an arrangement which has resulted in a considerable curtailment of competing trains, and a general increase in passenger fares. The most important decision in railway law in 1911-12 was that given by the Railway Commissioners sitting in Edinburgh, on the demurrage case brought by the Scottish traders against the principal companies. The decision was almost entirely in favour of the Companies, and its importance lies in the fact that it gives them full use of their wagons for their legitimate purpose, thus setting loose a large capital, previously locked up in rolling stock, which had virtually been seized by the trader as free storage accommodation.

The Scottish railways are behind those of England in regard to electrification, a beginning not yet having been made. On the other hand a series of successful experiments were carried out with a small electrical driven vessel, and it is probable that the next step will be

the construction of a large ship for service. It is appropriate that this departure should find its home on the Clyde, which 100 years ago witnessed the initiation of steam propulsion with the launch of the "Comet," an event which was elaborately celebrated on the Clyde in 1912. While there has been little in the way of railway development, there has been a growing agitation for improved communication by water. An ambitious project has been advocated, notably by Sir Charles Campbell, that a ship canal should be constructed, uniting the Forth with the Clyde on the route of the present shallow canal, or by a new route embracing Loch Lomond in its course. From a naval point of view it is urged that such a canal would be an important adjunct to Rosyth dock. So far, the scheme has failed to win much support from the commercial communities, and obviously the sum that would be required for its fulfilment is of such magnitude that it could not be ventured upon without Government subsidy.

Education.—The most remarkable feature of recent educational development in Scotland has been the growth of technical education. Technical schools are now established in every important town, and under the auspices of the county council the system has been extended to provide instruction for those in rural districts. The chief centre is naturally Glasgow, whose Royal Technical College (the "Royal" distinction was conferred upon it in 1912) is the largest institution of its kind in the United Kingdom, and among the largest in the world. The work of the College is associated with that of the University, and an endeavour is being made to bring the relationship still closer. The Scotch Universities themselves are proving responsive to the new spirit in education, and although strong as always, in the "Humanities" they are extending their curriculum to include instruction of a more utilitarian sort. This tendency is most marked in Glasgow, whose greatest development has been in the direction of Engineering Science and Chemical Research. St. Andrews, the most ancient seat of Scottish learning, which celebrated its quin-centenary in 1910, on an impressive, if less imposing scale than the sister University of Aberdeen, which celebrated her quatercentenary in 1906, remains largely a centre of pure scholarship, but utilitarian tendencies are evident in the development of the seats of learning in Edinburgh and Aberdeen. The princely benefaction to the Scottish Universities made by Dr. Andrew Carnegie in 1901, has tended to strengthen the democratic character of Scottish Academic life, which never, indeed, has been so exclusive as in the great English universities. With recent developments in Secondary and Higher Grade Schools, and the elaborate system of Continuation Classes the Scottish educational system may now claim to link in an unbroken chain the Elementary School with the University.

The most notable legislative event of recent years was the Scottish Education Act of 1908. It greatly extended the powers of school boards in the direction of feeding necessitous children, the medical inspection of pupils, and the compulsory attendance at continuation classes. It has also, to some extent, checked the spirit of sectarianism, the great church training colleges being now controlled by representative committees. Sectarianism however has never been a conspicuous blemish in the Scottish educational system, and the great Presbyterian bodies, the Church of Scotland, and the United Free Church, who formerly controlled the Training Colleges, loyally fell in with the new National scheme. The Act has not, however, affected to any appreciable extent the old school board areas, and it retains the system of cumulative voting, which leads to many abnormalities in representation.

Administration.—Scotland has a comprehensive system of county and municipal government, but as regards the country generally there is a lack of co-ordination and greater national control is obviously desirable. Thus it is still necessary when any great scheme of county or city development is promoted to have it considered by Parliamentary committees in London. The Private Bill Legislation Act, passed some years ago, has mitigated only to a slight extent this old standing grievance. Perhaps, however, it is in educational affairs that the system of administration proves most irritating. The headquarters of the Scotch Education Department are still in London, although much of the clerical work hitherto done there has been transferred to Edinburgh. It is felt that the educational authority should be concentrated in Scotland, and the desirability of rearrangement seems obvious from the fact that there are in Scotland, including Inspectors, 118 officers of the Education Department, and only 50 in London.

In the sphere of municipal activity the most notable event has been the extension of Glasgow boundaries. The total area of the city is now 19,982 acres, an addition of 6107, and the population of the city has been increased from 784,456 to 1,010,000. The scheme as

originally formulated would have increased the area to 33,166 acres and would have embraced large tracts of rural land, the object of the promoters being to give effect to the provisions of the Town Planning Act. The original scheme was practically endorsed by the House of Commons Committee, but it was curtailed to the extent indicated when it came before the Committee of the House of Lords. Greater Glasgow now includes the adjacent burghs of Govan and Partick and portions of the county areas of Lanark and Renfrew. The places absorbed, however, are all populous, and the density of the population in the extended city is only slightly less, being 52.8 per acre against 60.4; and it is still largely in excess of the other large cities of the kingdom. The valuation has been greatly increased. The latest valuation for the smaller area was £6,000,000 and the extension of boundaries is estimated to increase this by about £2,000,000. Under the Boundaries Act, however, it is stipulated that no increase of rates can be imposed on the places annexed, until the lapse of five years, so that during that period the cost of improvements will fall upon the ratepayers within the old city boundaries. Dunfermline has also extended her boundaries to include Rosyth, and an elaborate scheme of extension is at present under consideration by Dundee.

Poor Law.—The number of poor in receipt of relief in 1911 was 73,642, and 40,370 dependents, and the burden of local rates which steadily advances, having increased during a period of 15 years by 1/5. 4d. or 48.9 per cent is chiefly due to the increase of the poor rate, education and sanitation. The latest available returns, 1911, shows the total amount paid on local taxation to be £1,286,396. The most recent development in the relief of the poor is under the Unemployed Workmen's Act of 1905. The total population of the areas in which distress committees are engaged is 1,989,951, being 41.81 per cent of the population of Scotland. The total receipts from all sources from operations under the act amounted in 1911 to £29,182 which includes £14,300 from the Parliamentary Grant, £5737 from the rates, £2254 from voluntary contributions and £6315 from the work performed by the unemployed. The expenditure was £29,701.

Religion.—Presbyterianism continues the dominant faith in Scotland, but recent years have witnessed a considerable growth of the Roman Catholic community, and of the Scottish Episcopal Church. Latest returns give the membership of the Church of Scotland (1687 Churches) at 706,653; United Free Church (1,620 Churches) 501,573; Free Church (150 Congregations) 60,000; Episcopal Church (338 charges) 52,029. The Roman Catholic Church has 398 Churches, Chapels and Stations, 550 Priests, and the Roman Catholic community is estimated at 1,000,000. Politically, Scotland has never manifested any aggressive desire for national self government, and she has undoubtedly benefited materially from the Union with England. There have been frequent attempts to stimulate interest in "Home Rule for Scotland," but they have proved abortive, owing to the apathy of the people. In another sense, however, there has been within recent years an undoubted revival of national sentiment, reflected in the widespread interest now taken in Scottish customs, language, and literature. It has found expression in the establishment of a Scottish Chair in the University of Glasgow, to further which project a Scottish Exhibition was held in the city in 1911, resulting in a surplus of £20,000, which, with other contributions, has enabled the foundation of a Chair of Scottish History and Literature. And, although there cannot be said to exist a national demand for "Home Rule" in the form of a National Parliament, there is, as indicated, widespread dissatisfaction with the present conduct of national administration. The creation of the Scottish Office under a Secretary for Scotland has rather added to the confusion, and among all sections of the community, irrespective of party, there is a strong feeling that the Scottish department should be situated in Edinburgh, and under the control of a national administrative council. (DONALD MUIR.)

IRELAND¹

The material prosperity of Ireland reached a higher point in 1912 than at any period during the past century. It is true that, according to the census returns published in 1911, the population is still declining, but prosperity cannot be reckoned in terms of population alone. The population of Ireland, as given in these returns, which refer to the middle of 1910, is 4,381,951. (Details are furnished in Tables A and B.) During 1911 the marriages registered in Ireland numbered 23,473, the births 101,758, and the deaths 72,475. The marriage rate was 5.37 per thousand of the estimated population, an increase of 0.32 on the preceding year; the birth rate was 23.3 per thousand, the same as the preceding year; and the death rate was 16.6 per thousand, 0.5 below the rate of the preceding year. Since the census of 1901 the population has decreased by 76,824, or 1.7 per cent. This is the smallest decrease known since the institution of the census. Not only the decrease, but the rate of decrease is rapidly slackening. The decrease is very unevenly distributed over the four provinces—36,966 in Connaught, 43,103 in Munster, 7499 in Leinster, and 4254 in Ulster. There is a large growth in the population

¹ See *E. B.* xiv, 742 *et seq.*, and articles on the various counties and towns.

of the cities of Dublin and Belfast—over 18,000 and 36,000 respectively. In these cases the increase is due to internal expansion.

In certain counties, however, a slight but appreciable tendency on the part of the population to move from the rural to the urban districts may be noticed. This feature is especially marked in County Longford, the West Riding of County Cork, County

Cavan and County Sligo, where the urban population has increased by 6 per cent at the expense of the rural, County Roscommon 7 per cent and County Leitrim 8 per cent. Allowing both for the natural growth of the more important towns and the urban expansion in these districts at the expense of the rural population, the gross decline of agricultural population for the whole country during the decade is approximately 146,000. The total emigration represents a correspondingly large number, but the figures for 1911—31,058—are the smallest on record since early in the century.

Agriculture.—Most of the decline represented by these alarming figures must be allotted to the earlier years of the decade. Since 1909 the rural decline has been substantially checked. The earlier years of decline in arable cultivation, and consequently in agricultural population, were reflected in the increased production from pasture lands and of cattle feed generally, and the material increase in the number of store cattle. The cattle industry no longer flourishes directly at the expense of cultivation.

The total area of corn and green crops, including flax and fruit, in Ireland in 1912 was 2,357,969 acres, an increase of 9148 acres on the preceding year. The corn crop, growing on 1,265,597 acres, showed an increase of 11,166 acres. There was a decrease of 211 acres in the total area under wheat, but this was entirely due to the heavy decrease—1110 acres—in Connaught. The area under oats showed an increase of 5736 acres; in Ulster the increase was 10,379 acres, while the acreage had decreased in the other three provinces. The increase in barley—7186 acres—was distributed over the four provinces. The total area of potatoes was 595,218 acres, an increase in the year of 3959 acres; there were increases in Leinster and Ulster (876 and 3670 acres) and decreases in Munster and Connaught (1146 and 1441 acres). The acreage under turnips showed an increase of 956 acres to 271,761. The total area of hay was 2,479,159—a decrease of 33,244 acres in all the provinces. The approximate yield per acre was oats 51.1 bushels, barley 44.1 bushels, wheat 38 bushels. The total yield of potatoes was approximately 3.1 million tons, and of hay 5.1 million tons. The area under flax had decreased by 11,701 acres in 1912 to 54,917, the decrease being general throughout most of the flax-growing counties. The area of pasture, including mountain grazing, was 12,418,867 acres—a decrease of 11,931 acres. There were in 1912 4,848,498 cattle in Ireland, an increase in the year of 136,778; 617,532 horses, or +1201; 3,828,829 sheep, or -78,607; 1,323,957 pigs, or -91,162; 25,525,724 poultry, or +77,923.

Two factors have to be taken into account in a consideration of the rural regeneration of Ireland—the growth of co-operative principles and the effect of land purchase. In 1908 the Irish Agricultural Organization Society became involved in a dispute with the Irish Department of Agriculture and Technical Instruction. The political aspect of the question may be disregarded. Its economic aspect is contained in the charge that the Organization Society was “an association trading for profit.” Mr. T. W. Russell¹, who succeeded Sir Horace Plunkett² as vice-president of the Department in 1907, informed the Council of Agriculture in 1908 that he had decided to withdraw the Department’s subsidy to the Society, but he undertook to continue a diminishing grant for three years, £3000 for the first year, £2000 for the second, and £1000 for the third. The Agricultural Board later decided that the grant should be withdrawn at the end of 1908. Under the provisions of the Development Fund Act of 1909, the Development Commissioners were empowered to make advances for the organization of co-operation, either “to a Government Department or through a Government to a voluntary association not trading for profit.” In accordance with this provision, the Irish Agricultural Organization Society, like the similar societies in England and Scotland, applied for a grant in aid. The application was referred to the Department of Agriculture, which reported adversely. Much delay ensued, but, nearly a year after the application was sent in, the matter was submitted to the Council of Agriculture. This body endorsed Mr. T. W. Russell’s action. Mr. Russell then proposed to the Development Commissioners that a grant should be made to the Department for “non-controversial co-operation.” The Commissioners rejected this proposal early in 1912, and decided a few weeks later to make the grant on their own responsibility to the Irish Agricultural Organization Society—a course which had been repeatedly advocated by

² B. 1856; See *E. B.* xxi, 857.

the Chambers of Commerce of Dublin and Belfast, both of which bodies repudiated, as did the Society itself, the suggestion that the Society was entering into direct competition with legitimate traders. The Commissioners stipulated, however, that certain changes should be made in the composition of the governing committee of the Society as a condition to the grant of a subsidy. The temporary loss of State assistance does not appear to have injured the vitality or the financial stability of the society. According to the statement made at its annual meeting in 1911, it has about 900 branches, a membership of 100,000, and a turnover of nearly £3,000,000. In the spring of 1912 a Commission of Inquiry began to investigate the system of agricultural credit instituted by the Society. In the course of its proceedings it was found that the Department of Agriculture had lost only £100 out of £18,000 advanced to credit societies, and this loss was more illusory than real since it did not include reference to the interest paid on advances. It thus becomes clear that the department is making a handsome profit out of the agricultural credit societies, and that the system is working admirably.

The most interesting event of Irish economic history during 1910-12 was the establishment in 1910 of a society called the United Irishwomen. This body is affiliated to the Irish Agricultural Organization Society, and was founded in order to do on the social side of rural regeneration what the Organization Society has done, and is doing, on the economic. It was intended, in effect, to develop the principle of "better living" which is one tenet of the threefold faith of Irish rural reformers. Its policy includes the teaching of cookery, poultry management and dairying, and the encouragement of village crafts such as the making of furniture for cottages. Beginning with three branches, and finding the district of Connemara one which especially eagerly awaited development, the organizers of the United Irishwomen were able in a year to announce the existence of fifteen branches. This work is still rapidly expanding.

Two incidents may be noted as indicating the growth of popular appreciation of Sir Horace Plunkett and his work. In the early summer of 1910 the Department of Agriculture combined with the Estates Commissioners to reconstruct a little patch of rural life in Castlereagh. The first action of the new land-holders was to combine with one another in order to apply co-operative principles. This Mr. T. W. Russell admitted was "but a sample of what is going on all over the West." The other incident was an "All-Ireland Model Election" conducted in December 1911 by the Proportional Representation Society of Ireland. Intended as an "All-Ireland" election, it was ultimately confined in operation to Ulster and the immediate vicinity of Dublin. It resulted in the return at the head of the poll of a curious collocation of names—Mr. John Redmond, Sir Edward Carson, and Sir Horace Plunkett.

The new land purchase policy which was instituted by the Act of 1909 has not been justified by results. The changes from the provisions of the Wyndham Act may be briefly reviewed. Instead of cash payments landlords were to receive stock at 3 per cent. This stock was issued on a falling market, and cannot appreciate owing to the embarrassment of Irish estates; about half of each issue has had to be thrown back on the market for the redemption of mortgages. Instead of paying £3.5s per £100, tenants were to pay £3.10s without any reduction in the period of repayment. A large proportion of the holdings of Ireland are valued at less than £10 a year. A presumption was created that all holdings below that value were to be deemed "uneconomic," with the result that the whole of Connaught, with the counties of Donegal, Kerry, and part of Cork, became "congested." The Congested Districts Board, charged with conducting purchase in this area, is consequently swollen to unmanageable size. Comparisons between the work of the Wyndham Act and the Birrell Act show the following results: From 1903 to 1909 the number of potential purchasers was 217,209; from 1909 to 1911, or a third of the previous time, the number was only 8902—a decrease of over 80 per cent. Under the Act of 1903 landlords were assisted in the repurchase of their demesnes after selling their properties. Under the Act of 1903 the advances on resale to owners sanctioned by the Land Commission numbered 205; under the Act of 1909, up to the end of the financial year 1911, only two.

Manufactures.—Although agriculture still is, and must remain, the chief industry of the country, Ireland is continuing to fall into line as a manufacturing country. Irish expansion in this direction is largely due to the industrial revival movement. Great local forces have been at work in recent years in forwarding this revival. They received a considerable stimulus from the date (1907) of the International Exhibition in Dublin. There have since 1909 been exhibitions on a smaller scale, but of a similar nature, in Belfast, Cork, Limerick, Drogheda, Londonderry and elsewhere throughout the country. The *Ui Breasil* exhibition at Ballsbridge in the summer of 1911 gave another immense impetus to the movement. It is a common fallacy to suppose that the industrial life of Ireland is confined to Ulster. This is even less true at the present time than was the case four or five years ago. In many towns of the other three provinces thriving industries are to be found, small, indeed, when compared with the industries of Great Britain, but still appreciable. The "Made-in-Ireland" movement exercises an increasingly strong protectionist influence. It is supported by various political and economic associations such as the Gaelic League, Sinn Fein, and the Industrial Development Associations. Irish industry covers a far wider range than is commonly supposed. Industrial Development Associations have been formed, in addition to the original ones at Dublin, Belfast and Cork, in Limerick, Waterford, Wexford, Sligo and other smaller towns. The Cork Association in its annual report for 1911 speaks of an exhibition of Irish goods at its offices as including samples of woollens, linens, flannelettes, calicoes, threads, silk-gauze, maps, stationery, mosaics, marbles, lead-pipes, etc. The Dublin Association is, not unnaturally, more successful than any other. This is illustrated by the reports for two consecutive years. In the 1910 report articles which "could and ought to be manufactured in Ireland" include paper, bottles, stained-glass, church and school furniture and accessories, shop-fronts, general office requisites, soap, matches, candles and flour. In the report for the next year (1911) it is stated that all these articles are now "obtainable in Ireland on competitive lines."

There are at present some twenty hosiery factories and as many tweed mills in Ireland. These new industries appear to be making progress, though it cannot be specifically estimated. The woollen-making industry has consolidated its position. A factory in Galway paid in 1912 a dividend of twelve per cent. There are eleven tobacco factories, besides the established ones in Belfast, scattered over the West and South, employing 3000 hands. All of them suffer from the competition of the Imperial Tobacco Trust; this reason was advanced for the closing of a Dublin factory, which employed 300 hands, in August 1912. The Irish tobacco industry receives a small subsidy from the Treasury, but this ceases in 1913.

The linen industry is by far the largest industry in Ireland. The number of spindles is returned approximately at 946,000. The number of power looms shows a large increase to 36,892, of which 21,000 are in Belfast, 13,000 elsewhere in Ulster, while the rest represent small factories in Dublin, Cork, Dundalk, Drogheda and elsewhere. Next in importance is the shipbuilding industry.

The industrial troubles of 1911 and 1912 affected Ireland equally with the rest of the United Kingdom. In August 1911 a strike of the Dublin seamen and firemen interrupted the trade of the capital, though only for a brief period. A railway strike (which had no connection with the strike in Great Britain but was begun in sympathy with a portage strike) followed, and there were several local disputes, of which the most serious were a bakery strike in Dublin and a transport workers' stoppage at Wexford. The coal strike of March-April 1912, which sent up the supply to famine prices, did an indirect benefit to Irish industry by causing a development, which has since been partially maintained, in the output from the collieries at Athy and Kilkenny.

Fisheries.—That the Irish fisheries are a valuable asset to the country is established by the fact that the total value of fish landed in Ireland, and sold, was, according to recent returns, £375,636 against a total of £363,801 in the preceding year. But there has been a serious falling away in the number of vessels engaged in the Irish sea fisheries—a decrease of 324 vessels to 5652. The fisheries give employment to some 20,000 men. The Department of Agriculture and Technical Instruction has granted loans to fishermen for the purchase of boats and gear and the installation of petrol power. A station was established in 1910 at Courtmacsherry, where improved methods of curing, classification and packing are taught. The whale fisheries of Inishkea and Blacksod, which were decaying, have also been fostered

by help from the Department. Endeavours to extend the sale of fish in inland towns are being continued; in 1911 there were about 150 towns on the Department's official list.

Commerce.—In the fiscal year of 1909-10 the value of imports amounted to £63,779,709, and of exports to £69,946,186. In the fiscal year of 1910-11 the value of exports, for the first time on record since the institution of these returns in 1904, exceeded that of imports. Imports were returned at £65,044,477 and exports at £65,844,255—an aggregate of £130,888,732. This is nearly £28 per head of the population, while the corresponding figure for Great Britain was just over £20. Excepting Holland, Belgium, Switzerland and New Zealand, the external trade of Ireland is greater, in proportion to its size, than that of any country in the world. There is certainly no other country where the figures of external trade more closely approximate to a measure of the actual productive prosperity. The value of the export transit trade to Great Britain is officially estimated at four-fifths of the total, or about £52,600,000. There has been a substantial increase in the export trade of yarns, especially to foreign countries. The value for 1910 was £1,197,000. The increase was especially marked in the exports to the United States; linen goods form two thirds of the Irish trade with that country. In recent years, largely as the result of the efforts of the "Made-in-Ireland" movement, certain foreign countries have begun to show separate details for Irish imports in their trade returns. These returns illustrate the present variety and extent of Ireland's foreign trade. Those for 1910-11 are the latest available. The value of French imports from Ireland was £141,000 (mainly salted meat, pork, cereals and yarns); Belgian £4000 (iron, steel and linens); Dutch £234,000 (yarn, malt, flax, wool and grass seed); Cuban £216,000 (cotton, linen and woollen tissues). These figures represent the direct trade. The actual trade is many times greater, but the bulk of it passes through Great Britain and is credited under that heading by the Customs authorities.

The leading article of export from Ireland remains live-stock. Nearly all of it is imported by Great Britain. Reference has been made above to the causes of decline under this head. In the year ended March 31, 1912 the numbers of the live-stock export had decreased by more than 200,000 as compared with the preceding year. The numbers stood at 1,742,477 and the value at £13,520,754. Cattle accounted for 689,550 of the numbers and for £9,508,083 of the value. At the end of June 1912 the export of cattle to Great Britain came to an abrupt standstill in consequence of the discovery of foot-and-mouth disease in cattle despatched from Swords, County Dublin, and the subsequent closing of English ports against Irish cattle. The weekly loss to Ireland while this embargo (which was imposed at the height of the fat cattle season) rested was estimated at a minimum of £20,000. The disease was isolated with more success by the Irish Department of Agriculture than was the case in Great Britain, but during the first weeks after the outbreak the necessary "standstill" order resulted in the stagnation of the country fairs as well as the cessation of export. Six weeks after the outbreak all Irish ports except Dublin, Drogheda and Dundalk had been opened, but only for immediate slaughter at the English ports of landing. As a result the fat cattle trade suffered enormously, and as the season advanced the case of the store cattle trade became even worse. The calamity concentrated the attention of Irish stock-raisers on the merits of the dead-meat trade, whose establishment has been urged for several years past by the Irish Agricultural Organization Society. It was also recommended by a deputation of Irish farmers which in 1910, at the instance of the Department of Agriculture, investigated the dead-meat trade of Scotland. A dead-meat trade was established experimentally at Wexford and Drogheda and has since flourished. Late in August 1912 a movement to organise the trade throughout the country was set on foot.

The principal items of the Irish import trade remain chiefly the same as those of Great Britain in the past two years. In the case of articles similar to those produced in Ireland, however, it is noticeable that the bacon import had declined in value (1910-11) to £1,659,000. The butter import for the same year valued £478,000. The decline during the past two years in the Irish butter export was not, as an enquiry conducted by the Agricultural Organization Society showed, due to a decrease in production, but to an increase in home consumption for which the "better living" in rural districts which the Society promotes is responsible. In this connection the increase of deposits and cash balances in the Irish Joint Stock Banks, Trustee Savings Banks, and Post Office Savings Banks (£1,910,000 in 1909 to £2,402,000 at the beginning of 1911) is worthy of notice. Banking accounts also show much larger amounts under the head of advances to customers, made mainly for industrial purposes and land improvement.

Communications.—Railway traffic returns reveal similar features of expansion. The total receipts for 1909-10 were £41,180,023, and for 1910-11 £41,302,720. These returns are the highest on record. The railway strike in the summer of 1911 resulted in a slight setback, but this was successfully overcome. In 1910 the main railway companies met, for the purpose of developing the inland sale of fish referred to above, the demand for reduced freights and through rates for this traffic. The Great Southern Railway has made arrangements for a junction with the proposed Athy and Queen's County Railway at Athy, a project whose completion will benefit the coalfield of the district. The Midland Railway has completed the doubling of the line between Athenry and Attymon Junction, and this

is now being used for traffic. This company contemplates the opening of a new station in County Mayo, between Westport and Castlebar. The Dublin and South Eastern Railway has taken in hand the diversion of the line from Killiney round Bray Head to Greystones, since recent dangerous encroachments of the sea have rendered this course necessary. The Viceregal Commission on Irish railways issued its final report in 1910. Its majority report advocated State purchase and nationalisation, but a minority report dissented from this recommendation. The Royal Commission on the Canals and Inland Navigation of Ireland issued its final report in the following year. Here again State purchase and control were recommended. This report strongly urged that the problem of arterial drainage and relief from floods should also be attacked by a central authority. The pressing nature of the drainage question has been emphatically evidenced by the flooding, during the winter of 1911-12, of the basins of the Shannon, Barrow and Bann, and the consequent wholesale damage to property and public health. Nothing has yet been done in any of these directions. Projects for no less than 83 new railways were brought before the Viceregal Commission, but even improvements of the existing light railway system had to be abandoned, since there is no means of raising new capital under the system of legislation by which they were constructed. Road improvement proceeds slowly, but surely, under the local authorities. The Local Government Board of Ireland during the year 1911-12 made orders extending the limit of expenditure in 28 rural districts contained in 13 counties. In 16 cases the increase was required to permit road improvement by steam-rolling to be undertaken; in one case to provide for the repair of sudden damage by the sea, and in one case for the widening of dangerous bog roads. Loans of a total amount of £71,500 were sanctioned. In these districts (all in the West) the extension of communication facilities has been rendered desirable by the fact that these parts of Ireland look for an increasing part of their prosperity to the tourist traffic. The operation of the Health Resorts (Ireland) Act has also assisted in the opening up of the remoter districts to the tourist; local authorities are now empowered to strike a rate for tourist development purposes.

Local Government.—The Local Government Board for Ireland had occasion up to 1912 to pass, in its annual reports, favourable judgment on the smooth working of the various bodies created by the Act of 1898, but the report issued in August 1912 contains nothing under this head, from which it may be inferred that the Irish County Councils and District Councils are continuing to do satisfactory work. At the beginning of 1912 the restriction preventing women from being members of County and County Borough Councils was removed, bringing the Irish law into harmony with that in force in England and Scotland. The new Act became operative for the first time at the municipal elections of January 1912. Three women were successful at the polls, one in Dublin (Miss S. C. Harrison, well-known for her interest in distress work) and two in Waterford. New Acts in connection with local administration in Ireland which came into force at the same time were an Act empowering the Dublin Corporation to strike a halfpenny rate for the maintenance of the Dublin Municipal Gallery of Modern Art, and an Amending Act to the Irish Labourers Act, which granted another £1,000,000 for the building of labourers' cottages and enabled the Local Government Board to proceed with the scheme already lodged. The working of the Labourers Act gave an opportunity to the United Irishwomen to turn their attention to the provision of a proper water supply in the proximity of labourers' cottages, an object in which an active interest was also taken by the Women's National Health Association, the organization which the Countess of Aberdeen instituted in 1907 in order to combat the growth of tuberculosis in Ireland. This association has now 150 branches, with about 19,000 members; it has established two garden playgrounds in the most congested districts of Dublin, and a third is in course of preparation; it has established the Collier Memorial Dispensary for the prevention of tuberculosis, which centralises the work previously carried on by the Dublin Hospital Tuberculosis Committee, and formed the Dublin Samaritan Committee in connection with the dispensary, besides several such committees in connection with different branches; it has established a Preventorium at Sutton, a Pasteurised Milk Depot, and numerous babies' clubs in Dublin and throughout the country. The association has also undertaken, in the interval before the County Councils construct the necessary machinery, to work the sanatorium benefit under the Insurance Act, and has received £25,000 of the grant to Ireland for this purpose. The Registrar-General's return for 1911 attributes some part of the fall in the death rate (16.6 for 1000 or .5 below the rate of the preceding year) to these agencies. It is also due in part to the

operation of the Old Age Pensions Act, which, under the original estimate in 1909, affected some 70,000 persons in Ireland. This was exceeded by 128 per cent, but a large number of claims were subsequently disallowed. The number of appeals decided during 1911 was 11,727. The operation of the Insurance Act in Ireland cannot yet be estimated. Mr. Charles Kinnear was appointed Chief Commissioner. The number of insurable persons is estimated at 1,050,000, and 674,000 persons were returned as members of approved societies when the Act came into force.

Religion.—In the census of 1911 the population of Ireland is divided by religions as follows: Roman Catholics 3,238,656; Protestant Episcopalians (Church of Ireland) 574,489; Presbyterians 439,876; Methodists 61,806. The number of Roman Catholics had decreased by 70,005, of Protestant Episcopalians by 5600, of Presbyterians by 3400, and of Methodists by 200 during the decadal period since the last census. In Dublin 83.1 per cent of the population was Roman Catholic, 12.9 per cent Protestant Episcopalian, 1.4 per cent Presbyterian, and 0.8 per cent Methodist. In the county of Dublin (which includes the urban districts around the city) the percentages were 71, 22.8, 2.5, and 1.6. In Belfast Roman Catholics numbered 93,243, Protestant Episcopalians 118,173, Presbyterians 130,575, and Methodists 23,782. In County Antrim the numbers were 39,751; 42,118; 97,198; and 3813.

Owing to the special interest attaching to the Ulster question, mainly a Protestant one, it may be noted that, in the N.E. counties constituting "Ulster" in the political sense, there were 394,421 Roman Catholics (33.1 per cent), as against 794,274 of other denominations. In all Ulster the Roman Catholics numbered 690,816 (43.7 per cent) as against 890,880 of other denominations. In Munster, the Roman Catholics constituted 94 per cent; in Leinster 85.2 per cent; and in Connaught 96.3 per cent.

Notable changes occurred in the composition of the clergy in the Church of Ireland. Dr. Alexander, the Primate of Ireland, retired from the primacy in January 1911, and died shortly afterwards. In February Dr. Crozier, bishop of Down, Connor and Dromore was elected Primate, the see of Down being filled by the transference of the bishop of Ossory. Dean Bernard, dean of St. Patrick's, was appointed to the vacant bishopric. In June 1912 a canonry of St. Patrick's fell vacant and was filled by the appointment of the Rev. James O. Hannay, Rector of Westport, better known as the novelist "George A. Birmingham."

Justice and Law.—Ireland has been in a very satisfactory condition in respect of crime. In 1911 the prison population was the smallest on record. Drunkenness continued to supply a large proportion, the number of commitments under this and cognate charges being 9258, or 40 per cent of the total number committed to prison. In 1910 the figures were 10,088. During the year 1911 345 male and 345 female offenders under the age of 21 years were received under sentence. A Borstal Institution for males was established at Clonmel in November 1909 under the Prevention of Crimes Act of 1908; nearly all its past inmates placed out are doing well. During the period under review Ireland has been singularly free from serious crime. In 1909 there was a recurrence of agrarian crime—shooting outrages and cattle-driving—in certain counties, notably Tipperary, Clare and Westmeath. But since that year the number of Grand Juries congratulated by the judges of Assize on the satisfactory state of their counties has continued to rise. In 1911 the number rose to 90 per cent, and in 1912 it reached 95 per cent. The Recorders of the large towns have also been able to produce testimony as to their comparative freedom from crime. Almost without exception the judge of assize has vigorously protested year by year that agrarian outrage in the western counties—Kerry, Clare and Galway—where it still sporadically appears, is largely due to the unrestricted sale and carriage of firearms. The Irish Game Protection Society and similar associations have also identified themselves with this protest. There have been several changes in the composition of Bench and Bar. In 1909 Lord Justice Fitzgibbon, who had for many years been judge of the Appeal Court, died. The Attorney-General, Mr. R. R. Cherry, was raised to the Bench, and was succeeded by Mr. Redmond Barry, whose place as Solicitor-General was taken by Mr. Charles O'Connor. Sir Samuel

Walker, Lord Chancellor of Ireland, died towards the close of 1911, and was succeeded by the Attorney-General, Mr. Redmond Barry. Mr. Charles O'Connor became Attorney-General, and Mr. Ignatius O'Brien was appointed Solicitor-General.

Education.—So far as education is concerned, the situation is practically unchanged except for the establishment of the National University. Under the system of payment by results, the amount of the school grant paid to managers of intermediate schools in Ireland on account of the examinations in 1911 was £46,461. In June 1912 the Intermediate Board was requested by the Under Secretary for Ireland to draw up, in co-operation with the Board of National Education, a scheme of scholarship whereby suitable pupils might pass from the primary to the secondary schools. After conference between representatives of the board and of the teaching profession a scheme was drawn up and sent to the Treasury. The board suggested the extension of the scheme so as to provide increased facilities for agricultural and technical training. The Treasury refused to sanction the scheme. However, in July 1912 provision of £10,000 was made for scholarships to enable primary school children to enter secondary schools. These scholarships were to be open to all National School children under 13 years of age, and the examination was to be competitive, regional and annual, conducted by the National Board's inspectors. (Provision of £40,000 was also made to improve the status of secondary teachers, an improvement which consecutive teachers' congresses have annually demanded.) It was proposed that, when the scholarships expired, the holders should be elected to County Council scholarships. The County Councils offered these only on condition that they should be held at the National University. The Chief Secretary insisted that they should be tenable at any Irish University, and, as a result of the deadlock, the scheme remained in abeyance at the end of 1912. The National University of Ireland was the creation of Mr. Birrell's Irish Universities Act. The Act instituted University College, Dublin, and reconstructed the Queen's Colleges of Cork and Galway as constituent colleges. Queen's University, Belfast, became a separate establishment. Dublin was allotted an annual grant of £32,000, Cork, £20,000, and Galway £12,000 out of the new University's share of the original endowment of the Royal University. £150,000 was granted for building purposes to Dublin, £14,000 to Cork, and £6000 to Galway. The preparatory work of the Commission was completed in July 1911, but the authorities of the Dublin College experienced some difficulty in finding a suitable site. Eventually a site adjacent to that of the Royal University buildings was provided by Viscount Iveagh, the chancellor of Trinity College, Dublin. St. Patrick's College, Maynooth, has been "recognized" by the senate of the new university. The number of entrants to the university in 1912 was: 755 to University College, Dublin, an increase of 60 on the previous year; 425 to University College, Cork, an increase of 10; and 155 to University College, Galway, an increase of 5. An agitation in favour of making Irish compulsory for matriculation was begun by the Gaelic League, and the senate finally decided to make a course in Irish compulsory for those who did not take it at matriculation till 1913, in and after which year it is to be compulsory for matriculation. Mr. Dennis Coffey was appointed president of University College, Dublin. The five Connaught counties have struck a rate-in-aid of University College, Galway. Kerry, Waterford, Cork, Tipperary and Limerick have established scholarships to University College, Cork. It is estimated that when the County Council schemes are in full working order the National University of Ireland will derive an additional income of more than £12,000 from this source. The demand for the development of the constituent colleges into independent universities, on the plea that a federal system is wasteful and cumbrous, has already made itself audible. The proposal is supported by the Cork College and its president, Sir Bertram Windle. It is resisted by the Galway College and its president, Dr. Anderson. Trinity College, Dublin, celebrated the bi-centenary of its Medical School in July 1912. The recommendations in the report of the Science Schools Committee have now been completed by the gift of Lord Iveagh two months earlier of £10,000 to the Trinity College department of geology and mineralogy, which had been prevented by lack of funds from acquiring the appa-

tus, and meeting the expenses of research assistants, necessary to the carrying on of its work. There has been, contrary to expectation, no friction between the old and the new universities. The National University played a prominent part in the bi-centenary celebrations of Trinity College. The co-operative principle is working not only in agriculture. It is the key-note of the Ireland of to-day.

INDIA¹

Census of 1911.—The census was taken in India on March 10, 1911, and showed a total population for the Indian Empire of 315,132,537. Compared with the total for 1901, the increase is 20,771,481, or 7.1%. But part of this increase is due to the inclusion of tribal areas on both the N.W. and N.E. frontiers, with a population (mostly estimated, not actually enumerated) of 1,731,116. In the British Provinces the rate of increase is only 5.5%, while in the Native States and Agencies it is as high as 12.9%. The intervening decade had been, on the whole, favourable to agriculture, and a recovery was to be expected in the areas affected by the famines of 1897 and 1900. On the other hand, the visitation of plague had been severe and continuous, causing more than 6 million recorded deaths, chiefly in Northern India, where also an exceptional outbreak of malarial fever occurred. In the result, both the Punjab and the United Provinces show an actual decrease. The highest rates of increase are in the Central Provinces, Burma, and Eastern Bengal and Assam.

Classified according to religion, some interesting results appear. As on former occasions, the rate of increase among Mahommedans (6.7%) is higher than among Hindus (5%). So-called Animists (20%) and Buddhists (13%) both have a high rate of increase. Jains show an unexpected decrease (6%), while the reforming sect of the Arya Samaj in Northern India has grown from 92,419 to 243,514. But the most surprising results are in the case of Sikhs and Christians. The former have increased from 2,195,339 to 3,014,466 or by 38%; the latter from 2,923,241 to 3,876,196 or by 33%.

This increase of Christians,² which of course means native converts, deserves explanation in detail. The great majority are still to be found in the extreme South, where in the two States of Travancore and Cochin more than one-fourth of the total population are now Christians, and the rate of increase during the past decade was 30%. Though the actual numbers are much less, this rate of increase has been exceeded elsewhere. Taking native Christians alone, and thus excluding European troops, in the United Provinces the number has risen from 23,404 in 1891 to 68,841 in 1901 and 136,469 in 1911; while in the Punjab the number has risen from 19,561 in 1891 to 37,980 in 1901 and 163,220 in 1911. The rate of increase during the past decade has been 90% in Assam, 45% in Burma, and 33% in Bihar &c., while in the Mahommedan state of Hyderabad it has been threefold. Turning to the several denominations, Roman Catholics are still by far the most numerous, and their rate of increase has been 22%. Next come Syrians of various rites, and then Anglicans, among whom the rate of increase has been only 8.5%. Other Protestant denominations show extraordinary figures. Baptists, mainly in Madras and Burma, have multiplied from 221,040 to 336,596; Lutherans, in Madras and Bihar, from 155,455 to 218,499; Presbyterians, in the Punjab and Assam, from 53,931 to 181,128; Methodists, in the United Provinces, from 76,907 to 171,754; and Congregationalists, in Madras and Travancore, from 37,874 to 135,264. Salvationists now number 52,407, mostly in the Punjab, Travancore, Bombay and Madras.

The statistics of literacy are not strictly comparable, for the test has been changed, being now the ability to write a letter to a friend and read his reply. The total number of literate persons has risen during the decade from about 15½ to 18½ millions, the proportion per thousand having risen from 98 to 106 in the case of males and from 7 to 11 in the case of females. The total number of persons literate in English has risen from 1,125,231 to 1,670,387, the proportion per ten thousand having risen from 68 to 95 in the case of males and from 7 to 10 in the case of females. Excluding the exceptional case of Buddhist Burma, Bombay

¹ See *E. B.* xiv, 375 *et seq.*, and allied articles.

² Here it may be mentioned that those of mixed descent, formerly known as Eurasians, are henceforth to be officially styled Anglo-Indians.

continues to stand first in respect of literacy and the United Provinces last. Among native states Travancore and Baroda are conspicuous.

Finance.—In India financial equilibrium varies with the monsoon, upon which agriculture is mainly dependent. In 1908-9, following upon two bad seasons, which culminated in famine throughout the United Provinces, there was a deficit of no less than $3\frac{1}{2}$ millions entirely due to a fall in land revenue and in receipts from railways. Succeeding years have been favourable, though in 1911 the desired rainfall did not fall until as late as September. The consequence has been a succession of surpluses, amounting to £606,641 in 1909-10, £3,936,287 in 1910-1, and £4,848,000 in 1911-2. In both the last two years, however, no less than two millions of the surplus was due to an unexpected windfall from opium. In 1911-2, the net revenue reached the unprecedented total of 56 millions, compared with 49 millions two years before. During the interval, the only change in taxation was a new customs duty on silver, and increased duties on imported liquors, tobacco and petroleum. It should however, be added that the excise duties on liquors and drugs have likewise been raised throughout the several Provinces. As so large a portion of the recent surpluses has been derived from opium, a source of revenue that will shortly disappear, they have not been applied to the reduction of taxation, but have been utilised partly in extraordinary grants for education, sanitation, &c., and partly in reduction of debt. The cost of the Royal visit (one million) was entirely defrayed out of revenue, and it is anticipated that some part at least of the expenditure on the new capital at Delhi will come from the same source.

The Opium Question.—The subject of opium demands special mention. By arrangement with China, the Government of India undertook to reduce the quantity exported after January 1908 by amounts annually increasing until the export should entirely cease after ten years. Under a new agreement in 1911, the total cessation was to be accelerated if China suppressed her own production of the drug, and a further limitation was placed on the export to Chinese ports, such exports to be specially certified. As a result, the number of chests exported was reduced from 61,900 in 1908 to 44,600 in 1911, of which only 30,600 were certified for admission to China. In the meantime, of the two Government factories in the Ganges valley that at Patna has been closed, while the area under poppy has been reduced from about 500,000 to 200,000 acres, entirely in the United Provinces. A result not foreseen is that the restriction on export led to an increased demand and a doubling of the sale price. Thus is explained the windfall from opium which figures so conspicuously in the surpluses of the last two years. Finally, it should be stated that, in conformity with the international convention signed at the Hague in January 1911 the Indian Government has announced its intention of introducing legislation to discourage opium smoking. It is proposed to prohibit the practice absolutely in saloons or gatherings numbering more than two persons, to reduce the amount of the drug which a person may lawfully possess, and to increase the sale price to the public.

Agriculture.—The last three or four years have been characterised by favourable monsoons and consequently by wide-spread agricultural prosperity. If prices still range high, this must be attributed to the foreign demand for such staples as cotton, wheat and oilseeds. A notable example of prosperity is presented by the Canal Colonies in the Punjab, where wheat for export is the chief crop and horse breeding is also encouraged. The colonists have been allowed to acquire proprietary rights in their holdings, and the cooperative credit movement is making rapid progress. It may be mentioned that as much as £3,000 per acre has here been paid for market sites along the railway, that labour at harvest time fetches Rs. 2 (2s. 8d.) a day, that sovereigns are common in circulation, and that in one year Lyallpur remitted £147,000 by money order to other districts.

The United Provinces recovered with unexampled rapidity from the famine of 1908, owing as much to their previous prosperity as to the efficiency of relief operations. Bengal and Bihar suffered somewhat in 1909 from a poor harvest. But the only real distress has been in Bombay. Here the monsoon of 1911 failed almost entirely in Gujarat, including a large area of Native States. No difficulty was experienced in providing work and food for the destitute people, and private charity was to some extent successful in saving the cattle alive; for, as often happens, the drought caused a fodder famine. In 1912 the monsoon again failed in the Bombay Deccan, a tract particularly liable to drought.

The most notable feature of recent years, apart from the activity of the Agricultural Departments in the several Provinces, has been the steady growth of cooperative credit societies. Some of these are urban, for the benefit of artisans, &c.; but the great majority are rural, numbering nearly 5,000 in 1911, with a membership of 236,000 and a working capital of £730,000, of which £105,000 represents deposits by the members. The movement seems to have been most successful in the United Provinces, Madras and the Punjab. In

Bombay a Central Cooperative Bank has been founded by a leading Hindu merchant, Sir V. D. Thackersey, with a Government guarantee on its 4% debentures. It lends, only with the approval of the official registrar, at an interest which must not exceed 8%, and half of its surplus profits above 6% must ultimately be devoted to rebates on the interest payable.

Mines and Minerals.—The mining of coal, which is mainly concentrated in Bengal, has recently been subject to vicissitudes. While the total output increased from an average of 10 million tons during the five years ending 1908 to 12 million tons in 1910, the price fell considerably. The difficulties of local transport by both land and sea have become so troublesome that the railways with headquarters at Bombay were compelled in 1912 to invite contracts from Japan and Natal. The production of the gold mines in Mysore remains constant at about 545,000 ounces a year; the Hutti mine in Hyderabad yields about 15,000 ounces; but the mines in the Bombay district of Dharwar have all closed down, owing to disappointing results at deep levels. The production of manganese, chiefly in the Central Provinces and Madras, has increased from an average of 500,000 tons during the five years ending 1908 to 800,000 tons in 1910; and India may now claim to be the largest producer of high-grade ore in the world. The production of petroleum in Burma has similarly increased from an average of 146 million gallons during the five years ending 1907 to 215 million gallons in 1910; while the refining of the crude oil and the manufacture of petrol, paraffin, &c., have become an important industry at Rangoon. The iron industry, elsewhere languishing, has made a memorable start at Sachi, on the hilly borders of the Central Provinces and Orissa. Here the Tata Iron and Steel Company, with a capital of 1½ millions raised entirely in India, began work early in 1912. Equipped with the most modern machinery for smelting, puddling, forging, &c., it is intended to produce 87,000 tons of iron and steel in the year. The Government have erected a laboratory close by, at Kalimati, for testing the steel rails produced for use on the State railways, and Japan has already give a large order for steel.

Manufactures.—In manufactures, the most important event has been the passing of a new Factory Act, which came into force on July 1, 1912. The chief provisions applying to textile factories are: that no person shall be employed for more than 12 hours, no woman for more than 10 hours, and no child for more than 6 hours in any one day; that no person shall be employed before 5:30 a.m. or after 7 p.m.; and that mechanical or electrical power shall not be used for more than 12 hours in the day.

The cotton mills, chiefly centred in the Bombay Presidency, have passed through a long period of depression, though the number of both spindles and looms increases year by year. While the spinning of yarn has been generally unremunerative, the weaving of cloth, especially of the finer fabrics, is steadily advancing. During the five years ending 1910–11, the number of looms has risen from 55,000 to 79,000, and the production of woven goods from 159 to 231 million pounds. Another Tata company, with a capital of more than a million again raised entirely in India, has begun operations at Lonauli in the Western Ghats for providing electrical energy for the many industries of Bombay city. Jute mills, which are concentrated at Calcutta and mainly in English hands, have enjoyed almost unbroken prosperity. In 1910 the total number of factories under inspection in all India was 2,271, employing 800,000 persons, of whom 116,000 were women and 52,000 children. Mention may here be made of the recent development of banks, under Indian management and with Indian capital, with their headquarters at Bombay. One of these subscribed for the greater part of the Government loan of three crores (2 millions) issued in 1912.

Commerce.—The foreign trade reflects the series of favourable harvests. During the four years ending 1911–12, imports of merchandise have increased from 81 to 92 millions, exports of merchandise from 100 to 151 millions, and the net imports of treasure from 11 to 28 millions. The "balance of trade" in favour of India thus rose from 8 to 31 millions. Among imports, while cotton yarn shows a continuous decline, other cotton manufactures (almost entirely from England) have increased from 23 to 30 millions. Large increases are also shown in sugar (from Java), and in copper, the usual material for household vessels. Among exports, raw cotton continues to rank first, but the second place is now held by oilseeds, though raw jute and jute manufactures combined more than equal cotton. The export of rice depends upon the harvest in Burma, as that of wheat does upon the harvest in the Punjab. Within the last year barley has been sent in large quantities to England. About 62% of the total imports come from the United Kingdom, but only about 26% of the total exports are consigned thither. A notable feature during 1911–12 has been a fall in the imports of silver, accompanied by a very large rise in the imports of gold, both bullion and coin. Gold is no doubt hoarded and used for jewellery; but sovereigns are now common in circulation in some parts, while since 1910 the amount of gold held by Government in the paper currency reserve in India has increased from 9 to 20 millions.

Railways.—Railways have fully participated in the favourable seasons which India has recently enjoyed. Contrasted with a loss of 1½ millions under this head in the financial year 1908–9, gains are shown of more than ¾ of a million in 1909–10, of 2 millions in 1910–11, and of more than 3 millions in 1911–12. But, as all the railways do not belong to Government, it will be more convenient to take figures for the last calendar year. Between 1909 and 1911, the total length of line open increased from 31,484 to 32,839 miles, while the total mileage under construction or sanctioned at the close of 1911 was 2,675; the total capital outlay on

open lines increased from 286 to 300 millions; the total number of passengers carried increased from 329 to 410 millions; the total weight of goods carried increased from 61 to 76 million tons; and the net earnings increased from 13½ to more than 17 millions, the percentage of profit on capital rising from 4.81 to 5.71.

The most important new line recently opened is that through Rajputana from Muttra to Kotah, which affords communication from Northern India to Bombay on the broad gauge of the Bombay and Baroda system. The most important work in hand is the construction of a bridge across the Ganges at Sara in Bengal, which will bring the traffic from the north of the river (at present ferried over) direct to Calcutta. The most interesting project sanctioned is that of connecting the railway systems of India and Ceylon by means of a ferry service, for which a bridge along Adam's Reef may possibly be substituted. Three turbine steamers were in 1912 being built on the Clyde for this ferry service. The passage is about the same distance as from Dover to Calais, through practically smooth water at all seasons.

Complaints have often been made of the inadequacy of the railways to carry the increasing goods traffic. These culminated in the spring of 1912 under a combination of exceptional circumstances: the recent Durbar, the coal strike in England, the demand for fodder in the famine districts of Gujarat, a deficiency of water in some places, and the heavy bulk crops for export. The provision of rolling stock has been the chief item of capital expenditure for several years past. It is now recognised that the most pressing need is the adaptation of the railways to heavier and more frequent traffic by the doubling of lines, strengthening of bridges, increase of sidings, and improvements at terminal stations.

Irrigation.—According to the financial accounts, the net revenue from irrigation remains pretty constant at about £600,000 a year. But this gives a most inadequate conception of the important works undertaken by the Government. During the four years ending 1910-1, the capital outlay increased from 34½ to 39½ millions, while the total area irrigated and the net receipts showed little change, and consequently the percentage of profits fell from 6.74 to 6.33. Punjab is the province where the existing canals are the most necessary and also the most remunerative, and it is in the Punjab that the most important work is now under construction. This is known as the Triple Canal in the Upper Jhelum, the Upper Chenab, and the Lower Bari Doab, which will be completed in 1915 at a total cost of nearly 8 millions. In the United Provinces a series of minor canals have been constructed for the protection against famine of Bundelkhand, while a large scheme is under consideration to increase the supply of the Ganges and Jumna Canals from the overflow of the Sarda river in Oudh. The important project of throwing a barrage across the Indus at Sukkur, and thus effecting perennial irrigation in Sind, still awaits final sanction. These projects involve such heavy expenditure, in this case nearly 6 millions, that delay is justifiable. Minor works have been carried out on the Godavari river in Bombay, and also in the Central Provinces; but large schemes in Madras on the Kistna and the Kaveri rivers are still under consideration.

Education.—No subject connected with India has attracted more attention of late than education, starting from the reform of the universities in 1904. This reform has been slow in accomplishment, but the aim has now been effected, by which the academic syndicates have gained control over the affiliated colleges and have themselves undertaken to conduct postgraduate courses and research. Towards the end of 1910, a member for education in the person of Sir Harold Butler was appointed to the Viceroy's executive council. At the Delhi Durbar one of the boons announced by the King was a grant of 50 lakhs (£333,000) for education, which has been devoted mainly to primary schools. The Hon. G. K. Gokhale, the recognised leader of Indian opinion, introduced a bill in the Viceroy's Legislative Council for the gradual introduction of compulsory education, which was rejected by a large majority in March 1912. The alternative proposals of the Government were explained by Mr. Montagu, Under Secretary of State, in his budget speech to the House of Commons on July 30, 1912. Leaving compulsion for the future, it was pointed out that free education already exists for all girls and also for a proportion of boys varying from one-fifth to one-third in the several Provinces. What is now required is to augment the number of schools and to improve the teaching in the schools that already exist. The additional amount provided for education (higher as well as primary) in the estimates for 1912-3 was ¾ of a million.

During the ten years ending 1910-1 the total number of boys at school increased from 3,513,000 to 5,489,000, and the total number of girls increased from 446,000 to 866,000, while the total expenditure from all sources increased from £2,700,000 to £4,800,000. In 1911, the proportion of pupils to the population of school-going age, which is taken at 15% of the total population, was 28% for boys and 4% for girls. The attendance at Secondary schools, which is almost equivalent to education in English, increased during the ten years by 44%; and it is noteworthy that two-thirds of the cost is derived from fees. The number of students at Arts colleges increased from 17,430 to 23,714. Of those who graduated B.A. in 1911,

Brahmans numbered 530, non-Brahman Hindus 492, Mahomedans 173, and native Christians 31. An interesting movement is that for the creation of new universities. The Government has resolved to found one at Dacca in Eastern Bengal, which will probably be followed by others—at Rangoon for Burma and at Patna for the new Province of Bihar. Meanwhile the Mahomedans have been collecting large subscriptions in order to raise the Aligarh college to the status of a university, and the Hindus for a college at Benares.

In this connexion mention may be made of the scheme organised by the Secretary of State for the benefit of Indian students who come over to complete their education in England. The number of these is estimated at nearly 2,000, of whom 800 are in London. Prof. T. W. Arnold, formerly at Aligarh and Lahore, was appointed in 1909 with the title of educational adviser to superintend an office in Cromwell Road, London, for information, guidance and guardianship. The house in Cromwell Road contains bedrooms for students on their arrival, and also provides accommodation for two associations which promote social intercourse. So successful has the scheme been that in 1912 it was found necessary to make the additional appointment of a secretary at the India Office, who will be responsible for making arrangements for students in universities &c. outside London. Also a departmental committee was constituted to consider the means by which engineering and other technical students could obtain better facilities in England for practical experience in workshops and factories.

Political History.

The "Unrest."—Within the brief period of half a dozen years the political surface of India, usually so unruffled, has undergone two changes as sudden and as strange as the burst and the passing away of the annual monsoon. To assign their proper value to all the causes that contributed to provoke the spirit of political and social "unrest" would be a hopeless task. The Japanese victories over Russia, the "partition" of Bengal, racial antipathy, misdirected education, inflammatory publications and preachings each played their part. The result was an unexpected outbreak of anarchical crimes such as are really alien to the Indian character, and which could only be met by stern measures of repression. But while these crimes naturally attracted most attention in England, those responsible for the government of the country always recognised, as others can now see plainly, that the deepest and most permanent feeling beneath the "unrest" was a growing self-consciousness of nationality, with an inarticulate cry for greater sympathy in the administration. In 1909, when sedition was at its height, the Imperial Parliament passed an act enlarging the legislative councils by the introduction of an elected element, and also authorising the appointment of an Indian member to the executive councils of Madras, Bombay, and Bengal. The following year, when officials and representatives of the people met in friendly debate and shared in the responsible work of legislation, ushered in a period of appeasement, transfigured into effusive loyalty by the Royal visit.

Nevertheless, out of regard to historical truth, it is necessary to summarise the chief incidents of the black period. Though it was only in Bengal that sedition and outrage became endemic, under the influence of secret societies and the preaching of a sort of religious anarchism, the first overt signs of trouble were manifested in the Punjab, the recruiting ground of the Indian army, and in the remote south of Madras. The Punjab soon quieted down, after one of the ring-leaders had been deported to Burma, and a real grievance in connexion with the canal colonies had been redressed. In Madras also order was restored by severe punishments on the offenders. Meanwhile, at Poona, in the Bombay Deccan, the Chitpavan Brahmans, of the same caste as the former Peshwa of the Marathas, had long been fomenting disaffection. Their leader, Mr. Tilak, a man of great ability and a Sanskrit scholar, traversed the country to promote the cult of Sivaji, the founder of Maratha nationality. He was responsible for breaking up the National Congress held at Surat in December 1907, when the Extremists definitely separated themselves from the Moderates. After he was sentenced in July 1908 to six years' transportation for sedition, the local agitation suffered a check, but in truth it was only driven underground. In January 1909, the Queen Victoria Memorial at Nagpur was desecrated by a student of the agricultural college; on November 15th a bomb was thrown at Lord Minto when entering the city of Ahmadabad; and on December 23d Mr. Jackson, magistrate of Nasik, was assassinated. The thrower of the bomb was nev-

er discovered; but the actual murderers of Mr. Jackson were promptly tried and executed, though one of the conspirators (Savarkar), by escaping for the moment from a British steamer to the quay at Marseillès, furnished occasion for a reference to the international tribunal at the Hague, which decided against his extradition to France. It was also in 1909 that London was startled on July 2d by the assassination of Sir W. Curzon Wyllie and a Parsi doctor at the Imperial Institute. The murderer, a student from the Punjab, was duly hanged on July 27th. It may be emphasised that most of the anarchical crimes were committed by youths of imperfect education and morbid temperament. In January 1910, a Mahommedan superintendent of police was shot in a corridor of the Calcutta High Court while the final appeal in the Alipur bomb case was being heard; and in the same month an attempt was detected to tamper with the fidelity of a native regiment in garrison at Calcutta. Subsequently, despite an isolated outrage here and there, however, the spirit of conciliation overcame the demon of "unrest." An Indian member had been admitted to the executive council or cabinet of the Viceroy, and elected members sat on all the legislative councils. In February 1910, the government found themselves justified in releasing the nine persons who had been "deported," or imprisoned without any charge, two years before at a time when Bengal was honey-combed with *samitis* or secret societies. At the end of the year a further stage of conciliation was reached when Sir W. Wedderburn, a retired Bombay civilian of the highest character, went out to India to be president of the National Congress held at Allahabad, and to promote good will between Hindus and Mahommedans.

The New Viceroy.—With the arrival of the newly created Baron Hardinge of Penshurst (b. 1858) as Viceroy, in November 1910, it was everywhere tacitly recognised that a new chapter had opened in the political history of India, though no one dared to foretell the Royal visit and its marvellous results. Lord Hardinge had from 1906 been, as Sir Charles Hardinge, at the head of the Foreign Office in London, and intimately associated with King Edward (see *E. B.* viii, 999b); and in succeeding Lord Minto, who had been personally popular with all classes, he brought a varied official experience to bear on the problems of Indian government. Though 1911 was marked by one serious political crime, the murder of Mr. R. W. D. Ashe, a Madras magistrate, on June 19th, events proved that the end of an anxious period was in sight. Nor need this verdict be upset by the deplorable outrage on Lord Hardinge himself at the end of 1912, when on December 22 a bomb was thrown at the Viceroy as he entered Delhi in state, injuring him somewhat severely and killing an attendant. The occurrence of such a crime is serious enough, no doubt, but represents the spent force of pure anarchism and not any widespread movement.

The Royal Visit.—The Royal visit to India, announced in the speech from the throne on February 6, 1911, is known to have been undertaken on the King's own initiative, in spite of some not unnatural warnings. Never before, since Angevin times, had an English sovereign left his own realm for a state progress through his dominions beyond the sea. From first to last its success exceeded anticipation, being marred by no untoward incident. The P.&O. S.S. "Medina" was chosen for the Royal yacht and manned with a crew from the navy. She sailed on November 11th, and the first Indian port at which she touched was Aden, where the King and Queen landed. Bombay was reached on December 2d, and here three days were spent, the King and Queen sleeping on the "Medina." The chief public functions were a welcome on the Apollo Bandar, where a Saracenic archway and a pavilion had been erected; a procession through the streets of the city; and a children's fête. On the night of December 5th they departed from Bombay by the recently opened railway through Central India and Rajputana, arriving at Delhi on the morning of December 7th. Here ten days were crowded with ceremonial duties: first a procession from the Fort through the city to the Durbar camp; then the reception of ruling chiefs, whose visits were returned by the Viceroy; the laying of the foundation of the All India memorial to King Edward; the presentation of colours to British and Indian regiments; and a review of 50,000 troops. The culminating scene

was the Durbar on December 12th, in an immense amphitheatre constructed for the purpose, within which the King and Queen in their royal robes received the homage of the ruling chiefs and their coronation was proclaimed to the assembled people. Among the boons then announced were a grant of 50 lakhs (£333,000) for education, half a month's pay to all soldiers and subordinate officials, and the admission of Indian soldiers to the Victoria Cross. But what caused these to be ignored was the further announcement, altogether unexpected, that Delhi would henceforth be the capital of India in substitution for Calcutta, and that Bengal would be reunited under a governor-in-council. From December 16th to 29th the King went for a hunting trip to Nepal, where the Maharaja-minister welcomed him in person, and many tigers and rhinoceros were shot, while the Queen visited Agra and several cities of Rajputana. After meeting again near Patna they arrived at Calcutta on December 30th, and stayed there for nine days. Apart from the exuberant loyalty of the people, the most interesting incident was the historic pageant organised to represent the two festivals of the Hindu Dashara and the Mahommedan Nauroz. The return journey to Bombay was broken for an hour at Nagpur, and the "Medina" sailed on January 10, 1912, stopping at Port Sudan in the Red Sea and at Malta. The intention and the result of the Royal tour could not be better expressed than in the words which the King evidently uttered from his heart on leaving Bombay:—

"It is a matter of intense satisfaction to me to realise how all classes and creeds have joined together in the true-hearted welcome which has been so universally accorded to us. Is it not possible that the same unity and concord may in the future govern the daily relations of their public and private lives? The attainment of this would indeed be a happy outcome of our visit to India. To you . . . I deliver this our loving message of farewell to the Indian Empire."

What may be taken as a reply was sent by the Viceroy to the Prime Minister on the day of the King's arrival in England:—

"The Princes and people of India desire to take the opportunity afforded by the conclusion of the Royal visit to convey to the great English nation an expression of their cordial goodwill and fellowship. . . . Their Imperial Majesties, by their gracious demeanour, their unflinching sympathy and their deep solicitude for the welfare of all classes, have drawn closer the bonds that unite England to India. . . . We are confident that the great and historic event marks the beginning of a new era, ensuring greater happiness, prosperity and progress to the people of India under the aegis of the Crown."

Domestic Affairs.—The legislative council of the Viceroy, on which an official majority is required by the regulations, contains 60 "additional" members, besides those of the executive council or cabinet. Of these, 25 are elected by various representative bodies. For example, the non-official members of each of the provincial legislative councils, the Mahommedan community and the landholders in the larger provinces, and the chambers of commerce of Bengal and Bombay each have at least one representative. In the result, among these elected members, in 1912 there were 12 Hindus, 9 Mahommedans, two Englishmen, one Parsi, and one Buddhist from Burma. Of 35 nominated members, 26 were officials; and the remainder included two Hindus and two Mahommedans, and a representative of the domiciled Anglo-Indian community.

Undoubtedly the most conspicuous among the Indian members, alike for his knowledge of affairs, his eloquence, and his moderation, has been Mr. Gopal Krishna Gokhale, C.I.E. (b. 1866), one of the two representatives of the Bombay council. He is a Chitpavan Brahman from Poona, where he was for some years professor at the Fergusson College, and where he recently founded a society, called the Servants of India, for the study of social and economical questions and for their propagation by missionary effort. He has paid several visits to England, the latest in 1912; and in October 1912 he went to South Africa to examine on the spot the vexed question of the exclusion of Indian immigrants and to promote a conciliatory settlement.

The first Indian member to be admitted to the Viceroy's executive council was Mr. Satyendra Prasanna Sinha (b. 1864), a Hindu barrister, who had previously officiated as advocate-general for Bengal. He was appointed legal member in April 1909, and on his retirement in November 1910 he was succeeded by Syed Ali Imam, a Mahom-

medan barrister from Patna. It is perhaps worthy of note that both of these have sent their sons to be educated at public schools in England.

The enlarged legislative councils came into being in January 1910, and as the period of membership was for three years, fresh elections and fresh appointments were due at the end of 1912. Debates on bills and discussions on the budget have always been conducted without friction; resolutions proposed by Indian members have afforded useful opportunities for the pronouncement of official explanations; and the privilege of asking questions has been abundantly availed of. It is significant that almost the first Act passed by the legislative council of the Viceroy (in July 1910) was one empowering the Government to prohibit indentured emigration to any country whenever it considers that sufficient reason exists. Such emigration has accordingly been prohibited to Natal. Nothing excites so much feeling among all sections of Indians as the disabilities to which they are subjected in some of the self-governing British colonies.

During 1911 three important Acts were passed: a Factories Act, which had been long under consideration and of which the chief provisions are specified above; a Patents and Designs Act, on the lines of the English measure; and a Prevention of Seditious Meetings Act, renewing an expiring Act of 1907, with certain amendments, the most noteworthy of which permits the holding of meetings for the discussion of political subjects generally. A stringent Act for the regulation of the press, passed early in 1910, still remains in force, its chief provision being the requirement of security, which may be forfeited and the press confiscated on the publication of seditious matter.

In 1912 swelling revenues resulted in a large surplus, part of which was devoted to the pressing needs of improved sanitation. The monsoon was, on the whole, very favourable, and trade was unusually brisk. In the Viceroy's legislative council the most important event of the year was the rejection, as premature, of the Hon. G. K. Gokhale's bill for a considered scheme of free and compulsory education. An Act passed Parliament for carrying into effect the new constitution of Bengal and also the formation of legislative councils in Provinces under a chief commissioner. A Royal Commission was appointed, with Lord Islington as chairman, and including the English labour leader, Mr. Ramsay Macdonald, to examine and report on all matters connected with the various branches of the civil service, with special reference to the further employment of Indians and the present division of the services into Imperial and Provincial.

Echoes of the recent troubles were aroused during the year by two legal judgments, given on appeal after prolonged litigation by the Privy Council and the Calcutta High Court, both of which justified executive action taken by magistrates at a time of crisis. In the Mymensingh case, which dates back to 1907, the district magistrate had personally conducted a search for arms in a house near which an outrage had been committed the day before. No arms were found. The occupier of the house brought an action for trespass against the magistrate and obtained a judgment for £33 as damages, which judgment was confirmed by the High Court at Calcutta. Ultimately, after long delay, this judgment was reversed by the Judicial Committee of the Privy Council in July 1912, on the ground that the magistrate was acting within his powers as a criminal court of first instance. The circumstances of the Midnapur case are more complicated. Here there is little doubt that a seditious conspiracy existed in 1908, when several suspected persons were arrested. One of these, who had been soon discharged, brought an action against the magistrate and two Indian police officers for illegal arrest. After a trial before a judge of the Calcutta High Court, which lasted for nearly 200 days, he was awarded £66 as damages. Here it may be remarked that in India all civil actions are tried without a jury. On appeal to three judges of the High Court, one of whom was an Indian, this judgment was unanimously reversed in August 1912, and the plaintiff was condemned to pay the costs, estimated at £20,000.

Foreign Affairs.—Foreign affairs, which for India are almost equivalent to frontier affairs, may be briefly treated. Anarchy in Southern Persia has required the despatch of a native cavalry regiment to open the roads and protect trade. In the Persian Gulf the traffic in rifles and ammunition has been suppressed by combined naval and military

operations, supported by restrictions imposed by the Sultan of Muscat. The Amir of Afghanistan has continued to maintain a not unfriendly attitude. In 1910 he agreed to the appointment of a joint commission for the settlement of boundary disputes, which resulted in an agreement for the removal of outlaws from both countries to at least fifty miles from the border. Tibet has suffered from more than one revolution, and the end is not yet in sight. In 1910, the Dalai Lama, who had fled to China before the British occupation of Lhasa, took refuge in India from the tyranny of the Chinese, and was hospitably entertained, visiting the sacred sites of Buddhism. Afterwards, as a result of the revolution in China, the Tibetans rose against the Chinese with more or less success and invited the Dalai Lama to return. An agreement was concluded at Lhasa in August 1912 between the Tibetans and the Chinese, in the presence of the representative of Nepal, in accordance with which the Chinese garrison was to be repatriated by way of India. But fighting subsequently broke out afresh. In these troubles the Indian Government has taken no part, except by stopping a Mongolian mission that wished to proceed from Calcutta to Tibet. With Bhutan, on the other hand, relations have become more intimate. A formal treaty was executed in March, 1910, with the new ruler or Zimpon, whose full style and name is 5 Sris Ugyen Wangchuk. In July 1911, he was invested with the title of Maharaja and granted a salute of 15 guns; and at the Delhi Durbar, where he was a conspicuous figure in his Tibetan dress, he was created K.C.S.I. Further east, at the end of the Assam valley, the wild tribe of Abors murdered Mr. Williamson, a political officer, and most of his party in April 1911. A strong military expedition, under the command of General Bower, moved into the Abor country in October, and succeeded in punishing the culprits. Though there was little fighting, the natural difficulties to be overcome were very great, owing to dense jungle, steep hills, unfordable rivers, and perpetual rain or mist. An attempt to survey the gorge by which the Brahmaputra cuts through the Himalayas—one of the few unsolved problems of geographers—was not successful. At the same time a survey party was sent out from Sadiya east through the Mishmi country toward Rima, where the Chinese were said to be encroaching.

Obituary.—Among the native Indians who have passed away during the period the most notable name is that of BEHRAMJI MERWANJI MALABARI, the Parsi social reformer, who was born at Baroda in 1853, and died at Simla from heart failure on July 18, 1912. His boyhood was straitened by poverty, and he was unable to pass beyond the matriculation of the Bombay university. His first literary effort was a collection of Gujarati verse, entitled *Nivindoo* (1875). This was followed by a volume of English poetry—*Indian Muse in English Garb* (Bombay, 1876)—which was dedicated to Miss Mary Carpenter, and attracted the notice of Florence Nightingale, Max-Müller, Lord Shaftesbury and John Bright. Encouraged by letters from these, he now became a journalist and devoted the rest of his life to the cause of social reform. In 1880 he became proprietor and editor of the *Indian Spectator*, which he conducted almost unaided for 20 years. Since 1901 he had edited *East and West*. He will be remembered best for the agitation he conducted for many years on behalf of Indian women, touring throughout the country and thrice visiting England. The result was the passing, after bitter controversy, of the Age of Consent Act in 1891, by which the age for consummation of marriage in the case of a girl was raised from 10 to 12 years. Later undertakings of his were to found the Seva Sadan, a society for the improvement of women by women, and to establish with the help of native princes and others a sanatorium for consumptives at Dharampur in Northern India. He also conceived, but did not live to carry out, the foundation of a Morley chair for the philosophy of history at Bombay. Latterly his health broke down and he lived the life of a recluse. He is understood to have refused the Kaisar-i-Hind gold medal and also knighthood.

A strong contrast is presented in SYED ALI BILGRAMI, the most versatile Mahommedan of his time, who died at Hardoi in Oudh on May 23, 1911. A half-brother, younger by seven years, of Syed Husain, the first Mahommedan member of the Secretary of State's Council, he was born at Patna in 1851. Educated first at Patna College, he

graduated at the Calcutta University with double first class honours, taking Sanskrit as his second language. He then attended the Thomason Civil Engineering College at Rurki for a time; but having attracted the notice of Sir Salar Jung, the great minister of Hyderabad, he came in his suite to England in 1876 and joined the Royal School of Mines, where he passed the examination for the Associateship and was awarded the Murchison medal in geology. At this time he also travelled on the continent, and made himself proficient in French and German. Returning to India in 1879, he served for many years in Hyderabad in the departments of public works, mines and education. In 1892 he went up for the law examination at Calcutta, passing at the top of the list and winning the gold medal. Retiring from service in 1901, he settled with his wife in England, being appointed lecturer in Marathi at Cambridge, and also employed in cataloguing the Delhi collection of Arabic and Persian MSS. in the India Office. In 1907, he was called to the bar at Lincoln's Inn, and then returned to India, to devote himself to work for the Muslim League and the Aligarh College. Among his numerous publications are a monograph on the Book of Kalilah and Dimnah, Notes on the Educational Value of Persian as compared with Sanskrit, and a translation into Urdu of *Le Bon's Civilisation des Arabes*.

Yet a third type is represented by VENKATARAMA KRISHNASWAMI AIYAR, C.S.I., a Brahman lawyer, who died on December 28, 1912, at Mylapore, a suburb of Madras, at the age of 48. In 1909 he had been appointed a judge of the High Court and in January 1911 a member of the executive council. When attending the Durbar at Delhi his health broke down. Though a supporter of the National Congress and always maintaining very independent views, the esteem in which he was universally held was shown at a public meeting summoned by the Sheriff of Madras, at which the Governor was present, when it was resolved to erect a memorial statue of him. Another memorial is the Sanskrit college which he himself founded at Mylapore. Almost his last words are said to have been: "I want to do something yet for the country. I do hope God will not take me away before I have done it."

Bibliography.—Among recent books on India, the following are specially notable: *Indian Unrest*, by V. Chirol (1910); *Administrative Problems of British India*, by J. Chailley (1910); *India under Curzon and After*, by L. Fraser (1911); *Studies in Indian Life and Sentiment*, by Sir B. Fuller (1910); *India and the Durbar*, being a Reprint of the Indian Articles in the *Times* of May 24, 1911; *The Awakening of India*, by J. R. Macdonald (1910); *Education and Statesmanship in India*, by H. R. James (1911); *The Renaissance in India: Its Missionary Aspect*, by C. F. Andrews (1912); *The Economic Transition in India*, by Sir T. Morison (1911); *Der Heutige Indien*, von Prof. Dr. Georg Wegener (Berlin, 1912); *The Indian Scene*, by J. A. Spender (1912); *Narrative of the Visit to India of Their Majesties King George V and Queen Mary* and of the Coronation Durbar held at Delhi, 12 Dec., 1911, by the Hon. J. Fortescue (1912); *The King and Queen in India, 1911-2*, by Stanley Reed (Bombay, 1912); *In Abor Jungles*: being an Account of the Abor Expedition, the Mishmi Mission, and the Miri Mission, by Angus Hamilton (1912); *On the Track of the Abor*, by Powell Millington (1912). (J. S. COTTON.)

Indian States, Provinces and Cities

Notes are appended giving recent information on the more important states, provinces, and cities, supplementary to the accounts given in the *Encyclopaedia Britannica*. For convenience of reference they are given in alphabetical order.

ADEN.—The population of Aden in 1911 was 46,165, showing an increase of 5% during the decade. The trade, almost entirely a transit trade, does not increase, partly owing to troubles in the interior, but also to the development of French and Italian ports in the Red Sea. Aden was the first spot of Indian territory visited by the King and Queen on November 27, 1911, when they came ashore for a few hours and received an address from Mr. Cowasji Dinshaw, the leading Parsi merchant.

AGRA.—The population of Agra city in 1911 was 185,449, showing a decrease of 1.4% during the decade. Both the district and the division show still larger decreases. On the occasion of the royal visit to India the Queen spent three days at Agra, including a trip to Fatehpur Sikri, while the King was shooting in Nepal.

AHMEDABAD.—The population of Ahmedabad city in 1911 was 215,835, showing an increase of 16.1% during the decade, which follows upon an increase of 25.3% during the previous decade. This prosperity is mainly due to its cotton mills, which number 54. The population of the district increased by only 4%. The Arts College, formerly managed by a

local society, has recently been transferred to Government. By the munificence of a wealthy merchant, Sir Chinubhai Madhavlal, a Science Institute, with separate buildings for a hall and a library, are now being added.

AJMER.—The population of Ajmer city in 1911 was 86,222, showing an increase of 16.8 % during the decade. The minor province of Ajmer-Merwara shows an increase of only 5.1 %. On the occasion of the royal visit to India the Queen spent three days at Ajmer in December 1911, while the King was shooting in Nepal. She visited the Mayo College, Pushkar lake sacred to Hindus, and the tomb of the Mahomedan saint, Muin-ud-din Chisti.

ALLAHABAD.—The population of Allahabad city in 1911 was 171,697, showing a decrease of 2 % during the decade. The population of the district likewise decreased by 1.6 %, due to the prevalence of plague. On November 11, 1910 the Viceroy paid a visit to Allahabad to lay the foundation stone of a pillar in Minto Park, on which have been inscribed the two historic proclamations of Queen Victoria and Edward VII. In December of that year, while the National Congress was being held under the presidency of Sir W. Wedderburn, the largest exhibition yet held in India was opened by the Lieutenant-Governor. The agricultural court, which was a conspicuous success, has greatly stimulated the interest of landowners in the use of labour-saving implements, power-plant for pumping, and the manufacture of white sugar by machinery. A new bridge across the Ganges to connect with the Oudh and Rohilkhand Railway was opened in October 1912, while the railway bridge across the Jumna is being widened to carry a double line. Other public works in progress are a senate hall and a library for the university, while a new building for the High Court has been sanctioned. A trust fund has been formed for the purpose of opening out congested areas.

ALWAR.—The population of this native State in 1911 was 791,688, showing a decrease of 4.4 % during the decade. The Maharaja, Sir Sawai Jai Singh, was created K.C.I.E. at the Delhi Durbar.

AMRITSAR.—The population of Amritsar city in 1911 was 152,756, showing a decrease of 6 % during the decade. The population of the district also decreased by 14 %, due to plague and malaria. As a result of the malaria conference held at Simla in 1909, Amritsar has been selected for a laboratory; lectures are here given to medical officers, and a periodical is published.

ANDAMAN ISLANDS.—The population of Port Blair (the penal settlement) in 1911 was 16,324, showing an increase of 4 % during the decade, while in the rest of the Andamans only 1,317 persons were enumerated, showing an apparent decrease of 30 %. In the Nicobar Islands, however, which are under the same jurisdiction, there was an apparent increase of no less than 35.4 %.

ASSAM.—The population of Assam (which was incorporated with Eastern Bengal in 1905, but was again constituted a separate Province under a chief commissioner in 1912) was 7,959,857 in 1911, showing an increase of 17.1 % during the decade. This high rate of increase, more than three-fold that for all British India, may be ascribed partly to the immigration of labourers on the tea estates, but still more to recovery from the results of a severe epidemic fever. The tea industry has been very prosperous in recent years, demand having exceeded production. The total number of labourers on the tea estates in 1911 was 763,239, of whom only 20,868 were under the Act specially enforcing contracts, which it is proposed shortly to repeal. In 1912 Sir A. Earle was appointed chief commissioner of Assam, and it is proposed to give the province a legislative council under the powers conferred by the Act of Parliament passed in that year.

A valuable series of monographs on the more important tribes of Assam is being published by the Government.

BAHAWALPUR.—The population of this native State in 1911 was 780,641, showing an increase of 8.3 % during the decade. The Nawab, a boy of only 7, was a conspicuous figure at the Delhi Durbar, riding at the head of his camel corps in the military review. In February 1911, a feeder railway of 22 miles, constructed at the expense of the state, was opened by the Lieutenant-Governor of the Punjab.

BALUCHISTAN.—The population of British Baluchistan in 1911 was 414,412, showing an increase of 8.5 % during the decade. In the Baluchistan states, the population of Las Bela likewise increased by 9.1 %, while that of Kalat (excluding Kharan) shows an apparent decrease of 10 %, due to the fact that the earlier figure was based upon an estimate, not upon actual enumeration. In British territory, the recent period has been peaceful, except for raids by Afghan outlaws from across the frontier, in consequence of which it has been found necessary to re-arm the levy corps with Martini-Henry rifles. The value of transfrontier trade, though still small, exhibits an increase. The state of Kharan was disturbed after the death of its old chief in June 1909, and his successor was assassinated in April 1911. The ex-Khan of Kalat, who was dethroned in 1893, died at Pishin on May 20, 1909. A severe shock of earthquake was felt throughout Kalat on October 21, 1909, causing great loss of life and property.

A *Gazetteer* of Baluchistan has been published in 8 vols.

BANGALORE.—The population of Bangalore city (including the civil and military station under British jurisdiction) was 189,485 in 1911, showing an increase of 19.1 % during the decade. The Mysore state proposes to introduce an electric tramway service for ten miles through the city and its suburbs.

BANGANAPALLE.—The population of this native State in 1911 was 39,344, showing an increase of 21.9% during the decade.

BARODA.—The population of this native State in 1911 was 2,032,798, showing an increase of 4.1% during the decade; and the population of the city was 99,345, showing a decrease of 4.3%. The Maharaja Gackwar, with the Maharani, was absent during the greater part of 1910, visiting Japan, the United States (where his second son was at college), and England. They again came to London in 1911 for the Coronation. Concerning his act of homage at the Delhi Durbar the description of the official historian may be quoted: "One chief only marred the proceedings for a moment by a laboured ungainliness of bearing which lent itself to misinterpretation." His third son at Oxford has played cricket more than once for the university eleven. Baroda maintains its claim to be the most progressive state in India. In 1911, the length of railways open was 300 miles, and 100 miles more were under construction. In addition, £218,000 was spent on other public works. Export and import duties generally have been abolished, and also octroi in municipalities. Education in primary schools is compulsory and free. A bank and many factories have been established with official encouragement. The legislative council is active in passing laws and regulations. There is also a state council, presided over by the minister. See *A Year with the Gackwar of Baroda*, by E. St.C. Weeden (1912).

BASTAR.—The population of this feudatory State in 1911 was 433,310, showing an increase of no less than 41.4% during the decade, due partly to recovery from famine. In February 1910 there was a serious rising of the aboriginal tribes, which was not suppressed without the intervention of regular troops. Two British officers have since been deputed to assist the Raja, and many reforms have been introduced in the administration.

BEHAR AND ORISSA.—This is the name of the new province in India which was created on April 1, 1912, in accordance with the announcement of the King at the Delhi Durbar and the provisions of a subsequent Act of Parliament. Including Chota Nagpur in addition to the two historic tracts after which it is named, it has a total area (with native States) of about 116,000 sq. m., and a total population (1911) of about 38½ millions, among whom Hindus greatly predominate over Mahomedans. The capital has been fixed at Patna, and a hill station will probably be found on the Chota Nagpur plateau. The first Lieutenant-Governor is Sir Charles Bayley, transferred from Eastern Bengal and Assam; and the first Indian member of the executive council is the Maharaja of Darbhanga, a wealthy landowner in Behar.

BENARES.—The population of Benares city in 1911 was 203,804, showing a decrease of 4.4% during the decade, while the population of the district increased at the rate of 1.7%.

In November 1910 it was announced that the Raja of Benares, Sir Prabhu Narayan Singh, G.C.I.E., who already possessed the rank of His Highness and a salute of 13 guns, would be recognised as a ruling chief, and he was formally invested in April 1911. The new native State thus created, the first in Indian history, consists of what were before known as the Family Domains, with a total area of nearly 1,000 sq. m. in the two districts of Benares and Ghazipur, and a rent roll of about £66,000. In addition, the Raja owns private estates with a rent roll of about £46,000 subject to land revenue. He is descended from the father of Chet Singh, who rebelled against Warren Hastings and was dethroned in 1781.

BENGAL.—The Province of Bengal, while retaining the same official title, has undergone two fundamental changes of area within seven years. In 1905, the original province, practically identical with that comprised in the Diwani grant of 1765, was reduced by the separation of Eastern Bengal from a total area of about 190,000 sq. m. to about 150,000 sq. m., while the population was reduced from over 78 millions to over 54 millions. On April 1, 1912, in accordance with the announcement of the King at the Delhi Durbar and under a subsequent Act of Parliament, Eastern Bengal was reunited, while Behar, Orissa, and Chota Nagpur were separated to form a new Lieutenant-Governorship; and the province was at the same time raised to the rank of a Presidency, under a Governor, with powers and privileges similar to those of the Governors of Madras and Bombay.

In 1911, the population of the Province (as then existing, with the inclusion of native states) was 57,206,430, showing an increase of 4.8% during the decade. The population of the Province as now reconstituted is about 46 millions, with Mahomedans in a slight majority over Hindus. The first governor is Lord Carmichael, transferred from Madras; and the first Indian member of the executive council was Rai Kisori Lal Goswami Bahadur, appointed in November 1910 when an executive council was constituted under the Indian Councils Act of 1909. The same statute authorised the enlargement of the legislative council, which now consists of 52 members, including 25 elected by variously composed constituencies. In the total there were 20 Hindus and 7 Mahomedans. Calcutta remains the capital of Bengal, with Darjiling as the residence of the Governor during the hot season; but it has been solemnly promised that Dacca, the former capital of Eastern Bengal and a centre of Islam, shall always be occupied by the entire administration for a certain period of every year. In 1912, when the Province was reconstituted, the Indian member appointed to the executive council of the Governor was Dyed Shams-ul-Huda, a Mahomedan advocate.

BIHARATPUR.—The population of this native State in 1911 was 558,785, showing a decrease of 10.8% during the decade. The Maharaj, who is still a minor, recently spent two years in England, returning in October 1910. He was a page of honour at the Durbar.

BHOPAL.—The population of the Bhopal Agency in 1911 was 1,050,735, showing an increase of 13.4% during the decade, due to recovery after famine. The population of the city was 56,204, showing an apparent decrease of no less than 27%, due to plague at the time. The Begam of Bhopal, who is a most enlightened ruler and travelled lady, was a conspicuous though veiled figure at the Coronation in London and also at the Delhi Durbar, where one of her sons acted as an A.D.C. and another as a page of honour. She received the decoration of G.C.S.I. on January 1, 1910, and that of C.I. in December 1911.

See *A Pilgrimage to Mecca*, by the Begam of Bhopal (Trans. Calcutta, 1906); and *An Account of My Life*, by the Begam of Bhopal (Trans. 1912).

BIKANER.—The population of this native State in 1911 was 700,983, showing an increase of 19.9% during the decade, due to recovery after famine. The Maharaja, as A.D.C. to the King, was a conspicuous figure at the Coronation and also at the Delhi Durbar, where one of his sons acted as a page of honour. He was created G.C.S.I. on the occasion. In June 1911, he had received the honorary degree of LL.D. at Cambridge. In September 1912, he celebrated the twenty-fifth anniversary of his own accession by opening the Dugar Memorial College in his capital, named after the elder brother to whom he succeeded, and by announcing the formation of a legislative council. He has recently converted an infantry regiment, 500 strong, into Imperial Service troops; and he has offered to contribute towards the construction of a railway through his state to connect Delhi more directly with Karachi. The town of Bikaner is now lighted throughout by electricity. An English officer has been lent to the state to reform the land revenue system.

BOMBAY CITY.—The population of Bombay city in 1911 was 979,445, showing an apparent increase of 26.2% during the decade. But when the Census of 1901 was taken plague was raging in Bombay, and a special enumeration in 1906 returned a total of 959,537. It is also suggested that again in 1911 many persons had left the city owing to depression in the cotton industry or through fear of plague infection.

Bombay city has enjoyed almost unbroken peace and prosperity, its citizens being too well-to-do and too sensible to be affected by the "unrest" that manifested itself in other parts of the Presidency. The only serious trouble was caused in December 1909 by riots of a non-political character between rival sects of Mahomedans at the Muharram festival. It was found necessary to call out the troops, who fired on the mob and 20 lives were lost. Bombay was the scene of the arrival of the King and Queen in India, and also of their departure; and it was there that the King delivered two of his sympathetic speeches. It has been decided to commemorate the Royal visit by erecting an archway on the historic Apollo Bandar.

Two undertakings of the first magnitude are in progress at Bombay. One is the work of the Improvement Trust, which has already reclaimed 90,000 sq. yards from the foreshore for buildings, opened two wide roads through former slums, and erected sanitary chauls or lodging houses for 15,000 poor persons. With the aid of a special grant of £333,000 from the Government of India, it is now engaged in opening out the north of the island, which is difficult of access and sparsely inhabited. The other is the work of the Port Trust, which should be completed in 1913 at a total cost of more than £5,000,000. This consists in the construction of the Alexandra Dock, 50 acres in extent, with a dry dock 1,000 ft. long, and a mole where the mail steamers can lie alongside; and the reclamation of 600 acres for export traffic and a new railway station. Three other projects may be mentioned: the provision of electrical energy from water power in the Western Ghats, which has been commenced by a company with more than £1,000,000 of Indian capital under the auspices of the Tatta firm; a grandiose scheme, still in embryo, for the reclamation of no less than 1,000 acres in Back Bay, at an estimated cost of nearly £2,000,000, to be taken in hand by the Government; and the proposed electrification of all the railways in the island.

See *Gazetteer of Bombay City*, 3 vols. (Bombay, 1910).

BOMBAY PRESIDENCY.—The total population of the Bombay Presidency in 1911 (including Sind, Aden and native States) was 27,084,317, showing an increase of 6.3% during the decade, due mainly to recovery after famine. Agricultural seasons were on the whole favourable, except in Gujarat in 1911; but plague continued to be prevalent. In British territory alone (excluding Aden) the population was 19,626,477 and in native States 7,411,675, the rate of increase in each being almost equal.

Bombay claims to be the province where education is most widely spread and also most efficient. Under the stimulus of encouragement from the Governor, Sir George Clarke (who retired at the end of 1912, with a peerage as Lord Sydenham), great progress has been made in recent years, especially as regards the higher teaching of science. The university has revised its courses and made arrangements for post-graduate study. In Bombay city three wealthy merchants have subscribed £126,000 for the establishment of a Science College, and their example has been followed at Ahmedabad (*q.v.*). Consequently the Science College at Poona has been converted into a college for engineering. A first class agricultural college has been built at Poona. Nor has primary education been neglected. During the two years ending 1911 no less than 1,100 new schools were opened; but it is admitted that there are still 100,000 children whose parents would willingly send them to school if there were schools for them.

The first Indian member to be appointed to the executive council was Mr. Mahadev

Bhaskar Chaul, an advocate of high standing, who has since been nominated to serve on the Royal Commission to enquire into the civil service. The legislative council, as reconstituted in 1910, contains a majority of non-official members. Of the total of 46, Hindus number 20, Mahomedans 7, and Parsis 3.

See *Rural Economy in the Bombay Deccan*, by G. Keatinge (1912).

BUNDI.—The population of this native state in 1911 was 218,730, showing an increase of no less than 27.7% during the decade, due to recovery after famine. In December 1911 the Queen paid a visit to Bundi while the King was shooting in Nepal. There being no railway within the state, she travelled by motor from Ajmer (100 miles). She was hospitably entertained at the capital; and the Maharao, who afterwards came down to Bombay to bid farewell, there received from the King the decoration of G.C.V.O.

BURMA.—The population of the Province of Burma in 1911 was 12,115,217, showing an increase of 15.5% during the decade; more than double the rate of increase for all India. Of this increase about 53,000 is due to an estimate for tribes on the frontier not formerly included. It is noteworthy that the number of Chinese has risen from 62,000 to 123,000, of whom only 17,000 are females.

Burma is happy in the possession of no exciting history. The wave of "unrest" which recently ran through India never reached its borders. Its prosperity depends almost entirely upon rice, and even when the harvest has not been good, this has been compensated by high prices for export. Teak ranks next in importance to rice; and by the extension of working plans over the virgin forests the supply of timber is being maintained. In 1910-1, the net revenue of the forest department amounted to £440,000. Petroleum is another valuable product, though the supply of oil is apparently not increasing. The ruby mines cannot be considered a success; but in 1910-1 lead was produced to the value of £168,000, and rich discoveries of wolfram have recently been reported. What Burma most needs is an improvement in communications, for which purpose it has been proposed to levy a cess upon the rice exported from Rangoon. A line of railway is now being constructed into the Southern Shan States, and a small line has also been opened in the Northern Shan States by the Burma Mines Company. On the northern border, which marches with Chinese territory, occasional raids of Chins, Kachins, and other wild tribes occur; but these have never assumed a serious form. The Shan States are, on the whole, successfully administered by their own Sawbas or chiefs.

Under the recent reform, Burma has a small legislative council with a majority of non-officials, but the elective system has not been introduced. In a total of 15 members, there are 4 Burmans, one Mahomedan, one Parsi, and one Chinese.

CALCUTTA.—The population of the city of Calcutta proper in 1911 was 896,067, showing an increase of 5.7% during the decade; but if the suburbs and also Howrah on the opposite side of the Hughli be added, the total population would be raised to 1,222,313 and the rate of increase to 10.4%. The increase is entirely among Hindus, Mahomedans and Christians showing an actual fall, while females constitute less than one-third of the total.

Though the climate does not enjoy a favourable reputation, Calcutta is fortunate in escaping endemic plague. In 1911, the registered death rate was only 27.2 per thousand, as compared with an average of 32 per thousand for the previous five years. The municipality has recently completed two large projects for doubling the supply of filtered water and for improving the system of drainage. It has also taken over the lighting of the city, and by-laws have been passed relating to dairies, stables, public buildings and markets. During the past ten years the rateable value has increased by 58% to £2,365,000, while the total debt is £3,222,000. In August 1911 an Act was passed by the Bengal legislative council, constituting an Improvement Trust (similar to that at Bombay) to undertake schemes for clearing congested areas and making street improvements, the cost to be met from an increased duty on property transfers, a terminal tax on passengers, and a cess on jute, with contributions from the municipality and the government. The Port Trust has to provide for a trade that has doubled within the last ten years. The more important works completed or in progress are—the extension of docks and sidings, the acquisition and reclamation of land, and the provision of a coal depot, a landing stage, and four ferry steamers. In 1910-1, the receipts amounted to £855,000, while the debt was £5,622,000. Under the stimulus of recent reforms, the Calcutta University has advanced far towards becoming a teaching institution with no less than 49 lecturers and more than 500 students for post-graduate study. The newest college is one founded by Marwaris for commercial education, at a cost of £60,000; while a Hindu lawyer has promised £93,000 for the foundation of a College of Science.

The visit of the King and Queen to Calcutta from December 30, 1911, to January 8, 1912, was even more notable for a popular demonstration of loyalty than the Delhi Durbar. It cannot, however, be disguised that the transfer of the imperial capital to Delhi has been badly received, especially by the English residents, who will lose not only the attractions of a seasonal court but also the advantage of contact with the heads of the administration. Indians, on the other hand, are glad that Bengal is reunited, and that a civilian Lieutenant-Governor has been replaced by a Governor from England. Apart from a possible fall in house rent, there is no reason to suppose that the material prosperity of Calcutta will suffer.

CAWNPORE.—The population of Cawnpore city in 1911 was 178,557, showing an apparent decrease of no less than 12%; but plague was raging at the time, and a later enumeration

raised the number to 195,498. The population of the district likewise shows a decrease of 9%, due to plague and malaria. An agricultural college has recently been opened at Cawnpore, and a trust fund formed for opening out congested areas.

CENTRAL INDIA.—The total population of the Central India Agency in 1911 was 9,356,980, showing an increase of 10.1% during the decade, due to recovery after famine. For the more important states, see *Bhopal, Gwalior, Indore and Rewa*.

A *Gazetteer* of the Central India Agency has been published in 9 vols.

CENTRAL PROVINCES.—The total population of the Central Provinces and Berar (which form a single administration since 1905) was 16,033,310 in 1911, showing an increase of 17.9% during the decade, due to recovery after famine. In the feudatory states alone, with a population of 2,117,002, the rate of increase was as high as 29.8%. Native Christians have increased from 20,115 to 24,106, among whom the Quaker mission counts 1,140 converts. The province, with its large Maratha population, did not altogether escape the prevalent spirit of "unrest;" and in January 1909 the Queen Victoria Memorial at Nagpur was desecrated by a student of the agricultural college. But, on the whole, prosperity has followed upon good harvests, the crops for export being cotton, oilseeds, and wheat. As a result of the Irrigation Commission, a number of small tanks have been excavated to protect precarious tracts, and sanction has been given for the construction of three large canal systems from as many rivers. On January 9, 1912, the King and Queen, on their railway journey back from Calcutta to Bombay, stopped for an hour at Nagpur, to visit the fort and show themselves to the people. Under the Act of Parliament passed in 1912, it is proposed to give the Province a legislative council; but this can only apply with restrictions to Berar, which is not strictly British territory. The Viceroy visited Nagpur on December 17th, to lay the foundation stone of the council hall.

CHAMBA.—The population of this native State in 1911 was 135,873, showing an increase of 6.3% during the decade. A full account of the inscriptions found in the State, and also of the people and their dialects, is given in the *Chamba State Gazetteer* (Lahore, 1910).

COCHIN. The population of this native State in 1911 was 918,110, showing an increase of 13.1% during the decade. Christians number no less than 233,092, mostly Syrians of different rites and Roman Catholics. The state has been exceedingly prosperous of recent years, much attention having been paid to all departments of the administration, especially forests and navigable canals. In January 1911, the Raja's salute was increased to 19 guns as a personal distinction; and he was created G.C.I.E. at the Delhi Durbar.

COORG.—The population of this minor province in 1911 was 174,976, showing a decrease of 3.1% during the decade, due to the decline in the coffee industry. Out of 3,533 Christians, no less than 2,830 were Roman Catholics.

CUTCH.—The population of this native State in 1911 was 513,429, showing an increase of 5.2% during the decade. There are no railways in the State, and the proposal to construct a direct line from Bombay to Karachi through Cutch remains in abeyance.

DACCA.—The population of Dacca city in 1911 was 108,551, showing an increase of 21% during the decade, while both the district and the division increased by more than 11%.

Dacca was the capital of the new province of Eastern Bengal and Assam created in 1905; and now that Bengal has been reunited in 1912, a solemn promise has been made that Dacca shall be occupied by the government for part of every year. Important buildings have been erected for the residence of officials and for the secretariat. The remodelling of the water-works has been completed, and schemes for improving the drainage are in hand. Education, especially in English, is making rapid advance. Hostels and a hall have been opened for Mahomedan students, and it is announced that Dacca will shortly have a local university. At the Delhi Durbar, the Nawab, Sir Khwaja Salimulla, was created G.C.I.E.

DELHI.—The population of Delhi city in 1911 was 232,837, showing an increase of 11.6% during the decade, due to the growth of commerce and industries, while the population of Delhi district fell by 4.6% and that of Delhi division by as much as 8.9%, owing chiefly to plague and malaria.

An account of the Delhi Durbar is given above. Here it may be briefly said that the Royal visit, which lasted from December 7 to 16, 1911, was an unqualified success from the popular point of view. The canvas city along the historic ridge covered a total area of 25 sq. m.; the amphitheatre erected for the crowning ceremony accommodated 100,000 spectators; and 50,000 troops were present at the review. To the Indian mind the most attractive incident was when the King and Queen showed themselves to the crowds below from a balcony in the Fort where the Mogul emperors had been wont to view spectacles.

The site of the new capital is not that of the Durbar, nor does it include the spot where the king performed the ceremony of laying a foundation stone. In accordance with the advice of an expert commission, which included the chairman of the London County Council, it will be on a high and unoccupied tract S.W. of the city, where convenient space and healthy conditions can best be secured. Here at a distance of about 3 m. from the city walls, and separated from them by a wide belt of park, will be built the Viceroy's palace, the council chamber, and other government offices, at a cost provisionally estimated at £4,000,000. The style of architecture to be adopted was still under discussion in 1912, though designs had been invited from architects in India.

Meanwhile, as the Government will not return again to Calcutta, temporary residences and offices were erected at Delhi, at a cost of about £333,000, of which it is estimated that one-third will eventually be recovered. On October 1st, an enclave surrounding the city, with an area of 557 sq. m. and a total population of about 392,000, was by proclamation separated from the Punjab and constituted a new province under a Chief Commissioner, while the laws in force in the Punjab and the jurisdiction of the Chief Court at Lahore are preserved by an Act of the legislative council.

DHOLPUR.—The population of this native State in 1911 was 263,188, showing a decrease of 2.9% during the decade. The Maharaj Rana, Captain Sir Ram Singh Lokindar, K.C.I.E., died on March 29, 1911, and has been succeeded by his brother, Udaibhan Singh Lokindar.

EASTERN BENGAL.—The population of Eastern Bengal and Assam (which was created a separate province in 1905, but ceased to exist in 1912) was 34,018,527 in 1911, showing an increase of 11.5% during the decade. Under the reform, it received in 1910 a legislative council with a non-official majority. Of the total of 40 members, Hindus numbered 13 and Mahomedans 8.

GARHWAL.—The population of the British district of Garhwal in 1911 was 480,167, showing an increase of 11.7% during the decade; and the population of the native state of Tehri-Garhwal was 300,819, showing an increase of 11.9%. The Raja, Sir Kirti Sah, K.C.S.I., is a member of the legislative council for the United Provinces. For both district and State see *Garhwal Gazetteer* (Allahabad, 1910).

GWALIOR.—The population of the Gwalior Residency in 1911 was 9,356,980, showing an increase of 10% during the decade, due to recovery after famine. The population of Lashkar or Gwalior city was 46,952, showing an apparent decrease of no less than 47%, for plague was present at the time of the Census. A later enumeration gave a total of 60,931. The Maharaja Sindhia was a conspicuous figure, as A.D.C. to the King at the Coronation and also at the Delhi Durbar. While in England he received the honorary degrees of D.C.L. from Oxford and LL.D. from Edinburgh. His personal salute has been increased to 21 guns, and he has been raised to the rank of honorary major-general in the British army.

The *Gwalior State Gazetteer* consists of four volumes (Calcutta, Bombay, and Lucknow, 1908), one of which contains nearly 400 photographs of places of historical and archaeological interest, while another is an atlas of 15 maps.

HILL TIPPERA.—The population of this native State in 1911 was 229,613, showing an increase of no less than 32.5% during the decade, due to agricultural prosperity. Valuable deposits of limestone, kaolin, and red ochre have recently been reported. The Raja, Birendra Kishore Manikya, who succeeded his father in 1909, married in August 1910 a cousin of the Maharajadhiraj (nominal king) of Nepal.

HOWRAH.—The population of Howrah city in 1911 was 179,006, showing an increase of 13.6% during the decade; and the population of the district was 943,502, showing an increase of 10.9%. It has been determined to reconstruct the pontoon bridge connecting Howrah with Calcutta on the opposite side of the Hugli.

HYDERABAD.—The population of Hyderabad State in 1911 was 13,374,676, showing an increase of no less than 20% during the decade. The population of Hyderabad city (including the British cantonment of Secunderabad) was 500,623, showing an increase of 11.6%.

The late Nizam (*E. B.* xiv, 32) died on August 29, 1911, at the age of 45, having succeeded when only two years old. He was always constant to the tradition of his family as the loyal ally of the British Government. One of his latest acts was to prohibit the dissemination of seditious literature in his state. He was succeeded by his son, Usman Ali Khan, to whom the Viceroy paid a visit of congratulation in October 1911. At the Delhi Durbar he was a conspicuous figure as the first ruling chief to pay homage, clothed in plain black with a green turban of Mughal pattern. On the previous day he had been created G.C.S.I. On the occasion of his birthday, in July 1912, he announced a change in the administration. Salar Jung, grandson of the famous minister of the same name, was appointed to the office of prime minister, with the Nawab Inad-ul-Mulk (better known as Saiyid Husain Bilgrami, the first Mahomedan member of the Council of India) as his special adviser. The most important recent work has been the construction of the Musi reservoir, for flood protection and the water supply of the city, at a cost of about £666,000. There was a serious outbreak of plague in the early part of 1912.

INDORE.—The population of Indore state in 1911 was 979,360, showing an increase of 16.3% during the decade, due to recovery after famine. The population of Indore city was 44,947, showing an apparent decrease of no less than 48%, for plague was present at the time of the Census. A subsequent enumeration gave a total of 68,733. The young Maharaja Holkar, who had spent the greater part of two years in England and on the continent, was installed with ruling powers in November 1911. He takes over a state that has been vastly improved by the administration of a council during his minority. The most important addition to Indore city has been the completion of Daly College for the sons of Central India chiefs.

JAIPUR.—The population of Jaipur State in 1911 was 2,636,647, showing a decrease of 8% during the decade. The population of the city (the only one in Rajputana with more than 50,000 inhabitants) was 137,098, showing a decrease of 14.4%. Jaipur city was visited

by the Queen in December 1911, while the King was shooting in Nepal. She was entertained by the Maharaja. An excursion was made to Amber, the former capital, now in ruins.

JAISALMER.—The population of this native State in 1911 was 88,311, showing an increase of 20.4% during the decade, due to recovery after famine. The Maharawal, who was born in 1887 and succeeded in 1891, was granted ruling powers in December, 1908.

JHALAWAR.—The population of this native State in 1911 was 96,271, showing an increase of 6.7% during the decade, due to recovery after famine. The Maharaj-Rana paid a visit to England in 1912, when he was a conspicuous figure of the London season. His predecessor, dethroned for persistent misgovernment in 1896, died at Benares in October 1912.

See *Picture Travels: The Record of a European Tour*, by Sir Ghawani Singh, Maharaj-Rana of Jhalawar (1912.)

JIND.—The population of this native State in 1911 was 271,728, showing a decrease of 3.6% during the decade. The state has recently suffered from repeated outbreaks of plague. See *Phukian States Gazetteer* (Lahore, 1909).

JODHPUR.—The population of Jodhpur State in 1911 was 2,957,553, showing an increase of 6.3% during the decade, due to recovery after famine. Large sums have recently been expended upon irrigation, and many new schools have been opened. The Maharaja, who died in March 1911, has been succeeded by his son, a minor, who acted as a page of honour at the Delhi Durbar, and has since been brought to England for education. A regent has been found in Sir Pertab Singh (b. 1845) who had been regent to the boy's father, his own nephew. Sir Pertab Singh resigned for this purpose the state of Idar in Bombay, to which he had succeeded in 1902. He was a conspicuous figure as A.D.C. to the King at the Coronation and also at the Delhi Durbar, when he was created G.C.V.O.

KALAT.—The population of this native State (excluding Kharan) was 335,227 in 1911, showing an apparent decrease of 10% during the decade; but in 1901 the figures had been based on an estimate, not on actual enumeration. While Kalat proper has enjoyed an uneventful history, serious troubles have occurred in the subordinate state of Kharan. The chief, Sir Nauroz Khan, K.C.I.E., died in June 1909, and was succeeded by his son, Sardar Yakub Khan, who repudiated the conditions imposed by the British representative on his accession, and was ultimately killed by his own troops in April, 1911. The succession of his son, Habibullah Khan, has been recognised, and measures taken for the administration of the state during his minority. The ex-Khan of Kalat, Khudadad Khan, G.C.I.E., who had been deposed in 1893, died at Pishin in May, 1909.

KAPURTHALA.—The population of this native State in 1911 was 268,133, showing a decrease of 14.7% during the decade, due to repeated outbreaks of plague. The Maharaja is accustomed to pay frequent visits to England and the continent, leaving his state under an administrative council, presided over by an English official, lent by the Government. He was created G.C.S.I. at the Delhi Durbar.

KASHMIR.—The population of this native State in 1911 was 3,158,126, showing an increase of 8.7% during the decade. The population of Srinagar, the chief city, though the Maharaja resides at Jammu within the Punjab, was 126,344, showing an increase of 3%. The Maharaja is a British major-general, and was created G.C.I.E. at the Durbar.

Apart from a serious epidemic of cholera from June to November 1910, the state has recently enjoyed a period of prosperity. The total revenue has risen from about £666,000 to £761,000, while the cash balance in 1911 amounted to £225,000. In the meantime, large sums have been expended upon public works, especially upon an electrical power scheme on the Jhelum river; and education has been encouraged. The introduction of sericulture has been a notable success, the number of rearsers between 1910 and 1911 having increased from 27,000 to 36,000, and the weight of cocoons produced from 37,000 to 42,000 maunds.

KHAIRPUR.—The population of this native State in 1911 was 223,788, showing an increase of 12.3% during the decade. The Nawab, who succeeded his father in March 1909, was created G.C.I.E. at the Delhi Durbar.

KOLHAPUR.—The population of this native State was 833,441 in 1911, showing a decrease of 8.4% during the decade, due to plague. The Maharaja was created G.C.I.E. at the Delhi Durbar. In 1912 his two sons were brought to England for education.

KOTAH.—The population of this native State in 1911 was 639,089, showing an increase of 17.3% during the decade, due to recovery after famine. The Queen paid a visit to Kotah in December 1911, while the King was shooting in Nepal; and to commemorate the occasion the Maharao, who had been created G.C.S.I. at the Delhi Durbar, offered a lakh of rupees to be sent for the benefit of the women of India. It has been decided that this shall form the nucleus of a fund for founding the Queen Mary College and Hospital for Women at Delhi, towards which other princes and Indian noblemen have already contributed £100,000.

KUCH BEHAR.—The population of this native State in 1911 was 592,952, showing an increase of 4.6% during the decade. The Maharaja (*E. B.* xv, 937) who had come to England to attend the Coronation, died at Bexhill on September 18, 1911. As a colonel in the British army, his body was conveyed to the crematorium at Golder's Green with military ceremony, and a funeral service was read in accordance with the rites of the Brahma Samaj. He was succeeded by his eldest son, educated in England. A legislative council has been

instituted in the State, and one of its first measures was a Tenancy Act. The state railway has been converted from the 2 ft. 6 inch to the metre gauge.

LAHORE.—The population of Lahore city in 1911 was 228,687, showing an increase of 12.7 during the decade, due to its growing importance as a railway centre, with the workshops of the North-Western State Railway. In the district the population has slightly decreased, while in the division the decrease amounts to as much as 8.7%, due to plague and malaria. A water supply for the city has recently been completed.

LUCKNOW.—The population of Lucknow city in 1911 was 259,798, showing a decrease of 1.6% during the decade; the population of both the district and the division likewise decreased at about the same rate. A trust fund has been formed for the purpose of opening out congested areas in the city, and improvements are being made in water supply and drainage. A medical college, the only one in the province, is now approaching completion, and the Canning College has been reconstructed.

MADRAS PRESIDENCY.—The total population of the Madras Presidency (including native States) was 46,217,245 in 1911, showing an increase of 9% during the decade. In native states alone the rate of increase was as high as 14.9%. In British territory the population numbered 41,405,404.

Madras, usually so tranquil, did not escape from the prevalent spirit of "unrest." Apart from isolated disturbances, the most serious occurrence was the assassination of Mr. R. W. D. Ashe, collector of Tinnevely, at a railway station on June 19, 1911. The actual murderer committed suicide; but several of his accomplices were convicted by a special tribunal of the High Court after a prolonged trial. The monsoons, and therefore the harvests, have recently been favourable, permitting an increase in the export of cotton and ground-nuts. The co-operative credit movement has taken a firm hold. As regards irrigation, a project is under consideration for constructing a reservoir in the valley of the Kaveri which (it is said) will be the largest in the world. Apart from indentured emigration to British colonies, labour flows freely from Madras to Ceylon, Burma, and the Straits Settlements. The number of emigrants to the Straits rose from 49,000 in 1910 to 85,000 in 1911.

The first Indian member appointed to the executive council was the Raja of Bobbili, who resigned after a few months, being created G.C.I.E. at the Delhi Durbar. He was succeeded by V. Krishnaswami Aiyar, a Brahman judge of the High Court, who died in December 1911, (see above), and was succeeded by P. S. Sivaswami Aiyar, an advocate of the High Court. The legislative council, as reconstituted in 1909, consists of 46 members, with a non-official majority. Of the total, 19 are Hindus and 3 Mahomedans. Under revised regulations for the second election in December 1912, the number of elected members has been raised from 19 to 21, and the number of nominated members correspondingly reduced, while the electorate has been increased by about 30%. The new Governor, Lord Pentland, took his seat in October 1912, in succession to Lord Carmichael, transferred to Bengal. The districts in Madras are exceptionally large, so that it has recently been found necessary to create three new ones by redistribution: namely, Guntur, Chittoor, and Ramnad.

MADRAS CITY.—The population of Madras city in 1911 was 518,660, showing an increase of 1.8% during the decade. As compared with Calcutta and Bombay, the notable feature is the equal number of males and females, for the workers here bring their families to reside with them. The registered death rate in 1910 was as high as 40 per thousand, due partly to the large proportion of children. The municipality completed in 1911 a scheme for distributing the water supply, and a project for drainage is in hand. The harbour has been so much improved that P. & O. steamers now call at the port, and further improvements are being made. In 1911, the debt of the Port Trust amounted to £558,000.

MANDALAY.—The population of Mandalay city in 1911 was 138,299, showing a decrease of 24.8% during the decade; and the population of the district was 340,770, showing a decrease of 7%, both of which decreases are due to the decay of the former capital, for in the agricultural country around the number of inhabitants largely increased. A scheme for water supply and drainage improvements is in hand.

MANDI.—The population of this native State in 1911 was 181,110, showing an increase of 4.1% during the decade. In May 1909 popular discontent in the state culminated in a serious disturbance which necessitated the despatch of troops from Simla. Order was quickly restored, and an official of the Civil Service has been lent to the state to conduct a settlement of the land revenue. The Raja, Bhawani Sen, died in March 1912.

MYSORE.—The population of this State in 1911 was 5,806,193, showing an increase of 4.8% during the decade. The population of Mysore city was 71,306, showing an increase of 4.7%. The most important event has been the renewal of all the leases on the Kolar Gold Fields for a further term of thirty years from March 22, 1910. In 1911, the total production of gold was 547,746 ounces, all sent to London for refining. Another mineral product is manganese ore, of which 43,000 tons were raised in 1910. Apart from an epidemic of plague, the condition of the state has been prosperous. An economic conference was held for the first time in June, 1911, and cooperative societies have been placed upon a satisfactory basis. An interesting institution is the State Life Insurance Fund, in which policies are held by more than 7,000 persons, assuring a bonus of £447,000 for a monthly premium of £1,500. The

government has proposed a bill for the tentative introduction of compulsory education. The Yubaraja, brother and heir of the Maharaja, was created K.C.I.E. at the Delhi Durbar.

NABHA.—The population of this native State in 1911 was 2,48,887, showing a decrease of 16.5% during the decade, due to the prevalence of plague and malaria. The Raja, the honoured type of an old-fashioned Sikh chief, died on December 25, 1911, at the age of 68, having been too ill to attend the Delhi Durbar. He was succeeded by his son, Ripridaman Singh, born in 1883, who paid a visit to England in 1910, and who, as a member of the Viceroy's Legislative Council, introduced the Anand Marriage Act (passed in 1909) to validate a certain marriage rite of the Sikhs.

NICOBAR ISLANDS.—The population of the Nicobar Islands in 1911 was 8,818, showing an apparent increase of no less than 35.4% during the decade. For the first time most of the tribes were actually enumerated, while the savage Shom Pen, of whom not even an estimate could be formed, accidentally supplied the defect. At the very time of the Census they issued a declaration of war, accompanying it with two tally-sticks, on which notches were cut to indicate the number of fighting men in their settlements, the several settlements being marked off by lateral notches.

N.W. FRONTIER PROVINCE.—The total population of the North-West Frontier Province in 1911 was 3,819,027, showing an apparent increase of no less than 79.7% during the decade. But these figures are misleading. They include estimates of 1,084,824 in the agencies and of 519,441 in the trans-border tribal areas under "political" control, which were omitted from the Census of 1901. In British and "administered" territories alone, the population was 2,196,933, showing an increase of 7.6%. 2,039,994 were Mahomedans.

Agricultural seasons have been favourable, especially for the important wheat crop. There has, however, been a great increase in crime, not of a political nature and not connected with border feuds; and a regrettable outbreak of Mahomedans against Hindus occurred at Peshawar in March 1910. Education is very backward, but the proposal to found an Islamic college at Peshawar has been warmly taken up.

The peace on the frontier has nowhere been seriously disturbed. The large agency tract to the north, consisting of Dir, Swat and Chitral, shows steady progress and development, and a high standard of discipline and behaviour is maintained by all the militia corps. Raids there have been, especially by the Mahsuds; but they are being conciliated, partly by the offer of work on roads and railways, and partly by enlistment in the army. The most important matter has been the appointment of a joint commission with the Afghan government, which met from May to October, 1910, for the settlement of outstanding disputes, which came to an agreement for the removal of outlaws from both countries to a distance of fifty miles from the border. Caravan traffic through the Khyber Pass has gone on without interruption, and two of the Amir's motor cars ran through to Peshawar from Jalalabad.

PATIALA.—The population of this native State in 1911 was 1,407,659, showing a decrease of 11.8% during the decade, due to the prevalence of plague and malaria. The young Maharaja was invested with full powers on November 3, 1910, by the Viceroy, who visited the state for the purpose. In the following year he came to England for the Coronation, and on one or two occasions played cricket with success for the Indian team. At the Delhi Durbar, as the leading Sikh chief, he organised in person the Sikh religious service of loyalty that attracted much notice; and he was created G.C.I.E. The Maharani on the same occasion presented to the Queen an address from Indian ladies, with an historic jewel.

PATNA.—The population of Patna city in 1911 was 136,153, showing an apparent increase of 1% during the decade; but plague was raging at the time of the Census in 1901, and if comparison be made with an enumeration taken later in that year, there would appear a decrease of 11.4%. The district and of the division both show a small decrease.

Patna, or rather the adjoining civil station of Bankipur, has been chosen as the capital of the new province of Bihar and Orissa, constituted on April 1, 1912. In addition to the official buildings required, it is proposed to provide a High Court and also probably a University, both independent of Calcutta. The existing college has recently been equipped with hostels for students. The King twice passed in a steamer along the river front of the city in December 1911, when going to, and returning from, his shooting trip in Nepal.

POONA.—The population of Poona city in 1911 was 158,856, showing an increase of 3.6% during the decade; the population of the district was 1,071,512, showing an increase of 7.7%, due to recovery after famine. The Agricultural College has recently been completed and official buildings for the secretariat &c. are in progress. A water supply scheme, estimated to cost £116,000, has been begun. Among the most interesting modern institutions are the Servants of India Society, founded by the Hon. G. K. Gokhale for preparing graduates by further study for careers of national usefulness; and the Seva Sadan sisterhood, under the direction of the widow of Justice Ranade. The memorial to King Edward VII has taken the form of a hospital for women and children.

PUDUKKOTTAI.—The population of this native State in 1911 was 411,886, showing an increase of 8.3% during the decade. Owing to continued ill-health, the Raja has been absent in Europe for almost the whole of the last three years.

PUNJAB.—The total population of this Province in 1911 was 24,187,750, showing a decrease of 2.3% during the decade, due to the prevalence of plague and malaria. For the native

States alone the rate of decrease was as high as 4.8%. In British districts the population was 19,974,956, showing a decrease of 1.7%. It is noteworthy that the number of native Christians has risen from 37,980 to 163,220, mostly Presbyterians.

The spirit of "unrest," which found its first overt manifestation at Rawalpindi in 1907, died away very rapidly throughout the province, though there is still some friction between Hindus and Mahomedans. In this connexion it may be mentioned that the reforming Hindu sect of the Arya Samaj now number nearly 100,000, compared with only 9,000 males above fifteen who returned themselves as such in 1901. Despite heavy mortality from plague and malaria, the Punjab has enjoyed a large measure of prosperity, owing to the extension of irrigation and a succession of bountiful harvests. In 1910-1, the total area irrigated from government canals was 6 million acres, showing an increase of more than 400,000 acres in two years. The canal colonies are so prosperous that they can afford to hold up their wheat for a favourable price and at the same time to indulge in the luxury of hoarding gold. It is officially stated that £4,000,000 in sovereigns was absorbed by the Punjab during two years. What is known as the Triple Canal Project, on the Upper Jhelum, Upper Chenab, and Lower Bari Doab, is now nearing completion, at a total cost of about £6,500,000. Education is making steady progress, especially education in English. The Sikhs, the Mahomedans, and the Arya Samaj each support an Arts college of their own. In 1910 the percentage of boys of school-going age attending public institutions was 23.3 for Sikhs, 17.7 for Hindus, and 11.3 for Mahomedans.

In accordance with the reforms of 1909, the legislative council now consists of 24 members, of whom only 5 are elected. Of the total, 6 are Mahomedans, 5 Hindus or Sikhs, and one a Parsi. The Land Alienation Act of 1900, designed to protect hereditary land-owning tribes from expropriation by money lenders, has been extended to certain small tribes who are really agriculturists; and it is believed that the old land-owners are now recovering part of what formerly passed out of their hands. Tenants in the canal colonies have been encouraged to purchase hereditary rights in their holdings. An Agricultural College was opened at Lyallpur in December 1910. See *The Industrial Punjab*, by A. Latifi (1911).

RAJPUTANA.—The total population of the Rajputana Agency in 1911 was 10,530,432, showing an increase of 6.9% during the decade, due to recovery after famine. For the more important states, some of which were visited by the Queen in December, 1911, see *Bikaner, Bharatpur, Bundi, Jaipur, Jodhpur, Kotah and Udaipur*.

RAMPUR.—The population of this native State in 1911 was 531,217, showing a decrease of .4% during the decade. The population of Rampur city was 74,316, showing a decrease of 5.6%. As A.D.C. to the King, the Nawab was a conspicuous figure at the Delhi Durbar, when he was created G.C.V.O. He has recently converted six companies of infantry into Imperial Service troops. Though a Pathan, he is a Shiah, and is honoured as the head of that Mahomedan sect in Northern India. Large sums have been spent on the improvement of the capital, old mud houses and shops having been replaced by brick, while a new brick fort full of palaces has a circumference of nearly a mile. The library of Oriental MSS. has few superiors, and there is a large collection of pictures by European artists. A new sugar factory and distillery yield large profits, and the finances of the state are satisfactory.

RANGOON.—The population of Rangoon city, which forms a district by itself, was 293,316 in 1911, showing an increase of 19.5% during the decade. In recent years the city has been almost reconstructed, partly by land reclamation and partly by rebuilding. In 1911, the total debt of the municipality was £1,245,000, of which £403,000 was due to reclamation works. The incidence of direct taxation was 13s. per head. A new pumping station was completed. Rangoon now almost monopolises the trade of Burma, and conducts about 8% of the whole foreign trade of India. In 1910 the Port Commissioners, who found themselves in an embarrassed position, resolved to derive their revenue in future mainly from port and river dues, instead of from landing, shipping and warehousing charges. Their chief task is the construction of river training works, on which the welfare of the port must depend. In 1911, the debt amounted to £1,634,000. Within the last ten years the revenue has increased from £100,000 to £225,000. A local company with European directors, called the Bank of Burma, failed disastrously in 1912, and a public prosecution has been ordered.

REWA.—The population of the Baghelkhand Agency (almost co-extensive with Rewa state) was 1,772,574 in 1911, showing an increase of 14.1% during the decade. The eldest son of the Maharaja acted as one of the pages of honour at the Delhi Durbar.

SANDUR.—The population of this native State in 1911 was 13,526, showing an increase of 20.8% during the decade. The Raja, who is a minor, is being educated in the Court of Wards College in Madras. In 1909-10 the export of manganese ore from this little state by the General Sandur Mining Company reached 60,000 tons.

SIKKIM.—The population of this protected State in 1911 was 87,920, showing an apparent increase of 49% during the decade, following after an increase of 94% in the previous decade. The Maharaja, in his quasi-Tibetan dress, was a conspicuous figure at the Delhi Durbar, on which occasion he was created K.C.I.E. Both he and his son (educated at Oxford) take an active interest in extending education.

SIRMUR (or Nahan).—The population of this native State in 1911 was 138,520, showing

an increase of 2.1 % during the decade. The Raja died on July 4, 1911, and has been succeeded by his son, Amar Parkash.

TONK.—The population of this native State in 1911 was 303,081, showing an increase of 10.9 % during the decade, due to recovery after famine.

TRAVANCORE.—The population of this native State in 1911 was 3,428,975, showing an increase of 16.2 % during the decade, which follows upon an increase of 15.4 %. No further evidence is necessary to prove the extraordinary prosperity of the state, which is likewise indicated by the high standard of education; but it is noteworthy that native Christians have increased faster than the general population, and now number more than one-fourth of the total. The revenue has reached £780,000, and the value of the exports £3,658,000. In August 1912 the Kodyar irrigation works were opened, constructed at a cost of 70 lakhs to irrigate about 70,000 acres; the area of the reservoir will ultimately be 7 sq. m.

UDAIPUR (or Mewar).—The population of this native State in 1911, was 1,293,776, showing an increase of 25.6 % during the decade, due to recovery after famine. At the Delhi Durbar the Maharana, as recognised first in rank of all Rajput princes, was appointed to the dignity of ruling chief in waiting on the King-Emperor, and was created G.C.I.E.

UNITED PROVINCES.—The total population of the United Provinces of Agra and Oudh in 1911, was 48,014,080, showing a decrease of 1 % during the decade, due to the prevalence of plague and malaria. The native state of Tehri-Garhwal alone showed an increase of 12 %. In British territory the population was 47,182,044, the rate of decrease being .7 % in Agra and 2.1 % in Oudh. It is noteworthy that the number of native Christians has risen from 37,980 to 163,220, mostly Methodists.

The province has been happy in escaping almost entirely from the "unrest." This may be ascribed mainly to the efficiency of the local administration, under two popular Lieutenant-Governors. There is, indeed, some friction between Hindus and Mahommedans; and the numbers of the Arya Samaj, or reforming Hindu sect, have increased in ten years from 65,000 to 131,000. The prosperous condition of the people is proved by their rapid recovery from the famine of 1907-8. Relief was so efficiently administered that deaths from starvation were practically unknown, and the large sums then advanced for agricultural improvements were quickly repaid. Harvests have since been generally good. Irrigation has been extended through the precarious tract of Bundelkhand, and a comprehensive scheme is now under consideration to supplement the system of canals that take their water from the Ganges and the Jumna by diverting the overflow of the Sarda river in Oudh. The exhibition at Allahabad during the winter of 1910-1 was the means of popularising labour-saving implements and machinery for sugar making, and an agricultural college has recently been opened at Cawnpore. Special attention has also been paid to technical education and the encouragement of industries. It must, however, be admitted that the United Provinces still lag behind in the matter of primary instruction.

In accordance with the reforms of 1909, the legislative council now consists of 48 members, of whom 18 are Hindus and 9 Mahommedans. One of its most important measures has been a Court of Wards Act, for the disqualification of spendthrifts. Sir J. P. Hewett, whose term of office was marked by friendly cooperation with Indian sentiment, was succeeded as Lieutenant-Governor by Sir J. S. Meston in September 1912. It was understood that an executive council with an Indian member, as in Behar and Orissa, would shortly be given to the United Provinces.

(J. S. COTTON.)

CEYLON¹

The population of Ceylon in 1911 (census, March 10), inclusive of military and shipping, was 4,109,470, as compared with 3,578,333 in 1901, an increase of 531,137, or nearly 15 %. The figures for the nine provinces of the island were as follows:—

Provinces.	Population.	Increase per cent.	Provinces.	Population.	Increase per cent.
Western . . .	1,110,393	18.84	North Western . . .	433,958	21.86
Central . . .	671,806	7.76	North Central . . .	86,269	8.94
Northern . . .	369,654	8.65	Uva . . .	216,655	16.42
Southern . . .	628,491	10.89	Sabaragamuwa . . .	408,524	26.97
Eastern . . .	183,720	6.02			

A feature of the decade was the movement of population into the towns. Colombo with its population of 211,284 increased by 32.5 % and Kandy with 29,928 by 25.82 %. Newara Eliya, the health resort, with 7,412, shows an increase of 36.43 %. The only town of any importance showing a decrease of population is Trincomalie, where the naval yard has been closed and the military garrison taken away. There has been a satisfactory increase of 21 % in the number of Europeans, who are now twice as numerous as in 1871. Of the native races the low Country Sinhalese show the highest percentage, 18.7, of increase. The Moors show 16.8, the Kandians 14.2, the Tamils 11.3, and the Malays 9.9. There has been an increase in the number of Buddhists and Christians and a decrease in that of Hindus. In 1901 there were 8,806 females to 10,000 males, and in 1911, 8,878.

¹ See E. B. v, 780.

Agriculture.—Messrs A. M. & J. Ferguson, the authors of the *Ceylon Handbook and Directory*, estimate that out of a total of 15,809,280 acres in the island, there were in January 1912 about 3½ million acres under cultivation, a slight increase on the corresponding estimate made by them in July 1908. Coco-nuts occupy 770,000 acres, rice 620,000 acres, and palms, other than coco-nuts, about 300,000 acres.

The acreage under tea, about 395,000 acres, has not varied much since 1909, any increase due to newly planted fields being cancelled by the dying out of those where rubber has been interplanted. The crop for 1911, 187,674,990 lbs., though 6,000,000 lbs. in excess of that for 1910, fell short of the record crop for 1909 by 4,000,000 lbs. The estimate by the Planters' Association of the 1912 crop is 193,000,000 lbs.

In rubber planting there has been very rapid development. An area of 184,000 acres in 1909 has risen to 217,000 acres in 1912, while the shipment of 1½ million lbs. in the former year increased to over 7 million lbs. in 1911. It was estimated that in 1912 the shipments would again be more than doubled. In cocoa, about 32,000 acres, and cardamoms, about 8,000, there has been no increase of area under cultivation. Coffee and cinchona bark, once leading products, have practically disappeared from the list of exports. In cinnamon no change is recorded. Immigrant labour, brought over from southern India under a system of money advances, has from the first been the life blood of Ceylon planting. In 1910 the arrivals and departures were respectively 118,000 and 64,000; in January to June 1911 they were 40,000 and 36,000. The system has for the most part worked admirably. But in the last few years an excessive strain has been thrown on it by the vast area brought under cultivation for rubber both in Ceylon and in the Federated Malay States; and in the keen competition for coolies the amounts advanced have so increased as to leave small hope of recovery in full. To meet this proprietors of tea and rubber estates have formed "The Ceylon Proprietors' Labour Federation" with the object of limiting the amount of advances, and ultimately of substituting for the present system one under which all the initial expenses of the immigrant shall be paid in such manner that he shall start work in Ceylon free of debt.

Commerce.—The last Government Blue Book, in place of giving figures as previously for the calendar year, gives them for 18 months, January 1, 1910 to June 30, 1911 as follows: Imports, 164,864,703; exports, 173,717,722. The increase since 1900 is about 18%.

Finance.—The public revenue has risen from Rs. 27,325,930 in 1900 to Rs. 39,332,860 in 1909 and to Rs. 65,612,640 in the 18 months, January 1, 1910, to June 30, 1911. Assuming that the figures for 1910 must have exceeded Rs. 41,000,000 the increase in the present century has been fully 50%. Public expenditure has risen to correspond.

The public debt to June 30, 1911 was: loans raised in London £5,962,700, equivalent, at 1s. 4d. to the R., to Rs. 89,440,500; local loans, Rs. 3,064,027; the total debt, Rs. 92,504,527; less sinking funds, Rs. 12,425,330, making a net debt of Rs. 80,079,197, or the equivalent of £5,338,613, equal to about 2 years' revenue.

Railways.—The mileage open for traffic increased from 563 in 1908 to 604 in 1912, and 130 miles more are either in course of construction or have been sanctioned. Sanction has been sought for other 72 miles which should be complete within four years. The railways have from the first been a fruitful source of revenue to the government, to which they belong. In the 18 months from January 1, 1910 to June 30, 1911 the receipts were Rs. 13,583,160 and working expenses Rs. 6,337,583, showing a profit of Rs. 7,245,577. It is calculated that this is a return of 7½% on the capital expended.

Shipping.—The total tonnage of vessels calling at Ceylon ports in 1910 was 9,371,097 as against 8,453,236 in 1909. Over 90% was entered at Colombo, where the harbour, like the railways (though in a less degree), has become a source of government revenue. The estimated receipts for 1911–12 (July 1 to June 30) were Rs. 2,609,380, and the estimated expenditure Rs. 2,085,656, showing an estimated profit of Rs. 523,724. As the annual charge for the public debt only slightly exceeds Rs. 4,000,000, or not much more than half the profits of the railways and harbour, the financial condition is quite sound.

Political and Social Progress.—The Legislative Council, hitherto consisting of the governor, ten official members and eight unofficial members, has been reformed by Ordinance 13 of 1910. In the past the unofficial members were all nominated by the governor, who as a rule placed the nominations in the hands of the various representative bodies of the island. Three of the eight seats were held by Europeans, the other five by natives. The reformed council consists of the governor, eleven official members and ten unofficial members. The new official member is the government agent for the time being of the Southern Province. Of the unofficials four are elected by constituencies created under the above ordinance and are styled the European urban member, the European rural member, the burgher member and the Educated Ceylonese member, the electors being (1) Europeans resident in Colombo, Calle and Kandy; (2) other Europeans resident throughout the island; (3) the Burgher community; (4) natives who can read and write English. The other six unofficial members are nominated as before by the governor.

The first elections took place in November and December 1911. For the European seats there was no contest, and as under the old system, leading members of the Chamber of Commerce and Planters' Association were elected. The native seats were warmly contested. The reformed council held its first sitting on January 16, 1912. The reduction of the num-

ber of European unofficial members from three to two has been severely criticised. Committee work is perhaps the most important part of the work of the council and no committee can be counted complete without one European unofficial member on it. With only two members available it will hardly be possible to provide a representative on every committee.

Under the *Excise Ordinance* of 1911 introducing the Madras system into Ceylon 1140 "toddy" taverns have been recently opened under Government regulation. This has led to protests being lodged with the Secretary of State in London by the Native Races and Liquor Traffic United Committee and by many influential native gentlemen.

Education has become more widely diffused with the increase of prosperity. In 1911 there were 299,620 pupils under instruction, an increase of about 63% since 1901. The government has a training college with about 100 students, but there is not yet any general provision for higher technical education. Sir. H. E. McCallum, G.C.M.G. (b. 1852), resigned the governorship of the colony on Dec. 12, 1912, owing to a breakdown in health.

(W. MARTIN LEAKE.)

BRITISH MALAYA, ETC.¹

Straits Settlements.²—Exclusive of the floating population, in 1911 the residents in the Straits Settlements proper (excluding Christmas Island and the Cocos-Keeling Islands) numbered 705,405, males being nearly 2 to 1; Singapore had 303,321; Penang, 141,559; Province Wellesley, 128,978; Malacca, 124,081; The Dindings, 7,466. Chinese comprised more than half the total population, numbering 366,765; then came the Malays and allied races with 235,762; Indians, 81,928; and Europeans and Americans, 7,276. The military at Singapore (including dependents) numbered 3,714.

As regards religions, the census returns gave the following statistics: Non-Christian and non-Mahomedan Chinese 359,760; Mahomedans 261,154; Hindus 52,579; Christians 27,474; Buddhists (non-Chinese), 2,758; Jews 387; Sikhs 372.

In 1910 there were 216,321 Chinese immigrants, but in 1911 a fresh record was established with 269,854, made up of 226,129 men, 22,738 women, 16,030 boys and 4,957 girls. Most of them proceeded to the Malay States to work in the tin mines and on rubber estates, and a few went to neighbouring Dutch possessions. The number of Indian immigrants also established a record—108,471 in 1911 as against 83,723 in 1910.

The large increase in the number of immigrants from southern India of the free coolie class is due to the requirements of the rubber-planting industry. In 1911 the system of indentured labourers ceased. In 1910 37,829 adults and 1,251 children returned to India, and in 1911 46,754 adults and 5,614 children, so that the net gain to the Indian population of the Settlements in 1911 was 56,103.

The number of births in the Colony in 1911 was 18,069 against 18,012 in 1910, and the number of deaths 33,075 against 27,484 in 1910. The birth rate was 25.38 as against 27.5 per mille, and the death rate 46.45 as against 41.88 per mille.

In 1911, the police force had a total strength of 2,450, made up of 100 Europeans, 372 Sikhs, and 1,979 Malays, Tamils, and Chinese. The number of arrests during the year was 17,954, a decrease of 1,769 on 1910. There were 484 banishments, against 643 in 1910.

During 1900 the Education Board was appointed to assist the government in the control of money spent for educational purposes. All school fees and other sums collected by the Department are credited to the account of the Board. The levying of an education rate, which was new in 1910, has relieved the government of a large proportion of the expenditure on education. In 1911 Singapore had 33 schools, with an average enrollment of 7,714 pupils; Penang 102, with 10,469 pupils; Malacca 83, with 6,183 pupils. The total amount expended (\$427,225) was slightly higher than in 1910, and the net average expenditure per pupil was \$10.73, as against \$11.03 in 1910 and \$16.52 in 1909. The largest number of schools are for Malays. At the English schools the average attendance increased from 11,232 in 1910 to 11,456 in 1911. The number of girls attending school continues to increase, especially among the Chinese.

The years 1909 and 1910 witnessed a remarkable development of agricultural activity, especially in Malacca and Province Wellesley. In Singapore considerable acres of waste land were put under rubber, which was planted also through the pine-apple fields. At the end of 1911 there were 29,150 acres of rubber on this island alone. The expansion of rubber planting has led to the neglect of fruit cultivation and other forms of agriculture, but there is a slight increase in coco-nut planting, and several new plantations of pepper and gambier, which has been inclined to disappear, and a slight increase in indigo, citronella grass, ginger and ground-nuts. Sugar is going out as a product of Penang and Province Wellesley owing to the sale of plantations to rubber companies, and spices are still cultivated only to a small extent. In Malacca rubber planting expands at the expense of tapioca. At the end of 1911 there were 80,000 acres alienated for rubber estates. The actual acreage planted in rubber in the whole of the Settlements was 80,629 as against 60,568 in 1910.

¹ For information contained in this section the Editor is indebted to the Malay States Information Agency, London.

² See *E. B.* xxv, 980.

There are 165 square miles of forest land; about 10% being forest reserves.

The trade shows a steady growth. The total imports in 1911 were valued at £46,437,339 as against £42,521,576 in 1910; and exports £39,887,145, as against £37,822,142.

The values of the leading articles of import and export in round figures were as follows:—Imports: Tin and tin-ore, £9,780,870; rice and other grains, £6,679,620; cotton piece goods, £2,600,385; opium, £1,735,070; fish, £1,275,400; provisions, £1,211,000; coal, £851,670; machinery, £561,400; silk piece goods, £428,050; cycles, motor cars and accessories, £167,770. Exports: Tin, £10,737,770; gums (including rubber), £4,279,920; copra, £1,984,150; spices, £1,600,090; tapioca, £520,920; rattans, £515,085; gambier, £502,600; sago, £486,735; phosphate of lime, £383,485; coco-nut oil, £265,420; preserved pines, £288,750.

It should be stated that the trade of the ports is chiefly a transit trade, and that these statistics refer largely to the trade of the whole of the Malay Peninsula augmented by transshipments from and to neighbouring countries.

The merchant shipping entered and cleared (exclusive of native craft) in 1911 amounted to 24,086,904 tons, including 14,277,754 tons British.

Revenue in 1911 amounted to \$11,409,220, and expenditure to \$9,085,389. The position of the Loan Account—an additional sum of £2,750,000 having been raised in 1910—was as follows on December 31, 1911:— $3\frac{1}{2}$ % S.S. Inscribed Stock, £6,913,352; 4% S.S. Debentures £1,030,100, total £7,943,452. Provision is made for repayment of this loan by a sinking fund which will come into operation in 1917. The charge on account of interest in 1911 was \$2,449,243 as against \$1,608,865 in 1910. The greater portion of this charge, however, is borne by the Tanjong, Pager Dock Board and other bodies to whom portions of the loan funds have been allocated. The actual sums paid by the Colonial Government in 1910 and 1911 respectively were \$103,667 and \$806,961.

The revenue and expenditure of the Singapore, Penang and Malacca municipalities for 1910 and 1911 were as follows:—

	Revenue.		Expenditure.	
	1910	1911	1910	1911
Singapore . . .	\$2,512,507	\$2,961,876	\$2,446,041	\$2,926,626
Penang	1,103,587	1,206,244	1,116,307	1,128,605
Malacca	76,853	91,828	76,282	90,895

The debt of the three municipalities at the end of 1911 was as follows:—Singapore, \$7,067,300; Penang, \$2,630,000; Malacca, \$83,800.

In 1909 the excise farms were abolished. Towards the end of the year the Government Monopolies Department was formed and arrangements made for taking over not only the preparation and sale of opium but also the collection of duty on liquors; and at midnight on December 31 the "farmers" handed over premises, stock and utensils to the superintendent of the Department. In addition to supplying the Colony, the Department also arranged to supply the districts included in the Perak, Selangor and Negri Sembilan Coast Farms and also the State of Johore; and from January 1, 1911 the whole of the Federated Malay States were included in the operations of the Department. In 1911 the cash receipts for opium for consumption in the Colony were \$7,707,068, against \$6,612,918 in 1910. The collections in respect of duty on intoxicants in 1911 were:—Singapore \$665,258; Penang \$505,537; Malacca \$164,386.

For five years extensive works have been in progress to increase the wharfrage accommodation at Singapore and Penang, and otherwise to improve the harbour at Singapore, where a new graving dock, the largest in the Far East, has been constructed. The harbour works at Singapore include a new sea-wall and reclamation at Teluk Ayer and a lagoon wet dock and additional wharfrage at Tanjong Pagar.

A ferry now connects the railway system with the mainland at the straits of Johore, and a through service of trains, night and day, runs between Singapore and Penang, by way of Kuala Lumpur, the capital of the Federated Malay States. The journey occupies 23 hours. Improvements have taken place in the postal, telegraph and telephone services since the new treaty brought Kelantan, Trengganu, Kedah and Perlis under British suzerainty.

The mean temperature of Singapore and Penang in 1911 was 82.6° of Province Wellesley 83.7°; and of Malacca 82.1°. The rainfall recorded in 1911 was—Singapore, 88.10 inches; Penang, 77.25; Province Wellesley, 90.47; and Malacca 81.41 inches.

Labuan.¹—By the census of 1911 the population amounted to 6,546 (3,662 males, 2,884 females), of whom 34 were Europeans, 1,799 Chinese and 4,434 belonged to the Malay races. There were 189 births and 183 deaths, compared with 235 and 267 respectively in 1910. Census returns gave 116 inhabitants as Christians and 4,430 Mahommedans.

The revenue in 1910 was \$82,926.44, and in 1911 \$78,990.44; the expenditure \$104,855.98 in 1910 and \$105,989.87 in 1911. Imports in 1910 were valued at \$1,437,390, and in 1911 \$1,258,884; Exports \$1,217,132 in 1910, and in 1911 \$1,074,737.

The shipping entering Port Victoria was 282,742 tons (British, 152,668) in 1910; in 1911, 136,884 tons (British, 42,288).

¹ See E. B. xvi, 31.

A noteworthy feature in the history of the island in 1911 was the closing of the mines at Coal Point belonging to the Labuan Coalfields Co., Ltd. In 1909 there was an output of 61,855 tons and of 86,689 in 1910, the export in the respective years being 57,268 and 92,223 tons. Only 17,748 tons were exported as cargo and bunker coal in 1911. The shrinkage in trade was due entirely to the stoppage of mining.

A fortnightly mail service is maintained by German steamers between Labuan and Singapore. The rainfall was 151.25 inches in 1910; 99.82 inches in 1911.

Cocos-Keeling Islands.—The annual official visit to the Cocos Islands was made in September–October 1911 by Mr. Charleton Maxwell. A wireless telegraph installation had been erected on Direction Island in March. Messages have been sent a distance of 2,300 miles, and have been exchanged over a radius of 1,600 miles.

According to the census of 1911 there was a population of 749 (411 males, 338 females), of whom 39 were Europeans and 668 belonged to Malay races (including 33 Bantamese contract coolies). At the time of Mr. Maxwell's visit the population was recorded as follows:—Home Island, 640 (3 Europeans); Direction Island, 64 (27 Europeans); total, 704. The Europeans on Direction Island are members of the Eastern Extension Telegraph Company's staff. There were 50 Christians and 669 Mahommedans when the census was taken.

There are no independent trades or industries. Every able-bodied man and every boy over fourteen years of age is in the direct employment of the proprietor, Mr. Clunies-Ross. There are 172 men and boys rated for pay according to their ability, apprentices receiving 1 rupee per week and competent artisans 7 rupees. Fishing is done only as a recreation in spare time. One man is rated as a fisherman and supplies the proprietor's household with fish. Soap, vinegar and salt are manufactured locally. The soap is made from coco-nut oil and the ashes of the coco-nut husks; the vinegar from the palm wine "tuwak," and the salt from sea-water evaporated over a fire in iron pans. Mr. Clunies-Ross proposes to start a small export trade in shark's liver oil for the manufacture of cod-liver oil. Since the typhoon of 1909 a large number of coco-nuts have been used as seed, and the replanting of the entire area of the islands was nearly completed in October 1911. The area available for planting is 10 square miles or 6,400 acres, and is planted with 1,216,000 trees. In the typhoon there were over 1,000,000 trees, and only 3 per cent were left standing. No copra was exported in 1911, but export was expected to be renewed in 1913. In 1910 the export was 371 tons.

The rainfall of 1911 was 70.25 inches.

Christmas Island.²—In 1911 the population amounted to 1,369 (1,328 males, 41 females), 19 being Europeans, 1,252 Chinese and 44 Malays. Christians 32, Mahommedans 46.

The rainfall of 112.43 inches in 1909 was a record, but was eclipsed in 1910 with 136.93.

In 1909 the only export was phosphate of lime (105,481 tons), but in 1910, in addition to 137,700 tons of phosphate, there were exported 1,200 lbs. of cotton. Extension works are in hand to increase the output of phosphate. As the present quarry will be exhausted in a few years, the Company is building a light railway, 15 miles long, to open up phosphate beds, hitherto untouched, on the south-east end of the island. Value of imports (1911) \$229,513; exports \$3,288,208. Revenue (1910) \$85,023.34; expenditure, \$14,107.25.

British North Borneo.³—According to the census of 1911 the population was 208,183 (79,141 men, 60,081 women, 35,774 boys and 33,187 girls), compared with 104,527 in 1901, an increase of 103,656. In Sandakan, the seat of government, there were 8,256 inhabitants, and in Jesselton 2,686. The total of 208,183 included 355 Europeans, 167,586 natives of Borneo (of whom 87,951 were Dunsuns, 25,314 Muruts, and 22,587 Bajaws), 26,002 Chinese, 5,510 natives of the Dutch East Indies, 5,503 natives of the Sulu Archipelago, and 246 Japanese. Divided by religions there were 3,156 Christians, 61,165 Mahommedans, 24,076 Confucianists, 164 Buddhists, 150 Hindus, 173 Sikhs, and 119,299 pagans. Agriculturists numbered 74,469, labourers 18,865, and fishermen 3,528. Steps are being taken to attract agricultural immigrants, and arrangements have been made for the immigration of labourers.

Recent years have witnessed an enormous development in British North Borneo, and the Court of Directors of the Chartered Company by which its affairs are administered have every reason to be satisfied. "Seconded" by the Colonial Office for the purpose, Mr. J. Scott Mason (b. 1873) in 1912 assumed the governorship in succession to Mr. F. R. Ellis for a period of two years; but on December 5 he was killed by a fall from his horse, and Mr. Aylmer Pearson, formerly acting-governor, at once returned from England to take up the office. To aid the governor and the staff of civilians in the local administration, a legislative council was created in 1911, upon which the commercial, planting, Chinese and native communities have representatives. Sanitary Boards have been established at Sandakan, Lahad Datu and other townships.

The reorganization of the medical department is in progress, and a hill station for Europeans is in contemplation. Increased grants-in-aid have been made to the missionary bodies in whose hands educational affairs are at present.

There are 125 miles of railway on the north-west coast connecting Jesselton with Weston, in Brunei Bay, and Tenom, inland. The gross earnings amounted to £16,936 in 1911 against £13,214 in 1910. A sum of £28,000 was spent in improving and strengthening the

¹ See *E. B.* xv, 712.

² See *E. B.*, vi, 294.

³ See *E. B.* iv, 262 *et seq.*

line during the year. The Court has under consideration a scheme for the construction of roads to supersede the present bridle-paths. There is a regular weekly service of steamers between Singapore and North Borneo ports. It is also hoped to arrange a weekly service between Hongkong and Sandakan in place of the present uncertain fortnightly service. Other schemes are for the reclamation of land at Jesselton, the improvement of its wharf and pier, the provision of adequate water supplies for that port and for Sandakan, and the lighting of the coast. There are about 800 miles of telegraph lines. Their maintenance is costly and the Court has decided to erect wireless installations at various points.

The revenue was £247,599 in 1910, and £180,646 in 1911; the expenditure £95,107 in 1910, and £96,745 in 1911. The revenue for 1910 included £60,000 derived from concessions, £16,792 from land sales, £13,593 from railway receipts, £54,257 from customs, and £39,587 from excise and licences; while the expenditure included £17,180 for railway working expenses and £13,647 for constabulary. In 1911 customs brought in £59,005, excise farms and licences, £43,135, and railway receipts £17,040; there was no income from concessions and only £397 from land sales. The railway working expenses amounted to £20,125, and the cost of constabulary had fallen to £9,816.

Following the policy of the Straits Settlements, the British North Borneo Company has created an Opium Monopoly Department as from January 1, 1913.

The total volume of trade in 1910 was valued at £981,000 and in 1911 at £1,101,000, an increase of £120,000. Out of 47 headings 39 showed increases in 1911. Estate rubber heads the list, 149,000 lbs. exported being valued at £41,096, as compared with 54,000 lbs. and a value of £22,866 in 1910. Successive years should show a large increase as more estates come into bearing, but as cultivated rubber is free of export duty for another 43 years this item does not affect the revenue. At the end of July 1912, out of 30 companies operating in the territory, the majority were engaged in rubber growing, while others are engaged in coco-nut and tobacco cultivation. There were upwards of 23,000 acres under rubber. One company had a crop of 280,410 coco-nuts in 1911, and the export of copra was 1,183,866 lbs. against 1,034,533 lbs. in 1910. The output of tobacco was 13,750 bales as compared with 13,508 bales in 1910. The export of timber amounted to 1,311,539 cubic feet against 1,218,967 cubic feet in 1910. The British Borneo and Burmah Petroleum Syndicate have acquired a large tract in the Klias peninsula, where they had located an oil-field. Following upon this discovery, they have taken up on lease 440 square miles of territory, and are prospecting extensive areas. The output of coal in 1911 amounted to 38,920 tons. The Cowic Harbour Coal Company have satisfied the Court of Directors that the collieries are at present sufficiently developed to yield up to 500 tons of coal a day, provided that labour is available and some expenditure incurred to put the surface coal-handling arrangements in order.

Brunei.—The census of 1911 shows 6,380 males, 7,193 adult females, 4,139 male, and 3,986 female children, with a total of 21,718. Of these 20 were Europeans and 736 Chinese. The only town of any size, Brunei or Dar-ul-Salam (city of peace), has a population of 9,767, including 8 Europeans. It is composed of houses built in the river on nibong piles. With the establishment of peace and order the natives are gradually learning the advantages of cultivation and are migrating to terra firma. At Muara Damit (Brooketon), leased to Raja Brooke, where there is a colliery, there is a settlement of 1,447 persons. Since the appointment of a resident British official, the common people have shown eagerness to take up land, and plant coco-nuts. The wild rubber tree, Jelutong (*Dyera costulata*), is common and is worked for export. Land suitable for cultivation of Pará rubber (*Hevea brasiliensis*) is alienated by the government at an extremely low rental, and several European companies have taken out grants, and are proceeding with planting. At Brunei Town, the Island Trading Syndicate has its cutch factory, employing several hundreds of hands. The value of the cutch exported in 1911 amounted to \$262,216.

Coal is worked on Berembang and at Raja Brooke's Brooketon collieries. The gross output of coal from these collieries in 1910 was 18,418 tons and in 1911 25,607 tons.

The principal imports are piece goods, tobacco, kerosene and sugar. The main exports are cutch, sago, hides and jungle produce of various kinds. The imports at Brunei Town amounted to goods of a declared value of \$70,000 in 1909 and of \$82,000 in 1910. The exports from Brunei Town for the same years reached a value of \$237,000 and \$246,000.

That oil in payable quantities is to be found in Brunei can no longer be doubted. Bores are being sunk at Jenidong and in the Belait District, with every hope of success. Prospecting leases are granted on exceptionally easy terms.

Revenue (1911) \$261,865; expenditure, \$247,930. There is a public debt of \$400,000, and the state has investments to its credit of a capitalised value of \$444,744.

Federated Malay States.—Each year witnesses a steady growth in the progress and prosperity of the Federated Malay States. In 1911, though the output of tin was not greatly in excess of 1910, the enhanced value brought benefit, while the rapid expansion of the plantation rubber industry is reflected in the statistics of the various departments. The demands for labour in the mines and on the plantations have hampered to some extent the development of public works; but much has been done to construct new roads and

¹ See *E. B.* iv, 681.

² See *E. B.* xvii, 478 *et seq.*

waterworks, to extend the railway system, to improve the harbours and to carry out other public works necessitated by the expansion of commerce and the growth of industries.

In 1912 Benker Semang, a small tract of territory, 20 miles square, between the states of Kedah and Perak, was formally transferred from Kedah to the latter state.

Between 1901 and 1911 the population of the Federated Malay States increased by 358,404 persons, or 52.8 per cent. In the latter years of the decade, the extension of rubber planting was very rapid and labour was introduced to meet the demands of the numerous new estates. Towards the end of 1907 there began a slump in the tin-mining industry. The closing down of many of the lower grade mines threw numbers of Chinese out of employment, and led to much emigration. But the slump in the mining industry was well over before the last census was taken and the tide of immigration had set in with augmented force owing to the increased demand for Chinese labour on rubber estates. A comparison of the population enumerated in the censuses of 1891, 1901 and 1911 shows the remarkable increase from 418,509 in 1891 to 678,595 in 1901 and then to 1,036,999 in 1911. Of the latter total, 725,062 were males and 311,937 females. The races represented were as follows:—Europeans 3,284, Eurasians 2,649, Malays 420,840, Chinese 433,244, Indians 172,465, others 4,517. The religions professed were:—Mahomedan 406,860, Hindu 140,068, Christian 22,902, Sikh 7,406, other non-Christian religions 420,381, not given 12,164. In 1911 there were 108,471 Indian immigrants (the highest number recorded) against 83,723 in 1910. The excess of Chinese immigrants over emigrants in 1911 was 38,033 against 7,794 in 1910.

The total amount spent by the Education Department in 1911 was \$330,563. Schools increased from 356 in 1910 to 369, with an average enrolment of 22,566 pupils (19,585 boys, 2,981 girls) and an average attendance of 18,384. At the English schools 3,171 boys and 909 girls were in average attendance.

Throughout the year the battalion of Malay States Guides was kept up at full strength of 895, mainly Sikhs, Pathans and Mahomedans. The rank and file of the Malay States Volunteer Rifles, composed of Europeans, numbered 578. The police force was 2,882.

Revenue (1911) \$35,056,544; expenditure \$25,292,749. The largest amounts collected were:—customs \$11,313,173, licences and excise \$9,574,437, railways \$7,039,789, land \$1,771,317, interest \$1,383,981, municipal \$1,183,760, land sales \$519,646.

The actual Federal revenue (as distinct from the whole Federated Malay States revenue) was \$9,568,590, an increase of \$1,466,885 over that of 1910, of which railway revenue contributed \$1,043,140. The Federal expenditure was \$15,144,696, an increase of \$1,993,771 over that of 1910, of which \$7,550,513 was spent on railway account. The balance to the credit of the Federated Malay States is now \$52,537,647.

Rubber is now the principal agricultural product. The number of estates increased in 1911 to 700 against 435 in 1910; the labour force to 166,015 from 128,446; and the output to 21,809,617 lbs. from 12,563,220 lbs. For the first eleven months of 1912 the output was 31,024,086 lbs. Copra exports in 1911 reached approximately 8,000 tons, the value being \$1,553,000. It was a bad year for padi; the acreage under cultivation shrinking from 119,224 in 1910 to 103,278 in 1911. The output was 3,313,437 bushels. The following statistics show the agricultural acreages in 1911, exclusive of padi and horticulture:—rubber 352,974; coco-nuts 142,774; coffee 11,313; other cultivations 18,751. 153 square miles were added to reserved forests, bringing the total area reserved to 1,161 square miles out of a total area of 27,750 square miles. It was a prosperous year for mining owing to the high average price for tin. From all sources the revenue of the Mines Department was \$9,416,779 against \$7,753,143 in 1910. Of this amount \$8,818,764 was on account of the export duty on tin and tin-ore against \$7,162,026 in 1910. The output of tin was 44,149 tons in 1911, and the value \$69,645,466 against \$57,116,989 in 1910. The total labour force in mines was 196,427 against 170,361 in 1910. The output of wolfram was 88 tons, of a value of \$84,500 in 1911, against a value of \$47,400 in 1910. There was a falling off in gold production, the output being 9,228 ounces, valued at \$306,514, against 16,767 ounces in 1910, valued at \$574,868.

In the states of Perak, Selangor and Negri Sembilan, 3,890 fishermen were employed in 1911 on the fisheries compared with 3,765 in 1910.

Again there was an increase of trade on the record for 1910, the aggregate value, including bullion and specie, being \$182,812,966, against \$156,107,141 in 1910. The leading exports were:—coffee \$302,608; rice \$752,973; sugar \$235,343; gambier \$241,413; tapioca \$312,286; copra \$1,294,301; Pará rubber \$39,931,123; tin and tin-ore \$69,756,215 (total \$116,280,927).

The number of vessels, exclusive of native craft, entered and cleared in 1911 was 9,667, with a tonnage of 3,870,329, compared with 9,014 and 3,504,667 in 1910.

The provision of means of communication with a view to the development of the natural resources of the country has been a consistent policy of the Federal Government, and in addition to the construction of new roads, every year sees an improvement in roads already existing. At the end of 1911, the lengths of roads and paths were:—Metalled cart-roads, 1,988 miles; unmetalled, 234 miles; bridle roads and paths, 1,542 miles. New roadways are under construction in all the states. The total mileage of railway open to traffic at the end of 1911 was 560, an addition of 20 miles during the year, the capital account for railway and motor services being £6,383,200, or £340,074 more than in 1910.

The profit in 1911 was equivalent to a dividend at the rate of 6.03 per cent. The department was authorised to expend nearly £600,000 in new construction work in 1912.

Perak is the most populous of the four states, containing (1911) 494,057 persons (344,238 males, 149,819 females). Of these 1,396 were Europeans, 845 Eurasians, 199,034 Malays, 217,206 Chinese, 73,539 Indians and 2,037 others. Religions were:—Mahomedan, 192,991; Hindu, 56,988; Christian, 9,734; Sikh, 3,918; other non-Christian 213,386; not given 3,690. Ipoh, in the mining district of Kinta, had 23,978 inhabitants, Taipeng (the capital) 19,556, and Kampar, 11,604. Ipoh and Kampar nearly doubled their population in ten years. The aboriginal population is given as 12,632 against 7,982 in 1901. Births numbered 8,946, or 17.95 per mille, against 10,306 in 1910. Deaths numbered 14,026, or 28.16 per mille, against 13,118 deaths, with a death rate of 33.03, in 1910. There were 6,498 deaths from malaria in 1911. There was an excess of 19,053 Chinese immigrants over emigrants.

The strength of the police force was 1,180.

The total enrolment at 213 schools was 13,126, with an average attendance of 78 per cent. English was taught at 15 schools to 2,246 pupils, the majority being Chinese. The expenditure on education was \$149,025.

The revenue in 1911 was \$19,081,190; expenditure \$13,071,195. Balance of assets at the credit of the state, \$33,194,146. The revenue from land was \$860,277; land sales, \$218,367; customs, \$6,271,813; licences, excise, etc., \$4,584,938. There was an increase of \$3,106,837 under the last, due mainly to the establishment of the government chandu monopoly.

A record was created in the value of both imports and exports:—Imports (1911) \$29,349,234; exports \$55,535,590. Of exports, the principal values were:—Rice, \$725,724; padi, \$463,458; sugar, \$233,196; tin and tin-ore, \$41,105,822; copra, \$973,811; rubber, \$10,994,087.

There was an increased alienation of land for rubber and coco-nut cultivation over the areas so allocated in 1910 and 1909. Of the 262,487 acres alienated for rubber 124,681 were reported to be opened and 31,532 acres to be producing. The total crop for the year was 6,041,763 lbs. as against 2,962,218 in 1910. The total acreage under padi was 78,735, and the yield, in a year of poor crops, was 2,596,290 bushels. The fruit harvest, on the other hand, was the best on record. Under coco-nuts there were 73,120 acres as against 66,088 in 1910. Practically the whole delta between the Bernam and Perak rivers has been alienated for cultivation, and in a few years this vast plain, which was dense jungle four years ago, will present an unbroken field of coco-nut palms.

The total area of forest reserves is 422 sq. miles, an increase of 46 sq. m. during 1911.

The acting Resident (Mr. Oliver Marks) comments on the difficulty of obtaining contractors to undertake the construction of new roads, the prosperity in the planting industry having attracted both contractors and labourers. Nevertheless, 8½ miles were added to the metalled roads (now 745 miles) and 6½ miles of earth-road were metalled. Several bridges were constructed, and waterworks for Taipeng and Kampar completed.

The number of vessels entered and cleared at the ports of the state (exclusive of native craft) was 3,990 as against 3,550 in 1910, with a tonnage of 439,926 as against 383,976 in 1910. Taipeng recorded the largest rainfall, 147.09 in.; Lenggong the lowest, 69.90 in.

In **Selangor** the population was 294,035 in 1911, a gain of 74.2 per cent. There were 220,939 males and 73,096 females. Resident in the state were 1,348 Europeans, 64,952 Malays, 150,908 Chinese, 74,067 Indians, and Sakai (aboriginals) 1,739. Christianity was professed by 10,447, Mahomedanism by 66,639 and Hinduism by 62,940. Chinese immigrants numbered 46,598 and emigrants 24,512. There were 46,718 inhabitants (33,034 males, 13,684 females) in the capital, Kuala Lumpur, the largest town in the Federation.

Births numbered 5,036 against 4,456 in 1910, the rate per mille being 16.943. Deaths numbered 11,903 against 10,797 in 1910. The death rate was 40 per mille.

Pasture and agriculture employed 88,388; mining, 56,073.

The police force had a total of 681 of all ranks.

There were 58 schools—49 Malay, 1 Tamil, 1 Chinese vernacular school maintained by the government, and the remainder English-teaching schools in receipt of a grant-in-aid. The average enrolment was 4,397 and the average attendance 3,837, compared with 4,092 and 3,615 respectively in 1910. Two girls' schools had an average attendance of 61. The expenditure on education was \$62,548.

Total revenue (1911) \$12,330,945; expenditure \$8,715,718. The balance of assets amounts to \$27,073,607. A Chandu Monopoly Department was created on January 1, 1911. Its total sales amounted to 67,067 tahils, and there was a net profit on the working of the Department of \$2,206,641. Land revenue was \$695,906 as against \$659,705 in 1910.

The year was marked by an expansion in rubber, coco-nut and coffee production. There were 413,499 acres alienated for agriculture, comprising 145,222 acres under rubber; coco-nuts, 33,355 acres; coffee, 9,575; rice, 4,312; and gambier, 746 acres. 253 estates produced 11,438,996 lbs. of rubber. Forest reserves totalled 201,265 acres. There were 71,353 acres alienated for mining, mostly for tin. The recently discovered coal-field at Rawang promises well. A manufacturing plant has been established at Batu Caves for high-class cement.

Imports (1911) \$30,196,834; exports \$47,433,952. The principal exports were:—rubber, \$23,852,273; tin and tin-ore, \$21,724,430; copra, \$294,676; and wolfram \$40,503.

Ocean-going steamers using Port Swettenham numbered 469, against 448 in 1910, with

a tonnage of 1,673,067, against 1,503,510 in 1910. Altogether there entered 1,335 of coasting merchant vessels during the year with a tonnage of 1,422,741. All but six were British.

During 1911 22 miles of new roads were added to the state.

Sanitary Boards deal with such municipal affairs as roads and bridges, lighting, sewage and registration of vehicles at Kuala Lumpur, Klang and four other towns; and in April 1911 an Advisory Board was appointed for Port Swettenham, one of the members being nominated by the Selangor Chamber of Commerce.

In 1911 the Volunteers became a Federal force. Selangor contributed two companies totalling 209 officers and men.

The rainfall in 1911 ranged from 79.37 inches at Kuala Lumpur to 111.26 at Kuala Kubu.

In **Negri Sembilan**, out of a population of 130,199 (87,651 males, 42,548 females), there were 403 Europeans, 69,745 Malays, 40,843 Chinese, and 18,248 Indians in 1911. There were 69,330 Mahommedans, 15,700 Hindus, and 2,212 Christians. On 89 estates 26,688 persons were employed, and in mining 9,657. The birth rate was 23.5 per mille, and the death rate 73.6 per mille.

The police force included 369 of all ranks.

In the 65 schools, 3,893 pupils were enrolled as compared with 4,253 in 1910. Of the schools 59 were for Malay boys and 3 for Malay girls; there were 2 English-teaching schools and 1 Tamil school. There is a growing desire amongst the Malays for English education.

A company of Volunteers was raised for the Federal battalion in 1911, and 108 officers and men were enrolled.

Revenue (1911) \$2,512,002; expenditure \$1,768,733. Land revenue amounted to \$295,989 against \$272,578 in 1910; and the new Chandu Monopoly Department collected \$837,644 against the \$349,969 derived from the spirit and opium farms in 1910.

The balance of assets at the credit of the state amounts to \$1,471,644.

Rubber leads in agricultural produce, with 151 estates and a planted area of 75,356 acres. The output in 1911 was 4,297,715 lbs. To rice 48,306 acres were devoted, to coco-nuts 19,584 and to gambier 15,049. There is a tendency to abandon rice and gambier cultivation in favour of rubber and coco-nuts. The rice crop was a failure in 1911. There were 239 sq. miles of forest reserves. The total acreage of mining land was 22,837.

Imports (1911) \$4,630,404; exports \$8,419,046. These figures, however, are no true index to the total trade of the state, as much of the merchandise produced and consumed in the state is imported via Selangor. On the export side rubber was valued at \$5,039,968; gambier, \$168,457, and tin and tin-ore, \$750,108.

The number of vessels cleared at the ports (exclusive of native craft) was 1,328, with a tonnage of 363,362, against 1,548 and 496,380 respectively in 1910.

The rainfall in 1911 ranged from 64.35 inches at Jebebu to 96.50 at Port Dickson.

In **Pahang** the population was 118,708 in 1911 (72,234 males and 46,474 females). Of these 137 were Europeans, 87,109 Malays, 24,287 Chinese, and 6,611 Indians. There were 509 Christians, 77,900 Mahommedans, 4,440 Hindus, and 967 Sikhs. Aborigines numbered 10,213. With the smallest population of the four states Pahang has the highest birth rate and the lowest death rate. It is the only state in which the birth rate exceeds the death rate. The birth rate, per mille, was 27.13 and the death rate 26.40.

The police strength is 384.

The country is being opened up steadily by the extension of the road and railway systems. 20 miles of new trunk railway through the eastern states were opened on the Gemas-Kuala Semantan section between Triang and Semantan, 34½ miles of the permanent way laid from Semantan to Kuala Tembilang, and progress made with the extension into Kelantan. Out of 173 miles of telegraph lines in course of construction, 125 miles were completed.

Revenue (1911) \$1,133,307; expenditure \$1,647,102. The state debt stands at \$9,201,749. Revenue from the new Chandu Monopoly Department amounted to \$335,595.

The acreage alienated for agriculture amounted to 117,945, but the acreage planted was only as follows:—Coco-nuts, 16,715; rice, 8,201; rubber (31 estates), 7,715; tapioca, 500; coffee, 97. There were 31,144 lbs. of rubber exported. The live stock comprised 28,348 buffalos and 3,274 cattle, being 340 buffalos and 458 cattle fewer than in 1910. Forest reserves amounted to 106,208 acres. For mining, 44,439 acres were alienated.

Imports (1911) \$2,277,768; exports \$4,890,639. Among the exports, tin and tin-ore accounted for \$4,129,974; dried fish, \$174,817; rattans, \$54,008; getah grip, \$47,192; rubber, \$28,319; tapioca, \$24,645, and copra, \$17,185.

Rainfall in 1911 ranged from 81.20 inches at Temerloh to 153.14 at Sungei Lembing.

NON-FEDERATED STATES.¹—**Johore.**² Great progress has to be reported since the Sultan obtained the services of a General Adviser from the Governor of the Straits Settlements in his capacity of High Commissioner to the Malay States. Mr. Douglas Campbell, C. M. G., was lent by the Federated Malay States in 1909, and several officers were also seconded from the same service to organise and conduct government departments. Legislation was at once introduced, and the outcome is increased prosperity in the finances of Johore, while vast improvements are reported in administration, the opening up of roads and other means of

¹ See *E. B.* xvii, 482 *et seq.*

² See *E. B.* xv, 475.

communication and increased cultivation. A trigonometrical survey of the country is in progress, road and railway extensions are being carried out, and newly-created Town Boards in Johore Bahru, Bandar Maharani and Penggaram (Batu Pahat), have been able to effect improvements in sanitation, etc.

The census of 1911 showed a population of 180,412 (122,129 males, 58,283 females). Of these 205 were Europeans (161 British), 71,315 Malays, 63,405 Chinese, 30,904 Japanese, and 5,659 Indians. By religion, 110,939 were Mahomedans, 843 Christians, 847 Pagans, 251 Buddhists, and 4,455 Hindus. The capital, Johore Bahru, has 22,636 inhabitants. Malarial fever was rife in 1910 and 1911, and in 1911 there was a severe outbreak of smallpox. Two government vaccinators have been appointed and are doing good work.

As yet little attention has been devoted to mining in Johore, which is largely covered by jungle, but in 1911 276 tons of tin were exported. Under the new Land Enactment, grants of land are now made in perpetuity on conditions similar to those in force in the Federated Malay States. Gambier, pepper and tapioca are going out of cultivation. Coco-nuts and areca nuts are greatly favoured by Malay and Javanese agriculturists, and the export value of these crops in 1910 was \$2,150,000. The area under rubber at the end of 1911 was 75,205 acres, and the export of rubber in that year amounted to 1,244,500 lbs., against 613,600 lbs. in 1910. The total area leased, mostly by rubber companies, is 281,900 acres, and a large amount of land is taken up by Japanese. Most exports pay a specific export duty. Rubber and coco-nuts, however, if grown on land held on a title on which annual rent is reserved to the state pay 2½ per cent *ad valorem*; if otherwise, 5 per cent.

Revenue (1911) \$3,954,901; expenditure \$3,469,571. The expenditure for 1911 includes the repayment of \$500,000 of the capital sum lent by the Federated Malay States on account of the Johore State Railway. The Public Debt is \$11,168,578, representing capital outlay on the State Railway.

The railway through the state, connecting Singapore with the Federated Malay States system, was completed in 1909. Along its 120 miles it provides access to the extensive areas of valuable forest lands not conveniently reached by the natural waterways. In 1910 some 295 square miles of land adjoining the railway were alienated for cultivation. The expenditure on the railway was \$388,091 in 1911 and the profit on the last quarter's working was \$6,683. A narrow gauge railway, 11 miles long, has been constructed to facilitate the shipment of produce from the district south of Bandar Maharani. Its extension for a further 28 miles is in progress. This railway made a profit of \$12,336 in 1910, and of \$4,026 in 1911. Road construction is being pushed on, and in 1910 the Sultan sanctioned the construction of a main road across the peninsula, about 88 miles long, from Batu Pahat on the west to Mersing on the east, crossing the railway at Mengkibol.

The government maintains 39 schools, at two of which (Johore Bahru and Muar, with attendances of 300 and 140) English is taught. It is proposed to start an English boarding school on the lines of the school for the children of well-to-do Malays at Kuala Kangsar, in Perak. At the 37 vernacular schools, 2,529 pupils were enrolled.

Consisting solely of Malays, the police force, made up of 23 officers, 116 non-commissioned officers, and 450 constables, is distributed over 42 stations. It was arranged in 1912 that an European officer should take charge. The Sultan maintains and commands a regiment of Malays, comprising 220 regulars and 300 volunteers, as well as a force of 65 Pathan artillerymen.

In 1910 the rainfall was 106.05 inches.

Kelantan.—The most important event in the history of Kelantan since the British Adviser (Mr. J. S. Mason) took over the supervision of its affairs from Mr. W. A. Graham, the Siamese Commissioner, on July 15, 1909, was the determination in 1912 of the agreement between the Sultan and the Duff Development Company, and the resumption by the government of the sovereign powers conceded to the company over nearly two-thirds of the state. A new working agreement has been prepared under which the government of Kelantan undertakes to pay the company £300,000 and to grant to them the following rights: (a) The sole right to select blocks of land for agricultural purposes, amounting in the aggregate to not more than 50,000 acres; (b) the sole prospecting rights for minerals over the area of the concession; (c) the sole prospecting right over an area of approximately 78 sq. m. in the Sokor district, and the right to take up mining leases and certain other rights.

Great activity has characterised the administration, with a view to bring about a more effective centralised government of the country. In 1909 the State Council held 10 meetings and passed six important enactments; in 1910, when 12 meetings were held, 18 enactments were passed. In 1909 a beginning was made with an educational system. A government school was started at Kota Bahru with 119 pupils, and the enrolment had risen to 277 at the end of the year, 29 of the pupils taking up the study of the English language. Only four members of the royal house attended—one in the English class; but in 1910, when the average attendance was 117, a son of the Sultan was amongst the students. Three new schools were opened in that year, and a night school for clerks at Kota Bahru. The Kelantan Malays are keen on education; the boys are industrious students, and there is great eagerness to learn English. The Mosque school at Kota Bahru, a sort of theological institution with a great reputation in the peninsula, has a daily average attendance of 42.

Regular steamship communication has been established with Singapore and Bangkok. On August 1, 1909 postal rates were reduced from 9 cents to 3 cents between Kelantan and the Straits Settlements and the Federated Malay States, and in November to 8 cents for places within the Imperial Penny Postage Union. In spite of the reduced rates, the postal revenue has steadily increased. At the end of the year, the cash-on-delivery system was introduced for parcels and a money order system established with the Federated Malay States. The telephone and telegraph systems were extended, and the rate for telegrams to the Straits Settlements and the Federated Malay States reduced from 15 to 11 cents per word. In 1910 commission on money orders was reduced to half per cent, with a substantial increase of business. A start was made with the construction of roads, and at the end of 1909 there were 11 miles of gravelled roads and 6 of earth roads, and several hundreds of miles of foot tracks and bridle paths. In 1910 the road making was continued, and the most important work of the year was the beginning of a trunk road through the state.

The population (1911) is 286,751. There were 109 deaths from cholera in 1910.

The police force, numbering 232 men, with a European as Chief Police Officer, was reorganised on the Federated Malay States system in 1910. As the administration of justice had fallen into an unsatisfactory state, the opportunity was taken on the resignation of the Siamese judge in 1909 to appoint the Assistant Adviser as judge. The result was an immediate improvement in the *personnel* and conduct of the Courts.

Revenue (1910) \$419,327; expenditure \$403,552. Principal sources of revenue: customs \$129,560; licences, \$197,508; land, \$104,474. The public debt at the transference of the suzerainty was \$150,000 upon which Siam charged 6 per cent. This debt was taken over by the Federated Malay States, interest being reduced to 4 per cent.

In 1910 only about 124,200 acres were reported to be under cultivation in a country of approximately 6,500 square miles. This comprised 95,000 acres devoted to padi, 18,250 to coco-nuts, and 5,400 to rubber. Rubber planting, however, is spreading, and 64,500 acres were alienated in 1910 for this purpose, mostly to European companies. 3,763 tons of copra were exported, and 7,261 head of cattle, 1,480 sheep, 115,044 poultry and 684 pigs were exported to Singapore. Arrangements are being made to improve the breeds of cattle and sheep. The revenue from land in 1910 amounted to \$104,474—a large increase in the collection under the Siamese régime. A sago factory was installed at Kota Bahr in 1910. Many unworked mining concessions were cancelled in that year. The dredging operations for alluvial gold in the Galas, Nenggiri and Lebir rivers were scarcely so successful in 1910 as in the previous year, the gold won amounting to 3,698 oz., against 8,507 oz. in 1909. On the other hand the output of tin-ore, though small, showed an increase.

The total value of trade in 1910 was returned at \$3,003,935, against \$2,648,571 in 1909. Chief among the exports were—Copra, \$632,040; cattle, \$217,830; betel nuts, \$143,048; gold, \$129,465; fish, \$64,904; rice and padi, \$45,342. The principal imports were—Cotton piece goods, \$141,337; kerosene, \$111,886; opium, tobacco, salt, and woollen goods. Shipping amounted to 206,560 tons, an increase on 1909.

In 1910 the rainfall was 123.4 inches.

Trengganu.—Though the suzerainty was transferred from Siam to Great Britain on July 14, 1909, it was only on April 22, 1910 that the Sultan signed an agreement providing for a British agent to reside at Kuala Trengganu, to fulfil the functions of a Consular official, for the control of the foreign affairs by Great Britain, and for the limitation of mining and agricultural concessions to persons other than natives and subjects of Trengganu.

The population (1911) is 146,920; of Kuala Trengganu, 13,991.

In 1910 the Sultan issued his "kuasa" empowering the British agent to adjudicate as a magistrate, jointly with the Hakim, according to Mahommedan law and the state regulations, and five suits were disposed of in that year.

Several Europeans have taken up concessions for rubber planting, in which industry the Sultan shares, and a Japanese subject obtained a concession for coco-nut planting in 1910.

No less than 1,986 fishing boats were on the register at Kuala Trengganu in 1910, as well as 385 sailing vessels of a burden ranging from 25 to 100 tons. These sailing vessels were all built by native Malays for trade in the Archipelago. A bright future is predicted for Trengganu as a mining country, tin, wolfram and gold having been found, while traces of natural oil are reported near Dungun in the north-east.

The following were the values of imports and exports in 1910:—*Imports:* Rice, \$209,528; cotton goods, \$69,731; opium, \$60,909; sugar, \$49,420; sarongs, \$38,521; raw silk, \$36,100; tobacco and cigarettes, \$31,936; petroleum, \$21,645. *Exports:* Tin-ore, \$313,177; fish, \$464,288; copra, \$281,813; padi, \$174,295; black pepper, \$152,707.

Revenue is raised by means of "Farms" and duties on all kinds of exports.

Mr. W. D. Scott's report for 1910 says: "The area is estimated at 6,000 square miles. There are no main roads, railways or telegraphs; communication with the interior is by means of the rivers and by good native paths." Regular steamship communication is maintained with Singapore, and in order to obtain a good port of call a survey is to be made of Chendering, lying seven miles south of Kuala Trengganu. The state joined the Imperial penny postage system and the Postal Union on January 1, 1911.

Rainfall in 1910 (for nine months). 101.98 inches.

Kedah.—The years 1909 and 1910 were devoted largely to a reorganisation of the internal affairs of this state with a view of bringing its governmental system into line with the Federated States of Malaya. With the transfer of the suzerainty under the Anglo-Siamese Treaty of 1909, Mr. W. G. Maxwell, of the Federated Malay States Civil Service, as British Adviser, succeeded Mr. G. C. Hart, the Adviser appointed by the Siamese government. In that year the state council held 25 meetings and passed 13 enactments or decisions, by some of which forced labour was abolished and new methods introduced for raising revenue for state purposes. The administration is entrusted to departments, and in each district there are now district officers who interest themselves in the work of the land office, mines office, hospital, gaol, public works, etc. A sanitary board was brought into existence in the capital (Alor Star), and is doing good work. In 1910 the State Council held 75 meetings; 16 enactments were passed. They enable the central authorities to exercise closer control of finance and a more thorough management of business. Special mention should be made of the legislation for the speedy abolition of "debt bondage," a peculiar feature of ancient Malay life.

A survey department has been constituted. Road making, bridge building and canal extension are features of the new régime, and a tracing has been made of an extension of the railway from Province Wellesley into Kedah as far as Alor Star. New post offices have been established throughout the country, the money order system introduced and telegraph and telephone systems extended. The telephones are being connected with Penang.

Education is making rapid progress. Before 1905 there was only one school in Kedah. In 1910 there were 20 Malay schools, with 37 masters and 1,675 pupils enrolled. There is a growing demand for schools and the extension of accommodation in existing schools. An English school at Alor Star had 97 boys on the register in 1910 and an average daily attendance of 80, including two of the Sultan's sons. There is a girls' school at Alor Star.

There are 37 police stations, with a total police force of 419 men, of whom 2 are Europeans and 335 Malays. A Courts Enactment, passed in 1910, constitutes the various courts of the state and defines their powers. The Court of Appeal, which had formerly consisted of the State Council without the President and Adviser, but with the Assistant Adviser and two experts in Mahomedan law in their place, now consists of officers specially selected to be judges. At any appeal at least five judges must be present. Members of the State Council are not eligible to be the judges, but if any case appears to be of exceptional difficulty or importance, the Court may ask the State Council to sit with it. The enactment provides for a judge of the High Court sitting with two Assessors at the hearing of any murder case or criminal case of unusual importance or difficulty. It also gives the High Court full powers of revising on its own initiative the decisions of the District Courts. The powers of the Adviser in sitting in civil and criminal cases in which British subjects are defendants are the subject of special sections of the enactment. The efficiency of the High Court has been much improved, and the arrangements for the Chief Justice to go on circuit saves much trouble, expense and delay. Most of the work is done by the nine District Courts.

Population (1911) 245,986 (males 137,139, females 108,847); of these 195,411 were Malays, 33,746 Chinese, 8,135 Siamese, 6,074 Indians, and 136 Europeans (128 British). There were 198,720 Mahomedans in the state, 5,002 Hindus and 642 Christians. A smallpox epidemic in 1910 caused 36 deaths, and over 33,000 persons were vaccinated. The Kedah Malays believe in the efficacy of vaccination.

Revenue (1910) \$1,449,116; expenditure \$1,285,342. Seventy-three per cent of the revenue is derived from the opium monopoly, land revenue, and export and import duties. The revenue from land in 1910 was \$398,034 against \$242,873 in 1909.

In 1910 693 tons of tin were exported as against 744 tons in 1909; and 12 tons of wolfram. Agriculture is the mainstay of Kedah at present. An epidemic of rinderpest having swept the country in 1908-9 carrying off 9,000 head of cattle, valued at \$300,000, left many villages in the north without animals enough to plough the rice-fields. The State Council in 1910 came to the rescue of the cultivators, lending money against the security of title deeds at 6 per cent interest (against the 24 per cent formerly charged by native money lenders), the principal being repaid in instalments. An excellent harvest induced many of the cultivators to repay half the principal in the first year. The state veterinary surgeon reports that Koch's anti-rinderpest serum is less efficacious in Kedah than it appears to be in India, which is possibly due to the Indian cattle possessing a modified immunity through their ancestors having had rinderpest or to the deterioration of the serum in the Kedah climate. During 1910 16,741 head of cattle were licensed either as imported or born in the country as against 11,125 in 1909; 15,808 sales were registered as against 6,599 in 1909. Exports (1910) of rice were 614,080 gantang; of padi 13,653,936 gantangs (1 gallon = 1 gantang).

Canals have been extended for irrigation in the rice-growing districts. There has been great activity in rubber planting, and out of 40 agricultural estates registered at the end of 1910 only one had no rubber trees. The total acreage was 94,005, of which 20,034 acres were under rubber, 3,679 coco-nuts and 10,005 tapioca.

The passing of a Timber and Forest Produce Passes Enactment was the first step towards protecting the forests of the state. No forest reserves have yet been created.

The rainfall in 1910 ranged from 89.92 in. in South Kedah to 135.38 in. in North Kedah.

Perlis.—The chief work of the British Adviser (Mr. Meadows Frost) in 1909 and 1910 was

to reorganise the administrative departments of this small state. The population (1911) numbers 32,746 persons (16,808 males and 15,938 females). Of these 29,497 are Malays 1,627 Chinese, 1,388 Siamese and only 5 Europeans (3 British); 29,665 are Mahomedans and 8 Christians.

The state is governed by the Council, consisting of the Raja, the Adviser, and three other members. In 1910 it passed 8 enactments, one abolishing debt bondage. The State Council is the Appeal Court. There is a police force of 65—Malays and Indians.

As there was no proper register of titles for land and no rent-roll, Mr. Frost, soon after his arrival in 1909, set himself to draw up both, with the result that the collection of land rents in 1910 realised \$20,586 as compared with \$14,875 in 1909. The land office has issued a notice that no unregistered grant will be considered valid after a certain date.

Revenue (1910) \$114,834; expenditure \$101,493. When the transference of suzerainty from Siam to Great Britain occurred in 1909 there was a debt of \$474,796, which the Federated Malay States took over. In 1910 the debt was reduced by \$20,000.

In 1910 the State Council abolished the miscellaneous import duty of 3 per cent on all imported goods not specifically mentioned, and now the only duties raised are on spirits, beer, wine, tobacco, and kerosene or other oils used for heating or lighting purposes. The miscellaneous export duty of 5 per cent on all goods not specifically mentioned (such as tinore and guano) has also been abolished.

Except in the Coast districts, where there were excellent crops and plenty of cattle, the padi season of 1910 was a failure. Owing to the lack of bullocks the cultivators could not plough and they left off hand tillage till it was too late. Rinderpest wiped out the cattle, upwards of 7,490 head succumbing to the disease. The direct loss to the small cultivators was \$113,000, but there was a large indirect loss as well. The State Council came to the aid of the people, and loans are granted for restocking against land titles.

In 1910 there were 150 tons of tin-ore exported.

Many of the limestone hills of Perlis contain caves rich in deposits of guano. A company has been formed by some Dutchmen in Penang, called the Straits Guano Company, to work the deposits, and they have obtained a lease of seven hills. (The government retained the best-known hill for the use of the local cultivators.) The company has made two miles of earth road, which opens up good country, where people are anxious to take up land. The quantity of guano exported in 1910 was 838½ tons, which paid export duty at the rate of \$2.00 per ton. After a certain date the company is bound to extract not less than 500 tons per month, and the export duty will be 10 per cent *ad valorem* of the market price in Penang.

HONG-KONG¹

According to the census taken on May 25, 1911, the civil population of the colony numbered 456,739. The non-Chinese community numbered 12,075, while the Chinese population was thus distributed:—city of Victoria (including the Peak) 219,386; villages of Hong-Kong 16,106, Kowloon (including New Kowloon) 67,602; New Territories 80,622; population afloat 60,948. The general death rate for 1911 was 21.13 per 1000 among the Chinese community and 13.38 among the non-Chinese.

Public Health.—The colony has outlived its former notoriety for unhealthiness. The influence of the young pine forests created by the Afforestation department and the training of nullahs on the slopes have tended to check malaria, while the attention recently bestowed on sanitation has also had beneficial effects.

The gradual replacement of old Chinese dwellings by new premises, erected in accordance with the Public Health and Building Ordinance of 1903, is effecting an improvement in the healthiness of the native quarters, but the abnormal influx of refugees, estimated at some 20,000, who arrived in Hong-Kong during the revolutionary movement in south China, somewhat discounted the improvement by contributing largely to the number of cases of plague and smallpox which occurred towards the end of 1911. The number of deaths from beriberi during 1911 was only 320 as compared with 566 during 1910. This reduction was in some measure due to the dissemination of a circular of information among employers of coolie labour, which set forth the cause of beri-beri and advised the use of beans for food with rice in the absence of fresh meat or fresh fish.

The records at the Observatory, Kowloon, showed in 1911 a highest temperature of 93.1° F. in August, a lowest temperature of 47.1° F. in February, and a rainfall of 90.55 inches, occurring on 145 days.

Industries.—Of the total area of the colony, which, including the New Territories, is estimated at 249,551 acres, some 41,967 acres are cultivated; that is, practically the whole available area, the remainder being steep hillsides. The government Pine Plantations occupy 6800 acres and there are about 43,000 acres of Licensed Pine Plantations. With the exception of brewing, the manufacturing industries of the colony under European supervision increase in importance yearly, although the Chinese revolutionary disturbances in 1911 were adverse

¹ See E. B. xiii, 657.

to trade. The manufacture of lard is one of the important Chinese industries in the colony, most of the lard being sent to the Philippines, and during 1911 a lard and meat factory was started for the Philippine trade. Since the middle of 1910 a steam trawler has been engaged in the fishing industry and has contributed its hauls to the local markets.

Commerce.—Hong-Kong is a free port. The total reported imports during 1911 amounted to 3,995,793 tons as against 4,292,194 tons in 1910. The exports for 1911 show an increase of 71,672 tons or 3.1 per cent. Transit cargo shows an increase of 66,109 tons or 1.6 per cent. Of the more important articles of import, kerosene oil shows a remarkable increase. The imports of raw opium and the trade in compounds of opium have decreased considerably owing to recent legislation. The failure of the southern rice crops in 1911 caused a decrease in the rice imports and a corresponding increase in the import of American flour, which is used as a substitute for rice and rice-flour.

The demand for labour in the rubber plantations of Malaya is responsible for the continued increase in the number of Chinese emigrants to the Straits Settlements. The table which follows illustrates the extent of the Hong-Kong immigrant and emigrant trade:—

Year.	Emigrants to Straits Settlements.	Total Number of Emigrants	Total number of Immigrants (returning Emigrants).
1909	48,016	77,430	144,821
1910	76,705	111,058	149,564
1911	100,906	135,565	149,894

The total of the shipping entering and clearing at ports in Hong-Kong during the year 1910 was the highest reached in the history of the colony. The number of vessels engaged in foreign trade was 40,714, of 23,160,256 tons in 1910, and 44,978 of 23,063,108 in 1911, when 24.0 per cent by number and 50.7 per cent of the tonnage was British.

Finance.—In 1911 the revenue was £7,497,231 and the expenditure £7,077,177. The amount of the Consolidated Loan (Inscribed Stock Loans of 1893 and 1906) at the end of 1911 stood at £1,485,732, and, in addition, the advances by the Crown Agents for railway construction amounted to £340,000. The rateable value has doubled since 1900-01 and for 1911-12 stood at £11,161,390. The colony pays a military contribution fixed at 20 per cent of the revenue; the cost of volunteers is borne entirely by the colony.

Communications.—Hong-Kong has unrivalled steam communication with all parts of the world and there is a weekly European Mail service. During 1910 the Hong-Kong Post Office began to forward parcels to Great Britain and Germany *via* Shanghai, Dalny and the Trans-Siberian railway. The cash-on-delivery service for parcels exchanged with the United Kingdom was adopted on May 1, 1909. From Jan 1, 1911 the Hong-Kong government was relieved by the Imperial government of the charge of the postal agencies in China.

Extensive resumptions of land at Kowloon Point were effected during 1909 to provide a site for the terminal station of the Kowloon-Canton Railway. The British section of this railway, 21.78 miles in length and of 4' 8½" gauge, was opened on October 1, 1910, by Sir Henry May. A two-foot gauge branch from Fan Ling to Sha Tau Kok, a distance of 7¼ miles, was commenced in May 1911, and a length of 6½ miles of this branch was opened for traffic on December 21st. The Chinese section of the railway was opened, and through traffic between Kowloon and Canton established on October 4, 1911.

Government.—Sir Frederick Lugard, who was appointed Governor in July 1907, left the colony in March 1912, to become Governor of Nigeria. He was succeeded by Sir Francis Henry May, K.C.M.G., formerly Governor of Fiji and High Commissioner for the Western Pacific, who had previously been acting Governor.

In accordance with the resolutions of the International Opium Conference which met in Shanghai in February 1909, the opium ordinances have been amended and consolidated, and additional restrictions and safeguards have been imposed in respect of morphine, compounds of opium and cocaine. Twenty-six opium divans were closed in 1909, and all that remained both in the island of Hong-Kong and the New Territories were closed in 1910. A grant of £9000 was made to the colony by the Imperial Government for the year 1910 on account of the loss of opium revenue, and a grant of £12,000 for the same purpose for the year 1911-12. In order to replace the revenue lost on opium, a law was passed by the Legislative Council on September 17, 1909, imposing duties on intoxicating liquors consumed in the colony. The 34 ordinances passed in 1910 were chiefly concerned with the consolidation of the ordinances relating to the New Territories, copyright, crown suits, lepers, midwives, oaths and the volunteer

reserve. In 1911 the ordinances passed numbered 65, the largest number ever dealt with in one year. They related chiefly to defence, the consolidation of the liquor laws, the university, stamp duties, civil procedure, laws for the more effectual control of clubs and societies, and for the registration of Chinese partnerships with limitation of liability.

A conference lasting from June till November 1909 was held in Hong-Kong between the Portuguese and Chinese Commissioners for the delimitation of the boundaries of Macao. In July 1909 there was trouble in Macao with pirates on Colowan Island, in which Portuguese troops and gunboats were engaged. Some of the pirates escaped and were afterwards arrested at Cheung Chow Islands in the New Territories.

Police and Crime.—The strength of the police force in 1911 totalled 1080; the force is composed of 134 Europeans, 399 Indians and 547 Chinese. The District Watchmen Force, composed of 124 Chinese, patrols the Chinese quarters of the city of Victoria under the supervision of European police. The daily average of prisoners confined in the Victoria Gaol in 1911 was 595 as compared with 726 in 1904, the highest previous average. The average percentage of prisoners to population for the last ten years has been 0.14, but owing to the large floating population which is constantly moving between the colony and Canton, this percentage does not convey an accurate idea of the comparative criminality of the residents of the colony. The Chinese community in Hong-Kong was profoundly stirred by the revolutionary movement in China, and for some days in the early part of November 1911 great excitement prevailed. A proclamation under the Peace Preservation Ordinance was issued November 29th, and remained in force until February 26, 1912. The police succeeded in preventing any serious outbreak of lawlessness, though the influx of undesirable characters from Canton and other parts of China caused many cases of disorderliness, assaults and petty thieving. Military assistance had to be provided and special constables enlisted.

Education.—Education is provided at 67 government and Grant Schools comprising 20 upper grade schools (average attendance 4107) and 74 lower grade schools (average attendance 2196). On September 7, 1911, a Board of Chinese Vernacular Primary Education was constituted to promote efficient Chinese vernacular education and to collect funds to supplement the government subsidy made to the Board. The amount of the government subsidy for the year 1912 was £4100. Higher education is represented by the Technical Institute where instruction is given in scientific, technical and commercial subjects. The Hong-Kong University building was opened on March 12, 1912. The first chairs were to be those of medicine, engineering and the arts; the medium of instruction will be English. The primary object of the University is to train the character and morals of students and, so far as is possible, to inculcate western ideals. It will be open to all races and creeds, but owing to the position of Hong-Kong it is chiefly intended for the Chinese. At the end of 1911 the University endowment fund amounted to £40,098. The British government has promised a sum of £300 a year scholarships ("King Edward VII Scholars").

Social.—The Victoria Recreation Club, which, under the style of the Victoria Regatta club, held its first regatta in 1849, celebrated its 60th anniversary on July 10, 1909, in a new club house which had been built on an extension of what was formerly Murray Pier. The Club Germania commemorated its fiftieth anniversary on November 27, 1909. On June 22, 1911 the coronation of King George V was celebrated by a public holiday. The whole of the colony was illuminated for three nights, all the men-of-war in the harbour combining in the display.

During the past three years the colony has lost several of its prominent men by death, including Mr. George Murray Bain, who came to the colony in 1864 as sub-editor of the "China Mail" of which paper he ultimately became proprietor; he died April 21, 1909. Sir Hormusjee Mody, the donor of the Hong-Kong University buildings, died on June 26, 1911. On October 28, 1911, Mr. W. D. Barnes, the Colonial Secretary, who had only recently been transferred to Hongkong from the Federated Malay States, met with an untimely death on the polo ground.

(H. SPOONER.)

Weihaiwei¹

The population in 1911 was 147,177 (146,840 Chinese and 293 of other nationalities). This gives a density of about 510 per square mile. The European element numbers 215. It consists chiefly of the Royal Naval contingent on the island of Liu Kung, and of school-boys most of whom have their homes in Shanghai. Of the native male population about one-fifth is engaged in occupations other than agricultural. This frac-

¹ See *E. B.* xxviii, 494.

tion includes merchants (shopkeepers and employees), fishermen, carpenters and builders, smiths, boatmen and teachers—named in order of their numerical importance. As the inhabitants are mostly small-holders, many of them combine several occupations.

Weihaiwei is now a regular port of call for many China coasting steamers sailing northwards from Shanghai, and there is also a regular weekly service, carrying mails and passengers between Shanghai and Weihaiwei, subsidised by the Government. The mails are landed and shipped at Port Edward, where the main Post Office has been established and which is now the principal anchorage for steamers, instead of, as formerly, on the Island of Liu Kung. The shortest time in which a mail has arrived from London via Siberia is 15 days. The number of steamers that called during 1911 was 615, net tonnage 519,399.

Of the total area, which is 285 square miles, it is estimated that not more than two-fifths is arable land. The principal export crop is ground-nuts (*Arachis hypogaea*), the export of which amounted in 1911 to 547 tons of nuts and 8510 tons of seeds. Shark fishing has been carried on by the Japanese since 1908, but only seven boats were engaged during 1911.

Revenue in 1911-12 was \$74,673, expenditure £153,591, and grant-in-aid £6000.

The 1911 census returned 8637 males and 40 females of the Chinese population as able to read and write; that is, just below 6 per cent of the total population, or over 11 per cent of the male population. The people of the territory have voluntarily agreed to levy a small tax on theatrical performances for the improvement of the standard of education in village schools, which is very low. The government Free School during the year 1911 had an average attendance of 60 pupils. There are several other schools for boys and girls under the management of Europeans. From the Chinese treaty ports and Hong Kong, boys are now sent to the Weihaiwei School for European Boys. The average attendance is about 50 and the school is now the home of the First North China Troop of Boy Scouts.

The inhabitants of the territory are, for the most part, of an orderly nature, and crime is rare. In 1911 there were 786 convictions. Gambling is responsible for a large proportion of these. The prisoners are employed on labour of a useful kind, such as roadmending and treeplanting. The total strength of the police force is 3 European inspectors, 3 Chinese sergeants and 52 constables; an average of one policeman to 2830 of the population.

The territory is remarkable for the number of suicides—31 males and 63 females in 1911.

In 1909 the Provincial Assemblies were inaugurated in China. On the Weihaiwei register of the electors entitled to vote or to become members of the Provincial Assembly of Shantung, appeared about 500 names.

An ordinance was introduced in 1909, prohibiting generally the importation, sale and smoking of opium, or any other hypnotic except on medical grounds. A refuge was opened under the control of a medical officer for those who desired to rid themselves of the opium habit. The number of persons licenced to smoke opium in 1911 was 42 as compared with 50 in 1910 and 110 in 1909. The licenced smokers are either over 50 years of age or suffer from a chronic disease. The opium habit is becoming less prevalent and there are few young men who indulge in it. On the other hand cases of drunkenness, which till recent years were very rare among the Chinese of Weihaiwei, are now becoming more numerous.

The Revolution in China in 1911 caused an outbreak of disturbances on the Weihaiwei frontier, which necessitated employing marines to guard the boundary. On the withdrawal of the marines a force of a hundred men of the Royal Inniskilling Fusiliers was sent from Tientsin to take their place. The city of Weihaiwei, following the lead of the Treaty port of Chefoo, declared itself in favour of the Republican party on the 14th of November.

The Commissioner of Weihaiwei is Sir James Haldane Stewart Lockhart, K.C.M.G.

(H. SPOONER.)

Fiji¹

The total population at the end of 1911 was 142,761, as compared with 137,588 in 1910. During 1911 4,216 Indian immigrants entered as against 3,879 during 1910.

The colony continues to progress satisfactorily. A large area of native land has been taken up on leasehold and the industries have increased. The Sigatoka district, now opened up, promises to be one of the principal sugar-producing districts. The field work of the trigonometrical survey of Viti Levu was completed during 1911.

In March 1910 the colony was visited by a hurricane which did considerable damage to buildings and plantations. Banana plantations and many acres of sugar-cane were entirely destroyed, the latter being affected more particularly by floods in the low-lying country where cane is principally grown. Damage to coco-nut plantations was also considerable, but rubber plantations were unaffected by the wind.

Finance.—The revenue for 1911 amounted to £240,395 or £28,442 more than for 1910,

¹ See *E. B.* x, 335.

and £33,098 in excess of the original estimate. The expenditure for 1911 amounted to £265,347, which was £28,686 in excess of 1910. The principal increase in expenditure was for Public Works Extraordinary.

Trade.—The bulk of the colony's trade continues to be conducted through Australia and New Zealand. The total trade during 1911 amounted to £2,233,285. In 1910 the figures were £1,833,847. The total trade with the United Kingdom and British possessions, which is 88 per cent of the total trade, increased from £1,747,283 in 1910 to £2,138,827 in 1911. An extraordinary increase in the quantity of green fruit exported is noticeable. This is due to the fact that the banana industry was not in 1911 affected by any serious cyclonic disturbance. The total area of land under sugar cane in December 1911 was estimated at 43,358 acres, from which was produced 488,534 tons of sugar cane. The estimated cultivated area under banana and pine apples was 4,692 and 230 acres respectively. The area under coco-nuts was estimated at 37,562 acres. The principal minor export in 1911 was trocas shell, locally known as "sici." It is found abundantly on the reefs surrounding the greater part of the colony and is exported for use principally in France and Japan for the manufacture of buttons. It was placed on the list for the first time in 1910 and the export for 1911 amounted to £14,252 in value.

Government.—Sir Francis Henry May, K.C.M.G. was appointed Governor of Fiji and High Commissioner for the Western Pacific in 1911, to succeed Sir Everard im Thurn, K.C.M.G., C.B., who retired in 1910. In 1912 Sir Ernest Bickham Sweet-Escott, K.C.M.G. succeeded Sir F. H. May, who was appointed to the governorship of Hongkong.

Among legal enactments during 1910 and 1911 was an ordinance providing for the raising of a loan of £100,000 for the reclamation of the Suva harbour, and of harbour works at Suva and of works for the general sanitation of the town. Other ordinances relate to the taxation of buildings, the extension of restrictions regarding the sale of spirituous liquors, and the consolidation and amendment of laws relating to lepers and the constitution of a Central Board of Health.

Education.—During 1911 a special grant of £300 was allowed the Suva Public School for building purposes. The school has five teachers with an average attendance of 137.2. The Levuka school has two teachers and an average attendance during 1911 of 142.7. The education of natives is conducted mainly by the Wesleyan and Roman Catholic Missions. The former has 1002 schools with a total attendance of 16,525. The Roman Catholic Mission has 124 schools and in 1911 2293 native children were on the school rolls. The general question of education within the Colony was the subject of a commission which sat throughout 1909, but the steps to be taken are still under consideration.

Judicial.—The total number of offences reported to the police was 6160, which was 14 more than in 1910. Of these reported offences 776 were offences against the person, 372 larceny, 141 offences against property (other than larceny), and the greater portion of the balance were offences against labour laws by indentured labourers.

Climate.—The rainfall recorded at Suva during 1911 was 108.346 inches. In the previous year the rainfall was 107.812 inches. The greatest rainfall in any one day throughout the year was 15.907 inches on November 12th.

Shipping.—The number of vessels visiting the Colony during 1911 was 151 with a tonnage of 295,477 as against 140, with a tonnage of 262,273 in 1910.

GILBERT¹ AND ELLICE² ISLANDS PROTECTORATES

The population of these Protectorates in 1910 was about 30,000 of whom 150 were Europeans and 50 Asiatics. The natives are nearly all engaged in the copra industry but about 700 are employed by the Pacific Phosphate Company at Ocean Island and 100 by the owners of Fanning Island. An epidemic of dysentery caused a heavy death rate in 1908-09. The financial statement for 1910 showed an excess of liabilities over assets amounting to £5966. This adverse balance was caused by the purchase of the S. S. "Tokelau" and the erection of several residences for Government officials in 1909. The trade of the Gilberts was very much affected during the year by the prevailing drought which reduced the export of copra. But little progress was made during the year, the energy of the native officials being concentrated on combating famine. The export of phosphate of lime from Ocean Island amounted to 166,695 tons as against 119,425 tons in 1909.

TONGAN³ ISLANDS PROTECTORATE

The population in 1909 was 21,958. The latest report, dated 1910 and issued in 1912, stated that the islands are in a satisfactory financial and commercial condition, a condition of affairs brought about by the absence of drought and hurricane for a number of years. The general revenue for 1910 amounted to £44,007 as compared with £40,456 in 1909. The expenditure for these years amounted to £42,617 and £34,739 respectively. The imports in 1910 totalled £160,543 as against £152,870 in 1909 and the exports £245,946 in 1910 as compared with £217,155 in the previous year. The trade of the Protectorate could be considerably increased if the native government exercised a more efficient administration and made provision for an adequate supply of labour. Climate and soil are greatly

¹ See E. B. xii, 11.

² See E. B. ix, 291.

³ See E. B. xxvii, 3.

in favour of agricultural development but labour is scarce and expensive. Copra continues to be the principal export, 12,998 tons valued at £232,866 being sent away in 1910. About one quarter of the total output is shipped to Europe, the balance going to Australia. The Tongan Islands are now a place of call for a line of steamers running between Australia and San Francisco. The shipping returns for 1910 consequently show a considerable increase. In that year 59 vessels, with a tonnage of 104,403, entered. The Government College at Nukualofa was advanced by the appointment of a technical instructor in carpentry and the commencement of a Technical School.

SOLOMON ISLANDS¹

The natives of the Protectorate are estimated to number 150,000. In March 1911 the white and foreign population numbered 443, as against 251 in 1909. The number of indentured labourers employed in the Protectorate at the end of March 1911 numbered 4500. In 1909 the number was only 2284. The revenue for 1910-11 amounted to £14,130 and the expenditure to £9493. The loan of £2000 made from the funds in the hands of the High Commissioner for the Western Pacific for the purpose of extinguishing certain claims to land preferred by German claimants in the islands ceded by Germany to Great Britain in 1900 was paid off in 1909-10 and the Protectorate is now free from debt. The imports for 1910-11 were £103,147 and the exports £88,890. Almost the whole of the import and export trade is with New South Wales. The coconut plantations in the Protectorate are developing rapidly. It is estimated that the area of these plantations, owned by white men amounts to about 18,000 acres. The quantity of copra exported during 1910 amounted to 4030 tons and seems likely to increase. Ivory nuts rank next in importance to copra among the agricultural products. The nut is the fruit of a species of sago palm (*Calococcus solomonensis*), peculiar to the Solomon Islands. It grows naturally in swampy ground, where it is also being cultivated. The nuts are used in the manufacture of buttons and other similar articles. Bananas of high quality are now being produced and have lately come upon the Sydney market, but this industry is only in infancy. Rubber, cotton and other fibres are still in an experimental stage, but give promise of development. The shipping returns show that the number of British and other foreign-going vessels entered and cleared in the Protectorate during 1910-11 numbered 82, with a total tonnage of 63,257. The total rainfall registered at Tulagi in 1910 was 133.40 inches. (A. BRUCE JACKSON.)

Gibraltar²

The population on April 2, 1911, was 25,367 (14,145 males; 11,222 females), in addition to 8,050 men on board H.M. ships in harbour.

Revenue (1910) £80,929; (1911) £94,573. Expenditure (1910) £76,410; (1911) £73,390. The shipping, entered and cleared, amounted in 1911 to 11,704,163, of which 7,143,083 tons were British. A scheme is in hand for the improvement of commercial facilities at Waterport. In August 1911 the removal of coal hulks was considered as their presence, as offering shelter to torpedo boats, was held to be dangerous in war; on the other hand, their removal was viewed with concern by those interested in the coal traffic of the port.

The naval establishment was inspected on June 6, 1912, by Mr. Asquith, Mr. Winston Churchill, and Admiral H.S.H. Prince Louis of Battenberg.

Cyprus³

The census of April 2, 1911, gave a total of 274,108, including the military population; of this number 56,428 were Mahommedans and 217,680 non-Mahommedans. There were 4658 males in excess of females.

Agriculture.—As the result of two bad harvests in succession the year 1910 was not a prosperous one for Cyprus. There was a serious falling off in revenue and a trade depression which reacted on every industry and activity in the island. Wheat was below the average of the preceding five years; barley was a poor crop. The production of cotton on the other hand was almost double that of the previous year and there was a substantial increase of olives, carobs, grapes, pomegranates, oranges, lemons and silk. An exceptionally severe winter, succeeding late rains, had a disastrous effect on the flocks; in the Famagusta district there was a decrease of nearly 12,000 sheep and 1500 goats. The outlook for the wine industry was gloomy; and the relief works were continued in the Limassol district for the benefit of the vine growers. The crisis in the wine industry was suddenly relieved, however, by events in France and Italy which caused a brisk demand there for Cyprus wines. The output of wine was good and satisfactory prices were obtained.

In the seven nursery gardens in various parts of the island more attention is now given to the production of fruit trees, vegetables and economic plants than to the cultivation, as heretofore, of purely forest trees. In the experimental garden at Nicosia several thousand

¹ See *E. B.* xxv, 364.

² See *E. B.* xi, 938.

³ See *E. B.* vii, 695.

fruit trees were planted during the year and a number of vines were also planted to provide cuttings later on. The cotton experiments with the varieties previously tried again gave good results. The distillation of essential oils is an important item in the work of the Agricultural department, though the market appears to be somewhat limited. The art of basket-making is now taught and a number have been made for fruit transport. The export of potatoes to Egypt has shown considerable expansion, 36,271 cwt. (value £8472) being sent away in 1911 as against 14,983 cwt. (value £3839) in 1910.

The agricultural depression of 1910-11 affected the sale of building timber, the receipts from which amounted to £3592 as against £3762 during the previous year. Two new forest stations have been started in the Famagusta and Nicosia districts. The expenditure on the forestry department amounts to about £13,000 per annum, exclusive of the vote for special tree planting, and the revenue represents at present only about 35 per cent. of the cost, though the foundations are being gradually laid of a large revenue in the future. Now that the destruction of trees has been stopped and systematic planting undertaken the island may again become one of the best timber-producing areas in the Levant.

Mining.—The asbestos mining industry is progressing steadily under considerable difficulties as regards labour and transport. During the year 417 tons of dressed asbestos were exported. It is hoped to increase production with the aid of improved machinery. Asbestos is present in practically unlimited quantities but the fibre is for the most part very short, and the output does not in consequence possess a high market value.

Trade.—The value of imports during the year 1910, exclusive of specie, was £493,475 and the value of the exports £511,841; an excess of exports over imports of £18,366 whereas in 1909 there was an excess of imports over exports amounting to £130,643 due to importations of flour and the partial failure of the cereal and carob crop. The imports from the United Kingdom represent 26 per cent. of the whole; the exports to the United Kingdom 27 per cent of the total. The total number and tonnage of steam and sailing vessels entered and cleared in the foreign trade was 2,268 with a tonnage of 742,584, being a decrease of 90 steamers, with 48,967 tons and an increase of 180 sailing vessels and 6517 tons.

Finance.—The revenue collected in 1910-11 was £286,848 grant in aid £40,000, total £326,848. Expenditure £251,521, tribute £92,799, total £344,320. The excess of expenditure over revenue was due to the fact that surplus balances of £17,670 were drawn on to meet a special Forest Estimate of £5000, and a special Public Works Estimate of £12,670.

Political.—Major Sir Henry Hamilton John Goold-Adams, G.C.M.G., K.C.B., was appointed High Commissioner in succession to Sir Charles A. King-Harman, K.C.M.G., and arrived in October 1911 to take over the administration.

On September 5, 1911, the Legislative Council was dissolved and elections for a new council subsequently took place.

On May 27, 1912, the troops had to be called out to quell a riot between Greeks and Turks. Four persons were killed, 80 wounded. No Englishmen were hurt.

In August 1912 a deputation from the Greeks of Cyprus conferred with the British Colonial Secretary and asked for administrative reforms, including an increased proportion of Greeks to Turks on the Legislative Council, and also for the abolition of the tribute to Turkey of £42,000 a year.

Several measures of local utility were passed during the session of 1910. Of the most important was the law providing for the registration of trade marks.

Education.—In 1910-11 there were 583 primary schools, with 707 teachers and 30,779 scholars; an increase of 12 schools, 25 teachers and 1,203 scholars over 1909-10. The average daily attendance, excluding harvesting time, is estimated at 26,910. The schools were supported at an expense of £16,859 raised locally by assessment, contributions from religious funds or individuals. The schools are apportioned amongst the following religious communities: Moslem (187); Greek Christians (387); Armenian (5); Maronite (4). The average attendance in Moslem schools was 4659, and in Greek Christian schools 22,159.

Public Health.—At the end of 1910 an outbreak of smallpox occurred but this was checked by vigorous measures of isolation and vaccination. Malarial fever was less prevalent than in former years, 6074 cases being returned as compared with 7450 in 1909, and 10,476 in 1908. The hospitals of the islands show an all-round increase in attendance and admissions, and important improvements have been made. At the close of the year the inmates of the Leper Farm numbered 99 and their lot has been considerably relieved by a substantial increase to the grant allowed them by the government.

Climate.—The weather in Cyprus during 1911 was extremely varied as regards heat and cold. Snow fell on the central plains and remained on the ground some days, an event which had not occurred for 13 years. The average rainfall over the whole island was 23.49 inches.

(A. BRUCE JACKSON.)

Malta¹

The civil population of Malta on April 1, 1912, was estimated at 215,332, as against 215,395 on the corresponding date of 1911. The total number of births in the two years was 7211. The birth rate in 1911-12 was 33.49 as compared with 36.12 per thousand in the previous year. The total number of deaths was 5286, as compared with 4612 in 1910-11. The death rate of the civil population in 1911-12 was 24.42 per thousand, as against 21.42 in 1910-11. The general state of health in the island during the year was satisfactory, except for an extensive epidemic of measles and some cases of cholera. Cholera broke out in an encampment which was formed to shelter refugees from the war in Tripoli. There were 116 cases, 85 of which proved fatal. The preventive measures taken were successful in stamping out the disease.

Agriculture.—The total area of land under cultivation in 1911-12 was 41,866 acres, while the area of uncultivated land was estimated at 4707 acres. The total area under cereals was 13,444 acres. The total yield of cereals including wheat, barley and mischiato (a mixture of both) was 22,457 quarters. The area under beans and other pulse was 2004 acres, with a total yield of 3902 quarters. The area planted with potatoes was 4147 acres and the total yield was 448,454 cwts. Cummin seed was planted on 1594 acres. The total yield amounted to 11,430 cwts. The total quantity of oranges, lemons and mandarines gathered is estimated at 176,000 dozen. The acreage of land under cotton was 1100 acres; the total yield was 187,340 lbs. The average price obtained was 6½d per lb. The quantity exported was 122,041 lbs: of this 22,015 lb were exported to the United Kingdom.

Finance and Trade.—The revenue for 1911-12 amounted to £448,114 and the expenditures £467,783. The total expenditure on the garrison (including Militia) was £511,649. In 1910-11 the expenditure was £510,933. The total declared value of goods imported, exclusive of bullion and specie and of goods imported for transhipment was £2,413,687. The total declared value of goods exported (exclusive of transhipments) was £750,422.

Shipping.—The number of British steamers which called during 1911-12 was 997, tonnage 2,219,643. The number of foreign steamers was 1427, tonnage 1,871,595.

Royal Commission.—In 1911 a Royal Commission sat to enquire into the unsatisfactory economic condition of the island and as to the best means to restore its prosperity. The conditions show a financial deficit, a decline in the shipping trade and an increasing population above the economic capabilities of the island. Malta has suffered severely from the gradual reduction of the Imperial garrison, naval and military, since 1902—a reduction which includes two battalions and six battleships. Moreover, the fleet has for the past few years been more or less frequently absent from Malta, and it is estimated that this absence means a loss to the island of at least £1000 a day. On the whole the reduction of the garrison must mean a loss to the industries of Malta of not less than £400,000 annually. The financial position is now such that while the government expenditure continually increases, the revenue diminishes.

In 1906 when the Admiralty works were completed, the extra demand for labour which had arisen a few years before ceased and there began the growth of unemployment from which Malta is now suffering and which has been aggravated by a rapid increase in population. The former prosperity depended to a large extent upon Imperial expenditure in connection with the fortifications and military works and upon the expenditure of the garrison and the fleet. In 1905, 9175 men were employed in the Naval establishment as compared with 5181 in 1911, while the reduction of employment under the War department has also been considerable. The demand for Maltese lace has greatly fallen off in recent years, owing to the competition of machine-made lace, chiefly from Germany. It has been suggested that a government agency for the sale of genuine Maltese lace should be established.

The Commission, composed of Sir Francis Mowatt (chairman), Mr. Russell Rea, Sir Mackenzie Dalzell Chalmers and Mr. D. L. H. Baynes (secretary), emphasized in their report the fact that the difficulties, both financial and economic, from which Malta is at present suffering, can be traced almost entirely to the growth of her population without a corresponding increase in the means of subsistence, no alteration in the system of taxation or other measure serving as more than a temporary palliative. The Commission also refers to the density of population and the impossibility of providing adequate employment by the development of existing industries or by the introduction

¹ See *E. B.* xvii, 507.

of new ones. This condition is yearly intensified by the high birth rate, and thus the standard of living tends continually to fall and poverty to increase.

The Commission makes the following recommendations among others:—that in view of the importance of the agricultural industry to Malta this department should be developed and placed under an officer who would give his whole time to the work; that a committee should be appointed to conduct a thorough investigation into the expenditure of the government and to report what economies can be effected; that the scale and amount of expenditure on public works extraordinary should be cut down; that the annual contribution of £5000 paid to the Imperial government in aid of military services should be discontinued or that alternatively the island government should be authorised to charge a fair rent for all sites or buildings required by the Army or Navy for purposes other than fortifications; that the tax on imported grain should be reduced by half, the revenue thus lost being made up by increases in the duties on imported tobacco, beer, and sugar, and the liquor license duties, and by the imposition of a general *ad valorem* duty on imported articles at present untaxed; and that information with regard to opportunities for emigration should be made readily accessible.

Legislation.—Twelve ordinances were passed by the Council of Government during 1911. The most important of these relate to the management and regulation of customs, the criminal laws and the manufacture of spirit and artificial wine in the island.

Education.—There are 101 day schools and 42 night schools. The enrollment in the day schools in September 1911 was 19,282. The night schools were attended by 2666 pupils. The strength of the teaching staff during the year was 766. The total cost of the elementary schools was £28,265. An average of 175 students attended the secondary school for girls. The average daily attendance in the secondary school for boys was 66. The daily average number of students in the Lyceum was 484. The average number of students who attended the University was 149, as against 222 in the previous year.

On January 24, 1912, the islands were visited by King George V and Queen Mary, who remained from the 24th till the 27th and received an enthusiastic reception.

Climate.—The meteorological returns show a mean temperature for the year of 63.02° F. The total rainfall was 24.230 inches. Earthquakes were felt locally on September 30, October 16, and November 15, 1911.

(A. BRUCE JACKSON.)

BRITISH EAST AFRICA

British East Africa comprises (1) the East Africa Protectorate, (2) the Uganda Protectorate, (3) the Sultanate of Zanzibar. The first two are administered through the Colonial Office and in status closely approximate to crown colonies. The Sultanate of Zanzibar is a protected State, its affairs being supervised by the Foreign Office. The East Africa Protectorate by itself is popularly known as "British East Africa," but all three protectorates come strictly under the designation.

The East Africa Protectorate.¹—In 1912 the white population of the East Africa Protectorate was about 4,000; the Indian about 20,000. The native population was estimated at 4,000,000. The period 1909-12 witnessed a great development in the Highlands, that part of the protectorate suited for permanent occupation by Europeans. The area so available does not exceed Ireland in size. Nairobi, the capital, had (1911) 14,000 inhabitants (800 whites, 3,000 Indians). It contains handsome public and private buildings. A wireless telegraphy station was erected in 1912. The whites are almost wholly engaged in agriculture, including dairy farming and stock raising. Sisal hemp, black wattle (for tanning) and coffee are the chief products. Wheat, barley, maize, vegetables and cotton are also cultivated. Besides cattle, sheep and pigs, there are ostrich farms. During 1907-10, 62,000 acres of freehold and 1,718,000 of leasehold land were taken up; 1,141,000 being for grazing. Large areas near the coast have been planted for coco-nuts, rubber, tobacco, &c. The only mineral exploited is carbonate of soda, but coal was found in 1911 near the railway at Mackinnon Road Station.

Excluding government stores and specie exports rose in value from £515,000 in 1907-8 to £962,000 in 1910-11; imports (chiefly cotton goods, foodstuffs and agricultural implements) in the same period rose from £799,000 to £1,000,346. In 1911 60% of the imports came from the United Kingdom or British possessions and 10% from Germany. Of the exports

¹ See *E. B. iv*, 601 *et seq.*

40% went to the United Kingdom; France, Germany and the United States taking nearly all the remainder in about equal proportions. The revenue rose from £485,000 in 1908-9 to over £700,000 in 1911-12. In the same period expenditure was approximately £700,000 each year. Up to 1912 grants in aid were made by the British treasury, the amount so found in 1910-11 being £130,000. In 1912 the Protectorate became self-supporting.

Traffic on the Uganda railway increased very rapidly, as a result of the great agricultural development in Uganda as well as in the East Africa Protectorate. The total tonnage handled advanced from 60,000 tons in 1909-10 to 77,000 tons in 1910-11 and 100,000 tons in 1911-12. In 1912 nearly half a million passengers were carried; double the number of three years previously. A new railway, 93 miles long, starting from the Uganda railway 282 miles from Mombasa was built in 1911-12 to the Magadi Soda Lake, which lies towards the German frontier. It is owned by the company exploiting the soda, but worked by the government. Another railway (30 m. long) was built from Nairobi N.E. to the Thika river, opening up one of the best parts of the Highlands. The Imperial government made in 1912 a loan of £750,000 towards railway improvements and the provision of a deep water pier at Kilindini. On July 2, 1912 Mr. H. A. F. Currie, C.M.G. (b. 1866), who had been manager of the Uganda Railway since 1903, died. He was succeeded (in Oct.) by Mr. H. B. Taylor, Superintending Engineer, Indian State Railway.

The passing of ten years since the first settler (Lord Delamere, the 3d baron) made the Highlands his home has proved that climate and soil admirably suit the European constitution. The bulk of the farm work is done by the Kikuyu, a race which has distinct aptitude for agriculture. The settlers were largely recruited from the upper and middle classes of England, and by the end of the decade the Highlands were furnished with churches, schools, roads, race courses, fenced farms and substantial farm houses, newspapers, etc.

Sir J. Hayes Sadler, the governor, was in July 1909 succeeded by Sir Percy Girouard. He achieved the somewhat difficult task of working in harmony with the white settlers, who chafed under crown colony administration and the long delays in obtaining land grants. In September 1911 the indignation of the whole white community was roused by the deportation of Mr. Galbraith Cole (a pioneer settler and brother-in-law of Lord Delamere) by order of the British Colonial Secretary. Mr. Cole, after vainly seeking protection from native stock thieves, shot dead a Kikuyu caught sheep stealing who attempted to escape. Tried at Nairobi for murder the jury had acquitted Mr. Cole without leaving the box. One result of this episode was an endeavour by the administration to afford the settlers better protection. On July 17, 1912 the resignation was announced of Sir Percy Girouard, who had accepted an offer to join the engineering firm of Armstrong, Whitworth & Co., in England. Mr. H. C. Belfield, the new governor, who had served for 25 years in the Malay States, reached East Africa in October 1912.

Uganda.¹—The delimitation of the western and south-western frontiers of the Uganda protectorate, where they adjoin Belgian Congo and German East Africa, was completed in 1912. As a result a large tract of country north of Lake Kivu was brought under British administration while that part of the protectorate west of Lake Albert was handed over to Belgium. The area of the protectorate is now given as 117,681 sq. m.

At the 1911 census the population was returned at 2,843,325, including an estimate of 378,000 for natives in districts not under administrative control. The European population was 640 (including 203 government servants and 187 missionaries); Asiatics numbered 2,216 (chiefly traders and clerks). The increase in population, despite the ravages of sleeping sickness² was testimony to the prosperity of the country. The Baganda (most of whom are Christians) totalled 558,000, the Banyora, the next largest race, 270,000. Mengo had 32,441 inhabitants, Entebbe, on Victoria Nyanza, 9,569.

The years 1909-12 witnessed an unexampled development of cotton growing, the firm establishment of coffee plantations and a general expansion of trade. Besides cotton and coffee there is a large trade in chillies and in hides and skins, and in 1911 plantation rubber, as apart from wild rubber, first appeared in the export list. Wheat is grown in Toro and on the foot-hills of Mt. Elgon. The cultivation of the cotton is almost entirely in the hands of natives, the purchasing and collecting being the work mainly of Indians, while the ginning and exporting is done by European firms. In 1912, as the result of three year investigation, pure long staple varieties of cotton—"Sunflower" and "Allen's Improved"—

¹ See *E. B.* xxvii, 557 *et seq.*

² By 1910, in which year the deaths from the disease were 1,546, sleeping sickness had been got under control.

were substituted for the hybrids previously cultivated. The value of the cotton crop, £41,000 in 1908-9, was £165,000 in 1910-11 and over £250,000 in 1911-12. The imports (merchandise only) rose in value from £288,000 in 1909-10 to £347,000 in 1910-11, and exports increased from £225,000 to £340,000. In 1909-10 revenue (including a grant in aid of £103,000) was £268,000; in 1910-11 it was £287,000 though the grant in aid was reduced to £96,000. The expenditure in the two years was £240,000 and £252,000.

The railway from Jinja, near the Ripon Falls, along the Victoria Nile was completed to Namasagoli—58 m.—in December 1911. It cost £170,000. This railway connects with a steamer service on Lake Kioga and opens up Bukedi, where a rich soil and a well defined dry season provide exceptional opportunities for cotton growing. In 1912 the Imperial parliament voted £100,000 for the provision of metalled roads suitable for motor traffic in this region. A railway from Port Bell to Kampala (20 m.), built 1912, marked the beginning of a trunk line from the Victoria to the Albert Nyanza.

The Baganda continue to prove themselves a most progressive type of negro. Some 8,000 are in government service; over 32,000 of their children were in Anglican schools alone in 1911. The native government is in the hands of Sir Apolo Kagwa, K.C.M.G., and two co-regents. The Kabaka (king), Daudi, was 16 on August 8, 1912.

In March 1911 Mr. F. J. Jackson, C.B., succeeded Capt. H. E. S. Cordeaux (who was appointed to St. Helena) as governor of Uganda. Jackson had played an important part in bringing Uganda under British protection and since 1889 had served continuously either in Uganda or in the East Africa Protectorate.

Zanzibar.¹—The Sultan of Zanzibar, Ali bin Hamud, abdicated November 15, 1911, and on December 9th his son, Khalifa bin Harub, a child of six, was proclaimed Sultan by the British. Ali-bin-Hamud had been educated in Europe and he preferred the freer life and wider interests of Europe to his throne. The native administration is under the general control of the British Agent—Mr. Edward A. W. Clarke, who succeeded Mr. Basil S. Cave (appointed consul general at Algiers) in 1909. Capt. F. R. Barton, C.M.G., is First minister to the council of regency.

The population of Zanzibar island at a census taken in 1910 was 114,069, that of Pemba being 83,130. Zanzibar city had 35,262 inhabitants. The Arab aristocracy—large land-owners—number about 20,000; there are an equal number of British Indians and about 300 Europeans. The transhipment of goods to and from the mainland of East Africa and the growing of cloves are the main sources of wealth. The value of cloves exported in 1910 was £253,000, compared with £330,000 in 1909. In 1911 the crop was estimated at £300,000. Copra cultivation is increasing; the export in 1910 was £219,000, almost double the figure for 1909. Nearly all the other exports figure also as imports; they are goods in transit. Zanzibar has been to some extent replaced by Mombasa (British East Africa) and Dar-es-Salaam and Tanga (German East Africa) as the distributing centre for Indian and European goods. This is due to the extension of direct steamship communication between India and Europe and the mainland of East Africa, and to the establishment of equal rates of freights to Zanzibar and the coast town. The exports from Zanzibar to the mainland of East Africa, piece-goods, petroleum, rice, sugar, &c. received from abroad and transhipped fell in the ten years 1901-1910 from £574,000 to £348,000. In the same period the value of goods received from the mainland decreased from £341,000 to £242,000. But Zanzibar retains its position as the chief city of East Africa in native estimation; and it remains the headquarters of the principal Indian merchants trading with East Africa, and the centre of the dhow traffic on the coast. The tonnage of vessels clearing the port in 1910 was 682,000; the external trade was valued at £2,026,000. The British proportion of the trade declined from 55% in 1908 to 47% in 1910. Customs revenue in 1910 was £107,000; the total revenue £181,000 and the expenditure £192,000.

See the Colonial Office reports on East Africa Protectorate and on Uganda, and the Consular reports on Zanzibar; Lord Cranworth, *A Colony in the Making* (London, 1912); Ward and Miligan, *Handbook of British East Africa* (Nairobi and London, 1912); John Roscoe, *The Baganda* (London, 1911).

(F. R. CANA.)

¹ See E. B. xxviii, 957 *et seq.*

BRITISH SOMALILAND¹

During 1910 the British troops were withdrawn from the interior of Somaliland. The arrangements made for organising the tribes in the protectorate and providing them with arms for defence against the Mullah Mahommed—the "Mad" Mullah—led only to inter-tribal fighting and anarchy. The Mullah remained in Italian territory, and in October 1912 was officially reported to be suffering from an incurable disease.

The revenue for the years 1909-12 varied from £30,000 to £32,000; the expenditure, £192,000 in 1909-10 (owing to military operations), had dropped in 1911-12 to £74,000. Deficits are met by grants. The trade was valued at £490,000 in 1909-10 and £484,000 in 1911-12.

Gums (Arabic, myrrh, etc.), hides and skins, ghee, coffee and pearls are the chief exports. The decrease of trade between Zaila and Harrar continued owing to the competition of the railway from Jubiti. The pearl fisheries at Zaila increased in value. Berbera was placed in wireless telegraphy communication with Aden in 1911.

Mr. H. A. Byatt, C.M.G., who became commissioner of the protectorate in 1911, had served in Somaliland since 1905.

See the Colonial Office Reports, and R. E. Drake-Brockman, *British Somaliland* (London, 1912).

NYASALAND²

The period 1910-12 was one of prosperity in Nyasaland. The population in 1911 was, natives 969,183, (as against 927,355 in 1907), Europeans 766, Asiatics 481. The natives proved both peaceful and contented. Witchcraft and trial by ordeal were rendered illegal in 1911. Sleeping sickness slowly extended despite every effort to arrest it. The spread of the tsetse fly involved the closing of many roads to animal transport. This difficulty is being met by the construction of metalled roads along which motor vehicles can ply, but of the 3,156 miles of road in the Protectorate in 1911, only 23 miles—between Blantyre, the chief commercial centre, and Zomba, the administrative capital—were macadamised.

The external trade of the Protectorate in 1910-11 amounted to £368,000 and in 1911-12 to £446,000. To the United Kingdom in 1911-12 went produce valued at £179,000 and from it came goods valued at £194,000. The cultivation of coffee, at one time Nyasaland's staple product, gradually diminished since 1899-1900. In 1909-10 the export of coffee was valued at £15,500; in 1910-11 it had dropped to under £7,000. In 1911-12 it rose to £16,000, a temporary increase due to exceptionally suitable weather conditions. Cotton (£59,000) was the chief export in 1910-11, having more than doubled in a year. Owing to late export of part of the crop there was a drop in 1911-12 to £58,000. Tobacco exports were £42,000 in 1910-11 and £53,000 in 1911-12. Rubber exports in 1911-12 were £10,000.

A great obstacle to the expansion of trade was the inadequate communication with the outer world, due to the persistent diminution of water in the lower Shiré so that steamers ascending the Zambezi were frequently unable to reach Port Herald, whence a railway runs to Blantyre. During 1912 the Imperial Government arranged to extend the railway south from Port Herald to the Zambezi; the line to be continued eventually to Beira. In October 1912 the Portuguese government signed a contract with a Belgian group of financiers for the building of the part of the line from Beira to the Zambezi.

The revenue of the Protectorate was £94,980 in 1910-11 and £97,356 in 1911-12. Expenditure was £112,369 in 1910-11 and £118,070 in 1911-12. Deficits are made good from the British treasury. The institution in 1911 of a land tax of one halfpenny an acre per annum on all lands held by non-natives became a valuable source of revenue. The tax on native huts was raised in 1911 from 3s to 4s and from 6s to 8s for "low and high" grades respectively. The tax yielded in 1911-12 £50,900.

Sir Alfred Sharpe (b. 1853), who had served in official capacities in Nyasaland since 1891, and had governed the Protectorate since 1897, retired in 1910. He was succeeded by Sir W. H. Manning (b. 1863), the officer who raised the Central Africa regiment and commanded the Somaliland Field Force in 1902-3 (see *E. B.* xxv, 382a), and who from January to November 1910 was Commissioner of that Protectorate.

MAURITIUS³

The population of Mauritius at the census of 1911 was 368,791, a decrease of 2,232 compared with 1901. Males exceeded females by 22,000. Port Louis, the capital, had a pop. of 50,060, a decrease of 2,680. As Mauritius has an area of only 716 sq. miles, the density of population—514 per sq. mile—is one of the greatest in the British Empire. Indian immigrants and their descendants constituted about 70% of the total population, while the negro type had almost disappeared. The dependencies had 6,690 inhabitants in 1911; Rodriguez, the largest (area 42 sq. miles), had a population of 4,820.

Mauritius continues to yield practically nothing for export besides the products of the

¹ See *E. B.* xxv, 381.

² See *E. B.* iv, 595 *et seq.* ("British Central Africa").

³ See *E. B.* xvii, 913 *et seq.*

sugar cane. Moreover it produces little else for home consumption. Dependent on a single industry, the colony suffers when that industry is depressed. Owing to the high price fetched by sugar the colony during 1910-12 attained however a sounder position than it had held for years. The value of imports in 1909 was £1,800,000; in 1910 it had increased to £2,333,000. Exports in 1909 were valued at £2,295,000 and in 1910 at £2,435,000. About 79% of the total imports came from the United Kingdom and British Possessions, to whom went nearly 99% of the exports.

The sugar crop of 1910-11, exclusive of sugar for local consumption, was 214,372 tons (metric) as compared with the "record" 1909-10 crop of 246,560 tons; the value was £2,000,000. Over 144,000 acres, one-third of the whole area of the island, were in 1910 under sugar cultivation. There were at the same time sixty-two sugar factories working. The colony's three largest customers for sugar were in 1910: British India, 146,510 tons (metric); the United Kingdom, 47,316 tons, and Cape Colony, 19,137 tons. Great improvements have been made in the manufacture, and steam ploughs have been introduced for work in the cane-fields, but much of the land under cultivation is rocky and hand labour has not been superseded. Aloe-fibre and vanilla are the only other exports of any note. Imports of tea have increased considerably, although locally-grown tea has been found very satisfactory, and nearly £60,000 worth of culinary oils, etc., was imported in 1910 notwithstanding that the soil and climate are eminently suited to the cultivation of oil-bearing plants and trees. Experiments in the cultivation of cotton have been made.

The revenue for the financial year 1909-10 was £720,000, considerably exceeding that of any previous year. The expenditure was £630,000. In 1910-11 the revenue was £742,000, and the expenditure £638,500. The net debt of the colony in 1911 was £1,296,000.

Sir Cavendish Boyle (b. 1849), after serving as Governor of Mauritius for eight years, retired in 1911. He was succeeded by Major John Robert Chancellor (b. 1870), an officer who had served with distinction in the Tirah Expedition (1897-98) and in other campaigns, and who had been Secretary to the Imperial Defence Committee.

See A. Walter, *1911 Census Report* (Port Louis, 1912); and *Report of the Mauritius Royal Commission* (Cd. 5186) issued in 1910, a valuable guide to the economic condition of the colony. (F. R. CANA.)

SEYCHELLES¹

The population of Seychelles at the 1911 census was 22,691 (148 per sq. m.) of whom only 2,159 were not born in the islands; the increase in ten years was 3,454, or 18 per cent. 85 per cent are Roman Catholics.

The value of exports in 1911 fell to £126,867 from £149,467 in 1910 and imports were £90,126 as against £98,460 in the previous year. The United Kingdom and British Possessions took about a quarter of the total. France, with purchases to the extent of £47,000, was the colony's best customer. The chief article of export was copra, valued at £51,000, guano (£43,800) coming second. It is estimated that at the present rate of exploitation the supplies of guano will not last beyond 1920. Vanilla (£15,533) was spoilt by unseasonable rainfall, and the crop was one of the smallest on record since 1907, when the value of the harvest was nearly £67,000. Cinnamon bark comes fourth on the list; the trees were introduced during the French rule about 1775, but their cultivation was abandoned almost immediately and the trees spread through the forest and were neglected until 1908. A ton of tortoise shell was exported to London and Paris. Experiments have been made in the rearing of young turtles from the eggs in enclosed areas. The turtles grow more quickly in confinement and the weight of the shell is proportionately greater. Most of the imports came from the United Kingdom and British Possessions, the total for 1911 being £74,067 as against £16,047 from other countries. The chief import was rice, which India supplied to the value of £16,333. Methods of agriculture have been improved, and coco-nut plantations in particular show the results of more scientific treatment. Many thousands of seedlings have been planted out from the seeds of rubber trees growing in Seychelles, and in 1911 rubber appeared for the first time as an export.

The revenue in 1911 was £36,333 and the expenditure £34,133.

In October 1912 Mr. W. E. Davidson (b. 1859), who became Governor of Seychelles in 1904, was appointed Governor of Newfoundland, and Lieut.-Col. C. R. M. O'Brien (b. 1859), Colonial Secretary of the Gambia (who had served with distinction throughout the Anglo-Boer War 1899-1903), was made Governor. (F. R. CANA.)

BRITISH WEST AFRICA

In West Africa the British colonies and protectorates form separate governments directly dependent upon the Colonial Office in London. They are (1) the Gambia; (2) Sierra Leone; (3) the Gold Coast, with Ashanti and the Northern Territories; (4) S. and N. Nigeria. In every part of British West Africa the outstanding features of the period 1910-12 were practically unbroken public peace and a remarkable development of trade

¹ See E. B. xxiv, 751 *et seq.*

and improvement of means of communication. But the need of securing the natives in the unfettered enjoyment of their lands, as a condition necessary for the permanent prosperity of each of the colonies and protectorates, led to the appointment (June 26, 1912) of a Committee by the Colonial Secretary (Mr. L. Harcourt) to consider the laws relating to the transfer of land in British West Africa, with a view to seeing how far it was feasible to extend the system adopted in N. Nigeria, where the whole of the country is held in trust for the native inhabitants. Sir Kenelm Digby was appointed Chairman of the Committee, whose members included Sir F. M. Hodgson, an ex-Governor of the Gold Coast, and Mr. E. D. Morel, well known for many years' persistent advocacy of native rights on the Congo and elsewhere in tropical Africa.

Gambia.¹—The census taken in 1911 showed that the population of the Island of St. Mary at the mouth of the Gambia, on which is built Bathurst, the capital, was 7,700, compared with 8,807 in 1901. The population of the protectorate, mainly Jolloff and Mandingo, was 138,401, or 15,000 fewer than was estimated for 1907. In 1911 for the third successive year the revenue (£86,454) exceeded previous records, the expenditure being £71,390. In 1910, for the first time, the value of the trade reached over a million sterling, the figure being £1,134,460; and in 1911 it rose to £1,499,000, imports being valued at £807,000 and exports £682,000. The ground-nut industry is the main occupation of the people, and while it continues so lucrative the efforts of the Administration to widen the basis of prosperity meet with little success. In the five years 1907–11 the value of the crop varied from £245,000 to £437,000 (1911 tonnage 47,000).

Consisting of a narrow strip of land on either side of the lower Gambia the protectorate is hemmed in by French West Africa, and the commerce (though not the shipping) is largely in the hands of French firms established at Bathurst. The trade in ground nuts is almost wholly with France, and in 1911 84.8 p.c. of the exports (excluding specie) went to France and her Colonies. The British Empire took 6.3 p.c. and Germany 5.6 p.c. France had also about 45 p.c. of the import trade, Great Britain coming next with about 30 p.c.

In September 1911 Sir George Denton (b. 1851) who had administered the Gambia for nearly eleven years, retired. He was succeeded by Col. Sir H. L. Galway (b. 1859).

See H. F. Reeve, *The Gambia* (London, 1912), an excellent monograph by a retired official; Sir G. Denton, "Twenty Three Years in Lagos and the Gambia," *Jnl. African Soc.*, Vol. xi (1912); and the Annual Reports issued by the Colonial Office.

Sierra Leone.²—By a treaty with Liberia signed on the 21st of January 1911, the south-eastern district of Sierra Leone lying south of the Morro river was ceded to the Republic in exchange for the district of Kanre Lahun (see map in *E. B.* xi, 204). Immediately north of the Anglo-Liberian frontier the Anglo-French boundary underwent a modification (exchange of notes July 6, 1911), resulting in the transference to Sierra Leone from French Guinea of a narrow strip of territory with an area of 125 sq. m. The census of 1911 gave the population of the Colony at 75,572, while that of the Protectorate was estimated at 1,327,560. The figures for the chief tribes were: Mendi 442,000, Sherbro 107,000, both pagan; Timini 347,000, Limba 110,000, Konnoh 61,000, the last three Moslem (more or less). The European population was 650 (as against 309 in 1901), while the Syrians (who have obtained a considerable share of the petty trade of the country) had increased from 47 in 1901 to 175. Freetown, the capital, and one of the finest ports in West Africa, had a population of 34,000. There has been a general increase both in commerce and in agriculture, but the primitive and wasteful methods of farming adopted by the natives are leading to the disappearance of the dense forest lands—with unfortunate results, especially on the mountain slopes and tops, where in two years virgin forest may be turned into bare rock (see "Forestry" by Mr. G. B. Haddon Smith in the Colonial Office report on Sierra Leone for 1910.) The first step towards the reservation of forest land was made in 1911.

The commercial prosperity of Sierra Leone continues to be bound up with the products of the oil palm—constituting 72 p.c. of the domestic exports in 1911. Next in importance comes the Kola nut, a universal article of diet among the natives of West Africa; scarcely any of the nuts reach Europe. In the five years 1907–11, the value of the exports rose from £831,000, to £1,300,000; that of the imports from £988,000 to £1,267,000. The total revenue for the same period increased from £359,000 to £457,000; the corresponding figures for

¹ See *E. B.* xi, 437 *et seq.*

² See *E. B.* xxv, 54 *et seq.*

expenditure being £345,000 to £432,000. At the close of 1911 the colony had a funded debt of £1,255,000. Great Britain's share of the import trade in 1911 was 75%; of the export trade 24%. Germany ranks first (30%) in the export trade, as a result of the gravitation of the palm kernel trade to Hamburg, where there are large factories with the most modern machinery for extracting the oil from the kernels and making use of the waste products. The shipping statistics for 1911 showed a total tonnage of 1,246,000, 68% being British, compared with a tonnage of 993,000 in 1910, when the British percentage was 77%. The German tonnage rose from 13.55 in 1910 to 18.67 in 1911.

The expansion of trade depends largely on opening up new oil palm districts, and as the tsetse fly renders animal transport impossible attention is directed to other means of locomotion. A branch line (90 m. long) from the main railway, begun in 1910 and completed in 1912, runs northward from Boia (S.E. of Freetown), and crossing the Rokell river reaches Makene, the centre of one of the richest palm belts in the country. The opening up of the Hinterland by "feeder roads" also continues. A notable feature in the history of the country is the spread of Islam, coupled with a general desire for education. During 1911-12 a Government Model School was built at Freetown. In districts where Moslem influence is strong a high degree of sobriety and of amenability to good order prevails.

The visit of the Duke of Connaught to Freetown in December 1910, was an event of more than ceremonial importance. There were present from the Protectorate chiefs of many tribes which had fought hard against British dominion, and the cordial manner in which they were received by the uncle of King George has been told in every corner of the country. In April 1911 Sir Edward Marsh Merewether (b. 1858), formerly Lieut. Governor of Malta, became Governor in succession to Sir Leslie Probyn, transferred to Barbadoes. By the death of Dr. E. W. Blyden, at Freetown on February 7, 1912, at the age of 80, the British Empire lost a distinguished negro scholar and official (see *E. B.* xxv, 56d; and xvi, 541d).

See the annual reports on Sierra Leone issued by the Colonial Office; J. T. Aldridge, "Sierra Leone and its Commercial Expansion," *United Empire*, Vol. 2, 1911; Major R. G. Berry, "The Sierra Leone Cannibals," *Proc. Ryl. Irish Assn.*, 1912.

Gold Coast.¹—The census of 1911 gave the total population of the Gold Coast, Ashanti and the Northern Territories as 1,503,386 equal to 18.7 per square mile. The number in the Gold Coast proper was 853,766, in Ashanti 287,814, in the Northern Territories, 361,806. In all there were 1,625 Europeans. The increasing prosperity of the Gold Coast is shown in the returns of trade and revenue, in the absence of inter-tribal disputes, in the development of agriculture, and in marked improvement in sanitation.

The revenue for the financial year 1911, which amounted to £1,111,000, surpassed that of all previous years, and exceeded the expenditure by £197,000. The revenue in 1910 had been £1,006,000 and the expenditure (including £149,380 repayment of loans) £924,862. The public debt on December 31, 1911, was £2,489,000. The value of the seaborne trade increased from £5,049,000 in 1909, and £6,137,000 in 1910, to £7,576,000 in 1911. The imports for 1910 were £3,439,000, for 1911 £3,784,000; the exports for 1910 were £2,697,000, for 1911 £3,792,000, an increase of 40%. Cotton goods and spirits are the principal imports; the Gold Coast in addition imports much machinery and lumber for the mines. Cocoa, gold, rubber, and palm oil and kernels are the chief exports. The cocoa industry, which is entirely in native hands, has had a great development. In the two years 1910-11 the export was almost doubled in quantity and more than doubled in value. The figures for the three years 1909-11 were: 1909, quantity 45,277,000 lbs., value £755,000. 1910, quantity 50,692,000 lbs., value £866,000; 1911, quantity 88,987,000 lbs., value £1,513,000.

The gold mining industry is firmly established. The value of the gold mined during the first ten months of 1912 was £1,215,000 as against £1,069,000 for the whole of 1911, which was itself an increase of £313,000 over the figures of 1910. The mines of the Ashanti Goldfields Corporation export nearly half the total yield. About 20,000 natives are employed in the mines or in dredging the river beds for alluvial gold, 15% of the gold being obtained from alluvium. Besides cocoa and gold, rubber, lumber and oil palm products are the chief exports. Some 80% of the total trade is with the United Kingdom; but Germany has a large share of the shipping, the tonnage of the German ships cleared in 1911 being 438,000, British ships 773,000 and French ships 113,000—the total tonnage being 1,326,000.

Sir John Pickersgill (1851-1910), who had been Governor for seven years, retired in September 1910, and shortly afterwards died in England. He was succeeded by Mr. J. J. Thorburn—who had previously served in Ceylon and Lagos. Mr. Thorburn retired from the Colonial service in August 1912, and Sir Hugh Clifford (b. 1866), then Colonial Secretary of Ceylon, was appointed Governor. During 1911, Sir William Brandforth Griffith, Chief Justice since 1895, who had done much to codify the colony's laws, retired and was succeeded by Sir P. C. Smyly, Chief Justice of Sierra Leone.

¹ See *E. B.* xxi, 203 *et seq.*

A new and valuable direction has been given to education by the adoption of a combined system of literary and technical instruction in every Government assisted primary school. A Government Training Institution for teachers and a Technical School have been opened at Accra. The new system has the cordial co-operation of the missionary societies, on whom has fallen hitherto the bulk of the burden of education.

The history of Ashanti¹ has been one of marked development. Much of the success of the administration is attributable to the wise guidance of Mr. F. C. Fuller, Chief Commissioner since 1905. The Ashanti and allied tribes, having a comparative high mentality, have adapted themselves more readily than was expected to the changed conditions following the establishment of British rule, and have become keen agriculturists—cultivating cocoa, rubber and kola nuts. The town of Kumasi (pop. 18,853 in 1911, 93 being Europeans and 23 Syrians) is a great trade centre and contains many handsome buildings, some of them owned by Ashanti chiefs. Christianity is making progress—the Christian population in 1911 was 6,000—while Islam finds few converts.

In the Northern Territories of the Gold Coast—an open park-like country for the most part—there is a marked improvement in the condition of the people, the last tribe to dispute the authority of the British—the Zouaragu—having been subjugated in 1910. The protectorate is purely agricultural and pastoral; the chief exports, which are sent mainly to Kumasi, being live stock, shea butter, and dawa dawa. A small amount of cotton is raised. The energies of the Government have been largely directed to establishing and maintaining the legitimate authority of the chiefs, the country formerly being in an anarchical condition when each man did what was right in his own eyes.

See the Annual Reports on the Gold Coast, on Ashanti, and on the Northern Territories, published by the Colonial Office, London; Major F. G. Guggisberg, "Mapping the Gold Coast and Ashanti" in *Trans. Liverpool Geo. Soc.*, 1910; Mary Gaunt, *Alone in West Africa* (London, 1912); J. A. Barbour James, *The Agricultural and Other Industrial Possibilities of the Gold Coast* (London, 1911); L. P. Bowler, *Gold Coast Palaver*, London, 1911).

Nigeria.²—The unification of the protectorates of Southern and Northern Nigeria was decided upon early in 1912. Sir Frederick Lugard (*E. B.* xvii, 115) was selected as Governor of both protectorates, succeeding Sir Walter Egerton in S. Nigeria and Sir Hesketh Bell in N. Nigeria. Sir Frederick (whose appointment was gazetted on May 17th) did not arrive in Nigeria till October 1912. In both protectorates there was a marked development of trade in the period 1910–12, while the social condition of the people underwent rapid changes. The only part of S. Nigeria not brought under administrative control by the middle of 1912 was a small area in the N.E. corner inhabited by Munshis, a wild pagan tribe.

The population of Nigeria is approximately 18,000,000, of whom 2,400 are Europeans. The census of 1911 gave S. Nigeria 7,858,689 inhabitants; and N. Nigeria 8,110,631, but 9,270,000 is considered a more accurate figure for the northern protectorate. The pop. per sq. m. is 98 in S. Nigeria and about 40 in N. Nigeria. Yoruba numbers about 2,000,000; Ibos about 3,000,000. The Yoruba—readiest of all West African tribes to adapt themselves to Western civilisation—inhabit the Western Province of S. Nigeria, through which the railway from Lagos to the Niger passes. Their chief towns are Ibadan (pop. 175,000, in 1911), Ogbomosho (80,000), Abeokuta (51,255), Oshogbo (59,821). In contrast to the Western Province, where Yoruba is practically the only language, the census of 1911 revealed in the Central and Eastern provinces of S. Nigeria 57 different languages with 82 distinct tribes. In N. Nigeria two to three hundred different languages are spoken, Hausa being the widest spread. The only towns of more than 30,000 inhabitants in N. Nigeria are Kano (39,368 in 1911) and Ilorin (36,343).

In S. Nigeria the energies of the administration were chiefly concentrated on sanitation, the clearing of the network of waterways which form the Niger delta, the building of roads, and the putting down of inter-tribal disputes. At Lagos, the capital (pop. 73,766 in 1911), great harbour works were begun to enable steamers draught 24 ft. to lie alongside the quay. Large areas of swamp land have been reclaimed at Lagos and

¹ See *E. B.* ii, 724 *et seq.*

² See *E. B.* xix, 677 *et seq.*

Forcados (pop. 3,189), the port for steamers ascending the Niger. Throughout Yorubaland increased attention has been paid to education—several technical schools being established,—and there is springing up a group of intelligent, thinking men, born and educated in Southern Nigeria, who are imbued with love of their country and are devoting themselves to its service. In the Hausa States and Bornu in N. Nigeria—as among the Yoruba in S. Nigeria—the administration rules through the native governments. The establishment in 1911 of a *Beit-el-Mal* (State Treasury) in all the Hausa Emirates was an important step towards securing purity in the public services. From the *Beit-el-Mal* the native judges and other functionaries receive fixed salaries. At the same time the Emirs were given civil lists in lieu of depending upon what share they could get from the imposts levied on the people. The Land and Native Rights Ordinance, 1911, established the system of native land tenure on an inalienable basis.

Nigeria, with 80,000 sq. m. of dense forest, still depends mainly upon its sylvan products, but since 1910 its mineral resources have leapt into importance. The mineral survey of S. Nigeria revealed the existence of lignate at Asaba, 15 m. W. of the Niger, and of enormous deposits of coal at Udi, some 50 m. E. of the Niger at Onitsha. A survey for a railway to connect the Udi coalfield with Onitsha was made in 1912. In N. Nigeria the exploitation of the tin fields in the province of Bauchi attained large proportions. Mining, which began in a small way in 1902, attracted little attention till 1909. Since then over £3,000,000 capital has been invested in the field, which is alluvial and covers some 2,500 sq. m. Exports of tin ore rose from £38,000 in 1909 to £72,000 in 1910, and £181,000 in 1911. In that year 1,470 tons of tin were exported; from Jan 1st. to July 31, 1912 the export was 1,489 tons (value not stated). In October 1912, the Colonial Office announced that pending a systematic survey of the tin mining area no mining leases or prospecting licences would be granted to new applicants.¹ Rich reefs of galena carrying a considerable silver return have been found in the province of Muri, along the middle Benue.

The completion of the railway from Baro to Kano in March 1911, proved a potent factor, not alone in the development of trade, but in its influence on native life and thought. In the first year of working the receipts on the Baro-Kano railway came to about £70,000. The railway is 3 ft. 6 in. gauge and 356 miles long. In 1911 also the railway from Lagos was extended till it joined the Northern Nigeria line at Minna (250 miles from Lagos), the Niger being bridged at Jebba. A 2 ft. 6 in. gauge railway was built in 1911 from Zaria, on the main line, eastward to Rahamma, at the foot of the Bauchi Plateau and 40 m. W. of Naraguta, the headquarters of the tin field. It is 90 m. long and cost £2,000 a mile. Like the other Nigerian railways it is State owned and State worked.

During 1909–11 the volume of trade passing through S. Nigeria rose from £8,600,000 to £10,588,000, excluding the goods in transit to Porto Novo in Dahomey. In 1910, £546,000, and in 1911, £726,000, of the total was credited to N. Nigeria as the value of imports and exports by commercial firms. Palm kernels, valued in 1911 at £2,574,000, and palm oil (£1,696,000), were the chief exports. Rubber and cocoa were next in importance. The export of cocoa in 1911 (9,858,000 lbs.) showed an increase of 50% over 1910; its value was £164,000. Cotton, despite fluctuations in the crops, gave promise of expansion. Cotton cultivation for export also progressed in Northern Nigeria. Up to 1912 the price fetched by native cotton for local manufacture exceeded one penny per lb., the highest price offered by the British Cotton Growing Association. From N. Nigeria the chief exports during 1910–12 were palm kernels, shea nuts, rubber, gum and tin. The bulk of the trade of Nigeria, as also the shipping, is in British hands, though increasing competition is being met with from German and French firms.

In 1911 the revenue of S. Nigeria was £1,956,000, the highest on record. Of this £975,000 was derived from duties on imported spirits, and £307,000 (£130,000 net profit) was railway revenue. Expenditure was £1,717,000. On March 31, 1912, the public debt of S. Nigeria was £6,471,000. A loan of £5,000,000 was floated in 1911, calls to the end of the year being £3,223,000. In N. Nigeria in the financial year 1910–11 the total local revenue was £275,000 compared with £178,000 in 1908–9. In 1911–12 it was £545,000 (including a sum of £196,000 on account of native local administration, the corresponding sum not being shown in the 1910–11 statement). The expenditure in 1910 was £565,000, compared with £540,000 in 1908–9. In 1911–12 it was £827,000. In N. Nigeria the importation of trade spirits is forbidden and the chief source of revenue is the land tax—in reality a *pro rata* property tax—which increased from £124,000, in 1908–9 to £217,000 in 1911–12. (The land revenue is really double the figures given, one-half the amount collected being retained by the native government for local needs.) Deficits on the N. Nigeria revenue were met by grants in aid from the Imperial government, and as to £70,000 from the S. Nigeria treas-

¹ In some districts the presence of prospectors was resented. Mr. Campbell, a mining engineer, was murdered in June 1912 at Ninkada, Nassarawa province, by Mada pagans against whom a small force was sent, the Mada sustaining about 180 casualties.

ury. The revenue of the *Beit-el-Mal* amounted to over £200,000 in the first year of its institution. In N. Nigeria in the Moslem regions (i.e. the Hausa States and Bornu) are government schools where purely secular education, including crafts and agriculture, is given. Hausa is taught in Roman characters. As among the Yoruba and the Beni of S. Nigeria the chiefs in N. Nigeria are keenly interested in the schools.

See Capt. C. W. J. Orr, *The Making of Northern Nigeria* (1911); E. D. Morel, *Nigeria: Its Peoples and Its Problems*, (1911); Major A. J. N. Tremearne, *The Tailed Head Hunters of Nigeria* (1912); C. L. Temple, "Northern Nigeria," in *Geog. Jnl.* (Aug. 1912); Prof. Wyndham Dunstan, *Southern Nigeria: Mineral Survey* (Colonial Reports, miscellaneous nos. 81 and 83); J. D. Falconer, *The Geology and Geography of N. Nigeria* (1911) and *On Horseback Through Nigeria* (1911); A. F. Calvert, *Nigeria and Its Tin Fields* (1912) and *The Nigerian Tin Manual* (1912); Colonial Office Annual Reports on S. and N. Nigeria; S. Nigeria Census Reports 1911 (Lagos, 1912).

St. Helena¹

The population in 1911 was 3,520 (1,658 males; 1,862 females). Revenue (1910) £9,306 (including a grant-in-aid of £2,500 from the Imperial Exchequer); (1911) £8,622. Expenditure (1910) £9,596; (1911) £9,129. The Government flax fibre mills have been working only intermittently; having been opened in 1907 they were closed in 1910, the supply of leaf being exhausted, and they have remained so since, except during a few weeks. There is a lace school, but it does not support itself. Jamestown was visited by 51 ships in 1910 and 64 in 1911. On October 24, 1910, H.R.H. the Duke of Connaught visited the island, no member of the Royal Family having done so since the Duke of Edinburgh in 1860. Capt. H. E. S. Cordeaux, C.B., C.M.G., became governor in 1911 in succession to Lt.-Col. Sir H. L. Galway, K.C.M.G., transferred to Gambia.

Falkland Islands²

According to the census of 1911, the population, including South Georgia, was 3,275. The large increase since 1901 (pop. 2,043) is due to the development of the whaling industry. The population in 1911 was thus distributed:—East Falklands and adjacent islands, 1,608; West Falklands (including New Island), 664; South Georgia (including a shipping population of 563) 1,003—in 1901 it was uninhabited.

The average number of births during 1908–1912 was 52 and of deaths 18. The average density of population was:—Falkland Islands (6,500 sq. miles) 34; South Georgia (1000 sq. miles) 1,003. The total number of males and females was 2,370 and 905 respectively; or an average of only 38.2 females to every 100 males. The small population of females is due to the large number of men engaged in the whaling industry. In the statistics relating to religious beliefs 1,821 persons are returned as belonging to the Church of England, 769 as Lutherans and 63 as Baptists. Of the total population 2,107 were returned as British subjects; 13 of these being naturalised. Of the 1,093 foreigners 980 were natives of Sweden and Norway, the majority of these being engaged in the whaling industry.

With the exception of small government reserves the whole of the land of the colony is in the hands of sheep farmers. Closer settlement is thus rendered impossible and in spite of the high wages paid for labour there is no opening for new settlers. About one-fifth of the colony is composed of peat, but nothing has yet been done to develop it.

The rainfall registered at Port Stanley during 1911 amounted to 37.06 inches as compared with 27.68 inches in 1910.

Industries.—Sheep farming and whaling continue to be the principal industries. The number of sheep in the colony during 1911 was 706,170, which is 18,566 less than in 1910. The number of sheep slaughtered in 1911 was 76,315 as against 69,794 in the previous year. This increase is partly due to the establishment of two mutton-canning factories, capable of dealing respectively with 600 and 300 sheep daily. They began work in 1910, employing 100 men and producing 25,000 tins of preserved meat.

Whaling round the Falkland Islands was not so successful in 1911 as in former years, one company producing only a total of 7,400 barrels of oil and 50 tons of whalebone. In the dependencies, however, the whaling industry has developed rapidly and appears to be rivalling sheep-farming as the mainstay of the colony. In South Georgia eight companies are now established and employ 1000 men in their factories ashore and afloat. During the 1910–11 whaling season oil and guano were produced worth £534,715. The South Orkneys and the Sandwich Islands were each visited by one company, and ten companies held licences for the South Shetlands and Graham's Land. The total catch from these dependencies was 156,770 barrels of oil and 400 tons of whalebone, together worth over £468,500. The total value of the products during 1911 was £1,026,415. The export of whale oil in 1911 was 13,174 tons, valued at £270,762, more than double the export in 1910.

Trade is expanding steadily. The exports during 1911 amounted to £471,156 as com-

¹ See *E. B.* xxiv, 7.

² See *E. B.* x, 151.

pared with £308,930 in 1910. The imports were valued at £93,913 as against £94,294. The principal exports are whale oil and wool. Over 4½ million lb of wool, valued at £150,134, were sent away in 1911, a slight decrease on 1910. The other articles of export are tallow, sheep-skins, hides, seal-skins, whale oil, whalebone, whale plates and tinned meat.

The total general revenue during 1911 amounted to £36,146, exceeding that of 1910 by £9,566. The total general expenditure amounted to £23,407, an increase of £5,464 over 1910. The average excess of ordinary revenue over expenditure during 1908-12 was £2,910. At the end of 1911 the assets of the colony were £167,727, and the liabilities £76,546.

Communications.—The Pacific Steam Navigation Company's steamers call at Stanley on their voyage out to Callao and on their return voyage a fortnight later, thus making a monthly communication by letter with England, and fortnightly by cable *via* Monte Video and Chile. The hitherto isolated state of the colony will shortly be terminated by the erection of a wireless telegraph station, the tender of the Marconi Wireless Telegraph Company having been accepted for a 5 kilowatt installation capable of communicating at night with Buenos Aires or Monte Video.

The number of sailing vessels that entered inwards in 1911 was 14 with a tonnage of 12,940; an increase of 6,159 in tonnage but no increase in the number as compared with 1910. The number of steamers entering was 64 with a tonnage of 141,929; an increase of 6 in number but a decrease of 7,192 in tonnage.

Social Progress.—Among legal enactments of the year 1911 were new regulations concerning whaling, sealing, and the importation of animals, an ordinance dealing with the sale of liquor in the Falkland Islands and South Georgia, the imposition of an export duty of 3d a barrel on whale oil, and a publication of a new edition of the laws of the colony.

The volunteer force on December 31, 1911, had two officers and 117 non-commissioned officers and men. The "Boy Scouts" held their first meeting on July 23, 1911.

The results of the educational year in the government school are satisfactory. There is a further advance in the numbers on the roll, and a considerable improvement in the average attendances. The number of children educated during 1911 was 435.

The new hospital to be erected from a fund subscribed by the colonists as a memorial to King Edward VII was begun towards the end of 1911; it will have accommodation for 12 patients. A new town hall to take the place of the Stanley Assembly Room, recently destroyed by fire, is also in the course of erection.

In 1911 there were only 60 convictions for various offences as against 81 in 1910.

The reports of the medical officers indicate a general improvement in the public health of the colony.

(A. BRUCE JACKSON.)

THE BRITISH WEST INDIES

The history of the British West Indies is still that of the several colonies, no practicable scheme for federating the islands, British Guiana and British Honduras, having been forthcoming. During 1910-12 steady progress has, however, been made in the direction of securing greater uniformity in all matters concerning these colonies. The question of closer trade with Canada has helped to bring the various units together.

The preference of 37½ per cent given by the Dominion on British sugar had continued to attract West Indian produce to the Canadian market; the value of the preference was, however, reduced by the privilege given to the best refiners of Canada for three years from 1909 of importing at the British preferential rates two tons of sugar for every ton of Canadian beet refined, and by the further privilege extended to the Canadian refiners generally in the same year of importing foreign sugar to the amount of 20 per cent of their requirements, on the terms of the British preference, in view of an alleged combination of the West Indian producers to raise prices. In August 1909 a Commission consisting of Lord Balfour of Burleigh, the Hon. William Stevens Fielding, the Hon. William Paterson, Sir John Poynder Dickson-Poynder, M.P. (now Lord Islington), and Sir Daniel Morris, with Mr. H. R. Cowell as Secretary, was appointed to enquire into the question of trade relations between Canada and the West Indian colonies. The terms of reference included improvement of transportation and telegraphic communication. The Commissioners visited Canada in September 1909 and the West Indian colonies in January 1910. Evidence was also taken in London. In their Report they warmly advocated the establishment of reciprocal trade arrangements between Canada and the West Indies, and the improvement of steamship and telegraphic communication. With regard to steamship communication, they advocated the establishment of a service between the West Indies and the Mother Country *via* Canada, but this did not commend itself to the West Indian colonies, and the scheme was dropped in favour of

direct steamship communication. In April 1910 a conference of delegates from British Guiana and the West Indian islands (the Bahamas, Jamaica and Grenada excepted) met at Ottawa, and an agreement was arrived at on the basis of the grant of mutual preferential terms on the principal articles of import into the West Indies from Canada, and vice versa. During 1912 the agreement was approved by the Legislatures of all the West Indian colonies concerned, and by the Imperial government. A resolution approving of it was passed by the Dominion House of Commons in November 1912.

Since 1905, when the transatlantic mail contract was abandoned, the Royal Mail Steam Packet Company had carried the transatlantic mails on a poundage basis. In 1910 the Company gave notice to terminate the arrangement, and in November the direct service ceased, causing much inconvenience and loss to trade. On November 18th an intercolonial conference was held in Barbados, and the West India Committee strongly urged upon the Imperial Government the need for a mail subsidy. The government at last agreed to offer a subsidy of £40,000, and a contract was entered into with the Royal Mail Company for a transatlantic service to run until 1917 or concurrently with the intercolonial service (conducted for a subsidy of £25,000 payable half by the Imperial Government and half by the colonies served) for a subsidy of £63,000, to which Trinidad contributes £16,300, Barbados £4,000 and British Guiana £2700. Under the new service, which was inaugurated in 1911, Trinidad succeeded Barbados as headquarters and port of transshipment for the intercolonial steamers. In 1911 the direct service carried on since 1901 by the Imperial Direct West India Mail Service between Avonmouth and Jamaica under contract with the Imperial and Jamaica Governments ceased, the subsidy of £40,000 not being renewed. In the same year the Imperial Government discontinued the subsidy of £13,500 to the mail service between Canada and the West Indies, which is now conducted by the Dominion alone.

THE LEEWARD ISLANDS¹

The census of 1911 disclosed the population of the islands constituting this colony to be as follows: Antigua 32,265; Barbuda 775; St. Kitts 26,283; Nevis 12,945; Anguilla 4075; Dominica 33,863; Montserrat 12,196; Redonda 120; Virgin Islands 5562. During the financial year 1910-11 there were 4649 births and 3456 deaths. Of births 1762 were legitimate and 2,887 or 62 per cent illegitimate. The death rate of the Colony is conspicuously low, Montserrat enjoying the minimum with 13.15 per 1000. Next in order come Anguilla (14.64), the Virgin Islands (15), Barbuda (18), Nevis (23.62), Dominica (23.99), Antigua (27.38) and St. Kitts (29.37).

Sugar is the chief industry, and the principal source of revenue in Antigua and St. Kitts. Antigua during 1910-11 exported 13,488 tons (6397 tons of 96° grey crystals and 7091 tons muscovado). The central factory at Gunthorpe's (Antigua) manufactured 5400 tons of crystals, and Bendal's Factory 1015 tons. Extensions at Gunthorpe's during the year increased its manufacturing capacity to about 8000 tons of grey crystals in a crop. Consequently more estates have abandoned the muscovado process and now sell canes to the factory. The quantity of peasants' canes purchased in Antigua was 7718 tons as against 4579 in 1909, the price paid averaging 12s 1d per ton in 1910 as against 9s 6d a ton in the previous year. In St. Kitts a central factory has been established, with a maximum output of 10,000 tons of crystals. Further extensions of the central factory system, the success of which has been so pronounced, are also contemplated. In the cotton industry during 1910-11 prices fell somewhat from the high figures prevailing during the previous year, and trade depression in England early in 1911 also affected the sale. From the cultivators' standpoint, however, yields gave no cause for disappointment. The area planted was extended and there was comparative freedom from insect pests, a freedom not enjoyed by sugar planters, who were handicapped to a certain extent on this account. In the Presidency of Antigua, where 560 acres—an increase of 215—were cultivated, the average return amounted to 173 lb of lint per acre. In St. Kitts 1600 acres—an increase of 600—were planted, the average yield being 200 lb of lint per acre. A like yield was obtained in Nevis (the highest since the island turned its attention to cotton), where 1400 acres were cultivated—an increase of 500 acres. A similar return is reported in the case of Montserrat, which possesses the largest area under cotton—2000 acres. In the Virgin Islands there is no estates cultivation, the cotton being purchased from growers and ginned and exported by the Government.

¹ See E. B. xvi, 371, and allied articles.

Ever increasing prosperity attends the cultivation of the lime (*citrus acida* var. *medica*), the principal industry of Dominica. In 1910-11 lime crop for the year, 369,000 barrels, showed an increase of 85,000 barrels as compared with 1909-10. The export of citrate of lime amounted to 5194 cwt. valued at £16,880—an increase of 1747 cwt. A second citrate works was established and the operations of an existing works extended. In Montserrat the total export of limes was valued at £9000. In a minor degree, Antigua, Nevis and the Virgin Islands devote attention to this industry.

Dominica also exported cacao to the extent of 11,012 cwt. valued at £23,769. Cacao also engages a certain measure of attention in some of the other islands. Dominica has also embarked on rubber cultivation, a considerable area having been planted with *Hevea brasiliensis*. It is estimated that 40,000 plants are already in various stages of growth.

The cultivation of coconuts attracts attention in Antigua and Nevis, and in the latter island and in Dominica vanilla is receiving notice.

The only manufactures of importance are connected with sugar in Antigua and St. Kitts, Nevis and the cultivation of lime in Dominica. In St. Kitts rum is distilled.

The total imports were valued at (1909) £471,016, (1910) £541,713; and exports (1909) £420,800, (1910) £537,832. The separate figures for imports in 1910 were:—Antigua £170,033; St. Kitts-Nevis, £192,541; Dominica, £140,925; Montserrat, £29,718; Virgin Islands, £8496. For exports:—Antigua, £196,184; St. Kitts-Nevis, £195,506; Dominica, £109,529; Montserrat, £30,003; Virgin Islands, £6610. The imports came chiefly from:—the United Kingdom, £229,193 in 1910 (an increase of £45,667), British Colonies £102,738 (+ £21,130), and the United States £191,148 (+ £1041). The exports went chiefly to:—the United Kingdom, £188,984 (+ £41,666), British Colonies £271,020 (+ £68,934), and United States £43,462 (+ £5175).

The total revenue was (1909-10) £149,670, (1910-11) £164,375; and expenditure (1909-10) £149,906, (1910-11) £159,263. The revenue was raised by the respective Presidencies in 1910-11 in the following proportions:—Antigua £52,326; St. Kitts-Nevis £52,748; Dominica £41,473; Montserrat £12,262; Virgin Islands £5566.

The surplus of assets over liabilities on March 31, 1911, amounted to £54,845. The public debt of the Colony amounted to £273,250; the sinking fund stands at £80,688.

There are 24,573 children on the registers of the Government and grant-aided schools of the Colony, the average daily attendance being 12,082. There are 7 secondary schools in receipt of grants from local funds. The Colony also assists a Moravian Training College for females in Antigua, and furnishes an allowance for the training of local male students at the Mico College, Jamaica. From Imperial funds grants are made towards Antigua and St. Kitts Grammar Schools and Dominica Agricultural School. The Presidencies maintain in Antigua an industrial school to which boys are sent from each Presidency.

The total number of persons committed to prison during 1910 was 1144; 3140 offences were reported to the police; 13,458 persons were brought before the magistrates, and the summary convictions numbered 6802. Convictions in the Superior Court totalled 39.

Sir Henry Hesketh Bell, K.C.M.G., was appointed Governor of the Leeward Islands in 1912. The Administrators were: St. Kitts-Nevis, Hon. T. L. Roxburgh, C.M.G.; Dominica, Hon. L. Douglas Young, C.M.G.; Montserrat, Lt. Colonel L. B. Davidson-Houston, C.M.G. (Commissioner); and the Virgin Islands Hon. T. L. H. Jarvis.

BRITISH GUIANA¹

During 1909-12 the Government continued to obtain information with regard to the extent and value of the vast forest resources of British Guiana, and an officer of the Department of Lands and Mines with special qualifications for the work was appointed to make a systematic and detailed examination of the Forest Lands. In 1910-11 the Commissioners appointed to enquire into the question of the sea and river defences of the colony presented their report. Their recommendations, which included the execution and maintenance in future of the sea defences by the Public Works Department and the division of the colony into sea defence districts, were approved by the Combined Court, which decided that the cost should be met by the estates, villages and other properties within each district, and by the Government in the proportion of $\frac{3}{4}$ for the estates, villages and other properties, and $\frac{1}{4}$ from General Revenue.

The census of April 1911 showed a population of 295,713, exclusive of the aboriginal Indians in the unfrequented portions of the Colony. During 1910 there were 8332 births registered (27.5 per 1000), a slight decrease on the previous year. Of the births so registered, 60.1 per cent were illegitimate. The deaths registered were 10,424 (or 1057 more than in the previous year), giving a death rate of 34.4 per thousand. Mortality among children continues high: 234 per thousand.

¹ See E. B. xii, 676 et seq.

The acreage devoted to the principal products of the Colony stood as follows at the end of 1910:—sugar cane 69,736; rice 31,680; cacao 2200; coffee 2546; rubber 1700, coconuts 9466. Sugar and its by-products constitute 72 per cent of the export of locally grown produce, and 64.01 of the total exports. The export for 1910-11 declined by 7579 tons and the prices realised were below those of the previous year. The cultivation in certain districts suffered to such an extent from the ravages of insect pests that it was decided to obtain the services of an economic biologist. The experimental cultivation of canes was continued during the year by the Board of Agriculture, and on the plantations the area planted with varieties of cane other than Bourbon increased from 39,850 to 45,484 acres. Excellent rice is grown—largely by East Indians who settle in the colony after the expiration of their indentures on the sugar plantations. The export, which is absorbed mainly by the British West Indies, has risen from a few thousand pounds to a quantity running into seven figures. There is an enormous area available for rice cultivation, and although the output for 1910-11 was below that of the previous year, the industry is firmly established. The export of cacao fell considerably during 1910-11, but this is explained principally by an increased local consumption of sweets. Rubber as a local industry is still in its infancy. Cultivation is being prosecuted vigorously and the Government carries on experimental work. The export of coconuts has increased considerably. Cattle rearing is an important branch of local industry, and a low estimate gives the number of cattle as 71,500.

In 1910-11 the output of rum was upwards of 2,515,000 gallons, a falling off of half a million gallons as compared with 1909-10. This decline is attributed to the downward tendency in the price in the United Kingdom.

The output of gold for 1910-11 was 54,989 ozs.—a decrease compared with the previous year of 9841 ozs. The search for diamonds was actively prosecuted, although the output (3035 oz.) was below that of 1909-10.

Perhaps the most striking success has attended the balata industry, the amount collected in 1910-11—1,340,924 lb—being the highest on record. Four new companies were floated and commenced work, and new areas are being prospected.

The forest resources of the Colony are practically limitless, and of those resources timber is of the first importance. During 1910-11 256,845 cubic feet were exported, showing an increase of 58,648 cubic feet on the previous year. Woodcutting licences to the number of 218 were issued, covering an approximate area of 70,000 acres.

The total imports were valued (1909-10) at £1,774,457 and (1910-11) £1,749,766; the exports (1909-10) £1,985,337, and (1910-11) £1,820,198. Of the imports in 1910-11, the United Kingdom sent 47.64 per cent, the United States 24.41 per cent, and Canada 8.23 per cent. Of the exports the United Kingdom took 40 per cent, Canada 31.60 per cent, and the United States 14.20 per cent.

The revenue was (1909-10) £540,269, and (1910-11) £563,100; the expenditure (1909-10) £546,711, and (1910-11) £542,757. The excess of assets over liabilities on March 31, 1911, was £48,116. The public debt of the colony was then £887,115. Of this amount £817,115 represents sums borrowed for public purposes, the balance £70,000 having been raised for immigration purposes. £280,186 stood at the credit of the sinking fund account.

During the financial year 1910-11, the sum of £28,294 was distributed in grants in aid among 224 schools with an average daily attendance of 21,555, the number on the rolls being 34,562. Secondary education is provided for in the case of girls mainly by private enterprise. For boys, the Government maintains Queen's College. There are also two or three private schools. There is a system of scholarships under which pupils from primary schools can pass to the secondary schools; these scholarships being open both to boys and girls. In a country pre-eminently agricultural, like British Guiana, instruction in the principles of agriculture is of the first importance, and this fact is fully recognised by the Government. Model gardens, and gardens attached to schools are found throughout the colony. The establishment of an Agricultural School has also been determined upon. At the school founded for the reception and training of vagrant boys and youthful male offenders, the large majority are educated in agriculture, the institution being worked as a farm school and possessing 80 acres of land under cultivation.

During 1910-11, 8795 offences were reported to the police. There were committed to prison 4562 persons; and there were three cases of capital punishment.

In 1911 the Combined Court voted an increased salary for a Governor of tried administrative ability, and Sir Walter Egerton K.C.M.G., received the appointment in 1912.

WINDWARD ISLANDS¹

Grenada.—This island is the headquarters of the Government of the Windward Islands, the governor in 1912 being Sir James Hayes-Sadler, K.C.M.G. The population on December 31, 1910, estimated on the basis of natural increase, was 75,254. The census of 1911 however disclosed a total of 66,750. The discrepancy is attributed to emigration. The birth rate in 1911 was 39.92 per thousand, and the death rate 19.66.

¹ See *E. B.* xii, 578.

Cocoa, nutmegs and cotton represent the principal products, and in past years have practically absorbed the attention of the agricultural population. A healthy tendency however is now being manifested to open up other sources of development. The record cocoa crop of the island—73,863 bags—was reaped in the year ending September 30, 1910. In the following year it was 67,144 bags. Land settlement schemes have been initiated in the dependency of Carriacou, where a lime industry has been established, and also in Grenada itself, where rubber cultivation is extending. Practically the only manufacture is rum, of which 63,356 gallons were made in 1911; a soap factory is also in operation. The total imports for 1910 were valued at £279,368 and for 1911 at £309,227 and the exports at (1910) £291,760 (including cocoa £259,365) and (1911) £264,640 (cocoa £223,104).

The revenue was (1909-10) £71,224, (1910-11) £81,413, (1911-12) £98,645; the Expenditure (1909-10) £73,282, (1910-11) £75,561 and (1911-12) £81,012. The Colony's assets stood on March 31, 1912, at £56,419. The public debt was £123,670; and the accumulated sinking fund for its redemption between 1917 and 1942 amounted to £30,270. The Government owns and maintains 9 of the 49 existing schools, the remainder being grant-in-aid schools (22 Roman Catholic, 11 Anglican, 5 Wesleyan and 2 Church of Scotland). The number of scholars on the roll was 10,905, and the average attendance 5377.

St. Lucia.—The census of April 1911 showed a population of 48,637 as compared with 49,883 in 1901. The birth rate for 1910 was 30.1 per thousand and the death rate 16.6. In 1910 the Government made its first comprehensive attempt to combat the malaria problem by means of the free distribution of quinine.

The principal products are sugar and cocoa, which represent 92 per cent of the domestic exports. Lime cultivation is steadily increasing, while honey and cotton are also produced, though cotton does not appear to find favour with the planters. The Botanic station and special agricultural services involved an expenditure during 1910 of £638, and £507 was spent on the maintenance of the Agricultural School. Plants to a total number of 54,929 were distributed by the Agricultural Department. Local sulphur deposits are worked, but the quantity obtained in 1910 was so small that none was exported. The position of the rum industry is indicated by the following returns: distilled, 49,256 gallons; consumed, 42,456 gallons; exported, 4692 gallons. In 1909 the experiment was tried of shipping rum to Canada. In 1910 however this was found unprofitable owing to the low prices obtainable. Consequently less rum has since been manufactured. The outlook in regard to the trade of the port of Castries is encouraging. This remark applies especially to the extending coal trade. The total value of all imports was (1909) £266,228, (1910) £277,208; and of exports (1909) £250,674, and (1910) £238,955. The revenue was (1909-10) £65,739, and (1910-11) £65,066, and the expenditure (1909-10) £64,446, and (1910-11) £67,288. The Colony's surplus on March 31, 1911, stood at £25,014, in addition to the Public Buildings Insurance Fund (£3895). The Public Debt amounted to £146,929. There were 53 elementary schools in 1910, having 7259 scholars on the roll, with an average attendance of 4625.

The Administrator in 1912 was the Hon. Edward J. Cameron, C.M.G.

St. Vincent.²—The census of April 1911 showed a population of 41,877. The births in 1910-11 totalled 1661 (831 males, 830 females), 58.21 per cent being illegitimate. Deaths totalled 835 (19.93 per thousand), infant mortality standing at 24.91 per cent.

During recent years St. Vincent has taken up the cultivation of cotton with enthusiasm. The extent of the acreage and the quantity of the export in 1910 were the largest since the revival of the industry in the island. Sea Island cotton was planted over 3,587 acres, and 561,526 lb of lint were produced, the average yield of lint per acre being 156 lb. The total cotton production was 521,956 lb, valued at £38,409.

The success attending this cultivation has set up a serious rivalry with arrowroot, which has held pride of place in the exports for many years, but so long as cotton retains its average value of 18d. per lb of lint, it must constitute the staple crop of the Colony. Arrowroot can be grown on any land where cotton is cultivable, whereas the production of cotton is confined to the coast lands. Meanwhile arrowroot continues to receive increased attention. Towards the end of 1910 a Growers' and Exporters' Association began work, and it is notable that the price has advanced from 1½d. to 3½d. per lb. The soil and climate of the Colony appear to be better suited to arrowroot production than those of any other West Indian island. Sugar is produced chiefly in the Carib country, the only noticeable feature being an increase in the export of the crystallised, and a decrease in that of muscovado. Land settlement continues satisfactory.

The ginning of cotton is the principal industry, the Central Ginnery established by the Government in 1903-04 having proved a profitable—and indeed indispensable—factor in the success of cotton culture. The working of the establishment in 1910 yielded a profit

¹ See *E. B.* xxiv, 27.

Digitized by ² See *E. B.* xxiv, 50.

of £480. The sale to the ginnery of seed cotton is compulsory in the case of lots of less than 100 lb weight. Any amounts up to 4000 lb may also be sold by anyone to the ginnery. This cotton is bought on a profit-sharing basis. The law providing for this method of sale and purchase has proved highly popular among small cultivators. In addition to the Government establishment there are three private ginneries. The price of lint during the year was good, reaching 26d. per lb. in the case of some special bales. The average price, however, was 17d. to 20d. for Sea Island cotton, Marie Galante selling at from 6d. to 10d. per lb.

The whale oil industry would appear to be in a decadent state, there being a great fall in the value of the export. Efforts are being made to establish a sponge industry in the Grenadines. Turtling is carried on, but here again the exports disclose a conspicuous decrease. The total value of the imports was (1909) £87,810, (1910) £97,737; and of exports (1909) £88,698, and (1910) £101,180. The revenue was (1909-1910) £28,440, (1910-1911) £30,125; and the expenditure (1909-1910) £31,330, (1910-1911) £30,343. The excess of assets over liabilities amounted on March 31, 1911, to £6524. There is no public debt, the last loan instalment having been repaid in May 1910. The Colony is responsible for the unpaid balance of the Hurricane loan to planters from the Imperial Treasury, which on March 31, 1911, stood at £10,450, but against that amount there is a sinking fund of £2335. This loan is being steadily redeemed.

There are 28 primary schools, and 4552 scholars on the rolls with an average attendance of 2260. There is also a secondary school, and satisfactory results are obtained from the Agricultural School. Special effort is made to teach the cultivation of cotton.

The Administrator in 1912 was the Hon. C. Gideon Murray.

BRITISH HONDURAS¹

The development of British Honduras proceeds slowly. The Stann Creek Railway, begun in 1907, was nearing completion in 1912. It runs 20 miles inland, and opens up an extensive area suitable for banana cultivation. In 1911 a Town Board was constituted for the City of Belize. The population according to the census of 1911 was 40,809 (20,526 males, 20,283 females). The birth rate in 1911 was 42.303 and the death rate 24.8, malarial fever being the principal cause of mortality. Tuberculosis has seriously increased, and preventive measures are being adopted with some success.

The total imports for 1911 were valued at \$2,886,677 (—\$67,460 on 1910), and the exports at \$2,685,849 (—\$341,469), the bulk of the trade being with the United States. The revenue in 1910-11 was \$459,295, and the expenditure \$542,810. The loan debt on December 31, 1910, amounted to £168,815. Provision for the repayment of loans has been made by the investment of sinking funds which total \$92,173. There were 46 primary schools in 1911, with 4725 pupils. The cost of primary education was \$34,259. Of this sum the Government contributed \$20,103.

The Governor in 1912 was Sir E. J. E. Swayne, K.C.M.G.

BARBADOS²

In 1912 the House of Assembly voted £900 to defray the cost of a complete survey of the island, with a view more particularly to the investigation of the extent and position of the petroleum deposits. The existence of petroleum has been proved, but the industry has not yet been placed on a commercial footing. The survey was entrusted to Mr. E. H. Cunningham Craig. In 1912 the Legislature passed a Bill granting to the Anglo-Mexican Petroleum Products Co. Ltd. the exclusive right of supplying imported fuel-oil to calling steamers for a period of twenty-five years.

With an area of 166 square miles, Barbados is for its size the most densely populated British possession. The census of April 1911 showed a population of 171,417 (69,912 males and 101,505 females). The population and prosperity of the island are affected by two factors—the emigration of labourers to the Panama Canal Zone and the influx of visitors from abroad. The Panama Canal has been constructed mainly by West Indian labourers, of whom no fewer than 20,000 were natives of Barbados in 1909. It is claimed that any disturbance of the local labour supply has been more than compensated for by the remittances sent home by Barbadians from the Panama Canal Zone, and by the money brought back to the island by returning emigrants. In 1909 £80,000 was remitted; in the following year nearly £83,000. Tourists also help to circulate money. In 1910 5401 first and second class, and 12,441 steerage and deck passengers reached the

¹ See *E. B.* iv, 615. ² See *E. B.* iii, 380, 381.

island. The tourist business is assuming considerable dimensions; with a view to stimulating it a Barbados Improvement Association was started in 1911.

The birth rate in 1910 was 37.2 per thousand and the death rate 25.5 per thousand. Of the births 58.8 per cent were illegitimate. Infantile mortality stands at 268 per thousand.

Sugar has always been the chief product of Barbados. The crop for 1910 amounted to 35,906 hogsheads of muscovado, 3993 hogsheads of vacuum-pan crystals, and 77,722 puncheons of molasses, or 22,104 hogsheads of sugar and 8686 puncheons of molasses more than that of the previous year. Barbados was one of the first West Indian Colonies to participate in the revival of the cotton industry in the West Indies, and remarkable results were obtained within a comparatively brief period. In 1910 however the acreage reaped declined from 5768 to 4121, the decrease being due to the low price and poor yields obtained in 1908. The remunerative prices obtained during 1909 and 1910 resulted in an increase of the acreage from 4121 to 4741. Bananas are cultivated to some extent, and during 1910, 13,137 bunches were exported. 226,169 gallons of rum were manufactured in 1910, as compared with 207,239 gallons in 1909. Sea Island cotton is ginned locally.

The imports and exports in 1909 and 1910 were valued as follows:— (1909) exports, £888,086, imports £1,119,343; (1910) exports £1,058,830; imports £1,345,194. United Kingdom imports, £480,823 in 1909, rose to £592,641 in 1910; United States, £355,809 in 1909, to £399,649; Canadian, £131,910 in 1909, to £151,985. Canada in 1910 occupied only third place in the list of importing countries, but her advance is steady. The principal commodities purchased from Canada in 1910 were flour (£31,144) and white pine (£31,409); other articles, all of which show an increase, include oats, iron nails, staves and shooks, beef, cordage, fruit and vegetables, grain and shingles. Fish, butter, sulphate of ammonia and hay are also obtained from Canada. Of the total exports in 1910, £783,125 represented produce of the colony, and £305,705 the produce of other countries. Exports to the United Kingdom, £70,487 in 1909, rose to £117,223 in 1910; those to Canada, £348,707 in 1909, to £84,108; those to the United States, £37,219 in 1909, to £77,650. Exports of sugar (£396,004) showed an increase of £243,092, as compared with 1909, Canada alone taking £268,455 as against £107,222 in 1909.

The revenue in 1909-10 was £195,803, and in 1910-11 £213,298; the expenditure in 1909-10 was £199,625, and in 1910-11, £211,949. Public debt stood at close of the year at £422,900, and the sinking fund at £85,940.

The primary schools number 166 (Anglican 132, Wesleyan 18, and Moravian 16), scholars on the rolls numbering 27,658, and the average attendance being 16,829. The government grant towards these schools amounts to £11,264. The colony's total expenditure on education in 1910 was £19,209. First and second grade schools in receipt of annual legislature grants number 9 (7 boys' and 2 girls') the largest grant (£1000) being made to Harrison College (boys). The number of pupils on the rolls of these schools totals 635. The colony makes provision for scholarships tenable by students enrolled at Codrington College, and for a further scholarship tenable at a European or Canadian University. At the close of 1910 there were 4 ragged schools, having 285 scholars, with an average attendance of 173.

During 1910 there were 9888 summary convictions and 40 convictions in Supreme Courts. The percentage of convictions to population is 5.79. The daily average number of prisoners in Glendairy prison was 210 for 1910; the number of persons committed to penal imprisonment, 1785. There were 134 boys in the Industrial school on December 31, 1910. The proceeds of its agricultural work amounted to £1937, and the expenditure to £2483.

The Governor in 1912 was Sir Leslie Probyn, K.C.M.G.

JAMAICA¹

The census of April 1911 showed a population of 831,383 (females 433,944, males 397,439). Compared with the previous census of 1891 this return reveals an increase of 191,892 or 30 per cent compared with an increase of 26.3 per cent between 1871 and 1891. Every parish except Port Royal contributed to this increase, notably St. Mary 70 per cent and Portland 53.7 per cent. Labour requirements on the Panama Canal, in Cuba and in Costa Rica have affected the emigration and immigration returns; 13,109 labourers set out from the Colony during the year ending March 31, 1912 and 8,984 arrived at Kingston. The marriages celebrated during the financial year 1911-12 numbered 3607—a rate of 4.2 per thousand as compared with 4.0 in 1910-11. Both these rates show a remarkable decline when compared with 1907-08, when owing to the emotional effects of the earthquake at Kingston in January 1907 the rate rose to 7.4. As a result, in 1908-09 the return of illegitimate births declined to 60.59 per thousand. The total births registered in 1911-12 numbered 32,750, representing a rate of 39.0 per thousand, the rate for illegitimate births being 64.1 per cent. The death rate stood

¹ See E. B. xv, 132 et seq.

at 22.1 per thousand, the total number of deaths registered being 18,631. Of these 8,871 were due to infantile mortality; 38.9 per cent of the children born in Kingston and 35.5 per cent of those born in St. Andrew dying before the age of 5.

The total acreage under cultivation returned in 1911-12 was 2,171,709, distributed as follows:—tilled lands, 280,286, guinea grass 143,592, commons 517,830, wood and ruinate 1,230,001. This return shows an increase over the average for the four preceding years of 24,552 acres or 8 per cent in tilled lands; an increase of 3,902 acres or 3 per cent in guinea grass; of 28,589 or 6 per cent in commons, and of 2488 acres in wood and ruinate.

Tilled lands, classified under the agricultural products, give the following returns:—sugar cane 34,766, coffee 24,473, coconuts 16,691, bananas 82,435, ground provisions 74,723, mixed cultivation 30,167, cocoa 13,355, minor products 3676. These returns disclose an increase over the average for the four preceding years of 4450 acres in cane; of 3440 acres in coconuts; of 14,862 in bananas; of 3163 in cocoa. Ground provisions including mixed cultivation show a decrease of 146 acres, coffee 668 acres and minor products 603 acres.

During 1910-11 the Sugar Experiment Station was operated, the Imperial Grant enabling the station to be equipped with laboratories and an experimental distillery and to provide for experimental plants on estates. The operating expenses of the station were also provided for a period of 7 years. A central sugar factory at Rose Hall in St. James, recently completed, will deal with the produce of nine sugar estates. The work of agricultural instruction received considerable impetus, as the result of the appointment of four additional instructors. The rubber industry engaged attention during 1911, *Castilloa*, of which three distinct species have been established, giving the most promising results.

The total value of the imports and exports for 1909-10, and 1910-11 was:—(1909) imports, £2,561,674, exports £2,628,307; (1910) imports £2,614,943, exports £2,568,222. and (1911) imports £2,865,553, exports £2,948,067.

The principal articles of import were textiles (£638,331, in 1911), hardware (£304,128), wheaten flour (£255,207), dried and salted fish (£150,746), and lumber (£106,893).

The principal articles of export were bananas (£1,456,581 in 1911), sugar (£247,413), logwood & logwood extract (£265,138), coffee (£154,131), and rum (£85,916).

In 1910-11 the imports from the United States were for the first time slightly in excess of those from the United Kingdom. In the following year, however, imports to the value of £1,291,923 or 45.1 per cent came from the United Kingdom and £1,200,345 or 41.8 per cent from the United States and £249,546 or 8.5 per cent from Canada.

Of the exports the United States took 61.9 per cent in 1911, as against 54.1 in 1910; the United Kingdom 14.7 per cent as against 20.6; and Canada 8.6 per cent as against 8.4.

The revenue was (1909-10) £992,976, (1910-11) £990,399 and (1911-12) £1,161,014; and the expenditure (1909-10) £1,033,794, (1910-11) £987,304 and (1911-12) £1,155,208. The Government closed the financial year 1911-12 with a surplus of £190,191, having also £100,000 invested as an insurance fund to provide for the repair of damage to Government property by hurricane, fire or earthquake. The Public Debt of the island, most of which is represented by productive investments, amounted to £3,871,305 on March 31, 1912. The sinking funds amounted to £759,865, leaving a net liability of £3,111,440.

In 1911 there were 698 schools on the annual grant list, average number of scholars 98,576, average attendance 61,669, percentage 62.55, total payments to elementary schools and teachers £60,503. On January 1, 1911, the regulations for compulsory education in Kingston district, Falmouth and Lucca, came into effect. The work of school inspection was facilitated in 1911-12 by the addition of an Assistant Director, and of three Inspectors. A reduction from 100 to 70 of the number of schools in each inspector's district improves the oversight.

Serious crime finds no place in the social life of Jamaica. No execution of capital punishment took place in 1911-12. Commitments to prison totalled 5676, a decrease of 101 as compared with 1910-11 but an increase of 716 as compared with 1909-10. Reconvictions during the year amounted to 1442. Persons bound over as probationers numbered 103.

Work is proceeding on an extension of the Jamaica Government Railway from May Pen to Chapelton to be constructed at an estimated cost of £90,000; it will open up the fertile valley of the Rio Minho, and render 17,000 acres available for cultivation.

The western end of the island was visited by a destructive storm of hurricane violence in November 1912.

The Governor in 1912 was Sir Sydney Olivier, K.C.M.G.; but at the end of the year he resigned on being appointed secretary of the Board of Agriculture in England.

TRINIDAD¹

The estimated population on March 31, 1911, was 368,014. Arrivals in the Colony during the year numbered 22,845, and the departures 16,719, giving a net increase to the population by immigration of 6126. Included in these figures were 3286 East

¹ See *E. B.* xxvii, 284.

Indians brought to the Colony under indenture, and 622 who returned to India after the expiration of their indenture. The birth rate was 31.8 per thousand, and the death rate 20.5. The health conditions show steady improvement. During 1911 there were only two fatal cases of yellow fever, and twelve cases of plague.

Cocoa and sugar represent the chief products of Trinidad. Coconuts also engage widespread attention, and this remark holds good with regard to rubber,—large areas being planted under *Castilloa*, *Funtumia* and *Hevea brasiliensis*. During 1910-11 7376 lb of rubber, valued at £1395, were sent out of the Colony. Fruit, principally bananas, is cultivated, but the progress of this industry was arrested during 1910-11 by the uncertainty (now remedied) as to the continuance of a regular steamship service providing cold storage. Minor industries are greatly encouraged in Trinidad by means of the distribution of plants and seeds from the Botanic Stations, at reasonable rates.

The establishment and progress of the oil industry represents one of the most striking developments within recent years of industrial activity in the tropics. The most important borings are located in the South-western portion of the island, in the vicinity of the celebrated Pitch Lake, which for many years has provided immense quantities of asphalt exported largely to Great Britain and the United States,—a principal source of the Colony's economic wealth. The use of oil-fuel in the British Navy promises to enhance the importance of Trinidad as a British possession. During the financial year 1910-11 considerable advance was made in the industry, drilling being commenced on private lands at five centres. An aggregate depth of 15,347 feet was drilled, the number of wells in progress being 22. Thirteen have yielded fair results. Since prospecting commenced a total depth of 32,972 feet has been drilled, the number of wells being 44. The area affected by approved licences comprises 78,237 acres.

In addition to the oil and asphalt industries, maniak mining is carried on, and limestone quarries are worked. The manufacture of sugar and rum and molasses is an important characteristic of the colony's industry; apart from the quantity exported, about 8,000 tons of sugar (valued at £135,000) and 335,045 gallons of rum (valued at £29,000) were manufactured for local consumption in 1910-11. Also five million coconuts were used locally in the manufacture of 85,000 gallons of oil, valued at £16,000, nearly all of which was consumed in the colony.

Imports were valued at (1909) £3,288,826, (1910) £3,343,011; exports (1909) £3,218,092, (1910) £3,467,588. The increase in imports in 1910 as compared with 1909 is made up of £30,743 under raw materials (principally coal and lumber) and £83,719 under manufactured articles (chiefly machinery for the oil fields), less a decrease of £6,657 under live stock, food, etc. The growth of the coaling business of Port of Spain, the capital, is a striking feature of the Colony's trade. In 1910, 80,067 tons were imported (as compared with 23,235 tons in 1906-07); 44,295 tons being supplied to vessels (as against 6,703 tons in 1906-07). The value of machinery imported in 1910 was £122,788, as compared with £52,676 in the previous year. The raw material chiefly imported is coal, patent fuel, manure and lumber. The chief importing countries were:—the United Kingdom, £936,427; United States, £860,903; Venezuela £233,086; Canada, £134,609. The principal exports were:—cocoa, £1,230,097; sugar, rum and molasses, £743,969; coconuts and copra, £85,358; fruit, £19,952; asphalt, £179,146. The chief countries taking the exports were:—United States, £919,047; United Kingdom, £599,240; France, £483,211; Canada, £354,484.

The revenue in 1909-10 was £853,565, and in 1910-11, £948,383; the expenditure (1909-10) £863,253, (1910-11) £927,033. The revenue for 1910-11 was the largest ever collected in the colony, the chief increases being under customs (£67,340) and licences (£24,770). As regards expenditure, the recurrent expenses amounted in 1910-11 to £843,050 as compared with £798,262 in the previous year, whilst the extraordinary (public works, roads and bridges) amounted to £83,984 as against £64,991 in 1909-10. The surplus balance was £104,925 on March 31, 1911; assets totalling £606,630 and liabilities (exclusive of funded debt) to £591,705. The funded debt stood on the same date at £1,051,093, and the sinking funds at £174,426; a loan of £450,000 has also been authorised by Ordinance.

The elementary schools, exclusive of private schools, numbered 263 on March 31, 1911, Government schools totalling 53, and assisted schools 210. The assisted schools are as follows:—Roman Catholic 79, Anglican 51, Presbyterian Canadian Mission 56, Wesleyan 12, Moravian 12. Children on the rolls totalled 47,661, the average daily attendance standing at 27,083. The expenditure on elementary education from public funds amounted to £51,111. Practical agriculture and nature study are taught in nearly all primary boys' or mixed schools. Secondary education for boys is provided from public funds at Queen's Royal College (Port of Spain), and two affiliated schools, St. Mary's College (Port of Spain)

and Naparima College (San Fernando). St. Joseph Convent School for Girls is now affiliated to Queen's Royal College. A Board of Industrial Training carries on small night classes for apprentices, artisans also attending.

Offences reported to the police during 1910-11 numbered 20,928, the total number of persons arrested or brought before the magistrates being 23,787. Summary convictions numbered 15,857. Convictions in the supreme court totalled 185. The death penalty was imposed in 4 cases. Persons were committed to prison to the number of 4,780. The cost of prison administration during the year was £12,365. Prisoners' earnings were £7,749.

During 1911 the first sod of the Tabaquite-Poole Railway extension, which will open up 10,500 acres of fertile land, was turned; and work on an extension to Siparia, which will serve an area of 14,100, is in progress.

The Governor in 1912 was Sir George Le Hunte, K.C.M.G.

The Bahamas¹

In 1910 the Legislature passed a resolution authorising the Governor to ascertain on what terms the Canadian Dominion could incorporate the Bahamas; but the resolution was purely tentative. The Bahamas did not participate in the reciprocal Trade Conference at Ottawa in 1912. During 1910-12 the tourist business continued to increase, and the Legislature voted £1,000 for advertising the Islands in 1909-10.

The census of April 1911 gave a population of 55,872, a net increase of 2137 since 1901. The islands showing an increase were Andros (1,252), Abaco (1,146), and New Providence (1,020). On the other hand Eleuthera showed a decrease of 2,203. During 1901-11 about 6,000 labourers (accompanied in some cases by their families) emigrated to Florida, Mexico and Yucatan. The births during 1911 numbered 34.1 per thousand, and the deaths 21.7 per thousand. Nearly every industry has recently shown a decline. The export of tinned pineapples has fallen off, owing to poor stock, Hawaiian competition, and the effect of the American tariff. Sisal fibre cultivation is the most important industry, some 20,000 acres being planted, but the price is low and the rapid extension of the industry in other countries has had its effect on the Bahamas. The sisal is all shipped to the United States.

The exports of grape-fruit, which amounted to 365,000 in 1909, fell in 1911 to 309,194. The output of oranges, which in 1907 amounted to a million and a half valued at £3,000, fell in 1911 to 15,400 valued at £20. The feeling with regard to agricultural prospects is reflected by the decision of the Legislature to abolish the Board of Agriculture, after an existence of six years and the expenditure of £5,000 of public money. The one industry which has shown signs of progress has been sponge fishing. The sales of sponges during 1911 reached £79,102, as against £70,000 in 1910, and the total exports £110,740 as against £87,657.

The trade figures are—(1909), exports £171,442, imports £343,489; (1910) exports £193,803, imports £329,014; (1911) exports £209,251, imports £311,095.

Out of a total of £311,095, imports to the value of £203,550 came from the United States, and imports to the value of £82,360 from the United Kingdom in 1911. It should be explained, however, that in the absence of direct communication with the United Kingdom, many goods from the mother country being transhipped in America are classified as American. The United States is also the best customer of the Bahamas, having taken produce to the value of £98,975 out of a total of £174,895, the United Kingdom ranking next with £29,349. Here again, it must be remembered that as New York is the port of transhipment, many goods destined for Canada and the United Kingdom are classified as going to the United States.

The financial figures are: (1909-10) revenue £77,578, expenditure £92,858; (1910-11) revenue £84,391, expenditure £85,315; (1911-12) revenue £85,592, expenditure £82,675.

The excess of assets over liabilities on March 31, 1912, stood at £15,482. The public debt stands at £51,568, the annual charge for interest and sinking fund being £6,580. The existing debt will be wholly liquidated by 1926 unless anything unforeseen arises.

The number of primary schools (exclusive of private and denominational schools) is 64 (46 board schools and 18 grant-in-aid schools). Pupils number as follows:—Board Schools, 6,584; Aided Private Schools, 1,492; Church of England, 1,625; Roman Catholic, 531; Private Schools, 222; Wesleyan, 167, total 10,621.

The annual vote to the Board of Education amounts to £6,000. There is no State secondary education, but five private organisations provide instruction for 153 pupils.

The number of persons committed to Nassau Prison in 1910 was 189, as against 214 in 1909. The police force—largely recruited from Barbados—numbers 81 men.

Mr. G. Hadden-Smith was appointed to succeed Sir William Grey-Wilson, K.C.M.G. as governor in 1912.

Bermuda²

The population of Bermuda at the Census of 1911 was 18,994. The revenue for 1911 was £79,248, and the expenditure £90,101. No official report on the colony has been issued since 1907, but in 1910 the exports totalled £106,508 and the imports £517,074.

¹ See *E. B.* iii, 207 *et seq.* ² See *E. B.* iii, 793.

CANADA¹

Area.—In 1911 the fifth decennial census was taken. The area is given as 3,729,665 sq. m. of land and water, 15,909 sq. m. less than in 1901, the reduction being partly due to the Alaska award and partly to the new map measurements.

The areas of the separate provinces in sq. m. are:—Alberta, 255,285; British Columbia, 355,855; Manitoba, 73,731; New Brunswick, 27,985; Nova Scotia, 21,427; Ontario, 260,862; Prince Edward Island, 2,184; Quebec, 351,873. The population per square mile was 1.93 in 1911, as against 1.44 in 1901; the corresponding figures for the provinces being as follows: (1901 in parentheses)—Alberta 1.47 (.28), British Columbia 1.09 (.50), Manitoba, 6.18, (3.46), New Brunswick, 12.61 (11.83), Nova Scotia, 22.98 (21.45), Ontario, 9.67 (8.37), Prince Edward Island, 42.91 (47.27), Quebec, 5.69 (4.69), Saskatchewan, 1.95 (.36); in Yukon and the North-West Territories there have been decreases.

Population.—The population of Canada according to the census of 1911 was 7,204,838, an increase of 1,833,523 since 1901 or 34.13 per cent. The following were the populations of provinces and territories, with the increase or decrease per cent since 1901 in parentheses: Alberta, 374,663 (+413.08); British Columbia, 392,480 (+110.68); Manitoba, 455,614 (+78.52); New Brunswick, 351,889 (+6.27); Nova Scotia, 492,338 (+7.13); Ontario, 2,523,274 (+15.58); Prince Edward Island, 93,728 (-9.23); Quebec, 2,002,712 (+21.46); Saskatchewan, 492,432 (+439.48); Yukon, 8,512 (-68.73); North-West Territories, 17,196 (-15.79).

The rural population in 1911 was 3,924,394 and the urban population 3,280,444, the increase since 1901 being 17.16 per cent for the former and 62.25 per cent for the latter. In Alberta the increase of rural population in the ten years was 180,327 and of urban 121,314. In British Columbia the increase of rural population was 100,318 and of urban 113,505, and in Manitoba the rural increase was 70,511 and the urban 129,892. New Brunswick lost 1,493 rural and gained 22,262 urban, while Nova Scotia lost 23,981 rural and gained 56,745 urban. Ontario lost 52,184 rural and gained 392,511 urban. Prince Edward Island gained 15 urban, but lost 9,546 rural. Quebec shows gains of both rural and urban population, being 39,951 for the former and 313,863 for the latter. Saskatchewan also shows gains in both classes, being 287,338 for the former and 113,815 for the latter. In Yukon the rural loss was 13,430 and the urban loss 5,277. In the North-West Territories, whose population is wholly rural, the loss was 2,933.

The cities with populations exceeding 24,000 in 1911 were: Montreal, 470,480; Toronto, 376,538; Winnipeg 143,518; Vancouver, 100,401; Ottawa, 87,062; Hamilton, 81,969; Quebec, 78,100; Halifax, 46,619; London, 46,300; Calgary, 43,704; St. John, 42,511; Victoria, 31,660; Regina, 30,213; Edmonton, 24,900.

The total Indian population of the Dominion on March 31, 1912, was 104,956, and in addition there were 4,600 Eskimos within the confines of Canada, making a total native population of 109,556, a slight increase on the previous year. Of the Indians 43,382 were in Ontario, Quebec and the Maritime Provinces, 36,793 in the three Prairie Provinces and the northern territories, and 24,781 in British Columbia.

Immigration.—The total immigration to Canada during the fiscal year 1911-12 was as follows: From the United Kingdom 138,121; U.S.A. 133,710; other countries 82,406; For 1910-11 the total was 311,084 (British 123,013; U.S.A. 121,451), and for 1909-10, 208,794 (British 59,790, U.S.A. 45,206). The British immigrants in 1911-12 included 96,806 English and Welsh; 32,988 Scotch; 8,327 Irish.

Boundaries.—Important measures, extending the boundaries of the provinces of Quebec, Manitoba and Ontario, were passed by the Canadian parliament during the session 1911-12. The boundary of Quebec was extended to include the whole of the mainland north of her old boundary, excepting such territory over which Newfoundland has lawful jurisdiction, the additional territory being approximately 355,000 square miles. The eastern boundary of Manitoba was extended northerly to the 60th degree of latitude, and the eastern boundary north-easterly to the point where the eighty-ninth meridian of west longitude intersects the southern shore of Hudson's Bay, an addition of about 178,100 square miles. Additional territory to the north was also given to Ontario, amounting to approximately 146,500 square miles. This arrangement gave to Manitoba possession of the two ports on the Hudson's Bay—Fort Churchill and Port Nelson.

¹ See *E. B. v.*, 142 *et seq.*

It was, however, provided by Order in Council that access to the Bay should be provided for the Temiskaming and Northern Ontario Railway, a line belonging to the Ontario government. For this purpose Ontario is to be given a strip of land five miles wide, running from the new Boundary of Manitoba to the Nelson River, and terminating in a half mile strip along the east shore of that river. Should the Dominion government decide to extend the Hudson's Bay Railway to Fort Churchill, Ontario is to receive an additional strip 200 feet wide from the Nelson River to the nearest point on that railway, and to have running powers over that line to Hudson's Bay. On April 21, 1912 it was officially announced that the new district of Ontario is to be known as "Patricia."

Agriculture.—The details of area, yield, and value of the principal crops for 1911 were as follows: Wheat 10,373,958 acres, 215,851,300 bushels, value \$138,567,000; oats, 9,219,920 acres, 348,187,600 bushels, value \$126,814,000; barley, 1,404,352 acres, 40,641,000 bushels, value \$23,004,000; hay, 7,903,242 acres, 12,694,000 tons, value \$146,596,000. The total estimated wheat production of Canada for 1912 was 205,685,300 bushels, oats 381,502,000 bushels, and barley 43,895,300 bushels, the quality of these three crops being above the average of the two preceding years.

At the close of the fiscal year 1911-12, fifteen government experimental farms and stations were in operation throughout the Dominion, in addition to sub-stations. While much of the work done has been a continuation of years past, some of the features are practically new, especially in connection with the encouragement of mixed farming.

Conservation.—In February 1908, an international conference on the conservation of the natural resources of the North American continent was held at Washington, when the United States, Canada, Newfoundland and Mexico were represented by delegates. A declaration of principles was adopted respecting the use, development and conservation of land, water, forests, minerals and game, and the conference advised the establishment in each country of a permanent commission for the conservation of natural resources. The question having come before the Canadian parliament, a Commission of Conservation was created by statute. This body consists of thirty-two members, including the Dominion Ministers of the Interior, of Agriculture and of Mines respectively, and the member of each of the nine provincial governments who is charged with the administration of the natural resources of the province, together with twenty other members appointed by the Governor in Council. Of these twenty appointed members at least one from each province must be a member of the faculty of a university (if any) within the province. It is the duty of the commission to take into consideration all questions which may be brought to its notice relating to the conservation and better utilisation of the natural resources of the country, to make inventories, collect and disseminate information, and frame recommendations. The first annual meeting of the Commission was held in Ottawa in January 1910. Seven committees of the Commission were formed for lands, water and water powers, minerals, forests, public health, fisheries, game and fur bearing animals and press and co-operating organisations. A staff has been appointed and constituted as a department of the government at Ottawa, and in addition to the work of the Committees, numerous important subjects have been investigated and reported upon. One instance of a recommendation acted upon is that of setting aside the eastern slope of the Rocky Mountains as a forest reserve. This has been embodied in an Act of Parliament, and some 14,600 square miles will be reserved and protected. An exhaustive work containing the various regulations in force throughout Canada bearing upon lands, fisheries and minerals has been compiled and published under the auspices of the Commission, and a report has been issued dealing adequately for the first time with the extensive water powers of the country. Other reports bear on agriculture, insanitary housing, etc.

Fisheries.—An amendment to the Fisheries Act, R.S. 1906, c. 45, provides for the licensing in British Columbia of salmon canneries, and manufacturers of oil from sea lions, hair seals, sharks or dog fish, and alterations are made in the method of calculating the license fees to be paid by lobster cannery.

Commerce.—The value of the total exports, imports and goods entered for consump-

tion in Canada, with the duty collected thereon for 1910, 1911, and 1912, are shown below. The figures in each case are for the fiscal year ended March 31st:

	Total Exports.	Total Imports.	Entered for Consumption.	Duty.
1910	\$301,358,529	\$391,852,692	\$375,833,016	\$61,024,239
1911	297,196,365	472,247,540	461,951,318	73,312,367
1912	315,317,250	559,320,544	547,482,190	87,576,036

The aggregate trade with the United Kingdom, the United States, Germany, France and the West Indies for the same period is also given:

	United Kingdom.	United States.	Germany.	France.	West Indies.
1910	\$244,984,407	\$336,652,587	\$10,436,421	\$12,750,192	\$13,284,809
1911	246,901,573	404,331,540	12,710,357	14,345,865	15,603,170
1912	268,760,435	476,889,112	14,904,919	13,868,369	15,391,818

Manufactures.—Although the complete details showing the results of the census of 1911 are not yet available, some useful preliminary figures have been made public by the census and statistics office at Ottawa. Every factory in operation during the whole or part of the census year, which had given employment during any part of the year to five or more persons was required to make a report. Some places, such as brick or tile works, butter and cheese factories, electric light and power plants, fish curing plants, flour and gristing mills, lime kilns, saw and shingle mills may, however, be operated to yield large products with less than five hands. With these exceptions, factories employing five hands and over in 1910 made an average product of \$60,671 as compared with \$45,483 in 1905 and \$26,213 in 1890, being an increase per factory of 25 per cent in the ten years 1890 to 1900 and 84 per cent in the ten years 1900 to 1910. Or, compared by the production per head of the whole population, it was \$76 in 1890, \$89 in 1900 and \$161 in 1910. The total value of products of this class of factories grew from \$481,053,375 in 1900 to \$718,352,603 in 1905, and \$1,165,975,639 in 1910. In the five years 1900 to 1905, the growth was 47 per cent and in the next five years it was 61 per cent. For the same class of factories the earnings of salaries and wages were in 1910 \$241,008,416, being an increase of 112 per cent in the decade. The average of wages and salaries in 1910 was \$467, in wages alone \$418.

Classified by provinces, the values in dollars of manufactured products were as follows: Alberta, (1900) 1,313,375, (1910) 18,788,826; British Columbia, (1900) 19,447,778, (1910) 65,204,235; Manitoba, (1900) 12,927,439, (1910) 53,673,609; New Brunswick, (1900) 20,972,470, (1910) 35,422,302; Nova Scotia, (1900) 23,592,513, (1910) 52,706,184; Ontario (1900) 241,533,486, (1910) 579,810,225; Prince Edward Island, (1900) 2,326,708, (1910) 3,136,470; Quebec, (1900) 158,287,994, (1910) 350,901,656; Saskatchewan, (1900) 651,667, (1910) 6,332,132. It will be seen that Ontario and Quebec more than doubled their values, showing increases respectively of \$338,276,739 and \$192,613,662; but the four western provinces have shown rates of increase considerably higher, ranging from 1,323.78 per cent for Alberta to 871.68 per cent for Saskatchewan.

The principal manufacturing centres, with the values in dollars of products in 1910, are:—Montreal 166,296,972 (71,099,750 in 1900); Toronto, 154,306,948 (58,415,498 in 1900); Hamilton, 55,125,946 (17,122,346 in 1900); Winnipeg and St. Boniface, 39,400,608 (8,616,248 in 1900); Ottawa, 20,924,331 (7,638,688 in 1900); Maisonneuve, 20,813,774 (6,008,780 in 1900); Quebec 17,149,385 (12,779,546 in 1900); London, 16,273,999 (8,122,185 in 1900); Brantford, 15,866,229, (5,564,695 in 1900); Vancouver, 15,070,105 (4,990,152 in 1900); Halifax, 12,140,409 (6,927,552 in 1900); Windsor and Walkerville, 12,113,279 (3,278,126 in 1900); Berlin and Waterloo, 12,078,783 (4,359,690 in 1900); Peterborough, 10,633,119 (3,789,164 in 1900); St. John, 10,081,667 (6,712,769 in 1900); Sydney, 9,395,017 (631,396 in 1900); Sault Ste. Marie and Steelton, 7,842,384 (738,472 in 1900); Calgary, 7,751,011 (599,444 in 1900); Guelph, 7,392,336 (3,689,183 in 1900); Hull, 7,259,301 (3,182,050 in 1900); Lachine, 6,295,716 (2,909,847 in 1900); St. Catharines, 6,024,217 (2,070,543 in 1900); Galt, 5,252,600 (2,225,343 in 1900); Stratford, 5,133,840 (1,935,176 in 1900); Chatham, 5,023,560 (2,714,977 in 1900); Edmonton, 4,493,304 (243,778 in 1900); Victoria, 4,244,034 (2,617,573 in 1900).

Capital increased from \$331,635,499 in 1890 to \$446,916,487 in 1900 and to \$1,247,583,609 in 1910; salaries and wages in the same years from \$79,234,311 to \$113,283,602 and to \$241,008,416; and products from \$368,696,723 to \$481,053,375 and to \$1,165,975,639. The averages of the values of twelve out of fifteen groups of products were greater at the end of the first decade than in 1890, and at the end of the second they were greater for all groups,

the lowest showing an increase of 81 per cent. At the end of twenty years the increase in the values of all products was 216.54 per cent as compared with an average of 30.47 per cent in the first decade and of 142.13 per cent in the second.

In 1910 there were three hundred kinds of manufactures as compared with 264 ten years before. The cost of raw materials in 1900 was \$266,527,858, which when deducted from the value of products gave \$214,525,517 or 80.26 per cent as the value added by manufactures, compared with \$601,509,018, as the value of raw materials and \$564,466,621 or 93.76 per cent as the value added by manufactures in 1910.

Railways.—The total railway mileage for the year ended June 30, 1911, was 25,400, an increase of 669 miles over 1910. Seventy per cent of this increase was in the western provinces. On the same date there were about 1600 additional miles of railway in actual operation, which were officially regarded as being still under construction. The mileage under construction was:—graded or being graded, 6,223; track laid or being laid, 3,833. In addition to these figures some 2,500 miles of additional line were located, surveyed or being surveyed.

New construction on the Canadian Pacific Railway system between June 30, 1910 and June 30, 1912 amounted to 1,753 miles. On the Grand Trunk Pacific Railway, the Prairie Section (main line, Winnipeg to Wolf Creek, 916 miles) was completed at the beginning of 1910; of the Mountain Section (main line, Wolf Creek to Prince Rupert, 837 miles) 100 miles from Prince Rupert eastward to Copper River were completed at the beginning of 1910, the remaining 257 miles being under contract; from Copper River eastward to Bulkeley Summit, 175 miles, were to be completed in the spring of 1913; from Wolf Creek westward, 185 miles is completed, and a further distance westward to Second Crossing of Fraser River (120 miles) was also completed at the end of 1912.

From 1909 to the end of 1912, 849 miles of branch lines (of which 747 were graded) were constructed, as follows:—Regina Boundary Branch, 155 miles; Regina Moose Jaw Branch, 40 miles; Moose Jaw North-West Branch, 48 miles; Weyburn Branch, 15 miles; Prince Albert Branch, 111 miles; Battleford Branch, 48 miles; Cut Knife Branch, 50 miles; Harte Brandon Branch, 25 miles; Biggar Calgary Branch, 105 miles; Calgary Branch, 202 miles; Alberta Coal Branch, 50 miles.

During the year 1912 over 586 miles of newly constructed tracks were added to the Canadian Northern system, the average mileage operated being 3,888 miles. Great progress has been made in the construction of the transcontinental line of the Canadian Northern System, which was expected to be completed by the end of 1913; the line through British Columbia to connect the western lines of the railway with tidewater at the Pacific coast has advanced rapidly. In addition to the advantage of easy gradients, the location of the line enters without competition into a large territory, the physical characteristics of which are expected to attract a desirable class of settlers. The line will also give access to a hitherto unknown section of the Canadian Alps.

During the year \$61,650,300 was added to the stock issue of railways operating in Canada, and \$56,741,214 to funded debt. These additions brought the aggregate capital liability up to \$1,528,689,201. The aggregate earnings from all sources for the year were \$188,733,493, an increase of 8.7 per cent over 1910.

Ports.—Much attention has been and is being devoted to the provision of adequate dock accommodation and other shipping facilities. The harbour at Montreal has been vastly improved, and a new floating dry dock was launched by the Governor General on November 18, 1912, thus providing complete modern equipment for the repair and examination of large vessels. At Victoria, British Columbia, a contract has been let to an English firm for the construction of a breakwater as a first instalment of an important scheme of harbour improvement, and at Courtenay Bay, St. John, New Brunswick, another English firm of contractors were in 1912 undertaking dock and breakwater works on a large scale so as to enable the port to meet the demands that would be made upon it through the great railway extensions.

Postal Development.—During 1911-12 a very considerable expansion was witnessed. The number of post offices increased by 437, and there was an increase of 670 miles in the extent of the system over which mails were carried by railway. The number of miles over which mails were carried by railway and water routes and ordinary land routes was greater by 3,422,080 miles than it was for the year before. The increase in the number of letters and postcards sent during the year was over fifty-two millions and a quarter, or more than ten per cent greater than the year before. An Order in Council was passed during the year increasing to \$1500 the amount the Post Office Savings Banks are authorised to accept in any one year, and increasing the maximum limit of an account to \$5000, exclusive of interest. Formerly the maximum amount that could be accepted from a depositor in one year was \$1000, and the maximum limit of an account was fixed at \$3000. The increase in value of postage stamps sold was \$1,068,607, or about 10½ per cent.

Finance.—The federal revenue increased from \$71,186,072 in 1905 to \$136,108,217 in 1912, and the expenditure from \$78,804,138 to \$137,142,082. A large amount of this expenditure is chargeable to capital, and represents outlays in respect of railways, canals and public works, bounties, etc. The total debt in 1912 was \$508,338,591; the total assets \$168,419,131, and the net debt \$339,919,400.

The Governor General.—The Earl and Countess Grey embarked at Quebec for England on October 13, 1911, when His Excellency relinquished the office of Governor General. Appointed on September 26th, and assuming office on December 10, 1904, Lord Grey's tenure of office was in 1909 extended beyond the usual term of five years, and again for another year after the death of King Edward in 1910. He had thus held office longer than any of his eight predecessors since Confederation. In January 1911 it was notified that the Duke of Connaught would be appointed to succeed Lord Grey, and on March 21st, he was formally gazetted as Governor General and Commander in Chief for a period of two years. On October 12, 1911 the Duke and Duchess were welcomed at Quebec, where the new Governor General was formally sworn in.

Imperial Conference, 1911.—At the Imperial Conference in London in May and June 1911, the Canadian representatives were Sir Wilfrid Laurier,¹ Prime Minister, Sir F. W. Borden,² Minister of Militia & Defence, and Mr. L. P. Brodeur (b. 1862), Minister of Marine & Fisheries.

Among the resolutions adopted of particular interest to Canada was Resolution I, proposed by the Imperial government, which provided that (a) the Dominions shall be afforded an opportunity of consultation when instructions are being framed for British delegates at future meetings of the Hague Conference, and that Conventions affecting the Dominions provisionally assented to at that Conference shall be circulated among the Dominion governments for their consideration before any such convention is signed: (b) that a similar procedure, where time and opportunity and the subject matter permit shall, as far as possible, be used when preparing instructions for the negotiation of other international agreements affecting the Dominions. Moreover, in connection with the most-favoured-nation clause in certain Treaties still in force between Great Britain and other countries, Resolution XIX was adopted on the motion of Sir Wilfrid Laurier, as follows: "That His Majesty's Government be requested to open Negotiations with the several foreign governments having Treaties which apply to the Overseas Dominions with a view to securing liberty for any of those Dominions which may so desire to withdraw from the operation of the treaty without impairing the treaty in respect of the rest of the Empire." Steps were subsequently taken by the Imperial government towards the opening of negotiations with the countries concerned.

Resolution XX, also adopted on the motion of Sir Wilfrid Laurier, suggested the appointment of a Royal Commission to investigate and report upon the natural resources of the Empire and the development of mutual trading relations. Effect was given later in the year to this suggestion, and Mr. George E. Foster, the Minister of Trade & Commerce in Mr. Borden's cabinet, was appointed on the Dominions Royal Commission.

Parliamentary Politics.—The political history of Canada in 1910-13 centres round the two great questions of Reciprocity with the United States and Canadian naval policy in relation to the Empire. On July 18, 1911 parliament reassembled after the Coronation adjournment, and on July 29th the government of Sir Wilfrid Laurier, who had been Premier since 1896, decided to recommend the dissolution of parliament, and to submit their proposals for commercial reciprocity with the United States (see below) to the judgment of the Canadian people at a general election, which was fixed for September 21st. While the chief question before the electors was the Reciprocity Agreement, the question of Canada's Naval Policy (see below) received much attention, especially in the province of Quebec. The result was a complete defeat for the government and the Reciprocity party. What had been a Liberal majority of 43 was converted into a Conservative-Liberal and Anti-Reciprocity majority of 49. Mr. Fielding and Mr. Paterson, who were responsible for the negotiations with the United States, were both defeated, together with Sir F. Borden and four other ministers. On October 6th Sir Wilfrid Laurier and his administration resigned office. Sir Wilfrid Laurier retained his seat, however, and decided to remain at the head of his party, now in Opposition.

Mr. R. L. Borden,³ leader of the Conservative party, being called upon to form an Administration, accomplished this task on October 10, 1911, and the new ministry was

¹ B. 1841: see *E. B.* xvi, 286-7.

² B. 1847: see *E. B.* iv, 245.

³ Robert Laird Borden (see *E. B.* iv, 245) was born in Nova Scotia in 1854. Becoming a leading lawyer in his province, he entered the Dominion parliament in 1896, and in 1901 became leader of the Conservative Opposition.

constituted as follows: R. L. Borden, Premier and President of the Privy Council; George Eulas Foster,¹ Trade and Commerce; Robert Rogers (b. 1864), Interior; F. D. Monk (b. 1856), Public Works; Francis Cochrane (b. 1852), Railways and Canals; William T. White,² Finance; Louis P. Pelletier (b. 1857), Postmaster General; John D. Hazen (b. 1860), Marine and Fisheries and Naval Service; Charles J. Doherty (b. 1855), Justice; Samuel Hughes (b. 1853), Militia and Defence; William J. Roche (b. 1859), Secretary of State; Thomas W. Crothers (b. 1850), Labour; Wilfrid B. Nantel (b. 1857), Inland Revenue and Mines; John D. Reid (b. 1859), Customs; Martin Burrell (b. 1858), Agriculture; George H. Perley (b. 1857), Albert E. Kemp (b. 1858), and James A. Loughheed (b. 1854), members without portfolios. On October 22, 1912 Mr. Monk resigned on the question of Mr. Borden's naval policy (see below) and his portfolio was taken over by Mr. Rogers, Mr. W. J. Roche becoming Minister of the Interior in his place. The office of Secretary of State was filled by Mr. Louis Coderre (b. 1865), the member for the Hochelaga division of Montreal. On October 23, 1911 the Hon. Auguste Landry was appointed Speaker of the Senate, and on November 15th Dr. T. S. Sproule was elected Speaker of the House of Commons.

The twelfth parliament of the Dominion of Canada was opened on November 15, 1911 by the Governor General in person. The address in reply to the speech from the throne was voted on November 29, and on December 7th parliament adjourned over the Christmas recess until January 10, 1912. On resuming, the main business was financial, estimates including supplementaries being submitted for \$169,389,716 divided as to \$117,981,831 to Consolidated Fund Account, and \$51,407,885 to Capital Account. On April 1, 1912 parliament was prorogued.

When the new session opened on November 21, 1912, it was known that the announcement of Mr. Borden's naval programme would be the business of outstanding importance. The Governor General in the speech from the throne stated that, his advisers having consulted with the Imperial government, it had been concluded that it would be the duty of Canada at this juncture to afford aid for the purpose of strengthening the effective naval forces of the Empire; and on December 5th (see below) the Premier announced an Emergency Contribution Bill, leaving the permanent Naval Policy for future consideration.

The Reciprocity Question.—Sir W. Laurier's government had begun their official negotiations for Reciprocity with the United States in January 1911, as the result of private discussions in the previous year. The terms of the proposed Agreement were announced in the Canadian parliament by Mr. W. S. Fielding, the Finance Minister in Sir W. Laurier's cabinet, on January 26, 1911. It aimed at more free interchange of products by removing duties on certain articles and reducing them in others.

Among those which were to enter free in each country, if of the growth, product or manufactures of the other, were live animals, poultry, wheat and other grain, vegetables, fruit, dairy products, honey, cotton seed, oil and certain oil seeds, grass, garden, field and other seed, fish except those preserved in oil, certain fish oils, timber (not sawn), brass (not polished) rolled iron or steel sheets 14 gauge or thinner, galvanised, coated with zinc or tin, crucible cast steel, galvanised iron, steel or wire, typewriting and typesetting machines, barbed fencing wire, coke (round), wire rods, wood pulp, and cream separators. Among the articles to be admitted into Canada from the United States and into the United States from Canada at identical rates were the following:—Fresh meats 1½ cts. per lb.; bacon and hams, not in tins or jars, 1½ cts. per lb.; meats dried and preserved 1½ cts. per lb.; canned meats and poultry 20 per cent; lards, etc., 1½ cts. per lb.; barley, malt, per 100 lbs. 45 cts.; cereal foods 12½ cts. per 100 lbs.; biscuits, wafers, cakes, 25 per cent; confectionery 32½ per cent; farm wagons 22½ per cent; farming implements of various kinds 15 per cent; portable engines with boilers and traction engines for farm purposes 20 per cent; roofing slates 55 cts. per 100 ft.; cutlery plated or not 27½ per cent; clocks, watches, etc. 27½ per cent; automobiles 30 per cent. Arrangements were made for special rates of duty on a moderate scale to cover a large number of other commodities.

¹ See *E. B.* x, 732. Born in New Brunswick in 1847. In 1885 he was Minister of Marine and Fisheries, and in 1888-96 Minister of Finance.

² Born at Bronte, Ontario, in 1866. He became a successful financier in Toronto, occupying until recently the position of Vice-President of the National Trust Company.

The case presented for the adoption of this agreement was that reciprocal trade relations had been the policy of all parties in Canada for generations, that many efforts had been made to secure a treaty without success, and that Sir John Macdonald's National Policy Tariff (1879) contained a standing offer of reciprocity with the United States covering a large portion of the products included in the present agreement. The United States having approached Canada with fair offers, it was claimed that they should be fairly met, and that in making the arrangement the government were realising the desires which the Canadian people had expressed for half a century, and also that in promoting friendly relations with the neighbouring republic the best possible service to the empire was being done. As Canada was seeking markets everywhere for her surplus products, subsidising steamship lines, and sending out commercial agents, it would be absurd to refuse to avail herself of increased facilities in the markets at her doors.

A denial was given to the expressed fear that the imports from Great Britain would be seriously affected. It was pointed out that the greater part of the agreement dealt with natural products which did not come from Great Britain, and that the range of manufactures affected was small. It was further denied that there was any foundation for the assumption that the tariff rates agreed upon discriminated in favour of the United States and against Great Britain. The promoters of the agreement promised that in every case Great Britain would have the same rate or a lower one, and held that Canada's right to deal with the British preference as she pleased remained untouched.

The opposition to the agreement took the ground that the arrangement had been entered into hastily without its effects being fully appreciated, and that the question should be referred to the people. Attention was drawn to the success which had attended the efforts to build up a nation and bind the country together from east to west, and it was contended that, as the arrangements proposed would primarily affect the question of transportation by promoting a tendency to make trade move north and south, the immense efforts which had been made would be sacrificed, and the markets which had been secured in Great Britain abandoned. The action of the United States in approaching Canada with a desire to make such an agreement, after declining on so many occasions to consider the question when asked to do so by Canada, was looked upon with suspicion, and it was suggested that the balance of advantage would remain with the United States, the speeches of some of her most prominent public men being freely quoted in support of this view,—notably one by Mr. Champ Clark in Congress, and another by President Taft himself. It was held that the impelling cause was the desire of the United States to have access to the abundant natural resources of Canada, her own reserves of wood, coal and other minerals, and much of her farm land, having shown signs of exhaustion. It was thought the better plan was to conserve Canadian resources for Canadian use. A further objection to the proposals was that while they would change the whole current of Canadian industries, and be likely to dislocate the national development, the new markets proposed would be so entirely unstable and insecure that, after having had the benefit of them for a few years, they might be withdrawn, causing a reversion to the position of 25 years ago, and necessitating the rebuilding of home industries and re-making their reputation in markets which in the meantime had been entirely occupied by old competitors. Great importance was attached to the restriction on legislation which it was alleged this agreement would cause, as no trade aggrieved under it could obtain redress without the arrangement as a whole being upset. It was also urged that under it concessions in the tariff would have to be made, in accordance with existing treaties, to countries from which no equivalent advantages could be obtained; and it was declared that if this Reciprocity policy was pursued the ties of empire would eventually be cut, for it would lead to complete commercial union and in the end the political domination of the United States, to which Canada would simply be an annexe.

The debates in connection with the matter lasted for almost the remainder of the session; but on February 22, 1911, on the motion of Mr. F. D. Monk, the House adopted unanimously the following as an amendment to the motion for going into Committee

of Ways and Means: "But, before resuming the discussion of the terms of the agreement concluded between the government of Canada and the President of the United States, and with a view to dispel the feeling of unrest created in Canada by comments made in both countries as to the political consequence of the agreement, the House wishes to affirm emphatically its determination to preserve intact the bonds which unite Canada to the British Empire and the full liberty of Canada to control her fiscal policy and internal autonomy."

A Bill to give effect to this Reciprocity Agreement on the part of the United States was introduced in the American Congress on January 29th, and in due course passed the Senate on July 22nd, it being enacted that its provisions should become operative as soon as the necessary counterpart legislation had been passed by the Canadian parliament. Discussion continued in the Canadian House of Commons, but no progress was made towards the adoption of the proposals, and on July 29, 1911 the government decided to recommend the dissolution of parliament and to submit the matter to the judgment of the people at a general election. The defeat of the government followed, the result being greatly influenced by the strong opposition to Reciprocity which was shown by such well-known Liberals as Mr. Clifford Sifton (b. 1861; formerly Minister of the Interior in the Laurier cabinet), Mr. Lloyd Harris, and Mr. Wm. German, and by the steps taken by a body of prominent Liberals of Toronto, assisted by Sir Edmund Walker, President of the Canadian Bank of Commerce.

Sir W. Laurier's Naval Policy.—An outcome of the Imperial Conference of 1909 had been the determination of the Canadian government to establish a naval service; and on January 12, 1910 a Bill for this purpose was introduced into the House of Commons, and became law on May 4, 1910. It provided for the creation of a Naval Department, and transferred to it from the Department of Marine and Fisheries the wireless telegraph, fisheries protection, hydrographic, and tidal survey branches. It empowered the government to appoint a Naval Board to advise the minister, and to organise and maintain permanent, reserve and volunteer forces, and to place at the disposal of His Majesty, for general service in the Royal Navy, ships or men of the Canadian naval service. Provision was also made for a naval college. During the debate on the Bill, Sir Wilfrid Laurier announced that it was the intention of the government to construct, in Canada if possible, four cruisers of the improved "Bristol" class, and six destroyers of the improved "River" class. At conferences with the British Admiralty it was agreed that the naval stations for Canada should be two—one on the Atlantic to include the waters north of 30° N. lat. and west of the meridian of 40° W.; and one on the Pacific to include the waters north of 30° N. lat. and east of the meridian of 180°. Halifax Dockyard was taken over from the Imperial authorities on January 1, 1906, and the dockyard at Esquimalt on November 9, 1910. On August 28, 1911 it was announced that the King had approved of the naval forces of Canada receiving the style of "The Royal Canadian Navy," and of the ships of war of that navy being designated as "His Majesty's Canadian Ships." On December 16th the following regulations were published with regard to the flag and pennants to be flown by the Royal Canadian navy: "All ships and vessels of the Royal Canadian Navy shall fly at the stern the white ensign as the symbol of the authority of the Crown, and at the jack-staff the distinctive flag of the Dominion of Canada, such distinctive flag being the blue ensign with the Arms of the Dominion inset in the fly. The white pennant will be flown at the masthead."

In pursuance of Sir Wilfrid Laurier's naval policy, H.M.'s cruisers "Niobe" and "Rainbow" were purchased and taken over in the autumn of 1910. On July 29, 1911, however, H.M.C.S. "Niobe" sustained damage by grounding on the coast off Cape Sable; her repairs were undertaken at Halifax and took fifteen months to complete. The building of the proposed new cruisers and destroyers had, however, not been commenced at the time of the resignation of Sir Wilfrid Laurier's government.

Mr. Borden's Naval Policy.—The naval policy of Sir Wilfrid Laurier's government was that of a Canadian-built and Canadian-controlled navy, but this was criticised by the Opposition as involving a large expenditure, a discredited Imperial navy, and the construc-

of obsolete types of ships. Upon Mr. Borden's acceptance of office, the naval question became one of renewed interest. Mr. Borden stated that in his view the question of permanent co-operation between the Dominion and the rest of the Empire ought to be fully debated, and that the Canadian people should be given an opportunity of pronouncing upon it; pains would be taken to ascertain in the meantime what were the real conditions confronting the Empire. In pursuance of this object, Mr. Borden, with several of his colleagues, visited London in July 1912, and were cordially welcomed by Mr. Asquith's government, who enabled them, at meetings of the Imperial Defence Committee and otherwise, to obtain all the information available as to the problems of British foreign policy and the naval situation as it presented itself to the British Admiralty. The proposals which the Canadian government founded on the understanding thus arrived at were left, however, to be made public first in the Dominion Parliament after it met in November.

Mr. Borden's speech on December 5, 1912 must always be historic in the relationship between Canada and the Mother-country. It was notable for announcing two steps forward in a common Imperial policy. In the first place his "Bill to Authorize Measures for Increasing the effective Naval Forces of the Empire" proposed to contribute £7,000,000 (\$35,000,000) for the construction and equipment of three first-class battleships, to be under the control of the British Admiralty as part of the Royal Navy, subject to arrangements for their being at the disposal of the Canadian government if ever a separate Canadian Navy were established. And in the second place, by the agreement of the Imperial government to include a Canadian Minister as one of the permanent members of the Committee of Imperial Defence, the principle was recognised that, if the Dominions took their share in Imperial defence they must also have a share in determining Imperial policy.

The proposal for an "emergency contribution" of three battleships to the British Navy was founded on a memorandum (published in England on Dec. 5th, as a Parliamentary paper) drawn up by the Admiralty for the information of the Canadian government as to the existing international situation from a naval point of view; and Mr. Borden read this out in the course of his speech. It is given in full elsewhere in the YEAR-BOOK (see Part I. sect. i, "The World's Navies") and need not here be repeated. But the view taken by the Canadian government can best be shown by quoting the salient passages of Mr. Borden's speech.

As regards the vital need of naval security for the very existence of the Oversea Dominions as part of the British Empire, and the grave danger to that security indicated by the relative decline in the power of the British navy, owing to the growth of other navies, Mr. Borden said:

"This Empire is not a great military power, and it has based its security in the past, as in the present, almost entirely on the strength of its Navy. A crushing defeat upon the high seas would render the British Islands, or any Dominion, subject to invasion by any great military Power; loss of such a decisive battle by Great Britain would practically destroy the United Kingdom, shatter the British Empire to its foundations, and change profoundly the destiny of its component parts. . . . There is, therefore, grave cause for concern when once the naval supremacy of the Empire seems on the point of being successfully challenged.

"The great outstanding fact which arrests our attention in considering the existing conditions of naval power is this. Twelve years ago the British Navy and the British Flag were predominant in every ocean of the world and along the shores of every continent. To-day they are predominant nowhere except in the North Sea. The paramount duty of ensuring safety in home waters has been fulfilled by withdrawing or reducing squadrons in every part of the world, and by concentrating nearly all the effective naval forces in close proximity to the British Islands. In 1902 there were 55 British warships on the Mediterranean station; to-day there are 19. There were 14 on the North American and West Indies station; to-day there are three. There were three on the south-east coast of South America; to-day there is one. There were 16 on the Cape of Good Hope station; to-day there are three. There were eight on the Pacific station; to-day there are two. There were 42 on the China station; to-day there are 31. There were 12 on the Australian station; to-day there are eight. There were ten on the East Indies station; to-day there are nine. To sum up, in 1902 there were 160 ships on foreign and Colonial stations against 76 to-day. Do not imagine that this

result has been brought about by any reduction in expenditure, for the case is practically the reverse. Great Britain's total naval expenditure in 1902 was less than \$152,000,000 (£30,400,000). For the present fiscal year it exceeds \$220,000,000 (£44,000,000). Why then, has the naval force of the Empire been so enormously reduced while at the same time the expenditure has increased nearly 50 per cent? For the simple reason that the increasing strength of other navies, and especially of the German Navy, has compelled Great Britain not only to increase her fleet, but to concentrate it in the vicinity of the British Islands. . . .

"It is neither necessary nor desirable to debate or discuss the probability or imminence of war. The real test of our action is the existence or non-existence of absolute security. It should never be forgotten that without war, without firing a shot or striking a blow, our naval supremacy may disappear, and with it the sole guarantee of the Empire's continued existence. . . .

"The fact that trade routes, vital to the Empire's continued existence, are inadequately defended and protected by reason of the necessary concentration in home waters is exceedingly impressive, and even startling. Even during the present year the battleships of the British Mediterranean Fleet, based on Malta, have been withdrawn and based on Gibraltar, in order that they might become more easily available for necessary aid in home waters. The Atlantic Fleet, based on Gibraltar, has been withdrawn to the vicinity of the British Islands for the same reason. Under such conditions the British Flag is not predominant in the Mediterranean, and with every available exertion of the whole Empire it may be impossible to regain the necessary position of strength in that great highway before 1915 or 1916. Austria-Hungary, with only 140 miles of sea coast and absolutely no colonial possessions, is building in the Mediterranean a formidable fleet of Dreadnoughts which will attain its full strength in about three years, and which will be supported by strong battleships of the pre-Dreadnought type, and by cruisers, torpedo craft, and other necessary auxiliaries. The fleet of Italy in the same theatre will be even more powerful and more formidable. The withdrawal of the British Flag and the British Navy from so many parts of the world for the purpose of concentration in home waters has been necessary, but unfortunate. Our Navy was once dominant everywhere, and the White Ensign was the token of naval supremacy in all seas. Is it not time that the former conditions should, in some measure, be restored? Upon our own coasts, both Atlantic and Pacific, powerful squadrons were maintained 12 years ago. To-day the flag is not shown on either seaboard. I am assured that the aid which we propose will enable such special arrangements to be consummated that, without courting disaster at home, an effective fleet of battleships and cruisers can be established in the Pacific, and a powerful squadron can periodically visit our Atlantic seaboard and assert once more the naval strength of the Empire along these coasts. I do not forget, however, that it is the general naval supremacy of the Empire which primarily safeguards the Oversea Dominions. New Zealand's battleship is ranged in line with the other British battleships in the North Sea, because there New Zealand's interests may best be guarded by protecting the very heart of the Empire."

As regards the three Canadian battleships now to be added to the navy, Mr. Borden pointed out that, under the Admiralty, the Empire now had what he had convinced himself was the most thorough and effective naval organisation in the world, of which it was the best Canadian policy to make use. The hazardous and costly experiment of building up a separate naval organisation for Canada was quite unnecessary, and in any case could only provide a poor and weak substitute. In the present emergency the Canadian ships were best employed as part of the Empire navy under the Admiralty of the mother-country:

"Those ships will be at the disposal of His Majesty the King for the common defence of the Empire. They will be maintained and controlled as part of the Royal Navy, and we have the assurance that, if at any time in the future it be the will of the Canadian people to establish a Canadian unit of the British Navy, these vessels can be called by the Canadian government to form part of the Navy, in which case, of course, they will be maintained by Canada and not by Great Britain. In that event, there will, necessarily, be reasonable notice, and, indeed, Canada would not desire or suggest the sudden withdrawal of so powerful a contingent from any important theatre in which the naval forces of the Empire might be exposed to severe and sudden attack. In the meantime I am assured that special arrangements will be made to give Canadians an opportunity of serving as officers in these ships. . . .

"The ships will be built under Admiralty supervision in the United Kingdom for the reason that, at present, there are no adequate facilities for constructing them in Canada. The plant required for the construction of Dreadnought battleships is enormous, and it would be impossible at present to have shipbuilding in this country on such a scale. In any case, only half could be built in Canada, because the machinery for armour and guns would, necessarily, be constructed or manufactured in the United Kingdom. The additional cost of construction in Canada would be about 12 million dollars for three, and it would be impossible to estimate the delay. No one is more eager than myself for the development

of the shipbuilding industries in Canada, but we cannot, upon any business or economic considerations, begin with the construction of Dreadnoughts, and especially we could not do so when these ships are urgently required within two or three years at the outside for rendering aid upon which may depend the Empire's future existence. According to my conception, the effective development of the shipbuilding industries in Canada must commence with small beginnings and in a businesslike way. I have discussed the subject with the Admiralty, and they thoroughly realise that it is not to the Empire's advantage that all shipbuilding facilities should be concentrated in the United Kingdom. I am assured, therefore, that the Admiralty are prepared in the early future to give orders for the construction in Canada of small cruisers, oil tank vessels, and auxiliary craft of various kinds. The plant required is relatively small as compared with that which is necessary for Dreadnought battleships, and such an undertaking will have a much more secure and permanent basis from the business standpoint. For the purpose of stimulating so important and necessary an industry we have expressed our willingness to bear a portion of the increased cost for a time at least. I see no reason why all the vessels required in future for our government service should not be built in Canada, even at some additional cost. In connection with the development of shipbuilding I would not be surprised to see the establishment of a high class of engineering works which will produce articles now imported and not at present manufactured in Canada. Therefore, although the sum which we propose to devote for necessary naval aid at this critical juncture is to be expended in Great Britain, yet we believe that this step will result, under the conditions which I have described, in the very marked development of more than one industry in Canada, and that, even from a purely economic and material standpoint, the step has much to commend it."

The Canadian expenditure now proposed was, in Mr. Borden's view, a moderate one, regarded not as the beginning of a system of periodical contributions, but as an emergency aid at a moment of crisis:

"If we should neglect the duty which I conceive we owe to ourselves, and if irreparable disaster should ensue, what will be our future destiny? Obviously as an independent nation or as an important part of the great neighbouring Republic. What then would be our responsibilities, and what would be the burden upon us for a protection on the high seas much less powerful and less effective than that which we enjoy to-day? Take the case of one nation whose territory, resources, population, and wealth may fairly be compared with those in Canada. The naval estimates of Argentina for the four years from 1909 to 1912 inclusive amounted to \$35,000,000 (£7,000,000). No information is available as to the exact proportion of the last-mentioned sum which has been appropriated for naval purposes, but it is understood that the far greater portion is for naval construction. It is safe, therefore, to estimate that during the past four years Argentina has expended for naval purposes not less than from \$65,000,000 to \$70,000,000 (£13,000,000 to £14,000,000). The Federal and State expenditure of the United States comprises a total outlay for armaments of between \$250,000,000 and \$300,000,000 (£50,000,000 and £60,000,000), or at the rate of \$2.75 per head. Similar expenditure by Canada would mean an annual outlay of some \$20,000,000 to \$25,000,000, or between \$80,000,000 and \$100,000,000 during the same period.

"It is apparent, therefore, that the aid which we propose to bring at this juncture is of a moderate and reasonable character. For 45 years as a Confederation we have enjoyed the protection of the British Navy without the cost of a dollar. . . . So far as official estimates are available, the expenditure of Great Britain on naval and military defence for the provinces which now constitute Canada during the nineteenth century was not less than \$400,000,000 (£80,000,000). Even since the inception of our Confederation, and since Canada attained the status of a great Dominion, the amount so expended by Great Britain for the naval and military defence of Canada vastly exceeds the sum which we are now asking parliament to appropriate. From 1870 to 1890 the proportionate cost of the North Atlantic Squadrons which guarded our coasts was from \$125,000,000 to \$150,000,000 (£25,000,000 to £30,000,000). From 1853 to 1903 Great Britain's expenditure on military defence in Canada runs closely to \$100,000,000."

As regards the voice which it had been arranged that Canada should have on the Committee of Imperial Defence, Mr. Borden said:

"With increasing power and influence there has necessarily come, by sure and gradual steps, a certain development in our relations with the United Kingdom and the other Dominions. . . . In this constitutional development we are necessarily confronted with the problem of combining co-operation with autonomy. It seems most essential that there should be such co-operation in defence and in trade as will give to the whole Empire an effective organisation in these matters of vital concern. On the other hand, each Dominion must preserve in all important respects the autonomous government which it now possesses.

"The responsibility for the Empire's defence upon the high seas, in which is to be found the only effective guarantee of its existence, and which hitherto has been assumed by the United Kingdom, has necessarily carried with it the responsibility for and the control of

foreign policy. . . . When Great Britain no longer assumes sole responsibility for defence upon the high seas she can no longer undertake to assume sole responsibility for and sole control of foreign policy, which is closely, vitally, and constantly associated with that defence in which the Dominions participate. . . . The great Dominions, sharing in the defence of the Empire upon the high seas, must necessarily be entitled to share also in the responsibility for and in the control of foreign policy. Not only His Majesty's Ministers but also the leaders of the opposite political party in Great Britain, have explicitly accepted this principle.

"I have alluded to the difficulty of finding an acceptable basis upon which the great Dominions co-operating with the mother-country in defence can receive and assert an adequate voice in the control and moulding of foreign policy. We were brought closely in touch with both subjects when we met the British Ministers in the Committee of Imperial Defence. That committee is peculiarly constituted, but in my judgment is very effective. It consists of the Prime Minister of Great Britain and such persons as he may summon to attend it. Practically all the members of the cabinet from time to time attend its deliberations, and usually the more important members of the cabinet are present. In addition, naval and military experts and the technical officers of the various departments concerned are in attendance. A very large portion of the work of the committee is carried on by subcommittees, which often are composed in part of persons who are not members of the general committee itself, and who are selected for their special knowledge of the subjects to be considered and reported upon. The amount of work which thus has been performed during the past five or six years in particular is astonishing, and I have no doubt that it has contributed largely to the safety of the whole Empire in time of peril.

"The committee is not technically or constitutionally responsible to the House of Commons and thus it is not supposed to concern itself with policy. As so many important members of the cabinet are summoned to attend the committee, its conclusions are usually accepted by the cabinet and thus command the support of the majority of the House of Commons. While the committee does not control policy in any way and could not be undertaken to do so as it is not responsible to parliament, it is necessarily and constantly obliged to consider foreign policy and foreign relations for the obvious reason that defence, and especially naval defence, is inseparably connected with such considerations.

"I am assured by his Majesty's Government that pending a final solution of the question of voice and influence they would welcome the presence in London of a Canadian Minister during the whole or a portion of each year. Such minister would be regularly summoned to all meetings of the Committee of Imperial Defence and be regarded as one of its permanent members. No important step in foreign policy would be undertaken without consultation with such representative of Canada. This means a very marked advance both from our standpoint and from that of the United Kingdom. It would give us the opportunity of consultation and therefore influence which hitherto we have not possessed."

In opposition to the Government proposals, Sir Wilfrid Laurier on December 12th moved an amendment which, while not negating the first clause of the Government resolution providing for a vote for increasing the effective Naval forces of the Empire, would have substituted for the remaining clauses a resolution declaring it necessary that Canada without further delay should enter actively upon a permanent policy of naval defence, and that any measure of aid to Imperial naval defence which did not embody a permanent policy of participation by ships owned, manned and maintained by Canada, was not an adequate expression of the aspirations of the Canadian people. Mr. Borden, said Sir Wilfrid, had asserted that before she enacted a permanent policy Canada must have a voice in all questions affecting war or peace. But that was a large contract, and the question before them was that of emergency and immediate defence. If Canada was represented in the councils of war and peace the other Dominions and dependencies must be also. That question might take years to solve. It must be discussed by itself, and in the meantime Canada should continue in her preparations for defence. Sir Wilfrid Laurier condemned the Government's policy of direct contribution as un-Canadian and un-British, and as unsuited to the real needs of the Empire.

Other Legislation, 1910-12.—Among important acts passed during the session 1910-11 were the Opium and Drug Act, which prohibits the importation, manufacture, sale or possession for other than scientific or medicinal purposes of opium, cocaine, morphine and eucaïne, or any salts or compounds thereof; a new Seed Control Act; and an Act confirming and sanctioning the treaty signed at Washington on January 11, 1909, relating to the boundary waters and to the questions arising along the boundary between Canada and the United States. In the session 1911-12, an act was passed amending the Dry Docks Subsidies Act of 1910, and providing that any dry dock shall not be deemed, for the purpose of subsidy,

to be a dry dock of the first class unless there can be received and repaired therein the largest ships or vessels of the British navy existing at the time at which the contract is entered into. Another Act of this session provided for the constitution of a new Department under the First Minister, to deal with all official communications in connection with the external affairs of Canada, the administration of all matters relating to the foreign consular service in Canada, etc. A measure of great importance, dealing generally with grain inspection, was also passed; it provides for the appointment of Grain Commissioners, the establishment of inspection divisions, and the appointment of a Grain Standards Board for the purpose of establishing commercial grades, and defines the various established grades. Acts providing for the extension of the boundaries of Manitoba, Ontario and Quebec were also passed.

Under the Canadian Medical Act, chapter 137, Revised Statutes 1906, and the amending Act, chapter 16, 1911, provision was made for the formation of a Dominion Medical Council as soon as the Legislatures of the various provinces of Canada had enacted legislation accepting the provisions of the Acts. The object of the legislation is to provide for one central council consisting of representatives of the different provinces, for the purpose of (a) the establishment of a qualification in medicine, such that the holders thereof shall be acceptable and empowered to practise in all the provinces of Canada; (b) the establishment of a register for Canada of medical practitioners, and the publication and revision from time to time of such register; (c) the determination and fixing of the qualification and conditions necessary for registration, the examinations to be undergone with respect to professional subjects only, and generally the requisites for registration; (d) the establishment and maintenance of a board of examiners for examination and granting of certificates of qualification; (e) the enactment, with the consent and at the instance of the medical councils of the various provinces of Canada, of such provincial legislation as is necessary to supplement the provisions of this Act and to effect the foregoing purposes. The Secretary of State summoned a meeting on November 17, 1912 for the purpose of organising the Council, and a number of appointments were subsequently made.

The "Ne Temere" Decree.—On January 23, 1912 the House of Commons decided to refer to the Supreme Court of Canada, and later to the Judicial Committee of the Imperial Privy Council, the question whether the Dominion parliament may constitutionally pass a marriage law applicable in all respects in every province in Canada. On July 29, 1912 the Lord Chancellor delivered judgment, which, speaking generally, upheld the decision of the Supreme Court of Canada. It was ruled that the Dominion parliament is not entitled under the British North America Act to pass a uniform federal law legalising all marriages performed by authorised clergymen. The matter is in the jurisdiction of the provinces.

Anglo-American Peace Celebrations.—On June 4, 1912 at a representative meeting at Ottawa, a Committee was appointed to act for Canada in preparing a programme of the celebration of the 100 years of peace between the branches of the English-speaking people.

Fur Seal Convention.—The International Fur Seal Conference which was held at Washington from May 11 to July 7, 1911 resulted in a Convention being signed by which Great Britain, the United States, Russia, and Japan undertook that pelagic sealing should cease for a period of 15 years from December 15, 1911, and thereafter until terminated by one year's notice. Canada was represented by the under-secretary for external affairs, Mr. Joseph Pope, who in 1912 was created a K.C.M.G. Provision was made for an apportionment of the annual proceeds from the seals killed on land, the share payable to Canada being 15 per cent of the gross takings of the United States and Russia, and 10 per cent of those of Japan.

Provincial Governments.—On June 14, 1911 a general election was held in Nova Scotia, the result being the return of the government, which had been Liberal since 1884. The elections for the British Columbia Legislature took place on March 28, 1912, the result being the return of the government, 40 Conservatives and 2 Socialists being elected. The Hon. Richard McBride, K.C. (b. 1870), the Premier of British Columbia since 1903, was created a K.C.M.G. in 1912. The election in Ontario was held on December 11, 1911, when Sir James Whitney's government was returned by a majority of 60. In January 1912 the Prince Edward Island elections resulted in the return of 27 Conservatives and 3 Liberals. The Premier is Hon. J. A. Mathieson, K.C., who had formed a government in December 1911. The general election in New Brunswick took place on June 20, 1912, resulting in the return of 44 Conservatives, 2 Independents, and 2 Liberals. On May 15, 1912 the elections were held for the Quebec Legislature and resulted in the return of Sir Lomer Gouin's government with a slightly reduced majority. On July 11, 1912 the general election took place for the province of Saskatchewan. The chief issue was the Reciprocity agreement, as in the Dominion elections, and the overwhelming majority by which Mr. Scott's government was returned, was looked upon as a striking victory for the Reciprocity party.

The appointment of members of provincial governments to the new federal cabinet in 1911 necessitated some re-arrangements in the provincial cabinets.

In Manitoba the vacancy caused by the Hon. Robert Rogers joining the Dominion cabinet was filled by the inclusion of Mr. George Lawrence, as Minister of Agriculture. In 1912 the Hon. Rodmond Palen Roblin (b. 1853), Premier since 1900, was created K.C.M.G., and the retiring Chief Justice, Joseph Dubuc (b. 1840), was knighted.

In Ontario, Mr. W. H. Hearst, K.C., M.P., became Minister of Lands, Forests and Mines

in succession to the Hon. Frank Cochrane, the new Federal Minister of Railways and Canals. In 1912 the lieutenant-governor, Col. John Morison Gibson, was created a K.C.M.G.

In New Brunswick, owing to the appointment of the Hon. J. D. Hazen, Premier and Attorney General, to be Federal Minister of Marine and Fisheries, the Hon. J. K. Flemming, Provincial Secretary, was called upon to form a government. Mr. Flemming took the office of Surveyor General, and the Hon. W. C. H. Grimmer was appointed Attorney General; Hon. H. F. McLeod, Provincial Secretary; Hon. John Morrissy, Commissioner of Public Works; Hon. D. V. Landry, Agricultural Commissioner; and the Hon. Robert Maxwell and Hon. John A. Murray, without portfolios.

New Lieutenant Governors.—On August 1, 1911 Mr. D. C. Cameron was sworn in as Lieutenant Governor of Manitoba, in succession to Sir D. H. MacMillan retired. A native of Vankleek, Ontario, he was elected to the Ontario Legislature in 1902.

Sir Francis Xavier Langelier, Acting Chief Justice of the Supreme Court of Quebec, was appointed Lieutenant Governor of the Province of Quebec in succession to Sir C. A. Pelletier, deceased. Born in 1838, he has held several offices in Quebec Ministries, and sat in the Dominion House of Commons from 1884 to 1898.

In New Brunswick the term of office of the Hon. L. J. Tweedie expired on March 1, 1912, and he was succeeded as Lieutenant Governor by Senator Josiah Wood, who was born at Sackville, New Brunswick, in 1843.

Judiciary.—In succession to Sir Louis Jette, resigned, the Puisne Judge of the Court of King's Bench, the Hon. Horace Archambault, became Chief Justice of Quebec in 1912. Born at L'Assumption, Quebec, in 1857, he was educated at Laval University. In 1888 he was called to the Legislative Council, Quebec, and from 1897 to 1905 was Attorney General of the Province. Appointed a Q.C. in 1889 he was raised to the bench in 1908.

On the death of Sir Charles Moss, Chief Justice of Ontario, in 1912, he was succeeded by Sir Wm. Meredith, who was born at London, Ontario, in 1840, and was educated at Toronto University. He was member for London in the Ontario Legislature from 1872 to 1896. He was appointed Chief Justice of the Common Pleas in 1904.

The Hon. F. W. G. Haultain, formerly Premier of the North-West Territories, was gazetted on November 2, 1912, as Chief Justice of Saskatchewan. He was born in 1857 at Woolwich, England, going to Ontario in 1860. He was called to the Bar of Ontario in 1882, and to the Bar of the North-West Territories in 1884, being appointed a K.C. in 1902.

The Hon. Francis L. Haszard, K.C., Prime Minister of Prince Edward Island, was appointed Judge of the Canadian Supreme Court on May 4, 1911, being succeeded in the Premiership by the Hon. H. J. Palmer. The new Judge of the Supreme Court was born in Prince Edward Island in 1849 and was admitted to the Bar in 1872. From 1893 to 1900 he was Stipendiary Magistrate and Recorder of Charlottetown. Elected a member of the Provincial Legislative Assembly in 1904, he became Prime Minister of the Province in 1908.

In April 1912 four new Judgeships were authorised by parliament, and were filled as follows:—Mr. Alexander Haggart, ex-M.P. for Winnipeg, to the Manitoba Court of Appeal; Mr. W. L. Walsh, K.C., of Calgary, to the Supreme Court of Alberta; Mr. Hector Chauvin, K.C., of Hull, as Judge of the new judicial district of Labelle; and Mr. Haughton Lennox, M.P., for South Simcoe, to one of the extra judgeships of the High Commission of Ontario.

As Chief Justice of the Superior Court of Quebec, Mr. Justice Davidson has succeeded Sir Melbourne Tait. The new Chief Justice was born in Huntingdon, Quebec, in 1841; he was educated at McGill University, and was made a Q.C., being raised to the bench in 1887, where he has been a Puisne Judge of the Superior Court.

Personalia.—On October 22, 1912 Major G. W. Stephens resigned the position of Chairman of the Montreal Harbour Commission.—On March 1, 1912 Dr. J. G. Rutherford resigned his position as Veterinary Director General and Live Stock Commissioner. He was appointed Chief Veterinary Inspector in 1902, Veterinary Director in 1904, and Live Stock Commissioner in 1906.—On March 31, 1911 Dr. William Saunders, C.M.G. retired after nearly 25 years service as Director of Experimental Farms in Canada, during which time he showed a keen and enlightened sympathy with all that tended to assist in the development of the agricultural resources of the Dominion. Born in Devonshire, England, in 1836, he went to Canada in 1848. He is succeeded by Mr. J. H. Grisdale.

Obituary.—The Canadian obituary for 1911 included the following:—THOMAS MAYNE DALY (b. 1852), police magistrate at Winnipeg; d. June 24th. He was formerly a member of parliament, and was Minister of the Interior from 1892 to 1896.—DESIRE GIROUARD, the judge and man of letters; d. at Ottawa on March 22nd. He was born at St. Timothée, Quebec on July 7, 1836 and was educated at Montreal College, afterwards studying law. He stood for the Canadian House of Commons for several constituencies from 1872 to 1878, and was finally elected for Jacques Cartier in that year. He held the seat until 1895, when he became a judge of the Supreme Court. At the time of his death he was Senior Judge. He published a work on the Civil Laws of Marriage, one on the law of insolvency and one on bills of exchange; also *Lake St. Louis, Old and New*, and *Chevalier de la Salle*. He was an editor of *La Revue Critique*.—SIR CHARLES ALPHONSE PANTALÉON PELLETIER, K.C.M.G., the judge and statesman; d. at Quebec on May 1st. He was born at Rivière Ouelle on January 22, 1837 and educated at Laval University. He was called to the Bar in 1860 and became Q.C.

in 1879. In 1892 he was Batonnier of the Quebec Bar. He commanded a battalion of volunteers during the Fenian rising of 1866. He sat in the Dominion House of Commons from 1869 to 1877, when he was called to the Senate. From 1896 to 1901 he was Speaker of the Senate. In 1902 he was appointed a Judge of the Supreme Court of Canada and in 1908 Lieut.-Governor of the province of Quebec.—SIR HENRI ELZEAR TASCHEREAU, the judge; d. at Ottawa on April 19th. He was born at St. Mary's, Beauce Co., Quebec, on October 7, 1836 and educated at Quebec Seminary. He was called to the Quebec Bar in 1857, became Q.C. in 1867, Judge of the Superior Court, Quebec, in 1871, Judge of the Supreme Court of Canada in 1878 and Chief Justice in 1902. He was knighted in 1902, and made a Privy Councillor in 1906, when he resigned his Chief Justiceship. From 1861 to 1867 he had represented Beauce Co. in the Canadian Legislative Assembly. He published *Criminal Law of Canada* and *Code Civil Procedure of Province of Quebec*.—SIR JOHN CARLING, K.C. M.G., the agricultural administrator; b. at London, Ontario, 1828; d. November 6, 1911. Prior to Confederation he had held the positions of Receiver General, 1862, and Minister of Works and Agriculture, 1867-71, in the local government. From 1885 to 1892 he served as Minister of Agriculture in the Dominion Ministry of Sir John A. Macdonald, and to him is due the credit of establishing a number of Experimental Farms throughout the country.

The following are the more memorable among those who died in 1912:—ADAM CARR BELL, formerly Senator; b. 1847; d. at Picton, Nova Scotia, on October 31st. He entered the Nova Scotia legislature in 1878. In 1896 he was elected to the Dominion parliament, but was defeated in 1904.—EDWARD BLAKE (b. 1833), formerly prominent as a Canadian statesman, whose later career in the Imperial Parliament was of less account; d. at Toronto on March 1st (for biography see *E. B.* iv, 35a).—SIR RICHARD CARTWRIGHT (see *E. B.* v, 435), the statesman (b. 1835); d. at Kingston, Ontario, on September 23rd.—SIR EDWARD CLOUSTON, Bart., the financier, general manager and vice-president of the Bank of Montreal; b. 1849; d. November 23rd. He had been connected with the bank for nearly 50 years.—GEORGE RALPH RICHARDSON COCKBURN, the educationalist and politician; d. in London on January 24th. He was born in Edinburgh on February 15, 1832 and educated at the Royal High School and University there, afterwards going to France and Germany. He went to Upper Canada in 1858 and from 1861 was Principal of the Upper Canada College for over twenty years besides being Senator of Toronto University. From 1887 to 1896 he sat in the Dominion House of Commons as Conservative Member for Central Toronto. He was chief Canadian Commissioner at the Chicago World's Fair, 1893.—CHARLES M. HAYS (b. 1856 at Rock Island, Ill., U.S.A.), president of the Grand Trunk Railway; lost in the "Titanic" in April. Formerly general manager of the Wabash Railway, he was appointed to be manager of the Grand Trunk in 1896, and subsequently president. He was also president of the Grand Trunk Pacific.—GEORGE HOLMES, missionary bishop in the North-west; d. in London on February 3rd. He was born in England on November 23, 1858 and educated at St. John's College, Winnipeg. He was afterwards trained at the Church Missionary College, Islington, whence he returned to Canada in 1885. In 1887 he was ordained and worked as a missionary in the North-West Territory till 1905. In 1901-05 he was Archdeacon of Athabasca, in 1905-09 Bishop of Moosonee, and from 1909 till his death Bishop of Athabasca.—SIR JAMES MACPHERSON LEMOINE, the lawyer and author; d. at Quebec on February 5th. He was born at Quebec on January 24, 1825, and educated there. He was called to the Bar in 1850, but devoted himself chiefly to the writing of historical and ornithological works. In 1894 he was elected President of the Royal Society of Canada. His publications included *L'Ornithologie du Canada* (1861), *Les Pecheries du Canada* (1862), *Maple Leaves* (6 vols. 1863-94), *Quebec Past and Present* (1876), *Annals of the Port of Quebec* (1901), etc.—JAMES PITT MABEE, the judge; d. at Toronto on May 7th. He was born at Port Rowan, Ontario, on November 5, 1859 and educated at Toronto University. He was called to the Bar in 1882, made Queen's Counsel in 1899 and Judge of the Ontario High Court in 1905. He resigned his position as Judge in 1908 to become Chief Commissioner of the Board of Railway Commissioners for Canada.—JAMES MACDONALD, the politician and judge; d. at Halifax, N.S., on October 4th. Born in 1828, he entered the Dominion parliament, and was Minister of Justice in Sir John Alexander Macdonald's cabinet in 1878. Latterly he had been Chief Justice of his province.—SIR CHARLES MOSS, the judge; d. at Toronto on October 12th. He was born at Cobourg, Ontario, on March 8, 1840 and educated at the Ontario Law School. He was called to the Bar in 1869, became K.C. in 1881 and Judge in 1897. In 1902 he became Chief Justice of the Province of Ontario. He was knighted in 1907. From 1900 to 1906 he was Vice-Chancellor of Toronto University. He published, together with Mr. R. Sullivan, a handbook of Commercial Law for Upper Canada.—JAMES O'BORNE, a well-known railway official; d. at Vancouver on April 30th. He was born at Montreal on September 19, 1862 and was educated at the Montreal Public School. At thirteen years of age he began railway work and rose to be general superintendent of the British Columbia division of the Canadian Pacific Railway.—WILLIAM OGILVIE, first governor of Yukon; b. at Ottawa, 1846; d. November 13th. Formerly a Dominion Lands Surveyor and astronomer in the service of the Canadian Department of the Interior, he carried out important surveys in the Mackenzie and Yukon regions and also in connection with the Alaska boundary. As representative of the Dominion government in the Yukon during the exciting period of the Klondike gold rush, Mr. Ogilvie

performed excellent service for which he was justly esteemed.—WILLIAM ROSS, the Senator; b. 1825; d. at Halifax on March 17th. He became a member of the Legislative Assembly of Nova Scotia in 1859 and of the Dominion House of Commons in 1867. In 1874 he left parliament and became collector of customs at Halifax. In 1889 he was returned again to the Dominion parliament and in 1906 was appointed to the Senate. He was Minister of Militia in the Mackenzie government in 1873.—FREDERICK WILLIAM THOMPSON, manufacturer; b. 1862; d. May 7th. At the age of fifteen he entered the Exchange Bank of Montreal. When twenty-one he joined the Ogilvie Milling Co., becoming general manager of their North-Western business in 1899, and general manager of the whole business in 1900. In 1902 he re-organised it as the Ogilvie Flour Mills Co., Ltd. He had considerable political influence, and worked hard against the reciprocity agreement with the United States.

(W. L. GRIFFITH.)

NEWFOUNDLAND¹

Population.—The provisional returns of the census of 1911 show a total population of 242,966 persons (124,485 males and 118,481 females), of whom 230,027 are domiciled in Newfoundland, and 3,939 in Labrador. This constitutes an advance of 9.95% over the figures for 1901. The population of St. John's City has increased from 29,594 in 1901 to 32,292 in 1911. The religious classification includes Roman Catholics 81,914; Church of England 78,140; Methodists 68,127, and Salvation Army 10,127.

Economic Conditions.—The marked progress of Newfoundland during the last few years is in the main to be attributed to three factors, *viz.*, improved means of communication, the development of mineral resources, and the foundation of an important pulp and paper-making industry. The immediate results of these undertakings have been to give employment to large numbers of people hitherto dependent solely upon the great fishing industries as a means of livelihood, and to turn the attention of capitalists and administrators to the possibilities of the land as opposed to the sea.

Recent international and imperial events have brought Newfoundland much before public notice. Sir Edward Morris (b. 1859), Prime Minister since 1909, accompanied by special delegates, attended the Imperial Conference of 1911. The Colonial Government took a prominent part in the Festival of Empire held in London during the same year: the extensive collection of Newfoundland products there exhibited has been transferred to the Newfoundland Court at the Imperial Institute. The award of the Hague Tribunal in 1910 has been brought to a satisfactory conclusion by the Anglo-American Fisheries Treaty (1912), which settles outstanding difficulties between the Colony and the United States. The question of reciprocity between Newfoundland and the United States has been the subject of official discussion.

Fisheries.—The fisheries must for long remain the primary interest of Newfoundland, and measures have recently been taken to place the industries upon a thoroughly stable basis. Important work has been done by the newly-established Board of Trade in the official inspection, grading and branding of products. The Government has had under consideration the offers of the Booth Fisheries Company (U.S.A.) to undertake operations in Newfoundland, the proposal being to apply modern methods of cold-storage to the cod catch, and thus render available the extensive markets for fresh fish in the central and western states of America and elsewhere. Similar methods are proposed in connection with the lobster fishery. The award (1910) of the Hague Tribunal has been found to work satisfactorily and with the gratifying result of an increase of trade in fishery products with America. An agreement has recently been arrived at between the Governments of Newfoundland, the United States and Canada, which settles, among other difficulties, the delimitation of bays on the Newfoundland coast. The total value of the fishery exports in 1911 was £1,807,226: cod £1,344,689, cod oil £61,833, cod liver oil £12,041, herrings £79,971, lobsters £74,069, salmon £14,535, other fish £45,523, seal skins (undressed) £56,562, seal oil £79,155, whale oil £29,790, whale fertiliser £6,124, whale bone £2,934.

Forest Resources.—Exploitation of the forest wealth of the colony is developing rapidly in the pulp and lumber industries. It is stated that natural regeneration is sufficient to assure a permanent supply of raw material, but steps are being taken by the Government with regard to reforestation. Advance has been made in the lumber industry chiefly owing to the operations of American companies. Profitable markets have been developed in South and North America, the exports in 1910–11 being valued at £25,683. The forest resources of Labrador remain practically untouched. In its extensive forests and abundant and readily available water-power, Newfoundland possesses remarkable facilities for the establishment of a pulp and paper-making industry, and important advances have already

¹See *E. B.* xix, 478.

been made. The Anglo-Newfoundland Development Company, in which Lord Northcliffe is so largely interested, commenced operations in 1909 and now controls over 3,000 square miles of forest land yielding a fine quality of pulpwood. The mills erected at Grand Falls, on the Exploits River, are the second largest of their kind in the world and possess the most modern equipment. The whole of the power required is obtained from the Falls. At Bishop Falls, also on the Exploits River, and eleven miles distant from Grand Falls, Messrs. Albert Reed & Co., of London, have established a similar plant of only slightly smaller dimensions. Schemes are being framed for the erection of further mills by American and other companies in the Fortune Bay, Gander River and Grand Lake districts. The export of pulp and paper during 1910-11 was valued at £51,582 and £193,898 respectively. The whole of the trade was with the United Kingdom.

Agriculture.—The Government is prosecuting an active agricultural policy with a view to meeting the demand for farm produce which will arise from the industrial development of the country. The programme provides for the supply, at Government expense, of improved stock, seeds and implements, and considerable inducements are offered to agriculturists. Attention is also being given to agricultural education. Farm colonies are to be established by the Salvation Army. Mixed farming offers the best inducements, while the prospects for cattle, sheep and poultry are considered good. Special encouragement is being given to sheep-farming with a view to the establishment of a local woollen manufacturing industry. The average annual output of farm produce is valued at over £800,000, the principal crops being cabbages, turnips, hay and oats. Development of the fruit (berry) industry is anticipated. A successful Agricultural Show was held in St. John's in 1910.

Mineral Resources.—During the last twenty years the annual value of minerals exported has averaged nearly £257,000, the chief ores being those of copper and iron. The Government has recently concluded agreements with certain companies in respect of the development of coal, iron and petroleum resources, and has offered financial rewards to successful prospectors. The principal copper mine is that at Tilt Cove in Notre Dame Bay, but promising discoveries of ore have recently been made at points in White Bay, and on the north-east coast. The iron mines at Bell Island, Conception Bay, have been successfully worked by two companies, and it is estimated that 40,000,000 tons of haematite ores are in sight, with an unknown quantity in the extension of the beds seawards. Haematite has been found at River Exploits and at various points on Notre Dame Bay. Rich bessemer ores occur at White Bay, and extensive deposits of magnetic ore have been located along the west coast. Operations with iron pyrites have been commenced at Pilleys Island, in Notre Dame Bay. Developments are expected with regard to the west coast chromite deposits; the silver-lead ores near Placentia; and the slate beds at Bay of Islands, Smith Sound and elsewhere. Operations at Parson's Pond oil-field have advanced sufficiently to permit of a regular supply of oil to the gas works of St. John's for illuminating purposes. Favourable agreements have been concluded with certain English companies for the exploitation of the coal resources of the Island. During the last few years the valuable seams near Grand Lake have received considerable attention from the Reid Company.

Communications.—Progress has been made with the construction of the branch railways sanctioned by the Government in 1910. Steamship communication has been improved, and the telegraph, telephone and wireless services augmented.

Finance.—The trade and revenue returns (the highest ever recorded) for the year ending June 30, 1911, were: revenue £725,020; expenditure £689,587; imports £2,751,137, and exports £2,461,681. During 1910-11 the British Empire (chiefly Canada and the United Kingdom) supplied 60.8% of the imports, and received 39.7% of the exports.

Administration.—Sir Ralph Champney Williams, K.C.M.G., was to retire from the Governorship in February 1913, and to be succeeded by Mr. Walter Edward Davidson, C.M.G., Governor of the Seychelles.

The principal measures recently dealt with by the Legislature have reference to railway extension and steamship services, mining development, agriculture, and the fishing industry; while others are concerned with education, the extension of telegraph, telephone and wireless facilities, road development, woollen manufactures, the provision of sanatoria for consumptives, and old age pensions.

The death occurred at Ottawa on October 7, 1911, of Sir James Spearman Winter, formerly Premier (1897-1900). Born in Newfoundland in 1845, he became a barrister and in 1874 entered the Newfoundland legislature, being its speaker in 1877-78, and subsequently holding other offices. In 1910 he was one of the British Counsel in the Fisheries Arbitration.

See *Year-Book of Newfoundland* (1912); *Newfoundland Guide Book, 1911* (ed. D. W. Prowse); *Newfoundland in 1911* (P. T. McGrath); *Mineral Resources of Newfoundland* (James P. Howley, St. John's, 1909).

AUSTRALIA¹

Including as it does the adjacent island of Tasmania, the area of the Australian Commonwealth is now computed at 2,974,581 square miles, 1,149,320 of which are within the tropical zone (about five-thirteenth of the total). Since the Commonwealth was proclaimed in 1901 there have been three changes affecting the political boundaries of Australia. In 1905 Papua (the British portion of the island of New Guinea) was taken over from the British Government and constituted a Territory of the Commonwealth. In 1909 the Commonwealth took over an area in the south of New South Wales which was constituted a Federal Territory, and on which will be built the Federal Capital. In 1910 the Northern Territory was taken over from South Australia and constituted a Federal Territory.

Papua.—Soon after taking control of Papua the Australian Government appointed Colonel Murray as Lieutenant-Governor, with Mr. Staniforth Smith as a special officer to encourage industrial development. The suitability of Papua for various forms of tropical agriculture is undoubted, but there is a "labour difficulty" in the way of progress. The Papuan, like most South Sea Islanders, has an aversion to steady work. In Fiji, a British Colony in the South Pacific, a position similar to that existing in Papua has been met by the importing of industrious coolies from India to develop the sugar plantations. The Australian Government, however, is determined to keep Papua for the Papuans. It was proposed in 1908 that the Papuan should be forced to do a certain amount of work, either for himself, for private planters, or for the Government, the argument being advanced that since Nature was so bountiful as to keep him in reasonable comfort without work, he would never be driven to labour by necessity and must, therefore, be brought under some other form of compulsion. The Australian Government vetoed the proposal. The officials responsible for the government of Papua state now that they have hopes that the natives will be tempted into the paths of industry by desire for the white man's cloth, steel, etc.; ordinances have been framed to regulate the conditions of native labour; and during 1911 nearly 8,000 natives were engaged under contract in some form of labour. But the labour position does not hold out much hope of the growth of a great sugar-growing or cotton-growing industry.

The white population of Papua is about 1,000 and the native population about 500,000. There are about 15,000 acres under cultivation, mostly planted with coco-nut trees. Rubber, cotton, sisal, coffee are also grown and mining and pearl-shelling are considerable industries. The system of land tenure is by leasehold; freeholds are not granted; the conditions of leasing are not onerous.

The Federal Territory and Federal Capital Site.—The Constitution having provided that the capital of the Commonwealth should be within the State of New South Wales, at least one hundred miles from Sydney, the New South Wales Government in 1909 surrendered to the Commonwealth Government some 900 square miles of territory around Yass-Canberra, and also an area of two square miles on the shores of Jervis Bay for the construction of a Federal port; and with these areas went the right to construct a railway from this port to the Federal territory.

In 1910 the Federal Government took possession of the Territory. It established there in 1911 a military college, and instituted a competition among the architects of the world for the best plans for building a new Federal city. Unfortunately, because of a disagreement, many British architects of the first standing did not take part in the competition. The design which found most favour was the work of a Chicago (U.S.A.) architect, Mr. Walter Burley Griffin. At the proposed Federal capital will be housed the Governor-General, the Parliament, and as far as possible all the Federal government departments. The preliminary work of construction is in hand.

The Northern Territory.—With an area of 523,620 square miles (more than one-sixth of the continent), having some very fertile land, and with a better river system than most other parts of Australia, the Northern Territory is almost empty and undeveloped. The total population (other than aborigines) was 2,846 in 1910, of which the largest element was Chinese, the total white population being 1,182. The backwardness of the Territory as compared with the rest of Australia is due chiefly to political causes. When the Australian colonies first set up separate households it was convenient to none of them to include the Territory, and it was left in the hands of the Imperial Government. In 1863 South Australia took over the responsibility for the Territory, having formed a plan to connect it with Adelaide by a north-to-south trans-continental railway. With such a railway it would have been brought within the ambit of South Australian development. Without that railway it was actually more remote from communication with South Australia than with any other of the States. The railway was begun. It reached Pine Creek from Port Darwin at the north end, and Oodnadatta from Adelaide at the south end; then hope of its completion was abandoned. As soon as the Commonwealth came into existence it sought a

¹ See *E. B.* ii, 941 *et seq.*

transfer of the Northern Territory from South Australia. But it was not until January 1, 1911 that the final stage of the negotiations was reached and the Territory assumed by the Commonwealth. The terms of transfer were that all the past deficits incurred by South Australia in the administration of the Territory should be taken over by the Commonwealth, and that the trans-continental railway should be completed from Port Darwin in the north to Port Augusta (near Adelaide) in the south. The Commonwealth purchased the existing state railway from Port Augusta to Oodnadatta.

In 1912 the Commonwealth Government appointed an administrator for the Northern Territory and took preliminary steps for its development and colonisation. A scientific inquiry as to the possibilities of a white population flourishing in this tropical part of the continent is proceeding, and, so far, the evidence on that point is reassuring. There is very little malaria in the Northern Territory, and other specific tropical diseases are absent. The land is generally considered to be suitable for cattle-grazing (there are great herds of wild buffalo) and tropical farming on the coast, for sheep farming and dairy-farming on the tablelands. There are said to be possibilities of mineral wealth, but mining results in the past have been usually disappointing. In its policy of development the Australian Government does not propose to allow any further complete alienation of Crown lands. (There have passed into private hands already 473,990 acres.) In future all titles will be leasehold, but the leases will be in perpetuity, with reappraisal every 14 years in the case of town lands, every 21 years in the case of agricultural and pastoral lands. Political difficulties stand in the way of pushing on boldly with the north-to-south trans-continental railway, which is the chief need of the Territory. Some favour a direct route, some a route deviating so as to cross Western Queensland and New South Wales.

THE COMMONWEALTH

The Federal Act of July 1900 (see *E. B.* ii, 966) united in an indissoluble Australian Commonwealth six self-governing colonies, organised as British settlements between 1770 and 1859, which retain their individuality and, for certain purposes, their independence. The federating States, New South Wales (*E. B.* xix, 537 *et seq.*), Victoria (*E. B.* xxviii, 37 *et seq.*), Queensland (*E. B.* xxii, 732 *et seq.*), South Australia (*E. B.* xxv, 492 *et seq.*), Western Australia (*E. B.* xxviii, 539 *et seq.*) and Tasmania (*E. B.* xxvi, 438 *et seq.*), were left with certain self-governing powers and preserved their own political institutions. Separate notes are added later as to certain details in the internal affairs of the individual states, but in the following account Australia will be considered substantially as a whole, in its aspect of a single national unit.

Population.—Public opinion in Australia has at different times condemned as unsatisfactory the rate of growth of the population both by natural increase and by immigration. The feeling that the natural increase of the population was not sufficient led in New South Wales to the appointment of the Birth Rate Royal Commission (1903). An outgrowth of that Commission was a Federal Royal Commission on Secret Drugs and Cures which reported in 1907 and devoted much attention to the matter of artificial limitation of families. It was established fairly clearly by the first of these Commissions that there was no natural cause predisposing to sterility in Australia, but that the desire for comfort conduced to a fairly general artificial limitation of families. As a consequence of this Commission some public opinion against the tendency to "race suicide" was aroused; and certain administrative measures were adopted by the Customs and Police Departments which sought to lessen the facilities for artificial limitation of families. It is a coincidence, if not a case of cause and effect, that since 1903 "the natural increase" of population in the Commonwealth has steadily improved. Possibly a healthier public opinion following on the report of the Birth Rate Commission was in part responsible. Other possible contributory causes were a great increase in material prosperity following upon Federation, and an influx of immigrants from lands where artificial limitation of families was not so much practiced. The natural increase per 1,000 of mean population in 1906-10 was 15.93, which was higher than that of any European countries, except the Netherlands and Bulgaria, and compared with 11.58 for England and Wales. A natural increase which is almost the highest in the world must be accounted fairly satisfactory—even though the "crude birth rate" (number of births per 1,000 of mean population) is rather low (26.7 as

compared with 48.1 in Russia, 25.6 in England and Wales and 19.6 in France). But with a somewhat low birth rate (for a new country) Australia has a very low death rate, the lowest in the world except for New Zealand. The Australian death rate of 10.4 compares with 14.5 for England and Wales, 30.0 for Russia and 19.3 for France.

In regard to immigration, Australian public opinion has undergone a marked change within the last few years, a change due in the main to a fuller appreciation of the danger of leaving the lonely outpost of the Empire in the South Pacific so bare of population. There was for many years a desire on the part of the exceedingly prosperous working people of Australia to keep out immigrants as much as possible, lest a rush of population should cause a reduction in the wage rate or a hardening of the conditions of life. That desire survives in some quarters, and is still a force to be reckoned with in a country where the Labour voters have the controlling power in politics. But it is being recognised, by Labour leaders as well as by others, that a great access of population is necessary to the safety of the country and need not affect the general prosperity of a continent which has a population of under 5,000,000, and which has room, at a low estimate, for 100,000,000 people. In the beginning of Australian colonisation state-aided immigration brought a great influx of people to Australia who otherwise would never have been able to afford the expenses of the long journey from Europe. Since 1906 the policy of state-aided immigration has been re-established in Australia by several of the States.

The effects of a better natural increase and a better increase from immigration are shown in the following figures since 1901.

Year.	Natural increase.	Migration.	Total gain.
1901-1905	284,431	dec. 16,793	267,638
1906-1910	334,828	inc. 57,278	386,106

On April 3, 1911 the decennial census was taken in Australia, and the population ascertained to be 4,455,005, showing a rate of increase for the Federal decennium of 18.05% as against a rate of increase of 18.88 for the previous decennium. But whilst the annual rate of increase from 1901-1906 was only 1.39% the annual rate of increase 1906-1911 was 2.03. The year 1911 showed a total increase of 143,624, to which natural increase contributed 74,324 and immigration 69,300, exceeding in one year by over 50% the total immigration gains of the previous ten years.

It is clear that Australia has "turned the corner" in regard to immigration. For 1912 it was officially computed that the total immigration would be 100,000 persons from the United Kingdom alone; as emigration from the Commonwealth has almost ceased, this will represent a clear gain. The difficulty experienced in 1912 was not in persuading people in Great Britain that there were better chances of prosperity in Australia, nor in overcoming any Australian objection to new-comers, but in securing accommodation on ships to take British emigrants to Australia.

Social Conditions.—The Australian people are almost wholly British in character; a full 96% of the total are of British origin, 2% come from foreign European countries and 2% from foreign non-European countries. The standard of average education is high and illiteracy almost unknown. The wage rate is generally high and has shown lately a marked tendency to increase. Thus the average wage of females in the clothing trade (taking the lowest-paid class of labour) in Victoria was 10s 10d per week in 1897, but in 1910 the average wage was 21s 9d per week. From a West Australian Labour return endorsed by the Trade Union officials the following current average rates of wages in that state are taken: bakers £3 per week, blacksmiths 10s to 12s 6d a day, bricklayers 12s to 14s a day, carpenters 10s 6d to 12s a day, domestic servants 8s to 25s per week, engine drivers £2.8.0 to £3.7.6 per week, navvies 8s to 8s 6d per day, shoemakers £2.14.0 to £3 a week, waitresses from 12s 6d to 25s per week. These figures are fairly representative of Australia.

The cost of living in Australia is affected favourably on the one hand by the low price of food items which are local products, unfavourably on the other hand by the high wage rate ruling in the building trade and the local manufacturing industries. On the whole, it compares well with the cost in most civilised countries. In 1911 the statistician to the Commonwealth Government, Mr. G. H. Knibbs, instituted an inquiry into the cost of living, from which some valuable facts were gleaned. Taking four sets of family budgets, (a) of families with £200 a year and over, divided into families of four members and under four

members, (b) of families with less than £200 a year, divided similarly, he found that the average percentage of income spent on housing was 13.70, on food 29.30, on clothing 12.72, on fuel and light 3.46, on "other items" (including amusements, thrift, etc.) 40.82%. This last figure gives the best indication of a general prosperity, i. e. of a substantial margin out of wages and salaries for non-essential outgoings. The percentage of income expenditure on food in working class families in Australia is 36%, as compared with 57% in the United Kingdom, and a general average of over 50% in all other countries for which statistics are available. The indication this gives is of a good margin between wages and cost of subsistence, and it is strengthened by the fact—which cannot be supported by official statistics but is apparent to every observant traveller in Australia—that the working classes indulge in more varied, plentiful and luxurious food than the same classes in Great Britain. Thus of a total of 4s 10d spent in food the Australian apportioned 6d to bread, 1s 1d to meat, 7½d to vegetables and fruit, 6½d to milk, 7½d to butter, cheese etc., 3½d to sugar, 2½d to tea, coffee, etc., and 1s to "other food."

The Australian birth rate was 27.21 in 1911. The percentage of illegitimate births to total births was 5.84 in 1910. There has been a very slight decrease in this rate during the last decennium. The Australian population is predominantly masculine, the proportion being 108 males to every 100 females. The marriage rate (number of marriages per 1,000 of mean population) was 8.79 in 1911. The rate has improved steadily since 1908. (The rate for England and Wales calculated in the same way is 7.30). The most favoured ages for marriages are between 18 and 30. The average age of bridegrooms is, in the professional classes 31.26 years, the mercantile classes 29.74, the industrial classes 28.76 and the agricultural classes 30.93. The average age of brides in 1910 was 25.77. The celebration of a marriage is more easily effected in Australia than in England. The facilities for divorce differ in the various states, divorces being granted more readily in New South Wales and Victoria than in the other states. The total of Australian divorces in 1910 was 451, of which 254 were granted in New South Wales and 141 in Victoria.

A disquieting feature of Australian social life is the preponderance of the urban over the rural population. In South Australia nearly one half of the total population of the State (380,000 square miles in extent) is concentrated in the city of Adelaide. In Victoria 44%, in New South Wales 38% of the total population, is in one city, and in the whole Commonwealth 38% of the population is contained within six cities. The charm of the cities is great; the conditions in the "back country" are often hard. By cheap railway rates for the farmers' goods, by pushing such of the conveniences of civilisation as are under state control as far forward as possible, and by other means, the states and the Commonwealth strive to counterbalance the call of the cities. But all effort seems to be in vain. The proportion of the urban to the total population is growing. In 1906 Sydney had 35% of the total population of New South Wales, in 1911 it had 38%; in 1906 Melbourne had 42% of the population of Victoria, in 1911 44%; and in the whole Commonwealth six cities held 35.49 of the population in 1906 and 38% of the population in 1911.

At the last census 4,274,414 of 4,455,005 people were returned as Christians (Church of England 1,710,443, Roman Catholic 921,425, Presbyterian 558,336, Methodist 547,806, being the chief denominations). Of Hebrews, Pagans, Mahommedans, etc., there were 36,785; and some 25,000 were returned as agnostics, atheists or freethinkers. There is no established church.

Public Health.—Though part of Australia is within the tropics there is practically no tropical disease, and there is an absence also of small-pox, hydrophobia and other diseases which are known in some parts of Europe. The death rate from all causes in 1911 was 10.66 (including the death rate for the tropical Northern Territory, 19.58). It is the lowest death rate in the world except one. Lately there has been a betterment in regard to the infantile death rate, which the hot summers ruling over the greater part of the Commonwealth make the chief cause of public health anxiety. In 1901 it stood at 103.61 per thousand, in 1910 at 74.81 per thousand. It is noticeable that an abnormally hot summer forces up the infantile death rate; but this rate has been brought down to as low as 71.56 per thousand in 1909. To lessen infantile mortality, and at the same time to encourage the birth rate, there are two remarkable proposals (both likely to be carried through) before the Australian public to-day. One is that of the Commonwealth government to pay a bonus of £5 to the mother of every infant born in the Commonwealth whether legitimate or illegitimate. The other is that of the New South Wales State government to provide a free and compulsory medical service in childbirth. Apart from infantile mortality the chief foes to human life in Australia are tuberculosis, cancer, diseases of the heart and violence. The deaths from malaria (tropical) numbered forty in 1910.

Education.—The Australian system of elementary education is free, compulsory, undenominational and usually secular. Secondary education is not free, but a generous system of bursaries makes education to the stage of a University degree available to the poorest in most states. There is also a good system of agricultural and technical colleges. Slight differences as regards religious teaching exist in the various States. In Queensland "undenominational" teaching of the Bible is allowed, and clergymen may give religious teaching within school hours to children of their respective denominations. In New South Wales

and Western Australia "general religious teaching" is part of the course. In other states the system is more rigorously secular. In no state is denominational religion taught in the state schools; but private denominational schools exist, being maintained especially by the Roman Catholic Church. The compulsory age for school attendance is in the largest States from six years to fourteen years, in no State less than six years.

Production and Industry.—Australia, down to the end of 1912, had enjoyed seven fairly good years. The early stage of the Federation was marked by a severe drought which checked for a time the development of prosperity. But since 1905 the growth of prosperity in the Commonwealth has been very great. A valuation of the total production of the Commonwealth shows in 1907 a value of £114,585,000 (average per head £30.2.6), in 1909 £174,503,000 (per head £40.16.6), and in 1910 £187,734,000 (per head, £42.19.2).

In 1906 the total value of the pastoral products of the Commonwealth was £45,389,000; in 1907, £50,660,000; in 1908, £47,259,000; in 1909, £50,064,000; in 1910, £56,993,000. These returns from the chief Australian industry afford a safe index to the growth of prosperity in others. The area under crop in 1905-06 was 9,433,455 acres. It amounted in 1906-07 to 9,552,800 acres, in 1907-08 to 9,358,902 acres, in 1908-09 to 9,891,243 acres, in 1909-10 to 10,972,299 acres, and in 1911-12 to 12,105,125 acres. The production of wheat increased from 68,520,772 bushels in 1905-06 to 95,111,983 bushels in 1910-11 of a value of £16,458,187. The figures for 1911-12 are not so good, the estimated yield being 71,664,971 bushels; the falling off was due to a somewhat unfavourable season. The growth of sugar cane, in spite of the great change made in its conditions by cutting off the supply of coloured labour, has held its own. In all other crops—fruit, vines, oats, hops, potatoes—there was either progress or stability. Some promising indications were gleaned of future success in the cultivation of coffee, tobacco, cotton, oil plants and fibres. In dairy farming there was great progress. The export of butter in 1906 was 75,802,856 lbs., in 1910 it was 87,928,151 lbs., and the value of dairy farm exports increased from £3,352,803 in 1906 to £4,127,074 in 1910. The total yield from agriculture, including dairy, poultry and bee farming, was £38,960,000 in 1906 and £57,139,000 in 1910. In mineral production, Australia kept a high place, in spite of the dwindling gold returns from Victoria and West Australia. The mineral production of the Commonwealth reached to its highest point (£28,301,346) in 1907. In 1908 it was £24,580,303; in 1909 (the year of a disastrous coal strike) £23,074,935; in 1910 it was £23,215,191. The chief items in this total were gold £11,553,840, coal £3,684,041, copper £2,389,412, silver-lead bullion and ore (shipped abroad to be refined) £1,934,735, tin £950,768 and zinc £1,289,781. The great mineral resource of the future in Australia will, doubtless, be coal. A conservative estimate of the amount of coal available for easy working in the state of New South Wales alone is over a thousand million tons. Mineral oil shale exists also in Australia, and the Commonwealth Government is now offering bounties to the extent of £20,000 a year to encourage the local production of kerosene and paraffin wax. Up to 1910 the value of the products of oil shale in New South Wales had reached £2,251,081, and the actual year's production was worth £33,896. Queensland and Tasmania have also deposits of oil shales.

There has been a steady progress in manufactures in Australia since the Federation. In 1907 the total of wages and salaries paid in factories was £18,323,977, with an average wage of £77.32. In 1910 the total of wages paid was £23,874,959, with an average wage of £87.11. The total value of the output of factories in 1909 was £107,409,733; in 1910 £120,770,674. The value added in process of manufacture was £42,216,493 in 1909 and £48,048,032 in 1910. The factory industries are not, so far, of a highly organised type. Great iron industries are yet to be created, though the presence in many parts of Australia of deposits of iron ore and the cheapness of coal have invited their establishment for many years. In 1909 the Australian Government offered bounties to a total of £150,000 for pig iron, puddled bar-iron and steel made from Australian ore; and further bounties to the extent of £30,000 for galvanised iron, wire-netting and iron pipes. So far, however, no very great results have followed. During 1912 there were reports that great iron-smelting works were about to be established in New South Wales by a company which had been before chiefly interested in silver-mining.

Forests and fisheries bring an amount of nearly £5,000,000 to the Australian purse. But in neither case is there creditable progress. The timber resources are usually prodigally wasted; and until very recently there was no attempt at reforestation. The fisheries are not exploited in any systematic fashion, there being little or no deep-sea fishing or fish-curing. In both these matters, however, better things are promised in the future. Bounties were available during 1912 to the extent of £10,000 for Australian preserved fish, and there are 13 fish-curing establishments. In 1909 the Federal Government launched the "Endeavour," a vessel specially built to investigate and chart deep-sea fishing grounds. The "Endeavour" has since been engaged in the collection of information regarding the migration, feeding grounds, etc., of fish in the waters off the Australian coast, and it is hoped that the ultimate result will be the foundation of a great fishing industry.

Trade and Commerce.—Since Federation the overseas trade of the Commonwealth has increased rapidly. In 1901 the total was valued at £92,430,000; in 1911 at £146,456,000. The records since 1906 have been:—

Year.	Imports.	Exports.	Total.	Value per inhabitant.
1906	44,745,000	69,738,000	114,483,000	28. 3. 10.
1907	51,809,000	72,824,000	124,633,000	30. 4. 5.
1908	49,799,000	64,311,000	114,110,000	27. 4. 1.
1909	51,172,000	65,319,000	116,491,000	27. 5. 0.
1910	60,014,000	74,491,000	134,505,000	30. 15. 6.
1911	66,973,000	79,483,000	146,436,000	32. 12. 5.

The unfavourable figures for 1908 were due in a large measure to the financial crisis in the United States causing a lower range of world prices for wool and metals. The total public indebtedness of Australia is £267,127,283—most of it borrowed abroad—on which an average rate of interest of £3.14.4% per annum is paid. The payment of this interest affects the export figures. The import figures on the other hand are swollen by the continuance of public borrowing from abroad, which averaged for the nine years to 1911 about £6,000,000 a year. Probably in a normal year one item nearly balances the other.

The bulk of Australia's trade is with Great Britain and with British possessions. Of the imports in 1910, totalling £60,014,351, £36,646,441 were from the United Kingdom, £7,865,649 from British possessions, and £15,502,261 (not much more than one quarter) from foreign countries. Of the exports in 1910, totalling £74,491,150, £37,698,312 were to the United Kingdom, £8,323,486 to British possessions, and £28,469,352 (more than one third) to foreign countries. British imports to Australia have preferential tariff treatment. A profitable future is promised for Australian trade in supplying Asiatic countries with food products, minerals, and raw materials for textiles. Steps are being taken to foster this trade, and it has grown in value from £2,298,000 in 1904 to £3,121,000 in 1910.

Communications.—There were at the end of 1911 a total of 18,012 miles of railways open for traffic in Australia, showing an increase of nearly 1,000 miles over the previous year. Practically all the railways are owned by the state governments. There are four different gauges in use, broad, standard, narrow and very narrow. The Commonwealth has constitutional power, with the states' consent, to take over the railway systems and unify the gauges; but the power is not likely to be exercised for some time. At present Queensland and New South Wales are foremost in railway development. The Commonwealth Government has acquired from South Australia the railway line from Port Augusta to Oodnadatta, and has taken over with the Northern Territory the short railway from Port Darwin to Pine Creek. It is intended to connect Pine Creek with Oodnadatta, thus making a north-to-south trans-continental railway. Other proposed Commonwealth lines will connect the new Federal Capital with the Sydney to Melbourne main line, and with the Federal port of Jervis Bay. In a more advanced stage is the line which will complete railway communication between east and west. This trans-continental line from Port Augusta in South Australia to Kalgoorlie in West Australia will stretch over 1,100 miles; and the estimated cost is £3,988,000. The work is being carried out by the Government without the intervention of contractors, and was put in hand in September 1912.

The capital cost of the Government railways in Australia had reached to £152,855,000 in 1911. They are the chief asset standing against the public indebtedness of various states. The net revenue of these railways provides 4.44% for interest and sinking fund on the capital invested. After payment of all working expenses and interest there was calculated to be a profit of £1,424,000 in 1911 available for debt redemption.

Several great shipping companies have arisen in Australia to carry on the coastal trade; the trans-oceanic trade is mostly in the hands of British companies, though Australian, German, French, Italian, Norwegian and American lines have some share. The policy of the Australian Government is to seek to secure as much as possible of the coastal trade for Australian vessels, and to banish coloured labour from all ships trading to Australia. Since shipping legislation can only be carried out with the assent of the Imperial Government, these ideals cannot be fully realised, but the Commonwealth enforces white labour conditions to some extent by refusing postal subsidies to vessels employing coloured crews. A new Navigation Bill, drafted after several consultations with the Imperial Government, passed through its final stages in the Commonwealth Parliament in 1912. In this measure there are elaborate provisions for the safety of ships and the comfort of crews. The coastal trade is confined to Australian ships and to foreign ships licensed to engage in that trade; licenses are subject to the payment whilst on the Australian coast of Australian wage rates to seamen, and a further condition is that the ship receives no bonus or subsidy except from the Australian Government.

The proportion of British to foreign shipping entering and clearing Commonwealth ports is roughly 77.4 to 22.5.

Finance (Public).—The prosperity of Australia during the last quinquennium is reflected in the public revenues. The Commonwealth collects the revenue from Customs, Excise, Land Tax, Posts, Telegraphs and Telephones, Coinage (including Bank-note issue), and fees from various small services such as the Patents Office. It has to meet from this revenue the cost of naval and military defence, of its services (such as postal and telegraph), and of

its administration, and to pay a fixed annual subsidy to the state governments of 25s per head of the population resident in each state. In addition it has to meet the cost of the trans-continental railway from west to east already in process of construction; of the proposed trans-continental railway from north to south; and also of the administration of the Northern Territory, taken over from South Australia.

The early years of Federation were hampered by the want of revenue owing to the operation of the "Braddon clause" of the Constitution. But it was possible to make great changes in the financial position when Mr. Fisher took office in 1910. The lapsing of the Braddon clause gave him a larger share of the Customs and Excise receipts. The Land Taxes he imposed brought in a revenue of £1,370,344 in the financial year 1910-11. The Australian Notes Act which he passed made the Commonwealth Government the issuing authority for bank notes up to the value of £7,000,000, against which a gold reserve of one fourth that amount was to be kept. The issue might go above £7,000,000, but for any sum above that limit a gold reserve equal to the full issue had to be kept. A subsequent Act abolished this qualification, and left the amount of the issue unlimited provided that a gold reserve of 25% of the total was maintained. Serious objection was taken to this amendment in financial quarters, and Mr. Fisher undertook not to put the amending Act in force until after the General Election of 1913. At the same time as the Australian Government note issue was authorised, a tax of 10% per annum was imposed on the amount of all notes issued by private banks and any note issues by state governments were prohibited. Also a Commonwealth Bank, having all the ordinary functions of a bank, with a Savings Bank Department superimposed, was established, and opened its doors in 1912. In 1912 the Commonwealth note issue had reached to £10,048,472, against which a gold reserve of £4,841,536 was held.

The growth of Commonwealth revenue since 1906 is shown below in thousands of pounds, which disregards small items, except in the computation of the grand totals:—

	1906-7	1908-9	1910-11	1911-12	1912-13 Estimate
	£000	£000	£000	£000	£000
Customs and Excise	9,631	10,844	12,980	14,710	14,511
Post and Telegraph	3,128	3,409	3,906	3,916	4,202
Land Tax	1,370	1,366	1,300
Total	12,816	14,350	18,806	20,546	20,422

The expenditure has also grown. Excluding the subsidy paid to the states, the Australian Government spent £4,987,317 in 1906-07, £7,499,516 in 1909-10, and £13,158,529 in 1910-11 (the chief increase that year being in respect of the construction of the Australian Navy), £14,297,572 in 1911-12, and (estimated) £16,604,791 in 1912-13, of which, however, £2,261,541 did not come out of current revenue. Expenditure grows in all departments as new responsibilities call for outgoings. The deficit on Northern Territory administration for example was £166,856 in 1911 (a half-year only). On the other hand the subsidy to the states, which in 1906-07 was £7,845,574 and in 1909-10 £8,492,436 under the Braddon clause, dropped in 1911-12 to £5,824,423 under the new system of a definite subsidy of 25s per capita.

The debts of the various states can best be referred to here because the Commonwealth Government sought in 1910, and was granted by Act of Parliament and Referendum, the right to amend the Constitution so as to take over all the State debts and make them into one Federal debt. The total of the State debts outstanding in 1911 was £271,750,944, and they have largely increased during 1912. The total is represented in the main by such solid assets as railways. The transfer of these debts to the Commonwealth would involve, presumably, the transfer of the assets which stand against them, and would also necessitate some arrangement for Federal control of future borrowing. The Prime Minister announced in September 1912 that he was devoting earnest attention to the matter.

Finance (Private).—There are twenty-one private banks trading in Australia. Their paid-up capital totals £20,181,758, and their reserved profits total £10,330,457. Their total deposits in 1911 were £143,446,910, and the total of the advances made by them £108,578,774. Their total liabilities were £148,835,219 and their total assets £159,565,443. The last dividends of the four greatest banks were 10%, 10%, 14% and 12% respectively.

The Savings Banks' figures show a prosperous and thrifty working population. In 1911 there were 1,600,112 individual depositors in the Savings Banks of Australia, a proportion of 362 to every thousand of the population. The total of deposits was £59,393,682, giving an average deposit of £37. 2s. 4d. per depositor, or of £13. 8s. 5d. per head of the whole population. The life assurance figures impress the same lesson. There were nearly a million life assurance policies in force in Australia for 1910. More than half of these were for small amounts, but the total sum assured, exclusive of bonus additions, was about £110,000,000. Further the Friendly Societies have a total membership of 400,000 and a yearly revenue of £1,538,532.

Government and Politics.—Under the Federal Constitution the Commonwealth is governed by a Governor General appointed by the British Crown and acting on the advice of a Cabinet which is responsible to an Australian Parliament of two Houses. The Senate represents the states and is composed of six members from each state, elected for six years by the adults of the state voting *en masse* every three years to return three Senators; the House of Representatives is about double the Senate in numbers (75), represents the people numerically, and is elected every three years by the adults of Australia voting in single-member electorates, which are approximately equal in population. The number from each state varies with the growth of population. The Australian Parliament can only act within the powers set forth in the Constitution. The High Court is the final interpreter of that Constitution and may veto any legislation, either of the states or of the Commonwealth which is *ultra vires*.

It was not until the election of the fourth Parliament in 1910 that the political system of the Commonwealth of Australia began to have an aspect of permanency, and it is necessary to refer back to 1901 to understand fully the position of 1912. At the outset there had been some promise that the early years of the Union would have been marked by a truce among all political parties, during which the machinery of the new Government would be established firmly. This promise had been illustrated in the choice of the first Ministry. The first Governor General of the Commonwealth (the late Marquis of Linlithgow), in a situation which offered him the guidance of no precedent, had followed a sound constitutional course by "sending for" the Premier of the senior of the Federating states, Sir Wm. Lyne. But public opinion did not endorse the choice. Sir William Lyne (born in Tasmania in 1844) was a type of the politician who had served well in the days of the states. He had been the first champion of a Protective tariff in New South Wales, had risen to be her Premier, and had marked his term of office by a programme of social reform which had endeared him to the powerful Labour Party. But he had not been enthusiastic for Federation: rather otherwise. Public opinion demanded that the first government of the Union should be formed by its champion Sir Edmund (then Mr.) Barton (born in New South Wales in 1849). Mr. Barton had never been at home in state politics, though he had early devoted himself to a Parliamentary career, entering the New South Wales Assembly as member for the University of Sydney in 1879. His enthusiasm waited for the cause of the Federation of Australia. After the death of Sir Henry Parkes he assumed the leadership of the Federal movement, having for his chief lieutenants Mr. Alfred Deakin in Victoria, Sir Samuel Griffith in Queensland, Mr. B. R. Wise in New South Wales, and the late Mr. Kingston in South Australia. The Convention which framed the Federal Constitution had recognised Mr. Barton's services by electing him as its leader. Now there was such an unmistakable demand that he should be Federal Prime Minister that Sir William Lyne was unable to form a Government and advised that Mr. Barton should be "sent for." The latter called to his side all the Premiers of all the Federating states; with one exception they responded, and this Ministry of "all the talents" appealed to the people for support on a non-party platform.

But this fair promise at the outset was not fulfilled. Party warfare broke out at the first elections with great violence. Sir George (then Mr.) Reid led one opposition party. He had been the chief opponent of Federation. Born in Scotland in 1845, he went to Australia as a boy with his father, a Presbyterian clergyman, entered the Civil Service, ventured on a political career somewhat late in life, and entered the New South Wales Parliament as a champion of Free Trade, which was just then being attacked in its last Australian stronghold. Federation was to him anathema, for he saw that it would be fatal to Free Trade in New South Wales. But he finally recognised that the movement for Union was too strong, and as Premier of New South Wales he had convened the Federal Convention of 1899 which framed the Commonwealth Constitution. Now that Federation was achieved, he went to the polls in a Free Trade attack upon the Barton administration.

Another attack came from another quarter. In the various states there were labour parties of varying strength, very influential in New South Wales, Queensland and South Australia, weaker elsewhere. These combined in a Federal organisation, and, as a third independent party, went to the polls under the leadership of one of the remarkable men of Australian public life, Mr. J. C. Watson. Born of poor Scottish parents in 1867 whilst on the voyage to Australia, Mr. Watson was in boyhood deprived of nearly all the advantages of education, but taught himself enough to become a printer. Sagacious, tactful, resolute, he came to the front in the Australian Labour movement and was elected first leader of the Federal Labour party. The success of the Labour party under his leadership at the polls was extraordinary. The first Parliament of the Commonwealth was divided as between the Government followers and Mr. Reid's Opposition party almost equally, but with the Labour party (16 strong in the Representatives, 8 strong in the Senate) holding the balance of power.

This made a position of grave difficulty for the Government. The common-sense and moderation of Mr. Watson saved the situation to some extent. He gave a general support to the Government and assisted them in their most pressing tasks. Nevertheless the first Parliament was hampered by party fighting, the opposition seeking to win the Labour party over to their side, and the Government being forced to postpone a good deal, to modify a good deal, in order to keep in office. Sir Edmund Barton was deeply disappointed. He had looked to a first patriotic Parliament completing without any "scuffling on the steps of the temple"—to use his own phrase—the measures necessary for the stability of the Federation. He experienced a first Parliament in which party rancour had been extraordinarily rife. He retired to accept a Federal judgeship, and Mr. Deakin took his place (September 1903).

Mr. Alfred Deakin (born in Victoria in 1856) had cherished an enthusiasm for Federation not inferior to that of Sir Edmund Barton. But he had resolutely put away from him the idea of competing for the Federal leadership, recognising that it was best in the hands of a citizen of New South Wales, the chief citadel of anti-Federalism. He now took over the government at a time of great difficulty. Mr. Watson had led his Labour forces with moderation and with a sense of patriotism as distinguished from "partyism." Nevertheless the Labour member, and even more exigently, the Labour voter, had to be placated with some "Labour legislation." One of these Labour measures, the Industrial Arbitration Bill, had almost wrecked the Barton Government. The opposition fostered a point of division between the Government and its Labour allies, and on this point there arose a crisis, which was interrupted by the General Election of 1903.

Mr. Deakin met the Second Parliament of the Commonwealth in 1904 with his own following reduced, the following of the Labour party increased (23 in the Representatives, 14 in the Senate), and with party feeling embittered by the recriminations incidental to a contest at the hustings. Business was impossible, though Mr. Deakin proved to be an able and tactful leader.

In April 1904 Mr. Deakin went out of office and was succeeded by Mr. Watson. In August of the same year Mr. Deakin gave his support temporarily to Mr. George Reid, and a Reid-McLean coalition administration supplanted Mr. Watson's. This lasted through a long recess and a few days of Parliamentary life, and in July 1905 Mr. Deakin came back to office with the support of Mr. Watson. Mr. Watson was even at that time determined on resignation. But he was strongly convinced that a measure of tariff reform was necessary, and determined to remain in Parliament until it was effected. The first Federal tariff had had to make concessions to Free Trade sentiment. The second tariff was completely protectionist, and introduced a new principle into Australian politics by granting a "preference" to British imports. At the third General Election in 1907 the Labour party again improved its position, mostly at the expense of its allies.

Mr. Watson kept the leadership of the Labour party, and kept that party solidly behind Mr. Deakin, until the tariff was settled. Then he retired and Mr. Andrew

*Second
Parliament,
1903-07.*

Fisher took his place. Born in Scotland in 1862, Mr. Fisher was brought up as a coal-miner. He went to Queensland in 1885, entered the state Parliament and later the Federal Parliament. He had been included in Mr. Watson's Cabinet. Now, assuming the leadership, he very quickly gave Mr. Deakin notice to quit, and in 1908 formed his own administration. It lasted however little more than six months. Mr. Deakin then formed a coalition with the remnants of the Free Trade opposition, no longer now led by Mr. George Reid, but by Mr. Joseph Cook, his lieutenant, and the Deakin-Cook administration came into office; one of its first acts was to send Sir George Reid to London as High Commissioner for the Commonwealth. Mr. Cook, like Mr. Fisher, had been a miner. He entered New South Wales Parliament as a Labour member, drifted away from his party and entered the Federal Parliament as a Free Trader, was the chief supporter of Mr. Reid in an Anti-socialist party, and now joined with Mr. Deakin to oust the Labour party from office, one ground of attack being their lack of proper sympathy with the cause of Imperial defence.

This was at the time of the European crisis over Austria's annexation of Bosnia-Herzegovina, when public interest throughout the British Empire was being stirred over the question of maintaining British supremacy at sea and strengthening the hands of the Imperial Government in view of increasing international complications. New Zealand had promptly offered to provide a "Dreadnought" for the British navy. It was objected that Mr. Fisher had not done likewise. He claimed that his Imperial patriotism was not wanting, but that in his judgment more useful action could be taken by hurrying on with the creation of an Australian navy. This navy, he stated in a despatch to the British Government, would be organised and controlled by Australia in times of peace, but on the outbreak of war would pass automatically to the control of the British Admiralty. Mr. Fisher's direct following, though he was helped by Sir William Lyne, who now left Mr. Deakin's party, could not maintain him in office, and in June 1909 the Deakin-Cook administration came into power. Amid bitter party wrangles the third Australian Parliament closed its life, expiring by effluxion of time in January 1910.

The General Election of 1910 resulted in a sensational victory for the Labour party under Mr. Fisher. The party captured a working majority in both the Senate and the House of Representatives. The position of parties was: Deakin-Cook followers,—Representatives 31, Senators 13; Labour party,—Representatives 42, Senators 23. In the House of Representatives there were two independents. On April 29, 1910 Mr. Fisher formed his second administration under circumstances unique in Australian Federal history. In the Senate and the House of Representatives the opposition was powerless, the more completely so because the Labour party majority was bound solemnly to party fidelity. No opposition criticism on any issue could hope to detach a single Labour member from his allegiance to the Government, which in regard to all its measures consulted a caucus of its supporters beforehand as to both principles and details.

The decision which gave Australia's destinies completely into the hands of the Labour party (and that not the Labour party of Mr. Watson, but of Mr. Fisher—much more of a "party" man) was influenced very largely by negative considerations. The people disliked deeply the coalition of Mr. Deakin with Mr. Cook, who had before seemed to represent absolutely irreconcilable ideas in politics; and a vote for the Labour party was in many cases a vote of no-confidence in the coalition rather than actually an endorsement of Labour policy. An indication of this fact was given a little later, when the Labour Government (May 1911) submitted to a direct poll of the people amendments of the Federal Constitution, without which it could not carry out its Labour policy. These amendments sought: (a) to give the Commonwealth Parliament full power to legislate with respect to trade and commerce instead of the limited power it had under the Constitution (the limitation stood in the way of Federal legislation dealing with the conditions of labour); (b) to give the Commonwealth

**Third
Parliament,
1907-10.**

**Fourth
Parliament,
1910-13.**

Parliament full power over all trading corporations; (c) to give the Commonwealth Parliament specific power to deal with the wages and conditions of labour and labour disputes; (d) to give the Commonwealth Parliament power to deal with all combinations and monopolies. A further proposed amendment of the Constitution gave the Commonwealth Parliament power to declare that any business was a "monopoly," and following such declaration to acquire it, paying on just terms for any property used in connection with it. By a majority of about a quarter of a million votes in a total poll of about 1,155,000 votes the people declared against these amendments of the Constitution. Thus a Labour Government was left in office without power to carry out its Labour policy. It was announced that these amendments would be submitted again at the General Election of 1913.

Thwarted by the safeguards of the Constitution and the refusal of the people to allow amendments removing those safeguards, in an effort to move further towards the ideal of a socialistic state, the Fisher Government was yet able to carry out much advanced legislation. Its first task, however, had been to clear itself very completely of any suspicion of a lack of earnestness regarding the defence of Australia and the Empire. In 1909, whilst Mr. Deakin was Prime Minister, an Act of Parliament had been passed enforcing military training on all able-bodied male citizens. This enactment of universal service had not been opposed by the Labour party. Indeed their criticism was that the system proposed to be enforced was not thorough enough; and the Government of the day promised that an expert from Great Britain should be asked to report on the system. Field-Marshal Viscount Kitchener accepted an invitation to visit Australia, and his report was before the Parliament of 1910 with a Labour Government in power. That Government not only accepted all his recommendations but in some cases crossed his "t's" and dotted his "i's." There was established a system of universal training for military defence which Lord Kitchener guarantees as adequate and which the Fisher Government has enforced against various protests with a resolute courage. In the matter of naval defence the Fisher Government was equally firm in dissociating itself from any faltering policy.

Mr. Fisher, in carrying on and extending the defence policy of his predecessors, gave the opposition no reason for hostility. But his Land Tax was hotly contested. During his brief administration Mr. J. C. Watson had foreshadowed a Land Tax, the purpose of which was to be economic rather than fiscal; that is to say, it was to be designed chiefly to make the holding up of big estates against closer settlement unprofitable, and the collection of revenue was to be but an incidental matter. Mr. Fisher's Land Tax kept this "bursting up" of big estates in the foreground, but owed to a material interest in securing additional revenue to finance the great defence schemes which had been entered upon. Estates of under £5,000 in unimproved value were exempted if their proprietors were resident in Australia (absentee landlords had no exemption); upon estates of over £5,000 in unimproved value the tax was at the rate of one penny in the £, rising rapidly with the value of estates until at £75,000 unimproved value the rate was 6d. in the £, beyond which it did not go. In case of absentees the rate is higher, culminating in a tax of 7d. per £ of unimproved value.

Another highly important financial measure carried through by the Fisher Government was a re-arrangement of the financial basis between the Commonwealth and the states. The original financial basis of the Commonwealth Government was absurd, but it had been forced upon the makers of the Federation by circumstances. It was found during the various sessions of the Convention which sat to frame a Constitution that Federal enthusiasm was apt to evaporate, and to be replaced by a hard bargaining spirit, as soon as the allocation of revenues came to be discussed. There were six states to be united, two of them (New South Wales and Victoria) rich and powerful; two others (Tasmania and West Australia) poor in revenue and in population; two others (Queensland and South Australia) occupying middle places. As soon as the issue came up as to how the Commonwealth revenues were to be collected and distributed, the representatives of the large states began to fear that the small states

would "live upon them"; the small states began to fear that their revenues would be destroyed in the interests of the big states. Tasmania and West Australia won a large proportion of their income from the Customs taxation of goods from the other states, and that source would disappear with inter-state Free Trade. The difficulty was finally solved by a clause called the "Braddon clause" (or in party polemics "the Braddon Blot"), after its author, the late Sir Edward Braddon, Premier of Tasmania.

The Braddon clause provided that the Commonwealth Government, after collecting the Customs and Excise duties, should pay back at least $\frac{3}{4}$ of them to the revenues of the various states. The idea was ingenious. The Commonwealth Government in order to get 5s for itself would have to collect 15s for the states, and thus the smaller states could rely on no starveling policy of Customs and Excise taxation. Almost everybody said that the clause was absurd without being able to suggest an alternative. It was put in the Constitution with a proviso that it should last but ten years. During the first three Parliaments several efforts were made to secure, by agreement with the states, a less crippling arrangement. But party strife prevented resolute action on the part of any Federal treasurer. On their part the states were firm to maintain a system which in some cases they thought to be the only safeguard against bankruptcy, while in other cases they recognised it to be a source of most abounding revenues, which they had the pleasure of spending but not the odium of collecting. The Deakin-Cook administration, on the eve of going to the country in 1909, made an arrangement with the state Premiers to amend the constitution, so that in place of the provisions of the Braddon clause the Commonwealth should pay to the states 25s per head of population per annum out of the Customs and Excise collections. This amendment was sanctioned by Parliament. To come into force, however, it required the endorsement of the people at a referendum. That endorsement was refused. The position, then, when Mr. Fisher took office for the second time, was that the Braddon clause of the Federal Constitution was on the point of expiry and that the whole of the Customs and Excise revenues would then be at the unfettered disposal of the Commonwealth. He could have destroyed the financial independence of the states absolutely. He took a moderate course, and by an Act of Parliament of 1910 the states are allowed subsidies of 25s per head of population per annum, out of the Customs and Excise revenue for ten years. At the end of that time the Federal Parliament can make any other disposition that it thinks fit, since there is now no Constitutional provision on the subject.

Mr. Fisher with two of his colleagues attended the Imperial Conference of 1911. He was apparently impressed by the degree of confidence with which the British Government consulted the representatives of the overseas dominions. A first indication of the intention of Australia to take an active part in the foreign policy of the Empire was furnished in August 1912 by a protest against the United States policy in regard to the Panama Canal.

Australia at the end of 1912 was on the eve of her fifth General Election. The Labour party intended to ask for a renewal of confidence and for such amendments of the Constitution as would enable them to carry further their socialistic policy. The Opposition, under Mr. Cook,—Mr. Deakin announcing in December his withdrawal from the leadership,—raised a warning against this policy and condemned the administration of the Government as tinged with favouritism and inefficiency. The Opposition party was not as well organised as the Government party and it showed some signs of internal dissension. Many of its friends feared that it would succeed only in weakening and not in defeating the Labour Government. It was impossible for it under any circumstances to secure a majority in the Senate, even if it won all the 18 seats to be contested, for all the 18 Senators who were not retiring at the election of 1913 were Labour members. A by-election in 1912 at Werriwa (N.S.W.), at which the Labour party held the seat by a greatly decreased majority, seemed to foreshadow this result.

The Governor General of the Commonwealth in 1912 was Lord Denman. The following were the names of the Cabinet still in office at the end of the year:

<i>Prime Minister and Treasurer</i>	Andrew Fisher
<i>Attorney General</i>	W. M. Hughes
<i>Minister for External Affairs</i>	J. Thomas
<i>Minister for Home Affairs</i>	K. O'Malley
<i>Postmaster General</i>	C. E. Frazer
<i>Minister for Defence</i>	G. F. Pearce
<i>Minister for Trade and Customs</i>	F. G. Tudor
<i>Vice-President of Executive Council</i>	G. McGregor
<i>Honorary Ministers</i>	E. Findlay and E. A. Roberts

The Constitution and the High Court.—The Federal Constitution, in safeguarding the Federal power from trespass by the states and the power of the states from trespass by the Federation, necessarily set up a system of conservative check. But the full extent of that check was only understood when a High Court began to interpret the statutes in the light of the Constitution. Already a considerable amount of the legislation of the Australian Parliament has been declared *ultra vires* by the High Court. Some of the decisions affected political issues so deeply that it was sought to amend the Constitution so as to facilitate "Labour" legislation, but this effort failed. The power to amend the Constitution is in itself subject to many safeguards. A proposed amendment must first have the approval of an absolute majority of both Houses of Parliament; it is then submitted to a poll of the people, and to pass it must secure (a) a majority of the total votes cast, (b) a majority of the votes cast in a majority of the states. If the three largest states voted "Yes" and the three smallest states voted "No," though the total Australian vote was "yes," the proposed amendment would still fail.

In 1906 the Australian Parliament had passed an "Excise Act" which was intended to enforce what was called "the New Protection." A high protective Customs Duty had been placed on agricultural machinery, and at the same time an Excise Duty on the same machinery manufactured locally, with the provision that the Excise Duty should be remitted if the manufacturers paid "fair wages." On June 26, 1908 the High Court declared this Act invalid, on the ground that it was not what it purported to be—a taxing Act, but rather an Act to regulate wages within a state, a thing which the Federal power was not competent to undertake under the Constitution.

The first two Australian Parliaments devoted much time to discussing a Federal Industrial Arbitration Act, which included in its control state railway servants. This inclusion was nullified by a High Court decision that it was an unconstitutional interference by the Federal power with the affairs of the states. In the Trade Marks Act the Australian Parliament gave Trade Unions the right to register what is known in the United States as the "Union label," a mark showing that certain goods were manufactured by Trade Union labour only. The Australian High Court (August 1908) set this part of the statute aside on the ground that such a "Union label" was not a genuine trade mark, and the proposal to register it as a trade mark was really a subterfuge to assume control of labour conditions which were outside the province of the Commonwealth.

Not only Federal legislation but state legislation has been vetoed. An Arbitration Act in New South Wales had sought to give the widest powers of regulating industrial disputes. In a series of five appeals the High Court gave such a strict interpretation to the provisions of that Act that it was more than half destroyed. (The High Court is the only Court of Appeal in cases affecting the Constitution, and is with the Privy Council an alternative Court of Appeal in all other cases.)

In 1913 an effort was to be made to secure from the people a reversal of their verdict in 1911, when they refused to give endorsement to amendments of the Federal Constitution which would legalise for the future the Federal and Labour legislation which the High Court had vetoed. Meanwhile the Australian Constitution, as interpreted by the High Court, is a barrier against any great development of socialistic enterprise on the part of the Commonwealth Government.

Since the beginning of the Federation there have been two alterations of the Constitution sanctioned: one, unimportant, was designed to improve the electoral machinery; the other gave the Commonwealth power to take over all the states' debts. Three proposed alterations have been rejected: one which proposed to make constitutional provision for a subsidy to the states; one which proposed to give the Commonwealth Parliament control of labour legislation; and one which proposed to give the Commonwealth Parliament power to take over monopolies and conduct them under state control.

The Australian High Court was originally constituted (1903) of three Judges, Sir Samuel Griffith (chief), Sir Edmund Barton and Mr. R. E. O'Connor. In 1906 two other Judges were added, Mr. Henry Bournes Higgins and Mr. Isaac Isaacs. In 1912 it was proposed to strengthen further the Court to seven Judges. Sir Samuel Griffith (born in Queensland in 1845) had a distinguished career as a politician in his native state. He took an early interest in the Federal movement, was President of the Federal Council (which preceded Federation) from 1888 to 1893, and was chiefly responsible for the framing of the first Federal Constitution on which the more "popular" Constitution subsequently adopted was modelled. Sir Edmund Barton's services to Federation have been already noted. Mr. Richard E. O'Connor (born in New South Wales in 1851) was also one of the first advocates of Federation; he died on November 18, 1912. It was a curious circumstance that all three members of the first High Court were graduates of Sydney University. Mr. Higgins (born in Ireland) was leader of the Equity Bar in Victoria and accepted office as Attorney General in Mr. J. C. Watson's first Labour Ministry (1904). Mr. Isaacs (born in Victoria in 1855) had a distinguished career in state politics and was Attorney General in Mr. Deakin's second administration.

Industrial Disputes.—In spite of much advanced "Labour" legislation the industrial situation in Australia has not been altogether peaceful recently. The strike on the Victorian State Railways in 1903 was followed in 1908 by a strike on the Sydney State Tramways. Both of these strikes against state employment failed. New South Wales in 1908 altered its Industrial Arbitration system, and, this alteration being resented by the Trade Unions, various small strikes followed. The next year (1909) more serious strikes broke out on the Broken Hill (N.S.W.) silver-mining and the Newcastle (N.S.W.) coal-mining fields. Stern measures were taken by the New South Wales Government to repress these strikes, and the leaders in the strike movement were arrested and some of them punished with imprisonment. In 1910 there were strikes of tramway employees at Perth (W.A.) and of transport workers at Adelaide (S.A.). In 1912 the tramway employees of Brisbane came out on strike because of a slight grievance against their employers (a private company). The leaders formed a sympathetic strike on "Syndicalist" lines, calling out the workers in every industry with the avowed object of preventing all business. Serious riots accompanied the strike. The state Government acted however with decision, and the strike disorders were crushed and the Syndicalist movement defeated. This strike had not the general sympathy of Labour leaders in Australia. Shortly after, the Queensland Premier, Mr. Denham, went to the country to ask for sanction for a policy of dealing sternly with labour disorder. The General Election gave him a substantial majority, and he passed legislation (1912) making strikes illegal without due notice and without a secret ballot of the Trade Union affected.

The Labour Government of the Commonwealth has amended the Federal Industrial-Arbitration Act (introduced by the Deakin Government and passed by the Reid-McLean Government). It originally forbade the employment of Trade Union funds for political purposes. That restriction has been removed.

The Tariff.—The first Australian Tariff Act of 1901 was introduced by the late Mr. Charles Kingston, then Minister for Customs, in a form very like that of the later Tariff Act of 1908. In 1901 Free Trade opposition and Labour party criticism cut down Mr. Kingston's proposals materially, and his Tariff did not satisfy the Protectionists. But party divisions prevented reform for seven years. During 1906 however several small Tariff Acts were passed, the chief of which provided for a measure of Preferential Trade with South Africa. The 1908 Tariff Act raised the tariff generally and provided for a preferential rate on certain goods imported from Great Britain.

In 1910 the system of Customs book-keeping between the states was abolished in consequence of the substitution for the Braddon clause of a fixed subsidy from the Commonwealth to the states. Since then there have been no material changes in the Tariff, and the Customs Minister, Mr. Tudor, has expressed the view recently that the Government would not be willing to raise the Tariff further unless there were a certainty that labour conditions would be thereby bettered, a certainty which could not be provided by the Commonwealth legislature under the present constitutional limitations.

The preferential tariff treatment of British imports does not show any very marked effect on the trade figures as yet. The proportion of imports from the United Kingdom has remained fairly steady; it was 51.52% in 1908, 51.50 in 1909, 51.21 in 1910. Previous to 1908 the proportion of British imports was dwindling. British goods admitted at a preferential rate in 1910 paid £2,485,497 in duty, whereas if they had come under the general tariff they would have paid £3,457,671 in duty. The rebate was thus £972,174. In regard to £6,425,260 of British imports the Commonwealth admitted them free; foreign goods of the same classes and value would have paid an average tariff duty of 5.18%.

Defence.—When the Commonwealth Government took over the defence of Australia from the states in 1901 there existed for land defence in the various states very small forces of regular troops, used as instructional cadres and as garrisons for the forts; small forces of militia, enlisted under a voluntary system and paid for about 16 days of drill and camp training a year; further small forces of volunteers, not paid at all, and giving usually but scanty time to training. The total of these forces was 25,873, of whom a proportion could be counted as efficient. Naval defence, apart from the existence of various small craft, was entrusted to the British Navy, and a yearly subsidy (up to £126,000) was paid to the British Admiralty on condition that a fleet of a certain strength was maintained in Australian waters and certain facilities given to Australians wishing to enter the naval service.

At first the Federation did little to disturb these arrangements. The fleet subsidy was continued and extended. The military forces were taken over as they were. But the Defence Act of 1903 gave an indication of a new spirit. It made provision for the enlistment of all able-bodied males for defence service in case of war. An amendment proposed by Mr. W. M. Hughes, one of the leading members of the Labour party, that this universal obligation to military service should be accompanied by a universal obligation to training for service, was rejected. But it was inevitable that in time the one should follow the other. Mr. Hughes (born in Wales in 1864), a very advanced Socialist at the outset of his political life, constituted himself the Parliamentary champion of compulsory training for service, and—assisted outside the House by the National Defence League, of which Colonel Gerald Campbell, a volunteer officer of distinction, was the moving spirit—eventually secured the acceptance of the principle. A series of Acts in 1909, 1910 and 1911 gave Australia a military system under which, with few exceptions, the whole manhood of the country will be trained to the use of arms. Under this system, at the age of twelve, a boy must begin training (chiefly physical culture) as a junior cadet. Training as a senior cadet begins at 14, and lasts until 18; it comprises drills equivalent to 16 full days a year. At the age of 18 the obligation to undergo adult training begins, and lasts until the age of 25, through seven years. This adult training consists of the equivalent of 16 full days drilling a year, of which not less than eight shall be in a camp of continuous training. In the case of the artillery and the engineers the training extends to 25 days a year, of which not less than 17 must be in camp. There are certain exceptions, including one making provision for those who have conscientious scruples against bearing arms; these however are trained for the hospital and ambulance services. The thinness of the population in some districts forces another class of exemption: the residents of far “out back” cannot be economically mobilised for training, and for the present are left out of the scheme. A Staff College in the Federal Territory is provided for the training of officers, and its organisation is on severely practical lines. Cadets are accepted after examination. The whole cost of their college training is borne by the Army Estimates, and parents are forbidden to supplement the messing allowance by private pocket-

money. Even railway fares to and from the College when cadets go on holiday leave are paid by the Government, as are also all costs of uniform and equipment. A severe but not unwholesome discipline is exacted; the drinking of alcoholic liquors and cigarette smoking are both forbidden in the College.

It was not to be expected that a compulsory military system should be carried through altogether without protest. It had some opponents, influenced by religious objections or by those pacific ideals which would seek to abolish the possibility of war by abolishing all organisation for national defence. But the first stage and the second stage of the scheme dealing with the cadets have now (1912) been successfully surmounted, and the training has been put in hand of the first draft of 20,000 of adult citizen soldiers. An official statement published in September 1912 showed that 81% of those affected had complied with the provisions of the Act, and that there were in New South Wales only 643 offenders, "in the other states a considerably less number," who were so recalcitrant that it was necessary to prosecute them. In October 1912 the Defence Minister stated that the Opposition to the Act was no greater than to the Compulsory Education Act. Penalties of fines and imprisonment are provided for disobedience.

The numbers under training when the system is in full operation are estimated at 100,000 senior cadets and 120,000 citizen soldiers. But as after training the citizen soldier will pass into a reserve, the potential military resources of the Commonwealth in the future are only to be calculated by the total number of males of "military age" minus those who had been exempted from training. On the basis of the present population there would be 366,000 males between the ages of 18 and 26, 330,000 between 26 and 35, and a further 614,000 between 35 and 60. Exemptions, at a broad guess, might be 25%. The organisation of the establishment proposes at present 28 regiments of Light Horse, 56 batteries of Field Artillery, and 92 battalions of Infantry, and a due proportion of Engineers and Army Services Corps.

In regard to naval defence there was strong criticism of the subsidy policy at the very outset of the Federation. But that policy was warmly supported by the British Admiralty and the Imperial Defence Committee; and the impression was given that the only alternative to an Australian cash subsidy towards the British Navy was no co-operation at all in the naval defence of the Empire. Indeed the early advocates of an Australian Navy were met in their own country with charges of disloyalty to the mother country. But Australian public opinion steadily hardened on the subject. The British Admiralty was ultimately converted, in part at least. On December 19, 1907 Mr. Deakin as Prime Minister of Australia outlined a scheme by which Australia would devote the amount of the naval subsidy, then £200,000 a year, to the building of an Australian fleet, under the control of the Commonwealth Government but trained to co-operate with the British Navy. He proposed, in short, that in naval defence Australia should set up an independent but loyal system corresponding to the one she had adopted in military defence. Mr. Deakin announced that the British Admiralty did not altogether endorse his views, especially in regard to the control of the Australian Navy in time of war, which was kept with the Commonwealth Government unless it chose to pass that control over to the British Admiralty.

No great advance was made in regard to naval defence until the general anxiety as to the European situation in 1909 made the subject of Imperial Defence of the first importance. Australia was represented at an Imperial Defence Conference in 1909 which showed a remarkable change of opinion on the subject of "local navies" on the part of the British Admiralty. They brought down to the Conference, as a substitute for an Australian subsidy to the British Navy, a proposal for the building of an independent Australian fleet unit with the help of a British Treasury subsidy of £250,000. The Australian Government adopted the scheme in its entirety, except that it refused to accept the subsidy and decided to put the whole cost on the Australian taxpayer. Under this scheme Australia was to provide a fleet unit with a "Dreadnought" cruiser as its chief vessel. There was no provision for the automatic transfer

of the fleet to British control in the outbreak of war, that point having been allowed to drop out of sight. It is argued in Australia that a special provision of the sort is not needed, as full co-operation may be safely assumed.

In March 1911, at the request of the Australian Government, and at the close of a visit to Australia, Admiral Sir Reginald Henderson reported on the naval needs of the Commonwealth. His report was accepted, and it represents the present aim of Australian Naval Defence, though, according to a statement made by one member of the Australian Ministry (Mr. Roberts), the acceptance of Admiral Henderson's proposals was subject to ratification by the electors in 1913. But there seems to have been no division of opinion in the Cabinet as to its acceptance. "We have called in a doctor: we must take his prescription," was the statement made by one member of the Cabinet, discussing the expenditure that Admiral Henderson demanded. His proposed Australian navy would consist in 22 years of 52 vessels manned by 15,000 men. The highest annual vote would be £4,794,000, and the ultimate cost would be £88,500,000. The strength of the fleet would be 23 ships in 1918, 42 ships in 1923, 48 ships in 1928, and 52 ships in 1933.

At present the Australian building programme is confined to the fleet unit decided upon in 1909: a battle cruiser, of the "Indomitable" class, three unarmoured cruisers of the "Bristol" class, six destroyers of an improved "River" class, and three submarines of "C" class, and the necessary auxiliaries. In 1912 there were in actual commission the "Parramatta," "Yarra Warrego" (destroyers); and in the water, the "Australia" (a battle-cruiser completed in 1912), and "Melbourne" and "Sydney" (cruisers, one of which was due for completion in 1912). Construction of the fleet is proceeding simultaneously in Great Britain and in Australia. The *personnel* for the fleet will be largely drawn from the British Navy at the outset. But Australian officers and crews will be recruited and trained as quickly as possible. A site has been chosen for a naval college for the training of officers at Jervis Bay (N.S.W.), and a temporary college established at Geelong (Vic.). New Zealand is co-operating with Australia in the maintenance of the college for training naval officers. The provisions of the Act compelling universal training for service affect the naval manning, for young citizens may elect to train as naval cadets. The official report on the training of the first batch of naval cadets, issued September 1912, was satisfactory.

The cost of this great naval and military preparation is shown in the growth of the Australian Defence votes. In 1905-6 the Commonwealth devoted £970,345 to defence, in 1906-7 £1,035,795, in 1907-8 £1,334,744, in 1908-9 £1,050,590, in 1909-10 £1,534,881, in 1910-11 £3,008,705. The estimates for 1911-12 provide for an expenditure of £4,775,136. Administration of both the military and naval systems is by Boards.

OBITUARY. The Australian obituary for 1911 included the following names:—

SIR RICHARD CHAFFEY BAKER, President of the First Senate of the Commonwealth; d. at Adelaide, Australia, on the 18th March. He was born in North Adelaide in 1842, educated at Eton and Trinity College, Cambridge, and called to the Bar in 1864. He was president of the Legislative Council of South Australia from 1893 to 1901, and special envoy to London from the Australian Governments for the mail contract negotiations in 1885.

SIR JENKIN COLES, speaker of the South Australian Assembly since 1890; b. 1842; d. at Adelaide on the 7th of December.

SIR GEORGE HENRY JENKINS, Clerk of Parliaments in Victoria since 1891; d. at Colombo, Ceylon, on the 17th July. He was born in 1843 at Abergavenny in Monmouthshire, and becoming connected with the government department of Victoria made a special study of parliamentary procedure and became an authority in Australia on Constitutional questions. He was Clerk of the Legislative Assembly of Victoria from 1882 till 1891, and was knighted in 1904.

Cardinal **PATRICK FRANCIS MORAN**, third Archbishop of Sydney, New South Wales, and the first Australian Cardinal; (see *E. B.* xix, 543c); d. at Sydney on the 16th August. He was born in County Carlow, Ireland, on the 16th September 1830, and educated at the Irish College at Rome, where he became Vice-President and Professor of Hebrew. In 1873 he was consecrated Bishop of Ossory, and thence went in 1884 to Sydney as Roman Catholic primate of Australia. The cathedral of St. Mary, Sydney, was built under his direction.

WILLIAM LLOYD MURDOCH, the cricketer; d. suddenly during a cricket match at Melbourne, on the 18th February. Born in 1855 at Sandhurst, Victoria, he went to England as

captain of the Australian eleven in 1880, and in the historic test match of that year made 153 not out (see *E. B.* vii, 444b). He was captain of the Australian eleven in 1882 and 1884. From 1893 to 1899 he lived in England and played for Sussex; and, returning to Australia, he played for New South Wales.

In 1912 the following well-known Australians died:—

GEORGE JOHN BONNOR, the cricketer; d. at Sydney on the 28th June. Born in 1855 in Victoria, he first went to England as a cricketer in 1880, attracting special attention by his unusual height and strength. He played for Australia again in England in 1882, 1884, 1886 and 1888 (see *E. B.* vii, 444b).

JAMES FRANCIS CORBETT, Roman Catholic Bishop of Sale, Victoria; d. in Melbourne on the 29th May. He was born at Limerick in 1840, and educated in France. After a few years spent in Ireland as a priest he went to Melbourne as secretary to Archbishop Goold. He acted as Assistant Secretary to the Primary Australian Synod of his church in 1885, and in 1887 was consecrated first Bishop of Sale.

SIR MATTHEW HENRY DAVIES, Speaker of the Legislative Assembly of Victoria from 1887 to 1892; b. 1850; d. November 26th.

JOHN HUGHES, member of the Legislative Council of New South Wales, was born at Sydney in 1857, and died 18th December. He was Vice-President of the Executive Council in 1898-99 and again from 1904 to 1910. In 1899 he was for a few months Minister of Justice.

MARTIN HOWY IRVING, a prominent educationist; d. at Albury in Surrey, England, on the 23rd July. The son of Edward Irving (see *E. B.* xiv, 854b), the founder of the "Catholic Apostolic Church," he was born in 1831. After leaving Balliol College, Oxford, he was for a year a master at the City of London School, but went to Australia and was appointed to the Chair of Classics and English at Melbourne University. In 1876 he became head master of the Hawthorn Grammar School, and in 1884 commissioner of the new constituted Public Service Board. He was also for some years chairman of the Melbourne board of the Australian Mutual Provident Society, and a promoter of the volunteer movement.

SAMUEL EDWARD MARSDEN, former Bishop of New South Wales, d. at Clifton, England, on the 15th October. He was born at Sydney, N.S.W. in 1832, and educated privately and at Trinity College, Cambridge. He was ordained in 1855 and in 1861 was appointed diocesan inspector of schools for Worcester. In 1869 he was consecrated Bishop of New South Wales, and held the see till 1885. After his retirement he returned to England and became assistant bishop in the diocese of Gloucester and Bristol.

RICHARD O'CONNOR, Judge of the High Court, d. at Sydney, on the 18th of November. Born at Sydney in 1851, he gradually made a position at the N.S.W. Bar, and entered the state legislature; and he was an enthusiastic supporter of the movement for Federation. When this was accomplished in 1901, he became vice-president of the Council and leader of the Federal Senate; and in 1903 he was made a judge of the new High Court. From 1905 to 1908 he was president of the new Court of Conciliation and Arbitration.

SIR WILLIAM OWEN, formerly Judge of the Supreme Court of New South Wales; b. 1834; d. November 22.

NEW SOUTH WALES

The area of New South Wales is now computed at 309,472 square miles. The state has progressed rapidly since Federation. The population in 1900 was 1,364,590 and in 1911 1,646,734. During the same period the area under cultivation grew from 2,445,564 to 4,611,672 acres. In 1908 N.S.W. re-established a system of state-aided immigration. Its net gain from immigration was, however, only 438 in 1911. But since then the increase has been greater. The city of Sydney has shown a remarkable growth since Federation, and in 1912 a "Million Club" was formed to foster the growth of the city to 1,000,000 inhabitants. The estimated population in 1911 was 629,500.

At the General Election of 1910 the Labour party carried the day and Mr. J. C. T. McGowan formed a ministry which still held office at the end of 1912. Parties are very evenly divided, and the years 1911 and 1912 were marked by perpetual political fighting and very little legislative work. By securing from a member of the Opposition acceptance of the office of Speaker the Government was able to make its position more secure (his vote, of course, was lost to the Opposition), and this incident led to many remarkable scenes of disorder and violence in the House. An incident of the political situation has been a growth of unfriendly feeling between the state Government and the Federal Government. The state Government in 1912 decided that the Government House building could no longer be reserved for the use of the Federal Governor General. In consequence the Governor General will not live in Sydney in future during the Parliamentary recess.

Lord Chelmsford, appointed in 1909, was still Governor in 1912, but Sir Gerald Strickland was nominated in October to succeed him in 1913.

VICTORIA

Since Federation the population has increased from 1,197,206 to 1,337,678. State-aided immigration was re-established in 1908 and a vigorous policy of closer settlement has been adopted. Victoria is now the most forward of all the states in encouraging immigrants.

AUSTRALIA

Alone of all the Australian states, Victoria has never yet been governed by the Labour party. At the end of 1912 the Premier was Mr. W. A. Watt. His ministry is the successor of Mr. W. H. Irvine's (1902) which was very strongly opposed to the Labour party. After Mr. Irvine, Mr. Bent, then Mr. Murray, then (1912) Mr. Watt led this Government. As temporary seat of the Commonwealth Government, Melbourne, the capital of Victoria, has been also the political capital of Australia, and the housing of the chief of the Federal departments there has given some impetus to the city's growth. Since the inauguration of the Federation it has been improved greatly in appearance by a scheme of tree decoration applied to the river banks and the chief streets.

The Governor in 1912 was Sir John Michael Fleetwood Fuller.

SOUTH AUSTRALIA

South Australia has now an area of 380,070 square miles and a population of 408,558, having been relieved of the care of the Northern Territory. The state is facing the development of its "dry-belt" where wheat-growing has been found to be possible with a very low average rainfall. In 1901 the area under wheat was 1,743,452, in 1910-11 2,104,719 acres, in 1911-12 (estimated) 2,190,782 acres with an average yield of 9.29 bushels to the acre. A great access of prosperity is expected in South Australia as a result of the new trans-continental railway to Perth (W.A.).

In politics South Australia has always been very progressive in spirit. It was the first state to enfranchise women, and most of the "social reform" legislation of Australia originated here. The Labour party has often formed the Government. But since a strike of transport workers in 1910 there has been a reaction against that party in the state.

At the end of 1912 the Governor was Admiral Sir Day Hort Bosanquet, and the Premier the Hon. A. H. Peake.

QUEENSLAND

The population of Queensland is now 505,813; the state has progressed greatly since Federation, the population having increased in the last decade by 21.62%. The state is committed to a vigorous policy of railway development and immigration. Alone among the Australian states it develops its railways from several maritime centres instead of from the one capital city. The sugar industry is a great source of Queensland wealth, and some anxiety was formerly felt as to whether the "white labour" policy of the Commonwealth would not ruin this industry. That anxiety no longer exists. In 1910-11 there were 108,535 acres under sugar in Queensland, in 1910-11 141,779 acres, and the estimates for 1911-12 were extremely favourable. The sugar produced in 1910 was 1,840,447 tons. Agricultural farm applications in 1901 were 661, in 1910 1,733, showing the rapid progress of land settlement. Under all forms of settlement there were applications for 364,766 acres in 1901 and for 1,951,170 acres in 1910. The figures in each case represent new settlement.

Politically, the state was for long one of the strongholds of the Labour party, which shared the Government under a coalition system. Since 1907 (when woman suffrage was adopted) there has been a drift in the other direction. The Philip ministry (1907-8) was hostile to the Labour party. The Kidston ministry (1908) was, as regards its head, strongly pro-Labour at one time, but became more Conservative as a tortuous and troubled political situation developed. The Denham ministry (1911) was quite opposed to the Labour party. It had to face in 1912 a fierce "Syndicalist" labour strike; and, following the defeat of the strike, appealed to the country for a renewal of confidence. The General Election resulted in the decisive defeat of the Labour party. An Industrial Peace Bill was then brought forward to limit the right to strike, and was passed by the Legislative Assembly in September 1912. At the end of that year the Governor was Sir William MacGregor, and the Premier the Hon. Digby Frank Denham.

WEST AUSTRALIA

The population (282,114) shows an increase since Federation of 53%. The state has kept for many years a system of state-aided immigration, and in 1910 the number of immigrants was 6,655.

The backwardness in development of this, the largest of the states, is now being met by a vigorous land settlement policy and the pushing on of the trans-continental railway to connect the state by land with the eastern states. The wheat-growing industry has developed very greatly of recent years. In 1901 there were 94,710 acres under wheat, in 1910-11 581,862 acres, and the estimated area for 1911-12 is 559,195 acres. The gold yield is decreasing. In 1911 it was 1,370,868 oz.

West Australia with its large population has a strong Labour party, which was in power at the end of 1912 with the Hon. F. Scaddan as Premier. The Governor in 1912 was Sir Gerald Strickland, whose successor in 1913 was designated in November in Sir H. Barron.

TASMANIA

With a very mild climate, in which drought is unknown, Tasmania (pop. 191,211) is destined to be the garden orchard and small-culture farm of the mainland. But it has not

yet shared in the tide of the Commonwealth's prosperity, and during the last decade increased its population by only 10.86%, though its natural increase was almost the highest in the Commonwealth. It lost more by emigration than it gained by immigration.

In 1912 the Governor was Major General Sir Harry Barron (transferred 1913 to West Australia), and the Premier Sir Elliott Lewis; Mr. W. G. Ellison Macartney, deputy-master of the Royal Mint, was nominated on Dec. 11 to succeed Sir H. Barron as governor. (FRANK FOX.)

NEW ZEALAND¹

Population.—The population, according to the quinquennial census of April 2, 1911, was (exclusive of Maoris) 1,008,468, of whom 531,910 were males and 476,558 females. This shows an increase of 119,890 in five years—the largest in any quinquennial period in New Zealand's history. The density to sq. m. is 9,690; number of persons to an inhabited dwelling 4.68. The populations of the principal cities (including suburbs) were: Auckland 102,676; Wellington (the political capital) 70,729; Christchurch 80,193; Dunedin 64,237. Excluding suburbs the city populations were: Wellington 64,372; Christchurch 53,116; Dunedin 41,529; Auckland 40,536. The number of Maoris (including half-castes living as Maoris) was 54,025. Of the total population 996,418 were British subjects (born and naturalised), and only 12,050 were of foreign nationality. The birth-places of the British subjects were as follows: New Zealand 702,779; United Kingdom 228,684; Australia 50,693; other British possessions 4,570.

Births and Deaths.—The birth rate in 1886 was 35.40 per 1,000 of population, but it declined steadily from year to year until in 1899 it was 25.12—the lowest percentage reached in the history of New Zealand. The rate increased yearly until 1907, when 27.30 was recorded. In 1911 the rate fell to 25.97. The number of children to a marriage for the twenty-year period 1892–1911 shows a decline from 4.54 to 3.07. Of every 1,000 children born in 1911, 41 were born out of wedlock as against 45 in 1910.

The death rate per 1,000 of population has been as high as 10.95 (in 1907), but fell to 9.39 in 1911, which is slightly below the New Zealand average of the previous ten years, slightly below that of Australia and much below that of all European countries. The principal causes of death in 1911 were: cancer, 7.97 per 10,000 of mean population; phthisis, 5.58; pneumonia, 5.14; gastritis and enteritis, 3.69.

Although the birth rate in New Zealand is low as compared with that of some European countries the death rate (particularly among infants) is the lowest recorded by any country in the world. As a result, the natural increase of population—by excess of births over deaths—is exceptionally high. The natural increase per 1,000 of mean population for the decennial period ended 1911 was 17.00 as compared with 11.71 for England and Wales during the same period.

Migration.—The migration returns show considerable fluctuations. For instance the net increase by migration in the years 1907–11 was:—(1907) 5,730; (1908), 14,261; (1909), 4,719; (1910), 3,408; (1911), 4,200. In the same period the natural increase remained consistently steady: (1907), 15,028; (1908), 16,897; (1909), 17,565; (1910), 16,345; (1911), 16,820. During the same years, arrivals from the United Kingdom were: (1907), 7,449; (1908), 11,348; (1909), 11,184; (1910), 9,367; (1911), 11,379. Departures for the United Kingdom were: (1907), 2,446; (1908), 2,635; (1909), 2,676; (1910), 2,509; (1911), 2,755.

Religion.—The New Zealand census includes the religions of the people. An analysis of the 1911 returns gives the following percentages:—Church of England and Protestants not otherwise defined 41.14; Presbyterian 23.32; Roman Catholics and Catholics undefined 13.97; Methodist 9.43; Baptist 1.99; Hebrew 0.21. The number who objected to state their religion represented 3.57 per cent.

Agriculture.—The census for 1911 showed the total area of land under occupation to be 40,238,126 acres, of which 16,265,890 acres were under cultivation. The principal crops were: wheat, 8,290,221 bushels; oats, 10,118,917 bushels; barley, 927,112 bushels; potatoes, 141,510 tons. Of the total production of wheat 7,000 bushels were required for home consumption and seed in 1911. There is no regular export of wheat. Butter and cheese were exported in 1911 to the value of £1,216,137—an increase of about 200 per cent in ten years. Frozen meat exports doubled in value in ten years. The exports in 1911 were valued at £4,173,014.

Trade.—The value of imports has been:—(1909), £15,674,719 (from United Kingdom £9,287,786); (1910) £17,051,583 (from United Kingdom £10,498,771); (1911) £19,584,789 (from United Kingdom £11,787,300). Exports:—(1909) £19,661,996 (to United Kingdom £16,193,188); (1910) £22,180,209 (to United Kingdom £18,663,118); (1911) £19,528,490 (to United Kingdom £15,134,743). The total trade per head of population was:—(1909)

¹ See *E. B.* xix, 624 et seq. Digitized by Microsoft

£36.7.3; (1910) £39.10.4; (1911) £38.0.2. The imports and exports for the first six months of 1912 were:—imports, £10,281,641; exports, £14,339,086.

The Preferential Tariff takes the form of a surtax on certain goods not being the produce or manufacture of some part of the British Dominions. Out of the total of 486 items on the Tariff 193 are scheduled under the surtax. The surtax was legalised in 1903. The *New Zealand Official Year Book* says:—"The value of imports from foreign countries has never assumed large proportions, ranging from 13.5 to 17 per cent. of the total during the past ten years. From 1899 to 1904 there was a steady increase, but since the latter year the proportion has fallen—a result no doubt in a large measure due to the preferential treatment of British goods."

Reciprocity is provided for under the Customs Duties Act 1908, where any country, being part of the British Dominions, agrees to reduce or abolish a duty against New Zealand products or manufactures. Treaties under this Act are in force between New Zealand and the Union of South Africa, Southern Rhodesia and Canada.

Railways.—The chief asset in which loan money has been invested in the Dominion is the Railways. It is also the most profitable. According to the Railways report for the year ended March 31, 1912 the year's earnings (which exceeded those of the previous year by £182,327) were £3,676,509, and the expenditure £2,465,896, showing a net profit on working of £1,210,613, equal to a return of 3.98 per cent on the capital invested in the opened lines and 3.70 on the opened and unopened lines. The lines opened for traffic were 2,808 miles, and the capital cost £30,506,089; the capital cost of opened and unopened lines was £32,689,179 in 1912. The entire railway system, with the exception of a few miles of private lines used for specific purposes, is now owned and controlled by the government.

Defence.—The most interesting fact in connection with the Defence Forces has been the operation of the compulsory training provisions of the Defence Act of 1909 (amended 1910). That Act provides for the gradual military training of every male New Zealander from the age of 12 years to the age of 25, after which he must serve in the Reserve up to the age of 30. There are no distinctions and no exemptions; but those who, in consequence of religious convictions, have a conscientious objection to bearing arms, may be trained as far as possible in the non-combatant branches, of which ambulance work is made a special feature. From 12 to 14 a boy is a junior cadet; then he is transferred to the senior cadets and becomes a member of the Military Forces, although not liable to be called out to fight. He remains a senior cadet until 18, at which age he is drafted into the Territorial Force and is liable to be called out at any time for service within the Dominion. At 25 he is transferred to the Reserve till 30, when he is discharged but is still liable to be called back to his regiment in case of war. The number of Territorials and senior cadets registered or serving up to March 25, 1912 were as follows: Territorials under 21—6,309; registered for enrolment—22,214; senior cadets—30,560; territorials over age but desirous of continuing service—2,862; total 61,945. The training of the cadet and soldier is strictly territorial,—that is to say, except for the one week a year spent in camp, training is carried out within reach of the man's home and at convenient times. It is pointed out by the military authorities that the New Zealand Territorial Force cannot be fairly compared with the Territorial Force of the United Kingdom, which has the regular army and special reserve in front of it. The New Zealand Territorial Force is the New Zealand Army, and the Permanent Force (officers, warrant and non-commissioned officers) are its auxiliaries to control, guide and instruct it. The Force will be about 30,000 strong, and is organised in field and coast defence units, with practically the same establishment for peace as for war. Nine officers of the New Zealand Staff Corps were in 1912 undergoing instruction in England and two in India; the number of imperial officers interchanged and on loan from the imperial army, serving with the New Zealand forces, was 15.

Finance.—The budget of the new Minister of Finance was presented in the House of Representatives on August 6, 1912. The actual revenue for 1911-12 was £11,032,544, being £603,534 in excess of the estimate, and the actual expenditure £10,604,677, being £264,309 under the estimate. The gross public debt at the end of the financial year (March 31, 1912) amounted to £84,352,913, and the net debt (*i.e.* less accrued sinking fund) to £82,193,310. The following were the principal purposes for which the various amounts were borrowed and applied: Maori War, £2,537,000; Defence £3,369,952; Railways £20,154,970; Roads and Bridges Construction and Lands Improvements

£7,240,676; Public Buildings £5,643,912; Telegraph and Telephone lines £1,601,767; Immigration £2,477,119; Harbours and lighthouses £586,942; Purchase of Native lands £2,715,217. "Opinions may differ," said the Minister of Finance, "as to how much of the total is self-supporting, but the amount expended in the construction of railways, the purchase of native lands and the acquisition of lands for settlement are of this nature, and the amounts spent on telegraph and telephone lines, loans to local bodies, and reserve fund securities must be regarded as revenue producing. Other amounts, such as those expended on purchasing the Bank of New Zealand shares and for advances to settlers and workers, bring in more income than is paid out for interest." Loans were to fall due in the seven years ending 1919 amounting to £23,176,478, of which there was payable £10,568,550 in London, £2,133,550 in Australia and £10,474,378 in New Zealand. "A very large proportion of our public debt," said the Minister, "will require to be either renewed or paid off by fresh loans."

Political History.—The years 1909–12 are important in the political history of New Zealand, which in 1907 became a "Dominion." In 1909 the government offered Great Britain "at least one first-class battleship (and, if necessary, two) of the Dreadnought or latest type," and took the lead in the movement in the Oversea Dominions for imperialising the British navy. In 1911 the Imperial Conference in London was attended on behalf of New Zealand by Sir Joseph Ward (Prime Minister since 1906; b. 1857) and Sir John Findlay (Attorney General; b. 1862), and of the 52 resolutions which made up the Agenda for that Conference no fewer than 23 stood in the name of New Zealand—including one which aimed at the re-constitution of the Colonial Office and the constitution of an Imperial Council but was eventually withdrawn. Sir Joseph Ward and Sir John Findlay (the former having been created a baronet and the latter a knight during their attendance at the Conference) returned to New Zealand in the latter part of 1911, to face a general election at which the party which had ruled New Zealand uninterruptedly for more than twenty years under the leadership of John Ballance, Richard Seddon and Joseph Ward in succession, was shattered. The Prime Minister refused to accept the verdict of the elections, and met the new parliament with a new policy, but was defeated in the House of Representatives and resigned. He was succeeded in February 1912 by a member of the same party and a former colleague, Mr. Thomas MacKenzie (b. 1854) who formed a Ministry as follows: Thos. MacKenzie, Prime Minister and Minister of Lands; A. M. Myers, Minister of Finance and Defence; W. D. S. MacDonald, Minister of Native Affairs; J. A. Hannan, Minister of Education; G. Laursen, Minister of Customs; G. W. Russell, Minister of Internal Affairs; James Colvin, Minister of Mines; Thomas Buxton, Minister without portfolio; Te Rangihiroa, Minister representing Native Race. Mr. MacKenzie's government lasted however only five months, being defeated in July. And thus ended the ultra-Radical régime which had existed from January 1891 to July 1912—a period of over 21 years.

The most interesting incident in the short-lived career of the MacKenzie Ministry was in connection with the request of the Imperial government to include the battleship "New Zealand" (the Dominion's gift to the Imperial Navy) in the Home Fleet. In the early part of May 1912 the Colonial Secretary telegraphed to the New Zealand government: "In the event of the increases of the naval programmes of European Powers which now seem imminent and likely, in the interests of naval supremacy it would be desirable that the battle cruiser 'New Zealand,' instead of serving in China, should be appointed to the Home Fleet in the North Sea, where alone she would be matched against vessels of her own size and quality." The Premier of New Zealand replied: "The government approves your proposals and considers 'New Zealand' should be stationed where Home Government consider her of most value." This message was acknowledged by the Colonial Secretary in these terms: "His Majesty's Government convey their deep gratitude and appreciation of your patriotic action in accepting so readily the suggestion of the Admiralty in the interests of the Empire at large."

Mr. W. F. Massey (b. 1856), Leader of the Opposition for several years, who succeeded to the Premiership, was a Conservative in New Zealand political nomenclature but

a Moderate Liberal from an English point of view. He surrounded himself with colleagues who collectively made up the strongest cabinet New Zealand had possessed for a generation. More than half the members of the cabinet were university graduates—a distinction unique in the history of New Zealand Ministries. The Ministry, which had a good working majority, was constituted as follows: W. F. Massey, Prime Minister, Minister of Lands, Agriculture and Labour; J. Allen, Minister of Finance, Defence and Education; W. H. Herries, Minister of Railways and Native Affairs; W. Fraser, Minister of Public Works and Mines; A. L. Herdman, Attorney-General and Minister of Justice; F. M. B. Fisher, Minister of Customs and Marine; F. H. D. Bell, Minister of Internal Affairs and Leader of the Legislative Council; R. H. Rhodes, Postmaster-General and Minister of Public Health; Dr. Pomare, Member of the Executive Council representing the Native Race.

The Massey government announced their determination to bring about closer settlement of the land and to make this the most important plank in their policy. They proposed to lessen the graduated tax on estates of £5,000 unimproved value, and to provide that the graduation should be regular and increasing with every £1 increase in unimproved value, while increasing the tax payable on estates of over £30,000 unimproved value. The new law was to provide that the 25 per cent additional tax now imposed on estates of £40,000, or more in unimproved value should apply to estates of more than £30,000.

One of the first executive acts of the Massey Ministry was the appointment of Mr. Thomas MacKenzie to the position of High Commissioner in London in succession to Mr. C. Wray Palliser, who on Mr. MacKenzie's appointment resumed his office of secretary to the High Commissioner's Department, which he had held during Mr. W. Pember Reeves' and Sir William Hall-Jones' tenures of office as High Commissioners.

Obituary.—SIR JOHN LOGAN CAMPBELL, known as "The Father of New Zealand," died at Auckland on the 21st of June 1912. He was born in Edinburgh on the 8th of November 1817, and educated at Edinburgh University. After taking a medical degree he entered the service of the East India Company, but in 1839 he left it and emigrated to Sydney. A year later he went to New Zealand and there founded at Auckland the firm of Brown & Campbell. In 1856 he joined the Stafford government as a member of the Executive Council. From 1861 to 1871 he was in England; but he returned to New Zealand, and there held many important posts, including the chairmanship of the Board of Education in Auckland and of the Board of the Bank of New Zealand. He was the author of *Poenamo*, a book on early life in Auckland. He was knighted in 1902.

SIR WILLIAM STEWARD, ex-Speaker of New Zealand House of Representatives, died at Wellington, N.Z., on the 1st of November 1912. He was born at Reading, Berks., on the 20th of January 1841, and went to New Zealand in 1862, where for 30 years he was a journalist and newspaper proprietor. He was elected to the House of Representatives in 1870 and was its oldest member. From 1893 to 1901 he was Speaker of the House, and in 1901 he was knighted. He published *Carmina Varia* (1867) and *The Vision of Aorangi and Other Poems* (1906).
(L. J. BRIENT.)

SOUTH AFRICA¹

The area of British South Africa, according to 1911 official figures, is 1,204,358 sq. m. In the same year the census returns gave the total population as 8,196,224 of whom 1,305,531 were Europeans or whites. Administratively British South Africa consists of: (1) The Union of South Africa, a self-governing dominion comprising the Cape, Natal; Transvaal and Orange Free State provinces; (2) The Territory of Rhodesia, administered by the chartered company of British South Africa; (3) The Native Protectorates—Basutoland, Bechuanaland and Swaziland, administered as crown colonies. South Africa, however, forms one Customs Union, and the interests of Rhodesia and the Native Protectorates are so intimately connected with those of the Union that it is best to treat the whole area as a unit. This plan has been adopted below, but certain particulars regarding Rhodesia and the Protectorates are given in separate sections.

Vital Statistics.—Table I, compiled from the 1911 census return, gives details of the area and population. Compared with the census of 1904 the increase in the white population was 172,390. Of this increase 123,285 was in the Transvaal alone, the in-

¹ See *E. B.* xxv, 463 *et seq.* and allied articles.

Table I. Area and Population of British South Africa.

	Area Sq. m.	Pop. 1911 White.	Native and Coloured.	Total.
Union of S. Africa:—				
Cape Province	276,995	582,377	1,982,588	2,564,965
Transvaal Province	111,196	420,562	1,265,650	1,686,212
Natal Province (includes Zulu- land)	35,371	98,114	1,095,929	1,194,043
Orange Free State Province.	50,392	175,189	352,985	528,174
Total Union	473,954	1,276,242	4,697,152	5,973,394
Territories:—				
S. Rhodesia	148,575	23,606	747,471	771,077
N. Rhodesia	290,000	1,497	821,102	822,599
Total Rhodesia	438,575	25,103	1,568,573	1,593,676
Protectorates:—				
Bechuanaland	275,000	1,692	123,658	125,350
Basutoland	10,293	1,411	402,434	403,845
Swaziland	6,536	1,083	98,876	99,959
Total Protectorates	291,829	4,186	624,968	629,154
Total British South Africa	1,204,358	1,305,531	6,890,693	8,196,224

crease in the white population in the other provinces of the Union being slight. In Rhodesia the white population had nearly doubled in the seven years. The increase in the native and coloured population was 885,660. With respect to the coloured population two important factors must be remembered. (1) The Cape province total of native and coloured includes 391,000 persons with a marked strain of white blood, officially classed as "mixed;" the total "mixed" population being 435,000. (2) The Natal province total of native and coloured includes 133,000 Indians. There were also 10,048 Indians in the Transvaal, the total Asiatic population being 152,000.

The increase in the total population in the Union between 1904 and 1911 was 15.12%; in the white population 14.44%, in the native population 16%, in the Asiatic and other coloured races 9.84%. Among the whites there were 86.18 females to 100 males in 1911, compared with 75.85% in 1904. For all races there were 94.11 females to 100 males in 1911, compared with 92.97 in 1904. Increase by immigration is slight. In 1911, 55,000 passengers landed at S. African ports and 46,000 embarked.

The population of the chief towns at the 1911 census was: *Cape Province*.—Cape Town, with suburbs, 161,579 (85,442 whites); Port Elizabeth and suburbs, 37,063 (20,007 whites); East London, 24,606 (14,899 whites); Kimberley (including Beaconsfield, the municipalities were amalgamated in 1912), 44,433 (17,507 whites); Graham's Town, 13,830 (7,323 whites); King William's Town, 9,028 (5,570 whites). *Natal Province*.—Durban and suburbs, 89,998 (34,880 whites); Pietermaritzburg, 30,555 (14,737 whites); Ladysmith 5,595 (2,287 whites). *Transvaal Province*.—Pretoria and suburbs, 57,674 (35,942 whites); Johannesburg, 237,104 (119,953 whites); Germiston, 54,325 (15,579 whites); Boksburg, 43,628 (11,529 whites); Benoni, 32,560 (8,639 whites); Roodepoort-Maraiburg, 32,578 (7,657 whites)—these four last named are all towns on the Rand as is also Krugersdorp, 55,144 (13,132 whites). *Orange Free State Province*.—Bloemfontein, 26,925 (14,720 whites); Jagersfontein, 9,019 (2,067 whites); Harrismith, 6,799 (3,447 whites). *Rhodesia*.—Bulawayo, whites 5,199; Salisbury, whites 3,479.

Commerce and Agriculture.—While gold and diamonds are still the chief sources of wealth there was during 1910-12 a marked development in other mining industries (coal, copper, tin, &c.) and in agriculture. The value of external trade for the whole of British South Africa (excluding specie and government stores) is shown as follows:—

SOUTH AFRICA

	1910	1911	1912 (first nine months only)
Exports	£54,509,000	£57,734,000	£46,512,000
Imports	35,123,000	36,423,000	27,460,000

Compared with 1907 the export figures for 1911 showed an increase of over £10,000,000 or 21%; the imports for the same period increased £10,500,000 or over 40%. Of the imports in 1911 it was officially estimated that £6,351,000 or 17% were taken by native or coloured consumers, a significant indication of their economic importance to the country. In 1911 the United Kingdom supplied 58% of the imports, those of the British empire as a whole being 64%. Germany and the United States came next as importers. By reason of the preference tariff granted them British goods benefited in 1911, in the Union alone, by £538,000, Australian goods by £46,000 and Canadian goods by £16,000. Nearly all the exports (92% in 1911) go to the United Kingdom. The following were in 1911 the chief exports: gold £37,608,000; diamonds £8,282,000; wool £3,900,000; ostrich feathers! £2,253,000; angora and mohair £917,000; hides and skins £1,216,000; coal £1,079,000; copper £615,000. These figures do not, however, represent fully the agricultural development. The export of maize, bark (for tanning) and of fruit has greatly developed, while much of the increased production in 1911 was consumed locally. The imports of agricultural machinery, £148,000 in 1910, rose to £196,000 in 1911. But the development of industries besides gold and diamond mining is best shown by the value of other goods exported; valued at £9,500,000 in 1908, they were worth £13,300,000 in 1910 and £13,700,000 in 1911.

The gold output from the Transvaal mines for 1911 was £35,041,000; for the first ten months of 1912 it was £32,242,633. The issued capital at the end of 1911 was £62,325,000, and £8,066,000 represented dividends. The diamond output was, from the Cape Province (including £346,000 from river diggings) £5,506,000, an increase of £298,000 over 1910; the Transvaal diamond output in 1911 (mostly from the Premier mine) was £1,628,000. In May 1911 alluvial diamonds were discovered at Mooifontein on the Transvaal side of the Vaal in the Bloemhof district, and 17 m. N.W. of the river bank in a great gravel covered area. Alluvial diamonds had never previously been found so far from the river. A mining town of 10,000 inhabitants (half whites) has sprung up and there is every likelihood of the diggings having a life of several years. By the middle of 1912 diamonds worth over £300,000 had been found. Of more importance was the proof afforded in 1912 that there were rich copper fields in the Messina district, northern Transvaal.

Finance.—The following are the figures for the revenue and expenditure of the Union (Rhodesia and the protectorates being dealt with separately below). The financial year ends March 31, and as the Union was established on May 31, 1910, the first financial "year" contained ten months only. It should also be pointed out that the account of the Railways and Harbours Board is not shown in the budget statements, only the contribution from the board to the consolidated fund. *Revenue:* (1910-11) £14,392,000, (1911-12) £17,336,000, (1912-13 est.) £16,288,000. *Expenditure:* (1910-11) £13,598,000, (1911-12) £16,638,000, (1912-13 est.) £17,129,000. The actual revenue for April-September 1912 was £8,473,000; and the expenditure for the same period £7,629,000. The public debt on March 31, 1911 was £114,236,000; the yearly interest £3,876,000. The Union government, to the end of 1912, had contracted no permanent loan; the indebtedness being that incurred previously to Union.

The following figures for 1911-12 show the main sources of revenue: Customs £4,508,000; mines (part proprietary profits, part 10% tax on profits, imposed 1911) £2,305,000, licences, stamp duties, transfers &c. £1,653,000; taxes on natives £1,181,000; contribution from Railways and Harbours fund £1,159,000. In 1910-11 the Board's contribution had been £1,520,000; it was reduced in 1912-13 to £500,000, and is intended to cease altogether, profits from railways and harbours being allocated to developing industries, by reduction in rates and fares, and in improving means of communication. Expenditure is practically wholly on the civil service. In 1911-12 the sum of £418,000 was spent on defence. The provincial administrations cost the Union £3,315,000. (No permanent arrangement as to provincial finance had been reached by the close of 1912.) Up to March 1912 the sum of £5,889,000 was spent by the Railways and Harbours Board on capital and betterment account; of this £2,400,000 was allocated to building new railways. Reductions in railway rates to the end of 1912 represented a loss in revenue of £1,335,000. In 1911 the Railways Board showed a revenue of £12,163,000 and expenditure £12,056,000; the Harbours Board a revenue of £852,000 and expenditure £729,000. The state owned harbours are Cape Town, Port Elizabeth, East London, Durban and Mossel Bay.

Communications.—The contract for carrying ocean mails by the Union-Castle boats expired in September 1912. Meantime the company's fleet had been purchased by the Elder Dempster Shipping Company which on September 9, 1912 concluded a new agreement (to last ten years) with the government, framed to meet the requirements of an act passed in April 1911 by the Union Parliament forbidding the entry into any contract with any person or company which granted rebates to shippers. This act was aimed at the "shipping ring"

¹ South Africa supplies the world's markets with about 85% of their requirements of ostrich feathers.

which controlled freight rates to and from South Africa. The contract with Elder Dempster (who in October placed orders for two new liners for the S. African service, each of over 15,000 tons) left the time for the mail boat service unaltered, namely 16 days 15 hours, between Southampton and Cape Town. Over 80% of the shipping is British. The net tonnage of vessels entering and clearing Union ports rose from 11,494,000 in 1910 to over 12,550,000 in 1911. Another 2,000,000 tonnage represents the trade of Lourenço Marques and Beira with British South Africa.

Wireless telegraphic stations have been established at Cape Town and Durban. The inland telegraphic service was in 1911 connected with German S. W. Africa.

In October 1912 the total mileage of the railways open was, in the Union 8,400 (of this mileage 7,646 was state owned); belonging to the Rhodesian Railway Systems 2,357. The Rhodesian system includes the railway running through the Bechuanaland protectorate (it is part of the trunk line north from Cape Town) and the Beira railway. There was in 1912 through communication from Cape Town to Katanga (Belgian Congo) a distance of 2,316 miles, all save 167 miles being in British territory. With the following exceptions the railways built since 1910 were mainly short lines to serve rural districts. The railway from Ermelo to Piet Relief (70 m.) opened in July 1911, was in 1912 being extended to Vryheid (69 m.) to give a direct route from Durban to the Eastern Transvaal. In October 1912 the Johannesburg-Zeerust line was completed to Mafeking, thus reducing the railway distance from the Rand to Bulawayo by 240 miles and making Durban the Union port nearest to Rhodesia. In the northern Transvaal, the Pretoria-Pietersburg line was continued to Bandolier Kop (70 m.) and, after lying derelict many years, the old Selati railway was continued to Messina, on the Transvaal side of the Limpopo.

Public Buildings and Monuments.—During 1910-12 over £1,300,000 was spent on public buildings. The most notable are the Union government offices at Pretoria expected to be completed in 1914. The new General Post Office at Pretoria (opened Oct. 1911) is a handsome and commodious Renaissance building. The museum, government library and University College at Pretoria have also been completed. The Houses of Parliament at Cape Town have been enlarged, as have also the Law Courts in that city. New Law Courts have been built at Johannesburg and Durban. A University College has been built at Pietermaritzburg. Over £500,000 was spent on harbour improvements, notably at Durban where a permanent quay wall was built at the harbour entrance while the harbour at Congella was opened up.

A memorial to Cecil Rhodes has been placed in the Groot Schuur estate on the slopes of Table Mountain. It is a granite temple in the Doric style approached by a flight of steps on either side of which are four lions sculptured by J. M. Swan. At the foot of the steps is G. F. Watts's statue of "Physical Energy" (of which the cast is in Kensington Gardens, London) and in the centre of the temple is a gigantic bust of Rhodes.

Progress has been made with the new Anglican cathedral in Cape Town. In it was placed in 1912 a magnificently illuminated MS. vellum volume bearing the names of the British slain in the war of 1899-1902.

In November 1912 it was announced that Mr. Max Michaelas, formerly a partner in the firm of Wernher, Beit & Co., had purchased from Sir Hugh Lane a collection of 46 pictures by old Dutch masters, including paintings by Rembrandt, Frans Hals, Jan Steen and Vandyck. These he presented to the Union government to form the nucleus of a national gallery. Sir Hugh Lane had previously formed a collection of modern masters at the Johannesburg Municipal Gallery, of which he was the first honorary director. The Michaelas collection is to be housed at Cape Town.

Rhodesia.—In July 1911 N.E. and N.W. Rhodesia were amalgamated under the title of Northern Rhodesia, a change indicative of the recognition that N.E. Rhodesia would follow the fortunes of South Africa rather than those of Nyasaland. The census of April 1911 showed that the white population of Rhodesia had nearly doubled since 1904, but was still very sparse—25,000 persons to 438,000 sq. m. In the 18 months following the taking of the census there were fully 2,000 new European settlers. Over 90% of the white inhabitants are natural born British subjects—a higher percentage than in any other part of South Africa. The administration remained in the hands of the British South African Company, whose charter does not expire till 1914. Rhodesians were divided in their views of the future form of government between three policies (1) a renewal of the charter, (2) entry into the Union of South Africa, (3) a modified form of crown colony government. The party advocating the third alternative was most vocal. It was represented by the Southern Rhodesian League, which formulated its views in November 1912. In December 1912 the Chartered Company announced that the elected members of the Southern Rhodesia Legislative Council would be increased from seven to twelve, and the nominated members from five to eight.

The revenue figures in Southern Rhodesia are: (1910-11) £784,000, (1911-12) £864,000,

(1912-13 est.) £853,000; and the expenditure (1910-11) £684,000, (1911-12) £838,000, (1912-13 est.) £894,000.

The imports of "ordinary merchandise" (i.e. excluding railway material, government stores and specie) were valued at £2,222,000 in 1910 and at £2,569,000 in 1911. The exports (excluding goods in transit) were £3,018,000 in 1910 and £3,098,000 in 1911. For the first eight months of 1912 the figures were: imports £1,745,000, exports £2,081,000. In 1910 British imports were 69% of the whole; in 1911 they were 68%. One-fifth of the imports came from the Union of S. Africa. Germany and the United States each had about 5% of the import trade. Northern Rhodesia in 1911—apart from transit trade—sent exports worth £150,000 into Belgian Congo. This was consequent on the opening of railway communication with Katanga. Gold is the chief export. The output in 1910 was valued at £2,568,000, in 1911 at £2,647,000, for Jan-Oct. 1912 at £2,262,000. The export of chrome ore in 1910 was £100,000, in 1911 £118,000. The output of coal from the Wankie mines was 180,000 tons in 1910, and 212,000 tons in 1911.

Rhodesia is, however, pre-eminently a stock-raising and agricultural country and most of the new settlers are farmers. Maize is largely grown for export, but the chief export other than minerals was tobacco, valued at £31,000 in 1910, and £34,000 in 1911. Scarcity of native labour led to the establishment in October 1911 of an official Native Labour Recruiting Bureau which secured uniformity of recruiting conditions for all classes of employers and better conditions for the natives. A uniform tax of one shilling per native was imposed on all employers by an ordinance passed in December 1911. This tax the farmers refused to pay and to save the situation the ordinance was revoked by the Secretary of State for the Colonies, June 1912, at the request of the Chartered Company. The Legislative Council, in lieu of the tax, granted a subsidy to the Labour Bureau.

Complaints of the high cost of living and of excessive railway rates were rife during the last half of 1912, and led to vigorous protests against the increased duties on foodstuffs and clothing proposed by the Union commission on trade and industries. Suggestions to make Dutch an official language in Rhodesia were strongly resented. Owing to large gifts from Cecil Rhodes and Alfred Beit there are as good facilities in the country for elementary and secondary education of Europeans as in England. High schools for girls and for boys have been opened at Bulawayo and Salisbury.

The Native Protectorates.—The Bechuanaland Protectorate, Basutoland and Swaziland remain under the control of the Imperial Government, represented by the High Commissioner for South Africa, and are administered by Resident Commissioners. They form, in whole or in greater part, native reserves. The history of all three protectorates in 1910-12 was one of peaceful development, the fear of the Basuto and Bechuana that they would be immediately handed over to the Union having been allayed.

Basutoland in 1912 changed its financial year to end at March 31 (instead of June 30) to bring it in line with the rest of British South Africa. Its prosperity is shown by the fact that for the nine months which constituted the financial year 1911-12 the revenue was £138,000, compared with £145,000 for the full twelve months on the preceding financial year. Expenditure in 1910-11 was £134,000, in 1911-12 £111,000. At the time of the census of 1911 over 21,000 male Basutos were absent from the territory, 11,800 being engaged on the Rand mines. Agriculture and stock-raising are the occupations of those who stay at home. Strenuous efforts were made by the administrator to improve agricultural methods, and in 1912 there was a marked increase in the quality and quantity of wool and mohair produced. Education is fairly general; 17,400 scholars, the majority girls, were in attendance at the mission schools of the Paris Evangelical Society and other bodies. In 1911 the hut tax was abolished and a tax of £1 per annum on adult males substituted, or if a native has more than one wife he pays £1 p. a. for each wife up to a maximum of £3 a year for himself and his wives. This tax yielded £92,000 in 1912. The Basutoland national council met at the capital, Maseru, in March 1912. This council consists of 99 members (all natives) and the paramount chief (Letsie); 94 members are nominated by the Basuto themselves, 5 by the government. This council is an advisory body and keenly critical. The Resident Commissioner (appointed 1901), Mr. H. C. Sloley, was made a K.C.M.G. in 1911.

Bechuanaland is a much poorer country than Basutoland, and the Bechuana a much less virile race than the Basuto. They suffered in 1911, and again in 1912, from prolonged drought. Financially Bechuanaland approached an equilibrium in 1911-12, when the revenue was £59,000 and the expenditure £65,000, the deficit, made good by the Imperial Government, being the smallest on record. This was due to the fact that the staple product of the protectorate—cattle (which between 1904 and 1911 increased from 139,000 to 323,000)—had for the first time access to a good market, Johannesburg and Kimberley, restrictions previously enforced owing to fear of cattle disease being removed. A sum of £70,000 was realised by the natives through the sale of surplus cattle. Bathoen, paramount chief of the Bangwaketse died in July 1910 and Sebele, paramount chief of the Bakwena died in January 1911. Montsiva, chief of the Baralong, died in April 1911. All these chiefs were noted men in the early struggles between the Boers and British for the possession of Bechuanaland, Sebele being

son of the chief Sechele, the friend of David Livingstone. Khama survives and rules his tribe—the Bamangwato—with undisputed authority.

Swaziland is steadily recovering from the state of chaos into which it had fallen (see *E. B.* xxvi, 186). The white inhabitants are engaged in agriculture and in gold and tin mining. In 1911-12 the gold output was £62,000; that of tin £32,000. The staple agricultural product is maize. During 1911-12 there was a considerable development in fruit growing especially citrus fruits. The Swazis raise maize and other crops and own large stocks of cattle. From 7,000 to 10,000 Swazis obtain work on the Rand mines. The partition of rights between the European concessionaires and the Swazis was completed in 1911. Altogether £182,000 was expended on the settlement of this question. In 1911-12 the total revenue was £57,000; the expenditure £62,000. In 1911 a National Fund was established, to be used for purposes beneficial to the Swazis. To this fund every adult male Swazi pays a direct tax of 2s. a year. Naba Tsibeni, the "queen regent" continued to act as chief of the Swazis. Sobhuza, her grandson and nominally paramount chief, was in 1912 about fourteen years old.

Political History.—The most salient feature in the history of South Africa since the establishment of the Union has been the endeavour made to develop the material resources of the country, especially its agricultural and general trade. The results achieved have been indicated in preceding sections of this article.

The parliament of South Africa legislating for the whole Union, the provincial councils took a purely secondary position. Racial questions, as between the British and Boer sections of the community, tended to occupy a less conspicuous position, though the indiscreet actions and utterances of General Hertzog, the minister of Justice and an ardent champion of Boer nationality, caused much embarrassment to his colleagues and disquiet among the people.

General Botha,¹ the Prime Minister in the first session of the Union Parliament (opened November 1910), had the support not only of his own party, the Nationalist or "South African" party (predominantly Boer), but that of the four Labour members from the Rand and of several of the Natal members, elected as Independents. The opposition, known as the Unionist party (and mainly British), was led by Dr. Jameson (see *E. B.* xv, 147), who was created a baronet in January 1911. Owing to ill-health Sir Starr Jameson resigned the leadership in April 1912 and was succeeded by Sir Thomas Smartt, an ex-Cape minister, and like Jameson a medical man. In October 1912 Sir Starr Jameson retired from parliament altogether, resigning his seat for Albany (Graham's Town).

General Botha made one important change in the cabinet during the first session, Sir F. R. Moor, ex-Premier of Natal, being succeeded on February 22d as minister of Commerce and Industries by Col. George Leuchars, also a Natal representative. This first session was devoted mainly to putting the Union machinery into working order. The most controversial issue considered arose out of the Education Acts of the former Orange River Colony (see *E. B.* xx, 160) which enforced bi-lingualism. Elementary education was by the act establishing the Union left in the control of the provincial councils. The Union parliament could therefore only advise. A select committee on which both parties were equally represented considered the subject, and on the 17th of April 1911 presented a majority report recommending that up to standard IV instruction in schools be given in and through the "home language," with the optional use, on the demand of parents, of the other language, and that above standard IV freedom of choice be left to the parents; also that teachers should be free to qualify in either language. On April 24th the Union parliament approved this compromise, though General Hertzog (formerly minister of education in the Orange River Colony) was not in full agreement. The success of an action for slander brought against Hertzog (August 1911) by Mr. Wm. Fraser, an ex-inspector of schools—whom that minister had dismissed in May 1909—caused considerable scandal, which was intensified by the success of another slander action (November 1911) against Hertzog, the plaintiff in the second case being Dr. Ward, president of the O.F.S. medical council. The situation was rendered piquant by the fact that Hertzog was minister of Justice. Hertzog's resignation was

¹ General Botha was on August 16, 1912 appointed an honorary general in the British army.

tendered, but Botha, fearing to alienate the more extreme Boer element, of which Hertzog was the leading representative, did not accept it.

General Botha had delayed till October 1911 to urge, officially, that the educational compromise advocated by the Union parliament be adopted by the provincial councils.¹ Meantime the Transvaal provincial council had passed (August 1911) an ordinance in which the terms of the compromise were adopted, but with a modification which favoured the Dutch language. The Free State province passed an ordinance containing the same modification, and in August 1912, the Cape provincial council by a majority of three passed a similar ordinance. Meantime the Natal council in view of the departure of the inland provinces from the strict terms of the compromise had refused to alter its education law. But in the Free State the new ordinance was so far accepted that on June 30, 1912, the free schools opened in 1910 as a protest against General Hertzog's compulsory bi-lingual system were handed over to the provincial administration.

Besides the language problem, the Union parliament during 1911-12 attempted to grapple with great social and political issues which as separate colonies the various provinces of the Union had been unable to solve. They concerned the relation of the Europeans to the native population; the position of Asiatics in South Africa (nearly all the Asiatics in the country were British Indians); and national and imperial defence. In regard to the relation of the white and Kaffir races to each other some little progress was made. Assaults on white women by Kaffirs both on the Rand and in Rhodesia attracted much attention. On the Rand in the first half of 1911 three Kaffirs were shot by white women whom they had attempted to assault. This shooting followed the commutation, in January 1911, by the High Commissioner (Lord Gladstone) of a death sentence on a Rhodesian native convicted of an attempt to assault a white woman; action which roused much indignation against the High Commissioner. Feeling was intensified by the acquittal in August 1911, by a Rhodesian jury, of a white man who had shot dead a Kaffir.² In all during the year ending March 31, 1912, there was in the Union alone (*i.e.* Rhodesia excluded) 85 cases of outrages upon Europeans by natives, as compared with 69 during 1910. On the initiative of Sir Thomas Smartt a commission was appointed June 19, 1912 "to enquire into the prevalence of sexual assaults on women by men of the same or of different race and colour, the extent to which they are attributable to economic and social factors, and to report means for their suppression." Mr. Melius de Villiers (ex-Chief Justice of the Orange Free State and a brother of Lord de Villiers) was appointed chairman of the commission, whose membership included four ladies, one from each province. On the Rand the evil was attributed in part to illicit liquor selling and in part to the fact that the mine labourers were without their women-folk, and a petition signed by 52,000 Rand residents (presented to parliament May 1912) asked *inter alia* for the provision of compounds in which natives should be permitted to keep their wives, as well as for facilities for training native female servants and for the importation of European domestics.

This aspect of the case was recognised as but a part of a problem of vital importance, namely, the position of the natives in the body politic. South Africa at present is dependent on the native for unskilled labour. But even the position of the European as an overseer of blacks is threatened. In the Cape province the coloured population already competes with the whites in skilled labour, such as carpentry work, harness-making and boot-making (see *e.g.* *Report on Trade of British South Africa for 1911*). The pure African too has entered the skilled labour market, and is making many sacrifices in order to become well educated. Moreover in the Cape province—and to a slight extent in the other provinces—coloured and native men have entered the profes-

¹ The administrators of the various provinces were: Cape, Sir N. F. de Waal; Natal, the Hon. C. J. Smythe (b. 1852), an ex-premier of Natal; Orange Free State, Dr. A. E. W. Ramsbottom; Transvaal, Hon. J. Rissik (formerly member for lands and native affairs, Transvaal).

² Subsequently a special jury list was made for the trial of these cases, it being recognised that the ordinary jury could not be trusted to administer impartial justice.

sions. They are lawyers, doctors, land surveyors and journalists. One native was elected (1910) a member of the first Cape provincial council. A clash between the two races is feared by many thoughtful leaders of the white community. One solution of the problem favoured is the keeping of whites and blacks in separate areas. General Botha in a speech in parliament (May 9, 1912) stated that "the time was coming when the native question would have to be considered most seriously in the direction of keeping whites and natives apart and preventing their intermingling. They would have to fix attention closely on the question of segregation, while treating everyone with absolute justice."

The segregation plan also received the support, among many others, of Sir Mathew Nathan, an ex-governor of Natal, and General Hertzog. But it was opposed by those who, like Mr. P. W. Schreiner and Mr. Patrick Duncan (a leading member of the Unionist party), believe that it is both wrong and impolitic to put hindrances in the way of the advancement of the natives in civilisation and industrial efficiency. Mr. Duncan in a striking pamphlet published in October 1912 ("Suggestions for a Native Policy") admits the dangers foreseen by the segregationists, but sees a remedy in European immigration on a large scale. "Nothing else" he declares "will save South Africa for the European race." A motion brought forward at the Unionist Congress in Johannesburg (Nov. 21, 1912) to commit the party to the policy of segregation was defeated, the previous question being carried by 91 votes to 7.

Consciousness of the peril of the native problem caused the white inhabitants of South Africa to determine not willingly to add to it an Asiatic problem of equal perplexity. They exhibited a rigid determination to prohibit the immigration of Asiatics in the future alike on racial and economic grounds. The only dissentients were tea and sugar planters of Natal who were accustomed to depend upon coolies for labour. In 1911 and again in 1912 the government introduced an Immigrants Restriction Bill. General Smuts, Minister of the Interior, in moving the second reading of the bill, May 30, 1912, said that without excluding Asiatics by name the government had adopted the suggestion of the British Colonial Office (a suggestion supported by the government of India) to apply to immigrants an educational and medical test based on the Australian model. That test admitted of elasticity in its application so that whites might be encouraged to come in while Asiatics were kept out. An arrangement had been come to with the Imperial Government to allow the entry of educated professional Asiatics in limited numbers. Objections to any concessions to Indians were raised by the Free State supporters of the ministry and the bill was dropped, but in September 1912 the intention of the cabinet to introduce an amended bill in 1913 was announced. In October 1912 Mr. Gokhale, an elected member of the Indian Legislative Council, visited South Africa and in November went to Pretoria as the guest of the Union government to confer with them on the matter. The Indian government on its part had meantime (1911) prohibited the importation of indentured Indians to Natal.

Little indication was given of the manner in which the Union government meant to deal with "the Indian peril" in Natal. There are in Natal 133,000 Indians; they are more numerous than the whites; they are moreover not only labourers, they have monopolised several branches of trade. It would seem that they must remain a permanent factor in the life of Natal. But to prevent the same problem arising in the Transvaal the law of 1907 prohibiting the immigration of Asiatics into that province, and enacting the registration—by finger prints—of Indians already in the province, was enforced (see *E. B.* xxvii, 209, 210). In many cases the provincial administration applied the law in an unnecessarily objectionable form. The Indians replied by a campaign of passive resistance. Many of their leaders, high caste Hindus, were imprisoned and great indignation was aroused in India by what Mr. Gokhale called "the continued ill-treatment of Indians in South Africa." Before the end of 1911, however, certain modifications in the registration laws were agreed to by the provincial council, the exact status of British Indians in the Transvaal being left over for decision with the larger question of Asiatic immigration.

The session of 1911-12 revealed acute differences in the cabinet and in the ministerial ranks. Mr. J. X. Merriman, ex-Cape Premier, the most accomplished parliamentarian and ablest financier in the House of Assembly, was a very candid friend of the ministry, as when in June 1912 he denounced their financial proposals as predatory and extravagant. The ministry itself was divided on personal and provincial and also progressive and retrogressive lines. Chief among Botha's colleagues were Mr. H. C. Hull and Mr. Jacobus Wilhelmus Sauer. Mr. Hull (b. 1860) after being in the Cape civil service had practised at the bar, served in the war of 1899-1902 and was afterwards treasurer of the Transvaal and he entered the Union cabinet as minister of finance. Mr. Sauer (b. 1850) had been 30 years a member of the Cape House of Assembly and had frequently held office. On the establishment of the Union he became Minister of Railways and Harbours and Chairman of the Railways and Harbours Board created by the Union Act, the largest revenue producing department of state. Mr. Sauer became head of one section of the cabinet; General Botha or rather Mr. Hull head of another. As early as July 1911 cabinet dissensions occurred, but there was no open breach until May 18, 1912, when Mr. Hull resigned. The ministerial differences were aired in two set debates in the House of Assembly. Mr. Hull alleged that railway expenditure was not previously sanctioned by the Treasury and that there had been a tendency to regard railway administration as something for which the government had no collective responsibility. General Botha (May 22d) admitted that the cabinet had not been sufficiently considered in railway matters.

As a result of this episode within the ministry itself General Botha's authority was weakened. The reconstruction of the cabinet was postponed until after the close of the parliamentary session, on June 24th. After two days' negotiations, Mr. Sauer and his friends threatening to resign if their demands were not granted, a compromise was reached. Mr. Henry Burton, K.C., another ex-Cape Colony minister, took over the Railways and Harbours; General Smuts (Transvaal) was transferred from the Ministry of the Interior to that of Finance; Mr. Sauer became Minister of Agriculture (an office General Botha had held in conjunction with the premiership); Mr. Fischer (Orange Free State) became minister of the Interior, while retaining his portfolio as minister of Lands, while General Hertzog, in addition to his duties as Minister of Justice, undertook those concerning Native Affairs, which Mr. Burton had previously administered. The cabinet—whose other members were Col. Leuchars, Mr. F. S. Malan (Cape) and Sir David de Villiers Graaff (Cape)—was thus reduced to nine members, 4 of them being representatives from the Cape, 2 from the Transvaal, 2 from the Orange Free State and one from Natal.

The question of defence came prominently before the country in connection with the Imperial conference held in London in 1911, which General Botha attended as representing the Union. It was decided that South Africa should provide for its own internal defence, and a Defence Act was passed in the Union parliament in June 1912, creating a citizen force at a cost of about £500,000 a year; this is in addition to a permanent force of five regiments. The act provided for the military training of 50% of the young men between 18 and 21; the other 50% being compelled to join rifle clubs and similar associations. The 50% for training are obtained in the first place by voluntary enlistment, but if sufficient numbers are not forthcoming by this method, then by ballot. Members of the Citizen Force with the colours are paid. Provision was made for artillery, cavalry, infantry, engineer and transport units, uniformity with the units of the other over-sea Dominions being aimed at. General C. F. Beyers, one of the Transvaal commandants in the Anglo-Boer War was appointed Commandant General, while the Council of Defence created by the act consisted of General Schalk Burger (Transvaal), Col. Crewe (Cape), General de Wet (Orange Free State), and Col. Sir Duncan Mackenzie (Natal).

Objections to the act came chiefly from the "back-veld" Boers who entertained strong dislike to compulsory service. The force being established, the reduction of the strength of the British Imperial forces in South Africa from 11,500 to about 7,000

was announced in November 1912. The Union government had also under consideration proposals for a naval defence policy, General Botha educating his followers on this matter in several speeches made during 1912.

A notable event in the history of the country was the inauguration of the Rhodes memorial at Groot Schuur on July 5, 1912 by Earl Grey, a former director of the Chartered Company and ex-governor general of Canada. The ceremony was attended by Lord de Villiers, Chief Justice of South Africa, Mr. Merriman, and Mr. Burton, minister of Railways. General Botha was absent, but he subsequently wrote a foreword to the pamphlet containing Earl Grey's speech, in which he (Botha) paid a warm tribute to Rhodes' lofty conceptions and achievements.

Lord Gladstone, who filled the dual offices of Governor General of the Union and High Commissioner of South Africa, was subjected to much criticism over his action with regard to natives charged with assaults on white women, but he met his critics fairly and won their respect. In February 1911 he was made an LL.D. of Cape Town University.¹ In May of that year he visited Basutoland, in September he went to Rhodesia (where he received Lewanika, the paramount chief of the Barotse), extending his journey into Katanga (Belgian Congo). In the summer of 1912 Lord Gladstone paid a long visit to England, returning to South Africa in October.

The promotion of trade and agriculture occupied much attention, especially as the country suffered from prolonged drought, the severest experienced since 1862. Beginning in October 1911, it affected chiefly Natal, the Transvaal and Transkei, where thousands of natives were reduced to the verge of starvation. The severe losses sustained turned attention to the need of more scientific farming and to large irrigation works, upon which the government expended £500,000 in 1912. In October 1912 a government Land and Agricultural Bank began operations in the Union, and a similar institution was established by the Chartered Company in Rhodesia. Great relief was experienced in Natal and in the Rand by the break up of the drought in November 1912. Meantime the export of cereals from South Africa had fallen off considerably, while a new and formidable competitor for the European maize market was being found in Argentina.

Early in 1912 a commission, of which Sir T. M. Cullinan was chairman, appointed to enquire into the conditions of trade and industries reported in favour of increased duties on wheat, flour, sugar, tea, clothing and furniture, declaring that it was "not only necessary that a policy of protection should be adopted, but that there should be continuity of policy." Two influential members presented minority reports in favour of "the open-door." Rhodesian feeling was in favour of a lower tariff, and with reference to the increased duties proposed by the Union commission the Bulawayo Chamber of Commerce declared (August 1912) that it was to the interest of Rhodesia to withdraw from the Customs Union rather than bear greater fiscal burdens. The other Rhodesian Chambers of Commerce passed similar resolutions. At Johannesburg on November 19, 1912 Sir Thomas Smartt declared that a plank in the Unionist party's platform was a tariff primarily for revenue purposes, combined with a policy for the encouragement of industries for the general benefit and the extension of the existing imperial preference.

In December 1912 a political crisis involving the reconstruction of the ministry occurred. It was precipitated by the by-election in the Albany division to fill the vacancy caused by Sir Starr Jameson's resignation. (The election on Dec. 10 resulted in the return of the Unionist candidate Mr. Van der Riet by a large majority over the Ministerialist, Mr. Espin.) General Hertzog had already (Oct. 1912) created anew a feeling of political antagonism by describing, in a speech at Nylstroom, Sir Thomas Smartt and other Opposition leaders as "undesirable political foreign adventurers," and during the Albany election he made a speech—at Rustenburg on December 8,—pointedly against the Imperial policy advocated by General Botha, declaring that

¹ George V after his accession resigned his position as Chancellor of the Cape University, being succeeded in 1912 by the Duke of Connaught.

Imperialism appealed to him (Hertzog) only when it was useful to South Africa. He had a short time previously also pronounced in favour of the Dutch and British remaining "two nationalities flowing each in a separate channel." On December 13, Col. Leuchars, Minister of Public Works, resigned as a protest against General Hertzog's "Anti-Imperial and Anti-British sentiments." As Hertzog was not prepared to resign, General Botha tendered his resignation on December 15, and was at once asked by the Governor General to form a new ministry. This was accomplished on December 20; Mr. Fischer, a minister who had usually acted with General Hertzog, deciding after much hesitation to join the new ministry. The cabinet was reconstituted as follows:—General Botha, Premier and Minister of Agriculture, Mr. Sauer, Minister of Justice and Native Affairs; General Smuts, Minister of Finance and Defence; Mr. Fischer, Minister of the Interior and of Lands; Mr. Malan, Minister of Mines and Education; Mr. Burton, Minister of Railways and Harbours; Sir Thomas Watt, Minister of Posts, Telegraphs and Public Works; Sir D. de Villiers Graaff, minister without portfolio. The only new member was Sir T. Watt, who, as a Natal member of the House of Assembly, replaced Col. Leuchars. General Botha described the new ministry as aiming first "at building up a new country on non-racial lines."

OBITUARY.—The deaths of some prominent South Africans may here be noted:—

Sir THOMAS EKINS FULLER, formerly agent-general for Cape Colony, died at Tunbridge Wells on the 5th of September 1910. Born at West Drayton, Middlesex, in 1831, he was for some time a Baptist minister, leaving England to edit the *Cape Argus* in 1864. He was subsequently general manager of the Union Steamship Company, Chairman of the Cape Town Harbour Board, a director of the De Beers Mining Company and member of the House of Assembly (see *E. B.* v, 248). In 1902 he was appointed agent-general for Cape Colony in London, and knighted in 1904. "Tommy" Fuller was one of the most esteemed and respected men in South African circles.

PIET ARNOLDUS CRONJE, the Boer general (see *E. B.* vii, 501c), died at Klerksdorp, Transvaal, on the 4th of February 1911, aged 75. Since the war ended he had sunk into comparative obscurity.

Sir JACOBUS ALBERTUS DE WET, Member of the Legislative Council of Cape Colony, died at his home in Cape Colony on the 26th of March 1911, aged 71. He came of an old South African family. He was appointed British Agent at Pretoria in 1890, during the critical period (see *E. B.* xxvii, 200 *et seq.*) which ended with the closing of the Vaal River Drifts, and his name was familiar in connection with the proceedings after the Jameson raid in 1896.

Sir HENRY GEORGE ELLIOT, born in 1826, died at Cape Town, 20th of November 1912. He entered the Royal Marines in 1847 and served through the Crimean War. In 1877 he became chief magistrate of Tembuland, and for 26 years he took a great share in the government and development of Kaffraria (see *E. B.* xv, 630a).

Sir THOMAS CHARLES SCANLEN, the Cape Colony politician, died at Cape Town, on the 15th of May 1912, aged 77. He was admitted Attorney of the Supreme Court of Cape Colony in 1866, sat in the House of Assembly from 1870-96, and was Prime Minister of the Colony from 1881-84 (see *E. B.* v, 248b, and 242c). In 1894 he was appointed Legal Adviser to the British South Africa Company, and held the position of Acting Administrator of Rhodesia at intervals from 1898-1907. He was knighted in 1884.

ARTHUR JESSE SHEPSTONE, the Natal politician, died at Pietermaritzburg on the 30th of September 1912, aged 59. He was born in 1852, the son of Sir Theophilus Shepstone (see *E. B.* xxiv, 840), and was educated in Natal. He was a digger at the Kimberley Diamond Fields in 1871, and served as a trooper in the Natal Carbineers during the Langalibalele rebellion in 1873. In 1876 he was appointed Labour Agent for the Natal railways. In 1887 he became a resident magistrate, and served in various districts. In 1909 he became Secretary for Native Affairs in Natal.

Brown, *The Guide to South and East Africa* (London, yearly); *The South African Municipal Year Book* (Cape Town, 1912); *The Report of the Commission on Trade and Industries* (Pretoria, 1912) and other Union Blue Books (particulars may be obtained at the office of the High Commissioner for South Africa, Sir Richard Solomon 72, Victoria Street, London, S. W.); E. H. L. Schwarz *South African Geology* (London, 1912). For history see Sir Edgar Walton, *The Inner History of the National Convention of S. Africa* (London, 1912) mainly a summary of speeches; Basil Worsfold, *Union of South Africa* (London, 1912); Sir William Butler, *An Autobiography* (London, 1911), contains S. African chapters.

SECTION II. THE UNITED STATES OF AMERICA

THE UNITED STATES¹

POPULATION.—In 1910 the population of the United States and possessions (the latter estimated) was 101,100,000; the actual enumeration (including Alaska, Hawaii and Porto Rico) was 93,402,151; and the inhabitants of "continental" United States (including Alaska), 91,972,266, the figure used as a basis of comparison here. Of this total three-fifths (60.6%) was contained in the three-tenths of the country's area in the "Northern" states:² *i.e.* New England (one-fourteenth of the total population); the Middle Atlantic group (more than one-fifth); the East North Central group (nearly one-fifth); and the West North Central (more than one-eighth). In this group the proportion of population was twice the proportion of area. In the Southern states the proportion of population (nearly one-third) was about the same as the proportion of area, not quite three-tenths; in the South Atlantic group it was two-fifteenths (13.3%); in the East South Central one-eleventh (9.1%), and in the West South Central nearly a tenth (9.6%) of the total. The Western states with nearly two-fifths (39.6%) of the area had less than two-twenty-fifths (7.4%) of the population—relative population being to relative area as one to five; in the Mountain states there was about 2.9% and in the Pacific states about 4.6% of the total population. Roughly three-tenths of the area and seven-tenths of the population was east of the Mississippi river; and seven-tenths of the area and three-tenths of the population west of it.

Of the separate states eleven had each more than two and a half million inhabitants, and together they contained a larger population than the other 37 states (and the District of Columbia); in order these were: New York, Pennsylvania, Illinois, Ohio, Texas, Massachusetts, Missouri, Michigan, Indiana, Georgia and New Jersey. Only two of these states are west of the Mississippi—Texas, the largest state of the Union in area, and Missouri, an important manufacturing state. The only one in the "Old South" is Georgia, the great producer of coal and iron in the South.

The relative increase for the entire country in the decade was 21%,—a little more than in 1890-1900, but less than in any other decade, even 1860-70, when the rate was 22.6% (or a little more). The actual increase in 1900-10 was 15,977,691, a much greater one than ever before, and equal to the entire population about 1835.

The decade's growth was largest in the West, 66.7%, as compared with 19.8% for the South and 17.7% for the North. In the groups the greatest increase was 73.5% (only 28 in 1890-1900) in the three Pacific states; and least in the East South Central group (Kentucky, Tennessee, Alabama and Mississippi; 11.4% (in 1890-1900, 17.4%). In the most populous group, the three Middle Atlantic states, the rate was 25%. Three states, Washington, Oklahoma (both comparatively new states) and Idaho, doubled in population, and Nevada came near doubling; the growth in the last two states was partly due to changes in mining. Iowa, alone, decreased (0.3%) in the decade. The lowest rates of increase were in rural New England (Vermont, 3.6%; New Hampshire, 4.6%), where economic conditions resemble those in the East South Central group.

In 1910 the Middle Atlantic states ranked first and the East North Central states second, changing positions since 1900. In the same way the West South Central, fifth, and the East South Central, sixth in 1910, exchanged rankings in the decade.

¹ See *E. B.* xxvii, 612 *et seq.*

² The classification of states is as follows: Northern, including New England Group (Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut), Middle Atlantic (New York, New Jersey, and Pennsylvania), East North Central (Ohio, Indiana, Illinois, Michigan and Wisconsin), West North Central (Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska and Kansas) Southern, including the South Atlantic Group (Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia and Florida), East South Central (Kentucky, Tennessee, Alabama, and Mississippi), West South Central (Arkansas, Louisiana, Oklahoma, Texas), and Western, including the Mountain Group (Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah and Nevada) and Pacific Group (Washington, Oregon and California).

The other groups did not change in rank. South Atlantic, third; West North Central, fourth; New England, seventh; Pacific, eighth; and Mountain, ninth.

The average density of population in 1910 was 30.9 persons to the square mile—nearly thrice that (10.6) in 1860. The variations in different parts of the country are great; from 3.1 persons to the square mile in the Mountain Group (0.7 in Nevada)—a much smaller density in 1910 than that (4.5) for the original thirteen states in 1790—to 193.2 in the Middle Atlantic states (337.7 in New Jersey), 418.8 in Massachusetts and 508.5 in Rhode Island. The greatest density is in the District of Columbia (*i.e.*, Washington) 5,517.8.

The centre of population in 1910 was in Bloomington, Indiana ($39^{\circ} 10' 12''$ N. lat.; $86^{\circ} 32' 20''$ W. long.), or rather over 39 miles north of where it was in 1900; in 1790 it was 23 m. E. of Baltimore, only 6' 18" further north, but about 557 m. to the east. The median point of area of "Continental United States" is 657 m. further west and about 50 m. to the north, in Smith county, northern Kansas.

The number of males to 100 females was 106 in 1910 (104.4 in 1900; increase due to immigration), and the variation in different parts of the country was marked; 99.3 in New England, but 127.9 in the Mountain states and 129.5 in the Pacific states. More illuminating is the ratio of males to 100 females in different "nativities" and colours of the population: 98.9 among negroes; 99.5 among native whites of foreign parentage; 104 among native whites of native parentage; 129.2 among foreign whites; and 185 among all others—mostly Asiatics and temporary immigrants. These ratios differ little from those in 1900. In the West the ratios in each state were much higher than this average. Five states, comparatively the older communities,—Massachusetts, Rhode Island, Maryland, and North and South Carolina,—and the District of Columbia, had in 1910 more females than males. New Hampshire, New York, New Jersey, Virginia and Georgia,—also of the earlier-settled territory—were in this group in 1900 but not in 1910. In 1910 the males of voting age numbered 26,999,151, or 29.4 % of the total population (in 1900, 21,134,299; or 27.8 %).

In the decade 1900-10 the rate of increase of the white population was 22.3 % and that of the negro population 11.3 %, the former a little more and the latter a great deal less than the rate (21 %) for the entire population. So that the white population increased relatively from 87.9 % to 88.9 % of the total population, and the negroes decreased from 11.6 % to 10.7 % (8,833,994 in 1900; 9,828,294 in 1910). In 1910 the Indian population was 265,683 (237,196 in 1900); the Chinese, 70,944 (89,863 in 1900); and the Japanese, 71,722, nearly thrice the number (24,326) in 1900. The percentage of whites was highest in New England (98.9 %; in New Hampshire, 99.8 %) and lowest in the South Atlantic group (66.2 %), where, however, it was higher than in 1900 (64.2); and, for any one state, lowest in Mississippi (43.7; in 1900, 41.3 %). The relative decrease in the negro population is not due merely to the more rapid increase of population in the North, for there was such a decrease throughout the South Atlantic states, where they were 35.7 % in 1900 and only 33.7 % in 1910, and in Mississippi (58.5 and 56.2) and Alabama (45.2 and 42.5). In the South Atlantic states the highest percentage of negroes was in South Carolina, 58.4 in 1900 and 55.2 in 1910. In the New England and Middle Atlantic groups, manufacturing States fed by constant immigration, the whites of foreign birth and of foreign parentage made up more than one-half the total (59 % New England; 53.9 % Middle Atlantic). The Pacific states, with their strong appeal to the immigrant, come next with 45.7 % (48.5 in California). The New England and Middle Atlantic states rank highest in both foreign-parentage and foreign-birth, *i.e.*, in the immigration of the last and present generations. The East and West North Central states (28 % and 27.6 % of foreign parentage) rank next highest in the immigration of the last generation; and the Pacific states (20.6 % of foreign-born whites) next in more recent immigration. In the South the foreign element is small: 6 % (3.6 foreign-parentage and 2.4 foreign-born) in the South Atlantic states (only 1.1 % in South Carolina); 3.6 % (2.6 and 1) in East South Central (only 1.6 in Mississippi and 2.4 % in Alabama); and 10.9 % (6.9 and 4) in West South Central (3.4 in Arkansas).

Immigration.—Immigration is more and more from southern and eastern Europe. Austria-Hungary, Italy and Russia supplied one-sixteenth of the immigrants in 1871-80, one-sixth in the next decade, one-half in the next and nearly two-thirds in 1901-10. In 1910 the percentage to the total population of foreign-birth from Russia and Finland was 12.8 (6.3 in 1900), from Austria-Hungary 12.4 (6.2 in 1900), and from Italy 10.1 (4.7 in 1900). In 1900 there were 8,513 Greeks; in 1910 101,100. Although there were large percentages in 1910 of foreign-born whites from Germany (18.7), from Ireland (10.1), from the Scandinavian countries (9.4), from Great Britain (9.2) and from Canada and Newfoundland (9), this is much less important than the fact that these percentages were smaller than in 1900, when they were 27.5, 15.8, 10.4, 11.4 and 11.5, respectively. In mill work Slavs and Armenians are employed where, a generation ago, there were Irish and French-Canadians; and in small shops, especially in the East, Greeks are rapidly displacing the Italians, who were themselves new-comers, in the sale of fruit and in the ownership of boot-blackening and small barber shops fifteen years ago.

¹ This proportion is not typically American, but is nearer the ratio in Europe.

Urban Growth.—In 1910 the urban population (in 2,405 incorporated places each of 2,500 inhabitants or more) was 42,623,383, about six-thirteenths of the total population and in this territory the increase in the preceding decade was 34.8%, in rural territory, 11.2%, and in the whole country, 21%. The increase in urban population (nearly 12,000,000) made up about seven-tenths of the total increase in the decade. More than two-thirds of this urban population in 1910 was in the three groups (New England, 12.8%; Middle Atlantic, 32.2%; and East North Central, 22.6%), which were comparatively early-settled and are pre-eminently manufacturing. In New England (where the census includes townships or "towns" among urban territory) the urban population was five-sixths of the total; it was more than nine-tenths of the whole in Rhode Island (96.7%) and Massachusetts (92.8) and was less than half only in Vermont (48.6). In the Middle Atlantic states seven-tenths (71%) of the total population was urban; in New York, 78.8%; in New Jersey, 75.2%, and in Pennsylvania, 60.4%. In the East North Central the urban population made up more than half (52.7%) of the total; the ratios were highest in Illinois (61.7%) and Ohio (55.9%). Other states in which the urban population was greater than the rural were: California (61.8% urban), Washington (53%), Maryland (50.8%) and Colorado (50.7%). The percentage in the Pacific Group, where city growth has been very rapid, was 56.8 in 1910 but only 46.4 in 1900 and 36.2 in 1880; the urban population from 1900 to 1910 more than doubled and the percentage of increase in Washington was 166%, in Oregon, 115% and in California, 81.4%.

Nearly one-ninth of the country's urban population was in New York City (4,766,883), and about one-fifth (8,501,174) in New York City, Chicago (2,185,283) and Philadelphia (1,549,008),¹ taken together. In 1910 there was 5 (in 1900, 3) cities between 500,000 and 1,000,000; 11 (in 1900, 9), between 250,000 and 500,000; and 31 (in 1900, 23), between 100,000 and 250,000. The 50 cities each with more than 100,000 inhabitants included 14 which had less than 100,000 in 1900 (when Spokane had only 36,848); their total in 1910 was 20,302,138,—nearly one-half the urban population.

Illiteracy.—In spite of the great increase in 1900–10 of population especially in large cities, the growth of immigration and especially of immigration from southern and eastern Europe and from Asia, the number of illiterates (10 years old and over) decreased from 6,180,069 to 5,516,693. The percentage of illiterates was 10.7 in 1900 and 7.7 in 1910. In the latter year the rate was highest in the South: 17.4 in the East South Central, 16 in the South Atlantic and 13.2 in the West South Central. But these percentages showed immense progress over 1900 (when the corresponding figures were 24.9, 23.9 and 20.5). In each of the other groups of states the rate was lower than the average for the entire country—ranging from 6.8 (9.6 in 1900) in the Mountain states to 3 (4.2 in 1900) in the Pacific and 2.9 (4.1 in 1900) in the West North Central groups. In New York and Connecticut the actual number of illiterates increased in the decade and the percentage remained 5.5 in New York as it was in 1900 and increased in Connecticut from 5.9 to 6; this was due to large immigration of a non-Teuton class. The presence of a large proportion, and, in a few states, of a majority, of negroes in the South makes the rate of illiteracy high there; but the improvement in the decade is more marked in the negro than in the white population—the actual decrease during the decade in the number of all illiterates in the country was 663,376, of negro illiterates, 625,107. The highest rates for the entire population, over 10 years, in 1910 were: 29 in Louisiana (38.5 in 1900) and 25.7 in South Carolina (35.9 in 1900). In the former state the rate for whites was 14.2 (18.4 in 1900) and for negroes 48.4 (61.1 in 1900); and in South Carolina the rate for whites was 10.3 (13.5 in 1900) and for negroes 38.7 (52.8 in 1900). In the South, the number of white illiterates increased only in Texas and Louisiana; the number of negro illiterates increased only in Oklahoma.

*AGRICULTURE.*²—In 1910 the number of farms was 6,361,502, being 10.9% more than in 1900, but the area in farms, 878,798,325 acres (46.2% of the land area of the country), was only 4.8% more than in 1900. Considerably more than half of this area (478,451,750 acres) was improved and it is a true index of the progress of agriculture that this improved area was 15.4% greater than ten years before. The average farm acreage decreased from 146.2 to 138.1 acres, and both this fact and the increase in the average value of farm land per acre from \$15.57 to \$32.40 (108.1%—due, in part, no doubt, to the increased cost of living and general rise in prices) and in the average value of farm property per farm from \$3,563 to \$6,444 (80.9% increase—for a farm 5.5% smaller) show gradually intensified farming. The rapid increase in all prices can explain only a part of the increase, 100.5%, in the total value of farm property, \$40,991,449,090: of this total the items were: land \$28,475,674,169 (118.1% increase);

¹ A more exact idea of this centralisation of the urban population in these cities may be gained by taking the population of the three metropolitan districts, that is of the territory within 10 miles of the charter boundaries of each. The total for these three cities and their immediately adjacent districts was 10,913,831: New York (including Newark and Jersey City), 6,474,568; Chicago, 2,466,921, and Philadelphia, 1,972,342. On the same basis the population of the Boston district was 1,520,470, of the Pittsburgh district 1,042,855, and of St. Louis and its immediate vicinity, 828,733. Twenty-five such metropolitan districts each containing a city with more than 200,000, contained 22,088,331 inhabitants.

² See *E. B. 1*, 414 *et seq.*

buildings, \$6,325,451,528 (77.8%); implements and machinery \$1,265,149,783 (68.7%); and domestic animals, poultry and bees, \$4,925,173,610 (60.1%).

In 1910 east of the Mississippi were 41.7% of all farm land and 45.6% of improved farm land; in 1900, 43.8% and 51.1%. The land in farms was divided in 1910 between North, South and West in proportion of 47.1, 40.3 and 12.6%; the corresponding figures for 1900 being 45.6, 43.2 and 11.2%. Of the improved area 60.6% was in the North, 31.5% in the South and 7.9% in the West in 1910; the percentages in 1900 were 63, 30.4 and 6.6.

Acreage of Farms.—Of the total increase in farm acreage in the decade more than three-fourths was in the West North Central states, where the percentage of increase was 15.7%. An even larger percentage but a much smaller total increase was in the Mountain group (28.3%). There was scarcely any increase in the East South Central group (0.3%), and actual decreases in the West South Central (4.2%), in New England (4.1) and in the Middle Atlantic group (3.7%). Only in the two groups last named were there decreases in the improved acreage, 10.8% in New England and 4.8% in the Middle Atlantic group. In each state of these two groups there was a falling off both in total area and in improved area; in Vermont there was 23.2% less improved farm land in 1910 than in 1900. The greatest decreases in farm land for the separate states were: Arizona, 35.6% (but 37.6% increase in improved area); Utah, 17.5% (but 32.6% increase in improved area); Texas 10.6% (but 39.8% increase in improved acreage); West Virginia 5.9% (but a slight increase 0.4% in improved acreage). The greatest increases in area of all farms were: in New Mexico, 119.7% (and 348.9% increase in improved land); North Dakota, 82.9% (and 112.1% increase, improved land); Idaho, 64.9% (and 96.6% in improved land); Colorado, 42.8% (and 89.2% in improved land); Washington, 37.8% (and 83.9% improved); South Dakota, 36.4% (and 40.2% improved); Nebraska, 29.1% (and 32.3% improved); and Oklahoma, 25.5% (and 104.7% improved). The great increase in improved land is shown by the fact that in 1900 it was 49.4% but in 1910 54.4% of all farm land, and by the fact that although the percentage of the total farm land improved decreased slightly in the decade in New England (from 39.6 to 36.8) and in the Middle Atlantic states (from 68.6 to 67.9), this decrease was in two distinctly non-agricultural (but manufacturing) groups. In every other group there was increase; East North Central from 74.5% to 75.4% (in 1910, 56.6% of all land was improved farm land); West North Central from 67.5% to 70.6% (in 1910, 50.3% of all land was improved); South Atlantic, from 44.2% to 46.7%; East South Central, from 49.5% to 53.9% (38.2% of all land improved); West South Central, 22.5% to 34.4%; Mountain, 18.1% to 26.7% (only 2.9% of all land); and Pacific, from 39.6% to 42.9%. In 1910 59.5% of all farm land and 39.8% of all land was improved east of the Mississippi; and 50.8% of farm land and 19.2% of the entire land area, west of the Mississippi. In the North 70.1% of farm land and 49.3% of all land was improved; in the South, 42.5% and 26.8%; and in the West, 34.2% and 5%.

The average farm is larger in the newer than in the older part of the country; in the West, 296.9A. (386.1 in 1900), in the North, 143A. (133.2 in 1900), and in the South 114.4A. (138.2 in 1900); but the figures for the South are somewhat misleading, as the census classifies as separate farms the several tenant holdings of a large plantation. East of the Mississippi the average acres of land per farm was 93 (99.8 in 1900); and west, 211.3 (229 in 1900).

Farm Values.—In 1910 67% of the value of all farm property was in the North (33% in the West North Central and 24.7 in the East North Central group); 21.9% in the South (9.4 West South Central; 7.2, South Atlantic; 5.3, East South Central); and 11.1% in the West (6.8, Pacific and 4.3, Mountain). East of the Mississippi was 46.5% of the whole value; west, 53.5. But, east, the value of land was only 43.1% and the value of live stock only 43.8%; the value of buildings, 62.8%, and the value of implements 52.2% of the total of each of these items, the first two being less and the second two more than the percentage of the value of all property in the West. The percentage of increase in the value of all farm property was 69.1, east, and 139.3, west of the Mississippi; or, by the three-fold division, 90.1% in the North, 110.1 in the South, and 164.7% in the West. The average value of all farm property per acre was \$46.64 in 1910 and \$24.37 in 1900 for the entire country; in the North it was \$66.46 (76% more than in 1900); in the South, \$25.31 (114.7% increase); and in the West, \$40.93 (123.9% increase).

The average value of farm property per farm, east of the Mississippi, increased in the decade from \$3,067 to \$4,849; and west of the Mississippi from \$4,448 to \$9,030. In 1910 the average in the North was \$9,507; in the South \$2,897, and in the West, \$12,155 (Pacific group \$14,643; California, \$18,308; Nevada, \$22,462). But comparisons are misleading, because the average acreage differs so much in the different parts of the country and the number of live stock is so much greater in the West (and, to a less degree, in the North) than in the South. The average value of buildings per farm, it is to be noted, was higher in the North (\$1,564) than in the West (\$1,009) and much higher than in the South (\$461); but in land, machinery and live stock, the rank of the three regions was: first, the West; second, the North, and third, the South.

*Production.*¹—The crops of 1911 were unusually small and those of 1912 remarkably large.

¹ Statistics for 1911 are from the *Year-Book of the U.S. department of agriculture*; those for 1912 are preliminary estimates made by that department.

In May and June 1911 the country east of the Rocky Mountains suffered severely from a series of hot waves in May and June 1911 and from January to June 1911 from a sub-normal rainfall. The Weather Bureau reported that in a half century there had not been such a continuous high temperature as in these two months. The rainfall was 27.8% less than usual in New England, 21.6% less in the West South Central states, 21.2% below normal in the Pacific Northwest, 25.4% in the Dakotas, Nebraska and Kansas, 19.7% in Minnesota, Iowa and Missouri, 12.4% in the Middle Atlantic group, and 10.3% in the East South Central states. The result was that the total value of the crops of 1911, estimated at \$5,504,000,000, was only \$44,000,000 greater than in 1910, in spite of higher farm prices for all crops—except cotton, cotton-seed and flaxseed. The total value of all farm products in 1911 was \$8,417,000,000, being \$277,000,000 less than in 1910. The loss of \$321,000,000 (\$277,000,000 net loss plus \$44,000,000 increase in value of crops) was in animal products—eggs, wool, butter and poultry being less and only dairy cows more valuable than in 1910; in 1911 the value of animal products was \$2,913,000,000 (\$3,234,000,000 in 1910).

In 1912 there was no such damage from inclement weather. The value of animals slaughtered was less than in the preceding year (or in 1909, but more than in any other year since 1900); but the crop value was much greater and the total value of farm products was \$9,532,000,000. Taking 100 as the value of farm products in 1899, the United States department of agriculture estimates the products of 1905 at 133, of 1910 at 184.3, of 1911, at 178.4 (being less than in 1909 or the preceding year) and of 1912 at 202.1.

In 1911 nearly all crops were less than the average for the preceding five years; but in 1912 nearly every crop was greater than ever before. Wheat and tobacco had twice been greater, and cotton and rice also.

Indian Corn.—The crop of Indian corn in 1911 was estimated to be 2,531,500,000 bushels, with a farm price per bushel higher than in any year, except 1883, in the records of the United States department of agriculture; and the total value was greater than in the previous year, was twice the value of the cotton crop and was hardly exceeded by the value of cotton, wheat and oats combined. In 1912 the crop was 25.2% greater than in 1911.

Cotton.—The cotton crop of 1911, about 15,700,000 bales (only 11,610,000 in 1910), grown on 36,045,000 acres (only 32,403,000 in 1910), was probably the largest ever grown in the country, but its value, though above the average for the five preceding years, was less than that of 1910, lint being nearly 5 cents a pound cheaper and cotton-seed being correspondingly lower in price. In 1912 the crop was smaller than in 1911 or in 1904 and was exceeded in value by the crop of 1910.

Hay.—Third in value in 1911 was the hay crop, 47,444,000 tons. The average crop for the five years preceding was one-third greater and the crop since 1888 was each year larger. The crop was so small that there was an increase in farm value of \$2.50 a ton, and the total value, \$694,570,000 was exceeded only in 1910 and 1907, and was a little more than the five years average. In 1912 the hay crop was greater in value than the cotton crop or the great hay yield of 1910, being \$861,000,000—nearly as much as wheat, tobacco and potatoes together.

Wheat.—The 1911 wheat crop, about 621,340,000 bushels, was less than the five-year average; in the preceding decade the crop of 1904 only was smaller. The value of the wheat crop, about \$543,000,000, also was far below the average; it exceeded the value of the crop of 1906, when the average price a bushel was nearly one-third less. In 1912 about 730,267,000 bu. (\$555,280,000, farm price) was grown (less than in 1901 or 1906), the spring crop being much better than the winter yield and the total being one-ninth more than the average for the preceding five years.

Oats.—In oats, as in hay, the crop was so small in 1911 that the price was unusually high and the total farm-value above the five-year average. It was 922,000,000 bu. valued at \$414,000,000 (about \$408,000,000 in 1909 and in 1910). But in 1912 the crop was 46% greater than the previous maximum crop of 1909, 51.5% more than the five-year average. The large crop, 1,418,337,000 bushels, forced the price down and the value was \$452,469,000, only 22.2% more than the preceding five-year average.

Potatoes.—The 1911 crop of potatoes was about 290,000,000 bu. (349,000,000 in 1910; 376,500,000 in 1909), but the farm price was nearly one-half greater than in 1910, and the farm value, \$233,800,000, was far greater than the five-year average, or than in any preceding year of record. In 1912 the production was much larger, 420,647,000 bu.,—29% above the five-year average; the farm value was \$212,550,000.

Barley.—The barley crop of 1911, 160,000,000 bu., was much less than for any one of the years 1908, 1909, 1910; but the price was high and the total farm-value, about \$139,000,000, was a third greater than that of the 1910 crop. The 1912 crop was the largest on record, 223,820,000 bu., 35.7% more than the five-year average, but the price declined and the total value was \$112,957,000, much less than that of the small crop of 1911.

Tobacco.—The tobacco crop of 1911 not merely was short but commanded a price only a little higher a pound than in 1910 and considerably less than in any year between 1906 and 1909, inclusive. The crop, grown on 1,013,000 acres (in 1910, 1,366,000), was 905,109,000 lbs. (1,103,415,000 lbs. in 1910), valued at \$85,210,000,—nearly one-sixth less than in 1910. In 1912 the crop was 962,855,000 lbs.,—7.1% more than the five-year average; the average price per pound also increased, so that the gain in value will be greater.

Flax.—The most valuable of the smaller crops was flaxseed with an acreage in 1911 of 2,757,000 (about two-thirds in the Dakotas; most of the remainder in Montana and Iowa),—which is more than in any preceding year except 1902, 1903 and 1907,—a production of 19,370,000 bu.,—which was more than in 1910, but less than in any other year in the preceding decade. The value, \$35,272,000, was exceeded only by that of the record crop of 1909, and the average farm price was greater than in any year except 1910, when the short crop made it phenomenally high. In 1912 the crop was much larger, 28,073,000 bu. (or 44.1% above the five-year average), valued at \$32,202,000 (about 32.4% above).

Rye.—The rye crop of 1911 was 33,119,000 bu. (34,897,000 in 1910) from 2,127,000 acres, being smaller than in 1902, 1906, or 1910; but the farm price per bushel, 83.2 cents, was greater than in any year except 1867, 1868 and 1881, and the total farm value, \$27,557,000, was the highest known. The 1912 crop was 35,664,000 bushels, the largest on record, being 10% above the five-year average. Prices fell, and the total value was only \$23,636,000.

Sugar.—The sugar beet crop of 1911 was 599,500 tons, worth more than \$24,000,000; both in quantity and value it was nearly one-fourth greater than the five-year average. In 1912 the crop was nearly 700,000 tons. Of cane sugar the crop in 1912 was small because of floods in the Mississippi Valley.

Hops.—The crop of hops in 1911 was small, only 40,000,000 lbs., compared with 49,634,000 in 1910 and 57,510,000 in 1907, but the average price a pound was nearly twice the average of preceding years, and the crop value, \$15,500,000, was much more than twice as great as the average for the preceding five years. In 1912 the crop increased to 44,500,000 lbs., but prices fell and the total value was only about \$11,000,000.

Rice.—Rice was grown in 1911 on 696,000 acres (720,000 in 1909 and 723,000 in 1910) and the crop, 22,934,000 bu., though less than that of 1910 or 1909, was considerably above the five-year average. The farm value of the crop, \$18,274,000, was more than in any other year except 1909, when the price per bushel was higher. In 1912 the crop suffered from floods but was probably larger than in any year except 1909; its value was \$23,423,000.

Buckwheat.—The buckwheat crop of 1911, 17,549,000 bu., was a little less than that for 1910, 17,598,000 bu. (grown on 860,000 A.; 1911 acreage, 833,000), but much larger than for any other year in the last decade. The average farm price a bushel was 72.6 c., exceeded only in 1908 (75.6 c.), and the farm value of the crop much above the five-year average. In 1912 the crop was even larger,—about 19,124,000 bu.; value about \$12,000,000.

Animals.—The total value of animal products in 1912 was about \$3,395,000,000; being more than in 1911 but less than in 1910. The number of horses on January 1, 1912, 20,509,000, was larger than in 1911 or in any other year except 1909 and 1910 and the average value and the total value (\$2,172,694,000) larger than in any year except 1910 and 1911. The number of mules, 4,362,000, was greater than in any preceding year, and average value (\$120.51) and aggregate farm value (\$525,657,000) were exceeded in 1911 only. The number of milch cows, 20,699,000, was the smallest since 1906; the average value (\$39.39) and the total (\$815,414,000), were exceeded only in 1911. Other neat cattle numbered 37,260,000,—much less than for any year in the decade, but the average value, \$21.20, was higher; the total value was less than for any year since 1906. The number, 52,362,000, and total value, \$181,170,000, of sheep, also, were less than since 1906; and the average value, \$3.46, was far below the five-year average,—that for 1909 alone was lower. Swine numbered 65,410,000, a little less than in 1910, but far more than in any other year; the average farm price was exceeded in 1910 and in 1911, and the aggregate value only in 1911.

Plant Industry.—The U.S. department of agriculture established about twelve years ago its bureau of plant industry whose work has consisted largely of searching the world for grain, fruits, grasses, etc. and ascertaining by experiments which of them might be useful in the United States. Recently a force of 25 trained explorers have been busy in this work and some 34,000 varieties of plants have been imported and experimented with, their seeds and progeny being sent out to private breeders and experimenters. Mr. E. H. Wilson, of the Arnold Arboretum, Boston, Mass., who has distinguished himself in similar work and is said to have introduced into America more new plants than any other man, in 1912 received from the Royal Horticultural Society of Great Britain the Victoria Medal of Honour—never before conferred on any one outside of the British Isles.

The other activities of the Federal department of agriculture are manifold: the forest service and the weather bureau are subdivisions; meat inspection and the enforcement of the Federal food and drugs act are quasi-police functions of the department carried on by a bureau of animal industry, which, besides, investigates and eradicates diseases of animals, experiments in breeding and feeding, and works for the improvement of the dairy industry; and the department has experiment stations and co-operates with state agricultural experiment stations, and through its bureau of soils makes soil surveys—sometimes with the aid of state organizations. Other bureaus in the department are those of chemistry, entomology and biological survey. About 2,000 publications of the department appear each year in these different fields and the total number distributed in the year 1910–11 was 27,595,000.

MINERAL PRODUCTS.—Total value, 1911, \$1,918,326,253. This was 3.65% less than in 1910 and 7.4% less than in 1907, the only year when mineral products were valued at more than \$2,000,000,000. But the value in 1911 was greater than in 1908 (following the panic

of 1907) or 1909. The decrease as compared with 1910 was \$72,584,882 and this was more than covered by the decrease in pig-iron,¹ which was \$84,827,862. The same item explains the decrease (\$75,611,118) in the value of all metals from \$747,790,718 in 1910 to \$672,179,600. In other words, apart from pig iron, there was an actual increase from 1910 to 1911 of \$12,278,980 in the value of all other mineral products, and of \$9,216,744 in the value of all other metals. The difference between these two increases, about \$3,050,000, is the increase in the value of non-metals in the year; and it is to be noted that this increase was in spite of a decrease of \$18,104,235 in the value of bituminous coal, so that, apart from bituminous coal, there was in the year an increase of \$21,155,000, approximately.²

Metals.—Of pig iron the output in 1911 was 23,257,288 tons (one-eighth less than in 1910), valued at \$327,334,624 (one-fifth less). The average price per ton was \$14.07 in 1911, \$15.57 in 1910, \$16.25 in 1909, \$20.56 in 1907. Even greater was the decrease in iron ore marketed: in 1911, 40,989,808 tons (nearly one-fourth less than in 1910), valued at \$86,419,830 (more than three-eighths less),—the decrease in average price per ton being marked.

Second in value of the metals was copper, 1,097,232,749 lbs., valued at \$137,154,092 (quantity 1.58 % more, value 0.02 % less, than in 1910; about one-seventh more in quantity and one-eleventh less in value than the average for the five years, 1905–09). In copper and in iron the United States outranked any other country.

The output of gold was 4,687,053 oz., valued at \$96,890,000 ($\frac{2}{3}$ of 1 % more than in 1910). The value of silver, \$32,615,700, was 5.71 % more than in 1910, but was nearly 2 % less than the average for the five years, 1905–09.

Ranking immediately above and below silver in value among the metals were lead and zinc, respectively, with 406,148 tons (\$36,553,320,—one-ninth more than in 1910) and 271,621 tons (\$30,964,794,—nearly one-seventh increase). This is exclusive of antimonial lead, 14,078 tons, valued at \$1,380,556 (3 % increase).

The only other metals of importance were: aluminium (consumed), 46,125,000 lbs. (one-thirtieth less than in 1910), valued at \$8,084,000 (nearly one-tenth less); quicksilver, valued at \$977,989 (2 % increase); tin, \$56,635 (two and a half times as much as in 1910); and platinum, \$40,890 (three-fifths increase).

Fuels.—Of the non-metals,—and of all the minerals—by far the most valuable was coal with an output of 496,221,168 tons (501,596,378 tons in 1910), valued at \$626,366,876 (\$629,557,021 in 1910). The U. S. Geological Survey divides this total between Pennsylvania anthracite and bituminous coal (including brown coal, lignite and anthracite mined in other states than Pennsylvania). Using "bituminous coal" to include all this, the value was \$451,177,484 (3.86 % less than in 1910; see above) and the output, 405,757,101 tons (2.72 % less). There was an increase (7.08 % in quantity and 9.31 % in value) in the output of Pennsylvania anthracite, 80,771,488 tons, \$175,139,392. Not so large was the increase (5.2 % in quantity and 4.8 % in value) in petroleum; the output was 220,449,391 bbls., valued at \$134,044,752. Other fuels were, coke, 35,551,489 tons, valued at \$84,130,849 (nearly one-sixth less than in 1910); natural gas, \$74,127,534 (4.76 % increase); and peat, \$272,114.

Structural Materials.—Third in value,—to coal and iron,—were clay products, \$162,236,181 (4.63 % less than in 1910, but considerably more than the average for 1905–09). The more valuable building materials were: stone, \$77,108,567 (0.77 % more than in 1910, but about one-seventh more than the five-year average) and cement, 79,547,958 bbls. (2.27 % more than in 1910), valued at \$66,705,136 (nearly 3 % less than in 1910). Almost all of this (78,528,637 bbls.; value, \$66,248,817) was Portland cement. Natural cement was valued at \$378,533 and puzzolan at \$77,786. Minor building materials were: sand and gravel, \$19,614,850; lime, 3,392,887 tons, valued at \$13,688,970 (2.83 % less than in 1910, but nearly one-eighth more than the five-year average); gypsum \$6,462,035 (a very little less than in 1910); slate, \$5,728,019 (one-twelfth less than in 1910); glass sand, \$1,543,733 (1.78 % more than in 1910); and sand-lime brick, \$897,664 (nearly one-quarter less than in 1910).

Chemical Materials.—The output of phosphate rock was 3,053,279 tons (15 % more than in 1910), valued at \$11,900,693 (9 % increase). The value of salt was \$8,345,692 (5.64 % increase over 1910); of sulphur, \$4,787,049 (4 % increase); of sulphuric acid, \$2,733,696,—first reported in 1911 from fumes of copper and zinc smelters; of pyrite, \$1,164,871 (nearly one-fifth increase); of borax, \$1,569,151 (three-tenths increase); of fluorspar, \$611,447 (two-fifths increase); of calcium chloride, \$91,215 (two-ninths increase); of bromine, \$110,902 (more than thrice that of 1910); and of arsenious oxide \$73,408 (two-fifths more than in 1910; value more than twice as great). The Geological Survey is making an elaborate search for potash salts, drilling for saline residues at great depths and examining brines, alunites and igneous rocks. The Soils Bureau of the department of agriculture is studying the kelps of the Pacific Coast, for the same purpose, and is making a field survey of arid lands.

Pigments.—Mineral paints were valued at \$7,842,583 ($3\frac{1}{2}$ times as much as in 1910).

¹ Pig-iron and not iron ore is the basis of valuation adopted by the United States Geological Survey and the value of iron ore is not included in the total value of minerals given here.

² Exact figures are not given because the Geological Survey does not make "metals" and "non-metals" the only classes, but adds "unspecified products," mostly rare metals.

This excludes zinc oxide, not separately reported in 1911, but valued at \$5,238,945 in 1910 and \$6,156,755 in 1909. Crude barytes was valued at \$122,792, a little more than in 1910.

Abrasives.—Artificial abrasives were valued at \$1,493,040, about one-fourteenth less than in 1910. Grindstones were worth \$907,316, about one-seventh less than in 1910; oilstones and whetstones, \$214,991, less than in 1910 or than the average for the five-year period; and abrasive garnet, \$121,748.

Miscellaneous.—The output of asphalt (including bitumens and hydrocarbons not classified as petroleum) was 360,004 tons (almost two-fifths more than in 1910), valued at \$3,828,751 (one-fourth more than in 1910, and over double the annual average in 1905-09). Other products valued at \$500,000 or more were: mineral waters, \$6,837,888 (7% increase); talc and soapstone, \$1,032,732 (one-fifth increase) and fibrous talc, \$613,286 (about 16% decrease); bauxite, \$750,649 (4.8% increase), and feldspar, \$579,008 (15% increase).

MANUFACTURES.—In "continental" United States (excluding Alaska) there were in 1909 268,491 manufacturing establishments (29.4% more than in 1899), which employed 7,678,578 persons, of whom 6,615,046 were wage-earners (40.4% increase); had a capital of \$18,428,270,000 (105.3% increase); and manufactured products with a gross value of \$20,672,052,000 (81.2% increase) and a net value (gross, less cost of materials) of \$8,530,261,000 (76.6% increase). The increase in value, gross or net, must be interpreted with the increase of prices in view, or its meaning will be exaggerated.

The ten leading manufacturing states, ranked according to the gross value of products, and with the percentage of the total contributed by each, were: New York, 16.3; Pennsylvania, 12.7; Illinois, 9.3; Massachusetts, 7.2; Ohio, 7; New Jersey, 5.5; Michigan, 3.3; Wisconsin, 2.9; Indiana, 2.8, and Missouri, 2.8. (See the separate state articles.) The three Middle Atlantic states reported more than one-third (34.5%), the East North Central states about one-fourth (25.2%) and the New England states, more than one-eighth (12.9%), a total of nearly three-fourths (72.6%) of the total gross value of the country. Ranked on the same basis the ten leading cities in 1909 were: New York, Chicago, Philadelphia, St. Louis, Cleveland, Detroit, Pittsburg, Boston, Buffalo, and Milwaukee. The total gross value of manufactures from these ten cities was more than \$5,800,000,000,—nearly three-tenths of the total for the nation. In 50 cities which had 100,000 or more inhabitants the value of manufactures was more than two-fifths (42.3%) of the total; and the 603 cities over 10,000 contributed nearly seven-tenths of the total product value, employed nearly two-thirds of the wage-earners in manufactories, and contained more than half the establishments, although their combined population was only three-eighths that of the entire country.

Chief Industries.—The largest single industry, according to the census classification and judged by gross product, was slaughtering and meat packing with one-fifteenth of the total product value and more than one-half increase in the decade. Second of the single industries is that of foundries and machine shops, with nearly 6% of the total product value, in 1909; with this industry should be mentioned iron and steel from steel works and rolling mills (4.8% of the total) and iron and steel from blast furnaces (1.9%). Third in value was lumber and timber (5.6% of the total), with a product more than one-half greater than in 1899. Flour and grist mill products were valued at one twenty-fourth of the total product value. The more important textile products were: cotton goods (3% of the total), woollen, worsted and felt goods (2.1%), hosiery and knit goods (1%) and silk goods (1%). The value of men's clothing was 2.7% and of women's clothing 1.9%, of the total of all industries; that of boots and shoes, 2.5%; that of tobacco, 2%; that of cars and shop construction by steam railway companies, 2%, and by other manufacturers 0.6%. A metallurgical group of industries includes: copper smelting and refining (1.8%), lead smelting and refining (0.8%), copper, tin and sheet iron products (1%), and brass and bronze products (0.7%). Malt liquors are reported as 1.8% and distilled liquors as 1% of the total; but a Federal revenue tax, included in the reported value, makes it misleading. Other items, all valued at more than \$100,000,000, with the per cent of the total for each, were: leather (1.6%) and leather goods (0.5%); sugar and molasses, not including beet sugar (1.4%); butter, cheese and condensed milk (1.3%); paper and wood pulp (1.3%); automobiles (1.2%) and wagons and carriages (0.8%); furniture (1.2%); refined petroleum (1.1%); electrical machinery (1.1%); illuminating and heating gas (0.8%); canning and preserving (0.7%); cottonseed oil and cake (0.7%) and agricultural implements (0.7%).

Of the manufactures specifically named in the preceding paragraph only one, smelting and refining of lead, showed a decrease (9.9%) in the gross value between 1904 and 1909, and only two others, sugar and molasses, and wagons and carriages, a decrease in the value added

by manufacture in the same five years—and these decreases were small, 2.7% and much less than the increase, 77.5% and 9.6%, in the years 1899-1904. The gross value of automobiles increased 532.6% from 1899 to 1904 and 729.7% in 1904-09. Other high percentages of increase in gross value during the years 1904-09 were: 68.8%, iron and steel from blast furnaces; 66.6%, copper, tin and sheet-iron products; 63.2%, butter, cheese and condensed milk; 57.3%, copper smelting and refining; 57.2%, electrical machinery and apparatus; 55.9%, distilled liquors; 55.4%, women's clothing; 53.4%, cottonseed oil and cake.

Ownership.—In 1909 of 268,491 manufacturing establishments, 69,501 (25.9%); in 1904 23.6% were operated by corporations, and these establishments reported nearly four-fifths (in 1904 not three-fourths) of the total product value. In the Mountain Group of states 90.2% of the product value was from establishments owned by corporations, largely smelters; in the East North Central group the percentage was 85.1; in the West North Central, 83.9; in the Pacific states, 82.4; in New England and in the West South Central group, 81.4 for each; in the East South Central, 78.5; in the South Atlantic, 76.7; and in the Middle Atlantic, 71.9. The highest per cent in any state was 96.1, in Arizona. More than twice as many establishments were operated by individuals as by corporations, but their product value was less than one-eighth as large. Establishments operated by firms numbered about four-fifths as many as by corporations and had a product value a little more than one-eighth as large. In 1904 establishments operated by individuals reported 11.5% of the total value; in 1909, 9.9%. In 1904 establishments operated by firms reported 14.4%; in 1909 10.6%. The advance of corporation control is marked.

Establishments.—Establishments with an output of more than \$1,000,000 each numbered 1900 (0.9%) in 1904 and 3,061 (1.1%) in 1909; in the former year their product value was, 38%, in the latter 43.8% of the total for all establishments; in 1904 they employed 25.6%, in 1909, 30.5% of all wage-earners in manufacturing. In 1909 67.2% of all establishments had each an output less than \$20,000 in value; but these establishments produced only 5.5% of the total product value and employed only 9.3% of the wage-earners.

It will be surmised that the increase of large establishments is accompanied by greater efficiency, because the ratio of wage-earners to product is smaller in the large establishments; but it is more probable that this difference is due to the presence of more labour-saving machinery (and machinery that saves more labour) in the large establishments. And it should be noted that the million dollar establishments producing 43.8% of the gross value, produced only 35.7% of the net value (gross, less value of raw material); but that the establishments producing less than \$20,000 each and contributing 5.5% of the gross product, produced 7.7% of the value added by manufacture. Even from this, however, no generalisation may safely be drawn, since many establishments with large gross outputs are in industries which, from the nature of the raw material, add comparatively little by manufacture. This is shown in a striking way by the slaughtering and meat-packing industry, which ranks first in the country in gross products (\$1,370,568,000) but twelfth in "value added by manufacture" (\$168,740,000); or by flouring and grist-mills, with a gross value of \$883,584,000 (5th of all industries) and a net value of \$116,008,000 (18th). Both these industries have a large proportion of large establishments: in the former, 166 out of 1,641 had each an output of more than \$1,000,000. There were even larger percentages of million dollar establishments in copper smelting and refining (84.2, with 99% of product value); steel works and rolling mills (41.7, with 91%); blast furnaces (41.3, with 85.8%); refining petroleum (23.8, with 88%); and steam railway car construction and repairs (22.7, with 80.7%).

In Rhode Island 3.5% of all establishments produced each more than a million dollars' worth a year, with a total value nearly half the entire product value for the state. In Arizona 84.1% of the entire product value was from such establishments, in Montana 68.1%, and in Utah, 53.4%—almost all these being smelters; in Nebraska, 68.9%, and in Kansas, 62.9%, mostly slaughter houses and meat-packing establishments; in Illinois, 56.2%, meat-packing and iron and steel; in Pennsylvania, 50.7%, largely iron and steel; and in New Jersey, 56.7%, from copper smelters and petroleum refineries. New York, the first manufacturing state in the Union, reported only 37% of all product values from million dollar factories; this is partly due to the diverse character of manufacturing industries in that state and partly to the large number of clothing establishments, mostly very small.

Of the total population of "continental" United States, 7,678,578, about 1 in 12, were engaged in manufacturing; 487,173 being proprietors and officials, 576,359 clerks, and 6,615,046 wage-earners. Of wage-earners about 1 out of 5 were females, and about 1 out of 40 (162,246 in all) were under 16,—by official reports; the actual number was probably greater.

In dairy industries, flour-milling and baking the percentage of proprietors and officials was unusually high (33.3, 28.4 and 20.2, respectively), the dairy establishments being largely co-operative and in flour milling much labour-saving machinery is used which requires comparatively few wage-earners. Absolutely, the largest number of wage-earners in any one industry was 695,919 (more than one-tenth of the total) in the manufacture of lumber and timber. Other industries employing more than 200,000 wage-earners were: foundries and machine shops, 531,011; cotton factories, 378,880; steam railway companies' car construction, 282,174; printing and publishing, 258,434; steel works and rolling mills, 240,076; and men's clothing, 239,696. The percentage of children under 16 to all wage-earners is largest

in three textile industries: cotton goods, 10.4; hosiery and knit goods, 8.1 and silk, 8—the number of girls being much more than that of boys in the last two. In canning and preserving, in the woolen goods industry and in the manufacture of bags (not paper), of cigar boxes, of paper and fancy boxes, of cordage and twine, of needles, pins and hooks and eyes, of lead pencils, and in a few other comparatively unskilled industries, more than 5% of the wage-earners are under 16 years. Geographically, child labour is strongest in the South Atlantic group, where 6.3% (7.9% in 1899) of wage-earners were less than 16 years old. In South Carolina the percentage is 12.9 (in 1899, 18). The recent establishment of manufactories, especially cotton factories, the small percentage of immigrants to be employed, and the comparative laxness of child labour laws explain these high percentages. In general and particularly in the larger industries the proportion of women and children employed decreased markedly between 1899 and 1909.

TRANSPORTATION.—Railway mileage, January 1, 1912, 246,572.73, exclusive of 114,940 m. of second track and sidings. In the preceding year 3,292.66 miles of steam railway track were added; 793.40 in the Southwestern group, 729.34 in the Pacific states, 500.33 in the Northwestern, 460 in the South Atlantic, 318.51 in the Central Northern, 310.33 in the Gull and Mississippi Valley, 180.87 in the Middle States and 2.85 in New England. For local building operations see articles on separate states and for the Grand Trunk in New England see RHODE ISLAND, for the Western Maryland see MARYLAND, for the Key West railway see FLORIDA, for the barge canal see NEW YORK, for the Cape Cod Canal see MASSACHUSETTS, etc. See ALASKA, also. River and harbour improvements also are dealt with in separate state articles. The total appropriation for rivers and harbours in the last fiscal year was \$40,559,620. The only sign of economy in this respect is the growing tendency to make Federal appropriations contingent on local expenditures and co-operation.

FOREIGN COMMERCE

For the twelve months ending June 1912¹ the total imports of merchandise were valued at \$1,653,264,934 (as compared with \$1,527,226,105 for the preceding year and \$1,556,947,430 for the year ending June 1910), and the total exports at \$2,204,322,409 (in 1911, \$2,049,320,199; in 1910, \$1,744,984,720). The excess of exports was \$551,057,475 in the year ending June 1912; \$522,094,094 in the preceding year, and only \$188,037,290 in 1910.

The duties collected on imports were \$311,257,348 (in 1911, \$314,497,071, and in 1910, \$333,683,445). Of the imports 53.33% were free of duty. More than one-third the total imports was classified as crude materials for manufacture, valued at \$555,059,586, more than one-fifth (value, \$360,655,409) was manufactures ready for consumption, and the other large items were manufactures for further use in manufacturing, \$294,260,981; foodstuffs in crude condition, \$229,565,515; and foodstuffs partly or wholly manufactured, \$196,759,741. Of exports nearly one-third in value (\$722,488,531) was crude materials for use in manufactures, and the other major items were: manufactures ready for consumption, \$674,302,903; manufactures for further use in manufacturing, \$347,451,015; foodstuffs partly or wholly manufactured, \$318,262,524; and crude foodstuffs and food animals, \$99,659,023.

Of the world trade of the United States the major part of course is with Europe—in 1912 a little less than half the imports (\$819,585,326) and more than three-fifths of the exports (\$1,341,732,789). Of imports from Europe nearly one-third were from the United Kingdom (\$272,940,700) and of exports to Europe a little more than two-fifths goes to the United Kingdom (\$564,372,186). Germany and France rank next: Germany, imports to United States \$171,380,380, and exports from United States \$306,959,021; France, imports \$124,548,458 and exports \$135,388,851. Other countries with American imports or exports of \$100,000,000 or more were: Netherlands, exports from U.S. \$103,702,859 (imports to U.S. \$35,568,436); Canada, exports from U.S. \$329,257,302, imports to U.S. \$108,813,368; Cuba, imports to U.S. \$120,154,326 (exports from U.S. \$62,203,051); and Brazil, imports to U.S. \$123,881,644 (exports from U.S. \$34,678,081). The excess of imports over exports in the last two cases is due to the larger sugar and coffee trade.

The trade of continental United States with Alaska was: exports, domestic \$18,809,270 imports \$21,597,712 (including fish, copper, \$5,040,386) and not including gold and silver \$20,732,597. Shipments to Hawaii were valued at \$24,418,671, and from Hawaii to U.S. at \$55,055,816 (principally sugar, fruits and nuts, \$2,744,042). To Porto Rico \$37,424,545 and from Porto Rico to the mainland \$42,873,401 (sugar, coffee, tobacco and fruits). To the Philippines \$23,703,935, and from the Philippines to U.S. \$23,257,199 (including sugar fibres, fruits and nuts, cigars and cigarettes).

The Table shows the value of foreign commerce for the year ending June 1912 by the principal ports and customs districts, arranged by states.

¹ For the calendar year 1912, imports, \$1,817,662,340 and exports, \$2,399,995,973; for the calendar year 1911, imports, \$1,532,931,861 and exports, \$2,092,373,141.

UNITED STATES FOREIGN COMMERCE

723

Value of Imports and Exports by States and Districts, for the Year ending June 1912.

STATE	DISTRICT	PORTS OF ENTRY	IMPORTS	EXPORTS
Alabama	Mobile	Mobile	\$4,633,907	\$31,230,117
Alaska	Alaska	Juneau	563,503	1,010,072
Arizona	Arizona	Nogales	10,989,321	6,881,034
California	San Diego	San Diego	1,076,990	1,092,159
	Los Angeles	Los Angeles	3,225,618	161,735
	San Francisco	San Francisco	59,235,471	49,249,734
	Humboldt	Eureka	7,622	1,231,441
Colorado	Denver	Denver	495,520	3,196
Connecticut	Stonington	Stonington	22,559
	New London	New London	37,693	29,822
	Hartford	Hartford	2,217,247
	New Haven	New Haven	417,574
	Bridgeport	Bridgeport	1,719,353
Delaware	Delaware	Wilmington	1,935,110	2,838
District of Columbia	Georgetown		1,131,915
Florida	Fernandina	Fernandina	45,774	6,529,640
	Jacksonville	Jacksonville	1,354,000	2,329,322
	St. Augustine	St. Augustine	11,012

FINANCE.—The balance in the general fund on June 30, 1911, was \$140,176,926 and on June 30, 1912, \$167,152,479 (and on Nov. 11, 1912, \$147,982,307). For the fiscal year the receipts were: ordinary, \$691,778,465 (preceding year, \$701,372,375), Panama Canal bonds sold, \$33,189,104 (in 1911, \$18,102,170) and public debt, \$20,537,645 (in 1911, \$40,232,555). The disbursements were:—ordinary, \$654,553,963 (1911, \$654,137,998), Panama Canal, \$35,327,371 (1911, \$37,063,515) and public debt, \$28,648,327 (1911, \$35,223,336). The principal items in "ordinary" receipts were:—customs, \$311,321,672; ordinary internal revenue, \$293,028,896; corporation tax, \$28,583,303; and of "ordinary" disbursements: pensions, \$153,590,456; war, \$148,795,422; navy, \$135,591,956; interest on public debt, \$22,616,300; Indians, \$20,134,840; civil and miscellaneous, \$173,824,989.

The appropriations by annual acts (exclusive of postal, payable from postal revenues) were \$634,549,561 for 1912 and \$617,382,178 for 1913 (permanent appropriations: for 1912, \$68,575,924, and for 1913, \$72,556,424). The Democratic Congress cut down the appropriations for public defence: army, from \$93,374,756 for 1912 to \$90,958,713; navy, from \$126,495,509 for 1912 to \$123,151,539 for 1913; fortifications, from \$5,473,707 to \$4,036,235; and Military Academy, from \$1,163,424 to \$1,064,668. It is true that the total of annual appropriations for 1913 compared with that for 1912 showed retrenchment and an apparent effort for economy, but the decrease in the items just named and the "cut" of 25% in the "Sundry Civil" act (from \$135,241,935 to \$102,538,934), even if they were entirely laudable economies, do not hide, although they overbalance, the enormous increases in the Rivers and Harbors acts (almost one-third: from \$30,883,419 to \$40,559,620) and in the Pension Act (nearly one-twelfth; from \$153,682,000 to \$165,146,146),—both items notoriously for political purposes.

On June 30, 1912 the outstanding debt was \$2,849,373,874 (June 30, 1911: \$2,765,600,607), but more than half of this (\$1,524,535,369) was in certificates and treasury notes, offset by an equal amount of cash in the Treasury, so that the difference, \$1,343,838,505 is a less misleading figure. This sum is made up of the following items: interest bearing debt, \$963,776,770 (including \$646,250,150 in 2% consols of 1930; \$134,631,980 in Panama Canal loans of 1906 and 1908—both 2%—and of 1911, \$50,000,000 at 3%; \$118,489,900 of the 4% loan of 1925; \$63,945,460 of the 3% loan of 1908-18; and two issues of postal savings bonds at 2½%, the first, 1911-31 for \$41,900, and the second 1912-32, for \$417,380); debt on which interest has ceased since maturity, \$1,760,450; and debt bearing no interest, \$378,301,285—not including the certificates and treasury notes, mentioned above.

A system of postal savings banks was put in operation January 3, 1911 and at the beginning of November 1912 there were banks in 12,773 post-offices (out of a total of 58,133 in the country), including 644 branch offices and sub-stations, in every state of the Union; the number of depositors was 290,000, and the total deposits were \$28,000,000.

On June 27, 1912 President Taft sent to Congress a report of the president's commission on economy and efficiency¹ entitled *The Need for a National Budget* (submitted June 19; printed as 62nd Congress, 2nd Session, House Document No. 854) with a message approving the commission's recommendation that a budget be submitted to Congress by the President and that appropriations not based on this budget be acted upon in a separate bill. On July 10 heads of departments and establishments were instructed by the President to prepare for the year 1914 estimates and summaries not only in the form previously used, but in the uniform manner suggested by his commission. A letter from the President to the Secretary of the Treasury (Sept. 19) supplemented this order. Congress seemed prone to consider that the President was encroaching on its powers and in this letter the President said that he questioned not "the constitutional right to Congress to prescribe the manner in which reports . . . be submitted" but "the practical wisdom of continuing to operate the Government under 90 different statutes, passed at 90 different times, which prescribe 200 different forms."

¹ This commission was organized March 8, 1911 and took over work begun under Charles D. Norton, secretary to the President. Its chairman was Frederick A. Cleveland, formerly director of the New York City bureau of municipal research. See his paper in Vol. 3, No. 2 (1912) of *Proceedings of the Academy of Political Science*; and, for other activities of the commission, *Hearings before the House Subcommittee in charge of the Sundry Civil Appropriation Bill for 1913* (Washington, 1912). The distribution of all departmental documents by the Superintendent of Documents instead of by the separate departments is an accomplished reform proposed by the Committee, and improved and uniform filing is another.

Not only did Congress object to the work of the committee but in the legislative, executive and judicial bill (which President Taft twice vetoed) it required estimates to be submitted in the same way as before and in another way. Hence the President's letter of September 19.

The problem of rural credit has attracted much attention and in October 1912 the Federal government published a *Preliminary Report on Land and Agricultural Credit in Europe*, with a letter to governors of the states by President Taft recommending the introduction of co-operative credit on the lines of the Raiffeisen banks of Germany.¹

The National Monetary Commission (which terminated March 31, 1912) presented in October 1911 and on January 8, 1912 its recommendations,² notably for a National Reserve Association, formed of 15 district reserve associations, each made up of local associations of 10 banks or more, each local association with a combined capitalisation of \$5,000,000. To secure membership banks must subscribe for 20% of their capital in stock of the National Reserve Association and must fulfill certain requirements regarding capital, surplus, reserves and examination which put state banks and trust companies under supervision similar to that now in force for national banks. Earnings of the association are to be divided between the stockholders and the United States, a certain part, however, going to a surplus reserve for the association. No more national bank notes would be issued, their place being taken by notes of the association, based on bonds, and by additional circulating notes based on bankable commercial paper, etc. The association would be required to make weekly public reports to the comptroller of the currency and full reports five times a year. Its advocates think that the plan would be of particular value in financing crops and argue that as fiscal agent for the treasury the association would effect a more satisfactory relation between the treasury and the banks. In general opposition to the plan was: partisan, arising partly from the unpopularity of the reactionary or stand-pat wing of the Republican party with which Senator Nelson W. Aldrich, the chairman of the commission, was affiliated—a party group which was inextricably connected in the popular mind with tariff iniquities and favouritism to "Wall Street," the "interests" and the "Trusts"; or based on economic or political theory, which distrusted the management of a central institution and Federal interference in banking. The popular aversion to Wall Street immediately urged that the association could not fail to be under the control of this interest, in spite of the large size of the board of directors (47) and of the probable effect of the association to minimise the influence of the stock exchange on business conditions. The plan has practically the undivided opposition of the Democratic party, and the incoming administration will almost certainly not adopt it or any part of it.

The attitude of the Democratic party towards financial questions is hinted at by the "Money Trust" investigation carried on by the "Pujo committee" on banking and currency³ of the Federal House of Representatives (resolutions of February 24 and April 25, 1912), although it was charged that this was prompted not merely by hostility to organised finance but largely by a desire to make political capital to be used in the presidential campaign. Besides prominent bankers, including J. P. Morgan, the committee called before it Mr. Roosevelt, who testified on the action he had taken in the panic of 1907 (see *E. B.* xxvii, 734d); much of the testimony before the committee was of great interest and importance.

In 1912 Professor Irving Fisher of Yale⁴ suggested a gold seigniorage, adjusted by reference to price index numbers, as a means of reducing the cost of living through restoration to the gold dollar of its purchasing value. Woodrow Wilson had previously

¹ See O. R. Hobson, *Agricultural Credit Banks* (Washington, 1912).

² See Ludwig Bendix, *The Aldrich Plan in the Light of Modern Banking* (New York, 1912, and in German); J. L. Laughlin, *Banking Reform* (Chicago, 1912), a defence of the plan of the monetary commission, and the unfavourable criticism of Albert A. Bowles in *North American Review*, March 1912, vol. 195, pp. 310-318, on the ground that the system is too complicated and tries to secure the maximum of profit. Victor Morawetz, *The Banking and Currency Problem and its Solution* (New York, 1911) opposes the note-issue plan.

³ Chairman, Arsène Pujo (b. 1861), representative from Louisiana since 1903.

⁴ In a paper before the International Chambers of Commerce at Boston, printed in the *Independent* (New York) of September 26, 1912.

suggested an actual increase in the bulk of the coined dollar. Professor Fisher's plan would increase the bulk of the "uncoined dollar" without changing the coin dollar, once or repeatedly; and would substitute for the present uncoined dollar of fixed weight an uncoined dollar of variable weight but would make the coined dollar of fixed instead of variable value.

ARMY.—At the close of 1912 the regular army, limited by law to a maximum enlisted strength of 100,000, included 4,781 active commissioned officers (including 244 detached line officers, 127 first lieutenants of the Medical Reserve Corps and 60 dental surgeons) and 81,547 enlisted men, excluding provisional force and hospital corps. The branches of the force were: cavalry, 15 regiments with 765 officers and 13,823 men; field artillery, 6 regiments, with 252 officers and 5,417 men; coast artillery corps, 170 companies, with 715 officers and 18,471 men; infantry, 30 regiments, 1,530 officers and 30,340 men; Porto Rico infantry, 1 regiment, 32 officers and 591 men; Indian scouts, recruits, etc., 7 officers and 8,142 men; native Filipino scouts, 52 companies, 180 officers and 5,732 men; and engineers, 3 battalions, 1,942 men. The estimated strength of the organised state militia for the same year was 9,437 commissioned officers and 112,940 men.

The army is organised in four divisions: Eastern, including departments of the East and of the Gulf; Central, including departments of the Lakes, of the Missouri and of Texas; Western, including departments of California, of the Columbia (with Alaska) and of Hawaii; and Philippines, including departments of Luzon and Mindanao. There were 154 garrisoned posts and sub-posts, including two military prisons (Ft. Leavenworth, Kansas, and Alcatraz, California) and the Walter Reed General Hospital at Washington, D.C.

By Act of Congress of August 24, 1912, the term of enlistment after November 1, 1912 was increased from three years to seven, of which the active service is four years and the other three years are in the Army Reserve (thus established) on furlough without pay. After four years' service an enlisted man may re-enlist for seven years, with higher pay; and after three years' service he may upon request be furloughed and put on the Reserve. After two years' service enlisted men, unmarried and under 30 years of age, may take examinations for promotion to second lieutenant. Enlisted men, retired after 30 years' service, receive three-fourths pay and \$15.75 a month. The Army Appropriation Bill, carrying a clause aimed at Major-General Leonard Wood, Chief of Staff, and making him ineligible for this office, was vetoed by the President on June 17, 1912, and an appropriation measure without this clause was finally passed. There was a strong effort in the House, which did not succeed, to reduce the number of cavalry regiments from 15 to 10. On February 15, 1912, Adjutant-General Fred C. Ainsworth was removed from office by the President's order, pending trial for insubordination; on the 16th he was placed upon the retired list, on his own application. Gen. Ainsworth opposed the reorganisation scheme suggested by Major-General Leonard Wood, Chief of Staff. The opponents of the chief of staff in Congress and the friends of the adjutant-general demanded an investigation, and the committee on military affairs of the House of Representatives (House resolution 415, Feb. 23, 1912) asked the Secretary of War for all records in the case. In sending these records to the House the Secretary said that he had been directed by the President that their transmittal was "not to be construed as a recognition of the authority or jurisdiction of the House . . . to require of the Chief Executive a statement of the reasons of his official action in such matters or of a disclosure of the evidence upon which such official action is based." The majority report of the Committee (Report No. 508, 62nd Congress, 2nd Session) objected to the attitude of the Executive and declared that the Secretary of War had flagrantly abused his official authority; a minority report (Part 2 of same document) defended the President, the Secretary of War and the Chief of Staff, and criticised the adjutant-general.

The movement, especially strong in 1911 and 1912, to pay state militia from Federal funds is blocked by a technicality—the constitutional provision that militia shall not be required to serve beyond the limits of the United States. A bill has been prepared authorising the president to transfer to the army state militias in time of war or when war threatens, and providing for their payment.

In 1912 the principal administrative officers of the army were: Henry Lewis Stimson, secretary of war; Robert Shaw Oliver, assistant secretary of war; Major-General Leonard Wood, chief of the general staff; Brigadier-General George Andrews, adjutant-general, successor to F. C. Ainsworth in 1912; Brigadier-General E. A. Garlington, inspector-general; Brigadier-General E. H. Crowder, judge-advocate general; Brigadier-General J. B. Aleshire, quartermaster-general; Brigadier-General H. G. Sharpe, commissary-general; Brigadier-General G. H. Torney, surgeon-general; Brigadier-General George R. Smith, pay-master general, succeeding C. H. Whipple in 1912; Brigadier-General William H. Bixby, chief of engineers; Brigadier-General William Crozier, chief of ordnance; Brigadier-General James Allen, chief signal officer; Brigadier-General Frank McIntyre, chief of bureau of insular affairs, succeeding C. R. Edwards in 1912.

NAVY.—The principal vessels of the American navy, in service, under construction and authorised, may be classified as follows: first class battleships, 38; armoured cruisers, 12;

protected cruisers, 22; unprotected cruisers, 3; scout cruisers, 3; single-turret harbour defence monitors, 4; double-turret monitors, 6; gunboats, 13; light draught gunboats, 3; composite gunboats, 8; torpedo boat destroyers, 56; steel torpedo boats, 28; submarine torpedo boats, 49 (8 authorised); tugs, 45; auxiliary cruisers, 5; converted yachts, 17; colliers, 25; transports and supply ships, 15. For technical details see under SHIPS AND SHIPPING and THE WORLD'S NAVIES. There are three fleets: Atlantic, with four divisions; Asiatic, with four divisions; and Pacific. In 1912 there was a naval militia in each of 22 states and in the District of Columbia, with a total of 558 commissioned officers, 29 warrant officers, 1,361 petty officers and 5,372 men. Thirty-two vessels of the U.S. Navy are assigned to state naval militias. The navy active list of officers includes 2,796 commissioned, 273 warrant officers and 768 at the Naval Academy. The maximum number of enlisted men by law is 51,500.

In Congress there was a long struggle over an appropriation for battleships; on May 28, 1912 the House passed an appropriation bill with no provision for battleships; the Senate voted for two on July 5; and the conference report for one battleship was adopted by the Senate, August 19, 1912.

The secretary of the navy since March 6, 1909, was George von Lengerke Meyer (b. 1858) of Massachusetts. In 1912 Admiral George Dewey was president of the general board, and the administrative bureaus with their heads were: navigation, Rear Admiral Philip Andrews; yards and docks, Civil Engineer Homer R. Stanford; ordnance, Rear Admiral Nathan C. Twining; construction and repair, Chief Constructor Richard M. Watt; steam engineering, Engineer-in-Chief Hutchinson I. Cone; supplies and accounts, Paymaster General Thomas J. Cowie; medicine and surgery, Surgeon-General Charles F. Stokes; marine corps, Major-General William Phillip Biddle.

EDUCATION

At the close of the first decade of the 20th century there were in the United States about 25,000,000 children of school age, and about 20,000,000 enrolled in public and private schools, with an average daily attendance of about 14,000,000. The average school year was about 8 months of 20 days each. In the decade 1900-10 the school population increased at a much smaller rate than the entire population, as the birth rate has continually decreased. But this decrease has been much larger in the North than in the South or West, and, in general in the older parts of the country than in the newer. It is equally true that all averages for the entire country are misleading, because there is so great a variation between different states, and even between different parts of the same state. Less than two-thirds of the school population was enrolled in 1910 in ten states; and, in the same year, less than two-thirds of the enrolled number was in average daily attendance in 17 states. With an average of 160 days for the country's school term, 26 states fell below the average and several had only about 100 days of school a year. The average attendance of the total school population was less than 100 days in 42 states, less than 75 days in 19 of these, less than 50 in 5 states, and not more than 114 in any state; of the total enrollment it was less than 100 days in 19 states and less than 75 in 5 states.

For similar comparisons in regard to illiteracy see *Population* above. But it must be borne in mind that, even if such averages are misleading in many respects, they are approximately correct for purposes of comparison with previous years. The percentage of enrollment to total school population was 68.6% in 1900 and 72.5% in 1909. The length of the average school term increased from 144.3 to 155.3 days in the same period, and the average attendance of each pupil from 99 to 112.6 days. In spite of a steady tendency during the last part of the decade to consolidate small country districts, the number of public school-houses increased from 248,279 to 257,851, and the value of public school property increased from \$550,531,217 to \$967,775,587. The cost of public schools increased from \$214,964,618 to \$401,397,747, or 86%; and the cost per pupil increased from \$20.21 to \$31.65. The percentage of the total cost expended for teachers' salaries was 64% at the beginning and only 59.2% at the end of the decade. The average monthly salary of men teachers increased about 35% and of women teachers about 25%. Because the school year is longer the average yearly salary shows an even greater increase. Even thus the increase is probably less than the average increase in cost of living and scale of prices during the decade. This is no doubt one reason for the decreased proportion of men teachers; in 1900 they were about 30% and in 1909 about 21% of the total. What effect the growing tendency to pay women teachers as much as men will have upon the proportion of men to women is a question on which experts disagree and which the next decade may decide.

The public school system has been growing up and down. In the decade the number of children in public kindergartens increased 40% (from 131,657 to 185,471) in cities with

4,000 inhabitants or more, and not merely have the large cities extended their kindergarten work but smaller cities and country districts have adopted the methods of the kindergarten. In the same period the number of public high schools increased from 6,005 to 10,213 (70%), the number of pupils from 519,251 to 915,061 (76%) and that of high-school teachers from 20,372 to 41,667. Private secondary schools decreased in number, and the number of teachers increased only 10%.¹ Besides there can be no doubt that the public high schools have gained in efficiency absolutely and relatively to the private schools. Indeed it is a commonplace among university and college teachers that a majority of the best students come from the public schools and not, as a generation ago, from the private secondary schools.

During the decade the universities have done increasingly much for the secondary schools. The increasing growth and importance of the state universities and normal schools, in almost every instance under the same control (state board of education) as the public high schools, the dependence in a greater degree of higher institutions of learning upon the public secondary schools for the best part, qualitatively and quantitatively, of their clientele, and, above all, the new and wider study of education as a science and of the interesting special psychology of adolescence,—have been notable factors in this change. The unsettled problem of college entrance examinations is not the only one that is being carefully studied by the faculties of the higher schools—it is rather a part of the great question of curriculum.

Even more striking is the independent attitude toward the college of the secondary school, which considers itself more and more as a school preparatory for business and the trades rather than for college. Although the number of pupils in secondary schools increased 200% between 1890 and 1910 (when the total population increased 50%), only one-fifteenth of the pupils in secondary schools now go to college. First the commercial high-school, or the commercial course in a general high-school and manual-training high-schools, and now agricultural high-schools, mark the progress of this movement toward satisfying the practical needs of the present American population. To a large degree this has been effected by the work of the Morrill "land grant" agricultural and mechanical arts colleges, to a *rapprochement* between state departments of agriculture and education, which was promoted by the mere existence of these agricultural colleges, and to such movements in the schools as the Boys' Corn Clubs and Girls' Tomato Clubs, and the Farmers' Cooperative Demonstration Work, which began in the early part of the decade under Dr. Seaman Asabel Knapp and which at the close of the decade was symbolised in the establishment in connection with Peabody College for Teachers at Nashville of the Seaman A. Knapp School of Country Life (see TENNESSEE: *Education*). The spread during the last two years of agricultural and vocational education in primary and secondary public schools, and the provisions for courses in agriculture and domestic science in public normal schools, is shown in the articles on the different states.² It may be noted here that the General Education Board (Rockefeller Fund) in October 1912 appropriated money for agricultural schools in northern New York and in Maine; and that in 1911 and 1912 Senator Carroll S. Page of Vermont introduced a bill in Congress for Federal aid to secondary schools teaching agriculture, home economics, trades and industries, and for training teachers in state normal schools for these vocational subjects. Similar measures were introduced by C. R. Davis, Representative from Minnesota, William B. Wilson, Representative from Pennsylvania, and Senator L. S. Overman of North Carolina. In 1911, 12 states required instruction in agriculture in the common schools, 4 in rural schools and 3 in rural high schools; 16 gave aid to special agricultural schools and 12 to departments of agriculture in high schools; and 31 had agricultural colleges maintaining secondary courses (or schools) in agriculture. New York, Ohio, Massachusetts, Connecticut, New Jersey and Wisconsin had definite systems of vocational education—all but the first two the direct result of reports by state commissions on the subject. In Indiana and in Illinois the legislature of 1913 will be called to act upon reports from similar commissions.

Especially during the latter half of the decade, state laws have been stricter in regard to compulsory schooling and to such limitations of child labour as literacy requirements for children's certificates to work. Closely related to the movement for agricultural education is the greater attention paid to rural schools,³ state aid granted to "weak" school districts to assure full school terms and a fair teacher's wage, and the consolidation of small rural districts, often accompanied by free transportation of remoter pupils.

Urban schools are being more efficiently organised, school boards being reduced in size and removed from political control, and the appropriations and expenditures are more nearly adequate. Especially in the city public schools have experiments in testing efficiency of the educational plant been made and provisions made for sub-normal or defective children,⁴

¹ The increase of teachers proportionally to pupils, or rather the decrease of numbers in classes, in all branches of education—even in the face in large cities of enormous increases in population and lack of class-room—is a significant and promising phenomenon.

² See the summary, "Legislation for the Last Three Years on Vocational Education" by R. R. Simpkins, in *The School Review* for June 1912.

⁴ The National Association for the Study of Exceptional Children (Plainfield, New Jersey),

and for the physical welfare of all children—notably in physical training and examination, abolition of common drinking cups and towels, better cleaning and ventilating apparatus and more hygienic school furniture. A movement for holding city schools the year round seems to be gradually gaining favour. In 1911–12 investigations of the school systems of Baltimore and New York City were made by experts outside the municipal system.

Upon the colleges the utilitarian tendencies of secondary schools—and of other agencies—have had their effect, which may be seen negatively in the rapid minimisation in the college (as in the secondary school) of the humanities, particularly Greek, and, positively, in the establishment of schools of finance and of journalism in addition to the previous “professional” schools. The improvement of the professional schools, especially of law and medicine, though hampered by the licensing of lawyers and physicians under different requirements in different states, has still advanced. The requirements are being raised (and thus approximately standardised) by the legislatures of the different states. The wretched conditions in some medical schools and the wasteful multiplication of these institutions was pointed out in 1910 by Abraham Flexner in a report to the Carnegie Foundation for the Advancement of Teaching. This report, and the standards of efficiency required by the Carnegie Foundation in institutions to whose teachers it grants pensions, have promoted the cause of higher education, both special and general, by putting a premium on the best.¹

The principal change in recent years in the matter of college entrance requirements was a scheme adapted at Harvard in 1911 to be tested with the former scheme; it requires the satisfactory completion of an approved (but not a university ruled or supervised) course of secondary studies and examination in four subjects: English; Latin (arts course) or French or German (science course); mathematics or science (physics or chemistry); and one of Greek, French, German, history, mathematics, physics or chemistry, not chosen from the preceding three classes. This method had been proposed in 1910 at a meeting of the Association of New England Colleges, when it was summed up as “a certificate for quantity and an examination in a limited number of substantial subjects for the quality of school work.” Vocational subjects may be offered for entrance to the University of Wisconsin and the University of Chicago, but both universities (and the University of California) limit a student taking entrance examinations in such subjects and require him to combine them with more abstract and disciplinary subjects; and the University of Chicago announced as an “offset to this increased freedom” that students would no longer be admitted with conditions.

The growth of the large colleges and universities has made the problem of the small college,² and especially of the rural college, a difficult one. Amherst College definitely decided to adhere to a liberal arts curriculum. Hamilton College, Clinton, New York, in much the same difficulty, seriously considered the opposite course, dropping Greek from the requirements for the degree of Bachelor of Arts and building up a literary scientific curriculum, but in 1912 no very radical action was taken. In February and April 1911 representatives of several denominational boards of education decided to co-operate in the founding of colleges.

The most interesting and important new institutions opened during the years 1911–12 were: Rice Institute (see TEXAS) and Reed College (see OREGON).

Bibliography.—GENERAL: Paul Monroe (ed.), *A Cyclopaedia of Education* (New York, 1911; —3 vols. now published) is a remarkable evidence of the work of Columbia University and its Teachers College for general education; and G. E. Partridge's, *Genetic Philosophy of Education* (New York, 1912) is an epitome of the writings of G. Stanley Hall of Clark University. Of historical importance, especially for education in New York state, is Edward A. Fitzpatrick, *Educational Views and Influences of De Witt Clinton* (New York, 1911); and on women's education papers in the October and November numbers of the *Educational Review* by James M. Taylor of Vassar. The annual reports of the U.S. Commissioner of Education and the reports of state superintendents contain important statistical matter.

On the special topics mentioned above the following are some of the more important recent publications. SECONDARY SCHOOLS: C. H. Johnston and others, *High School Education*, (New York, 1912) and Julius Sachs, *The American High School* (New York, 1912). RURAL SCHOOLS, AGRICULTURAL AND VOCATIONAL EDUCATION: E. P. Cubberley, *The Improvement of the Rural Schools* (Boston, 1912); B. M. Davis, *Agricultural Education in the Public Schools* (Chicago, 1912); G. A. Bricker, *The Teaching of Agriculture in the High School* (New York, 1911); Part II, on agricultural education, of the *Eleventh Year Book of the National Society for the Study of Education* (Chicago, 1912); Edwin G. Cooley, “The Need for Vocational Schools”

The New Jersey Training School (Vineland) and the State University of Pennsylvania with its psychological clinic are the pioneers. The State University of Washington has a fund (Gatzert foundation) for training and studying mental defectives. There is a tendency to take the control of state schools for feeble-minded and other defectives from charitable (and penal) boards and to give it to state boards of education. See Frederick E. Bolton, “Public Education of Exceptional Children,” *Educational Review*, June 1912.

¹ On efficiency tests see various articles, including one by Clyde Furst, Secretary of the Carnegie Foundation, in the May 1912 *School Review*.

(RICHARD WEBSTER.)

CHURCHES AND DENOMINATIONAL STATISTICS

The most marked contemporary tendency among the religious bodies in the United States, particularly those ranking as Evangelical Christian, is that toward co-operation, federation and unity. Churches of similar faith are drawing closer to one another, and while they do not surrender that which is peculiar to each in doctrine, polity, discipline and method, they do emphasise their points of agreement and insist above all that they are engaged in a common task, that this common task is immense in extent and importance and that it cannot be accomplished except by most strenuous and united effort. The field of this effort is not only the United States and its colonies, but the entire world; to the leaders it is one and all-embracing. But, for convenience, we may distinguish between the work at home, or home missions, and the work in the rest of the world, or foreign missions.

The conditions in the foreign field present a problem so stupendous that the effort of individual denominations appears utterly inadequate and inefficient, and the logic of the situation drives the missionary societies to co-operation and combination. The work has gradually broadened in scope so that while evangelistic effort has increased, educational, publication, hospital, and industrial institutions have multiplied in number and importance. The demands from Asia for a western system of education and other adjuncts of Christian civilisation bear heavily and persistently upon the minds and hearts alike of the missionaries and of the directors at home; the hundreds of millions of non-Christian peoples appear to be drifting from the moorings of their ancient religions, and "immediate urgency" everywhere faces society and worker. Therefore universities and colleges, publishing houses, hospitals, etc., have become union organisations, with from two to half a dozen different denominations supporting and conducting each. Moreover by common agreement the native Church, when it shall become autonomous and independent of the societies, is not to reproduce all the denominational divisions of America and Europe, but is to have for its ideal complete Christian unity. So, following the example in Japan, half a dozen Presbyterian and Reformed bodies have united their mission churches into one organisation in India and China, and the three branches of the Anglican Communion operating in China have done likewise. In West China bodies as diverse as Baptists, Friends and Methodists have come to an agreement to create an undivided comprehensive native Christian Church. The World Missionary Conference at Edinburgh in 1910, representing all Protestant bodies, became the mount of vision, so to speak, for an exhaustive survey of conditions in the non-Christian world, for the purpose of sounding an advance for the missionary forces of all Protestantism. A Continuation Commission, serving for all, is studying the problem with the view of securing a more perfect comity, co-operation and unity, and a more adequate occupancy of the whole field and of strategic centres. A considerable saving in means and effort has resulted, and combination has increased efficiency and power many fold. This economy in expenditure has not reacted in smaller contributions by the American home churches for foreign missions; but the aggregate becomes constantly larger, reaching in 1912 nearly \$15,000,000 for the United States and Canada alone, about a half of the entire income from all countries.

The missionary problem in the United States appears from the evangelical point of view to be quite as important and urgent as that in the rest of the countries of the world. The coming to America of a vast stream of immigration, approximating a million souls a year, of whom probably a minority only may be regarded as professing any form of the Christian faith, makes a moving demand upon all the denominations—the Jewish, to care for those of their own religion, the Roman Catholic and Eastern Orthodox, to meet the needs of the multitudes of the Latin and Greek rites, and the Lutheran and Reformed, to provide for those adhering to the Augsburg and Heidelberg Confessions. Great numbers of immigrants have practically no religion, and Protestant missionaries are endeavouring to reach these in particular. While most of the newcomers are drawn to the cities, vast numbers of Italians, Poles, Hungarians, Slavs and Greeks find their way into the smaller cities and towns, and even into villages. The service to be given, therefore, is extensive as to territory and numbers, and comprehensive as to language. Add to this foreign-speaking conglomerate the pioneers in newly-settled sections, the negroes and the Indians, and the inhabitants of those older rural parishes which are weakened by the migration to cities, and the Churches feel that an extraordinary task confronts them. Combination of Protestant home missionary societies in a Council for conference, co-operation and united action, as far as possible, is the

outcome. The principle of comity, the prevention of waste by doing away with rivalry, overlapping, over-churching small communities, and the joint study of difficult problems are some of the achievements aimed at.

The missionary spirit thus dominates all Protestantism as well as the relations of one denomination to another. It has made possible the Federal Council of the Churches of Christ, the second quadrennial session of which was held in Chicago, early in December 1912. The Council is a consulting and advisory body composed of official delegates appointed by the chief judicatories of the various evangelical churches, including Baptist, Congregational, Disciples of Christ, Friends, Lutheran, Mennonite, Methodist, Presbyterian, Protestant Episcopal and Reformed bodies. The purpose of the Council is to express the common consciousness of the united churches upon matters of mutual and public interest, and to render such service in their behalf as may be possible; to co-ordinate and correlate the work of the churches so as to secure a more perfect distribution of effort and prevent duplication; to bring about the formation of state, city, town or other local federations of Churches, and to co-ordinate their work.

The affairs of the Council are directed, in the interval of its quadrennial sessions, by a large Executive Committee. Important commissions and committees deal with such subjects as evangelism, social service, peace and arbitration, temperance, Sabbath observance, family life and divorce, and theological and primary education. The Social Service Commission covers a wide field of activity, and has a broad policy for the moral and spiritual uplifting of the working people, of the vicious, criminal, unfortunate and depressed classes, for the improvement of industrial conditions for men and women and for the abatement of poverty, better housing, etc. In other words, by careful investigations and surveys and the thorough study of unsatisfactory conditions the commission seeks to find effective measures for the alleviation of unnecessary human suffering and human misery, and to apply the Gospel of Christ, in the Spirit of Christ, for salvation in the largest sense. Social service has also been done by the Men and Religion Forward Movement, the aim of which is to interest men in the Church and the Church in men. It has endeavoured by a series of conventions to arouse the churches, particularly in the cities, to the necessity of organised effort to secure social justice and civic reforms, to make Bible study interesting and profitable, to surround boys with good influences, etc. The Federal Council meeting at Chicago was very successful and showed no signs of denominational cleavage. The new president is Prof. Shailer Matthews, a Baptist, succeeding Bishop Eugene R. Hendrix, a Methodist. The general feeling was that this Council, which represents 16,000,000 communicants or more, is no longer an experiment, and that its province is to secure a wider and more complete practical unity.

Another movement aiming to bring about as far as possible the corporate union of Evangelical and Orthodox Christian Churches has been started under the auspices of the General Convention (1910) of the Protestant Episcopal Church. A large commission, of which Bishop Charles P. Anderson, of Chicago, is president, was appointed to invite all Christian Churches which "confess our Lord Jesus Christ as God and Saviour" to unite in arranging for and conducting a Conference for the consideration of questions of faith and order, with the reunion of Christendom as the ultimate object. Most of the Protestant bodies have responded cordially to the invitation, and have appointed commissions to confer with the Episcopalian Commission; the Church of England and the Episcopal Churches of Scotland, Ireland and Canada have agreed to co-operate. It is expected that individuals of the Roman Catholic and Oriental Orthodox Churches will assist in the arrangements for the conference and some of these bodies may participate officially in the conference itself. A circular issued late in 1912 in the name of the commission says that important preliminary questions, such as the basis of representation, the time and place of meeting, the method of procedure, may require years of discussion.

Reunion of bodies of similar faith, order and history has not made much progress in recent years. The Northern and Cumberland Presbyterian bodies voted in 1906 to consolidate, but only a minority of the ministers, churches and communicants of the latter entered the United Church. Much property litigation and consequent bitterness of feeling have resulted. Some important projects of union are pending. (1) Between the Methodist Episcopal, Methodist Episcopal, South and Methodist Protestant Churches. A plan in outline has been prepared, proposing that the three churches unite in one body with three or four territorial divisions, each to have a quadrennial conference for jurisdiction over its local affairs, and all to have a general conference with jurisdiction over the general affairs of the United Church. The plan contemplates the possibility of the union of the negro constituents of the Methodist Episcopal and Methodist Protestant bodies with the Colored Methodist Episcopal Church and other colored Methodists under a quadrennial Conference. The new Church would have from 5,000,000 to 5,500,000 communicants. The plan has received little general discussion so far. (2) Between the Church of the United Brethren in Christ and the Methodist Protestant Church, bodies similar in doctrine, discipline, polity and usage. (3) Between the Free Methodist and American Wesleyan Churches, small bodies not far apart. (4) Between the Evangelical Association and the United Evangelical Church, Methodist bodies which separated about twenty years ago. (5) The Presbyterian (Northern) and the Reformed Church in the United States (German). (6) The Presbyterian (Southern) and the

United Presbyterian Church. (7) Between the Northern Baptists and the Free Baptists, long separated by their Calvinistic and Arminian Confessions; the two bodies have consolidated their denominational missionary, publication and educational boards, but the merging of churches, conferences, associations, etc., will, it is expected, be a gradual process.

The Roman Catholic Church is steadily growing in America, having a population of over 15,000,000, not including Porto Rico, the Philippines, and the Panama Canal Zone. This population, embracing representatives of many of the peoples, races and languages of the world, stands for a communicant membership of about 12,750,000 (end of 1911), eliminating unconfirmed baptised children; this indicates a net gain of about 675,000 communicants in the last five years. The Pope, appreciating the freedom, loyalty and prosperity of the Church in the United States, gave it in 1908 a complete ecclesiastical status. Before that year it had been treated as a missionary organisation under the general supervision of the Congregation *de Propaganda Fide*, in Rome. Now it has the same measure of autonomy as is enjoyed by the Roman Catholic Church in England or Germany. The pope has appointed three new cardinals for the Church in the United States—Archbishop Farley of New York, Archbishop O'Connell, of Boston, and Monsignor Falconio, Apostolic Delegate at Washington. The Papal decree of September, 1910 prescribing rigorous measures to prevent "Modernism" from getting a footing in the Church, evoked no protest in the United States, and the oath required of the clergy was loyally given.

The group of Eastern Orthodox Churches having congregations in the United States has increased in number by immigration. In addition to the Russian, Greek, Armenian, Servian, and Syrian bodies, the Bulgarian and Rumanian Churches have organisations, the seven reporting an aggregate of about 434,000 communicants.

The Church of Christ Scientist, or Christian Science, appears to be gaining in number of branches, or churches, in "readers" and in practitioners. For some years no returns have been given of members. The death of the founder and director of the movement, Mrs. Mary Baker Eddy, in 1910, left the Board of five directors, which had been appointed by her, as the governing body of the denomination. Her fortune, amounting to \$2,500,000, was left for the benefit of the organisation. The withdrawal of a few branches and the organisation of a Reformed Christian Science Church is one of the events of 1912.

The fourth decennial Ecumenical Methodist Conference, for the discussion of problems common to Methodism was held in October, 1911 in Toronto. There were present about 500 delegates, 200 from the Methodist Churches of Great Britain, Ireland, France, South Africa and Australasia; and 300 from the many branches of Methodism in the United States and Canada. The questions treated in papers and discussions took a wide range, the newer phases of Church life and Church work, including missionary endeavour, social service, training and care of the young, evangelism, international peace, receiving much attention. Higher biblical criticism evoked expressions of acquiescence in ascertained results, although there was an undercurrent of dissent. Delegates from Great Britain and Australasia had enthusiastic reports to make of the results of the consolidation of a number of branches. An Ecumenical Methodist Commission, to act for the Methodism of the world in the interval of the decennial Conferences, and especially to cultivate a more intimate fellowship between the various branches, was created. Reports from the Eastern and Western Sections showed that Methodism in America has entered a period in which the rate of increase is lessening; while the British branches are encountering net losses. The larger bodies of the United States have all gained in communicants since 1906, the Methodist Episcopal reporting 3,293,526 in 1912, the Methodist Episcopal Church, South, 1,919,873 in 1912, the Methodist Protestant 183,318, the African Methodist Episcopal, 620,234 the African M. E. Zion, 547,216 and the Colored M. E., 234,721. In all, the 17 bodies have a total of about 6,905,000.

The Baptist World Alliance held its second Congress in Philadelphia, in June 1911. Delegates of the Northern, Southern, Colored and Free Baptist bodies of the United States and from the Baptist Churches of Canada, Great Britain, Russia and other countries of Europe, and from Africa, Australia, and countries of Asia were present. The sessions were crowded, and great enthusiasm was evoked by the Russian delegation, who told of persecution and progress and great opportunities. The Congress raised over \$60,000 for a theological seminary in St. Petersburg, and the American Baptists agreed to increase the fund to \$125,000. The Rev. R. S. MacArthur, D.D., of New York, was elected President, and he subsequently visited Russia, dedicated a Baptist Tabernacle in St. Petersburg and bought ground for the Seminary. The larger Baptist bodies of the United States are growing steadily. The Northern Baptists number about 1,176,000, the Southern 2,475,600 and the Colored over 1,912,000. A dozen other Baptist bodies bring the total up to about 5,894,000.

The Congregational Churches have under consideration a plan for the co-ordination of their benevolent societies and for changes in their national triennial Council which would give it administrative functions, with a permanent Secretary. The denomination is growing moderately, having at the close of 1912 742,000 communicants.

The Disciples of Christ, notwithstanding the division of some years ago into two bodies, show a healthy growth. In this denomination at the close of 1912 there were about 1,340,000 communicants, besides the 157,000 or more belonging to the conservative branch known as the Churches of Christ.

The Evangelical Association and the United Evangelical Church have 184,866 members, the Friends (4 bodies) 124,216, the German Evangelical Synod 258,911, the United Brethren in Christ (2 bodies) 320,960, the Reformed (4 bodies) 459,106.

The Protestant Episcopal Church, which, as a new feature for large city dioceses, has suffragan bishops, grows steadily. At the end of 1912 it had 970,451 communicants.

The Presbyterian bodies show a steady growth in numbers and in finances. The Northern Church has 1,368,150 communicants, the Southern 292,845, the United 139,617, and the Cumberland 120,000. The twelve bodies returned in 1912, 1,982,000 communicants.

Jewish immigration adds about 70,000 to 75,000 annually to the Jewish population in the United States, now about 2,000,000. Great activity in the organisation of societies and in the prosecution of various lines of work characterises the denomination.

The Lutheran Communion has an encouraging annual growth. Independently of the kindred Swedish Evangelical bodies (68,500) it has an aggregate of 2,353,702 communicants. It is developing steadily its missionary and other interests. Of the general bodies the Synodical Conference has 807,693 communicants, the General Council 473,295, the General Synod 309,702, and the United Synod, South, 50,669.

The grand total for all denominations in the United States, chiefly on the basis of the returns for 1912, rises above 36,675,000 members, including Christians, non-Christians and Jews.

(HENRY K. CARROLL.)

POLITICAL HISTORY 1909-12.

During the administration of President Taft, which began in the spring of 1909, the tariff assumed a place of first importance in the work of Congress and in public discussion. Called into special session for the purpose of revising the

**Payne-
Aldrich
Tariff 1909.**

tariff, Congress passed in August the Payne-Aldrich act. It was by no means a radical measure. There were some reductions in duties, as in the case of iron and steel, wood pulp and printing paper, and manufactures of leather; hides were placed on the free list. But there were also increases, notably in the finer grades of cotton and silk goods; and the woollen and sugar schedules, which had been the subjects of general criticism, remained virtually unchanged. Aside from such readjustments of the duties, the act had several notable features. It provided for free trade between the United States and the Philippines (*q.v.*), with the exception that certain imports from the islands were to be limited in quantity; it erected a customs court of appeals to review the findings of the Board of General Appraisers; it established a minimum and maximum system under which the President was empowered to impose an additional 25% *ad valorem* upon imports from countries which should discriminate against American imports; and it levied an excise tax of one per cent upon the net income of corporations. The constitutionality of this tax was upheld by the Supreme Court in 1911. Its imposition marks an advance in Federal control of corporations, entailing as it does supervision over annual accounts and business transactions. Congress also initiated an amendment to the Constitution which would permit the government to levy an income tax without apportioning it among the states according to population. Thirty-seven states had ratified the amendment¹ up to February 1913. It was officially proclaimed on February 25th.

The tariff act also empowered the President to "employ such persons as may be required" in securing the information necessary to the execution of the maximum and

**The Tariff
Board.**

minimum provisions. Under this vague authority he appointed a tariff board for the purpose, among other things, of investigating the difference in the cost of production in the United States and abroad, since the Republican platform of 1908 had promised tariff revision on the basis of equalising this cost (see *E. B.* xxvii, 735a). He urged Congress to make the board permanent and to adopt the policy of revising the tariff schedule by schedule in accordance with the findings of the board. He did manage to secure annual appropriations for the board until 1912; but though the board made exhaustive reports upon the paper, wool, and cotton schedules, Congress gave little heed to them in framing its tariff measures.

¹ The amendment becomes Article XVI of the Amendments to the Constitution and reads: The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration.

The passage of the Payne-Aldrich act marked a turning-point in the fortunes of the Republican party. Nineteen Republicans had opposed this party measure in the House, seven in the Senate; and it was soon evident that their course was widely approved by the people, especially in the Middle West. It did not appear that any real attempt had been made to revise the tariff in accordance with the pledges of the party platform. The President failed to understand the temper of the country. He declared, on signing the bill, that it was a sincere effort to make a downward revision, and again, somewhat later, that it was "the best customs law that has ever been passed." His attitude separated him from the progressive wing of the party, creating the impression that he had become dominated by reactionary influences. The breach became still wider when he laid before

Dissatisfaction with Taft's policy.

Canadian Reciprocity.

Congress, on January 26, 1911, a Reciprocity Agreement with Canada which required legislative adoption by both countries. The agreement provided for the free exchange of all primary food products and a reduction of duties upon secondary food products and certain manufactured articles. The progressives denounced it as a discrimination against the farmer: he would receive no real relief from the extortions of American trusts while having to meet the competition of Canadian food-stuffs. Opposed by the progressives for one reason and by the high-tariff Republicans for another, the Tariff bill failed in the Senate; and though the President carried it through the Sixty-second Congress in the spring of 1911, he had to rely mainly on the Democrats. His measure for reciprocity with Canada, with which he had expected to recover the prestige lost in 1909, still further irritated the Northern farmers. As a climax to this bitter disappointment the Canadian Parliament withheld its consent as a result of the election of 1911 (see CANADA), the ever-present fear of absorption by a powerful neighbour weighing heavily in the decision.

When the Sixty-second Congress convened in 1911 popular disapproval of the Taft administration was written large in the altered composition of the houses. The Democrats had a majority of sixty-seven in the House of Representatives and were only eleven votes below the majority in the Senate. For the first time in fourteen years they had broken Republican control of Congress.

They had also wrested seven states from the Republicans, electing the governor in Maine for the first time in thirty years and in New York for the first time in eighteen. Since their campaign had been conducted on the tariff issue, they clearly had received a mandate to proceed with the work of revision. Led by Oscar W. Underwood,¹ chairman of the committee of Ways and Means, and combining with the progressive Republicans in the Senate, they carried through Congress in the special session of 1911 a "farmers' free list bill" (August 1) which removed the duties from certain manufactures and food products; a bill which made considerable reductions in the duties on wool and woollens; and a bill cutting in half the duties on cotton goods. All three the President vetoed, condemning them as "empirical and haphazard" and holding that Congress should not touch the wool schedule until it received the report of the tariff board. In 1912 he followed the same course, vetoing reductions in the wool, cotton, and metal schedules; and the Democrats could not command the necessary majority of two-thirds in the Senate to override the veto. The Senate, in fact, rejected House bills revising the chemical schedule and placing sugar on the free list. Though protesting indignantly, the Democrats were not sorry to have so definite an issue to present to the electorate in the presidential campaign.

All through his administration President Taft vigorously enforced the Sherman anti-trust act which was passed in 1890 to protect interstate commerce from restraint

¹ Underwood (b. 1862), a native of Kentucky and educated at the University of Virginia, had represented the 9th Alabama district in Congress, since 1895. He was chairman of the state Democratic campaign committee which drafted the constitution of Alabama adopted in 1901. In 1911 W. J. Bryan in his weekly, *The Commoner*, charged that Underwood prevented the revision of the steel and iron tariff schedules because he was interested in the iron industry in Alabama. Underwood denied this, and in spite of the public break with Bryan retained the party leadership in the House which he had assumed that year.

and monopoly (see *E. B.* xiv, 713a). On May 15, 1911, the Supreme Court gave a new interpretation to this act, distinguishing for the first time in a majority opinion between reasonable and unreasonable restraint. Chief Justice Edward D. White¹ asserted the doctrine that combinations were illegal only when exercising an unreasonable restraint upon trade or when their "direct and necessary effect" was to stifle competition. Although Justice John M. Harlan sharply dissented from the opinion, pointing out that the court had expressly rejected the "rule of reason" fifteen years before, yet he joined his eight colleagues in decreeing the dissolution within 6 months of the Standard Oil Company (May 15) and the American Tobacco Company (May 29). Shortly afterwards these great corporations dissolved into their component parts. But the belief widely prevailed that their obedience to the court decree was only colourable. Justification of this view appeared in the suit which the government brought against the Standard Oil Companies of New Jersey and New York, August 29, 1912, charging conspiracy to ruin the business of the Pierce-Fordyce Oil Association of Texas and in the proof, adduced by proceedings in the state of Missouri, that control over the Waters-Pierce Company still rested with John D. Rockefeller and his associates of the Standard Oil. Among Republicans there now began to appear a definite cleavage of opinion as to the best methods of dealing with the trusts. President Taft wished to secure "competition without monopoly." He expressed satisfaction with the Sherman act, suggesting that amendments be adopted defining improper acts of restraint or monopoly as criminal offences. Mr. Roosevelt, on the other hand, regarded as chimerical the attempt to regulate trusts by means of a succession of lawsuits. He wished to have an administrative commission which would supervise other interstate corporations very much as was already being done in the case of railroads. This would preserve the advantages of large-scale production and give certainty to business. In the presidential campaign this question, though overshadowed by the tariff issue, was much discussed. The Democrats, with their *laissez-faire* notions, differed radically from Mr. Roosevelt, denouncing his scheme for a commission as state regulation of monopolies and emphasizing the function of the states in dealing with the problem. They also differed from Mr. Taft in wishing to reverse the interpretation which the court had placed upon the Sherman act.

During 1910-12 important questions came to the front with respect to the control of railroads. In 1911 the conflict between national and local authority became acute.

By court decisions severe restrictions were placed upon the states. The Supreme Court held that the equipment of a railroad which conducts an interstate business comes exclusively under the jurisdiction of the Interstate Commerce Commission, even in the case of cars moving entirely within the boundaries of a single state. The circuit court at St. Paul held invalid (April 21, 1911) a Minnesota law fixing the passenger rate at two cents a mile, the ground being that, while the law applied only within the state, it nevertheless discriminated against interstate passengers who had to pay a higher rate. Against this decision, as an encroachment upon state rights, the state governors protested on the occasion of their annual conference at Spring Lake, New Jersey, on September 12, 1911. In April, 1912, when the case came before the Supreme Court on appeal, three of the governors presented briefs. The decision, which will have far-reaching effects, had not been handed down in February 1913. In 1910 Congress adopted an amendment to the Interstate Commerce act. This extended the jurisdiction of the Interstate Commerce Commission to telegraph and telephone companies, increased its powers in fixing rates, created a commerce court to review its orders, and authorised the President to create a board to investigate railroad capitalisation. The new Commerce Court proceeded, in a series of decisions, to override the Commission, only to have several of the decisions reversed in 1912 by the Supreme Court which criticised it for exceeding its powers. Public

¹ Edward Douglass White (b. 1845), a native of Louisiana, a Democrat, and a former Confederate soldier, had become a justice of the Supreme Court in 1894, and in Dec. 1910 was appointed Chief-Justice. He had served in the U. S. Senate in 1891-94.

suspicion of the court was reflected in the refusal of Congress to authorise any grant for its maintenance until the President had twice returned the general appropriation bill for 1913 without his signature. Against one of the judges, Robert W. Archbald, who was charged with having used his position to secure favours from litigants, impeachment proceedings were brought (see below). The Railroad Securities Commission reported in December 1911 that it would be impracticable to place the issue of railroad securities under Federal control; it recommended full publicity under the supervision of the Interstate Commerce Commission, with power to make physical valuations.

Almost from the beginning of the Taft administration its attitude toward the conservation of natural resources was bitterly assailed. This was one of the chief circumstances which alienated the progressive wing of the Republican party from the President. In 1909 the Chief Forester, Gifford Pinchot,¹ attacked the good faith of Mr. Ballinger,² Secretary of the Interior, accusing him of being opposed to conservation and of supporting fraudulent claims to Alaskan coal lands. The charges were investigated by a Congressional committee. The majority report, laid before Congress in December, 1910, completely exonerated Mr. Ballinger as "a faithful and efficient public officer;" but, being dictated apparently by partisan motives, the report had no substantial effect upon public opinion. On March 6, 1911, Mr. Ballinger resigned, the victim, the President said, of "one of the most unscrupulous conspiracies for the defamation of character that history can show." He was succeeded by Walter L. Fisher,³ a pronounced conservationist. Nevertheless criticism of the land policy of the administration continued, in one case taking the form of unjustified imputations against the President and his brother in connection with the sale of land on Controller Bay, Alaska, to a coal-mining syndicate. See ALASKA.

The principle of conservation may apply not only to natural resources, but also to the people themselves and to the processes of government. The phenomenal increase of labour legislation shows that men have come to realise the social peril of the old *laissez-faire* attitude. Down to 1911 only three states had enacted workmen's insurance or compensation laws; and in two of these cases (Montana and New York) the courts, adhering to an ancient doctrine, held the acts unconstitutional as taking property without due process of law. In the past two years, on the other hand, fourteen states have taken action. Similarly, with reference to child labour, laws were passed in 1911 by thirty of the forty-one legislatures then in session, and the next year by eleven out of twenty. Among the other subjects covered in 1912⁴ were: the reporting of industrial accidents and diseases, woman's labour, wages, and hours of labour. In Massachusetts a commission was established with power to establish wage boards in any industry in which it may appear that the wages received by women are insufficient to supply them with necessaries and maintain them in health; but the boards may simply recommend a minimum wage and publish the names of

¹ Pinchot (b. 1865) graduated at Yale in 1889 and after studying forestry in Europe devoted himself to this subject, doing the first systematic forestry work in the United States at Biltmore, North Carolina, in 1892. He was Chief of the bureau of forestry, U. S. Department of Agriculture, in 1898-1910 and then became president of the National Conservation Association. In 1903 he became professor of forestry at Yale. He and his brother Amos were deeply interested in radical reform movements and in the 1912 presidential campaign supported La Follette and then Roosevelt. He wrote much on forestry, including the article "Forests and Forestry" in the 11th edition of the *E. B.*

² Richard Achilles Ballinger (b. 1858), a native of Iowa, graduated at Williams College in 1881, practised law in Kankakee, Illinois, New Decatur, Alabama, and Port Townsend and (after 1897) Seattle, Washington, was mayor of Seattle, 1904-06, and Commissioner of the Federal General Land Office, 1907-09; and became Secretary of the Interior in President Taft's cabinet March 4, 1909. He wrote on *Community Property* (1895) and edited and annotated the *Codes and Statutes of Washington* (1897).

³ Fisher was born in Wheeling, West Virginia, in 1862; studied at Marietta College, Ohio, and Hanover College, Indiana; was admitted to the bar in 1888; practised law in Chicago, where he was special traction counsel in 1906-11; and was an officer of the Conservation League of America, of the National Conservation Association, etc.

⁴ See separate state articles under *Legislation and Government*.

employers who refuse to adopt it. Federal legislation is notably increasing in volume. In 1912 the manufacture of poisonous phosphorus matches was prohibited (April 9) by an exercise of the taxing power; a commission established to examine into the relations between capital and labour; and the scope of the eight-hour and accident compensation laws applying to government employees enlarged. The welfare of wage-earners received unusual attention in the presidential campaign on account of the position accorded it in the platform of the Progressive party.

The sentiment against intemperance has been growing rapidly in the United States. A systematic agitation has given wide publicity to the economic waste and the social evils which it entails. At this time, by state or local action, the sale of liquor is prohibited in two-thirds of the whole country and among nearly half of the population. That the prohibition movement made no great progress and suffered no reverses in 1912 may be set down to the fact that it was a presidential year, and that the people were occupied with other questions, as may be seen from the losses of the Prohibition party in the 1912 campaign, partly to the Progressives. In New York the members of the legislature, fearing to compromise themselves, made no concessions either to the liquor interests or to their opponents. In the November elections, however, the state of West Virginia went "dry" by a large majority (92,342). It is also worthy of mention that several railroads in Pennsylvania, urged by the anti-saloon league of that state, discontinued serving drinks on their dining cars; that in Illinois (*q.v.*) certain railways did the same thing because of local prohibition; and that the Southern Pacific Railroad began the construction of recreation houses along its lines with the idea of keeping its employees away from the saloons. The new movement in politics which looks to the elimination of the boss and his corrupt affiliations will help the prohibition cause. Hitherto the control which the bosses have exercised over the government, and the liquor men over the bosses, has resulted in a general defiance of the law and a popular saying that "prohibition does not prohibit." It is also true that under Federal law liquor may be shipped from "wet" states into "dry" states and that the state authority may assume jurisdiction over it only when the original package (see *E. B.* xx, 273) has been broken or its contents have left the hands of the consignee. In February 1913 a bill to do away with this immunity was vetoed by President Taft.

Health laws are another phase of conservation. Not only have the states been seriously backward in legislation, but enforcement has been still more lax. Unfortunately the great hope which was placed in the Federal Pure Food and Drugs act of 1906 has not been altogether realised. By a decision of the Supreme Court, May 29, 1911 (*U.S. v. Johnson*), it was held that extravagant claims might be made for worthless patent medicines without any contravention of the act. Apparently the Secretary of Agriculture was not in sympathy with its strict enforcement. The intrigues against Dr. H. W. Wiley,¹ chief of the bureau of chemistry, attracted public attention in 1911. When he resigned (March 15, 1912), he announced that conditions in the department made it impossible for him to remain. There was a general feeling that the President should have intervened to eliminate the influences which drove Dr. Wiley out.

¹ Harvey Washington Wiley was born in Kent, Indiana, in 1844; graduated at Hanover College in 1867, Indiana Medical College in 1871 and Harvard in 1873. He taught Latin and Greek in Butler College, Indianapolis, in 1868-70; from 1874 to 1883 was state chemist of Indiana and professor of chemistry in Purdue University; and from 1883 to 1912 was chief chemist of the U. S. Department of Agriculture. His opposition to the use of benzoate of soda as a food preservative aroused the hostility of certain food packers, and a chemistry board (of experts) was appointed which disagreed with him in regard to the injurious effects of this preservative. On July 13, 1911, the Attorney-General recommended Wiley's dismissal on the ground that he had employed at a rate higher than the legal *per diem* a consulting expert, H. H. Rusby. President Taft sustained Dr. Wiley in a letter of Sept. 15, 1911. An impression prevailed that the incident was the outgrowth of a personal quarrel between Dr. Wiley and G. P. McCabe, solicitor and member of the personnel board of the Dept. Dr. Wiley was succeeded in December 1912 by Dr. Carl L. Alsberg.

The Prohibition movement.

Protection of public health.

The public conscience has also been much exercised over the prevalence of prostitution. In a number of cities careful investigations have been made, notably in Chicago where a commission has reported that there are more than a thousand houses of ill-fame with an income of \$16,000,000. Congress, in 1910, passed a law which makes the transportation of women for immoral purposes a felony. Half the states have passed laws to combat the "White Slave" traffic.

Conservation in government is efficiency. This has been notoriously lacking in the United States. For example, it was stated by Senator Aldrich that the loose methods of the Federal government wasted \$300,000,000 every year. To remedy this, President Taft appointed in December 1910 an Economy and Efficiency Commission, which investigated the organisation and accounting systems of the departments. One of their recommendations, that the President should submit an annual budget to Congress, met with anything but a kindly reception among those numerous Congressmen who profit politically by the wasteful diversion of public moneys. Accordingly, in 1912, they reduced the salaries of the commissioners and provided in another bill that only the usual departmental estimates should be submitted. President Taft, however, took a different view of his powers; and he made known his intention of sending his budget to Congress at the opening of the regular session. (See *Finance* above.) He showed the same commendable zeal in the improvement of the civil service. In several messages he urged that practically the entire Federal service, with the exception of the cabinet officers and their assistants, should be placed in the competitive classified list; and in October, 1912, he classified all unclassified fourth-class post-masters and in December many skilled labourers in navy-yards. By courageous use of the veto he prevented Congress from limiting the civil service tenure to seven years. Throughout the country there were marked advances in civil service reform during 1912, not only in the adoption of the merit system, but in the recognition of the importance of taking higher administrative officers out of politics. Not less worthy of notice is the founding of numerous legislative reference bureaus and bureaus of municipal research. In New York, Philadelphia, Cincinnati, and other large cities the methods of public accounting have been transformed; and the most modern business practices have been introduced into the departments.

The increased efficiency of the Federal government is illustrated by the fact that the chronic deficit in the post-office department¹ has been stopped and that Congress has been willing to entrust new functions to it. In 1910, a system of postal savings banks was established (see *E. B.* xxii, 196), such post-offices as a board of trustees may indicate paying two per cent on deposits of from \$1 to \$500, or giving in exchange for the deposits government bonds which bear two and a half per cent interest. The trustees may place moneys in state and national banks under guarantee of certain prescribed securities. Put gradually into operation, the system has worked splendidly. In May 1912 a limited parcel post for rural and city delivery routes was established, effective January 1, 1913. The maximum weight is eleven pounds; and the charges, beginning with five cents for the first and one cent for each additional pound, vary with the distance. A large discretion in modifying the original regulations is left with the Postmaster-General acting under the control of the Interstate Commerce Commission. Agitation for the parcel post has been largely due to the excessive charges made by the express companies. In July, 1912, however, the Interstate Commerce Commission ordered a reduction of about fifteen per cent, particularly affecting parcels under twelve pounds.

A few phases of American foreign relations deserve attention. In August 1911, as

¹ Many improvements in this department were due to the postmaster-general, Frank Harris Hitchcock (b. 1867), who graduated at Harvard in 1891, was admitted to the bar in 1894, and was 1st assistant postmaster-general in 1905-08. He managed Taft's presidential campaign in 1908 and was chairman of the Republican National Committee in 1908-09. Hitchcock's efforts to increase postal rates on periodicals brought on him and on the administration the sharp criticism of many popular and influential periodicals. The introduction of the parcel-post system was opposed by the powerful express companies.

the result of suggestions made by President Taft, general arbitration treaties between the United States on the one side and Great Britain and France on the other were signed at Washington. Questions of national honour were brought within the scope of the treaties; all "justiciable" disputes which could not be settled by diplomacy were to be submitted to the Hague Tribunal or some other body. In some quarters the treaties were regarded as heralding the dawn of universal peace; in others as a dangerous step in advance of public opinion, likely to breed friction and misunderstandings. Mr. Roosevelt opposed them. The Senate committee on Foreign Relations asserted that they would rouse into malign and dangerous activity a series of disputes now happily set at rest. Amendments were adopted in 1912 which left the Senate free in each case to determine whether the matter were justiciable or not, and which altogether excluded from arbitration under the treaty the alleged indebtedness of the states and other questions. Thus devitalised, the treaties remained unratified.

In the autumn of 1912 a controversy arose with England which remained unsettled at the end of the year, but seemed likely to raise the question of arbitration in a concrete form. The matter at issue depended upon the interpretation of the Hay-Pauncefote treaty. Congress passed on August 16, 1912, a bill providing for the government and regulating the use of the Panama Canal. The bill empowered the President to fix and alter tolls, admitted free of tolls American ships engaged in the coastwise trade, gave the Interstate Commerce Commission authority to exclude ship lines financially affiliated with railroads, and admitted to free registry under the American flag foreign-built ships owned exclusively by Americans. The English government protested while the bill was before Congress, urging that a subsidy calculated especially with reference to the use of the canal would not be in accordance with treaty obligations, and that it would be impossible to frame regulations for the exemption of ships in the coast-wise trade which would not constitute a preference to American shipping and therefore an infraction of the Hay-Pauncefote treaty. President Taft, however, signed the bill. Opinion in the United States was sharply divided both on the question itself and on the procedure adopted; but without doubt a large part of the American people held either that, as the President believed, the terms of the treaty were being observed or that the circumstances attending the construction of the canal were so different from those contemplated in the treaty that the treaty itself should be regarded as having practically lapsed.

American relations with the Latin-American Republics have been complicated by revolutionary movements in Mexico, Nicaragua, Cuba, and elsewhere. So serious did the disturbances become in Mexico during the early part of 1911, that an army of 20,000 was for a time mobilised on the frontier to prevent violation of neutrality and protect American interests, should occasion arise. Again, a year later, several regiments had to be despatched to patrol the border; and in September 1912, when armed bands of revolutionists came into conflict with the troops on American soil, the situation became exceedingly critical. Only the forbearance of President Taft saved the country from the perils of intervention. In May 1912 several hundred marines were hurried to Cuba, where a negro insurrection had assumed serious proportions. But again intervention proved unnecessary, President Gomez showing himself able to suppress the rebels. In October marines were landed in Santo Domingo to protect the customs houses, some of which had been seized by revolutionists. The collection of the customs revenue on that island has been supervised by agents of the United States Government for the past five years. In order to restore the finances of Honduras and Nicaragua in the same way President Taft negotiated treaties with them in 1911, under which the United States would make arrangements for a loan, supervise the customs service, and apply a certain part of the receipts to the payment of the foreign debt. Although the Senate refused to ratify the treaties, some of their provisions were carried out informally, an American being placed in charge of the Nicaraguan customs and a considerable loan being made by American bankers.

Arbitration treaties.

Panama Canal tolls.

Latin-American republics.

During the summer of 1912, 2,500 marines were sent to Nicaragua to protect the lives and property of Americans; they took part in several engagements.

In December 1911 the treaty of 1832 with Russia was abrogated because of the refusal to give proper recognition to the passports of American Jews in Russia.

The high cost of living has naturally led to demands for increased wages and to labour disturbances throughout the country. Acts of violence attended many of the strikes. Early in 1912 some 25,000 operatives employed in the mills of Lawrence, Massachusetts, left work on account of a reduction in wages following the passage of a state law which limited the hours of labour.

The strike ended with the concession of higher wages, but not before the militia had been ordered out and some bloodshed had occurred. In this struggle the operatives were led by a new organisation known as the Industrial Workers of the World. This organisation, though it has been in the public eye little except in 1911-12, dates further back. Its prototypes were the Knights of Labor, the Western Federation of Miners which struck in Idaho in 1899, the American Railway Union, which carried through the great railway strike of 1894, and, in form, the United Mine Workers. Each of these attempted to unite all the workmen, skilled and unskilled, in an industry. As a result of a conference of six active labour leaders in the autumn of 1904, the Industrial Workers of the World, with Debs of the American Railway Union and Haywood of the Western Federation of Miners, attempted to organise the workers of all industries, and in January 1905 published an Industrial Union Manifesto. There was a serious split in the Industrial Workers of the World, in 1906, when the radicals broke with the officials, whom they accused of too great conservatism but who kept control of the organisation. The Goldfield strike of 1907-08 (see *E. B.* xii, 210) centered about the I.W.W. In 1909 there was another schism; Daniel De Leon (b. 1852), a member of the Knights of Labor in 1888-95 and a leader in the Socialist Trade and Labor Alliance from 1895 to its fusion (1905) with the I.W.W., founded an "indirect" (or political) action branch with headquarters at Detroit, which is very different from the direct action policy of the Chicago School. There is the bitterest feeling between the two branches,—almost as strong as their enmity to the trades unions. The Detroit branch nearly coincides with the Socialist

**Industrial
Workers
of the World.**

Labor party, of which also De Leon is the leader. The Chicago branch would probably have amounted to little had not William D. Haywood been disowned early in 1908 (after his acquittal on the charge of murdering Governor Steunenberg) by the Western Federation of Miners. He thereupon devoted himself to the I.W.W. In 1909 the organisation engineered the McKees Rocks (Penn.) strike of the workers of the Pressed Steel Car Company including 16 nationalities, where success was largely due, as in 1912 in Lawrence, Massachusetts (*q.v.*), to the arousal of public sympathy, partly because of gross errors of the authorities in dealing with the trouble. In 1911-12 the workers campaigned for "free speech" in Oregon and California (*q.v.*).

There are two national unions, the Textile and the Lumber, affiliated with the I.W.W., and its appeal has been to the lower paid and more unskilled workman, the newer immigrant, and—in its free speech propaganda on the Pacific Coast—to the tramp. The basic principles of the I.W.W. are that "the working class and the employing class have nothing in common" and that between them a struggle must go on, through the organisation of all the members of all industries if necessary, until capitalism is overthrown and the wage system abolished. It considers a strike a mere incident in a prolonged warfare, to be followed, when strikers return to work, by "sabotage," i.e., idling at work, the British "ca' canny," and various ingenious methods of spoiling the machinery, business, market, etc., of the capitalist employer. The question of right and wrong is not to be considered. No agreements with an employer are sought and none are final.

The dynamiting work of the McNamaras and their associates (see CALIFORNIA and INDIANA) was done, not by members of the I.W.W., but by officials of unions affiliated with the American Federation of Labor which the I.W.W. has always opposed.

In the American Socialist party, the leaders Debs and Haywood were founders of the I.W.W. Besides Haywood, two other members of the Executive Committee were in sympathy with the I.W.W.; but the other four, Victor Berger (former Congressman from Wisconsin), John Spargo, the author, Morris Hillquit, the historian of Socialism, and Job Harriman, late candidate for mayor of Los Angeles, were opposed to it.

In the 1912 convention of the American Federation of Labor at Toledo, Ohio, on November 20, delegates from the United Mine Workers introduced, and those from the Western Federation of Miners supported, a resolution approving industrial organisation, the scheme of the I.W.W. The resolution was defeated two to one, but it is important to note that there is a movement of some strength in this craft organisation for a general industrial organisation of the I.W.W. type, which the Federation has always opposed. The I.W.W. has six publications at the present time. It has "National administrations" in Hawaii, Australia, New Zealand and South Africa.

Dissatisfaction with the economic conditions in the country and with the failure of the great political parties to face them seriously has greatly strengthened the Socialists.

In 1910 they cast 605,000 votes, a gain of nearly 200,000 over 1908; and in 1912 the Socialist vote for president was large (about 896,000), although the new Progressive party made its appeal on a somewhat socialistic programme. In 1911 they had 392 elected officials, including the first socialist Congressman, Victor Berger (defeated in 1912), 18 legislators in five states, 32 mayors (including Emil Seidel of Milwaukee and G. B. Lunn of Schenectady), and 341 minor officials. On the other hand, the Socialist Labor party, with much more radical principles, has steadily diminished in popular strength.¹ The trade unions have been increasing in number and in membership. The American Federation of Labor had, at the end of 1912, an enrollment of 1,841,268; and, during the year, 260 certificates of affiliation had been issued to unions. Injury was done to the labour cause in 1911, however, by the discovery that numerous dynamiting outrages had been planned and executed by men connected with the International Association of Bridge and Structural Ironworkers (see CALIFORNIA; INDIANA).

These outrages, extending over two years, culminated in the loss of 21 lives by the destruction of the Los Angeles *Times* building in October 1912. Their purpose was

to discourage the use of non-union materials and the employment of non-union labour. Ortie McManigal, who turned state's evidence, James B. McNamara, and J. J. McNamara, secretary of the Association, were indicted. The American Federation of Labor, warmly espousing their cause, collected a large sum of money for the defence and placed a committee in charge.

In December 1911 before the tedious process of selecting the jury had been completed the McNamaras confessed. They were sentenced to imprisonment for life and for fifteen years respectively. Their attorney, Clarence Darrow, was afterwards brought to trial for attempting to bribe a prospective juror, but acquitted; at the end of 1912 he was awaiting trial on another similar charge. As a sequel to the McNamara case forty-five officials or former officials of the Association were brought to trial at Indianapolis in October, 1912, upon the charge of conspiracy to transport explosives from state to state upon passenger trains. One of the defendants pleaded guilty. As the trial advanced, there was unfolded a remarkable story of criminal machinations, and eventually a verdict was returned for the prosecution.

During the past two or three years the growing alertness of public opinion has been illustrated by the exposure of political corruption in all parts of the country and in the electorate as well as in the government service. One of the most disturbing

revelations occurred in Adams county, Ohio, where, largely on the testimony of political workers who turned state's evidence, more than a quarter of the electorate were convicted of selling their votes. They were sentenced to a fine and disfranchisement for five years. Judge Blair, who conducted

¹The vote for Reimer, Socialist Labor candidate for president in 1912, was less than 40,000.

the inquiry, declared that similar conditions prevailed in other parts of Ohio and in neighbouring states. In the same year, 1911, detectives employed by a citizens' committee found evidence which led to the indictment of nineteen members of the Ohio legislature on charges of accepting bribes, and up to the end of 1912 the sergeant-at-arms and one senator had been convicted. In Illinois (*q.v.*) the confession of several members of the legislature indicated that William Lorimer had been elected to the United States Senate in 1909 by the use of bribery; and for over two years progressives of both the leading parties made a determined effort to have the election invalidated. The Senate first decided in March, 1911, that there was no evidence to connect Lorimer with the bribery, and that, even without the votes known to be tainted, he had been elected by the proper majority. This decision was generally regarded as a set-back for the cause of clean government. In deference to public protests and in view of the disclosure of new evidence the case was reopened. In May, 1912, the investigating committee reported once more in favour of Lorimer; but two months later the Senate voted to unseat him. Senator Stephenson of Wisconsin (*q.v.*), who admitted spending more than \$100,000 in his primary campaign, was allowed to keep his place. Instances of municipal corruption have been revealed in Detroit, Pittsburg, New York, and other cities. In New York (see NEW YORK), the murder of a gambler who was about to expose the system of police graft led to the indictment of four "gunmen" for the actual shooting, and of a police lieutenant named Charles Becker as the instigator of the crime. In trials which were remarkable for the absence of the usual delays and technical rulings, Becker was convicted in October, 1912, and the four gunmen in November. An investigation of the police administration, conducted by the board of aldermen, disclosed some facts of a disquieting nature; and the mayor, by way of a counterblast, charged members of the board with corruption in the granting of licences.

While the probity of judges is not often impugned in the American press, it is well enough known that they sometimes pay large sums for their nomination, and that their decisions sometimes show a tender regard for corporations.

Corruption and obscurantism in the courts. Recently the courts have been criticised with unusual freedom. Mr. Roosevelt has been chiefly instrumental in directing public sentiment against the corrupt or merely obscurantist action of certain courts in erecting constitutional barriers to the enactment of necessary social legislation. Surely it is

pertinent to ask why the court of appeals in New York should be allowed to prevent the legislature from enacting an employers' liability law such as the Supreme Court of the United States has declared valid under the "due process of law" clause of the Federal Constitution. In 1912 two Federal judges were involved in scandals. The House of Representatives presented to the Senate, in July, articles of impeachment against Judge Robert W. Archbald (b. 1848) of the commerce court, the charges relating generally to business transactions with railroad companies at times when the companies were litigants before his court or the Interstate Commerce Commission. The trial before the Senate began in December 1912 and he was found guilty early in 1913. The House also investigated the conduct of Cornelius Hanford, a district judge in the state of Washington, who was charged with "a long series of corrupt and unlawful decisions" and with being guilty of intemperance. Threatened with impeachment, he resigned. The public are also showing increasing impatience with the delays of justice and the technicalities of procedure. The widespread recognition of this evil will undoubtedly bring substantial reforms within the next few years. Congress, however, has as yet made no response to the demands which the President has frequently made for legislation upon this subject. Late in 1912 the Federal Supreme Court made important changes in its rules of procedure.

The existence of corruption is coming to be recognised as one of the chief obstacles to social and political advancement. The men who have felt this most strongly, believing that the sinister alliance between business and politics must be terminated and that the people must resume control of the government, have been styled "progressives." There have been progressives within both the Republican and Democratic parties;

but the movement within the Republican party is more interesting because it led to a definite political schism in 1912 and the formation, under Mr. Roosevelt's leadership, of a new National Progressive party. The creed of the insurgent or progressive Republicans was not well understood at first, even by themselves.

Rise of the Progressives. But, early in 1911, Senator Jonathan Bourne, Jr., of Oregon (see OREGON), with Senator Robert M. LaFollette (b. 1855) of Wisconsin (see WISCONSIN) and various radical members of both Houses of Congress, formed the National Progressive Republican League. It formulated a definite programme and gave coherence to the aims of the progressives. The essential feature of that programme was popular control of the government; and this it designed to establish by various methods.

It advocated the direct primary. Either by mandatory or by optional laws or else by party rule the system has, in some form, made its way into all but half a dozen of the states, sweeping away the old nominating conventions and substituting an election within each party. The object is to eliminate the boss, to bring the plain citizen into participation, and to let the voice of the majority govern in the choice of candidates. Names are placed upon the primary ballots by petition, although in some states (as New York) the party committees may make designations and have them appear under the party emblem. It cannot be said that experience has demonstrated the superiority of this plan over the simpler arrangements which prevail in Canada and England. The number of signatures required for the petition and the limited time allowed for circulating it sometimes handicap poorer men or men who are not backed by an active organisation. It is also true that where a man must make a declaration of party affiliation in order to enter the primary, the secrecy of the ballot is impaired, and where no test is exacted, the primaries may be flooded by voters from other parties. But whatever the defects, it has at least met with popular approval; and it has enabled the people, in striking instances, to drive out the disreputable element and assume control.

The selection of the presidential candidate of the party has come within the scope of the direct primary. In 1910 Oregon took the lead in prescribing the choice of delegates to the national convention by that method. A considerable number of the other states followed suit; and in their platform of 1912 the Democrats arranged for the holding of primaries for the choice of delegates and national committeemen even where there were no state laws providing for them. It was in Oregon also that voters were first permitted to express their choice for President directly. So keen was the interest in the primary campaign of 1912 within the Republican party, that thirteen other states—all but one of them in the North—provided for the presidential preference vote, legislation which had a decisive effect upon the future of the Republican party. There are objections to this plan. The delegates would be morally bound to vote as a unit in accordance with the expressed will of the majority in the state; and the unit rule in national conventions promotes deadlocks and boss control. Senator Albert Baird Cummins of Iowa (see IOWA), therefore introduced into Congress a bill establishing a national presidential preference primary; but it met with scanty support. As the new practice spreads, national conventions will do little more than register the popular verdict.

The Progressives also advocated the direct election of United States senators as against the present system of choice by the state legislatures. This would improve the personnel of the Senate and save the legislatures from prolonged deadlocks; but it would also have the disadvantage of strengthening the Senate and thus accentuating the dispersion of power in the American system of government. The reluctance of Congress to initiate the necessary amendment to the Constitution has led to the adoption under state law of practices which actually violate the spirit of the Constitution. By the rules of the Democratic party throughout the South, and by statute in eight Northern states, a moral obligation rests upon the members of each party in the legislature to vote for the party candidate success-

The direct primary.

Presidential preference primaries.

Direct election of U. S. senators.

ful in the primaries. Ten Northern states have adopted the "Oregon plan," under which each candidate for the state legislature must stipulate whether he will follow implicitly the popular choice for senator expressed in the general election. Thus in 1909 the Republican legislature in Oregon felt constrained to choose a Democrat. In response to the general demand, a resolution providing for the popular election of Senators was brought into the Senate in July, 1911. Apparently in the hope that the measure thus amended would be beaten by Democratic votes, an amendment was adopted giving the national government supervision over such elections. The Southerners took alarm, fearing the enfranchisement of the negro. But though they managed to defeat the resolution twice in 1911, they accepted it in 1912 believing that the Federal government would not assert its right to control the elections. This proposed 17th amendment was ratified by Massachusetts, May 22, Arizona, June 3, and Minnesota, June 12, 1912, and by several states early in 1913.

A determined effort is also being made to prevent the lavish use of money in the elections, especially the money of corporations, which not infrequently subsidise both the leading parties in order to make doubly sure of favourable consideration afterwards. The legislation on the subject is, for the most part, very recent. *Corrupt Practices acts.* The Federal law of 1907 prohibits all corporations from assisting candidates for national office and all corporations chartered by the United States from making any campaign contribution whatever; the law of 1910 requires publicity in the case of expenditures made by individuals and organisations which take part in the Federal election campaign in two or more states; and the law of 1911 requires publication of the accounts of candidates for Federal office before and after the primaries and elections, and limits to \$10,000 and \$5,000 respectively the amounts which candidates for the Senate and the House may spend personally. More than three-quarters of the states have passed campaign publicity laws. Of these 21 prohibit corporations from contributing, and require the publication of accounts after the primaries as well as after the election. About the same number of states limit the amount of expenditures, either by fixing a definite maximum for each office or a percentage of the first year's salary or a sum varying with the number of votes cast for the office in the last election. The Wisconsin law of 1911 is considered very complete. In conformity with the most approved tendency it enumerates the purposes for which expenses may be incurred, instead of merely forbidding, as state laws used to do, certain specified acts such as intimidation and bribery. Candidates and their agents must both file itemised statements. An interesting feature is the publicity pamphlet, published by the state and sent to all voters, in which candidates may print their biographies and indicate the policies for which they stand.

None of the reform ideas promise more for the improvement of American politics than the Short Ballot principle. The multiplication of elective offices which took place toward the middle of the nineteenth century has overburdened and confused the voter, making him accept the straight party ticket without considering the merits of the candidates. Some of the primary ballots in New York in 1912 were fourteen feet long. It is now proposed to strike at the power of the political boss and the political machine by placing in the hands of the voter a ballot which he can mark more simply and intelligently. In state government the tendency is to bring the administrative officers directly under the control of the governor, thus centring executive responsibility and power. California has eliminated two officers from the elective list; Illinois, Ohio, and New York are expected to follow suit. A beginning has also been made toward the reform of county government along the same lines. The short ballot idea was endorsed by the three leading candidates for president in 1912. The idea has won its chief success, however, in the adoption of what is known as commission government. Up to the end of 1912 more than 200 cities in thirty-four states had substituted for the mayor and council a small board elected on a general ticket and wielding both executive and legislative power. Recently two large cities, New Orleans and St. Paul, have adopted this form of government. *The short ballot.*

Whether or not the small board will be permanently retained, respect for two cherished American theories has been seriously impaired—the election of both political and administrative officers, and the separation of executive from legislative power.

In view of the attitude taken toward the question in the campaign of 1912, woman suffrage may be regarded as another of the Progressive principles. Presumably it has a bearing upon the movement for the uplifting of politics. Down to 1912 women enjoyed a limited suffrage, chiefly in relation to the schools, in twenty-three states, and full suffrage in Colorado, Idaho, California, Utah, Washington, and Wyoming. In that year proposed constitutional amendments conferring the privilege were defeated in Ohio, Michigan and Wisconsin, but ratified in Arizona, Kansas and Oregon. The nine suffrage states cover about a quarter of the entire Union and contain nearly three million women of voting age. During the presidential campaign the National Progressive party incorporated a woman suffrage plank in its platform; in five states all the parties did so.

The direct primary, the corrupt practices acts, and other reforms are calculated to improve the quality of public officers. A process of rehabilitation is going forward.

But meanwhile state legislatures and even executive officers, far from enjoying prestige, are viewed popularly with a profound distrust. This is shown not only in the marked tendency to restrict their powers, but also in the assumption by the people of a more immediate share in government.

No political phenomenon of the time is more significant than the spread of the Initiative, Referendum, and Recall. Under the Initiative, measures may be submitted to popular vote on the petition of a varying proportion of the voters (usually eight or ten per cent); under the Referendum, statutes passed by the legislature may be subjected to a popular vote upon the petition of a smaller proportion of the voters; under the Recall, the plebiscite may be invoked to determine if the people wish to remove a particular official and to effect such removal. In 1912 the Initiative and Referendum were adopted in Ohio, Mississippi, Nebraska, and Washington, thus making a total of fifteen states which employ this method of direct legislation. Three other states have partial systems; Wisconsin and North Dakota will vote upon the question in 1914. The Recall has not spread so widely. Oregon adopted it in 1908, California in 1911, Arizona and Washington in 1912. North Dakota and Wisconsin will decide in 1914 whether or not to adopt it. In Oregon, California, and Arizona the recall extends even to judges. Conservative men have denounced this as a fatal impairment of judicial independence. When, in 1911, Arizona (*q.v.*) applied for admission to statehood, the veto of President Taft forced the provision for the recall of judges out of the constitution, but, on acquiring statehood, Arizona took the first opportunity to restore it. In view of the reactionary decisions which the courts have so often given, and of the political power which they wield in interpreting general clauses of the constitution, the demand for a popular check upon them has increased. Mr. Roosevelt suggested in 1912 the recall of judicial decisions¹ instead of the recall of judges, the people being allowed by plebiscite to determine whether a statute, pronounced invalid, should nevertheless become law under the state police power. This proposal appears to many to preserve judicial independence and open the way for social legislation.

The rapid progress in the adoption of the Initiative, Referendum, and Recall illustrates the growing impatience with constitutional restrictions and with "the check and balance system." There is no country in the world of Western civilisation where so many obstacles are raised as in the United States to the enactment of social legislation. Not only must executive and legislature agree, but the courts must consent to an interpretation of the supreme law which will recognise the validity of an Act. Now, although the votaries of popular government will not admit it, their proposals are destined to work a fundamental change in American institutions. Not that the legislature will be supplanted; experience in

¹ In 1912 Colorado adopted a constitutional amendment for a popular recall of decisions by the state supreme court that laws were unconstitutional.

Woman suffrage.

The initiative, referendum and recall.

The decay of constitutionalism.

Oregon has shown that the radicals are really bent on rehabilitating the legislature.¹ But the distinction between constitutional and statutory law, which is a unique feature of the American system, is bound to break down. Already state constitutions have lost in substance, in many states, the character of constitutional law; they have become little more than bundles of statutes distinguished from other statutes only in name. The distinction in method of adoption is also breaking down; under the Initiative and Referendum in several states precisely the same method may be followed in amending the constitution or in passing ordinary laws. Will the judges care to say, especially with the Recall looming ahead, that a statute adopted directly by the people yesterday must give way to some vague provisions of the so-called fundamental law adopted a generation ago?

The effect of the popular propoganda was abundantly seen in the primary campaign for the presidential nomination. As delegates to the convention were to be chosen by direct vote in a considerable number of states, and as a presidential preference primary had been established in twelve of them, the various aspirants of both parties showed a deference to public opinion quite unusual at such an early stage in the campaign. To an unprecedented extent they travelled about the country making speeches; enormous quantities of literature were circulated; money was spent with as much profusion as in the regular election campaigns. This was mainly due to the contest for control of the parties by conservatives and progressives. Senator LaFollette had come forward in December, 1911, as the progressive candidate against President Taft; but following his temporary collapse in February, the governors of seven states united successfully in urging Mr. Roosevelt to accept the progressive leadership. It was felt that he alone could have good prospect of defeating the President for the nomination and of saving the party from disaster in the election. By the Democrats and by the conservative Republicans he was assailed for ignoring the tradition that the presidency should not be held by any man for more than two terms and he was charged with ignoring a specific pledge (differently interpreted by Mr. Roosevelt and his opponents), made by Mr. Roosevelt in 1904, upon being elected to the presidency, that he would under no circumstances accept a renomination—meaning, according to his followers, that he would not accept a nomination in 1908. That these attacks carried little weight with the people was evident from the fact that Roosevelt secured the great majority of those delegates who were elected directly, and completely outdistanced Taft in the preference vote. The latter denounced the progressives as “emotionalists and neurotics,” who would “hurry us into a condition which would find no parallel except in the French Revolution.” With Mr. Roosevelt he had a bitter exchange of personalities; and some thought that his participation in the campaign had impaired the dignity of the presidential office. Within the Democratic party the prominent candidates were Oscar W. Underwood, leader of his party in the House of Representatives; Speaker Champ Clark,² a man of great popularity rather than of intellectual distinction; Governor Judson Harmon³ of Ohio; and Governor

¹ But see OREGON for the proposed (but defeated) constitutional amendment for a one-chamber legislature.

² Champ Clark was born in Anderson county, Kentucky, March 7, 1850; studied at Kentucky University, Bethany College, and Cincinnati Law School; was president of Marshall College, West Virginia, in 1873-74; and was admitted to the bar in 1875, practising after 1880 in Bowling Green, Missouri. He was a Democratic representative in Congress in 1889-91, 1893-95 and since 1897; being minority leader in 1907-11 and becoming speaker in 1911. In 1904 he was permanent chairman of the Democratic National Convention.

³ Harmon was born near Cincinnati on February 3, 1846, the son of a Baptist minister of New England descent. He graduated at Denison University, Granville, in 1866, and at the Cincinnati Law School in 1869. He was judge of the superior court of Cincinnati in 1878-88, attorney-general in Cleveland's cabinet from June 8, 1895, to March 5, 1897, and governor of Ohio since 1909. In October 1896 he argued the first great anti-trust case, the Trans-Missouri freight case (see *E. B.* xiv, 713d), and secured a reversal by the U. S. Supreme Court of a decision for the railway in the lower courts. Attorney-General Moody retained him as special counsel in the Santa Fe case.

Woodrow Wilson¹ of New Jersey, formerly president of Princeton University, whose political administration had been characterised by great vigour and independence, and whose reputation as a publicist stood very high. Mr. Bryan (see *E. B.* iv, 697) announced that he would not offer himself as a candidate; but his attitude toward the various aspirants was felt to be important. In a series of speeches he denounced Governor Harmon as "a reactionary and the choice of the predatory interests," saying that either Speaker Clark or Governor Wilson would meet with his approval.

As the primary campaign proceeded, the public utterances of President Taft and Mr. Roosevelt were marked by increasing bitterness; and the irreconcilable differences between these leaders spread to the rank and file of the party. When the

The nominating conventions—Republican and Progressive.

Republican convention met at Chicago on June 18, 1912, it was evident that everything depended upon the decision of more than two hundred and fifty contests. Mr. Roosevelt denounced as theft the action of the national committee in placing only 19 of his contestants upon the temporary roll.

But an appeal to the convention was lost by more than fifty votes; and it was by about the same margin that the selection of Senator Elihu Root (see *E. B.* xxiii, 711) as temporary chairman was made. When the committee on credentials decided against the seating of his contesting delegates, Mr. Roosevelt denounced their conduct as fraudulent and advised his followers to take no active part in the proceedings. Accordingly most of them sat in silent protest while the platform was adopted and the nominations made. President Taft received 561 votes on the first ballot, or twenty-one more than the necessary majority. Vice-President Sherman (see *Obituary*, below), who was also renominated, died a few days before the general election.²

The disruption of the Republican convention led to the birth of a new party which took the name of National Progressive and appealed for the support of Democrats and Progressives alike. Its convention was held in Chicago early in August.

The new Progressive party.

There Mr. Roosevelt made a declaration of his political views, which were received with enthusiasm and embodied in the platform. He was nominated for president, and Governor Hiram Johnson of California (see CALIFORNIA) for vice-president. The convention was remarkable for several things: the absence of professional politicians, the prominent part taken by women and social workers, and the quasi-religious fervor which pervaded it.

¹ Woodrow Wilson was born in Staunton, Virginia, on December 28, 1856, the son of Joseph R. Wilson, a Presbyterian clergyman and professor of theology. He graduated at Princeton in 1879, studied law at the University of Virginia and practised in Atlanta, Georgia, in 1882-83, and in 1886 received the degree of doctor of philosophy at Johns Hopkins University. He was associate professor of history and political economy in 1885-88, at Bryn Mawr, and in 1889-90 at Wesleyan University, where he acted for a time as foot-ball coach. From 1890 to 1902 he was professor of jurisprudence and politics at Princeton, of which he became president on August 1, 1902. This position he resigned on October 20, 1910 and in November he was elected governor of New Jersey (by 233,682 to 184,626 votes for Lewis, Republican). As president of Princeton he attempted to democratise the University and aroused the opposition of many wealthy alumni by his criticism of the upper class clubs. In a controversy over the site and plan of a graduate school he argued for buildings on the present campus, and the faculty and alumni were divided between him and Andrew Fleming West (b. 1853), dean of the graduate school, who wished a separate campus for the elaborate graduate school he planned. At the age of twenty-three Wilson had published in the *International Review* (August 1879) the outline of his *Congressional Government*, which appeared in 1885. His *The State* (1889) has become a standard work. He wrote, besides, *Division and Reunion, 1820-1880* (1893), a short volume in a series on U.S. history; two volumes of essays, *An Old Master and Mere Literature* (1893); a life of Washington (1896), and a popular *History of the American People* (1902). As governor of New Jersey (*q.v.*) his administration was marked by legislative reforms and by the defeat of the "machine" element in the Democratic party. In 1912 he favoured the Initiative and Referendum, which he had formerly opposed. See the biography (1912) by W. B. Hale; H. E. Hosford's *Woodrow Wilson and New Jersey Made Over* (1912); A. L. P. Dennis in *Contemporary Review*, Dec. 1912, and W. G. McAdoo and Bliss Perry in *The Century*, Mar. 1913.

² The electoral votes of Utah and Vermont were formally cast for Taft for president, and for Nicholas Murray Butler of New York (president of Columbia University) for vice-president.

The cleavage between the conservative and radical wings of the Democratic party was clearly exposed when the national convention met at Baltimore on June 25. Although a conservative, Alton Brooks Parker (b. 1852; chief justice of the New York court of appeals in 1898-1904; Democratic candidate for the presidency in 1904), was chosen temporary chairman over Mr. Bryan, the latter's influence proved decisive in the choice of the permanent chairman and in the passage of a resolution attacking members of the party connected with Wall Street. Moreover the "unit rule," under which state delegations deliver a solid vote, was modified so as not to apply to delegates elected by districts under state primary laws. The permanent chairman was Ollie M. James of Kentucky (senator elect; representative in Congress since 1903), who was a lieutenant of Mr. Bryan. It required forty-six ballots to select the presidential candidate. On the first, Clark had 440½, Wilson 324, Harmon 148, Underwood 117½, Marshall 31, Bryan 1. When, on the tenth ballot, the Tammany-controlled New York delegation transferred its ninety votes from Harmon to Clark, Bryan declared that, as long as that situation lasted he would withhold his vote from Clark. That declaration had much to do with the final success (on the 46th ballot) of Governor Woodrow Wilson. Governor Marshall¹ of Indiana was nominated for the Vice-Presidency. Among the minor parties neither the Independence League nor the Populists put a national ticket in the field. The Prohibition party nominated Eugene W. Chafin (b. 1852) of Arizona, its candidate in 1908, and Aaron S. Watkins (b. 1863) of Ohio, candidate for governor in 1905 and for vice-president in 1908; the Socialist Labor party, Arthur E. Reimer of Massachusetts and August Gilhaus of New York, the party's candidate for president in 1908; the Socialist party, Eugene V. Debs (b. 1855) of Indiana, candidate of the Social Democrats in 1900 and of the Socialists in 1904 and 1908, and Emil Seidel (b. 1864) of Wisconsin, Socialist candidate for governor in 1902 and mayor of Milwaukee in 1910-12.

The platforms of the three leading parties held similar views upon a number of points, such as the reform of legal procedure, the establishment of a parcel post, and the maintenance of an adequate navy. But they had, of course, distinctive features. The Republican platform, both by what it omitted and by what it contained, exhibited a conservative spirit. Silent upon the subject of social legislation and the methods of bringing government nearer to the people, it laid emphasis upon the necessity of preserving the integrity and authority of the courts as the protectors of individual and property rights. It reaffirmed belief in a protective tariff high enough to furnish a revenue and give protection to American industries, readjustments to be made in accordance with the findings of an expert commission. With respect to the anti-trust law supplementary legislation should "define as criminal offences those specific acts which uniformly mark attempts to monopolise trade." In his speech of acceptance, President Taft made it appear that there were two issues in the campaign: the preservation of representative government supported by an independent judiciary, and the encouragement of business expansion through the free use of capital.

The Democrats and Progressives agreed on a number of points: the physical valuation of railroads, a regular Territorial government for Alaska, trial by jury for indirect

¹ Thomas Riley Marshall was born at North Manchester, Indiana, on March 14, 1854; a grandnephew of John Marshall, chief justice of the United States, and on his mother's side a descendant of Charles Carroll of Maryland, signer of the Declaration of Independence. He graduated at Wabash College, Crawfordsville, in 1873, was admitted to the bar in 1874, was prominent in local politics but ran for office only once, in 1880, when he was defeated for prosecuting attorney, before his nomination in 1908 for governor of Indiana. He was elected by 14,800 plurality over James E. Watson, Republican. As governor his principal work was the proposed state constitution which the Indiana supreme court decided could not be submitted to the voters of the state in 1912; see INDIANA. He enforced local laws against race-track gambling. He favoured the direct election of U.S. Senators; and opposed ship subsidies, protective tariff and a Federal inheritance tax. For his views of reform by legislation and of the curse of over legislation see his "Automatic Citizen," *Atlantic Monthly*, Sept. 1912.

contempt of court, limitation upon the use of injunctions, the spread of the direct primary and other instruments of popular rule, etc. But the Democratic programme was much less comprehensive and, except for the tariff, much less radical. *Democratic and Progressive.* It insisted upon the old doctrine of state rights, a single term for the President, the abolition of protective duties (but by legislation which "will not injure or destroy legitimate business"), and supplementary legislation to give the anti-trust act more definiteness and override the court's interpretation.

The most characteristic feature of the Progressive platform was the attention which it gave to the subject of social welfare and industrial justice. As a means to this end it advocated a more expeditious method of amending the Federal Constitution, the recall of judicial decisions, the right of appeal to the Supreme Court in cases where the highest state court should hold laws invalid under the Federal Constitution, and the bringing under effective national jurisdiction of those problems which have expanded beyond the reach of the states. The proposals with respect to the labouring class included minimum safety and health standards, prohibition of child labour and night work for women, minimum-wage standards for women, and much else. On the tariff, the Progressives differed from the Republicans only in demanding the immediate downward revision of excessive duties. They did, however, take a very different position with respect to the trusts, wishing to place their regulation under an administrative commission. They advocated woman suffrage.

The campaign presented peculiar features from the fact that it was a three-cornered contest. Each party had to fight the other two. The Republican cause, for which there seemed little hope, was badly managed; its appeal was addressed to the conservative class, who were told that Mr. Roosevelt and his party menaced the time-honoured institutions of the country. The Democrats emphasised the evils of the protective tariff, holding it responsible for the high cost of living and the corrupt alliance between business and politics. On this issue the other two parties opposed them, while, with respect to the trusts, Democrats and Republicans held to fairly similar positions as against the Progressives. The latter directed attention to the need of a constructive social policy. Their desire to break the "Solid South" and to attract Democratic voters was shown by Mr. Roosevelt's attitude towards the negro. He announced that the new party could not be built up in the South "by relying on and appealing to the negroes;" and in the settlement of contests between Southern delegates the national convention acted upon this principle. Although Mr. Roosevelt was received with enthusiasm during a speaking tour through the South, he managed to divert very few Democratic votes in the election. The concern expressed through the country when he was shot by a fanatic at Milwaukee on October 24 evidenced his great personal popularity. He addressed a mass-meeting for an hour and a half after being wounded. Democratic success in the elections, though foreshadowed by the disruption of the Republican party, was more complete than had been generally expected. Taft won only two states, Utah and Vermont, with 8 electoral votes; Roosevelt won California (11 of 13 votes), Michigan, Minnesota, Pennsylvania, South Dakota, and Washington, with 88 electoral votes. All the other states went for Wilson, who received 435 electoral votes. Sweeping though the victory was, it seems to have been mainly due to the split in the Republican party. Wilson had a plurality of more than two millions over Roosevelt, but he did not have a majority of the popular vote. The new Congress is Democratic in both branches. In the House almost exactly two-thirds of the members are Democrats; and the capture of state legislatures which had previously been Republican insured a small Democratic majority in the Senate. Out of 28 governors elected all but ten were Democrats. Mr. Wilson was formally inaugurated, March 4, 1913. His cabinet is: W. J. Bryan, State; W. G. McAdoo, Treasury; Lindley M. Garrison, War; J. C. McReynolds, Attorney-General; A. S. Burleson, Postmaster-General; Josephus Daniels, Navy; F. K. Lane, Interior; D. F. Houston, Agriculture; W. C. Redfield, Commerce; W. B. Wilson, Labor.

AMERICAN OBITUARY

The following persons, separately noticed in the *Encyclopaedia Britannica*, died between the publication of that work and the end of 1912.

- Thomas Ball** (b. 1819; see *E. B.* iii, 263), sculptor, on December 11, 1911.
- Clara Barton** (b. 1821; see *E. B.* iii, 452), philanthropist, on April 12, 1912.
- John Bigelow** (b. 1817; see *E. B.* iii, 922), diplomat and journalist, in New York City, on December 19, 1911.
- Cornelius Newton Bliss** (b. 1833; see *E. B.* iv, 72), merchant and politician, on October 9, 1911.
- Robert Collyer** (b. 1823; see *E. B.* vi, 694), Unitarian preacher and author, in New York City, on November 30, 1912.
- Mary Baker (Glover) Eddy** (b. 1822; see *E. B.* vi, 291a and 830c), founder of Christian Science, at Boston, on December 4, 1910.
- George Cary Eggleston** (b. 1839; see *E. B.* ix, 16b), writer, on April 14, 1911.
- Horace Howard Furness** (b. 1834; see *E. B.* xi, 362), Shakespearean scholar, at Wallingford, Pa., on August 13, 1912. He edited *Anthony and Cleopatra* in the *Variorum Shakespeare* in 1907.
- William Watson Goodwin** (b. 1831; see *E. B.* xii, 240), Greek grammarian, at Cambridge, Massachusetts, on June 15, 1912.
- Frederick Dent Grant** (b. 1850; see *E. B.* xii, 358c), army officer, commanding Eastern Division, in New York City, on April 11, 1912.
- John Marshall Harlan** (b. 1833; see *E. B.* xii, 954), justice of U.S. Supreme Court, on October 14, 1911.
- Edward Harrigan** (b. 1845; see *E. B.* xii, 17), actor and playwright, on June 6, 1911.
- Jonathan Scott Hartley** (b. 1845; see *E. B.* xiii, 35), sculptor, on December 6, 1912.
- Thomas Wentworth Higginson** (b. 1823; see *E. B.* xiii, 455), author, on May 9, 1911.
- Henry Christopher McCook** (b. 1837; see *E. B.* xvii, 205d), naturalist, on October 31, 1911.
- John James McCook** (b. 1845; see *E. B.* xvii, 205c), soldier and lawyer, on September 17, 1911.
- Francis Davis Millet** (b. 1846; see *E. B.* xviii, 466), painter and author, in the "Titanic" disaster, April 15, 1912. He had been recently appointed head of the American Academy at Rome.
- Roger Quarles Mills** (b. 1832; see *E. B.* xviii, 475), legislator, on September 2, 1911.
- Sara Agnes Pryor** (b. 1830; see *E. B.* xxii, 533b), author, on February 15, 1912.
- Howard Pyle** (b. 1853; see *E. B.* xxii, 679), artist and author, near Florence, Italy, on November 9, 1911.
- Whitelaw Reid** (b. 1837; see *E. B.* xxiii, 52), diplomat, in London, on December 15, 1912.
- Winfield Scott Schley** (b. 1839; see *E. B.* xxiv, 34c), naval officer, in New York City, on October 2, 1911.
- Frederick Porter Vinton** (b. 1846; see *E. B.* xxviii, 101), portrait painter, on May 20, 1911.
- Elizabeth Stuart Phelps Ward** (b. 1844; see *E. B.* xxviii, 319), author, on January 28, 1911. Among her later books were: *The Oath of Allegiance* (1909) and *Comrade* (1911).
- James Baird Weaver** (b. 1833; see *E. B.* xxviii, 439), politician, on February 6, 1912. In 1904-06 he was mayor of Colfax, Iowa.

The following is a series of brief sketches of some of the more important Americans¹ not separately treated in the 11th edition of the *Encyclopaedia Britannica*, who have died since its publication:

John Arbuckle, business man, died in New York City on March 27, 1912. He was born in Scotland in 1838, and in 1871 established in New York the house of Arbuckle Bros. which sold sugar and imported and roasted coffee for retail sale in packages, and in the sale of sugar and of coffee competed successfully with the "Sugar Trust." A terminal warehouse and a large towing and salvage business grew out of the coffee importation, and the house was very successful in raising wrecked vessels. Arbuckle established a farm-colony for the unemployed at New Paltz, N. Y. He was interested in horse-breeding and owned a large ranch in Wyoming. He left a large bequest for a memorial building under the care of Plymouth Church, Brooklyn, to be a home for young men and women.

Sidney Gillespie Ashmore, Latinist, professor at Union College since 1881, died in Schenectady, N. Y., on May 22, 1911. He was born in London, April 15, 1852, graduated at Columbia University in 1872, taught at Lehigh University in 1873-76 and at Columbia from 1876 until he went to Union, and wrote *The Classics and Modern Training* (1905) and edited with notes a complete text of *Terence* (1909), based on Tyrrell.

John Jacob Astor, capitalist, died when the "Titanic" sank, April 15, 1912. He was born at Rhinebeck, New York, on July 13, 1864, the great grandson of John Jacob Astor (see

¹ Other obituary notices are included in articles on separate states of the Union.

E. B. ii, 793), founder of the family. He graduated at Harvard in 1888. He was colonel on the staff of Governor Levi P. Morton of New York and, in the Spanish-American War was lieutenant-colonel of volunteers, serving in Cuba, with a battery of field guns equipped and organised by him. The Waldorf-Astoria, St. Regis, Knickerbocker and Astor hotels in New York City were built by him. He invented a turbine engine, a bicycle brake, etc., and wrote *A Journey in Other Worlds* (1890). His wife, née Madeline Force, whom he married in September 1911 after being divorced in 1909 by his first wife, Ava Willing, whom he had married in 1891, was rescued from the "Titanic" and bore him a posthumous son. Almost all his enormous estate, probably \$80,000,000 at the least, was left to his son by the former marriage, Vincent Astor, who came of age November 15, 1912.

Francis Bacon, physician, died April 26, 1912. He was born in 1831, graduated at Yale Medical School in 1853 and, after service as a surgeon in the Civil War in 1861-64, was professor of surgery at Yale in 1864-77 and lecturer on medical jurisprudence from 1899 to his death. He was known as an alienist and an authority on yellow fever.

Henry Carey Baird, publisher and author, died in Wayne, Pennsylvania, December 31, 1912. He was born in Philadelphia, September 10, 1825, a grandson of Henry Carey (see *E. B. v, 329*), and was an exponent of Carey's protectionist views. On this subject and on the currency he wrote several tracts and his Philadelphia publishing house, Henry Carey Baird & Co., specialised in technical and industrial books.

Willis Judson Beecher, Old Testament scholar, died, in Auburn, N. Y., on May 10, 1912. He was born at Hampden, O., April 29, 1838 and was ordained in the Presbyterian ministry in 1864, after graduation from Hamilton College in 1858 and from Auburn Theological Seminary in 1861. With the exception of two charges of short duration, his life was spent in teaching. He was professor of moral science and belles-lettres at Knox College, 1865-69, and of Hebrew language and literature at Auburn Seminary, 1871-1908. He was president of the Society of Biblical Literature and Exegesis in 1904. He wrote: *Father Tompkins and His Bibles* (1874), *The Prophets and the Promise* (1905), *The Teaching of Jesus Concerning the Future Life* (1906), *The Dated Events of the Old Testament* (1907), and *Reasonable Biblical Criticism* (1911).

Joel Benton, author, died September 15, 1911. He was born at Amenia, N. Y., May 29, 1832. He taught for a few years and then became a journalist and popular lecturer. He wrote: *Emerson as a Poet* (1882); *The Truth about Protection*, (1892); *Greeley on Lincoln* (1893); *In the Poe Circle* (1899), and many popular poems.

Emil Leopold Boas, American resident director and general manager (since 1892) of the Hamburg-Amerika Steamship Company, died at Greenwich, Conn., on May 3, 1912. He was born at Görlitz, Germany on November 15, 1854, and was educated in Breslau and Berlin. He came to the United States in 1873, and was a prominent member of important clubs and organisations of a public character.

Lewis Boss, astronomer, director of Dudley Observatory (Union University), Albany, since 1876, died on October 5, 1912. He was born in Providence, R. I., October 26, 1846, and graduated at Dartmouth College in 1870. He was assistant astronomer to the U. S. Northern Boundary Commission (1872) and a member of the American expedition to observe in Colorado the total eclipse of 1878 and chief of that to observe the transit of Venus in Santiago, Chile, in 1882; edited the *Astronomical Journal* (1909) and received the gold medal of the Royal Astronomical Society in 1905 and the Lalande prize of the French Academy of Sciences in 1911. His most important publications were star catalogues and essays on *The Physical Nature of Comets* (1881) and *Solar Motion* (1901).

Amory Howe Bradford, Congregational clergyman, died February 18, 1911. He was born in Granby, N. Y., April 14, 1846, graduated at Andover Theological Seminary in 1870, and studied at Oxford. He became pastor of the First Congregational Church at Montclair, N. J., in 1870, and was associate editor of *The Outlook* from 1892 to 1899. He was a prominent member of Congregational councils and missionary bodies in the United States and in Europe. He published more than fifteen books on religious subjects, including *Spirit and Life* (1888), *Hereditry and Christian Problems* (1895), *The Return to Christ* (1900), *The Age of Faith* (1900), *The Ascent of the Soul* (1902), and *The Inward Light*.

Gamaliel Bradford, financier and publicist, died August 21, 1911. He was born in Boston, Mass., January 15, 1831, and after graduating from Harvard in 1849 entered the banking business. In 1868 he retired and devoted the remainder of his life to the study of American institutions and government, especially the state and the municipality. He was an independent in politics and an ardent opponent of the colonial extension of the United States. He wrote *The Lesson of Popular Government* (1898), and many articles and monographs.

Edward Stuyvesant Bragg, soldier and legislator, died June 20, 1912. He was born at Unadilla, N. Y., February 20, 1827, studied at Hobart College in 1844-47, and was admitted to the New York bar in 1848. He removed to Wisconsin in 1850. In the Civil War he was commissioned brigadier-general of volunteers, June 25, 1864. He became a prominent member of the Democratic party and was a representative in four Congresses (1877-83). When seconding the presidential nomination of Grover Cleveland, in 1884, he used the famous phrase, "We love him for the enemies he has made." He was American minister to Mexico

in 1888-89. He supported the candidacy of McKinley (1900), and was consul-general at Havana (1902) and at Hong-Kong (1902-06).

George Jarvis Brush, American mineralogist, died February 6, 1912. He was born in Brooklyn, N. Y., December 15, 1831. He studied chemistry and mineralogy in New Haven and in Europe; and after teaching at the University of Louisville and the University of Virginia, became professor of metallurgy (1855) and of mineralogy (1864) at the Sheffield Scientific School of Yale University. From 1872 to 1898, when he became professor emeritus, he was director of that institution.

Charles Stedman Bull, physician, died April 17, 1911. He was born in New York City, graduated at the medical school of Columbia in 1868, and completed his studies at several European universities. His specialty was ophthalmology, which he taught at the Cornell University Medical College, and practised in St. Luke's and other hospitals in New York City. He was president of the American Ophthalmological Society in 1903-07.

Daniel Hudson Burnham, architect, died in Heidelberg, Germany, June 1, 1912. He was born in Henderson, N. Y., September 4, 1846. He studied architecture in Chicago, and established himself there. Many famous buildings in American cities, including the Rookery and Temple, Chicago, and the "Flatiron," New York, as well as Selfridge's, London, were designed by him. He was chief architect of the Columbian Exposition, Chicago, 1893. He was chairman of the national commission for beautifying Washington, D. C., and of the committee for remodelling Cleveland, Ohio. He also planned extensive alterations for Manila, San Francisco, and Chicago.

Silas Wright Burt, civil-service reformer, died in New York City, November 30, 1912. He was born in Albany, N. Y., April 25, 1830, graduated from Union College in 1849, and practised as a civil engineer for some years. About 1867 he began to take deep interest in civil-service reform and when, two years later, he was appointed special deputy naval officer of the port of New York he had the opportunity of studying the evils of the spoils system. He induced the naval officer to permit a competitive examination for promotion, which was however limited to persons whose applications for promotion were on file, and this was practically the beginning of the merit system. He was chairman of the supervisory examining board in New York, 1872-75, and was twice naval officer (1878-83; 1885-89) of the port of New York, chief examiner of the state civil service (1883-85), and a member of the state civil service commission from 1895 to 1900, and president in 1900. One of the founders (1880) of the Civil Service Reform Association of New York, he was its president in 1907.

Arthur Tracy Cabot, surgeon, died in Boston, November 4, 1912. He was born there on January 5, 1852, graduated from Harvard College in 1872 and from Harvard medical school in 1876, and studied in Vienna and Berlin. He was a fellow of Harvard University, chairman of the state commission on hospitals for consumptives, consulting surgeon of many hospitals, and a member of the American Association of Genito-Urinary Surgeons, etc.

Will Carleton, verse-writer, died in Brooklyn, New York, on December 18, 1912. He was born in Hudson, Michigan, October 21, 1845; graduated at Hillsdale College in 1869; was in newspaper work in Chicago and Detroit in 1870 and 1871 and in the latter year published in the Toledo *Blade* a poem "Betsy and I are out," which won such great popularity by its colloquial style and simple homely character that he left the *Detroit Tribune* to write verse and to be a lecturer and public reader of his writings. His published volumes, which had a large sale, include *Farm Ballads*, *Farm Legends*, *Farm Festivals*, *City Ballads*, *Rhymes of Our Planet*, *In Old School Days*.

John Merven Carrère, architect, died in New York City from injuries received in a cab accident, March 1, 1911. He was born in Rio de Janeiro, Brazil, November 9, 1858. He was one of the first Americans to study at the École des Beaux Arts, Paris. In New York he became associated with McKim, Mead & White, and in 1885 formed a partnership with Thomas Hastings. Their first important work, the Ponce de Leon Hotel at St. Augustine, Fla., placed them in the front rank of their profession. Among their other noted buildings are the New York Public Library, and the Senate and House of Representatives Office Building in Washington.

Henry Beebe Carrington, soldier, died in Boston, Mass., October 26, 1912. He was born in Wallingford, Conn., March 2, 1824, and graduated from the Yale law school in 1847. From 1848 to 1861 he practised law in Columbus, Ohio, and then took a prominent part in the Civil War, being appointed brigadier-general of volunteers in 1862. After the close of the war he entered the regular army as colonel. He was in command at Fort Phil Kearny at the time of the Fetterman massacre (December 1866) by the Sioux Indians. Wounded in a subsequent skirmish, he was retired from active service in 1870, and was appointed professor of military science at Wabash College. In 1875 he began to map the battlefields of the American War for Independence, the basis of his valuable *Battles of the American Revolution* (1876) and *Battle Maps and Charts of the American Revolution*. From 1889 to 1891 he was employed by the American Government to treat with the Indians. In 1904 he received the rank of brigadier-general, U.S.A. He also wrote *Washington the Soldier* (1899) and other works on American history, especially military.

William Campbell Clark, manufacturer, president of the Clark Thread Works of Newark, New Jersey, died on November 14, 1912. He was born in Paisley, Scotland, in 1863, of a

family of thread makers, and in 1879 went to the United States, where he succeeded his uncle as president of the Clark Company, which introduced British methods of manufacture in the United States, and became one of the largest concerns of the kind in the country.

Charles Finney Cox, railway officer, died at Yonkers, N. Y., January 24, 1912. Born in Richmond Co., New York, January 16, 1846, he graduated at Oberlin College in 1869. He was for many years treasurer of the New York Central lines west of Buffalo.

William Demos Crum, negro physician, minister resident and consul-general to Liberia since June 1910, died in Charleston, S. C., of African fever, on December 7, 1912. He was born in Charleston on February 9, 1859, graduated at the Avery Institute there in 1875 and at the medical school of Howard University in 1881, and practised medicine in Charleston. President Roosevelt appointed him port collector of that city in 1903, and in spite of local opposition and of the Senate not confirming his nomination, Crum administered the office from 1904 to 1910, when he resigned. He was managing commissioner of the negro exhibit at the South Carolina Interstate and West Indian Exposition of 1901-02 at Charleston.

William Bayard Cutting, lawyer and philanthropist, died March 1, 1912. He was born in New York City, January 12, 1850, graduated at Columbia College in 1869 and at the Columbia law school in 1871, and practised law in New York City. With his brother, Robert Fulton Cutting (b. 1852), he was interested in the work of the Association for Improving the Condition of the Poor, in building model tenements, and in many movements, notably the Citizens' Union, for the improvement of municipal politics. He was an active member of the Protestant Episcopal Church.

Homer Calvin Davenport, cartoonist, died May 2, 1912. He was born in Silverton, Oregon, March 8, 1867, and was reared on a farm. He was a jockey, a railroad fireman and a circus clown before his talent for caricature found him employment on a San Francisco newspaper in 1892. Three years later he went to New York, where he drew cartoons for the *American and Journal*, notably in the presidential campaign of 1900, when he originated the dollar-mark suit of clothes in his cartoons of Mark Hanna, and a gigantic figure of the trusts which became well-known. He was interested in the breeding of Arabian horses in the United States, and imported a number of them from Arabia. His cartoons have been published in book form, and he wrote *The Bell of Silverton* and *Other Short Oregon Stories*.

George Davidson, geographer, died in San Francisco, December 2, 1911. He was born in Nottingham, May 9, 1825, removed to the United States in 1832, and was educated at the Central High School of Philadelphia. He became honorary professor of geodesy at the University of California in 1870 and professor of geography there in 1898, and took a leading part in the study of the geography of western America, serving on government coast surveys on the Pacific Coast (in charge 1868-95), transit of Venus expeditions of U.S. government in 1874 (Japan) and 1882 (New Mexico), and as president of the Pacific Geographical Society. In 1908 he received the Daly gold medal of the American Geographical Society.

Sarah S. Platt Decker, a national leader in the women's suffrage movement, died at San Francisco, Cal., July 7, 1912. She was born at McIndoe Falls, Va., October 1, 1852. She worked successfully in Colorado for women's suffrage (adopted 1893), was president of the Women's Club of Denver, and served four years as president of the General Federation of Women's Clubs. In Colorado she was the first woman member of the state board of pardons, and later was appointed to the Colorado board of charities and corrections. She was also a member of the National Child Labor Committee and the state civil service committee. She was an earnest advocate of a sweeping anti-child-labour law, and urged the appointment of women to offices in institutions for juvenile delinquency. She had been twice a widow when she married Judge Decker of Colorado in 1901.

John Fairfield Dryden, insurance official, died November 24, 1911. He was born at Farmington, Me., August 7, 1839, and spent his youth at Worcester, Mass. He studied for two years at Yale University, but was prevented from graduation on account of ill health. Entering the insurance business as an agent, he made an exhaustive study of industrial insurance as practised in England, and in 1873 founded the present Prudential Insurance Co. of America, which, beginning as the Widow's and Orphan's Friendly Society, was the first successful industrial insurance institution in the United States. After 1881 he was president of the company. In 1880 by special act of legislature the right of policy holders to vote was withdrawn and the financial control came largely into his hands. He was U.S. senator from New Jersey in 1902-07.

Daniel Cady Eaton, art-critic, professor of the history and criticism of art in Yale University in 1869-76 and 1902-09, died on May 11, 1912. He was born in Johnstown, N. Y., June 16, 1837, graduated at Yale in 1860 and at the Albany Law School in 1861, practised law until 1866, and then studied art in Berlin and Paris. He wrote handbooks of Greek and Roman sculpture (1884) and of modern French painting (1909).

Alice Morse Earle, author, died February 16, 1911. She was born at Worcester, Mass., April 27, 1853, and was married to Henry Earle, in 1874. She wrote *Customs and Fashions in Old New England*, *Home Life in Colonial Days*, *Two Centuries of Costume in America*, and many other works on similar subjects.

Samuel Franklin Emmons, economic geologist, died in Washington, D. C., March 28, 1911. He was born in Boston, March 29, 1841, graduated at Harvard in 1861 and studied

in the schools of mining in Paris and Freiberg. He took part in the Fortieth Parallel Survey, and worked with Arnold Hague on the *Descriptive Geology* of that survey. In 1879 he was put in charge of economic geology in the Rocky Mountain Division of the U.S. Geological Survey, and worked at Leadville, preparing statistics on precious metals for the 10th Census. The scene of his last labours was Leadville again, but final results of his investigations had not been published at his death.

Robley Dunglison Evans, naval officer, died January 3, 1912. He was born in Floyd county, Va., August 18, 1846. He was commissioned ensign in the American Navy in 1863 after graduation from the Naval Academy. He served with the North Atlantic Blockading Squadron, and was permanently crippled by a wound in the right leg in the land attack by sailors on Fort Fisher (December 25, 1864). In 1891-92, commanding the "Yorktown" at Valparaiso, Chile, he displayed great ability and firmness in settling the trouble arising from the killing of several American sailors in that city. At this time he received the sobriquet "Fighting Bob." In the Spanish-American War he was captain of the battle-ship "Iowa," which took a prominent part in the destruction of Cervera's fleet off Santiago, Cuba. He was appointed rear admiral in 1901. He commanded the Asiatic station in 1902-04 and the Atlantic fleet in 1905-08. On August 18, 1908 he was retired, and on account of ill health gave up command of the Atlantic Fleet, then on tour of the world. He wrote *A Sailor's Log* (1901), and *An Admiral's Log* (1910).

Arthur Henry Ewing, missionary, died at Allahabad, India, on September 13, 1912. He was born at Saltsburg, Pa., on October 18, 1864. He graduated at Washington and Jefferson College (1887), at Western Theological Seminary (1890) and at Johns Hopkins University (1891), was ordained to the Presbyterian ministry in 1890, and became a missionary in India, where he was principal of a boys' boarding school at Ludhiana in 1891-08 and established the Christian College at Allahabad in 1901. He was chairman of the united council on work among young people in India from 1907 until his death.

Rose Eyttinge, actress, died December 30, 1911. She was born in Philadelphia, November 21, 1838, and acquired great popularity in emotional rôles, in the United States and England, playing with Edwin Booth (1862), in Lester Wallack's company (1868) and with Augustin Daly, but seldom appearing after 1884. For several years after 1870 she lived in Egypt where her husband (George H. Butler) was American consul-general. She dramatised several of Dickens' works, Browning's *Colombe's Birthday*, etc., and wrote a few novels and recollections of her life in Egypt.

Harry Fenn, artist, died April 24, 1911. He was born in Richmond, Surrey, September 14, 1838, but went to the United States in 1857. He was best known as a book illustrator, especially of gift books (poetry, travels, etc.), but he also acquired considerable reputation as an aquarelle painter and was a founder of the American Water Color Society.

Isaac Nelson Ford, journalist, died in London on August 7, 1912. He was born at Buffalo, N. Y., June 11, 1848, graduated at Brown University in 1870, and in the same year became a reporter for the *New York Tribune*, which he served as leader-writer, and, from 1895, as London correspondent. He was the founder of the London Pilgrims' Club. He wrote *Tropical America* (1893).

Sam Walter Foss, poet, died February 26, 1911. He was born at Candia, N. H., June 19, 1858, graduated at Brown University in 1882, and was an editor and later a lecturer and public reader of his own verse. He was librarian of the Somerville, Mass., Public Library, from 1898 until his death. He published five volumes of verse (*Songs of the Average Man*, *Dreams in Homespun*, etc.) of a popular nature.

Paul Caspar Freer, chemist, died April 17, 1912. He was born in Chicago, Ill., March 27, 1862, graduated from Rush Medical College in 1882, and subsequently studied chemistry in Germany (Ph.D., Munich, 1887) and in Owens College, Manchester, England. He taught at Tufts College in 1887-89, and then became professor of chemistry at the University of Michigan. In 1901 the American government sent Dr. Freer to Manila as superintendent of government laboratories. This organisation became, in 1905, the Bureau of Science of the Government of the Philippines, and he was made director. He was the pioneer in general scientific work in the islands, and built up a great research institution that is now classed with the best in the world. He was founder and editor-in-chief of the *Philippine Journal of Science*. The Philippine Medical School, founded in 1906 and now part of the University of the Philippines, was largely his own creation. He was dean of the College of Medicine and Surgery, and professor of chemistry in the University. He wrote several text-books of chemistry and many articles on the structure of ring compounds, etc.

William Pierce Frye, politician, died at Lewiston, Me., August 8, 1911. He was born there September 2, 1831. He practised law after his graduation from Bowdoin College (1850) and after studying under W. P. Fessenden. Affiliated always with the Republican party, he was a member of the state legislature (1861, 1862, 1867), mayor of Lewiston (1866-67), attorney-general of Maine (1867-69), representative in Congress in 1871-81, and successor to James G. Blaine in the U.S. Senate, where he served from 1881 until his death and was chairman of the commerce committee after 1889. He was president *pro-tem* of the Senate in 1896 and after 1901 and was a member of the Paris Peace Commission (1898) to negotiate terms of peace between Spain and the United States.

Isaac Kaufman Funk, publisher and author, died April 4, 1912. He was born in Clifton, O., September 10, 1839, studied at Wittenberg College, and entered the Lutheran ministry in 1861. He edited (1872 *seqq.*) several ecclesiastical weeklies, notably *The Homiletic Review*. In 1877 he, with A. W. Wagnalls, formed the publishing house of Funk & Wagnalls Company. The firm produced such noteworthy works as *A Standard Dictionary* and the *Jewish Encyclopaedia*, of which Dr. Funk was editor-in-chief or chairman of an editorial board; and published the *Literary Digest*. He was a Prohibitionist and in 1880 established *The Voice* as a party organ; and he was much interested in the problems of psychic phenomena, and wrote, *The Next Step in Evolution* (1902), *The Widow's Mite and Other Psychic Phenomena*, (1904) and *The Psychic Riddle* (1907).

Jacques Futrelle, author, was lost with the "Titanic," April 15, 1912. His wife was saved. He was born in Pike county, Georgia, April 9, 1875, and engaged in journalism (1890-1902) and theatrical management (1902-04). He wrote fiction of a popular nature, and his best known books are: *The Chase of the Golden Plate* (1906), *The Thinking Machine* (1907), and, published after his death, *My Lady's Garter*.

George Augustus Gates, educator, president of Fisk University (Nashville, Tenn.) from 1909, died at Wintershaven, Florida, on November 20, 1912. He was born in Topsham, Vermont, January 24, 1851, graduated at Dartmouth College in 1873 and at Andover Theological Seminary in 1880, and in the same year was ordained a Congregationalist minister. After a pastorate of seven years in Upper Montclair, New Jersey, he served as president of Iowa College in 1887-1901 and of Pomona College (California) in 1902-09.

John Warne Gates, American capitalist, died in Paris, August 8, 1911. He was born near Chicago, Ill., in 1855, and first displayed his great business ability as a travelling salesman, introducing barbed wire into Texas. He established himself in this business, and organized the Southern Wire Co. and later the Braddock Wire Co., which absorbed other companies. This was sold to the Federal Steel Co. in 1898, and Gates organized the American Steel and Wire Co. now a part of the U. S. Steel Corporation. His activities were also extended to deals in railway and industrial stocks. He had undoubted talent, although his methods were often severely criticised, and he died possessed of a large fortune.

William Washington Gordon, soldier and merchant, died at White Sulphur Springs, Va., on September 12, 1912. He was born at Savannah, Ga., on October 14, 1834, and graduated at Yale in 1854. At the beginning of the Civil War he became 2nd lieutenant in J. E. B. Stuart's cavalry (the Georgia Hussars), and was afterwards captain and inspector of Mercer's brigade, and then captain and adjutant of Anderson's brigade, in Joseph Wheeler's cavalry. He was senior partner in the cotton firm of W. W. Gordon & Co., and from 1876 to 1879 was president of the Savannah Cotton Exchange. From 1884 to 1890 he was a member of the Georgia House of Representatives. He served in the Spanish-American War as brigadier-general of volunteers, and was a member of the Porto Rican evacuation commission.

Charles Chapman Grafton, Protestant Episcopal bishop, since 1889, of Fond du Lac, died August 30, 1912. He was born in Boston, April 12, 1830, graduated at the Harvard Law School in 1853, studied divinity with Bishop Whittingham of Maryland, and was ordained deacon in 1855 and priest in 1858. He spent 1865-72 in England where he founded in 1865 with R. M. Benson the Society of the St. John the Evangelist, better known as the "Cowley Fathers," described in Hall Caine's *The Christian*. In 1872-88 he was rector of the Church of the Advent, Boston. He established the St. Margaret's Sisterhood in Boston, the Sisters of the Holy Nativity in Providence, R. I., and Grafton Hall, a school for girls at Fond du Lac. He was a leader of the High Church party in America, and wrote *Fond du Lac Tracts; Christian and Catholic* (1905) and *The Lineage of the American Catholic Church* (1911).

Benjamin Henry Grierson, military officer, died September 1, 1911. He was born at Pittsburg, Pa., July 8, 1826, and entered the Union cavalry at the opening of the Civil War. He captured Baton Rouge in May 1862 with forces from Tennessee, as a part of Grant's operations on Vicksburg, and the raids of his troops in Mississippi and Alabama in 1863-64, among the most brilliant minor performances of the great conflict, won him the brevets of brigadier and major-general, respectively. He became a colonel in the regular army in 1866, and was retired in 1890 after reaching the rank of brigadier-general.

Clement Acton Griscom, financier, died November 10, 1912. He was born in Philadelphia, Pa., November 15, 1841, and in 1857 entered the shipping business, in which he rose to be general manager (1894) of the International Mercantile Marine Co. (originally International Navigation Co.). This office he resigned in 1904, assuming the chairmanship of the board of directors. He was a director in many financial and industrial corporations.

Benjamin Guggenheim, capitalist, perished in the wreck of the "Titanic" on April 15, 1912, aged 47. He was a member of the firm of M. Guggenheim's Sons and of the American Smelting & Refining Co., with great interests in Colorado and Alaska.

Benjamin Morgan Harrod, civil engineer, died September 7, 1912. He was born in New Orleans, February 19, 1837, graduated at Harvard in 1856, served in the Confederate army, becoming captain of engineers, and was state engineer in 1877-80, member of the Mississippi River Commission 1879-1904 and of the Panama Canal Commission in 1904-07, city engineer of New Orleans in 1888-92, and in charge of that city's drainage construction in 1895-1902. In 1897-98 he was president of the American Society of Civil Engineers.

Frank Davis Hill, consular official, died at Frankfurt-am-Main, Germany, on May 23, 1912. He was born in Minnesota, May 28, 1862, and was educated at the University of Minnesota, and at the Columbian and National Law Schools, Washington. He was admitted to the Bar in 1884, and became consul at Asunción, Paraguay, in 1887, in Montevideo (1890), La Guayra (1893), Santos (1896) and Amsterdam (1899). In 1907 he became consular-general at St. Petersburg, in 1908 at Barcelona, and in 1910 at Frankfurt.

Edward Hitchcock, physician and teacher of physical culture, died February 11, 1911. He was born at Amherst, Mass., May 23, 1828, a son of Edward Hitchcock (see *E. B.* xiii, 533), geologist and president of Amherst College. He graduated at Amherst College 1849 and later at the Harvard Medical School. From 1861 he was professor of hygienic and physical education at Amherst, being the first physician in the United States to take up this work. He was acting president of Amherst in 1898-99. He wrote *Anatomy, Physiology and Anthropometry* (1860) and *A Manual of Gymnastic Exercises* (1884).

Herman S. Hoffman, bishop of the Reformed Episcopal Church since June 1903, died in Philadelphia on November 23, 1912. He was born near Salem, N. C., on June 9, 1841, studied in the Moravian theological seminary at Bethlehem, Pa., was ordained to the Moravian ministry in 1864, and founded five churches of that denomination in Philadelphia before 1881, when he became a member of the Reformed Episcopal Church. In 1905 he became assistant bishop in charge of the New York and Philadelphia synods. He wrote *Life Beyond the Grave* (1898).

Edwin Eugene Howell, geologist and cartographer, died in Washington, D. C., April 16, 1911. He was born in Genesee county, N. Y., March 12, 1845, and studied at the University of Rochester under the geologist Henry A. Ward; was geologist of the United States Geological surveys west of the Rocky Mountains in 1872-73, and was with the government survey of the Rocky Mountain region under Powell in 1874. In 1870 he made a relief map of the island of San Domingo, and in 1875 produced his famous relief map of the Grand Cañon of the Colorado, for the government. In his later years he devoted his time to the manufacture of geological models and maps first in the Rochester Museum and then in an establishment at Washington which he called the Microcosm. He wrote on meteorites, and was a founder of the Geological Society of America.

John Wesley Hoyt, administrator and author, died on May 23, 1912. He was born near Worthington, Ohio, on October 13, 1831, graduated at Ohio Wesleyan University in 1849, studied law and then medicine at the Eclectic Medical Institute (Cincinnati), where he taught chemistry in 1853-57, and was editor and publisher of an agricultural paper at Madison, Wisconsin, in 1857-67. He was an early member of the Republican party and in 1878-82 was governor of the Territory of Wyoming. His interests and activities were varied: he was president of the international jury of awards on education and science at the Vienna Exposition of 1873, at the Philadelphia Centennial Exposition of 1876 and at the New Orleans Exposition of 1884, and special representative for foreign affairs at the World's Columbian Exposition of 1893; worked for the founding of a National University; and wrote, besides reports of the Wisconsin Agricultural Society (1860-72), of the same state's railway commission (1874-75), and Federal reports on education in Europe and America (1870), *Studies in Civil Service* (1878) and histories (1893-95) of the universities of Bologna, Paris, Oxford and Cambridge in the Middle Ages.

Thomas Augustus Jagger, Protestant Episcopal bishop, since May 1908, in charge of American churches in Europe, died December 13, 1912. He was born in New York City on June 2, 1839, was a bank clerk before entering the ministry in 1863, and held among other charges one at Yonkers, N. Y., where he established St. John's Riverside Hospital. From 1875 to 1905 he was bishop of Southern Ohio. In 1900 he delivered the Bohlen lectures (Church of Holy Trinity, Philadelphia) on the personality of truth.

Edward Gamaliel Janeway, physician, died February 10, 1911. He was born in New Jersey, August 31, 1841. He left his medical studies at Columbia University to act as medical cadet at the army hospital at Newark, New Jersey, during the Civil War, but took his degree in 1864. His long connection with the University and Bellevue Hospital Medical College (from 1868) as curator and professor ended in 1905 with his retirement as professor of medicine and dean. He was a noted specialist on nervous diseases and in 1875-82 was health commissioner of New York City. He was the author of *Clinical Points in the Diagnosis of Hepatic Affections*.

Tom Loftin Johnson, capitalist and administrator, died in Cleveland, O., April 10, 1911. He was born at Blue Spring, Ky., July 18, 1854. He was a street railway owner and promoter in several large cities, including Detroit and Brooklyn. He became an ardent believer in the "single tax" doctrines of Henry George, and did much towards spreading them. He served as a Democratic representative in Congress in 1891-95 and was mayor of Cleveland, Ohio, in 1901-1909, in which office he was partially successful in establishing a three-cent street railway fare (see *E. B.* vi, 504d). See his autobiography, *My Story* (New York, 1911) and Carl Lorenz, *Tom L. Johnson* (*ibid.*, 1911).

Adrian Hoffman Joline, American lawyer, died October 15, 1912. He was born in Sing Sing (now Ossining), N. Y., June 30, 1850, and graduated at Princeton in 1870 and at the Columbia Law School in 1872. He was admitted to the bar in 1872, and became one of the best

known corporation lawyers in the country. He was especially active in the management of railroad properties, and was receiver for the Metropolitan Street Railway Co. of New York after 1907. For some time he was a trustee of Princeton University. He was an ardent collector of autographs, and wrote *Meditations of an Autograph Collector* (1902); *Diversions of a Book Lover* (1903); *At the Library Table* (1909) and *Edgehill Essays* (1910).

James Otis Kaler, writer of juveniles under the pen-name "James Otis," died in Portland, Maine, December 11, 1912. He was born in Winterport, Maine, March 19, 1848, and after 1865 was in newspaper work, first on the Boston *Journal* and then on the New York *Sun*, until he was employed (1870) on Leslie's *Boys and Girls*. In 1877 he wrote *Toby Tyler* as a serial in *Harper's Young People* and then devoted himself to books for children, notably the "Minute-Boy Series," writing nearly 150 volumes, including serials for *St. Nicholas*.

John Steinfort Kedney, professor of divinity in Seabury Divinity School, 1871-1908, died at Salem, New Jersey, March 8, 1911; he was senior priest of the American Episcopal Church. He was born in Essex county, New Jersey, February 12, 1819, graduated at Union College in 1838, and at the Union Theological Seminary in 1841, and was ordained priest in 1843. He was rector of several churches and lectured in the Concord School of Philosophy and in the Cambridge Episcopal Theological School. He wrote *The Beautiful and the Sublime* (1884), *Hegel's Aesthetics* (1886), and *Problems in Ethics* (1899).

John Mills Kendrick, Protestant Episcopal bishop (since January 1889) of Arizona and New Mexico, died in 1912. He was born in Gambier, Ohio, graduated at Marietta College in 1856, was admitted to the New York bar in 1858, served two years in the Civil War, and in 1865 was ordained to the priesthood. He was rector of churches in Fort Scott and Leavenworth, Kansas, and in Columbus, Ohio, and in 1878-89 was general missionary of the diocese of Southern Ohio.

Frederick Keppel, art-dealer, died in New York City on March 5, 1912. He was born at Tullow, Co. Carlow, Ireland, on March 22, 1845 and was educated at Wesley College, Dublin, and in England. In New York City he became a bookseller and then a print dealer and importer of pictures. He was an art critic of ability, and lectured on art at the Metropolitan Museum of Fine Arts and in Yale, Columbia, and Harvard universities. He published *The Golden Age of Engraving*, *A Day with Whistler*, and many articles in periodicals, especially in *The Print-Collector's Quarterly*.

Vaughan Kester, novelist, died July 4, 1911. He was born in New Brunswick, N. J., September 12, 1869, and was reared in Ohio. He portrayed types characteristic of the South and Middle West. Among his books are: *The Manager of the B. and A.* (1901); *John o' Jamestown* (1907); *The Prodigal Judge* (1911), and *The Just and the Unjust* (1912.)

Herman Knapp, physician, died May 1, 1911. He was born at Dauborn, Prussia, May 17, 1832, and practised as an eye-and-ear specialist in New York after 1868. He taught in the medical school of New York and Columbia universities, and founded the New York Ophthalmic and Aural Institute. He wrote a book on intraocular tumours, many papers on eye-and-ear surgery, and excellent text-books, and founded the valuable *Archives of Ophthalmology and Otology*.

James Proctor Knott, lawyer and legislator, died June 18, 1911. He was born in Kentucky, August 29, 1830, and was educated at home. He practised law in Missouri and after 1863 in Kentucky, was a member of the Missouri state legislature in 1858 and state attorney-general in 1858-61. He was a Democratic representative in Congress from Kentucky in 1867-71 and 1875-83, and governor in 1883-87. Between 1892 and 1901 he taught economics and law at Centre College (now part of Central University), Danville, Kentucky.

George William Knox, theologian, Union Seminary lecturer on Christianity in the Far East, died at Seoul, Korea, April 26, 1912. He was born at Rome, N. Y., August 11, 1853, graduated at Auburn Theological Seminary in 1877, and was ordained in the Presbyterian ministry in the same year. The first years of his professional life were spent in missionary work and teaching in Japan, where he was, for a time, professor of philosophy and ethics in the Imperial University, Tokio, and where he received the Order of the Rising Sun. In 1897 he became a lecturer on apologetics in Union Theological Seminary, New York, and after 1899, was professor of the philosophy and history of religion there. He wrote many books, mostly on religious subjects, both in Japanese and English—including *The Direct and Fundamental Proofs of the Christian Religion* (1903; N. W. Taylor Lectures at Yale), *The Spirit of the Orient* (1906), *The Development of Religion in Japan* (1907) and *The Religion of Jesus* (1909),—and contributed the article "Christianity" to the 11th ed. of the *Ency. Brit.*

William Mershon Lanning, judge of the U.S. District Court, for New Jersey, since June 1904, died February 16, 1912. He was born in Ewing township, Mercer county, New Jersey, January 1, 1849, studied at Lawrenceville, and was admitted to the bar in 1880. He was city solicitor of Trenton, 1883-87, judge of city district court, 1887-91, and (Republican) representative in Congress, 1903-04. He was a trustee of the General Assembly of the Presbyterian Church (North) and of Lawrenceville School, and a director of Princeton Theological Seminary.

Homer Lea, author, died at Los Angeles, November 1, 1912. He was born in Denver, November 17, 1876, and was educated in California, at Occidental College, the University of the Pacific and Leland Stanford Jr. University. Stories of his holding high rank in the

Chinese reform army seem to have no basis of fact except his unsuccessful mission to China in 1900 and his militaristic ideals. He wrote *The Vermilion Pencil* (1908), *The Valor of Ignorance* (1909), urging the necessity of military training in the United States in case of Japanese invasion, and *The Day of the Saxon*, predicting the fall of the British Empire.

Ida Lewis, American lighthouse keeper, died October 24, 1911. She was born in Newport, R. I., in 1841. In 1857, when her father was incapacitated, she took up his work as keeper of the Lime Rock Light, Newport Harbor. Her official appointment by act of Congress (the first given to a woman) was dated 1889. An expert rower and swimmer, she saved 18 lives from drowning, receiving many medals, and a pension from the Carnegie Fund. In 1870 she married W. H. Wilson.

Morris Loeb, chemist, died in New York, October 8, 1912. He was born in Cincinnati on May 23, 1863, graduated in 1883 at Harvard, where he studied under Wolcott Gibbs, whose assistant he was in 1888-89 after his return from Germany, where he worked under Hoffman in Berlin and Ostwald in Leipzig. He taught at Clark University in 1889-91 and then until his death was professor of chemistry in New York University. His principal chemical investigations were on the kinetics of substances in solution, osmotic pressure and crystallization of sodium iodide from alcohols. He was a member of a wealthy family and was prominent in Hebrew charities, to some of which he made large bequests, as well as to the American Chemical Society, the Smithsonian Institution, Cooper Institute, the American Museum of Natural History, the Metropolitan Museum of Art, and Harvard University.

Charles Battell Loomis, author, died September 23, 1911. He was born in Brooklyn, N. Y., November 12, 1861, and was a writer of humorous fiction and verse, his best known volumes being *Yankee Enchantments* (1900) and *Cheerful Americans* (1903).

Eben Jenks Loomis, astronomer, died at Amherst, Mass., December 2, 1912. He was born at Oppenheim, N. Y., November 11, 1828, and was educated at the scientific school of Harvard University. He spent 50 years in work on the American *Ephemeris and Nautical Almanac*. He was also a naturalist, a Shakespearian scholar, and a poet.

Patrick Anthony Ludden, Roman Catholic bishop of Syracuse since May 1887, died in that city, August 6, 1912. He was born near Castlebar, Ireland, in 1836, studied at St. Jarlath's College, Tuam, and at the Grande Séminaire, Montreal, and was ordained priest in 1864. He was rector of the Albany cathedral and vicar-general, 1877-80, and after seven years at St. Peter's, Troy, New York, was consecrated first bishop of Syracuse. In 1911 he urged the election of William F. Sheehan as U. S. senator from New York and declared that the opposition to Sheehan was due to his being a Catholic and of Irish descent.

Arthur MacArthur, army officer, died in Milwaukee, Wis., September 5, 1912. He was born in Springfield, Mass., June 2, 1845, but was educated in Milwaukee. He served in the volunteers in the Civil War, distinguished himself at Stone River, received a Congressional medal for bravery at Missionary Ridge, and became major at 19 and colonel before he was 20. He continued in the regular army and reached the high rank of lieutenant-general in 1906. As brigadier-general of volunteers he went to the Philippines during the Spanish-American War of 1898, and was made major-general of volunteers for his service at the capture of Manila. He was military governor of the islands in 1900-01, the most critical period of American occupation. On his return he commanded different military departments in the United States before he was retired in 1909.

Robert Lee MacCameron, portrait painter, died December 29, 1912. He was born in Chicago, January 14, 1866, and was brought up in Necedah, Wis., where he worked as a lumber jack when he was 14 years old. He became a newspaper illustrator in Chicago and later in New York and in London, on *The Boys' Own*, and in 1889 went to Paris, where he studied under Gerôme. He was made a chevalier of the Legion of Honor in July 1912. Besides portraits of celebrities, English and American, his best-known pictures were "Absinthe Drinkers," "The Dancers" (honourable mention, Paris Salon), "The Daughter's Return" (in the New York Metropolitan Museum), and in general scenes from the slums.

Alexander Mackay-Smith, Protestant Episcopal bishop, died November 16, 1911. He was born in New Haven, Conn., June 2, 1850, and was ordained priest in 1877, after studying at the General Theological Seminary and in England and Germany. In 1902, after service as rector in South Boston, New York (where he was first arch-deacon in 1887), and Washington, he was made coadjutor-bishop of Philadelphia, and bishop in 1910.

Willard Francis Mallalieu, Methodist Episcopal bishop, died at Auburndale, Mass., August 1, 1911. He was born at Sutton, Mass., December 11, 1828, and entered the ministry after graduation from Wesleyan University in 1857. He held several charges in Massachusetts and in 1882 was made presiding elder of the Boston district. In 1884 he was elected bishop. He was a prominent member of many church boards and commissions, and advocated total abstinence and Sabbath observance. He wrote *The Why, When, and How of Revivals*, *The Fullness of the Blessing of the Gospel of Christ*, etc.

John William Mallet, chemist, died November 6, 1912. He was born in Dublin, Ireland, October 10, 1832, and studied at Trinity College, Dublin and at Göttingen. He came to the United States in 1853, and taught chemistry at Amherst, at the universities of Alabama, Louisiana, Virginia, and Texas, and at Jefferson Medical College in Philadelphia. During the Civil War, he had charge of the ordnance laboratories of the Confederate States.

W J McGee (his full name), anthropologist and geologist, died September 4, 1912. He was born at Dubuque, Ia., April 17, 1853, and was self-educated. After studying mathematics, astronomy, law and other subjects, he turned his attention about 1875 to archaeology and geology. Without public aid he made a geological and topographic survey of north-western Iowa, and later became attached to the U. S. Geological Survey. He was in charge of the Bureau of American Ethnology in 1893-1903, resigning in order to undertake the work of assembling a collection of races for the St. Louis Exposition, 1904. His later years were devoted to the inland water-ways commission, and he was an expert in the U. S. department of agriculture. He wrote on anthropology, geology and hydrology.

George Wallace Melville, naval officer, died March 17, 1912. He was born in New York City, January 10, 1841, was educated at the Brooklyn Polytechnic Institute, entered the navy as assistant engineer in 1861 and served through the Civil War. In 1879 he sailed with the De Long Arctic expedition, and commanded the boat's crew that escaped from the *Lena* delta. He later headed the parties which recovered the records of the expedition and De Long's remains. After 1887, he was engineer in chief, U. S. Navy, and became rear-admiral, 1899 (retired, 1903). He invented many mechanical appliances, and wrote *In the Lena Delta*, a narrative of the De Long expedition after the loss of the "Jeannette."

Richard Wilde Micou, theologian, died at Oxford on June 4, 1912. He was born on June 12, 1848, at New Orleans, and after studying at the universities of Georgia and Alabama, he went to Erlangen, to Edinburgh, and to the General Theological Seminary in New York City. He was ordained in 1870. In 1892 he became professor of systematic divinity in the Philadelphia Divinity School, and in 1898 professor at the Virginia Theological Seminary.

Philip Verrill Mighels, author, died October 13, 1911. He was born in Carson City, Nevada, April 19, 1869, was admitted to the Nevada bar in 1890, was a journalist in San Francisco and New York, and in 1895 began writing fiction. He published about a dozen books, of which the best known is *Bruxer Jim's Baby*.

Darius Ogden Mills, American financier, died at Millbrae, California, on January 4, 1910, aged 84. Born at Salem, N. Y., on September 25, 1825, he was a clerk in New York, went to California during "the gold rush" of 1849, became a storekeeper at Sacramento, and founded the Gold Bank of Sacramento. After doing much for the development of the Comstock lode region, he was president of the Bank of California from 1864 (when he founded it) until 1873, and in 1875, when the bank was wrecked under other management, he returned and placed it on a sound basis. In California he had endowed a chair of philosophy in the state university and had been a trustee of the Lick estate and Observatory. He sent an astronomical expedition to Chile to observe stars not visible in the northern hemisphere. In New York (after 1880) he was a trustee of the Metropolitan Museum and of the Museum of Natural History and president of the New York Botanical Society; and he built the Mills Hotels, lodging-houses for working men. His daughter married Whitelaw Reid.

Paul Morton, administrator, died in New York City, January 19, 1911. He was born in Detroit, Mich., May 22, 1857. At the age of fifteen he began his business career as a clerk in the land office of the Burlington and Missouri R.R. He showed great executive ability as a railroad man, and rose to be second vice-president of the Santa Fe system in 1898. He was secretary of the navy in Mr. Roosevelt's cabinet in 1904-05. In 1906 he was made president of the Equitable Life Assurance Society, and by his able administration helped to restore the impaired fortunes of that company. He became vice-president of the Pan-American R.R. in 1910.

Francis Philip Nash, professor of Latin at Hobart College in 1871-76 and 1882-1907, died on February 5, 1911. He was born in Florence, Italy, December 5, 1836, graduated at Harvard in 1856 and at Harvard Law School in 1859, and practised law in New York City before becoming a teacher. He edited *Two Satires of Juvenal*, translated the American *Prayer Book* into Italian, and contributed to the *Nation* (New York).

John Willock Noble, Secretary of Interior in President Benjamin Harrison's cabinet, 1889-93, died March 22, 1912. He was born in Lancaster, Ohio, October 26, 1831, graduated at Yale in 1851 and at the Cincinnati Law School in 1852, and was admitted to the bar in 1853. He practised in St. Louis (1855) and then in Keokuk, Iowa, until the outbreak of the Civil War, during which he became colonel and brevet brigadier-general. He was U. S. district attorney in St. Louis in 1867-70 and prosecuted whisky and tobacco frauds.

Edward Payson North, civil engineer, died on July 20, 1911. He was born in Hartford, Conn., July 16, 1835, studied engineering at Union College, became assistant engineer of the Saratoga & Hudson River railway in 1864, and in 1866 chief engineer of the Stamford & New Canaan Railroad, on which he used, probably before any one else in the United States, nitro-glycerine in rock-excitation. In 1868 he became connected with the Union Pacific and in 1873-75 with U. S. Army engineering work on the upper Mississippi. He was superintendent of roads and streets in New York City in 1876 and, after being chief engineer of the Sinaloa & Durango railway in Mexico (1881), was engineering expert on many municipal projects, including the electric subways in New York, where he was head of the work on paving and repairing streets in 1895 and consulting engineer of the department of public works in 1897. He was a prominent member of the American Society of Civil Engineers and contributed many papers to its *Transactions* and to technical and other journals.

John Alsop Paine, archaeologist, died July 24, 1912. He was born in Newark, N. J., January 14, 1840, and studied at Andover for the Congregational ministry (ordained 1867). He also studied science at several universities of the United States and Germany. He was engaged in research work on the flora of New York state, 1862-67, and afterwards taught natural science at Robert College, Constantinople, Lake Forest University, Ill., and the College of Physicians and Surgeons, New York City. In 1871-72 he was associate editor of *The Independent* (New York). He was archaeologist of the first expedition of the Palestine Exploration Society in 1872-74; edited and conducted the *Journal of Christian Philosophy* (1882-84), was curator of the Metropolitan Museum, New York, 1889-1906, and was also on the staff of the *Century Dictionary*.

William Paret, Protestant Episcopal bishop of Maryland since 1884, died on January 18, 1911. He was born in New York City, September 23, 1826, graduated at Hobart College in 1849, was ordained in 1852 upon leaving the Hobart Divinity School, was rector successively in Clyde and Pierrepont Manor, N. Y., East Saginaw, Michigan, Elmira, N. Y., Williamsport, Penna., and Washington, D. C., and wrote *St. Peter and the Primacy of the Roman See and Our Freedom and our Catholic Heritage*.

Daniel Kimball Pearsons, philanthropist, died April 27, 1912. He was born in Bradford, Vt., April 14, 1820. He practised medicine in Massachusetts from 1842 to 1857, was a farmer in Illinois until 1860, and then engaged in the real-estate business in Chicago, from which he retired in 1887. He was childless and gave away his entire fortune—he lived on an annuity during his last years—to 30 colleges in 20 different states (especially Chicago Theological Seminary, Beloit College, Whitman College, Berea College) and to a public library and museum for Hinsdale, Ill., the village in which he made his home. A larger sum had to be raised from other sources before his donations were available, and he gave only to smaller institutions. He was an alderman in Chicago from 1873 to 1876.

William Alfred Pepper, politician, died at Grenola, Kansas, October 7, 1912. He was born in Cumberland county, Pennsylvania, September 10, 1831. He served as a private in an Illinois regiment during the Civil War, and in 1870 removed to Kansas where he practised law and edited newspapers in Fredonia and Coffeyville. He became a member of the state senate in 1874. In 1891-97 he was United States senator from Kansas, being the only member of the Populist party in the Senate. He had been a Republican before the establishment of the Populist party, which was largely due to him. In 1898 he was the Prohibitionist candidate for governor. He wrote *Myriorama*, a *National Poem*, several novels, *The Farmer's Side* (1891) and *Americanism and the Philippines* (1900).

David Graham Phillips, novelist, died January 24, 1911. He was born in Madison, Ind., October 31, 1867, and graduated at Princeton in 1887. After a short career as a journalist he devoted his time to the writing of fiction. He wrote *The Great God Success* (1901); *The Golden Fleece* (1903); *The Cost* (1904); *The Plum Tree* (1905); *Light Fingered Gentry* (1907); *The Second Generation* (1907); *Old Wives for New* (1908); and, posthumously published, *The Grain of Dust* (1911) and *The Price She Paid*. He presented, rather crudely, the social and economic problems of modern American life, especially in high society. He was murdered by a deranged man who imagined that his family had been satirised in Phillips's novel, *The Fashionable Adventures of Joshua Craig*.

Arthur Tappan Pierson, Presbyterian clergyman and editor, died June 3, 1911. He was born in New York City, March 6, 1837 and was ordained in the ministry upon graduation from the Union Theological Seminary in 1860. He filled pulpits in Detroit, Indianapolis, Philadelphia, and elsewhere, and in 1888 became editor of the *Missionary Review of the World*. His knowledge of the missionary field was very extensive and he was prominent in religious conferences at Northfield, Mass., of which he was a leader after the death of D. L. Moody. A trip around the world in the interest of foreign missions was interrupted by ill health in Korea. Dr. Pierson published about 30 books on missions and other religious subjects. See the biography (New York, 1912) by Delavan Leonard Pierson.

Louis McClellan Potter, sculptor, died in Seattle, Washington, August 29, 1912, possibly as a result of treatment by a Chinese physician. He was born in Troy, New York, November 14, 1873, graduated at Trinity College (Hartford) in 1896 and studied in Paris under Luc-Olivier Merson and Jean Dampt. In Tunis and Alaska he studied native types. His work, first realistic and then imaginative, includes a memorial in Hartford (1909) to Horace Wells and "Earthbound," a symbolic piece for the New York Child's Welfare Exhibit.

Joseph Pulitzer, editor and journalist, died October 29, 1911. He was born at Budapest Hungary, April 10, 1847. He emigrated to America practically penniless in 1864, served in the Union army through the Civil War, and became a reporter on the *St. Louis Westliche Post* in 1868, rising to be editor and part owner. This paper he combined with the *St. Louis Dispatch*, which he bought in 1878. He served in the Missouri House of Representatives in 1869 and was connected with the Liberal Republican movement in Missouri in 1872. In 1876-77 he reported for the *New York Sun* the proceedings of the Electoral Commission. In 1883 he bought from Jay Gould the *New York World* (see *E. B.* xix, 569c) which, although sensational, through a fearless editorial policy of combatting political evils became one of the most influential journals of the United States. In 1885 he was elected a Democratic member of Congress but resigned after a few months' service. His later years, owing to failing eye-

sight and a high state of nervous irritability, were spent in long cruises in his private yacht on which he died in the harbour of Charleston, S. C. But up to the end he was most active in directing the *World*. He founded the School of Journalism at Columbia University, New York City, and made bequests of \$500,000 each to the New York Philharmonic Society and the Metropolitan Museum.

Myrtle Reed, author, died August 17, 1911. She was born in Chicago, Ill., September 27, 1874, and married J. S. McCullough in 1906. She wrote popular fiction, essays and verse, including *Love Letters of a Musician* (1899); *Later Love Letters of a Musician* (1900); *The Spinster Book* (1901); *Lavender and Old Lace* (1902); *Pickaback Songs* (1903); *The Shadow of Victory* (1903); *The Master's Violin* (1904); *The Book of Clever Beasts* (1904); *At the Sign of the Jack o' Lantern* (1905); *A Spring in the Sun* (1906); *Love Affairs of Literary Men* (1907); *Flower of the Dusk* (1908); and the *Weavers of Dreams* (1911).

Eugene Lamb Richards, professor of mathematics at Yale in 1891-1906 and a director of the Yale gymnasium in 1892-1902, died at Beach Haven, N. J., August 5, 1912. He was born in Brooklyn, December 27, 1838, graduated at Yale in 1860, and became tutor in mathematics there in 1868. He wrote on college athletics and published text books of *Trigonometry* (1879) and *Elementary Navigation* (1902).

Maurice Howe Richardson, surgeon, died on July 31, 1912. He was born in Athol, Mass., on December 31, 1851, graduated at Harvard College in 1873 and at the Harvard Medical School in 1877, practised in Boston, and taught anatomy and surgery at Harvard after 1879, becoming Moseley professor of surgery in 1907. In 1911 the post of surgeon in chief to the Massachusetts General Hospital was created for him.

Theophilus Francis Rodenbaugh, soldier and author, died December 19, 1912. He was born in Easton, Pa., November 5, 1838; served as a volunteer in the Civil War, losing an arm and being made brigadier (March 13, 1865) for gallantry at Cold Harbor; entered the regular army in 1866, and retired in 1870 with rank of colonel; and in 1904 was made brigadier-general retired. He wrote: *From Everglade to Cañon with the Second Dragoons* (1875), *Afghanistan and the Anglo-Russian Dispute* (1885) and *Sabre and Bayonet* (1897), and edited in 1899 the *Journal of the Military Service Institution*.

Abbott Lawrence Rotch, meteorologist, died at Boston, Mass., April 7, 1912, where he was born January 6, 1861. He graduated from the Massachusetts Institute of Technology in 1864, and became professor of meteorology at Harvard in 1906. After 1885, he maintained from his private fortune the Blue Hill Meteorological Observatory near Boston. Here he first introduced the use of kites in exploring the upper air. He also obtained valuable data with registration balloons five to ten miles above the earth. He collaborated with Teisserenc de Bort (1905-06) in sending a steam yacht to explore the tropical atmosphere, and took part in scientific expeditions to South America, Europe and Africa. He wrote *Soundings of the Ocean of the Air* (1901) and *The Conquest of the Air* (1909). Upon his death the Blue Hill Observatory became the property of Harvard.

Patrick John Ryan, Catholic prelate, died February 11, 1911. He was born in Thurles, County Tipperary, Ireland, February 20, 1831, and removed to the United States after graduation from Carlow College and ordination as a sub-deacon in 1852. He taught English Literature at Carondelet Seminary in St. Louis, was ordained a priest in 1853, and became rector of St. John's Cathedral there. He was made coadjutor-bishop of St. Louis in 1872; was promoted to an archbishopric eleven years later; and in 1884 was transferred to the see of Philadelphia, where he remained for the rest of his life. President Roosevelt appointed him to the board of Indian Commissioners in 1902. He wrote *What Catholics Do Not Believe*, and *Causes of Modern Religious Skepticism*.

Charles Robert Sanger, chemist, director of the Harvard laboratory after September 1903, died on February 25, 1912. He was born in Boston, August 31, 1860, graduated in 1881 at Harvard, where he was assistant in chemistry in 1882 and 1884-86 and (after teaching the same subject at the U.S. Naval Academy in 1886-92 and at Washington University, St. Louis, in 1892-99) assistant professor in 1899-1903 and then professor.

Margaret Elizabeth (Munson) Sangster, editor and author, died at Glen Ridge, N. J., June 4, 1912. She was born at New Rochelle, N. Y., February 22, 1838, and was married to George Sangster in 1858. At an early age she began contributing to current periodicals, and became one of the best known writers in the United States on topics of special interest to women and girls. She was staff editor on many women's and children's periodicals. She wrote *Winsome Womanhood*, *Fairest Girlhood*, *The Queenly Mother in the Realm of Home*, etc.

William Lindsay Scruggs, diplomat and authority on South America, died in Atlanta, Georgia, on July 18, 1912. He was born near Knoxville, Tennessee, September 14, 1836, was admitted to the bar in 1858, edited the Columbus (Georgia) *Sun* in 1862-66 and the Atlanta *New Era* in 1870-72, and was minister to Colombia in 1872-77 and (after being consul-general in China) in 1882-87 and to Venezuela in 1889-93. In 1894-98 he was legal adviser of Venezuela and agent for the settlement of the boundary dispute with Great Britain, arbitrated in 1897. He wrote *The Colombian and Venezuelan Republics* (3 ed., 1905), *Origin and Meaning of the Monroe Doctrine* (1902), and several books on the boundary dispute.

William Hall Sherwood, pianist and composer, died in Chicago, January 7, 1911. He was born at Lyons, N. Y., January 31, 1854, the son of a music teacher, and studied music

under William Mason, Kullak, and Liszt. He was an organist in Stuttgart and Berlin, and became well-known as a piano soloist in Europe and America, being perhaps the first American who could be ranked as a first-class pianist. His merits as a composer for the piano were recognised in professional circles, and he wrote *Music Study and the Mutual Relation of Interpretation and Technic*. For many years he directed the Sherwood Music School in Chicago, where he settled in 1889 as head piano teacher in the Conservatory, and his University Extension Course of Music Study and Piano Playing was in many respects a new departure. He gave summer normal courses at Chautauqua.

James Schoolcraft Sherman, vice-president of the United States after 1909, died at Utica, N. Y., October 30, 1912. He was born on his father's farm near Utica, October 24, 1855, and graduated from Hamilton College in 1878. Admitted to the bar, in 1880, he established a law firm in Utica which continued until 1907. His savings were first invested in a canning factory founded by his father, and the enterprise prospered greatly under his guidance. Although at first he followed his family in its allegiance to the Democratic party, he soon became a Republican. He was mayor of Utica in 1884-85. In the winter of 1887, when only thirty-two years of age, he began a career in the House of Representatives which was uninterrupted until 1908 except during the term of the 52nd Congress (1891-93) to which he failed, by a small number of votes, to be elected. In the political campaigns of 1895, 1900, and 1908, he was chairman of the New York Republican State Convention, and in 1906 was chairman of the Republican National Congressional Committee. It was in the latter capacity that he appealed to Republicans throughout the country for one-dollar subscriptions, and obtained a large sum of money. For many years he was chairman of the Congressional committee on Indian affairs—he was related to Henry Schoolcraft, the well-known writer on American Indians—and it was on this committee that his most important legislative work was done; he also was a member of the committee on interstate and foreign commerce. In 1908 he was elected Vice-President of the United States on the ticket with Mr. Taft, and he was re-nominated at the Republican National Convention of 1912. He was one of the most expert parliamentarians in Congress in his time. His sympathies were with the conservative or "stand-pat" wing of the Republican party.

Albert Keith Smiley, philanthropist, died at Redlands, Cal., December 2, 1912. He was born of Quaker parentage at Vassalboro, Me., March 17, 1828, and graduated at Haverford College, in 1849. Until 1879 he was a teacher, but then began to develop a large tract of land in Ulster Co., N. Y., including the beautiful Lake Mohonk, which he had purchased ten years previously. It became a popular summer resort, and Smiley, who was now a member of the board of U.S. Indian Commissioners, arranged at his own expense for a conference each autumn for the discussion of the problems of the Indians and later of other dependent peoples, the Filipinos, Hawaiians, and Porto Ricans. The first of these was held in 1882. Likewise, after 1894, he called an annual spring conference in the interest of international arbitration. In 1889, he and his brother Alfred H. (d. 1903) purchased a large property at Redlands, Cal. In 1898, he presented a public library to Redlands, and he served as trustee for Brown University and Bryn Mawr College.

Gerrit Smith, composer, professor of music in Union Theological Seminary, New York City, died July 21, 1912, in Darien, Connecticut. He was a grand-nephew of the abolitionist of the same name, was born in Hagerstown, Maryland, December 11, 1859, was educated at Hobart College, where he was chapel organist, studied music in Stuttgart and under Haupt and Rohde, in Berlin, and was successively organist of St. Paul's Cathedral, Buffalo, St. Peter's, Albany, and (1885) Old South Church, New York City, where he gave many organ recitals. He composed songs, notably "The Night Has a Thousand Eyes" and a cycle *Thistledown*, and ecclesiastical music, including a cantata *King David*.

John Bernhardt Smith, entomologist, died on March 12, 1912. He was born in New York City, November 21, 1858, had a common school education, and was admitted to the bar in 1879. In 1884 he became a special agent of the Entomological Division of the U.S. Department of Agriculture and in 1889 professor of entomology in Rutgers College and entomologist of the New Jersey Agricultural College experiment station. As state entomologist, after 1898, he was in charge of the extermination of mosquitos in New Jersey. He wrote *Economic Entomology* (1896) and *Our Insect Friends and Enemies* (1909).

Paul Smith, guide and hunter, died in Montreal, December 15, 1912. He was born in Milton, Vermont, August 20, 1825, and in 1852 built a Hunters' Home at Loon Lake in the Adirondacks of New York, whence about 1858 he removed to St. Regis Lake, where he built a hotel and where the whole region came to be known by his name. The development of the Adirondack country was largely due to him.

John Russell Soley, lawyer and naval historian, died September 10, 1911. He was born in Boston, Mass., October 1, 1850 and graduated at Harvard in 1870. He made a specialty of international law, taught at the Naval Academy, was assistant secretary of the navy in 1890-93, and wrote a number of books on naval and maritime subjects. Among them are *The Blockade of the Cruisers* (1883), in a series on the American Civil War, *Foreign Systems of Naval Education* (1879) and *Life of Admiral Porter* (1903).

Julius Stahel, American soldier, died in New York City, December 4, 1912. He was born, November 5, 1825, in Hungary, and was educated in Budapest. After fighting for Hunga-

rian independence under Kossuth in 1848 he came to the United States (1856) and engaged in journalism until the Civil War broke out. In this he participated, first as lieutenant-colonel of a New York regiment, and rose to be major-general of volunteers in March 1863. He was prominent at the first battle of Bull Run, in Fremont's operations in the Shenandoah Valley, in Pope's Army of Virginia, and for a short time had command of the 11th Army Corps. In March 1863 he held a command in the defence of Washington. He was American consul at Yokohama, and consul-general at Shanghai in 1884-85.

Isidor Straus, merchant and philanthropist, was a victim of the "Titanic" disaster April 15, 1912. He was born in Rhenish Bavaria, February 6, 1845, went to the United States when nine years of age and was educated in Georgia. In 1863 he went to Europe to assist in purchasing steamers and supplies for the Confederate Government, and three years later joined his father in New York City in the business of importing pottery and glassware. He was also a partner in several large department stores in New York City. He was a strong supporter of tariff reform and sound money, took a prominent part in the Democratic presidential campaign of 1892, and in 1894-95 served in the Federal House of Representatives, where he assisted in drafting the Wilson Tariff. He was connected with many charitable and philanthropic institutions, notably the Educational Alliance of New York City.

Ralph Stockman Tarr, geographer, died March 21, 1912. He was born at Gloucester, Mass., January 15, 1864 and graduated at the Lawrence Scientific School of Harvard University in 1891. He was assistant professor of geology at Cornell University in 1892-97, professor of dynamic geology and physical geography in 1897-1906, and thereafter professor of physical geography. He had an international reputation through his work in geology and geography, especially in the field of glaciology, in the study of which he made several expeditions to Greenland and Alaska,—one to Alaska under the auspices of the National Geographic Society shortly before his death. He was president in 1911-12 of the Association of American Geographers, and was an associate-editor of the *Bulletin* of the American Geographical Society and the *Journal of Geography*. He wrote a number of valuable papers and monographs and was the author of a widely-used series of geographical text-books, of a *New Physical Geography* (1904), etc.

Denman Thompson, actor, died April 14, 1911. He was born at Girard, Pa., in 1833, but was reared in New Hampshire. He began his professional career with a travelling circus in New England about 1850. His work on the stage was inconspicuous, until, in 1875, he wrote a short play, *Joshua Whitcomb*, portraying characteristic types of rural New England, which was immediately successful and was expanded by its author to larger proportions and renamed *The Old Homestead*. This medium, peculiarly fitted to his abilities, was his sole dramatic resource until he abandoned the stage in 1910, and it brought him a large fortune.

Bradford Torrey, naturalist, died at Santa Barbara, California, on October 7, 1912. He was born in Weymouth, Mass., on October 9, 1843, and had a common school education. He was an editor in 1886-1901 of the *Youth's Companion* (Boston), and among his books were: *Birds in the Bush* (1885), *A Rambler's Lease* (1889), *A Florida Sketch-Book* (1894), *Every-Day Birds* (1900), *The Clerk of the Woods* (1903) and *Nature's Invitation* (1904).

Eugene F. Ware, lawyer and poet, widely known as "Ironquill," died at Cascade, Colo., July 1, 1911. He was born at Hartford, Conn., May 29, 1841 and was reared in Iowa. He served in the Union cavalry in the Civil War and was admitted to the Kansas bar in 1871. He held public office as (Republican) state senator in 1879-84 and was U.S. pension commissioner in 1902-05. His newspaper verse was afterwards collected in the *Rhymes of Ironquill* which has run through many editions. Among his other works are *The Rise and Fall of the Saloon* (1900); *The Lyon Campaign and History of the First Iowa Infantry* (1907) *Ithuriel* (1909); *From Court to Court* (1909). He also made translations of French and Latin works, including Justinian's *Roman Water Law*.

Henry White Warren, bishop of the Methodist Episcopal Church, died in Denver, Colorado, on July 23, 1912. He was born in Williamsburg, Massachusetts, on January 4, 1831, and was a brother of William Fairfield Warren (b. 1833; president of Boston University, 1873-1903). He graduated at Wesleyan University in 1853, was ordained in 1855, filled pastorates in Massachusetts in 1871, in Philadelphia in 1871-74 and from 1879 to 1880 when he was elected bishop. He edited *The Study* (1896-1900) and was a prolific writer, publishing *Recreations in Astronomy* (1879), *The Bible in the World's Education* (1892), etc.

Alexander Stewart Webb, military officer and educator, died February 12, 1911. He was born in New York City, February 15, 1831, and was graduated from the U.S. Military Academy in 1855. In the Civil War he served in the Army of the Potomac, being made brigadier-general of volunteers in June 1863. He was wounded at Gettysburg, on the Rapidan, and at Spottsylvania. At the time of Lee's surrender he was General Meade's chief of staff. After the war he was brevetted major-general in the regular army. In 1870 he was discharged at his own request because in the previous year he had been chosen president of the College of the City of New York. Here he remained until 1903, when he retired. He wrote *The Peninsula*, an excellent sketch of the McClellan Campaign of 1862.

Frederic Cope Whitehouse, lawyer and archaeologist, died November 16, 1911. He was born at Rochester, N. Y., November 9, 1842, graduated at Columbia University in 1861, studied in Europe, and was admitted to the New York bar in 1871. He spent much time

in Egypt, investigating Semitic traditions in regard to that country, and attempting to identify localities mentioned in the Bible. In 1882, he discovered the depression in the desert now known as the Wadi Raiyan and advocated unsuccessfully its use as a storage reservoir for the water of the Nile. The khedive granted him the Mejidieh order for his efforts in behalf of Nile regulation, and he was also a commander of the Osmanieh order.

Ozi William Whitaker, Protestant Episcopal bishop, died February 9, 1911. He was born at New Salem, Mass., May 10, 1830, and was ordained deacon and priest, in 1863, after graduation from the General Theological Seminary. After serving two years as rector at Gold Hill, Nev., he held a charge in Englewood, N. J., but returned to Nevada in 1867, and was rector at Virginia City for two years. He was then (1869) consecrated missionary bishop of Nevada, and became assistant bishop of Pennsylvania in 1886. In 1887 he succeeded Bishop Stevens. He laboured assiduously for the extension of the diocese until failing eye-sight compelled him to relinquish the charge in 1910.

Wilbur Wright, aeronaut, died at Dayton, Ohio, on May 30, 1912. He was born near Millville, Indiana, on April 16, 1867, and was the son of Milton Wright, a bishop of the United Brethren in Christ. He was educated in the high schools of Richmond, Indiana, and Dayton, Ohio. He and his brother, Orville, were early interested in problems of flying, and about 1900 began experiments on the coast of North Carolina in "gliding" from some high points. In 1903 they ventured to fit a petrol motor to their machine, and at the end of the year accomplished a flight of 260 yds., the first successful experiment of the kind with a motor-propelled aeroplane. On October 5, 1905, they established a record by flying 24½ miles at a speed of 38 miles an hour. They unsuccessfully tried to sell their patents to some one who would develop them, without any public exhibition. They were therefore obliged to come out into the open, and Wilbur went to France, where his great flight of 56 miles on September 21, 1908, established his fame. He set up a school at Pau and trained pupils. On December 31st of that year he flew 77 miles, remaining 2 hrs. 20 min. in the air. After that his advice and his machines were in great demand. He visited Italy and England in 1909, and on his return to America devoted himself to tests, which resulted in the sale to the War Department of a machine for \$30,000. From then till his death he worked mainly on the mechanical side of the business.

Walter Wyman, physician, died November 21, 1911. He was born at St. Louis, Mo., August 17, 1848, and graduated at Amherst College (1870) and the St. Louis Medical College (1873). He entered the Marine Hospital Service in 1876. His career was one of great activity in promoting better sanitary conditions among seamen and the prevention of epidemics, and he established the first government sanatorium for consumptives, at Fort Stanton, N. M. After 1902 he was surgeon-general of the U.S. public health and marine hospital service. He was instrumental in securing the government regulation of serums, toxins, etc., and the establishment of a leprosy investigation station in Hawaii.

ALABAMA¹

Population (1910), 2,138,093 (16.9% more than in 1900); average number per sq. m. 41.7 (35.7 in 1900). Of the total 56.6% were native whites (1.5% native whites of foreign parentage), 0.9% foreign-born whites, and 42.5% negroes (45.2% in 1900). In 11 counties running from East to West across the central part of the state (the "black belt"), negroes made up 75% or more of the population, and in 10 others 50% or more. Negroes constituted 42.3% of the urban population (45.3% in 1900), and 42.5% (45.2% in 1900) of the rural, including towns of less than 2,500. The "rural" population was 82.7% of the total. The cities with 2,500 inhabitants or over were: Birmingham, 132,685; Mobile, 51,521; Montgomery, 38,136; Selma, 13,649; Anniston, 12,794; Bessemer, 10,864; Gadsden, 10,557; Tuscaloosa, 8,407; Huntsville (town), 7,611; Dothan, 7,016; Florence, 6,689; New Decatur, 6,118; Talladega, 5,854.

Agriculture.—In 1900-1910 the number of farms increased 17.8% and the acreage of improved land 12%, although the total area of farm land increased only 0.2%. The average number of acres in a farm was 92.7 in 1900 and only 78.9 in 1910. The value of farm property increased from \$179,399,882 to \$370,138,429 (\$216,944,175 land; \$71,309,416 buildings; \$16,290,004 implements; and \$65,594,834 domestic animals). In 1910 the average value of farm land per acre was \$10.46; and 60.2% (in 1890 48.6%) of the farms were operated by tenants.

In 1912 (preliminary estimates) the state ranked below Texas and Georgia in production of cotton—1,330,000 bales (173 lbs. per A.). Other crops were; Indian corn, 54,180,000 bu. (3,150,000 A.); wheat, 318,000 bu. (30,000 A.); oats, 5,200,000 bu. (260,000 A.) rye, 12,000 bu. (1,000 A.); rice, 9,000 bu. (300 A.); potatoes, 1,215,000 bu. (15,000 A.); hay, 261,000 tons (209,000 A.); and tobacco, 225,000 lbs. (300 A.). In 1909 (U. S. Census) the value of all vegetables (excluding potatoes) was \$5,379,577 (69,468 A.) and of orchard fruits, \$1,818,508

¹ See E. B. i, 459 *et seq.*

(peaches and nectarines, \$1,055,971; apples, \$620,745). On January 1, 1912 there were on farms 143,000 horses, 265,000 mules, 396,000 milch cows, 540,000 other neat cattle, 140,000 sheep and 1,533,000 swine.

Besides the staple fruit crops, especially peaches, the Alabama farmers have recently experimented with pecans, Japanese persimmons, Satsuma oranges (usually planted with pecan trees) etc., and many cotton farmers are turning to horticulture or truck-raising because of the advance of the boll-weevil. The same cause tends to promote the selection of hardier cotton and more scientific methods of cultivation. The Alabama experiment station at Tuskegee in 1911 and 1912 carried on important studies in feeding beef-cattle and swine; it has bred two new varieties of cotton, notably "Carver's hybrid," and had experimented with Indian corn to produce a breed which will resist weevil. There is a state department of agriculture and industries, and a board of agriculture (established in 1911) supervises appropriations for farm demonstration work. County commissioners are authorised to appropriate funds for farm demonstration work or "farm life clubs" in counties where such work has been undertaken by Federal or state authorities.

Minerals.—Natural gas and petroleum were discovered at Fayette in the W. part of the Warrior coal field, early in 1909, when gas was found 475 ft. below the surface. Wells drilled early in 1910—some 2,200 ft. deep—had varying success. The field is undeveloped and the find has not yet been of commercial importance. In 1911 the total value of mineral products was \$28,005,278. The largest items were: coal, 15,021,421 tons, valued at \$19,079,949, nearly 10% less than in 1910, but ranking Alabama 5th in the Union; and iron, 1,617,150 tons (pig), worth \$17,379,171 (not included in total given above), more than a quarter less than the value in 1910, and 3,955,582 tons of ore (\$4,876,106; 3d in the United States). The Woodward mine with 502,471 tons of ore ranked 17th of the iron mines of the country. Clay products, \$1,947,102—a slight increase over 1910. Mineral waters were reported sold from 10 springs (3 in Mobile county), and a little mica is found.
