The provisions of the present article do not apply if the vessel is encountered at sea while unaware of the outbreak of hostilities, or if the master, after becoming aware of the outbreak of hostilities, has had no opportunity of disembarking the passengers. The vessel is deemed to be aware of the existence of a state of war if she left an enemy port subsequently to the outbreak of hostilities, or a neutral port subsequently to the notification of the outbreak of hostilities to the power to which such port belongs, provided that such notification was made in sufficient time. (Art. 45.)

A neutral vessel will be condemned and, in a general way, receive the same treatment as would be applicable to her if she were an enemy merchant vessel: (1) If she takes a direct part in the hostilities; (2) If she is under the orders or control of an agent placed on board by the enemy government; (3) If she is in the exclusive employment of the enemy government; (4) If she is exclusively engaged at the time either in the transport of enemy troops or in the transmission of intelligence in the interest of the enemy.

In the cases covered by the present article, goods belonging to the owner of the vessel are likewise liable to condemnation. (Art. 46.)

Any individual embodied in the armed forces of the enemy who is found on board a neutral merchant vessel may be made a prisoner of war, even though there be no ground for the capture of the vessel. (Art. 47.)

Visit and search.

The procedure employed to ascertain whether a neutral vessel carries contraband or not is called *Visit and Search* (see SEARCH), a belligerent right universally recognized and justified by the considerations that merchant ships of the enemy might evade capture by hoisting a neutral flag, if the belligerent had not the right of ascertaining the real character of the ship, and that private neutral vessels might carry contraband goods and generally help the enemy, if the belligerent had not the right of examining their cargo. All neutral private vessels in time of war are liable to visit by belligerent warships on the high seas and in the territorial waters of the belligerents, but not in the territorial waters of neutral states. Neutral public ships are not liable to visit (see above as to neutral public ships, mail ships, and convoy). Visit and search must be effected at every stage with "as much consideration as possible" (Herr von Bülow, in Reichstag, 19th January 1900). The visiting officer first examines the ship's papers. If satisfied that the vessel is not liable to detention, he immediately quits her. If not so satisfied, he proceeds to search her. If in the course of the search he is satisfied that the vessel is not liable to detention, the search is immediately discontinued. The visiting officer has the right to inspect any lockers, stores or boxes, and in case of refusal to open them he is justified in using such coercive measure as the case warrants. If after the visit and search the commander has reason to entertain suspicion he gives the master an opportunity of explanation, and if the explanation is unsatisfactory he detains the vessel. If the seizure turns out after all not to have been justified, the ship and cargo are immediately released and compensation is due for the loss through the detention. In the case of the stoppage and search of German vessels during the South African War, the German government proposed the appointment of arbitrators to decide upon the claims for compensation but this was an innovation to which the British government did not assent.

Resistance to search entails consequences which Art. 63 of the Declaration of London (1908–1909) has expressed as follows:—

Forcible resistance to the legitimate exercise of the right of stoppage, search and capture involves in all cases the condemnation of the vessel The cargo is liable to the same treatment as the cargo of an enemy vessel Goods belonging to the master or owner of the vessel are treated as enemy goods.

Capture, pre-emption, prize.

The consequence of carrying contraband are capture, trial by a belligerent prize court, and possible confiscation of the ship and cargo, or of the cargo alone or of a part of the cargo, according to the facts of the case. All are agreed as to articles which are absolute contraband being liable to capture. As regards conditional contraband, British law,[2] in so far, at least, as concerns "naval and victualling stores," is less severe, the Lords of the Admiralty being entitled to purchase such stores without condemnation in a prize court. In practice such purchases are made at the market value of the goods, with an additional 10% for loss of profit. This proceeding is known in International Law as the right of pre-emption. It is not, however, as yet officially recognized on the continent of Europe, though the need of some palliative for confiscation, in certain cases, is felt, and some continental jurists, moved by the same desire to distinguish unmistakable from so to speak constructive contraband, and protect trade against the vexation of uncertainty, have tried to argue conditional contraband away altogether.

The tendency, however, among the majority of continental authorities is seen in the rule drawn up in 1895, after several years of discussion, by the Institute of International Law, a body composed exclusively of international jurists of acknowledged standing. The majority which adopted it represents authoritative opinion in Germany, Denmark, Italy, Holland and France, showing that the old antagonism between the British and continental views on conditional contraband has ceased to exist. To prevent confusion the Institute declares conditional *contraband* abolished, and then adds that "nevertheless, the belligerent has, at his option and on condition of paying an equitable indemnity, *a right of sequestration or pre-emption* as to articles (*objets*) which, on their way to a port of the enemy, may serve equally for use in war or in peace." The proposed rule goes beyond the directions of the British Prize Act, and it could only come into operation under a verbal alteration of the Declaration of Paris, under which "contraband" alone is excepted from the protection of the neutral flag, a fact which seems to have escaped the notice of the Institute. British prize law is at present governed by the Prize Act of 1864. This act must be overhauled to meet the requirements of the new international law of the subject; the creation of an International Court of Appeal and the new rules adopted by the conferences of the Hague and London will make many changes necessary.

Enforcement of respect for neutral territory.

Absolute Duties of Neutrals.—The very sense of neutrality obviously implies abstention from direct corporate assistance. The duty of neutral states to enforce respect for their territory has become a very serious one. A belligerent cannot be allowed to cross the neutral frontier or carry on war operations in neutral waters, without the same right being granted to the other belligerent. Pursuit of one force by the other would amount to waging war on the neutral territory It is agreed among nations that the avoidance of such a contingency is in the interest of them all. During the Franco-German War both France and Germany,

[1] *Parl. Papers*, Africa, No. 1 (1900), pp. 14, 25.

[2] The Naval Prize Act 1864, sect. 38.

as belligerents, and Belgium and England, as neutrals, rigorously observed their duties and enforced their rights, and no difficulty occurred It is, nevertheless, conceivable that, under pressure of military necessity, or on account of an overwhelming interest, a powerful belligerent state would cross the territory of a weak neutral state and leave the consequences to diplomacy. The South African War was exceptional, in that the Portuguese government exposed itself to no international difficulty through allowing a belligerent, whose final victory was certain, and of necessity entailed total suppression of the conquered belligerent, to cross its colonial territory. At the same time it is an unfortunate precedent of taking advantage of the practical powerlessness of neighbouring neutral states to commit a violation of the law of nations, respect for which it is a primary duty of every self-respecting state to encourage.[1]

If, by inadvertence or otherwise, belligerent soldiers pass the frontier, they have to be turned back. If they claim the *droit d' asile*, they are arrested, disarmed, and kept in such a manner as to render it impossible for them to take any further part in the hostilities. In the case of territorial waters, as has already been pointed out, the neutral state is not in the same position as on land, all ships without distinction having a right of innocent passage through them. Belligerent ships also have the right to enter neutral ports, but the neutral authority is bound to take precautions to prevent any favour being shown to the one party or the other.[2]

Portuguese.

[1] The right of way claimed and acceded to under the Anglo-Portuguese Treaty of 11th June 1891 was a mere right of transit for merchandise, and could not in any way be construed as diminishing the neutral obligation to a belligerent who was ho party to the treaty.

[2] The rules laid down on this subject by the British authorities during the Spanish-American War were as follows:—

Rule 1.—During the continuance of the present state of war all ships of war of either belligerent are prohibited from making use of any port or roadstead in the United Kingdom, the Isle of Man or the Channel Islands, or of any of Her Majesty's colonies or foreign possessions or dependencies, or of any waters subject to the territorial jurisdiction of the British crown, as a station or place of resort for any warlike purpose, or for the purpose of obtaining any facilities for warlike equipment; and no ship of war of either belligerent shall hereafter be permitted to leave such port, roadstead or waters from which any vessel of the other belligerent (whether the same shall be a ship of war or a merchant ship) shall have previously departed until after the expiration of at least twenty-four hours from the departure of such last-mentioned vessel beyond the territorial jurisdiction of Her Majesty.

Rule 2.—If there is now in any such port, roadstead or waters subject to the territorial jurisdiction of the British crown any ship of war of either belligerent, such ship shall leave such port, roadstead, or waters within such time, not less than twenty-four hours, as shall be reasonable, having regard to all the circumstances and the condition of such ship as to repairs, provisions or things necessary for the subsistence of her crew, and if after the date hereof any ship of war of either belligerent shall enter any such port, roadstead or waters subject to the territorial jurisdiction of the British crown, such ship shall depart and put to sea within twenty-four hours after her entrance into any such port, roadstead or waters, except in case of stress of weather, or of her requiring provisions or things necessary for the subsistence of her crew, or repairs; in either of such cases the authorities of the port, or the nearest port (as the case may be), shall require her to put to sea as soon as possible after the expiration of such period of twenty-four hours, without permitting her to take in any supplies beyond what may be necessary for her immediate use; and no such vessel which may have been allowed to remain within British waters for the purpose of repair shall continue in any such port, roadstead or waters for a longer period than twenty-four hours after her necessary repairs shall have been completed. Provided, nevertheless, that in all cases in which there shall be any vessels (whether ships of war or merchant ships) of both the said belligerent parties in the same port, roadstead or waters within the territorial jurisdiction of Her Majesty, there shall be an interval of not less than twenty-four hours between the departure therefrom of any such vessel (whether a ship of war or merchant ship) of the one belligerent and the subsequent departure therefrom of any ship of war of the other belligerent, and the time hereby limited for the departure of such ships of war respectively shall always, in case of necessity, be extended so far as may be requisite for giving effect to this proviso, but no further or otherwise.

Rule 3.—No ship of war of either belligerent shall hereafter be permitted, while in any such port, roadstead or waters subject to the territorial jurisdiction of Her Majesty, to take in any supplies, except provisions and such other things as may be requisite for the subsistence of her crew, and except so much coal only as may be sufficient to carry such vessel to the nearest port of her own country or to some nearer destination; and no coal shall again be supplied to any such ship of war in the same or any other port, roadstead or waters subject to the territorial jurisdiction of Her Majesty, without special permission, until after the expiration of three months from the time when such coal may have been last supplied to her within British waters as aforesaid.

Rule 4.—Armed ships of either belligerent are interdicted from carrying prizes made by them into the ports, harbours, roadsteads or waters of the United Kingdom, the Isle of Man, the Channel Islands, or any of Her Majesty's colonies or possessions abroad.

[3] The French Penal Code, however, contains the following clauses covering the government's powers in this respect:—

Art 84.—Whoever shall by hostile acts, not approved by the Government, expose the State to a declaration of war, shall be punished by banishment, and should war follow, by deportation.

Art 85.—Whoever shall, by acts not approved by the Government, expose Frenchmen to the risk of reprisals, shall be punished by banishment

Relative Duties of Neutrals.—Relative duties embrace those duties which citizens are bound to observe and for which states incur a relative responsibility. It was the non-observance of these relative duties that led to difficulties between Great Britain and the United States at the close of the American Civil War and which brought the two countries themselves to the verge of conflict. The Treaty of Washington (8th May 1871) referring these difficulties to arbitration defined the scope of the duties in question for all future purposes between the two peoples (see below, "Proclamations of Neutrality"). Under this treaty the parties bind themselves to use "due diligence," where they have "reasonable ground" to believe that any acts have a belligerent character, in "preventing" them. They are bound to prevent—

Foreign enlistment, &c.

(1) Fitting out, arming, or equipping any vessel;

(2) The departure from their jurisdiction of any vessel, having been specially adapted in whole or in part within such jurisdiction to warlike uses;

(3) The making use by a belligerent of their ports or waters as a base of naval operations against the other;

(4) The making use thereof for the purpose of the renewal or augmenting of military supplies or arms;

(5) The making use thereof for the recruitment of men.

The contracting states undertook to bring the rules they adopted on this subject to the knowledge of other maritime powers, and to invite them to adopt them also, but nothing was ever done to get them accepted among other states. Provision had already been made to enable the government to carry them out in the Foreign Enlistment Act (9th August 1870). This act, which repealed the previous one of 1819 on the same subject, is minute in its provisions to prevent enlisting or recruiting men, or the building or the equipping of vessels, for the military service "of a foreign state at war with a friendly state." Other states, except the United States (which adopted a similar act), have not followed the example of Great Britain, but leave it to their governments to deal with the cases, when they may arise, as matters of public safety.[3]

There was evident reluctance among foreign states to commit themselves to the obligation of exercising "due diligence." It is clear that the duty of a state to forbear from committing any act which may be of assistance to either belligerent can never be formulated as an absolute one in regard to the acts of private persons, merely within the neutral jurisdiction. In recent times it has certainly become possible for states to exercise a more effective control than formerly over these acts; but at the present moment, though a much greater latitude is left to neutral subjects and citizens than is consistent with the idea of strict neutrality, there is no movement to alter the usages to the disadvantage of neutral interests. That the Geneva Arbitral Tribunal found in favour of the United States in the "Alabama" case in no way implied that International Law had undergone any change. The tribunal was bound by the antecedent fixation of the Washington rules, and laid down no new principle. On the other hand, the magnitude of the Geneva award was not likely to promote change in the direction of increasing neutral duties, except as part of a general regulation of neutral and belligerent rights. The whole subject was laid before the Hague Conference of 1907, which adopted the main principles of the rules enunciated in the Treaty of Washington (see Art. 8 of the Convention relating to the rights and duties of neutral states in maritime war).

To some extent the difficulty of determining the extent of relative neutral duty is overcome by the issue of proclamations of neutrality; but neutrality and its rights and duties are in no respect dependent on their being proclaimed by the neutral power. Germany issues no proclamation; at least the German empire has issued none in connexion with the different wars which have taken place since 1870. The Austro-Hungarian government during the same period only in the case of the war of 1870 itself, and in 1877, issued proclamations, and these probably had objects outside the ordinary purposes of proclamations of neutrality, and its usual practice is the same as that of Germany. France usually issues a short general proclamation, and Great Britain a more detailed one, which must be as old as the "ancient custom" of its being publicly read from the steps of the Royal Exchange by the sergeant-at-arms and common crier of the City of London.[1] The British proclamation practically recites the Foreign Enlistment Act 1870 (an act to regulate the conduct of His Majesty's subjects during the existence of hostilities between foreign states with which His Majesty is at peace), admonishes all persons entitled to British protection to observe and respect the exercise of those belligerent rights which "We and Our Royal Predecessors have always claimed to exercise," and warns them that any such persons "breaking, or endeavouring to break, any blockade lawfully and actually established" by either belligerent, "or carrying officers, soldiers, despatches, arms, ammunition, military stores, or materials, or article or articles, considered and deemed to be contraband of war, according to the law or modern usages of nations, for the use or service" of either belligerent, "rightfully incur, and are justly liable to, hostile capture and to the penalties denounced by the law of nations in that behalf." During the South African War no proclamation of neutrality was issued by any country.

Proclamations of neutrality.

Proclamations of neutrality may be made to serve the twofold purpose of warning the belligerent of the length to which the neutral government considers neutral duty to extend, and neutral subjects of the exceptional measures to which a foreign war exposes them. They may also be used to give effect to any modification of neutral right or duty which the neutral state may consider warranted by special or altered circumstances.

No purely mercantile transactions are considered a violation of neutrality. Six years before the American Civil War, President Pierce, in his message to the Thirty-fourth Congress, first session, made the following statement:—"The laws of the United States do not forbid their citizens to sell to either of the belligerent powers articles of contraband of war, or to take munitions of war or soldiers on board their private ships for transportation; and although in so doing the individual exposes his person or property to some of the hazards of war, his acts do not involve a breach of the national neutrality, nor of themselves implicate the government." This statement of international practice has been confirmed by art. 7 of the Hague Convention of October 18, 1907, on the Rights and Duties of Neutral States and Persons on Land (see below).

Sale of arms and ammunition by neutrals.

During the Franco-German War there was correspondence between the Prussian diplomatic representatives in London and at Washington and the British and United States foreign secretaries concerning shipments of arms and ammunition to the French armies, in which the Prussian government contended that it was incompatible with strict neutrality that French agents should be permitted to buy up in the neutral country, under the eyes and with the cognizance of the neutral government, "many thousands of breech-loaders, revolvers, and pistols, with the requisite ammunition, in order to arm therewith the French people, and make the formation of fresh army corps possible after the regular armies of France had been defeated and surrounded." Nothing, however, was done to prevent the departure of these supplies. Both the British and United States governments claimed entire liberty for the traffic in question.

[1] *The Times*, 28th April 1898.

In the case of loans publicly issued or raised on neutral territory the position is a little different, inasmuch as the neutral state is necessarily cognizant of the fact. No restriction, however, is imposed by international usage, and provided the same rights are granted to both belligerents, either or both can raise money *ad libitum* in neutral countries. Thus neutral states did not prevent the issue on their territory of the Russian war loan of 1876–1877. Nor in the war of 1894 between China and Japan was any opposition made by Japan to the raising of the Chinese loan in London. Art. 18 of the Hague Convention on the Rights and Duties of Neutral States and Persons on Land (see below) confirms the existing practice.

Raising of loans on neutral territory.

Neutrality Reforms.—At the Hague Peace Conference 1899 a suggestion was agreed to, without discussion, that a further state conference should be held for the purpose of dealing specially with neutrality. At the Conference of 1907 this was done, with the result that two fairly exhaustive conventions were adopted. The general provisions relating to neutrality are as follow:—

General neutrality convention of 1907.

ART. 1.—Neutral territory is inviolable.

ART. 2.—Belligerents are forbidden to send troops or convoys either of munitions of war or of provisions through the territory of a neutral state.

ART. 3.—Belligerents are also forbidden:—

(a) To instal, on the territory of a neutral state, a radio-telegraphic station or any apparatus intended to serve as a means of communication with the belligerent forces on land or sea;

(b) To make use of any installation of like nature, erected by them before the war, on the territory of the neutral state, for an exclusively military purpose, and which has not been opened to the service of public correspondence.

ART. 4.—Bodies of combatants shall not be formed or recruiting offices opened on territory of a neutral power for the benefit of the belligerents.

ART. 5.—A neutral state shall not allow on its territory any of the acts mentioned in arts. 2 to 4. It is only bound to repress acts contrary to neutrality in case they have been committed on its own territory.

ART. 6.—A neutral state is not responsible where individuals separately pass the frontier to place themselves at the disposal of either belligerent.

ART. 7.—A neutral state is not bound to prevent exportation or transit for the account of either belligerent, of arms, munitions of war, and, in general, of anything which may be useful for an army or a fleet.

ART. 8.—A neutral state is not bound to prohibit or restrict the use, for belligerents, of telegraphic or telephonic cables, or of wireless telegraphy apparatus, which are its property or that of companies or private individuals.

ART. 9.—Any prohibitive or restrictive measures adopted by a neutral state relative to the matters mentioned in arts. 7 and 8 shall be applied uniformly by it to both belligerents. The neutral state shall see that this obligation is observed by companies or private individuals owning telegraphic or telephonic cables or wireless telegraphic apparatus.

ART. 10.—The act by a neutral state of resisting any violation of its neutrality, even by force of arms, cannot be regarded as an act of hostility.

ART. 11.—A neutral state receiving, on its territory, troops belonging to the belligerent armies, shall, as far as possible, keep them distant from the area of hostilities.

It may keep them in camps, and even shut them up in fortified places, or in places suitable for this purpose. It shall decide whether officers may be left at liberty or parole not to leave the neutral territory without authorization.

ART. 12.—When there is no special convention a neutral state shall supply internal prisoners with food, clothing, and the aid which humanity calls for. When peace is established, the cost of keeping the prisoners shall be reimbursed.

ART. 13.—A neutral state receiving escaped prisoners of war shall leave them at liberty. If it allows them to stay on its territory, it may appoint a place of residence for them. The same rule is applicable to prisoners of war brought by troops taking refuge on neutral territory.

ART. 14.—A neutral state may authorize the passage on its territory of wounded or sick belonging to the belligerent armies, on condition that the trains which carry them shall transport none of the fighting force and no materials of war. In such a case, the neutral state is bound to take the necessary steps to ensure safety and control.

The wounded or sick brought in these circumstances into neutral territory by one of the belligerents, and belonging to the enemy, shall be detained by the neutral state in such a way that they cannot

again take part in the hostilities. This neutral state shall discharge the same duties if it be entrusted with the wounded or sick of the other army.

ART. 15.—The Geneva Convention applies to sick and wounded interned on neutral territory (see GENEVA CONVENTION).

ART. 16.—The natives of a state not taking part in the hostilities are considered as neutrals.

ART. 17.—A neutral person cannot take advantage of his neutrality:—

(*a*) If he commits hostile acts against a belligerent;

(*b*) If he commits acts in favour of a belligerent, for instance, if he voluntarily takes service in the ranks of the army of one of the parties.

In such a case the neutral shall not be treated with more severity by the belligerent against whom he has acted in contravention of his neutrality than a native of the other belligerent state would be for the same act.

ART. 18.—The following shall not be considered as acts committed in favour of one of the belligerents, in the sense of Art. 17 (*b*):—

(*a*) Supplies or loans made to one of the belligerents provided the purveyor or the lender inhabits neither the territory of the other party nor territory occupied by it, and provided the supplies do not come from these territories;

(*b*) Services rendered in matters of police or civil administration.

ART. 19.—Railway property coming from the territory of neutral states, whether it belongs to these states or to companies or to private persons, and recognizable as such, cannot be requisitioned or utilized by a belligerent, except in such cases and in such a manner as dictated by absolute necessity. Such property shall be returned to its country of origin as soon as possible.

The neutral state can even, in case of necessity, keep and utilize to that extent property coming from the territory of a belligerent state.

An indemnity shall be paid, proportionate to the amount of the property utilized and the duration of utilization.

The clauses of the Convention relating exclusively to neutrality in naval war, which are still fuller, are:—.

Convention of 1907 on neutrality in naval war.

ART. 1.—Belligerents are bound to respect the sovereign rights of neutral powers and to abstain, either on the territory or in neutral waters, from all acts which might constitute in the part of the powers permitting them a non-observance of their neutrality.

ART. 2.—All acts of hostility, including capture and the exercise of the right of *visit and search*, by belligerent ships of war in the territorial waters of a neutral power, constitute a breach of neutrality and are strictly forbidden.

ART. 3.—When a vessel has been captured in the territorial waters of a neutral power, this power shall, if the prize is still within its jurisdiction, use all means in its power to effect the release of the prize and its officers and crew, and that the crew placed on board by the captor shall be interned. If the prize is out of the jurisdiction of the neutral power, the capturing government shall, on the request of the former, release the prize with its officers and crew.

ART. 4.—No prize court can be constituted by a belligerent on neutral territory or on a vessel in neutral waters.

ART. 5.—Belligerents are forbidden to make neutral ports and waters the base of naval operations against their adversaries, especially by installing radio-telegraphic stations or any apparatus which may serve as means of communication with belligerent forces on sea or on land.

ART. 6.—The supply, under any ground whatever, either directly or indirectly, by a neutral power to a belligerent power, of ships of war, or of munitions or of material of war of any kind, is forbidden.

ART. 7.—A neutral power is not bound to prevent the exportation or transit, for the account of either belligerent, of arms, munitions of war, or, in general, of anything which may be useful to an army or a fleet.

ART. 8.—A neutral government is bound to use the means at its disposal to prevent, within its jurisdiction, the equipping or arming of any vessel, which it has any reasonable suspicion of being destined to act as a cruiser or to join in hostile operations against a power with which it is at peace.

It is also bound to exercise the same surveillance to prevent the departure out of its jurisdiction of any vessel intending to act as a cruiser or take part in hostile operations, and which, within the said jurisdiction, may have been adapted either wholly or in part for warlike purposes.

ART. 9.—A neutral power must apply equally to the two belligerents the restrictions, conditions and interdictions specified by it relating to admission to its ports, roadsteads, or territorial waters, with respect to ships of war or their prizes.

A neutral power may, however, forbid access to its ports and roadsteads, to any belligerent vessel which may have neglected to comply with the orders and directions issued by it or may have committed a breach of neutrality.

ART. 10.—The neutrality of a power is not compromised by the simple passage through its territorial waters of belligerent ships of war and of their prizes.

ART. 11.—A neutral power may allow ships of war of belligerents to make use of its licensed pilots.

ART. 12.—In default of other special provisions in the laws of a neutral power, ships of war of belligerents are forbidden to remain in the ports or roadsteads or in the territorial waters of the said power for more than twenty-four hours, except in the cases provided for by the present Convention.

ART. 13.—If a power which has received notice of the commencement of hostilities learns that a ship of war of a belligerent is in one of its ports and roadsteads or in its territorial waters, it shall notify the said ship that it must leave within twenty-four hours or within the time prescribed by the local law.

ART. 14.—A belligerent ship of war may not prolong its stay in a neutral port beyond the legal period, except for the purpose of repairing damage or by reason of the state of the sea. It must leave as soon as the cause of the delay has ceased.

The rules relating to the limitation of stay in ports, roadsteads, and neutral waters do not apply to ships of war exclusively employed on religious, scientific or philanthropic missions.

ART. 15.—In default of other special provisions in the laws of the neutral power, the maximum number of ships of war of a belligerent which may be at the same time in one of its ports or roadsteads shall be three.

ART. 16.—When ships of war of two belligerents are at the same time in a neutral port or roadstead, twenty-four hours at least must elapse between the departure of the ship of either belligerent before that of the other.

The order of departure shall be regulated by the order of arrival, unless the vessel arriving first is entitled to a prolongation of the legal period of its stay.

A belligerent ship of war may not leave a neutral port or roadstead until at least twenty-four hours after the departure of a merchant vessel carrying the flag of its adversary.

ART. 17.—In neutral ports and roadsteads, belligerent ships of war may only repair damage to the extent indispensable for their seaworthiness, and may not, in any way, increase their military strength. The neutral authority will ascertain the nature of the repairs to be executed, which shall be carried out as rapidly as possible.

ART. 18.—Belligerent ships of war may not make use of neutral ports, roadsteads and territorial waters for the purpose of renewing or increasing their military equipment or armament or for completing their crews.

ART. 19.—Belligerent ships may not revictual in neutral ports or roadsteads, except to complete their normal supplies as in time of peace. These ships may also only take on board the fuel necessary for the purpose of reaching the nearest port of their own country. They may also take in fuel sufficient to fill up their bunkers properly so called if they are in a neutral country which has adopted this method of fixing the amount of fuel to be supplied.

If, according to the law of the neutral power, ships may only receive coal twenty-four hours after their arrival, the legal period of their stay is prolonged for twenty-four hours.

ART. 20.—Belligerent ships of war which have taken in fuel in the port of a neutral power cannot renew their supply in a port of the same power within three months.

ART. 21.—A prize may not be brought into a neutral port except by reason of its unseaworthiness, or of the stress of weather or of insufficiency of fuel or provisions. It must leave again as soon as the cause of its entry has ceased. If it does not do so, the neutral power shall give it notice to leave immediately, and in the event of its not complying therewith, the neutral power shall use the means at its disposal to release it with its officers and crew and intern the crew placed on board by the captor.

ART. 22.—The neutral power shall also release any prize which has been brought in not in accordance with the conditions laid down in Art. 21.

ART. 23.—A neutral power may allow access to its ports and roadsteads to prizes, whether escorted or not, when they have been brought there to be left in sequestration pending the decision of a prize court. It may have the prize conducted to any other of its ports.

If the prize is escorted by a ship of war, the officers and men placed on board by the captor are allowed to go on board the escorting ship.

If the prize is navigating alone, the *personnel* placed on board is set at liberty.

ART. 24.—If, in spite of notice from the neutral authority, a belligerent ship of war does not leave a port in which it has no right to remain, the neutral power has the right to take such steps as it may think proper to render the ship incapable of going to sea during the continuance of the war, and the commander of the ship must facilitate the taking of such steps. When a belligerent ship is detained by a neutral power, the officers and crew are also detained.

The officers and crew thus detained may be left on board the ship or lodged on board another vessel or on shore, and they may be subjected to such restrictive measures as may be considered necessary to be imposed on them. In any event, sufficient men must be left on board the ship to keep it in order.

The officers may be released on giving their parole not to leave the neutral territory without permission.

ART. 25.—A neutral power is bound to exercise the surveillance of which the means in its power admit, to prevent within its

ports or roadsteads and in its waters any violation of the preceding provisions.

ART. 26.—The exercise by a neutral power of the rights defined by the present Convention can never be considered as an unfriendly act by either belligerent who has accepted the articles relating thereto.

ART. 27.—The contracting powers will communicate to each other, as soon as feasible, all the laws, ordinances and other provisions which within their jurisdiction govern belligerent ships of war in their ports and waters, by means of a notification addressed to the government of the Netherlands and immediately transmitted by the latter to the other contracting powers.

ART. 28.—The provisions of the present Convention are only applicable as between contracting powers, and only if the belligerents are all parties thereto.

Other reforms may be expected from the Conference of 1915. Germany in the course of the South African War and Great Britain in that of the Russo-Japanese War showed great irritation at the stoppage of certain of their merchant vessels, and Great Britain in the one case had to consent to and in the other to demand a modification of belligerent right under International Law—a modification which, be it said, is a perfectly justifiable one, viz. that the right of search for contraband of war be restricted to a specified area. It is probable that, in future wars, powerful neutral states will show, in similar cases, quite as much irritation as did Germany and Great Britain. (T. Ba.)

NEUVILLE, ALPHONSE MARIE DE (1836–1885), French painter, was born, the son of wealthy parents, at Saint-Omer, France, on the 31st of May 1836. From school he went to college, where he took his degree of *bachelier ès lettres*. In spite of the opposition of his family he entered the naval school at Lorient, and it was here, in 1856, that his artistic instincts first declared themselves. After being discouraged by several painters of repute, he was admitted to work in Picot's studio. He did not remain there long, and he was painting by himself when he produced his first picture, "The Fifth Battalion of Chasseurs at the Gervais Battery (Malakoff)." In 1860 de Neuville painted an "Episode of the taking of Naples by Garibaldi" for the Artists' Club in the Rue de Provence, and sent to the Salon in 1861 "The Light Horse Guards in the Trenches of the Mamelon Vert." He also illustrated *Le Tour du monde* and Guizot's *History of France*. At the same time he painted a number of remarkable pictures: "The Attack in the Streets of Magenta by Zouaves and the Light Horse" (1864), "A Zouave Sentinel" (1865), "The Battle of San Lorenzo" (1867), and "Dismounted Cavalry crossing the Tchernaia" (1869). In these he showed peculiar insight into military life, but his full power was not reached till after the war of 1870. He then aimed at depicting in his works the episodes of that war, and began by representing the "Bivouac before Le Bourget" (1872). His fame spread rapidly, and was increased by "The Last Cartridges" (1873), in which it is easy to discern the vast difference between the conventional treatment of military subjects, as practised by Horace Vernet, and that of a man who had lived through the life he painted. In 1874 the "Fight on a Railroad" was not less successful, and was followed by the "Attack on a House at Villersexel" (1875) and the "Railway Bridge at Styring" (1877). In 1878 the painter exhibited (not at the Great Exhibition) "Le Bourget," the "Surprise at Daybreak," "The Intercepted Despatch-bearer," and a considerable number of drawings. He also exhibited in London some episodes of the Zulu War. In 1881 he was made an officer of the Legion of Honour for "The Cemetery of Saint-Privat" and "The Despatch-bearer." During these years de Neuville was at work with Detaille on an important though less artistic work, "The Panorama of Rézonville." De Neuville died in Paris on the 18th of May 1885. At the sale of his works the state purchased for the Luxembourg the "Bourget" and the "Attack on a Barricaded House," with a water-colour "The Parley," and a drawing of a "Turco in Fighting Trim."

See Montrosier, *Les Peintres militaires* (Paris, 1881), "De Neuville," in *Gazette des beaux arts* (Paris, 1885).

NEUWEILER, a town of Germany, in the imperial province of Alsace-Lorraine, situated under the Vosges Mountains, 6 m. N. from Zabern by the railway to Rastatt. Pop. (1905) 1906. It is an interesting medieval town, still surrounded by walls. The Romanesque Evangelical church dates from the 12th century; there are also a Romanesque Roman Catholic church, which was restored in 1852, a synagogue, and an old town-hall. The town has a considerable trade in hops and wine. Above it rise the ruins of the fortress of Herrenstein, and of the castle of Hüneburg.

See Fischer, *Geschichte der Abtei und Stadt Neuweiler* (Zabern, 1876).

NEUWIED, a town of Germany, in the Prussian Rhine province, the capital of the mediatized countship of Wied, is situated on the right bank of the Rhine, 8 m. below Coblenz, on the railway from Frankfort on-Main to Cologne. Pop. (1905) 18,177. The principal edifice is the château of the princes of Wied. This is situated in a fine park, and contains a collection of Roman antiquities. The town has an Evangelical and a Roman Catholic church. Its chief products are starch, sugar, tobacco, cigars, chicory, buttons and enamelled goods. There are large rolling-mills, and in the vicinity are several large iron-foundries. The schools of Neuwied enjoy a high reputation.

Neuwied was founded by Count Frederick of Wied in 1662, on the site of the village of Langendorf, which was destroyed during the Thirty Years' War, and it rapidly increased owing to the toleration accorded to all religious sects. Among those who sought refuge here was a colony of Moravian Brethren; they still occupy a separate quarter of the town, where they carry on manufactures of porcelain stoves and deerskin gloves. Near Neuwied one of the largest Roman *castra* on the Rhine has been excavated. In April 1797 the French, under General Hoche, defeated the Austrians near Neuwied, this being their first decisive success in the revolutionary wars. Legenhaus, in the neighbourhood, is one of the residences of the princes of Weid.

See Wirtgen and Blenke, *Neuwied und seine Umgebung* (Neuwied, 1901).

NEVA, a river of Russia, which carries off into the Gulf of Finland the waters of Lakes Ladoga, Onega, Ilmen and many smaller basins. It issues from the south-west corner of Lake Ladoga in two channels, which are obstructed by sandstone reefs, so that the better of the two has a depth of only 7 to 16 ft. A little farther down it becomes completely navigable, and attains a breadth of 4200 ft.; but between the village of Ostrovki and that of Ust Tosna it passes over a limestone bed, which produces a series of rapids, and reduces the width of the river from 1050 to 840 and that of the navigable passage from 350 to 175 ft. Nine or ten miles before reaching its outfall the river enters St Petersburg, and 5 or 6 m. lower down breaks up into the Great Neva (850 to 1700 ft. wide), the Little Neva (945 to 1365), and the Great Nevka (280 to 1205), this last, 2 m. farther on, sending off the Little Nevka (370 to 1130 ft.). Its total length is only 40 m. In front of the delta are sandbanks and rocks which prevent the passage of vessels except by a canal, 18 m. long, 124 to 226 ft. wide, and admitting vessels with a draught of 18½ ft., from Kronstadt to St Petersburg. Most of its alluvial burden being deposited in the lakes, the Neva takes a long time to alter its channels or extend its delta. The ordinary rise and fall of the river is comparatively slight, but when the west wind blows steadily for a long time, or when Lake Ladoga sends down its vast accumulations of block-ice, inundations of a dangerous kind occur, as in 1777, 1824, 1879 and 1903.

According to observations extending from 1706 to 1899, the mean day of the freezing of the Neva is November 25th, the earliest October 28th, the latest January 9th, and the next latest December 26th. The mean day of opening is April 21st, the earliest March 18th, and the latest May 12th. The mean number of days open is 218, the least 172, the greatest 279.

NEVADA (a Spanish word meaning "snow-clad" or "snowy land," originally applied to a snow-capped mountain range on the Pacific slope), one of the far western states of the American Union, lying between 35° and 42° N. and 114° 1′ 34″ and 120° 1′ 34″ W. (37° and 43° W. of Washington). It is bounded N. by Oregon and Idaho, E. by Utah and Arizona, the Colorado River separating it in part from the latter state, and S. and W. by California. Nevada ranks sixth in size among the states of the Union. Of its total area of 110,690 sq. m., 869 sq. m. are

water surface. Its extreme length, N. and S., is 484 m., and its extreme width, E. and W., is 321 m. (For map, see CALIFORNIA.)

Physiography.—With the exception of its N.E. and S.E. corners, the state lies wholly within the Great Basin, the floor of which is really a vast table-land between 4000 and 5000 ft. above the sea. This plateau, however, is not a plain, but contains many buttes and mesas and isolated mountain ranges rising from 1000 to 8000 ft. above its surface. In the N.E. an unnamed range of highlands, with an E. and W. trend, forms the water-parting between the streams tributary to the Humboldt river in Nevada and those that flow into the Snake river through Idaho and Oregon and thence to the Pacific Ocean. This range is very broken and ill-defined, with peaks often reaching altitudes of from 9000 to 12,000 ft., and with numerous spurs diverging N. and S. from the main divide. Between this ridge and the valley of the Colorado river lies all that portion of the Great Basin included within the state. The surface of this table-land is very rugged, and frequently broken by mountain ranges running N. and S. and from 5 to 20 m. wide at their bases. Intersecting the mountains are numerous ravines and passes. Between the ranges lie valleys of about the same width as the bases of the mountains. These valleys are generally level-floored, but at their borders gradually slope upward, and are filled, often to a depth of several thousand feet, with the detritus of gravel, sand and silt from the neighbouring hills. This is a region of innumerable faulted crust blocks, the elevated ones creating the N. and S. mountain ranges, and the depressed ones the valleys that lie between. It is for this reason that the mountain slopes are generally more abrupt on one side than on the other. Several valleys often unite into a large elevated plain, broken only by scattered buttes and spurs. The combined areas of the valleys and the area occupied by the mountains are about equal.

The mean elevation of the state is 5500 ft. There are 5400 sq. m. between 2000 and 3000 ft. above the sea; 11,100 sq. m. between 3000 and 4000 ft.; 23,700 sq. m. between 4000 and 5000 ft.; 29,800 sq. m. between 5000 and 6000 ft.; 30,100 sq. m. between 6000 and 7000 ft.; 7800 sq. m. between 7000 and 8000 ft.; and 2800 sq. m. between 8000 and 9000 ft. The highest point within the state is Wheeler Peak, near the centre of the eastern boundary, with an elevation of 13,058 ft.; the lowest points are along the Colorado river, where the altitudes range from 700 to 800 ft. With the exception of this dip in the S.E. corner, the entire state lies above the 2000 ft. line.

The Sierra Nevada range, which forms the western rim of the Basin, sends into the state a single lofty spur, the Washoe Mountains. At the foot of this range there is, relatively speaking, a depression, with an altitude of about 3850 ft. above the sea, which receives the drainage of the eastern slopes of the Sierra and what little drainage there is in the northern half of Nevada. From this depression eastward the general level of the plateau gradually rises to an elevation of 6000 ft. near the eastern borders of the state. The mountains also increase in height and importance as far as the East Humboldt range, a lofty mass about 60 m. W. of the Utah boundary. This range is the water-parting for nearly all the westward-flowing streams of the state, and is by far the steepest and most rugged within Nevada, a number of its peaks attaining a height of 11,000 or 12,000 ft. On its eastern slope the waters soon disappear within the bed of narrow canyons, but break out again at the foot in ice-cold springs that form the source of the Ruby and Franklin lakes; on its western side the descent is more gentle, and the waters form the South Fork of the Humboldt river. Somewhat S. of the centre of the state lie the Toyabe Mountains, with several peaks from 10,000 to 12,000 ft. in height. The waters on the eastern slopes flow into the Smoky Valley; those on the other side assist the neighbouring Shoshone Mountains in feeding the Reese river, which flows N. toward the Humboldt, but seldom has sufficient volume to enable it to reach that stream. About 100 m. E. of the California boundary lies a third important range, the Humboldt Mountains, whose highest point (Star Peak) is 9925 ft. above the sea. Owing to their great height these three ranges receive heavier rainfall than the surrounding country and are feeders to the northern valleys, which constitute the chief agricultural region of the state. Many of the block mountains of the Great Basin are of complicated internal structure, showing rocks of all ages—slate, limestone, quartzites, granite, multi-coloured volcanic rocks, and large areas of lava overflow.

From the valley of the Humboldt river southward the plateau gradually rises until the divide between this stream and the Colorado river, in the vicinity of the White Pine Mountains, is reached. From this point there is a fall, which is gradual as far S. as the 38th parallel, and then more abrupt. Thus at Pioche the altitude is 6100 ft., at Hiko 3881 ft., at St Thomas 1600 ft., and at the Eldorado Canyon 828 ft. The region of the Colorado river is largely desert, with occasional buttes and spurs.

Rivers and Lakes.—There are three drainage systems within the state. North of the Humboldt Valley an area of about 5000 sq. m. is drained by the Owyhee, the Little Owyhee, the Salmon and Bruneau rivers, whose waters eventually reach the Pacific Ocean. Below this region flow the streams of the Great Basin, none of which reach the sea, but either terminate in lakes having no outlet or else vanish in sloughs or "sinks." Small streams often sink from sight in their beds of gravel, and after flowing some distance underground, reappear farther on. Of the basin streams the Humboldt is the most important. Rising in the N.E., it flows in a tortuous channel in a general S.W. direction for 300 m. and drains 7000 or 8000 sq. m. This stream empties into the Humboldt lake, the overflow from which goes into the so-called Carson Sink. At no part of its course is it a large river, and near its mouth its waters are sub-alkaline. The Truckee river flows with more vigour, having its source in Lake Tahoe, in California, at an altitude of 6225 ft., and entering the Carson river through an irrigation canal completed in 1905; before this date it flowed into Pyramid Lake and Lake Winnemucca in the depression at the foot of the Sierra Nevada. A short distance to the S. two other streams, the Carson and the Walker rivers, receive their waters from the eastern slope of this range and empty into lakes bearing their names. Of this group of lakes in the western depression, Pyramid Lake is the largest, being 33 m. long and 14 m. wide. Fed by the same stream is its western neighbour, Lake Winnemucca, a much smaller body. The waters of these two lakes are only moderately saline and may be used for live-stock but not for human beings. Next in importance is Walker lake, 33 m. long and 6 or 7 m. wide, whose waters are strongly saline. On the western boundary, and partly included within the limits of Nevada, is Lake Tahoe, 20 m. long and 10 m. wide, which is 1645 ft. deep at its centre and whose waters have never been known to freeze, notwithstanding the lake's elevation. The topography and the climate of Nevada have led to the formation of two kinds of lakes, the ephemeral and the perennial. The perennial lakes, such as those just described, hold their waters for years and perhaps centuries; but the ephemeral lakes usually evaporate in the course of the summer. The latter class is formed by waters that fall on the barren mountain-sides and rush down in torrents, forming in the valleys shallow bodies of water yellow with the mud held in suspension. The largest of these occurs in the Black Rock Desert, in the N.W., and at times is from 450 to 500 m. in length and only a few inches deep. Such bodies often become nothing but vast sheets of liquid mud, and are called "mud lakes," a term most frequently applied to the sloughs fed by Quinn's river. When the waters evaporate in the summer they leave a clay bed of remarkable hardness, which is sometimes encrusted with saline matter of a snowy whiteness and dazzles the eyes of the traveller. When such is the case the beds are called "alkali flats." During the glacial period many of the Nevada lakes attained a great size, several of them uniting to form the ancient "Lake Lahontan," in north-western Nevada. As these lakes shrank after the return of an arid climate, they left elevated beaches and deposits of various minerals, which mark their former extent. Both hot and cold springs are numerous, with temperatures ranging from 50° to 204° F.

In the S.E. corner of the state is the third drainage system. Here the Virgin river enters the state after crossing the N.W. corner of Arizona and flows S.W. for 60 m. until it joins the Colorado river. The latter stream flows for 150 m. along the S.E. boundary towards the Gulf of California.

Fauna and Flora.—Of native animals the varieties are few and the numbers of individuals small. In the arid valleys coyotes (prairie wolves), rabbits and badgers are found. Large animals, such as the black and the grizzly bear, and deer are found on the slopes of the Sierra Mountains, and antelope, deer and elk visit the northernmost valleys in the winter. At rare intervals antelope appear in the southern deserts. Here also are found the sage thrasher, Le Conte's thrasher, the Texas nighthawk, Baird's woodpecker, and the mourning dove. Certain species of grouse are common high in the timbered mountains. Several varieties of water-fowl, especially curlews, pelicans, gulls, ducks, terns, geese and snipe, are found in the vicinity of the lakes. The Truckee river and the western lakes abound in trout and black bass. Of the reptiles the leopard lizard and gridiron-tailed lizard, the "chuck-walla" (*Sauromalus ater*), the rattle-snake, and the horned toad are the most numerous. The "black mouse" or Carson field mouse (*Microtus montanus*) is found throughout Nevada, as well as in Utah, north-eastern California, and eastern Oregon; it multiplies rapidly under favourable conditions, and at times causes serious injury to crops.

The flora of Nevada, although scanty, varies greatly according to its location. With the exception of the alkali flats, no portion of the desert is devoid of vegetation, even in the driest seasons. In the Washoe Mountains, as in the rest of the Sierra Nevada range, there is a heavy growth of conifers, extending down to the very valleys; but in many places these mountains have been almost

deforested to provide timbers for the mines. In very limited spaces on other mountains there are scattered trees—the pinon (nut pine) and the juniper at an altitude between 5000 and 7000 ft. on all but the lowest ranges, the trees rarely reaching a height of over 15 ft.; and the stunted mountain mahogany on the principal ranges at an altitude of 6800 ft. Several varieties of poplar are found in the upper canyons, and trees of the willow-leaved species in the Humboldt Mountains often attain a height of 60 ft. But except for these infrequent wooded strips, the mountains are even more bare than the valleys, because their shrubs are dwarfed from exposure. The trees, except in the Washoe Mountains, are of very slow growth and therefore knotty and ill-adapted for timber. As a rule, the elevation of the timber line on the mountains increases as the latitude decreases. On the foothills are found phlox and lupine, and in the N. much bunch grass, which is valuable for grazing purposes. The valleys are covered with typical desert shrubs; greasewood (*sarcobatus vermiculatus*), creosote bushes (*larrea tridentata*), and sage-brush (*artemisia tridentata*); the first-named plant is abundant, chiefly in the N. This vegetation, covering plains, mesas, and even extending up the sides of the mountains, gives the entire landscape the greyish or dull olive colour characteristic of the Great Basin. To the southward, as the valleys become increasingly sandy and saline, even the sage-brush disappears, and little vegetation besides the cactus and the yucca is to be seen. The valleys are treeless, except in the vicinity of the Truckee river, where considerable quantities of the cotton wood and a small amount of willow, birch, and wild cherry are found. The mesquite grows some distance from water, and is especially common near the Colorado river. In January 1910 there were seven national forests in the state, created since July 1908 and chiefly in 1909, containing 7983·76 sq. m.

Climate.—As the lofty range of mountains on the W. deprives the winds from the Pacific of nearly all their moisture before they reach the Great Basin, the climate of Nevada is characterized by an excessive dryness. The skies are clear nearly every day in the year. The mean annual precipitation varies from 3 in. in the S.W. (Esmeralda county) to 12 in. in the E. (White Pine county). In the central, north-eastern and north-western sections, embracing the counties of Nye, Elko and Humboldt, the average annual rainfall varies from 7 to 8 in.; in the west-central section, at the foot of the Sierra, the average is about 10 in. A so-called "rainy season" lasts from October to April, but the precipitation is chiefly in the form of snow on the mountains. Except at great altitudes snow lies on the ground only a few days each year. The melting of the mountain snow-caps in the spring causes severe freshets, which in turn are followed by long seasons of drought at a time when water is most needed for agricultural purposes. Fogs and hail are rare, but, as in all treeless countries, the rain comes in unequal quantities, and cloudbursts are not unknown. The mean annual temperature for the state is 49° F., but varies from 54° in the S.W. to 46° in the N. The daily and annual variation is very great, and is intensified toward the E., where the altitudes are greater. At Elko, Elko county, in the N.E., the mean temperature for the year is 46° F.; for the winter (December, January and February) it is 26°, with extremes reported of 73° and −42°; the mean temperature for the summer (June, July and August) is 69°, with extremes of 108° and 20°. At Hawthorne, Esmeralda county, in the S.W., the mean temperature for the year is 54°; for the winter it is 36°, with extremes of 69° and −6°; the mean temperature for the summer is 72°, with extremes of 102° and 32°. At the head of the Humboldt river frosts are of almost nightly occurrence, and in the Carson Valley damaging frosts often occur in June. In the extreme S. the isothermal lines run almost due E. and W.; but farther northward they take a N.W. and S.E. direction. The annual range of temperature is about 124°; the highest temperature ever recorded being 119°, and the lowest −42°. In spite of the high temperatures of summer, however, the low humidity prevents the heat from being oppressive, and cases of sunstroke are unknown. While the western mountains keep out the moisture, they do not ward off the winds which pour down the steep slopes in the winter and spring and raise clouds of dust. Early-sown grain is often injured by flying sand and gravel. In the summer and autumn the winds are light.

Agriculture.—Because of this extreme aridity, agriculture in Nevada is dependent on irrigation. The three principal areas in which irrigation is practicable are along the Humboldt river, in the plains watered by the Carson, Truckee and Walker rivers, and at the foot of the mountains along the western edge of the state. There are various places also near the mouths of desert canyons, where small amounts of water are obtainable for irrigation purposes from intermittent streams. The total number of acres irrigated in 1899 was 504,168, an increase of 124·7% in the decade. In 1902 the total irrigated acreage was 570,001, an increase of 13·1% in three years. In 1902 Congress provided for the beginning of extensive irrigation works in the arid West, and Nevada (where preliminary reconnaissances had been made in 1889–1890) was the first state to profit from this undertaking. The survey for the Truckee-Carson system was begun in 1902, with the object of utilizing the waters flowing to waste in western Nevada for the irrigation and reclamation of the adjacent arid regions in Churchill, Lyon and Storey counties. A canal 31 m. long, diverting the waters of the Truckee river into the Carson river, was completed in 1905 at a cost of $1,250,000. A system of reservoirs (the main reservoir is Lake Tahoe with an area of 193 sq. m.), distributing canals, and drain ditches was also projected, making it possible to reclaim 231,300 acres of the desert. It was estimated that the works would require nine years for their completion, at a total cost of $9,000,000, although the first 200,000 acres could be reclaimed at a cost of $2,700,000. The works were to be operated by the government for ten years, and the cost assessed against the holders of the land.[1] At the conclusion of this period the system was to pass into the control of the landholders, with no further charge by the government.

The soil when reclaimed is well adapted for forage crops, cereals, vegetables and deciduous fruits. Nevada is a great ranching state, and stock-raising has shown a rapid extension. In 1900, 88·9% of its farm acreage was devoted to hay and forage crops, being more than doubled in the decade. Fifty-one per cent. of the improved lands in 1899 were devoted to the cultivation of these crops. With the growing of grasses as the chief agricultural product, farming in Nevada is necessarily extensive rather than intensive. In 1899 the average size of the farms was 1174 acres.[2] The value of the different kinds of agricultural products for 1899 was as follows: live stock, $4,373,973; hay and grain, $1,535,914; dairy produce, $385,220; vegetables, $216,600; fruits, $20,900. It thus appears that the live stock industry is one of the most important in the state; the value of its product in 1899 exceeded its output of gold and silver, which had then reached its lowest point, by over one million dollars.[3] About 64% of the value of the live stock was represented by neat cattle; 19% by sheep; 10% by horses, and the remainder by mules, swine, asses, burros and goats.

In spite of the predominating interest in stock-raising, intensive cultivation of the soil is practicable where the water supply is sufficient. Nevada, for example, ranked third in 1909 in the amount of wheat produced to the acre (28·7 bushels),[4] but in the total amount produced (1,033,000 bushels) ranked only thirty-eighth, and furnished only 0·145% of the crop of the United States. In 1909 in the amount of barley per acre (38 bushels) Nevada ranked third, and in the average farm price per bushel ($0·75) ranked first among the barley-producing states of the country, but in the total amount produced (304,000 bushels) held only the twenty-second place; and in the same year the average yield of potatoes per acre in Nevada was 180 bushels, exceeded in two states—the average for the entire country was 106·8 bushels per acre—but the total crop in Nevada (540,000 bushels) was smaller than in any state or Territory of the Union, except New Mexico.

The prevailing soils are sand and gravel loams, but other varieties are numerous, ranging from rich alluvial beds of extinct lakes, as in parts of Lyon and Esmeralda counties, to the strongly alkaline plains of the southern deserts. The most productive part of the state is the Humboldt Valley and the region near Pyramid Lake, including the counties of Humboldt, Elko and Washoe.

A singular menace to agriculture in Nevada was the plague in 1907–1908 of Carson field mice. These first appeared in large numbers in the lower part of the Humboldt Valley in the summer of 1906, and in October and November 1907 it was estimated that they numbered on certain ranches from 8000 to 12,000 on every acre. The alfalfa crop suffered particularly, the total loss being about $300,000. After unsuccessful attempts to rid themselves of the mice, the farmers appealed to the United States Biological Survey, and alfalfa hay poisoned with strychnia sulphate was used successfully in the Humboldt Valley in January 1908 and in the Carson Valley, where a similar plague threatened, in April 1908.[5]

Minerals.—To its mineral wealth Nevada owes its existence as a state; but for the richness of its veins of gold and silver ore it would be still little more than an arid waste. Extending from central California S.E. along the dividing line between that state and

[1] The public lands are open to entry free of charge, but the government withholds the title until all the payments for water have been made. The yearly payments amount to $2·60 per acre under the present system; this amount covers the cost of maintenance and operation and also of a thorough drainage system, which is as important to the settler as irrigation. Lands already held in private ownership are supplied with water at the same price as public lands.

[2] Compare this figure with that for the neighbouring state of California, where the average size of the farms was 397·4 acres.

[3] That conditions are favourable to the animal industry is shown by the fact that in 1897 the valleys of northern Nevada were so overrun with wild horses, to the detriment of the grazing grounds for cattle, that the legislature authorized the killing of such animals. For a time this was a profitable pursuit, as the horse hides brought good prices.

[4] This is the yield reported by the United States Department of Agriculture. Between its reports and those of the Census Bureau in census years there are sometimes great discrepancies. According to the *Year Book* of the Department of Agriculture in 1909 a crop of 165,000 bushels of oats was grown in Nevada on 7000 acres: there was no crop reported of Indian corn or of rye.

[5] See Stanley E. Piper, *The Nevada Mouse Plague of 1907–1908* (Washington, 1909), Farmers' Bulletin 352, U.S. Department of Agriculture.

Nevada, and thence past the Colorado river into Arizona, is one of the richest mineral belts in the world. Gold was found in Gold Canyon near Dayton, Nevada, as early as July 1849. In 1859 the discovery of the famous Comstock Lode in Western Nevada led to the building of Virginia City, a prosperous community on the side of a mountain where human beings under ordinary conditions would not have lived, and eventually brought a new state into existence. The mines of this one district had produced, up to 1902, $371,248,288, of which $148,145,385 was in gold, $204,653,040 in silver, and the remainder in unclassified tailings. For the years 1862–1868 inclusive, the average annual production was over $11,000,000; in the second period of great productivity (1873–1878), after the opening (by John W. Mackay and his partners, Flood, Fair and O'Brien) in the Comstock Lode of the Great Bonanza mine, the average annual yield was over $26,000,000. In 1877 the maximum annual output for the mines was attained, being $36,301,537. For the three years 1875–1877 the production of gold and silver in Nevada was more than the combined product of all the other American states and Territories. After this last year the output of the Comstock mines declined on account of the exhaustion of the ore supply, the increased expense of mining at great depths, and the decrease in the price of silver. The yield reached its lowest point in 1899, but subsequently increased through the application of improved machinery, while the tailings of the old diggings were treated by the cyanide process with profitable results. In 1859 the mines were worked only for their gold; the ignorant miners threw away the "black stuff" which was really valuable silver ore with an assay value four times as great as that of their ores of gold; and when this was discovered there came a period of unprecedented silver production. But the fall in the price of silver led to a reaction, and from 1893 the gold output predominated. The gold production of 1907 was valued at $12,099,455; the silver production at $4,675,178.

In connexion with the operation of the Comstock mines was built (in 1869–1879) the Sutro Tunnel, named in honour of its engineer, Adolph Sutro (1830–1898), piercing the mountain horizontally far below the mouth of the mines, and at a distance of nearly 4 m. striking the shafts of the Comstock Lode, securing ventilation and cool air for the miners, draining the mines above its level, and obviating much pumping and hoisting.[1] Two lateral tunnels were also constructed, making the total length 6½ m.

Another mining region that attained importance in the early period was the Eureka District, in Eureka county, about 90 m. S. of the Southern Pacific railway. Ore was first discovered here in 1864, but it was five years before the mines became productive. By 1882 they had produced $60,000,000 of precious metals.

With the working out of the deposits in the Comstock region, the mining industry declined, and between 1877 and 1900 there was a period of great depression, in which Nevada fell from first to sixth place among the silver-producing states and Territories. In May 1900, however, very rich deposits of gold and silver were discovered in Nye county, near the summit of the San Antonio Mountains, and a new era began in Nevada's mining industry. The village of Tonopah sprang into existence as soon as the rush of newcomers to this region began, and in 1903 it contained 4000 inhabitants. In two years $7,000,000 worth of gold and silver had been taken from the Tonopah mines and it was asserted that they would prove as rich as the mines of the Comstock Lode. The Tonopah ores were richer in silver than in gold, the respective values in 1904 and 1905 being approximately in the proportion of three to one. This discovery gave a new impetus to prospecting in south-western Nevada, and it was soon discovered that the district was not an isolated mining region but was in the heart of a great mineral belt. Tonopah is at the outcropping of a number of ledges which continue for several hundred feet below the surface for an unknown distance. In 1902, in Esmeralda county, 24 m. S. of Tonopah, rich ores were found in the Goldfield District, and within three years there were 8000 people in this region. During 1905 the town of Goldfield had a period of mushroom growth, then quieted, and finally revived to a healthy development. The value of the production of the Goldfield District in 1904 amounted to $2,341,979. This discovery was followed in 1904 by that of the Bullfrog District, in Nye county, 60 m. S.E. of Goldfield, and within ninety days after its birth the village of Bullfrog, although 100 m. from a railway, had an electric-lighting plant, an ice plant and a hotel. In 1905 gold was discovered in Nye county, 29 m. N.E. of Tonopah, in what became known as the Manhattan District, and by March 1906 the village of Manhattan was a mile in length and contained 3000 inhabitants.

After 1902 the production of gold and silver steadily increased, being $4,980,786 in that year, $9,184,996 in 1905, and $16,774,633 in 1907. By far the greater portion of these metals came from the southern part of the state. In production of gold in 1907 Esmeralda county ranked first with $8,533,617 (nearly 70% of the total); Nye county's output was $1,547,408, Lincoln county's $929,775, and Storey county's a little more than $250,000. In the production of silver Nye county ranked first in 1907 ($3,667,973, of which $3,544,788 was from Tonopah), Churchill county second ($432,617, from Fairview, Wonder and Stillwater), and Eureka county (with lead silver ores) and Storey county were third and fourth respectively. Copper, lead and zinc are produced in small quantities, being found in fissure veins with gold and silver. In 1907 the production of copper was 1,782,571 lb, valued at $356,514. The output of lead in 1907 was 6,271,341 lb (valued at $322,381). The output of zinc was 2,168,783 lb (valued at $127,958).

Other minerals exist in great variety. Salt deposits are extensive and commercially important in Washoe and Churchill counties. After 1900 the production of salt rapidly increased up to 1906, when it was 11,249 bbls.; in 1907 it was only 6457 bbls., all graded as "common coarse" and all obtained by solar evaporation from brine. Borax marshes are numerous in the west and south-west, but they are no longer commercially productive. Large beds of mica are found in the east. Gypsum occurs in a number of places, the best known being in the north-west. Veins of antimony are worked in the Battle Mountain District and in Bullion Canyon, 15 m. south of Mill City. There are veins of bismuth near Sodaville. A little graphite is produced in Humboldt county. A sub-bituminous lignite is mined in Esmeralda county (800 tons in 1906; 330 tons in 1907). Considerable quantities of the following minerals have been found: barytes (heavy spar), magnetite (magnetic iron ore), and pyrolusite (manganese dioxide) in Humboldt county; roofing slate in Esmeralda county; cinnabar (ore containing quicksilver) in Washoe county; haematite in Elko and Churchill counties; cerussite and galena (lead ores) in Eureka county; and wolframite (a source of tungsten) at Round Mountain, White Pine county. In 1903 and 1907 Nevada ranked second among the American states in the production of sulphur, but its output is very small in comparison with that of Louisiana.

Manufactures.—The manufacturing interests of Nevada are unimportant. Of the manufacturing establishments in the state in 1900, 109, or 47·8%, were situated in Reno, Carson City and Virginia City, named in the order of their importance. These places employed 35·9% of the labour engaged in manufacturing, and the value of their products was 38·8% of the total for the state. Manufactures based on the products of mines and quarries (chemicals, glass, clay, stone and metal works) constituted about one-fifth of the whole product. Car construction and general shop work of steam railways was the leading manufacturing industry in 1905; next in importance were the flour and grist milling industry and the printing and publishing of newspapers and periodicals. Such statistics of the special census of manufactures (under the factory system) of 1905 as are comparable with those of 1900 show 99 factories in 1900 and 115 in 1905, an increase of 16·2%. Their capital in 1900 was $1,251,208 and in 1905 $2,891,997, an increase of 131·1%. The value of their products in 1900 was $1.261.005, and in 1905, $3,096,274, an increase of 145·5%.

Transportation.—In its industrial development Nevada has always been hampered by lack of transportation facilities. There are no navigable waterways, and the railway mileage is small. Until the completion of the trans-continental railway in 1869, wagon trains were the only means of transporting the products of the mines across the desert. An unsuccessful attempt was made, beginning in 1861, to domesticate the camel for this purpose.[2] The railway mileage in 1880 was 739 m.; in 1890, 923 m.; in the following decade railway building was at a standstill. Since 1900, however, there has been considerable development, and the total mileage on the 1st of January 1909, was 1,866·92 m. The state is crossed from east and west by three main lines of railway, parts of the great transcontinental systems, the Southern Pacific and the Western Pacific in the northern part of the state and the San Pedro, Los Angeles & Salt Lake in the southern. The oldest of these trunk lines, the Southern Pacific (formerly the Central Pacific), follows the course of the Humboldt and Truckee rivers. It is met at several points by lines which serve the rich mining districts to the south; at Cobre by the Nevada Northern from Ely in White Pine county in the Robinson copper mining district; at Palisade by the Eureka & Palisade, a narrow-gauge railway, connecting with the lead and silver mines of the Eureka District; at Battle Mountain by the Nevada Central, also of narrow gauge, from Austin; at Hazen by the Nevada & California (controlled by the Southern Pacific) which runs to the California line, connecting in that state with other parts of the Southern Pacific system, and at Mina, Nevada, with the Tonopah & Goldfield, which runs to Tonopah and thence to Goldfield, thus giving these mining regions access to the Southern Pacific's transcontinental service; and at Reno, close to the western boundary, by the Virginia & Truckee, connecting with Carson City, Minden, in the Carson Valley, and Virginia City, in the Comstock District, and by the Nevada-California-Oregon, projected to run through north-eastern California into Oregon, in 1910, in operation to Alturas, California. The Western Pacific railway, completed in 1910, extending from Salt Lake City to San Francisco, and running entirely

[1] Apart from their commercial uses, the Sutro Tunnel and the shafts of the Comstock Lode have been employed for scientific investigations, with the object of classifying igneous rocks, determining the variations of temperature, and the character of electrical manifestations beneath the earth's surface, and the relation between the structure of rocks and their rate of cooling.

[2] It is interesting to note that in 1875 the Nevada legislature passed an act forbidding camels or dromedaries to run at large. This law remained on the statute books until 1898, when it was formally repealed.

across the state of Nevada, is parallel with the Southern Pacific for some distance in the eastern part of the state, and crosses the mountains at Beckwith Pass 20 m. north of Reno. The San Pedro, Los Angeles & Salt Lake railway, also an important factor in east and west transcontinental traffic, opened in May 1905, has been of special value in the development of the southern part of the state. It crosses a section that is mostly desert, but is connected with the Bullfrog District by the Las Vegas & Tonopah, which runs from Goldfield through Beatty and Rhyolite, and meets the San Pedro, Los Angeles & Salt Lake at Las Vegas. The Goldfield and Bullfrog districts have a further outlet to the south through a second railway, the Nevada Short Line (Bullfrog-Goldfield and Tonopah & Tidewater railways) which connects with the Atchison, Topeka & Santa Fé at Ludlow in California.

Population.—Nevada is the most sparsely settled state of the Union. Its population in 1860 was 6857; in 1870, 42,491; in 1880, 62,266; in 1890, 45,761; in 1900, 42,335; and in 1910, 81,875 (0·7 per sq. m.). In 1900 10,093 were foreign-born (mostly English, Irish, Germans, Italians and Chinese in almost equal proportions); and there were 35,405 white persons, 5216 Indians, 1352 Chinese, 228 Japanese and 134 negroes. There were then only three towns of importance: Reno, Virginia City and Carson City, the capital.

The Indian population consists of Paiute, Shoshoni and the remnants of a few other tribes of Shoshonean stock. On the Duck Valley reservation (488 sq. m.), established in 1877, in Elko county, between the forks of the Owyhee river and lying partly in Nevada and partly in Idaho, and under the western Shoshoni (boarding) school (55 pupils in 1908), there were 252 Paiute, 238 Shoshoni and 1 Hopi in 1908; on the Pyramid Lake reservation (503 sq. m.), established in 1874, in Washoe county, on the borders of the lake from which it is named, 486 Paiute; on the Walker river reservation (79·37 sq. m.), established in 1874 (partly opened to settlement in 1906) along Walker river and Walker Lake, 466 Paiute; on the Moapa river reserve (15·6 sq. m.), in the south-eastern part of the state, 117 Paiute.

In 1906, of the 14,944 members of religious denominations 9,970 were Roman Catholics, 1,210 Protestant Episcopalians, 1,105 Latter-Day Saints (Mormons), 618 Methodists and 520 Presbyterians.

Administration.—Nevada is governed under the original constitution of 1864, with the amendments adopted in 1880, 1889, 1904 and 1906. The constitution as adopted limited the suffrage to adult white males, but this provision was annulled by the fifteenth amendment to the Federal constitution; and in 1880 amendments to the state constitution were adopted striking out the word "white" from the suffrage clause and adding a new article granting rights of suffrage and office holding without regard to race, colour or previous condition of servitude. A residence in the state of six months and in the district or county of thirty days preceding the election is required of all voters. Persons guilty of treason or felony in any state or Territory and not restored to civil rights, idiots and insane persons, are excluded from the suffrage. An unusual provision in the constitution, a result of its adoption in the midst of the Civil War, gives soldiers and sailors in the service of the United States the right to vote; their votes to be applied to the township and county in which they were bona fide residents at the time of enlistment.[1] The legislature has the right to make the payment of the poll tax a requirement for voting, but no such provision is in force.[2] A law passed in 1887, requiring all voters to take an oath against polygamy, with the object of disfranchising Mormons, was declared unconstitutional by the State Supreme Court.

A governor, lieutenant-governor, secretary of state, attorney-general, controller, treasurer, superintendent of public instruction and surveyor-general are chosen by popular vote every four years. Their functions are similar to those of the administrative officials in other states, with the exception that the governor does not possess the usual pardoning power but is *ex officio* a member of the pardoning board. The governor and lieutenant-governor must each be at least twenty-five years old at the time of election to office. The legislative department consists of a Senate, with members chosen every four years, about half of whom retire every two years; and an Assembly, whose members are chosen biennially. The constitution requires that the number of senators shall be not less than one-third nor more than one-half the number of members of the Assembly, and that the total membership of both houses shall not exceed seventy-five. Bills of any character may originate in either house. The legislative sessions are biennial and are limited to fifty days; special sessions are limited to twenty days. The judicial department consists of a supreme court with a chief justice and two associate justices, chosen for six years, and district courts, with judges chosen for four years.

The state is divided into fifteen counties, each of which is governed in local matters by a board of county commissioners, and is divided for administrative purposes into townships. The constitution requires that township and county governments shall be uniform throughout the state. For each township there is a justice of the peace, chosen biennially by its voters. The homestead exemption extends to a dwelling-house, with its land and appurtenances, with a value not exceeding $5000; but no exemption is granted against a process to enforce the payment of purchase-money, or for improvements, or for legal taxes, or of a mortgage to which both the husband and wife have consented. The exemption can be claimed by the husband, wife, or other head of the family, by a written declaration duly acknowledged and recorded in the manner prescribed for conveyances; and the homestead can then be mortgaged or alienated by a husband only with the wife's consent, if the wife is at the time a resident of the state. The exemption is not affected by the death of the husband or wife, but inures to the benefit of the surviving members of the family. For divorce a residence in the state of six months is necessary; the grounds for divorce are desertion or neglect to provide for one year, conviction of felony, habitual drunkenness, cruelty or physical incapacity.

There are a number of unusual provisions in the constitution of Nevada. The assertion in the "Declaration of Rights" that "no power exists in the people of this or any other state of the Federal Union to dissolve their connexion therewith or perform any act tending to impair, subvert, or resist the supreme authority of the government of the United States," is a result of the drafting of the instrument during the Civil War. There is also a provision that only three-fourths of the jurors may be required to agree to a verdict in civil cases, although the legislature has the power to require by statute a unanimous agreement. Amendments to the constitution must be passed by a majority of each house of the legislature at two consecutive sessions and submitted to a vote of the people at the next regular election. Under this provision an amendment cannot be adopted until nearly four years after it is first proposed. At the election of 1904 an amendment was adopted which provides that whenever 10% of the voters of the state, as shown by the votes of the last preceding election, express a wish that any law or resolution of the legislature shall be submitted to the people, the Act or Resolve shall be voted on at the next election of the state or county officers, and if a majority of the voters approve the measure it shall stand; otherwise, it shall become void. Nevada thus became the fourth American state to adopt the referendum.

Institutions.—The state maintains a penitentiary at Carson City and an insane asylum at Reno. The deaf, dumb and blind are cared for at its expense in the California institution for these defectives. The State University, established at Elko in 1874 and removed to Reno in 1887, is supported by the income from a Federal grant of two townships (72 sq. m.) of public land and an additional grant, under the Morrill Act of 1862, of 90,000 acres for the support of a college for agriculture and mechanic arts. An agricultural experiment station and a normal school are conducted in connexion with the university. The control of this institution is vested in a board of regents, chosen by popular vote. At Virginia City is a school of mines, established by the state in 1903. The Federal government maintains three boarding schools for Indians in the state.

The public schools are supported by the income from a Federal grant of 2,000,000 acres of public land (given in lieu of the usual sixteenth and thirty-sixth sections) supplemented by state and local taxation. The constitution provides that a special state tax, at a rate of not over two mills on the dollar, may be levied for school purposes. All fines collected under the penal laws, all escheats and 2% of the receipts of toll roads and bridges go into the school fund, which is invested in state and Federal securities and the

[1] An interesting application of this provision was made in 1898, when Nevada soldiers on their way to Manila were allowed to vote at sea. It was discovered, however, that no statute had ever been passed to carry this provision into effect, and the votes were rejected.

[2] In 1897 a law was passed making the right of suffrage dependent on the payment of poll taxes for the preceding two years; but in the following year the State Supreme Court declared this act unconstitutional because the title was not descriptive of the matter.

interest apportioned among the counties according to their school population. The administration of the school system is in the hands of a superintendent of public instruction.

Finance.—The bonded debt of the state on the 31st of December 1908 amounted to $550,000, of which the state held an irredeemable bond for $380,000; the actual redeemable bonded debt of $170,000 was due to the investment of the school and university funds in the bonds of the state. The actual borrowing capacity of the state is limited by its constitution to $300,000, except for the extraordinary purpose of repelling invasion or suppressing insurrection. Practically all the revenue is derived from the taxation of real and personal property. Mines and mining claims are exempt from taxation, but a quarterly tax is levied on the net proceeds of mines, and is not to be paid a second time so long as the products remain in the hands of the original producer. The rate of taxation for state purposes is fixed by the legislature, and for county purposes by the board of county commissioners. A poll tax is required of all males between the ages of 21 and 60 years, one half of which goes to the county in which it is collected and the rest to the state. At the close of 1908 the state receipts for the year amounted to $1,004,041, and expenditures to $875,941.

History.—The first recorded person of European descent to enter the limits of Nevada was Francisco Garcés (1738–1781), of the Order of St Francis, who set out from Sonora in 1775 and passed through what is now the extreme southern corner of the state on his way to California. Half a century later a party of trappers of the Hudson's Bay Company entered Nevada and plied their trade along the Humboldt river. American trappers came about the same time. Emigrants to California followed the trappers, and many crossed Nevada in the early 'forties of the 19th century. During 1843–1845 John C. Frémont made a series of explorations in this region. By the treaty of Guadalupe Hidalgo, negotiated in 1848, at the close of the war with Mexico, Nevada became United States territory. It was then a part of California known as the Washoe Country, and remained so until the 9th of September 1850, when most of the present state was included in the newly organized Territory of Utah. In the meantime the discovery of gold in California had swelled the stream of westward migration across the Washoe Country, and had resulted in the settlement of traders, mostly Mormons, along the routes to the gold fields. The first settlement in what is now the state of Nevada was planted in the valley of the Carson river in 1849. The earliest recorded public meeting was held at Mormon Station (now Genoa) on the 12th of November 1851. The object of this gathering was to frame a government for the settlers, as the seat of the Territorial government of Utah was too remote to afford protection for life and property. Congress was petitioned to organize a separate Territory. An independent local government was formed a week later, and this lasted for several months, until the Utah authorities intervened. In 1854 the Utah legislature created the county of Carson, which included all the settlements in western Utah; but the inhabitants sought to rid themselves of all connexion with the people of the Salt Lake region, and petitioned Congress to annex them to California. In 1858 Carson City was laid out, and in the following year the people of Carson county held a mass meeting and chose delegates to a constitutional convention, which met at Genoa on the 18th of July 1859, and in ten days drafted a constitution. The instrument was submitted to a vote of the people and was adopted, and a full set of state officers was chosen. This attempt to create a new state proved abortive, however, and it was not till the mineral wealth of the Washoe Country became generally known that Congress took any action. On the 2nd of March 1861 the Territory of Utah was divided at 39° W. (of Washington) and the western portion was called Nevada. As then constituted, the northern boundary of Nevada was the 42nd parallel, its southern the 37th, and its western boundary was made to conform to the eastern limits of the state of California. James W. Nye (1814–1876) of New York was appointed Territorial governor. In December 1862 the Territorial legislature passed an act "to frame a constitution and state government for the state of Washoe." This was submitted to the people and adopted at the polls. Delegates to a constitutional convention accordingly drafted a frame of government, which on the 19th of January 1864 was submitted to a popular vote and overwhelmingly defeated. The instrument contained a very unpopular clause taxing all mining property, unproductive as well as productive. Moreover, as state officers were to be chosen at the same time that the constitution was voted on, disappointed candidates for party nominations fought against ratification. As a result, the constitution was rejected while officers to act under it were at the same time duly elected.

Early in 1864, when it became evident that two more Republican votes might be needed in the United States Senate for reconstruction purposes, party leaders at Washington urged the people of Nevada to adopt a constitution and enter the Union as a patriotic duty, and on the 21st of March 1864 Congress passed an act to enable the people of the Territory to form a state government. The third constitutional convention in its history now met at Carson City and drew up a constitution which was duly ratified. On the 31st of October President Lincoln issued a proclamation declaring Nevada a state. By the Enabling Act Congress had extended the eastern boundary to the 38th meridian (W. of Washington), and in 1866 still farther extended it to the 37th and fixed the southern boundary as it exists at present. The additions eastward were made from Utah and those to the south from Arizona.

Being "battle-born," Nevada was loyal to the Union throughout the Civil War, and in spite of its scanty population furnished a company of troops in 1861, which were joined to a California regiment. In 1863 the Territory raised six companies of infantry and six of cavalry (about 1000 men), which saw no actual service against the Confederates but were useful in subduing hostile Indians.

The history of the state since its organization has been largely a history of its mines. The period from 1860 to 1864 was one of rapid development accompanied by the wildest speculation. This was followed by a reaction and a general collapse of inflated values until 1873, when the discovery of the Great Bonanza mine brought about a revival of industry and of speculation. A second period of decline followed the working out of this mine and lasted until 1900, when the discovery of a new mineral belt in southern Nevada brought renewed prosperity. Until 1870 the state was regularly Republican, but in this year the Democrats gained most of the offices, including the seat in the national House of Representatives. The Republicans, however, secured the electoral votes of Nevada in 1872 and in 1876, and in 1878 were again in full control, only to suffer defeat in 1880. Not until the silver currency question became a political issue did Nevada take a prominent part in national politics. In 1885 the Nevada Silver Association was formed for the purpose of advocating the free and unlimited coinage of silver. Both parties in the state in 1888 declared in favour of free coinage, and in 1892 instructed their delegates to the national conventions to oppose any candidate who did not favour this policy. As a means of asserting their views effectively, the citizens, irrespective of party, organized local silver clubs, and these eventually led to the formation of the Silver party of Nevada, which drafted a "platform" and nominated a state ticket and presidential electors who were instructed to support the Populist national ticket. The Republicans in the state divided, and the majority of them went over to the Silver party. At the national election in this year the Silver ticket received in Nevada 7264 votes; the Republican 2811; the Democrat 714; and the Prohibitionist 86. In the state election of 1894 the Silver party was again victorious, and not a Democrat was returned to the legislature. In the election of 1896 all the parties in the state declared in favour of the free and unlimited coinage of silver at the ratio of 16 to 1. The Democratic and Silver parties united, with the result that the state's electoral vote went to Bryan and Sewall, the Democratic nominees, while the Silver party retained most of the state offices. In the presidential election of 1900 the Nevada Republicans pursued a non-committal policy with regard to the silver question, declaring in favour of "the largest use of silver as a money metal in all matters compatible with the best interests of our government." The Democratic and the Silver parties again

united, and subsequently dominated the politics of the state.

NEVADA, a city and the county-seat of Vernon county, Missouri, U.S.A., in the south-western part of the state, about 90 m. S. by E. of Kansas City. Pop. (1900) 7461, of whom 235 were foreign-born and 168 negroes; (1910) 7176. It is served by the Missouri Pacific and the Missouri, Kansas & Texas railway systems. The principal public buildings are the county court house, the federal building and the high school. Nevada is the seat of Cottey College for girls (Methodist-Episcopal, South, 1884) and of a state hospital for the insane, and there is a state camp ground for the National Guard of Missouri. There are three parks, one of which, Lake Park, is a pleasure and health resort, with a lake and chalybeate and sulphur springs. The smelting of lead and zinc and the manufacture of paper, lumber, sheet metal and bricks are among the city's industries. Nevada is a trading centre for the surrounding country, and a fine farming and stock-raising region, in which Indian corn, oats, wheat, clover, timothy and blue-grass are grown; coal is mined in the vicinity. The city's water-supply is drawn from artesian wells. Nevada ("Nevada City" until 1869) was platted in 1855, was burned down in 1863 during the occupancy by the state militia in war time, was incorporated as a town in 1869, was entered by the first railway in 1870, and was chartered as a city in 1880.

NEVADA CITY, a township and the county-seat of Nevada county, California, U.S.A., about 130 m. N.E. of San Francisco. Pop. (1890) 2524; (1900) 3250 (764 foreign-born); (1910) 2689. It is the terminus of the Nevada County Narrow Gauge railway, which connects with the Southern Pacific railway at Colfax, 23 m. S. An electric line extends to Grass Valley (pop. in 1900, 4719), 4 m. S.W. Situated in a hilly and picturesque region, 2580 ft. above the sea, Nevada City is frequented as a health and summer resort (annual mean temperature, about 53·5° F.; mean summer temperature, about 66°). Gold-mining and quartz-mining are its principal industries, and in 1907 Nevada county's output of gold (104,590·76 oz., worth $2,162,083) was second only to that of Butte county (134,813·39 oz., worth $2,786,840) in California; the county is the leading producer from quartz mines. Among the manufactures of the township are carriages and products of planing mills, foundries and machine shops; and grapes and fruits are raised in the surrounding country. Gold was first discovered within what is now Nevada City, on Deer Creek, in the summer of 1848, by James W. Marshall, who, in January of the same year, had found the metal near what is now Coloma, Eldorado county. The first settlement was made here in 1849; rich deposits of gold were soon afterwards found on or near the surface, and the settlement had the characteristic growth of a western mining town; its output of gold reached its maximum in 1850–1851. Nevada City was first incorporated in 1851 under a special act of the legislature (repealed in 1852); it was reincorporated in 1856 and again in 1878.

[1] Died the 21st of September, 1890, and Frank Bell became governor by virtue of his office as lieutenant-governor.

[2] Died the 10th of April 1895, and R. Sadler became governor by virtue of his office as lieutenant-governor.

NÉVÉ, or **FIRN**, the name given to the partly consolidated masses of snow and ice which form in the hollows on the sides of mountains below the belt of freshly fallen snow and just above the compact glacier-ice. The névé, which generally consists of broad sheets of great beauty, is formed from the freshly fallen snow during a series of alternate thaws and frosts. These processes are accompanied by a gradual descent down the mountain side, during which the névé suffers consolidation, until it becomes compact glacier-ice. The névé is thus the feeding ground of the glacier (*q.v.*). The word *névé* (Lat. *nix*, *nivis*, snow) is adopted from the French dialect of the French Alps; *firn* is German, meaning "last year's (snow)."

NEVERS, a town of central France, capital of the department of Nièvre, 159 m. S.S.E. of Paris by the Paris-Lyons-Méditerranée railway to Nîmes. Pop. (1906) 23,561. Nevers is situated on the slope of a hill on the right bank of the Loire at its confluence with the Nièvre. Narrow winding streets lead from the quay through the town where there are numerous old houses of the 14th to the 17th centuries. Among the ecclesiastical buildings the most important is the cathedral of St Cyr, which is a combination of two buildings, and possesses two apses. The apse and transept at the west end are the remains of a Romanesque church, while the nave and eastern apse are in the Gothic style and belong to the 14th century. There is no transept at the eastern end. The lateral portal on the south side belongs to the late 15th century; the massive and elaborately decorated tower which rises beside it to the early 16th century. The church of St Étienne is a specimen of the Romanesque style of Auvergne of which the disposition of the apse with its three radiating chapels is characteristic. It was consecrated at the close of the 11th century, and belonged to a priory affiliated to Cluny. The ducal palace at Nevers (now occupied by the courts of justice and an important ceramic museum) was built in the 15th and 16th centuries and is one of the principal feudal edifices in central France. The façade is flanked at each end by a turret and a round tower. A middle tower containing the great staircase has its windows adorned by sculptures relating to the history of the house of Clèves by the members of which the greater part of the palace was built. In front of the palace lies a wide open space with a fine view over the valley of the Loire. The Porte du Croux, a square tower, with corner turrets, dating from the end of the 14th century, is among the remnants of the old fortifications; it now contains a collection of sculptures and Roman antiquities. A triumphal arch of the 18th century, commemorating the victory of Fontenoy and the hôtel de ville, a modern building which contains the library, are of some interest. The Loire is crossed by a modern stone bridge, and by an iron railway bridge. Nevers is the seat of a bishopric, of tribunals of first instance and of commerce and of a court of assizes and has a chamber of commerce and a branch of the Bank of France. Its educational institutions include a *lycée*, a training college for female teachers, ecclesiastical seminaries and a school of art. The town manufactures porcelain, agricultural implements, chemical manures, glue, boilers and iron goods, boots and shoes and fur garments, and has distilleries, tanneries and dye-works. Its trade is in iron and steel, wood, wine, grain, live-stock, &c. Hydraulic lime, kaolin and clay for the manufacture of faience are worked in the vicinity.

Noviodunum, the early name of Nevers was in later times altered to *Nebirnum*. The quantities of medals and other Roman antiquities found on the site indicate the importance of the place at the time when Caesar chose it as a military depôt for corn, money and hostages. In 52 B.C. it was the first place seized by the revolting Aedui. It became the seat of a bishopric at the end of the 5th century. The countship (see below) dates at least from the beginning of the 10th century. The citizens of Nevers obtained charters in 1194 and in 1231. For a short time in the 14th century the town was the seat of a university, transferred from Orleans, to which it was restored.

COUNTS AND DUKES OF NEVERS. Having formed part of the duchy of Burgundy, the county of Nevers (Nivernais) was given by Duke Henry I. in 987 to his stepson, Otto William, afterwards count of Mâcon, who five years later handed it over to his son-in-law Landri. The first house of the hereditary counts of Nevers originated in this Landri, and was brought to an end in 1192 by the death of Agnes, countess of Nevers, wife of Pierre de Courtenay (d. 1217). The county subsequently passed by successive marriages into the houses of Donzy, Châtillon and Bourbon. Mahaut de Bourbon brought the county of Nevers, together with those of Auxerre and Tonnerre, to her husband Odo (Eudes), son of Hugh IV., duke of Burgundy, in 1248. Her eldest daughter, Yoland, received the county of Nevers as her dowry when in 1265 she married Jean Tristan, son of King Louis IX. She became a widow in 1270, and in 1272 married Robert de Dampierre, who became count of Flanders. Her descendant by her second marriage, Marguerite, daughter and heiress of Louis II. de Male, count of Flanders, married successively two dukes of Burgundy, Philip I. de Rouvre and Philip II. the Bold. Philip (d. 1415), the third son of Philip the Bold, received the counties of Nevers and of Rethel and the barony of Donzy; his last male descendant, John, died in 1491. The house of Cleves then inherited the Nivernais, which was erected into a duchy by King Francis I. for Francis of Cleves in 1539. In 1565 Louis de Gonzaga (d. 1595), son of Frederick II., duke of Mantua, married Henrietta of Cleves, duchess of Nevers, and one of his descendants, Charles (d. 1665), sold the Nivernais to Cardinal Mazarin in 1659. The cardinal devised it to his nephew Philippe Jules Mancini, whose descendants possessed it until the French Revolution. The last duke of Nivernais, Louis Jules Barbon Mancini Mazarini, died in 1798.

NEVILLE, or NEVILL, the family name of a famous English noble house, descended from Dolfin son of Uchtred, who had a grant from the prior of Durham in 1131 of "Staindropshire," co. Durham, a territory which remained in the hands of his descendants for over four centuries, and in which stood Raby castle, their chief seat. His grandson, Robert, son of Meldred, married the heiress of Geoffrey de Neville (d. 1192–1193), who inherited from her mother the Bulmer lordship of Brancepeth near Durham. Henceforth Brancepeth castle became the other seat of the house, of which the bull's head crest commemorates the Bulmers; but it adopted the Norman surname of Neville (*Neuville*). Robert's grandson, another Robert, (d. 1282) held high position in Northumbria, and sided with Henry III. in the Barons' War, as did his younger brother Geoffrey (d. 1285), ancestor of the Nevills of Hornby. This Robert's son Robert (d. 1271) extended the great possessions of the family into Yorkshire by his marriage with the heiress of Middleham, of which the powerful Norman castle still stands. The summons of their son Ranulf (d. 1331) to parliament as a baron (1294) did but recognize the position of the Nevills as mighty in the north country. Ralph (d. 1367) the second baron—whose elder brother "the Peacock of the North" was slain by the Douglas in 1318—was employed by Edward III. as a commander against the Scots and had a leading part in the victory of Nevill's Cross (1346), where David Bruce was captured, and by which Durham was saved. His active career as head of his house (1331–1367) did much to advance its fortunes and to make the name of Nevill a power on the Scottish march. Of his younger sons, Alexander became archbishop of York (1374–1388) and was a prominent supporter of Richard II., attending him closely and encouraging his absolutist policy; in consequence of which he was one of those "appealed of treason" by the opposition in 1388 and being found guilty was outlawed, and died abroad in 1392. His younger brother William, a naval commander, took the opposite side, was a leading Lollard and a friend of Wiclif, and in 1388–1389 acted with the lords appellant.

John, the 3rd baron (d. 1388), a warden of the Scottish marches and lieutenant of Aquitaine, a follower of John of Gaunt and a famous soldier in the French wars of Edward III., continued the policy of strengthening the family's position by marriage; his sisters and daughters became the wives of great northern lords; his first wife was a Percy, and his second Lord Latimer's heiress; and his younger son, Thomas, became Lord Furnival in right of his wife, while his son by his second wife became Lord Latimer. His eldest son Ralph (1364–1425), 1st earl of Westmorland (see WESTMORLAND, EARLS OF), carried the policy further, marrying for his second wife a daughter of John of Gaunt and securing heiresses for five of his sons, four of the younger ones becoming peers, while a fifth, Robert, was made bishop of Durham (1438–1457). Among his daughters were the duchesses of Norfolk, Buckingham and York (mother of Edward IV. and Richard III.) and an abbess of Barking. The Nevills were thus closely connected with the houses of Lancaster and York, and had themselves become the most important family in the realm. Of the earl's sons by his second marriage, Richard, earl of Salisbury (and three of his sons) and William, earl of Kent, are the subjects of separate notices.

The greatness of the Nevills centred in the "kingmaker" (Richard's son) and the heads of his house, after the 1st earl, were of small account in history, till Charles, the 6th earl, at the instigation of his wife, Surrey's daughter, joined Northumberland in the fatal northern rising of 1569 to the ruin of his house. His estates, with the noble castles of Brancepeth and Raby, were forfeited; Middleham, with the Yorkshire lands, had been settled by the 1st earl on the heirs of his second marriage.

Although the senior line became extinct on the earl's death abroad (1601), there were male descendants of the 1st earl remaining, sprung from George and Edward, sons of his second marriage. George, who was Lord Latimer, was father of Sir Henry, slain at Edgcote fight, and grandfather of Richard, 2nd lord (1469–1530), a soldier who distinguished himself in the north, especially at Flodden Field. His grandson (d. 1577) was the last lord, but there were male descendants of his younger sons, one of whom, Edmund, claimed the barony, and after 1601 the earldom of Westmorland, but vainly, owing to its attainder. In this line may still exist a male heir of this mighty house.

The heirs male of Edward, Lord "Bergavenny" (now "Abergavenny" co. Monmouth), who died in 1476, have retained their place in the peerage under that style to the present day by a special and anomalous devolution. His wife, the only child of Richard (Beauchamp), earl of Worcester (d. 1422), brought him the great estates which had come to her line with Fitz Alan and Despencer heiresses, and in 1450 he was summoned as Lord Bergavenny, though not seized of that castle. Their grandson, George (*c.* 1471–1535) the 3rd lord, was in favour with Henry VII. and Henry VIII., and recovered from the latter in 1512 the castle and lands of Abergavenny. He was prominent in the French campaigns of 1513–14 and 1523. On the death of his son, Henry, the 4th lord, in 1587, a long-famous contest ensued between his daughter, Lady Fane, and his heir-male, Edward Nevill, which was eventually ended by James I., in 1604, assigning the barony of Abergavenny to Edward's son and that of Despencer to Lady Fane. The former subsequently descended (on uncertain grounds) to the heirs-male with the old Beauchamp estates under special entails. In 1784 the then Lord Abergavenny received an earldom, and the next lord erected at Eridge, Sussex, the present seat of the family, on which the marquisate of Abergavenny and earldom of Lewes were conferred in 1876. Its Sussex estates are mainly derived through the Beauchamps, from the Fitz Alans, heirs of the Warennes.

The Nevills of Billingbear, Berks, were a junior line, of whom

was Sir Henry Nevill (d. 1615), courtier and diplomatist, who became a leading figure in parliament under James I. His grandson, another Sir Henry (d. 1694), was an author of some note and a Republican opponent of Cromwell, by whom he was banished from London in 1654. The family became extinct in 1740, and in 1762 Richard Aldworth (1717–1793), on inheriting Billingbear, took the name of Nevill. From him descend the Lords Braybrooke.

Neuville is a common French name, and it is not clear whether all the Nevills who occur in the 12th and 13th centuries were of the same stock as the lords of Raby. The baronial line of Nevill of "Essex" was founded by the marriage, *temp.* Richard I., of a Hugh de Nevill to the heiress of Henry de Cornhill, a wealthy Londoner. He went on crusade with Richard I. and was afterwards an active supporter of John, who names him in the Great Charter (1215). His descendant, Hugh de Nevill, was summoned as a baron in 1311, as was his son John, who served in the French and Flemish campaigns, and died, the last of his line, in 1358.

See Rowland's *Historical and Genealogical Account of the Family of Nevill* (1830); Drummond's *Noble British Families* (1846); Swallow's *De Nova Villa* (1885); and Barron's sketch in *The Ancestor*, No. 6 (1903). Also Dugdale's *Baronage*; G. E. C[okayne]'s *Complete Peerage*; J. H. Round's *Feudal England*; and for the Nevill castles Mackenzie's *Castles of England*. For the Kingmaker, see Oman's monograph (1891). (J. H. R.)

NEVILLE, GEORGE (*c.* 1432–1476), archbishop of York and chancellor of England, was the youngest son of Richard Neville, earl of Salisbury, and brother of Richard Neville, earl of Warwick, known as the "Kingmaker." He was educated at Balliol College, Oxford, and was from his childhood destined for the clerical profession, in which through the great influence of his family he obtained rapid advancement, becoming bishop of Exeter in 1458. From this time forward Neville took a prominent part in the troubled politics of the period. He was present with his brother Warwick at the battle of Northampton in July 1460, immediately after which the great seal was committed to his keeping. He took part in the proclamation of Edward of York as king, who confirmed his appointment as chancellor. In 1463 he was employed on a diplomatic mission in France; and in 1464, after taking part in negotiation with the Scots, Neville became archbishop of York. During the next few years he as well as his brothers fell into disfavour with Edward IV.; and in 1469, after a successful rising in Yorkshire secretly fermented by Warwick, the king fell into the hands of the archbishop, by whom, after a short imprisonment, he was permitted to escape. When Warwick was in turn defeated by the king's forces at Stamford in 1470, Archbishop Neville took the oath of allegiance to Edward, but during the short Lancastrian restoration which compelled Edward to cross to Holland, Neville acted as chancellor to Henry VI.; and when the tide once more turned he again trimmed his sails to the favouring breeze, making his peace with Edward, now again triumphant, by surrendering Henry into his hands. The archbishop for a short time shared Henry's captivity in the Tower. Having been pardoned in April 1471, he was re-arrested a year later on a charge of treason and secretly conveyed to France, where he remained a prisoner till 1475, when he returned to England; he died in the following year, on the 8th of June 1476. Archbishop Neville was a respectable scholar; and he was a considerable benefactor of the university of Oxford and especially of Balliol College.

See Thomas Rymer, *Foedera, &c.* (London, 1704); John Warkworth, *Chronicle of the first Thirteen Years of the Reign of Edward IV.*, ed. J. O. Halliwell (Camden Soc., London, 1839); *Paston Letters*, ed. J. Gairdner (London, 1872–1875); *The Historical Collections of a Citizen of London in the 15th century*, ed. J. Gairdner (Camden Soc., London, 1876); Sir James H. Ramsay, *Lancaster and York 1399–1485* (Oxford, 1892).

NEVILLE, RALPH (d. 1244), bishop of Chichester and chancellor of England, was a member of the great Neville family, but of illegitimate birth. In 1214 he became dean of Lichfield, and obtained several rich livings; and in 1224 he was consecrated bishop of Chichester. In 1226 he was appointed chancellor by the council governing during the minority of Henry III.; and when the king in 1236 demanded the return of the great seal, Neville refused to surrender it, on the ground that only the authority that had appointed him to the office had power to deprive him of it. In 1231 he was chosen archbishop by the monks of Canterbury, but the election was not ratified by the pope. He died in 1244.

Neville's residence in London was a palace in the street opposite the Temple, which from this association obtained the name of Chancery Lane, by which it is still known; while the palace itself, after passing into the hands of Henry de Lacy, earl of Lincoln, was called Lincoln's Inn after that nobleman when it became the abode of students of law. Neville bequeathed this property to the see of Chichester, and the memory of his connexion with the locality is further preserved in the name of a passage leading from Chancery Lane to Lincoln's Inn which still bears the name of Chichester Rents.

NEVIN, JOHN WILLIAMSON (1803–1886), American theologian and educationalist, was born on Herron's Branch, near Shippensburg, Franklin county, Pennsylvania, on the 20th of February 1803. He was a descendant of Hugh Williamson of North Carolina, and was of Scotch blood and Presbyterian training. He graduated at Union College in 1821; studied theology at Princeton Theological Seminary in 1823–1828, being in 1826–1828 in charge of the classes of Charles Hodge; was licensed to preach by the Carlisle Presbytery in 1828; and in 1830–1840 was professor of Biblical literature in the newly founded Western Theological Seminary of Allegheny, Pennsylvania. But under the influence of Neander he was gradually breaking away from "Puritanic Presbyterianism," and in 1840, having resigned his chair in Allegheny, he was appointed professor of theology in the (German Reformed) Theological Seminary at Mercersburg, Pa., and thus passed from the Presbyterian Church into the German Reformed. He soon became prominent; first by his contributions to its organ the *Messenger*; then by *The Anxious Bench—A Tract for the Times* (1843), attacking the vicious excesses of revivalistic methods; and by his defence of the inauguration address, *The Principle of Protestantism*, delivered by his colleague Philip Schaff, which aroused a storm of protest by its suggestion that Pauline Protestantism was not the last word in the development of the church but that a Johannean Christianity was to be its outgrowth, and by its recognition of Petrine Romanism as a stage in ecclesiastical development. To Dr Schaff's 122 theses of *The Principle of Protestantism* Nevin added his own theory of the mystical union between Christ and believers, and both Schaff and Nevin were accused of a "Romanizing tendency." Nevin characterized his critics as pseudo-Protestants, urged (with Dr Charles Hodge, and against the Presbyterian General Assembly) the validity of Roman Catholic baptism, and defended the doctrine of the "spiritual real presence" of Christ in the Lord's Supper, notably in *The Mystical Presence: a Vindication of the Reformed or Calvanistic Doctrine of the Holy Eucharist* (1846); to this the reply from the point of view of rationalistic puritanism was made by Charles Hodge in the *Princeton Review* of 1848. In 1849 the *Mercersburg Review* was founded as the organ of Nevin and the "Mercersburg Theology"; and to it he contributed from 1849 to 1883. In 1851 he resigned from the Mercersburg Seminary in order that its running expenses might be lightened; and from 1841 to 1853 he was president of Marshall College at Mercersburg. With Dr Schaff and others he was on the committee which prepared the liturgy of the German Reformed Church, which appeared in provisional form in 1857 and as *An Order of Worship* in 1866. In 1861–1866 he was instructor of history at Franklin and Marshall College (in which Marshall College had been merged), of which he was president in 1866–1876. He died at Lancaster, Penn., on the 6th of June 1886.

See Theodore Appel, *The Life and Work of John Williamson Nevin* (Philadelphia, 1889), containing Nevin's more important articles.

NEVIS, an island in the British West Indies, forming with St Kitts one of the five presidencies in the colony of the Leeward Islands. Pop. (1901) 12,774. It lies in 17° 14′ N. and 62° 35′ W., and is separated from St Kitts by a shallow channel 2 m. wide at its narrowest point. In form it is almost round, and from the sea has the appearance of a perfect cone, rising gradually to the height of 3200 ft. Its total area is 50 sq. m. Although the

island is subject to severe storms, the climate is healthy, the average temperature being 82° F. Sugar, rum and molasses are exported, and corn, yams, coffee and fruit are grown. There are medicinal springs and large deposits of sulphur. The chief town, Charlestown, lies on a wide bay on the S.W. The legislative council of St Kitts-Nevis meets at Basseterre, the capital of St Kitts. Nevis was discovered by Columbus in 1498 and first colonized in 1628 by the English from St Kitts. During the period of the slave trade it was a leading mart for slaves in the West Indies.

NEVYANSK, Nevyanskiy or Neyvinskiy Zavod, a town of Russia, in the government of Perm, 57 m. by rail N.N.W. of Ekaterinburg, on the eastern slope of the Ural mountians, in the populous mountain valley of the Neyva, in a district very rich in iron and auriferous sands. Pop. (1881) 13,980; (1897) about 16,000, all Great-Russians and mostly Nonconformists, who are employed, partly at the iron-works, partly in various small industries, such as the manufacture of boxes, widely sold in Siberia, iron wares and boots, and partly in agriculture. The iron-works at Nevyansk are the oldest in the Urals, having been founded in 1699. In 1702 Peter the Great presented them to Demidov, with 3,900,000 acres of land. Several other iron-works are situated within a short distance, the chief being Verkhne-Neyvinsk, 18 m. S.; Neyvo-Rudyansk, 8 m. S.; Petrokamensk, 32 m. N.E.; Neyvo-Shaitansk, 20 m. lower down the Neyva; and Neyvo-Alapayevsk, 64 m. N.E. of Nevyansk.

NEW ABBEY, a parish and village of Kirkcudbrightshire, Scotland. Pop. of parish (1901) 957. The hill of Criffel and Loch Kinder are situated within the parish boundaries. The lake contains two islets, of which one was a crannog and the other the site of an ancient kirk. The village, which lies 6½ m. S. of Maxwelltown, is famous for the ruin of Sweetheart Abbey, a Cistercian house built in 1275 by Devorguila in memory of her husband John de Baliol, who had died at Barnard Castle in 1269. His heart, embalmed and enshrined in a coffin of ebony and silver, which she always kept beside her, was, at her death in 1290, buried with her in the precincts of the abbey, which thus acquired its name (*Abbacia Dulcis Cordis*, or Douxquer). The building afterwards became known as the New Abbey, to distinguish it from the older foundation at Dundrennan, which had been erected in 1142 by Fergus of Galloway. The remains of the abbey chiefly consist of the shell of the beautiful Cruciform church, with a central saddleback tower rising from the transepts to a height of over 90 ft., and a graceful rose window at the west end of the nave. Most of the work is Early English with Decorated additions. The abbot's tower, a stately relic, stands about ½ m. N.E. of the abbey.

NEW ALBANY, a city and the county-seat of Floyd county, Indiana, U.S.A., on the N. bank of the Ohio river, at the head of low water navigation, nearly opposite Louisville, Kentucky, with which it is connected by three railway bridges, and 156 m. below Cincinnati, Ohio. Pop. (1890) 21,059; (1900) 20,628, of whom 1363 were foreign-born and 1905 negroes; (1910) 20,629. It is served by the Baltimore & Ohio South-western, the Chicago, Indianapolis & Louisville, the Pittsburg, Cincinnati, Chicago & St Louis and the Southern railways, by electric railways to Louisville, Indianapolis, &c., and by steamboats on the Ohio; it is connected by a belt line with the Louisville & Nashville, the Chesapeake & Ohio, the Illinois Central and other railways. The city is situated on an elevated plateau above the river, in an amphitheatre of wooded hills. It has a good public library, a well organized public school system and several private schools and academies. Within the city limits is a national cemetery. The manufactures include leather, iron, foundry and machine shop products, furniture and veneer, lumber, cotton goods and hosiery, distilled liquors and stoves. The value of the factory products in 1905 was $4,110,709, 13% more than in 1900. Originally settled about the beginning of the 19th century, New Albany was platted in 1813 and was chartered as a city in 1839. The city owed much of its early industrial importance to the plate-glass works successfully established here by Washington Charles de Pauw (1822–1887), who endowed the De Pauw College for Young Women (opened as the Indiana Asbury Female College in 1852). The glass works left the city because of the superior and cheaper fuel supplied by natural gas in central Indiana. The De Pauw College for Young Women was relatively unimportant after the endowment of Indiana Asbury University (now De Pauw University) by W. C. de Pauw in 1883, but it continued to give instruction until 1903.

NEW AMSTERDAM, a town of British Guiana, situated in 6° 20′ N. and 59° 15′ W. on the east bank of the Berbice river, about 4 m. from the mouth. Formerly the capital of the colony of Berbice, it is now the capital of the county of that name. It is a picturesque little town composed almost entirely of wooden houses, having a population estimated in 1904 at 7459. The Colony House, standing in handsome grounds beside the small but pretty botanical gardens, was formerly the residence of the governor and the seat of the legislature, and now contains the treasury and supreme courts. The town is lighted by municipally owned electric works, and contains various government institutions, a town hall and market. The local government is vested in a mayor and town council, the revenue (a little over £12,000 annually) being mainly raised by a direct rate on house property. The expenditure is principally on streets, street lighting, fire brigade, water supply and drainage. New Amsterdam is connected by ferry and rail with Georgetown, to which there is also a bi-weekly steamer service.

NEWARK, DAVID LESLIE, Lord (1601–1682), Scottish general, was born in 1601, the fifth son of Sir Patrick Leslie of Pitcairly, Fifeshire, commendator of Lindores, and Lady Jean Stuart, daughter of the 1st earl of Orkney. In his early life he served in the army of Gustavus Adolphus, where he rose to the rank of colonel of cavalry. In 1640 he returned to his native country to take part in the impending war for the Covenant. In 1643, when a Scottish army was iormed to intervene in the English Civil War (see Great Rebellion) and placed under the command of Alexander Leslie, earl of Leven, the foremost living Scottish soldier, Leslie was selected as Leven's major-general. This army engaged the Royalists under Prince Rupert at Marston Moor, and Leslie bore a particularly distinguished part in the battle. He was then sent into the north-western counties, and besieged and took Carlisle. When, after the battle of Kilsyth, Scotland was at the mercy of Montrose and his army, Leslie was recalled from England in 1645, and made lieutenant-general of horse. In September he surprised and routed Montrose at Philiphaugh near Selkirk, and was rewarded by the committee of estates with a present of 50,000 merks and a gold chain; but his victory was marred by the butchery of the captured Irish —men, women and children—to whom quarter had been given. He was then declared lieutenant-general of the forces, and, in addition to his pay as colonel, had a pension settled on him. Leslie returned to England and was present at the siege of Newark. On his return to Scotland he reduced several of the Highland clans that supported the cause of the king. In 1648 he refused to take part in the English expedition of the "engagers," the enterprise not having the sanction of the Kirk. In 1649 he purchased the lands of Abercrombie and St Monance, Fifeshire. In 1650 he was sent against Montrose, who was defeated and captured by Major Strachan, Leslie's advanced guard commander; and later in the year, all parties having for the moment combined to support Charles II., Leslie was appointed to the chief command of the new army levied for the purpose on behalf of Charles II. The result, though disastrous, abundantly demonstrated Leslie's capacity as a soldier, and it might be claimed for him that Cromwell and the English regulars proved no match for him until his movements were interfered with and his army reduced to indiscipline by the representatives of the Kirk party that accompanied his headquarters. After Dunbar Leslie fought a stubborn defensive campaign up to the crossing of the Forth by Cromwell, and then accompanied Charles to Worcester, where he was lieutenant general under the king who commanded in person. On the defeat of the royal army Leslie, intercepted in his retreat through Yorkshire, was committed to the Tower, where he remained till the Restoration

in 1660. He was fined £4000 by Cromwell's "Act of Grace" in 1654. In 1661 he was created Lord Newark, and received a pension of £500 per annum. He died in 1682. The title became extinct in 1790.

NEWARK (NEWARK-UPON-TRENT), a market town and municipal borough in the Newark parliamentary division of Nottinghamshire, England. Pop. (1901) 14,992. It lies in a flat, fertile lowland near the junction of the river Devon with the Trent, but actually on the Devon. By means of a canal 1½ m. in length it is connected with the Trent navigation. It is 120 m. N.N.W. from London by the Great Northern railway, and is on the Melton Mowbray joint branch of that company and the London & North-Western, and on the Nottingham & Lincoln branch of the Midland railway. The church of St Mary Magdalene, one of the largest and finest parish churches of England, is specially notable for the beauty of the tower and of the octagonal spire (223 ft. high) by which it is surmounted. The central piers of the old church, dating from the 11th or 12th century, remain, and the lower part of the tower is a fine example of Early English when at its best. The upper parts of the tower and spire are Decorated, completed about 1350; the nave dates from between 1384 and 1393, and the chancel from 1489. The sanctuary is bounded on the south and north by two chantry chapels, the former of which has on one of its panels a remarkable painting from the "Dance of Death." There are a few old monuments, and an exceedingly fine brass of the 14th century. The castle, supposed to have been founded by Egbert, king of the West Saxons, was partly rebuilt and greatly extended by Alexander, consecrated bishop of Lincoln in 1123, who established at it a mint. It rises picturesquely from the river, and from its position and great strength was for a long time known as the "key of the North." Of the original Norman stronghold the most important remains are the gate-house, a crypt and the lofty rectangular tower at the south-west angle. The building seems to have been reconstructed in the early part of the 13th century. In the reign of Edward III. it was used as a state prison. During the Great Rebellion it was garrisoned for Charles I., and endured three sieges. Its dismantling was begun in 1646, immediately after the surrender of the king. There is a very beautiful and interesting cross (the "Beaumond" cross) of the latter part of the 15th century in good preservation in the town. A grammar and song school was founded in the reign of Henry VIII., and endowed by Archdeacon Magnus, and there are other considerable charities. The other principal public buildings are the town-hall in the Grecian style (erected in 1774), the corn exchange (1848), the Stock library and Middleton newsroom (1828), the mechanics' institution (1836), a free library and a fine hospital (1881). There is a large trade in malt, coal, corn and cattle. There are iron and brass foundries, boiler-works, agricultural implement manufactories and breweries. Gypsum and limestone are obtained in the neighbourhood, and plaster of Paris is extensively manufactured. The town is governed by a mayor, 6 aldermen and 18 councillors. Area 1931 acres.

Newark (*Newerca, Nouwerk*) owed its origin, possibly in Roman times, to its position on the great road called the Fosse Way, in the valley of the Trent. In a document which purports to be a charter of 664 Newark is mentioned as having been granted to the abbey of Peterborough by Wulfhere. In the reign of Edward the Confessor it belonged to Godiva, who granted it to the monastery of Stow, and it remained in the hands of the bishops of Lincoln until the reign of Edward VI. The castle was erected by Bishop Alexander in 1123, and the bridge about the same time. Under Stephen a mint was established. There were burgesses in Newark at the time of the Domesday Survey, and in the reign of Edward III. there is evidence that it had long been a borough by prescription. It was incorporated under an alderman and twelve assistants in 1549, and the charter was confirmed and extended by Elizabeth. Charles I., owing to the increasing commercial prosperity of the town, reincorporated it under a mayor and aldermen, and this charter, except for a temporary surrender under James II., has continued the governing charter of the corporation. Newark returned two representatives to parliament from 1673 until 1885. A weekly market on Wednesdays, and a fair on the eve, day and morrow of the Invention of the Holy Cross, granted to the bishop of Lincoln by John, are still held; another fair at St Mary Magdalene and the four preceding days was granted by Henry III., and is probably represented by the fair now held on the 14th of May. A market for corn and cattle is still held on Wednesdays, and another on Tuesdays for fat stock has been added.

NEWARK, the largest city of New Jersey, U.S.A., a port of entry, and the county-seat of Essex county, on the Passaic river and Newark Bay, about 8 m. W. of New York City. Pop. (1890) 181,830; (1900) 246,070, of whom 71,363 were foreign-born, and 6694 were negroes; (1910 census), 347,469. Of the total foreign-born population in 1900 (48,329 of whom had been in the United States at least ten years), 25,139 were from Germany, 12,792 from Ireland, 8537 from Italy, 5874 from England, 5511 from Russia and 4074 from Austria. Of the total population, 143,306 were of foreign parentage on both sides, 56,404 German, 30,261 Irish, 13,068 Italian, 8951 English and 8531 Russian. Newark is served by the Pennsylvania, the Lehigh Valley, the Erie, the Delaware, Lackawanna & Western and the Central of New Jersey railways, and by steamboats engaged in coastwise and river commerce. By electric lines it is connected with most of the cities and towns within a radius of 20 m., including Jersey City, Paterson and the residential suburbs, among which are the Oranges, Montclair, Bloomfield, Glen Ridge, Belleville and Nutley. It has a frontage on the river and bay[1] of 10½ m., and a total area of 23·4 sq. m. The site is generally level, but the ground rises toward the western part. Broad Street, 120 ft., and Market Street, 90 ft. wide, the principal thoroughfares, intersect. The most prominent public buildings are the City Hall, completed in 1906; County Court-House, designed by Cass Gilbert (b. 1859), with sculpture by Andrew O'Connor and decorations by Howard Pyle, Will H. Low, Kenyon Cox, H. O. Walker, C. Y. Turner, F. D. Millet, George W. Maynard and Edwin H. Blashfield; United States Government Building; Public Library, finished in 1901, and City Hospital. There is a Roman Catholic Cathedral, and the city is the see of a Roman Catholic and of a Protestant Episcopal bishop. The Prudential Life Insurance Company and the Mutual Benefit Life Insurance Company have fine office buildings. Many of the older buildings are of a brown sandstone, quarried in or near the city. In Military Park is a monument to Major-General Philip Kearny (1815–1862), and in Washington Park is a monument to Seth Boyden (1785–1870), a Newark inventor of malleable iron, of machinery for making nails, and of improvements in the steam-locomotive. Newark has also a monument to Frederick Theodore Frelinghuysen (1817–1885), secretary of state in the cabinet of President Chester A. Arthur, and to Abraham Coles (1813–1891), a poet and physician, both of whom lived here. On the banks of the Passaic is a house having as a part of its walls the old walls of Cockloft Hall, in which Washington Irving frequently sojourned, and of which he gave a charming description in *Salmagundi*. In the vicinity are the remains of Peterborough, the home of Colonel Peter Schuyler (1710–1762), who served against the French in 1746–48 and in the French and Indian War. At the corner of Broad and William streets stood until 1835 the parsonage in which Aaron Burr was born.

In 1910 Newark had 658 acres in public parks, of which 637 acres were under the administration of the Essex County Park Commission. To Washington, Military and Lincoln parks, the older ones near the heart of the city, there have been added Branch Brook (277 acres), Weequahic (265·8 acres), West Side (23 acres), and East Side (12·5 acres) parks. The principal cemeteries are Mount Pleasant, overlooking the Passaic in the northern part of the city, and Fairmount in the western part; about 1804 the remains of the early settlers were removed from the Old

[1] The river channel before improvement had a navigable depth of 7 ft. at mean low water; the depth was increased to about 10 ft. by the Federal government before 1902; in 1907 further improvement was authorized by Congress, the channel to be made 300 ft. wide and 16 ft. deep.

Burying Ground to Fairmount Cemetery and placed in a large vault marked by a monument.

As parts of its public school system the city maintains twelve summer or vacation schools, evening schools, a normal and training school for the education of teachers, a school of drawing, and a technical school, the last for evening classes. The Newark Academy, founded in 1792, is the leading private school; and there are various Roman Catholic academies. In the township of Verona (pop. in 1905, 2576), about 7 m. N. by W. of Newark, is the City Home for boys, in which farming, printing and other trades are taught. The Public Library (opened in 1889) contained about 160,000 volumes in 1910, and the library of the New Jersey Historical Society about 26,000 books, about 27,000 pamphlets and many manuscripts; the Prudential Insurance Company has a law library of about 20,000 volumes; and the Essex County Lawyers' Club has one of 5000 volumes or more. Among the charitable institutions are the City Hospital, Saint Michael's Hospital, Saint Barnabas Hospital, Saint James Hospital, the German Hospital, a Babies' Hospital, an Eye and Ear Infirmary, a City Dispensary, the Newark Orphan Asylum, a Home for Crippled Children, a Home for Aged Women and three day nurseries. The municipality owns and operates the water-works, and the water is brought from reservoirs in the Pequanac Valley 20-30 m. N.W. of the city.

The city charter (1857) provides for government by a mayor, elected biennially, and a unicameral council, elected by popular vote. By popular vote, also, the board of street and water commissioners is chosen. The council chooses the city clerk, treasurer and tax receiver, and the mayor appoints the city attorney, police justices, the board of education, the trustees of the public library, and the excise and assessment commissioners, and, subject to the ratification of his choice by the council, the comptroller, auditor and the tax, police, health and fire commissioners.

Newark has long been one of the leading manufacturing cities of the country. The manufacture of shoes and other leather products, particularly patent leather, became an important industry early in the 19th century; in 1770 there was one tannery here; in 1792 there were three; a large one, still in operation, was built in 1827; in 1837 there were 155 curriers and patent leather makers in the city, which then had an annual product of leather valued at $899,200; in 1905 the value of the leather, tanned, curried and finished was $13,577,719. The manufacture of felt hats (product, 1905, $4,586,040, Newark ranking third in this industry among the cities of the United States), carriages, chairs and jewelry (an industry established about 1830; product, 1905, $9,258,095), developed rapidly early in the 19th century, and there are extensive manufactories of malt liquors (product, 1905, $10,917,003), and of clothing (product, 1905, $3,937,138), foundries and machine shops (product, 1905, $6,254,153), and large establishments for smelting and refining lead and copper, the product of the lead smelters and refining establishments being in 1905 the most valuable in the city. Among the other important manufactures in 1905 were: chemicals, valued at $3,964,726; slaughtering and meat packing, $2,933,877; varnish, $2,893,305; stamped ware, $2,689,766; enamelled goods, $2,361,350; boots and shoes, $2,382,051; reduction of gold and silver, not from ore, $2,361,350; corsets, $2,081,761; paints, $1,812,463; silverware and silver-smithing, $1,780,906; tobacco, cigars and cigarettes, $1,742,862; hardware, $1,616,755; buttons, $1,281,528, and saddlery hardware, $1,151,789. In 1905 an art pottery was established for making "crystal patina" and "robin's egg blue" wares, in imitation, to a certain extent, of old oriental pottery, and Clifton India ware, in imitation of pottery made by the American Indians. The total value of Newark's factory products increased from $112,728,045 in 1900 to $150,055,227 in 1905, or 33·1%. In 1905 the value of the city's factory product was almost one-fifth of that for the whole state, and Newark ranked tenth among the manufacturing cities of the entire country. In the same year Newark manufactured more than one-half (by value) of all the jewelry, leather and malt liquors produced in the state.

Insurance is another important business, for here are the headquarters of the Prudential, the Mutual Benefit Life and the American Fire, the Firemen's and the Newark Fire Insurance companies. The city's foreign trade is light (the value of its imports was $859,442 in 1907; of its exports $664,525), but its river traffic is heavy, amounting to about 3,000,000 tons annually, and being chiefly in general merchandise (including food-stuffs, machinery and manufactured products), ores and metals, chemicals and colours, stone and sand and brick.

Newark was settled in 1666 by about thirty Puritans from Milford, Connecticut, who were followed in the next year by about the same number of their sect from Branford and Guilford. Because of the union of the towns of the New Haven Jurisdiction with Connecticut, in 1664, and the consequent admission of others than church members to civil rights, these Puritans resolved to remove and found a new town, in which, as originally in the New Haven towns, only church members should have a voice in the government. They bought practically all of what is now Essex county from the Indians for "fifty double hands of powder, one hundred bars of lead, twenty axes, twenty coats, ten guns, twenty pistols, ten kettles, ten swords, four blankets, four barrels of beer, ten pairs of breeches, fifty knives, twenty horses, eighteen hundred and fifty fathoms of wampum, six ankers of liquor (or something equivalent), and three troopers' coats." Their first church was in Broad Street, nearly opposite the present First Presbyterian Church, with cupola and flankers from which "watchers" and "wards" might discover the approach of hostile Indians, and as an honour to their pastor, Rev. Abraham Pierson (1608–1678), who came from Newark-on-Trent, they gave the town its present name, having called it Milford upon their first settlement. The town was governed largely after the Mosaic law and continued essentially Puritan for fifty years or more; about 1730 Presbyterianism superseded Congregationalism, and in 1734 Colonel Josiah Ogden, having caused a schism in the preceding year, by saving his wheat one dry Sunday in a wet season, founded with several followers the first Episcopal or Church of England Society in Newark—Trinity Church. Partly because of its Puritanic genesis and partly because of its independent manufacturing interests, Newark has kept, in spite of its nearness to New York City, a distinct character of its own. The College of New Jersey, now Princeton University, was situated here from 1747 to 1756, for all but the first few months under the presidency of the Rev. Aaron Burr, who published in 1752 the well-known *Newark Grammar*, long used in Princeton and originally prepared for Burr's very successful boys' school in Newark. The city received large additions to its foreign-born population immediately after the revolution of 1848, when many Germans settled here—a German daily newspaper was established in 1857. Newark was incorporated as a township in 1693, was chartered as a city in 1836 and received another charter in 1857; from it the township of Orange was formed in 1806 and the township of Bloomfield in 1812.

See H. L. Thowless, *Historical Sketch of the City of Newark, New Jersey* (Newark, 1902); F. J. Urquhart, *Newark, The Story of its Early Days* (Newark, 1904); and J. Atkinson, *The History of Newark, New Jersey* (Newark, 1878).

NEWARK, a city and the county-seat of Licking county, Ohio, U.S.A., at the confluence of three forks of the Licking river, on the Ohio Canal, and 33 m. E. by N. of Columbus. Pop. (1890) 14,270; (1900) 18,157, of whom 1342 were foreign-born and 300 were negroes; (1910 census) 25,404. Newark is served by the Baltimore & Ohio, and the Pittsburg, Cincinnati, Chicago & St Louis railways, and by inter-urban electric lines. It lies on a level plain, but is surrounded by hills. Along two of the forks of the Licking are some of the most extensive earthworks of the "mound builders"; they occupy about 3 sq. m., and have a great variety of forms: parallel walls, circles, semicircles, a parallelogram, an octagon, &c. About 10 m. S.W. and connected with Newark by electric line is Buckeye Lake, an artificial body of water about 8 m. long and 1 m. wide, frequented as a summer resort. Among the city's attractive features are Idlewilde Park and a beautiful auditorium, built

as a memorial to the soldiers and sailors of the Civil War. Newark is the trade centre of an agricultural region, which also abounds in natural gas and coal; natural gas is piped as far as Cincinnati. The city has electric car and steam car shops and various manufactures, including stoves and furnaces (the most important), bottles, table glass-ware, cigars, rope halters, machine furniture and bent wood. The total factory product in 1905 was valued at $5,612,587, an increase of 94·9% over that in 1900. Newark was laid out about 1801 and was incorporated in 1813.

For an account of the earthworks see Gerard Fowke, *Archaeological History of Ohio* (Columbus, 1902).

NEW BEDFORD, a city and port of entry, and one of the county-seats of Bristol county, Massachusetts, U.S.A., 56 m. S. of Boston, at the mouth of the Acushnet river, and at the head of New Bedford Harbor, an arm of Buzzard's Bay. Pop. (1890) 40,733; (1900) 62,442, of whom 25,529 were foreign-born, including 8559 French Canadians, 5389 English, 4802 Portuguese and 3020 Irish; (1910 census) 96,652. New Bedford is the terminus of two divisions of the New York, New Haven & Hartford railroad, and is connected with Taunton (the other county-seat), Fall River, Brockton and other cities by interurban electric railways. Passenger steamboat lines connect with Martha's Vineyard, Nantucket and Buzzard's Bay points; a freight line and, in summer, daily passenger service to New York are maintained; the Insular Navigation Co. (Empreza Insulana de Navegação) runs passenger and freight steamers from New Bedford to Lisbon, and to the Azores; and there is a regular sailing packet service between New Bedford and the Cape Verde Islands. Two bridges connect New Bedford with the township of Fairhaven, on the E. side of the harbour; one, a steel bridge, is almost 1 m. in length and cost $1,500,000. New Bedford is attractively situated, and, commercially, occupies a particularly favourable position. It covers about 20 sq. m., and extends along the W. side of the river and harbour for several miles. Unusual dockage facilities are thus provided. The harbour was improved by the Federal government, between 1840 and 1906, the channel from Buzzard's Bay through the harbour being 18 ft. deep and 200 ft. wide; under a project of 1907 it was contemplated to increase the depth of the channel to 25 ft. and the width to 300 ft. There is a broad driveway along the shore of the harbour to Clark's Point at the entrance, where during the Civil War the United States government erected a stone fort, Fort Rodman, in which a garrison of artillery is still maintained; New Bedford was one of the 26 places reported by the U.S. Chief of Engineers in 1909 as having "permanent seacoast defences." Among the principal buildings and institutions are the post office and custom house, the city hall, the county court house, the registry of deeds building, the masonic building, the merchants' national bank, the institution for savings, St Joseph's and St Luke's hospitals, the Swain free school, St Mary's (Roman Catholic) school, the Friends' academy, a state textile school, a state armory and St Mary's home. The public library, established as a private society library in 1802, taken over by the city in 1853, and housed in the refitted old city hall building, was one of the first free public libraries in the United States; it contains about 100,000 volumes, and has notable collections relating to the whaling industry and to the Quakers. The Sailors' Bethel, built in 1831, and containing memorial tablets reminiscent of the whaling days, is of interest. The Old Dartmouth Historical Society was organized in 1903. A fine park system, aggregating 255 acres, includes the Common, and Brooklawn, Buttonwood, Hazelwood, Grove and Triangle Parks. The city owns and operates a fine water-supply system.

When whale-oil was a widely used illuminant, New Bedford was long the principal port of the world's whaling industry; and in point of tonnage owned it is perhaps still so, as many New Bedford vessels now sail from San Francisco. As early as the middle of the 18th century, vessels sailed on whaling voyages from the mouth of the Acushnet river, but it was not until 1765, when Joseph Rotch, a Nantucket merchant, bought a tract of land on the W. side of the river and constructed wharves and warehouses, that the industry became established here. At first the whales were obtained principally off the Virginia and Carolina coasts, but by the outbreak of the War of Independence, the New Bedford whalers sought their prey as far as West Indian and even South American waters. The War of Independence temporarily ruined the industry, but it was soon re-established, and the field of operations was much extended, after 1791 many ships regularly rounding Cape Horn into the Pacific Ocean. By 1804 there were 59 whaling vessels registered from New Bedford. The unsettled commercial conditions of the early years of the 19th century and the Embargo combined to ruin the business once more, but the close of the War of 1812 ushered in the greatest era of prosperity for the industry. By 1845 only New York, Boston and New Orleans of American ports exceeded New Bedford in tonnage. The production was greatest in that year, New Bedford whalers importing 158,000 bbls. of sperm oil, 272,000 bbls. of whale oil and 3,000,000 lb of whalebone. The beginning of Arctic whaling in 1848 marked a new step in the industry, and the tonnage was much increased. The highest point in capital, tonnage and vessels was reached in 1857, when New Bedford possessed 329 registered whaling ships, representing an investment of $12,000,000 and employing afloat and ashore 10,000 hands. From a succession of causes, of which the introduction of petroleum into general use as an illuminant was the chief, the industry began to decline from this time. The Civil War was a great blow to the whalers; 25 vessels were sunk by Confederate cruisers, entailing a loss of $1,650,000, and many more were bought by the government to be sunk at the entrances of southern harbours, or to be used as colliers or store ships.[1] In 1871 and 1876 many vessels were lost in the Arctic ice, involving losses of several millions. Still the industry survives on a comparatively small scale; in January 1909 there were 13 steamers and barks, 1 brig and 4 schooners, with an aggregate tonnage of 4710, employed, chiefly in sperm whaling, and the oil and whalebone product of 1908 was valued at about $350,000.

The prosperity that New Bedford lost with the decline of the whaling industry has been more than made up by the growth of the cotton spinning industry. In 1905 New Bedford ranked second among the cities of the United States in the manufacture of cotton goods (including cotton small wares), producing 5% of the total for the country; the speciality of the mills is the finer cotton goods. The first cotton mill, a five-storey stone structure, was built by Joseph Grinnell (1789–1885) and his associates in 1847, and began operations in the following year with 15,000 spindles and 200 looms. This was the beginning of the Wamsutta Mills, in 1907 comprising 8 buildings, 228,000 spindles and 4300 looms. In 1909 the city had some 50 mills, with a total of over 2,137,000 spindles. The value of cotton goods manufactured in 1905 was $22,411,936, or 76·1% of all manufactured products of New Bedford (in 1890 the product was $8,185,286; in 1900 $16,748,783). Among the city's other manufactures are tools, cordage and twine, boots and shoes, glass, oils, lubricants (notably black-fish oil, a lubricant for watches and clocks, of which almost the entire supply is manufactured here), mechanical toys, beer, ale, woollen and silk goods, and paints. The total value of all factory products was $23,397,491 in 1900 and $29,469,349 in 1905. There is an extensive commerce in coal, raw cotton, lumber and fish; the direct foreign trade is comparatively small—in 1909 the imports were valued at $542,995, and the exports at $34,473.

The site of New Bedford was visited in 1602 by the English navigator, Bartholomew Gosnold, who traded with the Indians at the mouth of the Acushnet or Acoosnet. It was originally part of the town of Dartmouth, which was occupied by settlers from Plymouth, who in 1652 purchased the land from Massasoit, Sachem of the Narragansets, and his son Wamsutta (called Alexander by the whites). About 1665 there was a considerable influx of Quakers, and members of this sect have always formed

[1] From New Bedford in November and December 1861 sailed the "Stone Fleet," a flotilla of 45 whaling vessels collected by the Federal government and loaded with stone, most of which were sunk off Charleston and other harbours on the South Atlantic coast for the purpose of stopping blockade running.

an important and influential element in the population. There were few settlers on the site of New Bedford until the middle of the 18th century, and there was no village, properly speaking, until 1760. The town was first called Bedford after Joseph Russell, one of the founders, whose family name was the same as that of the dukes of Bedford; and it was later called New Bedford to distinguish it from Bedford in Middlesex county. During the War of Independence the harbour became a rendezvous for American privateers; this led to an attack, on the 5th of September 1778, by a fleet and armed force under Earl Grey, which burned seventy ships and almost destroyed the town. In 1787 New Bedford was set off from Dartmouth and separately incorporated as a township; in 1812 the township of Fairhaven was separated from it. New Bedford was chartered as a city in 1847. Its first newspaper, the *Marine Journal*, was established in 1792. The *Mercury*, founded in 1807, now one of the oldest newspapers in continuous publication in the country, was for some time edited by William Ellery Channing (1818–1901). There are Portuguese and French weekly newspapers.

Tower, *A History of the American Whale Fishery* (Philadelphia, 1907); and *The Old Dartmouth Historical Sketches* (1903 seq.), published by the Old Dartmouth Historical Society.

NEWBERN, a city, port of entry and the county-seat of Craven county, North Carolina, U.S.A., near the head of the estuary of the Neuse river and at the mouth of the Trent river, about 90 m. N.E. of Wilmington. Pop. (1890) 7843; (1900) 9090, of whom 5878 were negroes; (1910 census) 9961. Newbern is served by the Atlantic Coast Line and the Norfolk & Southern railways. The Federal government has improved both the Neuse and the Trent rivers for navigation; the Neuse has a channel of 8 ft. at low water to Newbern and one of 4 ft. from Newbern to Kinston, and the Trent a channel of 3 ft. from Newbern to Trenton. The Trent and the Neuse are both spanned here by railway and county bridges. The "Waterway between Newbern and Beaufort," projected in 1884, had in 1908 a controlling depth at mean low water of only 2 to 2½ ft.; it was decided to abandon this waterway on the completion of an inland waterway about 18 m. long with a channel 10 ft. deep at low water and 90-250 ft. wide, projected in 1907, which would give Newbern an outlet to the ocean at Beaufort. The remains of Tryon Palace, the residence of the royal governor and the meeting-place of the legislature, which was built by William Tryon (*q.v.*) in 1765–1770, and was said to be the finest building of its time in the colonies, are of historic interest, and among the principal buildings are the United States government building, the county court house, the county jail and the county home. At Newbern is one of the national cemeteries of the Federal government, containing many fine monuments. The most important industries are the manufacture of lumber (especially pine) and trucking. The total value of factory products in 1905 was $1,343,384. In 1907 about 1000 men, mostly negroes, were employed in the saw-mills, whose annual product averages about 170,000,000 ft. Among the manufactures are fertilizers, cotton seed oil and carriages; repair shops of the Norfolk & Southern railway are here; the fisheries are of considerable importance; and the city ships quantities of fish, cotton and market-garden produce—much of the last being forced under canvas with steam heat. It is the port of entry of the Pamlico customs district; in 1908 its imports were valued at $71,421. Newbern was settled in 1710 by a company of Swiss and Germans under the leadership of Baron Emanuel de Graffenried (d. 1735) and was named for Bern, Switzerland. It was incorporated as a city in 1723, but its present charter dates from 1899 with amendments adopted in 1907. For several years it was the capital of the province and for a long time was the chief seaport of the state. Although strongly fortified early in the Civil War, Newbern was captured by a Union force under General A. E. Burnside on the 14th of March 1862 after an engagement near the city in which the loss to the Confederates, who were under the command of General Lawrence O'Brien Branch, was about 578 in killed, wounded, captured and missing, and the loss of the Union force was 90 killed and 380 wounded. Unsuccessful attempts to recapture the city were made by the Confederates on the 14th of March 1863, and on the 1st of February and the 5th of May 1864.

NEWBERRY, JOHN STRONG (1822–1892), American geologist, was born at Windsor, Connecticut, on the 22nd of December 1822, and received a medical education at Cleveland, Ohio, taking the degree of M.D. in 1848. He completed his medical studies in Paris. His attention was early attracted to geology by collecting coal-measure plants from mines that had been opened by his father, and an acquaintance with Professor James Hall established his interest in the science. Hence while in Paris he studied botany under A. T. Brongniart. In 1851 he settled in practice at Cleveland, but in 1855 he was appointed surgeon and geologist to an exploring party in northern California and Oregon, and in 1857 his reports on the geology, botany and zoology were published. Between then and 1861 he was employed on similar work in the region of the Colorado river under Lieutenant J. C. Ives, and his researches were extended over a large area of previously unknown country in Utah, Arizona and New Mexico, the further results being published in 1876. During the Civil War he did important work as a member of the U.S. Sanitary Commission, his organizing capacity being specially marked during the operations in the Mississippi Valley. In 1866 he was appointed professor of geology and palaeontology at the Columbia School of Mines, New York, where he commenced the formation of a magnificent collection of specimens; in 1869 he was made state geologist of Ohio and director of the (second) Geological Survey there, and in 1884 palaeontologist to the U.S. Geological Survey. Four volumes on the geology of Ohio were published while he was director of the survey, his own reports being confined to the surface geology and to the coal-measures and their fossil plants. He devoted much labour to the study of Triassic, Cretaceous and Tertiary plants, and in particular to those of the Laramie stage. He also carried on researches among the Palaeozoic and Triassic fishes of North America. Among his other publications may be mentioned *The Origin and Classification of Ore Deposits* (1880). His work throughout was characterized by great care and conscientious study, and it was recognized by his inclusion in most of the learned societies of America and the Old World. He received the Murchison medal of the Geological Society of London in 1888, and was president of the American Association for the Advancement of Science (1867), of the New York Academy of Sciences (1867–1891), and of the International Congress of Geologists (1891). He died at New Haven, Conn., on the 7th of December 1892.

Memoir (with portrait) by J. J. Stevenson, *American Geologist* (July 1893).

NEWBOLT, HENRY JOHN (1862–), English author, was born on the 6th of June 1862, the son of H. F. Newbolt, vicar of St Mary's, Bilston. He was educated at Clifton College, where he was head of the school in 1881 and edited the school magazine, and at Corpus Christi College, Oxford. He was called to the bar at Lincoln's Inn in 1887 and practised until 1899. His first book was a story, *Taken from the Enemy* (1892), and in 1895 he published a tragedy, *Mordred*; but it was the publication of his ballads, *Admirals All* (1897), that created his literary reputation. These were followed by other volumes of stirring verse, *The Island Race* (1898), *The Sailing of the Long-ships* (1902), *Songs of the Sea* (1904). From 1900 to 1905 he was the editor of the *Monthly Review*. Among his later books his novels *The Old Country* (1906) and *The New June* (1909) attracted considerable attention.

NEW BRIGHTON, formerly a village (coextensive with the town of Castleton) of Richmond county, New York, U.S.A., but since the 1st of January 1898 the first ward of the borough of Richmond, New York City. It is at the north-eastern end of Staten Island, about 6 m. S.W. of the borough of Manhattan, with which it is connected by ferry. Pop. (1890) 16,423; (1900)

21,441, of whom 6575 were foreign-born and 259 negroes; (1905 state census) 23,659. At New Brighton is the Sailors' Snug Harbor, founded under the will of Robert Richard Randall (*c.* 1740–1801), who in 1771 became a member of the Marine Society of New York (an organization for the relief of indigent masters of vessels and their families), and in 1790 bought from Baron Poelnitz the "Minto farm," about 21 acres of land in what is now the Fifteenth Ward of the Borough of Manhattan. This tract, with four lots in what is now the First Ward of Manhattan, and cash and stocks to the value of about $10,000 Randall (who himself seems to have followed the sea for a time, and was called "Captain") bequeathed to a board of trustees, directing that the income should be used "for the purpose of maintaining and supporting aged, decrepit and worn-out sailors," who had served at least five years under the American flag, and that the institution established for this purpose should be called "the Sailors' Snug Harbor." The will was bitterly contested by relatives, but finally was fully upheld in 1830 by the United States Supreme Court. The Sailors' Snug Harbor was incorporated in 1806, and its charter was amended in 1828 to permit the building of the institution on Staten Island rather than on the Randall estate, which had already greatly increased in value. In 1833 the institution, with lands covering 160 acres, was opened in New Brighton with about 50 inmates. Randall's body was removed to the grounds in 1834, and buried under a marble monument, and in 1884 a life-size bronze statue of him, by Augustus Saint Gaudens, was placed in front of the main building. In 1909 the institution comprised the main building, a hospital, a chapel, a parsonage, residences for the officials, and several other buildings. The inmates (about 1000 in 1909) employ themselves at simple trades, or at work about the grounds; the use of intoxicating liquors is strictly prohibited, but the men are furnished with plenty of tobacco, and are well cared for. The present immense value of the land bequeathed by Randall makes Snug Harbor one of the most liberally endowed charitable institutions in New York City. At New Brighton are also a Home for Destitute Children of Seamen, founded in 1846 at Stapleton, Staten Island, removed to a new building on the Snug Harbor property in 1852, and maintained by contributions and gifts; and the Samuel R. Smith Infirmary, founded in 1861 by the Medical Society of Richmond county, and named in honour of a Staten Island physician. At New Brighton there are dry docks, paper and plaster mills, and silk-dyeing and printing works. The village as incorporated in 1866 included the northern half of the township of Castleton, and as reincorporated in 1872 included all of that township.

NEW BRIGHTON, a borough of Beaver county, Pennsylvania, U.S.A., on Beaver river, 2 m. from its confluence with the Ohio and 28 m. N.W. of Pittsburg. Pop. (1890) 5616, (1900) 6820 (487 foreign-born and 179 negroes); (1910) 8329. It is served by the Pennsylvania railway, and is connected by bridge with Beaver Falls. The borough has a public art gallery, a public park and a general hospital. Coal and fireclay abound in the vicinity, the Beaver river furnishes good water power, and the borough has various manufactures. New Brighton was laid out as a town in 1815 and was incorporated as a borough in 1838.

NEW BRITAIN, a city of Hartford county, Connecticut, U.S.A., near the centre of the state, about 9 m. S.W. of the city of Hartford; land area 13·09 sq. m. in 1906. Pop. (1890) of the township, including the city, 19,007; of the city, 16,519; (1900) of the township, including the city, 28,202; of the city, 25,998, of whom 9293 were foreign-born, including 1869 Irish and 1811 Swedes, who have a weekly published here; (1910 census) 43,916. It is served by the New York, New Haven & Hartford railway, and by several inter-urban electric railways. The city is the seat of a state normal school, and has a free public library, formerly the New Britain Institute, and a public park of about 100 acres. New Britain is an important manufacturing centre; its principal products are hardware, cutlery and edge tools, hosiery, and foundry and machine shop products. In 1905 the capital invested in manufacturing was $19,979,712 (an increase of 45·1% since 1900) and the value of the factory products was $14,959,543 (an increase of 34·8%). More than one-half of the product-value was in hardware ($7,537,625).

New Britain, which was settled in 1687, was originally a part of the township of Farmington. On account of ecclesiastical difficulties the "New Britain Society"—a parish—was organized in 1754. New Britain became a part of Berlin when that township was established in 1785. In 1850 the township of New Britain was incorporated, and in 1871 the city was chartered. By act of the state legislature in 1905 the township of New Britain and the city of New Britain were consolidated; the first election under the new charter was in April 1906. The city was one of the first in the country to build a municipal subway for electric light, telephone and telegraph wires.

See D. N. Camp's *History of New Britain* (New Britain, 1889).

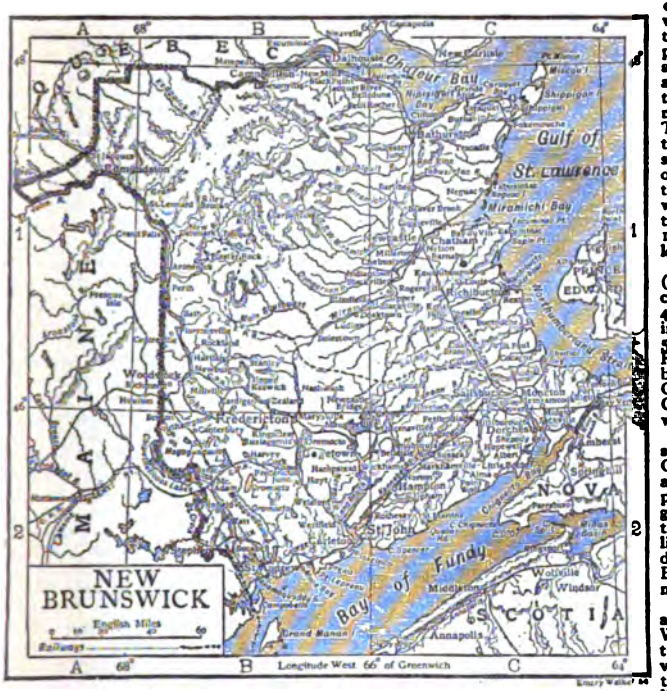
NEW BRUNSWICK, a province of the Dominion of Canada, lying between 45° 2′ and 48° 3′ N. and 63° 46′ and 69° 3′ W. Its length from N. to S. is 230 m., its greatest breadth 190 m., and it has a seaboard of about 550 m.

Physical Features.—The surface is generally undulating, but in the north and north-west of the province are many ranges of hills from 1000 to 2000 ft. in height, rising in Bald Mountain to 2400 ft. These elevations are an extension of the Appalachian Mountains and traverse the province from the state of Maine. This whole section of the province is densely wooded. The southern region embraces the district along the Bay of Fundy. Its coast is rocky and bold and interrupted by ravines. Inland the numerous rivers, flowing through the soft sandstone and conglomerate rocks, have cut broad valleys, the soil of which is extremely rich and fertile. Along the shores on the east coast, and for some miles inland, the country is flat and composed of mosses and marshes, but beyond that distance it rises into gently sloping hills, which extend as far as St John.

New Brunswick is a network of rivers, bays and lakes, several of which are navigable for vessels of large tonnage. The principal rivers are the St John, Miramichi, Restigouche, Saint Croix, Petitcodiac, Richibucto and Nipisiguit. The St John, which is famous for its scenery, rises in the state of Maine and is over 450 m. in length. It is navigable for vessels of moderate tonnage from St John on the Bay of Fundy to Fredericton, a distance of about 88 m., but steamers of light draught ply as far as Woodstock, 65 m. farther, and during the rainy season boats go as far as Grand Falls, a cataract 70 or 80 ft. high, 225 m. from the sea. Among the many lakes which it drains is Grand Lake, 20 m. long, and varying from 3 to 9 m. in breadth. The Miramichi flows N.E. into a bay of the same name. It is 225 m. long, 7 m. wide at its mouth, and navigable as far as Nelson (46 m.). In the spring and autumn small steamers and barges go much farther up. With its branches it drains a fourth of the province. A large lumber trade is done in this district, and many saw-mills are driven by the river. The Restigouche forms the north-east boundary of the province, is 100 m. in length and flows into the Bay of Chaleur. It is composed of five main branches, its name signifying in Indian "the river which divides like the hand." Large vessels may safely navigate it 18 m. from the bay. With its tributaries it drains over 4000 sq. m. of fertile and well-wooded country. The St Croix separates New Brunswick from the state of Maine at its south-west angle. Its source is a chain of lakes called the Chiputneticook. The Petitcodiac is navigable for 25 m. for ships, and schooners of 80 tons burden may proceed to the head of the tide, 12 m. farther; it empties into Shepody Bay. The Richibucto discharges into the Gulf of St Lawrence. The Nipisiguit and Tobique (a tributary of the St John) in the N. are in much repute among anglers.

The coast-line of New Brunswick is indented with numerous fine bays and harbours. The Bay of Fundy is an arm of the sea separating New Brunswick from Nova Scotia and terminating in two smaller bays, Chignecto Bay and the Basin of Minas. Its length up to Chignecto Bay is 140 m. and its extreme breadth 45 m. It is noted for its high tides, which rise about 30 ft. at St John and over 50 ft. at the head of Chignecto Bay. At Bay Verte, 14 m. distant, on the opposite side of the Isthmus of Chignecto, the tide rises little more than 4 or 5 ft. The Bay of

Chaleur, which has several excellent harbours, is over 90 m. in length and from 20 to 25 m. in breadth. The other inlets of consequence on the east coast are Miramichi, Richibucto, Buctouche, Cocagne and Shediac Bays; on the south coast are Passamaquoddy Bay, St John Harbour and Chignecto Bay.



At the mouths of the rivers are in nearly every case excellent harbours. To the province belong the islands of Campobello and Grand Manan, at the entrance of the Bay of Fundy, from both of which important fisheries are carried on.

Geology.—Along the Bay of Fundy, for about 30 m. inland, is a band of hard Cambrian and Cambro-Silurian rocks, with smaller areas of Devonian, Huronian and Laurentian. The city of St John is built upon very hard Cambrian slates, in which interesting fossils are found. North of this belt grey sandstones and conglomerates of Carboniferous age occupy a triangular area, the apex of which is near Oromocto Lake, the south side extending to Nova Scotia and the north-west side to Bathurst. Along the western border this area is 400 to 600 ft. high, but near the coast it is low and flat. "The Carboniferous area of New Brunswick is continuous across the isthmus [of Chignecto] with that of Nova Scotia, so that from Miscou on the Bay of Chaleur to Sydney on the Atlantic coast of Cape Breton, the whole coast of the Gulf of St Lawrence is bordered by coal-bearing rocks" (S. E. Dawson, *North America*, London, 1897). North-west of the Carboniferous a belt of 40 to 50 m. wide is occupied by Ordovician and pre-Cambrian formations, with large masses of intrusive granite. The Ordovician is composed of schistose, micaceous, and foliated slates and quartzites, in places highly altered and disturbed. The pre-Cambrian rocks consist of very hard crystalline reddish felsite, chloritic quartzites, and felspathic and micaceous schists. The whole of this region is rugged and broken into numerous ranges of hills. The remainder of the province to the north-western boundary is occupied by Silurian rocks, mostly calcareous slates and shales associated with beds of limestone. The whole province has been mantled with ice in the Pleistocene period, and boulder-clay and later modified deposits occupy the surface. Marine clay and sand containing fossil shells are found along the coast.

Climate.—The climate, though subject to extremes, is healthy. The average mean temperature in summer is 60° F., and in winter 19° F. The average rainfall for thirty years (1875 to 1905 inclusive) was 32·6 in., whereas in the neighbouring province of Nova Scotia, with its larger coast-line, it was 39·6. The winters are severe, and snow falls to a great depth, but the harbour of St John is open throughout the year. During the period 1875–1905 the average yearly snowfall was 97·5 in., 20 in. more than in Nova Scotia. The autumn is delightful, especially during the "Indian summer," after the first frost, but before the weather has broken.

Area and Population.—Not including the territorial sea, the area of the province is 27,985 sq. m., of which 74 are water. It thus occupies an area rather larger than that of the mainland of Scotland. The population in 1901 was 331,120, and is practically stationary, there being little or no immigration, and a steady exodus to the United States and to the western provinces of the Dominion. The number of males slightly exceeds that of females. The bulk of the people are of English descent, the remainder Irish and French. The Scots, so prominent in nearly all the other provinces of the Dominion, are here less conspicuous. Of the original Indian inhabitants of the province, who were of Algonquian stock and divided into two tribes, the Micmacs and the Malicites, about 1700 remain, many of whom have a greater or less proportion of white blood.

The capital is Fredericton, on the St John (pop. in 1901, 7117). The chief shipping and commercial centre is St John (pop. in 1901, 40,711). Moncton is a large railway centre (pop. in 1901, 9026). None of the other towns exceeds 5000 inhabitants. Owing to the large Irish and French element over one-third of the population belongs to the Roman Catholic Church. Campbellton (pop. 5000), a northern port on Chaleur Bay, with an important lumber trade, was destroyed by fire in July, 1910.

Administration.—The province sends ten senators and fourteen members of the House of Commons to the federal parliament. Since the abolition of the legislative council in 1892 the provincial legislature has consisted of a lieutenant-governor and a legislative assembly. Though in this the members are nominally divided on party lines, the smallness of the population renders the division rather one of persons than of principles. Both city and county districts have an elective municipal system.

Education.—There is a good system of primary and secondary schools under provincial control. When in 1871 the system of free undenominational primary schools supported by the province was introduced, feeling rose so high among the Roman Catholics that rioting broke out and life was lost. In view of the provisions in the British North America Act for protecting the rights of religious minorities, the Roman Catholics sought to have the new system declared unconstitutional, but the case, after being carried to the judicial committee of the imperial privy council, was decided against them. In 1875 a compromise was arranged, by which practical though not theoretic satisfaction is given to that church. Renewed rioting broke out among the French Roman Catholics in 1890, but after some years the compromise of 1875 was confirmed. At Fredericton an efficient normal school for the training of teachers is maintained, and a school for the deaf and dumb. The lazaretto for lepers at Tracadie and the marine hospital at St John are supported by the Dominion. At Fredericton is a small provincial university, founded in 1800 and re-established in 1859; at Sackville is the university of Mount Allison College under Methodist control, and at Memramcook one, working chiefly among the French, is owned by the Roman Catholics. In all these an adequate training is given in law, theology and the literary subjects, but for science, whether pure or applied, most of the provincial students go either to the United States or to the universities of Upper Canada.

Either owing to the beauty of its scenery or to the excellence of its education New Brunswick has produced a school of poetry, headed by Charles Roberts, which is unique in the Dominion.

Agriculture.—The great predominance of the lumber industry has tended to keep agriculture in the background. There is also a steady flow of the most active young men to the greater opportunities offered by the Canadian and American west. Thus the area under crop tends slowly to decrease. Rather more than 6000 sq. m. is now occupied, of which about 1500 is under crop and about 700 used for pasture, the rest being for the most part still covered with forest. In all the river valleys, and especially on the fertile diked lands along the head of the Bay of Fundy, many rich and prosperous farms are found varying in size from 100 to 240 acres, and good crops of wheat, oats, buckwheat and all the staple grains and roots are grown. The raising of sheep and cattle, and the production of cheese and butter, are becoming industries of importance. A dairy school is maintained by the provincial government at Sussex (King's county). Though no great development of agriculture is possible, a quiet, equable prosperity is attained by

hundreds of farmers. Much crown land still remains unoccupied, and is sold by the provincial government on easy terms to bona fide settlers.

Forests.—Its great forests, through which flow numerous rivers with excellent harbours at or near their mouths, have long made New Brunswick a centre of lumbering. This industry has affected the whole development of the province, and the wilder and more unsettled life of its woodsmen contrasts with that of the farmer of Ontario or of the west. The most valuable and most widely-spread tree is the black spruce (*Abies nigra*), from which is made a yearly increasing quantity of wood-pulp for paper-making. The hemlock (*Abies Canadensis*), the cedar, birch, beech, oak, ash and many other valuable trees, are also widely spread. The chief ports for shipping are St John, at the mouth of the St John river, and Chatham, at the mouth of the Miramichi.

Though much remains, much has been destroyed by forest fires. To this day traces may be seen of the fire which in 1825 utterly destroyed hundreds of square miles of timber along the river Miramichi.

The same forests are also a paradise for sportsmen. The game laws are being made increasingly strict, and the province draws a large revenue from the sale of licences, extra fees being imposed on sportsmen from other countries. Moose (*Cervus alces*), caribou and deer may only be shot during about two months in the autumn, and the number allowed to each gun is strictly limited. In 1902 the provincial government set aside a large area of the highlands at the sources of the Tobique, Nipisiquit and Miramichi rivers for a national park and game preserve.

Mines and Fisheries.—The mineral wealth of the province is small, though gold, iron, copper, lead, zinc and plumbago have been worked on a small scale at various times. Coal seams are numerous, but are worked solely for local consumption. Albertite, a species of coal found in Albert county and giving a very hot flame, is now exhausted. Limestone and gypsum are extensively quarried near St John and in Albert county.

The fisheries, on the other hand, are extensive, though less so than those of Nova Scotia. This industry centres in the counties of Charlotte and Gloucester, herring, salmon, lobsters, sardines and cod forming the chief catch. The Restigouche and other rivers near the northern border are much frequented by anglers in search of trout and salmon.

Manufactures.—The chief manufactures, apart from the shipping of St John, are connected with lumbering and with agriculture. The making of paper pulp and of furniture is growing steadily in importance. Co-operation in the manufacture of butter and cheese has produced excellent results, and numerous cheese and butter factories are scattered through the province. In no sense, however, does New Brunswick play an important part in the manufactures of the Dominion.

Communications.—The rivers are still the main arteries of the province. The roads, though improving, are as a rule bad. The main railway system has since 1876 been that of the Intercolonial, owned and operated by the federal government, by which the province is linked to Nova Scotia on the E. and to the rest of Canada on the W. The Canadian Pacific and the Grand Trunk Pacific also run through the province, and by the Canadian Pacific and the Maine Central it has communication with the United States. Various lines of steamers run, chiefly from St John, to American and other Canadian ports.

History.—Until 1784 New Brunswick formed part, first of the French province of Acadia, later of the British province of Nova Scotia. The first settlement within its borders was made in 1604 by Pierre de Guast, sieur de Monts, with whom was Samuel de Champlain. Their colony at the mouth of the St Croix river was soon abandoned, but throughout the French régime the district was frequented by bands of fur-traders. In 1762 the first English settlement was made at Maugerville on the St John river, and in 1764 a body of Scottish farmers and labourers took up land along the Miramichi. On the 18th of May 1783 a band of American loyalists settled at the mouth of the St John. Thousands more followed, and in 1784 New Brunswick was declared a separate province. At first governed by a representative assembly and an irresponsible council, it obtained responsible government in 1847–1848, after a constitutional struggle in which no little ability was shown. In 1867 it entered without reluctance but without enthusiasm into the Canadian Federation. Its economic and educational history, both more important than its political, have been indicated in earlier parts of this article. (For the boundary dispute, see MAINE.)

BIBLIOGRAPHY.—Sir J. W. Dawson, *Acadian Geology* (edition of 1891), is the most easily accessible work on the geology of the province. Numerous studies have been published, chiefly by the Geological Survey of Canada, by L. W. Bailey, R. W. Ells, A. P. Low, and G. F. Matthew. Valuable papers on various provincial subjects have been published in the *Transactions* of the Royal Society of Canada by W. F. Ganong. The provincial government issues a yearly volume of sessional papers; *Acadiensis*, a magazine published in St John, should also be consulted. The earliest account of New Brunswick is given by Nicholas Denys, *Description géographique* (published Paris, 1672; republished by W. F. Ganong with notes and introduction, 1908); there is no good modern history; R. Montgomery Martin, *History of New Brunswick* (1837); G. E. Fenety, *Political Notes* (1867); James Hannay, *History of Acadia* (1879), and *Lives of Wilmot and Tilley* (1907) may be consulted. (W. L. G.)

NEW BRUNSWICK, a city and the county-seat of Middlesex county, New Jersey, U.S.A., on the Raritan river, at the terminus of the Delaware & Raritan canal, about 23 m. S.W. of Newark. Pop. (1890) 18,603, (1900), 20,006, of whom 3526 were foreign-born and 755 were negroes; (1910 census) 23,388. It is served by the Pennsylvania and the Raritan River railways, and by daily steamboats to New York. There is a fine stone bridge across the Raritan. In the city are the Wells Memorial Hospital, St Peter's General Hospital, a Carnegie library, a Federal building and a Soldiers' Monument. New Brunswick is the seat of the Theological Seminary of the Reformed Church in America, the oldest theological school in the United States, founded in 1784 in New York City, situated at Flatbush, Long Island, in 1796–1810, and removed to New Brunswick in 1810, and of Rutgers College (originally Dutch Reformed, now non-sectarian), which was founded in 1766 as Queen's College, was rechartered in 1770 as a college for "the education of youth in the learned languages, liberal and useful arts and sciences and especially in divinity," was first opened for instruction in 1770, was closed during 1795–1807 and 1816–1825, and was renamed in 1825 in honour of Colonel Henry Rutgers (1745–1830), of New York City, a liberal benefactor. The college embraces two schools: the classical school and the scientific school, which in 1864, in pursuance of the Morrill Act of 1862, was constituted by the state legislature as the state college for the benefit of agriculture and the mechanic arts; a preparatory school is also controlled by its trustees. An agricultural experiment station is maintained in connexion with the college. In 1908–1909 there were 306 students. In 1908 the library of Rutgers College contained 57,000 volumes, and that of the Theological Seminary 48,000 volumes. The city has a variety of manufactures, and the total value of factory products in 1905 was $8,916,983, 54% more than in 1900.

A settlement was made here in 1681, and for a time the place was known as Prigmore's Swamp; later, after John Inian had established a ferry across the river, it was called Inian's Ferry; the present name was adopted in honour of the house of Brunswick. New Brunswick received a city charter from the royal governor in 1730, and was chartered as a city by the state legislature in 1784. During the War of Independence, General Washington and his army entered New Brunswick on the 28th of November 1776, but on the approach of the enemy evacuated it, and from the 3rd of December 1776 to the 13th of April 1777 it was occupied by the British under Lord Howe. Cornelius Vanderbilt was for several years the proprietor of the Bellona Hotel of New Brunswick, now a tenement house.

NEWBURGH, or NEWBURG, a city of Orange county, New York, U.S.A., on the W. bank of the Hudson river, about 57 m. N. of New York City. Pop. (1890) 23,087, (1900) 24,943, of whom 4346 were foreign-born and 558 negroes; (1910, census) 27,805. It is served by the Erie, the West Shore, and—by ferries across the Hudson—the Central New England and the New York Central & Hudson River railways. Across Newburgh Bay, as the expansion of the Hudson at this point is called, is the village of Fishkill, and an electric line connects with the village of Walden (pop. in 1910, 4004), about 12 m. N.W., which has various manufactures, the most important being pocket-knives. The city occupies a commanding position on terraces rising abruptly from the river, and on the flat plateau above, whence a view may be obtained of the Catskill Mountains to the N.W., of the Highlands of the Hudson to the S. and of the Hudson river for many miles in both directions. Orange Lake, between Newburgh and Walden, is known for its ice

yachting and skating races. Washington Park is in the central part of the city. Downing Park, named in honour of the horticulturist and landscape gardener Andrew Jackson Downing, (1815–1852), a native of Newburgh, lies on a high plateau overlooking the city and the surrounding country. Among Newburgh's institutions are a public library, St Luke's Hospital, a Children's Home, Mount St Mary's Academy (Roman Catholic) and a business college. In Colden Square there is a statue of Governor George Clinton. Cotton, woollen and silk goods, laces, paper, plaster, plush, felt and felt hats, carpets, engines and boilers, and mill and farm machinery are manufactured, and there are ship and brick yards. In 1905 factory products were valued at $7,142,327, an increase of 33·3% over their value for 1900. Newburgh was first settled in 1709 by a colony of Germans from the Rhenish Palatinate under their minister, Joshua Kockethal (d. 1719), and was known as "the Palatine Parish of Quassaic." Toward the middle of the century many of the Germans removed to Pennsylvania, and Scottish and English settlers took up their abandoned lands. In 1752 the place was renamed Newburgh, after the town of that name in Scotland, whence many of the new settlers had come. From the spring of 1782 until August 1783 Washington made his headquarters here, occupying the Hasbrouck House (built by Jonathan Hasbrouck between 1750 and 1770), which is still standing in Washington Park, and was bought by the state in 1849. It long contained a collection of historical relics, for which the state has erected a brick building in Washington Park. It was here on the 27th of May 1782 that he wrote his famous letter of rebuke to Colonel Lewis Nicola (1717–c. 1807), who had written to him on behalf of a coterie of army officers, it is said, suggesting that he assume the title of king. Here, also, Washington made his reply to the so-called "Newburgh Addresses," written by John Armstrong, and calling for action on the part of the army to force Congress to redress its grievances. Here the arrangements were completed for the disbandment of the Continental Army, and the centenary of the disbandment was celebrated here on the 18th of October 1883. In commemoration of the disbandment also a monument, known as the "Tower of Victory" (53 ft. high, with a life-sized statue of Washington), was erected in Washington Park by Federal and state authorities. Newburgh was incorporated as a village in 1800 and chartered as a city in 1865. The U.S. Geographic Board spells the name Newburg, but the spelling Newburgh is adopted locally and by the U.S. Post Office.

See E. M. Ruttenber, *History of the Town of Newburgh* (Newburgh, 1859) and *History of Orange County* (Newburgh, 1872).

NEWBURGH, a royal and police burgh of Fifeshire, Scotland. Pop. (1901) 1904. It is situated on the Firth of Tay, 7 m. N.W. of Ladybank Junction by the North British Railway. Its industries chiefly consist of the making of linen and floorcloth, malting and quarrying, and there are fisheries, especially of salmon. The harbour is used for the transhipment of the cargoes of Perth-bound vessels of over 200 tons. On high ground, about 1 m. S.W., stand the remains (only the pedestal) of Macduff's Cross, which marks the spot where the clan Macduff—in return for the chief's services against Macbeth—was granted rights of sanctuary and composition for murder done in hot blood. Denmyln castle, about 1½ m. S.E. of Newburgh, was the home for more than 250 years of the Balfour family, of which the two brothers, Sir James (1600–1657), the annalist and Lyon King, and Sir Andrew (1630–1694), founder of the Botanic Garden in Edinburgh, were the most distinguished members. Lindores abbey, the gem of the district, is situated on the Tay, close to Newburgh, and 1½ m. N. of the village of Lindores. Of the Benedictine abbey, founded in 1178 by David, earl of Huntingdon, brother of William the Lion, there only remain the groined arch of the principal entrance, a portion of the west tower and other Early English fragments, but the ground plan of the whole structure can still be traced. The monks were noted agriculturists and their orchards famous. At Blackearnside, a forest of alders, to the east of the village, Wallace defeated the earl of Pembroke in 1298.

NEWBURN, an urban district in the Tyneside parliamentary division of Northumberland, England, on the Tyne, 5½ m. W. of Newcastle by a branch of the North Eastern railway. Pop. (1901) 12,500. It has collieries, and iron, steel, engineering, tool and fire-clay works, and there is a large industrial population. Newburn is of considerable antiquity. Roman remains have been discovered in proximity to Hadrian's Wall. A church here was destroyed by fire in 1072 in the course of a dispute between two claimants of the earldom of Northumberland. Here in 1640 the Scottish Covenanters planted guns to protect them while fording the river, after which they defeated the English on the Durham side at Stellaheugh, and subsequently occupied Newcastle. The name of Scotswood, one of the manufacturing villages between Newburn and the city, commemorates one of their positions. The district has many associations with the famous engineer George Stephenson, born at Wylam, 3 m. W.

NEWBURY, a market town and municipal borough in the Newbury parliamentary division of Berkshire, England, 53 m. W. by S. of Reading by the Great Western railway. Pop. (1901) 11,061. It is beautifully situated in the narrow well-wooded valley of the Kennet, which is followed by the Kennet and Avon canal. The town has north and south communications by the Didcot, Newbury & Southampton railway (worked by the Great Western company), and is the terminus of the Lambourn Valley light railway. The church of St. Nicholas is a large Perpendicular building of the beginning of the 16th century. It is said to have been built mainly at the charge of John Winchcombe or Smalwoode (Jack of Newbury), an eminent clothier, who, according to the brass to his memory, died in February 1519. A few picturesque old buildings remain in the town, including part of Winchcombe's house and the Jacobean cloth hall, now a public museum. The almshouses called King John's Court are supported by a foundation known as St Bartholomew's Hospital, to which in 1215 King John granted by charter (renewed in 1596 to the corporation) the profits of a fair on St Bartholomew's day (24th of August). Shaw House, on the outskirts of the town to the north-east, is an Elizabethan mansion of brick, dating from 1581; to the north is Donnington castle, retaining a Perpendicular gateway and other fragments. The suburb of Speenhamland was formerly an important posting station on the Bath road. At Sandleford Priory, to the south of Newbury, the site and part of the buildings of an Augustinian priory (*c.* 1200) were utilized in the erection of a mansion, in 1781, for Mrs Elizabeth Montague. The householders of Newbury have the right to elect boys and girls to the educational foundation of Christ's Hospital. The cloth industry is long extinct in Newbury, but large wool fairs are held annually; there is considerable agricultural trade, and there are breweries and flour mills. A racecourse was opened in the vicinity of the town in 1905, and six meetings are held annually. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 1828 acres.

Newbury (Neubiri, Neubiry) possibly owes its origin to the village of Speen on the other side of the Kennet, which probably marks the site of the Roman station Spinae. The name Newbury (new town or borough) is first mentioned by Odericus Vitalis; it is probable, however, that the manor of Uluritone, entered in Domesday as held by Ernulph de Hesdain and containing fifty-one houses, covered a large part of the site of the town. The manor was subsequently held by the Marshalls, and later by the Mortimers, through whom it passed to the house of York and the crown. It formed part of the dowry of several queens-consort, and was held by Elizabeth before her accession. In 1627 it was granted by Charles I. at a fee-farm to the corporation. Newbury was a borough by prescription; in 1187 its inhabitants are called "burgesses" and a document of the time of Edward I. speaks of it as "*burgus*." It was incorporated by a charter of Elizabeth (1596) which was confirmed by Charles I. and Charles II.; a doubtfully valid charter of James II. (1685). Newbury sent two representatives to the parliament of 1302 and delegates to a council held in the reign of Edward III.

Newbury early became a centre of the woollen industry,

but at the beginning of the 17th century this was declining. John Kendrick (d. 1624) left a sum of money to benefit the clothing trade and to "set the poor on work," but the result was not what was expected. Elias Ashmole (d. 1629) says: "Newbury had lost most of its clothing trade, which the navigation of the river Kennet hither, now begun, will probably recover"; the trade, however, was already irrevocably lost. The Weavers' Company, which still exists, was incorporated in 1601. In the 18th century a considerable trade was done in corn and malt. Newbury castle, of which traces remained until the 17th century, is said to have been besieged by Stephen in 1152. Newbury was the scene of two battles during the Civil War, in the first of which (1643) Lord Falkland was killed. An important woollen market, established in 1862, is held annually on the first Wednesday in July.

See W. Money, *History of Newbury* (1887); *Victoria County History, Berks.*

NEWBURYPORT, a city and port of entry and one of the county-seats of Essex county, Massachusetts, U.S.A., on the S. bank of the Merrimac river, about 3 m. above its mouth, and about 38 m. N.N.E. of Boston. Pop. (1890) 13,947; (1900) 14,478, of whom 2863 were foreign-born; (1910 census) 14,949. Area, about 12·85 sq. m. The city is served by two divisions of the Boston & Maine railroad, and by coast and river freight steamers. There are many houses dating back to the 17th century; of these the stone "garrison" house (in Newbury), with walls 4 ft. thick and built in the form of a cross, is an interesting example. Other private houses worthy of mention are the former homes of "Lord" Timothy Dexter and Caleb Cushing, the birthplace of William Lloyd Garrison, and (3½ m. from Newburyport in the township of West Newbury) Indian Hill Farm, the birthplace of the journalist Ben Perley Poore (1820–1887), author of *Perley's Reminiscences of Sixty Years in the National Metropolis* (1886). Among the public buildings and institutions are the Marine Museum, the Public Library (founded in 1854 by Josiah Little and containing about 45,000 volumes), the old Tracy mansion (built in 1771 or 1772), which forms part of the Public Library building, the Anna Jacques and Homoeopathic hospitals, homes for aged women and men, a Home for Destitute Children, Old South Church, in which is the tomb of George Whitefield, and the Young Men's Christian Association building, which is a memorial to George Henry Corliss (1817–1888), the inventor, erected by his widow, a native of Newburyport. The General Charity Society is a benevolent association. The city has a good public school system. The Female High School was opened in 1843 and is said to be the first high school for girls to be established in the United States. The Putnam Free School, now part of the public school system, was endowed early in the 19th century by Oliver Putnam of Newburyport and afterwards of Hampstead, New Hampshire. Three parks, Washington, Cushing and Atkinson, are maintained by the city; and there are a statue of George Washington (1879), by J. Q. A. Ward, one of William Lloyd Garrison by D. C. French, and a memorial to the soldiers and sailors of the Civil War—a bronze statue, "The Volunteer"—by Mrs Theo (Ruggles) Kitson. A curious chain suspension bridge across the Merrimac, connecting Newburyport with Amesbury, was built in 1827, replacing a similar bridge built in 1810, which was one of the first suspension bridges in America.

Newburyport in the early part of the 18th century was one of the most prosperous commercial centres in New England. At that time fishing, whaling and shipbuilding were its principal industries, the clipper ships built here being among the fastest and best known on the seas. After the Civil War manufacturing became Newburyport's chief interest. In 1905 its factory product was valued at $6,809,979, an increase of 32·5% since 1900; ·57·6% was in boots and shoes, and the manufactures of combs and silverware, silversmithing products, cotton goods and electrical supplies are also important.

Newbury, including the site of the present Newburyport, was settled in 1635 by a company under the leadership of the Rev. Thomas Parker (1595–1677), who had taught in Newbury, England, in his youth. In 1639 a portion of the territory was set off to form the town of Rowley, and in 1764 about 647 acres were set off and incorporated as the town of Newburyport. In 1819 the town of Parsons (now West Newbury) was formed from Newbury. Newburyport, with its area considerably enlarged, became a city in 1851. During the War of Independence and the War of 1812 it sent out many privateers. In 1811 a fire destroyed 250 buildings, including the greater part of the business portion of the town.

See Caleb Cushing, *History and Present State of the Town of Newburyport* (Newburyport, 1826); Joshua Coffin, *History of Newbury, Newburyport, and West Newbury, 1635–1845* (Boston, 1845); Mrs E. V. Smith, *History of Newburyport* (Boston, 1854); D. H. Hurd, *History of Essex County* (Philadelphia, 1888); J. J. Currier, *History of Newbury from the First Settlement of the Town to the Beginning of the Twentieth Century* (Boston, 1902), *History of Newburyport, 1764–1905* (Newburyport, 1906), and *Ould Newbury, Historical and Biographical Sketches* (Boston, 1898).

NEW CALEDONIA (Fr. *Nouvelle-Calédonie*), an island in the western Pacific Ocean, belonging to France. (For map, see PACIFIC OCEAN.) It is about 250 m. long, and has an extreme breadth of 35 m. and an area including adjacent islets of 6450 sq. m.; is situated at the southern extremity of Melanesia, between 29° 5′ and 22° 16′ S., and between 164° and 167° 30′ E., and, like all the chief islands of that chain and the chain itself, lies north-west and south-east. An almost unbroken barrier reef skirts the west shore at about 5 m. distance, enclosing a navigable channel; on the east, which is more abrupt and precipitous, it is much interrupted. To the north the reefs continue, marking the former extension of the land, for about 160 m., ending with the Huon Islands. The Isle of Pines, so called from its araucarias (its native name is *Kunie*), geologically a continuation of New Caledonia, lies 30 m. from its south-east extremity. It formerly abounded in sandalwood, and consists of a central plateau surrounded by a belt of cultivation. At the two extremities of New Caledonia, parallel longitudinal ranges of mountains enclose valleys; for the rest the island consists essentially of confused masses and ranges of mountains, rising to an extreme elevation of 5387 ft., the plains being chiefly the deltas of rivers. The landscape is rich and beautiful, varied with grand rock scenery, the coast-line being broken by numerous small bays, into which flow streams rarely navigable even for short distances, but often skilfully utilized by the natives for irrigation; and sometimes flowing in subterranean channels. The larger rivers in the wet season form impassable morasses, especially in the S.E., where the mountains rise in isolated masses from flat plains.

Geology.[1]—Speaking generally, New Caledonia may be described as a band of Palaeozoic and probably Lower Palaeozoic rocks, associated doubtless with some Archean beds; this band runs from north-west to south-east, through the whole length of the island. The second element in the composition of the island consists of Mesozoic beds, which occur in a broken band along most of the south-western coast. Most of the island is occupied by the band of the old rocks, which include mica, glaucophane and sericite-schists and slates; there are small intrusions of granite, and numerous dikes and masses of basic eruptive rocks. The slates are interbedded with limestones containing fossil brachiopods, which have led to their determination as Silurian or Devonian; but L. Peletan classes all these limestones as Triassic. Triassic beds of the Pacific coastal type occur in a band along the south-western coast. They are covered by marine Jurassic beds and they in turn by Cretaceous coal-bearing, terrestrial deposits, resembling those of New Zealand. According to E. Glasser, the basic igneous rocks which are associated with the mineral deposits of New Caledonia were intrusive in Cainozoic times, at the severing of the connexion between New Caledonia and New Zealand. New Caledonia is part of the Australasian Festoon, and in its general characters resembles the geology of New Zealand. The main mineral deposits are the nickel ores, occurring as veins of garnierite, associated with peridotite dikes, in the ancient rocks of the eastern slope of the island.

[1] The basis of knowledge of the geology of New Caledonia was laid by Garnier, *Ann. des Mines*, ser. 6, vol. xii. (1867). Later accounts are by E. Glasser, "Les Richesses minérales de la Nouvelle Calédonie," *Ann. des Mines*, ser. 10, vol. iv. mem. pp. 299-392, pl. xi., and vol. v. mem. pp. 29-54, 503-701, pl. ii. and xii. (1904); and by L. Peletan, *Les Richesses minerales des colonies françaises* (Paris, 1902).

Climate, Flora, Fauna.—The hottest and wettest months are from December to March, but there is usually a fresh trade-wind blowing and the climate is healthy. There is much less moisture, and the flora is of a less tropical character than farther north; it has some Polynesian and New Zealand affinities, and on the west coast a partially Australian character; on the higher hills it is stunted; on the lower, however, there are fine grass lands, and a scattered growth of niaulis (*Melaleuca viridiflora*), useful for its timber, bark and cajeput oil. There is a great variety of fine timber trees. The bread-fruit, sago, banana, vanilla, ginger, arrowroot and curcuma grow wild. The cocoa nut, maize, sugar-cane, coffee, cotton, rice and tobacco (which last does not suffer like other crops from the locusts) do well. The orange, indigo, lucerne and European vegetables are grown. Mammals are very few; they include the rat and *Pteropus* and other bats. The commonest birds are pigeons (the large notou and other varieties), doves, parrots, kingfishers and ducks. The kagu (*Rhinochetus jubatus*), a peculiar "wingless" bird, is found here only. Turtle abound on the coast, and fish, of which some kinds, as the tetrodons (globe-fish), are poisonous, especially at certain seasons. Land and marine molluscs are numerous, and include various edible kinds.

Population.—At the census of 1901 the population of New Caledonia numbered 51,415, consisting of 12,253 free Europeans (colonists, soldiers, officials), 29,106 natives, 10,056 convicts. In 1898, however, the introduction of convicts into the island ceased. The centres of population are Nouméa (Numea), the capital, on a fine harbour of the west coast near the southern extremity of the island, with 7000 inhabitants; Bourail, an agricultural penitentiary (1800); La Foa, in the centre of the coffee plantations; Moindu, St Louis and St Vincent.

The natives, whom the French call Kanakas (*Canaques*, a word meaning "man," applied indiscriminately to many Pacific peoples), live on reservations. They are Melanesians of mixed blood, of two fairly distinct types, one sub-Papuan and the other Polynesian. Of the first the physical characteristics are a small, thin-limbed body, hair black, short and woolly, projecting jaws, rounded, narrow, retreating forehead, long and narrow head, enormous eyebrow ridges, flat nose and dark skin. The second type is characterized by a lighter skin, sometimes of a reddish-yellow, longer, less woolly hair, body taller with better-proportioned limbs, and head broader. This is the prevailing type in the east and south of the island. There is nowhere a real defining line between the two (many New Caledonians having black skins and woolly hair with Polynesian superiority of limb), but the Polynesian type is generally found among the chiefs and their kindred.

Both sexes among the natives pierce the lobes of the ear for ornaments. Tattooing is almost entirely confined to the women. Both sexes go naked, or with the scantiest loin-cloth. Their huts are usually beehive-shaped, with a single apartment, low narrow door, and no chimney. There are various degrees of hereditary chiefships, and a supreme chief recognized by all. As in some other Pacific islands, when a son is born the chiefship passes to him, but the father continues to govern as regent. All property descends to the eldest son by birth or adoption, though custom demands that the younger members of the family should have a share. The people have to work on the chief's plantations and fisheries, and also work in parties for each other, breaking up new land, &c. This often ends in feasting and in dances (*pilu pilu*), which include allegorical representations of events or ideas. The supreme chief's authority is limited by the advice of a council of elders, whom he is obliged to summon in certain emergencies. The standard of morality is low; women are practically slaves, and infanticide was formerly common.

The Kanakas are excellent agriculturists, being accounted superior in this matter to every other race of the Pacific. About the middle of the 19th century the indigenous population was 60,000. Returns for 1904 showed that this had fallen to rather less than half.

The languages of the different tribes are mutually unintelligible. They express abstract ideas imperfectly. Thus there are several words for eating, each applied to a particular article of food. Their reckoning shows the same peculiarity. The numbers go up to five, and for living objects the word *bird* is added, for inanimate *yam*, for large objects *ship*.[1] There are other terms for bundles of sugar-canes, rows (planted) of yams, &c.; and sometimes things are counted by threes. Ten is two fives, 15 three fives, 20 is a "man" (ten fingers and ten toes), 100 is "five men," and so on.

Administration and Industries.—The colony is administered by a governor, who exercises military power through a marine infantry colonel, and civil power with the assistance of a privy council, a director of the interior, a judicial head, and a director of the penitentiary administration. There is also an elective general council. Nouméa is the seat of a superior tribunal, a tribunal of first instance, and a tribunal of commerce. The island and its dependencies are divided into five arrondissements. Nouméa alone has (since 1879) a municipality, other localities being administered by commissions. There are about 1600 sq. m. of cultivable lands in the alluvial valleys, where coffee, maize, tobacco, sugar-cane, the vine, vegetables, potatoes, and some of the cereals are grown with success. Coffee was introduced about 1870, and has prospered well. Cheap agricultural labour is supplied by the convicts, by the liberated convicts, the Kanakas, and (to some extent) labourers from the New Hebrides. The soil is in three domains: that of the state, for the working of which concessions may be granted; that of the penitentiary administration; and that of the native reserve. Many horses, cattle and sheep have been imported, and the meat-preserving industry is prosecuted. Gold is found in the valley of the Diahot, as well as lead and copper at Balade. Iron is found everywhere. The yearly output of nickel and chrome is considerable, and these minerals, with cobalt, constitute the characteristic wealth of the island. Coal has been worked near Nouméa, and kaolin is found in places. Gypsum and marble also deserve mention. The chief industrial establishments are smelting furnaces for cobalt, meat-preserving works at Oüaco, sugar-works and distilleries at Nouméa and La Foa, tobacco, oil and soap factories at Nouméa. The commerce in 1888 amounted to £480,000, of which £200,000 represented the trade with France. In 1900 the total had risen to £820,000, of which £480,000 was for imports and £340,000 for exports, the share of France in that year having been 45% of imports and 47% of exports. The island imports wines, spirits, tissues, clothing and ironmongery; and exports ores, nickel, cobalt and chrome (which represent over three-quarters of the total exports in value), preserved meats and hides, coffee, copra and other colonial produce. There are about 150 m. of carriage roads, and in the mountainous regions there are many footpaths. A railway running north-westward from Nouméa to Dumbéa, &c., is designed to connect the capital with Bourail. The islands annexed to the colony of New Caledonia are the Isle of Pines, used as a place of detention for habitual criminals; the Loyalty Islands (*q.v.*), E. of New Caledonia; the Huon Islands, a practically barren group; the Wallis Archipelago (*q.v.*); and Futuna and Alofa, S. of the Wallis group.

History.—New Caledonia was discovered by Captain Cook in 1774. He touched at the haven of Balade (the original name of the island) near the north-western extremity, as did d'Entrecasteaux in 1793, who closely explored the coast and surrounding seas. They subsequently became known to sealers and traders in sandalwood, who, however, established no friendly relations with the natives. In 1843 French missionaries arrived at the island, and it was claimed for France, but on British representations the claim was renounced. In 1851 a landing party from a French vessel lying at Balade was attacked by the natives, and massacred with the exception of a single member. France was now determined on the annexation, and the flag was raised at the same spot in 1853, but simultaneously the commander of a British vessel was in negotiation with the native chief of the Isle of Pines, and the British flag was hoisted there. The chief, however, subsequently sided with the French, and the British claim was finally withdrawn. The capital, Nouméa, was founded in 1854 (it was then called Port de France); in 1860 New Caledonia became a colony distinct from the French possessions in the Pacific at large; in 1864 the first penal settlement was made on Nou Island, off Nouméa. In 1878 there was a serious native insurrection, and another in 1881 was only put down after much bloodshed.

NEWCASTLE, DUKES OF. Within the space of a century there were no less than four successive creations of dukes of Newcastle in the British peerage. William Cavendish (see below), nephew of the 1st earl of Devonshire, was raised to the dignity of duke of Newcastle-upon-Tyne in 1665. His son and successor Henry (1630–1691) died leaving daughters only, and one of these married John Holles (1662–1711), earl of Clare, who was created duke in 1694. This duke died also without male issue, leaving his estates to his sister's son, Thomas Pelham (see below), who, with other dignities, had the title of duke of Newcastle-upon-Tyne conferred on him in 1715, and a second and similar ducal title (that of Newcastle-under-Lyme) in 1756. The first dukedom became extinct at his death, but the second title was granted him with remainder to Henry Fiennes Clinton, earl of Lincoln, at once his nephew and nephew-in-law. From his heir, who ranks as the 2nd duke, Henry Fiennes Clinton (1720–1794), the dukedom passed through father and son from Thomas Pelham Clinton (d. 1795), Henry Pelham Fiennes Pelham Clinton (1785–1851), Henry Pelham Fiennes Pelham Clinton (1811–1864), Henry Pelham Alexander (1834–1879), to the 7th duke, Henry Pelham Archibald Douglas Pelham Clinton (b. 1864). The three principal dukes are more fully noticed below.

1. WILLIAM CAVENDISH, duke of Newcastle (1592–1676), eldest surviving son of Sir Charles Cavendish and of Catherine, daughter of Cuthbert, Lord Ogle, and grandson of Sir William Cavendish and "Bess of Hardwick," was born in 1592 and educated at St John's College, Cambridge. On the occasion of the creation of Prince Henry as prince of Wales in 1610 he was made a knight of the Bath, subsequently travelled with Sir Henry Wotton, then ambassador to the duke of Savoy, and on his return married his first wife, Elizabeth, daughter of William Basset of Blore, Staffordshire, and widow of Henry Howard, 3rd son of the earl of Suffolk. His fortune was immense, and he several times entertained James I. and Charles I. with great magnificence at Welbeck and Bolsover. On the 3rd of November 1620 he was created Viscount Mansfield, on the 7th of March 1628 earl of Newcastle, and in 1629 the barony of Ogle was restored to his mother, this title, together with an estate of £3000 per annum, descending to him. In 1638 he was made governor of the prince of Wales, and in 1639 a privy councillor. When the Scottish war broke out he assisted the king with a loan of £10,000 and a troop of volunteer horse, consisting of 120 knights and gentlemen. In 1641 he was implicated in the Army Plot, and in consequence withdrew for a time from the court. He was sent by Charles on the 11th of January 1642 to seize Hull, but was refused admittance. When the king declared open war, Newcastle was given the command of the four northern counties, and had the power conferred on him of making knights. He maintained troops at his own expense, and having occupied Newcastle kept open communications with the queen, and despatched to the king his foreign supplies. In November 1642 he advanced into Yorkshire, raised the siege of York, and compelled Fairfax to retire after attacking him at Tadcaster. Subsequently his plans were checked by the latter's recapture of Leeds in January 1643, and he retired to York. He escorted the queen, who returned from abroad in February, to York, and subsequently captured Wakefield, Rotherham and Sheffield, though failing at Leeds, but his successes were once more ravished from him by Fairfax. In June he advanced again, defeated the Fairfaxes to Adwalton Moor on the 30th of June, and obtained possession of all Yorkshire except Hull and Wressel Castle. He might now have joined the king against Essex, but continued his campaign in the north, advancing into Lincolnshire to attack the eastern association, and taking Gainsborough and Lincoln. Thence he returned to besiege Hull, and in his absence the force which he had left in Lincolnshire was defeated at Winceby by Cromwell on the 11th of October 1643, which caused the loss of the whole county. On the 27th of October 1643 he was created a marquis. Next year his position was further threatened by the advance of the Scots. Against prevailing numbers he could do little but harass and cut off supplies. He retreated to York, where the three armies of the Scots, Fairfax and Manchester surrounded him. On the 1st of July Rupert raised the siege, but on the next day threw away his success by engaging the three armies in battle, contrary to Newcastle's desire, at Marston Moor. After this disaster, notwithstanding the entreaties of the king and the remonstrances of Rupert, Newcastle immediately announced his intention of abandoning the cause and of quitting England. He sailed from Scarborough accompanied by a considerable following, including his two sons and his brother, resided at Hamburg from July 1644 to February 1645, and removed in April to Paris, where he lived for three years. There he married as his second wife Margaret (see below), daughter of Sir Thomas Lucas of St John's, Colchester. He left in 1648 for Rotterdam with the intention of joining the prince of Wales in command of the revolted navy, and finally took up his abode at Antwerp, where he remained till the Restoration. In April 1650 he was appointed a member of Charles II.'s privy council, and in opposition to Hyde advocated the agreement with the Scots. In Antwerp he established his famous riding-school, exercised "the art of manage," and published his first work on horsemanship, *Méthode et invention nouvelle de dresser les chevaux* (1658, 2nd ed., 1747; translated as *A General System of Horsemanship*, 1743).

At the Restoration Newcastle returned to England, and succeeded in regaining the greater part of his estates, though burdened with debts, his wife estimating his total losses in the war at the enormous sum of £941,303. He was reinstated in the offices he had filled under Charles I.; was invested in 1661 with the Garter which had been bestowed upon him in 1650, and was advanced to a dukedom on the 16th of March 1665. He retired, however, from public life and occupied himself with his estate and with his favourite pursuit of training horses. He established a racecourse near Welbeck, and published another work on horsemanship, *A New Method and Extraordinary Invention to Dress Horses and Work them according to Nature* . . . (1667). He wrote also several comedies, *The Country Captain and The Varietie* (1649), *The Humorous Lovers* and *The Triumphant Widow* (1677). With Dryden's assistance he translated Molière's *L'Étourdi* as *Sir Martin Mar-All* (1688). He contributed scenes to his wife's plays, and poems of his composition are to be found among her works; and he was the patron of Jonson, Shirley, Davenant, Dryden, Shadwell and Flecknoe, and of Hobbes, Gassendi and Descartes. He died on the 25th of December 1676, and was buried in Westminster Abbey. By his first wife he had ten children, of whom one son, Henry, survived him and became 2nd duke of Newcastle, dying in 1691 without male issue; the title then became extinct and the estates passed to his third daughter Margaret, wife of John Holles, earl of Clare, created duke of Newcastle in 1694.

As a commander in the field Clarendon spoke contemptuously of Newcastle as "a very lamentable man, and as fit to be a general as a bishop."[1] It can hardly be denied, however, that his achievements in the north were of great military value to the king's cause. For politics he had no taste, and adhered to the king's cause merely from motives of personal loyalty, from hatred of "whatsoever was like to disturb the public peace," and because the monarchy "was the foundation and support of his own greatness." Even Clarendon concedes that he was "a very fine gentleman," which is perhaps the best summary of his character.

His second wife, Margaret, duchess of Newcastle (*c.* 1625–1673), had been maid of honour to Henrietta Maria, and after she married the duke in 1645 they continued to cherish a mutual admiration of a very exaggerated character, each regarding the other as endowed with transcendent merits both of person

[1] *Calendar of Clarendon Papers*, ii. 63.

and mind. The duchess cultivated literary composition with exuberant fervour, and kept a bevy of maids of honour obliged to be ready at all hours "to register her Grace's conceptions." Walpole speaks of her as a "fertile pedant" with an "unbounded passion for scribbling"; and, although giving evidence of learning, ingenuity and imagination, her writings are fatally marred by a deficiency in judgment and self-restraint. She is best known by the *Life* she wrote of her husband, originally printed by A. Maxwell at London in 1667. She also published *Philosophical Fancies* (1653); *Poems and Fancies* (1653); *The World's Olio* (1655); *Nature's Picture drawn by Fancie's Pencil to the Life*, which includes an autobiography (1656); *Philosophical and Physical Opinions* (1655); *Orations* (1662); *Plays* (1662); *Sociable Letters* (1664); *Observations upon Experimental Philosophy* (1666); *Letters and Poems* (1676).

The Life of William Cavendish, Duke of Newcastle, by Margaret, duchess of Newcastle, has been edited by C. H. Firth (1886); it was criticized by Pepys as "the ridiculous history of my Lord Newcastle writ by his wife, which shows her to be a mad, conceited, ridiculous woman, and be an ass to suffer her to write what she writes to him and of him," but on the other hand eulogized by Charles Lamb as a work for which "no casket is rich enough, no case sufficiently durable to honour and keep soft such a jewel." See also *La Duchesse et le Duc de Newcastle*, by Emile Montégut (1895). The duchess's *Select Poems* were edited by Brydges in 1813, and her *Autobiography* in 1814. The latter, edited by Lower, was published along with her *Life of the Duke of Newcastle* in 1872.

2. THOMAS PELHAM HOLLES, duke of Newcastle (1693–1768), whose official life extended throughout the Whig supremacy of the 18th century, was the elder son of Thomas, first Lord Pelham, by his second wife Lady Grace Holles, younger sister of John Holles, duke of Newcastle-on-Tyne, who died in 1711, and left the whole of his vast estates to him. In 1712 he also succeeded his father in his peerage and estates, and in 1714, when he came of age, was one of the greatest landowners in the kingdom. He vigorously sustained the Whig party at Queen Anne's death, and had much influence in making the Londoners accept King George. His services were too great to be neglected, and in 1714 he was created earl of Clare, and in 1715 duke of Newcastle-on-Tyne. He also became lord-lieutenant of the counties of Middlesex and Nottingham and a knight of the Garter in 1718, in which year he increased his Whig connexion by marrying Lady Henrietta Godolphin, granddaughter of the great duke of Marlborough. In 1717 he first held political office as lord chamberlain of the household, and in 1724 was chosen by Sir Robert Walpole to be secretary of state in place of Lord Carteret. This office he held continuously for thirty years (1724–1754), and only changed it for the premiership on his brother's death. His long tenure of office has been attributed to his great Whig connexions and his wealth, but some praise must be given to his inexhaustible activity and great powers of debate. He was a peculiarly muddle-headed man, and unhappy if he had not more to do than he could possibly manage, but at the same time he was a consummate master of parliamentary tactics, and knew how to manage the Houses of Lords and Commons alike. Lord Hervey (*Memoirs*) compares him with Walpole in 1735, and says: "We have one minister that does everything with the same seeming ease and tranquillity as if he were doing nothing; we have another that does nothing in the same hurry and agitation as if he did everything." He continued in office on Walpole's fall in 1742, and became more powerful on his younger brother Henry becoming prime minister in 1743. On Henry Pelham's death in March 1754, Newcastle succeeded him as premier; but people who had been accustomed to him as secretary of state would not stand him as premier, and in November 1756 he gave place to the duke of Devonshire. For his long services he was created duke of Newcastle-under-Lyme, with remainder to Henry Fiennes Clinton, 9th earl of Lincoln, who had married his niece Catherine Pelham. In July 1757 he again became prime minister—for Pitt, though a great statesman, was a bad party leader—on the understanding, according to Horace Walpole, that "Mr Pitt does everything, the duke gives everything." Under this ministry England became famous abroad, but it gradually fell before the young king's affection for Lord Bute, who, after supplanting Pitt, became prime minister in the room of Newcastle in May 1762. The duke went into strong opposition, and lost his two lord-lieutenancies for opposing the peace of 1763. In 1765 he became lord privy seal for a few months, but his health was fast giving way, and he died in November 1768. The duke was certainly not a great man, but he was industrious and energetic, and to his credit be it said that the statesman who almost monopolized the patronage of office for half a century twice refused a pension, and finally left office £300,000 poorer than he entered it.

See *Memoirs of the Administration of the Right Hon. H. Pelham*, by W. Coxe (1829).

3. HENRY PELHAM FIENNES PELHAM CLINTON, 5th duke of Newcastle (1811–1864), the eldest son of Henry, the 4th duke, was educated at Eton and at Christ Church, Oxford, where he graduated in 1832. He was member of parliament for South Nottinghamshire from 1832 to 1846, when he became member for the Falkirk Burghs, retaining this seat until he became duke of Newcastle in January 1851. As earl of Lincoln he was first commissioner of woods and forests from 1841 to February 1846, when he was appointed chief secretary to the lord-lieutenant of Ireland, but the ministry fell in June of the same year. In 1852 Newcastle became secretary for war and the colonies under the earl of Aberdeen, and when, after the outbreak of the Crimean War, a separate war department was constituted, he was placed in charge of it. As secretary for war he was regarded as being largely responsible for the terrible hardships which befell the British troops in the Crimea in the winter of 1854, and as the result of a vote of censure he left office with his colleagues in January 1855. He was secretary for the colonies from 1859 to 1864, and died on the 18th of October 1864, being succeeded as 6th duke by his eldest son, Henry Pelham Alexander.

See J. Martineau, *The Life of Henry Pelham, 5th Duke of Newcastle* (1908).

NEWCASTLE, a seaport of Northumberland county, New South Wales, Australia, at the mouth of the Hunter river, 102 m. by rail and 62 m. by sea N. by E. of Sydney, in 32° 55′ S., 151° 49′ E. Newcastle is the second city in New South Wales, the fourth port of Australia, and the seat of an Anglican bishop. The city rises steeply from the sea, and possesses numerous fine buildings, among which may be mentioned the railway station, post office, custom-house, the cathedral of Christ Church, the school of art with its large library, and the Victoria Theatre. There are also two state-subsidized hospitals, a college, a school of mines, a technological museum, several large and handsome churches, and numerous subsidized charitable institutions. Communication between the different parts is maintained by tramways, and steam ferry-boats ply between the city and its suburbs on the shores of the harbour. The industries include brewing, shipbuilding, copper and iron-founding, carriage-building and fellmongery; there are boot factories, engineering works, biscuit factories and smelting works at Cockle Creek. There is also a large trade in frozen meat. There are numerous coal mines in the vicinity, yielding coal of the finest quality. Newcastle has a fine harbour, with an area of 540 acres, protected by two breakwaters; the breadth of the channel at its entrance is 1200 ft., and the depth at the bar is 25½ ft. Vessels of the largest tonnage can enter and lie alongside of the wharves, which are 5 m. in extent, equipped with travelling cranes, hydraulic and steam cranes, lighted by electric light and connected with the Great Northern railway by a branch line. There is a floating dock to lift 2000 tons, and at Stockton there is a patent slip to take large vessels for repair. The facilities for the shipment of coal are excellent, and Newcastle is the chief coaling port in the southern hemisphere. The harbour is protected by two forts, Fort Scratchley, the strongest in Australia, and Shepherd's Hill Fort. The city exports coal, wool, coke, horses, cattle, frozen meat, silver, lead, copper, tallow, hides and country produce. Newcastle returns three members to the legislative council and six members to the legislative assembly. Most of the suburbs are separate municipalities, namely, Stockton, Carrington, Wickham, Hamilton, Merewether, Adamstown, Waratah, New

Lambton, Lambton, Wallsend and Plattsburg. The population of the municipality of Newcastle is 14,250; of the town and suburbs about 70,000.

The mouth of the Hunter river (named after Governor John Hunter), now known as Newcastle Harbour, was discovered in 1797 by Lieutenant John Shortland, who accompanied Hunter to New South Wales. For many years after its discovery it was used as a convict station. It became a free settlement in 1821, and in 1859 was erected into a municipality. The centenary of the landing of Shortland was celebrated in 1897, when a monument commemorating the event was erected.

NEW CASTLE, a city of New Castle county, Delaware, U.S.A., in the northern part of the state, at the head of Delaware Bay, on a high point of land extending into the Delaware river, 6 m. south of Wilmington. Pop. (1890) 4010; (1900) 3380 (315 foreign-born); (1910) 3351. It is served by the Philadelphia, Baltimore & Washington (Pennsylvania System), and (*vid* Wilmington) the Baltimore & Ohio railways, and by steamship lines connecting with Baltimore, Philadelphia and river ports. The "old" county court house, possibly built by the Swedes, is in New Castle; and there are a public library, the Immanuel Protestant Episcopal Church (partly built in 1689), and several residences of Dutch and colonial types. The city has a good harbour and an excellent river front for manufacturing sites and for shipping; it is included in the customs district of Wilmington. Its industrial establishments include shipyards, rolling mills and steel works, flour-mills, and manufactories of cotton and woollen goods. The shad fisheries are of some importance. In 1651 Governor Peter Stuyvesant of New Netherland established near the place Fort Casimir, as the first determined move in his aggressive policy against the Swedes, who had settled in this vicinity about 1640. The Swedes captured the fort in 1654, but this precipitated the crisis in which New Sweden (Delaware) was lost to the Dutch in 1655. Fort Casimir (renamed Fort Amstel) was made the seat of government of the local Dutch possessions, and in 1657 was placed under the jurisdiction of the City of Amsterdam, under which it remained, though prospering little—disease, famine and fears of English attack causing most of the inhabitants to leave in 1658 and 1659—until just before the English seized the settlements in Delaware in 1664. Under the English the name was changed to New Castle, and trade and commerce prospered; and an arc with a radius of 12 m., having the New Castle court house as a centre, became the northern boundary of the "counties on the Delaware." New Castle was frequently the meeting place of the colonial legislature, and after the legislative separation of Delaware from Pennsylvania in 1704 it was the seat of administration of the colony until 1777. It was chartered as a city in 1875.

NEWCASTLE, a seaside resort of Co. Down, Ireland, finely situated on the western shore of Dundrum Bay, at the foot of Slieve Donard, the highest eminence of the Mourne Mountains. Pop. (1901) 1553. It is the terminus of the Belfast and County Down railway, being 36 m. S. of Belfast; and is also served by a branch of the Great Northern railway. A fort guarded the passage of the river Shimna here in early times, but the town is entirely modern. The sandy shore affords good bathing, there is a small spa, and the scenery of the Mournes is fine. The demesnes of Donard Lodge and Bryansford are of great beauty. The golf links of the County Down Club here are well known.

NEWCASTLE, a city and the county-seat of Lawrence county, Pennsylvania, U.S.A., on the Shenango river, at the mouth of Neshannock Creek, about 50 m. N.N.W. of Pittsburg. Pop. (1890) 11,600; (1900) 28,339, 5324 being foreign-born and 463 negroes; (1910) 36,280. It is served by the Pennsylvania, the Erie, the Baltimore & Ohio, the Buffalo, Rochester & Pittsburgh, and the Pittsburgh & Lake Erie railways. Cascade Park, in the neighbourhood, is a pleasure resort. The surrounding country, with which the city has an extensive trade, is well adapted to agriculture, and abounds in bituminous coal, iron ore, limestone, sandstone and fire-clay. In 1905 the city ranked fifth among the cities of the state in the value of its factory product, and of its products (valued at $29,433,635, an increase of 47·1% since 1900) iron and steel, and tin and terne-plates were the most important. Newcastle was founded in 1802, became a borough in 1869, and was first chartered as a city in 1875, its charter being revised in 1887.

NEWCASTLE-UNDER-LYME, a market town and municipal and parliamentary borough of Staffordshire, England, 2 m. W. of Stoke-upon-Trent by the North Staffordshire railway. Pop. (1901) 19,914. The parish church of St Giles was rebuilt in 1873–1876 by Sir Gilbert Scott, with the exception of the tower, which dates from the 12th century. The free grammar school, originally founded in 1602, possesses large endowments, increased by the amalgamation of various subsequent bequests for educational purposes, and now consists of high and middle schools for boys and Orme's school for girls. There is also a school of art included with a free library in handsome municipal buildings. The manufacture of hats was once the staple trade, but it has declined. There are cotton and paper mills; and tanning, brewing, malting and the manufacture of army clothing are carried on. In the neighbourhood there are large collieries, as at Silverdale and elsewhere. Partly included in the parliamentary borough is the populous parish of Wolstanton, of which the fine church, well placed on high ground, has good details of the 13th century, with a massive tower and spire. The mining town of Audley lies 4. m. N.W., with a fine early Decorated church. Newcastle-under-Lyme is governed by a mayor, 6 aldermen and 18 councillors. Area, 671 acres.

Newcastle-under-Lyme (Neofchastell-sur-Lyme, Newcastle-under-Lyme) is not mentioned in Domesday, but it must early have become a place of importance, for a charter, known only through a reference in a charter to Preston, was given to the town by Henry II. The town owes its name to a castle built here in the 12th century to supersede an older fortress at Chesterton about 2 m. to the north, of which the ruins were to be seen in the 16th century, and to the fact that it was situated under the forest of Lyme. Henry III. (1235) constituted it a free borough, granting a gild merchant and other privileges; in 1251 he leased it at fee-farm to the burgesses; the governing charter in 1835 was that of 1590 enlarged by that of 1664, under which the title of the corporation was the "mayor, bailiffs and burgesses of Newcastle-under-Lyme." Newcastle, which was originally held by the crown, was granted (1265) to Simon de Montfort, and subsequently to Edmund Crouchback, through whom it passed to Henry IV. In Leland's time the castle had disappeared "save one great Toure"; in the 17th and 18th centuries the town was flourishing and had a manufacture of hats. The market was originally held on Sunday; in the reign of John it was changed to Saturday; by the charter of Elizabeth it was fixed on Monday. Markets are now held on Monday, Wednesday and Saturday. Grants of fairs were given by Edward I., Edward III. and Henry VI. Up to the time of the passing of the Municipal Reform Act the farce of electing a mock mayor was gone through annually after the election of the real mayor. Newcastle sent two members to parliament from 1355 to 1885, when it lost one representative.

See *Victoria County History, Stafford*; T. Ingamells, *Historical Records and Directory of Newcastle-under-Lyme.*

NEWCASTLE-UPON-TYNE, a city and county of a city, municipal, county and parliamentary borough, and port of Northumberland, England, 272 m. N. by W. of London, on the North-Eastern railway. Pop. (1891) 186,300; (1901) 215,328. It stands on the N. bank of the Tyne, which is here high and steeply inclined above the river. The mouth of the river into the North Sea is 8 m. below Newcastle and its banks are lined with docks and industrial towns, while its narrow waters are crowded with traffic.

Though Newcastle owes its origin to a Roman station at a bridge over the river, its modern growth has largely destroyed traces of antiquity. Of the old walls which, according to Leland, "for strength and magnificence far surpassed all the walls of the cities of England and of most of the towns of Europe," and the circuit of which was 2 m. 239 yds., there are slight remains, although the fortifications were allowed to go into disrepair

after the union of Scotland and England. The castle, from which the town takes its name, stood on a slight elevation rising abruptly from the river, and was erected by Henry II. between 1172 and 1177 on the site of an older structure built in 1080 by Robert, eldest son of the Conqueror. It was originally the strongest fortress in the north of England, and its keep is now one of the finest specimens of the Norman stronghold remaining in the country. While it was still incomplete, William the Lion was led within its walls after his capture at Alnwick; and within its great hall Baliol, on the 26th of December 1292, did homage for the crown of Scotland to Edward I. The area of the castle within its outer walls and fosse was 3 acres. Fragments of these walls, with the principal entrance or Black Gate (portions of which are, however, of later construction) and the Watergate or southern postern remain, but the inner wall surrounding the keep has been entirely removed. The massive keep, with walls 14 ft. thick, is in a state of good preservation, as is also the chapel, a beautiful specimen of late Norman style. The castle was purchased by the corporation in 1809, and is under the charge of the Newcastle Society of Antiquaries, which uses a portion of it as an antiquarian museum. Near the castle is St Nicholas church, forming the cathedral of the diocese of Newcastle, instituted in 1882. The diocese covers practically the whole of Northumberland, with a very small portion of Cumberland. The church, which is principally Decorated, consists of nave, aisles, chancel and transepts, the total length of the interior from east to west being 245 ft., and the width at the transepts 128 ft. The principal feature of the church is the lantern tower, a later addition and a very fine specimen of early Perpendicular. Among other interesting old churches is St Andrew's church, erected in the 11th century, and retaining Norman characteristics, with a low square tower and a peal of six bells. During the siege by the Parliamentary army in 1644 it was greatly damaged. St John's church is a building of the 14th century with an ancient front. Of the nine conventual buildings at one time existing in Newcastle or its immediate neighbourhood, a few fragments of the monastery of the Black Friars remain, and the chapel of the hospital of St Mary at Jesmond forms a picturesque ruin. There are a number of quaint Elizabethan houses in the steep street called the Side, and in the Sandhill at its foot.

Some of the modern streets of Newcastle are spacious and handsome. The most noteworthy are Grey Street, in which a complete scheme of Grecian architecture is followed, and Grainger Street. This thoroughfare is named after Richard Grainger (1798–1861), a wealthy local architect who devoted himself to the beautifying of his city with remarkable energy. Of numerous modern churches may be noted that of St George, Jesmond, a landmark for a great distance and finely decorated within, and the Roman Catholic cathedral of the diocese of Hexham and Newcastle. The most important public buildings are the corporation buildings, including a large public hall, and a corn exchange; the guildhall, originally a hospital called the Maison de Dieu, and afterwards used as "the stately court of merchant adventurers," re-erected in 1658; the moot-hall (1810) for the meetings of assizes and sessions and the transaction of county business; the exchange (1860); the central newsroom and art gallery (1838); the Wood memorial hall (1870), used for the meetings of the North of England Institute of Engineers; and the custom-house. The Grey monument in Grey Street, an Ionic column surmounted by a statue of Earl Grey, was erected in 1836 to commemorate the passing of the Reform Bill; the Stephenson monument near the railway station was erected in 1862; a marble statue of Queen Victoria in front of the Royal Victoria Infirmary was unveiled in 1906, and a bronze statue of the queen in 1903 in the cathedral square.

Among educational establishments the chief are the colleges of medicine and of physical science of the university of Durham; the first granting degrees in medicine and surgery; the second, with which the school of art is incorporated, degrees in science and literature. The college of science, or Armstrong College as it is called in commemoration of the first Lord Armstrong, was founded in 1871; the north-east wing was opened in 1888; further parts of the building in 1894, and the west wing by King Edward in 1906. The royal free grammar school, founded in 1525, occupies modern buildings in Jesmond. There should be mentioned also Allan's endowed schools, founded in 1705, and reorganized by the charity commissioners in 1877; and Rutherford College and the Commercial Institute, providing technical and commercial education. The Laing Art Gallery was erected and presented to the city by Alexander Laing, and opened in 1904. Among clubs and similar institutions are the Literary and Philosophical Society, founded in 1793, the Society of Antiquaries, founded in 1813, with a museum in the castle; the Natural History Society and museum; the Tyneside Geographical Society; the Tyneside Naturalists' Club, established in 1846; the Mechanics' Institution, 1824; the North of England Institute of Mining Engineers, 1852; the Fine Arts Society; the Farmers' Club; the Northern Counties' Club; the Union Club; and the University Club. Several clubs for working men form a noteworthy social feature. There is a public library and newsroom. The Royal Victoria Infirmary on the Castle Leazes is a memorial of the Diamond Jubilee of Queen Victoria, and was opened in 1906. The benevolent institutions also include the dispensary (1777), fever house (1803), lying-in hospital (1760), eye infirmary (1822), children's hospital, Trinity almshouses (1492), hospital of the Holy Jesus (1682), hospital (1701) for keelmen, *i.e.* coal-bargemen; and institutions for the blind, dumb and orphans.

Newcastle is well supplied with public parks and recreation grounds. To the N. of the city is the Castle Leazes ornamental park of 35 acres, and beyond this the Town Moor and racecourse, an extensive common, the survival of the pasture land of the township. Eastward from Town Moor is Brandling Park, and westward Nun's Moor. The picturesque grounds of Armstrong Park N.E. of the city extend to about 50 acres, the larger half of which was presented by Sir W. G. Armstrong, who also presented the beautifully wooded grounds of Jesmond Dene. Elswick Park in the south-west of the city, extending to 8¾ acres, includes Elswick Hall. There are several others. Jesmond, N.E. of the city, is the chief residential suburb. It takes name from "Jesus Mount," and was formerly a place of pilgrimage, possessing a hospital dedicated to St Mary the Virgin.

Both the Northumberland and Durham banks of the river are lined with manufacturing towns or suburbs. Of these the most important is Gateshead (*q.v.*) immediately opposite Newcastle; while those adjacent to Newcastle on the same bank are Benwell and Fenham (pop. in 1901, 18,316) on the west, and Walker (13,336) on the east. The last-named two (formerly urban districts), together with part of Kenton, were incorporated with Newcastle in 1904. Newcastle is connected with the south bank of the Tyne by four bridges—two high-level bridges, an hydraulic swing bridge and a suspension bridge. The old high-level bridge carries the North-Eastern railway, with a road and footway beneath it. It was opened by Queen Victoria in 1849. The new high-level bridge, carrying the railway only, was opened by King Edward VII. in 1906; it consists of four steel spans on granite piers. The hydraulic swing bridge, on the low level, was built to replace a stone structure erected in 1781 on the site of a bridge-dating from 1250, and destroyed by a flood in 1771. The Roman bridge, the Pons Aelii, is said to have spanned the river at the same point. The hydraulic bridge (1876) consists of one large centre pier, two midstream piers and two abutments; and its foundations are iron cylinders resting on the solid rock, 60 ft. below the bed of the river. Two spans, which open simultaneously by machines impelled by steam, allow 103 ft. of waterway for vessels going up and down the river. About half a mile farther up the stream is the Redheugh bridge (1871). The central station of the North-Eastern railway is an extensive and handsome structure built on a sharp curve. An underground line connects it with the Blyth and Tyne station. The suburban line of the North-Eastern company from the central station to Jesmond, Gosforth and Benton was the first standard line to carry passengers by electric traction (1904).

Newcastle owes its prosperity to its convenient situation on a tidal river, and to the immense stores of coal in the neighbourhood, which, besides being largely exported, stimulate a great variety of industries which are dependent on their use. It began to export coal about the end of the 13th century, but the trade received a severe check by the act of Edward I. which made the burning of coal in London a capital offence. In the reign of Edward III. licence was granted to the inhabitants "to dig coals and stones in the common soil of the town without the walls thereof in the place called the Castle Field and the Forth." The quay in front of the town, extending from the hydraulic bridge to the Ouseburn, forms a fine thoroughfare of about a mile in length; and by means of dredging a depth of water has been obtained at the shore permitting vessels of large tonnage to approach, although the berths of the ocean steamers are a little farther down the river. The quay is supplied with the most improved mechanical appliances, and has direct communication with the North-Eastern railway. There is a large grain warehouse at the E. end of the quay. Exports include coal, chemicals, pig-iron, iron-work, steel, iron bars, plates and castings, machinery, fire-clay goods and copper. The chief imports are fruits, wheat, maize, oats, barley, iron and steel, petroleum, sulphur ore, timber and wood hoops, iron ore and potatoes. Steamers carrying passengers serve the principal English ports, Cardiff, Leith, &c.; also Baltic ports and New York; while Newcastle is one of the chief ports for the extensive Norwegian tourist traffic, the ships of the combined Bergenske and Nordenfjeldske companies regularly serving Stavanger, Bergen, Trondhjem and intermediate ports. To the industries of Newcastle indicated by the exports may be added glass, lead and shot, brick and tile, earthenware, tool, rope and ships'-fitting manufactures, and most important of all, shipbuilding. The celebrated Elswick works, founded by Messrs Armstrong in 1847, and amalgamated with those of Mitchell & Co., are among the most important in the world. The construction of ships of all sorts, including the largest ironclads with all their armour and guns, is carried on. Elswick is the name of the western part of the borough of Newcastle. The borough returns two members to parliament. It is the largest undivided parliamentary constituency in the United Kingdom. The city is governed by a lord mayor (the title was conferred in 1906), 19 aldermen and 57 councillors. Area, 8453 acres.

History.—Newcastle owes its origin to its position on the great Roman wall and on the estuary of the river Tyne. Its Roman occupation is proved by existing remains, most important among which are the foundations of a bridge, attributed to the emperor Hadrian. Before the Conquest little is known of the town except that it was called Monkchester, and that it was destroyed in the 9th century by the Danes. After the defeat of Edgar Ætheling and Earl Waltheof on Gateshead Fell, it was again destroyed by William the Conqueror, but Robert of Normandy is said to have raised a castle there in 1080 on his return from an expedition against Malcolm, king of Scotland, and from that time the town was called Newcastle. Shortly afterwards it was fortified by Robert de Mowbray in his rebellion against William Rufus, but it was taken by the king in 1095. In the reign of Stephen it was seized by David, king of Scotland, and after its restoration to the English in 1157 Henry II. rebuilt the castle and established a mint. The walls surrounding the town are attributed to Edward I. During the 14th century Newcastle was three times defended successfully against the Scots, but in 1640 it was occupied for a year by the Scottish Covenanters under Leslie. It was then garrisoned by royalists, but again surrendered to the Scots in 1644 after a siege of about six weeks, and Charles I. was taken there in 1646 when he had yielded himself to the Scottish army. The burgesses are said to have held the borough at a fee-farm rent under a grant from William Rufus. The title of mayor was conferred by Henry III., while Henry IV. in 1400 made the town a county of itself with a sheriff, and granted the burgesses power to elect 6 aldermen. Queen Elizabeth incorporated the town in 1589 under the title of mayor and burgesses, and Philip and Mary in 1556 granted 4 additional aldermen, while the charter of James I. in 1604 appointed 24 common councilmen. Newcastle has been represented in parliament by two members since 1295. The coal trade, to which the town owes its prosperity, began in the 13th century, but, partly owing to the act of parliament passed in the reign of Edward I. forbidding the use of coal in London, did not become important until the 17th century. Glassmaking was a considerable trade in the 17th century, and in 1823 George Stephenson established iron works at Newcastle, where the first engines used on the Stockton and Darlington, and Manchester and Liverpool lines were made.

See *Victoria County History, Northumberland*; John Brand, *The History and Antiquities of the Town and County of the Town of Newcastle-upon-Tyne* (1789); *Chirographia, or a Survey of Newcastle-upon-Tyne* (1818).

NEWCOMB, SIMON (1835–1909), American astronomer, was born in Wallace, Nova Scotia, on the 12th of March 1835. He became a resident of the United States in 1853, and graduated at the Lawrence Scientific School of Harvard University in 1858, having paid special attention to mathematics and astronomy. He assisted in the preparation of the American *Nautical Almanac* for 1857. In 1861 he became professor of mathematics in the United States navy, and was put in charge of the great 26-in. equatorial erected at Washington Observatory in 1873. In 1877 he was appointed director of the American *Nautical Almanac* office, a post which he held until March 1897. In 1884 he became professor of mathematics and astronomy at the Johns Hopkins University, continuing, however, to reside at Washington. He was also editor of the *American Journal of Mathematics* for many years. In view of the wide extent and importance of his labours, the variety of subjects of which he treats, and the unity of purpose which guided him throughout, Simon Newcomb must be considered as one of the most distinguished astronomers of his time. A study of his works reveals an unusual combination of skill and originality in the mathematical treatment of many of the most difficult problems of astronomy, an unfailing patience and sagacity in dealing with immense masses of numerical results, and a talent for observation of the highest order. On assuming the directorship of the *Nautical Almanac* he became very strongly impressed with the diversity existing in the values of the elements and constants of astronomy adopted by different astronomers, and the injurious effect which it exercised on the precision and symmetry of much astronomical work. Accordingly he resolved to "devote all the force which he could spare to the work of deriving improved values of the fundamental elements and embodying them in new tables of the celestial motions." The formation of the tables of a planet has been described by Cayley as "the culminating achievement of astronomy," but the gigantic task which Newcomb laid out for himself, and which he carried on for more than twenty years, was the building up, on an absolutely homogeneous basis, of the theory and tables of the whole planetary system. The results of these investigations have, for the most part, appeared in the *Astronomical Papers of the American Ephemeris*, and have been more or less completely adopted for use in the nautical almanacs of all countries. A valuable summary of a considerable part of this work, containing an account of the methods adopted, the materials employed, and the resulting values of the various quantities involved, was published in 1895, as a supplement to the *American Ephemeris* for 1897, entitled *The Elements of the Four Inner Planets and the Fundamental Constants of Astronomy*. In 1866 Newcomb had published[1] an important memoir on the orbit of Neptune, which was followed in 1873 by a similar investigation of the orbit of Uranus.[2] About twenty-five years later the tables of these planets were revised by him in view of all the observations which had accumulated in the meanwhile at Washington, Greenwich, Paris and Cambridge. In the meantime the theory of Jupiter and Saturn had been thoroughly worked out by G. W. Hill, Newcomb's distinguished collaborator in the *Nautical Almanac* office, and thus was

[1] *Smithsonian Contributions to Knowledge*, vol. xv.
[2] *Ibid.* vol. xix.

completed one important section of the work projected by Newcomb in 1877.

Among Newcomb's most notable achievements are his researches in connexion with the theory of the moon's motion. His first work on this abstruse subject, entitled *Théorie des perturbations de la lune, qui sont dues à l'action des planètes*,[1] is remarkable for the boldness of its conception, and constitutes an important addition to celestial dynamics. For some years after the publication of Hansen's tables of the moon in 1857 it was generally believed that the theory of that body was at last complete, and that its motion could be predicted as accurately as that of the other heavenly bodies. Newcomb showed that this belief was unfounded, and that as a matter of fact the moon was falling rapidly behind the tabular positions. With the view of examining this question, he undertook the reduction of every observation made before 1750 which appeared to be worthy of confidence. In an elaborate memoir[2] he showed that the ancient solar eclipses described by Herodotus, Thucydides, and others, which seemed to require an increased value of the secular acceleration of the moon's mean motion to bring them into line with modern results, might safely be neglected, the ambiguity of the accounts in each case rendering uncertain either the totality of the eclipse or the place from which it was visible. In his investigation he employed the eclipses of the moon recorded in the Almagest, the Arabian eclipses between A.D. 800 and 1004, extracted from Caussin's translation of Ibn Junis, the eclipses and occultations of Bullialdus, Gassendi, and Hevelius, of the French astronomers at Paris and St Petersburg, and of Flamsteed at Greenwich, and deduced a secular acceleration of 8·8″, agreeing well with the theoretical value.

On taking charge of the 26-in. equatorial at the United States Naval Observatory, Newcomb devoted it almost exclusively for the first two years to observations of the satellites of Uranus and Neptune, being of opinion that it was better to do one thing well than many things indifferently. The results of these skilfully conducted observations were published in a memoir on *The Uranian and Neptunian Systems*.[3] From this research it appears that the orbits of all four satellites of Uranus are sensibly circular, and although no special search was made, he concludes that none of Sir William Herschel's supposed outer satellites can have any real existence. From the motion of the satellites he finds that the mass of Uranus is $\frac{1}{23\,000}$th of that of the sun, while for the planet Neptune he finds a mass equal to $\frac{1}{19\,380}$th of the sun, agreeing with the value previously found by him from the perturbations of Uranus within $\frac{1}{10}$th of its amount. As early as 1860 Newcomb communicated an important memoir to the American Academy,[4] *On the Secular Variations and Mutual Relation of the Orbits of the Asteroids*, in which he discussed the two principal hypotheses to account for the origin of these bodies—one, that they are the shattered fragments of a single planet (Olbers' hypothesis), the other, that they have been formed by the breaking up of a revolving ring of nebulous matter.

In the *Astronomical Papers of the American Ephemeris* will be found a large number of contributions from Newcomb's pen on some fundamental and most important questions of astronomy. Among these are papers on *The Recurrence of Solar Eclipses*, *A Transformation of Hansen's Lunar Theory*, *Development of the Perturbative Function and its Derivatives*. His memoir *On the Motion of Hyperion, a New Case in Celestial Mechanics*, is in some respects one of his most original researches. He discussed the transits of Venus of 1761 and 1769, and those of Mercury from 1677 to 1881. At the international conference, which met at Paris in 1896 for the purpose of elaborating a common system of constants and fundamental stars to be employed in the various national ephemerides, Newcomb took a leading part, and at its suggestion undertook the task of determining a definite value of the constant of precession, and of compiling a new catalogue of standard stars. The results of these investigations were published in 1899,[5] and have been in use since the beginning of 1901. In the intervals of these immense labours, on which his reputation as an astronomer rests, he found leisure for works of a lighter character, *e.g.* his *Popular Astronomy* (1878) which has been translated into German, Russian, Norwegian, Czech, Dutch and Japanese, his *Astronomy for Schools and Colleges* (1880), written in conjunction with Professor E. S. Holden, and *Astronomy for Everybody* (1903). After his retirement from official life he published an excellent popular treatise on *The Stars* (1901). A more recondite work is his *Compendium of Spherical Astronomy* (1906). He also wrote on questions of finance and economics.

He received the honorary degrees of D.C.L. Oxford, and Sc. D. Cambridge and Dublin. In 1872 he was elected an associate of the Royal Astronomical Society, receiving its gold medal in 1874. In 1877 he was elected a foreign member of the Royal Society, which in 1890 awarded him the Copley medal. He also received the first Bruce medal of the Astronomical Society of the Pacific, awarded by the directors of the Berlin, Greenwich, Harvard, Lick, Paris and Yerkes observatories. Except Benjamin Franklin he was the only American to become an Associate of the French Institute. He died at Washington on the 11th of July 1909, and was given a military funeral, having been made a rear-admiral by Act of Congress in 1906.

An autobiography, *Reminiscences of an Astronomer*, appeared in 1903; and a bibliography of his writings is given by Mr Archibald in the *Trans. Roy. Soc. Canada*, XI. iii. 79. See also the obituary notice by H. H. Turner in the *Mon. Not. R.A.S.* (Feb. 1910), p. 305.

NEWCOMEN, MATTHEW (*c.* 1610–1669), English nonconformist divine, was born about 1610 and educated at St John's College, Cambridge (M.A. 1633). In 1636 he became lecturer at Dedham in Essex, and was the leader of the church reform party in that county. He assisted the elder Calamy in writing *Smectymnuus* (1641), and preached before parliament in 1643. He was a man of many gifts, excelling alike in preaching, in debate and in friendship, and declined many offers of more remunerative service. He protested against the extreme democratic proposals called "The Agreement of the People" (1647), and was one of the commissioners at the Savoy Synod of 1658. On the passing of the Act of Uniformity in 1662, Newcomen lost his living, but was soon invited to the pastorate at Leiden, where he was held in high esteem not only by his own people but by the university professors. He died of the plague in 1669.

NEWCOMEN, THOMAS (1663–1729), English engineer, one of the inventors of the steam-engine, was born at Dartmouth in 1663. While employed as an ironmonger in his native town, he corresponded with Robert Hooke about the previous investigations of Denis Papin and the marquis of Worcester as to the applicability of steam-power for the purpose of driving machinery, and in conjunction with John Calley (or Cawley), said to have been a grazier or glazier in Dartmouth, and Captain Thomas Savery (1650 ?–1715), a military engineer, he constructed in 1705 a "fire-engine," now known as the "atmospheric steam-engine." He died in 1729, probably in London. (See STEAM-ENGINE.)

NEWDIGATE, SIR ROGER (1719–1806), English antiquary, was born on the 30th of May 1719. He was the 5th baronet of Harefield (in Middlesex) and Arbury (in Warwickshire), and grandson of Sir Richard Newdigate, an English chief justice during the time of Richard Cromwell's protectorate. He was educated at University College, Oxford. From 1741 to 1747 he was M.P. for Middlesex, and from 1750 to 1780 M.P. for the university of Oxford. In 1753 he spoke in parliament on behalf of the repeal of the Plantation Act, and during the debates on the land tax in 1767 he opposed the duke of Grafton's administration and the proposed grant to the royal princes. Being the owner of extensive collieries near Bedworth in Warwickshire, he actively promoted the Coventry, Oxford and Grand Junction canal, cutting also a canal from his collieries to Coventry, and interesting himself in the construction of the turnpike road from

Coventry to Leicester. But it is as an antiquary and the founder of a prize at the Oxford university that he is chiefly remembered. His interest in old architecture dated from a tour in France and Italy which was undertaken while he was a young man. He filled two folio volumes with sketches of ancient buildings. His collection of antiquities included marbles, casts of statues and vases. Two marble candelabra found in Hadrian's villa at Rome he purchased for £1800 and presented them to the Radcliffe Library at Oxford. Among his other generosities to the university were a chimney piece, for the hall of University College, and the sum of £2000 for the removal by Flaxman of the Arundel collection of marbles to the Radcliffe Library. The "Newdigate" prize of twenty-one guineas for English verse, which is open for competition each year to the undergraduates of Oxford University, was founded by him and was first awarded in the year of his death. He died at Arbury on the 23rd of November 1806. His portrait was painted by Kirkby for University College, Oxford, and at the age of sixty-three he also sat to Romney.

NEWEL (O. Fr. *nouel* or *noel*, modern *noyau*, properly a kernel, from Lat. *nux*, nut; other foreign equivalents are Ital. *albero*, Ger. *Spindel*), the term given in architecture to the central shaft of a semicircular or winding staircase, which is built up or consists of the narrow ends of the steps standing one over the other. When in stone, both newel and steps are cut out of the same block; when in wood, the newel becomes a vertical post into which the steps are housed. The term is also given to the vertical post at the foot or the angles of a square staircase, into which the carriage or beam carrying the steps is tenoned.

NEW ENGLAND, a general name for the north-east section of the United States of America, embracing the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut. It has an area of 66,424 sq. m. (4448 sq. m. being water); and in 1910 its population was 6,552,681, more than one-half of which was in Massachusetts, although that state contains less than one-eighth of the total area. The region is traversed by the broken mountain ranges which form the N.E. continuation of the Appalachian system; the soil is rather sterile, except in the river valleys; and the climate of the long winters is often severe. But the picturesque scenery and delightful summer climate have made New England a favourite resort. When the commerce of New England was interrupted as a consequence of the Napoleonic wars, the abundance of water power afforded by the rivers encouraged manufacturing, and the region rapidly acquired prominence in this industry, especially in the manufacture of textiles, of boots and shoes, and of paper and wood pulp; in 1905 the value of the textile products of New England (excluding flax, hemp and jute) alone was $522,821,440 (more than 45% of that of the entire country), the value of boots and shoes was $181,023,946 (more than 55% of the total for the entire country), the value of paper and wood pulp was $49,813,133 (more than one-quarter of that of the entire country), and the value of all factory products amounted to $2,025,998,437 (nearly one-seventh of the total for the entire country).

Northmen very probably visited this region at the beginning of the 11th century. (See VINLAND). To Europeans who visited it in the 16th century it was included in "Norumbega," and some of the early explorers searched here for the mythical city of that name. Title to the territory was claimed by the English on the basis of its alleged exploration by the Cabots in 1498, and by the French on the basis of its exploration by Giovanni da Verrazano in 1524. It was made favourably known to the English by the explorations of Bartholomew Gosnold in 1602, of Martin Pring in 1603 and of George Weymouth in 1605, and was at this time called North Virginia. In 1606 King James I. granted it to the Plymouth Company with a view to encouraging settlement, and in the next year a colony was planted at the mouth of the Sagadahoc (now Kennebec) river, but this was abandoned in 1608; the efforts of the French to establish settlements along the Maine coast were likewise unsuccessful. In 1614–1616 Captain John Smith traversed the coast as far east as the mouth of the Penobscot river and as far south as Cape Cod, gathered much information from the Indians, wrote an attractive description of the country, prepared a map of it, suggested its present name, New England, and made another unsuccessful attempt to found a settlement. A new charter of 1620 conveyed to the New England Council, the successor of the Plymouth Company, all the territory in North America between latitudes 40° and 48° N. under the name of New England, and in the same year a permanent settlement was established at Plymouth by a band of Separatists, who, although they had expected to settle in Virginia, were prevailed upon by the captain of their vessel to land in New England. During its existence of fifteen years the New England Council made numerous grants of territory, and from three of these grew three of the present states: Massachusetts, from a grant to the Massachusetts Bay Company in 1628; Maine, from the grant to Sir Ferdinando Gorges and John Mason (the two most influential members of the council) in 1622; and New Hampshire, from the grant to John Mason in 1629. The Council attempted to establish a general government over its entire domain, but the scheme of some of its members for supporting such a government with contributions from each member in return for an allotment of land was a failure, and although Robert Gorges, the second son of Sir Ferdinando Gorges, was sent over as governor-general in 1623, he accomplished nothing and returned in the next year in disgust. In 1635, when the Dutch were hemming in its domain on the west and the French on the north, the Council made a final allotment of its remaining territory among its members and surrendered its charter. Connecticut was founded in the same year by emigrants from Massachusetts without any other authority than that given by the mother colony. A separate colony was founded at New Haven in 1638 by emigrants from England who had stayed for a time in Boston and other Massachusetts towns, but this was annexed to Connecticut in 1664 under the Connecticut charter of 1662. Rhode Island was founded in 1636 by exiles from Massachusetts who had no authority whatever from a superior government. Plymouth was a separate colony until its union with Massachusetts under the charter of 1691. New Hampshire was a part of Massachusetts from 1641–1643 to 1679. Maine, having passed under the jurisdiction of Massachusetts in 1652, did not regain its independence until 1820. Vermont was settled largely by emigrants from New Hampshire, but New York claimed the territory and the dispute was not settled until the new state was erected in 1791.

Massachusetts, Plymouth, Connecticut and New Haven constituted in their early years a group of neighbouring colonies, substantially independent of the mother country, and possessing a unity of purpose and similar institutions but in need of mutual protection from the Indians, the Dutch and the French, and also needing an arbiter to whom they might refer their own disputes, especially those relating to boundaries and trade. To meet these needs they organized, under Articles of Confederation signed in 1643, the first form of colonial union in America; they called it The United Colonies of New England, but it is more commonly known as the New England Confederacy. The confederate authority was vested in a board of eight commissioners, two from each colony chosen annually by its General Court.

This board was to meet annually in September, two years of every five at Boston, one year of every five at Hartford, one at New Haven, and one at Plymouth; special meetings also might be called by three magistrates of any of the four colonies. The commissioners chose their president at each meeting, but this officer had only the powers of a moderator. An agreement of six commissioners was necessary to pass any measure, but if there was an agreement of less than six the measure might be referred to the General Courts and become a law of the Confederacy if all of those courts approved. The most important powers of the Confederacy were those relating to defence, and in case of an invasion its entire force, consisting of 100 men from Massachusetts and 45 men from each of the other colonies (or some other proportion which the commissioners might name), was to march out if so requested by three magistrates of any of the contracting colonies. The expenses of every defensive war which the commissioners declared to be just were to be defrayed by the several colonies in proportion to their number of men and boys between the ages of sixteen and sixty. Other matters within the jurisdiction of the commissioners were such as related to disputes

between two or more colonies and the return of escaped servants, prisoners and fugitives from justice. As the commissioners had no means of enforcing their orders, their function was chiefly advisory, but it was nevertheless of considerable importance on several occasions. Although the number of commissioners from each of the colonies was the same, those from Massachusetts exerted the dominant influence.

The commissioners met regularly until 1684—annually until New Haven submitted to Connecticut in 1664, and triennially from 1664 to 1684, when Massachusetts lost its first charter. Upon the downfall of the Puritan Commonwealth in the mother country (1660) numerous grievances were presented to King Charles II. against the Puritan governments of New England, among them Massachusetts' extension of its jurisdiction over the towns of Maine and New Hampshire, the persecution of the Quakers, and the denial of the right of appeal to the crown, and in 1664 a royal commission, consisting of Richard Nicolls, Samuel Maverick, Robert Carr and George Cartwright, was sent over to settle disputes and secure some measure of imperial control, but Massachusetts, the chief offender, successfully baffled all attempts at interference, and the mission was almost a complete failure. The grievances of English merchants arising from the violation of the navigation laws by the colonies continued, however, to receive the attention of the home government.

In 1676 the Lords of Trade and Plantations sent over Edward Randolph to investigate and gather information which would show the justice and expediency of imposing imperial control, and two years later Randolph was appointed Collector and Surveyor of Customs in New England. Randolph sent back many charges, especially against Massachusetts, with the effect that, in 1684, the charter of that colony was annulled by a decree in Chancery on a writ of *quo warranto*. This done, the home government set to work to organize the royal domain which should be known as New England, or the Dominion of New England, and its plan for this provided for the annulment of the charters of Rhode Island and Connecticut, and the inclusion in the Dominion of these colonies, and New Hampshire, Maine, New York and the Jerseys, thereby restoring to New England all the territory, with the exception of Pennsylvania, that was included in the grant to the New England Council in 1620. A temporary government was established at Boston in May 1686, with Joseph Dudley as president, and in December of the same year Edmund Andros arrived with a commission and instructions which were a copy of those to the governor of New York and made him governor of all New England except Rhode Island and Connecticut. Rhode Island offered no resistance to the writ against its charter and Andros extended his authority over it immediately after his arrival. Connecticut successfully baffled the royal servants for a time, but when threatened with a division of its territory agreed not to resist the royal purpose, and on the last day of October 1687 it passed under the general government of New England. Finally, a new commission to Andros, issued in April 1688, extended his jurisdiction over New York and the Jerseys, and the whole region over which he was made governor by this instrument was named "Our Territory and Dominion of New England in America." But the English Revolution of 1688 inspired a revolt in New England by which Andros was deposed in April 1689. Under William and Mary no attempt was made to preserve the Dominion of New England, but Rhode Island and Connecticut were permitted to resume government under their old charters, Massachusetts received a new one, and New Hampshire again became a separate royal province.

New England is prominent in American colonial history as the "Land of the Puritans" and the home of the corporate colony. The chief motive of its founders in coming to the New World was the establishment of a new Christian commonwealth, but subordinate to this there was from the first an economic motive. So long as the religious motive remained dominant, "blue laws" were a prominent feature of the administration, but by a slow transition the economic motive became the dominant one, and, as a consequence of this transition and of the corporate form of government, European institutions were transformed into American institutions and new political ideas were generated more rapidly in New England than in either the Middle or the Southern colonies. Owing to its geographical position, nearer to Canada than any other group of colonies, New England had to stand the brunt of the fighting during the wars between the English and the French (aided by their Indian allies) in America, terminating with the conquest of Canada by the English in 1759–1760, and a sense of common danger helped to create a certain solidarity, which made easier the union of the colonies for common action against the mother country at the time of the War of American Independence. After that war, New England was long the most essentially commercial and industrial group of states, and was a stronghold of Federalism; and in the period immediately before and during the War of 1812, when its commercial interests suffered terribly, first from the restrictive measures of the general government and then from warfare, New England was a centre of that opposition to the policy of the National Administration (then Democratic), which culminated in the famous Hartford Convention of 1814–1815 (see HARTFORD).

See the articles on the separate New England states and the authorities there given; among good general works are J. G. Palfrey, *History of New England* (5 vols., Boston, 1858–1890); J. A. Doyle, *The Puritan Colonies* (2 vols., New York, 1889); B. B. James, *The Colonization of New England* (Philadelphia, 1904); H. L. Osgood, *The American Colonies in the Seventeenth Century* (3 vols., New York, 1904–1907); John Fiske, *The Beginnings of New England, or the Puritan Theocracy in its Relation to Civil and Religious Liberty* (Boston, 1896); S. A. Drake, *The Making of New England* (New York, 1896); W. B. Weeden, *Economic and Social History of New England* (2 vols., Boston, 1890); and Edward Channing, *History of the United States*, vols. i. and ii. (New York, 1905, 1908).

NEW FOREST, one of the few woodland regions left in England covering about 93,000 acres in the south-west of Hampshire, between the Solent, Southampton Water and the river Avon. About two-thirds of it is crown property, and is preserved more or less in its natural condition as open woodland interspersed with bogs and heaths. The trees principally represented are oak and beech, with some newer plantations of Scotch fir. The trees were formerly felled for building the ships of the navy and for feeding the iron furnaces of Sussex and Hampshire. Pigs and a hardy breed of ponies find a good living in the forest; and in spite of an act in 1851 providing for their extermination or removal, a few red deer still survive. Foxes, squirrels, otters, snakes (smooth snake, grass snake and adder), butterflies (some of them peculiar to the district), and an occasional badger range the forest freely. The tract derives its name from the extensive afforestation carried through in this region by William the Conqueror in 1079; and the deaths of two of his sons within its confines—Richard killed by a stag, and William Rufus by an arrow—were regarded in their generation as a judgment of Heaven for the cruelty and injustice perpetrated by their father when appropriating the forest. Rufus's stone, near Lyndhurst, marks the supposed spot where that monarch fell. About one-fourth of the area is under cultivation by private owners and tenants. The principal village within the forest is Lyndhurst (pop. 2167 in 1901); its church contains a fresco by Lord Leighton, and here is held the verderers' court, which since 1887 has had charge of the crown portion of the forest. On the western outskirts lies the town of Ringwood (*q.v.*). Brockenhurst and Beaulieu are the villages next in importance. Beaulieu, at the head of the picturesque estuary of the Beaulieu river, which debouches into the Solent, is famous for the ruins of Beaulieu Abbey, founded by King John for Cistercians. The gatehouse is restored as a residence, and the Early English refectory as a church. There are considerable remains of the cloisters, chapter house and domestic buildings. The New Forest gives name to a parliamentary division of the county.

The New Forest is one of the five forests mentioned in Domesday. It was a hunting-ground of the West Saxon kings, but, as already stated, was afforested by the Conqueror, whose cruelty in the matter is probably exaggerated by the traditional account. One of the chief sources of the wealth of the forest in early times was the herds of pigs fed there. The New Forest

being under the forest laws, was affected by the forest clauses of Magna Carta and by the Forest Charter (1217), which mitigated their severity. The chief officer of this, as of other forests, was the justice in eyre who held the justice seat, the highest forest court and the only court of record capable of entering and executing judgments on offenders; the lower courts were the Swainmote and Wodemote, the former of which is still held, in a modified form, in the Verderers' Hall of the King's House at Lyndhurst. The circuit of the justices in eyre, or their deputies, continued down to 1635; they were virtually ended by the Act for the Limitation of Forests (1640), though Charles II. attempted to revive them, and they were not legally abolished until 1817. The lower officers of the forest, who held merely local appointments, were the verderers, the regarders (one of whose duties was that of seeing to the expeditation of "great dogs"), the foresters, the woodwards and the agisters. There was also a lord warden, who was usually a nobleman and performed no judicial functions. The Deer Removal Act (1851) resulted in the almost total extinction of the forest deer. Under the act of 1877 the forest is administered rather as a national park than for the growing of timber on commercial principles.

See J. R. Wise, *The New Forest* (4th ed., 1883), with over sixty engravings by W. J. Linton and a dozen etchings by H. Sumner; and R. D. Blackmore, *Cradock Nowell* (1866).

NEWFOUNDLAND, a large island, forming a British colony, and occupying an important and commanding position off the eastern coast of the North American continent, not dissimilar to that occupied by Great Britain towards Europe. It stretches directly across the entrance of the Gulf of St Lawrence, to which access is afforded at both the northern and the southern extremities of the island. In the south-west its distance from Cape Breton is less than 60 m., while only 1640 m. separate its most easterly point from the coast of Ireland. It is situated between 46° 36′ 50″ and 51° 39′ N., and between 52° 37′ and 59° 24′ 50″ W. The total area of the island is about 40,200 sq. m. or one-sixth larger than Ireland: its maximum length from Cape Ray to Cape Norman is 317 m., its maximum breadth from Cape Spear to Cape Anguille, 316 m. In shape it is roughly triangular, three extensive peninsulas, which project from the north (Petit Nord) and south-east (Avalon), assisting the conformation, although the latter, the most populous region of the island, is joined by a very slender isthmus, at one place only 3 m. wide. A further division of the Avalon peninsula is wrought by the two bays of St Mary's and Conception. St John's, the capital, is situated on the eastern side of Avalon.

Physical Features.—Viewed from the ocean the coasts of Newfoundland appear bleak, rocky and barren. The brown wall of rock, 200 to 300 ft. in height, is, however, broken at frequent intervals by deep fjords and large bays running in some instances 80 to 90 m. inland, and throwing out smaller arms in all directions. For this reason the circumference of the island, which, measured from headland to headland, is about 1000 m., is actually doubled. The fjords resemble those of Norway; islands are numerous, some of them clad with vegetation; and picturesque scenery is not uncommon.

Near the coasts the surface of the country is of a hilly, rugged character. In the interior the elevated undulating plateau is diversified by ranges of low hills, valleys, woods, lakes, ponds and marshes. Much of this is a savanna country, giving sustenance to large herds of caribou. All the principal hill ranges have a N.N.E. and S.S.W. trend, as have also all the other great physical features of the island, such as the bays, larger lakes, rivers and valleys, a conformation doubtless shaped by glacial action during the Ice period. The most important range of mountains is the Long Range, beginning at Cape Ray and extending along the western side of the island for some 200 m., and having peaks more than 2000 ft. high. Parallel to this but nearer the west coast is the Anguille Range, running from Cape Anguille to the highlands of Bay St George. Some of the summits of the Blomidon Range, extending along the south shore of the Humber and Bay of Islands, attain a height of 2084 ft., being the highest on the island. Avalon peninsula is also very hilly, but the greatest altitude is only 1200 ft.—North-East Mountain, from which sixty-seven lakes are visible on a clear day. Over the interior are spread a number of detached sharply-pointed summits, springing abruptly from the great central plateau, bearing the local name of "tolts," and serviceable as landmarks.

In comparison with the island's size large rivers are few, owing to the broken, uneven character of most of the country, and the fact that the ponds and lakes find a convenient vent in the numerous lengthy inlets and arms of the sea. There are, however, three considerable streams, the Exploits, the Humber and the Gander. The first-named rises in the extreme S.W. angle of the island, close to the southern extremity of the Long Range, and after a course of 200 m. falls into the Bay of Exploits, Notre Dame Bay. It is a mile wide at its mouth, its channel is studded with islands, the largest being Thwart Island, 9 m. in length. Fourteen miles from the mouth is a succession of cascades known as Bishop's Falls, and farther inland are the picturesque Grand Falls. The Exploits drains an area of between 3000 and 4000 m., much of it fertile land, and densely wooded with pine, spruce, birch and poplar. The width of this fertile belt varies at different parts of the river, but it is estimated that some 200,000 acres might be available for agriculture. The Humber rises 20 m. inland from Bonne Bay, and, after emptying itself by a circuitous course into Deer Lake, falls into the Bay of Islands. It drains an area of 2000 sq. m. Rising near the southern coast, the Gander flows through Gander Lake into Hamilton Sound, draining an area of nearly 4000 sq. m. Besides these three there is the Codroy, rising in the Long Range and emptying into the Gulf of St Lawrence.

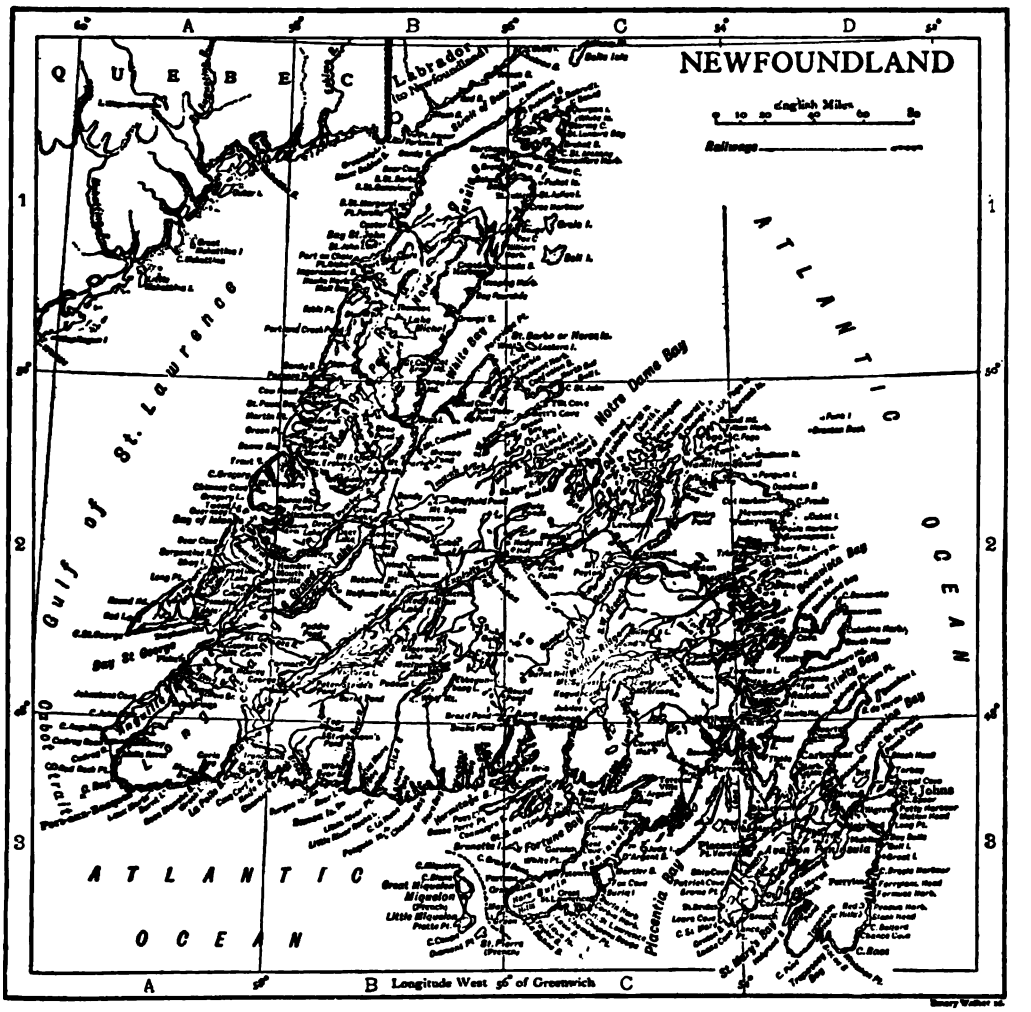
The immense number of lakes and ponds constitutes perhaps the most striking physical feature of the island. More than a third of the whole area is occupied by water. These bodies of water, large and small, are found in the most various positions: in the mountain gorges; in the depressions between the low hills; in the valleys and even in the hollows on the tops of the highest eminences. The largest is Grand Lake, 56 m. long, 5 in breadth, with an area of 192 sq. m. Its surface is but 50 ft. above sea-level, the bottom at its deepest portion being 300 ft. below sea-level. It contains an island 22 m. long. The next, Red Indian Lake, is 37 m. long, with an area of 64 sq. m. Gander Lake is 33 m. in length, and Deer Lake, through which the Humber flows, is 15 m. After these Michel Sandy Lake, Victoria, Hind's, Terra Nova and George IV. lakes rank next in size. Save where the railway and lumbering camps have invaded them the shores of these lakes are still primitive wilderness.

The coasts of the island, intersected by many great bays, have been familiar to fishermen from an early period, but the interior remained almost completely unknown until the geological survey, still in process, was begun in 1864. Chief amongst the inlets are Placentia Bay, 55 m. in width at its mouth and 90 m. long; Notre Dame Bay, 50 m. wide and 70 m. long; Fortune Bay, 25 m. wide and 70 long; and St Mary's Bay, 25 m. wide by 35 m. in length. Opposite Fortune Bay, which has several important arms, are the two islands of St Pierre and Miquelon, ceded by treaty in 1713 to France, as shelter for her fishermen, and now all that remains of French sovereignty in North America. In the neighbourhood of Bay St George, on the west coast (40 m. wide at the mouth and boasting a good harbour) are situated some of the most fertile lands in the island, well-timbered and containing large deposits of coal and other minerals. Three extensive arms run 20 m. inland from Bay of Islands, the seat of a profitable herring fishery. Conception Bay is one of the largest and most important in the island, having in 1901 a population scattered through the settlements on its shores of over 40,000 inhabitants. Another principal inlet is Bonavista Bay, which contains numerous groups of islands.

Geology.—All the great ancient rock systems, between the Lower Laurentian and the Coal-measures, are more or less represented at one part or another of Newfoundland.

The Laurentian system has an immense spread in the island. It constitutes the principal mountain ranges, coming to the surface through the more recent deposits, on the axes of anticlinal lines, or brought up by great dislocations, most of which trend nearly parallel with each other in a general bearing of about north-north-east and south-south-west. The Laurentian gneiss of the Long Range, on the western side, extends in a nearly straight course from Cape Ray to the headwaters of the Castor in the great northern peninsula. On the south-western extremity of the island these rocks occupy the coast from Cape Ray to La Poile. They are largely exhibited on Grand Lake, running in a spur from the Long Range between it and Red Indian Lake, and bearing for the south-eastern shores of Hall's Bay. The central portion of the northern peninsula is Laurentian, which also spreads over a wide expanse of country between Grand Lake and the Humber and Exploits rivers, and shows itself on the coast between Canada Bay and White Bay. Another range of Laurentian comes up in the district of Ferryland, and shows itself occasionally on the coast of Conception Bay. Thus more than half the island is Laurentian.

Three-fourths of the peninsula of Avalon are Huronian, a formation which does not extend west of Fortune Bay. The town of St John's and, in fact, nearly all the settlements between Fortune Bay and Bonavista Bay are built upon it. Signal Hill, overlooking the harbour of St John's, is capped with the sandstone of this formation. The whole Huronian system is not less than 10,000 ft. thick, and has been cut through by denudation to the Laurentian floor. The rocks of the Primordial Silurian age are spread unconformably over the area thus ground down. These evidences of denudation and reconstruction are very clear in Conception Bay, where the rocks



of the intermediary system have been ground down to the Laurentian gneiss, and, subsequently, the submarine valley thus formed has been filled up with a new set of sediments, the remains of which are still to be found skirting the shores of the bay and forming the islands in it.

Rocks of the Silurian age are most extensive on the peninsula of Cape St Mary, and around the head of Trinity Bay. These belong to the Primordial Silurian group. The Lower Silurian rocks have a large development, and in them the metallic ores occur which seem destined to render the island a great mining centre. The Lauzon division of the Quebec group, which is the true metalliferous zone of North America, has an immense spread in the island. It consists of serpentine rocks associated with dolomites, diorites, &c., and is well known throughout North America to be usually more or less metalliferous. The Newfoundland rocks are no exception, but give evidence of being rich in metallic ores. The Middle Silurian division of rocks is also widely spread; and the most fertile belts of land and the most valuable forests are nearly all situated on the country occupied by this formation. The great valley of the Exploits and Victoria rivers, the valley of the Gander and several smaller tracts belong to it.

The Carboniferous series occupies a large area on the western side of the island, in the neighbourhood of Bay St George and Grand Lake. There is also a wider spread of the same series along the valley of the Humber and round the shores of Deer Lake and the eastern half of Grand Lake, and as far as Sandy Lake. "Coal," says Mr J. P. Howley, F.R.G.S., head of the survey, "is known to exist at several places in this series; and seams, apparently of workable thickness, judging from their out-crops, occur on the Middle Barachois and Robinson's Brook, in St George's Bay."

It will thus be seen that the Carboniferous series is confined to the western side, while the middle, eastern and southern portions are occupied by Silurian, Huronian and Laurentian formations. From the extent to which the Lauzon division of the Quebec group, the true metalliferous zone of North America, prevails in the island, its yet undeveloped mineral wealth must be very great.

Climate.—The climate is more temperate than that of most portions of the neighbouring continent. It is but rarely, and then only for a few hours, that the thermometer sinks below zero in winter, while the summer range rarely exceeds 80° F., and for the most part does not rise above 70°. The Arctic current exerts a chilling influence along the eastern coast, but as a compensation it brings with it the enormous wealth of commercial fishes and seals which has rendered the fisheries the most productive in the world. The Gulf Stream, while it creates fogs, modifies the cold. The salubrity of the climate is evidenced by the robust healthy appearance of the inhabitants.

Open fireplaces are sufficient to warm the houses, and free exercise in the open air is attainable at all seasons. The average mean temperature at St John's is 41·2° F., the maximum being 83° and the minimum 7°; the average height of the barometer is 29·37 in. The average rainfall is 58·30 in. Winter sets in, as a rule, in the beginning of December and lasts until the middle of April. Generally the snow lies during this period, and the frost rarely penetrates the ground to a greater depth than a few inches. Spring is sometimes late in arriving, but once vegetation sets in it advances with marvellous rapidity. The autumn is usually very fine, and is often prolonged till November. There is nothing in the climate to interfere with agriculture. Tornadoes are unknown, and thunderstorms are very rare. Fogs, of which so much is said in connexion with the country, are confined to the shores and bays of the south-eastern and southern coasts.

Fauna.—Among the well-known wild animals indigenous to the country the caribou or reindeer hold a conspicuous place. They migrate regularly between the south-eastern and north-western portions of the island. The winter months are passed in the south, where "browse" is plentiful, and the snow is not too deep to prevent them from reaching the lichens on the lower grounds. In March they begin their spring migration to the barrens and mountains of the north-west. In May or June they bring forth their young. As soon as the frosts of October begin to nip the vegetation they turn south. September and October are the best months for stalking. In addition to the caribou, the wolf and black bear are found in the interior; the fox (black, silver, grey and red), beaver, otter, arctic hare, North-American hare, weasel, bat, rat, mouse and musquash or musk-rat are numerous. The famous Newfoundland dog is still to be met with, but good specimens are rare, and he appears to thrive better elsewhere. The common dogs are a degenerate mongrel race. It is estimated that there are three hundred species of birds in the island, most of them being migratory. Among them may be enumerated the eagle, hawk, owl, woodpecker, swallow, kingfisher, six species of fly-catchers and the same number of thrushes, warblers and swallows in great variety, finches, ravens, jays. The ptarmigan or willow grouse is very abundant, and is the finest game-bird in the island. The rock ptarmigan is found in the highest and barest mountain ridges. The American golden plover, various species of sandpipers and curlews, the brent goose, ducks, petrels, gulls and the great northern diver are met with everywhere. The great auk, now extinct, was once found in myriads around the island. The little auk, guillemot and the razor-billed auk are abundant. No venomous reptiles occur. Frogs have been introduced and thrive well. Of molluscous animals the common squid, a cephalopod about 6 or 7 in. in length, visits the coasts in immense shoals in August and September, and supplies a valuable bait. A gigantic species of cephalopod was discovered in 1873, which excited much interest among naturalists: the body varies from 7 to 15 ft. in length, with a circumference of 5 or 6 ft.; from the head ten arms radiate, the two longest (tentacles) being from 24 to 40 ft. in length, and covered with suckers at their extremities; the other eight arms vary from 6 to 11 ft., and on one side are entirely covered with suckers. Professor Verrill, of Yale College, distinguished two species—one he named *Architeuthis Harveyi*, after the discoverer, and the other *Architeuthis monachus*.

Flora.—The pine, spruce, birch, juniper and larch of the forests of the interior furnish ample materials for a large timber trade as well as for shipbuilding purposes. The white pine grows to the height of 70 or 80 ft. in some places, and is 3 or 4 ft. in diameter. There is an abundance of wood suitable for making pulp for paper; and in 1906–1907 a London company, with Lord Northcliffe (of the *Daily Mail*) at its head, acquired large tracts for this purpose, and operations were begun in 1910. The mountain ash, balsam poplar and aspen thrive well. Evergreens are in great variety. The berry-bearing plants cover large areas of the island. The maidenhair or capillaire yields a saccharine matter which is lusciously sweet. Flowering plants and ferns are in vast varieties, and wild grasses and clover grow luxuriantly. Garden vegetables of all kinds, and strawberries, raspberries, gooseberries, currants, &c., thrive well.

Population.—By the earliest computation made in 1654 the number of permanent inhabitants in the island was 1750. Twenty-six years later the resident population was stated to be 2280; in 1763, 7000; in 1804, 20,000. In 1832 the population had risen to 60,000; in 1836 to 75,094; in 1857, 124,288; and in 1874, 161,374. By the census of 1901 the total population of Newfoundland was 217,037, that of Labrador being 3947. The capital, St John's, which contained a population of 15,000 in 1835, had in 1901 29,594 souls. The rate of increase for the island for the ten years ending in 1901 was 9·37% as compared with the rate of increase 1874–1884, which was 22·30%. Certain districts such as Carbonear, Harbour Grace and Ferryland, as well as Labrador, showed a steady decline, the largest increase being in St George's district and on the west coast, where it is not less than 40%.

Of the various religious denominations the strength in 1901 was as follows: Roman Catholics, 75,989; Chuch of England, 73,008; Methodists, 61,388; Presbyterians, 1168; Congregationalists, 954; Salvationists, 6594; Moravians, Baptists and others, 1554. The system of public education is denominational, each religious body receiving grants from the revenue according to numerical strength. The total sum allotted to education in 1904–1905 was $196,192. The aggregate number of pupils under fifteen attending the 783 elementary schools and academies in the island was 35,204. It is estimated that 25% of the population, chiefly the older folk, are illiterate.

Fisheries.—These constitute the great staple industry of the island. On the export of its products the trade of the colony still mainly depends. The most important fish in these waters, commercially, is the cod, which is here more abundant than anywhere else in the world. Although subject to considerable fluctuation the average annual export of dried cod-fish over a term of years is about 1,200,000 quintals. The value of the export varies between five and six million dollars, according to the market price of the dried fish. The cod are taken on the shores of the island, along the Labrador coast and on "the Banks." These Banks, which have played such an important part in the history of the colony, and are the chief source of its wealth, stretch for about 300 m. in a south-east direction towards the centre of the North Atlantic, and probably at one time formed a part of the North American continent. The depths range from 15 to 80 or 90 fathoms. The deposits consist of sand and gravel composed of ancient rocks, and fragments of quartz, mica, hornblende, felspars and magnetite; along with these are many calcareous fragments of echinoderms, polyzoa and many foraminifera. In the deeper parts there is sometimes a fine mud containing the above-mentioned minerals and calcareous fragments, and in addition numerous frustules of diatoms. The Banks are swept by the cold Labrador current, and icebergs are frequently stranded upon them. The Gulf Stream passes over their southern portions. These two currents bear along many species of pelagic algae and animals, which supply abundant food to the myriads of echinoderms, molluscs, annelids, coelenterates and other invertebrates which live at all depths on the Banks. These invertebrates in turn supply food to the cod and other fishes which are sought for by the fishermen. Sea birds frequent the Banks in great numbers; and, as diving birds are not met with at any great distance from them, the presence of these in the sea gives seamen an indication of the shallower water.

The total annual catch of cod in Newfoundland waters has been estimated at about 2,500,000 quintals (a quintal being one-twentieth of a ton), with a value of about £1,400,000 sterling. The cod fishery forms four-fifths of the entire industry, in spite of the increase in the herring and lobster catch. No increase in the quantities taken is to be noted, but the market value of dried cod fish is generally enhanced. In 1885 an export of 1,284,710 quintals was only worth $4,061,600. In 1905 1,196,814 quintals were valued at $6,108,614. To this may be added the value of the fish consumed by the people of the colony, estimated at $450,000. According to the census of 1901 there were 41,231 males and 21,443 females engaged in the catching and curing of fish.

The figures have greatly varied in past years: as for instance in 1857, 31% of the total population were engaged in catching and curing fish: in 1869, 25·4%, in 1884, 30·6%, and in 1901, 28·4%. Small voyages and low prices have tended to limit fishery operations; and the opening up of other industries has diverted labour from the fisheries. The total number of vessels engaged is about 1550, with a tonnage of 54,500; over 11,000 fishing rooms are in actual use. The use of traps has followed the decrease in number of nets and seines, but the continued increase of fishing rooms shows that there is no falling off in the Newfoundland cod fishery, which has now been prosecuted for fully four centuries. Notwithstanding the enormous drafts every year, to all appearance the cod are as abundant as ever. They begin to appear on the coasts of the island about the first of June, at which time they move from the deep waters of the coast to the shallower and warmer waters near the shore, for spawning purposes. Their approach is heralded by the caplin, a beautiful little fish about 7 in. in length, vast shoals of which arrive, filling every bay and harbour. The cod follow in their wake, feasting greedily upon the caplin, which supply the best bait. In six weeks the caplin disappear, and their place is taken by the squid about the 1st of August. These also supply a valuable bait, and are followed by the herring, which continue till the middle or end of

October, when the cod fishery closes. The cod are taken by the hook-and-line, the seine, the cod-net or gill-net, the cod-trap and the bultow. Newfoundland exports cod to Brazil, Spain, Portugal, Italy, Great Britain, Greece, the West Indies and the United States. Brazil and Spain are the largest consumers.

After the cod the seal fishery is of next importance. The industry was begun about 1740, when the value of the seal oil exports was £1000. In 1904–1905 sealskins and seal oil to the value of $370,261 and $374,974 were exported, the price of a skin varying between $·90 to $1·25. This shows a considerable falling off. The number of men employed is about 4000. Steamers were first used in 1863. They are from 350 to 500 tons burden, most of them carrying from 200 to 300 men. The larger class can bring in from 30,000 to 40,000 seals. In one instance 41,900 seals were brought in by a single steamer, the "Neptune," the weight being 874 tons and the value $103,750. In bad years the catch may not exceed 200,000—in 1893 it fell to 129,061. By law no steamer may leave port on a sealing voyage until the 12th of March, and no seal may be killed before the 14th of March. The young seals are born on the ice between the 15th and 25th of February, and mature so rapidly that they are in excellent condition in four weeks.

Of more recent origin is the lobster fishery, their packing for export having begun in 1873. By 1888 the value of the lobster export had risen to $385,077. In 1904–1905, while the catch had somewhat diminished as compared with 1895, the value had increased to $512,662.

A vigorous effort has been made to establish the herring fishery on a scale commonsurate with the abundance of the fish in these waters. In 1855 the total quantity exported was 32,042 barrels, with a value of $91,357. In 1905 there were 176,633 barrels, valued at $379,938. The principal seats of the herring fishery are Fortune Bay, Placentia, Bay St George and Bay of Islands, and the whole coast of Labrador, which furnishes the finest kind of herring. Besides the herring exported, at least $150,000 worth is sold to the French and Americans as bait.

The export of preserved salmon, of which the island has an abundant supply, does not form a large or important item, seldom reaching in value $100,000. Salmon is taken for the most part in nets in the coves and bays and at the mouths of rivers. The season for taking it is brief, six or seven weeks, beginning at the end of May. The proper preservation of the salmon waters has been for generations neglected, and reckless practices bade fair wholly to exterminate the fish. In 1888, however, a fisheries commission was appointed, and river warders were charged with the stringent enforcement of the new laws. The best salmon fisheries are in Bonavista Bay, Gander and Exploits bays, and on the west coast.

Mackerel formerly frequented the Newfoundland coasts, but disappeared about the middle of the 19th century; and few halibut or haddock are caught. Sea trout and brook trout, however, abound, and latterly Loch Leven and Californian rainbow trout have been introduced with success.

The most extraordinary increase concerns the whaling industry. Before 1850 a very successful whale fishery was carried on, but it then suddenly ceased and has only recently been revived. The revival is due to the invention of a harpoon-gun which kills the whale effectually and with despatch. There are now fourteen whale factories in operation for the production of bone and oil. While in 1895 the value of the oil reached only $7300 and the bone $1000, a decade later the values were $384,062 and $34,833 respectively; no fewer than 1275 whales being caught. A patent process manufactures the carcases into a fine guano, and utilizes the by-products, thus adding $100,000 to the industry.

On the whole the aggregate value of the Newfoundland fisheries for 1906–1907 was nearly £2,000,000 sterling, including the fish consumed in the colony.

Agriculture.—Until recent years little attention has been paid to agriculture, the belief being current that the interior of the island was a desert. The reports of the geological survey dispelled this fiction, it being conclusively shown that out of the 28,000 sq. m. of dry land over one-sixth or 7000 sq. m. is available under suitable conditions for arable and for grazing purposes. The best land is situated in the Codroy valley, which is rich in alluvial soil. That in the Bay St George district is very fertile, and in the Humber valley, Exploits valley and elsewhere many thousands of farmers could work to advantage. In 1874 only 36,339 acres were under cultivation. In 1901, 215,579 acres were occupied, of which 85,533 acres were actually under cultivation, producing chiefly hay, oats, potatoes, turnips and cabbages. In the numbers of live stock there has been a notable increase, especially in sheep. Newfoundland seems especially adapted for a sheep-grazing country.

Mining.—Not until a comparatively recent date was Newfoundland known to contain mineral deposits of great value. The first discovery of copper ore took place at a small fishing hamlet called Tilt Cove in 1857. Seven years later the mine was opened, and during the following fifteen years Tilt Cove mine yielded about 50,000 tons of copper ore valued at $1,572,154, besides nickel worth $32,740. In 1875 another mine at Bett's Cove was opened. There are three principal mines, all in Notre Dame Bay, the copper exports in 1905 being 81,491 tons, with a value of $448,400. The copper-bearing deposits are widely distributed. According to the geological survey reports, copper-bearing rocks have a development of over 5000 sq. m. throughout the island. Iron-mining, however, has far surpassed copper-mining, the chief centre being at Bell Island in Conception Bay. Hematite iron has been found at Exploits river, Fortune Harbour, New Bay and other parts in Notre Dame Bay. The iron exported in 1905 amounted to 635,350 tons with a value of $635,350. In 1895 the value of iron exports was nil. Of iron pyrites 68,970 tons were exported in 1905 valued at $410,514. Similarly in 1895 no slate was exported. It has since been worked at Trinity Bay, Bonavista Bay and Bay of Islands, the latter deposit being declared equal to the best Carnarvon slate. In 1905 14,750 tons were shipped. The existence of coal in the island has been known since Captain Cook first reported its discovery in 1763, but until lately little has been done to exploit it. The most important carboniferous region is at Grand Lake, St George's and the Codroy region directly opposite the Cape Breton coal-fields.

Zinc has been found in many localities, as also antimony, silver and gold. Asbestos is frequently found, and mica of good size has been discovered in the Laurentian rocks in the Long Range Mountains and in Labrador. At the mouth of the Humber are large deposits of marble. The valuable non-metallic materials include talc, gypsum, graphite, lithographic stone and manganese.

Shipping.—The total number of vessels sailing under Newfoundland registry on the 31st of December 1905 was 3049, with a net tonnage of 129,617 tons. Of these 66 were steamers. The statistics of foreign-going tonnage show a remarkable growth in trade. The bounty granted by the legislature has given a considerable impetus to local shipbuilding. Between 1900 and 1905 the average of vessels annually built in the colony was 105, with a total tonnage for the five years of 17,698. In 1904–1905 the total value of exports was $10,669,342, of imports $10,279,203. For the period of seven years preceding the exports exceeded the imports by $7,174,676 or a balance of trade in favour of the colony of over one million dollars annually.

Manufactures.—In 1874 there were only five saw-mills in the colony, producing 2111 ft. of timber. The census returns of 1901 showed 195 saw-mills valued at $292,790, employing 2408 persons and producing 43,648 ft. of timber, 16,197 of shingle and 2020 of laths, of a total value of $480,555. Paper-making from wood-pulp has been mentioned in connexion with *Flora*, above. Six tanneries in 1901 produced goods to the value of $98,200. There are boot and shoe, tobacco, nail, soap, furniture and carriage manufactories. The rope-walk in St John's produces rope and line valued at $300,000 annually.

Government.—Newfoundland is a British colony, directly dependent on the crown. Representative government and a constitution were granted to it in 1832, and "responsible government" in 1855. Two legislative chambers were appointed—the house of assembly, to be elected, and the legislative council, to be nominated by the governor in council. This form of government has worked satisfactorily. It consists of a governor who is appointed by the crown, and whose term of office is usually about six years; an executive council chosen by the party commanding a majority in the house of assembly, and consisting of seven members; a legislative council or upper house, of fifteen members nominated by the governor in council and holding office for life; and a house of assembly elected every four years by the votes of the people on a household suffrage basis. There are seventeen electoral districts sending thirty-six members to the house of assembly, all of whom are paid. The sessional allowances range from $194 to $291. The supreme court, instituted in 1826, is composed of a chief justice and two assistant judges. They are appointed by the crown, and hold their office for life. The jurisdiction of Newfoundland extends over the whole of the Atlantic coast of Labrador.

Finance.—Duties levied on imports form the basis of the revenue. The tariff being intended for the cost of government and not for industrial protection, the duties are not as a rule differential, being partly *ad valorem*, partly specific.

There is no direct taxation, and there are no city or town corporations. The customs revenue grew from $840,936 in 1885 to $2,295,959 in 1905. The public debt increased from $2,149,597 in 1885 to $22,043,338 in 1905, against which there was a sinking fund of $300,244. The debt of St John's municipal council, $1,187,221, on which full interest is paid to the government, must be credited to the gross public debt. In December 1905 a new loan of $636,903 was floated in England. Based on the value of the exports the earning capacity of the population increased from $29 per head in 1885 to $47 per head in 1905. The postal and telegraph revenue amounted in 1905 to $125,000, having more than doubled in a decade. The crown lands revenue, which in 1895 was $5300, stood in 1905 at $41,357. With the United Kingdom, trade, which in 1888 was 38 % of the whole, steadily diminished in volume, until it was in 1905 only 22 % of the whole. Trade with

America in this period showed an increase of 128·5% and that with Canada 76·1%.

Roads and Railways.—Railways play a unique part in the modern history of the island. Not until 1825 was the first road made; it was 9 m. in length, from St John's to Portugal Cove. When representative government was established in 1832 an annual grant was voted for roads and bridges, and of late years not less than $100,000 per annum has been expended on this head. There are now over 1000 m. of postal roads, and over 2000 of district roads. In 1880 after much agitation the legislature finally agreed to raise a loan of £1,000,000 for the construction of a railway from St John's to Hall's Bay, with branches to Brigus and Harbour Grace, the distance being estimated at 340 m. In November 1884 the line was completed for traffic as far as Harbour Grace. In the following year the construction of a line, 27 m. in length, from Whitbourne to Placentia, the old French capital, was begun and finished in 1888. Shortly afterwards it was decided to resume the line northwards from St John's to Hall's Bay (which, owing to the failure of the contractors, had been discontinued) with a view ultimately to a transinsular railway. The tender of a well-known contractor, Mr R.G. Reid of Montreal, was accepted, and the work was begun in October 1890. But before the contractor had proceeded far with the Hall's Bay line a new survey was made and another route determined for the proposed transinsular railway, westwards from the valley of the Exploits, which was regarded as much more favourable than the one originally contemplated. It traversed the Exploits and Humber valleys, passing through the most fertile territory in the island, to the Bay of Islands on the west coast; hence it skirted Bay St George and the Codroy valley and terminated at Port-aux-Basques, a commodious harbour 93 m. distant from Sydney, Cape Breton. The new route was chosen, and a contract signed on the 16th of May 1893, whereby the contractor was to be paid $15,600 per mile in Newfoundland bonds, the whole line to be completed in three years. At the same time, in order to provide for the working of the line, it was agreed between the colonial government and Mr Reid that the latter should maintain and work it, as well as construct a system of telegraphs, for a period of ten years from the 1st of September 1893 at his own expense, in consideration of a "grant in fee simple to the contractor of 5000 acres of land for each one mile of mail line or branch railway to be operated." Should the line, therefore, be 500 m. in length the land grant would be 2,500,000 acres, to be situated on each side of the railway in alternate sections of 1 or 2 m. in length with the railway, and 8 m. in depth, the colony also retaining an equal amount of land with the contractor along the route. Much hostile criticism was subsequently directed towards this arrangement. In 1898 a new proposal was made by Mr Reid, under the terms of which he undertook to work all the railways in the island for a period of fifty years, free of cost to the government, provided that, at the termination of the said period, the railways should become his own property. He was also to receive a further concession of land to the extent of 2,500,000 acres on terms similar to those contained in the former contract. Mr Reid agreed to build and run seven steamers, one in each of the large bays, and one to ply in Labrador in summer, to provide an electric street railway for St John's, and also to pave a certain portion of the capital. The colony was to part with the telegraph system to the contractor, who was to acquire at a fixed price the government dry-dock at St John's. On the other hand, to complete the bargain, $1,000,000 in cash was to be paid by the contractor to the government within a year after the signing of the contract. This remarkable covenant, which was afterwards characterized by Mr Chamberlain, secretary of state for the colonies, as a transaction "without parallel in the history of any country," was nevertheless ratified by the legislature, and submitted to the governor, Sir Herbert Murray, for his approval. The governor declined to append his signature to the instrument, but upon its being referred to the imperial secretary of state, it was decided that the arrangement was one relating exclusively to the colony, and this being the case, that it would be "an unwarrantable interference with the rights of a self-governing colony" to disallow the measure. The Reid contract was therefore signed by Sir Herbert Murray before relinquishing his post early in 1898. Meanwhile considerable feeling had been manifested in the colony; numerous public meetings in support of the governor's action were held; and several petitions were despatched to England; but it was not until the spring of 1900 that Sir James Winter and his colleagues were forced to resign on account of the opposition which had been engendered. The general election brought a Liberal, Mr (afterwards Sir) Robert Bond, into power; and he had hardly assumed office when the contractor approached the ministry with further proposals to convert his property into a limited liability company with a capital of £5,000,000 sterling, for which proceeding the consent of the legislature was necessary, under the terms of 1898. Mr Bond refused unless a modification of the contract was agreed to. The modifications demanded were—that the telegraphs should revert at once to the government; that the land grants, which included a large amount of private property, should be readjusted so as to conserve the rights of those whose holdings had been confiscated; also, that it should be optional for the colony to take over the railways at the end of fifty years by paying back the sum of $1,000,000 with interest, the amount paid by Mr Reid to the colony; and a sum to be arrived at by arbitration for all improvements that may have been made on the property within the fifty years. After considerable dispute these terms were substantially agreed to, and the conversion into a company took place.

The Reid contract.

History.—Newfoundland, commonly termed the "senior colony" of Great Britain, antedates in discovery (though not in continuous settlement) any other British over-sea dominion. John Cabot, sailing from Bristol in 1497, appears to have made landfall at Bonavista and claimed the whole country for Henry VII. Three years later Gaspar Corte-Real, ranging the North American coasts, discovered and named Conception Bay and Portugal Cove, and was appointed Portuguese governor of Terra Nova. The long series of annual trans-Atlantic expeditions followed upon the voyages of Cabot and Corte-Real, and their reports in England, Portugal and France concerning the multitude of fish in Newfoundland. For a long time it was supposed that the English fishermen did not avail themselves to any extent of these advantages until the middle of the 16th century, but this is now shown to be erroneous. Mr Prowse states that the trade during the first half of the century was both "extensive and lucrative." In 1527 the little Devonshire fishing ships were unable to carry home their large catch, so "sack ships" (large merchant vessels) were employed to carry the salt cod to Spain and Portugal. An act of 1541 classes the Newfoundland trade with the Irish, Shetland and Iceland fisheries. Hakluyt, writing in 1578, mentions that the number of vessels employed in the fishery was 400, of which only one-quarter were English, the rest being French and Spanish Basque. But in the same year, according to Anthony Parkhurst, "the English are commonly lords of the harbours where they fish and use all help in fishing if need require." Shortly thereafter England awoke to the importance of Cabot's great discovery, and an attempt was made to plant a colony on the shores of the island. Sir Humphry Gilbert, provided with letters patent from Queen Elizabeth, landed in St John's in August 1583, and formally took possession of the country in the queen's name. The first attempt at colonizing was frustrated by the loss of Gilbert soon afterwards at sea. In 1610 James I. granted a patent to John Guy, an enterprising Bristol merchant, for a "plantation" in Newfoundland; but no marked success attended his efforts to found settlements. In 1615 Captain Richard Whitbourne of Exmouth in Devonshire was despatched to Newfoundland by the British admiralty to establish order and correct abuses which had grown up among the fishermen. On his return in 1622 he wrote a "Discourse and Discovery of Newfoundland Trade" which King James, by an order in council, caused to be distributed

Discovery.

Early colonizing.

among the parishes of the kingdom "for the encouragement of adventures unto plantation there." A year after the departure of Whitbourne, Sir George Calvert, afterwards the first Lord Baltimore, obtained a patent conveying to him the lordship of the whole southern peninsula of Newfoundland, and the right of fishing in the surrounding waters. He planted a colony at Ferryland, 40 m. north of Cape Race, where he built a handsome mansion and resided with his family for many years. The French so harassed his settlement by incessant attacks that he at length abandoned it.

Fishery policy.

In 1650, or about a century and a half after its discovery, Newfoundland contained only 350 families, or less than 2000 individuals, distributed in fifteen small settlements, chiefly along the eastern shore. These constituted the resident population; but in addition there was a floating population of several thousands who frequented the shores during the summer for the sake of the fisheries, which had now attained very large dimensions. So early as 1626, 150 vessels were annually despatched from Devonshire alone; and the shipowners and traders residing in the west of England sent out their ships and fishing crews early in summer to prosecute these lucrative fisheries. The fish caught were salted and dried on the shore; and on the approach of winter the fishermen re-embarked for England, carrying with them the products of their labour. Hence it became the interest of these traders and shipowners to discourage the settlement of the country, in order to retain the exclusive use of the harbours and fishing coves for their servants, and also a monopoly of the fisheries. They were able to enlist the British government of the day in their project, and stringent laws were passed prohibiting settlement within 6 m. of the shore, forbidding fishermen to remain behind at the close of the fishing season, and rendering it illegal to build or repair a house without a special licence. The object of this short-sighted policy, which was persisted in for more than a century, was to preserve the island as a fishing station and the fisheries as nurseries for British seamen.

Treaty of Utrecht.

There was, however, another element which retarded the prosperity of the country. The French had early realized the immense value of the fisheries, and strove long and desperately to obtain possession of the island. Their constant attacks and encroachments harassed the few settlers, and rendered life and property insecure during the long wars between England and France. When at length, in 1713, the treaty of Utrecht ended hostilities, it did not deliver Newfoundland from the grasp of France, as it yielded to her the right of catching and drying fish on the western and northern sides of the island. Though no territorial rights were conferred on the French, and the sovereignty was secured to England, the practical effect was to exclude the inhabitants from the fairest half of the island.

First governor.

In spite of the restrictive regulations, the number of the resident population continued to increase. The sturdy settlers clung to the soil, and combated the "adventurers" as the merchants were called, and after a lengthened conflict obtained freedom of settlement and relief from oppression. But the contest was severe and prolonged. The merchant-adventurers strenuously opposed the appointment of a governor; but at length, in 1728, the British government appointed Captain Henry Osborne first governor of Newfoundland, with a commission to establish a form of civil government. This constituted a new era in the history of the colony. In 1763 the fixed inhabitants had increased to 8000, while 5000 more were summer residents who returned home each winter. In 1763 the coast of Labrador, from Hudson's Strait to the river St John opposite the west end of the island of Anticosti, was attached to the governorship of Newfoundland. The population in 1785 had increased to 10,000. During the wars between England and France which followed the French Revolution, Newfoundland attained great prosperity, as all competitors in the fisheries were swept from the seas, and the markets of Europe were exclusively in the hands of the merchants of the country. The value of fish trebled, wages rose to a high figure, and in 1814 no less than 7000 emigrants arrived. The population now numbered 80,000. In 1832 representative government was granted to the colony, and provision was made for education. In 1846 a terrible fire destroyed three-fourths of St John's and with it an enormous amount of property; but the city rose from its ashes improved and beautified. In 1855 the system of responsible government was inaugurated. In 1858 the first Atlantic cable was landed at Bull Arm, Trinity Bay.

Recent history.

Unproductive fisheries, causing a widespread destitution among the working classes, marked the first eight years of the decade between 1860 and 1870. A system of able-bodied pauper relief was initiated to meet the necessities of the case but was attended with the usual demoralizing results. The necessity of extending the cultivation of the soil in order to meet the wants of the growing population was felt more and more as the pressure arising from the failure of the fisheries showed their precarious nature more sensibly. In 1864 copper ore was discovered in the north, and mining operations were successfully initiated. In 1869 a series of successful fisheries began which enabled the government to terminate the injurious system of able-bodied pauper relief. In 1871 the revenue rose to $831,160. In 1873 direct steam communication with England and America was established.

French claims.

By the treaty of Utrecht of 1713 a right was reserved to French subjects to catch fish and to dry them on that part of Newfoundland which stretches from Cape Bonavista to the northern part of the island and from thence coming down by the western side reaches as far as Pt. Riche. By the treaty of Versailles of 1783 France renounced the fishery from Bonavista to Cape St John on the east coast, receiving in return extended rights upon the west coast as far as Cape Ray. Neither treaty purported to grant exclusive right, but there was annexed to the treaty of Versailles a declaration to the effect that "His Britannic Majesty will take the most positive measures for preventing his subjects from interrupting in any manner by their competition the fishery of the French during the temporary exercise of it which is granted to them upon the coasts of the island of Newfoundland, and he will for this purpose cause the fixed settlements which shall be formed there to be removed." Upon this declaration the French founded a claim to exclusive fishing rights within the limits named. A convention was entered into with a view to defining these rights in 1854, but it remained inoperative, the consent of the Newfoundland legislature, to which it was made subject, having been refused. Meanwhile the French government granted a bounty to the French fishermen which enabled them to undersell the colonists.

Bait Act.

In 1884 a convention which had been arranged between the British and French governments was submitted to the colonial administration by its promoters Sir Clare Ford and Mr E. B. Pennell, C.M.G., but without commanding the support of the Newfoundland government. In the year following, on a change of ministry in the colony, the Ford-Pennell convention was again offered to the Newfoundland legislature in a slightly amended form, but the joint committee of the colonial house of assembly and the council absolutely refused to ratify the arrangement unless the French government would consent either to annul or to amend the system of bounties paid upon French-caught fish in Newfoundland waters. At the same time, to counteract the effect of these bounties, which pressed very hardly upon the British competition, a Bait Act was framed and carried in 1886, empowering the executive to prohibit the capture in Newfoundland waters for exportation or sale of bait fishes, except under special licence to be issued by the colonial government. The consequence of this measure, were its provisions properly enforced, would be to place an embargo upon the local supply of bait requisite to the French fishermen—the so-called "metropolitan fleet"—on the Grand Banks. Upon being apprised of this enactment, the French government immediately demanded that Great Britain should deny its sanction to this Newfoundland Bait Act, and pressed their objections with such persistence as to induce Lord Salisbury

to disallow the measure. Nevertheless, the despatch of the governor, Sir William des Voeux, to the colonial secretary, Sir H. Holland, was so entirely in favour of the principle of the bill that the Newfoundland authorities became imbued with a fixed determination to urge forward the measure for imperial acceptance. In 1887, therefore, a delegation, consisting of Sir Robert Thorburn, the premier, and Sir Ambrose Shea, visited England at a moment most propitious for obtaining the sympathy and support of the imperial government and the press and people of the mother country, it being the jubilee year of Queen Victoria's accession to the throne. A conference of colonial premiers was one of the notable events distinguishing that happy period, and the subject was argued before the conference at considerable length. The claim set up by the senior colony "to control and legislate for her own fisheries" met with general approval, the single dissentient being the representative of Canada, who feared that Canadian fishermen would suffer under the bill. When an assurance was tendered that Canada's fishermen would be placed upon the same footing with those of Newfoundland, the British government somewhat reluctantly sanctioned the Bait Act. The stipulation was made, however, that it should not be enforced until the spring following (1888). In the meantime the chagrin of the French Foreign Office at the failure of the Ford-Pennell negotiations, and the hostile attitude taken up by the Newfoundlanders in what they deemed to be the conservation of their interests, induced M. de Freycinet to devise retaliatory measures. Instructions were issued "to seize and confiscate all instruments of fishing belonging to foreigners resident or otherwise, who shall fish on that part of the coast which is reserved to our use." Lord Rosebery, then foreign secretary, protested to the French ambassador against the spirit of these instructions, which he insisted were in direct contravention of the treaty, inasmuch as they ignored the concurrent as well as those sovereign rights of Great Britain which France solemnly undertook by the treaties never to question or dispute. Nor were other opportunities soon wanting to the French to retort severely upon the Newfoundland authorities for their passage of the Bait Act, as well as to repair in large measure the injury which that act promised to inflict upon the French industry. About 1874 a Nova Scotian named Rumkey had established the first factory for the canning of lobsters on the west coast. This concern proved profitable, and others sprang up, until, at the close of the season of 1887, Captain Campbell, R.N., reported that twenty-six factories were at work, employing about 1100 hands. It was at that time understood that this was an industry which, by the very nature of the process and the permanent shore structure it involved, the French were disqualified from pursuing. So clearly was this recognized that in 1886, when Commander Browne of H.M.S. "Mallard" reported the existence of a French lobster factory at Port-aux-Choix, a substantially-built structure, roofed with corrugated iron, the French authorities conceded that the establishment was in violation of the treaties, and issued orders for its removal. But this conciliatory policy was of brief duration. The year of the Bait Act's first successful application was marked by the stoppage, by order of the French government, of Messrs Murphy and Andrew's lobster factory, and by their contention that the lobster-canning industry formed a part of the privileges conceded under the treaties to the French, whose participation by the British fishermen would be forcibly resisted.

An exchange of notes took place between Lord Salisbury and M. Waddington, the French ambassador, in which the latter expressed an opinion which evoked a spirited protest on the part of the British Foreign Office. "France," it was then declared, "preserved the exclusive right of fishing she always possessed. This right of France to the coast of Newfoundland reserved to her fishermen is only a part of her ancient sovereignty over the island which she retained in ceding the soil to England, and which she has never weakened or alienated." This claim of the French to an exclusive fishery was held to be wholly untenable, and their classification of the lobster catching and canning industry as amongst the "fishing" privileges granted them by the treaty was denounced as contrary to both letter and spirit of that instrument. Notwithstanding this, the French agents on the treaty shore clamoured for the removal of several of the British factories, which (it was declared) interfered with the exclusive fishing rights of the French. The French government also voted (1888) a special bounty for the establishment of lobster factories by their subjects on the treaty coast. Pending a settlement, the British foreign office deemed it expedient, in order not to give offence to France, to invest the French claims with a semblance of right by issuing instructions to British naval officers on the North American station to continue to interpret and enforce the treaties with regard to the Newfoundland lobster-canning industry on the same terms as they had done hitherto with regard to the cod-fishery. Acting under a statute passed in the reign of George III., empowering British naval officers to interpret and enforce the treaties, Sir Baldwin Walker and others proceeded to destroy or remove a number of British factories at the request of the French agents. In 1890 the unexpected discovery was made that the act empowering British naval officers to enforce the provisions of the treaties with France had expired in 1832 and had never been renewed. Consequently all the proceedings of which the colonists had been the victims were illegal. One of them, Mr James Baird, immediately took proceedings against Sir Baldwin Walker in the supreme court, which decided in his favour, mulcting the admiral in £1000.

On an appeal to the privy council the decision was upheld. But before this incident had taken place, the controversy between London and Paris culminated in the *modus vivendi* of 1890, by which the lobster factories, both British and French, which were in existence on the 1st of July 1889, were to continue for the present. Instantly the colony took alarm, and a deputation consisting of the island's leading men was sent to England to protest against both the principle and practice of such an arrangement. On their return they learnt that it was the intention of the imperial government to re-enact *verbatim et literatim* the act for the enforcement of the treaties which had expired fifty-nine years previously. To prevent such an occurrence, delegates from both parties in Newfoundland visited London in April 1891, and, appearing at the bar of the House of Lords, promised that if the measure which was then on the eve of being introduced into that body were withdrawn, a temporary measure would be passed by the Newfoundland legislature which would answer the same purpose of enabling Great Britain to carry out her treaty obligations with France. The hope then generally entertained was that the whole question of French rights in the colony would soon be the subject of definite negotiations looking to their total extinguishment. That hope was, however, not speedily realized. For a number of years the Modus Vivendi Act was annually passed by the legislature, each year under protest, the conviction gaining strength in the colony that the imperial government was averse from renewing negotiations with France.

Modus vivendi 1890.

In 1898 the secretary of state, Mr Chamberlain, yielding to the urgent request of the senior colony, despatched a commission consisting of Sir J. Bramston and Sir James Erskine, with Lord Westmeath as secretary, on a tour of investigation along the treaty shore; and the report which the royal commissioners made (though not published) touched all points of the unhappy dispute. Again, in 1901, on a suggestion put forward by the colony, Mr Chamberlain summoned Sir Robert Bond, the Newfoundland premier, and a colleague, Sir E. P. Morris, to London, for a new conference on the French shore question, in which Lord Lansdowne, the foreign secretary, participated. Nothing coming of this, the Modus Vivendi Act continued to be passed annually. In 1901 a fresh attempt was made to effect a settlement, but the negotiations were again unsuccessful, as the colony declined to make concessions in regard to the sale of bait unless the French system of bounties on the sale of fish by their citizens were abandoned or at least modified in important

particulars. Later in the same year negotiations were begun between the British and French governments for a general treaty, in which all outstanding matters of dispute between the two countries should be for ever settled. As regards Newfoundland, the discussion of the French fishery question on the basis of arrangement in the matter of bait and bounties having proved unavailing, it was proposed not to persist further in it, but to put before the French government an arrangement which would terminate the rights of French fishermen to land and dry their fish on the shores of the island, but leave a concurrent right of fishery, the regulation and policing of which would be in the manner provided in the North Sea Fishery Convention of 1881 and the convention of 1887.

On the 8th of April 1904 the Lansdowne-Cambon Convention was signed, which effected a final settlement of the French shore question. For the total abandonment of the French rights compensation was clearly not only due to the individuals actually engaged in the fishing industry, but to the French nation at large. Territorial concessions were therefore made consisting of a modification of the Anglo-French boundary line in the Niger and Lake Chad district, and a re-arrangement of the Gambia-Senegambia frontier, giving Yarbatenda to Senegambia. The Los Islands opposite Konakry Island were likewise ceded to France. Provision was made for the reciprocal recognition, on the convention coming into force, of a British consul at St Pierre and a French consul at St John's. Claims for indemnity were duly submitted to an arbitral tribunal, composed of an officer of each nation; and at length what is known as the Lyttelton Award, was made as follows:—

Convention of 1904.

General award for French rights . . .	$255,750
Loss of occupation	226,813
Effects left by the French on treaty coast . .	28,936

So far as concerned the French, an end was thus put to a situation on the treaty shore, which for nearly two hundred years had given rise to difficulties and anxieties.

Scarcely, however, had a year elapsed from the signing of the convention, when another international disagreement connected with the fisheries assumed grave importance. There had long been intense dissatisfaction in the colony over the attitude of the American government and American fishermen towards the colony. The action of the American Senate in rejecting the Bond-Hay treaty negotiated in 1902 stirred the colonial government to retaliatory measures. By virtue of the treaty of 1818 American fishermen enjoyed the following rights: (1) to take fish of every kind on that part of the southern coast of Newfoundland which extends from Cape Ray to Ramea Islands; (2) to take fish of every kind on the western and northern coasts of Newfoundland from the said Cape Ray to the Quirpon Islands; and (3) to take fish of every kind on the coasts, bays, harbours and creeks from Mount Joly to the southern coast of Labrador, to and through the straits of Belle Isle, and thence northward indefinitely along the coast. Subject to these limitations American fishermen have a right in common with British fishermen to prosecute their industry within those areas.

American fishing rights.

The foregoing embraces the whole of their fishing privileges. Every other right that they ever possessed they renounced under the treaty in the following language: "The United States hereby renounce for ever any liberty heretofore enjoyed or claimed by the inhabitants thereof, to take, dry or cure fish on or within three marine miles of any of the coasts, bays, creeks or harbours of His Britannic Majesty's dominions in America not included in the above limits." This renunciation contained but one qualification: "that American fishermen shall be permitted to enter such bays or harbours for the purpose of shelter and of repairing damages therein, of purchasing wood, and of obtaining water and for no other purpose whatever."

Under the Newfoundland Foreign Fishing Vessels Act of 1893 the governor in council was authorized to issue licences to foreign fishing vessels, enabling them to enter any port on the coasts of the island to purchase bait, ice, supplies and outfits for the fishery, and to ship crews. In 1905 this act was repealed and another passed by the colonial legislature imposing certain restrictions on American vessels, and a further more stringent act in 1906, preventing Newfoundlanders from joining American vessels. These acts were resented by the American government, which, through Mr Secretary Root, called upon the British government to disallow such interferences on the part of the Newfoundland legislature. Lord Elgin's reply was to suggest a *modus vivendi* pending further discussion of the questions at issue. In spite of the colony's energetic protest, a *modus vivendi* was agreed to in October 1906, whereby the Foreign Fishing Vessels Act of 1906 was held in abeyance, and the act of 1905 was held not to apply to American fishing vessels, and light dues were waived, while on the other hand American vessels were to report at the custom house on entry for clearance, and their fishermen were to comply with colonial fishery regulations. As regards Sunday fishing by the Americans, which was an important colonial grievance, the American government consented to waive it, if the use of purse seines by American fishermen were allowed. Lord Elgin's action was considered to be an interference with the internal affairs of the colony and great public indignation was aroused. Retaliatory measures were resolved upon, Newfoundland fishermen being declared liable to fine and imprisonment for selling bait to the Americans or for joining American vessels. The legislature voted an address to the imperial government, protesting against the *modus vivendi*, and this was carried to England in 1907 by Sir Robert Bond, the premier of the colony, but without avail. The matter was referred to the Hague tribunal for arbitration, and pending this the *modus vivendi* (agreed to in 1908) continued in force. The tribunal gave its award in September 1910, the two main points at issue being decided as follows: (*a*) Great Britain had the right to make regulations as to the fisheries without the consent of the United States, subject to the provisions of the treaty of 1818. (*b*) The "three-mile limit" in bays (subject to special judgment in individual cases) was to be taken from a line across the bay at the point, nearest the entrance, where a width of ten miles is not exceeded. Among other provisions it was decided that American vessels might employ foreign hands (but these received no benefit under the treaty); also that they might be required to report to customs houses if facilities to do so existed.

Modus vivendi, 1906.

Commerce received a shock, but derived a salutary lesson from bank failures which occurred in December 1894. The Union and Commercial banks suspended payment, followed by the suspension of the savings bank, a government institution. This at once lowered the credit of the colony abroad, and caused the utmost misfortune amongst all classes. There is little doubt but that a principal cause of the disaster was the vicious and dangerous system of credit which had been followed by the merchants in their dealings with the "planters" and commission merchants. The insolvent institutions were speedily replaced by branches of three prominent Canadian banks, and a loan of $1,000,000 procured in London by Mr Bond soon after the debacle served to tide the senior colony over its financial difficulties. A new era of prosperity has since set in.

In politics, apart from the matters already alluded to, there occurred in 1893 the filing of petitions under the Corrupt Practices Act to unseat Sir William Whiteway and his colleagues, who had been successful at the general election of that year. The charges created no little interest in England, and the new government was subjected to much unfair criticism, arising largely from a misapprehension of the political and administrative conditions in the colony. They were examined in detail by the supreme court, which finally pronounced them unsustained, and the Whiteway government resumed office after a brief period of abdication. On the whole, it may be said that Newfoundland has passed the critical stage in her history. Between 1863 and 1900 it has been estimated that $12,000,000 worth of copper ore has been exported, and since 1898, when a discovery of iron ore made at Bell Island, Conception Bay, led to important results, the belief in the island's mineral resources, long entertained by geologists, received practical corroboration.

In 1900 the British admiralty, acting upon the repeated suggestions of Sir Charles Dilke and others interested in the manning of the navy, decided to initiate a branch of the imperial naval reserve in the colony. In 1901 a difficulty arose as to paying the men, owing to the lack of any provision for that purpose in the Imperial Reserves Act under which they were enlisted. The colony was asked to bear the cost; its refusal was followed (1902) by the enactment of

special legislation rendering the enrolment and maintenance of the reserves in Newfoundland a special imperial undertaking. Several efforts had been and continued to be made to induce Newfoundland to confederate with the Dominion of Canada, but the project never met with any degree of favour with the electorate. Much of the disfavour with which confederation was regarded in the colony was said to be due to Sir John Macdonald's opposition on behalf of Canada to the Bond-Blaine commercial treaty, which was negotiated between an emissary from the government of Newfoundland and Mr Blaine, then secretary of state of the United States of America, in 1890, but was subsequently disallowed at his request by the imperial government. It is, however, probable that the treaty would never have received the sanction of the American Senate. After the insolvency of the colony in 1894–1895, a delegation was sent to Ottawa to ascertain if it were possible to arrange terms of confederation; but Sir Mackenzie Bowell's government objected to the assumption by the Dominion of the entire amount of Newfoundland's debt ($16,000,000), and the negotiations were abandoned.

Projects for union with Canada.

NEW GLARUS, a town and a village of Green county, Wisconsin, U.S.A., about 22 m. S.W. of Madison, on the Little Sugar river, a branch of the Rock river. Pop. of the town (1890) 1180; (1900) 1245; (1905) 685; (1910) 627; of the village, which was separated from the town in 1901 (1905) 665; (1910) 708. New Glarus is served by a branch of the Chicago, Milwaukee & St Paul railway. It has agricultural and dairying industries, but little or no manufacturing interests. It had its origin in a colonizing experiment made by the canton of Glarus, Switzerland in 1845. Agents sent by the canton chose the site of New Glarus largely because the rocky slopes of the valley suggested their Alpine home. The advance party then set about constructing houses and sent for the colonists; and some two hundred men, women and children started from Glarus in April 1845 under two leaders chosen by popular vote; misreading their directions the party got by mistake to St Louis, whence they proceeded up the Mississippi to Galena and thence overland to their new home. To all intents and purposes they were an independent people. They expected to be and were self-sustaining, and for a generation or more retained their exclusiveness to a remarkable degree. They brought with them a "form of government" drawn up by the Cantonal Council of Glarus and providing in great detail for a system of schools, for what was practically a state church (Reformed Lutheran) supported by tithes, for a system of poor relief, for a system of courts, and for a set of town officers elected on a limited property franchise. This "form" was to be amended and new laws were to be added, as circumstances should require, in a town-meeting in which the essential features of the referendum were observed. The original plan provided also for an equitable distribution of land so as to give to each head of a family pasture, timber and farm lands. With such adjustments as were found necessary for co-ordination with the town and county governments of Wisconsin, it remains practically the same to this day. The village and town still have an Old World aspect, and the architecture, customs, style of dress and language of the pioneers still persist to a great degree. A famous organization is the New Glarus William Tell Club of sharpshooters. The village owns its waterworks and its electric lighting plant.

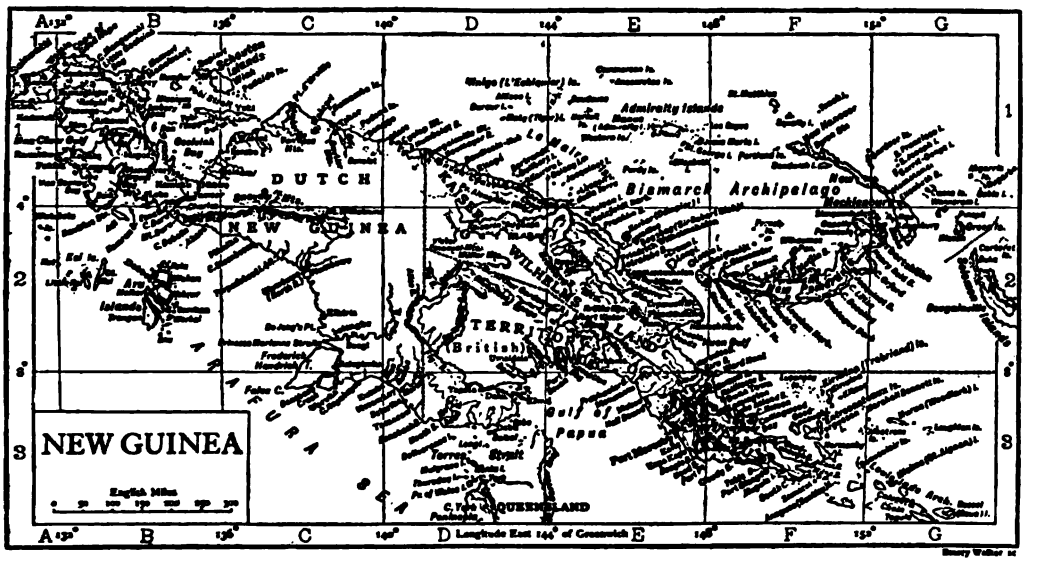
NEW GLASGOW, a manufacturing and mining town of Pictou county, Nova Scotia, Canada, on the East river, near its entrance into Pictou Harbour, and the Intercolonial railway, 104 m. N.E. of Halifax. Pop. (1901) 4447. Extensive coal mines are in the vicinity, and there are manufactures of iron and steel, mill machinery, door and sash factories, &c., as well as several shipbuilding yards.

NEW GRANADA (Span. *Nueva Granada*), the title under Spanish colonial administration of that part of South America now known as the republic of Colombia, which at one time was extended to include Venezuela and Ecuador. It also was for a time the title of the united territories of Panama and Colombia under republican auspices. The Bogotà plateau, then inhabited by a partly civilized Indian nation known to the Spaniards as Chibchas, or Muyscas (the second name seems to have been applied to them through a misunderstanding, the word meaning "men"), was invaded from the Caribbean coast and conquered in 1537 by Gonzalo Jiménez de Quesada, who, in honour of his native province, called it the "Nuevo Reino de Granada." The title at first applied only to the plateau regions of Colombia, as the coast provinces had been previously occupied and named. In 1550 an *audiencia real* under the viceroyalty of Peru was established at Santa Fé (Bogotà), but in 1564 this isolated group of Spanish settlements was transformed into a presidency. In 1718, owing to the unmanageable size of the viceroyalty of Peru, it was divided and a new viceroyalty was created from the various provinces lying in the north-western angle of the continent, extending from Tumbez northward to the northern limits of Panama, and eastward to the Orinoco, to which the name of Nueva Granada was given. The first viceroy was Pedroza y Guerrero, but his successor, Jorge Villalonga, resumed the title of president, and it was not until 1739 that the title of viceroy was definitely established. The new viceroyalty included the provinces of Tierra Firma (now the republic of Panama); Maracaibo, Caracas, Cumana and Guyana (now included in Venezuela); Cartagena, Santa Marta, Rio Hacha, Antioquia, Pamplona, Socorro, Tunja, Santa Fé, Neiva, Mariquita, Popayan and Pasto (now included in Colombia); and Quito, Cuenca and Guayaquil (now included in Ecuador). In 1777 the provinces of Maracaibo, Caracas, Cumana and Guyana were detached from the viceroyalty to form the captaincy-general of Caracas; otherwise it remained as above until the termination of Spanish rule in South America.

For the republic of Colombia (1819–1830), the republic of New Granada (1831–1861), the United States of Colombia (1861–1886), and the republic of Colombia (1886 to date), see COLOMBIA.

NEW GUINEA, the largest island (excluding Australia) in the world, lying between the equator and 12° S. and 130° 50′ and 151° 30′ E., separated from Australia by Torres Strait and having the Arafura Sea on the south-west. It is divided politically between Britain (south-east), Germany (north-east) and Holland (west), the Dutch territory occupying about 48·6% of the whole area, the German 28·3% and the British Territory of Papua 23·1%. The total area is estimated to be 312,329 sq. m.

New Guinea was probably in Miocene times, if not later, united to the northern part of Queensland. The deeply indented shore of the Gulf of Papua forms the boundary of the subsided area between the two countries, and from it the land stretches out for 200 to 300 m. north and west on both sides of the Fly river in vast plains, little elevated above sea-level. From Cape Buru westwards precipitous limestone cliffs, several hundred feet high, face the sea and rise into forest-clad mountains behind. The northern extremity of New Guinea is all but severed from the mainland by the deep MacCluer Inlet, running eastwards towards Geelvink Bay which deeply indents the northern coast. Southwards from Geelvink Bay the north-east coast is more regular than the south-western. Off its coast-line, on the parallel of 6° S., lies the vast Bismarck Archipelago, of which New Pomerania (Neu Pommern) is the most important member; and, on the parallel of 10°, the d'Entrecasteaux Islands, with the Marshall Bennett group to their north-east; while stretching out from the south-east promontory of the mainland is the Louisiade Archipelago. The Great Barrier Reef of Australia can be traced more or less continuously round the Gulf of Papua and along the south-east coast to the extremity of the Louisiades. In a general way it may be said that on the west coast of New Guinea, from Cape Buru to the Louisiades, the sea is shallow, while on its steeper eastern side the water close in-shore is often too deep



for safe anchorage. The islands on the southern margin of the Louisiade Archipelago are raised coral reefs, but the majority are mountainous, rarely, however, exceeding 3000 ft.; all of them are richly forested, but of little agricultural value. The volcanic d'Entrecasteaux Islands are mostly larger, more elevated (the highest being 8000 ft.), and stand in deeper water than the Louisiade group. To the east of Kiriwina (Trobriand) lies a small group of uniquely formed islets, each of which is completely surrounded by a steep forest-clad marginal rampart of coral 300 to 400 ft. high, concealing a depressed inhabited central plateau.

Starting in the southern extremity of New Guinea from an abrupt face some 3000 ft. high, and traversing its centre nearly parallel to both coasts, run high ranges of mountains, which, if not continuous, merge into each other in the same general direction. The Owen Stanley range–its highest summit, named by Huxley in 1850 Mount Owen Stanley, 13,120 ft.—the Albert Victor Mountains, the Sir Arthur Gordon range, and the Bismarck Mountains form a backbone united probably with the Sneeuw (Snowy) Mts., where perpetual snow was found by Dr. Lorentz in 1909 at 14,635 ft., and the height of Mt. Wilhelmina was fixed at 15,580 ft. This height may be exceeded by Mt. Carstensz. Other ranges, mostly of lower altitude, run parallel mainly to the east and west coasts. The most important and best-known rivers are the Amberno, in the north, discharging by a wide delta at Point d'Urville; the Kaiserin Augusta, which, rising in the Charles Louis range, and entering the Pacific near Cape della Torre, is navigable by ocean steamers for 180 m.; the Ottilien, a river of great length, which discharges into the sea a short distance south of the last named; and the Mambare, navigable by steam-launch for 50 m. which drains the eastern aspect of Wasigororo Mountains and enters the sea near the Anglo-German boundary. Below 8° S. the narrowness of the country precludes the existence of any very important rivers on either coast. The Purari, however, whose delta is 20 m. long by 20 broad, is navigable for 120 m. by steam-launch, while the Fly has been traversed by the same means for 500 and by a whale-boat for over 600 m. The latter drains an enormous tract of country, which is so little elevated above the sea-level that it can never be of any agricultural or commercial value. West of 141° E. the geographical features of the coast, except in the region of MacCluer Inlet and Geelvink Bay, are very little known, and those of the interior even less.

Geology.—The geology of British New Guinea is best known from the report of A. Gibb Maitland (*Ann. Rep.*, British New Guinea, 1891–1892; *Parl. Papers*, Queensland, 1893, C.A. I. 53-85, with 3 maps and 3 plates; bibliography, p. 85), which shows that the axis of the territory is a high range, composed of slates and schists of undetermined age, with intrusive plutonic rocks. In the district around Port Glasgow, on the south coast of the eastern peninsula, are the Boioro limestones, also of unknown age; they are lead-coloured, brecciated limestones with interbedded dolerites. Some Cretaceous or Upper Jurassic rocks occur in the basin of the Fly river. The Port Moresby beds are Cainozoic. They are highly inclined, and occupy a large range of country along the south coast, and include the Macgillivray Range, to the north-east of Beagle Bay. They are marine and probably Miocene; and range up to the height of 800 ft. above the sea, approximately the same limit as in Victoria. The Kevori grits, and the raised coral reefs are upper Cainozoic, and perhaps Pleistocene; but the reefs occur inland up to a height of 2000 ft. and their range back in time has not been fixed. The volcanic series include the rhyolite of Nell Island, some obsidian, and the sheets of basalts which form the Cloudy Mountains, Mount Dayman and Mount Trafalgar (an active volcano), and also cover wide areas to the south and west of the Owen Stanley Range. Most of western British New Guinea consists of recent superficial deposits, in the basin of the Fly river. The Louisiade and the d'Entrecasteaux Islands consist of the same slates and schists as form the main axis of the eastern peninsula, and they are auriferous. The geology of the rest of New Guinea is imperfectly known. It appears to consist in the main of a continuation of an axis of old schists and slates, with granite intrusions, and flanked by coastal plains with Cretaceous or Jurassic, and Miocene beds, with Pleistocene sands and reefs and volcanic rocks. In the north-west coal deposits occur. Fergusson Island clearly shows remains of extinct craters, and possesses numerous hot springs, saline lakes and solfataras depositing sulphur and alum. In Murua (Woodlark I.) are quarries of the banded quartzite from which the best stone adzes found throughout south-east New Guinea are made. In Rossel Island (Roua or Arova) occur crystalline schistose and volcanic rocks, and in Misima (St Aignan) limestones and lavas in addition. Nearly all the rivers in New Guinea yield "colours" of gold, but only in the Louisiade Archipelago has enough been discovered to constitute the district a goldfield. No auriferous reefs have been found. Black magnetic iron sand covers the shore in Milne Bay. Coal has been observed in the Purari sandstones. In the Gira river the valuable alloy osmiridium has been discovered. Earthquakes are rare on the mainland, but not infrequent in Bismarck and d'Entrecasteaux archipelagos.

Climate.—Since the mountains as a rule traverse the island parallel to its coasts, the eastern shores have far less rain than the western. The amount which falls, chiefly at night, varies from 30 in. on some parts of the coast to 130 at others, and to a far greater but unknown amount in the mountains. Throughout the dry or cool season the wind blows steadily and almost uninterruptedly (except for an hour or so forenoon and afternoon) from the south-east. The temperature

has an extreme range of from 72° to 95° F., with a mean of about 80°. At an elevation of 3000 ft. the climate is pleasantly cool; at 13,000 ft. ice forms in the night, but disappears with the heat of the sun. No snow is known certainly to fall, though it is alleged to have been seen from the sea lying on the summits of the Charles Louis range. Fever is very prevalent on the coasts, and even in the interior at 2000 ft. above the sea. Though generally of a mild character, it is persistently recurrent, and slowly saps and wears out the constitution; too often it is virulent and rapidly fatal.

Fauna.—New Guinea shares in the poverty in mammals of the Australian sub-region. Monotremes (2 species) and marsupials (4 families and 44 species) predominate, but are not abundant. Among the latter two genera, *Distaechurus* and *Dorcopsis*, are peculiar. A pig (*Sus papuensis*), a dingo, several species of mice (of which *Chiruromys* is a peculiar genus), a few squirrels, and a considerable number of *Chiroptera* (bats) inhabit the country. The island is specially remarkable for the number and beauty of its birds. The most recent lists record over 500 species as found in the Papuan area, and of these between 50 and 60 genera are peculiar to it. The birds of paradise, which are confined to the sub-region, give special celebrity to its fauna. Between 70 and 80 species have already been described, many of them the most gorgeously adorned, and others, such as the *Pteridophora albertisi*, the most wonderful of feathered creatures. They are absent from the Louisiades, but species occur in the d'Entrecasteaux Islands which have not been seen on the mainland opposite. The zoology of the Bismarck Archipelago is little known. The species of birds so far described from it number 178 (referable to 38 families), of which 74 are peculiar to it, though closely allied to Papuan forms. It contains, however, no *Paradiseidae*. The *Amphibia*, to which the sea is a barrier, are almost exclusively of Australian affinities. Turtles and tortoises are plentiful on the coast. *Ceratochelys insculpta* of the Fly river, a chelonian peculiar to New Guinea, is remarkable in having its nearest affinities (as have the Papuan tortoises) with South American species. Of the lizards, 3 of the 6 species of *Varanidae*, 16 of the 30 *Scincidae*, 8 *Geckonidae*, and 8 out of the 11 *Agamidae* are peculiar. Salamanders, toads and frogs are numerous, and crocodiles abound. Only 4 genera and 5 species of snakes are peculiar to New Guinea, many of them poisonous. Butterflies, moths and bees are very abundant, the former being remarkable for their size and splendid coloration; but these groups have not been investigated exhaustively enough to afford a correct idea of their number or their true affinities. Although the list of *Coleoptera* already known is long, it represents only a fraction of the species remaining to be discovered. The land molluscs show relationship with the Indian and the Malayan sub-regions; but many forms have here their centre, and have spread hence into Australia and the Pacific islands.

Flora.—Most of the foreshores of New Guinea are eucalyptus-dotted grass lands; in the interior dense forests prevail to a height of many thousand feet. Vast tracts of the country have been, however, deforested by fire, and these are covered by the tall ineradicable grass, *Imperata arundinacea*. So far the highest altitudes yet botanically investigated are those of the Owen Stanley range and the mountains in Kaiser Wilhelms Land, but of the flora of the highest range of all—the Charles Louis mountains—nothing is known. The vascular plants already described number about 1500 species. In the low and sub-mountainous lands the flora is a mixture of Malayan, Australian and Polynesian forms. There are, according to Müller, twice as many palms known from New Guinea as from Australia. The alpine flora, beginning at 6000 ft., is specially characterized by its rhododendrons, pines (*Araucaria* and *Libocedrus*), and palms, by numerous superb species of *Agapetes* (*Ericaceae*), and on the summits by an extraordinary association of species characteristically European (*Rubus, Ranunculus, Leontodon, Aspidium*), Himalayan, New Zealandian (*Veronica*), Antarctic and South American (*Drymus, Libocedrus*). Good pasture grasses are numerous, but pasture lands are limited. The usual tropical food-plants are cultivated. Tobacco has been found growing in the interior, and may be indigenous, as is in some districts the Kava pepper (*Piper methysticum*). At Dorey a cotton plant (*G. vitifolium*) grows wild, and is also cultivated.

Natives.—So large an area of New Guinea remains unexplored that it is impossible, except approximately, to state the number of its inhabitants, but probably 600,000 is under rather than over the mark. The people are broken up into numerous isolated tribes differing greatly in feature, colour and language. Ethnically they belong as a whole to the Melanesian division of the Indo-Pacific races. The predominant tribe are the Papuans (*q.v.*), who are found here in their greatest racial purity and occupy practically the whole island except its eastern extremity. The New Guinea native is usually of a negroid type with fine physique, but in the Arfak mountains in the north-west, and at points on the west and north coasts and adjacent islands, the very degraded and stunted Karons are found, with hardly the elements of social organization (possibly the aboriginal race unmixed with foreign elements), and resembling the Aetas or Negritos of the Philippines, and other kindred tribes in the Malay Archipelago. On the banks of the Fly river d'Albertis observed at least two widely differing types, those on its upper course bearing some resemblance to the tribes of the eastern coast. Here, wedged in among the ruder Papuans, who reappear at the extremity of the peninsula, a very different-looking people are found, whom competent observers, arguing from appearance, language and customs, assert to be a branch of the fair Polynesian race. But they are obviously of mixed blood. On the west coasts there is a semi-civilization, due to intercourse with Malays and Bugis, who have settled at various points, and carry on the trade with the neighbouring islands, in some of which, while the coast population is Malay or mixed, that of the interior is identical with the people of the mainland of New Guinea. On the west coasts Mahommedan teaching has also some civilizing effect. Many of the tribes at the west end of New Guinea are, at all events in war time, head-hunters, and in the mountains cannibals. Cannibalism, in fact, is practised here and there throughout New Guinea. The frequent hostility and mistrust of strangers are partly due to slave-hunting raids and ill-treatment by traders, but the different tribes vary much in character. Thus in the mountains of the north-west the Karons live by plunder, or by disposal of slaves or bird skins: while their neighbours the Kebars are a peaceful agricultural people. The mountain tribes are usually despised by their coast neighbours, but in the south of west New Guinea the coast people live in perpetual terror of their inland neighbours.

At Humboldt Bay the people are ready to trade, as are the tribes at Astrolabe Bay; here the Russian Miklucho Maclay lived for some time, and was favourably impressed by the natives. Still farther east, the plateaus of the Finisterre ranges are highly cultivated and artificially irrigated by a comparatively fair people. Many tribes in the south-west seem to be migratory. At Princess Marianne Straits tribes much wilder than those farther west, naked and painted, swarm like monkeys in the trees, the stems of which are submerged at high tide. But the Torres Straits islanders are employed by Europeans in the pearl shell fishery, and are good labourers; and in some of the Kei and Aru Islands the Papuan inhabitants form orderly Christian communities. The people of the south-east peninsula are generally far from ferocious. Englishmen, wandering inland and losing their way, have been found and brought back by them. Their manners are more courteous, their women better treated, than is usual with Papuans, but they show perhaps less ingenuity and artistic taste. Their children, in the mission schools, show much intelligence.

Exploration and Annexation.—Though probably sighted by Antonio d'Abreu, 1511, New Guinea was apparently first visited either by the Portuguese Don Jorge de Meneses, driven on his way from Goa to Ternate in 1526 to take shelter at "Isla Versija" (which has been identified with Warsia, a place on the N.W. coast, but may possibly be the island of Waigeu), or by the Spaniard Alvaro de Saavedra two years later. The name of "New Guinea" was probably given by Ortiz de Retez, or Roda, who in 1546 first laid down several points along the north coast. In the same and the two following centuries, though the coasts were visited by many illustrious navigators, as Willem Schouten and Jacob Lemaire, Abel Tasman, William Dampier, L. V. de Torres, L. A. de Bougainville and James Cook, little additional knowledge was gained. This was due first to the difficulties of the navigation, next to the exclusiveness of the Dutch, who, holding the Spice Islands, prevented all access to places east of them, and lastly to the stream of enterprise being latterly diverted to the more temperate regions farther south. The Dutch barrier was broken down by the arrival of Dampier and other "interlopers" from the east, and of emissaries from the (English) East India Company in search of spice-bearing lands. The voyage of Thomas Forrest (1774) in the "Tartar galley" of 10 tons, and his account of New Guinea (*Voyage to New Guinea and the Moluccas*, London, 1780), are still full of interest. New Guinea was actually annexed in 1793 by two commanders in the East India Company's service, and the island of Manasvari in Geelvink Bay was held for some months by their troops. After the peace of 1815 Dutch surveying expeditions to the west coasts became numerous, and in later times scientific explorers penetrated many of the unknown parts of Dutch New Guinea, such as A. R. Wallace (1856–1863), Odoardo Beccari (1871, 1875 and 1876), and Maria d'Albertis (1871–1878). Important expeditions were those of P. van der Crab, J. E. Teysmann, J. G. Coorengel, A. J. Langeveldt van Hemert and P. Swaan, undertaken for the Netherlands Indian government 1871–1872, 1875–1876 (reports published at The Hague in 1879); and of C. B. H. von Rosenberg in the Geelvink Bay districts in 1869–1870 (report published at The Hague in 1875). Subsequently to the visits of J. A. d'Entrecasteaux (1793) and Dumont d'Urville (1827–1840), the eastern coasts were surveyed by Captains F.P. Blackwood (1835),

Owen Stanley (1848), Charles B. Yule (1864), and other British officers, including J. Moresby (1874). Among other explorers in this period the following may be mentioned: Nicholas von Miklucho Maclay in 1870, 1877 and 1879–1881, in the Astrolabe Bay district, &c.; the missionary, Rev. S. Macfarlane (1875, Fly river, &c.); about 1875–1880 the north-east coasts and adjacent islands were explored by the Rev. G. Brown and by Wilfred Powell, and in 1882 Dr Otto Finsch, whose name is well known in connexion with scientific work in New Guinea, made valuable explorations in the neighbourhood of Port Moresby and the Loluki river.

The surveys and reports of Captain Moresby in 1874 brought home to Queensland (and Australia generally) the dangers possible to her commerce were the coasts opposite to Torres Strait and the entrance to the splendid waterway inside the Barrier Reef to fall into the possession of a foreign power. By authority, therefore, of Queensland, the mainland of New Guinea, opposite her shores east of the 141st meridian, was annexed to that colony in 1883. But this action was disallowed by the British government as Yule's and Moresby's had been. Finally, however, in 1884 a British protectorate was authoritatively proclaimed by Commodore Erskine over the region "lying between the 141st meridian eastward as far as East Cape, with the adjacent islands as far as Kosman Island." German New Guinea was annexed on the 16th of November 1884, when the German flag was raised in Friedrich Wilhelmshafen and a trading company was established on the north-east coast, and in 1885 the two countries agreed to fix their boundaries through the then neutral areas of the country. The result of this was the assignation to Great Britain of the portion now known as the Territory of Papua (British New Guinea), lying between the extreme limits of 5° and 12° S. and 141° and 155° E. To Germany were assigned all the territory and islands to the north of the British boundary under the name of Kaiser Wilhelms Land, while all to the west of the 141st meridian remained under its old flag as Dutch New Guinea.

Since this period explorers and investigators have been almost constantly at work. There may be mentioned the work of the Rev. J. Chalmers on the coast of the Gulf of Papua (1893), and of officers of the German New Guinea Company in the ship "Ysabel" on the coasts and among the islands of the German territory; the expedition which crossed the south-eastern peninsula from Huon Gulf of which both the leaders, O. Ehlers and M. Piering, lost their lives (1895), the important German expedition under C. Lauterbach (1896), and the various explorations carried out by or at the instigation of Sir William MacGregor, including a crossing of the island from the mouth of the Mambare river to that of the Vanapa, and a second crossing in the reverse direction (1897). Ethnographical researches have been prosecuted by Messrs C. G. Seligmann and W. Mersh Strong, and others. The reports of travellers and of various missionary societies have thrown a great deal of light on the natural history of the island, on its resources, and the islanders.

British New Guinea

The British Territory of Papua has an area of about 90,540 sq. m. and a population estimated at 400,000, of whom about 600 are Europeans. The Protectorate, as declared in 1884, with its seat of government at Port Moresby, was subsidized by the three Australian colonies of Queensland, New South Wales and Victoria, and lasted, under the administration of two successive special commissioners (Major-General Sir Peter Scratchley and the Hon. John Douglas), till the 4th of September 1888, when it was proclaimed by the first Administrator—afterwards Lieutenant-Governor—Sir William MacGregor, a possession of Queen Victoria. Its constitution was that of a crown colony in association with Queensland; but in 1901 the federal government took control of the territory and in 1906 a proclamation by the governor-general of the commonwealth gave it the name of the Territory of Papua. The lieutenant-governor is aided by an executive and a legislative council, and advised by a native regulation board. Justice is administered by petty sessions in the six magisterial districts into which the possession is divided, with a central court at Port Moresby (which, however, sits elsewhere as necessary) having the jurisdiction of a supreme court, from which in certain cases an appeal lies to the supreme court of Queensland. Order is maintained by an armed constabulary force, under a European officer, of about 180, almost all natives from different districts, whose members are found to be very efficient and trustworthy. The expenditure is about £38,000 annually, and the revenue, mainly derived from customs duties, is rapidly increasing. Only £5110 in 1895, it was £11,683 in 1899 and £19,197 in 1905.

Commerce and Trade.—The making of mats, fishing-nets, shell ornaments, decorated gourds, and stone implements, and the manufacture of pottery, canoes and sago, constitute the chief native industries, which are the subject of barter between different regions. European industries include gold mining, in which 500 miners, besides natives, are engaged (chiefly in the Louisiade Archipelago), and the bêche de mer and pearl-shell fisheries, which were formerly more productive than at present. Copra is naturally largely prepared, as coco-nut palms are very numerous, and are extensively planted every year. A small amount of tortoise-shell is collected. The rubber industry is, according to Sir W. MacGregor, "important and promising." Species of *Palaquium*, the genus from which, in the Indian Archipelago, the best gutta-percha is obtained, occur on the hills, and from their cultivation there might in time be obtained a large revenue independently of European labour. Timber of economic value is scarce. Red cedar (*Cedrilia*) abounds in the riverine flats, but the quality is poor and commercially valueless; and oaks are plentiful, but the wood is coarse. Small quantities of ebony and sandal-wood are exported. "There can be no reasonable doubt that the sugar-cane, which is native and present in a great many varieties, sago, cotton, probably also indigenous and of exceptionally fine quality, will eventually be valuable" (MacGregor). The trade of British New Guinea is exclusively with the Australian colonies. Imports were valued at £72,286 in 1899–1900 (an increase of over £20,110 in the year), and exports (including the gold mines) at £56,167, while in 1905 the figures were £67,188 for imports and £73,669 for exports, and in 1906 £79,671 and £80,290 respectively.

German New Guinea

The German protectorate of New Guinea, so called after the island which contributes the greatest area, comprehends, besides Kaiser Wilhelms Land, the islands which are now commonly called the Bismarck Archipelago—viz. New Pomerania, New Mecklenburg, with New Hanover and the Admiralty Islands and the Solomon Islands (Bougainville and Buka). There are besides nearly 200 smaller islands and islets scattered among their greater neighbours. In 1884 New Guinea was absolutely wild, not a single white man living on what is now the German part. On the islands New Pomerania and Mioko only two trading firms had their establishments; and on New Lauenburg the Wesleyans had a mission station. After the annexation commercial enterprise set in at once, hand in hand with political administration. Now on the mainland and in the islands plantations have been established and tobacco and cotton have been successfully grown. Three German mission societies formed settlements on New Guinea, with a branch one on the Gazelle peninsula. The protectorate is included in the Universal Postal Union; each harbour has its post office, also a leading official with a number of assistants to control the natives and the revenue. It is divided into two districts with separate administrations, New Guinea and the Bismarck Archipelago; over both presides an imperial governor, the seat of government being Herbertshöhe in New Pomerania. A small police force of natives has been formed. In each district there is a registry of deeds and a court of law, and in New Guinea a court of appeal, of which the governor is president. A line of steamers plies between New Guinea, the Bismarck Archipelago and Singapore. A special silver coin of rupee value has been introduced. The area of Kaiser Wilhelms Land is approximately 70,000 sq. m. It is impossible to speak with any precision of the number of the native population, but the white population in 1906 was 149.

The revenue of German New Guinea is derived from taxes, dues and licences, and amounted on the 31st of March 1892 to about £3000; on the same rate, 1901, to £3750. The annual revenue is averaged at £5000, and the expenditure at £4200. The New Guinea Company was to receive £20,000 for transferring proprietorship to government, which took over the administration in 1899. In 1905 imports into Kaiser Wilhelms Land were valued at £33,316, and exports at £7702, and the estimated expenditure for 1907–1908 of £76,000 included an imperial subvention of £57,696. The chief harbours are Friedrich Wilhelmshafen and Konstantinhafen.

Dutch New Guinea

Dutch New Guinea comprises all the western portion of the island. The boundary on the east, separating it from British New Guinea and German New Guinea, was finally settled in 1895. Starting from the south coast, it follows 141° 1′ 48″ E. up to the Fly river, which is mounts until 141° 1′ is reached, when it once more follows the meridian up to the north coast. The area of the territory is 151,789 sq. m., and the inhabitants have been conjectured to number some 200,000. A few missionaries have established themselves, but otherwise the Dutch have scarcely occupied their possession, which at present merely forms part of the residency of Ternate in the Moluccas. Dutch New Guinea, however, has better natural advantages than either the British or German possessions in the island, and should eventually prove of real value to the Netherlands. The claims to superiority over New Guinea on the part of the rulers of some of the small neighbouring islands date at least from the spread of Islam to the Moluccas at the beginning of the 15th century, and were maintained by the Malay rulers both of Bachian and of Gebeh and afterwards by the sultan of Tidore. When the Dutch first came to these seas it was their policy to ally themselves with certain chiefs, and support their claims over various islands, so as to extend their own commercial monopoly; and they therefore supported the claims (admitted by Great Britain in 1814) of the sultan of Tidore over both the Raja Ampat (*i.e.* the four Papuan kingships, Waigeu, Salawatti, Misol and Waigamma on Misol Island) and certain islands or points on the north-west coast of New Guinea. Nominally the sultan of Tidore is still the suzerain of western New Guinea, but his authority is scarcely recognized, except on some few shores and adjacent islands, and practically Dutch New Guinea used to be administered partly from Ternate and partly from Timor, upon more peaceful lines than was the case when the rule of the Dutch in New Guinea largely consisted of the sending of a warship now and again to some distant island or bay to burn a *kampong*, to punish rebellious villagers, and thus assert or reassert Dutch authority, or that of the sultan, who is their vassal. In 1901, however, a more serious effort was made to establish some kind of government in the southern province of Dutch New Guinea, at Merawkay, where a small Dutch-Indian garrison was stationed with the professed object of preventing raids by bands of savages into the British territory near by. Such raids had been rather frequent, the invaders attacking the natives who live under British protection, burning their huts, murdering the men, carrying off the women and children as slaves, and returning to their own haunts laden with booty. There is an assistant Resident at Merawkay, whose immediate chief is the Dutch Resident at Ternate, and who is the civil administrator of the province of southern Dutch New Guinea. Assistant Residencies have also been established at Manokvary in northern Dutch New Guinea, which has been formed into a province, under Ternate, and at Fakfak, in western Dutch New Guinea, likewise erected into a province, also under Ternate. By 1902, therefore, Dutch New Guinea formed a government, with its headquarters at Ternate, divided into the three provinces named. At regular intervals the steamers of the Dutch Royal Steam Packet Company call at Dorey and other points, while administrative posts have been established elsewhere in lieu of others previously attempted but abandoned.

A curious discussion arose in the Dutch states-general when the government was seeking legislative sanction for the above measures, with a provisional credit to cover the first establishment expenses. It was seriously contended in one part of the house that, as eminent men of geographical and ethnographical science had settled the question whether New Guinea belongs to Asia or Polynesia in favour of the latter, a New Guinea colonization scheme could not properly be proposed and decided upon in a section of the Dutch-Indian budget. This budget concerned only the Asiatic possessions of Holland, not the Polynesian ones, and Dutch New Guinea must, consequently, have its own budget. Finally, the majority of the states-general, backed by government, decided that New Guinea must still be reckoned to belong to Asia.

Authorities.—Narratives of the various explorers mentioned: E. C. Rye, "Bibliography of New Guinea" (complete in 1883), in *Supplementary Papers, R.G.S.* (1884); H. Haga, *Nederlandsch Nieuw Guinea en de Papoesche Eilanden. Historische Bijdrage, 1500–1883* (Batavia, 1884); H. H. Romilly, *The Western Pacific and New Guinea* (London, 1886); R. Parkinson, *Im Bismarck Archipel* (Leipzig, 1887); C. Kinloch Cooke, *Australian Defences and New Guinea* (London, 1887); J. Strachan, *Explorations and Adventures in New Guinea* (London, 1888); H. O. Forbes, "British New Guinea as a Colony," in *Blackwood's Magazine* (July 1892); J. P. Thompson, *British New Guinea* (London, 1892); L. NEW HAMPSHIRE, a North Atlantic state of the United States, one of the New England group, and one of the Original Thirteen, lying between latitudes 42° 40′ and 45° 18′ 23″ N., and between longitudes 70° 37′ and 72° 37′ W. It is bounded N. by the Canadian province of Quebec; E. by Maine, by the Salmon Falls river, which separates it in part from Maine, and by the Atlantic Ocean; S.E. and S. by Massachusetts; W. and N.W. by Vermont (from which it is separated by the Connecticut river—low water mark on the W. bank of the Connecticut is New Hampshire's W. boundary), and by Halls Stream which separates it from Quebec. The state has an area of 9341 sq. m., of which 310 sq. m. are water surface.

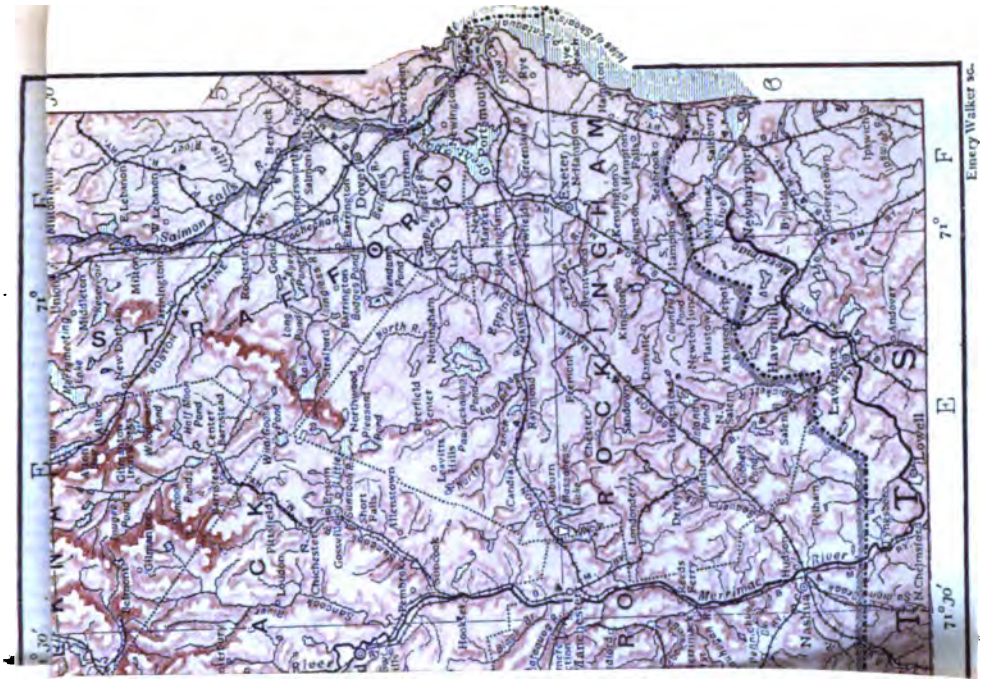
Physical Features.—The delightful scenery of mountains, lakes, streams and woodlands gives to the greater part of New Hampshire, which is in the New England physiographic province, the appearance of a vast and beautiful park; and the state is a favourite summer resort. In the N. central portion, the White Mountains, a continuation of the Appalachian system, rise very abruptly in several short ranges and in outlying mountain masses from a base level of 700-1500 ft. to generally rounded summits, the heights of several of which are nowhere exceeded in the eastern part of the United States except in the Black and the Unaka mountains of North Carolina; seventy-four rise more than 3000 ft. above the sea, twelve more than 5000 ft., and the highest, Mount Washington, attains an elevation of 6293 ft.

The principal ranges, the Presidential, the Franconia and the Carter-Moriah, have a north-eastern and south-western trend. The Presidential, in the north-eastern part of the region, is separated from the Franconia on the south-west by the Crawford, or White Mountain Notch, about 2000 ft. in depth, in which the Ammonoosuc and Saco rivers find a passage, and from the Carter-Moriah, parallel to it on the east, by the Glen-Ellis and Peabody rivers, the former noted for its beautiful falls. On the Presidential range, which is about 20 m. in length, are Mount Washington and nine other peaks exceeding 5000 ft. in height: Mount Adams, 5805 ft.; Mount Jefferson, 5725 ft.; Mount Sam Adams, 5585 ft.; Mount Clay, 5554 ft.; Boot Spur, 5520 ft.; Mount Monroe, 5390 ft.; J. Q. Adams Peak, 5384 ft.; Mount Madison, 5380 ft.; and Mount Franklin, 5028 ft. On the Franconia, a much shorter range, are Mount Lafayette, 5269 ft.; Mount Lincoln, 5098 ft.; and four others exceeding 4000 ft. The highest peak on the Carter-Moriah range is Carter Dome, 4860 ft., but seven others exceed 4000 ft. Loftiest of the isolated mountains is Moosilanke noted for its magnificent view-point 4810 ft. above the sea. Separating Franconia and Pemigewasset ranges is the romantic Franconia Notch, overlooking



smel ate also contai ring the latter decade that of Indian corn

which from the upper cliffs of Profile Mountain is a remarkable human profile, *The Great Stone Face*, immortalized by Nathaniel Hawthorne; here, too, is the Franconia Flume, a narrow upright fissure, 60 ft. in height, with beautiful waterfalls.

The whole White Mountain region abounds in deep narrow valleys, romantic glens, ravines, flumes, waterfalls, brooks and lakes. The part of the state which lies N. of the White Mountains is occupied by ridges and wide rolling valleys, the ridges rising occasionally to heights of 2000 ft. or more. South of the mountains a plateau-like surface—a part of the New England Uplands—broken by residual mountains, or "monadnocks" (a term derived from Mount Monadnock, 3186 ft. high, near the S.W. corner of the state) and lenticular hills, or drumlins, but having a general S.E. slope toward the sea, extends from the intervales of the Connecticut river to the E. border of the Merrimac Valley. Between the Merrimac Valley and the sea is the only low surface in the state; a considerable portion of this region is less than 500 ft. above the sea, but even here are numerous ridges 1000 ft. in height or more, and small drumlins. The seashore, about 18 m. in length, is for the most part a low sandy beach; here and there, however, especially to the northward, it is somewhat rocky, and to the southward are two bluffs. The only harbour is at Portsmouth near the mouth of the Piscataqua. About 9 m. from the shore are the bleak and nearly barren Isles of Shoals, nine in number, a part of which belong to New Hampshire and a part to Maine.

Extending from Mount Monadnock in Cheshire, the S.W. corner county, to the headwaters of the Connecticut river in the N.E. corner is a water-parting, W. of which the state is drained southward into Long Island Sound by the Connecticut and its tributaries and E. of which it is drained south-eastward into the Atlantic Ocean principally by the Merrimac in the S., the Saco and the headwaters of the Merrimac in the White Mountain region, and the Androscoggin in the N. The Piscataqua is a tidal estuary fed chiefly by the Salmon Falls, Lamprey and Exeter rivers. The headwaters of the rivers are for the most part mountain streams or elevated lakes; farther on their swift and winding currents—flowing sometimes between wide intervales, sometimes between rocky banks—are marked by numerous falls and fed by lakes.

The lakes and ponds, numbering several hundred, were formed by glacial action and the scenery of many of them is scarcely less attractive than that of the mountains. The largest and most widely known is Lake Winnepesaukee on the S. border of the White Mountain region, this is about 20 m. long and from 1 to 8 m. wide, is dotted by 274 islands, mostly verdant, and has clear water and a rather level shore, back of which hills or mountains rise on all sides. Among the more prominent of many others that are admired for their beauty are Squam, New Found, Sunapee and Ossipee, all within a radius of a few miles from Winnepesaukee; Massabesic farther S.; and Diamond Ponds, Umbagog and Connecticut lakes, N. of the White Mountains. The rivers with their numerous falls and the lakes with their high altitudes furnish a vast amount of water power for manufacturing, the Merrimac, in particular, into which many of the larger lakes, including Winnepesaukee, find an outlet, is one of the greatest power-yielding streams of the world.

Flora.—Except on the summits of the higher mountains New Hampshire was originally an unbroken forest of which the principal trees were the white pine, hemlock, sugar maple, yellow birch, beech, red oak, and white oak in the S., red spruce, balsam, and white birch on the upper mountain slopes, and red spruce, white pine, sugar maple, white spruce and white cedar in the other parts of the N. The primeval forests have nearly disappeared, but much of the N. third of the state and many abandoned farms in the S. have become reforested with much the same trees, except that on the lower levels in the N. yellow birch, sugar maple and beech have to a considerable extent supplanted spruce, white pine and hemlock, and that wherever forest fires have occurred there is much bird cherry, yellow birch and aspen. The butternut, hickory and chestnut are common nut-bearing trees in the S. Among indigenous fruit-bearing trees, shrubs and vines the state has the bird cherry, black cherry, blueberry, cranberry, raspberry, blackberry, gooseberry, strawberry, grape and black currant; and conspicuous among a very great variety of shrubs and flowering plants are the rose, dogwood, laurel, sumac, holly, winterberry, trilliums, anemones, arbutuses, violets, azaleas, eglantine, clematis, blue gentians, orange lilies, orchids, asters and golden rod. The summits of some of the mountains are too high for trees and above belts of dwarf spruce, balsam and birch they are clothed chiefly with sandworts, diapensia, cassiope, rushes, sedges and lichens.

Fauna.—The N. section of the state was originally a favourite hunting-ground of the Indians, for here in abundance were the moose, caribou, deer, wolf, bear, lynx, otter, beaver, fox, sable, mink, musk-rat, porcupine, wood-chuck, ruffed grouse and pigeon. These were rapidly reduced in number by the white man, the wild pigeons are extinct, and the moose, caribou, bear, wolf, lynx and beaver have become rare, but, under the protection of laws enacted during the latter part of the 19th century, deer and ruffed grouse are again quite plentiful. Rabbits, squirrels, raccoons, woodcock and quail are also common game. Many of the lakes and rivers have been stocked with trout and salmon or bass; some, with smelt; the fresh waters of the state also contain pickerel, perch, pouts, eels, suckers, dace, sunfish and shiners. In the S. half of New Hampshire are many song birds belonging to the Alleghany faunal area; in the N. part many others belonging to the Canadian faunal area. The hermit thrush, veery, song sparrow, red-eyed vireo, bunting, warbler and wren are among the song birds of the forests.

Climate.—The winters are usually long and severe, and the summers cool and salubrious, but the diversity of surface together with unequal distances from the sea cause marked variations for the different regions. The mean annual temperature ranges from about 42° F. at only moderate elevations in the White Mountain region and farther N. to 47° F. at low altitudes in the S.E. The greatest extremes of temperature occur in the deep mountain valleys where it sometimes rises to 102° F. or above, in summer, and falls to −38° F. or below in winter; higher up on the mountains it is never so warm and along the sea-coast both extremes are considerably less. The highest recorded winter mean is 25° F., at Nashua in the lower valley of the Merrimac, and at Durham near the sea-coast; the lowest recorded winter mean is 18° F., at Bethlehem 1470 ft. above the sea in the White Mountain region; the highest recorded summer mean is 69° F. at Nashua, and the lowest recorded summer mean is 64° F. at Bethlehem. The mean annual precipitation for the entire state is about 40 in.; it is 43 in. at Nashua, 45·3 in. at Durham, and perhaps still more on the E. slopes of the mountain ranges, but it is only 37·7 in. at Bethlehem in the N.W. part of the mountain region and only 35·5 in. at Stratford in the upper valley of the Connecticut. The distribution is quite even throughout the year, but summer and autumn are slightly more wet than winter and spring. Among the mountains and in the N. part of the state the annual fall of snow is from 7 to 8 ft., but in the S.E. corner it is little more than one-half that amount. The prevailing winds are generally N.W., but in the vicinity of the sea they are S.E. during summer.

Agriculture.—Fertile soil in New Hampshire is confined largely to the bottom-lands of the Merrimac and Connecticut rivers, where on deposits of glacial drift, which are generally quite deep in the southern half of the state, there is considerable alluvium. In the south-eastern section is also a moderately productive soil derived largely from the disintegration of slate. Elsewhere south of the mountains the surface soil is mostly *hard pan* or *till*, this being deepest on the drumlins. In the mountain region the soil is mostly a sandy loam composed of disintegrated granitic gneiss and organic matter; on the lower and more gentle slopes as well as in the valleys this is generally deep enough for a luxuriant vegetable growth but on the upper and more precipitous slopes it is thin, or the rocks are entirely bare.

Farms in the more sterile parts of New Hampshire were abandoned when the depleted soil and the old methods of agriculture made it impossible for owners or tenants to compete with western farmers. This abandonment led in 1889 to the adoption by the state Board of Agriculture of measures which promoted the development of the state, especially the central and northern parts, as a summer resort. Abandoned farms were advertised as suitable for country homes, and within fifteen years about two thousand were bought; and the carriage roads were improved, game preserved and the interests of visitors studied. Agriculture on the farms still operated was now greatly modified, and the production of vegetables, fruits, dairy products, poultry and eggs was largely substituted for the production of cereals. The total acreage of all land included in farms increased from 3,459,018 acres in 1890 to 3,609,784 acres in 1900, or from 60% to 62·6% of the total land area of the state, but the improved portion of this decreased during the decade from 1,727,387 acres to 1,076,879 acres, or from 49·9% to 29·8%; in no other state east of the Mississippi river was so small a proportion of the farm land improved at the close of the decade, although in Florida it was only a trifle larger. The total number of farms increased from 29,151 in 1890 to 29,324 in 1900, and the average size increased from 119 acres to 123·1 acres, but as a result of the more intensive form of agriculture, farms containing less than 50 acres increased from 8188 in 1890 to 8764 in 1900, and those containing 50 acres or more decreased during this decade from 20,963 to 20,560. Of the total number of farms in 1900, 26,344, or 89·8%, were operated by owners or part owners, 1639 by cash tenants and 546 by share tenants.

Hay is the principal crop; in 1909 the acreage was 640,000 acres and the yield was 621,000 tons. The total acreage of cereals decreased from 88,539 acres in 1879 to 61,498 acres in 1889, and to 42,335 acres in 1899; during the latter decade that of Indian corn

increased from 23,746 acres to 25,694 acres (30,000 acres in 1909), but that of oats decreased from 26,618 acres to 12,589 acres (14,000 acres in 1909), that of wheat decreased from 2027 acres to 271 acres (none reported in 1909), that of barley decreased from 4934 acres to 1596 acres (2000 acres in 1909), that of buckwheat decreased from 3117 acres to 1835 acres (2000 acres in 1909), and that of rye decreased from 1056 acres to 350 acres (none reported in 1909). With the exception of dairy cows and horses there was likewise a corresponding decrease in the number of livestock during these years: the number of hogs decreased from 58,585 in 1890 to 56,970 in 1900 (51,000 in 1910); of sheep, from 211,825 in 1880 to 105,702 in 1900 (74,000 in 1910); and of neat cattle other than dairy cows, from 141,841 in 1880 to 116,835 in 1900 (93,000 in 1910); but the number of horses increased from 52,458 in 1890 to 77,233 in 1900 (59,000 in 1910), and the number of dairy cows from 90,564 in 1890 to 115,036 in 1900 (122,000 in 1910). The value of the poultry and egg product of 1899 was $1,824,399, which was more than twice that of the cereals and nearly one-third of that of the hay and forage. The potato crop of the same year was grown on 19,422 acres and amounted to 2,420,668 bushels valued at $1,090,495; in 1909 the acreage was 21,000, and the crop was 2,730,000 bushels, valued at $1,747,000. The acreage of other vegetables in 1899 was 26,780 and the value of the market garden produce, including small fruits, which was sold, increased from $187,049 in 1889 to $394,283 in 1899 or 110·8%. Although the crop of orchard fruits was no greater in 1899 than in 1889 the number of apple trees increased during the decade from 1,744,779 to 2,034,398, the number of peach trees from 19,057 to 48,819 and the number of plum trees from 10,151 to 18,137; in the number of pear trees and of cherry trees there was a slight decrease. The fruit crop of 1899 included 1,978,797 bushels of apples, 19,341 bushels of pears, 6054 bushels of peaches, 4942 bushels of plums, 1183 bushels of cherries, 487,500 lb of grapes, 568,640 qts. of strawberries, 124,760 qts. of raspberries and 105,290 qts. of blackberries and dewberries. The valley of the Merrimac is the leading section for the production of hay, small fruits and dairy products. In the bottom lands of the Merrimac and of the Connecticut, south of the White Mountains, a large part of the Indian corn and vegetables is grown. Potatoes, however, are grown in large quantities north and west of the White Mountains; and this district leads in the number of cattle and sheep, and in the production of all the cereals except Indian corn. Apples, pears and grapes are successfully grown throughout the central and southern sections, but peaches and cherries chiefly south of Lake Winnepesaukee. Hillsboro and Rockingham counties, in the south-east, lead in the production of poultry and eggs.

Forests.—The White Mountain region and Coos county to the north of it, embracing in all nearly one-third of the total area of the state, is essentially a forest country. In 1903, however, only about 12% of this was still occupied by a virgin merchantable forest and 69·8% was cut-over or culled land. In the southern part of the state there is in the aggregate nearly as large an area of young forests on lands, most of which were until about 1850 used for agricultural purposes. The principal merchantable timber of the state is red spruce, and this is found chiefly in the virgin forests which remain in the north, especially in those on the steep mountain slopes between elevations of 1800 ft. and 3500 ft. All except a few scattered trees of the white pine, which was once abundant in all parts of the state below 1500 ft. in elevation, has been cut; but some of the second growth in the south is already merchantable. The most common hardwood trees are sugar maple, yellow birch, white birch and beech; these are widely distributed throughout the state, but are for the most part too young to be cut for lumber. White cedar is almost wholly confined to the swamps of the north, and white oak is found chiefly on the more fertile lands of the south. Most of the virgin forests of the northern section were cut in the latter half of the 19th century, while abandoned farms in the south were becoming reforested, and the value of the state's lumber and timber products increased from $1,099,492 in 1850 to $4,286,142 in 1870, and to $9,218,310 in 1900 and then decreased to $7,519,431 in 1905; since 1890 large quantities of wood, chiefly spruce, have also been used in the manufacture of paper and wood pulp. In 1909 a forestry commission was established.

Fisheries.—Although the trout and salmon of the fresh waters in the interior are a great attraction to sportsmen, the commercial fisheries, which are confined to Rockingham county, on the coast, are of small and declining importance. The take of 1898 consisted chiefly of cod, haddock, lobsters, mackerel, alewives, pollock and hake, but was valued at only $48,987, which was a decrease of 67% from that of 1889; in 1905 the total take was valued at $51,944, of which $32,575 was the value of lobsters and $8166 was the value of fresh cod—the only other items valued at more than $1000 were soft clams ($2770), Irish moss ($2400), alewives, fresh and salted ($1220), and haddock ($1048).

Minerals.—The most important of the mineral products of New Hampshire, which has long been known as "the Granite State," is granite, which is quarried in the southern part of the state in the area of "Lake Winnepesaukee gneiss," near Concord, Merrimack county, near Milford, Hillsboro county, and E. of Manchester in Rockingham county; in Sullivan county, near Sunapee; and in the east central part of the state in Carroll county, near Conway and Madison. In 1908 there were 8 quarries at Concord, all on Rattlesnake Hill, and all within 2 m. of the state house in Concord. The Concord granite is a medium bluish-grey coloured muscovite-biotite granite, with mica plates so abundant as to effect the durability of the polish of the stone; it is used for building—the outer walls of the Library of Congress at Washington, D.C., are made of this stone—to a less degree for monuments, for which the output of one quarry is used exclusively, and for paving blocks. The output of the Milford quarries, which numbered in 1908 fifteen—twelve south and south-west and three north-west of Milford—consists of fine and mostly even-grained, quartz monzonites (*i.e.* granites with an unusually large proportion of soda-lime feldspar), of various grey shades, sometimes tinged with blue, pink or buff, and always marked with black mica; the finer varieties take a high polish and are used for monuments, and the coarser grades are used for construction, especially of railway bridges, and for paving and curbing. The output of the Auburn quarry, 7 m. E. of Manchester, is a deep pink quartz monzonite, marked with fine black dots, which has a fine texture, takes a good polish and is used for monuments. The Conway quarries, four in number in 1908, are on either side of the Saco river, south-east and south-west of North Conway; their output is coarse constructional stones, all biotite or biotite-hornblende, but varying in colour, pinkish ("red") and dark-yellow greenish-grey ("green") varieties being found remarkably near each other at Redstone, on the east side of the Saco valley. About 2½ m. E. of Sunapee are quarried two kinds of monumental stone: the "light Sunapee," a light bluish-grey biotite-muscovite, finer than the Concord granite, and capable of a good polish and of fine carving; and the "black pearl" or "dark Sunapee," a dark bluish-grey quartz-diorite, which seems black mottled with white when polished, and which is coarser than the "light Sunapee." New Hampshire granites were used for building as early as 1623. The value of granite quarried in the state increased from $195,000 in 1887 to $1,147,097 in 1902, when building stone was valued at $619,916, monumental stone at $346,735 and paving stone at $101,548. In that year New Hampshire ranked fourth among the states in output of granite, with 6·3% of the total value of granite quarried in the entire country; in 1908, the value of granite ($867,028) was exceeded by that of each of seven other states but was more than one-half of the total value of all mineral products of the state. Of this total the only other large items were clay and clay products (valued at $371,640), and mineral waters ($259,520; of which $150,512 was the value of table waters) from nine springs, four in Rockingham, three in Hillsboro county and one each in Coos and Carrol counties—and other mineral waters were used in the manufacture of soft drinks. Mica, first mined at Grafton, Grafton county, in 1803, found also in the northern part of Merrimack county and in the north-western corner of Cheshire county in such quantities that for sixty years New Hampshire was the largest producer of mica in the United States, is no longer an important product: in 1907 its value ($7227) was less than that of the mica produced in South Dakota, Alabama, North Carolina or Colorado. A quartz schist, suitable for making whetstones and oilstones, was discovered in 1823 by Isaac Pike at Pike Station, Grafton county, and the Pike Manufacturing Company now owns and operates quarries outside this state also; in 1907 New Hampshire was the principal producer of scythe-stones in the United States, and the total value of whetstones made in 1907 (including the value of precious stones[1]) was $59,870.

Manufactures.—The heavy precipitation on the elevated central and northern parts, and the hundreds of lakes and ponds which serve as reservoirs, give to the lower southern part of the state on the Merrimac and other rivers such an abundant and constant water-power that southern New Hampshire has become an important manufacturing district, and manufacturing has become the leading industry of the state. During the last two decades of the 19th century the number of inhabitants engaged in agricultural pursuits decreased from 45,122 to 38,782; and the number engaged in manufacturing and mechanical pursuits increased from 57,283 to 75,945. Many farmers abandoned their sterile farms and made new homes in the West, where soil yielded larger returns for labour, and a foreign-born population, consisting largely of French Canadians, came to the cities in response to the demand for labour in the mills and factories.

From 1850 to 1860 the value of the manufactured products increased 62·3%; in the decade of the Civil War they further increased in value 89%; from 1890 to 1900 the increase was from $85,770,549 to $118,709,308, or 38·4%; and from 1900 to 1905 the value of the factory products increased from $107,590,803 to $123,610,904, or 14·9%. Textiles, and boots and shoes represented

[1] Gems are not sought for systematically in New Hampshire. Topaz occurs on Baldface Mountain, near North Chatham.

in 1905 more than one-half the total value. Cotton goods, the manufacture of which was introduced in 1804, increased in value only slightly during the last decade of the 19th century, from $21,958,002 to $22,998,249, but from 1900 to 1905 their value increased 28·4%, or to $29,540,770; except in 1900 the manufacture of cotton goods had long ranked first, measured by the value of the product, among the state's manufacturing industries. Factory-made boots and shoes increased in value from $11,986,003 in 1890 to $23,405,558 in 1900, or 95·3%, the industry ranking first in 1900; but in 1905 there was a decrease to $22,425,700, the industry then ranking second; in 1900 the value of boots and shoes was 21·8% and in 1905 it was 18·1% of the total value of all factory products, and in no other state was the degree of specialization in this industry so great as in New Hampshire. Woollen goods, third in rank, decreased in value from $10,963,250 in 1890 to $10,381,056 in 1900, but the factory product increased in value from $7,624,062 in 1900 to $11,013,982, in 1905, or 44·5%. Paper and wood pulp, for the manufacture of which the spruce forests of the state are so largely used, increased in value from $1,282,022 in 1890 to $7,244,733 in 1900, or 465·1%, and to $8,930,291 in 1905; and this industry rose from ninth in rank in 1890 to fifth in 1900 and to fourth in 1905. The manufacture of lumber and timber products, one of the oldest industries of the state, ranked fifth in 1905; these products had increased in value from $5,641,445 in 1890 to $9,218,310 in 1900, or 63·4%, but decreased to $7,519,431 in 1905, the decrease being in large measure due to the great demand for spruce at the paper and pulp mills. Foundry and machine shop products, hosiery and knit goods, wooden boxes, flour and grist mill products, and malt liquors are other important manufactures; the value of wooden boxes increased from $979,758 in 1900 to $2,565,612 in 1905, or 161·9%, and the value of hosiery and knit goods increased during the same period from $2,592,829 to $3,974,290, or 53·3%. As compared with other states of the Union, New Hampshire in 1905 ranked fifth in the manufacture of factory-made boots and shoes, and in woollen goods, sixth in cotton goods, and seventh in paper and wood pulp, in hosiery and knit goods, and in the dyeing and finishing of textiles. In 1905 the value of the products in the eight cities of Manchester, Nashua, Concord, Dover, Rochester, Laconia, Keene, and Portsmouth, all of which are south of Lake Winnepesaukee, was 59·5% of that for the entire state. Nearly one-half the cotton goods were manufactured in Manchester. Boots and shoes were manufactured chiefly in cities near the southern border. Dover led in the manufacture of woollens; Laconia in the manufacture of hosiery and knit goods; and Berlin, the chief manufacturing centre north of the White Mountains, in the manufacture of paper and wood pulp.

Transportation.—With the exception of a Grand Trunk line in the northern part of the state the several steam railways are owned or leased by the Boston & Maine. Up the steep slope of Mount Washington runs a cog railway. The first steps in railway building were taken in 1835, when the Boston & Maine, the Concord, and the Nashua & Lowell railways were incorporated. The Boston & Maine was opened from Boston, Mass., to Dover, N.H., in 1842. In 1850 there were in operation 467 m.; this mileage had increased to 1015 in 1880 and to 1167·14 on the 1st of January 1909. Portsmouth, the only port of entry, has a very small foreign trade, but there is a considerable traffic in coal and building materials here and on the Cocheco, which is navigable to Dover.

Population.—The population of the state was 141,885 in 1790; 183,858 in 1800; 214,460 in 1810; 244,161 in 1820; 269,328 in 1830; 284,574 in 1840; 317,976 in 1850; 326,073 in 1860; 318,300 in 1870; 346,991 in 1880; 376,530 in 1890; 411,588 in 1900; and 430,572 in 1910; the per cent of increase was 9·3 from 1890 to 1900 and 4·6 from 1900 to 1910. Of the total in 1900, 88,107 were foreign-born; 58,967, or 66·9%, were natives of Canada (44,420 French and 14,547 English), 13,547 of Ireland, 5100 of England, 2019 of Scotland, 2006 of Germany, and 2032 of Sweden. Of the 323,481 native-born, 80,435, or 24·8%, were natives of other states than New Hampshire; 56,210 of these were natives of other New England states, however, and 7502 were natives of New York. At the same time there were 124,561 natives of New Hampshire numbered among the inhabitants of other states, principally Massachusetts, Vermont, Maine, New York, Illinois, California, Connecticut, Rhode Island, Minnesota, Iowa, Wisconsin, Michigan, Pennsylvania, Ohio, New Jersey, Kansas and Nebraska, and to induce these to return for a holiday season to their native state the "Old Home Week" festival, now held throughout New England, was planned in 1899 by Frank West Rollins (b. 1860), who was then governor of New Hampshire. The Roman Catholic Church in 1906 had more members than any other religious denomination (119,863 out of 190,298 communicants of all denominations); in the same year there were 19,070 Congregationalists, 15,974 Baptists, 12,529 Methodist Episcopalians (North) and 4892 Protestant Episcopalians. Of the total population in 1890 the rural constituted 67·4% and the urban 37·6%, but in 1900 the rural constituted only 53·3% of the total and the urban 46·7%. The eleven cities having a population in 1900 of 5000 or more were: Manchester (56,987); Nashua (23,898); Concord (19,632); Dover (13,207); Portsmouth (10,637); Keene (9165); Berlin (8886); Rochester (8466); Laconia (8042); Somersworth (7023), and Franklin (5846).

Administration.—New Hampshire was the first of the original thirteen states to establish a government wholly independent of Great Britain. This was designed to be only temporary,[1] but was in operation from the 5th of January 1776 to the 2nd of June 1784. The constitution which then went into effect provided for a General Court consisting of a Senate and a House of Representatives and made the Council a body advisory to the state president; the 1784 instrument was much amended in 1792, when the title of president was changed to governor, but with the amendments adopted in that year it is in large measure the constitution of to-day. For sixty years there was no change whatever, and only three amendments, those of 1852 (removing the property qualifications of representatives, senators and the governor), were adopted until 1877, when twelve amendments were adopted,—the most important being those providing for biennial (instead of annual) state elections in November (instead of March), and those doing away with the previous requirement that representatives, senators and the governor "be of the Protestant religion." Five amendments were ratified in 1889 and four in 1902. New Hampshire is the only state in the Union in which amendments to the constitution may be proposed only by a constitutional convention, and once in seven years at the general election a popular vote is taken on the necessity of a revision of the constitution. A radical revision of the constitution is rendered especially difficult by a provision that no amendment proposed by a convention shall be adopted without the approval of two-thirds of the electors who vote on the subject when it is referred to them. Prior to 1902 every male inhabitant of a town who was twenty-one years of age or over, a citizen of the United States, and not a pauper or excused from paying taxes at his own request, had a right to vote, but an amendment adopted in this year made ability to read English and to write additional qualifications, except in the case of those physically unable to read or to write, of those then having the franchise, and of persons 60 years of age or more on the 1st of January 1904. Various other amendments have been proposed from time to time, but have been defeated at the polls. By an act approved on the 9th of April 1909 provision was made for direct nominations of candidates at primaries conducted by regular election officers.

There is a governor's council of five members, one from each councillor district, which has advisory duties and shares with the governor most of his powers. There is no lieutenant-governor. The governor and the councillors are elected for a term of two years, and a majority of the votes cast is necessary to a choice. Where no candidate receives such a majority the Senate and the House of Representatives by joint ballot choose one of the two having the greatest number. No person is eligible for either office who shall not at the time of his election be at least thirty years of age and have been an inhabitant of the state for the seven years next preceding; a councillor must be an inhabitant of the district from which he is chosen. The governor and council appoint all judicial

[1] The constitution of 1776 provided that the Congress which framed it "assume the name, power and authority of a House of Representatives"; that said house choose twelve persons to be "a distinct and separate branch of the legislature by the name of a Council"; that the Council appoint a president; that civil officers for the colony and for each county (except clerks of court, county treasurers and recorders) should be appointed by the two houses; and that "if the present unhappy dispute with Great Britain should continue longer than this present year, and the Continental Congress give no instruction or direction to the contrary, the Council be chosen by the people of each respective county in such manner as the Council and House of Representatives shall order." A constitution framed by a Convention which met in Concord on the 10th of June 1778 was rejected by the people in 1779.

officers, the attorney-general, auditor, important administrative boards, coroners and certain naval and military officers; they have power to pardon offences; and they may exercise some control over expenditure through the constitutional requirement of the governor's warrant for drawing money from the treasury. The governor may veto within five days, besides Sunday, after it has been presented to him, any bill or resolution of which he disapproves, and a two-thirds vote of the members of both houses is required to pass over his veto.

A Senate and a House of Representatives, which together constitute the General Court, meet at Concord on the first Wednesday in January of every odd-numbered year, and at such other times as the governor may appoint for a special session, principally for the making of laws and for the election of the secretary of state, the state treasurer, and the commissary-general. The Senate is composed of 24 members, one from each senatorial district, and these districts are formed so as to be approximately equal with respect to the amount of direct taxes paid in each; representation in this body is therefore apportioned on the basis of property. In the House of Representatives, which has the large membership of 390, representation is on the basis of population, but is so arranged as to favour the rural districts; thus every town or ward of a city having 600 inhabitants is allowed one representative, but, although for every additional representative 1200 additional inhabitants are required, any town having less than 600 inhabitants is allowed a representative for such proportionate part of the time the legislature is in session as the number of its inhabitants bears to 600. Senators and representatives are elected for a term of two years. A representative must have been an inhabitant of the state for at least two years next preceding his election, and must be an inhabitant of the town, parish or ward he is chosen to represent; a senator must be at least thirty years of age, must have been an inhabitant of the state for at least seven years next preceding his election, and must be an inhabitant of the district by which he is chosen. The constitution of New Hampshire places scarcely any restrictions on the powers of the legislature. By an amendment of 1877, however, it is forbidden to authorize any town to lend money or give credit for the benefit of any corporation whose object is profit. Although money bills may originate only in the House of Representatives the Senate may propose amendments. In 1909 the office of state auditor was created.

For the administration of justice the state has a supreme court and a superior court, each county has a probate court, and some towns as well as the cities have a police court. The supreme court and the superior court consist each of one justice and four associate justices. The supreme court holds one general term each year at Concord and on the first Tuesday of every month except July and August sits to hear arguments, make orders and render decisions; the superior court holds one or two sessions a year in every county. Both of these courts have extensive jurisdiction. Each probate court, consisting of a single judge, has jurisdiction within its county of the probate of wills, of the granting of administration, in insolvency proceedings, and in relation to the adoption of children; it may appoint and remove guardians of minors, insane persons and spendthrifts, and, upon application, may change a person's name. The court of a justice of the peace has jurisdiction in criminal cases only where the punishment is by fine not exceeding twenty dollars, or by imprisonment not exceeding six months, or by both, and in civil cases only where the title to real estate is not involved and the damage demanded does not exceed thirteen dollars and thirty-three cents. A police court has the same jurisdiction as that of a justice of the peace, and, in addition, concurrent jurisdiction with the superior court in certain cases where the title to real estate is not involved and the damage demanded does not exceed one hundred dollars. Judges and justices are appointed by the governor and council, and with the exception of justices of the peace they hold office during good behaviour or until they have attained the age of seventy years; justices of the peace are appointed for a term of five years only, but they may be reappointed.

Local affairs are administered by counties, towns (townships), village districts and cities. In each county a convention, composed of representatives from the towns, meets every two years to levy taxes and to authorize expenditures for grounds and buildings whenever more than one thousand dollars are required. For the discharge of other county functions the qualified electors of each county elect every two years three commissioners, a sheriff, a solicitor, a treasurer, a register of deeds and a register of probate; two auditors also are appointed annually by the supreme court. The county commissioners have the care of county buildings, consisting chiefly of a court house, gaol and house of correction, but are not allowed to expend more than one thousand dollars for repairs, new buildings or grounds, without authority from the county convention; the commissioners have the care also of all other county property, as well as of county paupers; and once every four years they are required to visit each town of their county, inspect the taxable property therein, determine whether it is incorrectly assessed and report to the state board of equalization. In each town a regular annual meeting of the qualified electors is called on the second Tuesday in March for the transaction of miscellaneous business and the election of town officers. These officers always include three selectmen, a clerk, a treasurer and one or more auditors, and they may include any or all of the following: assessors, who together with the selectmen constitute a board for the assessment of taxes, one or more collectors of taxes, overseers of the poor, constables, surveyors of highways, fence-viewers, sealers of weights and measures, measurers of wood and bark, surveyors of lumber, cullers of staves, a chief fireward or engineer and one or more assistants, a clerk of the market and a pound keeper. The moderator of the town meeting is elected at the general election in November for a term of two years, and a board of health, consisting of three members, is appointed by the selectmen, one member each year. The general business of the town, other than that which comes before the town meeting, is managed by the selectmen, and they are specially intrusted with the regulation of the highways, sidewalks and commons. A village district is a portion of a town, including a village, which is set apart and organized for protection from fire, for lighting or sprinkling the streets, for providing a water-supply, for the construction and maintenance of sewers, and for police protection; to serve these interests three commissioners, a moderator, a clerk, a treasurer and such other officers as the voters of the district may deem necessary are chosen, each for a term of one year. The government of cities is in part determined by general laws and in part by individual charters. In accordance with the general laws each city elects a mayor, a board of aldermen, and a common council in whom is vested the administration of its "fiscal, prudential and municipal affairs"; the mayor presides at the meetings of the board of aldermen, and has a veto on any measure of this body, and no measure can be passed over his veto except by an affirmative vote of at least two-thirds of all the aldermen; each ward elects three selectmen, a moderator and a clerk in whom is vested the charge of elections; the city marshal and assistant marshals are appointed by the mayor and aldermen, but the city clerk and city treasurer are elected by the aldermen and common council in joint session.

Under the laws of New Hampshire the property rights of husband and wife are nearly equal. The wife may hold, acquire and manage property the same as if she were single; she is also subject to the same liabilities in relation to her property as a single woman except that no contract or conveyance by her as surety or guarantor for her husband is binding. Rights of dower and courtesy both obtain. Where there is no will or its provisions are waived, the right of a widow, in addition to her dower and homestead rights, in the personal estate of a deceased husband is the same as that of a widower, in addition to his estate by courtesy and homestead right, in the personal estate of a deceased wife, *i.e.* one-half if there is no surviving issue and one-third if there is such issue. By releasing his or her right of dower or courtesy together with the homestead right, if any, the surviving widower or widow is also entitled, in fee, to one-half the real estate, if said deceased leaves no issue surviving; if the husband leaves issue by the widow surviving, she is entitled in fee to one-third of his real estate; if the wife leaves issue by him surviving, the husband also is entitled in fee to one-third of her estate; but if the wife leaves issue not by him, he is entitled only to a life interest in one-third of her real estate. Among the grounds for a divorce are adultery, impotency, extreme cruelty, conviction of a crime punishable in the state with imprisonment for more than a year and actual imprisonment under such conviction, treatment seriously injuring the health or endangering the reason, wilful desertion for three years, or joining a religious sect or society which professes to believe the relation of husband and wife unlawful, and conduct in accordance therewith for six months.

The homestead law of New Hampshire exempts from seizure for debt five hundred dollars' worth of any person's homestead except for the enforcement of a mortgage upon it, for the collection of debts incurred in making repairs or improvements, or for the collection of taxes. The law also provides that except where a mortgage is given to secure payment of the purchase money, the homestead right of a married person shall not be encumbered without the consent of both husband and wife. The surviving wife or husband and the minor children, if any, may occupy the homestead right during the minority of the children, and the surviving wife or husband is entitled to the right during the remainder of her or his lifetime.

From 1855 to 1903 the liquor law was essentially prohibitory, but in the latter year an act licensing the traffic was passed. However, some option still remains with each town and city. Once every four years in cities and once in two years in towns the question of licence or no-licence must be submitted to a vote of the electorate, and in a no-licence town or city no bar-room or saloon is to be permitted; in such a town or city, however, malt liquor, cider and light wines may be sold at a railway restaurant and an inn-keeper may serve liquors to his bona-fide registered guests.

Capital punishment for murder in the first degree is inflicted only upon the request of a jury.

The general supervision of railways is vested in a board of three commissioners appointed by the governor and council for a term of three years, one each year. The board is specially directed to prescribe the manner in which the railway corporations shall keep their accounts, to examine these accounts from time to time, to examine the railways at least once a year, to investigate the cause of

all accidents and upon the petition of an interested party to fix rates for the transportation of persons and freight. In 1909 an anti-pass law was enacted.

Education.—New Hampshire formed a part of Massachusetts when, in 1647, the General Court of that province passed the famous act requiring every town in which there were fifty householders to maintain a school for teaching reading and writing, and every town in which there were one hundred householders to maintain a grammar school with an instructor capable of preparing young men for college. Although not much enforced, this, with some slight changes, continued to be the school law until the close of the colonial era. The beginning of the new era was marked by the founding of Phillips Exeter Academy (1781), and later several other similar schools were opened. Their excellence aroused a much greater interest in the common school system, and throughout the 19th century various experiments for improving it were tried; among them were the division of towns into districts, the appointment of county school commissioners, and the establishment of a state board of education. These, however, have been abandoned, and the system is now administered chiefly by towns and a few special districts under the general supervision of a state superintendent.

Each town is constituted a school district, and some special districts are organized under special acts of the legislature. Some of the business relating to the schools is transacted at the annual district school meeting in which women as well as men have a vote, but the schools of each district are managed very largely by a school board elected at this meeting, one-third each year; in districts without a high school the board has only three members, but in districts having a high school the board may have three, six or nine members. The superintendent of public instruction is appointed by the governor and council for a term of two years, and it is his duty to prescribe the form of register to be kept in the schools, to investigate the condition of the schools, to make suggestions and recommendations for improving them, to lecture upon educational subjects in the towns and cities, to hold at least one teachers' institute each year in each of the counties, and to designate the times and places for holding examinations of those who wish to teach. The free school system now provides free high schools for all children within the state; for an act of 1903 requires any town not maintaining a high school, or school of corresponding grade, or not uniting with adjoining towns in maintaining one, to pay the tuition of any of its children who attend a high school or academy within the state. Evening schools for the instruction of persons over fourteen years of age must be established in any city or town of more than 5000 inhabitants if 5% of its legal voters petition for them. Any town upon application, and by contracting to appropriate annually a certain fixed sum for its maintenance, may receive state aid for establishing a library, and in 1904 libraries had been established by this means in 146 towns. Every district is required to keep its schools open at least twenty weeks each year.

All children between the ages of eight and fourteen and those between the ages of fourteen and sixteen who cannot read and write English are required to attend either a public or an approved private school for the full term unless excused by the school board on account of physical or mental infirmity. The schools are maintained chiefly out of the proceeds of a district school tax, which must not be less in any district than seven hundred and fifty dollars for every dollar of public taxes apportioned to the town or district, a proportion which has gradually increased from five to one in 1789 and from ninety to one in 1817. To this is added a "Literary Fund" (designed originally for founding a college) which is derived from the proceeds of a state tax on the deposits, stock, &c. of savings banks, trust companies, loan and trust companies, building and loan associations and other similar corporations not residing in the state, and a portion of the proceeds of a dog tax, both of which are distributed among the several districts in proportion to the number of pupils not less than five years of age who have attended school at least two weeks. The state also makes appropriations for the payment of a portion of the tuition in high schools and academies distributing it among the districts in proportion to the rate of school tax in each, appropriations for paying a portion of the salary of school superintendents where two or more districts unite to form a supervising district, and appropriations for general school purposes to be distributed among the districts according to the number of teachers trained in normal schools and to average school attendance.

The plan of 1821 to use the Literary Fund for founding and maintaining a state college for instruction in the higher branches of science and literature was abandoned in 1828 and the only state institutions of learning are the Plymouth Normal School (1870) at Plymouth, the Keene Normal School (1909) at Keene, and the New Hampshire College of Agriculture and Mechanic Arts, organized as a department of Dartmouth College in 1866, but removed to Durham, Strafford county, as a separate institution in 1891. The normal schools are managed by a board of trustees consisting of the governor, the superintendent of public instruction and five other members appointed by the governor and council for a term of five years, one each year, and they are maintained out of annual state appropriations. The College of Agriculture and Mechanic Arts is managed by a board of trustees consisting of the governor, the president of the college one member chosen by the alumni, and ten members appointed by the governor with the advice and consent of the council for a term of four years, and it is maintained out of the proceeds of grants by the United States government, annual state appropriations and a private endowment. The principal institutions of higher learning in the state are Dartmouth College (non-sectarian, opened in 1769), at Hanover, and Saint Anselm's College (Roman Catholic, opened in 1893), at Manchester. Dartmouth College receives some aid from the state.

The state charitable and correctional institutions consist of the New Hampshire School for Feeble-minded Children, at Laconia; the New Hampshire Soldiers' Home, at Tilton; the New Hampshire Industrial School, at Manchester; the New Hampshire Hospital for the Insane, and the State Prison, at Concord; and the New Hampshire Sanatorium for consumptives (1909) near Warren Summit, about 75 m. north of Concord. The state also makes annual appropriations for the care and education of blind and deaf and dumb persons in institutions outside of the state. Each county has an almshouse and house of correction. Here, too, many of the insane of the state were formerly confined; but by an act of 1903 the counties were entirely relieved of this care, and the insane were removed to the state hospital. Within the state are also sixteen orphan asylums, and though these are private institutions, in all but one of them children are boarded at county or city expense. Each of the state institutions is under the management of an officer or board of trustees appointed by the governor and council. In 1895 the legislature established a State Board of Charities and Correction. This consists of five members appointed by the governor and council for a term of five years, one each year, and its duties are chiefly advisory and supervisory. It is required to inspect both state and county charitable and correctional institutions, except the state prison and the state hospital, to recommend such changes to the state government as may seem desirable, and to have a special care for dependent children whether in institutions or placed in permanent homes.

Finance.—The income of the state, counties and towns is derived mainly from taxes levied on real estate, on male polls between the ages of twenty-one and seventy, on stock in public funds, on stock in corporations that pay a dividend and are not subject to some special form of tax, on surplus capital in banks, on stock in trade, on live-stock, on railways, on telegraph and telephone lines, on savings banks and on the stock of fire insurance companies. Except in the case of railways, telegraph and telephone lines, savings banks, building and loan associations and fire insurance companies, the taxes are assessed and collected by town officers, but every fourth year the county commissioners are required to inspect the taxable property in the towns and report any misappraisal to the state board of equalization whose duty it is to equalize the valuation of property in the several towns. This board, which is composed of five members appointed by the supreme court for a term of two years, also assesses the taxes on the railways, and on telegraph and telephone lines; for railways the average rate of taxation is assessed on the estimated actual value of the road beds, rolling stock and equipment, and for the telegraph and telephone lines this rate is assessed on the estimated actual value of the poles, wires, instruments, apparatus, office furniture and fixtures. Savings banks pay to the state treasurer a tax of three-fourths of 1% upon the amount of deposits on which they pay interest; building and loan associations pay to him a tax of three-fourths of 1% upon the whole amount of their capital stock paid in or shares in force, less the value of their real estate and loans secured by mortgages on real estate situated within the state and bearing interest not exceeding 5%; and fire insurance companies pay to the same officer a tax of 1% upon the amount of their paid-up capital. The railway tax is distributed as follows: one fourth is paid to the towns through which the railways pass; such a portion of the remainder is paid to any town as is equal to the portion of stock owned in that town; and what is left is reserved as a part of the state tax. Such a portion of 75% of the tax on fire insurance companies is distributed among the several towns, in proportion to the amount of stock owned in each, as the amount of stock owned within the state bears to the whole amount of stock, and the remainder is reserved as a part of the state tax. All taxes on savings banks are distributed to the towns in which the depositors reside, the tax on non-resident depositors constituting a Literary Fund which is distributed to the towns on the basis of the number of pupils in each. The whole tax received by the state treasurer from each building and loan association is paid by him to the treasurer of the town in which it is located. The state also derives an income from fees charged for chartering banks, railways, insurance companies and other corporations. The financial condition at the close of the War of Independence was alarming, and in September 1785 a mob at Exeter demanded relief through the issue of more paper currency. This was refused them

however, and by the beginning of the Civil War the state was almost free of debt. During that war the state incurred an indebtedness of about $4,236,000; this it reduced to $2,205,695 in 1872, and then assumed the war debt of the towns and cities, making its total indebtedness again $4,138,124. On the 1st of September 1908 the funded debt of the state was $706,700.

History.—Martin Pring was at the mouth of the Piscataqua in 1603 and, returning to England in the same year, gave an account of the New England coast from Casco Bay to Cape Cod Bay. Samuel de Champlain discovered the Isles of Shoals and sailed along the New Hampshire coast in 1605, and much more information concerning this part of the New World was gathered in 1614 by Captain John Smith, who in his *Description of New England* refers to the convenient harbour at the mouth of the Piscataqua and praises the country back from the rocky shore. Under the leadership of Sir Ferdinando Gorges there was formed in 1620 the Council for New England, which procured from King James I. a grant of all the country from sea to sea between 40° and 48° N. latitude, and which made the following grants bearing upon the history of New Hampshire by their inducement to settlement, by determining the boundaries or by causing strife through their conflicts with one another: to John Mason, who has been called "the founder of New Hampshire," on the 9th of March 1622, a grant of the region between the Salem and Merrimac rivers, under the name of Mariana; to John Mason and Sir Ferdinando Gorges jointly, on the 10th of August 1622, a grant of the region between the Merrimac and Kennebec rivers for 60 m. inland, under the name of the Province of Maine; to David Thomson and associates, in 1622, a grant of six thousand acres near the mouth of the Piscataqua; to Sir Henry Roswell and associates, on the 19th of March 1628, a grant of the region from 3 m. south of the Charles river, "or to the southward of any and every part thereof" to 3 m. N. of the Merrimac river, "or to the northward of any and every part thereof," and extending west to the South Sea or Pacific Ocean, under the name of Massachusetts; to John Mason alone, on the 7th of November 1629, a grant of that portion of the "Province of Maine" which lay between the Merrimac and the Piscataqua, under the name of New Hampshire; to the Laconia Company, consisting of Gorges, Mason and associates, on the 17th of November 1629, a grant of an extensive territory (which was called Laconia) around the Lake of the Iroquois (Lake Champlain) together with one thousand acres at some place to be selected along the sea coast; to Edward Hilton, on the 12th of March 1630, the grant of a tract on and about the lower part of Dover Neck; to the Laconia Company, in November 1631, a grant of a tract on both sides of the Piscataqua river near its mouth, known as the Pescataway grant; and finally to John Mason, on the 22nd of April 1635, a short time before the Council surrendered its charter, a grant of the region between the Salem river on the south and the Piscataqua and Salmon Falls rivers on the north-east and extending 60 m. inland, under the name of New Hampshire. Mason died in December of this year, and New Hampshire, unlike the other colonies from which the United States originated, New Jersey and Delaware excepted, never received a royal charter.

The first settlement of which there is indisputable evidence was established in 1623 by David Thomson at Little Harbor, now in the town of Rye. Thomson was the head of a company which was organized for fishing and trading and whose entire stock was to be held jointly for five years. He built a house on Odiorne's Point overlooking Little Harbor, and, although he removed to an island in Boston Harbor in 1626, he may have continued to superintend the business of the company until the expiration of the five-year term. At least there was a settlement here which was assessed in 1628, and it may not have been completely abandoned when colonists sent over by the Laconia Company arrived in 1630. The Laconia Company received its first grant under the erroneous impression that the Piscataqua river had its source in or near Lake Champlain, and its principal object was to establish an extensive fur trade with the Iroquois Indians. Although Lake Champlain could not be reached by boat up the Piscataqua, and although the enterprise was ultimately a failure, the company sent over colonists who occupied the house left standing by Thomson, and, not far away, built "Mason Hall" or the "Great House" in what is now Portsmouth, a name (for the entire settlement) that replaced "Strawberry Banke" in 1653. Edward Hilton with a few associates appears to have established a settlement on Dover Point about the time of Thomson's arrival at Little Harbor, and in the Hilton grant of 1630 it is stated that he had already built houses and planted there; as early as 1639 this settlement was named Dover. In 1638 the Rev. John Wheelwright, an Antinomian leader who had been banished from Massachusetts, founded Exeter on land claimed to have been bought by him from the Indians. In the same year Massachusetts encouraged friendly Puritans to settle Hampton on the same purchase, and about a year later this colony organized Hampton as a town with the right to send a deputy to the General Court. Serious dissensions had already arisen between Puritan and Anglican factions in Dover, and Captain John Underhill, another Antinomian, became for a time a leader of the Puritan faction. Puritan Massachusetts was naturally hostile to the Antinomians at Exeter as well as to the Anglicans at Strawberry Banke. Although Exeter, in 1639, Dover, in 1640, and Strawberry Banke, not later than 1640, adopted a plantation covenant, these settlements were especially weak from lack of a superior tribunal, and appeals had been made to Massachusetts as early as 1633. Moreover, the grants of Massachusetts and Mariana were clearly in conflict. Under these conditions Massachusetts discovered a new claim for its northern boundary. The charter of that colony was drafted under the impression that the Merrimac flowed east for its entire course, but now an investigation was in progress which was to show that its source in Lake Winnepesaukee was several miles north of any of the four settlements in New Hampshire. Accordingly, Massachusetts resolved to make the most of the clause in the charter which described the northern boundary as three English miles north of the Merrimac river, "or to the northward of any and every part thereof," to ignore the conflicting grants to Mason and to extend its jurisdiction over the offending settlements. Dover submitted in 1641, Strawberry Banke (Portsmouth) soon afterwards and Exeter in 1643.

The heirs of Mason protested, but little was done about the matter during the period of Puritan ascendancy in the mother country. Immediately after the resignation of Richard Cromwell, however, Robert Tufton Mason (a grandson of the original proprietor), who had become sole heir in 1655, began petitioning first parliament and later the king, for relief. The attorney-general, to whom the petition to the king was referred, reported that the petitioner had a "good and legal right and title to the lands." The commission appointed by the king in 1664 to hear and determine complaints in New England decided that Mason's lands were not within the jurisdiction of Massachusetts, and made an attempt to set up a government under which his claims could be tried, but this was a failure. In 1674 Mason offered to surrender his rights to the Crown in return for one-third of the customs, rents, fines, and other profits derived therefrom, but although the offer was at first favourably considered it was finally declined. Mason then petitioned again, and this time Massachusetts was requested to send agents to England to answer his complaints. They arrived in December 1676, and the case was tried before the Lords Chief Justices of the King's Bench and Common Pleas in April 1677. Mason presented no claim to the right of government, and as to the title to the lands claimed by him the court decided that this was a question between him and the several tenants to be determined by the local court having jurisdiction in such matters. Thereupon Mason, in January 1679, petitioned the king to appoint a governor who should have jurisdiction over all the lands which he claimed, and on the 18th of September of this year New Hampshire was constituted a separate province with a government vested in a president and council appointed by the king and an assembly chosen by the people. This was the principal outcome of Mason's persistent efforts to establish his rights to

the land; for although he succeeded in procuring the appointment of officers who supported his claims, and although decrees were issued in his favour, the tenants, who contended that they had profited nothing from what his grandfather had done or that they were on lands which Wheelwright had bought from the Indians, resisted the enforcement of those decrees. The contest, however, especially for the waste lands, was continued by Mason, his heirs and assigns until near the close of the 18th century.

From 1686 to 1689 New Hampshire formed a part of the Dominion of New England, which, after the first few months, was under Sir Edmund Andros as governor-general. There being no provincial authority in New Hampshire at the close of this period, a convention of the leading citizens of its four towns attempted to establish one. Upon the failure of this attempt, a temporary nominal union with Massachusetts was formed, but in 1692 Samuel Allen, the assign of Mason, caused a royal government to be established with his son-in-law, John Usher, as lieutenant-governor, and during the remainder of the colonial era New Hampshire was separate from Massachusetts except that from 1699 to 1741 the two had the same governor. The boundary between the two provinces was yet to be determined. Massachusetts proposed to confine New Hampshire to less than one-fourth its present area; that is, on the west to a line drawn 3 m. east of the south course of the Merrimac and on the north-east to a line drawn north-west from the source of the Salmon Falls river. New Hampshire claimed for its southern boundary a line drawn west from a point 3 m. north of the mouth of the Merrimac and for its upper eastern boundary a line running north by slightly west from the source of the Salmon Falls river. Both provinces granted townships within the disputed territory; Massachusetts arrested men there who refused to pay taxes to its officers, and sought to defer the settlement of the dispute. New Hampshire, being on the more friendly terms with the home government, finally petitioned the king to decide the matter, and in 1737 a royal order referred it to a commission to be composed of councillors from New York, Nova Scotia and Rhode Island. This body agreed upon the present eastern boundary but evaded deciding the southern one. Both parties then appealed to the king, and in 1741 the king in council confirmed the decision of the commission in regard to the eastern boundary and decided that the southern boundary should be a line corresponding to the course of the Merrimac from 3 m. north of its mouth to 3 m. north of Pawtucket Falls, at its most southerly bend, and thence due west to the next English province. This gave New Hampshire much more territory on the south than it had claimed. But the western boundary was not yet defined, and as early as 1749 a controversy over that arose with New York. New Hampshire asked for the territory west to within 20 m. of the Hudson river, or as far as the western boundaries of Massachusetts and Connecticut, while New York claimed east to the Connecticut river. Within a few years the governor of New Hampshire granted in the disputed territory 138 townships which were rapidly settled by those whom it was the duty of the province to protect. But there was a reluctance to incur the expense of a contest with so powerful a neighbour as New York, and in 1764 that province procured from the king in council a royal order declaring the western boundary of New Hampshire to be the western bank of the Connecticut river. The controversy, however, continued for some years thereafter (see VERMONT).

From 1676 to 1759 New Hampshire suffered greatly from the Indians, and the fear of them, together with the boundary disputes and Mason's claims, retarded settlement. But where these troubles were removed the population increased rapidly, and at the outbreak of the War of Independence the province had about 80,000 inhabitants, the great majority of whom were with the patriot or Whig party during that struggle. By June 1775 the once popular governor, Sir John Wentworth, was a refugee; on the 5th of January 1776 the fifth Provincial Congress established a provisional government; on the 15th of the following June the first Assembly elected under that government declared for independence; and on the 16th of August 1777 the important victory at Bennington was won by New Hampshire and Vermont troops under the command of General John Stark, who had a commission from New Hampshire. Six states had ratified the Federal constitution when the New Hampshire convention met at Exeter on the 13th of February 1788, to accept or reject that instrument, and so great was the opposition to it among the delegates from the central part of the state that after a discussion of ten days the leaders in favour of ratification dared not risk a decisive vote, but procured an adjournment in order that certain delegates who had been instructed to vote against it might consult their constituents. Eight states had ratified when the convention reassembled at Concord on the 17th of June, and four days later, when a motion to ratify was carried by a vote of 57 to 47, adoption by the necessary nine states was assured. The War of Independence left the state heavily burdened with debt and many of its citizens threatened with a debtor's prison. As a means of relief a number of citizens demanded of the legislature the issue of paper money equal in amount to the state's debt, and as this was refused, an armed mob numbering about 200 surrounded the meeting-house in Exeter in which the legislature was in session, towards evening on the 20th of September 1786. But General John Sullivan (1740–1795) was at that time president of the state, and on the next day he, with 2000 or more militia and volunteers, captured 39 of the leaders and suppressed the revolt without bloodshed.

National elections in New Hampshire were carried by the Federalists until 1816, except in 1804 when President Thomas Jefferson won by a small majority; but within this period of Federalist supremacy in national politics the Democrat-Republicans elected the governor from 1805 to 1812 inclusive except in 1809. In 1816 the Democrats won both state and national elections; and out of the transition from Federalist to Democratic control, which was effected under the leadership of William Plumer (1759–1850), a prominent politician in New Hampshire for half a century, a United States senator from 1802 to 1807 and governor of the state in 1812–1813 and 1816–1819, arose the famous Dartmouth College Case. As the trustees of this institution were Federalists with the right to fill vacancies in their number, the Democrats attempted to gain control by converting it into a state university and increasing the number of trustees, but when the case reached the Supreme Court of the United States that body pronounced (1819) the charter a contract which the Federal constitution forbade the state to violate. Heretofore the Federalist régime had taxed the people to support the Congregational Church, but now the Baptists, Methodists and Universalists joined the Democrats, and in 1819 this state support was abolished by the "Toleration Act." Because of Daniel Webster's arguments in the Dartmouth College Case, and because his party had favoured the support of the Congregational Church by public taxation, he became very unpopular in this his native state. Accordingly, his denunciation of President Andrew Jackson's bank policy added strength to the Jacksonian Democracy, and, later, his Whig connexions were the greatest source of the Whig party's weakness in New Hampshire. John Quincy Adams was an intimate friend of William Plumer, the Democratic leader, and carried the state both in 1824 and 1828, but a Jackson man was elected governor in 1827, 1829, 1830 and 1831. The Whigs never won a national or state election, and often their vote was only about one-half that of the Democrats. But the Democrats broke into two factions in 1846 over the question of slavery (see HALE, JOHN PARKER); the American or "Know-Nothing" party elected a governor in 1855 and 1856; and then control of the state passed to the Republican party which has held it to the present. After 1890 the railway corporations were charged with a corrupt domination of the legislature and the courts, and in 1906 a "Lincoln Republican" movement was organized under the leadership of the well-known novelist Winston Churchill (b. 1871), with the object of freeing the state from this influence.

The governors or presidents of the province and state have been:

Province.

John Cutt, president	1679–1681
Richard Waldron, president	1681–1682
Edward Cranfield, lieutenant-governor	1682–1685
Walter Barefoot, deputy-governor	1685–1686
Joseph Dudley, president of Council for New England	1686–1687
Edmund Andros, governor-general of New England	1687–1689
Without a government	1689–1690
Nominally united with Massachusetts	1690–1692
Samuel Allen, governor	1692–1698
Richard Coote, earl of Bellamont, governor	1699–1701
Joseph Dudley, governor	1702–1715
Samuel Shute, governor	1716–1723
John Wentworth, lieutenant-governor	1723–1728
William Burnett, governor	1729–1730
Jonathan Belcher, governor	1730–1741
Benning Wentworth, governor	1741–1767
John Wentworth, governor	1767–1775

Transition from Province to State.

Matthew Thornton, president of the Provincial Convention	1775

State Presidents.

Mesheck Weare	1776–1785
John Langdon	1785–1786
John Sullivan	1786–1787
John Langdon	1788–1789
John Sullivan	1789–1790
Josiah Bartlett	1790–1792

State Governors.

Josiah Bartlett	1792–1794	Federalist
John Taylor Gilman	1794–1805	"
John Langdon	1805–1809	Dem.-Repub.
Jeremiah Smith	1809–1810	Federalist

NEW HARMONY, a village in Posey county, Indiana, U.S.A., on the Wabash river, about 22 m. N.W. of Evansville. Pop. (1900) 1341; (1910) 1229. It is served by the Illinois Central railway, and has regular steamboat connexion with the river cities. New Harmony had its beginning in 1814–1815, when it became the home of a communistic religious sect known variously as the Harmonists, Harmonites and Rappites, founded in Germany towards the end of the 18th century by George Rapp (1757–1847), a native of Iptingen in Württemberg. Rapp and his followers, who sought to form a community after the manner of the primitive Christian Church, were persecuted in Germany, and in 1803-1804 emigrated to Butler county, Pennsylvania. There they established in 1805 a community known as Harmony, consisting of some 600 persons, who held their property in common and in 1807 adopted celibacy. In 1814 Rapp sold most of his Pennsylvania land and bought about 24,735 acres (in the next ten years more than 14,000 acres in addition) on the Wabash river in Indiana Territory. In 1814–1815 Rapp and a thousand of his followers settled on the Indiana tract, their headquarters being established at New Harmony, or Harmonie as they called it. The settlers, mostly Germans, devoted themselves to agriculture, weaving and leather-working so industriously that they prospered from the start. Rapp, however, in 1825 disposed of his lands and property to Robert Owen, having returned with part of his followers to Pennsylvania and founded a new community known as Economy (*q.v.*), in Beaver county, where he died in 1847. Intent on founding a socialistic community, Owen went to the United States in 1824, and purchased Rapp's lands and live stock for $182,000. He interested several well-known scientists in his settlement, and with them came to New Harmony in the spring of 1826. Within six months the community numbered over 1000. Among its most notable members were Robert Owen's sons, Robert Dale Owen (1801–1877), a political leader and diplomat; David Dale Owen (1807–1860) and Richard Owen (1810–1890), both geologists of note; William MaClure (1763–1840), the founder of the Academy of Natural Sciences at Philadelphia; Thomas Say (1787–1834), "the father of American Zoology"; Charles Lesueur, a scientist and antiquarian; and Gerard Troost (1776–1850), a well-known geologist. The greater part of the settlers, however, were impractical theorists or adventurers. Constitution after constitution was adopted, and with the adoption of each new constitution and with each new religious discussion a group would secede and form a separate community—in 1828 there were ten—the best known and most successful being Macluria (like the others, occupying a part of Owen's land), named after William MaClure, who became its directing power. The whole organization broke up in 1827, and Owen left New Harmony in 1828. New Harmony has a Working Men's Institute Public Library, founded in 1838 by William MaClure,

and having in 1907 18,000 volumes; the collection is rich in works dealing with socialism.

See "The Harmony Society" in *German-American Annals* (Philadelphia), vol. 2 (new series), for January 1904; C. B. Lockwood and C. A. Prosser, *The New Harmony Movement* (New York, 1907); Meredith Nicholson, *The Hoosiers* (New York, 1901); Morris Hillquit, *History of Socialism in the United States* (New York, 1903); and Frank Podmore, *Robert Owen* (London, 1906).

NEW HAVEN, the largest city of Connecticut, U.S.A., the county-seat of New Haven and the seat of Yale University. It is co-extensive with the township of New Haven (though there is both a township and a city government), and lies in the south-western part of the state, about 4 m. from Long Island Sound, at the head of New Haven Bay, into which empty three small streams, the Quinnipiac, the Mill and the West rivers. Pop. (1890) 81,298; (1900) 108,027, of whom 30,802 were foreign-born, including 10,491 Irish, 5262 Italians, 4743 Germans, 3193 Russians and 1376 Swedes; (1910 census) 133,605. Land area (1906) 17·91 sq. m., of which more than one-half was annexed since 1900. New Haven is served by the main line and five branches of the New York, New Haven & Hartford railway, by three inter-urban electric lines and by two steamship lines connecting with New York. The city is built on a level, sandy plain, in the rear of which is a line of hills terminating in two spurs, East Rock and West Rock, respectively 360 and 400 ft. high and 2 m. and 2¼ m. distant from the Green. On East Rock is a monument to the Connecticut soldiers who fell in the War of Independence, the War of 1812, the Mexican War and the Civil War; on the West Rock is a cave, "Judges' Cave," in which the regicides William Goffe and Edward Whalley are said to have concealed themselves when sought for by royal officers in 1661. The central and older portion of the city is laid out in squares surrounding a public Green of 16 acres, which was in former days the centre of religious and social life. New Haven is popularly known as the "City of Elms," because of the number of these trees. Besides the Green there are 12 other parks, ranging from 6 to 300 acres in area, four of them being on the water front, along the harbour. On the west side of the city is Edgewood Park (120 acres); on the north is Beaver Pond Park (100 acres); and East and West Rocks, mentioned above, have been made into suburban parks.

Among the public buildings and places of interest are the three churches on the Green, built in 1814; Center Church (Congregational), in the rear of which is the grave of John Dixwell (1608–1689), one of the regicides; United (formerly known as North) Church (Congregational), and Trinity Church, which belongs to one of the oldest Protestant Episcopal congregations in Connecticut. On the north-western side of the Green are the buildings of Yale University (*q.v.*); the "college" campus is the square enclosed by College, Chapel, High and Elm streets, with Battell Chapel at its eastern corner, Farnam, Lawrence, Phelps, Welch and Osborn halls on its south-eastern side, Vanderbilt Hall, Connecticut (or South Middle) Hall, the oldest of the Yale buildings (1750), and the Art School on the southern side, the Library, Dwight Hall and Alumni Hall on the north-western and Durfee Hall on the northern side; farther north of the Green are the Divinity School, the University Campus, on which are the Bicentennial Buildings and Memorial Hall, and, lying between Grove Street and Trumbull Street and Prospect Street and Hillhouse Avenue, the buildings of the Sheffield Scientific School. In the vicinity is the Grove Street Cemetery, in which are the graves of many famous Americans. Besides the University Library, there are a Public Library (1887), containing about 80,000 vols., the library of the Young Men's Institute (1826) and the collection of the New Haven Colony Historical Society. The city contains a State Normal School and a number of hospitals and charitable institutions.

Among the newspapers of New Haven are the *Morning Journal and Courier* (1832, Republican), whose weekly edition, the *Connecticut Herald and Weekly Journal*, was established as the *New Haven Journal* in 1766; the *Palladium* (Republican; daily, 1840; weekly, 1828); the *Evening Register* (Independent; daily, 1840; weekly, 1812); and the *Union* (1873), a Democratic evening paper. At New Haven also are published several weekly English, German and Italian papers, and a number of periodicals, including the *American Journal of Science* (1818), the *Yale Law Journal* (1890) and the *Yale Review* (1892), a quarterly.

In 1900 New Haven was the most important manufacturing centre in Connecticut, and in 1905 it was second only to Bridgeport in the value of its factory product. In 1905 its establishments numbered 490. The principal manufactures are hardware, foundry and machine shop products, ammunition and fire-arms (the Winchester Company), carriages and wagons, malt liquors, paper boxes and corsets. Meat packing is also an important industry. In 1905 the total capital invested in manufacturing was $31,412,715 and the total product $39,666,118 (a gain of 13·7% since 1900). Commercially, New Haven is primarily a distributing point for the Atlantic seaboard, but the city is a port of entry, and foreign commerce (almost exclusively importing) is carried on to some extent, the imports in 1909 being valued at $404,805. In 1908 the assessed valuation of real and personal property was $119,592,508, the net debt was $3,854,498 and the rate of taxation was 14·75 mills on the dollar.

Under a charter of 1899, as amended afterwards, the city government, which has almost entirely superseded the town government, is in the hands of a mayor, who holds office for two years and appoints most of the administrative officers, except a board of aldermen (of whom each has a two-year term, six are chosen from the city at large and the others one each from each ward, the even-numbered wards electing their representatives one year and the odd-numbered the next), a city clerk, controller, sheriff, treasurer and tax collector, all chosen by popular vote, and an assistant clerk, appointed by the board of aldermen.

The first settlement in New Haven (called Quinnipiac, its Indian name, until 1640) was made in the autumn of 1637 by a party of explorers in search of a site for colonization for a band of Puritans, led by Theophilus Eaton and the Rev. John Davenport, who had arrived at Boston, Massachusetts, from England in July 1637. In the following spring a permanent settlement was made. It was governed under a "plantation covenant" until the 4th of June 1639, when, at a general meeting, the "free planters" adopted the fundamental principles of a new government. They agreed that the Scriptures should be their guide in civil affairs, and that only approved church members should be admitted to the body politic; twelve men were appointed to choose seven men ("seven pillars") who should found the church and admit to its original membership such planters as they thought properly qualified. This having been done, the first General Court of which there is record met on the 25th of October. At this court the members of the new church, together with six members of other approved churches, were admitted to citizenship; a magistrate, four assistants, a secretary and a constable were chosen as the civil officers; annual elections and an annual session of the General Court in the last week of October were agreed upon; English statute and common law were expressly excluded; and the "worde of God was adopted as the onely rule to be attended unto in ordering the affayres of government in this plantation." As thus founded, New Haven was town and colony combined. In 1643–1644 the colony was expanded into the New Haven Jurisdiction, embracing the towns of New Haven, Guilford, Milford, Stamford and Branford in Connecticut, and, on Long Island, Southold; but this "Jurisdiction" was dissolved in 1664, and all these towns (except Southold) passed under the jurisdiction of Connecticut, according to the Connecticut charter of 1662. The government of the Jurisdiction was of the strictest Puritan type, and although the forty-five "blue laws" which the Rev. Samuel Peters, in his *General History of Connecticut*, ascribed to New Haven were much confused with the laws of the other New England colonies and some were mere inventions, yet many of them, and others equally "blue," were actually in operation as enactments or as court decisions in New Haven.

Among those in the Peters's list which are wholly or substantially true are the following: "The judges shall determine controversies without a jury"; "Married persons must live together or be imprisoned"; "A wife shall be good evidence against her husband"; "No minister shall keep school"; "The selectmen, on finding children ignorant, may take them away from their parents and put them into better hands, at the expense of their parents." Among those in the same list which are wholly or in part spurious are: "No woman shall kiss her child on the Sabbath or fasting day," and "No one shall travel, cook victuals, make beds, sweep house, cut hair or shave on the Sabbath day."

One of the most important events in the history of New Haven was the removal hither in October 1716 from Saybrook of the Collegiate School of Connecticut, which developed into Yale University. The period of greatest material prosperity of New Haven in the colonial period began about 1750, when a thriving commerce with other American ports and the West Indies developed. As a port it was notorious for its smuggling and illicit trade. New Haven also had extensive shipbuilding interests. All attempts to enforce the British commercial regulations were ineffectual. On the 22nd of February 1763 a town meeting resolved to encourage colonial manufactures and to refrain from importing from England hats, clothing, leather, gold and silver lace, buttons, cheese, liquors, &c. Two years later Jared Ingersoll (1722–1781), who had been sent to England to protest against the Stamp Act, but had accepted the office of Stamp Distributor on the advice of Benjamin Franklin, was forced to resign his office. In 1770 most of the merchants agreed not to import goods from England and transferred their trade with New York City, where Loyalist influence was strong, to Boston and Philadelphia. When news of the embargo of the port at Boston arrived at New Haven, a Committee of Correspondence was at once formed; and in the War of Independence the people enthusiastically supported the American cause. On the 5th of July 1779 the place was invaded by a British force under General William Tryon, who intended to burn the town, but met so strong a resistance that he withdrew before the next day. New Haven's commerce suffered severely during the war, but by the close of the first decade of the 19th century it had regained its former importance. When the War of 1812 opened there were fully 600 seamen in the city, practically all of whom were engaged in privateering or in the regular naval service of the United States. Among them was Captain Isaac Hull. In 1815 the *Fulton*, the first steamboat on Long Island Sound, made its first trip from New York to New Haven. The second quarter of the 19th century was the period of development of railways and manufactures. The period since the Civil War has been marked by a diversification of industries. To that conflict New Haven contributed approximately $30,000,000, and 3000 men, 500 of whom were killed. From 1701 until 1873 New Haven was the joint capital (with Hartford) of Connecticut. New Haven was incorporated as a city in 1784; new charters were secured from the General Assembly of the state in 1869, 1881 and 1899. Fair Haven was annexed to New Haven in 1897.

Hoadly; and the *Papers* and other publications (1865 sqq.) of New Haven Colony Historical Society.

NEWHAVEN, a seaport in the Eastbourne parliamentary division of Sussex, England, 56 m. S. from London by the London, Brighton & South Coast railway, on the English Channel at the mouth of the Ouse. Pop. of urban district (1901) 6772. The church of St Michael has a Norman square embattled tower surmounted by a spire, and an apsidal chancel. The port is protected by fortifications. A harbour was first granted to Newhaven in 1713, and during the early part of the 18th century it possessed a large shipping trade. This afterwards declined, but it is now one of the principal points of communication between England and France, the railway company maintaining a daily service of fast steamers to Dieppe in connexion with the Chemin de fer de l'Ouest. The tidal harbour, which is owned by a company, is enclosed by two piers and a breakwater, the area being about 30 acres, and the quayage 1400 yds. The roadstead is one of the finest on the coast of England. With France there is a large traffic in wines, spirits, silk, fruit, vegetables and general provisions. The coasting trade consists chiefly of imports of coal and provisions, the exports being principally timber for shipbuilding and flint for the Staffordshire potteries. Some shipbuilding is carried on.

NEW HEBRIDES, a chain of islands in the western Pacific Ocean, between 166° and 171° E., and 13° and 21° S., included in Melanesia, and under the joint influence of Great Britain and France. (For map, see PACIFIC OCEAN.) From New Caledonia to the S.W. they are separated by a deep channel; but a comparatively shallow sea indicates their physical connexion with the Santa Cruz group (*q.v.*) to the N. The chain lies S.E. and N.W., but the main islands are arranged somewhat in the form of the letter Y. The south-easternmost island is Aneiteum; N.W. from this the main islands are Tanna or Aipere, Eromanga, Efaté,[1] the Shepherd Islands and Api or Epi. At this point the arms of the Y divide, the western comprising the large islands of Malekula or Mallicollo and Espiritu Santo,[2] the eastern consisting of Ambrym, Arag and Maiwo or Aurora, with Aoba or Leper Island between the two arms. Espiritu Santo, the largest island, has an area of 875 sq. m. Irregularly disposed to the N. of the Y are the lesser islands composing the Banks group—Gaua, Vanua Lava, Mota, Valua, &c., and the Torres Islands.

With their rugged outline and rich vegetation, the islands as seen from the sea are very beautiful. Excepting the small Torres group, which are low-lying and perched on reefs, but without lagoons, all the islands are of volcanic, not coral, formation, the larger ones lying on both sides of the line of volcanic activity. The coasts are almost free from reefs and the shores rise abruptly from deep water. Old coral is sometimes found elevated to a considerable height. The islands are formed chiefly of basalt and recent eruptive material; earthquakes and submarine eruptions are not infrequent; and some of the islands themselves have active craters. All have considerable elevations, the loftiest being the isolated cone of Lopevi, near the junction of the arms of the Y; its height is 4714 ft. The volcanic soil is very rich. Numerous clear streams water the islands, but some debouch upon flat ground towards the sea, and form unhealthy marshes there. Copper, iron and nickel are the most important minerals known in the group, and sulphur is of some commercial importance.

The climate is generally hot and damp, but there is a season (November to April) which is specially distinguished, as such, and is somewhat unhealthy. The trees—*Casuarina*, candle nut (*Aleurites triloba*), kauri pine (or Tanna), various species of *Ficus*, *Myrtaceae* and many others—are magnificent; the coco-nut is not confined to the coast, but grows high up the valleys on the hill-sides. Sandal-wood is also found. Besides the breadfruit, sago-palm, banana, sugar, yam, taro, arrowroot and several forest fruits, the orange, pine-apple and other imported species flourish; and European vegetables are exported to Sydney. Land mammals are scarce; they include bats, rats and pigs which have run wild. There are some lizards and turtles; birds include pigeons, parrots, ducks and swallows; locusts, grasshoppers, butterflies and hornets are numerous, and the sea abounds in fish, which, however, are generally inferior as food, and in some cases poisonous.

The native population is estimated at 50,000; in 1904 the British population was 212, the French 401. The island of Efaté contains the seat of the joint government, Vila or Port Vila (formerly Franceville), and the majority of the French population. There are several British and French trading companies, and a considerable area is cleared and worked by settlers. The chief exports are copra, coffee, maize, bananas, timber, &c.

[1] Efaté, Vaté, Faté, Efat or Sandwich island.
[2] Abbreviated to Santo; native Marina.

The natives of the New Hebrides are Melanesians of mixed blood, and vary much in different islands. On Efaté and some others Polynesian immigration has produced a taller, fairer and less savage people. In some parts, as on Aoba, isolated Polynesian communities exist. But the general type is Melanesian: black skin, woolly hair, low, receding forehead, broad face, flat nose and thick lips. The natives decorate themselves with nose-rings and ear-rings and bracelets of shells. The men are constantly fighting; their weapons are bows and poisoned arrows, often beautifully designed, clubs of elaborate patterns and spears. Their houses are either round huts, or rectangular with pitched roofs resting on three parallel rows of posts. The villages are scrupulously clean and neat, ornamented with flowering shrubs, crotons and dracaenas, and are often fortified with stone walls. In character the New Hebrideans are ferocious and treacherous, though most of their unhospitality and savagery is to be traced to the misconduct and cruelty of traders and labour agents. The women occupy a degraded position, and in some islands widows are buried alive with the bodies of their husbands. There is a great belief in sorceries and omens; but prayer and offerings (usually of shell money) are addressed mainly to the spirits of the (recently) dead, and there is another class of spirits, called Vui, who are appealed to when incorporate in certain stones or animals; of one of two such the divinity is recognized generally. By the villages a space shadowed by a great banyan tree is often set apart for dances and public meetings. A certain sanctity attaches also sometimes to the *Casuarina* and the *Cycas*. An important institution is the club-house, in which there are various grades, whereon a man's rank and influence mainly depend, his grade being recognized even if he goes to another island where his language is unintelligible. In like manner a division into two great exogamous groups prevails, at all events throughout the northern islands. It would therefore seem that the present diversity of languages in the group must be of relatively recent origin. These languages or dialects are numerous, and mutually unintelligible, but alike as to grammatical construction, and belonging to the Melanesian class.

History.—The Portuguese Pedro Fernandez de Quiros, sighting Espiritu Santo in 1606, thought he had discovered the great southern continent then believed to exist, and named it Australia del Espiritu Santo. Louis de Bougainville visited the islands in 1768, and Captain Cook, who gave them the name they bear, in 1774. The subsequent visits of several explorers, the exploitation of the sandal-wood and other products by traders and the arrival of missionaries helped to open up the islands and to give them a certain commercial importance by the middle of the 19th century. Trade was mainly with New Caledonia, and France was thus indicated as the dominant power in the New Hebrides; even British planters pressed France to annex the islands in 1876, but in the following year some of the missionaries urged the same course on England. In 1878 the islands were declared neutral by Great Britain and France. The presence of British and French settlers under independent authority led to unsatisfactory administration, especially in regard to the settlement of civil actions and jurisdiction over the native population. As to the establishment of commercial supremacy, French interests clashed with Australian, and in 1882 M. John Higginson of New Caledonia (d. 1904) consolidated the former by founding the trading society which afterwards became the *Société française des Nouvelles-Hébrides*. In 1886 one of the most serious of many native outbreaks occurred, necessitating a French demonstration of force from New Caledonia. An Anglo-French convention of the 16th of November 1887 provided for the surveillance of the islands (protection of life and property) by a mixed commission of naval officers. The Anglo-French agreement of 1904 had a clause providing for an arrangement as to proper jurisdiction over the natives and for the appointment of a commission to settle disputes between British and French landed proprietors. In this and the following year there was much unrest among the natives, and a joint punitive expedition was necessary.

Strong feeling was aroused meanwhile in Australia owing to the disabilities suffered by British settlers in the islands. British annexation, or at least a division of the group into British and French spheres, was urged. But on the 20th of October 1906 a convention was signed in London, confirming a protocol of the preceding 27th of February, and providing that "the group of the New Hebrides, including the Banks and Torres Islands," should form "a region of joint influence," in which British and French subjects should have equal rights in all respects, and each power should retain jurisdiction over its own subjects or citizens. The claim of other powers to share the joint influence was excluded by the provision that their subjects resident on the islands must be under either British or French jurisdiction. A British and a French high commissioner were appointed, each assisted by a resident commissioner; provision was made for two police forces of equal strength, and the joint naval commission of 1887 was retained for the purpose of keeping order. The high commissioners were given authority over the native chiefs. A joint court was established, consisting of two judges, appointed respectively by Great Britain and France, and a third, to be president, and not a British subject or French citizen, appointed by the king of Spain. Its jurisdiction covers civil cases (including commercial suits and those respecting landed property), native offences or crimes against non-natives, and all offences against the provisions of the convention. The sale of arms and intoxicants to natives is forbidden; and the convention regulates the recruitment of native labour. Provision was made for community of interests in regard to public works, finance and the official use of the English and French languages. The creation of municipalities on the application of groups of not less than thirty non-native residents was provided for, municipal votes being given to both sexes. The convention provided against the establishment of a penal settlement and the erection of fortifications.

This convention was bitterly criticized in Australia on the ground that many of the provisions which nominally established equality between British and French would operate in practice to the advantage of the French; and there was no little dissatisfaction on the ground that the Australian government was neither represented at the preliminary conference, nor fully consulted during the negotiations.

See *Parliamentary Papers*, France, No. 1 (1888 and 1906); and "Correspondence relating to the Convention . . ." (Cd. 3288), (1907).

NEW IBERIA, a city of Louisiana, U.S.A., capital of Iberia parish, on the Bayou Teche, in the southern part of the state, about 125 m. W. of New Orleans. Pop. (1890) 3447; (1900) 6815 (3309 negroes); (1910) 7499. It is served by the Southern Pacific, the Franklin and Abbeville, and the New Iberia & Northern railways. Lumber, sugar, cotton and rice are produced in the neighbourhood. At the village of Avery Island, about 10 m. S.E., there are deposits of rock salt. The municipality owns and operates the waterworks and the electric lighting plant. New Iberia was laid out in 1835 and was chartered as a city in 1839.

NEW JERSEY, one of the Middle Atlantic states of the American Union, lying between 41° 21′ 22·6″ and 38° 55′ 40″ N. lat., and 75° 35′ and 73° 53′ 39″ W. long. It is bounded, N., by the state of New York; E., by the Hudson river, which separates the state from New York, and by the Atlantic Ocean; and S. and W. by the Delaware Bay and river, which separate New Jersey from Delaware and Pennsylvania. All the boundaries except the northern are natural. New Jersey has an extreme length, N. and S., of 166 m., an extreme width, E. and W., of 57 m., and a total area of 8224 sq. m., of which 710 sq. m. are water-surface.

Physiography.—There are within the state four distinct topographic belts—the Appalachian, the Highlands, the Triassic Lowland and the Coastal Plain. The folded Appalachian belt crosses the N.W. corner of the state, and includes the Kittatinny Mountain and Valley. The mountain has a north-east-south-west trend, crossing the Delaware river at the Delaware Water Gap and continuing S.W. into Pennsylvania. In width the range varies from 4 or 5 m. in the N. to about 2 m. in the S. Its western foot lies along the Delaware river, which for some distance flows parallel with the range, and has an altitude of about 400 ft. above the sea at Port Jervis, where it enters the state, and of about 300 ft. at the Water Gap, where it leaves it. Where the crest of the ridge enters the state its elevation is 1539 ft.; at High Point, 1½ m. S.W. the ridge attains a height of 1803 ft., the highest point within the state. A short distance S.W. of this point, in a depression in the mountain crest, is Lake Marcia, at an elevation of 1570 ft. Beyond Culver's Gap the mountain again narrows to a ridge, and for a portion of its length it is double-crested. On the eastern side the slope is so abrupt as to make ascent difficult and at places impossible, but the western slope, on account of a dip of the rock to the N.W., is more

gradual. The eastern foot has a very uniform altitude of from 900 to 1000 ft. above the sea. The crest of the ridge is from 600 to 1200 ft. W. of the foot, and from 450 to 600 ft. above it. At the Water Gap the ridge is cut through to its base, and the Delaware river flows through the opening. This gap, 900 ft. wide at the base and 4500 ft. wide at the top, with sides rising very abruptly to a height of 1200 ft. and more, is an impressive sight. The Kittatinny Valley, S.E. of and parallel to the Kittatinny Range, is about 40 m. long and 12 m. wide and has an average elevation of 700 ft. Its western margin is from 900 to 1000 ft. above the sea, and its eastern border is from 400 to 500 ft. lower. The floor of the valley is very undulating, and contains numerous small streams, whose divides are from 700 to 900 ft. above the sea. South-east of the Kittatinny Valley, and parallel with it, lies the second topographic belt, the Highlands. This region embraces an area of 900 sq. m., having a length, N.E. and S.W., of 60 m., and a width varying from 9 to 18 m. It consists of an upland plateau now dissected by streams into a series of hills and ridges, and corresponds to the Piedmont Belt farther to the S.W. and to the upland region of southern New England. The average elevation of the Highlands is about 1000 ft.; the highest point, between Canisteer and Vernon, in Sussex county, being 1496 ft. The third belt, called the Triassic Lowland, occupies about one-fifth of the surface of the state. Its N.W. border is marked by a line drawn S.W. across the state through Pompton, Morristown, Lebanon and Highbridge to the Delaware; its S.E. border by a line drawn from Woodbridge to Trenton. The surface is irregular, with altitudes ranging from about sea-level to 900 ft. A noteworthy feature of this area is the series of trap rock ridges, between which the Passaic river makes its irregular way through a region of flat bottom lands. On the N. E. border of the Lowland, one of these trap ridges lines the western bank of the Hudson river for about 25 m., and is known as the Palisade Ridge, or simply the Palisades, because of the scenic effect produced by the columnar jointing and steep eastern wall of the trap sheet. To the W. the slope of the ridge is very gentle. The Palisades extend from a point N. of the New York boundary as far S. as Weehawken, their height gradually decreasing southward. A slope of débris occurs at the E. base of the Palisade Ridge, but the summit is covered with trees. The trap formation extends to the Kill van Kull Channel, and includes, among other ridges, the so-called First and Second Watchung (or Orange) Mountains W. of the group of suburbs known as the "Oranges," but S. of Weehawken it has no scenic attractiveness. With the exception of the ridges, the Triassic Lowland N. of the Raritan river is usually below 200 ft. in altitude; S. of the Raritan the topography of this belt is similar to the northern portion, but much of the area is over 200 ft. above the sea. South-east of the Triassic Lowland lies the fourth topographic belt, the Coastal Plain, containing an area of 4400 sq. m., or slightly more than one-half the entire surface of the state. This belt, bordered on the E., S. and W. by water, is highest near its centre and lowest along its margins. It is free from mountainous ridges, but there are a number of isolated hills, such as the Navesink Highlands (259 ft.) in Monmouth county. One-third of the Coastal Plain is below 50 ft. in altitude; two-fifths are between 50 and 100 ft.; and somewhat more than a fourth of the area is over 100 ft. above sea-level. The total area of the belt as high as 200 ft. above the sea does not exceed 15 sq. m. About one-eighth of the area consists of tidal marsh, lying chiefly between the long sandy ridges or barrier beaches of the Atlantic coast and the mainland. The width of the marsh varies from 1 to 6 m., being least in the extreme N. and S. and greatest near the mouths of streams. There is also a marsh along Delaware Bay, unprotected by a beach. The waters between these beaches and the mainland are gradually filling with sediment and changing into tidal marsh. In addition to the stretches of marsh along the coast, the eastward-flowing rivers of the Coastal Plain are fringed with large areas of swamp land, some of which is well forested.

For the entire state the average elevation is 250 ft., with 4100 sq. m. below 100 ft.; 2100 sq. m. between 100 and 500 ft.; 1400 sq. m. between 500 and 1000 ft.; and 215 sq. m. between 1000 and 1500 ft. The four topographic belts of the state correspond very closely to the outcrops of its geological formations; the rocks of the Appalachian belt being of Palaeozoic age; the formation of the Highlands, Archaean; that of the Triassic Lowland, Triassic; that of the irregular hills of the Coastal Plain, Cretaceous and Tertiary.

The great terminal moraine of the glacial epoch crosses the N.E.-S.W. topographic belts of the state, in an irregular line running W. and N.W., from Staten Island, N.Y. North of the morainic belt the effect of the glaciation is seen in the irregular courses of the streams, the numerous lakes and freshwater marshes and the falls and rapids along those streams displaced by the glaciers from their former courses. The effect of glaciation on the soil is noted in a later paragraph.

The Delaware river, from its junction with the Neversink Creek to the capes, flows along the western and southern borders of the state for a distance of 245 m., and has a total drainage area in New Jersey of 2345 sq. m. Of equal importance is the Hudson, whose lower waters, forming the north-eastern boundary of New Jersey for a distance of 22 m., drain a very small part of the state, but have contributed materially to the state's commercial development. The streams lying wholly within the state are relatively unimportant. Of the tributaries to the Delaware river the northernmost is Flat Brook, 25 m. long, draining an area of 65 sq. m. W. of the Kittatinny Mountain. The Kittatinny Valley is drained by Paulins Kill and the Pequest river in the E. and S.E., and by the Walkill river in the N.E. Of the streams of the Highlands and the Triassic Lowland, the Passaic river is the most important. Rising in the N.E.—in the southern part of Morris county—it pursues a winding north-easterly course, passing through a gap in the trap rock at Little Falls, and by means of a cascade and a mile of rapids descends 40 ft. At Paterson, 3 m. farther, the stream passes through a crevasse in the trap rock and has a sheer fall of 70 ft. (the Great Falls of the Passaic).[1] The stream then makes a sharp bend southward and empties into Newark Bay.[2] The Passaic and its small tributaries—the Whippany, Rockaway, Pequanac, Wanaque, Saddle and Ramapo—drain an area of about 950 sq. m. On account of the rapid fall of its tributaries, the union of so many of them with the main stream near its middle course and the obstructions to the flow of the water in the lower course, the Passaic is subject to disastrous floods. In 1903 a heavy rainfall caused a flood which continued from the 8th to the 19th of October and destroyed not less than $7,000,000 worth of property. Another, which continued from the 25th of February to the 9th of March 1902, destroyed property valued at $1,000,000 or more, and there were less disastrous floods in 1882 and 1896.[3] The Hackensack river enters the state about 5 m. W. of the Hudson river, flows almost parallel with that stream, and empties into Newark Bay, having a length of 34 m. and a drainage area of 201 sq. m. The Raritan river, flowing eastwardly through the centre of the state, is the largest stream lying wholly within New Jersey, and drains 1105 sq. m. Commercially, however, this stream is less important than the Passaic. In the southern half of the state the drainage is simple, and the streams are unimportant, flowing straight to the Delaware or the Atlantic. The westward streams are only small creeks; the eastward and southward streams, however, on account of the wider slope, have greater length. Among the latter are the Maurice river, 33 m. long, emptying into Delaware Bay; and the Great Egg Harbor river, 38 m. long, and the Mullica, 32 m. long, emptying into the Atlantic. In the northern part of the state, and especially among the Highlands, are numerous lakes, which are popular places of resort during the summer months. Of these the largest and the most frequented are Lake Hopatcong, an irregular body of water in Morris and Sussex counties, and Greenwood Lake, lying partly in New York and partly in New Jersey.

Fauna and Flora.—The fauna of New Jersey does not differ materially from that of the other Middle Atlantic states. Large game has almost disappeared. The red, or Virginia, deer and the grey fox are still found in circumscribed localities; and of the smaller mammals, the squirrel, chipmunk, rabbit, raccoon and opossum are still numerous. Among game birds are various species of ducks, the quail, or "Bob White," and the woodcock. The waters of the coast and bays abound in shad, menhaden, bluefish, weak-fish (squeteague), clams and oysters. The interior streams are stocked with trout, black bass and perch.

The conditions of plant growth are varied. In the northern and north central parts of the state, where the soil consists partly of glacial drift, the species have a wider range than is the case farther S., where the soil is more uniform. New Jersey is a meeting ground for many species which have their principal habitat farther N. or farther S., and its flora therefore may be divided into a northern and a southern. Still another class, and the most clearly marked of all, is the flora of the beaches, salt marshes and meadows. The total woodland area of the state is about 3234 sq. m. Two distinct types of forest are recognized, with the usual transition zone between them. South and east of a line drawn approximately from Seabright to Glassboro, and thence southward to Delaware Bay, is a nearly level, sandy region known as "The Pines." This is the great forest area of the state; it contains about 1,200,000 acres of woodland, practically continuous, and portions of it still but sparsely inhabited. The original forest has been entirely removed, but a young growth of the same tree species, chiefly pitch pine with a variety of oaks, replaces it. Within "The Pines," immediately north of the Mullica river, lies an area of about 20,000 acres called "The Plains." These are sparsely clothed with prostrate pitch pine, scrub oak and laurel. Tree forms are entirely absent. The cause of this condition is still undetermined. Along the streams in this section are many swamps, valuable for the white cedar that they produce, or when cleared, for cranberry bogs. The northern part of the state is much more rugged.

[1] As the waters of the stream have been diverted into mill races, the river very seldom makes this leap in its natural channel. The power thus generated has been largely instrumental in creating the city of Paterson (*q.v.*).

[2] The total length of the Passaic is about 100 m., but its course is so irregular that the distance in a straight line from its source to its mouth is only about 15 m.

and the forests are chiefly of chestnut and various species of oak. Though much broken by farms and other elements of culture they aggregate about 740,000 acres. New Jersey's forests have suffered much from fire, but with the exception of "The Plains" the soil everywhere is well adapted to tree growth. A comparatively mild climate and good market facilities increase the potential value of the whole woodland area. The state maintains a Forest Commission whose chief concern is to control the fires and thereby give value to private holdings. In this effort it is meeting with considerable success. The state is also acquiring, and maintaining as demonstration acres and public parks, forest reserves in various parts of the state. The five reserves now held are in Atlantic, Burlington and Sussex counties and aggregate 9899 acres.[1]

Climate.—Between the extreme northern and southern sections of the state there is a greater variation in climate than would naturally result from their difference in latitude. This is due to the proximity of the ocean in the S. and to the relatively high altitudes in the N. Near Cape May fruit trees bloom two or three weeks earlier than in the Highlands. The mean annual temperature ranges from 49·2° F. at Dover, in the N., to 55·4° at Bridgeton, in the S. The average date of the first killing frost at Dover is the 4th of October, and of the last, the 10th of May; at Atlantic City, on the sea-coast, these dates are respectively the 4th of November and the 11th of April. At Dover the mean annual temperature is 49°; the mean for the winter is 28°, with an extreme minimum recorded of −13°; and the mean for the summer is 70°, with an extreme maximum recorded of 102°. At Atlantic City the mean annual temperature is 52°; for the winter it is 34°, with an extreme of −7°; and for the summer, 70°, with an extreme of 99°. At Vineland, a southern interior town, the mean annual temperature is 53°; for the winter it is 33°, with an extreme of −13°; and for the summer, 74°, with an extreme of 105°. These records of temperature afford a striking illustration of the moderating influence of the ocean upon the extremes of summer and winter. On account of the proximity to the sea, New Jersey has a more equable climate than have some of the states in the same latitude farther west. During the summer months the general course of the wind along the sea-coast is interrupted about midday by an incoming current of air, the "sea breeze," which gradually increases until about three o'clock in the afternoon, and then gradually lessens until the offshore wind takes its place. As the heat is thus made less oppressive along the coast, the beaches of New Jersey have rapidly built up with towns and cities that have become popular summer resorts—among the best known of these are Long Branch, Asbury Park, Ocean Grove, Atlantic City (also a winter resort) and Cape May. Among the interior resorts are Lakewood, a fashionable winter resort, and Lake Hopatcong, and Greenwood Lake and surrounding regions, much frequented in the summer. In the summer the prevailing winds throughout the state are from the S.W.; in the winter, from the N.W. The normal annual precipitation is 47·7 in., varying from 46·6 in. on the sea-coast to 49·1 in. in the Highlands and the Kittatinny Valley. Precipitation is from 1 to 3 in. greater in the summer than in the other seasons, which differ among themselves very little in the average amount of rainfall. From December to March, inclusively, part of the precipitation is in the form of snow. In the extreme S. there is more rain than snow in the winter; but no part of the state is free from snow storms. In the summer thunder storms are frequent, but are generally local in extent, and are much more common in the afternoon and early evening than in the morning.

Soils.—The soils of the state exhibit great variety. Those of the northern and central sections are made up in part of glacial drift; those of the S. are sandy or loamy, and are locally enriched by deposits of marl. The most fertile soils of the state lie in the clay and marl region, a belt from 10 to 20 m. wide extending across the state in a general south-westerly direction from Long Branch to Salem. South of this belt the soils are generally sandy and are not very fertile except at altitudes of less than 50 ft., where they are loamy and of alluvial origin.

Agriculture.—In 1900 very little more land was under cultivation than in 1850, the total acreage for these years being respectively 2,840,966 and 2,752,946. The number of farms, however, increased from 23,905 to 34,294, and the average size of the farms decreased from 115·2 acres to 82 acres, an indication that agriculture gradually became more intensive. In 1900, 22% of the farms contained from 20 to 50 acres, 48·3%, 50-175 acres and only 7·8% contained over 175 acres. Farms were smallest in Hudson county, where the average size was 7·9 acres, and largest in Sussex county, where the average size was 143·4 acres. The counties with the largest total acreage were Burlington (343,096), Sussex (256,896) and Hunterdon (248,733). Between 1880 and 1900 the percentage of farms operated by owners decreased from 75·4 to 70·1; the percentage of cash tenants increased from 10·5 to 15·3; and that of share tenants remained about stationary, being 14·1 in 1880 and 14·6 in 1900. In this last year 27·5 % of the farms derived their principal income from live stock, 20·3 % from vegetables, 17·2 % from dairy produce, 7·8 % from fruits and 7·8 % from hay and grain.

In 1907, according to the *Year Book* of the United States Department of Agriculture, the principal crops were: hay, 634,000 tons ($10,778,000); potatoes, 8,400,000 bushels ($6,216,000); Indian corn, 8,757,000 bushels ($5,517,000); wheat, 1,998,000 bushels ($1,958,000); rye, 1,372,000 bushels ($1,043,000); oats, 1,770,000 bushels ($991,000). The number and value of each of the various classes of live stock in the state on the 1st of January 1908 were as follows: horses, 102,000 ($11,526,000); mules, 5000 ($675,000); milch cows, 190,000 ($8,170,000); other neat cattle, 82,000 ($1,722,000); sheep, 44,000 ($220,000); swine, 155,000 ($1,555,000). In 1899, 5959 farms were classified as dairy farms, *i.e.* they derived at least 40 % of their income from dairy products; and the total value of dairy products was $8,436,869, the larger items being $6,318,568 for milk sold and $818,624 for butter sold. Poultry raising also is an important agricultural industry: poultry in the state was valued at $1,300,853 on the 1st of June 1900; and for the year 1899 the value of all poultry raised was $2,265,816, and the value of eggs was $1,938,304. In the production of cereals the state has not taken high rank since the development of the wheat fields of the western states; but in 1899 the acreage in cereals was 45·4 % of the acreage in all crops, and the value of the yield was 25·3 % of that of all crops. Of the total acreage in cereals in 1907, 278,000 acres were in Indian corn; 108,000 in wheat; 78,000 in rye; and 60,000 in oats. The chief cereal-producing counties in 1899 were Burlington, Hunterdon, Monmouth and Salem. The most valuable field crop in 1907 was hay and forage, consisting mostly of clover and cultivated grasses; in 1899 the value of this crop was 20·2 % of that of all crops.

Since 1830 market gardening in New Jersey has become increasingly important, especially in the vicinity of large cities, and has proved more profitable than the growing of cereals. In the total acreage devoted to the raising of vegetables in marketable quantities New Jersey in 1900 was surpassed by only two other states. The value of the marketable vegetables in 1899 was $4,630,658, and the value of the total vegetable crop, $8,425,596, or 30·7 % of that of all crops. Among the vegetables grown the potato is the most important; in 1907 there were 70,000 acres in potatoes, yielding 8,400,000 bushels, valued at $6,216,000. Between 1899 and 1907 the value of the potato crop more than doubled. In 1899 the state also produced 5,304,503 bushels of tomatoes; 2,418,641 bushels of sweet potatoes; 2,052,200 bunches of asparagus; 17,890,980 heads of cabbage; 21,495,940 musk melons; 3,300,330 water melons; and 1,015,111 bushels of sweet corn. Fruit-growing has also attained considerable importance. In 1899 the total value of the crop was $4,082,788; the value of the orchard fruit was $2,594,981; of small fruits, $1,406,049; and of grapes, $81,758. Peaches grow in all parts of the state, but most of the crop comes from Hunterdon, Sussex and Somerset counties. Apples are grown there and also in the western part of Burlington county. In the decade 1889–1899 the apple crop increased from 603,890 to 4,640,896 bushels. In Monmouth, Camden and parts of Burlington and Gloucester counties great quantities of pears are grown. Atlantic, Burlington, Camden and Salem counties are the great centres for strawberries; Atlantic, Cumberland and Salem counties lead in grape-growing; and a large huckleberry crop is yearly gathered in "the Pines." In 1899 New Jersey produced nearly a fourth of the cranberry crop of the United States, the chief centre of production being the bogs of Burlington and Ocean counties. Other fruits grown in considerable quantities are cherries, plums, blackberries and raspberries.

Minerals and Mining.—In 1907 the total value of the state's mineral products was $32,800,299. Clays of different degrees of value are found in nearly every section, but the principal clay mining areas are: the Middlesex county area, where the best clays are found along the Raritan river and the coast; the Trenton area, in which clay is mined chiefly at Dogtown, E. of Trenton; the Delaware river area, in the vicinity of Palmyra; and the Woodmansie area, in Ocean county. As the clay pits contain only small amounts of any one kind of clay, it has proved more profitable for manufacturers to buy their raw materials from a number of miners than for them to operate the mines themselves, and consequently clay mining and the manufacture of clay products are largely distinct industries. In New Jersey the mining of clays is more important than in any other state, the amount mined and sold in 1902 being a third of the entire output of the United States, and the amount in 1907 (440,138 tons) being more than one-fifth of all clay mined and sold in the United States; and in 1907 in the value of clay products ($16,005,460; brick and tile, $9,019, 834, and pottery, $6,985,626) New Jersey was outranked only by Ohio and Pennsylvania. In Warren and Sussex counties are abundant materials for the manufacture of Portland cement, an industry that has attained importance since 1892; in the value of its product in 1907 ($4,738,516) New Jersey was surpassed only by Pennsylvania. Granite is found in Morris and Sussex counties, but is not extensively quarried; there are extensive quarries of sandstone in the Piedmont

[1] The amount of timber cut within the state is very small. Before the introduction of coal and coke as fuel in the forges and furnaces the cutting of young trees for the manufacture of charcoal was a profitable industry, and the process of deforestation reached its maximum. Since 1860 the forest area has only slightly diminished, and the condition of the timber has improved, but large trees are still scarce.

section; and limestone and trap rock are important mineral resources. In 1907 the total value of stone quarried in the state was $1,523,312, of which $995,436 was the value of trap rock, $274,452 of limestone, $177,667 of sandstone and $75,757 of granite. Some roofing slate is produced in Sussex county; in 1907 the output was valued at $8000. The mining of natural fertilizers—white and greensand marls—is a long established industry; the output in 1907 was 14,091 tons, valued at $8429.

Of mineral ores the most important are iron, zinc and copper. The manufacture of iron in New Jersey dates from 1674, when the metal was reduced from its ores near Shrewsbury, Monmouth county. Magnetic ores, found chiefly in Morris, Passaic and Warren counties, form the basis of the present industry. Bog ores were mined until about 1840; since that date they have had no market. The product of the iron mines has fluctuated greatly in quantity, being nearly 1,000,000 tons of ore in 1892, 257,235 tons in 1897, and 549,760 tons in 1907, when the output was valued at $1,815,586; and was about nine-tenths magnetite and one-tenth brown ore. The chief places of production are Hibernia (Morris county) and Mt Pleasant (Hunterdon county); in 1907 four mines in the state produced 316,236 tons. In the production of zinc New Jersey once took a prominent part; in 1907 the only producer was The New Jersey Zinc Company's mine at Franklin Furnace, Sussex county, with an output of 13,573 short tons, valued at $1,601,614. The chief deposits consist of red oxide, silicate and franklinite, and the average zinc content is 23 %. The copper deposits of the state were worked to a small extent in colonial days. One of the brass cannon used at Yorktown was made of copper taken from the Watchung Mountains during the War for Independence. These mountains are still the chief source of copper, but the ores, chiefly cuprite, malachite and chrysocolla, are also found in various parts of the Piedmont region. In the years following 1900 there was renewed interest in copper mining. There are many valuable mineral springs in the state: for 1907 eleven springs (three in Bergen and two each in Morris, Camden and Somerset counties) reported to the U.S. Geological Survey the sale of 982,445 gallons (mostly table water), valued at $103,082. Other minerals, which are not found in commercial quantities, are lead in the form of galena, in Sussex county; graphite, in the crystalline schistose rocks of the Highlands; molybdenum, in the form of a sulphide, in Sussex county; and barytes in Mercer and Sussex counties. In Bergen, Warren, Sussex and Morris counties are numerous bogs containing peat of a good quality.

Manufactures.—After 1850 New Jersey made rapid progress in manufacturing, which soon became its leading industry. In 1850 7·7 % of the population were employed as wage-earners in manufacturing establishments; in 1900, 12·8 %. The value of the products in 1850 was $39,851,256; in 1890, $354,573,571; in 1900, $611,748,933. Such figures of the census of 1900 as are comparable with those of the special census of 1905, when only the establishments under the factory system were enumerated, show that between 1900 and 1905 the number of factories increased 9·3 %; the capital, 49·8 %; and the value of the products,[1] 40 % (from $353,005,684 to $774,369,025). This rapid development is due to the excellent transportation facilities, and to the proximity of large markets and of great natural resources, such as the clays of New Jersey and the coal and iron of Pennsylvania. The chief manufacturing centres in 1905, as judged by the value of their products, were Newark ($150,055,277), Jersey City ($75,740,934), Bayonne ($60,633,761), Paterson ($54,673,083), Perth Amboy ($34,800,402), Camden ($33,587,273), and Trenton ($32,719,945). In 1905, 67·1 % of the factories were in municipalities having a population of at least 8000 in 1900, and their product was 74·1 % (in value) of the total. There are indications, however, that industries are slowly shifting to the smaller towns.

The textile industries taken together are the most important of the manufacturing industries, having a greater output (in 1900, $81,910,850; in 1905, $96,060,407), employing more labourers and capital, and paying more wages than any other group. Among the various textiles silk takes the first place, the value of the factory product in 1900 being $39,966,662, and in 1905, $42,862,907. In 1900 the value of the silk output was 48·8 % of the total value of the textiles, and silk manufacturing was more important than any other industry (textile or not); in 1905, however, owing to the great progress in other industries, silk had dropped to fourth place, but still contributed 44·6 % of the value of the textiles. In 1900 New Jersey furnished 37·3 %, and in 1905, 32·2 %, of the silk products of the United States, and was surpassed by no other state. The silk industry is centred at Paterson, the chief silk manufacturing city of the United States. West Hoboken and Jersey City are also important producers. A second textile industry in which New Jersey in 1900 and in 1905 took first rank was the manufacture of felt hats; the total value of the product in 1905 was $9,540,433, a gain of 32·3 % since 1900, and constituting 26 % of the value of the product of the entire United States. Most of the product comes from the cities of Newark and Orange. From 1900 to 1905 the value of the worsted goods increased from $6,823,721 to $11,925,126, or 74·8 %, the greatest gain made by any of the textiles. In this industry New Jersey was surpassed only by Massachusetts, Rhode Island and Pennsylvania. During this five-year period there was an increase of 31·2 % (from $6,540,289 to $8,518,527) in the value of the cotton goods manufactured in New Jersey; of 12·6 % (from $2,168,570 to $2,441,516) in that of linen goods; of 45·3 % (from $1,748,148 to $2,539,178) in that of hosiery and knit goods, and of 14·8 % (from $1,522,827 to $1,748,831) in that of carpets and rugs. In dyeing and finishing textiles New Jersey was first among the states of the Union in 1900 (value, $10,488,963, being 23·3 % of the total for the country) and in 1905 (value, $11,979,947, being 23·6 % of the total for the country); Paterson is the centre of this industry in New Jersey.

In the manufacture of clay products, including brick, tiling, terra cotta and pottery, the state takes high rank: the total value of pottery, terra cotta and fire-clay products increased from $8,940,723 in 1900 to $11,717,103 in 1905; in 1905 the most valuable pottery product was sanitary ware, valued at $3,006,406; and in that year New Jersey furnished 18·2 % of the total pottery product of the United States, and was surpassed in this industry only by Ohio. The city of Trenton is one of the two great centres of the American pottery industry, and in 1905 it manufactured more than one-half of the state's output of pottery, terra cotta and fire-clay products. The pottery products include china, c.c. ware, white granite ware, sanitary ware, belleek and porcelain. Much of the raw material for this industry, such as ball, flint, and spar clays and kaolin, is imported from other states. In 1905 the value of brick and tile manufactured in the state was $1,830,080. Glass is also an important product of New Jersey; the output being valued at $5,093,822 in 1900 and at $6,450,195 in 1905. Since 1880, however, the state had fallen from second to fourth place (in 1905) in this industry.

The leading single industry in the state in 1905, as determined by the value of its products, was the smelting and refining of copper. In 1900 the output was valued at $38,365,131; in 1905, at $62,795,713, an increase of 63·7 %; and in 1905 21·6 % of the product of the United States came from New Jersey. The raw materials for this industry, however, are imported into New Jersey from other states. In the smelting and refining of platinum, nickel, gold and silver (not from the ore) there was a striking development between 1900 and 1905, the value of the product increasing from $469,224 to $7,034,139. The value in 1905 of gold and silver reduced and refined (not from the ore) was $5,281,805. The values of the other leading manufactures in 1905 were as follows: products of foundry and machine shops, $49,425,385; iron and steel[2] (including products of blast furnaces and rolling mills), $23,667,483; wire (exclusive of copper wire), $11,103,959; petroleum refining, $46,608,984; tanned, curried and finished leather, $21,495,329 (5th in the United States in 1900 and 1905); malt liquors, $17,446,447; slaughter-house products and packed meats, $17,238,076; electrical machinery, supplies and apparatus, $13,893,476 (5th in the United States in 1900 and in 1905); chemicals, $13,023,629; rubber belting and hose, $9,915,742; jewelry, $9,303,646 (4th in the United States in 1900 and in 1905); tobacco, cigars and cigarettes, $8,331,611. Other manufactures valued in 1905 at more than $5,000,000 were: boots and shoes, cars and general railway shop work, illuminating and heating gas, lumber and planing mill products, phonographs, fertilizers, flour and grist mill products, iron and steel ships, refined lard and paper and wood pulp.

Fisheries.—The fisheries of the state are of great commercial value. In 1904 the fisheries and the wholesale fish trade gave employment to 9094 persons. Until 1901 New Jersey's fisheries were more important than those of any other state in the Middle or South Atlantic groups; but after that date, owing to a decrease in the catch of bluefish, shad, clams and oysters, the annual catch of New York and Virginia became more valuable. The great length of river and sea front, and the easy communication from all parts of the state with the leading urban markets, have brought about the development of this industry. The total catch in 1904 was 90,108,068 lb, valued at $3,385,415, a decline of 28 % in value since 1901. The chief varieties of the product in 1904, with their value, were as follows: oysters, $1,691,953; clams, $430,766; shad, $238,517; squeteague (weak-fish), $253,200; bluefish, $120,085; menhaden, $109,090; sea bass, $97,903; cod, $53,789. Fishing, as a commercial pursuit, is carried on in seventeen counties, and attains its greatest importance in Cumberland county, where the catch in 1904 was valued at $1,090,157, and the oyster catch alone at $1,046,147. In the other counties along the Delaware shad is the chief product, and these counties furnish nearly nine-tenths of the catch. A small amount of shad is taken also in the Hudson river. The value of the shad fisheries has greatly declined since 1901. Along the coast squeteague is the most abundant edible variety taken. Bluefish are very plentiful from 4 to 10 m. off Seabright. The shell fisheries (oysters particularly) are centred in Delaware Bay and at Maurice River Cove, in Cumberland county, but are important also in Cape May, Atlantic, Ocean and Monmouth

[1] The following statistics of the products for 1900 and for 1905 are for factory products, those for 1900 differing, therefore, from the statistics which appear in the reports of the census of 1900.

[2] This is one of the oldest of the important industries in New Jersey: at Old Boonton, about 1770, was established a rolling and slitting mill, probably the first in the country.

counties on the Atlantic seaboard. This industry declined for a time, partly on account of the pollution of the streams by sewage and the refuse of manufacturing establishments, but laws have been enacted for its protection and development. Clams are gathered from Perth Amboy to the upper Delaware Bay; the most important fisheries being at Keyport, Port Monmouth and Belford. In 1909 the State Bureau of Shell Fisheries estimated the annual value of shell fisheries in the state at nearly $6,000,000, of which $500,000 was the value of clams. Monmouth, Ocean and Cape May counties furnish large quantities of menhaden, which are utilized for oil and fertilizer. This industry in 1904 yielded fertilizer valued at $154,360 and oil valued at $33,110.

Transportation.—In 1905, with a total railway mileage of 2274·40, New Jersey possessed an average of 30·22 m. of railway for each 100 sq. m. of territory, an average higher than that of any other American state; in 1909, according to the State Railroad Commissioners, the mileage was 2354·63 (including additional tracks, sidings, &c., 5471·38 m.). Owing to its geographical position the state is crossed by all roads reaching New York City from the S. and W., and all those reaching Philadelphia from the N. and E. The eastern terminals of the southern and western lines running from New York City are situated on the western shore of the Hudson river, in Weehawken, Hoboken or Jersey City; whence passengers and freight are carried by ferry to New York. Jersey City and Hoboken are also connected with New York by tunnels under the Hudson river. Among these lines are the Erie system, extending W. from Jersey City via Buffalo; the New York, Susquehanna & Western (subsidiary to the Erie), from Jersey City to Wilkes-Barré, Pennsylvania; the Delaware, Lackawanna & Western, from Hoboken to Buffalo; the Lehigh Valley, from Jersey City to Buffalo; the Pennsylvania, from Jersey City to the S. and W.[1]; the New York, Ontario & Western (controlled by the New York, New Haven & Hartford), from Weehawken to Oswego; the West Shore (leased by the New York Central), from Weehawken to Buffalo; and the Central railway of New Jersey (controlled by the Philadelphia & Reading), with numerous short lines from Jersey City to the S. and W. These roads also operate numerous branch lines and control other short lines built independently. Among the latter class are the Atlantic City railway (controlled by the Philadelphia & Reading) from Philadelphia to various coast resorts in southern New Jersey; and the West Jersey & Seashore (controlled by the Pennsylvania), from Philadelphia to Atlantic City and Cape May. The railways operating independently of the great "trunk" systems are few and unimportant. The excellence of the waggon roads of the state is largely due to the plentiful supply of trap rock in New Jersey.

Of New Jersey's 487 m. of boundary, 319 m. are touched by waters navigable for boats of varying draft. There is tidal water on the E. and S., and also on the W. as far N. as Trenton. The lower Hudson is navigable for the largest ocean-going steamers. From Bergen Point to Perth Amboy, W. of Staten Island, lie the narrow channels of the Kill van Kull and Arthur Kill, with a minimum depth of 9 or 10 ft. at low water. Raritan Bay, to the S., is navigable only for small vessels. There are no good harbours on the Atlantic coast. The lower Delaware is navigable for ocean steamships as far N. as Camden (opposite Philadelphia), and for small vessels as far as Trenton, which is the head of navigation. The only deep water terminals of the state are Jersey City and Hoboken. Among the rivers the Raritan is navigable to New Brunswick, the Hackensack for small boats for 20 m. above its mouth, the Rahway as far as Rahway, the Great Egg Harbor river as far as May's Landing, the Mullica for 20 m. above its mouth, and the Elizabeth river as far as Elizabeth. In 1907 an inland waterway from Cape May to Bay Head was planned: the length of this channel, through and between coastal sounds from the southernmost part of the state to the northern end of Barnegat Bay in the N.E. part of Ocean county, was to be about 116·6 m., and the channel was to be 6 ft. deep and 100 ft. wide. The Delaware and Raritan canal[2] was long a very important artificial waterway. Its main channel (opened for traffic in 1838) extends from Bordentown, Burlington county, on the Delaware to New Brunswick, on the Raritan, 44 m. by the canal route, and thus carries the waters of the Delaware river entirely across the state, discharging them into the Raritan at New Brunswick. It is 40 ft. wide at the bottom, 80 ft. at the top and 9 ft. deep; it has a navigable feeder (30 ft. wide at the bottom and 60 ft. wide at the top, with a depth of 9 ft.), which is 22 m. long, extending from the Delaware at Bull's Head to Trenton. The canal passes through Trenton (the highest point—56·3 ft. above mean tide), Kingston, Griggston, Weston and Bound Brook, and has one lock (or more) at each of these places. It is used chiefly for the transportation of Pennsylvania coal to New York, and is controlled by the Pennsylvania railway. The total cost up to 1906 was $5,113,749. The Morris Canal,[3] opened in 1836, is 50 ft. wide at the surface, 30 ft. wide at the bottom and 5 ft. deep, and (excluding 4·1 m. of feeders) 102·38 m. long, beginning at Jersey City and passing through Newark, Bloomfield, Paterson, Little Falls, Boonton, Rockaway, Dover, Port Oram, Lake Hopatcong, Hackettstown and Washington to Phillipsburg on the Delaware; it is practically in two sections, one east and the other west of Lake Hopatcong (Sussex and Morris counties; about 928 ft. above sea-level; 9 m. long from N.E. to S.W.; maximum width, 1 m.), which is a reservoir and feeder for the canal's eastern and western branches, and which was enlarged considerably when the canal was built. There is another feeder, the Pompton, 3·6 m. long, in Passaic county. The canal crosses the Passaic and Pompton rivers on aqueducts. The Canal (the Morris Canal Banking Company) was leased in April 1871 to the Lehigh Valley Railroad Company for 999 years. It is no longer of commercial importance as a waterway. At Phillipsburg it connects with an important coal carrying canal (lying almost entirely in Pennsylvania), the property of the Lehigh Coal and Navigation Co. (leased to the Central Railroad of New Jersey), which follows the Lehigh river to Coalport (Carbon county, Pennsylvania), penetrating the coal regions of Pennsylvania.

Population.—The population of the state in 1880 was 1,131,116; in 1890, 1,444,933; in 1900, 1,883,669 (431,884 foreign-born, and 69,844 negroes); in 1905 (state census) 2,144,134; in 1910, 2,537,167. Of the native-born white population in 1900, 556,294 were of foreign parentage, and 825,973 were of native parentage. Among the various elements comprising the foreign-born population were 119,598 Germans; 94,844 Irish; 45,428 English; 41,865 Italians; 19,745 Russians; 14,913 Hungarians; 14,728 Austrians; 14,357 Poles; 14,211 Scotch; and 10,261 Dutch. In 1800 barely 2% of the population was urban; in 1900 80% of the inhabitants either lived in cities or were in daily communication with Philadelphia or New York. The rural population is practically stationary. The chief cities in 1910 were Newark (pop. 347,469), Jersey City (267,779), Paterson (125,600), Trenton (96,815), Camden (94,538) and Hoboken (70,324). Owing to its milder climate and its larger number of cities New Jersey has a negro population somewhat larger than that of the states of the same latitude farther west. The rate of increase of this element, which is greatest in the cities, is about the same as that for the white inhabitants. Since 1881 colonies of Hebrews have been established in the southern part of the state, among them being Alliance (1881), Rosenhayn (1882), Carmel (1883), and, most noted of all, Woodbine, which owes its origin to the liberality of Baron de Hirsch, and contains the Baron de Hirsch Agricultural and Industrial School. As regards church affiliation, in 1906 Roman Catholics were the most numerous, with 441,432 members out of a total of 857,548 communicants of all denominations; there were 122,511 Methodists, 79,912 Presbyterians, 65,248 Baptists, 53,921 Protestant Episcopalians, 32,290 members of the Reformed (Dutch) Church in America, and 24,147 Lutherans.

[1] The Pennsylvania railway has constructed tunnels under the Hudson river, and has erected a large terminal station on Manhattan Island.

[2] In William Winterbotham's *An Historical, Geographical, Commercial and Philosophical View of the American United States*, &c. (London, 1795) there was a discussion of the feasibility of a canal between the Delaware and the Raritan. In 1804 a company was chartered to build such a canal; in 1816 a route was surveyed; in 1823 a commission was appointed which recommended a route and suggested that the state take part in building the canal; in December 1826 a canal company was incorporated with a monopoly of canal and railway privileges within 10 m. of any part of the canal authorized, but Pennsylvania refused permission to use the waters of the Delaware, and the charter lapsed; in 1830 the Delaware and Raritan Canal Company was incorporated by an act which forbade the construction of any other canal within 5 m. of the proposed route of the Delaware and Raritan, and which reserved to the state the right to buy the waterway 30 years (changed in 1831 to 50 years) after its completion. Lieutenant (afterwards Commodore) Robert F. Stockton (1795–1866), president of the Company, contributed greatly to its financial success. In 1831 it was combined with the Camden & Amboy railway.

[3] The Morris Canal & Banking Company was chartered in 1824 to build the Morris Canal, which never proved a financial success, partly because of the competition of the Delaware Raritan, which soon commanded the coal trade, and partly because of physical and mechanical defects. It was exempted from all taxation by the state, which reserved the right to buy it, at a fair price, in 1923 or, without making any payment, to succeed to the actual ownership in 1973 upon the expiration of the charter. The idea of utilizing the waters of Lake Hopatcong was that of George P. MacCulloch of Morristown. A peculiar feature of the canal was a system of inclined planes or railways on which there were cradles, carrying the canal boat up (or down) the incline; these were devised by Professor James Renwick (1818–1895) of Columbia College; 12 of them in the eastern division raised boats altogether about 720 ft., and 11 of them in the western division lowered the boats about 690 ft.—the remainder of the grade was overcome by locks.

Administration.—The state is governed under the constitution of 1844, with subsequent amendments of 1875 and of 1897. The only other constitution under which the state has been governed was that of 1776 (see *History* below). The right of suffrage is conferred upon all males, twenty-one years of age and over, who have resided in the state for one year and in the county for five months preceding the election.[1] Paupers, idiots, insane persons and persons who are convicted of crimes which exclude them from being witnesses and who have not been pardoned and restored to civil rights are disfranchised. The executive power is vested in a governor, who is elected for a term of three years and may not serve two successive terms, though he may be re-elected after he has been out of office for a full term. He must be at least thirty years of age, and must have been a citizen of the United States for a least twenty years, and a resident of the state seven years next preceding his election. He may not be elected by the legislature, during the term for which he is elected as governor, to any office under the state or the United States governments. He receives a salary of $10,000 a year. If the governor die, resign or be removed from office, or if his office be otherwise vacant, he is succeeded by the president of the Senate, who serves until another governor is elected and qualified. The governor's powers under the constitution of 1776 were greatly limited by the constitution of 1844. His appointive power is unusually large. With the advice and consent of the state Senate he selects the secretary of state, attorney-general, superintendent of public instruction, chancellor, chief justice, judges of the supreme, circuit, inferior and district courts, and the so-called "lay" judges of the court of errors and appeals, in addition to the minor administrative officers who are usually appointive in all American states. The governor may make no appointments in the last week of his term. The state treasurer, comptroller and the commissioners of deeds are appointed by the two houses of the legislature in joint session. The governor is *ex officio* a member of the court of pardons, and his affirmative vote is necessary in all cases of pardon or commutation of sentence (see below).

The legislative department consists of a Senate and a General Assembly. In the Senate each of the 21 counties has one representative, chosen for a term of three years, and about one-third of the membership is chosen each year. The members of the General Assembly are elected annually, are limited to sixty (the actual number in 1909), and are apportioned among the counties according to population, with the important proviso, however, that every county shall have at least one member.

The arrangement of senatorial representation is very unequal; and the densely populated counties are under-represented. A senator must at the time of his election be at least thirty years old, and must have been a citizen and inhabitant of the state for four years and of his county for one year immediately preceding his election; and an assemblyman must at the time of his election be at least twenty-one years old, and must have been a citizen and inhabitant of the state for two years, and of his county for one year, immediately preceding his election. The annual salary of each senator and of each member of the General Assembly is $500. Money bills originate in the lower house, but the Senate may propose amendments. The legislature may not create any debt or liability "which shall, single or in the aggregate with any previous debts or liabilities, at any time exceed $100,000," except for purposes of war, to repel invasion or to suppress insurrection, without specifying distinctly the purpose or object, providing for the payment of interest, and limiting the liability to thirty-five years; and the measure as thus passed must be ratified by popular vote. The constitution as amended in 1875 forbids the legislature to pass any private or special laws regulating the affairs of towns or counties, or to vote state grants to any municipal or industrial corporations or societies, and prescribes that in imposing taxes the assessment of taxable property shall be according to general laws and by uniform rules; and anti-race-track agitation in 1891–1897 led to a further amendment prohibiting the legalizing of lotteries, of pool-selling or of other forms of gambling. The governor may (since 1875) veto any item in any appropriation bill, but any bill (or item) may be passed over his veto by bare majorities (of all members elected) in both houses. Bills not returned to the legislature in five days become law, unless the legislature adjourns in the meantime. Amendments to the constitution must first be passed by the legislature at two consecutive sessions (receiving a majority vote of all members elected to each house), and then be ratified by the voters at a special election, and no amendment or amendments may be submitted by the legislature to the people oftener than once in five years.

The judicial system is complex and is an interesting development from the English system of the 18th century. At its head is a court of errors and appeals composed of the chancellor, the justices of the supreme court and six additional "lay" judges. The supreme court consists of a chief justice and eight associate justices, but it may be held by the chief justice alone or by any one of the associate justices. The state is divided into nine judicial districts, and each supreme court justice holds circuit courts within each county of a judicial district, besides being associated with the "president" judge of the court of common pleas of each county in holding the court of common pleas, the court of quarter sessions, the court of oyer and terminer and the orphans' court. One of five additional judges may hold a circuit court in the absence of a justice of the supreme court, or the "president" judge of a court of common pleas may do so if the supreme court justice requests it. In each township there are from two to five justices of the peace, any one of whom may preside over the "small cause court," which has jurisdiction of cases in which the matter in dispute does not exceed $200 and is not an action of replevin, one in which the charge is slander, trespass or assault, battery or imprisonment, or in which the title to real estate is in question.

The court of common pleas, which may be held either by the "president" judge or by a justice of the supreme court, may hear appeals from the "small cause court," and has original jurisdiction in all civil matters except those in which the title to real estate is in question. The court of quarter sessions, which may likewise be held by either the judge of the court of common pleas or by a justice of the supreme court, has jurisdiction over all criminal cases except those of treason or murder. The court of oyer and terminer is a higher criminal court, and has cognizance of all crimes and offences whatever. Except in counties having a population of 300,000 or more, a justice of the supreme court must preside over it, and the judge of the court of common pleas may or may not sit with him; in a county having a population of 300,000 or more the judge of the court of common pleas may sit alone. Writs of error in cases punishable with death are returnable only to the court of errors and appeals. No appeals are permitted in criminal cases. The orphans' court may be held either by the judge of the court of common pleas or by a justice of the supreme court; and it has jurisdiction over controversies respecting the existence of wills, the fairness of inventories, the right of administration and guardianship, the allowance of accounts to executors, administrators, guardians or trustees, and over suits for the recovery of legacies and distributive shares, but it may refer any matter coming before it to a master in chancery. The prerogative court, which is presided over by the chancellor as ordinary and surrogate-general, or by a vice-ordinary and vice-surrogate-general, may hear appeals from the orphans' court, and has the authority to grant probate of wills and letters of administration and guardianship, and to hear and determine disputes arising therein. The court of chancery is administered by a chancellor, seven vice-chancellors and numerous masters in chancery. Besides the ordinary chancery jurisdiction it hears all applications for divorce or nullity of marriage. Appeals from the court of chancery as well as writs of error from the supreme court are heard by the court of errors and appeals. New Jersey has a court of pardons composed of the governor, chancellor and the six "lay" judges of the court of errors and appeals, and the concurrence of a majority of its members, of whom the governor shall be one, is necessary to grant a pardon, commute a sentence or remit a fine. This court has, also, the authority to grant to a convict a licence to be at large upon such security, terms, conditions and limitations as it may require. The judges of the several New Jersey courts are appointed by the governor with the consent of the Senate for a term of years, usually five to seven.

For the purposes of local government the state is divided into counties, cities, townships, towns and boroughs. The government of the towns is administered through a council, clerk, collector, assessor, treasurer, &c., chosen by popular vote; that of the townships is vested in the annual town meeting, at which administrative officers are elected. Any township with more

[1] The constitution of 1844 limited the suffrage to white males, and although this limitation was annulled by the fifteenth amendment to the Federal Constitution, it was not until 1875 that the state by an amendment (adopted on the 7th of September) struck the word "white" from its suffrage clause. At the same time another amendment was adopted providing that sailors and soldiers in the service of the United States in time of war might vote although absent from their election districts.

than 5000 inhabitants may be incorporated as a town, with its government vested in a mayor and council. Any township or part thereof with less than 4 sq. m. of territory, and less than 5000 inhabitants, may be incorporated as a borough, with its government vested in a mayor and council.

In 1903 a law (revised in 1908) was passed providing for the conduct at public cost of primary elections for the nomination of nearly all elective officers, and for the nomination of delegates to party nominating conventions; nominations for primary elections are made by petitions signed by at least ten voters (except in very small election districts) who make affidavit as to their party affiliations; the nominee thus indorsed must file a letter of acceptance. Under this act a "political party" is one which polled at least one-twentieth of the total number of votes cast in the next preceding election in the area for which the nomination is made; and in party conventions there must be one delegate from each election district, and one delegate for each 200 votes cast by the party in the next preceding gubernatorial election.

An act approved on the 10th of April 1908 authorized a Civil Service Commission of four members appointed by the governor, who choose a chief examiner and a secretary of the commission. Civil service rules adopted by this commission went into effect in the same year for certain state employes. In 1910 that part of the law permitting municipalities to adopt these rules through their governing bodies was declared unconstitutional; but municipalities may adopt them by popular vote.

A state Board of Railroad Commissioners (three appointed by the governor), created in 1907, became in 1910 a Board of Public Utility Commissioners with jurisdiction over all public utilities (including telephones and telegraphs); its approval is necessary for the issue of stock or bonds, but it has no power to fix rates.

The state acts concurrently with New York in preserving the natural beauties of the Palisades of the Hudson river; and in 1909 the Palisades Interstate Park, with a front of 13 m. on the Hudson, from Fort Lee to Piermont, was dedicated.

The homestead exempt from sale under seizure is limited to the house and lot, not exceeding $1000 in value, of a debtor having a family. To entitle the property to exemption, it must be registered as a homestead in the office of the county clerk, and it may be sold, then, only with the consent of the husband and wife, and the proceeds of the sale, to the amount of $1000, must be applied to the purchase of another homestead. The exemption does not extend to a sale for unpaid taxes, for labour done on the homestead, materials furnished to it, or for a debt contracted in the purchase thereof, or prior to the recording of the notice. The exemption inures to the benefit of the widow and family of the householder until the youngest child becomes twenty-one years of age.

Capital punishment is by electrocution. A law of 1902 provides the death penalty for any murderous assault on the president of the United States, the chief executive of any state, or the heir to any foreign throne.

The grounds for an absolute divorce are only two: adultery and "wilful, continued and obstinate" desertion for two years; but a decree of limited or permanent separation may be obtained in case of extreme cruelty. Unless the cause of action is adultery or at least one of the parties was a resident of the state at the time the cause of action arose and has continued to reside there, no suit for a divorce can be begun until one of the parties shall have resided in the state for the two years next preceding. Furthermore, the cause of action must have been recognized in the jurisdiction in which the petitioner resided at the time it arose.

No child less than fourteen years old is permitted to work in any factory, workshop or mill; and the penalty for each offence is $50. The employment of children under sixteen years of age in any mercantile establishment for more than 10 hours a day, or 55 hours a week, or between 6 o'clock in the evening and 6 o'clock in the morning is prohibited, except one evening each week when they may be permitted to work until 9 o'clock, and except in the evenings from the 15th to the 25th of December when they may be permitted to work until 10 o'clock. There are strict provisions for the protection and for the sanitary housing of factory employees, and prohibiting sweat-shops. A state law (1899) requires the payment of wages in lawful money at least every two weeks to its employees on the part of every firm, association or partnership doing business in the state.

Education.—During the colonial period there were schools maintained by churches, a few town schools of the New England type, and, in the latter part of the era, a number of private schools. But the schools of colonial New Jersey, especially the private schools, were usually taught by incompetent masters, and many children were permitted to grow up without any schooling whatever. Public interest in education, however, began to awaken soon after the close of the War of Independence. Under the encouragement of an act of the legislature passed in 1794 several academies were established. A public school fund was established in 1817. Three years later townships were authorized to levy taxes for maintaining schools for poor children. The division of townships into school districts and the election of three trustees were provided for in 1829. In 1846 each township was required to raise as much money for school purposes as the state contributed. In 1855 a normal school for training teachers was established at Trenton. And in 1867 a school law was passed which established the main features of the present school system, although it was four years later before a state school tax was imposed and schools were made free to all children in the state. The public school system is administered under the direction of a superintendent of public instruction and a state board of education. The former decides all controversies arising under the school law, and exercises a general supervision over the public schools; the latter has the control of a number of special state educational institutions, appoints the county superintendents and supervises the execution of the school laws of the state. In general each city, town and township in the state constitutes a separate school district, although two or more of these may unite to form a single district. Each district is required to furnish free textbooks. All children between the ages of 7 and 15 are required to attend school for the full school year, and those who at 15 years of age have not completed the grammar school course must continue to attend until they either complete it or arrive at the age of 17. Furthermore, children past 15 years of age who have completed the grammar school course but are not regularly and lawfully employed at some useful occupation must attend a high school or a manual training school until 17 years of age.

Funds for the support of the public schools are derived from various sources: (1) the interest on the "surplus revenue" ($760,670), deposited with New Jersey by the Federal government in 1836; (2) the income from the state school fund, consisting largely of receipts from the sale and rental of riparian lands[1]; (3) a state school tax; (4) a direct appropriation by the legislature to supplement the school tax, so that the two combined will form a sum equal to a tax of two and three-fourths mills on each dollar of taxable property; and (5) local taxes. At the close of the fiscal year 1908 the school fund of the state was $4,850,602·41; the income for the year was $224,233·56 and the disbursements were $373,095·76. The income from the state school fund is divided among the counties on the basis of the total number of days of attendance of the public school pupils; the legislative appropriation, however, is apportioned among the counties according to their assessed property values. Each county also received 90% of the state school tax it has paid, the remainder forming a reserve fund to be distributed among the counties at the discretion of the state board. The state will duplicate any yearly sum between $250 and $5000 which a school district may raise to maintain a school or courses of manual training. In like manner, any school that raises $20 for a library will receive the same amount from the state, which will also contribute $10 each year thereafter for maintenance, if the school raises a similar sum. The total number of teachers in the public schools in 1908 was 10,279; the total school enrollment was 402,866, with an average daily attendance of 289,167; and the average length of the school term was nine months and two days. For the benefit of veteran and invalid public school teachers there is a "retirement fund," which owes its origin to voluntary contributions by teachers in active service. The state has taken official recognition of this fund and administers it on behalf of the contributors through a board of trustees appointed by the governor.

In addition to the regular public schools, the state maintains a normal and a model school at Trenton, a normal school at Montclair (opened 1908), the Farnum Preparatory School at Beverly, a Manual Training and Industrial School for Colored Youth at Bordentown, and an agricultural college and experiment station, maintained in connexion with Rutgers College, at New Brunswick. There are industrial schools in Newark, Hoboken and Trenton, for which the state made an appropriation of $20,000 in 1908. Among the prominent institutions not receiving state aid are Princeton University, at Princeton; Rutgers College (excluding its agricultural school), at New Brunswick; and the Stevens Institute of Technology, at Hoboken. Among the denominational institutions are the Theological Seminary (Presbyterian) at Princeton; the Drew Theological Seminary (Methodist Episcopal) at Madison; Seton Hall College (Roman Catholic), at South Orange; St Peter's College (Roman Catholic) at Jersey City; St Benedict's College (Roman Catholic) at Newark; the German Theological School of Newark

[1] The state's title to its riparian lands was established, after a long controversy, in 1870 in the case of *Stevens* v. *the Paterson & Newark R.R. Co.* (5 *Vroom's Reports* 532). Since that date, with the exception of the period of Governor Abbett's second administration (1890–1893), the proceeds from the sale and rental of these lands have been regularly applied to the school fund.

(Presbyterian) at Bloomfield; and the Theological Seminary of the (Dutch) Reformed Church in America, at New Brunswick. There are many private academies and secondary schools, sectarian and non-sectarian.

The state supports the following charitable and correctional institutions all under the inspection of a State Department of Charities and Correction (1905); hospitals for the insane at Trenton and Morris Plains; a training-school for feeble-minded children (partly supported by the state) and a home for feeble-minded women at Vineland; a sanatorium for tuberculous diseases at Glen Gardner; a village for epileptics, with a farm of 700 acres, near Skillman, Somerset county; a state home (reform school) for boys near Jamesburg, Middlesex county, and for girls in Ewing township, near Trenton; a state reformatory for criminals sixteen to thirty years of age, near Rahway; a state prison at Trenton; a home for disabled soldiers at Kearney,[1] Hudson county; a home for disabled soldiers, sailors and their wives at Vineland[2]; and a school for the deaf at Trenton. There is no institution for the blind, but the state pays the expenses of blind children who are sent from New Jersey to the New York State School for the Blind. A State Board of Children's Guardians, with an office in Jersey City, cares for destitute children. A convict parole law went into operation in 1891.

Finance.—The revenues for state and for local purposes are derived from separate sources. The expenses of the state government are met chiefly by special taxes on railway and canal corporations, a franchise tax on the capital stock of other corporations, a collateral inheritance tax and leases of riparian lands. The counties and municipalities derive their revenues chiefly from taxes on real and personal property. Real and personal property is free from a state tax, except for school purposes. The school tax is apportioned among the counties in proportion to their taxable property.

A large part of the state's revenue comes from the tax on railways and canals, which is levied on the property actually employed in their operation. Any property of railways other than the "main stem" (*i.e.* the road-bed with the rails and sleepers not over 100 ft. in width),[3] that is employed in operating the road or canal is taxed by the state for local purposes. Counties and municipalities may tax property within their jurisdiction belonging to railways but not actually used for railway purposes. Domestic telegraph, telephone, express, cable, parlour- and sleeping-car, gas- and electric-lighting, oil and pipe line companies, and several classes of insurance companies, are taxed on the amount of their gross receipts. Other domestic corporations are taxed on the amount of their capital stock. The rate of this tax decreases as the amount of capital stock increases, thus favouring large corporations. On all capital stock up to $3,000,000, the rate is one-tenth of 1%; on all amounts between three and five million dollars, the rate is one-twentieth of 1%; and on all above five million dollars, thirty dollars per million, or 3/1000 of 1%. An inheritance tax is levied on all bequests in excess of $500 to persons other than specially excepted classes; and in 1907 the receipts from the "collateral inheritance tax" were $241,480. County and municipal revenue are derived from the tax on general property. The poll tax is restricted almost entirely to municipalities, which devote the proceeds to roads and schools. The fees received for issuing charters to corporations are another source of revenue to the state. Toward corporations the policy of New Jersey has always been liberal; there is no limit fixed either to capitalization or to bonded indebtedness; the tax rate, as already indicated, is lower for large than for small corporations; and so many large combinations of capital have been incorporated under the laws of the state that it is sometimes called "the home of the trusts." For the fiscal year 1907 the fees collected from corporations by the secretary of state amounted to $204,454, the receipts from the tax on corporations other than railways amounted to $2,584,363·60, and the receipts from the tax on railway corporations were $807,780.[4] It is the revenue from these sources that has enabled New Jersey to dispense almost entirely with the general property tax for state purposes. The legal requirement that every corporation chartered by the state must maintain its principal office there has given rise to the peculiar institution called the "corporation agency," a single office which serves as the "principal office" of numbers of corporations. At the close of the fiscal year 1907 the state was free from bonded indebtedness,[5] and had a balance on hand of $1,320,038 (much less than in 1906, because of the non-payment of railway taxes, pending litigation). In the state fund, the total receipts for the year were $4,602,100, and the total disbursements, $5,366,813.

History.—Bones and implements have been found in the Quaternary gravels at Trenton, which have been held by some authorities to prove the presence of Palaeolithic man; but the earliest inhabitants of New Jersey of whom there is any certain record were the Lenni-Lennapé or Delaware Indians, a branch of the Algonquian family. They were most numerous in the southern and central portions of the state, preferring the river valleys; but their total number, perhaps, never exceeded a thousand. Between them and the European settlers there were seldom any manifestations of acute hostility, though each race feared and distrusted the other. Many Indians were enslaved, and intermarriage between them and negro slaves became common. During the 18th century the Indian title to the soil was rapidly extinguished, and at the same time the vices and diseases of the stronger race were gradually reducing their numbers. In 1758 an Indian reservation, said to have been the first established within the present limits of the United States, was established at Edgepelick, or Brotherton (now called Indian Mills) in Burlington county. The surviving aborigines remained there until 1802, when they joined the Mohegans in New York and migrated to Wisconsin and later to Indian Territory, now part of the state of Oklahoma. For the extinction of all Indian titles the legislature of New Jersey in 1832 appropriated $2000, and since that date almost every vestige of Indian occupation has disappeared.

The first authenticated visit of a European to what is now New Jersey was made under French authority by Giovanni da Verrazano, a Florentine navigator, who in the spring of 1524 sailed within Sandy Hook and dropped anchor in the waters of upper New York Bay. In the following year Estevan Gomez, a Portuguese sailor in the service of the emperor Charles V., in his reputed voyage southward from Labrador, is said to have made note of the Hudson and Delaware rivers. It is very probable, also, that French traders soon afterward penetrated the region along the lower Hudson. Voyages to this region for exploration, trade and settlement, however, may be said to have really begun with the year 1609, when Henry Hudson explored the region between Sandy Hook and Raritan Bay and sailed up the river which now bears his name. After this voyage came Dutch traders, who established themselves on Manhattan Island and soon spread across the Hudson river into what are now Hudson and Bergen counties. In 1614 Cornelis Jacobsen Mey explored the lower Delaware, and two years later Cornelis Hendricksen more thoroughly explored this stream. In 1623 the first party of permanent homeseekers arrived at New Amsterdam, and a portion of these formed a settlement on the eastern bank of the Delaware and built Fort Nassau near the site of the present Gloucester City. In 1631 Samuel Godyn and Samuel Blommaert secured a patent from Peter Minuit, the director of New Netherland, authorizing them to plant a settlement near Cape May, but the effort was soon abandoned. A trading hut built at Paulus Hook in 1633 was the beginning of the present Jersey City. On the western bank of the Hudson the trading post of Hobocanhackingh, on the site of the present city of Hoboken, was established at an early date. From these places and from New Amsterdam the Dutch spread into the Raritan Valley. During the rule of Governor William Kieft, the Indians, disturbed by the encroachments of the settlers, assumed a hostile attitude. The actual occasion of the Indian outbreak was the massacre of a number of Tappan Indians in 1643 by soldiers acting under Kieft's orders. From the Connecticut to the Raritan the savages rose in arms, laid waste the farms, massacred the settlers and compelled those who escaped to take refuge on Manhattan Island. The Dutch engaged the services of about fifty Englishmen under Captain John Underhill, a hero of the Pequot War, and in 1644 the Indians were defeated in several engagements, but a general peace with them was not established until the 30th of August 1645.

In the meantime colonists of another nationality had set foot on the shores of the lower Delaware. To found a colony in

[1] Also receives Federal aid.

[2] *Idem.*

[3] Passenger stations and depot buildings were included as part of the "main stem" until 1906, when their exclusion gave considerable added revenue to the municipalities.

[4] The tax on railway corporations collected by the state for local purposes and paid over to the local governments in 1907 amounted to $581,794.

[5] The only state debt is state certificates for $116,000 issued to the commissioners of the Agricultural College.

the new world was long the desire of Gustavus Adolphus of Sweden, but incessant European wars prevented the establishment of any settlement until after his death. In 1638 fifty colonists landed on the western bank of the Delaware and built Fort Christina on the site of the modern Wilmington. Five years later, on the eastern bank a triangular fort, called Elfsborg, was constructed near the present Salem. But the Swedish rule was short-lived, as in 1655 the settlements surrendered to Peter Stuyvesant and passed under the control of the Dutch. Upon the subsequent history of New Jersey the attempts of Holland and Sweden at colonization had very little influence. The Dutch and Swedes between the Delaware and the Hudson were mostly traders, and therefore did not make many permanent settlements or establish forms of government.

By the English of New England and Virginia the Dutch and Swedes were regarded as intruders, and were repeatedly warned against trespassing on English soil.[1] As early as 1634 a patent had been issued to Sir Edmund Plowden, appointing him governor over New Albion, a tract of land including the present states of New Jersey, Delaware, Maryland and Pennsylvania. In spite of great efforts, however, Sir Edmund failed to plant a colony.[2] In 1634 a party of English from Virginia, having ascended the Delaware and occupied Fort Nassau, which the Dutch had abandoned, were promptly captured by the Dutch, taken to New Amsterdam, and thence sent home, arriving just in time to prevent the departure of a second English expedition up the Delaware. In 1641 English colonists from New Haven migrated southward and planted a settlement on the eastern bank of the Delaware river, declaring it to be a part of the New Haven jurisdiction. In the following year Governor Kieft, with the assistance of the Swedes, arrested the English and sent them back to New Haven.

Many years elapsed before an English sovereign made any effort to oust the Dutch from the dominions he claimed by virtue of the discovery of the Cabots. On the 12th of March 1664 Charles II. bestowed upon his brother James, duke of York, all the lands between the Connecticut river and the eastern side of Delaware Bay, as well as all the islands between Cape Cod and the Hudson river. An expedition was sent from England in May, under the command of Richard Nicolls, and in the following August the English flag floated over New Amsterdam. In October Sir Robert Carr took possession of the settlements on the Delaware, and terminated the rule of the Dutch. The few inhabitants of what is now New Jersey acquiesced in the new order. While the expedition commanded by Nicolls was still at sea, the duke of York, by deeds of lease and release, transferred to Lord John Berkeley, baron of Stratton, and Sir George Carteret (*q.v.*), all that part of his new possessions extending eastward from the Delaware Bay and river to the Atlantic Ocean and the Hudson river, and northward from Cape May to a line drawn from the northernmost branch of the Delaware, "which is 41° 40′ lat.," to the Hudson river in 41° N. lat. To this tract the name of *Nova Caesarea*, or New Jersey, was given, as the same name had been given in a patent to Carteret issued in 1650, to "a certain island and adjacent islets" near Virginia, in America, which were never settled—in honour of Carteret, who governed the isle of Jersey in 1643–1651 and there entertained Prince Charles during his exile from England. The grant conferred upon Berkeley and Carteret all the territorial rights which the royal charter had conferred upon the duke of York; but whether or not the rights of government went with these soon became a vexed question. In order to attract immigrants, the proprietors in February 1665 published their "Concession and Agreement," by which they made provision for a governor, a governor's council, and an assembly chosen by the freemen and having the power to levy taxes. Special inducements in the way of land grants were offered to persons embarking with the first governor. In the meantime Governor Nicolls of New York, ignorant of the grant to Berkeley and Carteret, had approved certain Indian sales of land to settlers within New Jersey, and had confirmed their titles to tracts in what later became Elizabethtown, Middletown and Shrewsbury. In this way he unconsciously opened the way for future trouble. Moreover, when he had learned that the duke had parted with New Jersey he convinced him that it was a great loss, and in the effort to save what was possible, Staten Island was taken from the proprietors on the plea that one arm of the Hudson flowed along its western border.

In August 1665 Philip Carteret, a relative of Sir George, arrived in the province as its first governor. In May 1668 he convoked the first assembly at Elizabethtown. At the next session, in the following November, the towns of Shrewsbury and Middletown declared that they held their grants from Governor Nicolls, and that they were consequently exempt from any quit-rents the proprietors might claim. They refused to pay their share of the public expenses; and their deputies, on refusing to take the oath of allegiance and fidelity, were expelled from the assembly. The disaffection soon spread and led to the so-called "disorganizing" assembly in 1672, which went so far as to choose James Carteret, a landgrave of Carolina and presumably a natural son of Sir George, as "President." Philip Carteret returned to England and laid the case before the proprietors; they ordered President Carteret to continue on his way to Carolina and confirmed as governor John Berry, whom Governor Carteret had left behind as deputy. The duke of York declared that the grants made by Nicolls were null and void; the king enjoined obedience to the proprietors, and quiet was restored. Another change was impending, however, and in August 1673, when a Dutch fleet appeared off Staten Island, New Jersey for a second time became a part of New Netherland. The settled region was called "Achter Koll," or "Back Bay," after Newark Bay, whose waters, lying behind the bay of New York, had to be crossed in order to reach Elizabethtown. The period of Dutch rule was short, and by the treaty of Westminster, of the 9th of February 1674, the territory was restored to England. The crown lawyers decided that the rights of the proprietors of New York and New Jersey had been extinguished by the conquest, and that by treaty the lands had been reconveyed, not to the proprietors, but to the king. On the 13th of June 1674 Charles II. accordingly wrote a letter confirming the title and power of Carteret in the eastern half of New Jersey. No similar grant was made to Berkeley, as on the 18th of March he had sold his interest in the province to John Fenwicke, sometime major in the Parliamentary army and later a member of the Society of Friends, and Edward Byllynge (d. 1687), a Quaker merchant.[3] On the 29th of June the duke of York received a new patent similar to that of 1664, and he at once (on the 28th and 29th of July) confirmed Carteret in all his rights in that portion of New Jersey N. of a line drawn from Barnegat Creek to "Rankokus Kill"—a stream a little S. of the site of Burlington—which was considerably more than one-half of the province. The duke of York commissioned Sir Edmund Andros as governor of his dominions, including "all ye land from ye West side of Connecticut River to ye East side of Delaware Bay." Sir George Carteret again sent over his kinsman Philip Carteret to be governor of the eastern part of New Jersey, and the two governors arrived in October 1674 in the same ship. A disagreement arose as to

[1] As early as 1613, Captain Samuel Argall, on his way to Virginia, after breaking up some Jesuit settlements at Port Royal, and Mount Desert, passed through the Narrows near the mouth of the Hudson, and finding a group of Dutch traders, made them haul down their flag and replace it with that of England. In the spring of 1620 Thomas Dermer, an English ship captain, on his way from Monhegan to Virginia, visited Manhattan Island and told the Dutch traders that they would not be allowed to remain. In 1627 Governor William Bradford of Plymouth protested by letter to the Dutch against their occupancy, and this warning from the Pilgrims was repeated at least twice.

[2] As late as 1784, Charles Varlo, an Englishman who had purchased one-third of the grant from the heirs of Sir Edmund Plowden, came to New Jersey and sought to substantiate his claim. Failing in a suit in chancery to obtain redress, he returned to England, and nothing further was heard of the claimants to New Albion.

[3] It has been supposed that Fenwicke and Byllynge intended to establish in America a retreat for those who desired religious and political freedom.

the respective interests of Fenwicke and Byllynge in the western portion of the province, and they chose William Penn, a new member of the Society of Friends, as arbitrator. To Byllynge Penn awarded nine-tenths of the territory and to Fenwicke one-tenth. Financial embarrassments a short time afterward caused Byllynge to assign his shares in trust for his creditors to three Quakers, William Penn, Gawen Lawrie and Nicholas Lucas. Later they acquired control of Fenwicke's share also. In 1675 Fenwicke with his family and a company of settlers reached the Delaware in the ship "Griffith" from London, and on the eastern shore they formed a settlement to which they gave the name of Salem. This was the first permanent English settlement in this part of New Jersey. Refusing to recognize Fenwicke's jurisdiction, Governor Andros of New York attempted to secure his peaceful recognition of the duke's authority, and, failing in this, he sent a military force into this district in December 1676 and made Fenwicke a prisoner. In January, however, he was released on his promise not to act in a public capacity until he should receive further authority. Meanwhile the trustees of Byllynge were seeking a division of the province more to their advantage and, Sir George Carteret having been persuaded by the duke of York to surrender his grant of July 1674, the so-called "quintipartite deed" was executed on the 1st of July 1676. This instrument defined the interests of Carteret, Penn, Lawrie, Lucas and Byllynge, by fixing a line of partition from Little Egg Harbor to a point on the Delaware river, in 41° 40′ N. lat., and by assigning the province east of this line (East Jersey) to Carteret and the province west of this line (West Jersey), about five-eighths of the whole, to the Quaker associates. The Quakers' title to West Jersey, however, still bore the cloud resulting from the Dutch conquest, and the duke of York had desired to recover all of his original grant to Berkeley and Carteret ever since Governor Nicolls had protested against it. But at this time his own right to the crown of England was threatened with the Exclusion Bill, and under these conditions instead of pressing his case against the Quakers he not only permitted it to be decided against him but in August 1680 confirmed their title by a new deed.

A very liberal frame of government for West Jersey, drafted presumably by William Penn, and entitled "the Concessions and Agreements of the Proprietors, Freeholders and Inhabitants of West Jersey in America," was adopted in March 1677. This vested the principal powers of government in an assembly of one hundred members, who were to be chosen annually and to be subject to instructions from their constituents. In the intervals between sessions of the assembly, affairs were to be managed by ten commissioners chosen by that body. Religious toleration was assured. In August 1677 the ship "Kent" arrived in the Delaware, with 230 Quakers from London and Yorkshire. These founded a settlement, which became the modern Burlington, and in the next few months several hundred more colonists arrived. But the new colony was never actually governed under "the Concessions and Agreements"; for from the beginning until the first assembly was called in November 1681 its affairs were managed by commissioners named by the proprietors and when in 1680 the duke of York confirmed the title to the land to Byllynge and his associates he conveyed the right to govern to Byllynge alone. Although he was one of the signers of "the Concessions and Agreements" Byllynge now commissioned Samuel Jennings as governor of the province, and the other proprietors acquiesced, appointing Byllynge governor and permitting Jennings to serve as his deputy. Jennings immediately called the first assembly, and this body passed a number of fundamental laws which provided for a governor and council, but were in other respects much like the clauses relating to government in "the Concessions and Agreements." When, as if to test his authority, Byllynge, in 1682–1683, removed Jennings who had been a popular governor, the assembly, by the advice of William Penn, passed a series of resolutions in the form of a protest, and in 1684 two agents were sent to England to negotiate with Byllynge. There the dispute was finally submitted for arbitration to George Fox and other Quakers, and they decided that, as the government of the province was legally vested in Byllynge by the duke's conveyance to him, he had the right to name the deputy governor. Fenwicke, after his release by Andros, endeavoured to re-establish a government at Salem with himself as "Lord and Chief Proprietor" of West Jersey, but the duke's officers further contested his claims and in 1682 Penn effected a peaceful settlement with him.

In East Jersey, after the return of Governor Carteret, there was a period of quiet, until the death of Sir George Carteret in 1680 gave the zealous Andros another chance to further the supposed interests of his ducal master. Claiming jurisdiction over New Jersey by the terms of his commission, he issued a proclamation in March 1680 ordering Philip Carteret and his "pretended" officers to cease exercising jurisdiction within the duke's dominions unless he could show warrant. To this Carteret made a spirited reply, and on the 30th of April a detachment of soldiers dragged the governor of East Jersey from his bed and carried him prisoner to New York. Here he was confined for four weeks, and was released only on his promise not to exercise any authority until the matter could be referred to England for adjudication. When the assembly of East Jersey met in June, Andros appeared before it as governor and recommended such measures as he deemed advisable, but the deputies refused to pass them. In England, too, his conduct was disavowed, and he was called home to answer charges that had been preferred against him. Philip Carteret reassumed the duties of his office, but his administration, now that Andros was no longer feared, was again marked by much friction with the assembly. Sir George Carteret had bequeathed his province to eight trustees, who were to administer it for the benefit of his creditors, and for the next two years the government was conducted in the name of his widow and executrix, Lady Elizabeth. Early in 1682, after several unsuccessful attempts to effect a sale by other means, the province was offered for sale at public auction, and was purchased by William Penn and eleven associates for £3400. Later each of these twelve sold one-half of his share to another associate, thus making twenty-four proprietors; and on the 14th of March the duke of York confirmed the sale, and gave them all the powers necessary for governing the province. Robert Barclay, one of the proprietors, was chosen governor for life, with the privilege of performing his duties by deputy, and as his deputy he sent over Thomas Rudyard. In 1683 Rudyard was succeeded by Gawen Lawrie, who brought over with him a curious frame of government entitled "the Fundamental Constitutions." This instrument, which was designed to replace the Concessions, provided for the government of the province by a governor chosen by the proprietors, a common council consisting of the proprietors or their proxies together with 12 freemen, and a great council consisting of the proprietors or their proxies together with 144 freemen chosen by a mixed system of elections and the casting of lots. But the new system was to apply only to those who, in return for the greater privileges which it was alleged to ensure, would agree to a resurvey of their lands, arrange to pay quit-rents and provide for the permanent support of the government, and as Governor Lawrie found the colonists generally unwilling to make the exchange on the proposed terms, he discreetly refrained from any attempt to put the Fundamental Constitutions in operation and thereby avoided the confusion which must have resulted from two sets of laws. The government of the twenty-four proprietors, however, was liberal. Recognizing the necessity of some one in the province with full power "to do all things that may contribute to the good and advancement of the same," they directed the appointment of the American Board of Proprietors—a body of men identified with the province, who with the deputy-governor were to look after the proprietary interests in such matters as the approval of legislation and the granting of lands, and thereby prevent the delay caused by the transmission of such matters to England for approval. In 1686 another effort was made to put the Fundamental Constitutions in force, but when the deputies and the council rejected the instrument, the proprietors did not force the matter. In 1686 Perth Amboy,

the newly created port of East Jersey, became its seat of government.

After his accession to the throne in 1685, James II. showed an unyielding determination to annul the privileges of the colonies, and to unite New York, New Jersey and the New England colonies under a single government. In order, therefore, to save their rights in the soil, the proprietors of East and West Jersey offered to surrender their claims to jurisdiction, and to this arrangement the king consented. Andros, previously appointed viceroy of New England, thereupon received a new commission extending his authority over New York and the Jerseys, and in August 1688 he formally annexed these provinces to the Dominion of New England. The seizure of Andros by the people of Boston in April 1689, following the news of the revolt in England against James II., gave the Jersey proprietors an opportunity to resume their rights, but the proprietary governments regained their former footing very slowly. The proprietors were widely separated—some being in America, some in England and others in Scotland—and unity of action was impracticable. For three years there was little or no government in the Jerseys, beyond the measures taken by local officers for preserving the peace.

In 1692 an important change occurred in the administrative system through the appointment of Andrew Hamilton (d. 1703) as governor of both East and West Jersey. In 1697 a faction opposed to Hamilton secured his removal and the appointment of their partisan, Jeremiah Basse. The opposition in the two colonies to Basse became so formidable that he was removed in 1699 and Hamilton was reappointed. Certain disaffected elements thereupon refused to recognize his authority, on the ground that his appointment had not received the required approval of the crown, and for a time the condition of the provinces bordered on anarchy. These disorders, and especially complaints against the Jerseys as centres of illegal trade, were brought to the attention of King William and his lawyers contended that as only the king could convey powers of government those exercised by the Jersey proprietors, derived as they were from the duke of York, were without sufficient warrant. Moreover, the inhabitants sent petitions to England, praying that they might be placed under the direct control of the crown. The proprietors of East Jersey had already offered to surrender their jurisdiction, in return for certain concessions by the royal government, but no action had been taken. In 1701 the proprietors of both provinces made another proposal, which was accepted, and in April 1702 all rights of jurisdiction were transferred to the crown, while the rights to the soil remained in the proprietors. The provinces of East and West Jersey were then united under a government similar to that of the other royal provinces. Until 1738 the governor of New York was also governor of New Jersey; after that date each colony had its own governor. The legislature met alternately at Burlington and Perth Amboy, until 1790, when Trenton was selected as the capital of the state.

The next four decades were years of development disturbed, however, by friction between the assembly and the royal governors, and by bitter disputes, accompanied by much rioting, with the proprietors concerning land-titles (1744–1749). Independence of the absentee landlords was again claimed by virtue of the grants made by Nicolls nearly a century before. Agriculture at this time was the main pursuit. The climate was more temperate and the soil more fertile than that of New England; but there were similar small farms and no marked tendencies towards the plantation system of the southern colonies. Slavery had been introduced by the Dutch and Swedes, and from the time of the earliest English occupation had been legally recognized. East Jersey had a fugitive slave law as early as 1675. With the exception of laying an import duty no legislative effort was made—nor is it likely that any would have been allowed by the crown—to restrict the importation of slaves during the colonial period. In addition to African and Indian slaves there was the class known as "redemptioners," or term slaves, consisting of indented servants, who bound themselves to their masters before leaving the mother country, and "free willers," who allowed themselves to be sold after reaching America, in order to reimburse the ship captain for the cost of their passage. Between East and West Jersey certain political and religious differences developed. The former, settled largely by people from New England and Long Island, was dominated by Puritans; the latter by Quakers. In East Jersey, as in New England, the township became a vigorous element of local government; in West Jersey the county became the unit. Important events in the period of royal government were the preaching of George Whitefield in 1739 and the following years, and the chartering of the College of New Jersey (now Princeton University) in 1746, and of Queen's (now Rutgers) College in 1766. The colony gave many proofs of its loyalty to the mother country: it furnished three companies of troops for Admiral Vernon's unfortunate expedition against Cartagena in 1741; in King George's War it raised £2000 for supplies, furnished troops for the capture of Louisburg and sent over six hundred men to Albany; and in the French and Indian (or Seven Years') War its militia participated in the capture of both Quebec and Havana. Against England the colony had fewer grievances than did some of its more commercial neighbours, but the Stamp Act and the subsequent efforts to tax tea aroused great opposition. In 1774 occurred the "Greenwich Tea Party."[1]

The last colonial assembly of New Jersey met in November 1775. From the 26th of May to the 2nd of July 1776 the second provincial congress met at Burlington, Trenton and New Brunswick and for a time became the supreme governing power. By its orders the royal governor, William Franklin (the natural son of Benjamin Franklin) was arrested and deported to Connecticut, where he remained a prisoner for two years, until exchanged and taken to New York under British protection. Following the recommendation of the Continental Congress, that the colonies should create independent governments, the provincial congress also drafted a provincial constitution, which, without being submitted to the people, was published on the 3rd of July 1776; it contained the stipulation that "if a reconciliation between Great Britain and these colonies should take place, and the latter be taken again under the protection of the crown of Britain, this charter shall be null and void—otherwise to remain firm and inviolable." On the 20th of September 1777 it was amended by the New Jersey legislature, the words "state" and "states" being substituted for the words "colony" (or "province") and "colonies." The state furnished a full quota for the Continental army, but the divided sentiment of the people is shown by the fact that six battalions of loyalists were also organized. Tories were active in New Jersey throughout the struggle; among them were bands known as "Pine Robbers," who hid in the pines or along the dunes by day and made their raids at night. In the state were fought some of the most important engagements of the war. When Washington, in the autumn of 1776, was no longer able to hold the lower Hudson he retreated across New Jersey to the Delaware near Trenton and seizing every boat for miles up the river he placed his dispirited troops on the opposite side and left the pursuing army no means of crossing. With about 2500 men he recrossed the Delaware on the night of the 25th of December, surprised three regiments of Hessians at Trenton the next morning, and took 1000 prisoners and 1000 stands of arms. In a series of movements following up this success he outgeneraled the British commander, Lord Cornwallis, and on the 3rd of January 1776, defeated a detachment of his army at Princeton (*q.v.*). The American army then went into winter quarters at Morristown, while a part of the British army wintered at New Brunswick. To protect the

[1] Greenwich then had some importance as a port on Cohansey Creek on the lower Delaware. In the summer of 1774 the captain of the ship "Greyhound," bound for Philadelphia with a cargo of tea, on account of the state of opinion in that city, put in at Greenwich and stored his tea there in a cellar It remained undisturbed till the night of the 22nd of November, when a band of about 40 men dressed as Indians, in imitation of the Boston party, broke into the cellar and made a bonfire of the tea. All attempts to punish the offenders were futile.

inhabitants of the Raritan Valley from British foraging parties General Benjamin Lincoln with 500 men was by Washington's orders stationed at Bound Brook, but on the 13th of April 1777 Lincoln was surprised by a force of about 4000 men under Cornwallis, and although he escaped with small loss it was only by remarkably rapid movements. When the British had gained possession of Philadelphia, in September 1777, their communication between that city and the ocean through the Lower Delaware was obstructed on the New Jersey side by Fort Mercer, commanded by Colonel Christopher Greene, at Red Bank; three battalions of Hessians under Colonel Karl Emil Kurt von Donop attacked the fort on the 22nd of October, but they were repulsed with heavy loss. The fort was abandoned later, however. As the British army under General Clinton was retreating, in June 1778, from Philadelphia to New York, the American army engaged it in the battle of Monmouth (June 28, 1778); the result was indecisive, but that the British were not badly defeated was ascribed to the conduct of General Charles Lee. Before daylight on the 19th of August 1779 was approaching, Major Henry Lee with a force of about 400 men surprised the British garrison at Paulus Hook, where Jersey City now stands, and, although sustaining a loss of 20 men, killed 50 of the garrison and took about 160 prisoners. In 1779–1780 Morristown was again Washington's headquarters. The Congress of the Confederation met in Princeton, in Nassau Hall, which still stands, from June to November 1783.

After the war New Jersey found its commercial existence threatened by New York and Philadelphia, and it was a feeling of weakness from this cause rather than any lack of state pride that caused the state to join in the movements for a closer Federal Union. In 1786 New Jersey sent delegates to the Annapolis Convention, which was the forerunner of the Federal Convention at Philadelphia in the following year. In the latter body, on the 15th of June, one of the New Jersey delegates, William Paterson (1745–1806), presented what was called the "New Jersey plan" of union, representing the wishes of the smaller states, which objected to representation in a national Congress being based on wealth or on population. This merely federal plan, reported from a Conference attended by the delegates from Connecticut, New York and Delaware, as well as those from New Jersey (and by Luther Martin of Maryland), consisted of nine resolutions; the first was that "the Articles of Confederation ought to be so revised, corrected and enlarged as to render the federal Constitution adequate to the exigencies of government and the preservation of the Union"; and the actual "plan" was for a single legislative body, in which each state should be represented by one member, and which should elect the supreme court and have power to remove the executive (a Council), to lay taxes and import duties, to control commerce, and even, if necessary, to make requisitions for funds from the states. Madison opposed the plan, on the ground that it would not prevent violations by the states of treaties and of laws of nations. On the first resolution only there was a definite vote; on the 19th of June it was voted to postpone the consideration of this resolution and to report the resolutions (the Virginia plan) formerly agreed upon by the committee of the whole. The New Jersey plan left its impress in the provision of the Constitution (approved in the Convention on the 7th of July) for equal representation in the national Senate. The Federal Constitution was ratified by a unanimous vote in the state convention which met at Trenton on the 18th of December 1787.

The state's own constitution, which had been adopted in 1776 and amended in 1777, retained, like other state constitutions framed during the War of Independence, many features of colonial government ill-adapted to a state increasingly democratic. The basis of representation, each county electing three members to the assembly and one member to the legislative council, soon became antiquated. The property qualifications were, for members of the council, "one thousand pounds proclamation money, of real and personal estate, in the same county," and, for members of the assembly, "five hundred pounds proclamation money, in real and personal estate, in the same county." These and the property qualifications for suffrage, which was granted to "all inhabitants of this state, of full age, who are worth fifty pounds proclamation money, clear estate in the same," &c., were soon considered undemocratic; and the democratic tendency of certain election officers may be seen from their construing the words "all inhabitants of full age" to include women, and from their permitting women to vote. The governor was chosen by the joint vote of the council and assembly; he was president of the council, with a casting vote; he was chancellor, captain-general and commander-in-chief of the militia; he had three members of the legislature to act as a privy-council; and he, with the council (of which seven formed a quorum), constituted "the Court of Appeals in the last resort in all causes of law, as heretofore," which, in addition, had "the power of granting pardons to criminals, after condemnation, in all cases of treason, felony or other offences."

In 1838 the opposition to the governor's extensive powers under the constitution was greatly increased in the "Broad Seal" or "Great Seal" War. After a closely contested election in which six members of Congress were chosen on a general ticket, although there was an apparent Democratic majority of about one hundred votes (in a total of 57,000), two county clerks rejected as irregular sufficient returns from townships to elect five Whig candidates to whom the state board of canvassers (mostly Whigs and headed by the Whig governor, William Pennington) gave commissions under the broad seal of the state. Excluding these five members from New Jersey the House of Representatives contained 119 Democrats and 118 Whigs, so that the choice of a Whig speaker could be secured only by the seating of the five Whigs from New Jersey rather than their Democratic rivals. It was decided that only members whose seats were not contested should vote for speaker, and Robert M. T. Hunter, of Virginia, a Democrat and a compromise candidate, was elected to the position; and on the 28th of February 1839 the Democratic candidates were admitted to their seats, to which a congressional committee, reporting afterwards, declared them entitled.[1]

Agitation for constitutional reform resulted in a constitutional convention, which met at Trenton from the 14th of May to the 29th of June 1844 and drafted a new frame of government, introducing a number of radical changes. This instrument was ratified at the polls on the 13th of August. The election of the governor was taken from the legislature and given to the people; the powers of government were distributed among legislative, executive and judicial departments; representation in the assembly was based on population; and the property qualification for membership in the legislature and for the suffrage was abolished.

The constitution of 1844 declared that "All men are by nature free and independent, and have certain unalienable rights, among which are those of enjoying and defending life and liberty . . . and of pursuing and obtaining safety and happiness." A similar clause in the constitution of Massachusetts had been interpreted by the courts as an abolition of slavery, and an effort was made to have the same ruling applied in New Jersey, where the institution of slavery still existed. The courts, however, declared that the clause in the constitution of New Jersey was a "general proposition," not applying "to man in his private, industrial or domestic capacity." An attempt at abolition had previously been made in 1804 by an act declaring that every child born of a slave should be free, but should remain the servant of its mother's owner until twenty-five years of age if a male or twenty-one years of age if a female. The owner of the mother, however, might abandon the child after a year, and it then became a public charge. This last provision produced such a heavy drain on the treasury for the support of abandoned negro children that in 1811 the statute was repealed. In 1846 an act was passed designating slaves as apprentices bound to service until discharged by their owners, and providing that children of

[1] The election to the U.S. Senate in 1865 of John Potter Stockton (1826–1900), a great-grandson of Richard Stockton, a signer of the Declaration of Independence, created hardly less excitement than the Broad Seal War. The state legislature which elected him senator did so by a plurality vote, having previously passed a resolution changing the vote requisite to choose a senator from a majority to a plurality vote. He took his seat in the Senate and his election was upheld by the Senate committee on the judiciary, whose report was adopted (26 March 1866) by a vote of 22 to 21, his own vote carrying the motion; but, because of the objection of Charles Sumner, he withdrew his vote on the 27th of March, and was thereupon unseated by a vote of 23 to 21.

such apprentices should be free at birth, but were to be supported by the masters of their parents for six years. There were consequently a few vestiges of the slavery system in New Jersey until the adoption of the Thirteenth Amendment to the Federal Constitution.

Toward the political questions that disturbed the American people immediately before the Civil War the attitude of the state was conservative. In 1852 the Free-soil candidate for the presidency received only 350 votes in New Jersey; and in 1856 the Democratic candidate received a plurality of 18,605 votes, even though William L. Dayton, a citizen of the state, was the Republican nominee for the vice-presidency. In 1860 three of the state's electoral votes were given to Douglas and four to Lincoln. During the Civil War New Jersey furnished 89,305 men for the Union cause and incurred extraordinary expenditures to the amount of $2,894,385. The state readily consented to the Thirteenth and Fourteenth Amendments to the Federal Constitution, but in 1868 withdrew its consent to the latter. The Fifteenth Amendment was rejected by one legislature, but was accepted by its successor, in which the Republican party had obtained a majority.

Industrially the early part of the 19th century was marked in New Jersey by the construction of bridges and turnpikes, the utilization of water power for manufactures, and the introduction of steam motive power upon the navigable waters. The second war with England interrupted this material progress, and at its beginning was so unpopular, especially with the Quakers, that the Federalists carried the elections in the autumn of 1812. But the attempt of this party to retain control by a "gerrymandering" process was unsuccessful. The Democrats were triumphant in 1813, and the Federalist as well as the Democratic administration responded with aid for the defence of New York and Philadelphia. The state also contributed several hundred men to the service of the United States. Material progress in New Jersey after the war is indicated by the construction of the Morris (1824–1836) and the Delaware & Raritan (1826–1838) canals, and the completion of its first railway, the Camden & Amboy, in 1834.

The years following the Civil War were marked by great industrial development. The numerous projects, good and bad, that were inaugurated in 1866–1875, and the various kinds of laws and charters conferring special privileges that were secured, led to the constitutional prohibition of special legislation already mentioned. In this same period there was a bitter railway war. The Delaware & Raritan Canal Company and the Camden & Amboy Railroad Company, both chartered in 1830 and both monopolies,[1] had been practically consolidated in 1831; in 1836 these joint companies gained control of the Philadelphia & Trenton railway; in 1867 these "United New Jersey Railroad & Canal Companies" consolidated with the New Jersey Railroad & Transportation Company (which was opened in 1836 and controlled the important railway link between New Brunswick and Jersey City), and profits were to be divided equally between the four companies; and in 1871 these entire properties were leased for 999 years to the Pennsylvania Railroad Company. This combination threatened to monopolize traffic, and it was opposed by the Central Railroad of New Jersey, the Delaware, Lackawanna & Western, and a branch of the North Pennsylvania (from Jenkintown to Yardley; sometimes called the "national" or "air-line"), and by the general public; and in 1873 the state passed a general railway law giving other railways than the United New Jersey holdings of the Pennsylvania the right to connect New York and Philadelphia. In 1876 the "national" line was extended to Bound Brook (as the Delaware & Bound Brook) and this road, the North Pennsylvania & Central Railroad of New Jersey, were operated under a tripartite agreement as a through line between New York and Philadelphia; but in 1879 these three lines were leased for 990 years to the Philadelphia & Reading railway. The state itself then became engaged in a struggle with the railways in order to secure from them their full portion of taxes, as the property of individuals was then taxed many times as heavily as that of railways. In 1884 the state gained the victory by securing the passage of a law taxing the franchises of railway corporations.

A reform movement in politics, called the "New Idea," and led by Everett Colby (b. 1874), then a Republican member of the Assembly and in 1906–1908 a state senator, began in 1904; it did much to secure the passage of acts limiting public service franchises to 20 years (unless extended to 40 years by the voters of the municipality concerned), the increase of taxes on railways, the increase of franchise tax rates by 1½% each year up to 5%, the adoption of direct primary elections, and the modification of the existing promoters' liability law.

Before 1800 the state was dominated by the Federalist party; from that date until 1896 it was generally controlled by the Democrats, and from 1896 to 1911 by the Republicans.

The governors of New Jersey have been as follows:—

GOVERNORS: UNDER THE PROPRIETORS

Philip Carteret	1665–1672
John Berry	1672–1673
Anthony Colve[2]	1673–1674

Governors of East Jersey and their Deputies.

Philip Carteret	1674–1682
Robert Barclay	1682–1688
Thomas Rudyard, Deputy	1682–1683
Gawen Lawrie, Deputy	1683–1686
Lord Neill Campbell, Deputy	1686
Andrew Hamilton, Deputy	1686–1688
Edmund Andros	1688–1689
Andrew Hamilton	1692–1697
Jeremiah Basse	1697–1699
Andrew Hamilton	1699–1702

Governors of West Jersey and their Deputies.

Edward Byllynge	1680–1687
Samuel Jennings, Deputy	1681–1684
Thomas Olive, Deputy	1684–1685
John Skene, Deputy	1685–1687
Daniel Coxe	1687–1688
Edward Hunloke, Deputy	1687
Edmund Andros	1688–1689
Andrew Hamilton	1692–1697
Jeremiah Basse	1697–1699
Andrew Hamilton	1699–1702

UNDER THE ROYAL GOVERNMENT

Governors of New York and New Jersey.

Edward Hyde, Lord Cornbury	1703–1708
John, Lord Lovelace	1708–1709
Richard Ingoldsby, Lieut.-Governor	1709–1710
Robert Hunter	1710–1719
William Burnet	1720–1728
John Montgomerie	1728–1731
Lewis Morris,[3] Pres. Council	1731–1732
William Cosby	1732–1736
John Anderson,[3] Pres. Council	1736
John Hamilton,[3] Pres. Council	1736–1738

Governors of New Jersey only.

Lewis Morris	1738–1746
John Hamilton, Pres. Council	1746–1747
John Reading, Pres. Council	1747
Jonathan Belcher	1747–1757
Thomas Pownall, Lieut.-Governor	1757
John Reading, Pres. Council	1757–1758
Francis Bernard	1758–1760
Thomas Boone	1760–1761
Josiah Hardy	1761–1762
William Franklin	1762–1776

[1] In 1864 a bill was introduced in the Federal House of Representatives making the Camden & Atlantic (now the Atlantic City) railway and the Raritan & Delaware Bay (now a part of the Central of New Jersey) a post route between New York and Philadelphia and authorizing these railways to carry passengers and freight between New York and Philadelphia. Thereupon the governor and legislature of New Jersey protested that such a measure was an infringement of the reserved rights of the state, since the state had contracted with the Camden & Amboy not to construct nor to authorize others to construct within a specified time any other railway across the state to be used for carrying passengers or freight between New York and Philadelphia.

[2] Governor-general of New Netherland.

[3] Jurisdiction only over New Jersey.

GOVERNORS OF THE STATE

William Livingston	1776–1790	Federalist
William Paterson	1790–1793	"

BIBLIOGRAPHY.—For descriptive material see bibliographies in *Bulletins* No. 177 and 301 of the United States Geological Survey; the *Annual Reports* and especially the *Final Report* of the New Jersey Geological Survey; and the *Annual Reports of the New Jersey State Museum*, the New Jersey Agricultural Experiment Station, and the New Jersey State Board of Agriculture.

History.—The most important sources are: *Documents Relating to the Colonial History of the State of New Jersey* (Archives of the State of New Jersey, 1st series), edited by W. A. Whitehead, F. W. Ricardo and W. Nelson (26 vols., Newark, 1880–1903); *Documents Relating to the Revolutionary History of the State of New Jersey* (Archives of the State of New Jersey, 2nd series; 2 vols., Trenton, 1901–1903); and *Acts of the General Assembly of New Jersey from 1703–1761*, reprinted by A. Leaming and J. Spicer (Somerville, New Jersey, 1881).

For the period of the Dutch rule, see E. B. O'Callaghan's *History of New Netherland* (New York, 1846); and John Romeyn Brodhead's *History of the State of New York* (2nd vol., New York, 1853, 1871); E. P. Tanner, *The Province of New Jersey* (New York, 1908), the most thorough study of the period from 1664 to 1738; Samuel Smith's *History of the Colony of Nova Caesarea, or New Jersey* (Burlington, 1765; 2nd ed., Trenton, 1877), still one of the best accounts of the colonial period, and particularly valuable on account of its copious extracts from the sources, many of which are no longer accessible; see, also, William A. Whitehead's "The English in East and West Jersey, 1664–1689" (in vol. iii. of Justin Winsor's *Narrative and Critical History of America*). Among the monographic contributions are Austin Scott's *Influence of the Proprietors in Founding the State of New Jersey* (Baltimore, 1885) and H. S. Cooley's *Study of Slavery in New Jersey* (Baltimore, 1896). Other useful contributions are A. D. Mellick, *Story of an Old Farm; or, Life in New Jersey in the 18th Century* (Somerville, New Jersey, 1889), full of interesting details; F. B. Lee and others, *New Jersey as a Colony and as a State* (4 vols., with an additional biographical volume, New York, 1902, rather unevenly proportioned, and inaccurate as to details; W. J. Mills, *Historic Houses of New Jersey* (Philadelphia, 1902); William Nelson, *The New Jersey Coast in Three Centuries* (2 vols., New York, 1902); Isaac S. Mulford, *Civil and Political History of New Jersey* (Philadelphia, 1851); W. A. Whitehead, *East Jersey under the Proprietary Governments* (New Jersey Historical Society *Collections*, vol. i., Newark, 1875); W. S. Stryker, *Official Register of the Officers and Men of New Jersey in the Revolutionary War* (Trenton, 1872); W. E. Sackett, *Modern Battles of Trenton* (Trenton, 1895), a political history of New Jersey from 1868 to 1894, dealing especially with the railway controversies; John E. Stillwell, *Historical and Genealogical Miscellany* (2 vols., New York, 1903–1906), containing data relating to the settlement and settlers of New York and New Jersey; R. S. Field, *The Provincial Courts of New Jersey*; L. Q. C. Elmer, *The Constitution and Government of New Jersey* (vols. iii. and vii. of New Jersey Historical Society *Collections*, Newark, 1849, 1872); and David Murray, *History of Education in New Jersey* (No. 23 of Circulars of Information issued by the United States Bureau of Education, Washington, 1899).

NEW JERUSALEM CHURCH, or NEW CHURCH, the community founded by the followers of Emmanuel Swedenborg (*q.v.*). Swedenborg himself took no steps to found a church, but having given a new interpretation of Scripture, it was inevitable that those who accepted his doctrine should separate themselves and organize a society in accordance therewith. Those who received them fully during Swedenborg's lifetime were few and scattered, but courageously undertook the task of dissemination, and gave themselves to translating and distributing their master's writings. Two Anglican clergymen were conspicuous in this work: Thomas Hartley (d. 1784), rector of Winwick, and John Clowes (1743–1831), vicar of St John's, Manchester. Hartley translated *Heaven and Hell* (1778) and *True Christian Religion* (1781); Clowes, who taught New Church doctrine in the existing churches and was opposed to the forming of new organizations, translated 17 volumes, including the *Arcana Coelestia*, and published over 50 volumes of exposition and defence. Through his influence Lancashire became the stronghold of the Swedenborgians, and to-day includes a third of the congregations and more than half the members of the New Church in the United Kingdom.

In 1782 a society for publishing Swedenborg's writings was formed in Manchester, and in December 1783 a little company of sympathizers with similar aims met in London and founded "The Theosophical Society," among the members of which were John Flaxman the sculptor, William Sharpe the engraver, and F. H. Barthélemon the composer. In the early days most of them worshipped at the Female Orphan Asylum, St George's, whose chaplain, Rev. Jacob Duche, like Clowes at Manchester, preached the doctrines from his own pulpit. In 1785 and 1787 J. W. Salmon and R. Mather conducted an open-air missionary tour in the Midlands and the North with some success. Five prominent Wesleyan preachers adopted the new teaching and were cut off from their connexion, a step which led, in spite of remonstrance from Clowes and others, to the formal organization of the New Jerusalem Church on the 7th of May 1787. For some months the members met in private houses, but in January 1788 began worship in a church in Great Eastcheap with a liturgy specially prepared by the Rev. James Hindmarsh and Isaac Hawkins. "The Theosophical Society" was now dissolved. In April 1789 a General Conference of British Swedenborgians was held in Great Eastcheap Church, followed by another and by the publication of a journal, the *New Jerusalem Magazine*, in 1790. Since 1815 conferences have been held every year. A weekly paper, the *Morning Light*, is published, as well as monthly magazines for adults (the *New Church Magazine*) and young folk. The liturgy (containing five services for Morning and Evening, together with the order of Baptism, Holy Supper, Marriage, &c.) was prepared in 1828, revised and extended in 1875; the hymn book of 1823 was revised and enlarged in 1880.

In the provinces the first church was at Birmingham (1791), followed by one at Manchester and another at Liverpool (1793). The Accrington church, the largest in Great Britain, was founded in 1802. Many of the early converts to the New Church were among the most fervent advocates of the abolition of slavery, one was the medical officer of the first batch of convicts sent to Botany Bay; from the house of another, William Cookworthy of Plymouth, Captain Cook sailed on his last voyage. Others were pioneers of elementary education, establishing free day schools long before they were thought of by the state.

In 1815 the conference took up the question of home missionary work, and its agents were able to found many branches of the church. In 1813 the Manchester and Salford (now the North of

England) Missionary Society was founded, chiefly to provide preachers for the smaller churches in its area; in 1857 a National Missionary Institution was founded and endowed, to which most of the local ones have been affiliated. Other denominational agencies have been concerned with the printing and circulation of Swedenborgian literature, a training college for the ministry (founded in 1852), and a Ministers' Aid Fund (1854), and an Orphanage (1881). The centenary of the New Church as a spiritual system was celebrated in 1857, as an external organization in 1883. A few Swedenborgians still hold to the non-separating policy, but more from force of circumstances than from deliberate principle. The constitution of the New Church is of the Independent Congregational type; the conference may advise and counsel, but cannot compel the obedience of the societies. The returns for 1909 showed 45 ministers, 8 recognized leaders, 10 recognized missionaries, 70 societies, 6665 registered members, 7907 Sunday scholars. There are also five or six small societies not connected with the conference.

The New Church in Europe.—In Sweden the Philanthropic Exegetic Society was formed by C. F. Nordenskiold in 1786 to collect documents about Swedenborg and to publish his writings. The introduction of alchemy and mesmerism led to its dissolution in 1789, but its work was continued by the society "Pro fide et charitate," which existed from 1796 to 1820. For many years the works of Swedenborg and his followers were proscribed, and receivers of his writings fined or deprived of office, but in 1866, when religious liberty had made progress, the cause was again taken up; in 1875 the society of "Confessors of the New Church" was formed in Stockholm, and since 1877 services have been regularly held. There is also a church in Gothenburg, and lectures are given from time to time in most of the towns of Sweden. In Norway there is no New Church organization; in Denmark a church was founded in Copenhagen in 1871. In Germany Prelate Oetinger of Württemberg translated many of Swedenborg's writings between 1765 and 1786, but the great name is that of Immanuel Tafel (d. 1863), librarian of Tübingen, who not only edited, translated and published, but in 1848 founded a "Union of the New Church in Germany and Switzerland" which held quarterly meetings. There is a church in Berlin, but otherwise activity in Germany has taken shape in the German Swedenborg Society with headquarters at Stuttgart. In Switzerland, on the contrary, there is an organized body of the New Church; divine service being held in the Society at Zürich and by circles at Berne, Herisau and Nesslau. The Zürich pastor is a member of the American Convention, and has oversight also of the Austrian societies at Vienna and Trieste. In Hungary there are societies at Buda Pesth and Gyorkony. In France there were early Swedenborgians of rank and learning, and much translation was accomplished before 1800. About 1838 J. F. E. Le Boys de Guays began his masterly translation of all Swedenborg's theological works and instituted public New Church worship, which was carried on at his house for thirty years. Sunday worship is now held in the New Church Temple on the Rue Thouin. In Italy (Rome), Holland (The Hague), Belgium (Antwerp and Bruges), there are small societies, and nearly every European country has some known adherents.

In America.—About 1784 James Glen, a London Scot, delivered lectures "For the Sentimentalists" on the new doctrine in Philadelphia and Boston and circulated some of Swedenborg's works. Francis Bailey, state printer of Pennsylvania, was attracted by them and became active in their promulgation. During the next ten years a number of prominent men gave their support to the teaching, which gradually spread inland and southward. The first society for worship was formed in Baltimore in 1792 (reorganized 1798), though a short-lived one had preceded it at Halifax, N.S., in 1791. Other churches grew up in Philadelphia, Cincinnati, Boston and New York, and the General Convention, which meets annually, was formed at Philadelphia in 1817. In 1907 there were 102 ministers and 103 societies with a membership of 6560. Of these, 4 societies and 140 members are in Canada, while the German Synod counts for 11 societies and 325 members.

In Australia, &c.—The formation of societies in Australia began at Adelaide in 1844. Melbourne and Sydney followed in 1854, Brisbane in 1865, Rodborough, Vict., in 1878. There is a circle at Perth. New Zealand has a church at Auckland (1883) and scattered members in the south island. An Australasian conference met at Melbourne in 1881 and has continued to meet in alternate years. There is a society at Mauritius, and correspondents in various parts of South and West Africa, India, Japan, the West Indies and South America.

See L. P. Mercer, *The New Jerusalem in the World's Religious Congresses of 1893*; *Minutes of the General Conference of the New Church* (annual); *Journal of the Annual Session of the General Convention of the New Jerusalem in the United States of America.*

(A. J. G.)

NEW KENSINGTON, a borough of Westmoreland county, Pennsylvania, U.S.A., on the Allegheny river, 18 m. N.E. of Pittsburg. Pop. (1900) 4665 (1042 foreign-born and 86 negroes); (1910) 7707. It is served by the Pennsylvania railroad and by electric railways to neighbouring towns. There are a variety of manufactures. The borough was founded in 1891 and was incorporated in the following year.

NEWLANDS, JOHN ALEXANDER REINA (1838–1898), English chemist, was born in 1838. He was one of the first, if not quite the first, to propound the conception of periodicity among the chemical elements. His earliest contribution to the question took the form of a letter published in the *Chemical News* in February 1863. In the succeeding year he showed, in the same journal, that if the elements be arranged in the order of their atomic weights, those having consecutive numbers frequently either belong to the same group or occupy similar positions in different groups, and he pointed out that each eighth element starting from a given one is in this arrangement a kind of repetition of the first, like the eighth note of an octave in music. The Law of Octaves thus enunciated was at first ignored or treated with ridicule as a fantastic notion unworthy of serious consideration, but the idea, subsequently elaborated by D. I. Mendeléeff and other workers into the Periodic Law, has taken its place as one of the most important generalizations in modern chemical theory. Newlands, who was of Italian extraction on his mother's side, and fought as a volunteer in the cause of Italian freedom under Garibaldi in 1860, died in London on the 29th of July 1898. He collected his various papers on the atomicity of the elements in a little volume on the *Discovery of the Periodic Law* published in London in 1884.

NEW LONDON, a city, port of entry, and one of the county-seats of New London county, Connecticut, U.S.A., coextensive with the township of New London, in the S.E. part of the state, on the Thames river, about 3 m. from its entrance into Long Island Sound. Pop. (1890) 13,757; (1900) 17,548, of whom 3743 were foreign-born; (1910 census) 19,659. It is served by the New York, New Haven & Hartford, and the New London Northern (leased by the Central Vermont) railways, by electric railway to Norwich, Westerly, Groton, Stonington and East Lyme, by a daily line of passenger steamboats to New York City, and by two lines of freight steamers, and in the summer months by daily steamboats to Sag Harbor and Greenport, Long Island, and Watch Hill and Block Island, Rhode Island. New London's harbour is the best on the Sound. The city is the headquarters of a United States artillery district, embracing Fort H. G. Wright on Fisher's Island, New York, Fort Michie on Gull Island, New York, Fort Terry on Plum Island, New York, and Fort Mansfield on Napatree Point, Rhode Island—fortifications which command the eastern entrance to Long Island Sound; and it is the headquarters of the Third District of the U.S. Engineers and of the Third District of the Lighthouse Department. The harbour was formerly defended by two forts, both now obsolete—Fort Trumbull on the right bank of the Thames, and Fort Griswold on the left bank, in the township of Groton (pop. 1900, 5962). The city is built on a declivity facing the south-east; from the higher points there are excellent views of Long Island Sound and the surrounding country. New London is a summer resort, and is a station of the New York Yacht Club; the boat races between Harvard and Yale universities are annually rowed on the river near the city. Among the places of interest are the Town Mill, built in 1650 by John Winthrop, Jr., in co-operation with the town; the Hempstead Mansion, built by John Hempstead about 1678; the old cemetery, north-east of the city, laid out in 1653; a school house in which Nathan Hale taught; and a court house built in 1785. There is a public library (about 30,000 volumes), and the New London County Historical Society (incorporated 1870) has an historical library. There are two endowed high schools, the Bulkeley School for boys and the Williams Memorial Institute (1891) for girls, and an endowed Manual Training and Industrial School (1872), all offering free instruction. In the 18th century New London had a large trade in lumber, flour and food supplies with the West Indies, Gibraltar

and the Barbary States; but this trade declined after the War of 1812, and the whaling and sealing industries, once very lucrative, have also declined in value. The imports in 1906 were valued at $54,873 and the exports at $60,522; in 1909 their respective values were $10,870 and $10,295. Manufacturing is the principal industry; among the products are silk goods, cotton gins, printing presses and foundry and machine shop products. The total value of factory products was $4,709,628 in 1905, an increase of 11·6% since 1900.

New London was founded in 1646 by John Winthrop, the younger. It was known by its Indian name "Nameaug" until 1658, when the General Court of Connecticut approved the wish of the settlers to adopt its present name from London, England, the river Monhegin at the same time becoming the Thames. During the War of Independence it was a rendezvous for American privateers. In 1776 the first naval expedition authorized by Congress was organized in its harbour, and there in the next three years twenty privateers were fitted out. On the 6th of September 1781, 800 British troops and Loyalists under General Benedict Arnold (who was born in New London county) raided New London, destroyed much private property, and at Fort Griswold killed 84 American soldiers, many of them after their surrender. The massacre is commemorated by an obelisk, 134 ft. high, on Groton Heights. The city was incorporated in 1784. In 1798 there was an epidemic of yellow fever. From the 7th of November 1812 until the close of the second war with Great Britain the harbour was blockaded by a British fleet.

See F. M. Caulkins's *History of New London* (new ed., New London, 1900); and the publications of the New London County Historical Society (New London).

NEWLYN, a village in the St Ives parliamentary division of Cornwall, England, on the shore of Mount's Bay, 1 m. S.W. of Penzance. It is a small fishing port, with narrow paved lanes and old-fashioned cottages. Near the parish church of St Peter stands an ancient cross of granite, discovered in a field close by. The harbour, one of the safest for small craft in the west country, is sheltered by two long and massive stone piers. A more ancient pier, originally constructed in the reign of Henry VI., was renewed in that of James I. Tin mining and smelting have been largely carried on in the neighbourhood, and several galleries were worked far under the sea. The principal modern industry, however, is fishing, especially for pilchard. The picturesque appearance of the village, with its quays and little harbour, and the grandeur of the cliffs and moorland scenery towards Land's End, make Newlyn an attractive spot. Between 1880 and 1890 an artistic coterie grew up here, the leaders of which were Edwin Harris, Walter Langley, Fred Hall, Frank Bramley, T. C. Gotch, Mr and Mrs Stanhope Forbes, Chevalier Taylor and H. S. Tuke. The earlier artists at Newlyn were said to have selected it as their centre, because a greyness in the atmosphere helped their depiction of subtleties in tone, part of their creed being subordination of colour to tone-gradation. In later times, the element of a common ideal tended to disappear, but the interest of the "Newlyn school" attracted a regular art-colony, who in various ways assimilated and expressed the picturesque influences of the place (see PAINTING: *Recent British*). There is a permanent Art Gallery, containing examples of the work of the Newlyn artists. Newlyn ward in the urban district of PAUL (pop. 6332) had in 1901 a population of 3749.

NEW MADRID, a city and the county-seat of New Madrid county, Missouri, U.S.A., on the right bank of the Mississippi river, about 35 m. S. by W. of Cairo, Ill. Pop. (1900) 1489; (1910) 1882. It is served by the St Louis South-western railway and by river packets. The city is a shipping point for a rich grain, cotton, livestock and lumber region. Among its manufactures are lumber, staves, and hoops. The municipality owns its water-works. Owing to the encroachments of the Mississippi river, the site of the first permanent settlement of New Madrid is said to lie now about 1½ m. from the E. bank of the river, in Kentucky. This settlement was made in 1788, on an elaborately laid out town site, and was named New Madrid by its founder, Colonel George Morgan (1742–1810),[1] who, late in 1787, had received a grant of a large tract of land on the right bank of the Mississippi river, below the mouth of the Ohio, from Don Diego de Gardoqui, Spanish minister to the United States. The tract lay within the province of "Louisiana," and the grant to Morgan was a part of Gardoqui's plan to annex to that province the western American settlements, Morgan being required to establish thereon a large number of emigrants, whom he secured from New Jersey, Canada and elsewhere. Governor Estevan Miro of Louisiana, however, disapproved of the grant, on the ground that it would cause the province to be overrun by Americans; the settlers became restive under the restraints imposed upon them; Morgan himself left; and in December 1811 and January 1812 a series of severe earthquake shocks caused a general emigration. New Madrid was occupied by Confederate troops under General Gideon J. Pillow, on the 28th of July 1861, and after the surrender of Fort Donelson (February 16, 1862) the troops previously at Columbus, forming the Confederate left flank, were withdrawn to New Madrid and Island No. 10 (in the Mississippi about 10 m. S.). There were Confederate batteries on the left bank of the Mississippi opposite Island No. 10, and along the same bank from a point opposite New Madrid to Tiptonville, Tennessee. Behind these batteries were Reelfoot Lake and overflowed lands. Retreat by land was thus virtually impossible. Early in March, Major-General John Pope and Commodore A.H. Foote proceeded against these positions; New Madrid, then in command of General John P. McGown, was evacuated on the 14th; (Admiral) Henry Walke (1808–1896), commanding the "Carondelet," ran past the batteries of Island No. 10 and the shore batteries on the 4th of April, and Lieut.-Commander Egbert Thompson, commanding the "Pittsburgh," on the 7th; meanwhile the Federals under the direction of Colonel Josiah W. Bissell (b. 1818), of the engineer corps, had, with great difficulty, constructed an artificial channel to New Madrid across the peninsula (swamp land) formed by a great loop of the Mississippi; troops were conveyed by transports through this channel below the island, Federal batteries having been established on the right bank of the river; the retreat of the Confederates down stream was effectually blocked; they evacuated the island on April 7th, and on the 8th the garrison and the forces stationed in the shore batteries, a total of about 7000, under General W. W. Mackall (who had succeeded General McGown on the 31st of March) was surrendered at Tiptonville. The island was subsequently washed away, a new one being formed in the vicinity.

NEWMAN, FRANCIS WILLIAM (1805–1897), English scholar and miscellaneous writer, younger brother of Cardinal Newman, was born in London on the 27th of June 1805. Like his brother, he was educated at Ealing, and subsequently at Oxford, where he had a brilliant career, obtaining a double first class in 1826. He was elected fellow of Balliol in the same year. Conscientious scruples respecting the ceremony of infant baptism led him to resign his fellowship in 1830, and he went to Baghdad as assistant in the mission of the Rev. A. N. Groves. In 1833 he returned to England to procure additional support for the mission, but rumours of unsoundness in his views on the doctrine of eternal punishment had preceded him, and finding himself generally looked upon with suspicion, he gave up the vocation of missionary to become classical tutor in an unsectarian college at Bristol. His letters written home during the period of his mission were collected and published in 1856, and form an interesting little volume. Newman's views matured rapidly, and in 1840 he became professor of Latin in Manchester New College, the celebrated Unitarian seminary long established at York, and the parent of Manchester College, Oxford. In 1846 he quitted this appointment to become professor in University College, London, where he remained until 1869. During all this period

[1] Morgan had been made Indian agent at Fort Pitt (Pittsburg) in 1776, and was commissioned a colonel in the Continental Army in 1777. In 1806 he was visited at his home, near Pittsburg, by Aaron Burr, who told him something about his famous "conspiracy" scheme in the West, which Morgan reported to Jefferson—"the very first intimation I had of the plot." Jefferson afterward wrote to Morgan.

he was assiduously carrying on his studies in mathematics and oriental languages, but wrote little until 1847, when he published anonymously a *History of the Hebrew Monarchy*, intended to introduce the results of German investigation in this department of Biblical criticism. In 1849 appeared *The Soul, her Sorrows and Aspirations*, and in 1850, *Phases of Faith, or Passages from the History of my Creed*—the former a tender but searching analysis of the relations of the spirit of man with the Creator; the latter a religious autobiography detailing the author's passage from Calvinism to pure theism. It is on these two books that Professor Newman's celebrity will principally rest; having in both to describe his personal experience, his intense earnestness has kept him free from the eccentricity which marred most of his other writings, excepting his contributions to mathematical research and oriental philology. There was, indeed, scarcely a crotchet, except "spiritualism," of which he was not at one time or another the advocate. His versatility was amazing: he wrote on logic, political economy, English reforms, Austrian politics, Roman history, diet, grammar, the most abstruse departments of mathematics, Arabic, the emendation of Greek texts, and languages as out of the way as the Berber and as obsolete as the dialect of the Iguvine inscriptions. In treating all these subjects he showed signal ability, but, wherever the theme allowed, an incurable crotchetiness; and in his numerous metrical translations from the classics, especially his version of the *Iliad*, he betrayed an insensibility to the ridiculous which would almost have justified the irreverent criticism of Matthew Arnold, had this been conveyed in more seemly fashion. His miscellaneous essays, some of much value, were collected in several volumes before his death: his last publication, *Contributions chiefly to the Early History of Cardinal Newman* (1891), was generally condemned as deficient in fraternal feeling. He was far from possessing his brother's subtlety of reasoning, but he impresses by a transparent sincerity and singleness of mind not always displayed by the more celebrated writer; his style is too individual to be taken as a model, but is admirable for its simplicity and clearness. His character is vividly drawn by Carlyle in his life of Sterling, of whose son Newman was guardian: "a man of fine attainments, of the sharpest-cutting and most restlessly advancing intellect and of the mildest pious enthusiasm." It was his great misfortune that this enthusiasm should have been correlated, as is not unfrequently the case, with an entire insensibility to the humorous side of things. After his retirement from University College, Professor Newman continued to live for some years in London, subsequently removing to Clifton, and eventually to Weston-super-Mare, where he died on the 7th of October 1897. He had been blind for five years before his death, but retained his faculties to the last. He was twice married.

See T. G. Sieveking, *Memoir and Letters of Francis W. Newman* (1909). (R. G.)

NEWMAN, JOHN HENRY (1801–1890), English Cardinal, was born in London on the 21st of February 1801, the eldest son of John Newman, banker, of the firm of Ramsbottom, Newman and Co. The family was understood to be of Dutch extraction, and the name itself, spelt "Newmann" in an earlier generation, further suggests Hebrew origin. His mother, Jemima Fourdrinier, was of a Huguenot family, long established in London as engravers and paper manufacturers. John Henry was the eldest of six children. The second son, Charles Robert, a man of ability but of impracticable temper, a professed atheist and a recluse, died in 1884. The youngest son, Francis William (*q.v.*), was for many years professor of Latin in University College, London. Two of the three daughters, Harriett Elizabeth and Jemima Charlotte, married brothers, Thomas and John Mozley; and Anne Mozley, a daughter of the latter, edited in 1892 Newman's Anglican *Life and Correspondence*, having been entrusted by him in 1885 with an autobiography written in the third person to form the basis of a narrative of the first thirty years of his life. The third daughter, Mary Sophia, died unmarried in 1828.

At the age of seven Newman was sent to a private school conducted by Dr Nicholas at Ealing, where he was distinguished by diligence and good conduct, as also by a certain shyness and aloofness, taking no part in the school games. He speaks of himself as having been "very superstitious" in these early years. He took great delight in reading the Bible, and also the novels of Scott, then in course of publication. At the age of fifteen, during his last year at school, he was "converted," an incident that throughout life remained to him "more certain than that he had hands or feet." It was in the autumn of 1816 that he thus fell under the influence of a definite creed, and received into his intellect impressions of dogma never afterwards effaced. The tone of his mind was at this date evangelical and Calvinistic, and he held that the pope was anti-Christ. Matriculating at Trinity College, Oxford, 14th December 1816, he went into residence there in June the following year, and in 1818 he gained a scholarship of £60, tenable for nine years. But for this he would have been unable to remain at the university, as in 1819 his father's bank suspended payment. In that year his name was entered at Lincoln's Inn. Anxiety to do well in the final schools produced the opposite result; he broke down in the examination, and so graduated with third-class honours in 1821. Desiring to remain in Oxford, he took private pupils and read for a fellowship at Oriel, then "the acknowledged centre of Oxford intellectualism." To his intense relief and delight he was elected on the 12th of April 1822. E. B. Pusey was elected a fellow of the same society in 1823.

On Trinity Sunday, 13th June 1824, Newman was ordained, and became, at Pusey's suggestion, curate of St Clement's, Oxford. Here for two years he was busily engaged in parochial work, but he found time to write articles on "Apollonius of Tyana," on "Cicero" and on "Miracles" for the *Encyclopaedia Metropolitana*. In 1825, at Whately's request, he became vice-principal of St Alban's Hall, but this post he held for one year only. To his association with Whately at this time he attributed much of his "mental improvement" and a partial conquest of his shyness. He assisted Whately in his popular work on logic, and from him he gained his first definite idea of the Christian Church. He broke with him in 1827 on the occasion of the re-election of Peel for the University, Newman opposing this on personal grounds. In 1826 he became tutor of Oriel, and the same year R. H. Froude, described by Newman as "one of the acutest, cleverest and deepest men" he ever met, was elected fellow. The two formed a high ideal of the tutorial office as clerical and pastoral rather than secular. In 1827 he was a preacher at Whitehall. The year following Newman supported and secured the election of Hawkins as provost of Oriel in preference to Keble, a choice which he later defended or apologized for as having in effect produced the Oxford Movement with all its consequences. In the same year he was appointed vicar of St Mary's, to which the chapelry of Littlemore was attached, and Pusey was made regius professor of Hebrew. At this date, though still nominally associated with the Evangelicals, Newman's views were gradually assuming a higher ecclesiastical tone, and while local secretary of the Church Missionary Society he circulated an anonymous letter suggesting a method by which Churchmen might practically oust Nonconformists from all control of the society. This resulted in his being dismissed from the post, 8th March 1830; and three months later he withdrew from the Bible Society, thus completing his severance from the Low Church party. In 1831–1832 he was select preacher before the University. In 1832, his difference with Hawkins as to the "substantially religious nature" of a college tutorship becoming acute, he resigned that post, and in December went with R. H. Froude, on account of the latter's health, for a tour in South Europe. On board the mail steamship "Hermes" they visited Gibraltar, Malta and the Ionian Islands, and subsequently Sicily, Naples and Rome, where Newman made the acquaintance of Dr Wiseman. In a letter home he described Rome as "the most wonderful place on earth," but the Roman Catholic religion as "polytheistic, degrading and idolatrous." It was during the course of this tour that he wrote most of the short poems which a year later were printed in the *Lyra Apostolica*. From Rome Newman returned to Sicily alone, and was dangerously ill with

fever at Leonforte, recovering from it with the conviction that he had a work to do in England.

In June 1833 he left Palermo for Marseilles in an orange boat, which was becalmed in the Strait of Bonifacio, and here he wrote the verses, "Lead, kindly Light," which later became popular as a hymn. He was at home again in Oxford on the 9th of July, and on the 14th Keble preached at St Mary's an assize sermon on "National Apostasy," which Newman afterwards regarded as the inauguration of the Oxford Movement. In the words of Dean Church, it was "Keble who inspired, Froude who gave the impetus and Newman who took up the work"; but the first organization of it was due to H. J. Rose, editor of the *British Magazine*, who has been styled "the Cambridge originator of the Oxford Movement." It was in his rectory house at Hadleigh, Suffolk, that a meeting of High Church clergymen was held, 25th to 29th of July (Newman was not present), at which it was resolved to fight for "the apostolical succession and the integrity of the Prayer-Book." A few weeks later Newman started, apparently on his own initiative, the *Tracts for the Times*, from which the movement was subsequently named "Tractarian." Its aim was to secure for the Church of England a definite basis of doctrine and discipline, in case either of disestablishment or of a determination of High Churchmen to quit the establishment, an eventuality that was thought not impossible in view of the States' recent high-handed dealings with the sister established Church of Ireland. The teaching of the tracts was supplemented by Newman's Sunday afternoon sermons at St Mary's, the influence of which, especially over the junior members of the university, was increasingly marked during a period of eight years. In 1835 Pusey joined the movement, which, so far as concerned ritual observances, was later called "Puseyite"; and in 1836 its supporters secured further coherence by their united opposition to the appointment of Hampden as regius professor of divinity. His Bampton Lectures (in the preparation of which Blanco White had assisted him) were suspected of heresy, and this suspicion was accentuated by a pamphlet put forth by Newman, *Elucidations of Dr Hampden's Theological Statements*. At this date Newman became editor of the *British Critic*, and he also gave courses of lectures in a side-chapel of St Mary's in defence of the *via media* of the Anglican Church as between Romanism and popular Protestantism. His influence in Oxford was supreme about the year 1839, when, however, his study of the monophysite heresy first raised in his mind a doubt as to whether the Anglican position was really tenable on those principles of ecclesiastical authority which he had accepted; and this doubt returned when he read, in Wiseman's article in the *Dublin Review* on "The Anglican Claim," the words of St Augustine against the Donatists, "*securus judicat orbis terrarum*," words which suggested a simpler authoritative rule than that of the teaching of antiquity. He continued his work, however, as a High Anglican controversialist until he had published, in 1841, *Tract 90*, the last of the series, in which he put forth, as a kind of proof charge, to test the tenability of all Catholic doctrine within the Church of England, a detailed examination of the XXXIX. Articles, suggesting that their negations were not directed against the authorized creed of Roman Catholics, but only against popular errors and exaggerations. This theory, though not altogether new, aroused much indignation in Oxford, and A. C. Tait, afterwards archbishop of Canterbury), with three other senior tutors, denounced it as "suggesting and opening a way by which men might violate their solemn engagements to the university." The alarm was shared by the heads of houses and by others in authority; and, at the request of the bishop of Oxford, the publication of the Tracts came to an end. At this date Newman also resigned the editorship of the *British Critic*, and was thenceforth, as he himself later described it, "on his deathbed as regards membership with the Anglican Church." He now recognized that the position of Anglicans was similar to that of the semi-Arians in the Arian controversy; and the arrangement made at this time that an Anglican bishopric should be established in Jerusalem, the appointment to lie alternately with the British and Prussian governments, was to him further evidence of the non-apostolical character of the Church of England. In 1842 he withdrew to Littlemore, and lived there under monastic conditions with a small band of followers, their life being one of great physical austerity as well as of anxiety and suspense. To his disciples there he assigned the task of writing lives of the English saints, while his own time was largely devoted to the completion of an essay on the development of Christian doctrine, by which principle he sought to reconcile himself to the elaborated creed and the practical system of the Roman Church. In February 1843 he published, as an advertisement in the *Oxford Conservative Journal*, an anonymous but otherwise formal retractation of all the hard things he had said against Rome; and in September, after the secession of one of the inmates of the house, he preached his last Anglican sermon at Littlemore and resigned the living of St Mary's. But still an interval of two years elapsed before he was formally received into the Roman Catholic Church (9th October 1845) by Father Dominic, an Italian Passionist. In February 1846 he left Oxford for Oscott, where Bishop Wiseman, then vicar-apostolic of the Midland district, resided; and in October he proceeded to Rome, where he was ordained priest and was given the degree of D.D. by the pope. At the close of 1847 he returned to England as an Oratorian, and resided first at Maryvale (near Oscott); then at St Wilfrid's College, Cheadle; then at St Ann's, Alcester Street, Birmingham; and finally at Edgbaston, where spacious premises were built for the community, and where (except for four years in Ireland) he lived a secluded life for nearly forty years. Before the house at Edgbaston was occupied he had established the London Oratory, with Father Faber as its superior, and there (in King William Street, Strand) he delivered a course of lectures on "The Present Position of Catholics in England," in the fifth of which he protested against the anti-Catholic utterances of Dr Achilli, an ex-Dominican friar, whom he accused in detail of numerous acts of immorality. Popular Protestant feeling ran very high at the time, partly in consequence of the recent establishment of a Roman Catholic diocesan hierarchy by Pius IX., and criminal proceedings against Newman for libel resulted in an acknowledged gross miscarriage of justice. He was found guilty, and was sentenced to pay a fine of £100, while his expenses as defendant amounted to about £14,000, a sum that was at once raised by public subscription, a surplus being spent on the purchase of Rednall, a small property picturesquely situated on the Lickey Hills, with a chapel and cemetery, where Newman now lies buried. In 1854, at the request of the Irish bishops, Newman went to Dublin as rector of the newly-established Catholic university there. But practical organization was not among his gifts, and the bishops became jealous of his influence, so that after four years he retired, the best outcome of his stay there being a volume of lectures entitled *Idea of a University*, containing some of his most effective writing. In 1858 he projected a branch house of the Oratory at Oxford; but this was opposed by Manning and others, as likely to induce Catholics to send their sons to that university, and the scheme was abandoned. In 1859 he established, in connexion with the Birmingham Oratory, a school for the education of the sons of gentlemen on lines similar to those of the English public schools, an important work in which he never ceased to take the greatest interest. But all this time (since 1841) Newman had been under a cloud, so far as concerned the great mass of cultivated Englishmen, and he was now awaiting an opportunity to vindicate his career; and in 1862 he began to prepare autobiographical and other memoranda for the purpose. The occasion came when, in January 1864, Charles Kingsley, reviewing Froude's *History of England* in *Macmillan's Magazine*, incidentally asserted that "Father Newman informs us that truth for its own sake need not be, and on the whole ought not to be, a virtue of the Roman clergy." After some preliminary sparring between the two—Newman's pamphlet, "Mr Kingsley and Dr Newman: a Correspondence on the Question whether Dr Newman teaches that Truth is no Virtue," published in 1864 and not reprinted, is unsurpassed in the English language for the vigour of its satire: the anger displayed was

later, in a letter to Sir William Cope, admitted to have been largely feigned—Newman published in bi-monthly parts his *Apologia pro vita sua*, a religious autobiography of unsurpassed interest, the simple confidential tone of which "revolutionized the popular estimate of its author," establishing the strength and sincerity of the convictions which had led him into the Roman Catholic Church. Kingsley's accusation indeed, in so far as it concerned the Roman clergy generally, was not precisely dealt with; only a passing sentence, in an appendix on lying and equivocation, maintained that English Catholic priests are as truthful as English Catholic laymen; but of the author's own personal rectitude no room for doubt was left.

In 1870 he put forth his *Grammar of Assent*, the most closely reasoned of his works, in which the case for religious belief is maintained by arguments differing somewhat from those commonly used by Roman Catholic theologians; and in 1877, in the republication of his Anglican works, he added to the two volumes containing his defence of the *via media* a long preface and numerous notes in which he criticized and replied to sundry anti-Catholic arguments of his own in the original issues. At the time of the Vatican Council (1869–1870) he was known to be opposed to the definition of Papal infallibility, and in a private letter to his bishop (Ullathorne), surreptitiously published, he denounced the "insolent and aggressive faction" that had pushed the matter forward. But he made no sign of disapproval when the doctrine was defined, and subsequently, in a letter nominally addressed to the duke of Norfolk on the occasion of Mr Gladstone's accusing the Roman Church of having "equally repudiated modern thought and ancient history," Newman affirmed that he had always believed the doctrine, and had only feared the deterrent effect of its definition on conversions on account of acknowledged historical difficulties. In this letter, and especially in the postscript to the second edition of it, Newman finally silenced all cavillers as to his not being really at ease within the Roman Church. In 1878 his old college (Trinity), to his great delight, elected him an honorary fellow, and he revisited Oxford after an interval of thirty-two years. At the same date died Pope Pius IX., who had long mistrusted him; and Leo XIII. was encouraged by the duke of Norfolk and other distinguished Roman Catholic laymen to make Newman a cardinal, the distinction being a marked one, because he was a simple priest and not resident in Rome. The offer was made in February 1879, and the announcement of it was received with universal applause throughout the English-speaking world. The "creation" took place on 12th May, with the title of St George in Velabro, Newman taking occasion while in Rome to insist on the lifelong consistency of his opposition to "liberalism in religion." After an illness that excited apprehension he returned to England, and thenceforward resided at the Oratory until his death, 11th August 1890, making occasional visits to London, and chiefly to his old friend, R. W. Church, dean of St Paul's, who as proctor had vetoed the condemnation of *Tract 90* in 1841. As cardinal Newman published nothing beyond a preface to a work by A. W. Hutton on the *Anglican Ministry* (1879) and an article on Biblical criticism in the *Nineteenth Century* (February 1884).

Newman's influence as controversialist and preacher (*i.e.* as reader of his written sermons, for he was never a speaker) was very great. For the Roman Church his conversion secured great prestige and the dissipation of many prejudices. Within it his influence was mainly in the direction of a broader spirit and of a recognition of the important part played by development both in doctrine and in Church government. And although he never called himself a mystic, he showed that in his judgment spiritual truth is apprehended by direct intuition, as an antecedent necessity to the professedly purely rational basis of the Roman Catholic creed. Within the Anglican Church, and even within the more strictly Protestant Churches, his influence was greater, but in a different direction, viz. in showing the necessity of dogma and the indispensableness of the austere, ascetic, chastened and graver side of the Christian religion. If his teaching as to the Church was less widely followed, it was because of doubts as to the thoroughness of his knowledge of history and as to his freedom from bias as a critic. Some hundreds of clergymen, influenced by the movement of which for ten or twelve years he was the acknowledged leader, made their submission to the Church of Rome; but a very much larger number, who also came under its influence, failed to learn from him that belief in the Church involves belief in the pope. The natural tendency of his mind is often (and correctly) spoken of as sceptical. He held that, apart from an interior and unreasoned conviction, there is no cogent proof of the existence of God; and in *Tract 85* he dealt with the difficulties of the Creed and of the canon of Scripture, with the apparent implication that they are insurmountable unless overridden by the authority of an infallible Church. In his own case these views did not lead to scepticism, because he had always possessed the necessary interior conviction; and in writing *Tract 85* his only doubt would have been where the true Church is to be found. But, so far as the rest of the world is concerned, his teaching amounts to this: that the man who has not this interior conviction has no choice but to remain an agnostic, while the man who has it is bound sooner or later to become a Roman Catholic.

He was a man of magnetic personality, with an intense belief in the significance of his own career; and his character may be described as feminine, both in its strength and in its weakness. As a poet he had inspiration and genuine power. Some of his short and earlier poems, in spite of a characteristic element of fierceness and intolerance in one or two cases, are described by R. H. Hutton as "unequalled for grandeur of outline, purity of taste and radiance of total effect"; while his latest and longest, "The Dream of Gerontius," is generally recognized as the happiest effort to represent the unseen world that has been made since the time of Dante. His prose style, especially in his Catholic days, is fresh and vigorous, and is attractive to many who do not sympathize with his conclusions, from the apparent candour with which difficulties are admitted and grappled with, while in his private correspondence there is a charm that places it at the head of that branch of English literature. He was too sensitive and self-conscious to be altogether successful as a leader of men, and too impetuous to take part in public affairs; but he had many of the gifts that go to make a first-rate journalist, for, "with all his love for and his profound study of antiquity, there was something about him that was conspicuously modern." Nevertheless, with the scientific and critical literature of the years 1850–1890 he was barely acquainted, and he knew no German. There are a few passages in his writings in which he seems to show some sympathy with a broader theology. Thus he admitted that there was "something true and divinely revealed in every religion." He held that "freedom from symbols and articles is abstractedly the highest state of Christian communion," but was "the peculiar privilege of the primitive Church." And even in 1877 he allowed that "in a religion that embraces large and separate classes of adherents there always is of necessity to a certain extent an exoteric and an esoteric doctrine." These admissions, together with his elucidation of the idea of doctrinal development and his eloquent assertion of the supremacy of conscience, have led some critics to hold that, in spite of all his protests to the contrary, he was himself somewhat of a Liberal. But it is certain that he explained to his own satisfaction and accepted every item of the Roman Catholic creed, even going beyond it, as in holding the pope to be infallible in canonization; and while expressing his preference for English as compared with Italian devotional forms, he was himself one of the first to introduce such into England, together with the ritual peculiarities of the local Roman Church. The motto that he adopted for use with the arms emblazoned for him as cardinal—*Cor ad cor loquitur*, and that which he directed to be engraved on his memorial tablet at Edgbaston—*Ex umbris et imaginibus in veritatem*—together seem to disclose as much as can be disclosed of the secret of a life which, both to contemporaries and to later students, has been one of almost fascinating interest, at once devout and inquiring, affectionate and yet sternly self-restrained.

There is at Oxford a bust of Newman by Woolner. His portrait by Ouless is at the Birmingham Oratory, and his portrait by Millais is in the possession of the duke of Norfolk, a replica being at the London Oratory. Outside the latter building, and facing the Brompton Road, there is a marble statue of Newman as cardinal. (A. W. Hu.)

The chief authorities for Newman's life are his *Apologia* and the *Letters and Correspondence*, edited by Miss Mozley, above referred to. The letters and memoranda dealing with the years 1845–1890 were entrusted by Newman to the Rev. W. Neville as literary executor. Works by R. W. Church, J. B. Mozley, T. Mozley and Wilfrid Ward should also be consulted, as well as an appreciation by R. H. Hutton. Adverse criticism will be found in the writings of Dr E. A. Abbott (*e.g. The Anglican Career of Cardinal Newman*, 2 vols. London, 1892), while some minor traits and foibles were noted by A. W. Hutton in the *Expositor* (September, October and November 1890). NEWMARCH, WILLIAM (1820–1882), English economist and statistician, was born at Thirsk, Yorkshire, on the 28th of January 1820. He settled in London in 1846 as an official of the Agra Bank, but resigned in 1851 on his appointment as secretary of the Globe Insurance Company. This post he held till 1862, when he became chief officer in the banking-house of Glyn, Mills & Co., in whose employ he remained until 1881. Notwithstanding the continuous pressure of an active business life he found time to contribute largely many valuable articles to the magazines and newspapers, and took an active part in the proceedings of the Royal Statistical Society (of which he was one of the honorary secretaries, editor of its journal, and in 1869–1871 president) and the Political Economy Club. He was also elected a fellow of the Royal Society. His extensive knowledge of banking was displayed in the evidence which he gave before the select committee on the Bank Acts in 1857. He collaborated with Thomas Tooke in the two final volumes of his *History of Prices* and was responsible for the greater part of the work in those volumes. For nineteen years he wrote an admirable survey of the commercial history of the year in the *Economist*. He died at Torquay on the 23rd of March 1882. After his death his friends founded, in perpetuation of his memory, a Newmarch Lectureship in economic science and statistics at University College, London.

NEWMARKET, a market town in the Newmarket parliamentary division of Cambridgeshire, England, 13¾ m. E. by N. of Cambridge on the Bury branch of the Great Eastern railway. Pop. (1901) 10,688. A part of the town is in Suffolk, and the urban district is in the administrative county of West Suffolk. Newmarket has been celebrated for its horse-races from the time of James I., though at that time there was more of coursing and hawking than horse-racing. Charles I. instituted the first cup-race here. For the use of Charles II., during his visits to the races, a palace, no longer extant, was built on the site of the lodge of James I. There are numerous residences belonging to patrons of the turf, together with stables, and racing and training establishments. The racecourse, which lies south-west of the town, has a full extent of 4 m., but is divided into various lengths to suit the different races. The course intersects the so-called Devil's Ditch or Dyke (sometimes also known as St Edmund's Dyke), an earthwork consisting of a ditch and mound stretching almost straight for 5 m. from Reach to Wood Ditton. It is 12 ft. wide at the top, 18 ft. above the level of the country, and 30 ft. above the bottom of the ditch, with a slope of 50 ft. on the south-west side and 26 ft. on the north-east. It formed part of the boundary between the kingdoms of East Anglia and Mercia, but is doubtless of much earlier origin. Roman remains have been found in the neighbourhood.

NEW MECKLENBURG (Ger. *Neu-Mecklenburg*, formerly *New Ireland*, native *Tombara*), an island of the Bismarck Archipelago, N.E. of New Guinea in the Pacific Ocean, about 3° S., 152° E., in the administration of German New Guinea. It is about 240 m. long but seldom over 15 wide. From St George's Channel at the south, separating it from New Pomerania, it sweeps north and then north-west, being divided from New Hanover at the other extremity by Byron Strait. It is mountainous throughout, having an extreme elevation of about 6500 ft. in the north, where the prevalent formations are sandstone and limestone, whereas in the south they are granite, porphyry and basalt. There is a white population of about forty; the natives are Papuans of a less fine type than the natives of New Pomerania, and rather resemble the Solomon islanders. Jacob Lemaire and Willem Cornelis Schouten sighted New Mecklenburg in 1616, but it was only recognized as part of an island separate from New Guinea by William Dampier in 1700, and as separate from New Pomerania in 1767 by Philip Carteret.

NEW MEXICO, a south-western state of the United States, lying between 31° 20′ and 37° N. lat., and 103° and 109° 2′ W. long. It is bounded N. by Colorado; E. by Oklahoma and Texas; S. by Texas and Mexico; and W. by Arizona. It has an extreme length N. and S. of 400 m., an extreme width E. and W. of 358 m., and a total area of 122,634 sq. m., of which 131 sq. m. are water-surface.

Physiography.—New Mexico is a region of mountains and high plateaus. Broadly speaking, its surface is a vast tableland tilted toward the S. and E., and broken by parallel ranges of mountains whose trend is most frequently N. and S. About midway between the western boundary and the Rio Grande passes the Continental Divide, which separates the waters entering the Gulf of Mexico from those that flow into the Gulf of California. In the region E. of the Continental Divide, which embraces about three-fourths of the surface of the state, the general south-eastern slope is very marked. Thus, at Santa Fé, in the north central part of the state, the elevation is 7013 ft.; at Raton, in the N.E., 6400 ft.; at Las Cruces, in the extreme S.. 3570 ft.; and at Red Bluff, in the extreme S.E., 2876 ft.

The Rocky Mountain system enters New Mexico near the centre of the northern boundary; its main ridge, lying E. of the Rio Grande, extends as far S. as the city of Santa Fé. It forms the water-parting between the upper waters of the Canadian river and the Rio Grande, and contains many of the loftiest peaks in New Mexico, among them being Truchas (13,275 ft.), Costilla (12,634 ft.) and Baldy (12,623 ft.). On the E. this ridge is bounded by the region of the Great Plains, the dissected topography of which is characterized by many broad valleys intervening. W. of the Rio Grande lies a series of lower ranges, also a part of the Rocky Mountain system, whose western slopes merge almost imperceptibly with the Plateau Region. The San Juan, Gallinas and Nacimiento ranges are among the most notable in this group. South of the Rocky Mountains lies the so-called Basin Region, in which isolated, but sometimes lofty and massive, mountains, the result in many instances of a series of numerous parallel faults, rise from level plains like islands from the sea and enclose the valleys with bare walls of grey and brown rock. These valley plains, from 10 m. to 20 m. wide and sometimes 100 m. long, sloping gradually toward their centres, are usually covered with detritus from the neighbouring mountains, and seldom have a distinct drainage outlet. The Spaniards called them "bolsons" (purses), a term that geologists have retained. In many of these bolsons are ephemeral lakes, in which the waters collect during the rainy season and stand for several months. These waters are frequently impregnated with alkali or salt, and on evaporating leave upon the bed of the lake a thin encrustation of snowy whiteness. Such beds, locally known as "alkali flats," are especially numerous in Valencia, Socorro, Dona Ana and Otero counties, and a number of them furnish all the salt needed by the cattle ranges in their vicinity. East of the San Andreas Range, in the south central part of New Mexico, lies the basin of the extinct Lake Otero, in which are found the remarkable "white sands," consisting of dunes of almost pure granular gypsum and covering the area of 300 sq. m. In this region many species of reptiles and insects are almost perfectly white—an interesting example of protective coloration. Both E. and W. of the central portion of the Basin Region the bolson plains soon lose their distinctive character, the valleys become wider and broader and the mountains less lofty and more isolated. East of the Pecos and S. of the Canadian rivers lies the great arid tableland known as the Staked Plains (Llano Estacado), a vast stretch of barren wastes, with almost nothing to break the monotony of its landscape. This is a part of the Great Plains and a continuation of the high plains region of Texas. The Plateau Region includes most of the area N.

of the Gila river and W. of the Rio Grande. Here volcanic activity and powerful erosion have combined to produce a series of remarkable scenic effects. The eastern border of this area is formed by the valley of the Rio Grande and the western foot-hills of the Rocky Mountains; the southern boundary overlooks the Gila river; and on the N. and W. the plateau continues into Colorado, Utah and Arizona. Near its southern and eastern borders are many lava flows and extinct volcanic mountains, one of the most imposing of those in New Mexico being the Mt. Taylor volcano (11,389 ft.), which is surrounded by lava tables and some of the most wonderful volcanic buttes in the world. In other portions of New Mexico there is also much evidence of former volcanic activity. A conspicuous feature of the New Mexican landscape is the *mesa*, a flat-topped hill created by differential erosion and projecting above the surrounding country like a table. A notable example is the mesa of Acoma, in Valencia county, capped with volcanic rocks; upon its summit, about 350 ft. above the plain, is the Indian pueblo of Acoma.

The average elevation of New Mexico is 5700 ft., with 40,200 sq. m. between 3000 and 5000 ft.; 56,680 sq. m. between 5000 and 7000 ft.; 22,500 sq. m. between 7000 and 9000 ft.; and 2000 sq. m. above 9000 ft.

For a region with such a small amount of rainfall the rivers are numerous, but none of the streams is navigable, and in many of them during the dry season (and in some of them because of broken stratification) the water in places disappears entirely beneath the sandy bed, and after flowing underground for some distance, breaks out afresh farther on as a river, rivulet or spring. The most important stream is the Rio Grande, which, rising in southern Colorado, enters New Mexico through deep canyons near the centre of the northern boundary and continues southward across the entire state. During its course it changes from a mountain stream in the N. to a sluggish river turgid with sand in the S. In the lowlands it loses much of its volume through evaporation and absorption by the sands, and through irrigation, and in its lower course in New Mexico its bed is frequently dry. In the flood season it usually leaves its banks and inundates the lowlands, spreading over the sands a rich deposit of silt; and on account of this characteristic it is sometimes called "the Nile of New Mexico." The stream next in importance is the Pecos river, which rises in Mora county and flows southward into Texas, where it joins the Rio Grande. It has the same general characteristics as the latter river, being a mountain stream near its source, and after leaving the highlands becoming sluggish and losing much of its water. Along the lower course many underground streams from the mountains break out as springs and empty into the Pecos. The Canadian river drains the eastern slope of the Rocky Mountains and flows in a general south-easterly direction through Texas into Oklahoma, where it empties into the Arkansas. Most of its course in New Mexico lies through a canyon. The westward-flowing streams—the San Juan, Rio Puerco of the West, Zuñi, Rio San Francisco and Gila—are of only slight importance, though their flow is perennial. In the valleys there are many small streams whose waters never reach the ocean, but disappear by seepage or evaporation.

Fauna and Flora.—Of native animals the species are numerous, but their numbers are small. Bison no longer roam the plains, and the elk has been driven out; but among the larger mammals still to be found in certain districts are the deer, prong-horn (in small numbers), puma, coyote, timber wolf, lynx (*Lynx rufus* and *Lynx Canadensis*) and the black and grizzly bear. Badgers, hares and rabbits are found everywhere, and prairie-dogs are so numerous in some places as to be considered a nuisance. There are numerous species of aquatic birds. From time to time upon the Rio Grande may be seen ducks, wild geese, swans, cranes, herons and gulls. Eagles are often seen, and in the arid and elevated regions crows and ravens are numerous. Gamble's quail, bob-white, grouse, English pheasants and wild turkeys are the most important game birds, and the mocking-bird is common throughout south-western New Mexico. Among the venomous reptiles and insects are the rattlesnake, the Gila monster (*Heloderma suspectum*), a poisonous lizard, and the tarantula (*Mygale Hentzii*), which, however, are common only in certain places and at certain seasons.

New Mexico has such a great range of elevations that all four of the zones of vegetation into which the South-West has been divided according to altitude are found within its limits; namely, the zone of cactus, yucca and agave (3000–3500 ft.), where grass is scanty; the zone of greasewood and sage-brush (3500–4900 ft.), where there is little grass, and the cactus species are less numerous; the zone of the cedar (4900–6800 ft.); and the zone of the pine and fir (6800–10,800 ft.), in which grass is more abundant. The total woodland area has been estimated at 23,700 sq. m., or a little more than 19% of the land area. Only the higher ranges and plateaus are timbered, and even there the forests are not dense. The lower slopes are usually covered with the scrub oak, juniper and pifion; but some mountains, especially those along the eastern border of the Rio Grande Valley, are absolutely treeless. The principal forest areas are upon the southern end of the San Juan Range, upon the Sangre de Cristo Range and in Socorro county, W. of the Rio Grande. The chief varieties of timber are the red fir, Engelmann's spruce and yellow pine. Up to 1910 the Federal government had created eleven forest reservations in New Mexico, embracing an area of 10,971,711 acres. In the valleys the only trees nati
are the willow and cottonwood, found along the wate

Manufacturers) New Mexico contained 2,600,000 sheep

number in any state or Territory except Montana and Wyoming; and in April 1909 there were 3,200,000 sheep of shearing age in New Mexico, but this number was less than that in Montana or Wyoming at that time.

Except in a few mountain valleys in the N., agriculture was long entirely dependent upon irrigation, which has been practised in New Mexico by the Pueblo Indians since prehistoric times. In 1899 the total irrigated area outside of Indian reservations amounted to 203,893 acres (67·2% of all improved land)—an increase of 122·2% in the preceding decade. Of the total land in crops in that year 89·2% was irrigated. After the passage of the Federal Reclamation Act in 1902, a number of extensive irrigation works in New Mexico were undertaken by the Federal government. The Carlsbad reservoir and diverting dam in Eddy county and the Rio Hondo canals and reservoir in Chaves county were completed in 1907 and are capable of supplying water to tracts of 20,000 and 10,000 acres respectively. In 1908 an irrigation reservoir in McKinley county for the use of the Zuñi Indians and the Leasburg project (Dona Ana county; 20,000 acres) were completed. The Rio Grande project was planned in 1907 for the storage of the flood waters of the Rio Grande near Engle, New Mexico, in order to reclaim about 155,000 acres of land in New Mexico and Texas, and to deliver to Mexico above the city of Juarez 60,000 acre-feet of water per year, as provided by a treaty (proclaimed on the 16th of January 1907) between that republic and the United States. Other systems contemplated by the government were the Las Vegas project for reclaiming 10,000 acres near Las Vegas, the Urton Lake project for reclaiming 60,000 acres in the Pecos Valley, and the La Plata Valley project for irrigating about 40,000 acres in the north-western part of New Mexico, 35 m. S.W. of Durango, Colorado. A special irrigation commission was appointed in 1897, and in 1905 the legislature created the office of Territorial irrigation engineer. Irrigation by private companies is of some importance, especially in the San Juan Valley, the Rio Grande Valley and the Pecos Valley. In 1909 it was estimated that about 500,000 acres were irrigated. Dry farming has proved a great success in New Mexico, as elsewhere in the South-West, especially since 1900; and in 1907 it was estimated that 2,000,000 acres were cultivated without irrigation.

Manufactures.—As New Mexico is primarily a mining and stock-raising region, its manufacturing industries are of comparatively small importance. The value of the manufactured products in 1880 was $1,284,846; in 1890 $1,516,195; and in 1900 $5,605,795, an increase in the latter decade of 269·7%. In 1905 there were 199 establishments under the factory system (an increase of 14·4% over the number in 1900); the amount of capital invested was $4,638,248, and the value of "factory" products was $5,705,880 (an increase of 40·5% over the value of the "factory" products in 1900). The leading industries in 1905 were the construction of cars and general railway shop and repair work by steam railway companies (value of product, $2,509,845), the manufacture of lumber and timber products (value $1,315,364) and of flour and grist mill products (value $388,124), and the printing and publishing of newspapers and periodicals (value $279,858). In 1900 the manufactures of Albuquerque, Santa Fé and Socorro were valued at 39·4% of the total value of New Mexico's products.

Minerals.—The existence of valuable mineral deposits was early known to the Spaniards. There was some production of gold by the Mexicans, but the silver mining was unimportant until 1881, when the Lake Valley silver mines in Sierra county began to yield. Between that year and 1884 the coining value of the silver product increased from $275,000 to $3,000,000. After 1885 there was a gradual decline in the output, whose bullion value in 1908 was $250,986. The production of gold has shown a somewhat similar movement; the output in 1881 was valued at $185,000; in 1889, at $1,000,000, and in 1908 at $298,757. The leading gold- and silver-producing counties are Socorro, Grant, Sierra and Dona Ana. Only silver is mined in the last-named county. Copper has been mined for many years, and in 1906 and 1908 constituted New Mexico's most valuable metallic product, the value of the yield in these years being $1,356,533 and $658,858 respectively. Nearly all the product comes from Grant county, and in 1908 nearly 98% of the output was from Grant and Otero counties. In 1905–1908 the decrease in output was large. In the same years there was an increase in the output of zinc, which in 1906 was valued at $67,710 and in 1908 at $168,096. Most of the zinc comes from Socorro county, where the mines of the Magdalena District in 1908 yielded 93% of the entire product. A small amount of lead is produced incidentally to the mining of zinc, being derived from mixed lead and zinc ores. Far the most important mineral product, however, is coal, which is found in all forms—lignite to anthracite—and in widely distributed areas. The chief centres of production are the Raton field, in Colfax county; the Durango-Gallup field, in McKinley and Rio Arriba counties; the Whitecoaks field, in Lincoln county; and the Los Cerillos and Tejon areas, in Santa Fé county. Much of the coal is suitable for coke of which a considerable amount is manufactured. The value of the coal product in 1902 was $1,500,230; in 1904, $1,904,499; and in 1908, $3,368,753. Iron ores are widely distributed, but have not been developed; graphite is mined in Colfax county; mica in Taos county, and to a small extent in Rio Arriba county; marble is quarried in Otero county and sandstone in Bernalillo, Colfax and San Miguel counties. Gypsum beds are widely distributed, and the supply is inexhaustible, but their great distance from centres of consumption has prevented their profitable working. In New Mexico are found turquoises and a few garnets; it seems probable that turquoises were mined by the Aztecs. The largest of the old Spanish turquoise mines in the Cerillos District, 18 m. S. of Santa Fé, furnished a turquoise product between 1890 and 1900 valued at more than $2,000,000. Other mines are in Grant and Otero counties. The New Mexican garnets are found in McKinley county. The output of precious stones in 1902 was valued at $51,100, in 1908 at $72,100.

Transportation.—The total railway mileage on the 31st of December 1908 was 2,918·02, more than twice as much as that of 1890. The length of railway per inhabitant in New Mexico in 1907 was about five times as great as that for the whole country, but the amount of line per square mile of territory was only about one-third as great as the average for the United States. New Mexico is traversed by two transcontinental lines, the Atchison, Topeka & Santa Fé, from Chicago to San Francisco and the Southern Pacific, from New Orleans to San Francisco. The main line of the former enters New Mexico near Raton, extends S.W. to Albuquerque and thence westward into Arizona. A southward extension taps the Southern Pacific at El Paso, Texas, and Deming, New Mexico, and there are numerous shorter branches. This system also controls the Pecos Valley & North-Eastern railway, which serves the south-western part of New Mexico. The Southern Pacific crosses New Mexico westward from El Paso, Texas. The western division of the El Paso & South-Western system, connecting El Paso and Benson, Arizona, crosses New Mexico just N. of the Mexican boundary. Its eastern division (including the El Paso & North-Eastern, the El Paso & Rock Island, the Alamogordo & Sacramento Mountain and the Dawson railways) connects with the Chicago, Rock Island & Pacific at Tucumcari; thus forming a connecting link between that system and the Southern Pacific. The Santa Fé Central, extending southward from Santa Fé to Torrance, is a connecting link between the Atchison, Topeka & Santa Fé and the El Paso & South-Western systems. Branches of the Denver & Rio Grande serve the northern parts of New Mexico.

Population.—The population of New Mexico consists of three distinct classes—Indians; Spanish-Americans, locally known as "Mexicans"; and the English-speaking class called, in distinction from the others, "Americans." Of the Indians there are two types, both of the Athapascan family; in one are the Pueblos, and in the other the Navahos, in the N.W. part of the state, and their near kinsmen, the Apaches, to the south. The Pueblo Indians live in adobe houses, are quiet and usually self-sustaining, and have been converted to the forms of Christianity. They had irrigated farms and dwelt in six-storey communal houses long before the advent of the white man. By the treaty of Guadalupe-Hidalgo, in 1848, the United States government recognized them as citizens. They lived in 19 villages of pueblos, the largest of which, Zuñi, is more properly called a reservation, as it has been enlarged from time to time by grants from the Federal government. The 18 pueblos and the Zuñi reservation contained in 1900 a population of 8127, and a total area of 1417 sq. m. The pueblos are held under Spanish grants which were confirmed by the United States. The terraced architecture of the villages is very remarkable. Originally the Pueblo Indians lived in many-storeyed communal houses, built sometimes of stone, sometimes of adobe, and occasionally chiselled into the sides of a stone cliff, as best suited the convenience of the builders. At present there is a tendency among them to copy the one-storey huts of the Mexicans. Taos (pop. in 1900, 419) is one of the most imposing of the pueblos, consisting of two six-storeyed pyramidal tenements, separated by a brook. Zuñi (pop. 1525) has a five-storeyed dwelling surrounded by detached huts; Acoma (pop. 492 in 1900; 566 in 1902), standing on a cliff 357 ft. high (Acoma means "people of the white rock" and Aco, the Indian name for the pueblo, means "white rock"), contains three blocks of three-storeyed terraced buildings,[1] and Laguna also contains some three-storeyed

[1] About 3 m. N.E. of Acoma stands the Enchanted Mesa (Mesa Encantada; Katzimo in Keresan), rising 430 ft. above the plain, and being 2050 ft. long and 100 to 350 ft. wide. Upon its summit, according to Indian tradition, once stood the village of Acoma, but while the inhabitants were tending their crops in the plains a powerful earth movement threw down the rocky ladder by which alone the summit could be reached. According to the story, three women had been left in the village and these perished. The Mesa was first climbed by white men in 1896 by Prof. William Libbey (b. 1855), of Princeton University; it was climbed again in 1897 by a party led by F. W. Hodge; and pottery and stone implements were found here.

dwellings, but the Laguna tribe, numbering, 1077 in 1900 and 1384 in 1905, now live mostly in their former summer villages on the plain. The other Indians live on reservations, of which there are three: the Mescalero Apache reservation, in Otero county, containing 554 Indians in 1900; the Jicarilla Apache reservation, in Rio Arriba county, with a population of 829; and the Navaho reservation, in Utah, Arizona and New Mexico, which contains in that part of it situated in New Mexico a population of 2480.

The inhabitants of Spanish descent have been only slightly assimilated and cling tenaciously to their racial peculiarities. As a rule, they live in low adobe houses built around a court, and are poor and ignorant, but hospitable. They are more Americanized in the Rio Grande Valley than among the mountains, where English is rarely spoken. Many of them have intermarried with the Indians, creating the class of half-breeds known as "Mestizos." Although the proportion of Spanish-American and Indian inhabitants is steadily decreasing with the arrival of immigrants from other parts of the United States, it was nevertheless computed by the New Mexican authorities to be about 63% in 1904. About one-tenth of the Spanish-American and Indian population habitually use the English language.

The total population of New Mexico in 1870 was 91,874; in 1880, 119,565; in 1890, 153,593; in 1900, 195,310, and in 1910, according to the U.S. census, the figure was 327,301. Of the native white population in 1900, 17,917 were of foreign parentage. Of the foreign-born element 6649, or about one-half, were Mexicans, 1360 were Germans and the rest chiefly English, Irish, Canadians, Italians, Scotch and Austrians. The chief cities were Albuquerque (6238), Santa Fé (5603), Las Vegas (3552) and Raton (3540). Far the greater portion of the population (in 1906, 56·2% of the estimated population) are communicants of the Roman Catholic Church, which had in 1906 121,558 members, the total communicants of all denominations in that year numbering 137,009. Among Protestants there were 6560 Methodists, 2935 Presbyterians and 2331 Baptists.

Administration.—The executive officers until 1911 were a governor and a Territorial secretary appointed by the President of the United States, and a treasurer, auditor, superintendent of public instruction, adjutant-general, commissioner of public lands and other administrative officials appointed by the governor. The legislative department included a council of 12 members and a House of Representatives of 24 members, chosen by popular vote. The sessions were biennial and limited to 60 days. All laws passed by the Assembly and approved by the governor had to be submitted to the Federal Congress for its approval. The Territory was represented in Congress by a delegate, chosen by popular vote, with the right to speak in the national legislature but not to vote. The judicial department included a supreme court, district courts, probate courts and local justices of the peace. The supreme court consisted of a chief justice and six associate justices appointed by the President. There were seven judicial districts, each with a court presided over by a justice of the supreme court. Each county had a probate court, and each precinct a justice of the peace.

For the purposes of local government New Mexico is divided into 26 counties, each being governed by a board of county commissioners, chosen by the people. Each county is divided by the commissioners into precincts. Municipal corporations with a population of 3000 and over are cities, and are governed through a mayor and board of aldermen; those with a population of between 1500 and 3000 are towns, and are governed through a mayor and trustees.

A rather unusual institution within New Mexico is the mounted police, who numbered 11 in 1907, whose work was almost entirely in the cattle country, and who had authority to patrol the entire Territory and to make arrests or to preserve order wherever their presence was needed, unhampered by the restrictions limiting the jurisdiction of local police.

A homestead not exceeding $1000 in value, and held by a husband and wife or by a widow or widower with an unmarried daughter or an unmarried minor son, may be held exempt from seizure and sale by legal process. The exemption may be claimed by either the husband or the wife, but may not be granted if each owns a homestead; and it does not extend to judgments rendered against the debtor on account of a mortgage, non-payment of the purchase money or supplies and labour for building and repairs.

In 1907 the legislature passed a radical measure, making the penalty for operating games of chance six months' imprisonment in the county-jail, and, at the discretion of the court, a fine of not less than $100 and not more than $500; this law went into effect on the 1st of January 1908. Gambling had formerly been licensed—the gambling-house keeper paying $200 per annum for each gaming table or apparatus, this sum going to the district and county school funds.

Revenues for the support of the government are derived chiefly from the general property tax. There are also special corporation taxes on car companies, express companies and foreign corporations producing, refining or selling petroleum or coal oil; and a system of licence-charges or business taxes. A poll tax is levied by the state for school purposes and may also be levied by municipalities. The county and the municipal tax rates are limited respectively to 5 and 10 mills on the dollar. A special tax not exceeding 3 mills on the dollar may be levied on all taxable property for school purposes, and the proceeds apportioned among the school districts according to the number of school children. The proceeds of the poll tax are distributed in the counties in which the tax is collected. Each school district may supplement the aid from the state by laying special taxes, and the Federal government has granted to each township 4 sq. m. of public land to aid in the support of the schools. Land-grants amounting in 1907 to 1,343,080 acres had also been made for the benefit of various educational, charitable and correctional institutions, and for irrigation purposes. At the close of the fiscal year ending on the 31st of May 1908, New Mexico showed expenditures of $721,272·81, receipts of $754,080·94 and a balance in the treasury of $378,653·63. The bonded debt, amounting on the 31st of May 1908 to $788,000, was incurred partly in meeting temporary deficits in the treasury and partly in the construction of public buildings.

Education.—At the head of the public school system is a Board of Education of seven members, including the governor and the superintendent of public instruction; this Board apportions the school fund among the counties, selects the text-books and prepares the examinations for teachers. The superintendent of public instruction exercises a general supervision over the schools of New Mexico. There is also a superintendent of schools for each county, and the counties are divided into school districts, each having three directors, who disburse the school funds and have the care of the school property. In incorporated cities and towns these functions are discharged by local boards of education. The school age is from five to twenty-one years, and for children between the ages of seven and fourteen school attendance for three months in each year is compulsory. The total enrollment for the year ending the 1st of August 1906 was 39,377, with an average daily attendance of 25,174; the average length of the school year was 5 months and 19 days. The use of English in the schoolroom is required by law; New Mexico has adopted a uniform system of text-books.

The state supports the University of New Mexico at Albuquerque; a College of Agriculture and Mechanic Arts[1] (established 1889, opened 1890) at Mesilla Park, 40 m. from El Paso; a Normal School at Silver City (pop. 1900, 2735; county-seat of Grant county); a Normal University at Las Vegas; a School of Mines (at Socorro; pop. 1900, 1512; county-seat of Socorro county), which was founded in 1889, was organized and opened in 1895 when it received from Congress 50,000 acres of land, has in its library the private library of John W. Powell, formerly director of the U.S. Geological Survey, and owns the Torrance Mine at the foot of Socorro Mountain, 2 m. from the college campus; and a Military Institute at Roswell (pop. 1900, 2006; county-seat of Chaves county). Indian day schools are maintained by the Federal government at Albuquerque, Jicarilla, Santa Fé and Zuñi.

The state maintains an insane asylum at Las Vegas, a deaf and dumb asylum and penitentiary at Santa Fé, an institute for the blind at Almagordo, a reform school at El Rito and a miners' hospital at Raton. For many years the legislature has also contributed to the support of a number of private hospitals and charitable institutions.

History.—To the existence of an Old-World myth New Mexico owes its early exploration by the Spaniards. Early in the 16th century it was believed that in the New World would be found the fabled cities and creatures of which Europeans had heard for centuries. There was a story that in the 8th century a bishop of Lisbon, to escape from the Arabs, had fled to islands in the West, where he and his followers had founded seven cities; and when the Indians in Mexico related to the Spanish explorers a bit of their folk-lore, to the effect that they had issued from seven caves, the imaginative white men soon identified these caves with the famous Seven Cities. In 1536 came Cabeza

[1] This college also receives Federal aid: 100,000 acres of public land were voted to it in 1898.

de Vaca into Mexico after eight years of wandering across the continent and related to his countrymen the stories he had heard of wonderful cities of stone in the north. He had not seen the cities himself, nor had he, as is frequently asserted, gone as far north as the present New Mexico, but his reports tended to confirm previous rumours and led the viceroy, Don Antonio de Mendoza, to send Fray Marcos de Niza, a Franciscan friar, on a small and inexpensive expedition of discovery.

Fray Marcos (*q.v.*) was the first European to enter the limits of what is now New Mexico. A glimpse of the terraced houses of an Indian village—now identified as Zuñi—convinced him that he had seen one of the Seven Cities, and he hastened back with the good news. The stories that he told grew in their passage from mouth to mouth until the Spaniards believed that in the north were cities "very rich, having silversmiths, and that the women wore strings of gold beads and the men girdles of gold." Full of missionary zeal, and desirous that settlements should be planted in the new region in order that the heathen might be converted, Fray Marcos did little to refute these exaggerations. The conquest of the Seven Cities was determined upon, and a band of adventurers, led by Francisco Vasquez de Coronado (*q.v.*), set out in 1539. Following the route of Fray Marcos de Niza, Coronado reached the first of the alleged cities, and to his great disappointment found only an Indian pueblo. An exploring party sent eastward reached Acoma, and then proceeded to Tiguex on the Rio Grande, and finally to the Pecos river. The main body of Coronado's expedition remained in New Mexico on the Rio Grande while he pushed on to the fabled land of Quivíra,[1] only to meet with another disappointment.

Forty years elapsed before the Spaniards again entered New Mexico. In 1581 Fray Augustin Rodriguez, another Franciscan, explored the valley of the Rio Grande, and in 1582–1583 Antonio Espejo made extended explorations to the E. and W. of this stream. It was about this time, apparently, that the Spaniards in Mexico adopted the term New Mexico to designate the land to the north; Rodriguez had called the country San Felipe, and Espejo had named it Nueva Andalucia. Between 1583 and 1595 several attempts at the conquest and occupation of New Mexico were made, but for various reasons they were unsuccessful. In the spring of 1598 Don Juan de Oñate entered New Mexico with about 400 colonists, and choosing the pueblo of San Juan (30 m. N.W. of the modern Santa Fé) as a temporary dwelling-place, made preparations for building a town at the junction of the Rio Chama and the Rio Grande, to be known as San Francisco. In the following year the new settlement was renamed San Gabriel. Some years later a second settlement was made at Santa Fé, which has ever since been the seat of government of New Mexico. Although the Franciscan missionaries by 1617 had built seven churches and had baptized 14,000 Indians, there were in this year only 48 soldiers and settlers in the province. The zeal of the friars in stamping out the religious rites of the natives, the severe penalties inflicted for non-observance of the rules of the Church, and the heavy tribute in kind demanded by the Spanish authorities, aroused feelings of resentment in the Pueblo Indians and led in 1680 to a general revolt, headed by a native named Popé. Over 400 Spaniards were massacred, and the remnant, after enduring a siege in Santa Fé, fled southward to a mission near the present El Paso. For a decade the natives enjoyed their independence, destroying nearly all vestiges of Spanish occupation, and venting their wrath particularly upon the churches. After several attempts at reconquest had failed, Don Diego de Vargas marched up the Rio Grande in 1692, and largely by moral suasion secured the surrender of Santa Fé, then held by the Indians. During the next four years the submission of all the pueblos was secured, and the permanency of European occupation was assured. The history of New Mexico in the 18th century was uneventful, being chiefly a story of petty disagreements among the pueblos, and occasional forays of the more warlike tribes, the Navahos, Apaches and Comanches. During the Mexican War of Independence (1811–21) New Mexico was tranquil and little disturbed by events farther south; but when, near the close of the year 1821, the news of independence arrived it was received with enthusiasm. Under the Mexican republic New Mexico was called a province till 1824, when it was united with Chihuahua and Durango to form the Estado Interno del Norte. Several months later, however, it was separated from these two provinces and became a Territory; in 1836 it was officially designated as a department, and remained as such until ceded to the United States by the treaty of Guadalupe-Hidalgo, in 1848. Its government during this period was only slightly changed from what it had been under Spain.

Of great importance to New Mexico during the first half of the 19th century was the development of its trade with the United States. American traders had occasionally ventured as far as Santa Fé before the independence of Mexico, but they were frequently expelled and their goods confiscated by the Spanish authorities. After 1822 trading expeditions became larger and more numerous. From Missouri caravans of pack animals, and later wagon trains, set out in May of each year on the 800 m. journey to Santa Fé, along the route later followed in its general lines by the Atchison, Topeka & Santa Fé railway. The value of the products carried by these trains increased from $15,000 in 1822 to $450,000 in 1843. On their return trip the wagons often brought loads of wool, fur and blankets.

In 1841 the republic of Texas, claiming that its western boundary was the Rio Grande, sent a force of 300 men to New Mexico to enforce these claims. The Texans reached the frontier in a starved and exhausted condition, were made prisoners by the New Mexican militia, and were sent to Mexico, where after a short term of confinement they were released.

In 1846 the Congress of the United States declared that war existed with Mexico, and on the 3rd of June Brigadier-General Stephen W. Kearny was ordered to undertake the conquest of New Mexico and California and to "establish temporary civil governments therein." Kearny reached Las Vegas on the 15th of August, assured the people of protection if they remained peaceable, and three days later entered Santa Fé without opposition. Here he organized a civil government and compiled a code of laws, some of which are still in force, thus exceeding his instructions and ignoring the territorial claims of Texas, out of which had grown the war. After Kearny's departure for California and Col. Alexander William Doniphan's (1808–1887) setting out (Dec. 1846) on his heroic expedition to join Gen. Wool at Chihuahua, some of the inhabitants revolted, and in January 1847 assassinated the governor, Charles Bent, and a number of Americans and Mexicans who had taken office under the new regime. The insurrection was quickly suppressed, but the citizens soon grew tired of a military government, and in 1848 and again in 1849 petitioned Congress for a government "purely civil in character." In 1850 a convention met in Santa Fé and drafted a state constitution prohibiting slavery; this constitution was ratified, and state officials were chosen to act under it. The governor by military appointment, Colonel John Munroe (1796–1861), refused to surrender his jurisdiction in favour of the state officials until authorized to do so by Congress, and for a time there was much writing of pronunciamentos by the military and the quasi-state officials. But finally a regular Territorial form of government, provided by Congress by an act of the 13th of December 1850 (a part of the Compromise of 1850), was formally inaugurated on the 3rd of March 1851.

As originally constituted, the Territory included, besides most of its present area, nearly all of what is now Arizona, and a small portion of the present Colorado. By the terms of the Compromise Measures of 1850 Texas surrendered all claims to the portion of New Mexico E. of the Rio Grande, and was reimbursed for this loss of territory by the Federal Government. The Gadsden Purchase (see GADSDEN, JAMES), concluded on the 30th of

[1] Although the Quivíra story was fabricated by an Indian captive and its fraudulent character was fully exposed by Coronado in 1541, ignorant American treasure-seekers still search for this mythical region. By a strange perversion of names the deserted stone pueblo of Tabirá, S. of Albuquerque in the vicinity of the Manzano Mountains, has received the appellation of "Gran Quivíra," thereby causing many deluded persons to make a vain search among its ruins for treasure.

December 1853, and proclaimed by President Pierce on the 30th of June 1854, added to the Territory an area of 45,535 sq. m., and changed the southern boundary W. of the Rio Grande so that from the Rio Grande the new boundary ran due W. on the parallel of 31° 47′ N. lat. for 100 m., then due S. to the parallel of 31° 20′ N. lat., then due W. on that parallel to its intersection with the 111th meridian of longitude west of Greenwich, from that point of intersection in a straight line to the Colorado river, 20 m. below its junction with the Gila, and thence up the middle of the Colorado river to the boundary line between Mexico and California. In 1861 a portion of north-eastern New Mexico was taken to form part of Colorado; and in 1863 all of the area W. of the 109th meridian was organized as the separate Territory of Arizona.

By the Compromise of 1850 the question whether New Mexico should have slavery was left to the decision of the inhabitants. Only a few African slaves were ever brought into the Territory, and these were usually the property of civil and military officers. There were two classes of the population, however, whose status was practically that of slaves; namely, Indian captives and *peons*. Before slavery was prohibited in the Territory by Act of Congress in 1862, Indian captives were regularly bought and sold, a traffic sanctioned by custom and not prohibited by law. *Peons* were persons held in servitude on account of debt, and the peonage system was sanctioned both by the custom of the Mexican provinces and by the laws of the Territory. An act of 1851 forbade servants from leaving masters to whom they were indebted, and in 1853 sheriffs were authorized in some instances to dispose of the debtor's labour to the highest bidder. Peonage remained a legalized institution until 1867, when it was prohibited by an act of Congress.

At the outbreak of the Civil War the inhabitants were generally apathetic; but when the Confederates invaded New Mexico they proved loyal to the Union.[1] In February 1862 General H. H. Sibley, commanding a force of about 3800 Texans, marched into New Mexico, fought a successful engagement at Valverde, on the Rio Grande, against Union forces under Colonel, later General, Edward R. S. Canby, and occupied Albuquerque and Santa Fé. The Union troops were reinforced from Colorado, however, and after a series of skirmishes the Confederates were compelled to retreat to Texas, leaving behind about half their original number in killed, wounded and missing. New Mexico furnished to the Union army between 5000 and 6000 men.

The period following the American occupation of New Mexico was marked by constant depredations of the Indians, chiefly the Navahos, Apaches and a few Utes, their main object being plunder. While the troops were occupied with the Confederate invaders the Indians had a free hand, but in 1863 an energetic campaign was begun by General James H. Carleton against the Navahos, who were subdued and placed on a reservation on the Pecos river, and later removed to the north-western part of the Territory. There they grew peaceful and prosperous, acquiring large flocks of sheep and gaining a reputation as makers of blankets. The Apache Indians, the most savage of all, were placed on reservations somewhat later, but for many years bands of their warriors would escape and make raids into New Mexico, Arizona and Mexico. The most notable of the later outbreaks were those in 1879–1880 and in 1885–1886 respectively of the Apache chiefs Victorio and Geronimo (*c.* 1834–1909).

When the United States acquired possession of New Mexico, the best portions of the Territory were held in private ownership under Spanish and Mexican grants, which were confirmed by the treaty of Guadalupe-Hidalgo. To determine the validity of these claims, which had been complicated by transfers and subdivisions, and to fix their boundaries, which were often very vaguely described, proved a very formidable undertaking; and the slow process of confirmation greatly retarded the development of the Territory. There was but little material progress before the advent of the railway. The Atchison, Topeka & Santa Fé railway reached Albuquerque in 1880, and the Southern Pacific railway effected a junction with it at Deming in 1881, thus connecting the Territory with the eastern and western coasts of the United States. With the railway came capital and the development of mines, great cattle ranges and modern towns. Immigrants from the states, however, rarely settled beyond the zone of the railway, and in the remote rural regions the process of Americanization was slow.

After the Civil War numerous attempts were made to secure the admission of New Mexico into the Union as a state. In 1872 a state constitution was drafted, and it was proposed for a time to call the new state Lincoln, but the movement came to nothing. In 1889 another constitution was drafted, but it was rejected when submitted to a popular vote. On the 6th of November 1906 the question of the joint admission of New Mexico and Arizona as a single state bearing the name of the latter Territory was submitted to a vote of their citizens. The vote of New Mexico was favourable (26,195 to 14,735), but the measure was defeated in Arizona. In June 1910 the President approved an enabling act providing for the admission of Arizona and New Mexico as separate states.

The governors of New Mexico since its independence from Spain have been as follows:

Under the Mexican Republic[2]	
Francisco Javier Chavez	1822
Antonio Vizcarra	1822–1823
Francisco Javier Chavez (acting)	1823
Bartolomé Vaca	1823–1825
Antonio Narbona	1825–1827
Manuel Armijo	1827–1828
Antonio Vizcarra (acting)	1828
José Antonio Chavez	1828–1831
Santiago Abreu	1831–1833
Francisco Sarracino	1833–1835
Juan Rafael Ortiz (acting)	1834
Mariano Chavez (acting)	1835
Albino Perez	1835–1837
José Gonzalez, revolutionary governor or pretendant	1837–1838
Manuel Armijo	1838–1846
Antonio Sandoval (acting)	1841
Mariano Martinez de Lejanza (acting)	1844–1845
José Chavez (acting)	1845
Juan Bautista Vigil y Alarid (acting)	1846
Under the United States	
Governors by Military Appointment.	
Charles Bent	1846–1847[3]
Donaciano Vigil	1847–1848
John Marshall Washington	1848–1849[4]
John Munroe	1849–1851[4]
Governors by Presidential Appointment.	
James S. Calhoun	1851–1852
E. V. Sumner (Military Commander, acting)	1852
John Greiner (Secretary, acting)	1852
William Carr Lane	1852–1853
David Merriwether	1853–1857
Abraham Rencher	1857–1861
Henry Connelly	1861–1865
W. E. M. Arny (Secretary, acting)	1865–1866
Robert B. Mitchell	1866–1869
William A. Pile	1869–1871
Marsh Gidding	1871–1875
William G. Ritch (Secretary, acting)	1875
Samuel B. Axtell	1875–1878
Lewis Wallace	1878–1881
Lionel A. Sheldon	1881–1885
Edmund G. Ross	1885–1889
L. Bradford Prince	1889–1893
William T. Thornton	1893–1897
Miguel A. Otero	1897–1906
Herbert J. Hagerman	1906–1907
J. W. Raynolds (Secretary, acting as governor)	1907
George Curry	1907–1909
William J. Mills	1909–

Bancroft, *Arizona and New Mexico* (San

[1] According to the historian H. H. Bancroft, the loyalty to the Union cause resulted "largely from the fact that the Confederate invasion came from Texas, the old hatred of the Texans being the strongest popular feeling of the natives, far outweighing their devotion to either the North or the South."

[2] Under the republic until 1837 the governor was officially designated as *jefe político*; after that date as *gobernador*.

[3] Assassinated during the Mexican revolt on the 19th of January 1847.

[4] Governor as Commander of the Department.

NEW MILLS, an urban district in the High Peak parliamentary division of Derbyshire, England, at the confluence of the rivers Goyt and Kinder, on the border of Cheshire, 13 m. S.E. of Manchester, on the Midland and the London & North-Western railways. Pop. (1901) 7773. Its ancient name was Bowden Middle Cale. The name of New Mills was given to it from a corn-mill erected on the Kinder in the hamlet of Ollersett, and is specially applied to the group of factories which have grown up round it. Formerly paper and cloth were the staple industries of the district, but the inhabitants of the various hamlets are now occupied chiefly in iron and brass foundries, cotton mills and print-works. A short branch of the Midland railway leads to the town of Hayfield (pop. 2614).

NEWMILNS, a manufacturing town and police burgh of Ayrshire, Scotland. Pop. (1901) 4467. It is situated 7½ m. E. of Kilmarnock by the Glasgow and South-Western railway. It was made a burgh of barony in 1490 by James IV., the charter being confirmed in 1566 by Sir Matthew Campbell, the laird of Loudoun, in which parish the town is situated. Muslin- and lace-curtain making and the manufacture of mosquito-nets are the chief industries. Nearly 2 m. E. lies Darvel (pop. 3070), a police burgh and manufacturing town, with a station on the Glasgow and South-Western railway; its chief manufactures are those of lace curtains, muslins and carpets. Two miles E. rises Loudoun Hill (1036 ft.) where Robert Bruce defeated the English in 1307, and about a mile farther E. is the cairn raised to commemorate one of Wallace's victories.

NEW ORLEANS, a city of Louisiana, U.S.A., situated almost wholly on the left bank of the Mississippi, 107 m. from its mouth, in that portion of the state which constitutes the river's larger delta, and lying between Lake Pontchartrain (to the north and west) and Lake Borgne (to the east and south); its latitude is about 30°, nearly the same as that of Cairo, Egypt. Pop. (1910) 339,075. The city lay originally at the angle of a deep three-sided bend in the river. Into this hollow it gradually spread, the curving river front, some 9 m. long, serving as its harbour; and hence its old appellation, the Crescent City. Long ago, however, the city filled the pocket of the bend, and spreading farther along the river, now has the form of an "S." Directly north, and still about 3 m. distant from the parts of the city proper that have advanced farthest toward it, lies Lake Pontchartrain (about 40 m. long and 20 m. wide). Lake and river are parallel to one another for many miles; the city lies on the narrow alluvial strip between. The total area included within the municipal limits is 196·25 sq. m., but the city proper covers about 40 sq. m. The larger limits are coextensive with those of the parish of Orleans, and include the district of Algiers, on the right bank of the Mississippi.

The river at New Orleans varies from 1500 to 3000 ft. in width, and its broad channel often stretches almost from shore to shore, with a depth varying frequently at short intervals from 40 ft. to more than 200 ft. Around the margins a line of wharves and shipping extends for miles on each shore. Including the suburbs of Westwego, Gretna, &c., on the right bank of the stream, there is a river frontage of more than 20 m. Gretna, the seat of Jefferson parish, McDonoghville, in Jefferson parish, and Algiers, or West New Orleans, a part of the city, are industrial suburbs on the west bank of the Mississippi, connected with the east bank by a steam ferry and with one another by electric railway. At Algiers are railway terminals and repair shops of the Southern Pacific and the Texas & Pacific; and the United States Naval Station here, which was built in 1894 (though land was bought for it in 1849), and has a large steel floating dry dock, is the only fresh-water station south of Portsmouth, Virginia, and is equipped to make all repairs.

The city site is almost perfectly level; there is an exceedingly slight slope from the river toward the tidal morasses that border Lake Pontchartrain. The elevation of the city plain is only 10 ft. above the sea, and its lower parts are as much as 10-12 ft. below the Mississippi at high flood water. About 6 m. of heavy "levees" or dykes—in some parts rising clear above the city plain, but backed by filled-in areas graded down from the shores where the traffic of the water-front is concentrated—protect it from the waters. The speed of the current reaches, in times of high water, a rate of 5 m. an hour. Along the immediate front of the principal commercial quarter, this current, losing some of its force by change of direction, deposits its alluvium in such quantities as to produce a constant encroachment of the shore upon the harbour. At its widest part this new land or batture, with wharves, streets and warehouses following eagerly after it, has advanced some 1500 ft. beyond the water-line of the middle of the 18th century.

The climate is not marked by extremes of absolute heat or cold. Only once in thirty-seven years (1871–1907) did the thermometer register as high as 102° F., and on only a few days did it register above 96°; in February 1899 the temperature was 7°, but it rarely falls below 22°. The average annual rainfall is about 58 in.

Canal Street, the centre of retail trade and street life, bounds on the south-west near the river the *Vieux Carré*—the old rectangle within the walls of the original city, bounded by the river, Canal, Rampart and Esplanade streets—and separates the picturesque, peaceful French (or Latin) Quarter of the north-east from the bustling business and dignified residence districts of the American Quarter, or New City, on the south-west. In the latter St Charles Avenue and Prytania Street have the finest residences, and in the former Esplanade Avenue. Just below Canal Street, in the oldest part of the American Quarter, are many of the most important or imposing buildings of the city, and some of the places most intimately associated with its history. Here are the St Charles Hotel (1894), the third of that name on the present site, all famous hostelries, and the first (1838–1851) one of the earliest of the great hotels of the country; and Lafayette Square, surrounded by the City Hall (built in 1850 in the style of an Ionic temple), the new Post Office, two handsome churches, St Patrick's and the First Presbyterian, Odd Fellows' Hall and other buildings. In the square are statues of Henry Clay (by Joel T. Hart) and Franklin (by Hiram Powers), and a monument to John McDonogh (1898); and in the vicinity are the Howard Memorial Library (1887; a memorial to Charles T. Howard), which was the last work of H. H. Richardson, a native of Louisiana, and the Confederate Memorial Hall (presented to the city by F. T. Howard) with Confederate relics. Two blocks away in Marguerite Place is a statue erected (1884) by the women of the city to Margaret Haughery (d. 1882), the "Orphan's Friend," a noble woman of humble birth and circumstances, who devoted a toilful but successful life to charities. In Lee Circle is a monument to Robert E. Lee, and facing it is the New Orleans Public Library building (1908). Just off Canal Street, at Carondelet and Gravier Street, is the Cotton Exchange (1882–1883), and in Magazine Street the Produce Exchange. The large office buildings are on Canal, Carondelet, Common and Gravier streets; among them may be mentioned the Maison Blanche, the Hennen Building, the Tulane Newcomb Building and the Canal Louisiana Bank and Trust Company Building. On Camp Street, between Gravier and Poydras, are the office buildings of the *Picayune* and the *Times-Democrat*; on Carondelet and Gravier are the wholesale cotton houses; on Poydras and Tchoupitoulas are the wholesale

grocery houses; and on North Peters and Custom House streets the sugar and rice industries are concentrated. Little of history or tradition is associated with the American Quarter, with the exception of the former site (before 1900) of the Clay statue in Canal Street where Royal Street and St Charles Avenue begin, which was the scene of popular meetings in the Italian troubles of 1891; here, in Liberty Place, a triangle at the intersection of Canal, North Peters and Tchoupitoulas streets, on the scene of the fight of the 14th of September 1874 between conservative citizens and the radical authorities of the state, is a granite memorial called the Liberty Monument. The Customs House, long renowned for its "marble room," is in the old city, just off Canal Street. The corner-stone was laid by Henry Clay in 1847. The Boston (1845) and Pickwick (1857) are the best known of the general social clubs, and the Harmony (1862) of the Jewish clubs.

It is the French Quarter in which the history, poetry and romance of New Orleans are indissolubly united. The memory of French dominion is retained in the titles, and in the foreign aspect as well, of Toulouse, Orleans, Du Maine, Conti, Bourbon, Dauphiné and Chartres streets; while even more distinctly the Spaniard has superimposed his impress on stuccoed wall and iron lattice, huge locks and hinges, arches and gratings, balconies, jalousies, inner courts with parterres, urns and basins with fountains, and statues half hid in roses and vines. There are streets named from its Spanish governors: Unzaga, Galvez, Miro, Salcedo, Casa Calvo, Carondelet and the baron Carondelet's Baronne. The moated and palisaded boundaries of early days are indicated by the wide, tree-planted and grassy avenues named respectively from the Canal, the Rampart and the Esplanade that once lay along their course; the original "commons" outside the walls are commemorated in Common Street; and the old parade ground in the midst of the early town's river front, now laid off in flower-beds, white-shelled walks and shaven shrubbery, and known as Jackson Square, still retains its older name of the Place d'Armes. With this quaint, sunny and dusty old square is associated nearly every important event in Louisiana's colonial history. This was the *place publique*, associated with traffic, gossip, military muster and official acts of state. On one side is the cathedral of St Louis, first built in 1718, burned in 1788, rebuilt in 1792–1794, and largely rebuilt again in 1850. Flanking the cathedral on one side stands the calaboose (*Calabozo*, 1810), and on the other the *Cabildo*—so named from the municipal council that sat here under Spanish rule, when it was the government house and palace of justice. Both buildings are to-day used as law courts. The Cabildo is a dignified two-storey structure of adobe and shell-lime, built in 1795; an incongruous mansard roof was added in 1850. On the 30th of November 1803, in the council hall, the city keys were handed back to the representatives of the French government and the people of Louisiana were absolved from their allegiance to the Spanish king; and here, only twenty days afterward, with similar ceremonies, the keys of the city passed from the hands of the French colonial prefect to those of the commissioners for the United States. In the old Place d'Armes a bronze equestrian statue (1846) of Andrew Jackson by Clark Mills is a remembrance of the ceremonies attending Jackson's triumphal entry into the city after the battle of New Orleans in 1815. In 1825 Lafayette was lodged in the Cabildo as the city's guest.

The appearance of the square was greatly changed in 1849, when the Baroness de Pontalba, in whose estate it was then comprised, cut down the ancient elms that shaded it and laid it out in its present style of a French garden. She also is responsible for the low brick "Pontalba Mansions" on the north and south sides of the square. The Babel of Tongues in the French Market (1813), on the site of an older market, immediately below Jackson Square, and at the "Picayune Tier" just adjacent, is an interesting feature of the city. Near the Cathedral, in Orleans Street, is the convent of the Holy Family, a brick building housing a negro sisterhood founded in 1835, and formerly the scene of New Orleans's famous "quadroon balls." The archiepiscopal palace (1730), said to be the oldest building of the Mississippi Valley, is part of the unchanged original Ursuline convent; it was used as the State Capitol in 1831, and then it was the residence, and since 1899 has been the administrative office of the archbishop, and houses a colonial museum with the ecclesiastical records. The French Opera House (1860) was the successor of various French theatres built after 1808. The carnival balls are given here. New Orleans was by far the earliest of American cities to have an annual opera season.

The 18th-century fortifications about the old city were destroyed about 1804. The United States Branch Mint (1838) occupies the site of Fort St Charles (destroyed 1826), where Jackson reviewed his troops as they marched to Chalmette. Just outside the *Vieux Carré* is Beauregard Square, formerly known as Congo Square, because in early days the slaves were wont to gather here for their barbaric dances. The Hotel St Louis (1836), rebuilt in 1884 as the Hotel Royal, was the seat of the Republican reconstruction governments of governors Kellogg and Packard, and the prison fortress of both, respectively in 1874 and 1877, when the whites rose against Republican rule; its rotunda was also once a famous slave mart. Many other spots in the Latin Quarter are of scarcely less interest than those mentioned, not excluding those which were made famous by the romances of G. W. Cable, and whose only title to historic consideration is that which his imagination has given them.

City Park (216·6 acres, partly water), lying between the city and the lake, is notable in the local duelling annals of earlier days. Audubon Park (249 acres) was once the sugar plantation of Étienne de Boré, who first successfully made granulated sugar in 1795–1796; earlier experiments had been made in 1791 by Antonio Mendes, from whom de Boré, who established the sugar industry, bought a plantation in St Bernard Parish. The park was bought by the city for $180,000 in 1871, but was little improved until 1884, when the Cotton Centennial Exposition was held here. It contains to-day a state Sugar Experiment Station, in which a part of their work in course is done by the students in the Audubon Sugar School of the State University at Baton Rouge, and Horticultural Hall, the only one of the Exposition buildings now standing, with a display of tropical trees and plants; opposite Audubon Park is the campus of Tulane University. West End is a suburban resort and residential district on Lake Pontchartrain.

A noted feature of New Orleans is its cemeteries. Owing to the undrained condition of the subsoil, burials are made entirely above ground, in tombs of stuccoed brick and of granite and marble. Some of these are very elegant and costly, and many of the burial-grounds, with their long alleys of these tombs of diverse designs, deeply shaded by avenues of cedars and magnolias, possess a severe but emphatic beauty. Jews and the poor bury their dead underground in shallow graves. The oldest cemetery, St Louis No. 1, contains the graves of many persons notable in history. St Roch's Campo Santo has a wonder-working shrine, and is the most picturesque of the old burying-grounds. Metairie, on the site of an old race track, is the finest of the new. It contains a monument[1] to the Army of the Tennessee and its commander, Albert Sidney Johnston, with an equestrian statue of Johnston by Alexander Doyle, and a monument to the Army of Northern Virginia surmounted by a statue of General T. J. Jackson. In Greenwood Cemetery is the first monument erected to Confederate dead, given by the women of New Orleans. At Chalmette (on the Mississippi, about 5 m. E. of Canal Street), where the battle of New Orleans was fought in 1815, there is a National Cemetery, in which some 12,000 Union soldiers in the Civil War are buried.

Population.—The population in 1900[2] was 287,104, New

[1] In the burial vault of this tomb, with the bodies of many other soldiers, are the remains of General P. G. T. Beauregard, who was born near New Orleans.

[2] At the earlier censuses the population of the city was as follows: 17,242 in 1810 (when it was the sixth city in population in the United States); 27,176 in 1820 (when, as in 1830 and 1850, it was the fifth city); 46,082 in 1830; not reported separately in 1840; 116,375 in 1850; 168,675 in 1860; 191,418 in 1870; 216,090 in 1880; and 242,039 in 1890.

Orleans ranking twelfth among the cities of the United States; in 1910 it was 339,075. Of the 1900 total, 256,779 were native-born, and 30,325 were foreign-born, including 8733 Germans, 5866 Italians, 5398 Irish, 4428 French and 1262 English; and there were 77,714 negroes. In 1900 the population of foreign parentage was 108,010, of whom 78,269 had foreign fathers and foreign mothers, 27,259 being of German, 15,465 of Irish, 10,694 of Italian, 9317 of French and 1882 of English parentage. The Latin element that came in colonial times included Frenchmen, French-Canadians, colonists from the French and Spanish West Indies, Canary Islanders (whose descendants are still known as *Isleños*), and French refugees from Acadia in 1765 and the years following, and from Santo Domingo at the end of the 18th century. The earliest French immigrants were largely Bretons and Normans, and various creole words in common use (such as *banquette* for "side-walk") still recall these racial beginnings. The creoles of New Orleans and the surrounding delta are a handsome, graceful, intelligent race, of a decidedly Gallic type, though softened in features, speech and carriage. Their dialect has been formed from the French entirely by sound, has no established orthography, and is of much philological interest. Until very recent years the Latin races, though fusing somewhat among themselves, mixed little in blood with the Anglo-American. The Spaniards when in power at the end of the 18th century were notably different from the French in their liberalism in this respect. In social life and standards the French creoles were very conservative; the old styles of dress, *e.g.* of the late 18th century—wigs, silk stockings and knee-breeches—lingered later among them, probably, than in any other part of the country. But before the pressure of Anglo-American immigration, capital, enterprise and education, this creole civilization has slowly yielded ground, at last fairly beginning to amalgamate with the social system of the American nation. But the creole has stamped his influence upon wellnigh every aspect in the life of the city that has broadened out so widely on every side of his antique town. Its cuisine, its speech, its "continental" Latin Sundays, its opera, its carnival, its general fashions and manners, its intolerance of all sorts of rigour, its whole outward tone and bearing, testify to this patent Latin impress. A comparatively recent addition to the Latin element in the city has been through Italian immigration.

The coloured population, notwithstanding the presence among it of that noted quadroon class which enjoyed a certain legal freedom for generations before the Civil War, has not greatly improved since the date of emancipation. Catholicism is naturally extremely strong in New Orleans. So also are the Baptist and Methodist churches.

Carnivals.—The famous carnival displays of New Orleans are participated in very largely by the "Americain," *i.e.* the Anglo-American; but they mark one of the victories of the Latin-American over North-American tastes, and probably owe mainly to the "Americain" their pretentious dignity and to the creole their more legitimate harlequin frivolity. Out of the simple idea of masked revelry in the open streets, as borrowed from Italian cities, the American bent for organization appears to have developed, by a natural growth, the costly fashion of gorgeous torch-lighted processions of elaborately equipped masques in tableaux drawn on immense cars by teams of caparisoned mules, and combining to illustrate in a symmetrical whole some theme chosen from the great faiths or literatures or from history. Legends, fairy-tales, mythologies and theologies, literature from Homer to Shakespeare, science and pure fantasy are drawn upon for these ornate representations, which are accompanied by all the picturesque licence of street life characteristic of carnival times in other cities. They have no rival in America, and for glitter, colour and elaborateness are by many esteemed the most splendid carnival celebrations of the world. The first carnival parade (as distinguished from the Mardi Gras celebration) was held in 1827 by masked students recently returned from Paris. In 1837 and 1839 the first processions with "floats" were held in New Orleans. The regular annual pageants, almost uninterrupted save during the Civil War, date from 1857, when the "Mystic Krewe of Comus," the oldest of the carnival organizations, was formed; similar organizations, secret societies or clubs are the "Twelfth Knight Revelers" (1870), "Rex" and "Knights of Momus" (both 1872, when the carnival was reviewed by the Grand Duke Alexis of Russia), the "Krewe of Proteus" (1882), and the "Krewe of Nereus" (1895). Balls, processions and other festivities are now spread over a considerable period, culminating in those of Shrove Tuesday (*Mardi Gras*). During this time the festivities quite engross public attention, and many thousands of visitors from all parts of America are yearly attracted to the city.

Charitable Institutions.—The large Charity Hospital (1786) and the Richard Milliken Memorial Hospital for Children are supported by the state. The Touro Infirmary (1854; controlled by the Hebrew Benevolent Association; founded by Judah Touro (1775–1854; a Jew of Dutch descent, son of Isaac Touro of Newport, Rhode Island), includes a free clinic open to the needy of all faiths. Other hospitals are: the U.S. Marine Hospital (1885); the Hôtel Dieu (1859) and the St Joseph's Maternity Hospital (1863), both under the Sisters of Charity; the Sarah Goodrich Hospital (1896; Methodist Episcopal); and the Eye, Ear, Nose and Throat Hospital (1889; private). The Poydras Asylum, on Magazine Street, was founded in 1817 by Julien Poydras (1746–1824), a successful trader and delegate from Orleans Territory to the Federal Congress in 1809–1811; the present building was erected in 1836; the asylum, which is for orphans, is controlled by Presbyterian trustees, although it was, during Poydras's life, under the charge of Sisters of Charity. St Vincent's Infant Asylum (1858), or "Margaret's Baby House," is in charge of Sisters of Charity. Other orphanages and children's homes are: the New Orleans Female Orphan Asylum (1849) and St Elizabeth's Industrial School (1845), under the Sisters of Charity; an Ursuline Orphanage (1729); the Immaculate Conception Girls' Asylum (1851) and St Mary's Catholic Orphan Boys' Asylum (1835, under the Sisters Marianites of the Holy Cross); the St Alphonsus Orphan Asylum (1878) and St Vincent's Home for Newsboys (1878), under the Sisters of Mercy; the Mount Carmel Orphan Asylum (1869), under the Sisters of Mount Carmel; the Sacred Heart Orphan Asylum (1894) for girls, under the Missionary Sisters of the Sacred Heart; St Joseph's Orphan Asylum (1863), under the Sisters of Notre Dame; a Protestant Orphans' Home (1853); a Jewish Orphans' Home (1855); the Children's Home of the Protestant Episcopal Church (1859); the Evangelical Lutheran Bethlehem Orphan Asylum (1881); the German Protestant Orphan Asylum (1866); the Freedmen's Orphan Asylum (Baptist); and, under private and non-sectarian control, the Asylum for Destitute Orphan Boys (1824) and the Colored Industrial Home and School (1902). The J. D. Fink Fund and the Fink Home (1874) or Asylum (for Protestant widows and their children) are the gift of an eccentric, whose offer of marriage had been refused by one preferring not to marry at all, and who forbade that any old maid should enter the asylum. Other homes for adults are: the Soldiers' Home of Louisiana for Confederate Veterans; two Homes for the Aged (1869 and 1882), both under the Little Sisters of the Poor; the Faith Home (1888; Baptist) for old coloured women; the German Protestant Bethany Home (1889) and the German Protestant Home for the Aged and Infirm (1887); the Julius Weis Home for Aged and Infirm (1899), under the Hebrew Benevolent Association; and, all under private corporations, the Maison Hospitalière (1893) for aged women, the New Orleans Home for Incurables (1893) and St Anna's Asylum (1850) for destitute women and their children. Temporary homes are: the Convent of the Good Shepherd (1859), under the Sisters of the Good Shepherd, and a Memorial Home (1886; both for wayward women); a Home for Homeless Women (1888), and the New Orleans Convalescent Home (1885). Kingsley House is modelled after Hull House in Chicago. The Louisiana Retreat, a private asylum for the insane, is in New Orleans, and there also is a state House of Detention.

Education.—The public schools give equal opportunities to whites and blacks, but the whites take decidedly greater advantage of them; a large number even of the whites still make practically no use of either public or parochial schools. The races are kept separate: the attempt was made to mix attendance in 1870, but the whites compelled its abandonment. To a bequest of John McDonogh (1778–1850), whose life is one of the romances and the lessons of New Orleans,[1] the city owes already some thirty school buildings. The Home Institute (1883) provides free night schooling for hundreds of students, and similar work is done on a larger scale by public night schools. Of the adult male population in 1900 13·4 % were illiterate (could not write), seven-tenths of the illiterates being negroes, of whom the illiterates constituted 36 %.

There are various higher institutions of learning in the city. Tulane University of Louisiana was named after its benefactor Paul Tulane (1801–1887), a merchant of New Orleans, who gave $1,050,000 in 1882–1887 to a Board of Trustees for the education of "the white young persons in the city." The university was established, under

[1] See William Allan's *Life and Work of John McDonogh* (Baltimore, 1886).

its present name, in 1884, the former university of Louisiana (1834) being merged in it; it gives free tuition in the academic department to one student from each senatorial and each representative district or parish in the state, and its income-producing property, up to $5,000,000, is exempted from taxation by the state. In 1908–1909 Tulane University had 192 instructors and 2236 students; and it included a Graduate Department, a College of Arts and Sciences (1884), a College of Technology with 157 students, Extension Courses with 148 students, the H. Sophie Newcomb Memorial College for Girls (1886; endowed in memory of her only daughter by Josephine Louise, wife of Warren Newcomb, a sugar merchant of the city), with 288 students in the college and 102 in Newcomb High School, a Teachers' College, a Law Department (1847), a Medical Department (1834) with 648 students, a Department of Pharmacy and a Summer School with 860 students. The College of the Immaculate Conception (Jesuit, 1847) is an important school. Higher schools for the negroes include Leland University (1870; Baptist), with college courses, preparatory courses (there are several Baptist secondary schools affiliated with the university), normal and manual training departments, a school of music, a theological school, a woman's Christian Workers' Class and a night school; Straight University (1870; Congregational), with kindergarten, primary, high school and industrial departments; New Orleans University (1873; Methodist) and Southern University (1883). The last is supported by the state.

Libraries.—The public, society and school libraries in the city in 1909, many being very small, aggregated 301,000 volumes, 227,000 being in five collections. A central library building and three branch buildings, costing $275,000, were presented to the city by Andrew Carnegie. The Howard Memorial Library (1887) is an important reference library, peculiarly rich in books on the history of Louisiana. The Louisiana Historical Society (1836) and the Athenée Louisianaise (1876) may also be mentioned; the latter has for its purpose the conservation and cultivation of the French language. The Union Franchaise (1872) supplements with educational and charitable activities the general bond of fraternity offered by it to the French population. In New Orleans there is a State Museum, devoted to the history, institutions and resources of the state.

Newspapers.—Among the older newspapers are *L'Abeille* (1827) and the *Picayune* (1837), which is one of the most famous and influential papers of the South, and was founded by George Wilkins Kendall (1809–1867), a native of New Hampshire, who organized a special military correspondence for his paper during the Mexican War, probably the earliest instance of such service in the United States. The *Times-Democrat* (1863) is counted among the ablest and most energetic papers of the South. *De Bow's Commercial Review* (published in New Orleans 1846–1864), founded and edited by James D. B. De Bow (1820–1867), was in its day one of the most important periodicals of the country, and remains a valuable repository of information on conditions in the South before the war.

Commerce.—It was its potential commercial value, as indicated by its geographical position, that in 1803, when New Orleans was only a small, poor and remote Franco-Spanish-American port, led to its purchase by the United States. But various causes operated to impede the city's growth: the invention of railway transit, the development of the carrying trade on the Great Lakes, the bars at the mouth of the Mississippi, over which few large ships could pass, the scourge of yellow fever, the provincialism and the lethargy of an isolated and indolent civilization. Slavery kept away free labour, and the plantation system fostered that "improvidence and that feudal self-complacency which looked with indolent contempt upon public co-operative measures" (G. W. Cable). However, in 1860 the exports, imports and domestic receipts of New Orleans aggregated $324,000,000. As a result of the Civil War the commerce of New Orleans experienced an early paralysis; the port was soon blockaded by the United States navy; the city fell into the hands of the Federal forces (1st May 1862); its commerce with the interior was practically annihilated until after 1865, and from the depression of the years following the war the city did not fully recover for a quarter of a century. Only after 1880 did its total commerce again equal that of 1860. It was almost solely as the dispenser of the products of the greatest agricultural valley in the world that New Orleans grew from a little frontier town to the dimensions of a great city. This trade is still dominant in the city's commerce. In the season that follows the harvest of the South and West, the levee, the wharves and the contiguous streets are gorged with the raw staples of the regions that lie about the Mississippi and its greater and lesser tributaries—sugar, molasses, rice, tobacco, Indian corn, pork, staves, wheat, oats, flour and, above all else, from one-fourth to one-third the country's entire supply of cotton. All other movement is subsidiary or insignificant.

By 1900 the drawbacks which have been enumerated had been practically eliminated, and uncertainty as to the investment of capital had been removed. The southward tendency in railway traffic favours the city. Deep water to the ocean was secured by a system of jetties at the South Pass mouth of the Mississippi, built by James B. Eads in 1875–1879; but in time this ceased to maintain an adequate depth of water, and (after the report in 1900 of a board of engineers) in 1902 Congress began appropriations for an improvement of the South-west Pass[1] by opening a channel 1000 ft. wide and at least 35 ft. deep. Many lines of steamers give direct connexion with the West Indies, Central America, Europe, New York and also with Japan (for the shipment of raw cotton via Suez). Ocean steamers, loaded in large part by elevators, now bear away the exports for which a swarm of sailing-ships of much lighter draft and average freight-room once made long stays at the city's wharves. Passenger traffic on the rivers has practically vanished, and the shrunken fleet of river steamers (only 15 in 1907) are devoted to the carrying of slow freights and the towing of barges on the rivers and bayous of the lower Mississippi Valley.[2]

The total value of all merchandise exported in the six customs years 1902–1903 to 1907–1908 averaged $154,757,110 yearly, and the imports $37,319,254. For the ten years 1890–1899 the corresponding averages were $95,956,618 and $15,924,594. Bank clearings increased in the ten customs years preceding 1906–1907 from $447,673,946 to $1,027,798,476 (bank clearings were $956,154,504 and $786,067,353 respectively for the calendar years 1907 and 1908). There has been an extraordinary increase of exports since 1900, and imports from Central America have similarly increased. Cotton represents roughly two-thirds of the value of all exports. As a cotton port New Orleans in 1908 was second only to Galveston, which had only recently surpassed it; and more than half of the raw cotton exports of the country passed through these two ports. The Board of Trade has maintained a cotton-inspection department since 1884, and its statistics are standard on the cotton crop. Cotton exports in the four seasons 1903–1904 to 1906–1907 averaged 1,001,199,468 lb, valued at $104,108,824. Wheat and flour, Indian corn, lumber and tobacco are especially noteworthy articles of the export, and bananas and coffee of the import, trade. Importations of coffee have more than quintupled since 1900; the coffee comes for the most part from Brazil and grain wholly from American fields. The imports of bananas, for which New Orleans is the leading port of the country, more than doubled in the same period, and increased more than eight-fold in the twenty-five years following 1882 (1,200,000 to 10,200,000 bunches).

Railway traffic has grown immensely, and port facilities have been vastly improved in recent years. A belt railway owned by the city (built 1905–1907) connects all railway terminals, public wharves and many manufactories and warehouses. Public ownership protects the city's interest in the harbour front, while at the same time all railways are equally and cheaply served; and new railways, which could not enter the city or have access to the water front because of the impossibility of securing individual trackage, can now enter on the municipal belt. Of privately owned railway terminals in 1908 those of the Illinois Central system had nearly 200 m. of track; the Stuyvesant Docks of the railway have 15 m. of track, a wharf almost 1 m. long, immense warehouses and grain elevators. The New Orleans Terminal Company constructed at Chalmette

[1] The South-west Pass, originally the usual entrance, could not be entered by vessels drawing more than 16 ft.; the Eads jetties, aided by dredging, provided through the South Pass (500 ft. broad) a channel 180 ft. wide and 25 to 28 ft. deep. South-west Pass has always been the primary outlet of the river, venting half or more of its volume. Active work on its improvement was begun in 1903 and practically completed in 1909. Including the jetties, this Pass is nearly 20 m. long and has an average width of about 2150 ft.; the deep channel through it is more than 1000 ft. wide. The jetties, 4 m. long on one side and 3 m. on the other, are 6000 ft. apart at their head and 3600 ft. at the sea line. They are built on willow mats (foundation mats 200×150×2 ft.) in wooden frames, sunk with stone and surmounted above the water by a concrete wall.

[2] The value of the river commerce was about $8,000,000 in 1816 and $82,000,000 in 1849. The first steamboat descended the Mississippi to New Orleans (from Pittsburg) in 1811, and the first steamboat trip up the river was made in 1817. The halcyon period of river steamer traffic was from 1840 to 1860. The luxury of the passenger boats then on the Mississippi and the immense volume of the freighting traffic are things of the past since the advent of the railway era. The best time ever made (1870) from New Orleans to St Louis (1278 m.) was 3 days, 21 hours and 25 minutes. The races of these river boats were prominent news items in the papers of America and even in those of Europe, and they have been recorded in more than one page of literature. Steam packets replaced sailing vessels in the ocean trade about 1845.

(1908) splendid terminals, including an immense slip in the river (1500×300 ft., excavated to give 30 ft. of water below zero gauge) capable of accommodating nine vessels at dock simultaneously, and arranged with remarkable conveniences for the loading of grain. Steel-concrete warehouses and elevators surround the slip. The greater industrial establishments of the city cluster about the terminals. New Orleans is served by eleven railways, including the Illinois Central, Southern Pacific, Texas & Pacific and Louisville & Nashville systems. The New Orleans & North-eastern crosses Lake Pontchartrain over a trestle bridge 7 m. long (originally 25 m. before end filling).

Within the city are two canals, now of little importance, because too shallow except for local trade: the Carondelet or Old Basin canal, built in 1798, is 2·5 m. long, 55–65 ft. wide and 7 ft. deep, and goes via Bayou St John to Lake Pontchartrain; and the New Basin Canal, built in 1837 by the New Orleans Canal & Banking Company, and state property since 1866, is 6·7 m. long, 100 ft. wide and 8 ft. deep, and also connects with Lake Pontchartrain. Neither of these canals connects with the Mississippi river as do the following privately owned canals: the Lake Borgne Canal, from a point 10 m. below the city to Lake Borgne, 7 m. long, 80 ft. wide, 7 ft. deep, shortening the water distance between Mobile and New Orleans by 60 m.; and the Barataria & Lafourche Company Canal (7 m. long, 45 ft. wide and 6 ft. deep) and Harvey's Canal (5·35 m. long, 70 ft. wide and 6 ft. deep), both connecting with the Bayou Teche region.

Manufactures.—Manufacturing has greatly developed since 1890. The value of products increased 146·7% from 1880 to 1890, and in the following decade the increase of wages paid, cost of materials used and value of product were respectively 7·6, 53·3 and 31·5%. In 1905 the value of the factory product was $84,604,006, 45·4% of the value of the total factory product of the state, and an increase of 47·3% since 1900; during this same period capital increased 36·6%, the average number of wage-earners 8·9%, the amount of wages 20·5% and the cost of materials used 53·3%. The sugar and molasses industry is the most important, with a product value of $34,908,614 in 1905; New Orleans ranked second to Philadelphia among the cities of the country in the value of this product, that of New Orleans being 12·6% of the total value of the country's product. At New Orleans is a sugar refinery said to be the largest in the world. Of the manufactures from products of the state the most noteworthy are rice (value of product cleaned and polished in 1905, $4,881,954), bags other than paper ($4,076,226), cotton-seed oil and cake ($3,698,509), malt liquors ($2,170,714), tobacco ($1,408,883), lumber and timber products ($1,644,329) and planing mill products ($1,105,497) and cotton goods ($1,081,951). Other important manufactures are foundry and machine-shop products ($2,085,327), men's clothing ($1,979,308), coffee and spice roasted and ground ($1,638,263) and steam railway cars constructed and repaired ($1,627,435). New Orleans is the chief centre of the country for the manufacture of cotton-seed products and for rice milling. Oyster canning is a recent and rapidly growing industry. There are also furniture establishments, paper mills and cotton cloth mills.

Government.—Municipal government is organized under a charter framed by the state legislature in 1896, and amended by acts of 1898 and 1900. The seven municipal districts correspond to seven independent faubourgs successively annexed. A mayor and various other executive officers and a legislative unicameral council are elected for four years. The mayor and the heads of departments consult as a "cabinet." Various boards—of civil service, public debt, education, health, police, fire, drainage, water and sewerage and state commissioners of the port—control many of the most important interests of the city. The mayor, through his office and his appointive powers, exercises great influence in a number of these. In 1896 New Orleans followed the example of New York and Chicago in subjecting its civil service to a competitive merit system and to rules of a civil service board. The police board is non-partisan. The board of education is composed of seventeen members, each elected by one of the seventeen wards of the city. In addition to the city board of health, a state board acts with municipal authority, and (since April 1907) the United States government maintains the maritime quarantine of the Mississippi. The commissioners of the port are officials of the state. Owing to the complete dominance of the Democratic party, all reform movements in politics must come from within that organization. Reform organizations have been intermittently powerful since 1888, and among their achievements for good were the beginning of the great drainage and sewerage improvements and the adoption of the charter of 1896. The present government of the city compares very favourably with systems tried in the past.[1]

In 1909 the total assessed valuation of property was $221,373,362, of which $154,604,325 was realty and the remainder personalty. The bonded debt on the 30th of June 1909 was $32,521,040 and the floating debt at the end of 1908 was $1,264,030.

From 1890 to 1900 the expenditures for permanent works (including sewerage, lighting, paving, levees, improvements in connexion with street and steam railways, docks, &c.) aggregated $30,000,000. Almost all the public services, nevertheless, were in 1909 in private hands. Electric traction was introduced in 1891–1895, and the street railways were consolidated in 1902 under one management. In 1869 the city bought, and nine years later sold again, the waterworks; municipal ownership and control, under a sewerage and water board, was again undertaken in 1900. In 1900 arrangements were made to transfer the extensive markets from private lessees to direct municipal control, and in May 1901 the wharves of the city passed from private to municipal control.[2] The municipal belt railway was constructed in 1905–1907.

Until 1900 there were no sewers, open gutters serving their purpose. It is remarkable that the city twice granted franchises to private parties for the construction of a sewerage system, but without result. The low and extremely level character of the city site, of which nearly one-third is at or below the level of the Gulf, the recurrence of back-water floods from Lake Pontchartrain and the tremendous rains of the region have made the engineering problems involved very difficult. In 1896 a Drainage Commission (merged in 1900 in a Sewerage and Water Board) devised a plan involving the sale of street railway franchises to pay for the installation of drainage canals and pumps, and in 1899 the people voted a 2-mill tax over 42 years assuring a bond issue of $12,000,000 to pay for sewerage, drainage and water works to be owned by the municipality and to be controlled by a Sewerage and Water Board. Work was begun on the sewerage system in 1903 and on the water works in 1905. In 1906 the legislature authorized the issue of municipal bonds for $8,000,000 to be expended on this work. Up to 1909 the drainage system had cost about $6,000,000 and the sewerage system about $5,000,000; and 310 m. of sewers and nine sewerage pumping stations discharged sewage into the Mississippi below the centre of the city. Garbage is used to fill in swamps and abandoned canals. The new water-supply is secured from the river and is filtered by mechanical precipitation and other means. By 1909 about 500 m. of water-mains had been laid, $7,000,000 had been expended for the water-system, and filtering plants had been established with a capacity of 50,000,000 gallons a day. In August 1905 a city ordinance required the screening of aerial cisterns, formerly characteristic of the city, which were breeding-places of the yellow fever *Stegomyia*, and soon afterwards the state legislature authorized the Sewerage and Water Board to require the removal of all such cisterns. About two-thirds of the street surface in 1899 was still unpaved; the first improvements in paving began in 1890.

As regards hygienic conditions much too has been done in recent years. New Orleans was long notorious for unhealthiness. Yellow fever first appeared in 1769, and there were about thirty epidemics from 1769 to 1878. Though the first board of health and first quarantine system date back to 1821, from 1787 to 1853 the average death-rate was 59·63 per 1000; never did it fall below 25·00, which was the rate in 1827. In 1832, a cholera year, it rose to 148; in 1853–1854–1855, the great yellow-fever years, complicated in 1854–1855 by cholera, it was 102, 72 and 73. During these three years there were more than 25,000 deaths. The millesimal mortality in 1851–1855 and succeeding quinquennial periods to 1880 was as follows: 70, 45, 40, 39, 34·5 and 33·5. The rate reported by the national census of 1900 was 28·9, the highest of any of the large

[1] The charter of 1805 organized the old *cité* (the *Vieux Carré*) and the faubourgs as distinct municipalities with almost wholly separate governments: they issued paper money independently, for example. The charter of 1836 was also an extreme statement of local self-government; the municipalities were practically independent, although there was a common mayor and a general council of the entire city meeting once annually. This organization was in large part due to the hostility of the creoles to the Americans. The charter of 1852 formed a consolidated city. That of 1856 added to and amended its predecessor. That of 1870 was very notable as an attempt to secure a business-like and simplified administration. A mayor and seven "administrators," elected on a general ticket and constituting individually the different administrative departments, formed collectively a council with legislative powers. All sessions of the council were public, and liberties of suggestion were freely accorded to the citizens. Tried in better times, and as a movement for reform sprung from the people and not due primarily to an external impulse, this system might have been permanent and might have exercised great influence on other cities. The early 'seventies were marked by a great widening of the city's corporate limits. In 1882 another charter went back to the ordinary American plan of elective district councillors chosen for the legislative branch, and executive officers chosen on a general ticket. The latter held seats in the council and could debate but not vote. This is the present system.

[2] They were leased to a private company in 1891–1901, but the lease was unprofitable and was disadvantageous to trade. From 1901 to 1908 wharfage and harbour dues were reduced 25 to 85%.

cities of the United States.[1] This high death-rate is often attributed in great part to the large negro population, among whom the mortality in 1900 was 42·1 per 1000; but the negro population largely comprises that labouring element whose faulty provision for health and sickness in every large city swells the death-rate. A light yellow-fever epidemic occurred in 1897–1898–1899, after nineteen years of immunity, and a more serious one in 1905, when the United States Marine Hospital Service for a time took control of the city's sanitation and attempted to exterminate the *Stegomyia* mosquito. The city Board of Health has done much to secure pure food for the people, and has exercised efficient oversight of communicable diseases, including yellow fever. In movements for the betterment of the city—in commerce, sanitation, public works and general enterprise—a leading part has been taken by an organization of citizens known as the New Orleans Progressive Union, whose charter and by-laws prohibit its participation in political and religious issues.

History.—New Orleans was founded in 1718 by Jean Baptiste Lemoyne, Sieur de Bienville, and was named in honour of the then Regent of France.[2] The priest-chronicler Charlevoix described it in 1721 as a place of a hundred wretched hovels in a malarious wet thicket of willows and dwarf palmettos, infested by serpents and alligators; he seems to have been the first, however, to predict for it an imperial future. In 1722 New Orleans was made the capital of the vast province of Louisiana (*q.v.*). Much of the population in early days was of the wildest and, in part, of the most undesirable character—deported galley-slaves, trappers, gold-hunters and city scourings; and the governors' letters are full of complaints regarding the riff-raff sent as soldiers as late as Kerlerec's administration (1753–1763). In 1788 a fire destroyed a large part of the city. In 1795–1796 the sugar industry was first put upon a firm basis. The last twenty years of the 18th century were especially characterized by the growth of commerce on the Mississippi, and the development of those international interests, commercial and political, of which New Orleans was the centre. The year 1803 is memorable for the actual transfer (at New Orleans) of Louisiana to France, and the establishment of American dominion. At this time the city had about 10,000 inhabitants, mostly French creoles and their slaves. The next dozen years were marked by the beginnings of self-government in city and state; by the excitement attending the Aaron Burr conspiracy (in the course of which, in 1806–1807, General James Wilkinson practically put New Orleans under martial law); by the immigration from Cuba of French planters; and by the American War of 1812.

In 1815 New Orleans was attacked by a conjunct expedition of British naval and military forces from Halifax, N.S., and other points. The American government managed to obtain early information of the enterprise and prepared to meet it with forces (regular and militia) under Maj.-Gen. Andrew Jackson. The British advance was made by way of Lake Borgne, and the troops landed at a fisherman's village on the 23rd of December 1814, Major-General Sir E. Pakenham taking command there on the 25th. An immediate advance on the still insufficiently prepared defences of the Americans might have led to the capture of the city, but this was not attempted, and both sides remained inactive for some time awaiting reinforcements. At last in the early morning of the 8th of January 1815 (after the Treaty of Ghent had been signed) a direct attack was made on the now strongly entrenched line of the defenders at Chalmette, near the Mississippi river. It failed disastrously with a loss of 2000 out of 9000 British troops engaged, among the dead being Pakenham and Major-General Gibbs. The expedition was soon afterwards abandoned and the troops embarked for England.

From this time to the outbreak of the American Civil War the city annals are almost wholly commercial. Hopeful activity and great development characterized especially the decade 1830–1840. The introduction of gas (about 1830); the building of the New Orleans and Pontchartrain railway (1820–1830), one of the earliest in the United States; the introduction of the first steam cotton press (1832), and the beginning of the public school system (1840) marked these years; foreign exports more than doubled in the period 1831–1833. Travellers in this decade have left pictures of the animation of the river trade—more congested in those days of river boats and steamers and ocean-sailing craft than to-day; of the institution of slavery, the quadroon balls, the medley of Latin tongues, the disorder and carousals of the river-men and adventurers that filled the city. Altogether there was much of the wildness of a frontier town, and a seemingly boundless promise of prosperity. The crisis of 1837, indeed, was severely felt, but did not greatly retard the city's advancement, which continued unchecked until the Civil War. In 1849 Baton Rouge replaced New Orleans as the capital of the state. In 1850 telegraphic communication was established with St Louis and New York; in 1851 the New Orleans & Jackson railway, the first railway outlet northward, now part of the Illinois Central, and in 1854 the western outlet, now the Southern Pacific, were begun.

The political and commercial importance of New Orleans, as well as its strategic position, marked it out as the objective of a Union expedition soon after the opening of the Civil War. Captain D. G. Farragut (*q.v.*) was selected by the Union government for the command of the Western Gulf squadron in January 1862. The four heavy ships of the squadron (none of them armoured) were with many difficulties brought up to the head of the passes, and around them assembled nineteen smaller vessels (mostly gunboats) and a flotilla of twenty mortar-boats under Commander D. D. Porter (*q.v.*). The main defences of the Mississippi consisted of the two permanent forts Jackson and St Philip. These were of masonry and brick construction, armed with heavy rifled guns as well as smooth-bores, and placed on either bank so as to command long reaches of the river and the surrounding flats. In addition, the Confederates had some improvised ironclads and gunboats, large and small. On the 16th of April, after elaborate reconnaissances, the Union fleet steamed up into position below the forts, and on the 18th the mortar-boats opened fire. Their shells fell with great accuracy, and although one of the boats was sunk and two disabled, fort Jackson was seriously damaged. But the defences were by no means crippled even after a second bombardment on the 19th, and a formidable obstacle to the advance of the Union main fleet was a boom between the forts designed to detain the ships under close fire should they attempt to run past. At that time the eternal duel of ship *versus* fort seemed to have been settled in favour of the latter, and it was well for the Union government that it had placed its ablest and most resolute officer at the head of the squadron. Gunboats were repeatedly sent up at night to endeavour to destroy the boom, and the bombardment went on, disabling only a few guns but keeping the gunners of fort Jackson under cover. At last the gunboats "Pinola" and "Itasca" ran in and broke a gap in the boom, and at 2 A.M. on the 24th the fleet weighed, Farragut in the corvette "Hartford" leading. After a severe conflict at close quarters, with the forts and with the ironclads and fire rafts of the defence, almost all the Union fleet (except the mortar-boats) forced its way past. At noon on the 25th Farragut anchored in front of New Orleans; forts Jackson and St Philip, isolated and continuously bombarded by the mortar-boats, surrendered on the 28th; and soon afterwards the military portion of the expedition occupied the city. The commander, General B. F. Butler, subjected New Orleans to a rigorous martial law so tactlessly administered as greatly to intensify the hostility of South and North, but his administration was in many respects beneficial to the city, which was kept both orderly and healthy. Towards the end of the war General N.P. Banks held the command at New Orleans.

Throughout the years of the Civil War and the Reconstruction period the history of the city is inseparable from that of the state. All the constitutional conventions were held here, the seat of

[1] But the death-rate of New Orleans was not so high as that of some smaller Southern cities, Richmond (29·7), Savannah (34·3) or Charleston (37·5), for example. According to *Mortality Statistics, 1905* (Washington, 1907), the death-rate in New Orleans in 1905 was 23·7, and the annual average between 1900 and 1904 was 23·1.

[2] Two of the lakes in the vicinity commemorate respectively Louis Phelypeaux, Count Pontchartrain, minister and chancellor of France, and Jean Frederic Phelypeaux, Count Maurepas, minister and secretary of state; a third is really a landlocked inlet of the sea, and its name (Lake Borgne) has reference to its "incomplete" or "defective" character.

government again was here (in 1864–1882) and New Orleans was the centre of dispute and organization in the struggle between the races for the control of government. Notable events of that struggle in city history were: the street riot of the 30th of July 1866, at the time of the meeting of the radical constitutional convention; and the "revolution" of the 14th of September 1874, when the White League worsted the Republican metropolitan police in pitched battle and forced the temporary flight of the Kellogg government. The latter was reinstated in power by the United States troops, and by the same power the Democrats were frustrated in January 1875, after they had wrested from the Republicans the organization of the state legislature. Nevertheless, the "revolution" of 1874 is generally regarded as the independence day of Reconstruction, although not until President Hayes withdrew the troops in 1877 and the Packard government fell did the Democrats actually hold control of the state and city. The financial condition of the city when the whites gained control was very bad. The tax-rate had risen in 1873 to 3%. The city defaulted in 1874 on the interest of its bonded debt, later refunding this ($22,000,000 in 1875) at a lower rate, so as to decrease the annual charge from $1,416,000 to $307,500. Among events in the decade 1880–1890 were the World's Industrial and Cotton Centennial Exposition of 1884–1885 (celebrating the centennial of the cotton industry of the country), and the introduction of electric lighting (1886); in the decade 1890–1900 the introduction of electric transit, the latest charter and the improvements in public works already detailed. The lynching of Italian subjects by a mob in 1891[1] caused serious international complications.

Among the many floods from which the city has suffered those of 1849 and 1882 were the most destructive.

NEW PHILADELPHIA, a city and the county-seat of Tuscarawas county, Ohio, U.S.A., on the Tuscarawas River and near the Ohio canal, about 75 m. S. by E. of Cleveland. Pop. (1890) 4456; (1900) 6213 (554 foreign-born); (1910) 8542. It is served by the Baltimore & Ohio (the Cleveland, Lorain & Wheeling Division), and the Pennsylvania (Cleveland & Pittsburgh Division) railways, and by an inter-urban electric system. The city has a level site in the midst of a good agricultural country, which abounds in coal and fire-clay. In the public square is a soldiers' monument, and the city has a public library and a park. Its principal manufactures are steel, enamelled ware, clay goods, brooms, flour and carriages. The first settlement in the vicinity was made in May 1772, when Moravian Indian converts migrated from Pennsylvania (Friedenshütten, Bradford county, and Friedenstadt, Lawrence county) to Schoenbrunn, called by the Indians Welhik-Tuppeek, a spring (now dry) a little south of the present New Philadelphia. Under David Zeisberger (1721–1808) and Johann Gottlieb Ernestus Heckewelder (1743–1823) other missionary villages were planted at Gnadenhütten (October 1772), Lichtenau (1776) and Salem (1780), all in the present county of Tuscarawas. After the massacre of Christian Indians at Gnadenhütten in 1782 the Indians removed to Michigan and in 1791 to Fairfield, Ontario; in 1798 some of them returned to Tuscarawas county and settled Goshen, where Zeisberger is buried. New Philadelphia was laid out in 1804 and was named by its founder, John Knisely, after Philadelphia in Pennsylvania; it was incorporated as a village in 1815, and was first chartered as a city in 1896.

See *Ohio Archaeological and Historical Quarterly* for April 1909 (Columbus, Ohio) for several articles on the early settlement by Moravian Indians.

NEW PLYMOUTH, a municipality and seaport on the west coast of North Island, New Zealand, capital of the provincial district of Taranaki, 258 m. N.N.W. of Wellington by rail. Pop. (1906) 5141. The town slopes to the ocean, with a background of forest surmounted by the snow-clad volcanic cone of Mount Egmont (8270 ft.). The district is not unjustly termed "the garden of New Zealand." It is highly fertile, cereals and fruits growing well; and dairy products are extensively exported. In the town are leather-works, timber-works and flour-mills, with freezing-works for export dairy produce. The settlement was founded in 1841 by the Plymouth Company under the auspices of the New Zealand Company, and chiefly consisted of emigrants from Devonshire and Cornwall. On the seashore in the neighbourhood are extensive deposits of ironsand.

NEW POMERANIA (Ger. *Neu-Pommern*, formerly *New Britain*, native *Birara*), an island of the Bismarck Archipelago, N.E. of New Guinea in the Pacific Ocean, about 6° S., 150° E., in the administration of German New Guinea. It is crescent-shaped, about 330 m. long, and, except where the Willaumez Peninsula projects northward, nowhere more than 60 m. wide. The north-eastern extremity consists of the broad, irregular Gazelle Peninsula, joined to the main mass by a narrow neck. The total area is about 9500 sq. m. The island is in great part unexplored. The coasts are in some parts precipitous; in others the mountains recede inland, and the coast is flat and bordered by coral reefs. The formation appears otherwise to be volcanic, and there are some active craters. The greatest elevation occurs towards the west—about 6500 ft. There is a rich tropical vegetation, and a number of considerable streams water the island. The chief centre is Herbertshöhe at the north of the Gazelle Peninsula; it is the seat of the governor of German New Guinea (see NEW GUINEA).

The natives are Melanesians, resembling their Papuan kinsmen of eastern New Guinea, and are a powerful well-formed race. Their villages are clean and well kept. Unlike their Papuan relatives, the islanders are unskilled in carving and pottery, but are clever farmers and fishermen, constructing ingenious fishing weirs. They have a fixed monetary system consisting of strings of cowries. They perform complicated surgical operations with an obsidian knife or a shark's tooth. The common dead are buried or exposed to sharks on the reefs; bodies of chiefs are exposed in the fork of a tree. Justice is executed, and taboos, feasts, taxes, &c., arranged by a mysterious disguised figure, the *duk-duk*. The population is divided into two exogamous classes. The children belong to the class of the mother, and when the father dies go to her village for support, the land and fruit trees in each district being divided between the two classes. There are several dialects, the construction resembling Fijian, as in the pronominal suffixes in singular, triad and plural; the numerals, however, are Polynesian in character.

NEWPORT, a market town and municipal borough, the chief town of the Isle of Wight, England. Pop. (1901) 10,911. It is situated near the centre of the island, at the head of the navigation of the Medina River, 5 m. S. from its mouth at Cowes. It is the chief centre of the railway system of the island. The church of St Thomas of Canterbury, rebuilt in 1854 in the Decorated style, contains many interesting old monuments; and one by Marochetti to the princess Elizabeth, daughter of Charles I., erected by Queen Victoria. The guildhall, erected in 1816 from the designs of Nash, includes the town-hall in the upper story with the market-place below. There are a corn exchange and museum. The grammar school (the scene of

[1] In October 1890 the chief of police was assassinated, and before he died charged the crime to Italians. He had been active in proceedings against certain Italians accused of crime, and his death was popularly attributed to the Mafia. Nineteen Sicilians were indicted, and of nine put on trial six were acquitted and three escaped conviction on the ground of a mis-trial. On the 14th of March 1891 a mob broke into the jail and lynched eleven of the accused. The Italian government demanded that the lynchers should be punished, entered claims for indemnity in the case of the three Sicilians who had been Italian subjects, and, failing to secure as prompt an answer as it desired, withdrew its ambassador from Washington. In 1892 the United States paid an indemnity of $25,000 to Italy.

negotiations between Charles I. and the parliament) was founded in 1612, and there is a blue-coat school for girls founded in 1761. The Albany barracks and Parkhurst prison lie north of the town. A considerable trade is carried on in timber, malt, wheat and flour. The town is governed by a mayor, 6 aldermen and 18 councillors. Area 504 acres.

It is supposed that Newport (*Newport*) was a Roman settlement, then known as *Medina*. There are no traces of Saxon occupation, and no evidence that Newport became a borough before the reign of Henry II., though it was probably used before that time as a port of entrance for the ancient capital of Carisbrooke. The first charter was granted by Richard de Redvers between 1177 and 1184, freeing the burgesses from tolls throughout the island, from hundred suits, and from being impleaded without the walls, and giving them permission to choose their own reeve—privileges for which they paid 18 marks yearly. These grants, repeated and extended by the countess Isabel de Fortibus, were confirmed in 1349 by Edward III. and afterwards by successive kings, Henry VII. in 1489 granting in addition the petty customs within all ports and creeks of the island. The borough was incorporated by James I. in 1607, and a second charter of incorporation granted by Charles I. in 1637 is that by which Newport was governed until 1835. It was represented in parliament in 1295, but no return was made from that time until 1584, from which date it regularly sent two members. In 1867 the number was reduced to one, and in 1885 its representation was merged in that of the island. A fair was formerly held on Whit-Monday and the two following days, and on the three Saturdays nearest Whitsuntide, known as "Bargain Saturdays," there was a hiring fair for servants. There is now no fair. The Saturday market dates from 1184, and there is a Wednesday cattle market. Owing to its facilities for trade, Newport early superseded Carisbrooke as the capital of the island. Its prosperity in medieval times depended upon its harbour dues and its oyster beds in the river Medina.

NEWPORT, a municipal and county borough, contributory parliamentary borough, seaport and market town in the Monmouth parliamentary division of boroughs, Monmouthshire, England, on the Usk, 5 m. from its confluence with the Severn, and 133½ m. W. of London by the Great Western railway. Pop. (1891) 54,707; (1901) 67,270. It lies chiefly on the right (west) bank of the river, and on the E., N. and W. it is sheltered by a line of lofty hills. The old parish church of St Woollos stands finely on Stow Hill. Originally it consisted only of the present nave, a fine specimen of grand though unadorned Norman architecture; but a massive square tower (of the time of Henry III.) and a chancel were subsequently added; a large western Early English lady-chapel is interposed between the nave and the tower. The old castle, built about 1130 by Robert, earl of Gloucester, was greatly altered in the late Perpendicular period. The remains include two towers and the river frontage. The old Dominican monastery is entirely rebuilt and occupied as a private residence; but there are a few fragments of a house of White Friars. The principal public buildings are the spacious Victoria Hall, the Albert Hall, the town-hall, county council offices, market-house, custom-house, and museum and art gallery. Newport owes a rapid increase in importance to its situation on a deep and spacious tidal river, which renders it a convenient outlet for the trade of a rich mineral district. It has extensive docks and wharves, to which large steamers have access at all tides. Three docks, the Alexandra, South and Old Docks, had together a water area of about 60 acres, besides the Alexandra graving dock and dry docks. But additional accommodation was found necessary. In 1905 the Alexandra Docks and Railway company let the contract for the extension of the docks by 50 acres of water area, and the scheme was enlarged later so as to afford an additional area of 86 acres in all. The new works, added to the old Alexandra Dock, give a total deep-water area of over 130 acres. The first part to be completed (48 acres) was filled in the autumn of 1907. The river is crossed by a transporter bridge, opened in 1906, and having a span of 645 ft. and a clear headway from high water of 177 ft., with a travelling truck worked by electricity. Iron ore, pig iron, timber and grain are among the chief imports, while coal and iron goods are exported. Besides the Great Western railway, Newport is served by the London and North-Western, the Rhymney, and the Brecon & Merthyr systems. The town possesses large iron foundries and engineering works, and among other industries are the manufacture of wagons and wheels, nails, bolts and wire, shipbuilding and the making of railway plant, chemical manures and agricultural implements. There are also large breweries, glass and pottery works, and an extensive cattle market. Newport gives name to a Roman Catholic bishopric, but the cathedral church is at Belmont near Hereford. With Monmouth and Usk, Newport returns one member to parliament. In 1889 Maindee, a populous suburb on the left bank of the Usk, was incorporated with Newport, and constitutes one of its five wards. The town is governed by a mayor, 10 aldermen and 30 councillors. Area 4431 acres.

Newport, an ancient mesne borough and castle, occupied an important position on the Welsh marches. The town, which is not mentioned in Domesday, grew up round the castle built early in the 12th century. Giraldus Cambrensis, writing in 1187, calls it *Novus Burgus*, probably to distinguish it from Caerleon, whose prosperity declined as that of Newport increased. The first lord was Robert Fitz Hamon, who died in 1107, and from him the lordship passed to the earls of Gloucester and Stafford and the dukes of Buckingham. Hugh le Despenser, who held the lordship for a short time, obtained in 1323 a charter of liberties for the burgesses, granting them freedom from toll throughout England, Ireland and Aquitaine. The earl of Stafford granted a further charter in 1385, confirmed by his grandson in 1427, which gave the burgesses the right of self-government and of a merchant gild. On the attainder of the duke of Buckingham in 1483 the lordship lapsed to the crown, of whom it was held in the 16th and 17th centuries by the Pembrokes, and in the 19th by the Beauforts. The town was incorporated by charter of James I. in 1624 under the title of "Mayor and Bailiffs." This charter was confirmed by Charles II. in 1685 and holds force at the present day. By the act of 1535-1536 Newport is entitled as an ancient borough to take part in the election of a member for Monmouth town. The commercial importance of the town dates only from the second half of the 19th century, the Old Dock being partially formed in 1842, while the Alexandra was opened in 1875. In 1801 the population of the town was only 1135. In 1385 the borough obtained a market lasting fifteen days from the vigil of St Lawrence (August 10). The charter of 1624 granted two fairs, one on the feast of the Ascension, and a second (still held) on St Leonard's day (November 6). Newport was the scene of a serious Chartist riot in 1839.

NEWPORT, a market town in the Newport parliamentary division of Shropshire, England, 145 m. N.W. from London on the Stafford-Shrewsbury joint line of the London & North-Western and Great Western railways, and on the Shrewsbury canal. Pop. of urban district (1901) 3241. The church of St Nicholas is Early English and Perpendicular. There is an ancient market cross, greatly decayed. Newport possesses a literary institute, and a free grammar school founded in 1665. Four miles S. are the beautiful ruins of Lilleshall abbey, including a fine Norman west door and part of the front, considerable remains of the church besides, and traces of domestic buildings. The abbey was founded in 1145, under charter from King Stephen, by Richard de Baumes or Belmeis, dean of St Alkmund, Shrewsbury, for Augustinian canons, who were brought from Dorchester Abbey, Oxfordshire. Ironstone, coal and limestone are worked in the parish.

Newport is not mentioned in the Domesday Survey, but at the time of the Conquest formed part of the manor of Edgmond, which William I. gave with the rest of the county of Shropshire to Roger, earl of Shrewsbury. Henry I. is supposed to have founded the borough, at first called New Borough, after the manor had come into his hands through the forfeiture of Robert de Belesme. The site was probably chosen partly on

account of the fisheries, which are mentioned in the Domesday Survey, one of the chief services of the burgesses being that of taking fish to the king's court wherever it might be. This custom was continued after Henry III. had granted the borough with the manor of Edgmond, to Henry de Audley, but in the middle of the 13th century James, son of Henry de Audley, granted that the burgesses need not take the fish anywhere except within the county of Shropshire. The burgesses must have received certain privileges from Henry I., since Henry II. in an undated charter granted them all the liberties, rights and customs which they had in the time of Henry I. This probably included a gild merchant which is mentioned in the *Quo Warranto* Rolls as one of the privileges claimed by the burgesses. Confirmation charters were granted by Edward I. in 1287 and Edward II. in 1311, while the town was incorporated in 1551 by Edward VI. whose charter was confirmed by James I. in 1604. The governing body consisted of a high steward, deputy steward, two water-bailiffs and 28 burgesses, but the corporation was abolished by the Municipal Corporation Act of 1883, and a Local Board was formed, which, under the Local Government Act, gave place in 1894 to an urban district council.

See Edward Jones, *Historical Records of Newport, co. Salop*; *Shropshire Archaeol. and Natural History Society*, vols. viii. and ix. (1885–1886); *Victoria County History, Shropshire.*

NEWPORT, a city of Campbell county, Kentucky, U.S.A., on the Ohio River opposite Cincinnati, Ohio, and at the mouth of the Licking River opposite Covington, Ky. Pop. (1900) 28,301, of whom 4081 were foreign-born and 424 were negroes; (1910 census) 30,309. It is served by the Louisville & Nashville, and the Chesapeake & Ohio railways, and by electric lines to Covington, Cincinnati, Bellevue, Fort Thomas and Dayton. With Cincinnati and Covington it is connected by bridges. In the highlands, about 3 m. back of the city, is Fort Thomas, a United States military post, established in 1888 to supersede Newport Barracks (1804), in the city, which were abandoned in 1894. Newport is essentially a residential suburb of Cincinnati, but it is also industrially important. In 1905 the value of the factory product was $5,231,084, Newport ranking third among the manufacturing centres of the state. Newport was settled late in the 18th century, was laid out in 1791, was incorporated as a town in 1795, and was chartered as a city in 1834.

NEWPORT, a city, a port of entry and the county-seat of Newport county, Rhode Island, U.S.A., occupying the southern portion of the island of Rhode Island at the entrance to Narragansett Bay, about 30 m. S. by E. of Providence, about 71 m. S. by W. of Boston and about 165 m. E.N.E. of New York. Pop. (1905 state census) 25,039, of whom 6111 were foreign-born, 2590 being born in Ireland; (1910 U.S. census) 27,149. It is served by the Newport & Wickford Railroad and Steamboat Line, which connects with the New York, New Haven & Hartford railway at Wickford Junction; by ferry to Bristol, and by steamboats to Providence, Fall River and New York.

The broken water-front of the island, about 17 m. long, is partly rocky and partly made up of sandy beaches. From the harbour on the south-west the land rises to a gently rolling plateau with maximum elevations of about 250 ft. The climate is notably mild and equable throughout the greater part of the year. In the newer parts of the city there are many magnificent estates of summer residents; and in the "Old Town," the greater part of which is close to the harbour, and extending up the hillside, are many 18th-century houses and Thames Street, its principal business thoroughfare, only 20 ft. wide. Near the northern end of Thames Street, Washington Square or the Parade, connects with Broadway, which extends northward and is the principal thoroughfare through a large residential district of the permanent inhabitants. From the Parade, also, Touro Street extends eastward to the upper end of Bellevue Avenue, the principal street, which extends southward to the ocean. There Bellevue Avenue connects with the southern end of the Cliff Walk, which for about 3 m. winds along the cliffs on the eastern coast of the island. North of the walk is the smooth, hard Easton's Beach, frequented for sea-bathing. South of the Cliff Walk is Bailey's Beach, a private bathing-beach; at its western end is the Spouting Rock, through an opening in which the water, during violent south-east gales, has been thrown to a height of about 50 ft. Ocean Drive, about 9 m. long, encircles the south-western peninsula. Beyond Easton's Beach, in the town of Middletown, is Sachuest, or Second, Beach, with a heavier surf, and here is a fissure in the rocks, 150 ft. long and 50 ft. deep, and 8-14 ft. wide, known as Purgatory. North of Sachuest Beach are the picturesque Paradise Rocks and the Hanging Rocks.

At the head of the Parade stands the old State House (used when Newport was one of the capitals of Rhode Island); it was completed about 1743, was used as a hospital during the War of Independence, and is now the seat of the county court. In the vicinity are the City Hall and a monument to Oliver Hazard Perry. Fronting on Touro Street is a synagogue, erected in 1762–1763, and said to be the oldest in the United States; one of the early rabbis was Isaac Touro, a Jew of Dutch birth, whose name is borne by a street and a park in Newport. Near the corner of Touro Street and Bellevue Avenue is the Hebrew cemetery. Of chief historic interest along Bellevue Avenue are Touro Park and Redwood Library. In the park is the historic old Stone Mill or "Round Tower," which Longfellow, in accordance with the contention of certain members of the Society of Danish Antiquarians, ascribes, in his *Skeleton in Armour*, to the Norsemen, but which Benedict Arnold (1615–1678), governor of Rhode Island, repeatedly mentions in his will as "my Stone-built Wind-Mill." Opposite the park stands the William Ellery Channing Memorial Church; and in the park are monuments to Channing and to Matthew Calbraith Perry. The Channing House on Mary Street, built in 1751, is now used for a Children's Home. The Redwood Library grew out of the Philosophical Society, established in 1730, which Bishop (then Dean) Berkeley possibly helped to found during his residence here in 1729–1731; the Library was incorporated in 1747, being named in honour of Abraham Redwood (*c.* 1709–1788), a wealthy Friend who early contributed £500 toward supplying it with books; the building was completed in 1750. In Berkeley Avenue, north of Paradise Road, is Whitehall, which Berkeley built for his home in 1729 and which was restored in 1900. The first newspaper of Newport was published in 1732 by James Franklin, a brother of Benjamin Franklin, and in 1758 James Franklin's son, also named James, founded the present Newport *Mercury*.

Newport is best known as a fashionable resort during the summer and autumn; there are annual horse and dog shows, and fox-hunting is one of the amusements. The harbour is a rendezvous for racing- and pleasure-yachts. On Bellevue Avenue is the country club, the Casino. Among the great estates with magnificent "cottages" here are those of Mrs Cornelius Vanderbilt, Wm. B. Leeds, Mrs O. H. P. Belmont (the "Marble Palace," built for W. K. Vanderbilt), Mrs Ogden Goelet, Mrs Robert Goelet, Perry Belmont, and J. J. Astor—all on the Cliff Walk.

Newport has an inner and an outer harbour; the inner is landlocked, 1 m. long and ½ m. wide, but is not deep enough to admit vessels drawing more than 15 ft. of water; the outer admits the largest vessels and is a refuge for foreign and coastwise commerce. The whole harbour is protected at its entrance by Fort Adams, at the mouth of the inner harbour, Fort Wetherill on Conanicut Island, and Fort Greble on Dutch Island. The Lime Rock Lighthouse was for many years in charge of Mrs Ida Lewis Wilson (b. 1841), famous for the many lives she saved. On Goat Island, which partly encloses the inner harbour, is Fort Walcott, with a United States torpedo station and torpedo factory, and on Coasters Harbor Island, farther north, are a United States Naval Training Station and a War College. Along the western border of the outer harbour is Conanicut Island, on which is the town of Jamestown (pop. in 1905, 1337), with the Conanicut Yacht Club and other attractions for summer visitors. Newport has little foreign trade. There is, however, considerable coastwise trade in fish, coal and general merchandise, and in 1905 the total tonnage of the port amounted to 1,770,816 tons.

Fishing is an industry of some importance. The value of the city's factory products decreased from $1,575,192 in 1900 to $1,347,104 in 1905.

Newport is governed under a charter of 1906, which is unique as an instrument for the government of a city, and aims to restore in a measure the salient features of township government. Most of the powers usually vested in a town meeting are here vested in a representative council of 195 members—39 from each of 5 wards. A candidate for councilman must secure the signature of at least 30 electors in his ward before his name can be placed on the ballot. A mayor, one alderman from each ward, and a school committee are elected in much the same manner: a candidate for mayor must have his election paper signed by at least 250 qualified electors, and an alderman or member of the school committee by at least 100. All other important officers are appointed by the council. The mayor and aldermen are for the most part executive officials corresponding to the selectmen of a town.

Newport was founded by Nicholas Easton (1593–1675), William Coddington (1601–1678), John Coggeshall, John Clarke (1609–1676), William Brenton (d. 1674), William Dyer, Thomas Hazard, Henry Bull (1609–1693) and Jeremy Clerke (d. 1652), who, as Antinomians, were driven from Massachusetts Bay, and in 1638 settled at Pocasset (later Portsmouth, in the northern part of the island of Rhode Island; pop. in 1905, 2371). As radical tendencies prevailed in Pocasset they removed, and in 1639 settled Newport at the southern end of the island (called Aquidneck until 1644), which they had bought from the Indians. Most of the founders are commemorated by place-names in the city; in the Coddington Burying-Ground are the tombs of Governor William Coddington, Governor Henry Bull, and Governor Nicholas Easton; and in the Coggeshall Burying-Ground John Coggeshall was buried. At the beginning an independent government by judge and elders was established (Newport and Portsmouth being united in 1640), but in 1647 the town was united with Providence, Portsmouth and Warwick in the formation of Rhode Island according to the Williams (or, as it is commonly called, the Warwick) charter of 1644. During 1651–1654 Newport and Portsmouth were temporarily separated from the other two towns. About 1640 a Baptist Church was founded, which is probably the oldest in the United States except the Baptist congregation in Providence; here, too, at nearly the same time, one of the first free schools in America was opened. In 1656 English Friends settled here. Between 1739 and 1760 great fortunes were amassed by the "Triangular Trade," which consisted in the exchange in Africa of rum for slaves, the exchange in the Barbadoes of slaves for sugar and molasses, and the exchange in Newport of sugar and molasses for rum. The destruction here on the 17th of May 1769 of the British revenue sloop "Liberty," formerly the property of John Hancock, was one of the first acts of violence leading up to the War of American Independence. The foreign trade of Newport, which in 1770 was greater than that of New York, was destroyed by the War of Independence. During the war the town was in the possession of the British from December 1776 to the 25th of October 1779; a plan to recover it in 1778 by a land force under General John Sullivan, co-operating with the French fleet under Count d'Estaing, came to nothing. Soon after the evacuation of the British, French troops, under Comte de Rochambeau, arrived and remained until near the end of the war, and Newport was a station of the French fleet in 1780–1781. The Sayer house, which was the headquarters of Richard Prescott (1725–1788), the British general; the Vernon house, which was the headquarters of Rochambeau, and the Gibbs house, which was for a short time occupied by Major-General Nathanael Greene, are still standing.

Newport was chartered as a city in 1784, but in 1787 it surrendered its charter and returned to government by town meeting. It was rechartered as a city in 1853; the charter of this year was much amended in 1875 and in 1906 was superseded by another. Until 1900, when Providence became the sole capital, Newport was one of the seats of government of Rhode Island.

NEWPORT NEWS, a city and port of entry of Warwick county, Virginia, U.S.A., on the James River and Hampton Roads, 14 m. N. by W. of Norfolk and 75 m. S.E. of Richmond; it is situated on what is known as the Virginia Peninsula. Pop. (1890) 4449; (1900) 19,635, of whom 1614 were foreign-born and 6798 were negroes; (1910 census) 20,205. Newport News is served by the Chesapeake & Ohio railway, of which it is a terminus; by river boats to Richmond and Petersburg, Va.; by coastwise steamship lines to Washington, D.C., Baltimore, Philadelphia, New York, Boston and Providence; by foreign steamship lines to London, Glasgow, Liverpool, Dublin, Belfast, Rotterdam, Hamburg and other ports; and by electric lines to Old Point Comfort, Norfolk and Portsmouth. A public park extending from the James to the heart of the city, a deep, spacious and well-protected harbour, a large shipbuilding yard with three immense dry docks, and two large grain elevators of 2,000,000 bushels capacity, are among the most prominent features; at the shipbuilding yard various United States battleships, including the "Kearsarge," "Kentucky," "Illinois," "Missouri," "Louisiana," "Minnesota," "Virginia" and "West Virginia," were constructed, as well as cruisers, gun-boats, merchant vessels, ferry-boats and submarines. The city's export of grain and its coastwise trade in coal are especially large. Among the manufactures are shoes, tobacco, medicines and knit goods. The value of the factory products in 1905 was $9,053,906, being 52·5% more than in 1900. Both in 1900 and in 1905 Newport News ranked second to Richmond among the cities of the state in the value of factory products. The first settlement on the site of Newport News was made in 1621 by planters brought from Ireland by Daniel Gookin, the father of Daniel Gookin (1612–1687) of Massachusetts, who selected the site on the advice of Sir William Newce and his brother Captain Newce. The present city dates only from 1882, when it was laid out in consequence of the extension of the Chesapeake & Ohio railway to the coast here; it was incorporated in 1896. The name is said to be in honour of Christopher Newport and Sir William Newce.

NEWPORT PAGNELL, a market town in the Buckingham parliamentary division of Buckinghamshire, England, 56 m. N.W. by N. of London, on a branch of the London & North-Western railway, and at the junction of the river Ouzel with the Ouse. Pop. of urban district (1901) 4028. The church of St Paul and St Peter has Early English portions, including fine north and south porches. An inscription on the tomb of Thomas Abbott Hamilton in the churchyard is by the poet Cowper, who lived in the neighbouring town of Olney (*q.v.*). The almshouse called Queen Anne's Hospital is named from Anne of Denmark, queen of James I., who reconstituted a foundation of the time of Edward I., dedicated to St John the Baptist and St John the Evangelist.

NEWQUAY, a seaport and watering-place, in the St Austell parliamentary division of Cornwall, England, 14 m. N. of Truro, on a branch of the Great Western railway. Pop. of urban district (1901) 2935. It is finely situated on the north coast, on Newquay Bay, which is sheltered to the west by Towan Head. The cliff scenery is grand, and there is a fine sandy beach along the northward sweep of the coast in Watergate Bay. The harbour, artificially constructed, and equipped with a jetty and piers, admits vessels of 250 tons. The chief exports are iron and other ores, china clay, granite, fish and grain. The imports are coal, salt and manures.

NEW ROCHELLE, a city of Westchester county, in southern New York, U.S.A., on Long Island Sound, 16½ m. from the Grand Central Station, New York City. Pop. (1890) 9057, (1900)

14,720, of whom 4425 were foreign-born and 777 negroes; (1910 census) 28,867. It is served by the New York, New Haven & Hartford Railroad, and by electric railways to New York City and neighbouring places. The city is primarily a residential suburb of New York City, and has some fine colonial residences, and several beautiful residential parks, notably Rochelle, Neptune, and Beechmont Parks. Its large foreign-born population is comparatively recent and comparatively isolated. Among the prominent buildings of the city are a public library, the high school, a theatre (owned by the Knights of Columbus), a Masonic Temple, the City Bank and several churches, of which the most notable, perhaps, are the Baptist, Methodist, and St Gabriel's (Roman Catholic), which is the gift of members of the Iselin family, to whose interest in yachting is due in part the prominence of the New Rochelle and Larchmont Yacht Clubs. The Ursuline College of St Angela (1904) and the Merrill School (1906), both for girls, are in New Rochelle. The principal building of the first is Leland Castle, built in 1858–1860 by Simon Leland and finely decorated with frescoes and coloured marbles. A People's Forum, growing out of the work of the People's Institute of New York City, was established here in 1903–1904. In the road between New Rochelle and White Plains is the monument to Thomas Paine, provided for in his will, on the farm which was confiscated from a Tory by the state and was given to him at the end of the American War of Independence. On the Sound, in Hudson Park, is a monument commemorating the landing-place of the first Huguenot settlers. Immediately S. of New Rochelle, in the Sound, is Glen Island, an amusement resort; belonging to the Glen Island group, E. of Pelham Manor, is Travers Island, with the out-of-town clubhouse and grounds of the New York Athletic Club. On David's Island, 1½ m. S.W. of New Rochelle, is Fort Slocum, a United States Army post. The suburban villages of Larchmont and Pelham (and Pelham Manor) lie respectively N.E. and W. of New Rochelle. The important industries are the manufacture of scales and of other instruments of precision, and printing and publishing—the Knickerbocker Press of G. P. Putnam's Sons, New York, is here. The site of New Rochelle is part of a purchase by Thomas Pell in 1654 and of a grant to him by Richard Nicolls in 1666; it was sold in 1689 to Jacob Leisler. The first settlement of importance was made in 1688 by Huguenots, some of whom were natives of La Rochelle. New Rochelle was incorporated as a village in 1847, and as a city in 1899.

See R. and C. W. Bolton, *History of the Several Towns, Manors and Patents of Westchester County* (New York, 1881), and J. Thomas Scharf's *History of Westchester County* (2 vols., Philadelphia, 1886).

NEW ROSS, a market-town of Co. Wexford, Ireland, on the acclivity of a hill on the E. bank of the Barrow, 2 m. below its junction with the Nore, 102 m. S.S.W. of Dublin by the Dublin & South-Eastern railway. Pop. (1901) 5847. The Barrow is crossed by an iron bridge with a swivel pillar in the centre on which a portion of the bridge is turned to admit the passage of vessels. Vessels of 600 tons can lie alongside the quays. The inland water communications reach to Dublin by means of the Barrow and the Grand Canal. The Nore is navigable to Inistioge. New Ross has breweries and tan-yards, a salmon fishery, and a brisk export trade in agricultural produce. The urban district of New Ross includes Rosbercon, on the opposite side of the Barrow.

It is stated that St Alban built the abbey of Rossmactreoin, which gave rise to an ancient city formerly called Rossglas. A Dominican foundation of the 13th century has left some remains in Rosbercon. According to Camden, New Ross was founded by Isabella, daughter of Strongbow and wife of William Marshal, afterwards earl of Pembroke. A charter was granted to it by Roger Bigod in the reign of Edward I., which was extended by James I. and James II. From 1374 it returned two members to parliament, but at the Union in 1800 the number was reduced to one, and the town ceased to be a parliamentary borough in 1885. In 1269 it was surrounded by walls. The fortresses were dismantled by Cromwell, but some remains are extant.

NEWRY, a seaport, market town and parliamentary borough (returning one member) of Co. Down, Ireland, on the Newry water and Newry canal at the extreme head of Carlingford Lough. Pop. (1901) 12,405. It is 73 m. N. of Dublin by the Great Northern railway. A railway owned by the London & North-Western company connects Newry with the deep-water harbour at Greenore; and there is an electric railway to Bessbrook in Co. Armagh. The western part, called Ballybot, is connected with the eastern part, or old town, by four bridges over the canal and four over the tidal water. The situation of the town is striking, the Newry Mountains and Slieve Gullion on the west, and the Mourne Mountains on the east, enclosing the narrow valley in which it lies. Newry is one of the most important ports of the province of Ulster, and in connexion with several sub-ports farther down the river is the outlet for the trade of a very extensive district. The port admits vessels of 2000 tons to Victoria Docks, 3 m. from the town, but vessels drawing 15 ft. can go up the ship canal to the Albert Basin, 3 m. from the sea. The principal exports are grain, eggs, cattle, linen cloth and flax, and the imports include timber, groceries and coal. In the neighbourhood granite of a fine quality is quarried, and the town possesses rope and sail works, breweries, distilleries, flour-mills and tanneries. It is governed by an urban district council. In 1175 an abbey was founded here by Maurice M'Loughlin, king of Ireland. The abbey was converted in 1543 into a collegiate church for secular priests, and was dissolved by Edward VI., who granted it to Sir Nicholas Bagenal, marshal of Ireland. Bagenal made it his private residence, and laid the foundations of its prosperity. In 1689 Newry was set on fire by the duke of Berwick when in retreat before Schomberg. Charters were granted to the town by James I. and James II. By the charter of James I. it sent two members to parliament, but at the Union in 1800 it was restricted to one member. Until 1898 a portion of Newry was situated in Co. Armagh. A mile N.E. of the town is a notable rath or enclosure, taking its name of Crown rath from traditional single encounters between native princes in contention for the sovereignty.

NEW SIBERIA ARCHIPELAGO, a group of islands situated off the Arctic coast of Siberia, from 73° to 76° 6′ N., and 135° 20′ to 148° E. The name is loosely applied, covering either the northern group only of these islands, for which the name of New Siberia Archipelago, or of Anjou Islands, ought properly to be reserved, or the southern group as well, which ought to maintain its name of Lyakhov Islands. Some confusion prevails also as to whether the islands Bennett, Henrietta and Jeannette, discovered by the "Jeannette" expedition, ought to be included in the same archipelago, or described separately as the Jeannette Islands. The first of these three belongs geographically, and probably geologically, to New Siberia Archipelago, from which it is only 97 m. distant. As to Henrietta and Jeannette Islands, situated 200 m. N.E. of New Siberia Island, in 157° to 159° E., they can hardly be included in the New Siberia Archipelago. There seems, moreover, to be land due north of Kotelnyi Island in 78° N., first sighted by Sannikov and described as Sannikov Land. It was also seen by Baron Toll.

The *New Siberia* or *Anjou Islands* consist, beginning from the west, of Kotelnyi, the largest (116 m. long, 100 m. wide), having the small island Byelkovskiy near its western shore; Thaddeus (Faddéevskiy), in the middle; and New Siberia (Novaya Sibir), in the east (90 m. long, 40 m. wide). Kotelnyi is the highest and most massive of the four, reaching a maximum altitude of 1200 ft. in the Malakatyn-tras mountain. Its north-east portion consists of Upper Silurian coral limestones (Llandovery division), containing a rich fossil fauna and representing a series of folds running north-north-west. The same Silurian deposits are widely spread on the mainland as far as Olenek. The western portion of Kotelnyi is built up of Middle Devonian limestones and slates, folded the same way, of which the fossil fauna is similar to that of the Urals. Triassic slates appear in the south-east. Diabases pierce to Devonian rocks, and olivine rocks appear as dykes amidst the Triassic deposits. The Malakatyn-tras is also made up of volcanic rocks. The eastern portion of the island, named Bunge's Land, is thickly covered with Post-Tertiary deposits. Thaddeus Island has a long promontory, Anjou, protruding north-westwards. New Siberia Island attains altitudes of 200 to 300 ft. in its western portion. A range of hills, composed of Tertiary deposits, and named Hedenström's Mountains, runs along its south-western coast, and the same rocks form a promontory protruding northwards. The so-called Wood Mountains, which

were supposed to be accumulations of floating wood, are denudations of Miocene deposits containing layers of brown coal with full stems of trees. These Tertiary deposits are characterized by a rich fauna; fully developed leaves of poplars, numerous fruits of the mammoth tree, needles of several conifers, &c., being found in them, thus testifying to a climate once very much warmer. The only representative of tree vegetation now is a dwarf willow 1 in. high.

The *Lyakhov Islands* consist of the Bolshoy (Large), or Blizhniy (Nearest), which is separated by Laptev Strait, 27 m. wide, from Svyatoy Nos of Siberia; Malyi (Small), or Dalniy (Farthest), to the north-west of Blizhniy; and three smaller islands—Stolbovyi (Pillars), Semenovskiy and Vasilevskiy—to the west of Malyi. Dr Bunge found Bolshoy to consist of granite protruding from beneath non-fossiliferous deposits; while the promontory of Svyatoy Nos consists of basalt hills, 1400 ft. high. Along the southern coast of Bolshoy Baron Toll found immense layers of fossil ice, 70 ft. thick, evidently relics from the Ice Age, covered by an upper layer of Post-Tertiary deposits containing numbers of perfectly well-preserved mammoth remains, rhinoceros, *Ovibos*, and bones of the horse, reindeer, American stag, antelope, *saiga* and even the tiger. The proof that these animals lived and fed in this latitude (73° 20′ N)., at a time when the islands were not yet separated from the continent, is given by the relics of forest vegetation which are found in the same deposits. A stem of *Alnus fruticosa*, 90 ft. high, was found with all its roots and even fruits.

Basalts and Tertiary brown coal deposits enter into the composition of the southern extremity of Bennett Island, and the mountains of Sannikov Land, seen by Toll, have the aspect of basaltic "table mountains."

The climate of these islands is very severe. In 1886 the winter ended only in June, to begin anew in August (21st May, −5·8° F.; 16th October, −34·6°). The highest summer temperature was 50°. Flocks of geese and other birds come to the islands from the north (Bunge and Toll), as also the gull *Lestris pomarina*, which feeds chiefly on the lemming. The lemmings are very numerous, and in certain years undertake migrations to the mainland and back. Reindeer, followed by wolves, come also every year to the islands; the polar fox and polar bear, both feeding on the lemmings, are numerous. Hunters come in numbers to the Lyakhovs, which must have been long known to Arctic hunters.

A Yakutsk Cossack, named Vaghin, wintered on Bolsnoy in 1712, but it was a merchant, Lyakhov, who first described the two greater islands of this group in 1770, and three years later reached on sledges the largest island of the New Siberia group, which he named Kotelnyi. The Lyakhovs were mapped in 1777. J. Sannikov, with a party of hunters, discovered in 1805–1808 Stolbovyi, Thaddeus and New Siberia Islands, and a merchant, Byelkov, the Byelkovskyi Islands. He sighted the land to the north of Kotelnyi and the land to the north of New Siberia (now Bennett Island). A Russian officer named Hedenström, accompanied by Sannikov, explored the archipelago and published a map of it in 1811. Lieutenant Anjou visited it in 1821–1823. A scientific expedition under Dr Alexander Bunge (including Baron Eduard Toll) explored it in 1885–1886. Baron Toll revisited it in 1893 with Lieutenant Shileiko, and again in 1900 with F. G. Seeberg. Papers were found on Bennett Island showing that he left it for the south in November 1902, but he never returned home, and two relief parties in 1903 failed to find traces of him.

NEW SOUTH WALES, a state of the Australian Commonwealth. The name was given by Captain Cook, in his exploratory voyage in 1770, to the southern portion of the eastern coast of Australia, from some imagined resemblance of its coast-line to that of South Wales. The name was afterwards extended to the eastern half of Australia, but now designates a much more restricted area. New South Wales is bounded by the Pacific Ocean on the E., by Queensland on the N., by South Australia on the W. and by Victoria on the S. It lies between 28° and 38° S. lat., and 141° and 154° E. long. The coast-line, which is about 700 m. in length, extends from Cape Howe (37° 30′) at the south-eastern corner of Australia to Point Danger in 28° 7′ S. The colony is approximately rectangular in form, with an average depth from the coast of 650 m. and an average width from north to south of 500 m. The superficial area is estimated at 310,700 sq. m., or about one-tenth of the whole of Australia.

Physical Configuration.—The surface of the state is divided naturally into three distinct zones, each widely differing in general character and physical aspect, and clearly defined by the Great Dividing Range running from north to south. The tableland, which forms the summit of the range, comprises one of the three zones and separates the other zones, viz. the coastal region, and the great plain district of the interior. The main range follows the line of the coast, varying from 30 to 140 m. distant, being nearest at the south and receding the farthest at the sources of the Goulburn river, the main tributary of the Hunter. The crest of this range is, in some places, narrow; in others it spreads out into a wide tableland. The eastern slopes are, as a rule, rugged and precipitous, but the western versant falls gently to plains. The highest part of the Dividing Range is in the south-eastern portions of the state, on the borders of Victoria. Here some of the peaks rise to a height of over 7000 ft.; one of these, Mount Kosciusco, the highest peak in Australia, attains an elevation of 7328 ft. The tableland varies greatly in elevation, but nowhere does it fall below 1500 ft., and in places it reaches an average of 5000 ft. The great plain district, lying west of the tableland, is part of a vast basin which comprises portions of Queensland, South Australia and Victoria, as well as of New South Wales. The great plains are traversed by a few rivers, whose long and uncertain courses carry their waters to the river Murray, which empties itself into the Southern Ocean through the state of South Australia, and during 1250 m. of its course forms the boundary between the states of New South Wales and Victoria. The Murray has a very tortuous course, as may be judged from the fact that the measurement along the joint boundary of New South Wales and Victoria is only 460 m. in a straight line, the river course being 1250. The chief tributaries of the Murray are the Darling and the Murrumbidgee, which is joined by the Lachlan. The Murray and the Murrumbidgee are permanent streams, but the Darling occasionally ceases to run in part of its course, and for a thousand miles above its junction with the Murray it receives no tributary. In its upper course the Darling receives numerous tributaries. Those on the right bank all come from Queensland and bring down enormous volumes of water in flood time; on the left bank the most important tributaries are the Gwydir, Namoi, Castlereagh, Bogan and Macquarie. Here and there along the course of the western rivers are found lagoons, sometimes of considerable dimensions. These are commonly called lakes, but are in reality shallow depressions receiving water from the overflow of the rivers in times of flood, and in return feeding them when the floods have subsided.

The coastal belt differs greatly from the other divisions of the state. The main range gives rise to numerous rivers flowing eastward to the South Pacific. Almost everywhere between the main range and the sea the country is hilly and serrated, more particularly in the southern portions of the state. In the Illawarra district, 50 m. south of Sydney, the mountains skirt the very edge of the coast, but farther north there is a wider coast-land, with greater stretches of country available for tillage and pasture.

Along the sea-board are twenty-two well-defined headlands or capes and about a score of bays or inlets, to mark which for navigators there are thirty-four lighthouses. There are four very fine natural harbours, viz. Jervis Bay, Port Jackson, Broken Bay and Port Stephens, and several others of minor importance. Port Jackson, on which is situated the city of Sydney, is one of the six greatest ports of the British empire. The port second of commercial importance to Sydney is Newcastle, at the mouth of the Hunter river, which is the great coal-shipping port of the colony. Secondary harbours, available for coasting steamers, south of Sydney are at Port Hacking, Wollongong,

Kiama, Shoalhaven, Bateman's Bay, Ulladulla, Merimbula, and Twofold Bay. North of Sydney the secondary ports are at the mouths of the Hawkesbury, Manning, Hastings, Macleay, Nambucca, Bellingen, Clarence, Richmond and Tweed rivers. The rivers of the sea-board are as just enumerated, the only other of importance being the Hunter. The Richmond drains an area of 2400 sq. m. and is navigable for 60 m. The Clarence is a fine stream draining an area of 8000 sq. m.; it has a course of 240 m. navigable for 67 m. The Macleay drains an area of 4800 sq. m., and empties at Trial Bay after a course of 200 m., of which 20 m. are navigable. The Hastings and Manning are both important rivers. The Hunter is one of the chief rivers of the state and embouches at Port Hunter or Newcastle Harbour after a course of 200 m. It drains an area of 11,000 sq. m., more than twice the area of the Thames basin. Less commercially important than the Hunter, the Hawkesbury is nevertheless a fine stream; it has a course of 330 m., of which 70 m. are navigable. South of Sydney the rivers are of less importance; the principal is the Shoalhaven, 260 m. long, draining an area of 3300 sq. m.

Climate.—The three geographical regions above described constitute three distinct climatic divisions. The coastal region, 28° to 37° S. lat., shows a difference between the average summer and winter temperatures of only 24° Fahrenheit. Sydney, which is situated midway between the extreme points of the state (33° 51′ S.), has a mean temperature of 63°, the mean summer temperature being 71° and that of winter 54°, showing a mean range of 17°; the highest temperature in the shade experienced at Sydney in 1896 was 108·5°, and the lowest 35·9. The coastal district has an area of 38,000 sq. m., over which there is an average rainfall of 42 in. The rainfall is greatest at the sea-board, diminishing inland; the fall also diminishes from north to south. Sydney has an average fall of 50 in., while the Clarence Heads, in the north, has 58 in., and Eden, in the south, 35·5 in. The tableland is a distinct climatic region. On the high southern plateau, at an elevation of 4640 ft., stands the town of Kiandra, with a mean summer temperature of 56·4° and winter of 32·5°. Cooma, in the centre of the Monaro plains, at an elevation of 2637 ft., has a mean summer temperature of 65·9° and winter, 41·7°; its summers are therefore as mild as those of London or Paris, while its winters are much less severe. On the New England tableland, under latitude 30° S., the yearly average temperature is 56·5°, the mean summer 67·7° and the mean winter 44·3°. The tablelands cover an area of 85,000 sq. m. and have an average rainfall of 32·6 in.; there is, however, a small area in the southern portion where an average fall of 64 in. is experienced. In the western division, or great plains, severe heat is experienced throughout the summer, and on occasional days the thermometer in the shade ranges above 100° Fahrenheit, but it is a dry heat and more easily borne than a much less degree of temperature at the sea-board. The mean summer temperature ranges between 75° at Deniliquin in the south and 84° at Bourke. The mean range in winter is between 48° and 54·5°, and, accompanied as this is with clear skies, the season is very refreshing. West of the tableland the amount of rainfall decreases as the distance from the Pacific increases, and in a large area west of the Darling the average annual rainfall does not exceed 10 in. For the whole western division, embracing an area of 188,000 sq. m., the average rainfall is 19·8 in. (T. A. C.)

Geology.—New South Wales consists geologically as well as geographically of three main divisions which traverse the state from north to south. The highlands of eastern Australia form the middle belt of the state, to the east of which are the low coastal districts and to the west the wide western plains. The highlands of New South Wales consist, geographically, of a series of tablelands, now in the condition of dissected peneplains; geologically, they are built of a foundation of Archean and folded Lower Palaeozoic rocks, covered in places by sheets of more horizontal Upper Palaeozoic and Mesozoic rocks; these deposits occur along the edge of the highlands, and are widely distributed on the floor of the coastal districts. They have been lowered to this level by a monoclinal fold, which has brought down the Mesozoic rocks, so that they extend eastward to the coast, where they dip beneath the sea. The western plains contain isolated ridges of the old Archean and Lower Palaeozoic rocks; but in the main, they consist of plains of Cretaceous beds covered by Cainozoic drifts. The stratified rocks in the highlands strike north and south, as if they had been crumpled into folds, in Upper Palaeozoic times, by pressure from east to west. The weak areas in the crust caused by the earth movements were invaded by great masses of Devonian granites. They altered the Lower Palaeozoic rocks on their edges, and were once thought to have converted wide areas of Lower Palaeozoic rocks into schists and gneisses. Most of these foliated rocks, however, are doubtless of Archean age. The highland rocks no doubt once extended along the whole length of the state from north to south; but they are now crossed by a band of Upper Palaeozoic sediments, which extend up to the valley of the Hunter river and separate the Blue Mountains and the Southern Highlands of New South Wales from the New England tableland to the north.

The oldest rocks in New South Wales are referrable to the Archean system, and consist of gneisses and schists, including the glaucophane-schists in the New England tableland, and hornblende-schists of Berthong. The Archean rocks are comparatively sparsely exposed in New South Wales. They enter the state from the south, being continuous with the Archean block of north-eastern Victoria. They occupy a large area in the western districts of New South Wales, where a projection from the Archean plateau of central Australia crosses into the state from South Australia; it is best exposed in the Barrier Ranges around Broken Hill. Cambrian rocks have not yet been discovered in New South Wales; but Pittman has recorded an *Agnostus* from Mandurama, near Orange. The rocks of the Ordovician system, though widely distributed, have not always been separated from the Silurian rocks, which they often closely resemble lithologically. The occurrence of Ordovician rocks was first established by Dun at Tomingley, 33 m. S.W. of Dubbo, where he discovered graptolites that he identified as *Climacograptus* and *Dicellograptus*. Other graptolites have been found near Orange, and at Lyndhurst, near Carcoar. The fossiliferous horizon is of Upper Ordovician age. The extent of the Ordovician will probably be increased by addition of areas, which cannot yet be separated from the Silurian. The Silurian system is the best-known constituent of the Lower Palaeozoic foundation of New South Wales. The rocks consist of sandstones, quartzites, slates and shales, associated with lenticular masses of limestone. The typical Silurian rocks are richly fossiliferous, the shales containing trilobites, the sandstones many brachiopods, and the limestones a rich coral and bryozoan fauna. There are also beds of chert, which are largely composed of radiolaria. Caves have been dissolved in the limestones by underground streams; the Jenolan caves in the Blue Mountains and those of Yarrangobilly and the Goulburn district are the most famous. The slates of the Silurian have been bent into folds, and saddle reefs occur along the axis of the folds, as at Hargraves. Numerous quartz reefs occur both in the Silurian and Ordovician rocks. In these reefs the chief mineral is gold. Some schists, attributed to the Silurian, but possibly older, contain platinum; and associated with the limestones are beds of copper.

The rocks of the Devonian system rest unconformably upon the Silurian; but some beds of which the age is still uncertain are called Devono-Silurian. The Devonian beds are well developed in the Blue Mountains, where the lower Devonian sediments at Mount Lambie are estimated to be 10,000 ft. in thickness. They are extensively developed along the Cox river and along the slopes of Mount Canoblas. They are also developed in the New South Wales highlands, to the south-east of Goulburn. Some of the best-known exposures are in the ranges which rise above the western plains, such as the Rankin Range on the Darling and the Kokopara Range to the north of the Murrumbidgee. The Devonian rocks at Yalwal are sharply folded and are associated with a series of rhyolites and basic lavas. The lower part of this series is probably Lower Devonian; and it is covered by shales and volcanic rocks belonging to the Upper Devonian. In the extreme south-east of New South Wales, at the head of the Genoa river, are sandstones with *Archaeopteris howitti*, which are an extension of the Lower Devonian beds of Victoria; while farther to the east, at Eden and Twofold Bay, are Upper Devonian sandstones.

The Devonian system is separated from the Carboniferous by an interval, during which there were powerful earth movements; they produced a lofty mountain chain, running north and south across New South Wales. The highlands are the worn down stumps of this mountain line. In Lower Carboniferous times these mountains were snow-capped, and the valleys on their flanks were occupied by glaciers.

The Lower Carboniferous beds are represented by conglomerates and sandstones with some shales and limestones. The sandstones are characterized by *Lepidodendron* (*Bergeria*) *australe*. It is associated with beds of lava and volcanic ash, some of which contain copper ores. Granites and granodiorites were intruded at this period into the older rocks, and altered the adjacent Devonian beds into slates and quartzites, and formed gold-quartz veins, which have been worked in the Devonian rocks at Yalwal. The Lower Carboniferous rocks also occur in the Blue Mountains, along the Cox river and Capertee river; and a northern continuation occurs along the western slope of the New England tableland, from the Macintyre river to the Queensland border.

The Upper Carboniferous rocks are most important from their rich seams of coal. They occupy from 24,000 to 28,000 sq. m., which are best exposed in the Hunter river and around Newcastle.

Kiama, Shoalhaven, Bateman's Bay, Ulladulla, Merimbula, and Twofold Bay. North of Sydney the secondary ports are at the mouths of the Hawkesbury, Manning, Hastings, Macleay, Nambucca, Bellingen, Clarence, Richmond and Tweed rivers. The rivers of the sea-board are as just enumerated, the only other of importance being the Hunter. The Richmond drains an area of 2400 sq. m. and is navigable for 60 m. The Clarence is a fine stream draining an area of 8000 sq. m.; it has a course of 240 m. navigable for 67 m. The Macleay drains an area of 4800 sq. m., and empties at Trial Bay after a course of 200 m., of which 20 m. are navigable. The Hastings and Manning are both important rivers. The Hunter is one of the chief rivers of the state and embouches at Port Hunter or Newcastle Harbour after a course of 200 m. It drains an area of 11,000 sq. m., more than twice the area of the Thames basin. Less commercially important than the Hunter, the Hawkesbury is nevertheless a fine stream; it has a course of 330 m., of which 70 m. are navigable. South of Sydney the rivers are of less importance; the principal is the Shoalhaven, 260 m. long, draining an area of 3300 sq. m.

Climate.—The three geographical regions above described constitute three distinct climatic divisions. The coastal region, 28° to 37° S. lat., shows a difference between the average summer and winter temperatures of only 24° Fahrenheit. Sydney, which is situated midway between the extreme points of the state (33° 51′ S.), has a mean temperature of 63°, the mean summer temperature being 71° and that of winter 54°, showing a mean range of 17°; the highest temperature in the shade experienced at Sydney in 1896 was 108·5°, and the lowest 35·9. The coastal district has an area of 38,000 sq. m., over which there is an average rainfall of 42 in. The rainfall is greatest at the sea-board, diminishing inland; the fall also diminishes from north to south. Sydney has an average fall of 50 in., while the Clarence Heads, in the north, has 58 in., and Eden, in the south, 35·5 in. The tableland is a distinct climatic region. On the high southern plateau, at an elevation of 4640 ft., stands the town of Kiandra, with a mean summer temperature of 56·4° and winter of 32·5°. Cooma, in the centre of the Monaro plains, at an elevation of 2637 ft., has a mean summer temperature of 65·9° and winter, 41·7°; its summers are therefore as mild as those of London or Paris, while its winters are much less severe. On the New England tableland, under latitude 30° S., the yearly average temperature is 56·5°, the mean summer 67·7° and the mean winter 44·3°. The tablelands cover an area of 85,000 sq. m. and have an average rainfall of 32·6 in.; there is, however, a small area in the southern portion where an average fall of 64 in. is experienced. In the western division, or great plains, severe heat is experienced throughout the summer, and on occasional days the thermometer in the shade ranges above 100° Fahrenheit, but it is a dry heat and more easily borne than a much less degree of temperature at the sea-board. The mean summer temperature ranges between 75° at Deniliquin in the south and 84° at Bourke. The mean range in winter is between 48° and 54·5°, and, accompanied as this is with clear skies, the season is very refreshing. West of the tableland the amount of rainfall decreases as the distance from the Pacific increases, and in a large area west of the Darling the average annual rainfall does not exceed 10 in. For the whole western division, embracing an area of 188,000 sq. m., the average rainfall is 19·8 in. (T. A. C.)

Geology.—New South Wales consists geologically as well as geographically of three main divisions which traverse the state from north to south. The highlands of eastern Australia form the middle belt of the state, to the east of which are the low coastal districts and to the west the wide western plains. The highlands of New South Wales consist, geographically, of a series of tablelands, now in the condition of dissected peneplains; geologically, they are built of a foundation of Archean and folded Lower Palaeozoic rocks, covered in places by sheets of more horizontal Upper Palaeozoic and Mesozoic rocks; these deposits occur along the edge of the highlands, and are widely distributed on the floor of the coastal districts. They have been lowered to this level by a monoclinal fold, which has brought down the Mesozoic rocks, so that they extend eastward to the coast, where they dip beneath the sea. The western plains contain isolated ridges of the old Archean and Lower Palaeozoic rocks; but in the main, they consist of plains of Cretaceous beds covered by Cainozoic drifts. The stratified rocks in the highlands strike north and south, as if they had been crumpled into folds, in Upper Palaeozoic times, by pressure from east to west. The weak areas in the crust caused by the earth movements were invaded by great masses of Devonian granites. They altered the Lower Palaeozoic rocks on their edges, and were once thought to have converted wide areas of Lower Palaeozoic rocks into schists and gneisses. Most of these foliated rocks, however, are doubtless of Archean age. The highland rocks no doubt once extended along the whole length of the state from north to south; but they are now crossed by a band of Upper Palaeozoic sediments, which extend up to the valley of the Hunter river and separate the Blue Mountains and the Southern Highlands of New South Wales from the New England tableland to the north.

The oldest rocks in New South Wales are referrable to the Archean system, and consist of gneisses and schists, including the glaucophane-schists in the New England tableland, and hornblende-schists of Berthong. The Archean rocks are comparatively sparsely exposed in New South Wales. They enter the state from the south, being continuous with the Archean block of north-eastern Victoria. They occupy a large area in the western districts of New South Wales, where a projection from the Archean plateau of central Australia crosses into the state from South Australia; it is best exposed in the Barrier Ranges around Broken Hill. Cambrian rocks have not yet been discovered in New South Wales; but Pittman has recorded an *Agnostus* from Mandurama, near Orange. The rocks of the Ordovician system, though widely distributed, have not always been separated from the Silurian rocks, which they often closely resemble lithologically. The occurrence of Ordovician rocks was first established by Dun at Tomingley, 33 m. S.W. of Dubbo, where he discovered graptolites that he identified as *Climacograptus* and *Dicellograptus*. Other graptolites have been found near Orange, and at Lyndhurst, near Carcoar. The fossiliferous horizon is of Upper Ordovician age. The extent of the Ordovician will probably be increased by addition of areas, which cannot yet be separated from the Silurian. The Silurian system is the best-known constituent of the Lower Palaeozoic foundation of New South Wales. The rocks consist of sandstones, quartzites, slates and shales, associated with lenticular masses of limestone. The typical Silurian rocks are richly fossiliferous, the shales containing trilobites, the sandstones many brachiopods, and the limestones a rich coral and bryozoan fauna. There are also beds of chert, which are largely composed of radiolaria. Caves have been dissolved in the limestones by underground streams; the Jenolan caves in the Blue Mountains and those of Yarrangobilly and the Goulburn district are the most famous. The slates of the Silurian have been bent into folds, and saddle reefs occur along the axis of the folds, as at Hargraves. Numerous quartz reefs occur both in the Silurian and Ordovician rocks. In these reefs the chief mineral is gold. Some schists, attributed to the Silurian, but possibly older, contain platinum; and associated with the limestones are beds of copper.

The rocks of the Devonian system rest unconformably upon the Silurian; but some beds of which the age is still uncertain are called Devono-Silurian. The Devonian beds are well developed in the Blue Mountains, where the lower Devonian sediments at Mount Lambie are estimated to be 10,000 ft. in thickness. They are extensively developed along the Cox river and along the slopes of Mount Canoblas. They are also developed in the New South Wales highlands, to the south-east of Goulburn. Some of the best-known exposures are in the ranges which rise above the western plains, such as the Rankin Range on the Darling and the Kokopara Range to the north of the Murrumbidgee. The Devonian rocks at Yalwal are sharply folded and are associated with a series of rhyolites and basic lavas. The lower part of this series is probably Lower Devonian; and it is covered by shales and volcanic rocks belonging to the Upper Devonian. In the extreme south-east of New South Wales, at the head of the Genoa river, are sandstones with *Archaeopteris howitti*, which are an extension of the Lower Devonian beds of Victoria; while farther to the east, at Eden and Twofold Bay, are Upper Devonian sandstones.

The Devonian system is separated from the Carboniferous by an interval, during which there were powerful earth movements; they produced a lofty mountain chain, running north and south across New South Wales. The highlands are the worn down stumps of this mountain line. In Lower Carboniferous times these mountains were snow-capped, and the valleys on their flanks were occupied by glaciers.

The Lower Carboniferous beds are represented by conglomerates and sandstones with some shales and limestones. The sandstones are characterized by *Lepidodendron* (*Bergeria*) *australe*. It is associated with beds of lava and volcanic ash, some of which contain copper ores. Granites and granodiorites were intruded at this period into the older rocks, and altered the adjacent Devonian beds into slates and quartzites, and formed gold-quartz veins, which have been worked in the Devonian rocks at Yalwal. The Lower Carboniferous rocks also occur in the Blue Mountains, along the Cox river and Capertee river; and a northern continuation occurs along the western slope of the New England tableland, from the Macintyre river to the Queensland border.

The Upper Carboniferous rocks are most important from their rich seams of coal. They occupy from 24,000 to 28,000 sq. m., which are best exposed in the Hunter river and around Newcastle.

Farther south they disappear beneath the Mesozoic sandstones, from which they again rise along the coast around Lake Illawarra and near the mouth of the Shoalhaven river. The Coal Measures have been reached under Sydney, by a deep bore at Balmain, which pierced a seam of coal 10 ft. thick, at the depth of 2917 ft. The Coal Measures are classified by Professor T. W. David as follows:—

	Ft.
1. Upper or Newcastle Coal Measures, containing an aggregate of about 100 ft. of coal	1,150
2. Dempsey Series; freshwater beds, containing no productive coal. This series thins out completely in certain directions	2,000
3. Middle, or Tomago, or East Maitland Coal Measures, containing an aggregate of about 40 ft. of coal	570
4. Upper Marine Series; specially characterized by the predominance of *Productus brachythaerus*	5,000
5. Lower or Greta Coal Measures, containing an aggregate of about 20 ft. of coal	130
6. Lower Marine Series; specially characterized by the predominance of *Eurydesma cordata*	4,800
	13,650

Geologically, perhaps, the most interesting rocks in the Carboniferous are the glacial conglomerates, containing ice-scratched, erratic blocks. Some of the boulders are encrusted by marine organisms and must have been dropped by icebergs in the sea. The northern limit of the glacial beds is in dispute; they have been described as far north as Ashford. The Carboniferous beds contain numerous sheets and flows of basalt and andesite. A syenite *massif* of this age occurs at Mittagong; and leucite has been discovered in Carboniferous basalts by David.

The Mesozoic rocks of New South Wales begin with the Narrabeen Shales; they are covered by the Hawkesbury Sandstones, which are well exposed around Sydney; and they in turn are covered by the Wianamatta Shales. The Triassic age of the Hawkesbury Sandstone is supported by the evidence of the fossil fish; though, according to Dr Smith Woodward, they may perhaps be Rhaetic. But the fossil plants of which the chief are *Taeniopteris daintreei* and *Thinnfeldia odontopteroides* are regarded by Seward as Lower Jurassic. At Talbragar there is a bed containing Jurassic fish, which rests in an erosion hollow in the Hawkesbury Sandstone. The Talbragar beds, then, may be representative of the Jurassic; and the underlying Hawkesbury Sandstone may be Upper Triassic. The Cretaceous system is widely developed in the western part of the state, where it is represented by two divisions. The Rolling Downs formation is regarded as Lower Cretaceous. It consists of a thick series of shales containing marine fossils. It is covered in places by tablelands and ridges of the Desert Sandstone, the remnants of a sheet which doubtless once covered the whole of the Western Plains. The chief economic product of the Desert Sandstone is opal, which occurs in it at White Cliffs and Wilcannia. The opal beds contain Cretaceous fossils such as *Cimoliosaurus*. An occurrence of Upper Cretaceous beds occurs in the coastal district at Nimbin on the Richmond river. The Cainozoic rocks are best developed in the western districts, as the silts of the Darling and Murray plains. They include some Miocene, or perhaps Oligocene marine sands, formed in the northern part of an inland sea, which occupied the basin of the Lower Murray. The most significant point in the distribution of the marine Cainozoic rocks in New South Wales is their complete absence from the coastal districts; this fact indicates that while the Middle Cainozoic marine beds of Victoria and New Guinea were being deposited, Australia extended far eastward into the Tasman Sea. The Cainozoic series of New South Wales contains many interesting volcanic rocks, including leucite-basalts, nepheline-basalts and sodalite-basalts. In a basic neck of this period at Inverell, there are eclogite boulders, containing diamonds *in situ*; and it is doubtless from these basic volcanic necks that the diamonds of the New England tableland have been derived. The volcanic rocks occur on the tableland of New South Wales, and contribute much to the fertility of their soils.

The most important mineral in New South Wales is coal, of which the state has probably a larger available supply than any other country in the southern hemisphere. The coal-fields occupy 24,000 sq. m. The coal is present in such vast amount as to offer the possibility of very economical working of the abundant iron ores of Australia. Kerosene shale occurs in the Blue Mountains to the west of Sydney, in the Upper Carboniferous rocks. Gold is widely distributed through the highlands. It was first recorded by James McBrien in 1823, as occurring in grains in the sands of the Fish river, between Rydal and Bathurst; and though further discoveries were made, they were kept secret as far as possible. The first discovery of gold in mining quantities was made by Hargraves in 1851, at the junction of Lewis Ponds and Summerhill Creek, in what was called the Ophir Diggings, near Bathurst. The gold mines are very numerous and widely scattered, but individually they are mostly small and of no great depth. The total value of the gold raised since 1850 is over £50,000,000. The output of alluvial gold is now increased by the employment of dredges. The gold-quartz veins are mainly in the Ordovician and Silurian rocks; but some also occur in the Devonian, and there are impregnations of gold in tufas of Devonian age. Deep leads beneath the basalts occur at Kiandra.

The silver-lead mines of New South Wales are famous owing to the importance of Broken Hill. The mines there occur in gneiss and schists, which are probably of Archean age; the lode has in places been worked for a width of over 200 ft. The zinc ores associated with the silver-lead long lay unutilized, as the problem of their separation from the associated rhodonite has only recently been overcome. Tin is worked in the rivers of the New England tableland as at Vegetable Creek. The chief copper field is at Cobar in the north-western plains. Bismuth, platinum, molybdenum and antimony are obtained in small quantities.

The geology of New South Wales has been described in the Monographs, Memoirs and Records of the Geological Survey, which in the fullness and high scientific character form the most valuable contribution to Australasian geology. Pittman's map of the state in two sheets, on the scale of 16 m. to the inch, was issued by the Survey in 1893. The economic geology has been admirably summarized in a work by E. F. Pittman, *The Mineral Resources of New South Wales* (1901). Numerous geological memoirs have appeared in the *Rep. Austral. Assoc. for the Advancement of Science*, the *Journ. R. Soc. N.S. Wales* and the *Proc. of the Linnaean Soc. N.S. Wales*. A systematic account of the minerals has been published by A. Liversidge, *The Minerals of New South Wales* (1888), and to him is due a valuable chemical study of the meteorites and gold nuggets. Contributions on the palaeontology of New South Wales are contained in the Rec. Austral. Museum, Sydney. A bibliography of the economic geography has been issued by W. S. Dun, *Rec. Geol. Surv. N.S. Wales*, vol. vi., 1899, and of the Cretaceous geology, also by W. S. Dun, in *Journ. of Proc. Royal Soc. N.S. Wales*, 1903, vol. xxxvii. pp. 140–153. (J. W. G.)

Artesian Water.—Before actual boring proved that the belief was well founded, it had long been scientifically demonstrated that water would probably be obtained in the Cretaceous formation which underlies the whole of the north-west of New South Wales; and it is probable that the artesian water-bearing basin extends much farther south than was previously supposed. It may, indeed, be yet found to extend approximately along the course of the Lower Darling. Artesian water is also obtainable in other than Cretaceous rocks. This is shown by palaeontological evidence; and some of the most successful bores, such as those at Coonamble, Moree, Gil Gil and Euroka, have pierced rocks of Triassic age, corresponding with the Ipswich Coal Measures.

Population.—The population on the 1st of July 1906 was 1,504,700, viz. 799,260 males and 705,440 females. The total includes 105,000 Chinese and 7500 aborigines and half-castes. Since 1860 New South Wales had added more largely to its population than any of the other Australian states. In 1860 the population was 348,546; in 1890 the number was 1,121,860. From 1890 to 1901 the population increased 238,083, or at the rate of 21·2%. By far the largest part of the increase is due to excess of births over deaths, for out of the increase of over 1,000,000 since 1860, only 350,000 was due to immigration. In 1905 there were 39,572 births and 14,980 deaths; these figures are equal to 26·78 and 10·13 per thousand respectively. The birth-rate has fallen very much, especially since 1899. In 1861–1865 it was 42·71 per 1000; in 1896–1899 it was 27·92, and in 1906 it had fallen still further to 26·78. The marriage rate for 1905 was 7·40 per thousand, and the persons married 14·80 per thousand. The mean for 20 years was 7·39. The chief cities are Sydney and suburbs, population in 1906, 535,000; Newcastle and suburbs, 56,000; Broken Hill, 30,000; in 1901, Parramatta, 12,568; Goulburn, 10,610; and Maitland (East and West), 10,085. There are nine other towns with between 5000 and 10,000 inhabitants each.

Religion.—The proportions of the leading denominations in 1901 were:—Church of England, 46·6%; Roman Catholic, 26·0; Presbyterian, 9·9; Wesleyan and other Methodists, 10·3; Congregationalist, 1·9; Baptist, 1·2; Jews, 0·5; others, 3·6. Sydney is the seat of Anglican and Roman Catholic archbishoprics; the Anglican archbishop is also primate of Australia and Tasmania.

Education.—The state has in its employ 3135 male and 2424 female teachers, and maintains 2901 schools. The law requires that all children over six years and under fourteen years shall attend school, and in 1904, 220,000 children of these ages, as well as 39,000 others below or beyond the school ages, were receiving instruction, making a total of 259,000. Of this number 211,000 were in state schools and 48,000 in private schools. The majority of the private schools are controlled by one or other of the religious bodies. The Roman Catholic Church has 361 schools, with 1835 teachers and an attendance of 33,000 pupils. The total expenditure of the state on public instruction, science and art during the year ended 30th June 1906 was £911,000. During the calendar year 1906 a sum of £840,000 was expended on primary instruction. The fees from pupils

amounted to £82,000, making the actual cost of primary instruction £758,000. There are a university and a technical college in Sydney.

Finance.—The revenue of the state is derived from four main sources, viz. taxation; sale and lease of lands; earnings of railways, tramways and other services; and share of surplus revenue returned by the commonwealth. During 1906 the income derived under each of these heads was: from taxation £1,297,776; from lands £1,729,887; from railways and other services £5,856,826; from commonwealth £2,742,770; these with miscellaneous collections to the amount of £655,823 made up a total revenue of £12,283,082. The direct taxation is represented by a tax of one penny in the pound on the unimproved value of land, sixpence in the pound on the annual income derived in the state from all sources, except the use and occupation of land and improvements thereon. There are also various stamp duties. The land revenue is derived partly from the alienation of the public estate, either absolutely or under conditions, but mainly from the occupation of the public lands. There is also a small revenue from mining lands, timber licences, &c. The state still holds 146 million acres out of a total of 196 million acres, having alienated about 50 million acres. The principal heads of expenditure were: interest and charges on public debt, £3,291,059; public instruction, £911,177; working expenses of railways and tramways, £2,954,777; other services working expenses, £208,242; other services, £3,900,726. The public debt in 1906 was £85,641,734, equal to £56, 11s. per inhabitant; the great proportion of this debt has been incurred for works that are revenue producing, only about £11,000,000 was not so expended. Of the total debt in 1903 about £66,000,000 was held in London. The net return from public works in excess of expenditure in 1906 amounted to nearly 3¼% on the whole public debt, and the interest paid averages 3·6%.

Administration.—The political constitution of New South Wales is that of a self-governing British colony, and rests on the provisions of the Constitution Act. The governor is appointed by the crown, the term of office being generally for five years, and the salary £5000. The governor is the official medium of communication between the colonial government and the secretary for the colonies, but at the same time the colony maintains its own agent-general in London, who not only sees to all its commercial business but communicates with the colonial office. The powers of the state parliament have been since 1901 restricted by the transfer of certain powers to the commonwealth of Australia. In the legislative assembly there are 90 members. The principle adopted in distributing the representation is that of equal electoral districts, modified in practice by a preference given to the distant and rural constituencies at the cost of the metropolitan electorates. The suffrage qualification is a residence of twelve months and the attainment of the age of 21 years. Women are entitled to the franchise: there are the usual restrictions in regard to the pauper and criminal classes. An elector has only one vote, which is attached to the district in which he resides. Members of the Legislative Assembly are allowed a salary of £300 a year. There were in 1906 about 700,000 electors. Each electoral district returns one member. The Legislative Council consists of persons nominated for life by the governor, acting on the advice of the Executive Council; the number of members is not fixed by law but in 1906 it was 55. Parliaments are triennial. Local government was extended in 1905 and 1906 to the whole state, excepting the sparsely populated western division; formerly it was confined to an area of about 2800 sq. m. There are altogether about 55,000 m. of road communications, but not more than 15,000 m. are properly formed. The various local bodies are municipalities or shires, the former is the term applied to closely peopled areas of small extent endowed with complete local government, and the latter is the designation of the more extensive districts, thinly peopled, to which a less complete system of local government has been granted.

Federal Capital.—In 1908 the Seat of Government Act provided that the federal territory and capital of Australia should be in the Yass-Canberra district of New South Wales, and that the territory should have an area of not less than 900 sq. m. and easy access to the sea. In 1909 a Board appointed to consider the several possible sites within this district reported in favour of Canberra, on the Molonglo river, near Queanbeyan, as the site for the new city, and the basins of the Molonglo, Queanbeyan and Cotter rivers were indicated as suitable to form the federal territory. Jervis Bay was recommended as offering a site for a port for the territory. Bills were passed in 1909 by the legislative assembly of New South Wales and by the federal parliament, transferring this territory to the federation.

Agriculture.—New South Wales might be described as essentially a pastoral country, and the cultivation of the soil has always been secondary to stock-raising. But the predominance of the pastoral industry is not by any means so marked as it was even as late as the last decade of the 19th century. The want of progress in agriculture was not to be ascribed to defects of climate or soil, but chiefly to the great distance of Australia from the markets of the world. This difficulty has, for the most part, been removed by the establishment of numerous important lines of steamers trading between Australia and Europe, and recent years have therefore seen considerable expansion in all forms of agriculture.

In 1882 the area of land under cultivation was 733,582 acres, which is slightly less than 1 acre per inhabitant. In 1900 the total area under cultivation was 2,439,639 acres, and in 1906 it had risen to 2,838,081 acres, which is a little short of 2 acres per inhabitant.

The area devoted to each of the principal crops was as follows:—

	Acres.
Wheat	1,939,400
Maize	189,000
Oats	38,500
Sugar Cane	21,500
Hay	438,000
Vines	8,100

The average yield per acre of crops may be set down as follows:—

	Bushels.
Wheat	10·5
Maize	30
Oats	23
Sugar Cane	20 tons, cane
Hay	1 ton
Wine	185 gallons

The total value of production in the year 1906 may be set down at £6,543,000, which works out at £2, 6s. 1d. per acre.

Although the coastal districts are still important, as the crops yielding the largest returns per acre are grown there, as regards the total area under crop these districts are of much less importance compared with the whole state than formerly.

The area under crop on the coast districts is about 320,000 acres; on the tablelands 375,000 acres; on the western slopes, 1,100,000 acres; the Riverina district, 750,000 acres; the western plains, chiefly in the central portion, 270,000 acres; and less than 20,000 acres in the western division, which comprises nearly half the total area of the state. The soil in that part of the country is, for the most part, suitable for cultivation, and there are large areas of rich land, but the rainfall is too light and irregular for the purpose of agriculture.

There were 76,000 occupiers of rural holdings in 1905, and the area occupied by them, exclusive of lands leased from the state, is 48,081,000 acres. The great majority, 80% in 1905, of occupiers are freeholders; the practice of renting farm lands is not followed to any considerable extent, except in the dairying lands on the coast district. New South Wales took up its position amongst wheat-exporting countries in 1900; the bulk of the grain exported goes to the United Kingdom. Hay crops and maize rank next in importance to wheat. The cultivation of fruit is receiving increased attention, but the growing of sugar cane and tobacco and the production of wine, until recently so promising, are, if not declining, at least stationary, in spite of the suitability of the soil of many districts for these crops.

Grazing and Dairying.—The grazing industry still holds a chief place amongst the productive industries of the state. In 1906 the number of horses was 507,000; of sheep, 40,000,000; of cattle, 2,340,000; and swine, 311,000. There were considerable losses of sheep in 1902 owing to the drought of that year, but the flocks in 1906 were of better quality than at any previous period and little short of the number of 1898. The vast majority of the sheep are of the merino breed, but there are about a million long-woolled sheep and between two and three million cross-bred. Dairying made very great strides in the ten years preceding 1906, and ranks as one of the great industries of the state. There were 644,000 dairy cows in 1906, and the numbers are increasing year by year. The production of wool was 300,000,000 lb. as in the grease; tallow, 493,000 cwt.; butter, 500,000 cwt.; cheese, 42,000 cwt.; and bacon and hams, 110,000 cwt.

Mining.—The mining industry has made great strides. In 1905 there were about 38,000 men engaged in the various mines, besides 3300 employed in smelting. Of these, 10,700 were employed in gold-mining; in coal-mining there were 14,100; silver, 7100; tin, 2750, and copper, 1850. The value of mining machinery may be approximately set down at £2,900,000. The following summary shows the value of the various minerals won in 1905. It is impossible to separate the values of silver and lead contained in the ore obtained at Broken Hill; the two metals are therefore shown together.

Minerals.		Quantity.	Value.
Metallic—			
Gold	oz. fine	274,267	£1,165,013
Silver	,,	417,520	52,196
Silver, lead and ore	ton	441,447	2,441,856

The value of gold won varies from year to year, but from 1894 to 1906 in only two years did it fall below £1,000,000. About one-fourth of the gold won is alluvial. The yield of gold from quartz mines was in 1904 11 dwt. 14 grs. per ton, which was somewhat below the average for the previous ten years. The Broken Hill silver lode is the largest as yet discovered; it varies in width from 10 ft. to 200 ft., and may be traced for several miles. The Broken Hill Proprietary Company owns the principal mine, and at Port Pirie in the neighbouring colony of South Australia erected a complete smelting plant; the problem of the recovery of the zinc contents of the ore having been satisfactorily solved, the company made extensive additions to the plant already erected, and in 1906 the manufacture of spelter was undertaken. From the commencement of mining operations on a large scale in 1885 to the end of 1905 the value of silver and lead ore won was £40,000,000. The production of tin rapidly declined after 1881, when the value of ore raised was £569,000: the production varies both with the price and the occurrence of rain, but the principal cause of the decreased production was the exhaustion of the shallow deposits of stream tin, from which most of the ore was obtained. The principal deposits of copper are in the central parts between the Macquarie, Bogan and Darling rivers. The copper lodes of New South Wales contain ores of a much higher grade than those of many well-known mines worked at a profit in other parts of the world, and, with a fair price for copper, the production largely increases. Iron is widely diffused, principally in the form of magnetite, brown haematite, limonite and bog iron. Coal mining is carried on in three districts. In the northern or Hunter river district there were 63 collieries, employing 10,500 men, and the quantity of coal raised was in 1904 about 4,100,000 tons; in the southern district there were fifteen collieries, employing 3100 men and raising 1,600,000 tons of coal. The western or mountain collieries were seventeen in number, employing 540 men and raising about 418,000 tons. About 52% of the coal obtained is exported. Kerosene shale (torbanite) is abundant and is systematically worked.

Manufacturing.—There are a large and rapidly increasing number of manufactories, but in 1905 only about 250 employed more than 50 hands. The following gives a statement of factory employment for eleven years:—

Year.	No. of Establishments.	Hands Employed.	Value of Plant and Machinery.
1895	2723	48,030	£5,255,000
1900	3077	60,779	5,708,000
1905	3700	72,175	7,920,000

About 5·3% of the males and 10·6% of the females employed are under sixteen years; the total number of male employees in 1905 was 56,117, and of females, 16,058. About two-thirds of the hands are employed in Sydney and the adjacent district. The total value of the articles produced in manufactories, and the increased value of materials after undergoing treatment, was £30,028,000 in 1905, of which £17,500,000 represented value of materials used and £600,000 the value of fuel: the total wages paid was £5,200,000.

Commerce.—During 1905, 2725 vessels entered New South Wales ports from places outside the state; their tonnage was 4,697,500; the value of goods imported was £29,424,008; and the value of exports was £36,757,002. The average value of imports per inhabitant was £20 and of exports £24, 17s. The bulk of the trade is carried on with the other Australian states; in 1905 the value of such trade was, imports, £14,938,885, and exports, £12,263,472; the British trade is also considerable, the imports direct from Great Britain being valued at £8,602,288 and the exports £10,222,422. With all British countries the trade was, imports, £25,989,399, and exports, £25,994,563. New South Wales maintains a large trade with foreign countries aggregating £3,434,609 imports and £10,762,439 exports. France, Germany, Belgium and the United States are the principal foreign countries with which the state trades.

Wool is the staple export, and represents, in most years, one-third the value of the exports. Gold coin and bullion form one of the principal items in the export list, but only a small portion of the export is of local production, the balance being Queensland and New Zealand gold sent to Sydney for coinage. The course of trade from 1880 to 1905 was as follows:—

Year.	Imports.	Exports.
1880	£14,176,063	£15,682,802
1885	23,737,461	16,750,107
1890	22,615,004	22,045,937
1895	15,992,415	21,934,785
1900	27,561,071	28,164,516
1905	29,424,008	36,757,002

The principal articles of export in 1905 were: Wool, £13,446,260; gold, £3,053,331; silver and concentrates, £2,407,142; lead, £1,072,858; butter, £817,820; coal, £1,565,602; copper, £1,280,599; breadstuffs, £1,345,589; leather and skins, £1,559,033; meats, £761,235; tallow, £464,330; timber, £353,265; tin, £466,049.

Banking.—The banks of issue number thirteen; their paid-up capital amounts to £13,918,000 and the capital and reserves to £19,319,000, but of this sum only about £9,000,000 is used in the state. On the 30th of June 1906 the coin and bullion in reserve amounted to £8,192,000 and the note circulation to £1,462,000. The banks had on deposit £23,325,730 bearing interest and £15,773,883 not bearing interest, representing a total of £39,100,000. The savings banks had on their books at the close of 1905 about 355,714 depositors, with £13,500,000 to their credit. This represents £9, 1s. 6d. per inhabitant. The total deposits in all banks therefore amounted to £52,600,000. The progress from 1860 to 1905 was as follows:—

Year.	Amount on Deposit.	Average per Inhabitant.
		£. s. d.
1860	£5,721,208	16 8 3
1870	7,044,464	14 2 6
1880	19,958,880	26 13 8
1890	43,390,141	38 13 6
1900	43,135,000	31 17 0
1905	52,600,000	34 17 6

Postal and Telegraph Service.—The postal business of 1905 was represented by the carriage of 102,292,888 letters and postcards, 44,599,104 newspapers and 23,077,094 parcels and books; the telegrams despatched numbered 3,837,962. To transact the postal business of the country, mail conveyances travelled 12,000,000 m. The income of the postal and telegraph department in 1905 was £1,065,618 and the expenditure £933,121, but there were some items of expenditure not included in the sum named, such as interest charges, &c., and cost of new buildings.—The administration of the post office is under the commonwealth government

Railways.—The railways are almost entirely in the hands of the state, for out of 3471 m. open in 1906 the state owned 3390 m. The capital expended on the state lines open for traffic was £43,626,000, of which sum £7,400,000 was expended on rolling stock and equipment and £36,226,000 on construction of roads, stations and permanent ways. The net earnings amounted in 1906 to £1,926,407, which represents a return of 4·41% upon the capital invested. The state pays, on an average, 3·69% for the money borrowed to construct the lines, and there is therefore a considerable surplus to the advantage of the revenue. The year 1906 was, however, a very excellent one as regards railway working, the operations of the ten previous years showing an average loss of about a quarter of 1%. (T. A. C.)

History

Early history.

New South Wales was discovered by Captain Cook on board the "Endeavour," on 20th April 1770. After he had observed the transit of Venus at Tahiti, he circumnavigated New Zealand and went in search of the eastern coast of the great continent whose western shores had long been known to the Dutch. He sighted the Australian coast at

Gippsland, Victoria, near Cape Everard, which he named Point Hicks, and sailed along the east coast of Australia as far north as Botany Bay, where he landed, and claimed possession of the continent on behalf of King George III. He then continued his voyage along the east coast of Australia, and returned to England by way of Torres Strait and the Indian Ocean. The favourable reports made by Captain Cook of the country around Botany Bay induced the British government to found a penal settlement on the south-eastern part of what was then known as New Holland. An expedition, consisting of H.M.S. "Sirius" of 20 guns, the armed trader "Supply," three store-ships and six transports, left England on 17th May 1787, and after touching at Tenerife, Rio de Janeiro, and the Cape of Good Hope, arrived at Botany Bay on the 20th of January 1788, under the command of Captain Arthur Phillip, R.N., with Captain John Hunter, R.N., as second. The persons on board the fleet included 564 male and 192 female convicts, and a detachment of marines, consisting of Major Ross, commandant, 16 officers, 24 non-commissioned officers, an adjutant and quartermaster, 160 privates and 40 women. There were in addition five medical men and a few mechanics. The live stock consisted of one bull and four cows, a stallion and three mares, some sheep, goats, pigs and a large number of fowls. The expedition was well provided with seeds of all descriptions.

Penal settlement regime.

The shores of Botany Bay were found to be unsuitable for residence or cultivation, and Captain Phillip transferred the people under his command to Port Jackson, half a dozen miles away, near the site of the present city of Sydney. For some years the history of the infant settlement was that of a large gaol; the attempts made to till the soil at Farm Cove near Sydney and near Parramatta were only partially successful, and upon several occasions the residents of the encampment suffered much privation. But by degrees the difficulties inseparable from the foundation of a remote colony were surmounted, several additional convict-ships landed their living freight on the shores of Port Jackson, and in 1793 an emigrant-ship arrived with free settlers, who were furnished with provisions and presented with free grants of land. By the end of the 18th century the inhabitants of Sydney and its neighbourhood numbered 5000. Immediately after the arrival of the first fleet, surveys of the adjacent coast were made; the existence of a strait between Australia and Tasmania was discovered by Surgeon Bass; and before the retirement of Governor King in 1806 Australia had been circumnavigated and the principal features of its coast-line accurately surveyed by Captain Flinders, R.N. The explorations landward were, however, not so successful, and for many years the Blue Mountains, which rise a few miles back from Sydney, formed an impenetrable barrier to the progress of colonization. Penal establishments were formed at Newcastle in New South Wales, at Hobart and Launceston in Tasmania, and an unsuccessful attempt was made to colonize Port Phillip. The most noteworthy incident in the first decade of the 19th century was the forcible deportation by the officers of the New South Wales Corps, a regiment raised in England for service in the colony, of the governor, Captain Bligh, R.N., the naval officer identified with the mutiny of the "Bounty." For some time the government was administered by the senior officer of the New South Wales Corps, but in 1809 he was succeeded by Captain Macquarie, who retained the governorship for eleven years.

Captain Macquarie's governorship.

During the régime of this able administrator New South Wales was transformed from a penal settlement to a colony. Before the arrival of Macquarie schools and churches had been erected, a newspaper, the *Sydney Gazette and New South Wales Advertiser*, had been started, and attempts had been made to acclimatize the drama. But he was the first governor to open up the country. He constructed permanent buildings at Sydney and Parramatta, formed roads and built bridges in the districts along the coast, and commenced a track across the Blue Mountains, which had been crossed in 1813 by Wentworth and others, thus opening up the rich interior to the inhabitants of Sydney. It was during Captain Macquarie's administration that the first banking institution, the Bank of New South Wales, was founded. The final fall of Napoleon in 1815 gave the people of the United Kingdom leisure to think about their possessions at the Antipodes; and in 1817 free settlers commenced to arrive in considerable numbers, attracted by the success of Captain John M'Arthur, an officer in the New South Wales Regiment, who had demonstrated that the soil, grass and climate were well adapted for the growth of merino wool. But although the free settlers prospered, and were enabled to purchase land on very easy terms, they were dissatisfied with the administration of justice, which was in the hands of a judge-advocate assisted by military officers, and with the absence of a free press and representative institutions. They also demanded permission to occupy the vast plains of the interior, without having to obtain by purchase or by grant the fee-simple of the lands upon which their sheep and cattle grazed. These demands were urged during the governorships of Sir Thomas Brisbane and General Darling; but they were not finally conceded, together with perfect religious equality, until the regime of Sir Richard Bourke, which lasted from 1831 to 1837. At the latter date the population had increased to 76,793, of whom 25,254 males and 2557 females were or had been convicts. Settlement had progressed at a rapid rate. Parramatta, Richmond and Windsor had indeed been founded within the first decade of the colony's existence; Newcastle, Maitland and Morpeth, near the coast to the north of Sydney, had been begun during the earlier years of the 19th century; but the towns of the interior, Goulburn, Bathurst and others, were not commenced till about 1835, in which year the site of Melbourne was first occupied by Batman and Fawkner. The explorations which followed the passage of the Blue Mountains opened up a large portion of south-eastern Australia. Van Diemen's Land was declared a separate colony in 1825, West Australia in 1829, South Australia in 1836 and New Zealand in 1839; so that before 1840 the original area of New South Wales, which at first included the mainland of Australia and the islands in the South Pacific, had been greatly reduced. In 1840 the press was free in every part of Australia, trial by jury had been introduced, and every colony possessed a legislature, although in none of them except New South Wales had the principle of representation been introduced, and in that colony only to a very limited extent. The policy of granting land without payment, originally in force in New South Wales, had been abandoned in favour of sales of the public lands by auction at the upset price of twenty shillings per acre; and the system of squatting licences, under which colonists were allowed to occupy the waste lands on payment of a small annual licence, had been conceded. In 1851, when separate autonomy was granted to Victoria, New South Wales had a population of 187,243, the annual imports were £2,078,338, the exports £2,399,580, the revenue was £575,794, and the colony contained 132,437 horses, 1,738,965 cattle and 13,059,324 sheep.

1821 to 1851.

Gold was discovered at Summerhill Creek, near Bathurst, in February 1851, by Edward Hammond Hargraves; and at the end of June the first shipment, valued at £3500, left Sydney. This discovery made an important change in the position of the colony, and transportation, which had been discontinued during the previous year, was finally abolished. The first mail steamer arrived in August 1852, and in 1853 a branch of the Royal Mint was established at Sydney. The New Constitution Bill, passed during the same year by the local legislature, provided for two deliberative chambers, the assembly to be elected and the council nominated, and for the responsibility of the executive to the legislature. The Sydney University, founded in 1850, was enlarged in 1854, and the first railway in New South Wales, from Sydney to Parramatta, commenced in 1850, was opened in 1855. In the same year the Imperial parliament passed the New Constitution Act; and in June 1856 the first responsible government in Australia was formed, during the governorship of Sir William Denison, by Mr Stuart Alexander Donaldson.

Responsible government. 1856.

The first administration lasted only for a few weeks, and it was some years before constitutional government worked smoothly. The powers of the new parliament were utilized for extending representative institutions. Vote by ballot was introduced; the number of members in the assembly was increased to 80, and the franchise was granted to every adult male after six months' residence in any electoral area. Meanwhile the material progress of the colony was unchecked. A census taken at the end of 1857 showed that the population of Sydney was, including the suburbs, 81,327. Telegraphic communication was established between Sydney, Melbourne, Adelaide and Tasmania in 1859; and during the same year the Moreton Bay district was separated from New South Wales and was constituted the colony of Queensland.

Sir John Young's governorship.

During the regime of Sir John Young, afterwards Lord Lisgar, who succeeded Sir William Denison in 1861, several important events occurred. The land policy of previous governments was entirely revised, and the Land Bill, framed by Sir John Robertson, introduced the principle of deferred payments for the purchase of crown lands, and made residence and cultivation, rather than a sufficient price, the object to be sought by the crown in alienating the public estate. This measure, passed with great difficulty and by bringing considerable pressure to bear upon the nominated council, was the outcome of a lengthened agitation throughout the Australian colonies, and was followed by similar legislation in all of them. It was during the governorship of Sir John Young that the distinction between the descendants of convicts and the descendants of free settlers, hitherto maintained with great strictness, was finally abandoned. In 1862 the agitation against the Chinese assumed importance, and the attitude of the miners at Lambing Flat was so threatening that a large force, military and police, was despatched to that goldfield in order to protect the Chinamen from ill-treatment by the miners. At this time, the only drawback to the general progress and prosperity of the country was the recrudescence of bushranging, or robbery under arms, in the country districts. This crime, originally confined to runaway convicts, was now committed by young men born in the colony, familiar with its mountains and forests, who were good horsemen and excellent shots. It was not until a large number of lives had been sacrificed, and many bushrangers brought to the scaffold, that the offence was thoroughly stamped out in New South Wales, only to reappear some years afterwards in Victoria under somewhat similar conditions.

The earl of Belmore became governor in 1868, and it was during his first year of office that H.R.H. the duke of Edinburgh visited the colony in command of the "Galatea." An attempt made upon his life, during a picnic at Clontarf, caused great excitement throughout Australia, and his assailant, a man named O'Farrell, was hanged. A measure which virtually made primary education free, compulsory and unsectarian came into operation. A census taken in 1871 showed that the population was 503,981; the revenue, £2,908,155; the expenditure, £3,006,576; the imports, £9,609,508; and the exports, £11,245,032. Sir Hercules Robinson, afterwards Lord Rosmead, was sworn in as governor in 1872. During his rule, which lasted till 1879, the Fiji Islands were annexed; telegraphic communication with England and mail communication with the United States were established; and the long series of political struggles, which prevented any administration from remaining in office long enough to develop its policy, was brought to an end by a coalition between Sir Henry Parkes and Sir John Robertson. Lord Augustus Loftus became governor in 1879, in time to inaugurate the first International Exhibition ever held in Australia. The census taken during the following year gave the population of the colony as 751,468, of whom 411,149 were males and 340,319 females. The railway to Melbourne was completed in 1880; and in 1883 valuable deposits of silver were discovered at Broken Hill. In 1885 the Hon. W. B. Dalley, who was acting Premier during the absence through ill-health of Sir Alexander Stuart, made to the British government the offer of a contingent of the armed forces of New South Wales to aid the Imperial troops in the Sudan. The offer was accepted; the contingent left Sydney in March 1885, on board the "Iberia" and "Australasian," and for the first time a British colony sent its armed forces outside its own boundaries to fight on behalf of the mother-country.

Sudan contingent 1885.

In July of the same year Dr Moran, the Roman Catholic archbishop of Sydney, became the first Australasian cardinal. Lord Carrington, who was appointed governor in 1888, opened the railway to Queensland, and during the same year the centenary of the colony was celebrated. The agitation against the Chinese, always more or less existent, became intense, and the government forcibly prevented the Chinese passengers of four ships from landing, and passed laws which practically prohibit the immigration of Chinese.

In 1889 the premier, Sir Henry Parkes, gave in his adhesion to the movement for Australasian federation, and New South Wales was represented at the first conference held at Melbourne in the beginning of 1890. Lord Jersey assumed office on the 15th of January 1891, and a few weeks afterwards the conference to consider the question of federating the Australian colonies was held at Sydney, and the great strike, which at one time had threatened to paralyse the trade of the colony, came to an end. A board of arbitration and conciliation to hear and determine labour questions and disputes was formed, and by later legislation its powers have been strengthened. (For the labour legislation of the state, see AUSTRALIA.) A census taken on the 5th of April 1891 showed that the population was 1,134,207, of whom the aborigines numbered 7705 and the Chinese 12,781. In 1893 a financial crisis resulted in the suspension of ten banks; but with two exceptions they were reconstructed, and by the following year the effects of the depression had passed away. Federation was not so popular in New South Wales as in the neighbouring colonies, and no progress was made between 1891 and 1894, although Sir Henry Parkes, who was at that time in opposition, brought the question before the legislature. The Rt. Hon. Sir William Duff, who followed Lord Jersey as governor, died at Sydney in 1895, and was succeeded by Lord Hampden. In 1896 a conference of Australian premiers was held at Sydney to consider the question of federation. The then Premier, Mr Reid, was rather lukewarm, as he considered that the free-trade policy of New South Wales would be overridden by its protectionist neighbours and its metropolitan position interfered with. But his hand was to a great extent forced by a People's Federation Convention held at Bathurst, and in the early portion of 1897 delegates from New South Wales met those from all the other colonies, except Queensland, at Adelaide, and drafted the constitution, which with some few modifications eventually became law. The visit of the Australian premiers to England on the occasion of Queen Victoria's Diamond Jubilee gave an additional impetus to federation, and in September 1897 the convention reassembled in Sydney and discussed the modifications in the constitution which had been suggested in the local parliaments. In January 1898 the bill was finally agreed to and submitted to a popular referendum of the inhabitants of each colony. Those of Victoria, South Australia and Tasmania agreed to the measure; but the majority in New South Wales, 5458, was not sufficient to carry the bill. The local parliament subsequently suggested certain amendments, one of them being that Sydney should be the federal capital. The general election returned a majority pledged to federation, and after some opposition to the federal Bill by the legislative council it was again referred to the electors of the colony and agreed to by them, 107,420 votes being recorded in its favour, and 82,741 against it. One of the provisions of the bill as finally carried was that the federal metropolis, although in New South Wales, should be more than 100 m. from Sydney. The Enabling Bill passed through all its stages in the British parliament during the summer of 1900, all the Australian colonies assenting to its provisions; and on the 1st of January 1901 Lord Hopetoun, the governor-general of Australia, and the federal ministry, of which the premier, Mr Barton, and Sir

Attitude towards federation.

William Lyne, Home Secretary, represented New South Wales, were sworn in at Sydney amidst great rejoicings. Large contingents of troops from New South Wales were sent to South Africa during 1899 and 1900. (G. C. L.)

NEWSPAPERS. The word "newspaper," as now employed, covers so wide a field that it is difficult, if not impossible, to give it a precise definition. By the English "Newspaper Libel and Registration Act" of 1881 it is defined as "any paper containing public news, intelligence or occurrences, or any remarks or observations therein printed for sale, and published periodically or in parts or numbers at intervals not exceeding twenty-six days"; and the British Post Office defines a newspaper as "any publication"—to summarize the wording—"printed and published in numbers at intervals of not more than seven days, consisting wholly or in part of political or other news, or of articles relating thereto or to other current topics, with or without advertisements." In ordinary practice, the "newspapers," as distinguished from other periodicals (*q.v.*), mean the daily or (at most) weekly publications which are principally concerned with reporting and commenting upon general current events.

For the laws regulating the conduct and contents of newspapers see PRESS LAWS and allied articles. The two real essentials of a "newspaper" are that it contains "news," and is issued at regular intervals. But the course of history has involved considerable changes both in the mode of issue and in the conception of what "news" is. For purposes of modern usage we have to distinguish historically between the product of a printing-press which is manifolded by that means, and a mere manuscript sheet which is only capable of being copied by hand. "News" again varies both according to the appetite and according to its method of collection and presentation. A distinction ought perhaps to be made between literary and pictorial news, but this is almost impossible in practice.

1. GENERAL CONSIDERATIONS

So far as very early forms of what we now recognize as corresponding to a "newspaper" are concerned, involving public reports of news, the Roman *Acta Diurna* and the Chinese *Peking Gazette* may be mentioned here, if only on account of their historical interest. The *Acta Diurna* ("Daily Events") in ancient Rome (lasting to the fall of the Western Empire), were short announcements containing official intelligence of battles, elections, games, fires, religious rites, &c., and were compiled by the *actuarii* officers appointed for the purpose; they were kept as public records, and were also posted up in the forum or other places in Rome, and were sometimes copied for despatch to the provinces. Juvenal speaks of a Roman lady passing her morning in reading the paper, so that it appears that private copies were in vogue. In China the *Peking Gazette*, as foreigners call it, containing imperial rescripts and official news, has appeared regularly ever since the days of the Tang dynasty (A.D. 618–905). Even older than it, as is alleged, is the monthly *Peking News* (*Tsing-Pao*)—now in appearance an octavo book of 24 pages in a yellow cover—which, according to M. Huart, French Consul at Canton, was founded early in the 6th century. But it is not of any real moment to do more than refer to such publications as these, which have little in common with the ideas of Western civilization. The "newspaper" in its modern acceptation can only be properly dated from the time when in Western Europe the invention of printing made a multiplication of copies a commercial possibility in any satisfactory sense.

On the point of terminology, Mr J. B. W. Williams, in his *History of English Journalism to the Foundation of the Gazette* (1908), the first scholarly account of the early evolution of the Press in England, describes the *Oxford Gazette* of 1665 (the original of the *London Gazette*) as the first English "newspaper" in the precise sense, *i.e.* a "paper" of news;[1] for it was a half-sheet in folio, two pages, and not a "pamphlet" as previous periodicals of news had been. A pamphlet (*q.v.*) was one or more unbound sheets of paper folded in quarto, and these earlier periodicals were called "news *books*." The term "news *sheet*," again, had implied, up to that time, a written letter of news—a "newsletter" as it came afterwards to be called. But it is hardly necessary to insist here on the distinction between a "news book" and a "newspaper," interesting as it is to note that the English inclusion of newspapers among "books" for the purpose of the law of copyright is strictly justified by the original nomenclature. The "newsbook" made what is for modern purposes the essential advance upon either the written "newsletter" or the isolated printed announcement of some event, in being both printed and also issued in a series at regular and continuous intervals. Yet both these forms of publication were in the direct ancestry of the newspaper. The writing of "letters of news" or "letters of intelligence" was a regular profession before the printed newspaper was introduced, and lasted as such for some time afterwards, having indeed the advantage of being outside the necessity of obtaining a licence, which hampered the printed publication; and the profession of "scrivener" naturally suggested that of the later type of journalist. Of what used, again, to be called a "relation," *i.e.* a statement of an isolated piece of news, there are various printed examples as early as during the latter part of the 15th century. For instance, an official manifesto of Archbishop Dietrich of Cologne was printed at Mainz in 1462. A French pamphlet giving an account of the surrender of Granada to Ferdinand and Isabella—"le premier jour de janvier dernièrement passé"—appeared in 1492.

Precisely at what point, and in what instance, it can be said that a continuous series of news-pamphlets started, which can therefore be called the earliest newspaper, is hard to decide, upon the materials now available. But it was on the continent of Europe, and not in England; and probably in the Netherlands. We have, for instance, pamphlets in the British Museum, which contain news-items and suggest periodical publication, though they are not actually known to form copies of a regular series. A *Newe Zeytung; Die Schlact des turkischen Keysers, &c.*, dates from 1526; another *Newe Zeytung*, still more varied in its contents, contains a letter from Winchester dated July 24, 1554. In Germany alone about 800 examples of such news-pamphlets dating earlier than 1610 are known. The effect of the Cologne *Mercurius Gallobelgicus* (1594) on English purveyors of "relations" is dealt with below (under *United Kingdom*); but this was rather a book than a newspaper. The earliest plainly periodical publication containing "news of the day" was, however, the German *Frankfurter Journal*, a weekly started by Egenolph Emmel in 1615. The Antwerp *Nieuwe Tijdinghen* followed in 1616; and in 1622 the history of English newspapers begins with the *Weekly Newes* published in London by Archer and Bourne. From this point we are on firmer ground, and the evolution of the modern Press in the different countries, as traced below, can be continuously followed. It is worth noting that a link in the history of journalism with the Roman *Acta Diurna* is provided by the Venetian government written *gazetti* (from which comes our "gazette") of the 16th century, official bulletins or leaflets dealing with public affairs, which were avowedly based on the ancient Roman model. Italy indeed originated not only the title "gazette" (probably derived from the Gr. γάζα, *i.e.* treasury of news), but also that of "coranto" (Fr. *courant*; also early anglicized as "current," *i.e.* a "running" relation), both of which are familiar in the history of the English and foreign Press.

The art and business of journalism, as now understood—taking "journalism" here in the sense of the production of the literary contents of a newspaper, and not the production and distribution of the printed sheet itself—is a combination of the mere recording or reporting of news and of its presentation in such a way, and with such comment, as to influence the minds of readers in some particular direction. The history of the "leading article" as a great factor in the shaping of public opinion begins with Swift, Defoe, Bolingbroke and Pulteney, in the many English newspapers, from the *Review* and the *Examiner* to the *Craftsman*, by which was waged the

Journalism.

[1] For the earliest known use of the term "newspaper" he cites a letter in 1670 to Charles Perrot, second editor of the *Gazette*: "I wanted your newes paper Monday last past."

keen political strife of the years 1704–1740. There is no counterpart to it in France until the Revolution of 1789, nor in Germany until 1796 or 1798. It was a Frenchman who wrote—"Suffer yourself to be blamed, imprisoned, condemned; suffer yourself even to be hanged; but publish your opinions. It is not a right; it is a duty." It was in England that the course so pithily described was actually taken, in the face of fine, imprisonment and pillory, at a time when in France the public had to depend upon foreign journals illicitly circulated, when its own chief writers resorted to clandestine presses, to paltry disguises, and to very poor subterfuges to escape the responsibilities of avowed authorship, and when in Germany there was no political publicity worthy to be named. When the *Mercure de France* (1672), after a long period of mediocrity, came into the hands of men of large intellectual faculty, they had the most cogent reasons for exerting their powers upon topics of literature rather than upon themes of politics. True political journalism dates in France only from the French Revolution (see, for instance, MALLET DU PAN), and it then had a very brief existence. It occupied a cluster of writers, some of whom left an enduring mark upon French literature. A term of high aspiration was followed quickly by a much longer term of frantic licence and of literary infamy. Then came the long rule of a despotic censorship; and cycles of licence followed by cycles of repression. In 1870 indeed the democratic government at Bordeaux issued against journals of high aims and of unspotted integrity, but opposed to its pretensions, edicts as arbitrary as the worst acts in that kind of Napoleon I., and unparalleled in the whole course of the government of Napoleon III.

In all the other countries of Europe political journalism, in any characteristic sense, was the creation of the 19th century—somewhat earlier in the century in northern Europe, somewhat later in southern. The *Ordinarie Post-Tidende* of Stockholm dates indeed from 1643, but until recent times it was a mere news-letter. Denmark had no sort of journal worth remark until the foundation in 1749 of the *Berlingske Tidende*, and that too attained to no political rank. The *Gazette* (*Viedomosti*) of St Petersburg—the patriarch of Russian newspapers—dating from the 16th of December 1702, is a government organ, and nearly synchronizes with the *Boston News-Letter* (1704), the first successful attempt at a newspaper in the British colonies in America. Journalism in Italy begins with the *Diario di Roma* in 1716, but in politics the Italian press remained a nullity for all practical purposes until nearly the middle of the 19th century, when the newspapers of Sardinia, at the impulse of Cavour, began to foreshadow the approach of the influential Italian press of a later day. In Spain no rudiments of a newspaper press can be found until the 18th century; the *Gaceta de Madrid* started about 1726. As late as in 1826 an inquisitive American traveller recorded his inability to lay his hands, during his Peninsular tour, upon more than two Spanish newspapers.

While originally the newspaper depended entirely on its own reporters and correspondents for news, and still largely does so, the widening of the field of modern journalism is largely due to collective enterprise, by which outside organizations known as "news agencies" send a common service of news to all papers which arrange to take it. The first of the great collecting and distributing news agencies, Reuter's Agency, was founded by Julius Reuter, a Prussian government-messenger, who was impressed by the common interest roused by the revolutionary movements of 1848. In 1849 he established a news-transmitting agency in Paris, with all the appliances that were then available. Between Brussels and Aix-la-Chapelle he formed a pigeon-service, connecting it with Paris and with Berlin by telegraph. As the wires extended, he quickly followed them with agency-offices in many parts of the continent. He then went to London, where his progress was for a moment held in check. Mr Walter of *The Times* listened very courteously to his proposals, but (on that first occasion) ended their interview by saying, "We generally find that we can do our own business better than anybody else can." He went to the office of the *Morning Advertiser*, which had then the next largest circulation to that of *The Times*, and had better success. He entered into an agreement with that and afterwards with other London journals, including *The Times*, and also with many commercial corporations and firms. The newspapers, of course, continued to employ their own organizations and to extend them, but they found great advantage in the use of Reuter's telegrams as supplementary. Within a few years the business is said to have yielded the founder some £25,000 a year, and in 1865 it was transferred to a limited company. In later years this type of news-agency operating all over the world was repeated by others, and also by agencies operating mainly or exclusively only in one country.

It is no longer possible nowadays to confine the meaning of "journalism" merely to the work of those who write for the Press. Properly it may be said to include the whole intellectual work comprised in the production of a newspaper; and although the designation of "journalist" is generally applied only to editors and to writers, and would not be extended at all to the purely mechanical staff—the compositors, foundry-men and machinists—nor even to the proof-readers, whose sphere is analogous rather to the sub-editorial than to the mechanical departments, the modern tendency has nevertheless been, not only to install mere reporting (*q.v.*) in a place of high importance, but to give increased weight in journalism to those who occupy what may be called the "managerial" offices, the business side of making a paper pay having itself developed into an art on its own account. To be a great "journalist" was once, but is hardly now, the same as being a great "publicist." The publicist proper is he who delivers his views on public affairs in the Press; but the excellence of his articles may nevertheless be consistent with the journal being a disastrous failure, and his reputation as a journalist is then but poor. The great journalist is he who makes the paper with which he is connected a success; and in days of competition the elements necessary for obtaining and keeping a hold on the public are so diverse, and the factors bearing on the financial success, the business side, of the paper are so many, that the organization of victory frequently depends on other considerations than those of its intrinsic literary excellence or sagacity of opinion, even if it cannot be wholly independent of these. The modern newspaper, moreover, depends for its financial success no longer primarily on its receipts from circulation, but on its receipts from advertisements; and though these can only ultimately be secured on the basis of circulation (the number of people who buy and read the paper), the establishment of the paper as the organ of a large body of readers for whose custom it is desirable to advertise often involves other capacities than those of the great publicist; and even in so far as the circulation depends on the attractiveness of its "news," the direction given to the supply of news may be managerial rather than editorial. Thus, in the division of labour, the editorial functions, formerly supreme and all-embracing, because the excellence of the contents of the paper made its success, have gradually, by a fissiparous process, yielded some of their authority to the managerial functions, and these have grown into an independence which—since editorial possibilities ultimately depend on financial resources—has given increased importance in journalism to the business side.

It must suffice here to say therefore that the work of journalism may be broadly divided into its editorial and managerial sides. And apart from exceptional cases of a working proprietor who is both editor and manager, or of a managing-editor, or of a great manager who exercises editorial functions, or a great editor who exercises managerial functions, the ordinary course is to keep them fairly distinct. The managerial side involves the business work of a paper, including the obtaining of advertisements and all the operations directly connected with producing it and making it pay as a commercial enterprise. The editorial side is engaged—however much managerial exigencies may dictate its policy—in providing the "reading matter" which forms its contents, other than such as is of the nature of advertising. The editorial staff includes editors and assistant-editors, sub-editors (in Great Britain a term usually restricted in daily journalism to those engaged in the "news" departments),

leader-writers, critics, reporters (more narrowly considered part of the "sub-editorial" staff), &c. The actual owner of the paper, the proprietor, may or may not take part in either side, but in law his authority is delegated to those who produce it. The older ideas of journalistic management survive in making the editor, publisher and printer, but curiously not the "manager," liable in a writ for libel, contempt of court, &c., together with the proprietor in English law. But no satisfactory legal definition of "editor," still less of "manager," is possible, since their positions and powers vary according to circumstances.

So far as the general relations of the staff of a paper with its proprietor are concerned, we may briefly note that engagements are contracts for personal service; they will not therefore be specifically enforced, and the remedy for injury is dismissal or action for damages; and they must be in writing and stamped, to be evidence in law, if for a year or longer. The editor is the agent of the proprietor, and binds him for acts within the scope of editorial authority (which includes the insertion of any matter in the paper). Being an agent he can have no power as against the proprietor, but unreasonable interference on the latter's part may entitle an editor to an action for breach of contract or for damage to his professional reputation: while gross misconduct on the part of an editor might similarly entitle the proprietor to damages. Letters, manuscripts, &c., come into the editor's hands as agent for his proprietor, and are the latter's property. Uninvited contributors send him articles at their own risk, but the sending to them of a type-set proof has been held to be evidence of acceptance. Apart from special terms, the editor is entitled to "edit" such articles, *i.e.* use them wholly or in part, or alter them; he has a free hand to do so in the case of anonymous articles; in the case of signed articles it is clearly his duty to keep them free from libel or illegality, but the right to edit is limited in so far as his alterations might attribute to the writer anything which would give the latter a claim for damages. Though the highest function of an editor is embodied in the etymology of the word (a "bringer forth" or producer), as one who acts as the literary midwife in the literary setting forth of ideas, it is probably his use of the proverbial blue-pencil, altering or deleting, which is generally associated with the word "to edit." Each aspect, however, of editorial work has its own importance—the organization and inspiration on the one hand, the moulding into shape on the other. And "good" editing is necessarily relative, depending to a certain extent on the character of the paper which it is intended to produce.

See PRESS LAWS, LIBEL, COPYRIGHT, &c.; and generally, for law, Fisher and Strachan, *Law of the Press* (2nd ed., 1898).

The history of the Newspaper Press is told for various countries of importance under their respective sections below. The practical development of the modern newspaper is indeed due to a union of causes, largely mechanical, that may well be termed marvellous. A machine (see PRINTING) that, from a web of paper 3 or 4 m. long, can, in one hour, print, fold, cut and deliver many thousand perfected broadsheets, is, however, not so great a marvel as is the organizing skill which collects information by conversation, post or telegraph, from all over the world, and then distributes these communications in cheap printed copies regularly every day to an enormous public, sifted, arranged and commented upon, in the course of a few hours. But for a high ideal of public responsibility and duty, conjoined with high culture and with great "staying-power," in the editorial rooms, all these marvels of ingenuity—which now combine to develop public opinion on great public interests, and to guide it—would be nothing better than a vast mechanism for making money out of man's natural aptitude to spend his time either in telling or in hearing some new thing. A newspaper, after all, is essentially a business, conducted by its proprietors for gain. That the commercial motive is a danger to honest journals is obvious, were it not indeed that here as elsewhere honesty is in the long run the best commercial policy.

The influence of American journalism.

The example of American journalism has so greatly affected the developments in England and other countries since about 1890, that it is important to realize the conditions under which, in the United States, the newer type of journalism arose.[1] In substance very much the same causes produced very much the same effects, though at a slower rate, in England; but British conservatism operated here as elsewhere. Several circumstances combined in the last quarter of the 19th century to promote great changes in the condition and character of American newspapers. (1) Paper was enormously cheapened. Before and during the Civil War it cost large New York newspapers at times 22 cents per lb for even a poor quality. In 1864 it cost 16 cents in February, and ran up a cent every month till in midsummer it touched 21 and 22 cents. As late as 1873 it was still sold at from 12 to 13 cents. As new materials were found and machinery was improved, the price slowly declined. When the manufacture from wood-pulp was made commercially successful, the profits tempted great investments of new capital; bigger mills were built, competition became keen, and new inventions cheapened the various processes. Thus in New York in 1875 the average price for the year for fair "news" paper was 8·53 cents per lb; in 1880, 6·92; in 1885, 5·16; and in 1890, 3·38. At last, about 1897, large contracts for a good average quality, delivered at the press-room, were made in New York at as low a figure as 1·5 cents per lb. Subsequently advances in raw materials, one or two dry seasons which curtailed the water-power, and combinations resulting from over-competition, caused some reaction. Yet it could still be said in 1900 that prudent publishers could buy for $1 as much paper as would have cost them $3 twenty years earlier, or $10 about 1875. (2) Printing machinery for great newspaper offices was transformed. Instead of the old cylinder presses fed by hand, with the product then folded and counted by hand, machines came into common use to print, fold, cut, paste and count and deliver in bundles, ready either for the carrier or the mail, at rates of speed formerly not dreamed of. The size of the paper could be increased or diminished at will, as late news might require, within an hour of the time when it must be in the hands of its readers. Instead of cutting down other news to make room for something late and important, more pages were added, and this steadily increased the tendency to larger papers. Devices were also found for printing the same sheet in different colours at the same rate of speed; and in this way startling headlines were made more startling in red ink, or a piece of news for which special attention was desired was made so glaring that no one could help seeing it. (3) Hand-setting (for great newspapers) was practically abolished. Instead of the slow gathering of single types by hand separate lines were now produced and cast by machines, capable when pushed to their utmost capacity of doing each the work of five average compositors. Thus between 1880 and 1900 there were reductions in the cost—(1) of the raw material for the manufacture of newspapers from two-thirds to three-fourths; (2) of printing, at least as much; and (3) of composition, at least one-half, while the facilities in each department for a greater product within a given time were enormously increased. The obvious business tendency of these changes was either a reduction in price or an increase of size, or both.

Electricity became the only news-carrier. New ocean cables broke down the high rates charged at the outset. The American news appetite, growing by what it fed on, soon demanded fat fuller cablegrams of European news; and the wars in which Great Britain and the United States were involved accelerated the movement. The establishment of a strong telegraph company, capable of efficient competition with the one which practically controlled the inland service in 1880, likewise cheapened domestic news by telegraph and increased its volume. The companies presently recognized their interest in encouraging rival news associations, and so getting double work for the wires, while promoting the establishment of new papers. Wild competition between news agencies was thus encouraged (even in the cases of some already known to be bankrupt) to the extent of credits of a quarter or half a million dollars on telegraphic tolls. The rapid spread of long-distance telephone lines further contributed to this tendency to make the whole continent a whispering gallery for the press. Every great paper had both telegraph and telephone wires run directly into its newsroom.

Photography and etching were added to the office equipment. Various "process" methods were found, by which the popular desire for a picture to make the news clearer could be gratified. Drawings were reproduced successfully in stereotype plates for

[1] The account which follows is reproduced from Mr Whitelaw Reid's article in the 10th edition of the *Ency. Brit.*

the fastest rotary presses. The field of political caricature had heretofore belonged exclusively to the weekly papers, but the great dailies now seized upon it, and commanded the service of the cleverest caricaturists. Newspapers found a way to put the "half-tone" etching of a photograph, such as had heretofore been printed only on slow flat presses, bodily into the stereotype plate for the great quadruple and octuple presses; and thereafter portraits and photographs of important groups on notable occasions began to appear, embodied in the text describing the occurrences, a few hours after the camera had been turned on them, in papers printed at the rate of thirty and forty thousand an hour. In this development of illustrated daily journalism America rapidly went far beyond other countries.

News agencies multiplied and gave cheaper service. The New York Associated Press had been the chief agency for the whole country. It admitted new customers with great caution, and its refusal to admit was almost prohibitory, while its withdrawal of news from established papers was practically fatal. It was owned by the leading New York journals. Their disagreements led to the success of a rival, the United Press. The New York Associated Press finally dissolved, most of the New York members became connected with the United Press, and many of their Western and Southern clients organized the Associated Press of Illinois, more nearly on a mutual plan. The United Press finally failed, and most of its New York members went into the Associated Press of Illinois, which in turn was forced into plans for reorganization by decisions of Illinois courts against its rules for confining its services to its own members. One result of these successive changes was to encourage new papers by making it easy for them to secure a comprehensive news service, and thus to threaten the value of the old papers. Another was the struggle to increase the volume of the service, leading to reports of multitudes of occurrences formerly left without notice in the great news centres, and extension of agencies into the remotest hamlets, and less scrupulous care in the consideration and preparation of the reports filed at many points for transmission. News syndicates for special purposes also developed, as well as small news associations, sometimes with a service sufficient for the wants of many papers. The almost official authenticity which the public formerly attributed to an Associated Press despatch measurably declined; and the dailies found more difficulty in sifting and deciding upon the news that came to them, and incurred more individual responsibility for what they printed.

The great accumulation of private fortunes also changed the newspapers. Millionaires came to think it advantageous to own newspapers, openly or secretly, which could be conducted without reference to direct profits, for the sake primarily of political, social or business considerations. To secure large circulations for such enterprises they were willing to sell the paper for long periods at much below the cost of manufacture, and to spend money for news and writers more lavishly than the legitimate business of established journals would allow. Great business corporations seeking for favourable or fearing adverse legislation sometimes made secret newspaper investments for the same purpose.

These various new conditions, affecting the newspaper press of the United States with ever-increasing force, gradually changed the average character of the papers and their effect upon their readers. A large circulation became the only evidence of success and the only way to make the sale of a newspaper below cost ultimately a source of profit. A disposition to lower the character in order to catch the largest audience naturally followed. Criminal news was reported more fully than formerly, with more piquant details. Competitors outdid each other in the effort to treat all news with unprecedented sensationalism. The lowest possible price was regarded as essential to the largest possible circulation, and so a favourite price even for large newspapers became one cent to the public, and consequently only half a cent to the publishers, whose business was practically all at wholesale with dealers and news companies. The feeling that the most must be given for the money prompted also the great increase in size, only made possible by the reductions in paper, composition, presswork, &c., already noted. Yet mere quantity and mere sensation after a time palled on the jaded appetite, and the spice of intense personality became necessary. As most people like to see their names in print, and can bear criticism of their neighbours with composure, these two chords of human nature were incessantly played upon.

Characteristics of modern newspapers.

The principal feature in the development of modern newspapers is the importance attached to obtaining, and prominently displaying, "news" of all sorts, and incidentally there has been a considerable change of view as to what sort of news should be given prominence. Sport and finance are treated at greater length and more popularly; and, partly owing to the largely increased number of papers and consequent greater competition, partly to a desire to appeal to the larger public, which is now able to read and ready to buy reading-matter, there has been a tendency to follow the tastes of the vast number of people who can read at all rather than of those to whom reading means a very high standard of literary and intellectual enjoyment. This has involved a more popular form of presenting news, not only in a less literary style and by the presentation of "tit-bits" of information with an appeal to cruder sentiments, but also in a more liberal use of headlines and of similar devices for catching the eye of the reader. "Personal journalism," *i.e.* paragraphs about the private life or personal appearance of individuals—either men or women—of note or notoriety in society or public affairs, has become far more marked; and in this respect, as in many others, encouragement has been given to a spirit of inquisitiveness, and also to a widespread inclination either to flatter or be oneself flattered, the latter desire being indeed conspicuously prevalent in these "democratic days" even among the classes which once affected to despise such publicity.

The modern impulse, culminating in England in the last decade of the 19th century in what was then called the "New Journalism," was a direct product of American conditions and ways of life, but in Great Britain it was also the result of the democratic movement produced by the Education Act of 1870 and the Reform Act of 1885; and it affected more or less all countries which came within the influence of free institutions. The most generally adopted American innovation (for, though not known before even in England, it was practically a new thing as carried out in American newspapers) was the "interview" (the report in dialogue form of a conversation with some prominent person, whose views were thus elicited by a reporter), which during the early 'nineties was taken up in varying degrees by English newspapers; it was "cheap copy"—the word "copy" covering in journalistic slang any matter in the shape of an article—and could easily be made both informing and interesting; and "interviewing" caused a large increase in the journalistic profession, notably among women. The rage for the "interview" again declined in vogue outside American journalism in proportion as people of importance became less ready to talk for publication—or for nothing.

From the highest class of paper downwards, however, real news—and especially early news—has been more and more sought after, and all the force of organization both within individual newspaper offices and outside them in the shape of news agencies, has been applied to the purpose of obtaining early news and publishing it as quickly as possible. In this matter the Press has certainly been helped most materially not only by the advance in telegraphic facilities (see REPORTING) but by all the other new rapid methods of production in Type-setting (see TYPOGRAPHY) and Press-work (see PRINTING) which have been the feature of the modern period. The vastly increased amount of telegraphic work now done has perhaps not been all pure gain to the best sort of journalism. It has to some extent weakened the effect of the considered article, and led to hasty conclusions and precipitate publication, with results that sometimes cannot be compensated for by any later contradiction or modification. In some cases a reaction ensued. Take for instance the case of war correspondence. The prestige of the

"war correspondent" became at one time enormous, and his evolution from the days of H. Crabb Robinson, who wrote to *The Times* from Spain in 1807–1809, has been traced by busy pens with all the precision of a special interest in history. Certainly nothing finer in active English journalism was ever done than in W. H. Russell's letters to *The Times* from the Crimea, or the work of Archibald Forbes and others in the Franco-Prussian War; but more recently, although first-rate abilities have been forthcoming, the news agencies, often favoured by the military Press censor, have generally been ahead of the "specials," and the individual work that might have been done for isolated papers has been much hampered by restrictions. This is due partly to the increased competition, partly to military jealousy and officialism, partly to the vital importance of secrecy in modern warfare: but the result has been to a considerable extent to reduce the value of the "war correspondent" as compared with what was done in the Press in the days of Russell and Forbes. A letter arriving weeks after the telegraphic account, however meagre, is largely shorn of its interest. Given a brilliant foreign correspondent, the form of letters sent home from abroad on general subjects is still, no doubt, very effective. But the telegram is necessarily the backbone of the news service of the daily paper. The Press, be it added, is frequently able to acquaint the public with what is going on while a government itself is still uninformed. The work of officials and statesmen is admittedly increased and sometimes embarrassed by the new strain imposed upon them in consequence, but the public are on the whole well served by their emancipation from the obscurity of purely official intelligence and by the obligation of straightforward dealing imposed upon governments, which in their nature are apt to be secretive.

Connected with the increased attention given to news is the greater vogue of the newspaper "poster" or contents-bill, which is exhibited in the streets. The poster has acquired commercial importance for indicating the possession of some special news without revealing its whole nature, and the tendency has been to have fewer lines and fewer words in larger type, in order to catch the eye more impressively. Rotary machines for printing these posters enable them to be turned out with greater rapidity; and in the case especially of evening papers it is possible at any time during the afternoon, should important news arrive, to issue a new poster and thus secure a large street sale by the insertion of a few words only in the "stop press" or "fudge" without the necessity of changes in the plates. The catch-penny style of the poster has transferred itself also to the newspaper itself, in the shape of the "scare" headlines. And there has been a tendency for the news to be so "displayed" in the headlines as to make any further reading unnecessary.

Apart from the publication of "news" and reports, and occasional original articles of a descriptive and miscellaneous character, the chief function of a newspaper is criticism, whether of politics or other topics of the moment, or of the drama, art, music, books, sport or finance. As regards sport, the comments of the various newspapers are mainly descriptive; but a prominent feature in the United Kingdom has been the attention paid to "tipping" probable winners on the Turf, and the insertion of betting news. The publication of the "odds" some time before a race, and of starting-prices, undoubtedly helped to foster the increase of this form of gambling, as was pointed out in the report of the Select Committee on Gambling in England in 1902, but the efforts to induce the English newspapers to keep such matter out of their columns have not had much success. The *Daily News* (London) in 1902 started on a new proprietorship under Mr Cadbury with a declared policy of not referring to horse-racing or betting; but when its principal proprietors in 1909 became largely concerned also in the *Star* and *Morning Leader*, they were apparently content to retain the "tipster" elements which bulked large in them, and this inconsistency aroused considerable comment. The sporting interest (*i.e.* the desire to know results of racing and cricket, &c.) largely inflates the circulation of most of the London and provincial halfpenny evening papers.

Between about 1870 and 1880 the English newspapers began to pay increased attention to literary and artistic criticism; and gradually the daily Press, which formerly applied itself mainly to recording news, and to political, social and financial subjects, became a formidable rival in this sphere to the weekly reviews and the monthly and quarterly magazines. Books are "reviewed" in the Press partly for literary reasons, partly as a *quid pro quo* for publishers' advertisements; and the desire for "something to quote," irrespectively of the responsible nature of the criticism, became in the early 'nineties a mania with publishers, who in general appear to have considered that their sales depended upon their catching a public which would be satisfied by seeing in the advertisement that such and such a book was pronounced by such and such a paper to be "indispensable to any gentleman's library." Unfortunately the enormous output of books made it impossible for editors to have them all reviewed, and equally impossible for them to be certain of discriminating properly between those which were really worth reviewing or not. The result has been that the work of book-reviewing in the newspapers is often hastily and poorly or very spasmodically done. But there have been some honourable exceptions. The "Literary Supplement" (since 1901) to *The Times* is the most ambitious attempt made by any daily paper to deal seriously with literature. The *Daily Chronicle* started a "literary page" in 1891, and it was imitated in varying degrees by other English papers. The *Scotsman* and some other provincial papers have also for some time devoted much space to excellent literary criticism. The "literary supplement" has also been developed to excellent effect in some journals in the United States, such as the New York *Times*, where this feature was indeed originally started. As a form of serious criticism, however, the review has, in the general newspapers of later years, taken a lower place than must be desirable, partly owing to the cause named, partly to a tendency among reviewers either to indiscriminate praise or to irresponsible irrelevance, partly to a suspicion of "log-rolling"; and to a large extent it has become the practice merely to treat the appearance of new books as so much news, to be chronicled, with or without extracts, according as the subject makes good "copy," like any other event of the day.

The modern tendency, resulting from the enormous amount of newspaper production, has been to make journalism less literary and at the same time literature more journalistic. Either as reviewers, leader-writers or editors, many of the principal "men of letters" have worked for longer or shorter periods as writers for some newspaper or other, and much of the published literature of the time has appeared originally in the columns of the newspapers, in the form of essays, poems, short stories or novels (in serial form). Publication in this shape has many advantages for an author besides that of additional remuneration; it offers an opportunity for a new writer to try his wings, and it helps to introduce him at once to a large public. Moreover, the newspapers read by the educated classes profit by the superior class of journalist represented by writers of a literary turn. But the increased popularity of the newspaper, and the close tie between it and the literary world, have on the whole impressed a journalistic stamp upon much of the literature of the day. However popular at the moment a writer may be, the infection with journalistic methods—while rightly employed by journalists, as such, in dealing with contemporary events and for strictly contemporary purposes—is apt to be responsible for something wanting in his work, the loss of which deprives him of the permanent literary or scientific rank to which he might otherwise aspire.

The new point of departure for the more popular style of English journalism (apart from the influence of American models) is really to be found in the publication of Sir George (then Mr) Newnes's *Tit-Bits* in 1881. This penny weekly paper, with its appeal to the masses, who liked to read snippets of information brightly put together, showed what enormous profits were to be made by this style of enterprise; and the multiplication of journals of this description—notably Mr

Alfred Harmsworth's (Lord Northcliffe's) *Answers* (1888) and Mr C. Arthur Pearson's *Pearson's Weekly* (1890)—had a further influence on public taste, so that even the classes above that which primarily enjoyed these publications were affected in the same direction. A new note was thus introduced into English daily journalism in England. Whereas before 1885 the chief feature in London journalism, outside *The Times* and other great morning papers, had been the literary brilliance of the *Saturday Review* and its evening paper analogues, the *Pall Mall* and *St James's Gazettes*, in the early 'nineties came a craze for "actuality." Mr T. P. O'Connor, with his vivid pen (first in the *Star*, then in the *Sunday Sun* and elsewhere), set the pace for a crowd of imitators; the successful establishment of the *Daily Mail* in 1896, with its system of compressing the news of the day briefly and pointedly into short paragraphs, while at the same time catering for all tastes and employing first-rate correspondents and reporters to supply it with special information, gave a distinct shake-up to the older traditions of daily journalism. The old tendency had been to rely for success either on writers of exceptional knowledge or capacity, men who were essentially amateurs, or on a class of professional journalists who at all events had a literary tradition behind them. A different sort of amateur now arose, and a different sort of professional. Even when an attempt was made to provide for a literary public, success came to be generally sought by popular rather than by literary methods. The literary public in the proper sense of the word is inevitably a small one, and the greater part of the Press deals with literature on lines more suited to a larger and less refined *clientèle*. It may be claimed, no doubt, that the best sort of journalism shows a high, and sometimes the highest, literary standard, but the fact remains that for the bulk of modern journalism its conductors realize only too well that their business is to appeal to the masses, and to a standard of education and taste which falls far short of anything that can be called intellectual.

It is often said that the leading articles or "editorials," expressing the attitude of the paper towards important subjects of the day, have lost their importance, but this is only a half-truth. Allowance being made for changes in literary style, the actual amount of good writing in this department in the great organs of opinion—well-informed, scholarly and incisive—may justly be considered equal to anything done in what are sometimes considered its palmy days.[1] On the other hand, it is undoubtedly the case that in the newer type of newspaper, which appeals rather on the score of its tit-bits of news and rapid readableness to a more casual and less serious public, the whole *raison d'être* of the old-fashioned leading article has disappeared, and its place is taken by a few brief notes, merely indicating the attitude of the paper, and not seeking to discuss any subject comprehensively at all. The "leader" is to some extent a form of newspaper routine, but on the whole it is a routine which has proved its value by experience. The continuous high standard of tone, maintained by so many great journals, depends more largely than is sometimes realized on the regular industry and skill of those whose business it is to discuss the latest developments of affairs every day or every week in a manner which gives reasonable men something fresh to think about, or interprets for them the thoughts which are only vaguely floating in their minds. The liberty of the Press enables every sort of view, right or wrong, to be discussed in this prominent form, and thus every aspect of a question is brought out in public, to be accepted or rejected according to the weight of evidence and of argument.

The same end is assisted by the devotion of so much space to "letters to the editor." It is sometimes said that in England the London *Times* owes its position largely to the fact that if any individual grievance is felt it is generally ventilated by a letter to *The Times*. Whatever may be the organization of the Press for reporting the news of the day, the resources of no newspaper staff are great enough to cover an area of information as large as that represented by its readers; and the value of the outlet for opinion and information afforded by the correspondence columns cannot be overstated.

Most people probably read more papers than is compatible with a healthy mental digestion, but the Press, as such, has to-day an enormous—and none the less real because subtle—influence; and this is largely due to the reputation maintained by its higher representatives. While, individually, the great papers wield considerable influence, due partly to real sagacity and authority, partly to the psychological effect produced by mere print or by reiterated statement, collectively the Press now represents the Public, and expresses popular opinion more directly than any representative assembly. The multiplication of "Press-cutting agencies," and of such essentially "newsy" publications as *Who's Who* (the English form of which originated with Mr Douglas Sladen in 1897) and similar biographical reference books—all tending to increase the publicity of modern life—has contributed materially to the pervading influence of journalism in everyday life and the constant dependence of society in most of its manifestations on the activity of the "Fourth Estate." (H. Cr.)

Price of newspapers.

From the introduction of low rates for telegraphy and from the increase of mechanical methods of production, and of the desire to read and the growth of advertising (see ADVERTISEMENT), the modern low-priced newspaper has resulted. But it is by no means a recent development merely. In France, Theophrastus Renaudot's *Gazette de Paris* (1631) was started at the price of six centimes. In England we find the first mention of inexpensive news-sheets towards the close of the 17th century, when a number of half-penny and farthing *Posts* sprang into existence, and appeared at more or less irregular intervals. These consisted of small leaflets, containing a few items of news—sometimes accompanied by advertisements—and were commonly sold in the streets by hawkers. The rise in cost was really due to artificial causes. The increase of these newspapers, and especially the growing practice of inserting advertisements, led the legislature to contemplate a stamp tax of a penny per sheet on all news publications. As a protest, a curious pamphlet—of which a copy is preserved in the British Museum—was issued in 1701, and it sheds an interesting light upon this early phase of cheap journalism. The pamphlet is entitled *Reasons humbly offered to the Parliament on behalf of several persons concerned in the paper-making, printing and publishing of the halfpenny newspapers.* It states that five master printers were engaged in the trade, which used 20,000 reams of paper per annum. The journals are described in the following terms: "The said newspapers have been always a whole sheet and a half, and sold for one halfpenny to the poorer sort of people, who are purchasers of it by reason of its cheapness, to divert themselves, and also to allure herewith their young children and entice them to reading; and should a duty of three halfpence be laid on these mean newspapers (which, by reason of the coarseness of the paper, the generality of gentlemen are above conversing with), it would utterly extinguish and suppress the same." The pamphlet goes on to say that hundreds of families, including a considerable number of blind people, were supported by selling the half-penny journals in the streets.

In 1712 a tax of a halfpenny per sheet was imposed, and the cheap newspapers at once ceased to exist. This tax on the press was increased from time to time, till in 1815 it stood at fourpence per sheet. The usual price of newspapers was then sevenpence a copy. From these facts it seems highly probable that, had not the stamp tax been imposed, the halfpenny paper would soon have become the normal type, and would have continued so to this day. In 1724 a committee of the House of Commons sat to consider the action of certain printers who were evading the stamp tax by publishing cheap newspapers under the guise of pamphlets. They found that there were then two *Halfpenny Posts* published in London, one by Read of Whitefriars, and the

[1] It must be remembered that the style of public speeches has also altered. Nobody thinks of quoting the classics nowadays in the House of Commons. A more business-like form of speech is adopted in public life, and the Press reflects this change.

other by Parker of Salisbury Street. There were also three weekly papers issued at a halfpenny a copy. The tax, after several reductions, was finally repealed on 15th June 1855, and a rush of cheap papers immediately followed. A penny became the usual price for London daily papers, with the exception of *The Times*, and halfpenny papers soon became common.

The growth of the cheap newspaper has since been practically a simultaneous one throughout the civilized world. This has been notably the case in the United States, France and Great Britain. The general tendency in newspaper production, as in all other branches of industry, has in recent times been towards the lowering of prices while maintaining excellence of quality, experience having proved the advantage of large sales with a small margin of profit over a limited circulation with a higher rate of profit. The development—and indeed the possibility—of the cheap daily paper was due to a number of causes operating together during the latter half of the 19th century. Among these, the first place must undoubtedly be given to the cheapening of paper, through the introduction of wood pulp and the perfecting of the machinery used in the manufacture. From 1875 to 1885 paper cheapened rapidly, and it has been estimated that the introduction of wood pulp trebled the circulation of newspapers in England. Keen competition in the paper trade also did much to lower prices. At the same time the prime cost of newspaper production was increased by the introduction of improved machinery into the printing office. The growth of advertisements must also be taken into account in considering the evolution of the halfpenny journal. The income from this source alone made it possible to embark upon journalistic enterprises which would otherwise have been simply to court disaster. The popular journal of the present day does not, however, owe its existence and success merely to questions of diminished cost and improved methods of production. A change has come over the public mind. The modern reader likes his news in a brief, handy form, so that he can see at a glance the main facts without the task of reading through wordy articles. This is especially the case with the man of business, who desires to master the news of the past twenty-four hours as he travels to his office in the morning. It is to economize time rather than money that the modern reader would often prefer a halfpenny paper; while the man of leisure, who likes to peruse leading articles and full descriptive accounts, finds what he needs in the more highly priced journals. The halfpenny paper in England has not had to contend with the opposition that the penny newspaper met from its threepenny contemporaries in the 'fifties and 'sixties. This is largely due to the fact that in most cases the contributors, paper, printing and general arrangement of the cheaper journal do not leave much room for criticism. Mr G. A. Sala once complained that the reporters of the older papers objected to work side by side with him when he represented the first penny London daily (the *Daily Telegraph*), through fear of losing caste, but this does not now apply, for in the United Kingdom, France and the United States the cheap journals, owing to their vast circulation, are able to offer the best rates of remuneration, and can thus command the services of some of the best men in all the various departments of journalism. (N.)

Another aspect of the newspaper which may here be considered is the introduction of pictorial illustrations (see also ILLUSTRATION). The earliest attempts at popular illustration of news events took the form in England of "broadsides." One broadside dated 1587 recounted the *Valiant Exploits of Sir Francis Drake*; another dated 1607 gave an account of *A wonderful flood in Somersetshire and Norfolk*. The series of murder broadsides which lasted almost to our own time commenced in 1613 with one that gave an account of the murder of Mr William Storre, a clergyman of Market Rasen, in Lincolnshire, by Francis Cartwright. Early in the reign of Charles I. there appeared a broadside which described a fall of meteors in Berkshire. A little later—in 1683—the *Weekly News* came out with the picture of an island which was supposed to have risen from the sea on the French coast. The execution of Strafford in 1641 was made the subject of a picture pamphlet that is to be seen in the British Museum, and in 1642 the first attempt to portray the House of Commons appeared in *A Perfect Diurnall of the Passages in Parliament*. In 1643 a pamphlet was published, called *The Bloody Prince; or a Declaration of the Most Cruel Practices of Prince Rupert and the rest of the Cavaliers in fighting against God and the True Ministers of His Church*. This contains a woodcut representation of Prince Rupert on his charger, one of the first attempts at providing the public with a portrait of a contemporary celebrity.

Illustrated papers.

Soon after this there appeared a journal, entitled *Mercurius Civicus*, which frequently gave illustrations, and, allowing for the *Weekly News* with its one attempt at an illustration above mentioned, must be counted the first illustrated paper. *Mercurius Civicus*, however, only gave portraits; it published Charles I. and his queen, Prince Rupert, Sir Thomas Fairfax and all the leading men on both sides in the Civil War. Perhaps the most interesting illustration of the next four years was that contained in a tract intended to evoke sympathy for the conquered and captured king. It represented Charles in Carisbrooke Castle in 1648. There were many later attempts to depict the tragedy of Charles I.'s execution, and several woodcuts present to us also the execution of the regicides after Charles II. came to the throne. A broadside of the reign of the second Charles shows the Frost Fair on the Thames in 1683, and with a broadside describing *Great Britain's Lamentations, or the Funeral Obsequies of that most incomparable Protestant Princess*—Queen Mary, the wife of William III., in 1695—we close the illustrated journalism of the 17th century.

Curiously enough, the 18th century, so rich in journalistic enterprise and initiative so far as the printed page was concerned, did less than the previous century to illustrate news. In 1731, however, in the *Grub Street Journal*, there appeared the first illustration of the Lord Mayor's procession. In 1740 another journal, the *Daily Post*, gave an illustration of Admiral Vernon's attack on Porto Bello. The narrative was introduced by the editor with the information that the letter that he is printing is from a friend who witnessed the conflict between the English and the Spaniards. The writer of the letter, who must be put on record as the father of war correspondents, signed himself "William Richardson."

There were some interesting efforts to illustrate magazines about this time. In the *Gentleman's Magazine* for 1746 there was a lengthy account of the famous rising of 1745, and a map was given of the country round Carlisle, showing the route of the Scottish rebels; and in the same volume there was a portrait of the duke of Cumberland. In 1747 the *Gentleman's* gave a bird's-eye view of the city of Genoa, illustrating the account of the insurrection there, and so on year by year there were further pictures. In 1751 an obituary notice was illustrated by a portrait of a certain Edward Bright of Maldon, Essex. Mr Bright died at the age of thirty, and his interest to the public was that he weighed 42½ stones. There were a number of magazines besides the *Gentleman's* that came out about this time and continued well into the next century. In the *Thespian Magazine* for 1793, for example, there is an illustration of a new theatre at Birmingham. Then there were the *English Magazine*, the *Macaroni Magazine*, the *Monstrous Magazine*. Every one of these contained illustrations on copper, more or less topical.

William Clement, the proprietor of the *Observer*, the first number of which was published in 1791, was the first real pioneer of illustrated journalism, although his ideals fell short in this particular, that he was never prepared to face the illustration of news systematically; he only attempted to illustrate events when there was a great crisis in public affairs. In 1818 Abraham Thornton, who was tried for murder, appealed to the wager of battle, which after long arguments before judges was proved to be still in accordance with statute law, and he escaped hanging in consequence. Thornton's portrait appeared in the *Observer*. Clement owned for some time *Bell's Life* and the *Morning Chronicle*. All his journals contained occasional topical illustrations. The *Observer's* illustration of the house where the Cato Street conspirators met is really sufficiently

elaborate for a journal of to-day, and in 1820 it gave its readers "A Faithful Reproduction of the Interior of the House of Lords as prepared for the Trial of Her Most Gracious Majesty Queen Caroline." In 1821 it published an interior of the House of Commons with the members in their places. The *Observer* of 22nd July 1821—the Coronation number—contained four engravings. Of the George IV. Coronation number Mr Clement sold 60,000 copies, but even that was nothing to the popularity that this journal secured by its illustrations of the once famous murder of Mr Weare and the trial of the murderer Thurtell. The *Observer* in 1838 gave a picture of the Coronation of Queen Victoria. In 1841 there was a fire at the Tower of London, when the armoury was destroyed. The *Observer* published three illustrations of the fire; it further published an emblematic engraving on the birth of the prince of Wales, and issued a large page engraving of the christening ceremony in the following January. Thus it had in it all the elements of pictorial journalism as we know it to-day.

The weekly *Illustrated London News* was, however, the first illustrated newspaper by virtue of its regularity. It was the first illustrated paper, because all the illustrations to which we have referred as appearing in the *Observer* and other publications were irregular. They came at intervals; they were quite subordinate to the letterpress of the paper; they were given only occasionally in times of excitement, with a view to promoting some little extra sale. That they did not really achieve the result hoped for to any great extent may be gauged by the fact that from 1842 to 1847 the *Observer* published scarcely any illustrations at all, and in the meantime the *Illustrated London News* had taken an assured place as a journal devoted mainly to the illustration of news week by week. That is why its first publication marked an epoch in journalism. The casual illustration of other journals still went on: the *Weekly Chronicle*, for example, still published a number of pictures; the *Sunday Times*, also a very old paper, illustrated in these early days many topical subjects. In 1834, indeed, it pictured the ruins of the House of Commons, when that building was burned down. A paper started in 1837 called the *Magnet* gave illustrations, one of them of the removal from St Helena and delivery of the remains of the emperor Napoleon to the prince de Joinville in 1840.

The first number of the *Illustrated London News* appeared on 14th May 1842. Its founder was Herbert Ingram (1811–1860), who was born in Boston, Lincolnshire, and started life amid the most humble surroundings, what education he ever received having been secured at the free school of his native town. Apprenticed at fourteen to a printer in Hull, he later settled in Nottingham as a printer and newsagent in a small way. It was during his career as a newsvendor at Nottingham that he was seized with the belief that it was possible to produce a paper entirely devoted to illustration of news. In the first number of the *Illustrated London News*, however, there was not a single picture that was drawn from actual sight, the factor which is the most essential element of the illustrated journalism of to-day. Sir John Gilbert (1817–1897), the artist, has stated that not one of the events depicted by him—a state ball at which the queen and the prince consort appeared, the queen with the young prince of Wales in her arms, and other incidental illustrations—was taken from life.

The *Illustrated London News* had not been long in existence before there were many imitators, in America *Harper's Weekly*, in France *L'Illustration* and in Germany *Über Land und Meer*, and from that day there has been constant development, the *Illustrated Zeitung* of Leipzig being perhaps the most striking. In America the use of illustrations in the daily papers has become a regular feature, culminating in the bulky Sunday editions of the principal journals; and the practice of presenting the news in pictorial form has increased continuously even in England. In 1910 three London daily newspapers were principally devoted to illustration—the *Daily Graphic*, the *Daily Mirror* and the *Daily Sketch*, while most of the penny and halfpenny journals included some form of pictorial matter. This change was due to the ever-increasing cheapening and ever-growing celerity of manufacture of what are known as half-tone blocks. It was in 1890 that the application of photography to illustrated journalism began in England, and by 1910 it had grown to enormous dimensions, but the first newspaper photographs (mainly portraits) had to be engraved on wood, although the use of half-tone came in well-nigh simultaneously. Up to 1890 illustrated journalism was in the hands of the artists, and the artists were in the hands of the wood engravers, who reproduced their work sometimes effectively—often inefficiently. But in the course of twenty years the wood engraver had been utterly superseded so far as illustrated journalism was concerned. The further developments of journalism seemed likely to be entirely in the direction of coloured reproductions, block-making and machinery for facilitating their production having made particularly rapid strides.

(C. K. S.)

Comparative statistics.

It is almost impossible by any statistical detail to give an idea of the advances made by the newspaper press as a whole; but an outline of the general results for 1828, 1866 and 1882, together with a fourth, as given in the 10th edition of this encyclopaedia for 1900, may have its utility.

The earliest summary is that of Adrien Balbi. It was published in the *Revue encyclopédique* for 1828 (vol. i. pp. 593–603), along with much matter of more than merely statistical interest. The numbers of newspapers published in different countries at that date are given as follows: France, 490; United Kingdom, 483; Austria, about 80; Prussia, 288; rest of the Germanic Confederation, 305; Netherlands, 150; Spain, 16; Portugal and the Azores, 17; Denmark, Sweden and Norway, 161; Russia and Poland, 84. The respective proportions of journals to populations were—for Prussia 1 to 41,500, Germa states 1 to 45,300, United Kingdom 1 to 46,000, France 1 to 64,000, Switzerland 1 to 66,000, Austria 1 to 400,000, Russia 1 to 565,000. Europe had in all 2142 newspapers, America 978, Asia 27, Africa 12 and Oceania 9; total 3168. Of these, 1378 were published in English-speaking countries (800 of them in the United States), having a population of 154 millions, and 1790 in other countries, with a population of 583 millions.

The second summary (1886) is that given by Eugène Hatin in an appendix to his valuable *Bibliothèque de la presse périodique*. His enumeration of newspapers is as follows: France, 1640; United Kingdom, 1260; Prussia, 700; Italy, 500; Austria-Hungary, 365; Switzerland, 300; Belgium, 275; Holland, 225; Russia, 200; Spain, 200; Sweden and Norway, 150; Denmark, 100; United States, 4000. Here the proportions of papers to population are—Switzerland and United States 1 to 7000, Belgium 1 to 17,000, France and the United Kingdom 1 to 20,000, Prussia 1 to 30,000, Spain 1 to 75,000, Austria 1 to 100,000, Russia 1 to 300,000. Hatin assigns to Europe a total of 7000, to America 5000 and to the rest of the world 250, making in all 12,500.

The third summary is taken from that of Henry Hubbard, published in his *Newspaper Directory of the World* (New Haven, Connecticut, 1882). Its scope embraces a considerable number of serial publications which cannot be classed as newspapers. Still Hubbard's figures, which were collected (chiefly by the American consuls and consular agents in all parts of the world) about 1880, cannot be disregarded. The following are his general results:—

	Daily Newspapers.	Other Publications.
Europe . .	2403	10,730
Asia . . .	154	337
Africa . . .	25	125
N. America .	1136	9,656
S. America .	208	427
Australasia .	94	471
Total . .	4020	21,746

The following summary for 1900, given in the 10th edition of the *Ency. Brit.*, and compiled by G. F. Barwick and Dorset Eccles, of the British Museum, included everything in the nature of a newspaper, as distinct from periodicals.

Totals of Newspapers, 1900.

Great Britain and Ireland	2,902	Belgium	290
United States	15,904	Holland	312
France	2,400	Luxemburg	12
Germany	3,278	Russia	280
Austria	393	Italy	251
Hungary	171	Spain	338
Sweden	213	Portugal	79
Denmark	145	Switzerland	600
Iceland and Faroe Islands	3	Greece	47
Norway	132	Rumania	47
		Servia	24

Bulgaria	15	Central and West Indies	129
Montenegro	2	South American Republics	340
Turkey	22	Australasia—	
Persia	3	New South Wales	227

East Indies	39	Auckland	17
South Africa	109	Hawkes Bay	11
West Africa	10	Canterbury	23
Central Africa, &c.	76	Sundry	36
Egypt	21		
Canada	742	Total	31,026

2. British Newspapers

United Kingdom.[1]

The first regular English journalists may be identified with the writers of manuscript "news-letters," originally the dependants of great men, each employed in keeping his own master or patron well-informed, during his absence from court, of all that happened there. The duty grew at length into a calling. The writer had his periodical subscription list, and instead of writing a single letter wrote as many letters as he had customers. Then one more enterprising than the rest established an "intelligence office," with a staff of clerks, such as Ben Jonson's Cymbal depicts from the life in *The Staple of News*, acted in 1625, which is the best-known dramatic notice of the news-sheets.

> "This is the outer room where my clerks sit,
> And keep their sides, the register in the midst;
> The examiner, he sits private there within;
> And here I have my several rolls and files
> Of news by the alphabet, and all put up
> Under their heads."

Of the earlier news-letters good examples may be seen in the *Paston Letters*, and in the *Sydney Papers*. Of those of later date specimens will be found in Knowler's *Letters and Despatches of Strafford*, and other well-known books. Still later examples may be seen amongst the papers collected by the historian Thomas Carte, preserved in the Bodleian Library at Oxford. Of these, several series were addressed to the first duke of Ormond, partly by correspondents in England and Ireland, partly by correspondents in Paris; others were addressed to successive earls of Huntingdon; others, again, to various members of the Wharton family. And similar valuable collections are to be seen in the library of the British Museum, and in the Record Office in London. In Edinburgh the Advocates' Library possesses a series of the 16th century, written by Richard Scudamore to Sir Philip Hoby during his embassy to Vienna. The MS. news-letters—some of them proceeding from writers of marked ability who had access to official information, and were able to write with greater freedom and independence of tone than the compilers of the printed news—held their ground, although within narrowing limits, until nearly the middle of the 18th century. The distinction between the news-letter and the newspaper is pointed out in the preceding section.

Early news-letters.

It was at one time believed that the earliest regular English newspaper was an *English Mercurie* of 1588, to which George Chalmers, the political writer and antiquarian, referred in his *Life of Ruddiman* (1794) as being (with others of the same date) in the British Museum. The falsehood of this supposition, which was long accepted on Chalmers's authority, was, however, pointed out by Thomas Watts, of the British Museum, in 1839, in a volume with the title *Letter to Antonio Panizzi on the Reputed earliest printed Newspaper*, and again in 1850, in an article in the *Gentleman's Magazine* (n.s. xxxiii. 485-491). The documents in question are (1) a MS. unnumbered issue of the *English Mercurie*, dated "Whitehall, July 26th, 1588"; (2) a printed copy, No. 50, of July 23, 1588; (3) a printed copy of No. 51; (4) a printed copy of No. 54, of November 24, 1588; (5) and three other MS. copies. These were included in a collection bequeathed to the Museum of Dr Birch (1766), and are incontestably 18th-century forgeries. The handwriting of the spurious MSS. was identified by a letter among Dr Birch's correspondence as that of Philip Yorke, afterwards 2nd Lord Hardwicke, and there were trifling corrections in Dr Birch's handwriting, showing that he was a party with Yorke, the author, to the mystification. No information is forthcoming as to the object of it, but it is worth mentioning that Yorke and his brother also published a clever *jeu d'esprit* called *The Athenian Letters*, purporting to be a transcript from a Spanish translation of letters written by a Persian agent during the Peloponnesian War; so that it may be inferred that this sort of thing recommended itself to Yorke, and not necessarily for any deception.

Early newspapers.

Various English pamphlets, as well as French, Italian and German, occur in the 16th century with such titles as *Newes from Spaine*, and the like. In the early years of the 17th century they became very numerous; the Charles Burney collection in the British Museum is particularly valuable for this early period, the newsbooks and newspapers in it commencing with a "relation" of 1603. In 1614 we find Burton (the author of the *Anatomy of Melancholy*) pointing a sarcasm against the non-reading habits of "the major part" by adding, "if they read a book at any time ... 'tis an English chronicle, Sir Huon of Bordeaux, Amadis de Gaul, &c., a play-book, or *some pamphlet of news*." But up to 1641, owing to the fact that to print domestic news was barred by the royal prerogative, the English periodicals which are to be considered as strictly the forerunners of the regular newspaper were only translations or adaptations of foreign periodicals containing news of what was going on abroad.

There is in the British Museum a *Mercurius Gallobelgicus; Sive rerum in Gallia et Belgio potissimum, Hispania quoque, Italia, Anglia, Germania, Polonia, Vicinisque Locis ab anno 1588 usque ad Martium anni praesentis 1594 gestarum, nuncius. Opusculum in Sex libris qui totidem annos complectuntur, divinum auctore D. M. Jansonio Doccomensi Frisio. Editio altera. Coloniae Agrippinae. Apud Godefridum Kempensem. Anno MDXCIV.* This production of Janson's at Cologne is a fairly thick octavo book, giving a Latin chronicle of events from 1587 to 1594, and is really a sort of annual register. It was continued down to 1635. The *Mercurius Gallobelgicus* is chiefly interesting because, by circulating in England, it started the idea of a periodical supplying foreign news, and apparently became to English contemporaries a type of the newfangled news-summaries.[1] In 1614 there was published in London a little square book (45 pp.), by Robert Booth, *A Relation of all matters passed ... since March last to the present 1614, translated according to the originall of Mercurius Gallobelgicus*, which has the running title *Mercurius Gallobelgicus his relation since March last.* From a repetition of such "relations" at irregular intervals, to the periodical publication of news-books with a common title in a numbered series, was a natural development. Thus on the 1st of June 1619 Ralph Rounthwaite entered at Stationers' Hall *A Relation of all matters done in Bohemia, Austria, Poland, Sletia, France*, &c., *that is worthy of relating, since the 2nd of March 1618* (1619 N.S.) *until the 4th of May.*[2] Again at the beginning of November 1621 Bartholomew Downes and another entered in like manner *The certaine and true newes from all parts of Germany and Poland, to this present 20 of October 1621.*[3] No copy of either of these papers is now known to exist. Nor is any copy known of the *Courant or Weekly Newes from forreign parts* of October 9, 1621—"taken out of the High Dutch,"—mentioned by John Nichols.[4] But in May 1622 we arrive at a regular weekly newspaper which may still be seen in the British Museum.

[1] In the following account of early British newspapers certain portions of the article by E. Edwards in the 9th ed. of the *Ency. Brit.* have been incorporated.

[1] The title *Mercurius* or Mercury—as representing the messenger of the gods—thus became a common one for English periodicals.

[2] Registers of the Stationers' Company, as printed by Edward Arber, iii. 302.

[3] *Ibid.* iv. 23.

[4] *Literary Anecdotes*, iv. 38.

The Stationers' Registers contain an entry on May 18th of *A Currant of generall newes. Dated in 14th May last*; no copy of this issue is preserved, but what is presumably the next number is to be found in the Burney collection. It is entitled "The 23rd of May—*The Weekely Newes from Italy, Germany, &c.*, London, printed by J. D. for Nicholas Bourne and Thomas Archer." On many subsequent numbers the name of Nathaniel Butter appears in connexion sometimes with Bourne and sometimes with Archer; so that there was probably an eventual partnership in the new undertaking. Archer is known as a publisher of "relations" since 1603; he died in 1634. Butter had published *Newes from Spaine* in 1611, and he continued to be a publisher of news until 1641, if not later,[1] and died in 1664.

For details of the history of the development of the news-book down to 1641, and thence to the starting of the *London Gazette* in 1665, reference should be made to Mr J. B. Williams's *History of English Journalism* (1908), already referred to. Mr Williams, by his study of the materials preserved in the British Museum in the Burney and Thomason[2] collections, has considerably modified many of the previously accepted views as to the affiliation and authorship of these early English periodicals. The leading facts can only be summarized here.

The *Weekely Newes* (1622), though the first English "Coranto," had no regular title connecting one number with the rest; it was simply the news of the week, and so described. The first periodical with a title was a *Mercurius Britannicus* published by Archer (1625; the earliest copy in existence being No. 16, April 7th), which probably lasted till the end of 1627. But the activity of the Coranto-makers was checked by the Star Chamber edict in 1632 against the printing of news from foreign parts. The next step in the evolution of the newspaper was due to the abolition of the Star Chamber in 1641, and the consequent freeing of the Press; and at last we come to the English periodical with domestic news. In November 1641 begins *The Head of severall proceedings in the present parliament* (outside title) or *Diurnal Occurrences* (inside title), the latter being the title under which it was soon known as a weekly; and on Jan. 31st 1642 appeared *A Perfect Diurnal of the Passages in Parliament*. These were printed for William Cooke, and were written apparently by Samuel Pecke, "the first of the patriarchs of English domestic journalism" (Williams). It is unnecessary here to mention every domestic journal which played its part in the verbal warfare in the Great Rebellion. The weekly *Diurnals* were soon copied by other booksellers. At first they were naturally on the side of the parliament. In January 1643, however, appeared at Oxford the first Royalist diurnal, named *Mercurius Aulicus* (continued till September 1645, and soon succeeded by *Mercurius Academicus*), which struck a higher literary note; its chief writer was Sir John Birkenhead. *Mercurius Civicus*, the first regularly illustrated periodical in London, was started by the parliamentarian Richard Collings on May 11th, 1643 (continued to December 1646); Collings had also started earlier in the year the *Kingdome's Weekly Intelligencer*, which lasted till October 1649. In September 1643 appeared another Puritan opponent of *M. Aulicus* in the *Mercurius Britanicus* (*sic*) of Captain Thomas Audley, which temporarily ceased publication on September 9th, 1644, only to be revived on September 30th by Marchamont (or Marchmont) Nedham, a writer who plays a prominent part in the journalism of this period, and to be continued till May 18th 1646.

In January 1647 was started the *Perfect Occurrences* by Henry Walker ("Luke Harruney"), who was not only a great journalist on the parliamentary side but is important as having originated the introduction of advertisements into the news-books. Later in the year a number of new Royalist Mercuries came into the field from which *Aulicus* and *Academicus* had now withdrawn: the first was *Mercuricus Melancholicus* (until 1649), and the most important were *Mercurius Pragmaticus* (Sept. 1647 to May 1650) and *Mercuricus Elencticus* (Nov. 1647 to Nov. 1649). *M. Pragmaticus* was not, as has been stated, originated by Marchamont Nedham (who about this time turned his coat and became Royalist), but in 1648–1649 he was its writer until he again turned parliamentarian; "history," says Mr Williams, "has no personage so shamelessly cynical as Marchamont Nedham, with his powerful pen and his political convictions ever ready to be enlisted on the side of the highest bidder; he even wrote for Charles II. in later years." Against the unlicensed Royalist Mercuries in London, where the people were on the king's side, the parliament waged active war, but some of them managed to come out, although writer after writer was imprisoned, until the middle of 1650. Meanwhile from October 1649 to June 1650, by a new act of parliament, the licensed press itself was entirely suppressed, and in 1649 two official journals were issued, *A Brief Relation* (up to October 1650) and *Severall Proceedings in Parliament* (till September 1655), a third licensed periodical, *A Perfect Diurnall* (till September 1655), being added later in the year, and a fourth, *Mercurius Politicus* (of which Milton was the editor for a year or so and Marchamont Nedham one of the principal writers), starting on June 13th, 1650 (continuing till April 12th, 1660). After the middle of 1650 there was a revival of some of the older licensed news-books; but the *Weekly Intelligence of the Commonwealth* (July 1650 to September 1655), by R. Collings, was the only important newcomer up to September 1655, when Cromwell suppressed all such publications with the exception of *Mercurius Politicus* and the *Publick Intelligencer* (October 1655 to April 1660), both being official and conducted by Marchamont Nedham.

Till Cromwell's death (Sept. 3rd. 1658) Nedham reigned alone in the press, but with the Rump he fell into disgrace, and in 1659 a rival appeared in Henry Muddiman (a great writer also of "news-letters"), whose *Parliamentary Intelligencer*, renamed the *Kingdom's Intelligencer* (till August 1663), was supported by General Monck. Nedham's journalistic career came finally to an end (he died in 1678) at the hand of Monck's council of state in April 1660. The following announcement was published in the *Parliamentary Intelligencer*: "Whereas Marchmont Nedham, the author of the weekly news-books called *Mercurius Politicus* and the *Publique Intelligencer* is, by order of the council of state, discharged from writing or publishing any publique intelligence; the reader is desired to take notice that, by order of the said council, Giles Dury and Henry Muddiman are authorized henceforth to write and publish the said intelligence, the one upon the Thursday and the other upon the Monday, which they do intend to set out under the titles of the *Parliamentary Intelligencer* and of *Mercurius Publicus*." This arrangement with Muddiman lasted till 1663, when he was supplanted by Sir Roger L'Estrange, who was appointed "surveyor of the Press." On him was conferred by royal grant—and, as it proved, for only a short period—"all the sole privilege of writing, printing, and publishing all narratives, advertisements, mercuries, intelligencers, diurnals and other books of public intelligence; . . with power to search for and seize the unlicensed and treasonable schismatical and scandalous books and papers." L'Estrange discontinued *Mercurius Politicus* and *Kingdom's Intelligencer* and substituted two papers, the *Intelligencer* (Aug. 1st) and the *Newes* (Sept. 3rd) at a halfpenny, the former on Mondays and the latter on Thursdays; they were continued till January 29th, 1666, but from the beginning of 1664 the *Intelligencer* was made consecutive with the *Newes*, numbered and paged as one.

We come now to the origin of the famous *London Gazette*. Muddiman, obliged to devote himself solely to his news-letters, was associated with Joseph Williamson (under-secretary and afterwards secretary of state), who was for a time L'Estrange's

[1] It is to him that a passage in *Fletcher's Fair Maid of the Inn* (Act iv. Sc. 2) obviously refers (written in 1625): "It shall be the ghost of some lying stationer. A spirit shall look as if *butter* would not melt in his mouth; a new *Mercurius Gallo-Belgicus*." The quotation also illustrates the contemporary regard paid to the *Mercurius Gallobelgicus*.

[2] George Thomason (d. 1666) was a London bookseller who in 1641 began collecting contemporary pamphlets, &c. His collection was ultimately bought by George III. and presented to the British Museum in 1762. A catalogue was completed in 1908, with introduction by Dr G. K. Fortescue. There is also a catalogue of early English newspapers in the *Bibliotheca Lindesiana, Collections and Notes No. 5*, of Lord Crawford (1901).

assistant in the compilation of the *Intelligencer*.[1] Muddiman organized for himself a far-spread foreign correspondence, and carried on the business of a news-letter writer on a larger scale than had till then been known. Presently L'Estrange, whose monopoly of printing was highly unpopular, found his own sources of information much abridged, while Williamson, for his own ambitious purposes, entered into a complicated intrigue (analysed in detail by Williams, *op. cit.* pp. 190 seq.) for getting the whole business into his hands, with Muddiman as his tool and with Muddiman's clients as his customers. To L'Estrange's application for renewed assistance Williamson replied that he could not give it, but would procure for him a salary of £100 a year if he would give up his right in the news-book.[2] The *Intelligencer* appealed (Oct. 1665) to Lord Arlington, and pathetically assured him that the charge for "entertaining spies for information was £500 in the first year."[3] But L'Estrange boasted that he had "doubled" the size and price of the book,[4] and had brought the profit from £200 to £400 or £500 a year.[5] The appeal was in vain. At that time the great plague had driven the court to Oxford. The first number of the bi-weekly *Oxford Gazette*, licensed by Arlington and written by Muddiman, was published on the 16th November 1665. It was a "paper" of news, of the same size and shape as Muddiman's news-letters. With the publication of the 24th number (Monday, February 5th, 1665–1666 O.S.) the *Oxford Gazette* became the *London Gazette*. After the 25th number Muddiman, who saw that he was not safe in Williamson's hands, seceded. Williamson had the general control of the *Gazette*, and for a considerable time Charles Perrot, a member of Oriel College, was the acting editor.[6] L'Estrange was soon driven out of the field, being solaced, on his personal appeal to the king, with a charge of £100 a year on the news-books (henceforth "taken into the secretaries' office") and a further £200 out of secret service money for his place as surveyor of the press. Muddiman, meanwhile, attached himself to the other secretary of state, Sir W. Morice, and he was authorized to issue an opposition official paper, which appeared as *Current Intelligence* (June 4–Aug. 20, 1666); and though the Great Fire, which burnt out all the London printers, resulted in the reappearance, after a week's interval, of the *Gazette* alone, Muddiman's unrivalled organization of news-letters remained; and they continued, till his death in 1692, to be the more popular source of information. The *Gazette*, however, now remained for some time the only "newspaper" in the strict sense already mentioned. For several years it was regularly translated into French by one Moranville. During the Stuart reigns generally its contents were very meagre, although in the reign of Anne some improvement is already visible. More than a century after the establishment of the *Gazette*, we find Secretary Lord Weymouth addressing a circular[7] to the several secretaries of legation and the British consuls abroad, in which he says, "The writer of the *Gazette* has represented that the reputation of that paper is greatly lessened, and the sale diminished, from the small portion of foreign news with which it is supplied." He desires that each of them will send regularly all such articles of foreign intelligence as may appear proper for that paper, "taking particular care—as the *Gazette* is the only paper of authority printed in this country—never to send anything concerning the authenticity of which there is the smallest doubt." From such humble beginnings has arisen the great repertory of State Papers, now so valuable to the writers and to the students of English history. The *London Gazette* has appeared twice a week (on Tuesday and Friday) in a continuous series ever since.[8] The editorship is a government appointment.

The London Gazette.

[1] This help seems to have been given at the request of the secretary of state, Lord Arlington (then Sir H. Bennet), in 1663; *State Papers, Domestic, Charles II.*, lxxix. 112, 113.

[2] *State Papers, Domestic, Charles II.*, cxxxiv. 103 (Rolls House).

[3] *Ibid.* 117.

[4] In 1664 he had halved them, so that this really only means he had now restored the original size.

[8] A complete set is now of extreme rarity.

We come now to the Revolution. The very day after the departure of James II. was marked by the appearance of three newspapers—The *Universal Intelligence*, the *English Courant* and the *London Courant*. Within a few days more these were followed by the *London Mercury*, the *Orange Gazette*, the *London Intelligence*, the *Harlem Currant* and others. The Licensing Act, which was in force at the date of the Revolution, expired in 1692, but was continued for a year, after which it finally ceased. On the appearance of a paragraph in the *Flying Post* of 1st April 1697, which appeared to the House of Commons to attack the credit of the Exchequer Bills, leave was given to bring in a bill "to prevent writing, printing or publishing of any news without licence"; but the bill was thrown out in an early stage of its progress. That *Flying Post* which gave occasion to this attempt was also noticeable for a new method of printing, which it thus announced to its customers—"If any gentleman has a mind to oblige his country friend or correspondent with this account of public affairs, he can have it for twopence .. on a sheet of fine paper, half of which being left blank, he may thereon write his own affairs, *or the material news of the day*."

In 1696 Edward Lloyd—the virtual founder of the famous "Lloyd's" of commerce—started a thrice-a-week paper, *Lloyd's News*, which had but a brief existence in its first shape, but was the precursor of the *Lloyd's List* of the present day. No. 76 of the original paper contained a paragraph referring to the House of Lords, for the appearance of which a public apology must, the publisher was told, be made. He preferred to discontinue his publication (February 1697). Nearly thirty years afterwards he in part revived it, under the title of *Lloyd's List*—published at first weekly, afterwards twice a week.[9] This dates from 1726. It is now published daily.

It was in the reign of Queen Anne that the English newspaper press first became really eminent for the amount of intellectual power and of versatile talent which was employed upon it. It was also in that reign that the press was first fettered by the newspaper stamp. The accession of Anne was quickly followed by the appearance of the first successful London daily newspaper, the *Daily Courant* (11th of March 1702–1703). Seven years earlier, in 1695, the *Postboy* had been started as a daily paper (actually the first in London), but only four numbers appeared. The *Courant* was published and edited by the learned printer Samuel Buckley, who explained to the public that "the author has taken care to be duly furnished with all that comes from abroad, in any language.... At the beginning of each article he will quote the foreign paper from which it is taken, that the public, seeing from what country a piece of news comes, with the allowance of that government, may be better able to judge of the credibility and fairness of the relation. Nor will he take upon himself to give any comments, . . . supposing other people to have sense enough to make reflexions for themselves." Then came, in rapid succession, a crowd of new competitors for public favour, of less frequent publication. The first number of one of these, the *Country Gentleman's Courant* (1706), was given away gratuitously, and made a special claim to public favour on the ground that "here the reader is not only diverted with a faithful register of the most remarkable and momentary [*i.e.* momentous] transactions at home and abroad, . . . but also with a geographical description of the most material places mentioned in every article of news, whereby he is freed the trouble of looking into maps."

First London daily.

On the 19th of February 1704, whilst still imprisoned in Newgate for a political offence, Defoe (*q.v.*) began his famous paper, the *Review*. At the outset it was published weekly, afterwards twice, and at length three times a week. It continued substantially in its first form until July 29, 1712; and a complete set is of extreme rarity. From the first page to the last it is characterized by the manly

Defoe's Review.

[9] Frederick Martin, *History of Lloyd's*, 66-77 and 107-120. The great collection of newspapers in the British Museum contains only one number of *Lloyd's News*; but sixty-nine numbers may be seen in the Bodleian Library. Of the *List*, also, no complete series is known to exist; that in the library of Lloyd's begins with 1740.

boldness and persistent tenacity with which the almost unaided author utters and defends his opinions on public affairs against a host of able and bitter assailants. Some of the numbers were written during travel, some in Edinburgh. But the *Review* appeared regularly. When interrupted by the pressure of the Stamp Act (which came into force on the 1st of August 1712), the writer modified the form of his paper, and began a new series (August 2, 1712, to June 11, 1713). In those early and monthly supplements of his paper which he entitled "Advice from the Scandalous Club," and set apart for the discussion of questions of literature and manners, and sometimes of topics of a graver kind, Defoe to some extent anticipated Richard Steele's *Tatler* (1709) and Steele and Addison's *Spectator* (1711). In 1705 he severed those supplements from his chief newspaper, and published them twice a week as the *Little Review*. But they soon ceased to appear. It may here be added that in May 1716 Defoe began a new monthly paper under an old title, *Mercurius Politicus*, . . . "by a lover of old England." This journal continued to appear until September 1720. The year 1710 was marked by the appearance of the *Examiner, or Remarks upon Papers and Occurrences* (No. 1, August 3), of which thirteen numbers appeared by the co-operation of Bolingbroke, Prior, Freind and King before it was placed under the sole control of Swift. The *Whig Examiner*, avowedly intended "to censure the writings of others, and to give all persons a rehearing who had suffered under any unjust sentence of the *Examiner*," followed on the 1st September, and the *Medley* three weeks afterwards.

This increasing popularity and influence of the newspaper press could not fail to be distasteful to the government of the day. Prosecutions were multiplied, but with small success. At length some busy projector hit upon the expedient of a newspaper tax. The paper which seems to contain the first germ of the plan is still preserved amongst the treasury papers. It is anonymous and undated, but probably belongs to the year 1711. "There are published weekly," says the writer, "about 44,000 newspapers, viz. *Daily Courant*, *London Post*, *English Post*, *London Gazette*, *Postman*, *Postboy*, *Flying Post*, *Review* and *Observator*."[1] The duty eventually imposed (1712) was a halfpenny on papers of half a sheet or less, and a penny on such as ranged from half a sheet to a single sheet (10 Anne, c. xix. § 101). The first results of the tax cannot be more succinctly or more vividly described than in the following characteristic passage of Swift's *Journal to Stella* (August 7, 1712): "Do you know that Grub Street is dead and gone last week? No more ghosts or murders now for love or money. I plied it close the last fortnight, and published at least seven papers of my own, besides some of other people's; but now every single half-sheet pays a halfpenny to the queen. The *Observator* is fallen; the *Medleys* are jumbled together with the *Flying Post*; the *Examiner* is deadly sick; the *Spectator* keeps up, and doubles its price—I know not how long it will hold. Have you seen the *red stamp* the papers are marked with? *Methinks the stamping is worth a halfpenny.*"

Stamp tax of 1712.

Swift's doubt as to the ability of the *Spectator* to hold out against the tax was justified by its discontinuance in December 1712, Steele starting the *Guardian* in 1713, which only ran for six months. But the impost which was thus fruitful in mischief, by suppressing much good literature, wholly failed in keeping out bad. Some of the worst journals that were already in existence kept their ground, and the number of such ere long increased.[2] An enumeration of the London papers of 1714 comprises the *Daily Courant*, the *Examiner*, the *British Merchant*, the *Lover*, the *Patriot*, the *Monitor*, the *Flying Post*, the *Postboy*, *Mercator*, the *Weekly Pacquet* and *Dunton's Ghost*. Another enumeration in 1733 includes the *Daily Courant*, the *Craftsman*, *Fog's Journal*, *Mist's Journal*, the *London Journal*, the *Free Briton*, the *Grub Street Journal*, the *Weekly Register*, the *Universal Spectator*, the *Auditor*, the *Weekly Miscellany*, the *London Crier*, *Read's Journal*, *Oedipus or the Postman Remounted*, the *St James's Post*, the *London Evening Post* and the *London Daily Post*, which afterwards became better known as the *Public Advertiser*. Part of this increase may fairly be ascribed to political corruption. In 1742 the committee of the House of Commons appointed to inquire into the political conduct of the earl of Orford reported to the House that during the last ten years of the Walpole ministry there was paid, out of public money, no "less a sum than £50,077, 18s. to authors and printers of newspapers, such as the *Free Briton*, *Daily Courant*, *Gazetteer* and other political papers."[3] But some part of the payment may well have been made for advertisements. Towards the middle of the century the provisions and the penalties of the Stamp Act were made more stringent. Yet the number of newspapers continued to rise. Dr Johnson, who in 1750 started his twopenny bi-weekly *Rambler*, and in 1758 his weekly *Idler*, writing in the latter bears testimony to the still growing thirst for news: "Journals are daily multiplied, without increase of knowledge. The tale of the morning paper is told in the evening, and the narratives of the evening are bought again in the morning. These repetitions, indeed, waste time, but they do not shorten it. The most eager peruser of news is tired before he has completed his labour; and many a man who enters the coffee-house in his nightgown and slippers is called away to his shop or his dinner before he has well considered the state of Europe." Five years before (*i.e.* in 1753) the aggregate number of copies of newspapers annually sold in England, on an average of three years, amounted to 7,411,757. In 1760 it had risen to 9,464,790, and in 1767 to 11,300,980. In 1776 the number of newspapers published in London alone had increased to fifty-three.

Dr Johnson's time.

When Johnson wrote his sarcastic strictures on the newspapers that were the contemporaries and, in a sense, the rivals of the *Idler*, the newswriters had fallen below the standard of an earlier day. A generation before the newspaper was often much more of a political organ than of an industrial venture. All of the many enterprises of Defoe in this field of journalism united indeed both characteristics. But if he was a keen tradesman, he was also a passionate politician. And not a few of his fellow-workers in that field were conspicuous as statesmen no less than as journalists. Even less than twenty years before the appearance of Johnson's remarks, men of the mental calibre of Henry Fielding were still to be found amongst the editors and writers of newspapers. The task had fallen to a different class of men in 1750.

The history of newspapers during the long reign of George III. is a history of the struggle for freedom of speech in the face of repeated criminal prosecutions, in which individual writers and editors were defeated and severely punished, while the Press itself derived new strength from the protracted conflict, and turned ignominious penalties into signal triumphs. From the days of Wilkes's *North Briton* onwards (see WILKES, JOHN: it was started in 1761), every conspicuous newspaper prosecution gave tenfold currency to the doctrines that were assailed. In the earlier part of this period men who were mere traders in politics—whose motives were obviously base and their lives contemptible—became for a time powers in the state, able to brave king, legislature and law courts, by virtue of the simple truth that a free people must have a free press. One of the minor incidents of the *North Briton* excitement (Wilkes's prosecution in 1763) led indirectly to valuable results with reference to the much-vexed question of parliamentary reporting. During the discussions respecting the Middlesex election, Almon, a bookseller, collected from members of the House of Commons some particulars of the debates, and published them in the *London Evening Post*. The success which attended these reports induced the proprietors of the *St James's Chronicle* to employ a reporter to collect notes

Press prosecutions.

in the lobby and at the coffee-houses. This repeated infraction of the privilege of secret legislation led to the memorable proceedings of the House of Commons in 1771, with their fierce debates, angry resolutions and arbitrary imprisonments—all resulting, at length, in that tacit concession of publicity of discussion which in the main, with brief occasional exceptions, has ever since prevailed.

London evening press.

Evening journalism in England started originally with supplemental editions of the morning papers, giving the latest foreign war news. In July 1695, when William III. was fighting France in the Netherlands, a "Postscript to the Pacquet-boat from Holland to Flanders" was published with special advices from the seat of war; and from that time there were frequent afternoon issues of morning journals, giving war news. In August 1706 a "Six at Night" evening paper was started in London. The first London evening paper of any importance, however, was the *Courier* (1792), which during the latter part of the Napoleonic War, with Mackintosh, Coleridge and Wordsworth among its contributors, became one of the chief papers of the day. It was edited successively by Daniel Stuart, William Mudford, Eugenius Roche, John Galt, James Stuart and Laman Blanchard. In 1827 a twenty-fourth share in the paper sold for 5000 guineas, but it gradually declined and came to an end in 1842, when it was incorporated by the *Globe* (still existing).

London press in George III.'s reign.

The principal metropolitan newspapers at different periods of George III.'s reign were the *Public Advertiser*, the *Morning Post*, the *Morning Chronicle*, the *Morning Herald* and finally *The Times*. Of these the *Morning Post* and *The Times*, still existing, are dealt with later. Of the three which eventually ceased to exist, the first was known in 1726 as the *London Daily Post and General Advertiser*. In 1738 the first part of this title was dropped, and in 1752 *General Advertiser* was altered into *Public Advertiser*, a name which the letters of Junius made so famous. Many of these had appeared before the smallest perceptible effect was produced on the circulation of the paper; but when the "Letter to the King" came out (19th December 1769, almost a year from the beginning of the series) it caused an addition of 1750 copies to the ordinary impression. The effect of subsequent letters was variable; but when Junius ceased to write the monthly sale of the paper had risen to 83,950. This was in December 1771. Seven years earlier the monthly sale had been but 47,515. It now became so valuable a property that shares in it were sold, according to John Nichols, "as regularly as those of the New River Company." But the fortunes of the *Advertiser* declined almost as rapidly as they had risen. It continued to appear until 1798, and then expired, being amalgamated with the commercial paper called the *Public Ledger* (dating from 1759). Actions for libel were brought against the paper by Edmund Burke in 1784, and by William Pitt in 1785, and in both suits damages were given.

The *Morning Chronicle* was begun in 1769. William Woodfall was its printer, reporter and editor, and continued to conduct it until 1789. James Perry succeeded him as editor, and so continued, with an interval during which the editorship was in the hands of Mr Sergeant Spankie, until his death in 1821. Perry's editorial functions were occasionally discharged in Newgate in consequence of repeated prosecutions for political libel. In 1819 the daily sale reached nearly 4000. It was sold in 1823 to Mr Clement, the purchase-money amounting to £42,000. Mr Clement held it for about eleven years, and then sold it to Sir John Easthope for £16,000. It was then, and until 1843, edited by John Black, who numbered amongst his staff Albany Fonblanque, Charles Dickens and John Payne Collier, the circulation being about 6000. The paper continued to be distinguished by much literary ability, but not by commercial prosperity. In 1849 (the circulation having fallen to 3000) it became the joint property of the duke of Newcastle, Mr W. E. Gladstone and some of their political friends; and by them, in 1854, it was sold to Mr Sergeant Glover. From 1848 to 1854 Douglas Cook (afterwards of the *Saturday Review*) was editor. At length the *Morning Chronicle* ended in the Bankruptcy Court, after an existence of more than ninety years. The *Morning Herald* was founded and first edited by Henry Bate (Sir Henry Bate Dudley) in 1781, and came to an end at the close of 1869; for some time it was a popular Tory paper, and from 1835 to 1845 had a circulation of about 6000.

Abolition of taxes on knowledge.

The development of the Press was enormously assisted by the gradual abolition of the "taxes on knowledge," and also by the introduction of a cheap postal system. In 1756 an additional halfpenny was added to the tax of 1712. In 1765 and in 1773 various restrictive regulations were imposed. In 1789 the three-halfpence was increased to twopence, in 1798 to twopence-halfpenny, in 1804 to threepence-halfpenny, and in 1815 to fourpence, less a discount of 20%. Penalties of all kinds were also increased, and obstructive regulations were multiplied. In the course of the struggle between this constantly enhanced taxation and the irrepressible desire for cheap newspapers, more than seven hundred prosecutions for publishing unstamped journals were instituted, and more than five hundred were imprisoned, sometimes for considerable periods. As the prosecutions multiplied, and the penalties became more serious, *Poor Man's Guardians*, *Democrats*, *Destructives* and their congeners multiplied also, and their revolutionary tendencies increased in a still greater ratio. Blasphemy was added to sedition. Penny and halfpenny journals were established which dealt exclusively with narratives of gross vice and crime, and which vied with each other in every kind of artifice to make vice and crime attractive. Between the years 1831 and 1835 many scores of unstamped newspapers made their appearance. The political tone of most of them was fiercely revolutionary. Prosecution followed prosecution; but all failed to suppress the obnoxious publications.

To Bulwer Lytton, the novelist and politician (Baron Lytton), and subsequently to Milner Gibson and Richard Cobden, is chiefly due the credit of grappling with this question in the House of Commons in a manner which secured first the reduction of the tax to a penny on the 15th of September 1836, and then its total abolition at last in 1855. The measure for the final abolition of the stamp tax was substantially prepared by W. E. Gladstone during his chancellorship of the exchequer in 1854, but was carried by his successor in 1855. The number of newspapers established from the early part of 1855, when the repeal of the duty had become a certainty, and continuing in existence at the beginning of 1857, amounted to 107; 26 were metropolitan and 81 provincial. Of the latter, the majority belonged to towns which possessed no newspaper whatever under the Stamp Acts, and the price of nearly one-third of them was but a penny. In some cases, however, a portion of these new cheap papers of 1857 was printed in London, usually with pictorial illustrations, and to this was added a local supplement containing the news of the district.

Amongst the earliest results of the change in newspaper law made in 1855 was the establishment in quick succession of a series of penny metropolitan local papers, chiefly suburban, of a kind very different from their unstamped forerunners. They spread rapidly, and attained considerable success, chiefly as advertising sheets, and as sometimes the organs, more often the critics, of the local vestries and other administrations. One of them, the *Clerkenwell News and Daily Chronicle*, so prospered in the commercial sense, being crowded with advertisements, that it sold for £30,000, and was then transformed into the London *Daily Chronicle* (28th May 1877). Another conspicuous result of the legislation of 1855 was an enormous increase in the number and influence of what are known as "class papers" and professional and trade papers. The duties on paper itself were finally abolished in 1861.

"Taxes on knowledge" having thus been abolished, the later developments in newspaper history are mainly connected with the increase in number, due largely to the spread of education, the improvements in machinery and distribution and in collection of news, the constant adaptation to the new demands

of a wider public, and the progress in the art of advertising as applied to the Press. The following sections on the more important newspapers in London and the Provinces fill in the remaining details of the history of the British Press, so far as they are substantially important or interesting. Much that is in its nature ephemeral or trivial is necessarily passed over.

Modern London Newspapers.

"Morning Post."

The *Morning Post* (oldest of existing London daily papers) dates from 1772. For some years it was in the hands of Henry Bate (Sir Henry Bate Dudley), and it attained some degree of temporary popularity, though of no very enviable sort. In 1795 the entire copyright, with house and printing materials, was sold for £600 to Peter and Daniel Stuart, who quickly raised the position of the *Post* by enlisting Sir James Mackintosh and the poet Coleridge in its service, and also by giving unremitting attention to advertisements and to the copious supply of incidental news and amusing paragraphs. There has been much controversy about the share which Coleridge had in elevating the *Post* from obscurity to eminence. That he greatly promoted this result there can be no doubt. His famous "Character of Pitt," published in 1800, was especially successful, and created a demand for the particular number in which it appeared that lasted for weeks, a thing almost without precedent. Coleridge wrote for this paper from 1795 until 1802, and during that period its circulation in ordinary rose from 350 copies, on the average, to 4500. Whatever the amount of rhetorical hyperbole in Fox's saying—recorded as spoken in the House of Commons—"Mr Coleridge's essays in the *Morning Post* led to the rupture of the treaty of Amiens," it is none the less a striking testimony, not only to Coleridge's powers as a publicist, but to the position which the newspaper press had won, in spite of innumerable obstacles at that time. The list of his fellow-workers in the *Post* is a most brilliant and varied one. Besides Mackintosh, Southey and Arthur Young, it included a galaxy of poets. Many of the lyrics of Moore, many of the social verses of Mackworth Praed, some of the noblest sonnets of Wordsworth, were first published in the columns of the *Post*. And the story of the paper, in its early days, had tragic as well as poetic episodes. In consequence of offence taken at some of its articles, the editor and proprietor, Nicholas Byrne (who succeeded Daniel Stuart), was assaulted and murdered whilst sitting in his office.

Up to about 1850 the history of the *Morning Post* offers little to record; with the *Morning Chronicle* and *Morning Herald*, and having a smaller circulation than either of them, it was being rapidly eclipsed in London journalism by *The Times* (see below), and in 1847 only sold some three thousand copies. Heavily in debt to Messrs J. and T. B. Crompton, the paper manufacturers, it had been taken over by them; and in that year the management was entrusted to Peter Borthwick (1804–1852), a Scotsman who, after graduation both at Edinburgh and Cambridge, had taken to politics in the Conservative interest and had sat in parliament for Evesham from 1835 to 1838 and from 1841 to 1847, when he was almost ruined by fighting an election petition in which he was unseated. Peter Borthwick took the task of reviving the paper seriously in hand, and in a few years was already improving its position when he fell ill and died; and he was succeeded in 1852 by his son Algernon Borthwick, afterwards Lord Glenesk (1830–1908). The later history of the paper is primarily connected with its practical re-establishment and successful conduct under the latter. Algernon Borthwick had been its Paris correspondent from 1850, and had shown social gifts and journalistic acumen of great promise. When he became managing editor in 1852 he devoted himself with such energy to the work that in seven years the debt on the business had been paid off. He gave the paper a strong political colour, Conservative, Imperialist and Protectionist; and in the 'fifties and 'sixties Borthwick was a keen supporter of Lord Palmerston. After the death of Mr Crompton, his nephew, Mr Rideout, the principal surviving partner in the paper manufacturing firm, was so impressed with Borthwick's success that he vested the entire control of the paper in him for life; and on Mr Rideout's death in 1877, Borthwick was enabled, by the help of his friend Andrew Montague, to buy the property and become sole proprietor. The *Morning Post* had now become, largely through Borthwick's own social qualities, the principal organ of the fashionable world; but in 1881 he took what was then considered the hazardous step of reducing its price from threepence to a penny, and appealing no longer to the "threepenny public" with *The Times* but to a wider clientèle with the *Daily Telegraph* and *Standard*. The result was a ten-fold increase in circulation and a financial success exceeding all anticipations. Borthwick himself, who was knighted in 1880, and was created a baronet in 1887, had entered parliament in 1880 for Evesham, and from 1885 to 1895 sat for South Kensington, being finally raised to the peerage in 1895. His political gifts naturally increased the influence of the paper; he supported the "Tory democracy" and was an active worker for the Primrose League, of which he was three times chancellor; and the *Morning Post*, under his control, became one of the great organs of opinion on the Conservative side. From 1880 onwards he devolved the editorial duties on others, at first Sir William Hardman, and then successively Mr A. K. Moore, Mr Algernon Locker, Mr James Nicol Dunn (from 1897 to 1905; afterwards editor of the *Manchester Courier*) and Mr Fabian Ware; under them the literary standard of the paper was kept at a high level, and constant improvements were introduced; and the staff included a number of well-known writers, notably Mr Spencer Wilkinson (b. 1853), who in 1909 was appointed professor of military history at Oxford. From 1897 till his death in 1905, at the age of thirty-two, Lord Glenesk's son, Oliver Borthwick, had much to do with the managerial side. On Lord Glenesk's own death on the 24th November 1908, the proprietorship passed to the trustees of his only surviving child, a daughter, who in 1893 had married the 7th Earl Bathurst.

"The Times."

The Times[1] is usually dated from the 1st of January 1788, but was really started by John Walter on the 1st of January 1785, under the title of *The London Daily Universal Register, printed logographically*. On its reaching its 940th issue its name was changed. The logographic or "word-printing" process had been invented by a printer named Henry Johnson several years before, and found a warm advocate in John Walter, who expounded its peculiarities at great length in No. 510 of his *Daily Universal Register*. In a later number he stated, very amusingly, his reasons for adopting the altered title, which the enterprise and ability of his successors (see WALTER, JOHN) made world-famous. Within two years John Walter had his share in the Georgian persecutions of the press, by successive sentences to three fines and to three several imprisonments in Newgate, chiefly for having stated that the prince of Wales and the dukes of York and Clarence had so misconducted themselves "as to incur the just disapprobation of his Majesty." In 1803 the management was transferred (together with the joint proprietorship of the journal) to his son, John Walter (2), by whom it was carried on with extraordinary energy and consummate ability, and at the same time with marked independence. To Lord Sidmouth's government he gave a general but independent support. That of Pitt he opposed, especially on the questions of the Catamaran expedition and the malversations of Lord Melville. This opposition was resented by depriving the elder Walter of the printing for the customs department, by the withdrawal of government advertisements from *The Times*, and also, it is said, by the systematic detention at the outports of the foreign intelligence addressed to its editor. John Walter the Second, however, was strong and resolute enough to brave the government. He organized a better system of news transmission than had ever before existed. He introduced steam-printing (1814) and repeatedly improved its mechanism (see PRINTING); and although modern machines may now seem to thrust into insignificance a press of which it was at first announced as a notable triumph that "no less than 1100 sheets are impressed in one hour," yet the assertion was none the less true that *The Times* of 29th November 1814 "presented to the public the practical result of the greatest improvement connected with printing since the discovery of the art itself." The effort to secure for *The Times* the best attainable literary talent in all departments kept at least an equal pace with those which were directed towards the improvement of its mechanical resources. And thus it came to pass that a circulation which did not, even in 1815, exceed on the average 5000 copies became, in 1834, 10,000; in 1840, 18,500; in 1844, 23,000; in 1851, 40,000; and in 1854, 51,648. In the year last named the average circulation of the other London dailies was—*Morning Advertiser*, 7644; *Daily News*, 4160; *Morning Herald*, 3712; *Morning Chronicle*, 2800; *Morning Post*, 2667; so that the supremacy of *The Times* can readily be understood.

Sir John Stoddart, afterwards governor of Malta, edited *The Times* for several years prior to 1816. He was succeeded by Thomas Barnes, who for many years wrote largely in the paper. When his health began to fail the largest share of the editorial work came into the hands of Captain Edward Sterling—the contributor about a quarter of a century earlier of a noteworthy series of political letters signed "Vetus," the Paris correspondent of *The Times* in 1814 and subsequent eventful years, and afterwards for many years the most conspicuous among its leader-writers.[2] From 1841 to 1877 the chief editor was John Thadeus Delane, who had his brother-in-law G. W. Dasent for assistant-editor, and another brother-in-law, Mowbray Morris, as business manager. By the time of the second John Walter's death (1847) the substantial monopoly of *The Times* in London journalism had been established; and under the proprietorship of the third John Walter the result of the labour of Delane as editor, and of the brilliant staff of contributors whom he directed, among whom Henry Reeve was conspicuous as regards foreign affairs,

[1] See the centenary number of January 2, 1888; the pamphlet by S. V. Makower, issued by *The Times* in 1904, "The History of *The Times*"; and the article by Hugh Chisholm on "*The Times*, 1785–1908" in the *National Review* (May 1908).

[2] See *Life of John Sterling*, by Carlyle, who says of him at this time: "The emphatic, big-voiced, always influential and often strongly unreasonable *Times* newspaper was the express emblem of Edward Sterling. He, more than any other man, . . . was *The Times*, and thundered through it, to the shaking of the spheres." The nickname of "The Thunderer," for *The Times*, came in vogue in his day.

was to turn the "favourite broadsheet" of the English public into the "leading journal of the world." When Delane retired, he was succeeded as editor by Thomas Chenery, and on his death in 1884 by George Earle Buckle (b. 1854). At the beginning of 1908 considerable changes took place in the proprietorial side of *The Times*, which was converted into a company, with Mr A. F. Walter (chief proprietor since 1891) as chairman and Mr C. Moberly Bell (b. 1847; manager since 1890) as managing director; the financial control passing into the hands of Lord Northcliffe.

In the history of *The Times* its influence on the mechanical side of newspaper work was very great. The increasing circulation of *The Times* between the years 1840 and 1850 made an improvement in the printing-presses necessary, as sometimes the publication could not be completed before the afternoon. To meet this want the Applegath vertical press was introduced in 1848 and the American Hoe tenfeeder press in 1858. Meanwhile the idea of stereotyping from the movable types had been making steady progress. About the year 1856, however, a Swiss named Dellagana introduced to *The Times* Kroning's idea of casting from papier-mâché instead of plaster, and was allowed to experiment in *The Times* office. After a time the invention was so much improved that matrices of pages could be taken and the stereotype plates fixed bodily on the printing machine in place of the movable type. This cleared the way for the introduction of the famous Walter press. Hitherto only one set of "formes" could be used, as the type was set up once only—one side of the paper being worked on one machine and the sheets then taken to another machine to be "perfected." Stereotyping enabled the formes to be multiplied to any extent, as several plates could be cast from one matrix. Mr MacDonald, the manager of *The Times*, had devoted himself for several years to the production of a press which could print papers on both sides in one operation from a large reel of paper, the web of paper being cut into the required size after printing, instead of each sheet being "laid on" by a man and then printed. After years of experiment the Walter press was introduced into the *Times* machine-room in 1869, and the question of printing great numbers in a short time was solved. Each press turned out 12,000 sheets per hour, and it was therefore only a question of multiplying the stereo plates and presses to obtain any number of printed papers by a certain time. Meanwhile Messrs Hoe had set about producing something even quicker and better than the Walter press. They succeeded in accomplishing this by multiplying the reels of paper on each press, and also adding folders and stitchers. The result was the production of over 36,000 sheets per hour from each machine. These presses were adopted by *The Times* in 1895.

In 1868 the question of composing machines for the quicker setting-up of type was taken up by *The Times*. A German named Kastenbein had an invention which he brought to the notice of *The Times*, and arrangements were made for him to continue his experiments in *The Times* office. In a couple of years a machine was made, which was worked and improved until in 1874 several machines were ready to set up a portion of the paper; but it was not until 1879 that the arrangements were sufficiently advanced to make certain that they could do all that was wanted from them. The introduction of composing machines, and the necessary alterations in the office arrangements which followed, led to some trouble among the compositors, which in 1880 culminated in a partial strike; but a part of the staff remaining loyal, the printer was able by extra effort to produce the paper at the proper time on the morning following the strike. Various improvements were made, until one machine was able to set up as many as 298 lines of *The Times* in one hour, equal to 16,688 separate types. A system of telephoning the parliamentary report from the House of Commons direct to the compositor was begun in 1885, and was continued until the House decided to rise at midnight, which enabled the more economical method of composing direct from the "copy" to be resumed.

Ever since the introduction of the composing machines the business had been much hampered by the question of "distribution"—that is, the breaking-up and sorting of the types after use. Kastenbein had invented a distributing machine to accompany his composing machine, but it proved to be unsatisfactory. Various systems were tried at *The Times* office, but for many years the work of the composing machines was to some extent crippled by the distribution difficulty. This had been recognized by Mr Frederick Wicks (d. 1910), the inventor of the Wicks Rotary Type-casting Machine, who for many years had been working at a machine which would cast new type so quickly and so cheaply as to do away with the old system of distribution and substitute new type every day. In 1899 his machine was practically perfect, and *The Times* entered into a contract with him to supply any quantity of new type every day. The difficult question of distribution was thus surmounted, and composition by machines placed on a satisfactory basis.

Thus during the last half of the 19th century *The Times* continued to take the lead in new inventions relating to the printing of a newspaper, just as it had in the fifty years preceding. The three most important advances during the later period were practically worked out at *The Times* office—namely, fast-printing presses, stereotyping and machine composing, and without these it is safe to say that the cheap newspaper of the present day could not exist. Further indications of the enterprise of *The Times* in taking up journalistic novelties may also be seen in its organizing a wireless telegraphy service, with a special steamer, in the Far East, at the opening of the Russo-Japanese War.

The price at which *The Times* has been sold has been changed at various dates: in 1796 to 4½d., 1799 to 6d., 1809 to 6½d., 1815 to 7d., 1836 to 5d., 1855 to 4d., 1861 (Oct. 1) to 3d., and in 1904 (still remaining at 3d.) it started a method of payment by subscription which gave subscribers an advantage in one form or another and thus in reality reduced the price further. In 1905 this advantage took the form of the price (3d.) covering a subscription to *The Times* Book Club, a circulating library and book-shop on novel lines (see BOOKSELLING and PUBLISHING).

The first number of the paper contained 57 brief advertisements, but as it grew in repute and in size its advertising revenue became very large, and with the growth of this revenue came *pari passu* the means of spending more money on the contents. As far back as 1861 a single issue had contained 105 columns of advertisements, and another 98. Prior to 1884 the paper had only on two occasions consisted of 24 pages in a single issue. Between that year and 1902 more than 80 separate issues of this size were published, many of them containing over 80 columns of advertisements. Of two issues, one containing the news of the death and the other the account of the funeral of Queen Victoria, 140,000 copies were printed. From that time issues of 20 pages and over became an ordinary matter: and on May 24, 1909 (Empire Day), *The Times* signalized the occasion by bringing out a huge supplement of 72 pages full of articles on Imperial topics.

The Times has long stood in a class by itself among newspapers, owing to its abundance of trustworthy news, its high literary standard and its command of the ablest writers, who, however, are generally anonymous in its columns. It has always claimed to be a national rather than a party organ. It was Liberal in its politics in the Reform days, but became more and more Conservative and Imperialist when the Unionist and anti-Home Rule era set in. On the conversion of Mr Gladstone to Home Rule, *The Times* was, indeed, largely instrumental in forming the Liberal-Unionist party. In the course of its vigorous campaign against Irish Nationalism it published as part of its case a series of articles on "Parnellism and Crime," including what were alleged to be *facsimile* reproductions of letters from Mr Parnell showing his complicity with the Phoenix Park murders. The history of this episode, and of the appointment of the Special Commission of investigation by the government, is told under PARNELL. One of the strongest features of *The Times* has been always its foreign correspondence.

Among leading incidents in the history of *The Times* a few may be more particularly mentioned. In 1840 the Paris correspondent of the paper (Mr O'Reilly) obtained information respecting a gigantic scheme of forgery which had been planned in France, together with particulars of the examination at Antwerp of a minor agent in the conspiracy, who had been there, almost by chance, arrested. All that he could collect on the subject, including the names of the chief conspirators, was published by *The Times* on the 26th of May in that year, under the heading "Extraordinary and Extensive Forgery and Swindling Conspiracy on the Continent (Private Correspondence)." The project contemplated the almost simultaneous presentation at the chief banking-houses throughout the Continent of forged letters of credit, purporting to be those of Glyn & Company, to a very large amount; and its failure appears to have been in a great degree owing to the exertions made, and the responsibility assumed, by *The Times*. One of the persons implicated brought an action for libel against the paper, which was tried at Croydon in August 1841, with a verdict for the plaintiff, *one farthing damages*. A subscription towards defraying the heavy expenses (amounting to more than £5000) which *The Times* had incurred was speedily opened, but the proprietors declined to profit by it; and the sum which had been raised was devoted to the foundation of two "*Times* scholarships," in connexion with Christ's Hospital and the City of London School. Three years afterwards *The Times* rendered noble public service in a different direction. It used its vast power with vigour—at the expense of materially checking the growth of its own advertisement fund—by denouncing the fraudulent schemes which underlay the "railway mania" of 1845. The Parnell affair has already been mentioned. And more recently the "book war," arising out of the attack by the combined publishers on *The Times* Book Club in 1906, was prosecuted by *The Times* with great vigour, until in 1908 it came quietly to an end.

Various adjuncts to *The Times*, issued by its proprietors, have still to be mentioned. *The Mail*, published three times a week at the price of 2d. per number, gives a summary of two days' issue of *The Times*. *The Times Weekly Edition* (begun in 1877) is published every Friday at 2d., and gives an epitome of *The Times* for the six days. The *Law Reports* (begun in 1884) are conducted by a special staff of *Times* law reporters. *Commercial Cases* deals with cases of a commercial nature. *Issues* is a useful half-yearly compilation of all the company announcements and demands for new capital, taken from the advertisement columns of *The Times*.

In 1897 *The Times* started a weekly literary organ under the title of *Literature*. In 1901, however, a weekly literary supplement to *The Times* was issued instead, and *Literature* passed into the hands of the proprietor of the *Academy*, with which paper it was incorporated. The "Literary Supplement," which appears each Thursday

(at first on Fridays), is printed in a different form, and separately paged. In 1904 a "Financial and Commercial Supplement" (at first on Mondays, and later on Fridays) was added; in 1905 an "Engineering Supplement" (Wednesdays), and in 1910 a "Woman's Supplement."

The publishing department of *The Times* also invaded several new fields of enterprise. *The Times Atlas* was first published in 1895, and this publication was supplemented by that of *The Times* (previously Longmans') *Gazetteer*. A much larger amd more important venture was the issue in 1898 of a reprint of the ninth edition of the *Encyclopaedia Britannica* at less than half the original price, on a new system of terms (known as *The Times* system) that enabled the purchaser to receive the whole work at once and to pay for it by a series of equal monthly payments. This was followed by a similar sale of the *Century Dictionary* and of a reprint of the first fifty years of *Punch*; and eleven new volumes of the *Encyclopaedia Britannica*, supplementing the ninth edition, and forming with it the tenth edition, were issued by *The Times* in 1902 on similar terms (see ENCYCLOPAEDIA).

In 1895 *The Times*, through its Vienna correspondent, purchased from Dr Moritz Busch the MS. and entire copyright of his journals, containing a very minute record of his intimate relations with Bismarck. It was stipulated in the contract that these were not to be published until after the death of the prince. That event occurred on the 30th July 1898, and on the 12th September of the same year *The Times* published through Messrs Macmillan (in 3 vols.) *Bismarck: Some Secret Pages of his History*, by Dr Moritz Busch.

The Times History of the War in South Africa arose out of a desire to preserve in a more readable form the excellent work done by the numerous *Times* correspondents in South Africa. When originally projected in the early days of 1900 it was hoped that the war would be of short duration, and that the history of it could be rapidly completed. The length of the war naturally upset all these calculations, and eventually the sixth and last volume was only issued in 1909.

For a long period after the establishment of *The Times*, no effort to found a new daily London morning newspaper was ever conspicuously successful. Among unfruitful attempts were—(1) the *New Times*, started by Dr (afterwards Sir John) Stoddart, upon his departure from Printing-House Square; (2) the *Representative* (1824), established by John Murray, under circumstances which seemed at the outset exceptionally promising; (3) the *Constitutional*, begun in 1836 and carried on for eight months by a joint-stock company, exceptionally favoured in having for editor and sub-editor Laman Blanchard and Thornton Hunt, with a staff of contributors which included Thackeray, Douglas Jerrold and Bulwer; (4) the *Morning Star*, founded in 1856, and kept afloat until 1870, when it was merged in the *Daily News*; (5) in 1867, the *Day*, for six weeks only; (6) in 1873 the *Hour*, for three years; (7) in 1878, the *Daily Express*, which soon failed.

A measure of greater success followed the establishment (1794) of the *Morning Advertiser*, under special circumstances. It was the joint-stock venture of a large society of licensed victuallers, amongst whom subscription to the paper was the condition of membership. For nearly sixty years its circulation lay almost entirely in public-houses and coffee-houses, but amongst them it sold nearly 5000 copies daily, and it yielded a steady profit of about £6000 a year. Then, by the ability and enterprise of an experienced editor, James Grant (1802–1879), it was within four years raised to a circulation of nearly 8000, and to an aggregate profit of £12,000 a year. In 1891 its price was reduced from threepence to a penny.

"Morning Advertiser."

The history of the *Daily News*, founded in 1846, has been told by Mr Justin McCarthy and Sir John R. Robinson in a volume of "political and social retrospect" published in 1896 on the occasion of its jubilee. It could boast of having continuously been the champion of Liberal ideas and principles—of what (so long as Mr Gladstone lived) might be called official Liberalism at home and of liberty abroad. It became a penny paper in 1868. Its only rival in the history of Liberal journalism in London for many years was the *Morning Star*, which in 1870 it absorbed. Notably, it led British public opinion in foreign affairs as champion of the North in the American Civil War, of the cause of Italy, of the emancipation of Bulgaria from the Turk and of Armenia. Its early editors were Charles Dickens (21st January–March 1846), John Forster (March–October 1846), E. E. Crowe (1847–1851), F. K. Hunt (1851–1854), W. Weir (1854–1858), T. Walker (1858–1869). In 1868 the price was reduced to a penny, and it came under the management of Mr (afterwards Sir) John R. Robinson (1828–1903), who only retired in 1901. Its later editors included (1868–1886) Mr F. H. Hill (the brilliant author of *Political Portraits*), and subsequently Sir John Robinson, as managing editor, in conjunction with Mr P. W. Clayden (1827–1902), the author of *Life of Samuel Rogers, England under the Coalition* and other able works, as political and literary editor, down to 1896, and Mr E. T. Cook from 1896 to 1901. Mr Cook, during the negotiations with the Boer government in 1899, strongly supported Sir Alfred Milner; and under him the *Daily News*, as an exponent of Lord Rosebery's Liberal Imperialism, gave no countenance to the pro-Boer views of some of the more active members of the Liberal party. In 1901, however, the proprietary changed, and Mr George Cadbury became chief owner of the paper. Mr E. T. Cook, who had shown brilliant ability as a publicist, but whose views on the Boer War were not shared by the new proprietor, retired, subsequently joining the staff of the *Daily Chronicle*; the journal then became an organ of the anti-imperialist section of the Liberal party. Mr A. G. Gardiner became editor in 1902; and in 1904 considerable changes were made in the style of the paper, which was reduced in price to a halfpenny. The influence of Mr Cadbury, and of the group of Quaker families—largely associated with the manufacture of cocoa—who followed his example in promoting the publication of Liberal and Free Trade newspapers, led in later years to somewhat violent attacks from political opponents on the so-called "Cocoa Press," with the *Daily News* at its head.

"Daily News."

The first number of the *Daily Telegraph* was published on 29th June 1855, as a twopenny newspaper. Its proprietor was Colonel Sleigh. This gentleman soon found himself in pecuniary straits, and in satisfaction of the debt for the printing of the paper it was transferred to Mr Joseph Moses Levy in the following September. On 17th September Mr Levy published it as a four-paged penny journal, the first penny newspaper produced in London. His son, afterwards Sir Edward Lawson (b. 1833), who was created Baron Burnham in 1904, immediately entered the office, and after a short time became editor, a post which he only abandoned in 1885, when he became managing proprietor and sole director. From the outset Mr Levy gathered round him a staff of high literary skill and reputation. Among the first were Thornton Hunt, Geoffrey Prowse, George Hooper and Sir Edwin Arnold. E. L. Blanchard was among the earliest of the dramatic critics, and Alexander Harper the City editor. Later there came George Augustus Sala (*q.v.*), then one of Charles Dickens's young men; Clement Scott (1841–1904), at one time a clerk in the War Office; and Edward Dicey (b. 1832), then fresh from Cambridge. The Hon. Frank Lawley turned to journalism from official life; and among the most remarkable of the early contributors to the paper was J. P. Benjamin, the great Anglo-American lawyer. H. D. Traill was a leader-writer for well-nigh a quarter of a century. J. M. Le Sage (b. 1837), for many years the managing editor, began his connexion with the paper under Mr Levy. Others prominently associated with the paper have been W. L. Courtney (b. 1850), a distinguished man of letters who, after several years of work as tutor at New College, Oxford, joined the staff in 1890, and in 1894 also became editor of the *Fortnightly Review*; E. B. Iwan-Müller (d. 1910) and J. L. Garvin (from 1899), afterwards (1904) editor of the *Observer*. After 1890 Mr H. W. L. Lawson, Lord Burnham's eldest son and heir, assisted his father in the general control of the paper.

"Daily Telegraph."

The *Daily Telegraph* may be said to have led the way in London journalism in capturing a large and important reading-public from the monopoly of *The Times*. It became the great organ of the middle classes, and was distinguished for its enterprise in many fields. In June 1873 the *Telegraph* despatched George Smith to carry out a series of archaeological researches in Nineveh, which resulted in the discovery of the missing fragments of the cuneiform account of the Deluge, and many other inscriptions. In co-operation with the *New York Herald* it equipped H. M. Stanley's second great expedition to Central Africa (1875–1877). Another geographical feat with which the name of the *Daily Telegraph* is associated was the exploration of Kilimanjaro (1884–1885) by Mr (afterwards Sir) Harry Johnston, whose account of his work appeared in the *Daily Telegraph* during 1885. And Mr Lionel Decle's march from the Cape to Cairo, in 1899 and 1900, was also undertaken under the auspices of the paper. The *Telegraph* raised many large funds for public purposes. Almost the first was the subscription for the relief of the sufferers by the cotton famine in Lancashire, in the winter of 1862–1863; the fund in aid of the starving and impoverished people of Paris at the close of the siege in 1871; the prince of Wales's Hospital Fund in commemoration of the Jubilee of 1897; and the Shilling Fund for the soldiers' widows and orphans in connexion with the Boer War. An undertaking of a more festive kind was the fête given to 30,000 London school children in Hyde Park on the occasion of Queen Victoria's Jubilee in 1887.

In politics the *Daily Telegraph* was consistently Liberal up to 1878, when it opposed Mr Gladstone's foreign policy as explained in his Midlothian speeches. After 1886 it represented Unionist opinions. Among special feats of which it can boast was the first news brought to England of the conclusion of peace after the Franco-German War.

Prior to 1874 the *Daily Telegraph* was printed by eight- and ten-feeder machines, through which every sheet had to be passed twice to complete the impression. Under these conditions it was necessary to start printing one side of the paper as early as ten or eleven o'clock. The handicap which this imposed on the satisfactory production of a newspaper was removed by the introduction of Hoe's web machines at the end of 1874. No further change took place until 1891, when they were superseded by others built by the same makers capable of printing a 12-page paper at the rate of about 24,000 an hour, cut, folded, delivered and counted in quires. In 1896 they were modified so as to be suitable for turning out an 8-, 10-, 12-, 14- or 16-page paper. Up to 1894 the setting of type had been done entirely by hand, but in that year the linotype, after an experimental trial, was introduced on a large scale.

The *Standard* was established as an evening paper in the Tory interest (as the express organ of the opponents of the measure for removing Roman Catholic disabilities) in 1827, its first editor being Stanley Lees Giffard, father of the first earl of Halsbury, who had Alaric Watts and Dr William Maginn, famous as one of the originators of *Fraser's Magazine*, as his chief helpers. In the course of two or three years it became a pecuniary, as it had from the first been a political, success, and gradually ousted the *Courier*, which was for a time conducted by William Mudford, whose son half a century later became the most distinguished editor of the *Standard*. In course of time the latter became the property of Mr Charles Baldwin, whose father was proprietor of the *Morning Herald*, and when the father died the son found himself in possession of both a morning and an evening journal. In his hands neither of them prospered, although the *Standard* retained a large circulation and constantly printed early and accurate political information. At length, midway in the 'fifties, both papers were purchased by Mr James Johnstone, Mr John Maxwell, the publisher, being for a time associated with him in the ownership. Mr Johnstone realized that he had before him a great opportunity, and at once set to work to grasp it. He brought out the *Standard* as a morning paper (29th June 1857), increased its size from four to eight pages, and reduced the price from fourpence to twopence. One of the most curious features of the early numbers was a novel by William Howard Russell. The evening edition was continued. In February 1858 Mr Johnstone again reduced the price, this time to a penny. When that step was taken the *Standard* announced that its politics were "enlightened amelioration and progress," but that it was "bound to no party"; and to those independent lines it in the main adhered. In the course of four or five years it became a financial success, and then began to attract to itself many brilliant pens, one of its contributors in the 'sixties, Lord Robert Cecil, being destined to become illustrious as marquess of Salisbury. Lord Robert was an occasional leader-writer, whose contributions were confined almost entirely to political subjects. It was at this time that the *Standard* laid the foundation of the great reputation for early and detailed foreign news which it has ever since enjoyed. During the American Civil War it obtained the services of a representative signing himself "Manhattan," whose vivid and forcible letters from the battlefield arrested attention from the beginning. As the campaign progressed, these full, picturesque and accurate accounts of the most terrible struggle of modern times were looked for with eager interest. There were no "special cables" to discount the poignant curiosity of the reader, and the paper reached a circulation far beyond anything hitherto known. The distinction thus acquired was maintained during the Prussian-Austrian War of 1866, and greatly increased by the letters and telegrams describing the triumphs and disasters of the campaign of 1870. In the early 'sixties the staff had been reinforced by the engagement of Mr William Heseltine Mudford. In the midst of his work as a parliamentary reporter, he was sent as special correspondent to Jamaica in 1865 to report upon the troubles which involved the recall of Governor Eyre; a further period in the gallery of the House of Commons followed, and in 1873 Mr Mudford became business manager. Mr Johnstone's first editor was Captain Hamber, who afterwards acceded to the short-lived *Hour*, with whom had been associated Mr David Morier Evans as manager. He was succeeded by the owner's eldest son, to whom Mr (afterwards Sir) John Gorst was joined in a consultative capacity. In 1876 Mr Mudford became editor, still, however, retaining managerial control. Mr Johnstone, the proprietor to whose energy and perspicacity the paper owed so much, died in 1878, and under his will Mr Mudford was appointed editor and manager for life, or until resignation. Already a great property, the *Standard* in Mr Mudford's hands entered upon a very successful period. He had for his first assistant-editor Mr Gilbert Venables, who was succeeded after a short term by Mr George Byron Curtis, previously one of the leader-writers, who thus held the position through nearly the whole of Mr Mudford's long editorship. The staff at this time comprised many men, and some women, whose names are distinguished in letters as well as in journalism. Mr Alfred Austin, Mr T. H. S. Escott, Miss Frances Power Cobbe and Professor Palmer were all writing for the paper at the same time. To them must be added, among others, Mr E. D. J. Wilson, the brilliant political leader-writer (afterwards of *The Times*), Mr Percy Greg, son of "Cassandra" Greg, Mr T. E. Kebbel and Dr Robert Brown, who wrote copiously upon scientific and miscellaneous subjects. Foremost among the war correspondents were Mr G. A. Henty, who represented the paper on many a stricken field; Mr John A. Cameron, who was killed at Abu Klea; and Mr William Maxwell. In January 1900 Mr Mudford retired, and was succeeded in the editorship by Mr G. Byron Curtis (d. 1907), Mr S. H. Jeyes, whose connexion with the paper had begun in 1891, becoming assistant-editor. In November 1904 the *Standard*, which had at that time taken rather a strong line in deprecating the tariff reform movement within the Unionist party, was sold to Mr C. Arthur Pearson (proprietor of the *Daily Express*, see below), who was chairman of the Tariff Reform League, and considerable changes were made in the paper, Mr H. A. Gwynne becoming editor. In 1910 Mr Pearson, owing to ill-health, transferred his interests in the proprietary company he had formed in 1904 to Mr Davison Dalziel.

The Standard.

The *Daily Chronicle* arose, as already mentioned, out of the local *Clerkenwell News*, the latter paper having been purchased by Mr Edward Lloyd in 1877, and converted into "an Imperial morning paper" on independent Liberal lines. Under the editorship of Mr R. Whelan Boyle the *Daily Chronicle* soon took rank among the other London daily journals, the only traces of its original character being shown in the attention paid to metropolitan affairs and the appearance of numerous small advertisements. The independent tone of the journal was conspicuous in its treatment of the Home Rule question. At first deprecating the system of combined agitation and outrage with which the term was synonymous, the *Daily Chronicle*, under the editorship of Mr A. E. Fletcher (1890–1895), ceased to be a Unionist journal, and supported Mr Gladstone's Bill of 1893. Another instance was afforded in the course of the Boer War. During the negotiations and the early stages of the campaign, the *Daily Chronicle*, which was then edited by Mr H. W. Massingham (b. 1860), strove for peace by supporting the Boer side against the diplomacy of Mr Chamberlain. Mr Massingham's policy was, however, not to the liking of the proprietors, and he retired from the editorship towards the end of 1899, Mr W. J. Fisher succeeding him as editor. In 1904 Mr Robert Donald became editor, and the price was reduced to a halfpenny. Mr Massingham during his editorship, ably seconded by Mr (afterwards Sir) Henry Norman (b. 1858), had largely increased the interest of the paper, particularly on its literary side. A new impetus had been given in this direction in 1891, when a "literary page" was started, conducted at first by Mr J. A. Manson, and after 1892 by Mr Massingham, when he became assistant-editor under Mr Fletcher. The *Chronicle* had taken a leading part in many public movements since 1877. It was conspicuous in its advocacy of the cause of the men in the London dock strike of 1889; and in the great mining dispute for a "living wage," which was brought to a close by Lord Rosebery in November 1893, raised over £13,000 for the relief committees. Much attention was given to the theosophical discussion of 1891 and to the exposure of the adventurer "De Rougemont" after he had appeared before the British Association at Bristol in 1898. The *Chronicle* took an active part in the negotiations which led to the Venezuelan Arbitration Treaty of 1897; it energetically pleaded the cause of the Armenians and Cretans during the massacres of 1896, and it encouraged the Greeks in the war with Turkey in 1897. Its foreign policy was, however, more distinguished by goodwill than by discretion—and notably in the latter instance. The *Chronicle* also worked strenuously for the Progressive cause in London in regard to the County Council, Borough Councils and the School Board. Its new successes included the first announcement of the revolution in eastern Rumelia (1885); the first circumstantial account of the death of Prince Rudolph (1889); Nansen's own narrative of his expedition towards the North Pole; Sir Martin Conway's journey across Spitzbergen in 1896; and the first ascent of Aconcagua in 1897.

Daily Chronicle.

In 1890 the illustrated morning daily paper, the *Daily Graphic*, was founded by W. L. Thomas (1830–1901) as an offshoot from the weekly illustrated *Graphic*, and soon came into favour.

Daily Graphic.

In 1906 a new Liberal morning daily was started by Mr Franklin Thomason in the shape of the *Tribune*, edited by Mr W. Hill, who retired after a few months, with Mr L. T. Hobhouse as political editor. Later Mr Pryor became managing editor, but at the beginning of 1908, after heavy losses, the publication was stopped.

Tribune.

Two morning papers, at the popular price of halfpenny, appeared in the spring of 1892, the *Morning* and the *Morning Leader*. They raced for priority of publication, the former winning by a day. The *Morning Leader*, under the same management as the (evening) *Star*, continued to flourish, but the *Morning* had but a brief career.

Morning Leader.

The halfpenny *Daily Mail* was originated by Mr Alfred Charles Harmsworth (b. 1865), who was subsequently created a baronet (1904) and in 1905 a peer as Baron Northcliffe; it appeared in 1896, on the same day as Sir G. Newnes's penny *Courier* (which only lasted a few weeks). In the evolution of English journalism the foundation of the *Daily Mail* carried still farther the work begun by the *Daily Telegraph* in earlier days. It was the first halfpenny morning newspaper to place at the disposal of its readers a news service competing with that of any of the higher-priced newspapers, and soon took an increasingly important place in the Press. At the opening of the 20th century it claimed a regular circulation of about a million copies daily (and had occasionally sold as many as 1,500,000 copies of a single issue), and it was produced simultaneously in London and Manchester, the whole of the contents being telegraphed nightly. In May 1904 it began publishing a continental edition in Paris. The sensational success of the *Daily Mail*, which first made Lord Northcliffe one of the dominant personalities in English journalism, was due, not to individual writers, but to a consistent policy of catering for a modern public and serving them with lively news and articles, and constant change of interest. Its large circulation, and resulting advertising revenue, gave it an influence which in politics was used on the Unionist side; but the readers of the *Daily Mail* went to it, not for politics, but for news, brightly and briefly displayed. Its triumph represented the

Daily Mail.

success of a business organization, in which individual views on affairs played a comparatively minor part.

Daily Express.

The halfpenny *Daily Express*, founded by Mr Cyril Arthur Pearson (b. 1866) on the lines of the *Daily Mail*, first appeared in 1900, and soon won a large clientèle. With R. D. Blumenfeld as editor (from 1904) it worked strenuously for Tariff Reform.

Daily Mirror.

The *Daily Mirror*, started by Mr Harmsworth as a women's penny daily in 1904, failed to attract in its original form and was quickly changed into a halfpenny general daily, relying as a novelty on the presentation of news by photographic pictures of current events. This new feature soon obtained for it a large circulation under the enterprising management of Mr Kennedy Jones (b. 1865), who was already known for his successful conduct of the *Evening News* and his share in the business of the *Daily Mail*.

Globe.

The *Globe* (founded Jan. 1st., 1803), the oldest of existing London evening papers, owed its origin to the desire of the booksellers or publishers of the day for an advertising medium, at a moment when the *Morning Post* gave them the cold shoulder. A syndicate of publishers started a morning paper, the *British Press* (which had only a short career), to combat the *Post*, and the *Globe* as a rival to the *Courier* (see above), which, like the *Post*, was under Daniel Stuart's control. George Lane, previously Stuart's chief assistant, was the editor. From 1815 a prominent member of the staff was Mr (afterwards vice-chancellor Sir James) Bacon. After swallowing up some other journals, in 1823 it absorbed the property and title of the *Traveller*, controlled by Colonel Torrens, who in the reorganization became principal proprietor and brought over Walter Coulson as the editor. John Wilson succeeded as editor in 1834, efficiently seconded by Mr Moran; Thomas Love Peacock and R. H. Barham ("Ingoldsby") being famous contributors during his regime. For some time the *Globe* was the principal Whig organ, and Mr (afterwards Deputy Judge Advocate Sir James) O'Dowd its political inspirer. Mahony ("Father Prout") was its Paris correspondent. In 1842 the *Courier* was incorporated, but a gradual decline in the fortunes of the paper, and Colonel Torrens's death in 1864, brought about a reorganization in 1866, when a small Conservative syndicate, including Sir Stafford Northcote, bought it and converted the *Globe* into a Conservative organ. In 1868 the pink colour since associated with the paper was started. In 1869 its price (originally sixpence) was lowered to a penny. Mr W. T. Madge (b. 1845), whose vigorous management was afterwards so valuable, and who in 1881 started with Captain Armstrong the *People*, a popular Sunday journal for the masses, joined the paper in 1866; and after brief periods of editorship by Messrs Westcomb, R. H. Patterson, H. N. Barnett and Marwood Tucker (1868), in 1871 Captain George C. H. Armstrong (1836–1907), who in 1892 was created a baronet, was put in control; he edited the paper for some years, and then it became his property. The editorial chair was filled in succession by Mr Ponsonby Ogle, Mr Algernon Locker (1891), and the proprietor's son and heir Lieut. G. E. Armstrong, R.N. (1895), until in June 1907, after Sir G. Armstrong's death, the paper was sold to Mr Hildebrand Harmsworth. The *Globe* "Turnovers" (miscellaneous articles, turning over from the first to the second page) began in 1871, and became famous for variety and humour. The jocular "By the Way" column, another characteristic feature, was started in 1881, and owed much to Mr Kay Robinson and Mr C. L. Graves. In the history of the *Globe* one of the best-known incidents is its publication of the Salisbury-Schuvaloff treaty of 1878. It was the first London daily to use the linotype composing-machine (1892).

Pall Mall Gazette.

A new period of evening journalism, characteristic of the later 19th century, opened with the founding of the *Pall Mall Gazette*. The first number (at twopence) was issued on 7th February 1865 from Salisbury Street, Strand. Mr George Smith, of the publishing firm of Smith and Elder, was its first proprietor; Mr Frederick Greenwood (*q.v.*), its first editor, took the *Anti-Jacobin* for his model; the paper was intended to realize Thackeray's picture (in *Pendennis*) of one "written by gentlemen for gentlemen." Its political attitude was to be independent, and much space was to be given to literature and non-political matter. It had brilliant supporters, such as Sir J. Fitzjames Stephen as writer of leading articles (replaced to a certain extent, after 1869, by Sir Henry Maine), R. H. Hutton, Matthew James Higgins ("Jacob Omnium"), James Hannay, and George Henry Lewes, with George Eliot, Anthony Trollope, Charles Reade, and Thomas Hughes as occasional contributors; but the paper failed to attract the general public until, in the following year, Mr Greenwood's brother, James, furnished it with three articles on "A Night in a Workhouse: by an Amateur Casual." A morning edition had already been tried and dropped, and so was a distinct morning paper attempted in 1870. In 1867 new premises were taken in Northumberland Street, Strand. Three years later the *Pall Mall Gazette* was the first to announce the surrender of Napoleon III. at Sedan. Matthew Arnold contributed his famous "Arminius" letters ("Friendship's Garland") in 1871, and Richard Jefferies contributed "The Gamekeeper at Home" in 1876 and onwards. Mr Greenwood made the paper unflinchingly Conservative and strongly adherent to Lord Beaconsfield's foreign policy. In 1880, however, Mr Smith handed over the *Pall Mall Gazette* to his son-in-law, Mr Henry Yates Thompson, who turned it into a Liberal journal. Mr Greenwood then retired from the editorship and shortly afterwards started the *St James's Gazette*; Mr John (afterwards Viscount) Morley became editor of the *Pall Mall*, with Mr W. T. Stead (b. 1849) as assistant-editor. The price was reduced in 1882 to one penny. Many of the old contributors remained, and they were reinforced by Robert Louis Stevenson, who wrote some "Letters from Davos," Professor Tyndall, Professor Freeman, James Payn and Mrs Humphry Ward. When Mr Morley exchanged journalism for politics in 1883, he was succeeded by Mr W. T. Stead (*q.v.*), with Mr Alfred Milner, afterwards Lord Milner, as his assistant. Adopting an adventurous policy, Mr Stead imported the "interview" from America, and a report of General Gordon's opinion was believed to have been the cause of his ill-fated mission to Khartum. A series of articles called "The Truth about the Navy" (1884) had considerable influence in causing the Admiralty to lay down more ships next year. But Mr Stead's career as the editor came to an end in 1889, in consequence of his publishing a series of articles called "The Maiden Tribute of Modern Babylon," purporting to further the Criminal Law Amendment Bill. Mr Stead had made a feature of reprints called "extras"; and, edited by Mr Charles Morley, the *Pall Mall Budget* became an illustrated weekly. Mr Stead was replaced in 1889 by E. T. Cook, who had become assistant-editor in succession to Milner. The *Pall Mall Gazette* was now steadily Liberal and a strong advocate of Irish Home Rule. On its staff were Edmund Garrett (a gifted writer who became editor of the *Cape Times* in South Africa, and died prematurely in 1907), F. C. Gould the caricaturist, and J. Alfred Spender (b. 1862). Mr Cook resigned in 1892, on the sale of the paper to Mr William Waldorf Astor, the American millionaire, who turned it again into a Conservative organ, and also changed its shape, abandoning the old small pages for a larger sheet; and he and his assistant Mr Spender continued the Liberalism of the *Pall Mall* in the *Westminster Gazette* (see below). Mr Henry Cust, M.P., was appointed editor, with Mr E. B. Iwan-Müller as assistant-editor. Mr Cust (b. 1861), who was Lord Brownlow's heir, and came fresh to editorship with enthusiasms acquired from his experiences in parliament and in society, made the columns of the *Pall Mall* very lively for the next couple of years. It became well known for its "booms," and its "smartness" generally. Some papers contributed to it by Sir Charles Dilke and Mr Spenser Wilkinson resulted in the establishment of the Navy League in 1894. The paper had, too, the first news of Mr Gladstone's resignation and the appointment of Lord Rosebery to succeed him. But though the *Pall Mall* under Mr Cust had outshone all its competitors, its independence of those business considerations which ultimately appeal to most proprietors hardly represented a durable state of affairs; and eventually the relations between proprietor and editor became strained. In February 1896 Mr Cust and Mr Iwan-Müller were succeeded respectively by Sir Douglas Straight and Mr Lloyd Sanders, the latter of whom retired in 1902. Sir Douglas Straight (b. 1844) had been in early days a well-known London barrister, and from 1879 to 1892 was a judge in India. Sir Douglas Straight remained editor till the end of 1908, when he was succeeded by Mr Higginbottom.

The St James's Gazette.

Founded in 1880 by Mr H. Hucks Gibbs (afterwards Lord Aldenham), for Mr Frederick Greenwood to edit when he had left the *Pall Mall*, the *St James's Gazette* represented the more intellectual and literary side of Tory journalism in opposition to the new Liberalism of Mr Greenwood's former organ; it was in fact meant to carry on the idea of the original *Pall Mall* as Mr Greenwood had conceived it, and was (like it) more of a daily review than a chronicle of news. In 1888 the paper having then been sold to Mr E. Steinkopff, Mr Greenwood retired and was succeeded as editor (1888–1897) by Mr Sidney Low, subsequently author of *The Governance of England* and other able works, who had as his chief assistant-editors Mr S. H. Jeyes (till 1891), and Mr Hugh Chisholm (1892–1897), the latter succeeding him as editor (1897–1900). In those days mere news was not considered the important feature; or rather, original and sagacious views were identified with a sort of novelty such a paper could best promulgate. The *St James's* was for many years conspicuous for its literary character, and for the number of distinguished literary men who wrote for it, some of whom first became known to the public by means of its columns. Its interest in newspaper history is really that of a paper which appealed to and influenced a comparatively small circle of cultured readers, a "superior" function more and more difficult to reconcile with business considerations. It was one of the earliest supporters of the Imperialist movement, and between 1895 and 1899 was the chief advocate in the Press of resistance to the foreign bounties on sugar which were ruining the West Indies, thus giving an early impetus to the movement for Tariff Reform and Colonial Preference. During the years immediately following 1892, when the *Pall Mall Gazette* again became Conservative, the competition between Conservative evening papers became acute, because the *Globe* and *Evening Standard* were also penny Conservative journals; and it was increasingly difficult to carry on the *St James's* on its old lines so as to secure a profit to the proprietor; by degrees modifications were made in the general character of the paper, with a view to its containing more news and less purely literary matter. But it retained its original shape; with sixteen (after 1897, twenty) small pages, a form which the

Pall Mall abandoned in 1892. Gradually these changes took effect. In 1900 Mr Theodore Andrea Cook, who had been assistant-editor since 1898, became editor for a brief period, and subsequently Mr Ronald MacNeill (till 1903) acted in this capacity, with Mr W. D. Ross as manager. Meanwhile the *St James's Budget*, which up to 1893 had been a weekly edition of the *Gazette*, was turned into an independent illustrated weekly, edited from the same office by Mr J. Penderel-Brodhurst (afterwards editor of the *Guardian*), who had been on the editorial staff since 1888; and it continued to be published till 1899. In 1903 the *St James's* was sold to Mr C. Arthur Pearson, who in 1905, having bought the morning *Standard*, amalgamated the *St James's* with the *Evening Standard*.

Evening Standard.

The *Evening Standard* had been founded in 1827 (see under the *Standard* above), and when it was amalgamated with the *St James's Gazette* in 1905, the two titles covered a new paper, in a new form, as the penny *Evening Standard and St James's Gazette*.

The Westminster Gazette.

When the *Pall Mall Gazette* was sold to Mr Astor in 1892 and converted into a Conservative organ, Mr E. T. Cook, the editor, and most of his staff, resigned, and in 1893 they came together again on the *Westminster Gazette*, newly started for the purpose by Sir G. Newnes (who had made a fortune out of *Tit-bits* and other popular papers) as a penny Liberal evening paper. It was printed on green paper, but the novelty of this soon wore off. The paper was conducted on the lines of the old *Pall Mall*, and it had the advantage of a brilliant political cartoonist in F. Carruthers Gould. In 1895 Mr Cook was appointed editor of the *Daily News*, and his place was ably filled by Mr J. Alfred Spender, who had been his assistant-editor, Mr Gould (who was knighted in 1906) being his chief assistant. Apart from Sir F. C. Gould's cartoons, the *Westminster* became conspicuous in London evening journalism for its high standard of judicious political and literary criticism. It gradually became the chief organ of Liberal thought in London. One of its early literary successes was the original publication of Mr Anthony Hope's *Dolly Dialogues*, and it continued to maintain, more than any other evening paper, the older literary and political tradition of the "gentlemanly journalism" out of which it had sprung. In 1908 a change of proprietorship took place, the paper being sold by Sir G. Newnes (d. 1910) to Mr (afterwards Sir) Alfred Mond, but without affecting the *personnel* or policy of the paper.

Halfpenny Evening Papers.

The first modern English evening newspaper to be issued at a half-penny was the *London Evening News*—afterwards known as the *Day*. It was started in 1855, but soon failed to meet expenses and disappeared from the scene. In 1868 appeared the London *Echo*, published by Henry Cassell. It had for its first editor, until 1875, Mr (afterwards Sir) Arthur Arnold (1833–1902), afterwards M.P. for Salford (1880–1886) and chairman of the London County Council (1895–1896), who was well known both as a writer and traveller and as founder of the Free Land League (1885). Baron Albert Grant (1830–1899), the pioneer of modern mammoth company-promoting,[1] afterwards took the *Echo* in hand and wasted a fortune over it; and eventually it was owned for some years by Mr Passmore Edwards, coming to an end in 1905. The *Evening News* was begun at a halfpenny in 1881 as a Liberal organ, but was shortly afterwards bought by a Conservative syndicate. It saw stormy times, and at the end of thirteen years it had absorbed £298,000 and was heavily in debt. Its shares could then be purchased for threepence or fourpence each. In August 1894 it was purchased by Messrs Harmsworth for £25,000, and under Mr Kennedy Jones's management developed into a highly successful property. On 17th January 1888 the first number of the *Star* appeared, under the editorship of Mr T. P. O'Connor (b. 1848), as a half penny evening newspaper in support of Mr. Gladstone's policy. When Mr O'Connor left the paper, Mr H. W. Massingham became its editor, and subsequently Mr Ernest Parke. In 1909 the *Star* was acquired by a new proprietorship in which Messrs Cadbury and the *Daily News* had an important share. From the first it was conspicuous for its advanced attitude in politics, and also for excellent literary criticism. In 1893 Mr T. P. O'Connor founded the *Sun*, which eventually passed into the hands of a succession of proprietors and came to an end in October 1906.

Sporting and financial dailies.

As regards the purely sporting press in London, *Sporting Life*, started in 1859, became a daily in 1883, and in 1886 incorporated the old *Bell's Life*. The daily *Sportsman*, the leading paper, was founded in 1865. The financial daily press is a modern creation and has taken many shapes; the *Financier* was the first regular daily, but in 1884 the *Financial News*, under Mr H. H. Marks, made its appearance, and in 1888 the *Financial Times*; and these became the leading papers of their class.

London weekly newspapers.

The London weekly press (see also under Periodicals) has always worn a motley garb. Weekly publication facilitates the individuality of a journal, both as respects its editorship and as respects the class of readers to which it more especially addresses itself. From the days of Daniel Defoe there have always been newspapers bearing the unmistakable impress of an individual and powerful mind. Cobbett's *Weekly Register* affords perhaps as striking an illustration of journalism in its greatness and in its meanness as could be found throughout its entire annals. And Cobbett's paper has had many successors, some of which, profiting by the marvellous mechanical appliances of the present day, have attained a far wider popular influence than was possessed by the *Weekly Register* in its most prosperous days.

Spectator and Saturday Review

The history of the weekly reviews practically begins with the *Examiner*, which was founded in 1808 and had a long career as one of the most prominent organs of the Liberals, ending in 1881. That its literary reputation was great resulted naturally from a succession of such editors as Leigh Hunt, Albany Fonblanque, John Forster and Henry Morley. This was succeeded in January 1817 by the foundation of the *Literary Gazette*, the proprietor of which was Henry Colburn and the first editor William Jerdan. Jerdan succeeded in inducing Crabbe and Campbell to contribute to it, and among those who assisted him were Bulwer Lytton, Barry Cornwall and Mrs Hemans. The *Literary Gazette* came to an end in 1862. At the end of 1820 Theodore Hook founded *John Bull*, which for a time had extraordinary popularity; to it he contributed the most brilliant of his *jeux d'esprit*.

Epochs in the development of this form of literature were marked by the foundation of the *Athenaeum* by James Silk Buckingham in January 1828 and by that of the *Spectator* by Robert Stephen Rintoul later in the same year.

The *Spectator* was edited for thirty years by Robert Rintoul. In 1858 the latter sold the paper to Mr Scott, who retired, however, from the editorship after a few months; and for a time the *Spectator* was in low water. In 1861 it passed into the hands of R. H. Hutton (*q.v.*) and Meredith Townsend, and under them became a successful exponent of moderate Liberalism and thoughtful criticism, particularly in the discussion of religious problems, such as were uppermost in the days of the Metaphysical Society. The high character and literary reputation of the *Spectator* were already established when, in 1897, it passed into the hands of Mr J. St Loe Strachey (b. 1860), but under him it became a more powerful organ, if only because it more than maintained its position while the other weekly papers declined. Unionist in politics since 1886, the *Spectator* after 1903 was the leading organ of Free Trade Unionists who opposed tariff reform, until the progress of socialism and the extravagance of Mr Lloyd-George's budget in 1909 caused it to accept the full policy of the Unionist party in preference to the dangers of socialistic radicalism. No paper in London, it may well be said, has earned higher respect than the *Spectator*, or carried more weight in its criticisms, both on politics and on literature. This has not been on account of any special brilliance of the pyrotechnic order, but because of continuous sobriety and good sense and unimpeachable good faith.

The *Saturday Review*, on the other hand, is important historically rather for the brilliance of its "palmy days." First published on the 3rd of November 1855, it was founded by A. J. B. Beresford Hope (1820–1887), a brother-in-law of Lord Salisbury, M.P. for Maidstone and for Cambridge University, and a prominent churchman and art patron; with John Douglas Cook (1808–1868) as editor. Mr Hope was the son of James Hope (1770–1831), author of *Anastatius*; and it was reputed that Douglas Cook was "Anastatius" Hope's natural son. For several years the *Saturday* maintained an exceptional position in London journalism. On the political side it was at first Peelite, but the strong churchmanship of Mr Beresford Hope and antagonism to Mr Gladstone did much to bring it round to a pronounced Conservative view. Most, though not all, of its early staff had already worked under Mr Cook, when he was editor of the *Morning Chronicle* (from 1848 to 1854). In its literary comment it gave much space to articles of pure criticism and scholarship, and almost every writer of contemporary note on the Tory side contributed to its columns. But the matter which did most to give it its peculiar character was found in its outspoken or even sensational "middles"—"The Frisky Matron," "The Girl of the Period" (by Mrs Lynn Linton), "The Birch in the Boudoir," &c. The editorship remained in the hands of Mr Cook till his death in 1868. In 1861 a secession from the *Saturday* lasting till 1863, led to the temporary brilliance of the *London Review* (1860–1868), started by Charles Mackay. Douglas Cook was succeeded by Philip Harwood (1809–1887), who had followed him from the *Morning Chronicle* and under whom Mr Andrew Lang became a contributor, with others of note. Mr Harwood retired in 1883, and was succeeded by his former assistant Mr Walter Herries Pollock, under whom the paper underwent some modifications in form to meet changes in the public taste; Mr G. Saintsbury and Mr H. D. Traill were then prominent members of the staff, and Mr Frederick Greenwood wrote for the paper till he started the *Anti-Jacobin*. In 1894 the *Saturday Review*

[1] Albert Grant, who took that name though his father's was Gottheimer, was given the title of baron by King Victor Emmanuel of Italy in 1868 for his services in connexion with the Milan picture gallery. He made a large fortune by company-promoting, and in 1865 became M.P. for Kidderminster. He became a prominent public character in London. In 1873 he built Kensington House, a vast mansion close to Kensington Palace, which in 1883 was demolished and the site seized by his creditors. In 1874 he bought up Leicester Square, converted it into a public garden, and presented it to the Metropolitan Board of Works. But soon afterwards he failed, and from 1876 to his death he constantly figured in the law-courts at the suit of his creditors.

was sold by the heirs of Mr Beresford Hope to Mr Lewis Edmunds, from whose hands it soon passed to Mr Frank Harris. In 1899 the paper was sold to Lord Hardwicke and came under the editorship of Mr Harold Hodge, who remained in this position when, after Lord Hardwicke's death in 1905, it passed into the hands of Mr Gervase Becket.

The *Saturday Review* and *Spectator*, as the exponents of brilliant Toryism and serious Liberalism, had the field practically to themselves for some years; but when in 1886 the *Spectator* followed the Liberal Unionists in opposing Home Rule for Ireland, and ceased to support Mr Gladstone, the result was the addition to London journalism of the Radical *Speaker* (1898); and in 1898 the threepenny *Outlook* (altered in price in 1905 to sixpence) was started, to present more particularly the growing interests of the Colonies and the Empire, a side further developed in 1905 and 1906 under the editorship of Mr J. L. Garvin (b. 1868) in its advocacy of Mr Chamberlain's policy of a preferential tariff, when the *Spectator* became aggressively Free Trade. In December 1906 the *Outlook* was sold by its proprietor, Mr C. S. Goldman, to Lord Iveagh, and Mr Garvin resigned the editorship. In 1907 the *Speaker* was incorporated with the *Nation*, a new Radical weekly, edited by H. W. Massingham. Several ambitious new weeklies meanwhile started, and some passed away before the end of the century, such as the *Realm*, the *British Review* and the *Review of the Week*. The most brilliant of all these, which also lasted the longest, was the *Scots* (soon renamed the *National*) *Observer* (1888–1897), edited at first by W. E. Henley (*q.v.*), and subsequently by J. E. Vincent (d. 1909). Mr Henley, assisted by Mr Charles Whibley, collected a band of clever young writers, who formed almost a "school" of literary journalism, and many of whom won their spurs in literature by their contributions to this paper. The *Pilot* (1900) under Mr D. C. Lathbury was another brilliant attempt, but it failed to pay its way and hardly lasted for three years.

Among purely literary weeklies the *Athenaeum* found a rival in the *Academy*, founded in October 1869 by Dr Appleton and edited by him. Later, under the editorship of J. S. Cotton, it was famous for its signed reviews and scholarly character; but the small circle to whom pure literature appealed made financial success difficult. In 1896 the *Academy* was bought by Mr Morgan Richards, and for some years was edited by Mr Lewis Hind, amalgamating *Literature* (a weekly which had been started by *The Times*) in 1901; and subsequently under changed proprietors it was successively edited by Mr Teignmouth Shore and Mr Anderson Graham. In April 1907 it was bought from Sir G. Newnes by Sir Edward Tennant, and subsequently passed under the control of Lord Alfred Douglas, who in 1910 parted with it to a new proprietary.

The publication of Sunday editions of the daily papers has not found the same favour in England as in the United States. In 1899 a Sunday *Daily Mail* and a Sunday *Daily Telegraph* appeared simultaneously; but public opinion was so violent against seven-day journalism that both were withdrawn. The oldest of the Sunday papers, the *Observer* (1791), was conducted by one editor, Mr Doxat, for more than fifty years. It was one of the first papers to contain illustrations. In later years Mr Edward Dicey was a notable editor. In 1905 the *Observer* passed into the hands of Lord Northcliffe, his first editor being Mr Austin Harrison, a son of Frederic Harrison. In 1907 Mr J. L. Garvin became editor, and under him the old influence of the *Observer* revived.

Sunday papers.

Lloyd's Weekly Newspaper started as an unstamped illustrated journal at a penny in September 1842. In 1843 it was enlarged in size, and the price raised to threepence. Curious ingenuity was shown in advertising it by all sorts of expedients. Amongst others, all the pennies its proprietor could lay his hands on were embossed, by a cleverly constructed machine, with the title and price of the new journal. *The Times* drew attention to this defacement of the coin of the realm, and so gave it a better advertisement still. From a weekly sale of 33,000 in 1848 it rose to 170,000 in 1861. In anticipation of the abolition of the paper duty, the price was then reduced to a penny, and its circulation continued to increase. In later years it had an able editor in Mr T. Catling. *Reynolds's Weekly Newspaper*, an extreme Radical paper with a large circulation, dates from May 1850. Other Sunday papers came later into existence—the *People* (1881), the *Sunday* (afterwards *Weekly*) *Sun* (1891), the *Sunday Special* (1897)— with which in 1904 was amalgamated the *Sunday Times* (1822). The *Referee* (1877), a paper with a strong sporting and theatrical interest, is famous for the humorous contributions by "Dagonet" (G. R. Sims) and the pungency of its miscellaneous articles.

Of the London illustrated weekly papers the oldest, the *Illustrated London News*, was founded in 1842; the *Graphic* in 1869; while the *Pictorial World*, which lasted for some years, began in 1874. In 1891 *Black and White* was started; and in 1892 the *Sketch*, edited by Mr Clement Shorter (also then editor of the *Illustrated London News*), introduced a lighter vein. Mr Shorter gave up the editorship of these two weeklies in 1901, and became editor of a new illustrated weekly, the *Sphere*, with the proprietorship of which came also to be associated the *Tatler*. Another new illustrated weekly of a high class, *Country Life Illustrated*, began in 1897.

Illustrated weekly papers.

The "Society" weeklies, *Truth* (1877), *Vanity Fair* (1868)—with a separate cartoon as a special feature, famous for the artistic work of Pellegrini, Leslie Ward and others—and the *World* (1874), brought a new "note" into regular journalism. Mr Edmund Yates's success with the *World* largely contributing to the increase of the personal style which he did so much to introduce; and *Truth* made its proprietor, the politician Mr Henry Labouchere, one of the most prominent men of the day, not so much for its aggressive Radicalism as for its vigorous exposures of all sorts of public charlatanry.

"Society" and other weeklies.

Among other weeklies, important ones are such ecclesiastical papers as the *Guardian* (1846), the *Record* (1828), the *Church Times* (1863), the *Tablet* (1840), *Christian World* (1857), *Methodist Times* (1885); the medical papers, the *Lancet* (1823) and *British Medical Journal*; the financial papers, the *Economist* (1843) and *Statist* (1878); and the great sporting and country-house paper, the *Field* (1853).

Among humorous papers *Punch* (1840) stands first (see CARICATURE,) of which (1895) Mr M. H. Spielmann published a *History*; *Fun* (1860–1901), Mr Harry Furniss's *Lika Joko* (1894, only for a few months), *Judy* (1867), *Moonshine* (1879) and *Pick-me-up* (1888), have also catered for popular gaiety.

Humorous papers.

The introduction of women into English journalism in any large degree was one of the new departures of the last quarter of the 19th century. It was indeed no new thing for women to write for the Press. Harriet Martineau was, in her day, one of the principal members of the *Daily News* staff, and Miss Frances Power Cobbe (1822–1905) the advocate of anti-vivisectionism, was an active journalist. Miss Flora Shaw (Lady Lugard), as writer of colonial topics for *The Times*, or Mrs Crawford, as Paris correspondent of the *Daily News*, are other notable instances of the prominence of women's work in the same spheres with the ablest men. But such cases as these were exceptional, in which something in the nature of a personal mission and a peculiar aptitude gave the impulse. Journalism as a profession for women came, however, to be widely resorted to, partly through its obvious recommendation in a day when women's education required an alternative outlet, for those who had to earn their living, to that of the teaching profession; partly, and *pari passu*, through the immense increase in women readers and the immensely increased publicity given in newspapers to matters of primarily feminine interest. In 1880 the only "ladies' paper" of any importance was the *Queen*, a weekly which dates from 1861. But subsequently a considerable number of new weeklies entered the field: notably the *Lady's Pictorial* (1880); the *Lady* (1885); *Woman* (1889); the *Gentlewoman* (1890), which owed its success to the vigorous management of Mr J. S. Wood; *Madame* (1895); and the *Ladies' Field* (1898). New monthlies also appeared, in the *Englishwoman*, the *Ladies' Realm* and the *Woman at Home*. The sphere of action of the lady journalist was soon by no means confined to the "ladies' papers," or to the writing of columns on dress or cookery for such general journals as found it useful to cultivate feminine readers; women invaded every other field of journalism, especially the large new field of "interviewing" and fashionable gossip. The increase in women-writers generally, novelists, dramatists, poets, reacted on their connexion with journalism; the increased "respectability" of journalism made it easier for them to work side by side with men; and gradually nobody thought the introduction of women into this sphere anything out of the common; a lady journalist, in fact, was much less remarkable than a lady doctor.

Women journalists.

British Provincial Press.

England and Wales.—Though the real development of English provincial journalism, as a power co-ordinate with that of London, only dates from the abolition of the stamp duty in 1855, many country newspapers before that time had been marked by literary ability and originality of character. The history of the provincial press of England begins in 1690 with the weekly *Worcester Postman* (now *Berrow's Worcester Journal*). The *Stamford Mercury* (1695; earliest known 1712; long known as *Lincoln, Rutland and Stamford Mercury*); *Norwich Postman*[1] (1706); *Nottingham Courant* (1710), afterwards renamed *Journal*; *Newcastle Courant* (1711); *Liverpool Courant* (1712; shortlived); *Hereford Journal* (1713); *Salisbury Postman* (1715); *Bristol Felix Farley's Journal* (1715; merged into the *Bristol Times* in 1735[2]); the *Canterbury Kentish Post* (1717; afterwards *Kentish Gazette*); *Leeds Mercury* (1717); *Exeter Mercury, Protestant Mercury*,[3] and *Postmaster or Loyal Mercury* (all 1718[3]); *York Mercury* (1718), and *Manchester Weekly Journal* (1719), came

[1] The *Norwich Postman*, a small quarto of meagre contents, was published at a penny, but its proprietor notified that "a halfpenny is not refused"! Within a few years Norwich also had its *Courant* (1712) and *Weekly Mercury* or *Protestant's Packet* (1720).

[2] Amalgamated with the *Bristol Mirror* (1773) in 1865 to form the *Daily Bristol Times and Mirror*.

[3] Exeter was then fiercely political. These three newspapers commented so freely on proceedings in parliament that their editors were summoned to appear at bar (*Journal of the House of Commons*, xix. 30, 43, 1718). The incident is curious as showing that each represented a rival MS. news-letter writer in London.

quickly afterwards; and other early papers worth mentioning were the *Salisbury Journal* (1729); *Manchester Gazette* (1730–1760); *Manchester Mercury* (1762–1830); the earliest Birmingham paper, *Aris's Gazette* (1741); the *Cambridge Chronicle* (1744); and the *Oxford Journal* (1753). Liverpool also boasted of the *Liverpool Advertiser* (1756) and *Gore's General Advertiser* (1765–1870). Of the above the *Leeds Mercury* (1717) became an increasingly important provincial organ. It was originally published weekly, and its price was three-halfpence. In 1729 it was reduced to four pages of larger size, and sold, with a stamp, at twopence. From 1755 to 1766 its publication was suspended, but was resumed in January 1767, under the management of James Bowley, who continued to conduct it for twenty-seven years, and raised it to a circulation of 3000. Its price at this time was fourpence. The increase of the stamp duty in 1797 altered its price to sixpence, and the circulation sank from 3000 to 800. It was purchased in 1801 by Edward Baines, who first began the insertion of "leaders," and whose family left an impress not only on journalism but on literature in the North of England. It took him three years to obtain a circulation of 1500; but the *Mercury* afterwards made rapid progress. When the Stamp Tax was removed, its price was reduced to a penny, and in 1901 to a halfpenny. For many years it admitted neither racing nor theatrical new to its columns, and it had a powerful moral and political influence in Lancashire and Yorkshire.

The abolition of the duty on advertisements in 1853, of the stamp duty in 1855, and of the paper duty in 1861, opened the way for a cheap press, and within ten years of the abolition of the paper duty penny morning newspapers had taken up commanding positions in Edinburgh, Glasgow, Dundee and Aberdeen; in Liverpool, Manchester, Leeds, Bradford, Newcastle and Sheffield; in Birmingham and Nottingham; in Bristol, Cardiff and Plymouth; and across St George's Channel in Dublin, Cork, Belfast and Waterford. As time went on, and increasingly after the 'seventies, provincial evening papers began to multiply. But any real importance as organs of opinion was still confined to only a few of the great penny provincial dailies, notably the *Yorkshire Post*, *Manchester Guardian*, *Birmingham Post* (1857), *Sheffield Telegraph* (associated with Sir W. Leng), *Liverpool Daily Post*, *Leeds Mercury* and *Western Morning News*; others too numerous to mention here were at the same time cradling journalists who were to become famous in a larger sphere, such as the *Darlington Northern Echo*, on which Mr W. T. Stead made his début, while Mr Joseph Cowen for some years made the Newcastle *Daily Chronicle* a powerful force.

The provincial journals began as strictly local organs. But even in 1870 it was beginning to be universally perceived that, though the influence of a newspaper depends upon the sagacity, sound judgment and courage of the editor, its success as a business enterprise rests mainly with the business manager. Managers demanded less localism, a wider range of news, prompter and fuller reports of all important events, longer parliamentary reports, parliamentary sketches, verbatim reports of speeches by statesmen of the first rank. In the early 'seventies such a thing as a full telegraphic report in a provincial morning newspaper of parliamentary proceedings, or of a speech by a leading statesman, was almost unheard of. The Press Association had been in existence a short time, but had not then covered the country with its organization. Reuter's foreign news service very briefly reported important events. Leading articles were written during the day. Between 1870 and 1880 a complete revolution was effected, as the result of the social and educational changes. Leader-writers began to discuss the latest topics. Newspapers that had been content to fill their columns with local news and clippings from London and distant provincial papers put such matter aside. Telegraphic news crushed it out. In February 1870 the government took over the telegraph system. The advantage of the change was immediately felt by newspapers and their readers. Leading English and Irish newspapers, following Scotland's lead, began to open offices in London, where Fleet Street soon began to be an open directory to the provincial press—English, Scottish and Irish. The Scottish and the leading Irish newspapers of necessity, the wealthiest and most enterprising English papers for convenience and advantage, engaged special wires. Others that were near enough to London to do so secured London news and advertisements by railway, and completed their news supply by a liberal use of the telegraph. Commercial news, both home and foreign, especially American, was expanded. The Press Association spread its news-collecting organization over the whole country, and was stimulated to activity by the rising opposition of the Central News. All this energy had its counterpart in the business side of the press. Rapid "perfecting" printing machines were introduced, and newspaper managers found themselves in possession of newspapers full of the latest news, and procurable in practically unlimited quantities. By the use of special trains and other organizations, circulation increased apace. The development of news agencies, and their universal employment, tended to produce sameness in the provincial press. From this fate the more enterprising journals saved themselves by special London letters, parliamentary sketches and other special contributions. In 1881 the reporters' gallery in the House of Commons was opened to some provincial newspapers, and these accordingly enjoyed new facilities for special effort and distinction. A more important matter, however, was the bombardment of Alexandria and the subsequent Egyptian War. The leading provincial newspapers had already emancipated themselves from localism, and in general news and criticism had risen almost, if not quite, to the average level of the first-class London journals. Now they were to step abroad into the field of war. Singly or in syndicates, or by arrangement with London journals, the leading provincial newspapers sent out war correspondents, and were able to record the history of events as promptly and fully as the metropolitan press. The first syndicate to send out war correspondents was formed by the *Glasgow News*, the *Liverpool Daily Post*, *Manchester Courier*, *Birmingham Gazette* and *Western Morning News*, who despatched two correspondents to Egypt, and the new departure was attended with complete success. The Central News also sent out war correspondents to Egypt and the Sudan. During the South African War (1899–1902) the Press Association, in conjunction with Reuter's Agency, employed correspondents, as well as the Central News. The leading provincial newspapers, however, all formed syndicates amongst themselves to secure war telegrams, and in many cases made arrangements for the simultaneous publication of the letters and telegrams of leading London journals. This system of securing simultaneous publication, in provincial newspapers, of special contributions to London morning newspapers was afterwards still further extended, and articles of exceptional interest that have been specially prepared for London journals may now be found on the same day in some of the leading provincial newspapers.

By the beginning of 1880 the country had fallen upon a period of low prices, and extra expenditure upon war telegrams and on an improved supply of general news was to a considerable extent balanced by the reduced cost of paper. A list compiled at the commencement of 1902 gave the names of eighty-seven halfpenny daily newspapers published in English provincial towns, a considerable number of these being morning journals. Of these, sixty-two had been issued since 1870, those bearing earlier dates of origin being in most cases sheets which formerly were issued at a penny or more, but had subsequently reduced their prices. Of the sixty-two that were issued since 1870, twenty-seven appeared between 1871 and 1882, nineteen between 1882 and 1892 and sixteen between 1892 and 1902. Under the stimulus of cheapness the news-sheet was enlarged. More advertisements, more news, more varied contributions, filled up the additional space. The cost of composition increased, and, though circulation and revenue increased also, there was some danger to the margin of profit. Again invention came to the rescue. In the 'eighties some of the leading provincial newspapers began to use type-setting machines. In this forward step the provinces were far ahead of the London papers, excepting *The Times*. The *Southport Daily News*—since dead—led the way by introducing six Hattersley machines, and soon afterwards type-setting machinery became the rule in the provincial press. In the development of provincial papers, one factor of special importance must be noted, the desire for news about all branches of sport. In 1870 sporting meant horse-racing and little more. By degrees it embraced athleticism in all its branches, and progressive newspapers were looked to for information on football, hockey, golf, cricket, lawn-tennis, yachting, boating, cycling, wrestling, coursing, hunting, polo, running, bowls, billiards, chess, &c., quite as much as for notices of musical and dramatic performances, and of other forms of recreation and amusement. The ordinary provincial press, and its halfpenny evening representatives, largely depend on the attraction of the sporting news; and a number of special local papers have also been started to cater for this public.

Scotland.—The first newspaper purporting by its title to be Scottish (the *Scotch Intelligencer*,[1] 7th September 1643) and the first newspapers actually printed in Scotland (*Mercurius Civicus* and *Mercurius Politicus*, published at Leith in 1651 and 1653) were of English manufacture—the first being intended to communicate more particularly the affairs of Scotland to the Londoners, the others to keep Cromwell's army well acquainted with the London news. The reprinting of the *Politicus* was transferred to Edinburgh in November 1654, and it continued to appear (under the altered title *Mercurius Publicus* subsequently to April 1660) until the beginning of 1663. Meanwhile an attempt by Thomas Sydserfe to establish a really Scottish newspaper, *Mercurius Caledonius*, had failed after the appearance of ten numbers, the first of which had been published at Edinburgh on the 8th of January 1660. It was not until March 1699 that a Scottish newspaper was firmly established, under the title of the *Edinburgh Gazette*, by James Watson, a printer of eminent skill in his art.[2] Before the close of the

[1] This was followed by the *Scotch Dove*, the first number of which is dated "September 30 to October 20, 1643," and by the *Scottish Mercury* (No. 1, October 5, 1643). In 1648 a *Mercurius Scoticus* and a *Mercurius Caledonius* were published in London. The *Scotch Dove* was the only one of these which attained a lengthened existence.

[2] Watson was the printer and editor, but the person licensed was James Donaldson, merchant in Edinburgh ("Act in favors of James Donaldson for printing the *Gazette*," March 10, 1699, published in *Miscellany of the Maitland Club*, ii. 232 sq.). Arnot, in his *History of Edinburgh*, mentions as the second of Edinburgh newspapers—intervening between *Mercurius Caledonius* and the *Gazette*—a

year the *Gazette* was transferred to John Reid, by whose family it long continued to be printed. In February 1705 Watson started the *Edinburgh Courant*, of which he only published fifty-five numbers. He states it to be his plan to give "most of the remarkable foreign news from their prints, and also the home news from the ports of this kingdom . . . now altogether neglected." The *Courant* appeared thrice a week. Upon complaint being made to the privy council concerning an advertisement inserted after the transfer of the paper to Adam Boig, the new printer presented a supplication to the council in which he expressed his willingness "that in all time coming no inland news or advertisements shall be put into the *Courant*, but at the sight and allowance of the clerks of council." In 1710 the town council authorized Mr Daniel Defoe to print the *Edinburgh Courant* in the place of the deceased Adam Boig. Four years earlier (1706) the indefatigable pioneer of the Scottish press, James Watson, had begun the *Scots Courant*, which he continued to print until after the year 1718. To these papers were added in October 1708 the *Edinburgh Flying Post* and in August 1709 the *Scots Postman*. Five years later this paper appears to have been incorporated with the *Edinburgh Gazette*. The *Caledonian Mercury* began April 28, 1720. At one period it was published thrice and afterwards twice a week. Its first proprietor was William Rolland, an advocate, and its first editor Thomas Ruddiman. The property passed to Ruddiman on Rolland's death in 1729, and remained in his family until 1772. It is curious to notice that in his initiatory number of April 1720, Rolland claimed a right to identify his *Mercury* with that of 1660. This journal, he said in his preface to the public, "is the oldest [existing] in Great Britain." And his successor of the year 1860 followed suit by celebrating the "second centenary" of the *Caledonian Mercury*. He brought out a facsimile of No. 1 of *Mercurius Caledonius* (January 1660), in its eight pages of small quarto, curiously contrasting with the great double sheet of the day. But sixty years is a long period of suspended animation, and the connexion of the two newspapers cannot be proved to be more than nominal. The *Caledonian Mercury* was the first of Scottish journals to give conspicuous place to literature—foreign as well as Scottish. In "the '45" one of its editors, Thomas Ruddiman, junior, virtually sacrificed his life,[1] and the other, James Grant, went into exile, for the expression of conscientious political opinion. Its publication ceased after an existence of more than one hundred and forty years.

Notwithstanding the positive assertion[2] that the *Edinburgh Courant* and the *Edinburgh Evening Courant* "were entirely different journals, and never had any connexion whatever with each other," a substantial identity may be asserted upon better grounds than those for which identity used to be claimed for the *Caledonian Mercury* with *Mercurius Caledonius*. The grant by the town council of Edinburgh in December 1718 of a licence to James M'Ewan to print an *Evening Courant* three times a week appears to have been really a revival, in altered form, of the original *Courant*, repeatedly referred to in earlier, but not much earlier, records of the same corporation. So revived, the *Evening Courant* was the first Scottish paper to give foreign intelligence from original sources, instead of repeating the advices sent to London. In 1780 David Ramsay became its proprietor. Under his management it is said to have attained the largest Scottish circulation of its day. It was then of neutral politics. Subsequently, returning to its original title, and appearing as a daily morning paper, it ranked for long as the senior organ of the Conservative party in Scotland, but at last the competition of the *Scotsman* caused its disappearance, and after amalgamating with the *Glasgow News* or the *Scottish News* in 1886, it expired in 1888.

The *Edinburgh Weekly Journal* began in 1744, but it only attained celebrity when, almost seventy years afterwards, it became the joint property of Sir Walter Scott and of James Ballantyne. Scott wrote in its columns many characteristic articles. Ballantyne edited it until his death in 1833, and was succeeded in the editorship by Thomas Moir. The paper was discontinued about 1840. The *Edinburgh Evening News* started in 1873.

The *Scotsman*, the leading Scottish newspaper, was established as a twice-a-week paper in January 1817 and became a daily in June 1855. It ranked as the chief organ of the Liberal party in Scotland, until the Home Rule split in 1886, when it became Unionist. It was founded by William Ritchie, in conjunction with Charles Maclaren. For a short period it was edited by J. R. M'Culloch, the eminent political economist. He was succeeded by Maclaren, who edited the paper until 1845, and he in turn in 1848 by Alexander Russel (1814–1876), who (with Mr Law as manager) continued to conduct it with great ability until 1876. In 1859 the first of Hoe's rotary machines brought into Scotland was erected for the *Scotsman*. The *Scotsman* soon developed into a great newspaper, strong both on its literary side and also in gathering news; and it was circulated all over Scotland, its publishing offices being opened in Glasgow, which was a better centre for distributing in the west, and in Perth for the north. At last under Charles A. Cooper it succeeded in killing all its rivals in Edinburgh. In 1885 the *Scotsman* issued an evening paper.

The *North British Advertiser* was founded in 1826. The *Witness* began in 1840 as the avowed organ of what speedily became the Free Church party in Scotland. In its first prospectus it calls itself the *Old Whig*. The paper appeared twice a week, and its editor, Hugh Miller, very soon made it famous. In the course of less than sixteen years he wrote about a thousand articles and papers, conspicuous for literary ability, still more so for a wide range of acquirement and of original thought, most of all for deep conscientiousness. It survived its first editor's death (1855) only a few years.

In Glasgow the *Glasgow Herald* was founded in 1782. When the *Scotsman* extended its activities to Glasgow, the *Herald* opened an office in Edinburgh; and it took an active part in breaking down the old localism of Scottish papers. In later years it became a powerful organ. The *North British Daily Mail* was established in April 1847. George Troup, its first editor, made it specially famous for the organizing skill with which he brought his intelligence at an unprecedented rate of speed from Carlisle, the nearest point then connected with London by railway.[3] The *Glasgow Evening News* was started in 1870.

The *Aberdeen Journal* was founded as a weekly paper in 1748 and became a daily in 1876. In 1879 it issued an evening edition. The *Aberdeen Daily Free Press*, originally a weekly, dates from 1853. In 1881 it issued an evening paper in connexion with itself. The *Dundee Advertiser*, established in 1801, towards the latter part of the century extended its sphere of influence much on the lines of the *Scotsman* and *Glasgow Herald*. It issued the *Evening Telegraph* in 1877. In 1859 the *Dundee Courier*, a halfpenny paper, had begun.

It may be added that a very large number of the men who have distinguished themselves by their labours on the great newspapers of London, and several who rank as founders of these, began their career and have left their mark on the newspapers of Scotland.

Ireland.—In 1641 appeared a sheet called *Warranted Tidings from Ireland*, but this, with *Ireland's True Diurnal* (1642), *Mercurius Hibernicus* (1644), the *Irish Courant* (1690), were all of them London newspapers containing Irish news. The real newspaper press of Ireland began with the *Dublin News-Letter* of 1685. Five years later appeared the *Dublin Intelligencer* (No. 1, September 30, 1690). Both of these were shortlived. *Pue's Occurrences* followed in 1700 and lasted for more than fifty years, as the pioneer of the daily press of Ireland. In 1710 or in 1711 (there is some doubt as to the date of the earliest number) the *Dublin Gazette* began to appear, the official organ of the vice-regal government. *Falkener's Journal* was established in 1728. *Esdaile's News-Letter* began in 1744, took the title of *Saunders's News-Letter* in 1754 (when it appeared three times a week), and became a daily newspaper in 1777.

In the Nationalist press the famous *Freeman's Journal* has long been prominent amongst the Dublin papers. It was established as a daily paper by a committee of the first society of "United Irishmen" in 1763, and its first editor was Dr Lucas. Flood and Grattan were at one time numbered amongst its contributors, although the latter, at a subsequent period, is reported to have exclaimed in his place in the Irish parliament, "The *Freeman's Journal* is a liar . . . a public, pitiful liar." In 1870 it brought out the *Evening Telegraph*. In 1891 the dissensions among the Irish Nationalists led to the establishment of the Parnellite *Dublin Daily Independent* and *Evening Herald*. In 1897 the *Nation*, formerly a weekly, was brought out as a daily. On the Unionist side the principal Irish paper is the Dublin *Irish Times* (1859).

Waterford possessed a newspaper as early as 1729, entitled the *Waterford Flying Post*. It professed to contain "the most material news both foreign and domestic," was printed on common writing paper and published twice a week at the price of a halfpenny. The *Waterford Chronicle* was started in 1766.

The *Belfast News-Letter* was started in 1737; the *Belfast Evening Telegraph* in 1870; the *Belfast Northern Whig* in 1824.

British Dominions beyond the Sea.

It is unnecessary here to give all the statistics for the British Colonial press, which has enormously developed in modern times. So far as its early history is concerned, it may be noted that *Keimer's Gazette* was started in Barbadoes in 1731 and Granada followed with a newspaper of its own in 1742. In Canada the *Halifax Gazette* was established in 1751 and the *Montreal Gazette* in 1765. The first Australasian paper was the *Sydney Gazette and New South Wales Advertiser* (1803–1843), the *Derwent Star*, in Van Dieman's Land (Tasmania), starting in 1810. In modern days all the British dominions beyond the sea have produced important and well-conducted papers. The Canadian press has naturally had certain marked affinities with the American; but the *Globe* in Toronto, as

Kingdom's Intelligencer. But this was a London newspaper, dating from 1662, which may occasionally have been reprinted in Scotland; no such copies, however, are now known to exist. In like manner the *Scottish Mercury*, No. 1, May 8, 1692, appears to have been a London newspaper based upon Scottish news-letters, although in an article written in 1848, in the *Scottish Journal of Topography*, vol. ii. p. 303, it is mentioned as an Edinburgh newspaper.

[1] During an imprisonment of six weeks in the Tolbooth of Edinburgh his health suffered so severely that he died very shortly after his release.

[3] See *Notes and Queries*, 5th series, vii. 45, viii. 205.

the organ of the Liberal party, has played a leading part in Canadian history. In Australia the *Sydney Bulletin*, the *Sydney Morning Herald* (1831—daily since 1840), *Sydney Daily Telegraph*, *Melbourne Argus* (1846) and *Melbourne Age* (1854), with the evening *Melbourne Herald*, have been the most important. In South Africa the *Cape Times* (1876) has been the principal paper, but some of the Transvaal English papers have exercised great influence in the disturbed political conditions since about 1895.

India.—For a considerable period under the rule of the East India Company the Indian press was very unimportant both in character and influence. It was permitted to shape its course and to gain a position as it could, under the potent checks of the deportation power and the libel law, without any direct censorship. Nor was it found difficult to inflict exemplary punishment on the writers of "offensive paragraphs."

Prior to Lord Wellesley's administration the most considerable newspapers published at Calcutta were the *World*, the *Bengal Journal*, the *Hurkaru*, the *Calcutta Gazette* (the organ of the Bengal government), the *Telegraph*, the *Calcutta Courier*, the *Asiatic Mirror* and the *Indian Gazette*. Mr Duane, the editor of the *World*, was sent to Europe in 1794 for "an inflammatory address to the army," as was Mr Charles Maclean, four years afterwards for animadverting in the *Telegraph* on the official conduct of a local magistrate.

The *Calcutta Englishman* dates from 1821. Lord Wellesley was the first governor-general who created a censorship (April 1799). His press-code was abolished by the marquis of Hastings in 1818. The power of transporting obnoxious editors to Europe of course remained. Perhaps the most conspicuous instance of its exercise was the removal of the editor of the *Calcutta Journal* (Silk Buckingham), which occurred immediately after Lord Hastings's departure from India and during the government of his temporary successor, Mr John Adan. Buckingham's departure was followed closely (14th March 1823) by a new licensing act, far exceeding in stringency that of Lord Wellesley, and (5th April 1823) by an elaborate "Regulation for preventing the Establishment of Printing-Presses without Licence, and for restraining under certain circumstances the Circulation of Printed Books and Papers." The first application of it was to suppress the *Calcutta Journal*.

In the course of the elaborate inquiry into the administration of India which occupied both Houses of Parliament in 1832, prior to the renewal of the Company's charter, it was stated that there were, besides 5 native journals, 6 European newspapers: three daily, the *Bengal Hurkaru*, *John Bull* and the *Indian Gazette*; one published twice a week, the *Government Gazette*; and two weekly the *Bengal Herald* and the *Oriental Observer*. At this period every paper was published under a licence, revocable at pleasure, with or without previous inquiry or notice. At Madras, on the other hand, the press remained under rigid restriction. The Madras censorship was removed whilst the parliamentary inquiry of 1832 was still pending.

One question only, and that but for a brief interval, disturbed Lord William Bentinck's love of free discussion. The too famous "Half-Batta" measure led him to think that a resolute persistence in an unwise policy by the home government against the known convictions of the men actually at the helm in India and an unfettered press were two things that could scarcely co-exist. It was on this occasion that Sir Charles Metcalfe recorded his minute of September 1830, the reasoning of which fully justifies the assertion —"I have, for my own part, always advocated the liberty of the press, believing its benefits to outweigh its mischiefs; and I continue of the same opinion." This opinion was amply carried out in the memorable law (drafted by Macaulay and enacted by Metcalfe as governor-general in 1835), which totally abrogated the licensing system. It left all men at liberty to express their sentiments on public affairs, under the legal and moral responsibilities of ordinary life, and remained in force until the outbreak of the mutiny of 1857.

In 1853 Garcin de Tassy, when opening at Paris his annual course of lectures on the Hindustani language, enumerated and gave some interesting details concerning twenty-seven journals (of all sorts) in Hindustani. In 1860 he made mention of seventeen additional ones. Of course the circulation and the literary merits of all of them were relatively small. One, however, he said, had reached a sale of 4000 copies.[1]

In 1857 Lord Canning's law, like that of 1823, on which it was closely modelled, absolutely prohibited the keeping or using of printing-presses, types or other materials for printing, in any part of the territories in the possession and under the government of the East Indian Company, except with the previous sanction and licence of government, and also gave full powers for the seizure and prohibition from circulation of all books and papers, whether printed within the Indian territories or elsewhere.

In 1878 an act was passed, which long remained in force, regulating the vernacular press of India: "Printers or publishers of journals in Oriental languages must, upon demand by the due officer, give bond not to print or publish in such newspapers anything likely to excite feelings of disaffection to the government or antipathy between persons of different castes or religions, or for purposes of extortion. Notification of warning is to be made in the official gazette if these regulations be infringed (whether there be bond or not); on repetition, a warrant is to issue for seizure of plant, &c.; if a deposit have been made, forfeiture is to ensue. Provision is made not to exact a deposit if there be an agreement to submit to a government officer proofs before publication." After the disturbances of 1908–1909 further and more stringent regulations were made.

The *Indian Daily Mirror* (1863) was the first Indian daily in English edited by natives. The total number of journals of all kinds published within all the territories of British India was reported by the American consular staff in 1882 as 373, with an estimated average aggregate circulation per issue of 288,300 copies. Of these, 43, with an aggregate circulation of 56,650 copies, were published in Calcutta; 60, with an aggregate circulation of 51,776 copies, at Bombay. In 1900 it appeared from the official tables that there were about 600 newspapers, so called, published in the Indian empire, of which about one-third, mostly dailies, were in the Indian vernaculars. Calcutta had 15 dailies (*Calcutta Englishman*, &c.); Bombay 2 (*Bombay Gazette*); Madras 4 (*Madras Mail*); Rangoon 3 (*Rangoon Times*); Allahabad 2 (*Pioneer*); Lahore 2 (*Civil and Military Gazette*).

3. NEWSPAPERS OF THE UNITED STATES[2]

Massachusetts.—Boston was the first city of America that possessed a local newspaper; but the earliest attempt in that direction, made in 1689, and a second attempt, under the title *Publick Occurrences*, which followed in September 1690, were both suppressed by the government of Massachusetts. Nearly fourteen years afterwards (April 24, 1704), the first number of the *Boston News-Letter* was "printed by B. Green, and sold by Nicholas Boone." Its proprietor and editor—so far as it can be said to have had an editor, for extracts from the London papers were its staple contents—was John Campbell, postmaster of the town. In 1719 he enlarged his paper, in order, as he told his readers, "to make the news newer and more acceptable; ... whereby that which seem'd old in the former half-sheets becomes new now by the sheet. . . . This time twelvemonth we were thirteen months behind with the foreign news beyond Great Britain,[3] and now less than five months; so that . . . we have retrieved about eight months since January last"; and he encourages his subscribers with the assurance that if they will continue steady "until January next, life permitted, they will be accommodated with all the news of Europe . . . that are needful to be known in these parts." But Campbell's new plans were soon disturbed by the loss of his office, and the commencement of a new journal by his successor in the postmastership, William Brooker, entitled the *Boston Gazette* "published by authority" (No. 1, 21st December 1719). The old journalist had a bitter controversy with his rival, but at the end of the year 1722 relinquished his concern in the paper to Benjamin Green, who carried it on, with higher aims and greater success, until his death, at the close of 1733, being then succeeded by his son-in-law, John Draper, who published it until December 1762. By Richard Draper, who followed his father, the title was altered to *Massachusetts Gazette and Boston News-Letter*; and the maintenance of the British rule against the rising spirit of independence uniformly characterized his editorship and that of his widow (to whom, at a subsequent period, a pension was

[1] The *Hurkaru* and the *Indian Gazette* were long afterwards combined under the new leading title, *Indian Daily News* (with the old name appended).

[2] For the general conditions producing the modern type of American newspaper, see the first section of this article. In the following account of American and foreign newspapers, the historical material in the 9th and 10th editions of the *Ency. Brit.* has been utilized and in parts repeated.

[3] In other words, the attention of the Bostonian politicians was engrossed on the siege of Belgrade, when their contemporaries in the mother country were intent on the destruction of the Spanish fleet on the coast of Sicily.

granted by the British government). It was the only paper printed in Boston during the siege, and ceased to appear when the British troops were compelled to evacuate the city.

The *Boston Gazette*, founded in 1719, had James Franklin, elder brother of the celebrated Benjamin Franklin, as its first printer. It lasted until the end of 1754, its editorship usually changing with the change of the postmasters. On the 17th August 1721 James Franklin started the *New England Courant*, the publication of which ceased in 1727; and two years later Benjamin Franklin purchased the *Pennsylvania Gazette*, which he continued weekly until 1765.

To the *Boston Gazette* and the *Courant* succeeded the *New England Weekly Journal* (20th March 1727; incorporated with the *Boston Gazette* in 1741), and the *Weekly Rehearsal* (27th September 1731), which became the *Boston Evening Post* (August 1735), and under that title was for a time the most popular of the Boston newspapers. It aimed at neutrality in politics, and therefore did not survive the exciting events of the spring of 1775. Several minor papers followed, which may be passed over without notice. A new *Boston Gazette*, which began in April 1755 (merged in 1836 in the *Centinel*), is of more interest. For a long time it was the main organ of the popular party against England, and expounded their policy with great ability, and in a dignified temper. Otis, John Adams, Samuel Adams and Joseph Warren were amongst its writers. It was strongly Republican after the adoption of the constitution, especially opposing its old contributor John Adams.

The *Massachusetts Spy* (1770), under the indefatigable editorship of the American historian of printing, Isaiah Thomas, did yeoman's service in this struggle, although of a different kind from that of the *Boston Gazette*. The latter spoke chiefly to the thinkers and natural leaders of the people. The *Spy* was a light and active skirmisher who engaged his antagonists wherever he met them, and frequently carried the war into the enemy's country. In July 1774, during the operation of the Boston Port Act, and soon after the landing of four British regiments, it adopted Franklin's odd device, representing Great Britain as a dragon, and the colonies as a snake divided into nine parts with the motto, "join or die." But Boston grew too hot for the patriotic printer, and he had to remove to Worcester on the day of the battle of Lexington. Here the paper continued to be published (as the *Worcester Spy*) until 1786,—the lack of the stirring revolutionary matter being occasionally supplied by the republication in its columns of entire books, such as Robertson's *America* and Gordon's *History of the Revolution*. This journal, like so many more, was for a time killed by a tax. The stamp duty imposed in March 1786, though amounting to but two-thirds of a penny, and very speedily repealed, led to its suspension until April 1788, when the weekly *Massachusetts Spy* was revived, lasting till 1848. A morning edition, the *Worcester Spy*, was started in 1845 and continued to be published till May 1904.

The Boston *Centinel* was another memorable newspaper. It was founded in 1784 as the *Massachusetts Centinel and the Republican Journal*, a semi-weekly; in 1790 becoming the *Columbian Centinel*. For many years it was edited by Major B. Russell (1761–1845), a man who combined real ability with moderation of temper and singular modesty and disinterestedness. He printed the Acts of Congress for a very long time without charge, but the government eventually gave him £1400 in recognition of his work. The *Centinel* had good foreign news, and Russell was intimate with Louis Philippe and Talleyrand when they were in Boston. In 1830 it absorbed the *Palladium* (founded in 1793 as the *Massachusetts Mercury*, and renamed in 1801 the *Massachusetts Mercury and New England Palladium*), and in 1836 the *Boston Gazette*, but in 1840 was merged in the *Boston Advertiser*. The *Boston Daily Advertiser* was founded in 1813, and in 1832 absorbed the *Patriot*, which in 1819 was started out of a nucleus chiefly composed of the *New England Chronicle* (1776).

William Lloyd Garrison's once well-known *Liberator* was founded at Boston on New Year's Day 1831 For a time its editor was also writer, compositor and pressman. In December of that year the legislature of Georgia offered a reward of 5000 dollars to any one who would cause him to be apprehended and brought to trial. He continued the paper till 1865 and lived to witness the abolition of negro slavery. In 1827 Garrison also edited in Boston the *National Philanthropist*, the first American total abstinence paper.

Among modern Boston papers the most important are the *Evening Transcript* (1830), *Herald* (1836), *Daily Advertiser* (1813), *Globe* (1872), *Boston American* (1904) and *Post* (1831).

Of Massachusetts papers outside Boston the most important still in existence in 1910 was the morning *Springfield Republican* (weekly, 1824; daily, 1844), established by Samuel Bowles, father of Samuel Bowles (1826–1878), its most famous editor.

The *Evening Salem Gazette*, originally a weekly (1768), was a famous paper during the War of Independence and in the period immediately after. The *Hampshire Gazette* of Northampton, Massachusetts, founded in September 1786 in the interests of the Administration at the time of Shays's Rebellion, started its daily edition in 1890. The weekly *Gazette and Courier* (1841), was a consolidation of the *Greenfield Gazette* (1792) and the *Courier* (1838). The Salem *Register and Mercury* continues the *Salem Register* (1800) and the *Mercury*, which was published in Salem as early as 1768, but not continuously. The Haverhill *Evening Gazette* dates from 1798. In Pittsfield is published the *Berkshire County Eagle*, a weekly established in 1789, with an evening edition, the *Berkshire Evening Eagle* (1892). The Newburyport *Herald* (evening 1880; morning 1892) continues the title of an earlier paper (1797) owned by Ephraim W. Allen and William S. Allen.

At the commencement of the struggle for independence in 1775 Massachusetts possessed 7 newspapers, New Hampshire 1 (the *New Hampshire Gazette*), Rhode Island 2, and Connecticut 3,—making 13 in all for the New England colonies. Pennsylvania had 8, of which the earliest in date was the *American Weekly Mercury* (No. 1, 22nd December 1719); and New York but 3, the oldest of them being the *New York Gazette* (1725). Up to that period (1725) Boston and Philadelphia were the only towns possessing a newspaper throughout America. In the middle and southern colonies there were, in 1775, in the aggregate, 10 journals, of which Maryland, Virginia and North Carolina possessed each 2, South Carolina 3 and Georgia 1. The total number of the Anglo-American papers was 34, and all of them were of weekly publication.

New Hampshire.—The *New Hampshire Gazette* (1756; daily edition since 1852), published at Portsmouth, was the "father" of the New England press. The *Cheshire Republican* (1793) and *New Hampshire Sentinel* (1799; evening edition since 1890) are still published at Keene.

Vermont.—The earliest paper established in Vermont was the *Green Mountain Postboy*, first published in April 1781. The oldest important paper in Vermont is the *Rutland Herald* (established in 1794 as a weekly; daily edition since 1861). The *Vermont Journal* of Windsor, Vermont, was established in 1783.

Maine.—The first papers of any importance published in Maine were the Portland *Advertiser* (evening, 1785), of which James G. Blaine was editor in 1857–1860; and the *Eastern Argus* of Portland (September 1803). The latter was established by Nathaniel Willis (1780–1870), the father of N. P. Willis. Willis was converted in Portland by Edward Payson and about 1808 he left the paper. In 1816–1826 he established in Boston the *Recorder*, which is supposed to have been the first American religious paper. In 1827 Willis established the *Youth's Companion*, the most popular American juvenile paper. The *Eastern Argus* was edited in 1820–1824 by Seba Smith (1818–1868), who established in 1829 the *Portland Courier*, which he edited until 1837 and to which he contributed the sketches republished in 1833 as *Life and Letters of Major Jack Downing*.

Connecticut.—The *Connecticut Courant* of Hartford was established in October 1764 as a weekly; in 1893 there appeared a semi-weekly issue, and its daily issue, the *Hartford Courant*, first appeared in 1837. The paper was a strong supporter of the administrations of Washington and Adams. Probably the best known of its editors is Joseph R. Hawley. Charles Dudley Warner was long a member of the staff. The *Hartford Times* (semi-weekly 1817; daily, 1841) has always been a prominent paper. Its principal early editors were Gideon Wells in 1826–1836 (in 1861–1869 he was United States secretary of the navy), and John Milton Niles (1787–1856), who was United States

senator in 1835–1839 and 1843–1849 and was postmaster-general of the United States in 1840–1841.

Next to the *Courant*, the oldest paper still published in Connecticut is the *New Haven Journal*, established as a weekly in 1766 (the weekly edition is now styled the *Connecticut Herald*), which first appeared as a daily in 1834 as the *Morning Journal and Courier*. The *New London Gazette* (1763), which in 1773 became the *Connecticut Gazette*, ceased publication in 1844. Another *Gazette* was established in New London for a time, but is no longer published and was in no way connected with the earlier paper. The *Danbury News* (weekly, 1870, when *The Times* and *Jeffersonian* were consolidated; daily, 1883) is known for the humorous sketches contributed by its proprietor James Montgomery Bailey (1841–1894). The *Republican Farmer* (weekly) was established in 1790 in Danbury and in 1810 removed to Bridgeport; the *Evening Farmer* was first published in 1855. The Norwich *Courier* (weekly, 1796) has a daily edition, the *Bulletin* (1858).

Rhode Island.—The oldest paper now published in Rhode Island is the *Newport Mercury* (weekly; 1758), which, like most of the other New England patriot sheets, was suppressed in 1765; it was established by James Franklin, a nephew of Benjamin Franklin.

Pennsylvania.—The *Aurora* (1790) was the most notable of the early Philadelphia papers, next to Franklin's *Gazette*. It was founded by Franklin's grandson, Benjamin Franklin Bache, who in 1784 had started the *American Daily Advertiser*, the first American daily. Bache and his successor William Duane (who edited the paper till 1822) bitterly attacked Washington, Adams and Hamilton; and the *Aurora* after 1793 was practically the organ of Jefferson, but ceased to be of importance after the national capital was removed from Philadelphia. From 1791 to 1793 the principal Anti-Federalist paper was the *National Gazette*, edited by Philip Freneau, whom Jefferson brought to Philadelphia. As opposed to these there was the *United States Gazette*, founded in New York in 1789, but removed to Philadelphia in 1790, which represented Alexander Hamilton. This journal afterwards (1826–1847) was an important Whig organ, under the editorship of Joseph Ripley Chandler (1792–1880). In 1847 it was consolidated with the *North American* (1830), which still survives in Philadelphia, having in its progress also absorbed the *Pennsylvania Gazette* (1729–1845), for a time owned by Benjamin Franklin, the *Pennsylvania Packet* (founded 1771) and other papers.

Other important Philadelphia papers still in existence are, the *Public Ledger* (1836), founded as a one-cent paper, purchased in 1864 by George W. Childs, who increased the price from 6¼ to 10 cents a week; the *Philadelphia Evening Bulletin*, which consolidated the *American Sentinel* (1815) and the *Evening Bulletin* (1847); and the *Press* (1857), edited from 1880 to 1908 by Charles Emory Smith (1842–1908), United States Minister to Russia in 1890–1892, and postmaster-general of the United States in 1898–1902.

Benjamin Lundy edited in Philadelphia in 1836–1838 the *National Enquirer* (anti-slavery), which became the *Pennsylvania Freeman* and in 1838–1840 was edited by John G. Whittier.

Outside of Philadelphia the oldest papers of importance in Pennsylvania are the *Pittsburgh Gazette*, first published in 1786 and probably the first newspaper published west of the Alleghanies, which in 1906 was consolidated with the *Times* (1879) to form the *Gazette Times*; and the *Pittsburgh Post* (1792; daily, 1842), one of the few influential Democratic papers published in Pennsylvania; the *Pittsburgh Dispatch* (1846) is a morning paper. Other papers founded before 1801 (and still published) in Pennsylvania are: the *Franklin Repository* of Chambersburg (weekly, 1790; daily, 1883), of which A. K. McClure was proprietor and editor in 1850–1856; the Reading *Adler* (weekly, 1796), the oldest existing German newspaper in the country; the *Intelligencer* of Lancaster (1799), with which the *Journal* (1794) was combined in 1839; the *Westmoreland Democrat* of Greensburg (weekly, 1799); the *Herald* of Norristown (weekly, 1799; daily, 1848).

Maryland.—The earliest journal of Maryland was William Parks's *Maryland Gazette*, of Annapolis, begun in 1727, when in all America it had but six existing predecessors. Discontinued in 1736, it was revived in 1739 by Jonas Green and lasted till 1839. The oldest paper now published in Baltimore is the *American*, the successor of the *Maryland Journal and Baltimore Advertiser* founded in August 1773; on the 21st September 1814 it published "The Star Spangled Banner." The *Baltimore Sun* was started in 1837.

New Jersey.—New Jersey had no really established newspaper before the Revolution, although the first number of an intended journal was published in 1765, under the title of the *Constitutional Gazette, containing matters interesting to Liberty, but no wise repugnant to Royalty*. The earliest regular paper was the *New Jersey Gazette*, which began in December 1777 at Burlington (soon removing to Trenton), and ceased publication in 1786. A *State Gazette* (weekly), now published in Trenton, dates from 1792 (daily, 1846); Trenton's largest paper is the *Times* (evening; 1882). The *Sentinel of Freedom*, a Newark weekly, was first published in 1796; its daily edition, the *Star*, dates from 1832. Newark's largest paper is the *Evening News* (1883). The *New Brunswick Times* was first published as a weekly in 1792; a daily edition was added in 1849.

Virginia.—Virginia, notwithstanding its illustrious precedency—the province of Raleigh, the cradle of Washington—possessed neither newspaper nor printing office until 1736, so that (as respects one-half at least of the wish) there was once a prospect that the devout aspiration of Sir William Berkeley might be realized. "Thank God," said this Virginian governor in 1671, "we have neither free school nor printing press, and I hope may not have for a hundred years to come." The earliest journal established in the state was the *Virginia Gazette*, commenced in 1736. It was still published at Williamsburg in 1766, when a second paper of the same name was established there. This second paper, backed by Thomas Jefferson, was afterwards called the *American Advertiser* and then the *Commercial Advertiser*, and stopped in 1822. The *Richmond Enquirer*, which started in 1808, succeeding the *Examiner*, early attained a leading position as a Democratic organ; it was discontinued in 1880. The *Alexandria Gazette* (1816) is still published.

Washington, D.C.—The first "administration organ" (*i.e.* expressing the political views of the administration, but not officially a government paper), was the *National Intelligencer* (1800); this position it held until 1829, when it became an opposition paper. In Jackson's administration the *United States Telegraph*, which had been purchased in 1826 by Duff Green, became the "administration organ"; but in 1830 it was supplanted by the *Globe*. The *United States Telegraph*, which had supported Calhoun, remained his organ until 1835, strongly favouring slavery and opposing the abolition press. The *Globe* after December 1830 was conducted by Francis Preston Blair the elder and John C. Rives (1795–1864); it opposed Nullification, Secession, and the Southern wing of the Democratic party. In 1841 the *National Intelligencer* became the administration organ; it was succeeded in the same year by a new paper, the *Daily Madisonian*, President Tyler's organ, and in 1845 the *Union* became the organ of President Polk. To the *Union* in 1845 the *Globe* sold out, but only as a party organ. In 1846 to 1871 the *Globe* was the publisher of the Congressional debates. President Taylor's organ during his administration was the newly established *Republican*. During President Fillmore's presidency the *National Intelligencer*, which was a Webster-Whig organ, returned to power, and during Pierce's administration the *Union* was again the administration organ, with the *Evening Star* (1852) a close second. In Buchanan's administration the influence of the *Union* continued. During the Civil War most of these papers died off, except the *Star* and the *National Intelligencer*, which in 1870 removed to New York, where it stayed as a semi-weekly for some time. The *Washington Post*, now the leading paper, was founded in 1877. The *National Era*, the organ of the American and Foreign Anti-Slavery Society, first published in Washington in 1844 (the Cincinnati *Philanthropist* was merged with it in 1847) by Gamaliel Bailey, is known principally because *Uncle Tom's Cabin* ran in its columns as a serial in 1851–1852. A *New*

National Era (1870), was conducted in Washington by Frederick Douglass and his sons.

New York.—The *New York Gazette* (which started in New York City on the 16th of October 1725) was followed by the *Weekly Journal* (No. 1, 5th November 1733), still memorable for the prosecution for sedition which it entailed on its printer, John Peter Zenger, and for the masterly defence of the accused by Andrew Hamilton. "The trial of Zenger," said Gouverneur Morris, "was the germ of American freedom." Gaines's *New York Mercury* was published from 1752 to 1783. James Rivington (1724–1802) in 1773 published the *New York Gazetteer* as a loyalist sheet, but his press was destroyed in 1775 and he went to England; in 1777 he returned and published *Rivington's New York Loyal Gazette* (semi-weekly), renamed first the *Royal Gazette* and then *Rivington's New York Gazette* and *Universal Advertiser*, which came to an end in 1783. The semi-weekly *Independent Journal* was one of the papers of New York City in which, between October 27th, 1787, and April 2nd, 1788, the *Federalist* essays were published; in 1788 it became part of the *New York Gazette*, and then in 1840 was consolidated with the *Journal of Commerce*. The first daily newspaper published in the city or state of New York was the *New York Journal and Register*, commenced in 1788. In 1802 the *Morning Chronicle*, edited by Peter Irving (1771–1838), a brother of Washington Irving, was established as Aaron Burr's organ; in 1805 it was merged in the *Poughkeepsie Journal*. Another political paper was the *Minerva* (1793), under Noah Webster, which had a semi-weekly edition, the *Herald*. These in 1797 became the *Commercial Advertiser* and *New York Spectator* respectively. The former (surviving as the *Globe and Commerical Advertiser*) was edited in 1820–1844 by W. L. Stone and in 1867 by Thurlow Weed.

In 1810 the aggregate number of papers published within the state was 66, of which 14 belonged to New York City. Ten years later the city press included 8 daily journals, with an aggregate daily circulation of 10,800 copies. No one paper circulated more than 2000, and but two—the *Evening Post* (1801) and the *Commercial Advertiser* (1797)—attained that number.

The New York *Evening Post* was at first strongly Federalist and practically an organ of Alexander Hamilton, who with John Jay assisted in founding it. Its first editor was William Coleman (1766–1829). In the years immediately following 1819 John Rodman Drake contributed to the *Post* the "Croaker" pieces, in which FitzGreene Halleck joined. William Cullen Bryant began to write for the *Post* in 1826, and became its editor-in-chief in 1828. John Bigelow, Parke Godwin, Carl Schurz, Horace White, E. L. Godkin, editor from 1881 to 1901, and Henry Villard, are the important names in its history. Rollo Ogden became editor in 1903. Closely connected with the *Post* is the weekly *Nation*, long edited by E. L. Godkin (*q.v.*). The *Post* was strongly Federalist until the War of 1812; it opposed the Hartford Convention; until 1860 it was consistently Democratic; it supported Lincoln in 1860 and in 1864 and Grant in 1868; in later years it was an advocate of free trade and of civil service reform. There were earlier *Evening Posts* in 1746–1747 and in 1794.

The cheap (two-cent) press of America (the previous price having usually been six cents) began in New York in the shape of the *Morning Post* (1st January 1833), which only lasted a few weeks; the real pioneer was the *Daily Sun* (No. 1, 23rd September 1833), written, edited, set up, and worked off by Benjamin Henry Day, a journeyman printer. It sold at one cent till the Civil War, when it charged two cents, the price remaining at that figure. The New York *Sun* was acquired in 1868 by Charles Anderson Dana (*q.v.*), who made it a powerful organ, and under his successor William M. Laffan (1848–1909) it remained one of the great dailies.

The *New York Herald* followed in May 1835, founded and edited by James Gordon Bennett (*q.v.*), and his efforts and those of his son gave it an enormous commercial success.

The *New York Tribune* was established in 1841 by Horace Greeley (*q.v.*), who remained its editor and one of its proprietors until his death, shortly after his defeat for the presidency in 1872. He was succeeded as editor and proprietor by Whitelaw Reid (b. 1837), who had joined the staff in 1868 and afterwards became U.S. Ambassador in London. Directed by two such men the *Tribune* became a powerful organ.

The *New York Times*, which was to rank with the *Tribune* and *Sun* among the best modern American daily papers, was established by Henry J. Raymond (*q.v.*) in September 1851; and, though absent at times in the discharge of his duties as lieut.-governor of New York and member of Congress, he continued its editor and chief proprietor until his death in June 1869. At the end of the century, under the control of Mr Adolph S. Ochs (b. 1858), it was prominent in American journalism for the excellence of its news service and literary character.

The New York *World* was founded in 1860 as a highly moral and religious sheet, which immediately failed and had to be reorganized. In 1861 the *Morning Courier* and the *Enquirer* were merged into it. In 1864 it and the *Journal of Commerce* were suppressed for several days by the Federal authorities because each had been tricked into publishing a forged presidential proclamation of a draft and of a general fast day. In 1869 it became the sole property of Manton Marble (b. 1834), who retired from its editorship in 1875; in 1876 it was sold to a syndicate and came under the control of Jay Gould; in 1883 it was purchased by Joseph Pulitzer (b. 1847), and its modern activity began. It worked hard for Grover Cleveland, especially in his first campaign, and opposed W. J. Bryan and his policies.

The journals owned by W. R. Hearst (b. 1863) all over America represent perhaps more conspicuously than any others the popular developments which at the end of the 19th century were associated with the nickname of the "Yellow Press." His papers in New York in 1910 were the *American* (originally *Journal*; morning except Sunday); the *Evening Journal*, the *American and Journal* (Sunday) and *Das Morgen Journal*. Starting in the 'nineties as proprietor of the San Francisco *Examiner*, Mr Hearst had a large fortune to enable him to carry out his ideas of a thoroughgoing democratic journalism, appealing particularly to the less literate masses and supplying all sorts of sensational news. The class prejudice often underlying the policy of his papers was bitterly criticized and resented by sober American opinion, but their passionate appeal to the masses, combined with their audacious and lively presentation of news, gave Mr Hearst nevertheless a position of considerable power; and no secret was made of his ambition to reach the highest political positions, both in New York itself and in the Republic. Dangerous as his social influence was considered by important sections of the community, and unsuccessful as he remained up to 1910 in obtaining municipal office or presidential nomination, it remained the fact that, in the type of journalism so indefatigably conducted under him, he represented a serious force in American social and political life, and his journalistic methods were a remarkable outcome of the conditions of a modern free press in a democratic country, where a large public exists for the consumption of the sort of newspaper fare which he was ready to provide.

The *New York Press* (1887) is a morning Republican paper of the strictest party type.

An important commercial paper of long standing in New York is the *Journal of Commerce and Commercial Bulletin*, founded in 1827 as the *Journal of Commerce* by Arthur Tappan (1786–1865) and his brother Lewis Tappan (1788–1873), and in 1893 consolidated with the *Commercial Bulletin* (1865). The *Journal of Commerce* in 1829–1830 was the first American paper to send out news schooners which intercepted packet ships which brought news especially of the French Revolution of 1830. Arthur Tappan, who was one of the founders of Oberlin College, established in 1833 the *Emancipator*, an abolitionist paper, of which in 1833–1837 Elizur Wright (1804–1885), and in 1837–1840 Josbua Leavitt (1794–1873), were editors. Leavitt took the paper to Boston. It was the weekly organ of the American Anti-Slavery Society.

The New York *Evening Mail* (1833), for a time the *Mail*

and Express, was bought in 1888 and reorganized by Elliott Fitch Shepard (1833–1893). The *Express* was established in 1836 with the help of Willis Hall (1801–1868), a prominent Whig lawyer and politician, by James Brooks (1810–1873), who had formerly been on the Portland *Advertiser* and in 1832 had written (for the *Advertiser*) the first regular Washington correspondence. His brother Erastus (1815–1886) was joint owner of the *Express* in 1836–1877. James Brooks wrote several books of travel and was involved in the scandal of the Crédit Mobilier.

Of the New York newspapers not in English the most important are the following. The *Staats-Zeitung* (evening, 1834) is published by a company of which in 1909 Herman Ridder (b. 1851) was president, having since 1890 been treasurer and manager. Ridder, a prominent German Democrat and Roman Catholic, established in 1886 the *Catholic News*, a weekly with a large circulation, edited by his son Henry Ridder. The *Zeitung* (morning, 1845), *Herald* (evening, 1879), and *Revue* (Sundays) are other German papers published by one company. Mr Hearst's *Das Morgen Journal* dates from 1890. A Socialist Labour paper—daily *Volks Zeitung* and weekly *Vorwaerts*—was established in 1878. The *Jewish Daily News* and (weekly) *Jewish Gazette* (1874) in Yiddish and English have large circulations; so have the *Jewish Morning Journal* (1901; *Abend Post*, 1899, and weekly, *Jewish Journal*, 1899); the *Jewish Herald* (evening) and *Volksadvocat* (weekly), both editions, 1887; and *Forward* (evening, 1897). The *Courrier des Etats-Unis* (1828) publishes small daily, Sunday and weekly editions. There are four Italian dailies, the more important being *L'Araldo Italiano* (1894) and *Il Progresso Italo-Americano* (1879). The *Atlantis* (evening, 1894) is a Greek daily. The *Listy* (1875) and *Hlas Lidu* (1886) are Bohemian dailies; the *Narodni List* (1898) is a Croatian daily; the *Gaelic American* (1903), *Irish Nationalist* (1888), *Irish-American* (1849) and *Irish World* are Irish weeklies printed in English; the *Amerikai Magyar Nepsava* (1897) is a Hungarian daily, also published in Cleveland, Ohio; the *Glas Naroda* (1893) is a small Slavonic daily.

Among the New York weekly publications must be mentioned *Harper's Weekly*, founded in 1856; George William Curtis was first connected with it in 1857, and after 1864 was its political editor. Under Curtis it was a powerful advocate of civil service reform, and its campaigns against Tammany were made famous by the cartoons of Thomas Nast. During the Civil War *Harper's Weekly* published Nast's sketches in the field. *Frank Leslie's Illustrated Newspaper* (now *Leslie's Weekly*) was founded in 1855 by Frank Leslie (1821–1880), whose ability as a wood-engraver was the basis of its success. Nast was employed by Leslie in 1854 and subsequent years, and was sent to England to sketch the Heenan-Sayers fight. With Harper's and Leslie's *Weeklies* ranks *Collier's Weekly*, established in 1888 by Peter Fenelon Collier (d. 1909).

The following are newspapers of Brooklyn. The *Eagle* (evening, 1841), of which Walt Whitman was editor in 1846–1847, came in 1885 under the editorship of St Clair McKelway (b. 1845), editor in 1878–1885 of the Albany *Argus*. The *Times* (evening, 1848), like the *Eagle*, makes a specialty of the news of Long Island. *Brooklyner Freie Presse* (evening, 1864). The *Standard Union* (evening, 1864). The *Citizen* (evening, 1886).

Outside of New York City the most important papers in the political history of the state have been those of Albany. The Albany *Argus*, established in 1813 (daily, 1824), was the organ of the famous Albany Regency. The *Evening Journal* of Albany was established in 1830 by Thurlow Weed, who controlled it for 35 years. After 1865 it became the property of Samuel Wilkeson (1817–1889), and in 1889 William Barnes, Jr., became its editor. The *Argus* and the *Journal* held alternately the valuable state printing. A factional fight in the Democratic party over the printing resulted in the establishment of the *Atlas* in 1843; in 1858 this was consolidated with the *Argus*.

In Buffalo the oldest paper is the *Commercial*, the successor of the Buffalo *Gazette* (1811, weekly), which in 1818 became the *Niagara Patriot* and in 1820 the *Buffalo Patriot*, and in 1834 the *Buffalo Patriot and Commercial Advertiser*. The daily issue began in 1835 as the *Commercial Advertiser*; the weekly was still called by the earlier name. The weekly ceased publication in 1909. In 1890 the daily became the *Commercial*. The first daily in Buffalo was the *Courier* (1828), controlled in 1909 by W. J. Conners. The *Evening Times* (1885) was in 1909 edited by Norman Mack, who was in 1908 treasurer of the Democratic National Committee.

In Rochester are the *Democrat and Chronicle* (morning and weekly; *Democrat*, 1826; *Chronicle*, 1868); *Post-Express* (evening, 1858); *Herald* (morning, 1879); and *Union and Advertiser* (evening, 1826). It was in Rochester that Myron Holly (1779–1841), who had formerly edited the Lyons (N.Y.) *Countryman* (anti-masonic), edited the *Freeman*, an anti-slavery paper; and here in 1847–1860 Frederick Douglass edited the *North Star*, called *Frederick Douglass's Paper* after 1855.

In Syracuse are the *Evening Herald* (1877) and the *Post-Standard* (morning, *Standard*, 1829, and *Post*, 1894, consolidated in 1899).

In Troy are the *Record* (morning and evening, successor to the *Post*, 1812), the *Times* (daily, 1851; weekly, 1856), the *Evening Standard* (1877), and the *Northern Budget* (weekly only, 1797).

The Utica *Herald-Despatch and Daily Gazette* is the successor of the Whitestown *Gazette* (1793); the *Daily Gazette* first appeared in 1842; the *Morning Herald* (1847) was consolidated with it in 1867; and in 1900 it was purchased by the owners of the *Evening Despatch* (1898).

In Catskill, Greene county, New York, was established in August 1792 by Mackay Croswell the *Packet*, which in May 1804 was succeeded by the *Recorder*, which in 1909 was still published as a weekly, the largest in the county. Mackay Croswell's son Edwin Croswell (1797–1871) left the *Recorder* in 1823 and in 1824 became editor of the Albany *Argus*; Croswell was state printer in 1824–1840 and 1844–1847.

Other papers (mostly with small circulations) in New York state founded before 1801 are: the *Gazette* of Hudson (weekly, 1785; daily, *Evening Register*, 1866); the *Register* of Newburgh (1796; now a daily only); the *Washington County Post* of Cambridge (weekly only, 1798); the *Journal* of Ballston Spa (weekly, 1798; *Ballston Daily Journal*, 1894; Republican); and the *Gazette* of Owego (weekly only, 1800).

Ohio.—The *Repository* (weekly, 1815; daily, 1878), formerly the *Ohio Repository*, of Canton, is one of the oldest papers in Ohio. The *Western Hemisphere* of Columbus was purchased in 1836 by Samuel Medary (1801–1864), who changed its name to the *Ohio Statesman*; Medary—the "old wheel horse of Democracy," who is said to have originated the cry of "Fifty-four, forty, or fight!"—was a friend of Stephen A. Douglas and governor of Minnesota in 1857–1858 and of Kansas in 1858–1860; S. S. Cox was editor of the *Statesman* in 1853–1854.

The *Weekly Gazette* of Cincinnati (founded in 1793 as the *Centinel*; in 1804–1815 called the *Liberty Hall*; in 1815–1883 the *Cincinnati Gazette*), and the *Commercial Tribune* (morning; formed in 1896 by the consolidation of the *Commercial Gazette* and *Tribune*), are published by the same firm. In 1825–1840 Charles Hammond (1779–1841), an anti-slavery leader, was editor of the *Gazette*. The *Commercial* was made by Murat Halstead (1829–1908), a prominent Republican politician, and writer of several "campaign lives" of Republican presidential candidates, who was the first editor in the Middle West to get news freely by telegraph. The *Cincinnati Enquirer* (morning, 1842) became a great power in Ohio politics under the ownership (after 1852) of Washington McLean and his son John R. McLean. The *Post* (1880), the *Times-Star* (*Times* 1836), the *Volksblatt* (1836), the *Volksfreund* (daily 1850; weekly 1852), and the *Freie Presse* (1874) are the other large dailies of Cincinnati. In Cincinnati James G. Birney established in 1835 the *Philanthropist*, an anti-slavery paper, which Gamaliel Bailey edited in 1837–1847.

The *Cleveland Leader* (Republican, 1847) was bought in 1853 by Edwin Cowles (1825–1890) and Joseph Medill (after 1855 of the Chicago *Tribune*). Cowles became sole owner in 1854; he was an anti-slavery Whig and one of the founders of the Republican party in the state. The *Leader* of 1853 was a consolidation of the *Cleveland Forest City*, a Whig paper founded in 1849 by Joseph Medill and united in 1852 with the *Free Democrat*. Like the Chicago *Tribune* it was in 1909 controlled by Medill's grandson, Medill McCormick (b. 1877), a son-in-law of M. A. Hanna. The *Press* of Cleveland (evening, independent) was established in 1878 by James Edmund Scripps (1835–1906); with Milton A. McRae (b. 1858) he formed the Scripps-McRae Press Association of Cleveland and the Scripps-McRae League, which included the Cincinnati *Post*, the St Louis *Star-Chronicle*, the Cleveland *Press*, the Kentucky *Post* of Covington, the Columbus *Citizen*, and the *Times*, the *News-Bee* and *Times-Bee* of Toledo. Scripps and McRae organized the Publishers' Press Association of New York, a rival of the Associated Press. Scripps in his later years was a benefactor of the city of Detroit, where he had established (1873) the *Evening News*. The Cleveland *Plain-Dealer* (morning, 1841) is a well-known paper; in its columns appeared the first "Artemus Ward" sketches, contributed by Charles Farrar Browne (1834–1867), who in 1861 went to New York to edit the short-lived humorous *Vanity Fair*. The *Waechter und Anzeiger* (*Waechter* 1852; *Anzeiger* 1872) is published in Cleveland.

The larger papers of Columbus are the *Ohio State Journal* (morning, 1811), the *Press-Post* (evening, 1827), the *Citizen* (evening, 1899), and the *Express und Westbote* (weekly, 1880; Sunday, 1878; daily, 1890—the different editions being under different names). The *News* of Springfield has a weekly edition, the *Weekly Republic*, which was founded in 1817. The *Toledo Blade* (daily, 1848; weekly, 1835) before and during the Civil War contained the attacks on slavery and on political abuses written by "Petroleum V. Nasby," *i.e.* David Ross Locke (1833–1888). The first of these letters (signed "Rev. Petroleum Vesuvious Nasby") appeared in the *Jeffersonian* of Findlay, Ohio, in 1860, when he was its editor. He had edited small papers in Plymouth and Mansfield (O.) before his connexion with the *Blade*; in 1871 he became managing editor of the *Evening Mail* of New York City. Will Carleton (b. 1845) was a member of the *Blade's* staff, and contributed to the *Blade* his first "ballads." The *News-Bee* (evening) of Toledo was formed by the consolidation in 1903 of the *Times* (1846), *News* (1888) and *Bee* (1894), and has a morning edition called the *Times* and a Sunday edition called the *Times-Bee*. The Zanesville *Courier* (Republican; daily, 1846) has a weekly edition dating from 1809 (originally the *Muskingum Messenger*).

Among the smaller newspapers of Ohio the following are more than 100 years old: the *Western Star* of Lebanon (weekly, 1806); the *Ohio Patriot* of Lisbon (weekly, 1808; daily and semi-weekly, 1898); and the *Journal* of Dayton (morning, 1808).

Illinois.—The first newspaper in Illinois was the *Illinois Herald* (1814; succeeded in 1815 by the *Illinois Intelligencer*) of Kaskaskia (then the seat of government); it removed to Vandalia, which then became the capital, in 1820; it became the *Vandalia Whig and Illinois Intelligencer* in 1832; and it ceased publication about 1839, when Springfield became the capital.

The principal papers in Illinois are naturally those of Chicago. The *Chicago Tribune* (morning; 1847) succeeded *The Gem of the Prairie* (1844), and a weekly edition was for a time continued under that name. In August 1848 John Locke Scripps (1818–1866) bought a third interest in the *Tribune* and became its managing editor. In 1852 he sold it to a syndicate of Whig politicians. A part (in 1855) and eventually the whole (in 1874) was bought by Joseph Medill (1823–1899). Horace White (b. 1834) was a reporter on the *Tribune* in 1856, and was its editor and one of its proprietors in 1864–1874; from 1883 to 1903 he was editor-in-chief of the New York *Evening Post*. In 1858 the *Daily Democratic Press*, which J. L. Scripps had established in 1852 with William Bross, was consolidated with the *Tribune* as the *Press and Tribune*; in 1860 the name became the *Tribune* again; the Tribune Company was incorporated in 1861, with J. L. Scripps as its president. The first newspaper published in Chicago, the *Democrat* (November 1833), was merged with the *Daily Tribune* in 1861. The *Inter-Ocean* (morning; 1872), under the editorship (from 1897) of George Wheeler Hinman (b. 1863), has made a specialty of foreign affairs. The *News* (evening; 1875) was founded and developed by Melville E. Stone (b. 1848) as a one-cent evening paper. After 1883 Eugene Field contributed to this paper his column "Sharps and Flats," including much verse. In 1888 Victor Fremont Lawson (b. 1850), who had been associated with Stone, acquired the paper. The *Record* (morning; 1881), started by Lawson, was consolidated in 1901 with the *Herald* (1881) as the *Record-Herald*. The *Evening Post* dates from 1889. In 1900 W. R. Hearst established in Chicago two papers, *Hearst's Evening American* and the *Examiner* (the name assumed in 1902 for his morning *American*). The Chicago German papers include the *Freie Presse* (evening and weekly; 1871), the *Staats-Zeitung* (daily, 1847, weekly—*Westen und Daheim*—1845; evening edition, the *Abend Presse*) and *Abendpost* (1899). The *Skandinaven* (semi-weekly, 1866; daily, 1871) is an important Norwegian-Danish paper; and there are large Bohemian and Polish dailies.

In Springfield, the state capital, there are two party journals, the *Illinois State Journal* (Republican; semi-weekly, 1831; daily, 1848) and the *Illinois State Register* (Democratic; weekly, 1836; daily, 1848).

Michigan.—The *Detroit Free Press* (morning, 1835; with a weekly agricultural edition, *Farm and Live Stock Journal*, 1831) was particularly known in 1869–1891 for the humorous sketches of Charles Bertrand Lewis (b. 1842), who wrote under the pseudonym "M. Quad." The *News* (morning, 1873) was established by J. E. Scripps (1835–1906).

Missouri.—The oldest paper is the *Republic* of St Louis, formerly the *Republican*, founded as a weekly in July 1808, by Joseph Charless, an Irishman who had worked on the *Kentucky Gazette* in Lexington; it was called first the *Missouri Gazette*, then (1809) the *Louisiana Gazette*, then (1812) the *Missouri Gazette* again, and then (1822) the *Missouri Republican*, and in 1886–1888 the *St Louis Republican*; the present name was adopted in 1888. Its first daily issue was in September 1836 and the first Sunday issue in 1848. The *Republican* was originally a Jeffersonian Democratic paper; it opposed Thos. H. Benton; it supported Wm. Henry Harrison in 1840, and became a Whig organ; and from 1856 was a Democratic paper. A *cause célèbre* was the trial in 1830 for the impeachment of Judge James H. Peck of the U.S. District Court for Missouri, who had suspended from practice for 18 months and had imprisoned for 24 hours an attorney, Luke Edward Lawless, who had criticized in the *Republican* Judge Peck's decision in a Spanish land grant case, which was adverse to Lawless, attorney for the plaintiff. William Wirt appeared for Peck, and he was acquitted. Since 1837 the paper has been almost continuously the property of the Knapp and Paschall families. In 1871 the *Republican* purchased a Walter press from *The Times* of London; it introduced stereotyping in 1860, probably before any other newspaper. The *Globe-Democrat* (morning; Republican, 1852) of St Louis early became a valuable property: in 1872 it was sold for $456,100. In St Louis in 1833–1836 Elijah P. Lovejoy published the *Observer*, primarily a religious paper, which because of local opposition to its attacks on slavery he removed in July 1836 to Alton, Ill., where he was killed by a mob.

The *Post-Dispatch* (evening, 1851) is a consolidation made in 1878 by its proprietor Joseph Pulitzer. Pulitzer's first newspaper experience was in 1868 as a reporter on the *Westliche Post* (morning, 1857) of St Louis, which has an evening edition, the *Anzeiger*, a Sunday edition, Mississippi *Blaetter*, and a semi-weekly and weekly edition, *Anzeiger des Westens*. Carl Schurz was editor of the *Westliche Post* in 1867. Another German newspaper in St Louis is *Amerika* (morning; 1872).

The two principal dailies of Kansas City are the *Star* (evening, 1880–1881; with a morning edition, the *Times*, 1838, and a *Weekly Star*, 1890), founded by William R. Nelson (b. 1841); and the *Journal* (morning, 1854; with a weekly edition). The *News-Press* (*News*, 1878; *Press*, 1902; evening) is the principal paper of St Joseph.

North Carolina.—The *Observer* (weekly, 1817; daily, 1896) of Fayetteville. The *News and Observer* (daily; *News*, 1872; *Observer*, 1876) and *North Carolinian* (weekly, 1892) of Raleigh.

South Carolina.—The *News and Courier* of Charleston (*Courier*, established 1803 by Loring Andrews, d. 1805, of Hingham, Mass.; *News*, 1865; consolidated, 1873). The *City Gazette* of Charleston (founded in 1783 as the *South Carolina Weekly Gazette*) was edited by W. G. Simms in 1828–1833, but then failed, after bravely attempting to oppose Nullification, and was finally purchased by the *Courier*. The *State* of Columbia (1891) is one of the most influential papers in the South.

Alabama.—The *News* (evening, 1887) and *Age-Herald* (morning, 1887) of Birmingham. The *Mercury* of Huntsville (weekly, 1816; daily, 1885). The *Register* of Mobile (weekly, 1821). The *Advertiser* of Montgomery (1828). The *Morning Times* of Selma (weekly edition, 1825).

Georgia.—The *Constitution* of Atlanta (daily, 1868; weekly, 1870): Henry W. Grady (1851–1889), the orator, was its editor and proprietor-in-part from 1880 until his death; Joel Chandler Harris was an editor (1890–1901) and contributed the *Uncle Remus* sketches; Frank Lebby Stanton (b. 1857) is well known as a contributor of humorous paragraphs and excellent verse. The *Journal* of Atlanta (1883; semi-weekly, 1885); its proprietor in 1887–1898 was Hoke Smith (b. 1855), U.S. Secretary of the Interior in 1893–1896, and governor of Georgia in 1907–1909. The *Chronicle* of Augusta (1785, semi-weekly; now semi-weekly and, since 1837, daily); originally the *Augusta Chronicle and Gazette of the State*, in 1821 it became the *Augusta Chronicle and Georgia Gazette* (then *Advertiser*); in 1835, the *Augusta Chronicle*; in 1837, when it incorporated the *State's Rights Sentinel*—edited for about a dozen years by Judge Augustus Baldwin Longstreet (1790–1870), son of the inventor William Longstreet, and author of *Georgia Scenes* (1840)—the *Daily Chronicle and Sentinel*; in 1877, after merging with the *Constitutionalist* (founded before 1800), the *Chronicle and Constitutionalist*; James R. Randall (1839–1908), author of "Maryland, my Maryland," was senior editor of the *Chronicle* for some time, having been connected with the *Constitutionalist* after 1866. The *Enquirer-Sun* of Columbus (weekly, 1828; daily, 1858). The *Telegraph* of Macon (semi-weekly, 1826; now daily also). The *Union-Recorder* of Milledgeville (the *Federal Union*, 1829, and the *Southern Recorder*, 1819, united in 1872). The *Tribune* of Rome (1843). The *Morning News* of Savannah (1850).

Louisiana.—The *Picayune* of New Orleans (daily, 1837; weekly, 1841). The *Item* (evening, 1877) of New Orleans. The *Times-Democrat* (daily, 1863; semi-weekly, 1895) of New Orleans. *L'Abeille de la Nouvelle-Orleans* (1827). The *States* (1880) of New Orleans. On all these see NEW ORLEANS. *De Bow's Commercial Review* appeared in New Orleans in 1846–1861, in Charleston and Washington in 1861–1864, and in New York in 1866–1870; it was edited by James Dunwoody Brownson De Bow (1820–1867), formerly (1844–1845) of the *Southern Quarterly Review*, professor (1848–1850) of political economy in the University of Louisiana, director of the state census in 1850–1853, and of the Federal census in 1853–1855. The *Review* was intensely Southern in tone and is a most important "source" for the economic history of the South; from it De Bow extracted *Industrial Resources of the Southern and Western States* (3 vols. New Orleans, 1852–1853).

Florida.—The *Florida Times Union and Citizen* (1865), with daily and semi-weekly editions; and the *Metropolis* (1887), both of Jacksonville. The *Morning Tribune* (weekly, 1870; daily, 1891) of Tampa.

Texas.—The *Statesman* of Austin (1871). The *Morning News* of Dallas, established in 1885 by Alfred H. Belo (1839–1901), who in 1875 bought the *Galveston News* (established 1842) and built up these two papers. The *Post* (1880) and the *Chronicle and Herald* (1901) of Houston.

Tennessee.—The *Journal and Tribune* (*Journal*, 1839, and *Tribune*, 1816, consolidated in 1898) of Knoxville. The *Commercial Appeal* (*Appeal*, 1840; *Avalanche*, 1857; *Commercial*, 1889; consolidated in 1894); and the *News Scimitar* (*Evening Scimitar*, 1880, and *News*, 1902, consolidated in 1904), both of Memphis. The *Banner* (1875), and the *American* (1830), both of Nashville. The first paper published in the state was the *Gazette* (1791) of Rogersville, which removed in 1818 to Knoxville, where it was published for a few years.

Kentucky.—The Louisville *Courier-Journal* (*Journal*, 1830; *Courier*, 1843; *Democrat*, 1844; consolidated 1868), edited by Henry Watterson, who began his connexion with the *Journal* in 1867. The *Herald* (1869) of Louisville. In Frankfort, the *Argus of Western America* was established in 1806; in 1816 Amos Kendall (1789–1869) became part owner and co-editor, and under him the *Argus* was a political power; it was succeeded in 1840 by the *Yeoman*.

Indiana.—The first paper in Indianapolis was the *Gazette* (January 1822), which in 1830 was consolidated with (and took the name of) the *Indiana Democrat*; in 1840 it was reorganized as the *Indiana Sentinel*; in 1851 it was first published as a daily; in 1865 its name was changed to the *Herald*, and in 1868 again to the *Indianapolis Sentinel*; in February 1905 it was bought by the *News* (*v. infra*). The Indianapolis *Journal* (1823) ceased publication in 1904, but was an important Republican sheet especially after 1878, when John Chalfant New (1831–1906) became its editor and proprietor; New was a wealthy banker who was U.S. treasurer in 1875–1876, assistant secretary of the treasury in 1882–1884, and for many years a member (part of the time, treasurer) of the Republican National Committee. The paper was also owned and edited by his son, Harry Stewart New (b. 1858), who was a member of the executive committee of the Republican National Committee. The Indianapolis *News* (evening, 1869) and the *Star* (morning, 1903) are the principal papers in the city. The first paper published in the state was at Vincennes in July 1804 and called the *Western Sun*; it is still published (daily edition since 1879).

Wisconsin.—The principal papers are those of Milwaukee: the *Evening Wisconsin* (1847); the *Sentinel* (morning, 1837), edited in 1845–1861 by Rufus King (1814–1876), who was U.S. minister to the Pontifical States in 1863–1867, and a brigadier of volunteers in the Civil War; the *News* (evening, 1866); the *Free Press* (morning, 1901); the *Germania-Abend-Post* (1872, with a large weekly edition), and the *Kuryer Polski* (evening, 1888).

Minnesota.—The *Journal* (evening, 1878); the *Tribune* (morning, evening and weekly, 1867); and the *Tidende* (daily, 1887; weekly, 1851; Norwegian-Danish) are the principal papers of Minneapolis. In St Paul the best-known paper is the *Pioneer Press* (founded in 1849; daily since 1854); the *Minnesota Pioneer* was the first paper printed in the state, and in 1855 it was consolidated with the *Minnesota Democrat* under the name of *Pioneer and Democrat*; in 1862 it became the *St Paul Pioneer*; and in 1875 after the St Paul *Press* united with it it took the name of the *Pioneer Press*. The other dailies are the *Dispatch* (evening, 1868); the *News* (evening, 1900) and the *Volks Zeitung* (weekly, 1857; daily, 1877).

Kansas.—The Emporia *Gazette* (evening, 1890) is one of the notable smaller city papers of the country; its reputation being due to its editor and proprietor William Allen White (b. 1868). Other papers of interest are the Leavenworth *Times* (morning and weekly, 1857); in Topeka, the *Capital* (daily and semi-weekly, 1879); the *State Journal* (evening and weekly, 1872), and the *Herald* (evening, 1901); and in Wichita, the *Eagle* (morning, 1884, and weekly, 1872).

Nebraska.—The *News* (evening, 1899), the *World-Herald* (morning and evening, weekly and semi-weekly, 1865), and the *Omaha Bee* (morning and evening, 1871) are all of Omaha. The *Bee* was established by Edward Rosewater (1841–1906); his son Victor (b. 1871) succeeding him in 1895 as managing editor. The Rosewaters were prominent in the Republican party and headed the opposition in the state to William Jennings Bryan, who was in 1894–1896 editor of the *World-Herald*. Bryan also founded at Lincoln the *Commoner*, a weekly used by him in spreading his political views and in advancing his candidacy for the presidency. The Lincoln dailies are the *Nebraska State Journal* (morning, 1870; *Evening News*, 1880; *Weekly State Journal*, 1868), the *Star* (evening, 1902); and the evening *Post* (1896).

Iowa.—The Des Moines papers are the *Capital* (evening, 1883), the *News* (evening, 1881), and the *Register and Leader* (morning, *Leader*, 1849, and *Register*, 1856, consolidated in 1902). At Burlington is the *Hawk Eye* (morning, 1839), to which Robert Jones Burdette (b. 1844), associate editor in the seventies, contributed humorous squibs. The Burlington *Evening Gazette*, originally the *Wisconsin Territorial Gazette* (1837), is one of the oldest papers in the state.

Arkansas.—The *Arkansas Gazette* (Democratic; morning and weekly) was first published at Arkansas Post in 1819, then removed to Little Rock.

Colorado.—At Denver are the *Republican* (morning and weekly, 1866); the *Post* (evening, 1893; weekly, 1901); and the *Rocky Mountain News* (morning, 1859; evening, *The Times*, 1872; and a weekly edition).

Arizona.—At Tombstone, the county-seat of Cochise county, is the well-known *Epitaph* (1882), a Sunday edition of the *Prospector* (daily, 1886).

Utah.—At Salt Lake City are the *Deseret Evening News* (daily and semi-weekly, 1850), controlled by the Mormons; the *Salt Lake Tribune* (daily, 1870; semi-weekly, 1894), founded by Godbe and Harrison, opponents of Brigham Young, and always anti-Mormon; and the *Salt Lake Herald* (daily and semi-weekly, 1870). The last named was the principal—and for a time the only—Democratic paper in Utah; in 1901 it was purchased by Senator W. A. Clark, who sold it in August 1909 to Republican politicians.

California.—At San Francisco are the *Call* (morning, 1856), owned by John D. Spreckels (b. 1853), principal owner of the Oceanic Steamship Company, and son of Claus Spreckels the "sugar-king"; the *Examiner* (morning, 1865), founded by Senator George Hearst (1820–1891), the inheritance of which started his son, William Randolph Hearst, in the newspaper business; the *Bulletin* (morning, 1855); the *Chronicle* (morning, 1865; weekly, 1874); the *Evening Post* (1871; weekly edition, 1875), and the *California Demokrat* (morning, 1853; consolidated in 1902 with the *Abend Post*; weekly edition, *California Staats-Zeitung*, 1854). The *Argonaut* (1877) is an able literary weekly.

In Los Angeles the large dailies are the *Times* (morning, 1881; weekly edition, *Saturday Times and Weekly Mirror*, 1873); the *Herald* (morning, 1873); the *Express* (evening, 1871); the *Record* (evening, 1895); and W. R. Hearst's *Examiner* (morning, 1903).

Oregon.—At Portland are the *Morning Oregonian* (1861; weekly edition, 1850) which has a great reputation on the Pacific Coast; the *Oregon Daily Journal* (evening and semi-weekly; 1902); and the *Evening Telegram* (1868).

Washington.—At Seattle are the *Post Intelligencer* (morning, 1867), and the *Times* (evening and weekly, 1861).

4. NEWSPAPERS OF FRANCE

The annals of French journalism begin with the *Gazette* (afterwards called *Gazette de France*), established by Théophraste Renaudot in 1631, under the patronage of Richelieu, and with his active co-operation. Its price was six centimes. Much of its earliest foreign news came direct from the minister, and not seldom in his own hand. Louis XIII. took a keen, perhaps a somewhat childish, interest in the progress of the infant *Gazette*, and was a frequent contributor, now and then taking his little paragraphs to the printing office himself, and seeing them put into type. Renaudot was born at Loudun in 1584, studied medicine in Paris and at Montpellier, established himself in the capital in 1612, and soon became conspicuous both within and beyond the limits of his profession. Endowed by nature with great energy and versatility, he seems at an early period of his career to have attracted the attention of the great cardinal, and to have obtained permission to establish a sort of general agency office, under the designation of "Bureau d'Adresses et de Rencontre." An enterprise like this would, perhaps, naturally suggest to such a mind as Renaudot's the advantage of following it up by the foundation of a newspaper. According to some French writers, however, the project was formed by Pierre d'Hozier, the genealogist, who carried on an extensive correspondence both at home and abroad, and was thus in a position to give valuable help; according to others by Richelieu himself. Be this as it may, Renaudot put his hand zealously to the work, and brought out his first weekly number in May 1631. So much, at least, may be inferred from the date (4th July 1631) of the sixth number, which was the first *dated*

Gazette de France.

publication, the five preceding numbers being marked by "signatures" only—A to E. Each number consists of a single sheet (eight pages) in small quarto, and is divided into two parts—the first simply entitled *Gazette*, the second *Nouvelles ordinaires de divers endroits*. For this division the author assigns two reasons—(1) that two persons may thus read his journal at the same time, and (2) that it facilitates a division of the subject-matter, the *Nouvelles* containing usually intelligence from the northern and western countries, the *Gazette* from the southern and eastern. He commonly begins with foreign and ends with home news, a method which was long and generally followed, and which still obtains. Once a month he published a supplement, under the title of *Relation des nouvelles du monde, reçues dans tout le mois*. In October 1631 Renaudot obtained letters patent to himself and his heirs, conferring the exclusive privilege of printing and selling, where and how they might please, "the gazettes, news and narratives of all that has passed or may pass within and without the kingdom." His assailants were numerous, but he steadily pursued his course, and at his death in October 1653 left the *Gazette* to his sons in flourishing circumstances. In 1752 the title *Gazette de France* was first used. Under this designation it continued to appear until the 24th August 1848. During the five days which followed that date it was suspended; on the 30th it was resumed as *Le Peuple français, journal de l'appel à la nation*, and again modified on the 14th September to *L'Étoile de la France, journal des droits de tous*. On the 25th October it became *Gazette de France, journal de l'appel à la nation*; and under this title it continued.

Jean Loret's rhymed *Gazette* (1650 to March 1665) will always have interest in the eyes of students who care less for the "dignity" of history than for the fidelity of its local colouring and the animation of its backgrounds. It were vain to look there for any deep appreciation of the events of those stormy times; but it abounds in vivid portraits of the men and manners of the day. It paints rudely, yet to the life, the Paris of the Fronde, with all its effervescence and depression, its versatility and fickleness, its cowardice and its courage.

Mercure de France.

Of the *Mercure galant*, established by Donneau de Vizé in 1672, with Thomas Corneille for its sub-editor, it may be said that it sought to combine the qualities of the *Gazettes*, both grave and gay. Like the *Gazette de France*, it contained the permitted state news and court circulars of the day. Like Loret's *Gazette*, it amused its readers with satirical verses, and with sketches of men and manners, which, if not always true, were at least well invented. Reviews and sermons, law pleas and street airs, the last reception at the Academy and the last new fashion of the milliners, all found their place. De Vizé carried on his enterprise for more than thirty years, and at his death (1710) it was continued by Rivière du Fresny. The next editor, Lefèvre de Fontenay, altered the title to *Nouveau Mercure*, which in 1728 was altered to *Mercure de France*, a designation retained, with slight modification, until 1853. The *Mercure* passed through many hands before it came into those of Panckoucke, at the eve of the Revolution. Amongst its more conspicuous writers, immediately before this change, had been Raynal and Marmontel. The latter, indeed, had for many years been its principal editor, and in his *Mémoires* has left us a very interesting record of the views and aims which governed him in the performance of an arduous task. He there narrates the curious fact that it was Madame de Pompadour who contrived the plan of giving pensions to eminent men of letters out of the profits of the *Mercure*. To one of Marmontel's predecessors the "privilege," or patent, had been worth more than £1000 sterling annually. This revenue was now to be shared amongst several, and to become a means of extending royal "patronage" of literature at a cheap rate. It is to this pension scheme, too, that we owe the *Contes Moraux*. Marmontel, who had long before lost his "patent" by an act of high-minded generosity, continued to share in the composition of the literary articles with Chamfort and La Harpe, whilst Mallet du Pan, a far abler writer than either, became the most prominent of the political writers in the *Mercure*. In 1789 he contributed a series of remarkable articles on the well-known book of de Lolme; and in the same year he penned some comments on the "Declaration of the Rights of Man," very distasteful to violent men of all parties, but which forcibly illustrate the pregnant truth they begin with: "The gospel has given the simplest, the shortest and the most comprehensive 'Declaration of the Rights of Man,' in saying, 'Do unto others as you would that they should do unto you.' All politics hinge upon this."

In 1790 the sale of the *Mercure* rose very rapidly. It attained for a time a circulation of 13,000 copies. Mirabeau styled it in debate "the most able of the newspapers." Great pains were taken in the collection of statistics and state papers, the absence of which from the French newspaper press had helped to depress its credit as compared with the political journalism of England and to some extent of Germany. But, as the Revolution marched on towards a destructive democracy, Mallet du Pan evinced more and more unmistakably his rooted attachment to a constitutional monarchy. And, like so many of his compatriots, he soon found the tide too strong for him. The political part of the *Mercure* (in 1791 its title was altered to *Mercure français*) changed hands, and after the 10th August 1792 its publication was suspended.

Moniteur universel.

All this time the *Moniteur* (*Gazette nationale, ou le moniteur universel*), founded in 1789, was under the same general management. The first idea, indeed, of this famous official journal appears to have been Panckoucke's, but it did not firmly establish itself until he had purchased the *Journal de l'assemblée nationale*, and so secured the best report of the debates. The *Moniteur*, however, kept step with the majority of the assembly, the *Mercure* with the minority. So marked a contrast between two journals, with one proprietor, gave too favourable a leverage to the republican wits not to be turned to good account. Camille Desmoulins depicted him as Janus—one face radiant at the blessings of coming liberty, the other plunged in grief for the epoch that was rapidly disappearing.

When resumed, after a very brief interval, the *Mercure français* became again *Mercure de France*—its political importance diminished, whilst its literary worth was enhanced. During the later days of the Revolution, and under the imperial rule, its roll of contributors included the names of Geoffroy, Ginguené, Morellet, Lacretelle, Fontanes and Chateaubriand. The statesman last named brought upon the *Mercure* another temporary suppression in June 1807 (at which date he was its sole proprietor), by words in true unison with the noblest deed of his chequered career—his retirement, namely, from the imperial service on the day that the news of the execution of the duke of Enghien reached him, being the day after he had been appointed by Napoleon a minister plenipotentiary.

Thus it chanced that alike under the brilliant despotism of Napoleon and under the crapulous malversation of Louis XV. the management of the *Mercure* was revolutionized for protests which conferred honour upon the journal no less than upon the individual writers who made them. Resumed by other hands, the *Mercure* continued to appear until January 1820, when it was again suspended. In the following year it reappeared as *Le Mercure de France, au dix-neuvième siècle*, and in February 1853 it finally ceased.

Journal de Paris.

The only other newspaper of a date anterior to the Revolution which needs to be noticed here is the first French daily, the *Journal de Paris*, which was started on New Year's Day of 1777. It had but a feeble infancy, yet lived till 1819. Its tameness, however, did not save it from sharing in the "suspensions" of its predecessors. After the Revolution such men as Garat, Condorcet and Regnaud de St. Jean d'Angély appear amongst its contributors, but those of earlier date were obscure. Its period of highest prosperity may be dated about 1792, when its circulation is said to have exceeded 20,000.

The police adventures of the writers of the MS. news-letters, or *Nouvelles à la main*, were still more numerous, and, if we

may judge from the copious specimens of these epistles which yet survive, must also not unfrequently have arisen from lack of official employment, rather than from substantial provocation. Madame Doublet de Persan, the widow of a member of the French board of trade, was a conspicuous purveyor of news of this sort. For nearly forty years daily meetings were held in her house at which the gossip and table-talk of the town were systematically (and literally) *registered*; and weekly abstracts or epitomes were sent into the country by post. Piron, Mirabaud, Falconet, D'Argental and, above all, Bachaumont, were prominent members of the "society," and each of them is said to have had his assigned seat beneath his own portrait. The lady's valet-de-chambre appears to have been editor *ex officio*; and as he occasionally suffered imprisonment, when offensive newsletters had been seized by the police, so responsible a duty was doubtless "considered in the wages." News and anecdotes of all kinds—political and literary, grave, gay or merely scandalous—were all admitted into the *Nouvelles à la main*; and their contents, during a long series of years, form the staple of those *Mémoires secrets pour servir à l'histoire de la république des lettres* which extend to thirty-six volumes, have been frequently printed (at first with the false imprint "Londres: John Adamson, 1777–89"), and are usually referred to by French writers as the *Mémoires de Bachaumont*.

Nouvelles à la main.

The journalism of the first Revolution has been the theme of many bulky volumes, and only a very casual glance at this part of our subject can be given to it here. When at least one half of the French people was in a ferment of hope or of fear at the approaching convocation of the states-general, most of the existing newspapers were still in a state of torpor. Long paragraphs, for example, about a terrible "wild beast of the Gevaudan"—whether wolf or bear, or as yet nondescript, was uncertain—were still current in the Paris journals at this momentous juncture. Mirabeau was among the foremost to supply the popular want. His *Lettres à ses commettants* began on the 2nd May 1789, and with the twenty-first number became the *Courrier de Provence*. Within a week Maret (afterwards duke of Bassano) followed with the *Bulletin des séances de l'assemblée nationale*, and Lehodey with the *Journal des états généraux*. In June Brissot de Warville began his *Patriote français*. Gorsas published the first number of his *Courrier de Versailles* in the following month, from which also dates the famous periodical of Prudhomme, Loustalot and Tournon, entitled *Révolutions de Paris*, with its characteristic motto—"Les grands ne nous paraissent grands que parce que nous sommes à genoux; levons nous!" In August 1789 Baudouin began the *Journal des débats* (edited in 1792 by Louvet) and Marat the *Ami du Peuple* (which at first was called *Le Publiciste parisien*). The *Moniteur universel* (of which we have spoken already) was first published on the 24th November, although numbers were afterwards printed bearing date from the 5th May, the day on which the states-general first assembled. Camille Desmoulins also commenced his *Révolutions de France et de Brabant* in November 1789. The *Ami du roi* was first published in June 1790, *La Quotidienne* in September 1792.

Newspapers of the Revolution.

Journal des débats and Moniteur

The *Moniteur* and *Débats* survived, but most of these papers expired either in the autumn of 1792 or with the fall of the party of the Gironde in September 1793. In some of them the energy for good and for evil of a whole lifetime seems to be compressed into the fugitive writings of a few months. Even the satirical journals which combated the Revolution with shafts of ridicule and wit, keen enough after their kind, but too light to do much damage to men terribly in earnest, abound with matter well deserving the attention of all students desirous of a thorough knowledge of the period.

The consular government began its dealings with the press by reducing the number of political papers to thirteen. At this period the number of daily journals had been nineteen, and their aggregate provincial circulation, apart from the Paris sale, 49,313, an average of 2600 each.

Under Napoleon the *Moniteur* was the only political paper that was really regarded with an eye of favour. Even as respects the nation at large, the monstrous excesses into which the Revolutionary press had plunged left an enduring stigma on the class. When Bertin acquired the *Journal des débats* from Baudouin, the printer, for 20,000 francs, he had to vanquish popular indifference on the one hand, as well as imperial mistrust on the other. The men he called to his aid were Geoffroy and Fievée; and by the brilliancy of their talents and the keenness of his own judgment he converted the *Débats* into a paper having 32,000 subscribers, and producing a profit of 200,000 francs a year. When the imposition of a special censorship was threatened in 1805, at the instance of Fouché, a remarkable correspondence took place between Fievée and Napoleon himself, in the course of which the emperor wrote that the only means of preserving a newspaper from suspension was "to avoid the publication of any news unfavourable to the government, until the truth of it is so well established that the publication becomes needless." The censorship was avoided, but Fievée had to become the responsible editor, and the title was altered to *Journal de l'empire*—the imperial critic taking exception to the word *Débats* as "inconvenient." The old title was resumed in August 1815. The revolution of July did but enhance the power and the profit of the paper. It has held its course since with uniform dignity, as well as with splendid ability, and may still be said, in the words which Lamartine applied to it in an earlier day, to have "made itself part of French history."

Shortly before the *Journal de l'empire* became again the *Journal des débats* (in 1815), a severance occurred amidst both the writers and subscribers. It led to the foundation of the *Constitutionnel*, which at first and for a short time bore the title of *L'Indépendant*. The former became, for a time, the organ of the royalists *par excellence*, the latter the leader of the opposition. In 1824, however, both were in conflict with the government of the day. At that date, in a secret report addressed to the ministry, the aggregate circulation of the opposition press of Paris was stated at 41,330,[1] while that of the government press amounted only to 14,344.[2]

The rapid rise of the *Constitutionnel* was due partly to the great ability and influence of Jay, of Étienne, of Béranger and of Saint Albin (who had been secretary to Carnot in his ministry of 1815), all of whom co-operated in its early editorship, and partly to its sympathy with the popular reverence for the memory of Napoleon, as well as to the vigorous share it took in the literary quarrel between the classicists and romanticists. Its part in bringing about the revolution of 1830 raised it to the zenith of its fortunes. For a brief period it could boast of 23,000 subscribers at 80 francs a year. But the invasion of cheap newspapers, and that temporary lack of enterprise which so often follows a brilliant success, lowered it with still greater rapidity. When the author of the *Mémoires d'un bourgeois*, Dr Véron, purchased it, the sale had sunk to 3000. Véron gave 100,000 francs for the *Juif errant* of Sue, and the Sue fever rewarded him for a while with more than the old circulation. Afterwards the paper passed under the editorship of Césena, Granier de Cassagnac, and La Guéronnière.

Constitutionnel.

The cheap journalism of Paris began in 1836 (1st July) with the journal of Girardin, *La Presse*, followed instantly by *Le Siècle*, under the management of Dutacq, to whom, it is said—not incredibly—the original idea was really due. The first-named journal attained a circulation of 10,000 copies within three months of its commencement of and soon doubled that number. The *Siècle* prospered even more strikingly, and in a few years had reached a circulation (then without precedent in France) of 38,000 copies.

La Presse and Le Siècle.

The rapid growth of the newspaper press of Paris under

[1] *Le Constitutionnel*, 16,250; *Journal des débats*, 13,000; *La Quotidienne*, 5800; *Le Courrier français*, 2975; *Journal de commerce*, 2380; *L'Aristarque*, 925.

[2] *Journal de Paris*, 4175; *L'Étoile*, 2749; *Gazette de France*, 2370; *Le Moniteur*, 2250; *Le Drapeau blanc*, 1900; *Le Pilote*, 900.

Louis-Philippe will be best appreciated from the fact that, while in 1828 the number of stamps issued was 28 millions, in 1836, 1843, 1845 and 1846 the figures were 42, 61, 65 and 79 millions respectively. At the last-mentioned date the papers with a circulation of upwards of 10,000 were (besides the *Moniteur*, of which the circulation was chiefly official and gratuitous) as follows: *Le Siècle*, 31,000; *La Presse* and *Le Constitutionnel*, between 20,000 and 25,000; *Journal des Débats* and *L'Époque*, between 10,000 and 15,000.

If we cast a retrospective glance at the general characteristics (1) of the newspaper press of France, and (2) of the legislation concerning it, between the respective periods of the devastating revolution of 1793–1794 and the scarcely less destructive revolution of 1848, it will be found that the years 1819, 1828, 1830 (July), and 1835 (September) mark epochs full of pregnant teaching upon our subject. We pass over, as already sufficiently indicated, the newspaper licence of the first-named years (1793–1794), carried to a pitch which became a disgrace to civilization, and the stern Napoleonic censorship which followed it—also carried to an excess, disgraceful, not, indeed, to civilization, but to the splendid intellect which had once given utterance to the words, "Physical discovery is a grand faculty of the human mind, but literature is the mind itself."

The year 1819 is marked by a virtual cessation of the arbitrary power of suppression lodged till then in the government, and by the substitution of a graduated system of preliminary bonds and sureties (" cautionnements ") on the one hand, and of strict penalties for convicted press-offences on the other. This initiatory amelioration of 1819 became, in 1828, a measure of substantial yet regulated freedom, which for two years worked, in the main, alike with equity towards the just claims of journalism as a profession and with steady development towards the public of its capabilities as a great factor in the growth of civilization. Those two years were followed by a widely contrasted period of five years. That was a term of entire liberty often grossly abused, and fitly ending with the just and necessary restrictions of September 1835. But that period of 1830–1835 was also signalized by some noble attempts to use the powers of the newspaper press for promoting the highest and the enduring interests of France. Not least memorable amongst these was the joint enterprise of Montalembert and Lamennais—soon to be aided by Lacordaire,—when, by the establishment (October 1830) of the newspaper *L'Avenir*, they claimed for the church of France " her just part in the liberties acquired by the country," and asserted for the sacred symbols of Christianity their lawful place, alike above the tricolor and above the lilies. " Dieu et la liberté " was the motto which Montalembert chose for his newspaper, as he had chosen it long before for the guiding star of his youthful aspirations. *L'Avenir* existed only for one year and one month. It came to its early end from no lack of energy and patience in its writers, but in part from that mission of the editors to Rome (November 1831) which, at least for a time, necessitated the discontinuance of their newspaper. Human regrets had higher than human consolations. " Our labours " on *L'Avenir*, wrote Montalembert, with simple truth, " decided the attitude of Catholics in France and elsewhere, from the time of the July revolution to the time of the second empire."

There were many other papers, at this time and afterwards, which, like *L'Avenir*, were, in their degree, organs of ideas, not speculations of trade. But they cannot be even enumerated here. No very notable specially religious paper succeeded *L'Avenir* until the foundation in 1843—under widely different auspices, although twice at the outset the editorship was offered to Lacordaire—of *L'Univers Religieux*. That journal was edited, at first, by De Coux, then by Louis Veuillot; it underwent innumerable lawsuits, " warnings," suppressions and interdicts, for causes very diverse. Several prelates suppressed *L'Univers Religieux* in their respective dioceses, amongst them the great bishop Dupanloup in that of Orleans (1853). Napoleon III. suppressed it in 1861, permitted it to reappear as *Le Monde*, and suspended it many times afterwards; but it survived all its misfortunes for a good many years. *Le Monde* had the curious fate, at one time, of being conducted jointly by the first editor of *L'Avenir*, Lamennais, and by George Sand, who had previously figured in the newspaper annals of France as co-foundress of *L'Éclaireur de l'Indre*, a journal published at Orleans. The account given by that brilliant writer of her adventures in what was then to her a new department of activity is an instructive one. With that breadth of sympathy which was so characteristic of her, she strove to interest all her friends (however varied in character, as in rank) in the enterprise. There is, perhaps, scarcely anything more amusing in French journalistic annals than is her (contemporary) account of the first meeting of the shareholders—at which, she tells us, about five hundred resolutions were moved for the guidance of the editor at his desk.

The impulse given to the growth of advertisements in the days which followed July 1830, became, as the years rolled on, sufficiently developed to induce the formation of a company—in which one of the Laffittes took part—to farm them,[1] at a yearly rent of £12,000 sterling (300,000 francs), so far (at first) as regarded the four leading journals (*Débats, Constitutionnel, Siècle, Presse*), to which were afterwards added two others (*Le Pays* and *La Patrie*). The combination greatly embarrassed advertisers, first, since its great aim was to force them either to advertise in all, whether addressing the classes intended to be canvassed or not, or else to pay for each advertisement in a selected newspaper the price of many proffered advertisements in all the papers collectively, and, secondly, because by many repetitions in certain newspapers no additional publicity was really gained, two or three of the favoured journals circulating for the main amongst the same class of buyers. *La France* was then the newspaper of the Conservative aristocracy of the nation; *Le Monde* and the *Union* more especially addressed the clergy; the *Débats* and the *Temps* were the journals of the upper mercantile class, the *Siècle* and *L'Opinion* of the lower or shopkeeping class. A man who asked to advertise briefly, in the *Siècle*, for example, alone, was charged 2 francs for each several insertion. If he went the round of the six, his advertisement cost him only 75 centimes per journal, for ten successive insertions in each of them, all round.

To a great extent, the inundation of newspapers which followed the revolution of February 1848 was but a parody on the revolutionary press of 1793. Most of them, of course, had very short lives. When Cavaignac took the helm he suppressed eleven journals, including *La Presse* and *L'Assemblée Nationale*. The former had at this period a circulation of nearly 70,000, and its proprietor, in a petition to the National Assembly, declared that it gave subsistence to more than one thousand persons, and was worth in the market at least 1,500,000 francs. In August the system of sureties was restored. On the 13th June 1849 the president of the republic suspended *Le Peuple, La Révolution Démocratique et Sociale, La Vraie République, La Démocratie Pacifique, La Réforme* and *La Tribune des Peuples*. On July 16, 1850, the assembly passed what is called the " Loi Tinguy " (from the name of the otherwise obscure deputy who proposed it), by which the author of every newspaper article on any subject, political, philosophical or religious, was bound to affix his name to it, on penalty of a fine of 500 francs for the first offence, and of 1000 francs for its repetition. Every false or feigned signature was to be punished by a fine of 1000 francs, " together with six months' imprisonment, both for the author and the editor." The practical working of this law lay in the creation of a new functionary in the more important newspaper offices, who was called " secrétaire de la rédaction," and was, in fact, the scapegoat *ex officio*. The " Loi Tinguy," though now long repealed, has had a permanent influence on French journalism in the continued prevalence of signed articles, and the consequent prominence of individual writers as compared with the same class of work in other countries. In February 1852 all the press laws were incorporated, with increased stringency, into a " Décret organique sur la presse." The stamp duty for each sheet was fixed at 6 centimes, within certain dimensions, and a proportional increase in case of excess. *Loi Tinguy.*

In 1858 the order of the six leading Parisian papers in point of circulation was—(1) *Siècle*, (2) *Presse*, (3) *Constitutionnel*, (4) *Patrie*, (5) *Débats*, (6) *Assemblée Nationale*. The number of provincial papers exceeded five hundred. " Newspapers, nowadays," wrote a keenly observant publicist in that year, " are almanacs, bulletins, advertising mediums, rather than the guides and the centres of opinion." In 1866 the change had become more marked still. The monetary success of Girardin's many commercial speculations in this branch of commerce greatly increased the number of Parisian journals, whilst lowering the status of those of established rank. The aggregate daily issue of the Parisian " dailies " had increased to about 350,000 copies, but the evening paper, *Le Petit Moniteur*, alone issued nearly 130,000 of these. The average circulation of *Le Siècle* had fallen from 55,000 to 45,000 copies; that of *La Patrie* was reduced by one-half (32,000 to 16,000); that of *Le Constitutionnel* from 24,000 to 13,000; of *L'Opinion Nationale* from 18,000 to 15,000; whilst the chief journal of all—with grand antecedents and with a brilliant history of public service rendered—had for a time descended, it is said, from 12,000 copies to 9000. And yet almost over the whole of this very period the brilliant " Lundis " of Sainte-Beuve were making their punctual appearance in *Le Constitutionnel*, to be presently continued in *Le Moniteur* and in *Le Temps*; and writers like St Marc Girardin, Cuvillier-Fleury, and Prévost-Paradol were constantly writing in the *Journal des Débats*. Meanwhile, Villemessant and his colleagues were making their fortunes out of *Le Figaro* (begun 1854, but a daily from 1866), and helping to make frivolous petty " paragraphs " on matters of literature almost everywhere take the place of able and well-elaborated articles. Well might Albert Sorel say,[2] " Our trumpery newspapers are the newspapers that pay." In 1872 the circulation of *Le Petit Journal* (founded 1863), the pioneer of the French halfpenny press, was 212,500, and it went on rapidly increasing.

No incident in the newspaper history of this period made more temporary noise than did the strange charges brought in 1867 against the *Débats*, the *Siècle* and *L'Opinion Nationale*, by M. Kerveguen, member for Toulon, in the French assembly. He charged them

[1] Or, to speak more precisely, to farm a certain conspicuous page of each newspaper, in perpetuity.

[2] When comparing the French newspaper press as it stood in 1873 with that of Germany, in the *Revue des deux Mondes*, article " La Presse Allemande," vol. ii. of 1873, p. 715.

collectively with receiving bribes, both from the government of Prussia and from that of Italy—upon the faith, as it afterwards appeared, of statements made by another newspaper, not of France but of Belgium, *La Finance*. An elaborate inquiry, presided over by M Berryer, pronounced the accusation to be absolutely groundless. Yet it was soon revived by *Le Pays*, in the shape of a specific charge against an individual editor of *Le Siècle*—La Varenne. All that was eventually proved, in due course of law, was merely the agency in Paris of La Varenne for the Italian government, at a time prior to the events of 1866.

In 1874 an elaborate return showed that in thirty-five principal towns of France, comprising a population of 2,566,000, their respective journals had an aggregate weekly issue of 2,800,000 copies.

In 1878 the total number of journals of all kinds published in France was 2200. Of these 150 were political, strictly speaking, of which Paris published 49. Of Parisian journals other than political there were 1141 (including 71 religious, 104 legal, 153 commercial, 134 technological, 98 scientific and medical, 59 artistic). At that date *Le Figaro* had a circulation of about 70,000, *Le Petit Journal* (at a halfpenny) one of about 650,000.

The principal Parisian newspapers in 1883 may be classified thus—

(*a*) Organs of the Legitimists and of the Church of France: *Gazette de France*, *Le Monde*, *L'Union*, *La Défense*, *La Civilisation*, *L'Univers*.

(*b*) Orleanist organs: *Le Moniteur Universel*, *Le Constitutionnel*, *Le Français* (under the auspices of the Duc de Broglie), *Le Soleil*.

(*c*) Bonapartist organ: *Le Pays* (edited at one time by Lamartine).

(*d*) Republican organs: *Journal des Débats*, *Le Temps* (founded 1861, with the title of the earlier *Temps* of 1829–1842), *Le Siècle*, *Le XIX. Siècle*, *Le Paix*, *La Justice*, *Paris*, *La République Française* (founded in 1871 by Gambetta), *Le Parlement* (founded by Dufaure), the Socialist *La Petite République* (1875).

The law concerning the liberty of the press, of July 29, 1881, abolished suretyship for newspapers, and transferred their registration from the ministry of justice at Paris to the local representative of the attorney-general (*le parquet*) in each town respectively. It made the establishment of a newspaper virtually free, upon legal deposit of two copies, and upon due registration of each newspaper under the simple guarantee of a registered director, French by birth, responsible in case of libel. And it took away the former discretionary power, lodged in the home office, of interdicting the circulation in France of foreign journals. The home minister might still prohibit a single number of a newspaper; only the whole council of ministers, duly convened, could prohibit the circulation of a foreign newspaper absolutely.[1]

Later developments.

The newspapers of Paris, and similarly of France, practically doubled in number between 1880 and 1900. In 1880 there were about 120 Paris newspapers, in 1890 about 160, and in 1900 about 240. The total number of newspapers, as distinguished from periodicals, published in France during 1900 was in round numbers 2400. Of these, about 2160 appeared in 540 provincial towns.

The history of the French press during the last twenty years of the 19th century followed very closely that of the country itself, Boulangist and anti-Boulangist, Dreyfusist or anti-Dreyfusist, Republican or Nationalist; finally it became either Moderate Republican or Radical-Socialist with a sprinkling of Nationalist organs and a small minority of Royalist and Bonapartist sheets.

At the head of the Moderate Republican organs were *Le Temps* and *Le Journal des Débats* among the evening papers, and *Le Figaro*, *Le Journal*, *Le Siècle*, *Le Petit Parisien* and *Le Petit Journal* among the morning dailies. *Le Figaro* was until 1901 under the editorship of M. F. de Rodays, and the brilliant articles of M. J. Cornély were one of the features of the paper; but a dispute among the proprietors in 1901 resulted in the dismissal of M. Cornély and the retirement of M. de Rodays. M. Jean Dupuy (a member of the Waldeck-Rousseau government) was the proprietor and editor of *Le Petit Parisien*, a popular organ almost rivalling *Le Petit Journal*; the circulation of the latter had, however, reached over one million and a quarter copies daily.

Le Matin and *L'Éclair*, among the Moderate Republican organs, gave less attention to the discussion of political questions from the party point of view than to the collection of news, and they were followed by the *Écho de Paris* (1884). *Le Matin*, which also dates from 1884, was from its origin essentially what is called in France a *journal d'informations*, publishing every morning a mass of telegraphic news from all countries. By an arrangement with the London *Times*, it gave every day a translation of most of the telegrams published in that newspaper.

In April 1901 the proprietorship of *Le Siècle* was changed, in consequence of the lack of support given by Parisian readers to that journal as edited by M. Yves Guyot (formerly minister of public works). The latter was a staunch free-trader, a courageous defender of Captain Dreyfus, and an eloquent advocate of a good understanding between France and England; he emphatically endorsed the British policy in South Africa, and tried to explain it to his countrymen. The paper was, however, bought in by a number of friends of M. Yves Guyot, who remained as editor. The greatest opponent of Yves Guyot from the economic point of view was Jules Méline, also a former minister, whose paper, *La République*, was the recognized organ of Protectionism.

The Radical and Socialist ideas which in latter years made such progress in France were very ably advocated by several newspapers whose influence steadily grew, such as *L'Aurore*, *La Lanterne* and *L'Humanité* (the organ of Jean Jaurès). Such individual organs of opinion must also be mentioned as *L'Intransigéant*, the organ of Henri Rochefort, and M. Clemenceau's organ, *Le Bloc*, in which he advocated the practical application of all of the revolutionary republican principles, pure and unadulterated, forming a whole (*bloc*), no part of which could or ought to be sacrificed to temporary political necessities.

As an intermediate link between the Republican organs of all shades and the various Monarchist newspapers, came the so-called Nationalist press, an offshoot of or successor to the Boulangist press of the preceding decade. As were the Boulangists, so were the Nationalists, a sort of *syndical des mécontents*, their chief organs being *La Patrie*, edited by M. Millevoye, and *La Cocarde*; these papers represented the views of those who had vague hankerings after a different *régime* and a decided hostility towards the republican form of government.

There was a considerable diminution of influence in the Monarchist press. *Le Soleil*, however, had a large circle of readers among the Conservative *bourgeoisie* with Orleanist leanings. *Le Gaulois* remained a Royalist paper of somewhat doubtful tendencies, the editor, M. Arthur Meyer, having incurred the displeasure of the Pretender whose cause he defended. Of the old Legitimist press there remained the old *Gazette de France*, which was founded in 1631 and had still a diminishing band of faithful readers. The organ of the religious (Roman Catholic) associations in France, *La Croix*, founded in 1880, represented the views of the French religious associations, and discussed all questions from the point of view of Catholic interests. *La Croix* was published in Paris, but had in the provinces one hundred and four local weekly supplements to the Paris edition, each one taking its name from the parent journal and adding to it the name of the department or locality in which it was printed: such as *La Croix de l'Allier*, *La Croix de Lyon*.

The French papers, of whatever party, took an increased interest during this period in foreign matters, and much improved

[1] The history of French journals published abroad is interesting. The *Annales politiques* of Linguet—for a time of Linguet and Mallet du Pan jointly—was, from about 1770 to about 1785, almost a power in Europe, in its way. Mallet du Pan's own *Mercure Britannique*, during the eventful years 1798–1800, was brilliant, sagacious and honest. When the pen literally fell from his dying hand—a hand that had kept its integrity under the pains of exile and of bitter poverty—that pen was taken up (for a short interval) by Malouet. When Napoleon forcibly suppressed, a little later, the *Courrier de l'Europe* of the count of Montlosier, he offered the deprived editor a pension, which was refused, until accompanied by the offer of a post in which the able minister of Louis XVI. could still work for his country.

English journalism in France was for long associated with *Galignani's Messenger*, started by Giovanni Antonio Galignani (1757–1822) in 1814, and turned into a daily just before his death. Its palmy days were between 1814 and 1848. In 1895 it was turned into the *Daily Messenger*, but proved a failure and was dropped in 1904: it was really killed by the competition of the Paris edition of the *New York Herald*. It had been preceded by Sampson Perry's *Argus* (1809), a Napoleonic organ. In May 1905 a new era of English journalism on the continent began by the institution of the Paris edition of the London *Daily Mail*.

their organization for collecting news. Some of them, in fact, were almost exclusively news-sheets, and the *journal d'informations*—*Le Matin* or *L'Éclair*, for instance—took its place beside the *journal* properly so called, more perhaps as a rival than as a complement. The natural result followed, and the more old-type newspapers took steps to provide their readers with news as well as with leading articles, current and literary topics, society gossip, dramatic criticism and law reports. The most remarkable as well as perhaps the earliest attempt to enlarge the scope of Parisian newspapers was made in 1893 by Georges Patinot, editor of the *Journal des Débats*. Instead of one edition, that newspaper published two entirely distinct editions, a morning one and an evening one. After some time the plucky attempt had to be given up, and the *Journal des Débats* became an evening paper. The bold experiment made by the *Journal des Débats* (which celebrated its centenary in 1889) led the other newspapers to find a happy mean between a four-page paper published twice a day and an eight-page paper on the pattern of English newspapers, and the result was that now most great daily papers in Paris came out with six pages, the *Figaro* giving the lead. As French newspapers increased in size they reduced their price. Most six-page newspapers, with the exception of *Le Figaro*, were by 1902 sold at 5 centimes, and the price of 15 centimes, which used to be the rule, became the exception. In 1902 60 Paris papers (daily and weekly) were sold at 5 centimes and 51 at 10 centimes, whilst only 11 cost 15 centimes. In 1880 only 23 were 5-centime papers and 24 were 10-centime papers.

The American style of journalism came into vogue in Paris in the 'eighties, and "interviews" were frequent; but the general tendency of Parisian editors was to adopt the English compromise, and to eschew any extreme sensational methods. Most of the important Parisian newspapers had their special correspondents in the great capitals of Europe, London, Berlin, St Petersburg, Vienna and Rome. Nothing perhaps was so striking after 1890 as the demand of the French public for foreign and colonial news, or the readiness of the papers to supply it by means of special representatives independent of the news agencies.

In home matters the French press made greater progress still in the rapid and accurate collection of news, and in this respect the provincial press showed more enterprise and more ability than that of Paris. Its development was remarkable, for whereas in 1880 the inhabitants of the departments had to await the arrival of the Parisian papers for their news, they now had the advantage of being supplied every morning with local newspapers inferior to none of the best organs of Paris. Among the best provincial papers may be mentioned *La Gironde* and *La Petite Gironde* of Bordeaux, *La Dépêche* of Toulouse, *Le Lyon Républicain*, *L'Écho du Nord* of Lille, *Le Journal de Rouen*, all having a staff in Paris engaged in collecting news, reporting parliamentary proceedings and law cases, telegraphed or telephoned during the night and published early the next morning in their respective localities. Being perfectly independent of purely Parisian opinion or even bias, the decentralization of the French provincial press became complete. The newspapers of the large towns circulated not only in the city in which they were printed but throughout the region of which it was the centre. Thus the *Dépêche* of Toulouse, with its twelve editions daily, was read in the whole of the departments extending from the Lot to the Pyrenees, whilst the *Petite Gironde* was found in all south-western France. The influence of the provincial, as of the Paris, press became so great that, as M. Avenel says in his book on the French press, there came a tendency to resent its omnipotence. The power of the newspaper in France differs from that of the English newspaper, in that it seems to act more on the government and the parliament than on public opinion. The French newspapers have taken upon themselves, in many cases, functions which belong more properly to the legislative or to the judicial power than to the press, and the result has not always been successful. The cause of this is that too many men of talent with political ambition look upon journalism as "leading to everything, provided one gets out of it," and use it alternately as an antechamber of parliament or of the cabinet, and a lounge during their parliamentary or ministerial eclipses.

5. Newspapers of Germany

Printed newspapers in Germany begin with the *Frankfurter Journal*, established in 1615 by Egenolph Emmel, a bookseller of Frankfort-on-Main. The following year saw the foundation of the *Frankfurter Oberpostamtszeitung*—continued until the year 1866 as *Frankfurter Postzeitung*. Fulda appears to have been the next German town to possess a newspaper, then Hildesheim (1619) and Herford (1630). In the course of the century almost all German cities of the first rank possessed their respective journals. The earliest in Leipzig bears the date 1660. The *Rostocker Zeitung* was founded in 1710. The *Hamburgischer Correspondent* (1714) was originally published under the name of *Holsteinische Zeitungs-Correspondens*, two years earlier, and was almost the only German newspaper which really drew its foreign news from "our own correspondent." Berlin had in the 18th century two papers, those of Voss (the *Vossische Zeitung*, 1722) and of J. K. P. Spener (1749–1827; the *Spener'sche Zeitung*, or *Berlinische Nachrichten*, 1772). Some half-dozen papers which glimmered in the surrounding darkness were the reservoirs whence the rest replenished their little lamps. On the whole, it may be said that the German newspapers were of very small account until after the outbreak of the French Revolution. Meanwhile the MS. news-letters, as in earlier days, continued to enjoy a large circulation in Germany. Many came from London. The correspondence, for instance, known under the name of "Mary Pinearis"—that, apparently, of a French refugee settled in London—had a great German circulation between 1725 and 1735. Another series was edited by the Cologne gazetteer, Jean Ignace de Rodérique, also a French refugee, and remembered as the subject of a characteristic despatch from Frederick II. of Prussia to his envoy in that city, enclosing 100 ducats to be expended in hiring a stout fellow with a cudgel to give a beating to the gazetteer as the punishment of an offensive paragraph.[1] The money, it seems, was earned, for Rodérique was well-nigh killed. At Berlin itself, Franz Hermann Ortgies carried on a brisk trade in these news-letters (1728–1735), until he too came under displeasure on account of them, was kept in prison several months, and then exiled for life.[2] Nor, indeed, can any journal of a high order be mentioned of prior appearance to the *Allgemeine Zeitung*, founded at Leipzig by the bookseller Cotta (at first under the title of *Neueste Weltkunde*) in 1798. Posselt was its first editor, but his want of nerve—and perhaps his weak health—hindered the application of his high powers to political journalism. His articles, too, gave offence to the Austrian court, and the paper had to change both its title and its place of publication. It had been commenced at Tübingen, and removed to Stuttgart; it was now transferred to Ulm, and again to Augsburg. It was Cotta's aim to make this the organ of statesmen and publicists, to reach the public through the thinkers, to hold an even balance between the rival parties of the day, and to provide a trustworthy magazine of materials for the historians to come; and, in the course of time, his plan was so worked out as to raise the *Allgemeine Zeitung* into European fame. Cotta was also the founder, at various periods, of the *Morgenblatt*, which became famous for its critical ability and tact, of *Vesperus*, of *Das Inland*, of *Nemesis*, of the *Oppositionsblatt* of Weimar (for a time edited by Bertuch), and even of the *Archives Parisiennes*.

Whilst French influence was dominant in Germany, the German papers were naturally little more than echoes of the Parisian press. But amidst the excitements of the "war of

[1] Fr. Kapp, "Berliner geschriebene Zeitungen," in *Deutsche Rundschau*, xxi. 107-122 (1879), citing Droysen, *Zeitschr. f. preuss. Gesch.* xiii. 11. The story, as told by Droysen, is an instructive commentary on Carlyle's praise of Frederick's "love of the liberty of the press."

[2] Kapp, *ut supra*.

liberation" a crowd of new journals appeared. Niebuhr started a *Preussischer Correspondent*; Görres—who in 1798 had founded at Coblentz *Das rothe Blatt*, soon suppressed by the invading French—undertook the *Rheinischer Mercur* (January 1814 to January 1816), which was suppressed by the Prussian government, under Von Hardenberg. This journal, during its initiatory year, had the honour of being termed by Napoleon—perhaps satirically—"the fifth power of Europe." Wetzel, somewhat later, founded the *Fränkischer Mercur*, published at Bamberg, and Friedrich Seybold the *Neckarzeitung*. Some of these journals lasted but two or three years. Most of the survivors fell victims to that resolution of the diet (20th September 1819) which subjected the newspaper press, even of countries where the censorship had been formally abolished, to police superintendence of a very stringent kind.

The aspirations for some measure of freedom which burst forth again under the influences of 1830 led to the establishment of such papers as Siebenpfeiffer's *Westbote*, Lohbauer's *Hochwächter*, Wirth's *Deutsche Tribune*, Eisenmann's *Baierisches Volksblatt*, *Der Freisinnige* of Rotteck and Welcker, and many more of much freer utterance than had been heard before in Germany. This led, in the ordinary course, to new declarations in the diet against the licence and revolutionary tendencies of the press, and to "regulations" of a kind which will be sufficiently indicated by the mention of one, in virtue whereof no editor of a suppressed journal could undertake another journal, during the space of five years, within any part of Germany. It need hardly be added that few of the newspapers of 1830 saw the Christmas of 1832. Very gradually some of the older journals —and amongst the number the patriarch of all, the *Frankfurter Oberpostamtszeitung*—plucked up courage enough to speak out a little; and some additional newspapers were again attempted. Amongst those which acquired deserved influence were Brockhaus's *Deutsche Allgemeine Zeitung*, the advocate of free trade and of a moderate liberalism, possessing a large circulation in northern Germany (1837); the *Deutsche Zeitung*, edited by Gervinus, at Heidelberg (July 1847); and the *Dorfzeitung*, published at Hildburghausen. The stirring events of 1848 called forth in Germany, as in so many other countries, a plentiful crop of political instructors of the people, many of whom manifestly lacked even the capacity to learn, and vanished almost as suddenly as they had appeared. But it is undeniable that a marked improvement in the ability and energy of the German political press may be dated from this period.

At the beginning of the 20th century the position and influence of the German press were passing through a period of change. The Germans had become a newspaper-reading people. Indeed, with the remarkable growth of the commercial spirit in Germany there had simultaneously been a change in the intellectual attitude and habits of the mass of the nation. The German of "the great period" of 1866 and 1870 derived his knowledge of his own and other countries to a very great extent from the more or less intelligent study of books, pamphlets and magazines. The busy German of the opening years of the 20th century had become almost as much the slave of his newspaper as the average American. Berlin in 1900 had 45 dailies, Leipzig 8, Munich 12, Hamburg 11, Stuttgart 8, Strassburg 6. In the domains both of home and of foreign politics the result was often a chaos of crude opinions and impulses, the strata of which were only differentiated by certain permanent tendencies of German political thought based upon tradition, class feeling, material interests, or distinctions of religious creed. In these circumstances it was still possible for the government, as in the days of Prince Bismarck and Dr Moritz Busch, to bring its superior knowledge to bear upon the anarchy of public sentiment through the medium of the inspired (or as it used to be called, the "reptile") press, but this operation had now to be performed with greater delicacy and skill. The press had begun to feel its power. It was at least able to drive a bargain with those who would officially control it, and it was conscious in its relations with the authorities that the advantage no longer rested exclusively on the side of the latter. It would be instructive to compare, with the aid of Dr Busch's "Secret Pages" of the history of Prince Bismarck, the methods by which the first Chancellor used to create and control a movement of public opinion with the devices by which, for instance, count von Bülow and his subordinates endeavoured to manage the press of a later day. The journalists who placed themselves at the disposal of Prince Bismarck were mostly treated as his menials; as he himself said, "Decent people do not write for me." Count von Bülow's methods, and to a certain extent those of his predecessor, Prince Hohenlohe, moved on somewhat different lines. These methods might be characterized as the psychological treatment of the individual journalist, the endeavour to appeal to his personal vanity or to his legitimate ambition, and only in a minor degree to his fear of the *dossier*, the public prosecutor, and the official boycott. There was also a further development of Prince Bismarck's system of acknowledging the existence of political and social movements the origin of which was wholly or partially independent. As in Bismarck's time, the tendencies of these movements were carefully observed, and they were turned to account where they seemed capable of subserving the main objects of state policy. Thus at the opening of the century the pro-Boer and agrarian movements were both employed in support of German foreign and colonial policy, and of an elaborate scheme of naval construction; while the growth of the commercial spirit on the one hand and the awakening of the lower middle classes on the other, were pressed into the service of *Welt-politik* and of its auxiliary—a system of protective tariffs. It required no small skill to bring into line and to hold together the various classes and interests from time to time arrayed in the press in support of German foreign policy. The organs of the government in the press were the sheep-dogs which held the flock together.

The German journals of which foreigners hear most belong with few exceptions to the daily press of Berlin. There are, however, one or two provincial or non-Prussian newspapers which from time to time enjoy more careful inspiration from the government offices than any of their Berlin contemporaries. There is, for example, the *Cologne Gazette* (*Kölnische Zeitung*, 1848), of which Prince Bismarck once said that it was "worth an army corps on the Rhine." It is difficult to trace all the channels by which information is conveyed to an organ of this kind, but there have undoubtedly been times when leading articles and *entre-filets* in the Rhenish organ were virtually or actually written in the German Foreign Office. Indeed, the methods of the institution which has been called the "Press Bureau," but which in the realm of foreign policy at least represented no concrete organization, have been so numerous and varied that it would be hopeless for any one except the most practised observer to trace their manifestations. The advantage of a semi-official press, if it could be manipulated with unvarying success, is that it can easily be disavowed when the suggestions, overtures or menaces of which it has been the exponent have served their turn or have become inexpedient. Thus during the blockade of Manila in 1898 the *Cologne Gazette* gave all the prominence of its first column and of leaded type to an article taken from the *Marine Politische Korrespondenz*, which practically warned the United States of the intention of Germany to have a share in the Pacific possessions of Spain if these should eventually change hands. Some ten days later the authority of this menace was explicitly disavowed by the *North German Gazette*, which announced that the *Marine Politische Korrespondenz* had never possessed a semi-official character. The *Cologne Gazette* continued in the west of Germany to serve the German government much as it did in the time of Prince Bismarck, although for prudential reasons its inspiration became on the whole more intermittent than it was in the days of the first Chancellor. The *Hamburgischer Correspondent*, the leading Hamburg journal, played a minor rôle of the same nature in the chief Hanseatic port, while the *Hamburger Nachrichten*, celebrated especially during the exile of Prince Bismarck and the closing years of his life at Friedrichsruh as the receptacle of indiscreet revelations and violent attacks upon his successors, almost lost all significance except as a local organ of violent Anglophobia. The *Allgemeine Zeitung* of Munich, once famous throughout Europe as the *Augsburger Allgemeine Zeitung* before its transference to the Bavarian capital, became in the hands of new proprietors practically an organ of the imperial Chancellor. In Prince Bismarck's days the press bureau of the Prussian Ministry of the Interior, and a similar organization in the Imperial Home Office, used to furnish hundreds of petty local newspapers known as *Kreis-blätter* with whole articles gratis, so that the policy of the government might be advocated in every nook and corner of the country. The numerous journals in which these communications used to appear simultaneously and in an identical form were the government organs to which the Radical and Socialist

opposition more particularly applied the term "Reptile Press." Later this practice of wholesale inspiration was abandoned, but there remained many channels, public and private, through which almost every department of the government could communicate information and guidance to newspapers in all parts of Germany. The Prussian Ministry of the Interior distributed to all and sundry a news-letter known as the *Berliner Korrespondenz*, professing only to give statistics and information, and to correct erroneous statements, but also frequently containing articles advocating some proposal of the government or combating the arguments of its opponents. The *Süd-Deutsche Reichs-Korrespondenz* had a similar character, and in 1902 served as an exponent of the policy and tactics of the imperial Chancellor, count von Bülow. Almost every one of the political parties has its *Korrespondenz* (or news-letter) supplying views rather than news. These circular letters deal, in fact, with the policy of the party with which they are associated, although they occasionally also embody information which the party leaders in the Reichstag or in the Prussian Diet have received from representatives of the government for their own guidance. They form the means of holding the parties together, and of inspiring them with common aims, as they are reproduced throughout the country by all the party organs.

It was in the press of Berlin that the greatest changes took place towards the end of the 19th century. During the regime of Prince Bismarck the *North German Gazette*, and occasionally the *Post*, used to keep Europe in a state of nervous tension by fulminant *communiqués* which the great Chancellor himself often dictated, or by what he used to call "jets of cold water" (*Kaltwasserstrahl*), which were mostly directed against France or Russia. So far as France and Russia are concerned, a much more pacific tone prevailed in Berlin after the conclusion of the Dual Alliance, and it was upon England that the press mainly concentrated its attacks. The *North German Gazette*, which was originally established by a private individual, in order "to place a blank sheet of paper at the disposal of Prince Bismarck," became on the whole, a mere record of home news and a summary of foreign intelligence bearing the semi-official stamp of Wolff's Telegraph Agency. It had doubtless been found that the constant employment of an organ so distinctly official as the *Norddeutsche Allgemeine* as a medium of expression for the views of the government was apt to lead to indiscretions which committed the authorities too deeply. Indeed, immediately before Prince Bismarck's fall he had actually employed this journal in order to attack the labour policy of the emperor. Official communications still continued to appear in the *North German Gazette*, but mostly characterized by a vagueness and awkwardness of style in striking contrast to the force and point of Prince Bismarck's polemics. The *Imperial Gazette* (*Reichsanzeiger*), corresponding to the *London Gazette*, is purely a record of official intelligence, though on rare occasions it publishes in the section marked *Nicht Amtlich* (non-official), some *démenti*, some statement of policy or some official document—a proceeding which always requires the express sanction of the emperor.

The journals which in 1880 were most widely read in Berlin, and which were best known abroad as the exponents of Berlin opinion, were the Liberal or Radical *Vossische Zeitung* and *Berliner Tageblatt*, and the National Liberal *National Zeitung*. The *Vossische Zeitung*, the oldest of all the Berlin newspapers, written with a degree of literary ability which justified its real title, *Königlich privilegierte Berlinische Zeitung für Staats- und Gelehrtensachen*, held its place. The *National Zeitung*, however (founded in 1848 by Bernhard Wolff, the originator of Wolff's news agency), which represented as long as it could those vestiges of old German Liberalism which survived in the National Liberal party, was compelled to come to an end on January 1st, 1905. The *Kreuz Zeitung* represented the "small but mighty party" of the reactionary Conservatives and Agrarians in the state, and of the orthodox (Lutheran) Protestants in the Church. It was the favourite journal of officers in the army, of the Conservative gentry (*Junker*), as well as the medium through which people of social standing preferred to announce births, marriages and deaths. The *Post* continued to be subsidized by a small number of industrial and rural magnates in the interests of the *Reichspartei*, or Free Conservative party, which for the most part subordinated its views to those of the government. The *Berliner Neueste Nachrichten*, like the *Post*, was a consistent advocate of the development of the German navy and of a vigorous *Welt-politik*. The *Boersen Zeitung* and the *Boersen-Courier* were organs of the Berlin Stock Exchange; the first of a National Liberal colour, and the other expressing the views of the Moderate Radicals (*Freisinnige Vereinigung*) and of opponents of extreme protection. The *Vorwärts* was the central organ of the German Social-Democrats, who had established a considerable number of other journals throughout Germany. The clericals or Centre party were represented by the *Germania*, less influential than the other leading organ of the Roman Catholic "governing party," the *Kölnische Volks-zeitung*. The *Deutsche Tageszeitung* made itself a name by its advocacy of the agrarian movement, while the *Freisinnige Zeitung* (founded, and to a great extent edited, by the Radical leader Eugen Richter) represented the Radical point of view. Among the provincial papers the *Frankfurter Zeitung* (Radical) was distinguished by the excellence of its news, especially on commercial subjects. The *Schlesische Zeitung* (1752) a leading Conservative organ, had continued to appear in Breslau since the days of Frederick the Great. The *Magdeburger Zeitung* and the *Hannoversche Courier* gave an independent or National Liberal support to the government. The *Weser Zeitung*, published at Bremen, was an exponent of the Liberalism of the commercial classes, while the *Strassburger Post* was one of the journals which enjoyed government inspiration, and helped to maintain *die Wacht am Rhein*. A considerable number of journals, published in the Polish language, advocated the Polish cause in the eastern provinces of Prussia.

Great success attended a new departure in German journalism, represented by newspapers like the Berlin *Lokal-Anzeiger*, describing themselves as non-political. The *Lokal-Anzeiger*, founded by August Scherl, who had gained his journalistic experience in America, had a circulation in Germany comparable with that of the *Petit Journal* in France, and it exercised a very marked influence upon public opinion in Berlin.

The external form and arrangement of German newspapers is often puzzling at first sight to an English reader. There is an absence of the striking headlines, which in English journals direct attention to news of importance, and which in America almost swamp the text. The outside page generally contains the editorial articles and the news of most importance, while the intelligence received immediately before going to press is placed in the last column of the last sheet. The bulk of the paper can apparently be increased indefinitely in accordance with the supply of news or literary matter, or with the number of advertisements. The *Vossische Zeitung* on a Sunday morning assumes, with its numerous supplementary sheets, the dimensions of a thick Blue-book. The quantity of extraneous matter, such as articles on literary, social and technical subjects, is enormous, and even the most serious political journals invariably publish a novel in serial form, as well as numerous novelettes and sketches. The local news in Berlin and other large cities is written with the minuteness and the familiarity of style of a village chronicle, and gives the impression that every one is occupied in observing the doings of his neighbour. The signed article is very much in vogue, and most writers and salaried correspondents have at least a cypher or initial by which they are distinguished. The greatest licence prevails in reporting and discussing the affairs of other countries, combined with the keenest sensitiveness to foreign criticism of anything that concerns Germany. The example of the government is followed in advertising the products of German industry, while those of foreigners are studiously depreciated.

6. Other European Countries

Austria-Hungary.—At the beginning of 1840 the whole number of Austro-German and Hungarian periodicals, of all sorts, was less than 100, only 22 being (after a fashion) political newspapers; and of these nearly all drew their materials and their inspiration from the official papers of Vienna (*Wiener Zeitung* and *Oesterreichischer Beobachter*). These two were all that appeared in the capital. Agram, Pesth, Pressburg, Lemberg and Prague had also two each; but no other city had more than a single journal. In 1846 the aggregate number of periodicals had grown to 155, of which 46 were political, but political only in the character of mere conduit-pipes for intelligence "approved of" by the government. In 1855 the number of political papers published throughout the entire territory under Austrian government, the Italian provinces excepted, was 60. The *Neue Freie Presse*, the chief Vienna daily, was founded in 1864. In 1873, ten years after the virtual cessation of a very strict censorship, the number of political journals, including all the specifically administrative organs, as well local as general, was 267, and that of mere advertising papers 42; in 1883 the former number had increased to about 280, the latter to about 60. Vienna had in 1883 in all 18 daily newspapers, ten of which ranged in average circulation from 14,000 to 54,000 copies.

In the period from 1880 to 1888 the only notable paper founded in Austria, was the *Wiener Allgemeine Zeitung* (1880). It appeared three times daily, but in spite of the impetus communicated to its start by the well-known "Freilands" Apostle Theodor Hertzka, it soon fell away, and eventually became simply a late evening paper, known as the *6 Uhr Abendblatt*. It was with the rise of the anti-Semitic and Socialistic movements of 1888 onwards that the Vienna daily press first began a fresh increase. The *Deutsche Volksblatt* (anti-Semitic) was founded in 1898, the *Ostdeutsche Rundschau* (Radical) in 1893, and the *Reichspost* (the organ of the Catholic section of the Christian Socialist party) in 1894. The Labour movement led to the development of the *Arbeiterzeitung* from a weekly, when it succeeded the *Gleichheit* in 1889, to a daily in 1895. It was therefore the first Social Democratic daily of Austria. In 1893 the *Neues Wiener Journal* was founded as a political neutral, and the old *Presse* disappeared in 1894, its place being filled by the weekly *Reichswehr* (military), established in 1888. The French daily paper, *Le Petit Journal de Vienne*, was founded in May 1899. In 1902 nineteen political dailies were published in Vienna.

In 1883 the Hungarian journals numbered 170; in 1899 they were returned as 764. Budapest, which in 1890 had 14 dailies and 10 weeklies, in 1900 had 21 and 3 respectively. The leading papers are the *Budapest Közlöny*, the *Pester Lloyd* and the *Budapeste Hirlap*. Of the German provincial press the most highly developed is in the German towns of Bohemia and in Prague, and the foundation of the *Deutsche Volkszeitung* at Reichenberg in 1885 marks the date of

separation of the *Deutschfortschrittliche* and *Deutschvolkliche* parties, while the Radical party, which greatly increased in Bohemia, was first represented by the weekly *Deutscher Volksbote* at Prague, and also in 1897 by the *Unverfälschte deutsche Worte*, edited by Iro at Eger. A peculiar feature in Austrian journalism is the existence of German organs of the Czech national movement, of which the representative is the Prague daily *Politik*, founded in 1862. In Silesia the anti-Semitic *Freie Schlesische Presse* was founded in 1881 at Troppau, and when it changed sides in 1889 it was speedily replaced, 1891, by the *Deutsche Wehr*. In Moravia the representative papers of the Czech Conservatives and Radicals were the *Mir* and the *Posar* respectively. The newspapers in Galicia, which increased steadily after 1870, are both numerous and important. The leading ones are the *Slowo Polskie* in Lemberg and the *Glos Naroda* in Cracow. In 1900 there were 161 newspapers in Polish, as against 10 in 1848 and 50 in 1873. Of the lesser Slavic nations, the Slovenians advanced the most, the *Slovenski List* having started at the end of 1896. In Illyrian journalism the chief newspapers founded after 1880 were the *Crvena Hrvatska* (1891), and the *Hrvatska Kruna* (1893). An attempt at unity amongst the Ruthenian factions in 1885 to 1887 produced the *Mir*, while the *Ruslan*, a daily founded at Lemberg in 1896, advocated joint action by Poles and Ruthenians. The *Bukowyna*, established in 1885, developed into the organ of "Young Ruthenia," and the *Bukowinska Widomosty*, established in 1895, represented the Old Ruthenians.

The Italian press in Austria was represented in 1900 chiefly by the very popular daily *Piccolo*, published at Trieste; it had a formidable rival in the *Mattino*, from 1885 to 1898. The *Fede e Lavoro*, published at Roveredo, was the organ of the Catholic Labour party, and *L'Avvenire del Lavoro*, at Bozen, that of the Socialists. In Dalmatia the *Corriere Nazionale*, founded in 1896 at Zara and afterwards published at Trieste, was the organ of the autonomist Italians, while *Il Dalmata* continued to represent the National Liberals.

Belgium.—The *Nieuwe Tijdinghen* of Antwerp, published by Abraham Verhoeven, has been said to date virtually from 1605, in which year a "licence for the exclusive retailing of news" was accorded to him by the archduke Albert and the archduchess Isabella. But the claim is conjectural. No copy of any number anterior to 1616 is now known to exist. It seems probable that the *Gazette Extraordinaris Posttijdinghen*, published by Wilhelm Verdussen between 1637 and 1644, is a continuation of Verhoeven's paper. But, be this as it may, that of Verdussen was certainly the foundation of the well-known *Gazette van Antwerpen*, which continued to appear until 1827.

Bruges had its *Nieuwe Tijdinghen uyt verscheyden Quartieren*, published (in black letter) by Nicholaes Breyghel. When this paper was commenced is uncertain, but various numbers of it exist with dates between 1637 and 1645. In one of these (26th July 1644) a *Brusselsche Gazette* of the 24th of that month is quoted, apart from which citation no Brussels paper is known of earlier date than 1649. When the first number of *Le Courier véritable des Pays-Bas* made its appearance, the publisher (Jean Mommaert) prefaced the first number by an address to the reader, in which he says: "I have long endeavoured to meet with somebody who would give employment to my presses in defending truth against the falsehoods which malignity and ignorance *send daily abroad*. I have at length found what I sought, and shall now be able to tell you, weekly, the most important things that are going on in the world." This paper became afterwards the *Gazette de Bruxelles*, then *Gazette des Pays-Bas*; and, under the last-named title, it continued to appear until 1791. The *Annales Politiques* of Linguet was one of the most remarkable of the political journals of Brussels in the 18th century. For a time the editor won the favour of the emperor Joseph II by praising his reforms, and the Government subscribed for 1200 copies of his paper at two louis d'ors each a year; but here, as in almost every other place of residence during his chequered career, Linguet at length incurred fine and imprisonment. His journal was repeatedly suppressed, and as often resumed under many modifications of title. It was continued in France, in Switzerland (at Lausanne), and in England. At one time it was so popular that a printer in Brussels regularly and rapidly published a pirated edition of it. For a brief period the publication was resumed at Brussels. Mallet Du Pan was, for a time, a collaborator in the editorship. Linguet died by the guillotine in 1794. *Le National* was a famous paper for a short period prior to the revolution of 1830. Soon after its cessation—its presses were destroyed by the populace on the 26th August—the official journal, *Le Moniteur Belge*, was established,—"the ministry deeming it indispensable to the success of its great political enterprise that a journal should be created which might expound its views, and act daily upon public opinion"; and, on decree of the regency, it was published accordingly.

The first newspaper published at Ghent, *Gazette van Gent*, appeared in 1667. *Den Vaderlander*, begun in October 1829, was, for a long period, one of the most widely circulated of the Flemish journals.

In 1890 Brussels published 34 papers of various periodicity, among which the *Moniteur Belge* held the lead with a circulation of 90,000, while *Le National* (revived in 1885) and *L'Etoile* (1869) circulated 21,000 and 5000 respectively. In 1900 there were 18 dailies and 14 weeklies, &c. Antwerp had 7 dailies in 1890 and 1900; Ghent 7 dailies in 1890 and 6 in 1900; Liége 6 in 1890 and 5 in 1900. The halfpenny paper is well established.

Holland.—The kingdom of the Netherlands has always been rich in newspapers, but they have usually had more weight commercially than politically. Amsterdam in 1890 had 10 dailies, and in 1900 had 12 dailies (*Algemeen Handelsblad*, *Nieuws van den Dag*, &c.). In 1900 the Hague had 6 dailies (*Daghlad*, *Vaderland*, &c.); and Rotterdam had 5 dailies (*Nieuwe Rotterdammer Courant*, &c.). The oldest Dutch paper, the *Haarlemsche Courant*, founded in 1656, is still one of the leading journals.

Italy.—The *Diario di Roma*, although dating only from 1716, may claim to have been the patriarch of the Italian press. It lasted for nearly a century and a half. During its later years it was a daily paper, with a weekly supplement having the somewhat whimsical title *Notizie del Giorno*. Next to this came the *Gazzetta Ufficiale di Napoli*. These and their congeners were published under a rigid censorship until far into the 19th century, and exercised little influence of any kind. The first tentative movement towards a free press may, perhaps, be dated from the effort to establish at Milan, in 1818, under the editorship of Silvio Pellico, the *Conciliatore*, in which Simonde de Sismondi Gonfalonieri and Romagnosi were fellow-writers. But the new journal was suppressed in 1820. The first really effectual effort had to wait for the lapse of nearly thirty years. *L'Opinione* was first published in Turin (26th December 1847) afterwards in Rome. It had, amongst its many editors, Giacomo Durando (a soldier of mark, and twice minister of foreign affairs), Montezemolo, Giovini Bianchi and Giacomo Dina. The Florence *Diritto*, originally founded at Turin, in 1851, by Lorenzo Valerio, was edited successively by Macchi, Bargini and Civinini, and as a radical organ attained great influence. Counting journals of all kinds, there were published in Italy in 1836 185 newspapers; in 1845, 200; in 1856, 311; in 1864, 450; in 1875, 479. In 1882 the "periodicals" of all kinds numbered 1454, and total number of political dailies was 149. In 1890 Rome published 13 dailies, and in 1900, 10 dailies. The leading Roman papers were the *Fanfulla*, representing the court and government; the *Tribuna* (5 centimes), a Liberal paper founded in 1883; the organ of the Vatican, *L'Osservatore Romano*; and the popular *Messaggiero*. *Il Secolo* (1866) and the *Corriere della Sera* (1876) are issued from Milan.

Russia, Poland and Finland.—The earliest gazette of Moscow (*Moskovskya Viedomosti*) was issued by order of Peter the Great on the 16th December 1702, but no copy is known now to exist of earlier date than the 2nd January following. The whole gazette of the year 1703 was reproduced in facsimile by order of Baron de Korff (the imperial librarian at St Petersburg) in 1855, on occasion of the festival for the 3rd century of Moscow university. The existing *Viedomosti* dates only from 1766. That of St Petersburg dates from 1718. The historian Karamzin established a short-lived Moscow journal (*Moskovski Listok*), and afterwards at St Petersburg the once widely-known Russian *Courrier de l'Europe* (1802). The profits of the successful *Invalide Russe* (*Russki Invalid*), established in 1815 by Persorovius, were devoted to the sufferers by the war with France. Adding to the distinctively political journals those of miscellaneous character, the whole number of newspapers published within the Russian states—Poland and Finland excepted—in the year 1835 was 136; in 1858 that number had grown to 179, of which 82 were published in St Petersburg and 15 in Moscow; 132 were printed in Russian, 3 in Russian and in German, 1 in Russian and in Polish, 28 in German, 8 in French, 3 in English, 1 in Polish, 1 in Lithuanian, 1 in Italian. In 1879, under the more liberal rule of Alexander II., the number of political and miscellaneous journals had grown to 293, and of these 105 were under the direct influence of the Government. But, in truth, the period of relaxation of censorship, if strictly examined, will be found to have lasted only from 1855 to 1864, when repressive measures were again and frequently resorted to. Poland in 1830 had 49 newspapers. Fifty years later the number was still less than 70, of which 54 were in Polish, these numbers including journals of all kinds. Finland in 1860 had 24 newspapers, half in Swedish, half in Finnish. In 1863 the number had increased to 32, in spite of the zealous opposition of Count de Berg, the governor-general, to all discussion of political events and "subjects which do not concern the people." He was very friendly to journals of gardening and cottage economy, and to magazines of light literature, and did not regard comic papers with anger provided they kept quite clear of politics. The paper which was long the chief Finnish organ, *Suometar* (founded at Helsingfors in 1847), owed much of its popularity to the pains its editors took with their correspondence. The *Oulun Wukko-Sanomat* ("Uleaborg Daily News") was for a considerable period the most northerly newspaper of the world, with the one exception of the little journal published at Tromsö, in Norway.

In 1880 the whole number of newspapers printed within the government of Finland was 46, while the total number of newspapers and journals of all kinds published within the whole Russian empire during the same year was 608. Of these, 417 were printed in the Russian language, 155 of them being official or administrative organs; 54 were printed in Polish, 40 in German, 11 in Lettish, 10 in French, 7 in Esthonian, 3 in Lithuanian.

In 1890 St Petersburg had 6 dailies; and in 1900 there were 16 dailies (the *St Petersburgskya Viedomosti*, the *Novoya Vremja*, the *Journal de St Pétersbourg*, &c.). Moscow increased from 5 to 8 dailies (the *Moskovskya Viedomosti*, &c.). The rest of Russia proper produced about 100 newspapers, of which one-third were dailies.

In Russian Poland about 11 papers, one-half being dailies, were published at Warsaw in 1900 (*Kurier Warszawski*, *Gazeta Polska*, &c.).

Spain and Portugal.—In Spain no newspaper of any kind existed earlier than the 18th century, a *Gaceta de Madrid* starting about 1726 (an alleged *gaceta* in 1626 is a myth). Even during the early years of the 19th century the capital contented itself with a single journal, the *Diario de Madrid*. The Peninsular War and the establishment of the Cortes gave the first impulse towards something which might be called political journalism, but the change from total repression to absolute freedom was too sudden not to be grossly abused. The *Diario de las Cortes*, the *Semanario Patriotico* (published at Cadiz from 1808 to 1811,) and the *Aurora Mallorquina* (published at Palma in 1812–1813) were the first of the new papers that attained importance. In 1814 the circulation or receipt in Spain of English newspapers was prohibited under penalty of ten years' imprisonment. Most of the native journals fell with the Cortes in 1823. In the following year Ferdinand decreed the suppression of all the journals except the then *Diario* and *Gaceta* of Madrid, the *Gaceta de Bayona*, and certain provincial papers which dealt exclusively with commercial or scientific subjects. At the close of his reign only three or four papers were published in Madrid. Ten years afterwards there were 40; but the number was far more noticeable than the value. Spanish newspapers have been too often the mere stepping-stones of political adventurers, and not unfrequently the worst of them appear to have served the turn more completely than the best. Gonzales Bravo attained office mainly by the help of a paper of notorious scurrility,—*El Guirigay*. His press-law of 1867 introduced a sort of indirect censorship, and a system of "warnings," rather clandestine than avowed; and his former rivals met craft with craft. The *Universal* and the *Correo* were successively the organs of José Salamanca. At the end of 1854 the political journals published in Madrid numbered about 40, the most conspicuous being the now defunct *España* and *El Clamor Publico*. In 1890 Madrid published 38 papers, of which 15 were dailies; but by 1900 they declined to 28, of which 19 were dailies. The leading Spanish papers in 1900 were—*El Correo* (1879), Monarchico-Liberal; *La Epoca*, Conservative; *El Imparcial*, Independent Liberal; *La Justicia*, an evening Republican paper; *El Liberal*, numbering among its contributors the best writers without distinction of party; and *El Pais*, the organ of the Progressives.

Portugal in 1882 was credited with 179 journals of all kinds and of various periodicity. Of this number 68 appeared in Lisbon. The strictly political daily papers of Lisbon were 6 in number; those of Oporto 3. In 1890 Lisbon published 11 dailies; and in 1900, 19 dailies.

Sweden.—In Sweden the earliest regular newspaper appears to have been the *Ordinarie Post-Tidende* of Stockholm, first published in 1645, and continued until 1680, then, after long suspension, revived under the title *Post- och Inrikes-Tidning*. Stockholm has also its *Aftonbladet*. The *Post-Tidende* was followed by the *Svensk Mercurius* (1675–1683) and the Latin *Relationes Curiosae* (1682–1701). In 1742 a Swedish newspaper in French (*Gazette Française de Stockholm*) was commenced, and was followed in 1772 by the *Mercure de Suède*. But the press in Sweden had small political influence until 1820, when the *Argus* was established by Johannsen. The strife between "classicists" and "romanticists" spread itself in Sweden, as in France, from the field of literature into that of politics. Crusenstolpe's *Fädernesländbladet* and Hjerta's *Aftonbladet*, founded in 1830, were long the most conspicuous of the Swedish journals,—the former on the side of the royalists, the latter on that of the reformers. Hjerta's paper, in its best days, could boast of a circulation of 5000 copies; but on the accession of King Oscar it ceased to appear as an opposition organ. Almost every town in the provinces now has its paper. In 1890 Stockholm had 5 dailies and 12 weeklies, &c.; in 1900 it had 11 dailies and 4 weeklies, &c., while 93 provincial towns published 197 papers, mostly weeklies, &c. In the period 1890–1894 a large number of newspapers appeared at Stockholm, but their duration was in general very short, often only a few months (Lundstadt, *Sveriges Periodiska Literatur*, ii. 1896). A newspaper in Finnish is published at Haparanda.

Denmark.—While Denmark published an *Europäische Zeitung* as early as 1663 and the *Danske Mercurius* in 1666, the political influence of the press is a newer thing in that country than even in Sweden. Until 1830 Copenhagen had but two papers, and they filled their columns with mild extracts from foreign journals. Real activity in this direction dates from the establishment of the provincial states in 1834. The *Berlingske Tidende* dates from 1749, and was at first published in German. The *Fädrelandet* in 1848–1849 was in a glow of zeal for Scandinavianism and "Young Denmark." In 1890 Copenhagen produced 8 dailies and 6 weeklies, &c. In 1900 it had 12 dailies and 2 weeklies, while 121 papers appeared in sixty-eight provincial towns.

Reykjavik (*Iceland*) published two weekly papers in 1890, and the same number in 1900 (*Thiódólfr* and *Isafold*).

Norway.—The earliest Norwegian paper was the Christiania *Intelligentssedler*, founded in 1763. Next to this came the *Adressecontors Efterretninger* (1765), published at Bergen. *Den Constitutionelle* absorbed an older paper, called *Norske Rigstidende*. The *Morgenblad* was founded in 1819. In 1890 Christiania published 12 papers, of which only three appeared daily; in 1900 only 10 papers were produced; but 8 of them were dailies. The *Morgenbladet* still held its rank, and the *Aftenposten* had a large circulation.

Switzerland.—In 1873 the total number of political and general newspapers in Switzerland was 230. In 1881 they numbered 342; 53 were of daily issue, 166 appeared twice or thrice a week, and 7 only were of weekly issue. A monthly compendium of the news of the day appeared at Rorschach, in the canton of St Gall, as early as January 1597. The editor was a German, one Samuel Dilbaum, of Augsburg. He varied his titles, so that his monthly newsbooks, although really consecutive, do not wear the appearance of serial publications. Sometimes he called his issue *Historische Relatio*, sometimes *Beschreibung*, sometimes *Historische Erzählung*. Switzerland has since become remarkable for the number of its newspapers in proportion to its size. Among the more important may be mentioned the *Journal de Genève* and the *Gazette de Lausanne*, both Moderate Liberal, and the Catholic *Courrier de Genève*. *La Tribune de Genève* (1878) is a leading five-centime paper.

Greece.—The few newspapers that made their sudden appearance in Greece during the war of liberation departed as hastily when King Otho brought with him a press-law, one of the provisos of which demanded caution-money by actual deposit. The journal *Saviour* was established, in 1834, as a Government organ, and was soon followed by *Athena* as the journal of the opposition. Ten years later 7 distinctively political papers had been established, along with 13 journals of miscellaneous nature. In 1877 there were, of all sorts, 81 journals, of which 77 appeared in Greek, 2 in Greek and French, 2 in French only; 37 of these were printed in Athens, 17 in the Ionian Islands. In 1890 Athens published 9 dailies and 4 weeklies, &c., and in 1900, 10 dailies and 2 weeklies. The chief papers, the *Asty* and the *Acropolis*, were mainly political and on the Liberal side, as indeed were nearly all the Athenian papers.

Turkey.—During the embassy (1795) of Verninac Saint-Maur, envoy of the French republic, a French journal was established at Pera. This, possibly, is the pioneer of all Turkish newspapers. Thirty years later (1825) the *Spectateur de l'Orient* was founded at Smyrna, also by a Frenchman (Alexander Blacquet?). It was afterwards published under the titles *Courrier* and *Journal de Smyrne*. In like manner, the *Moniteur Ottoman*, first of strictly Constantinopolitan journals, was founded by the above-named Blacquet in 1831. It soon changed its language to Turkish, and was edited by Franceschi. The second Smyrna newspaper, *Echo de l'Orient*, established in 1838, was transferred to Constantinople in 1846. But not one of these papers has survived. In 1876 the total number of journals of all kinds published in the capital was 72 (namely, 20 in French, 16 in Turkish, 13 in Armenian, 12 in Greek, 11 in as many other tongues). In 1890 there were 19 papers, in various languages, published at Constantinople, most of them dailies; and in 1900 the number of papers decreased to 18. They appeared in the following languages: the *Stamboul* and 4 others in French, 3 in Turkish, 1 in Turkish and Greek, 3 in Greek, 2 in Armenian, 1 in English and French, and 1 each in Arabic, English, Italian and Persian. Smyrna published 8 papers, mostly weeklies, in 1890, and the same number in 1900. Owing to the number of Mahommedan fasts and feasts Turkish newspapers are somewhat irregular in their appearance.

For the newspapers of other countries (*e.g.* Japan) or of important towns, see under the separate topographical headings. (H. Cb.).

NEWT (a corrupted form from "an evet" or "an effet," a term of Anglo-Saxon origin, still used in many parts of England), the name usually applied to the aquatic members of the family *Salamandridae* which constitute the genus *Molge*, formerly known as *Triton*. But the name *Triton*, applied to these Batrachians by N. Laurenti (1768), has already been used by Linnaeus (*Systema Naturae*) for parts of the barnacle (*Lepas anatifera*). B. Merem (1820) proposed to substitute for it the name *Molge*, said to be derived from the Gr. Μόλγης or Μόλγος, "slow," in allusion to the movements of these animals on land. The similar name *Molch* designates these Batrachians in German.

The newts are very closely related to the true Salamanders, Salamandra, from which they differ principally in the shape of the tail, which is compressed, in relation to their aquatic habits during a considerable part of the active period. Their aquatic progression is effected principally by means of the tail, and during the act of swimming the legs are turned backwards and folded against the body and tail, so as to admit of the smallest possible degree of resistance.

A very marked sexual dimorphism prevails in most species of this genus, the males being more brilliantly coloured than the females and provided with a dorsal crest which attains its greatest development during the breeding season, lasting through the spring and the early summer. Later in the season the males more or less completely lose their crests and other nuptial ornaments, and the two sexes are more alike; they then retire on

land, concealing themselves under stones, logs of wood, or in holes in damp earth, but leaving their retreat at night or in wet weather to search for earth-worms and slugs which constitute their principal food. In the water they are very destructive of tadpoles, insect larvae and crustaceans.

A remarkable feature of the newts, which they share with the other tailed Batrachians and the larvae of the frogs and toads, is the great facility with which they regenerate lost parts, such as the tail, limbs, and even the eye, a faculty which has given rise to a great variety of experiments, from the days of Charles Bonnet and Spallanzani to those of the present school of *Entwickelungsmechanik*.

Extraordinary as it may appear, considering the abundance of these creatures and the attention they have received from naturalists, it was only in 1880 that their mode of fecundation was correctly ascertained, from observation of the common newt by the Italian zoologist F. Gasco. The amorous games of the newts, so graphically represented by M. Rusconi, had been repeatedly described, and Abbé Spallanzani, as early as 1766, had ascertained the impregnation to be internal. The then current belief that the water served as a vehicle to convey the spermatozoa to the female organs had received a blow on Karl Theodor von Siebold's discovery of a *receptaculum seminis* in the female, but no satisfactory explanation had been given of the manner in which the spermatozoa reach these pouches. This mystery Gasco succeeded in elucidating in his masterly paper published in 1880, which has since been supplemented by his own investigations on the axolotl, and those of E. Zeller, E. O. Jordan and others on the European and American newts.

All who have kept newts in an aquarium have witnessed the curious antics of the male placing himself before the female and rapidly vibrating his folded tail, or bending his body in a semicircle, as if to prevent her from passing ahead of him. The male then emits, at short intervals, in front of the female, several conical or bell-shaped spermatophores (a gelatinous secretion from the cloaca), adhering to the ground and crowned by a spherical mass of spermatozoa, which the female afterwards gathers in the lips of her cloaca either by mere application or by holding the spermatophore between her hind legs and pressing the mass of spermatozoa into the cloaca, whence they ultimately find their way into the lower part of the oviducts, where the eggs are fecundated as they descend.

The larvae are provided with three pairs of long, fringed, plume-like external gills, which are not lost until the very last stages of the metamorphosis, and, in exceptional cases are even retained throughout life, the newt breeding in the branchiate condition, as often happens in the axolotl. The fore limbs are developed before the hind limbs.

The genus *Molge* has a wide distribution, extending over Europe, north-west Africa, south-western Asia, eastern temperate Asia (China and Japan) and North America as far south as southern California and the Rio Grande del Norte. Twenty species are distinguished. The British species are the crested newt (*M. cristata*), the common newt (*M. vulgaris*) and the palmated newt (*M. palmata*). The first is the largest, and measures 4 to 6 in. The skin is more or less rugose, with granular warts, a strong fold extends across the throat, and the male is provided with a very high dentate dorsal crest which is interrupted over the sacral region; the upper parts are dark, with more or less distinct black spots; the sides are speckled with white, and the lower parts are yellow or orange, spotted or marbled with black; a silvery stripe adorns the side of the tail in the male. The common and the palmated newts are smaller, 2½ to 4 in. in length, and have a smooth skin. The dorsal crest of the male is high and festooned in the former, low and straight-edged in the latter; during the breeding season the feet of the common newt are lobate like a grebe's, whilst they are webbed like a duck's in the palmated newt, which is further distinguished in having the tail truncate and terminating in a filament.

It is a remarkable fact that, although related so closely and occurring so frequently together in pools of small extent, the common and palmated newts are not known ever to produce hybrids, whilst the crested newt, when coexisting (in some parts of France) with a south-western ally, the beautiful *Molge marmorata*, to which it is by no means more nearly akin than are the two above-named species to each other, regularly gives rise to the form known as *M. blasii*, which has been proved to be a cross between *M. cristata* and *M. marmorata*.

NEWTON, ALFRED (1829–1907), English zoologist, was born at Geneva on the 11th of June 1829. In 1854 he was elected travelling fellow of Magdalene College, Cambridge, of which he had been an undergraduate, and subsequently visited many parts of the world, including Lapland, Iceland, Spitsbergen, the West Indies and North America. In 1866 he became the first professor of zoology and comparative anatomy at Cambridge, a position which he retained till his death. His services to ornithology and zoogeography were recognized by the Royal Society in 1900, when it awarded him a Royal medal. He wrote many books, including *Zoology of Ancient Europe* (1862), *Ootheca Wolleyana* (begun in 1864), *Zoology* (1872), and a *Dictionary of Birds* (1893–1896). The last, still a standard work, was an amplification of the numerous articles on birds which he contributed to the 9th edition of the *Encyclopaedia Britannica*, and which with comparatively slight revision are retained in the present edition. He contributed many memoirs to scientific societies, and edited *The Ibis* (1865–1870), the *Zoological Record* (1870–1872), and *Yarrell's British Birds* (1871–1882). He died at Cambridge on the 7th of June 1907.

NEWTON, SIR CHARLES THOMAS (1816–1894), British archaeologist, was born on the 16th of September 1816, at Bredwardine in Herefordshire, and educated at Shrewsbury School and Christ Church, Oxford. He entered the British Museum in 1840 as an assistant in the Antiquities Department. Antiquities, classical, Oriental and medieval, as well as ethnographical objects, were at the time included in one department, which had no classical archaeologist among its officers. In 1852 Newton quitted the Museum to become vice-consul at Mitylene, with the object of exploring the coasts and islands of Asia Minor. Aided by funds supplied by Lord Stratford de Redcliffe, then British ambassador at Constantinople, he made in 1852 and 1855 important discoveries of inscriptions at the island of Calymnos, off the coast of Caria; and in 1856–1857 achieved the great archaeological exploit of his life by the discovery of the remains of the mausoleum of Halicarnassus, one of the "seven wonders" of the ancient world. He was greatly assisted by Murdoch Smith, afterwards celebrated in connexion with Persian telegraphs. The results were described by Newton in his *History of Discoveries at Halicarnassus* (1862–1863), written in conjunction with R. P. Pullan, and in his *Travels and Discoveries in the Levant* (1865). These works included particulars of other important discoveries, especially at Branchidae, where he disinterred the statues which had anciently lined the Sacred Way, and at Cnidos, where R. P. Pullan, acting under his direction, found the colossal lion now in the British Museum.

In 1855 Newton declined the regius professorship of Greek at Oxford. In 1860 he was made British consul at Rome, but had scarcely entered upon the post when an opportunity presented itself of reorganizing the amorphous department of antiquities at the British Museum, which was divided into three and ultimately four branches. The Greek and Roman section naturally fell to Newton, who returned as Keeper, and held the office until 1885, declining the offer of the principal librarianship made to him in 1878. The Mausoleum Room, to accommodate the treasures he had found in Asia Minor, was built under his supervision, but the most brilliant episode of his administration was the acquisition of the Blacas and Castellani gems and sculptures. The Farnese and Pourtalès collections were also acquired by him. He took a leading part in the foundation of the Society for the Promotion of Hellenic Studies, the British School at Athens, and the Egypt Exploration Fund. He was Yates professor of classical archaeology at University College, London, from 1880 to 1888. His collected *Essays on Art and Archaeology* were published in 1886. When, on his retirement from the Museum, his bust by Boehm, now placed in one of the sculpture galleries, was presented to him as a testimonial, he desired the unexpended balance to be given to the school at Athens. After his retirement he was much occupied with the publication of the Greek inscriptions in the British Museum, but his health failed greatly in the latter years of his life. He died at Margate on the 28th of November 1894. He married in 1861 the daughter of his successor in the consulate at Rome, the painter Severn, herself a distinguished artist. She died in 1866. (R. G.)

NEWTON, SIR ISAAC (1642–1727), English natural philosopher, was born on the 25th of December 1642 (O.S.), at Woolsthorpe, a hamlet in the parish of Colsterworth, Lincolnshire, about 6 m. from Grantham. His father (also Isaac Newton) who farmed a small freehold property of his own, died before his son's birth, a few months after his marriage to Hannah Ayscough, a daughter of James Ayscough of Market-Overton. When Newton was little more than two years old his mother married Barnabas Smith, rector of North Witham. Of this marriage there was issue, Benjamin, Mary and Hannah Smith, and to their children Sir Isaac Newton subsequently left the greater part of his property. After having acquired the rudiments of education at two small schools in hamlets close to Woolsthorpe, Newton was sent at the age of twelve to the grammar school of Grantham. While attending Grantham school Newton lived in the house of Mr Clark, an apothecary of that town. According to his own confession he was far from industrious, and stood very low in his class. An unprovoked attack from the boy next above him led to a fight, in which Newton's pluck gave him the victory. This success seems to have led him to greater exertions, and he rose to be the head boy of the school. He displayed very early a taste and an aptitude for mechanical contrivances. He made windmills, water-clocks, kites and dials, and he is said to have invented a four-wheeled carriage which was to be moved by the rider. In 1656 Mr Smith died, and Newton's mother came back with her three children to Woolsthorpe. Newton was then in his fifteenth year, and, as his mother in all probability intended him to be a farmer, he was taken away from school. He was frequently sent on market days to Grantham with an old and trusty servant, who made all the purchases, while Newton spent his time among the books in Mr Clark's house. It soon became apparent to Newton's relatives that they were making a great mistake in attempting to turn him into a farmer, and he was therefore sent back again to school at Grantham. His mother's brother, William Ayscough, the rector of Burton Coggles, the next parish, was a graduate of Trinity College, Cambridge, and when he found that Newton's mind was wholly devoted to mechanical and mathematical problems, he urged upon Mrs Smith the desirability of sending her son to his own college. He was accordingly admitted a member of Trinity College on the 5th of June 1661, as a subsizar, and was matriculated on the 8th of July. We have scarcely any information as to his attainments when he commenced residence, and very little as to his studies as an undergraduate. It is known that while still at Woolsthorpe Sanderson's *Logic* had been read by him to such purpose that his tutor at Trinity College excused his attendance at a course of lectures on that subject. Newton tells us himself that, when he had purchased a book on astrology at Stourbridge fair, a fair held close to Cambridge, he was unable, on account of his ignorance of trigonometry, to understand a figure of the heavens which was drawn in this book. He therefore bought an English edition of Euclid with an index of propositions at the end of it, and, having turned to two or three which he thought likely to remove his difficulties, he found them so self-evident that he put aside Euclid "as a trifling book," and applied himself to the study of Descartes's *Geometry*. It is reported that in his examination for a scholarship at Trinity, to which he was elected on the 28th of April 1664, he was examined in Euclid by Dr Isaac Barrow, who formed a poor opinion of his knowledge, and that in consequence Newton was led to read the *Elements* again with care, and thereby to form a more favourable estimate of Euclid's merits.

The study of Descartes's *Geometry* seems to have inspired Newton with a love of the subject, and to have introduced him to the higher mathematics. In a small commonplace book, bearing on the seventh page the date of January 1663/1664, there are several articles on angular sections, and the squaring of curves and "crooked lines that may be squared," several calculations about musical notes, geometrical propositions from Francis Vieta and Frans van Schooten, annotations out of Wallis's *Arithmetic of Infinities*, together with observations on refraction, on the grinding of "spherical optic glasses," on the errors of lenses and the method of rectifying them, and on the extraction of all kinds of roots, particularly those "in affected powers." And in this same commonplace book the following entry made by Newton himself, many years afterwards, gives a further account of the nature of his work during the period when he was an undergraduate:—

"July 4, 1699.—By consulting an account of my expenses at Cambridge, in the years 1663 and 1664, I find that in the year 1664 a little before Christmas, I, being then Senior Sophister, bought Schooten's *Miscellanies* and Cartes' *Geometry* (having read this *Geometry* and Oughtred's *Clavis* clean over half a year before), and borrowed Wallis's works, and by consequence made these annotations out of Schooten and Wallis, in winter between the years 1664 and 1665. At such time I found the method of Infinite Series; and in summer 1665, being forced from Cambridge by the plague, I computed the area of the Hyperbola at Boothby, in Lincolnshire, to two and fifty figures by the same method."

That Newton must have begun early to make careful observations of natural phenomena is sufficiently testified by the following remarks about halos, which appear in his *Optics*, book ii. part iv. obs. 13:—

"The like Crowns appear sometimes about the moon; for in the beginning of the Year 1664, February 19th, at night, I saw two such Crowns about her. The Diameter of the first or innermost was about three Degrees, and that of the second about five Degrees and an half. Next about the moon was a Circle of white, and next about that the inner Crown, which was of a bluish green within next the white, and of a yellow and red without, and next about these Colours were blue and green on the inside of the Outward Crown, and red on the outside of it. At the same time there appear'd a Halo about 22 Degrees 35′ distant from the center of the moon. It was elliptical, and its long Diameter was perpendicular to the Horizon, verging below farthest from the moon."

In January 1665 Newton took the degree of B.A. The persons appointed (in conjunction with the proctors, John Slade of Catharine Hall, and Benjamin Pulleyn of Trinity College, Newton's tutor) to examine the questionists were John Eachard of Catharine Hall and Thomas Gipps of Trinity College. It is a curious accident that we have no information about the respective merits of the candidates for a degree in this year, as the "ordo senioritatis" of the bachelors of arts for the year is omitted in the "Grace Book."

It is supposed that it was in 1665 that the method of fluxions first occurred to Newton's mind. There are several papers still existing in Newton's handwriting bearing dates 1665 and 1666 in which the method is described, in some of which dotted or dashed letters are used to represent fluxions, and in some of which the method is explained without the use of dotted letters.

Both in 1665 and in 1666 Trinity College was dismissed on account of the plague. On each occasion it was agreed, as appears by entries in the "Conclusion Book" of the college, bearing dates August 7th, 1665, and June 22nd, 1666, and signed by the master of the college, Dr Pearson, that all fellows and scholars who were dismissed on account of the pestilence be allowed one month's commons. Newton must have left college before August 1665, as his name does not appear in the list of those who received extra commons on that occasion, and he tells us himself in the extract from his commonplace book already quoted that he was "forced from Cambridge by the plague" in the summer of that year. He was elected a fellow of his college on the 1st of October 1667. There were nine vacancies, one of which was caused by the death of Abraham Cowley in the previous summer, and the nine successful candidates were all of the same academical standing. A few weeks after his election to a fellowship Newton went to Lincolnshire, and did not return to Cambridge till the February following. On the 16th of March 1668 he took his degree of M.A.

During the years 1666 to 1669 Newton's studies were of a very varied kind. It is known that he purchased prisms and lenses on two or three several occasions, and also chemicals and a furnace, apparently for chemical experiments; but he also employed part of his time on the theory of fluxions and other branches of pure mathematics. He wrote a paper *Analysis per Equationes Numero Terminorum Infinitas*, which he put, probably in June 1669, into the hands of Isaac Barrow (then Lucasian professor of mathematics), at the same time giving him

permission to communicate the contents to their common friend John Collins (1624–1683), a mathematician of no mean order. Barrow did this on the 31st of July 1669, but kept the name of the author a secret, and merely told Collins that he was a friend staying at Cambridge, who had a powerful genius for such matters. In a subsequent letter on the 20th of August, Barrow expressed his pleasure at hearing the favourable opinion which Collins had formed of the paper, and added, "the name of the author is Newton, a fellow of our college, and a young man, who is only in his second year since he took the degree of master of arts, and who, with an unparalleled genius (*eximio quo est acumine*), has made very great progress in this branch of mathematics." Shortly afterwards Barrow resigned his chair, and was instrumental in securing Newton's election as his successor. Newton was elected Lucasian professor on the 29th of October 1669. It was his duty as professor to lecture at least once a week in term time on some portion of geometry, arithmetic, astronomy, geography, optics, statics, or some other mathematical subject, and also for two hours in the week to allow an audience to any student who might come to consult with the professor on any difficulties he had met with. The subject which Newton chose for his lectures was optics. The success which attended his researches in optics must have been great, although the results were known only through his own oral lectures, until he presented an account of them to the Royal Society in the spring of 1672. On the 21st of December 1671 he was proposed as a candidate for admission into the Royal Society by Dr Seth Ward, bishop of Salisbury, and on the 11th of January 1672 he was elected a fellow of the Society. At the meeting at which Newton was elected a description of a reflecting telescope which he had invented was read, and "it was ordered that a letter should be written by the secretary to Mr Newton to acquaint him of his election into the Society, and to thank him for the communication of his telescope, and to assure him that the Society would take care that all right should be done him with respect to this invention."

In his reply to the secretary on the 18th of January 1672, Newton writes:—

"I desire that in your next letter you would inform me for what time the society continue their weekly meetings; because, if they continue them for any time, I am purposing them to be considered of and examined an account of a philosophical discovery, which induced me to the making of the said telescope, and which I doubt not but will prove much more grateful than the communication of that instrument being in my judgment the oddest if not the most considerable detection which hath hitherto been made into the operations of nature."

The promise here made was fulfilled in a communication which Newton addressed to Henry Oldenburg, the secretary of the Royal Society, on the 6th of February 1672, and which was read before the society two days afterwards. The whole is printed in No. 80 of the *Philosophical Transactions*.

After explaining his discovery of the composition of white light, he proceeds:—

"When I understood this, I left off my aforesaid Glass works; for I saw, that the perfection of Telescopes was hitherto limited, not so much for want of glasses truly figured according to the prescriptions of Optick Authors (which all men have hitherto imagined), as because that Light itself is a *Heterogeneous mixture of differently refrangible Rays*. So that, were a glass so exactly figured as to collect any one sort of rays into one point, it could not collect those also into the same point, which having the same Incidence upon the same Medium are apt to suffer a different refraction. Nay, I wondered, that seeing the difference of refrangibility was so great, as I found it, Telescopes should arrive to that perfection they are now at."

He then points out why "the object-glass of any Telescope cannot collect all the rays which come from one point of an object, so as to make them convene at its *focus* in less room than in a circular space, whose diameter is the 50th part of the Diameter of its Aperture: which is an irregularity some hundreds of times greater, than a circularly figured *Lens*, of so small a section as the Object-glasses of long Telescopes are, would cause by the unfitness of its figure, were Light *uniform*." He adds: "This made me take reflections into consideration, and finding them regular, so that the Angle of *Reflection* of all sorts of Rays was equal to their Angle of Incidence; I understood, that by their mediation Optick instruments might be brought to any degree of perfection imaginable, provided a Reflecting substance could be found, which would polish as finely as Glass, and *reflect* as much light, as glass *transmits*, and the art of communicating to it a *Parabolick* figure be also attained. But these seemed very great difficulties, and I have almost thought them insuperable, when I further considered, that every irregularity in a reflecting superficies makes the rays stray 5 or 6 times more out of their due course, than the like irregularities in a refracting one; so that a much greater curiosity would be here requisite, than in figuring glasses for Refraction.

"Amidst these thoughts I was forced from *Cambridge* by the Intervening Plague, and it was more than two years before I proceeded further. But then having thought on a tender way of polishing, proper for metall, whereby, as I imagined, the figure also would be corrected to the last; I began to try, what might be effected in this kind, and by degrees so far perfected an Instrument (in the essential parts of it like that I sent to *London*), by which I could discern Jupiters 4 Concomitants, and shewed them divers times to two others of my acquaintance. I could also discern the Moon-like phase of *Venus*, but not very distinctly, nor without some niceness in disposing the Instrument.

"From that time I was interrupted till this last Autumn, when I made the other. And as that was sensibly better than the first (especially for Day-Objects), so I doubt not, but they will be still brought to a much greater perfection by their endeavours, who, as you inform me, are taking care about it at *London*."

After a remark that microscopes seem as capable of improvement as telescopes, he adds: "I shall now proceed to acquaint you with another more notable difformity in its Rays, wherein the *Origin of Colour* is unfolded: Concerning which I shall lay down the *Doctrine* first, and then, for its examination, give you an instance or two of the *Experiments*, as a specimen of the rest. The Doctrine you will find comprehended and illustrated in the following propositions:

"1. As the Rays of light differ in degrees of Refrangibility, so they also differ in their disposition to exhibit this or that particular colour. Colours are not *Qualifications of Light*, derived from Refractions, or Reflections of natural Bodies (as 'tis generally believed), but *original and connate properties*, which in divers Rays are divers. Some Rays are disposed to exhibit a red colour and no other; some a yellow and no other, some a green and no other, and so of the rest. Nor are there only Rays proper and particular to the more eminent colours, but even to all their intermediate gradations.

"2. To the same degree of Refrangibility ever belongs the same colour, and to the same colour ever belongs the same degree of Refrangibility. The *least Refrangible* Rays are all disposed to exhibit a *Red* colour, and contrarily those Rays, which are disposed to exhibit a *Red* colour, are all the least Refrangible: So the *most refrangible* Rays are all disposed to exhibit a deep *Violet Colour*, and contrarily those which are apt to exhibit such a violet colour are all the most Refrangible.

"And so to all the intermediate colours in a continued series belong intermediate degrees of refrangibility. And this Analogy 'twixt colours, and refrangibility is very precise and strict; the Rays always either exactly agreeing in both, or proportionally disagreeing in both.

"3. The species of colour, and degree of Refrangibility proper to any particular sort of Rays, is not mutable by Refraction, nor by Reflection from natural bodies, nor by any other cause, that I could yet observe. When any one sort of Rays hath been well parted from those of other kinds, it hath afterwards obstinately retained its colour, notwithstanding my utmost endeavours to change it. I have refracted it with Prismes, and reflected it with Bodies, which in Day-light were of other colours; I have intercepted it with the coloured film of Air interceding two compressed plates of glass, transmitted it through coloured Mediums, and through Mediums irradiated with other sorts of Rays, and diversly terminated it; and yet could never produce any new colour out of it. It would by contracting or dilating become more brisk, or faint, and by the loss of many Rays, in some cases very obscure and dark; but I could never see it changed *in specie*.

"Yet seeming transmutations of Colours may be made, where there is any mixture of divers sorts of Rays. For in such mixtures, the component colours appear not, but, by their mutual allaying each other constitute a midling colour."

Further on, after some remarks on the subject of compound colours, he says: "I might add more instances of this nature, but I shall conclude with this general one, that the Colours of all natural Bodies have no other origin than this, that they are variously qualified to reflect one sort of light in greater plenty then another. And this I have experimented in a dark Room by illuminating those bodies with uncompounded light of divers colours. For by that means any body may be made to appear of any colour. They have there no appropriate colour, but ever appear of the colour of the light cast upon them, but yet with this difference, that they are most brisk and vivid in the light of their own day-light colour. *Minium* appeareth there of any colour indifferently, with which 'tis illustrated, but yet most luminous in red, and so *Bise* appeareth indifferently of any colour with which 'tis illustrated, but yet most luminous in blew. And therefore *minium* reflecteth Rays of any colour, but most copiously those indued with red; and consequently white illustrated with day-light, that is with all sorts of Rays promiscuously

blended, those qualified with red shall abound most in the reflected light, and by their prevalence cause it to appear of that colour. And for the same reason *Bise*, reflecting blew most copiously, shall appear blew by the excess of those Rays in its reflected light; and the like of other bodies. And that this is the intire and adequate cause of their colours, is manifest, because they have no power to change or alter the colours of any sort of Rays incident apart, but put on all colours indifferently, with which they are inlightened.

. . . . . .

"Reviewing what I have written, I see the discourse it self will lead to divers Experiments sufficient for its examination: And therefore I shall not trouble you further, than to describe one of those, which I have already insinuated.

"In a darkened Room make a hole in the shut of a window whose diameter may conveniently be about a third part of an inch, to admit a convenient quantity of the Suns light: And there place a clear and colourless Prisme, to refract the entring light towards the further part of the Room, which, as I said, will thereby be diffused into an oblong coloured Image. Then place a Lens of about three foot radius (suppose a broad Object-glass of a three foot Telescope), at the distance of about four or five foot from thence, through which all those colours may at once be transmitted, and made by its Refraction to convene at a further distance of about ten or twelve feet. If at that distance you intercept this light with a sheet of white paper, you will see the colours converted into whiteness again by being mingled.

"But it is requisite, that the *Prisme* and *Lens* be placed steddy, and that the paper, on which the colours are cast be moved to and fro; for, by such motion, you will not only find, at what distance the whiteness is most perfect but also see, how the colours gradually convene, and vanish into whiteness, and afterwards having crossed one another in that place where they compound Whiteness, are again dissipated and severed, and in an inverted order retain the same colours, which they had before they entered the composition. You may also see, that, if any of the Colours at the *Lens* be intercepted, the Whiteness will be changed into the other colours. And therefore, that the composition of whiteness be perfect, care must be taken, that none of the colours fall besides the *Lens*."

He concludes his communication with the words: "This, I conceive, is enough for an Introduction to Experiments of this kind: which if any of the *R. Society* shall be so curious as to prosecute, I should be very glad to be informed with what success: That, if any thing seem to be defective, or to thwart this relation, I may have an opportunity of giving further direction about it, or of acknowledging my errors, if I have committed any."

The publication of these discoveries led to a series of controversies which lasted for several years, in which Newton had to contend with the eminent English natural philosopher Robert Hooke; Lucas, mathematical professor at Liége; Linus, a physician in Liége, and many others. Some of his opponents denied the truth of his experiments, refusing to believe in the existence of the spectrum. Others criticized the experiments, saying that the length of the spectrum was never more than three and a half times the breadth, whereas Newton found it to be five times the breadth. It appears that Newton made the mistake of supposing that all prisms would give a spectrum of exactly the same length; the objections of his opponents led him to measure carefully the lengths of spectra formed by prisms of different angles and of different refractive indices; and it seems strange that he was not led thereby to the discovery of the different dispersive powers of different refractive substances.

Newton carried on the discussion with the objectors with great courtesy and patience, but the amount of pain which these perpetual discussions gave to his sensitive mind may be estimated from the fact of his writing on the 18th of November 1676 to Oldenburg:—

"I promised to send you an answer to Mr Lucas this next Tuesday, but I find I shall scarce finish what I have designed, so as to get a copy taken of it by that time, and therefore I beg your patience a week longer. I see I have made myself a slave to philosophy, but if I get free of Mr Lucas's business, I will resolutely bid adieu to it eternally, excepting what I do for my private satisfaction, or leave to come out after me; for I see a man must either resolve to put out nothing new, or to become a slave to defend it."

It was a fortunate circumstance that these disputes did not so thoroughly damp Newton's ardour as he at the time felt they would. He subsequently published many papers in the *Philosophical Transactions* on various parts of the science of optics, and, although some of his views have been found to be erroneous, and are now almost universally rejected, his investigations led to discoveries which are of permanent value. He succeeded in explaining the colour of thin and of thick plates, and the inflexion of light, and he wrote on double refraction, polarization and binocular vision. He also invented a reflecting sextant for observing the distance between the moon and the fixed stars,—the same in every essential as the instrument which is still in everyday use at sea under the name of Hadley's quadrant. This discovery was communicated by him to Edmund Halley in 1700, but was not published, or communicated to the Royal Society, till after Newton's death, when a description of it was found among his papers.

In March 1673 Newton took a prominent part in a dispute in the university. The public oratorship fell vacant, and a contest arose between the heads of the colleges and the members of the senate as to the mode of electing to the office. The heads claimed the right of nominating two persons, one of whom was to be elected by the senate. The senate insisted that the proper mode was by an open election. The duke of Buckingham, who was the chancellor of the university, endeavoured to effect a compromise which, he says, "I hope may for the present satisfy both sides. I propose that the heads may for this time nominate and the body comply, yet interposing (if they think fit) a protestation concerning their plea that this election may not hereafter pass for a decisive precedent in prejudice of their claim," and, "whereas I understand that the whole university has chiefly consideration for Dr Henry Paman of St John's and Mr Craven of Trinity College, I do recommend them both to be nominated." The heads, however, nominated Dr Paman and Ralph Sanderson of St John's, and the next day one hundred and twenty-one members of the senate recorded their votes for Craven and ninety-eight for Paman. On the morning of the election a protest in which Newton's name appeared was read, and entered in the Regent House. But the vice-chancellor admitted Paman the same morning, and so ended the first contest of a non-scientific character in which Newton took part.

On the 8th of March 1673 Newton wrote to Oldenburg, the secretary of the Royal Society:

"Sir, I desire that you will procure that I may be put out from being any longer Fellow of the Royal Society: for though I honour that body, yet since I see I shall neither profit them, nor (by reason of this distance) can partake of the advantage of their assemblies, I desire to withdraw."

Oldenburg must have replied to this by an offer to apply to the Society to excuse Newton the weekly payments, as in a letter of Newton's to Oldenburg, dated the 23rd of June 1673, he says, "For your proffer about my quarterly payments, I thank you, but I would not have you trouble yourself to get them excused, if you have not done it already." Nothing further seems to have been done in the matter until the 28th of January 1675, when Oldenburg informed "the Society that Mr Newton is now in such circumstances that he desires to be excused from the weekly payments." Upon this "it was agreed to by the council that he be dispensed with, as several others are." On the 18th of February 1675 Newton was formally admitted into the Society. The most probable explanation of the cause why Newton wished to be excused from these payments is to be found in the fact that, as he was not in holy orders, his fellowship at Trinity College would lapse in the autumn of 1675. It is true that the loss to his income which this would have caused was obviated by a patent from the crown in April 1675, allowing him as Lucasian professor to retain his fellowship without the obligation of taking holy orders. This must have relieved Newton's mind from a great deal of anxiety about pecuniary matters, as we find him in November 1676 subscribing £40 towards the building of the new library of Trinity College.

It is supposed that it was at Woolsthorpe in the summer of 1666 that Newton's thoughts were directed to the subject of gravity. Voltaire is the authority for the well-known anecdote about the apple. He had his information from Newton's favourite niece Catharine Barton, who married Conduitt, a fellow of the Royal Society, and one of Newton's intimate friends. How much truth there is in what is a plausible and a favourite story can never be known, but it is certain that tradition marked a tree as that from which the apple fell, till 1820, when, owing to decay, the tree was cut down and its wood carefully preserved.

Johann Kepler had proved by an elaborate series of measurements that each planet revolves in an elliptical orbit round the sun, whose centre occupies one of the foci of the orbit, that the radius vector of each planet drawn from the sun describes equal areas in equal times, and that the squares of the periodic times of the planets are in the same proportion as the cubes of their mean distances from the sun. The fact that heavy bodies have always a tendency to fall to the earth, no matter at what height they are placed above the earth's surface, seems to have led Newton to conjecture that it was possible that the same tendency to fall to the earth was the cause by which the moon was retained in its orbit round the earth. Newton, by calculating from Kepler's laws, and supposing the orbits of the planets to be circles round the sun in the centre, had already proved that the force of the sun acting upon the different planets must vary as the inverse square of the distances of the planets from the sun. He therefore was led to inquire whether, if the earth's attraction extended to the moon, the force at that distance would be of the exact magnitude necessary to retain the moon in its orbit. He found that the moon by her motion in her orbit was deflected from the tangent in every minute of time through a space of thirteen feet. But by observing the distance through which a body would fall in one second of time at the earth's surface, and by calculating from that on the supposition of the force diminishing in the ratio of the inverse square of the distance, he found that the earth's attraction at the distance of the moon would draw a body through 15 ft. in 1 min. Newton regarded the discrepancy between the results as a proof of the inaccuracy of his conjecture, and "laid aside at that time any further thoughts of this matter." But in 1679 a controversy between Hooke and Newton, about the form of the path of a body falling from a height, taking the motion of the earth round its axis into consideration, led Newton again to revert to his former conjectures on the moon. The measure of the earth, which had hitherto been accepted by geographers and navigators, was based on the very rough estimate that the length of a degree of latitude of the earth's surface measured along a meridian was 60 m. More accurate estimates had been made by R. Norwood and W. Snell, and more recently by P. Picard. At a meeting of the Royal Society on the 11th of January 1672, Oldenburg the secretary read a letter from Paris describing the method followed by Picard in measuring a degree, and specifically stating the precise length that he calculated it to be. It is probable that Newton had become acquainted with this measurement of Picard's, and that he was therefore led to make use of it when his thoughts were redirected to the subject. This estimate of the earth's magnitude, giving 69·1 m. to 1°, made the two results, the discrepancy between which Newton had regarded as a disproof of his conjecture, to agree so exactly that he now regarded his conjecture as fully established.

In January 1684 Sir Christopher Wren, Halley and Hooke were led to discuss the law of gravity, and, although probably they all agreed in the truth of the law of the inverse square, yet this truth was not looked upon as established. It appears that Hooke professed to have a solution of the problem of the path of a body moving round a centre of force attracting as the inverse square of the distance; but Halley, finding, after a delay of some months, that Hooke "had not been so good as his word" in showing his solution to Wren, started in the month of August 1684 for Cambridge to consult Newton on the subject. Without mentioning the speculations which had been made, he asked Newton what would be the curve described by a planet round the sun on the assumption that the sun's force diminished as the square of the distance. Newton replied promptly, "an ellipse," and on being questioned by Halley as to the reason for his answer he replied, "Why, I have calculated it." He could not, however, put his hand upon his calculation, but he promised to send it to Halley. After the latter had left Cambridge, Newton set to work to reproduce the calculation. After making a mistake and producing a different result he corrected his work and obtained his former result.

In the following November Newton redeemed his promise to Halley by sending him, by the hand of Mr Paget, one of the fellows of his own college, and at that time mathematical master of Christ's Hospital, a copy of his demonstration; and very soon afterwards Halley paid another visit to Cambridge to confer with Newton about the problem; and on his return to London on the 10th of December 1684, he informed the Royal Society "that he had lately seen Mr Newton at Cambridge, who had showed him a curious treatise *De Motu*," which at Halley's desire he promised to send to the Society to be entered upon their register. "Mr Halley was desired to put Mr Newton in mind of his promise for the securing this invention to himself, till such time as he could be at leisure to publish it," and Paget was desired to join with Halley in urging Newton to do so. By the middle of February Newton had sent his paper to Aston, one of the secretaries of the Society, and in a letter to Aston dated the 23rd of February 1685, we find Newton thanking him for "having entered on the register his notions about motion." This treatise *De Motu* was the germ of the *Principia*, and was obviously meant to be a short account of what that work was intended to embrace. It occupies twenty-four octavo pages, and consists of four theorems and seven problems, some of which are identical with some of the most important propositions of the second and third sections of the first book of the *Principia*.

The years 1685 and 1686 will ever be memorable in the history of science. It was in them that Newton composed almost the whole of his great work. During this period Newton had a very extensive correspondence with John Flamsteed, who was then the astronomer-royal. Many of the letters are lost, but it is clear from one of Newton's, dated the 19th of September 1685, that he had received many useful communications from Flamsteed, and especially regarding Saturn, "whose orbit, as defined by Kepler," Newton "found too little for the sesquialterate proportions." In the other letters written in 1685 and 1686 he applies to Flamsteed for information respecting the orbits of the satellites of Jupiter and Saturn, respecting the rise and fall of the spring and neap tides at the solstices and the equinoxes, respecting the flattening of Jupiter at the poles (which, if certain, he says, would conduce much to the stating the reasons of the precession of the equinoxes), and respecting the difference between the observed places of Saturn and those computed from Kepler's tables about the time of his conjunction with Jupiter. On this last point the information supplied by Flamsteed was peculiarly gratifying to Newton; and it is obvious from the language of this part of his letter that he had still doubts of the universal application of the sesquialteral proportion. "Your information," he says, "about the errors of Kepler's tables for Jupiter and Saturn has eased me of several scruples. I was apt to suspect there might be some cause or other unknown to me which might disturb the sesquialteral proportions, for the influences of the planets one upon another seemed not great enough, though I imagined Jupiter's influence greater than your numbers determine it. It would add to my satisfaction if you would be pleased to let me know the long diameters of the orbits of Jupiter and Saturn, assigned by yourself and Mr Halley in your new tables, that I may see how the sesquialteral proportion fills the heavens, together with another small proportion which must be allowed for."

Upon Newton's return from Lincolnshire in the beginning of April 1685, he seems to have devoted himself to the preparation of his work. In the spring he had determined the attractions of masses, and thus completed the law of universal gravitation. In the summer he had finished the second book of the *Principia*, the first book being the treatise *De Motu*, which he had enlarged and completed. Excepting in the correspondence with Flamsteed we hear nothing more of the preparation of the *Principia* until the 21st of April 1686, when Halley read to the Royal Society his *Discourse concerning Gravity and its Properties*, in which he states "that his worthy countryman Mr Isaac Newton has an incomparable treatise of motion almost ready for the press," and that the law of the inverse square "is the principle on which Mr Newton has made out all the

phenomena of the celestial motions so easily and naturally, that its truth is past dispute." At the next meeting of the Society, on the 28th of April, "Dr Vincent presented to the Society a manuscript treatise entitled *Philosophiae Naturalis Principia Mathematica*, and dedicated to the Society by Mr Isaac Newton." Although this manuscript contained only the first book, yet such was the confidence the Society placed in the author that an order was given "that a letter of thanks be written to Mr Newton; and that the printing of his book be referred to the consideration of the council; and that in the meantime the book be put into the hands of Mr Halley, to make a report thereof to the council." Although there could be no doubt as to the intention of this report, yet no step was taken towards the publication of the work. At the next meeting of the Society, on the 19th of May, some dissatisfaction seems to have been expressed at the delay, as it was ordered "that Mr Newton's work should be printed forthwith in quarto, and that a letter should be written to him to signify the Society's resolutions, and to desire his opinion as to the print, volume, cuts and so forth." Three days afterwards Halley communicated the resolution to Newton, and stated to him that the printing was to be at the charge of the Society. At the next meeting of the council, on the 2nd of June, it was again ordered "that Mr Newton's book be printed," but, instead of sanctioning the resolution of the general meeting to print it at their charge, they added "that Mr Halley undertake the business of looking after it, and printing it at his own charge, which he engaged to do."

In order to explain to Newton the cause of the delay, Halley in his letter of the 22nd of May alleges that it arose from "the president's attendance on the king, and the absence of the vice-presidents, whom the good weather had drawn out of town"; but there is reason to believe that this was not the true cause, and that the unwillingness of the council to undertake the publication arose from the state of the finances of the Society. Halley certainly deserves the gratitude of posterity for undertaking the publication of the work at a very considerable pecuniary risk to himself. In the same letter Halley found it necessary to inform Newton of Hooke's conduct when the manuscript of the *Principia* was presented to the Society. Sir John Hoskyns was in the chair when Dr Vincent presented the manuscript, and passed a high encomium on the novelty and dignity of the subject. Hooke was offended because Sir John did not mention what he had told him of his own discovery. Halley only communicated to Newton the fact "that Hooke had some pretensions to the invention of the rule for the decrease of gravity being reciprocally as the squares of the distances from the centre," acknowledging at the same time that, though Newton had the notion from him, "yet the demonstration of the curves generated thereby belonged wholly to Newton." "How much of this," Halley adds, "is so, you know best, so likewise what you have to do in this matter; only Mr Hooke seems to expect you should make some mention of him in the preface, which 'tis possible you may see reason to prefix. I must beg your pardon that 'tis I that send you this ungrateful account; but I thought it my duty to let you know it, so that you might act accordingly, being in myself fully satisfied that nothing but the greatest candour imaginable is to be expected from a person who has of all men the least need to borrow reputation."

In thus appealing to Newton's candour, Halley obviously wished that some acknowledgment of Hooke should be made. He knew indeed that before Newton had announced the inverse law Hooke and Wren and himself had spoken of it and discussed it, and therefore justice demanded that, though none of them had given a demonstration of the law, Hooke especially should receive credit for having maintained it as a truth of which he was seeking the demonstration. On the 20th of June 1686 Newton wrote to Halley the following letter:—

"Sir,—In order to let you know the case between Mr Hooke and me, I give you an account of what passed between us in our letters, so far as I could remember; for 'tis long since they were writ, and I do not know that I have seen them since. I am almost confident by circumstances, that Sir Chr. Wren knew the duplicate proportion when I gave him a visit; and then Mr Hooke (by his book *Cometa* written afterwards) will prove the last of us three that knew it. I intended in this letter to let you understand the case fully; but it being a frivolous business, I shall content myself to give you the heads of it in short, viz. that I never extended the duplicate proportion lower than to the superficies of the earth, and before a certain demonstration I found the last year, have suspected it did not reach accurately enough down so low; and therefore in the doctrine of projectiles never used it nor considered the motions of the heavens; and consequently Mr Hooke could not from my letters, which were about projectiles and the regions descending hence to the centre, conclude me ignorant of the theory of the heavens. That what he told me of the duplicate proportion was erroneous, namely, that it reached down from hence to the centre of the earth.

"That it is not candid to require me now to confess myself, in print, then ignorant of the duplicate proportion in the heavens; for no other reason, but because he had told it me in the case of projectiles, and so upon mistaken grounds accused me of that ignorance. That in my answer to his first letter I refused his correspondence, told him I had laid philosophy aside, sent him only the experiment of projectiles (rather shortly hinted than carefully described), in compliment to sweeten my answer, expected to hear no further from him; could scarce persuade myself to answer his second letter; did not answer his third, was upon other things; thought no further of philosophical matters than his letters put me upon it, and therefore may be allowed not to have had my thoughts of that kind about me so well at that time. That by the same reason he concludes me then ignorant of the rest of the duplicate proportion, he may as well conclude me ignorant of the rest of that theory I had read before in his books. That in one of my papers writ (I cannot say in what year, but I am sure some time before I had any correspondence with Mr Oldenburg, and that's above fifteen years ago), the proportion of the forces of the planets from the sun, reciprocally duplicate of their distances from him, is expressed, and the proportion of our gravity to the moon's *conatus recedendi a centro terrae* is calculated, though not accurately enough. That when Hugenius put out his *Horol. Oscil.*, a copy being presented to me, in my letter of thanks to him I gave those rules in the end thereof a particular commendation for their usefulness in Philosophy, and added out of my aforesaid paper an instance of their usefulness, in comparing the forces of the moon from the earth, and earth from the sun; in determining a problem about the moon's phase, and putting a limit to the sun's parallax, which shews that I had then my eye upon comparing the forces of the planets arising from their circular motion, and understood it; so that a while after, when Mr Hooke propounded the problem solemnly, in the end of his attempt to prove the motion of the earth, if I had not known the duplicate proportion before, I could not but have found it now. Between ten and eleven years ago there was an hypothesis of mine registered in your books, wherein I hinted a cause of gravity towards the earth, sun and planets, with the dependence of the celestial motions thereon; in which the proportion of the decrease of gravity from the superficies of the planet (though for brevity's sake not there expressed) can be no other than reciprocally duplicate of the distance from the centre. And I hope I shall not be urged to declare, in print, that I understood not the obvious mathematical condition of my own hypothesis. But, grant I received it afterwards from Mr Hooke, yet have I as great a right to it as to the ellipsis. For as Kepler knew the orb to be not circular but oval, and guessed it to be elliptical, so Mr Hooke, without knowing what I have found out since his letters to me, can know no more, but that the proportion was duplicate *quam proximè* at great distances from the centre, and only guessed it to be so accurately, and guessed amiss in extending that proportion down to the very centre, whereas Kepler guessed right at the ellipsis. And so Mr Hooke found less of the proportion than Kepler of the ellipsis.

"There is so strong an objection against the accurateness of this proportion, that without my demonstrations, to which Mr Hooke is yet a stranger, it cannot be believed by a judicious philosopher to be any where accurate. And so, in stating this business, I do pretend to have done as much for the proportion as for the ellipsis, and to have as much right to the one from Mr Hooke and all men, as to the other from Kepler; and therefore on this account also he must at least moderate his pretences.

"The proof you sent me I like very well. I designed the whole to consist of three books; the second was finished last summer being short, and only wants transcribing, and drawing the cuts fairly. Some new propositions I have since thought on, which I can as well let alone. The third wants the theory of comets. In autumn last I spent two months in calculations to no purpose for want of a good method, which made me afterwards return to the first book, and enlarge it with divers propositions, some relating to comets, others to other things, found out last winter. The third I now design to suppress. Philosophy is such an impertinently litigious lady, that a man has as good be engaged in lawsuits, as have to do with her. I found it so formerly, and now I am no sooner come near her again, but she gives me warning. The two first books, without the third, will not so well bear the title of *Philosophiae Naturalis Principia Mathematica*; and therefore I had altered it to this, *De Motu Corporum libri duo*.

"But, upon second thoughts, I retain the former title. 'Twill help the sale of the book, which I ought not to diminish now 'tis yours. The articles are, with the largest, to be called by that name; if you please you may change the word to sections, though it be not material. In the first page, I have struck out the words '*uti posthac docebitur*,' as referring to the third book; which is all at present, from your affectionate friend, and humble servant,

"Is. Newton."

On the 29th of June 1686 Halley wrote to Newton:—"I am heartily sorry that in this matter, wherein all mankind ought to acknowledge their obligations to you, you should meet with anything that should give you unquiet"; and then, after an account of Hooke's claim to the discovery as made at a meeting of the Royal Society, he concludes:—

"But I found that they were all of opinion that nothing thereof appearing in print, nor on the books of the Society, you ought to be considered as the inventor. And if in truth he knew it before you, he ought not to blame any but himself for having taken no more care to secure a discovery, which he puts so much value on. What application he has made in private, I know not; but I am sure that the Society have a very great satisfaction, in the honour you do them, by the dedication of so worthy a treatise. Sir, I must now again beg you, not to let your resentments run so high, as to deprive us of your third book, wherein the application of your mathematical doctrine to the theory of comets and several curious experiments, which, as I guess by what you write, ought to compose it, will undoubtedly render it acceptable to those, who will call themselves Philosophers without Mathematics, which are much the greater number. Now you approve of the character and paper, I will push on the edition vigorously. I have sometimes had thoughts of having the cuts neatly done in wood, so as to stand in the page with the demonstrations. It will be more convenient, and not much more charge. If it please you to have it so, I will try how well it can be done; otherwise I will have them in somewhat a larger size than those you have sent up.—I am, Sir, your most affectionate humble servant,

E. Halley."

On the 30th of June 1686 the president was desired by the council to license Newton's book, entitled *Philosophiae Naturalis Principia Mathematica*.

On the 14th of July 1686 Newton wrote to Halley approving of his proposal to introduce woodcuts among the letterpress, stating clearly the different things which he had from Hooke, and adding, "And now having sincerely told you the case between Mr Hooke and me, I hope I shall be free for the future from the prejudice of his letters. I have considered how best to compose the present dispute, and I think it may be done by the inclosed scholium to the fourth proposition." This scholium was—"The inverse law of gravity holds in all the celestial motions, as was discovered also independently by my countrymen Wren, Hooke and Halley." After this letter of Newton's the printing of the *Principia* was begun. The second book, though ready for the press in the autumn of 1686, was not sent to the printers until March 1687. The third book was presented to the Society on the 6th of April 1687, and the whole work published about midsummer in that year. It was dedicated to the Royal Society, and to it was prefixed a set of Latin hexameters addressed by Halley to the author. The work, as might have been expected, caused a great deal of excitement throughout Europe, and the whole of the impression was very soon sold. In 1691 a copy of the *Principia* was hardly to be procured.

While Newton was writing the second and third books of the *Principia*, a very important event occurred at Cambridge which had the effect of bringing him before the public in a new light. James II. had already, in 1686, in open violation of the law, conferred the deanery of Christ Church at Oxford on John Massey, a person whose sole qualification was that he was a member of the Church of Rome; and the king had boasted to the pope's legate that "what he had done at Oxford would very soon be done at Cambridge." In accordance with this boast, in February 1687 he issued a mandate directing that Father Alban Francis, a Benedictine monk, should be admitted a master of arts of the university of Cambridge, without taking the oaths of allegiance and supremacy. Upon receiving the mandamus Dr Pechell, the master of Magdalene College, who was vice-chancellor, sent a messenger to the duke of Albemarle, the chancellor, to request him to get the mandamus recalled; and the registrary and the bedells waited upon Francis to offer him instant admission to the degree if only he would take the necessary oaths. Both the king and the monk were inexorable. The court and the university were thus placed in open collision. A menacing letter was despatched by Sunderland to shake the firmness of the university; but, though humble and respectful explanations were returned, the university showed no sign of compliance, nor even of a desire to suggest a compromise. In consequence the vice-chancellor and deputies from the senate were summoned to appear before the High Commission Court at Westminster. Newton was one of the eight deputies appointed by the senate for this purpose. The deputies, before starting for London, held a meeting to prepare their case for the court. A compromise which was put forward by one of them was stoutly and successfully resisted by Newton, and on the 21st of April the deputation, with their case carefully prepared, appeared before the court. Lord Jeffreys presided at the board. The deputation appeared as a matter of course before the commissioners, and were dismissed. On the 27th of April they gave in their plea. On the 7th of May it was discussed, and feebly defended by the vice-chancellor. The deputies maintained that in the late reign several royal mandates had been withdrawn, and that no degree had ever been conferred without the oaths having been previously taken. Jeffreys spoke with his accustomed insolence to the vice-chancellor, silenced the other deputies when they offered to speak, and ordered them out of court. When recalled the deputies were reprimanded, and Pechell was deprived of his office as vice-chancellor, and of his emoluments as master of Magdalene. Newton returned to Trinity College to complete the *Principia*. While thus occupied he had an extensive correspondence with Halley, a very great part of which is extant. The following letter from Halley, dated London, July 5th, 1687, announcing the completion of the *Principia*, is of peculiar interest:—

"I have at length brought your book to an end, and hope it will please you. The last errata came just in time to be inserted. I will present from you the book you desire to the Royal Society, Mr Boyle, Mr Paget, Mr Flamsteed, and if there be any else in town that you design to gratify that way; and I have sent you to bestow on your friends in the University 20 copies, which I entreat you to accept. In the same parcel you will receive 40 more, which having no acquaintance in Cambridge, I must entreat you to put into the hands of one or more of your ablest booksellers to dispose of them. I intend the price of them, bound in calves' leather, and lettered, to be 9 shillings here. Those I send you I value in quires at 6 shillings, to take my money as they are sold, or at 5^{sh} for ready, or else at some short time; for I am satisfied there is no dealing in books without interesting the booksellers; and I am contented to let them go halves with me, rather than have your excellent work smothered by their combinations. I hope you will not repent you of the pains you have taken in so laudable a piece, so much to your own and the nation's credit, but rather, after you shall have a little diverted yourself with other studies, that you will resume those contemplations wherein you had so great success, and attempt the perfection of the lunar theory, which will be of prodigious use in navigation, as well as of profound and public speculation. . . . You will receive a box from me on Thursday next by the waggon, that starts from town to-morrow."

In 1692 and 1693 Newton seems to have had a serious illness, the nature of which has given rise to very considerable dispute. In a letter dated the 13th of September 1693, addressed to Samuel Pepys, he writes:—

"Some time after Mr Millington had delivered your message, he pressed me to see you the next time I went to London. I was averse, but upon his pressing consented, before I considered what I did, for I am extremely troubled at the embroilment I am in, and have neither ate nor slept well this twelvemonth, nor have my former consistency of mind. I never designed to get any thing by your interest, nor by King James's favour, but am now sensible that I must withdraw from your acquaintance, and see neither you nor the rest of my friends any more, if I may but have them quietly. I beg your pardon for saying I would see you again, and rest your most humble and obedient servant."

And in a letter written to John Locke in reply to one of his about the second edition of his book, and dated the 15th of October 1693, Newton wrote:—

"The last winter, by sleeping too often by my fire, I got an ill habit of sleeping; and a distemper, which this summer has been epidemical, put me farther out of order, so that when I wrote to you, I had not slept an hour a night for a fortnight together, and for five days together not a wink. I remember I wrote to you, but

what I said of your book I remember not. If you please to send me a transcript of that passage, I will give you an account of it if I can."

The loss of sleep to a person of Newton's temperament, whose mind was never at rest, and at times so wholly engrossed in his scientific pursuits that he even neglected to take food, must necessarily have led to a very great deal of nervous excitability. It is not astonishing that rumours got abroad that there was a danger of his mind giving way, or, according to a report which was believed at the time, that it had actually done so. Pepys must have heard such rumours, as in a letter to his friend Millington, the tutor of Magdalene College at Cambridge, dated the 26th of September 1693, he wrote:—

"I must acknowledge myself not at the ease I would be glad to be at in reference to excellent Mr Newton; concerning whom (methinks) your answer labours under the same kind of restraint which (to tell you the truth) my asking did. For I was loth at first dash to tell you that I had lately received a letter from him so surprising to me for the inconsistency of every part of it, as to be put into great disorder by it, from the concernment I have for him, lest it should arise from that which of all mankind I should least dread from him and most lament for—I mean a discomposure in head, or mind, or both. Let me, therefore, beg you, Sir, having now told you the true ground of the trouble I lately gave you, to let me know the very truth of the matter, as far at least as comes within your knowledge."

On the 30th of September 1693 Millington wrote to Pepys that he had been to look for Newton some time before, but that "he was out of town, and since," he says,

"I have not seen him, till upon the 28th I met him at Huntingdon, where, upon his own accord, and before I had time to ask him any question, he told me that he had writt to you a very odd letter, at which he was much concerned; added, that it was in a distemper that much seized his head, and that kept him awake for above five nights together, which upon occasion he desired I would represent to you, and beg your pardon, he being very much ashamed he should be so rude to a person for whom he hath so great an honour. He is now very well, and though I fear he is under some small degree of melancholy, yet I think there is no reason to suspect it hath at all touched his understanding, and I hope never will; and so I am sure all ought to wish that love learning or the honour of our nation, which it is a sign how much it is looked after, when such a person as Mr Newton lyes so neglected by those in power."

The illness of Newton was very much exaggerated by foreign contemporary writers. In a manuscript journal of Huygens is to be found an entry:—

"29 Maj. 1694.—Narravit mihi D. Colm Scotus virum celeberrimum ac summum geometram Is. Neutonum in phrenesin incidisse abhinc anno et sex mensibus. An ex nimia studii assiduitate, an dolore infortunii, quod incendio laboratorium chymicum et scripta quaedam amiserat? Cum ad Archiepiscopum Cantabrigiensem venisset, ea locutum, quae alienationem mentis indicarent. Deinde ab amicis curam ejus susceptam, domoque clauso remedia volenti nolenti adhibita, quibus jam sanitatem recuperavit ut jam rursus librum suum Principiorum Philosophiae Mathematicorum intelligere incipiat."

Huygens, in a letter dated the 8th of June 1694, wrote to Leibnitz, "I do not know if you are acquainted with the accident which has happened to the good Mr Newton, namely, that he has had an attack of phrenitis, which lasted eighteen months, and of which they say his friends have cured him by means of remedies, and keeping him shut up." To which Leibnitz, in a letter dated the 22nd of June, replied, "I am very glad that I received information of the cure of Mr Newton at the same time that I first heard of his illness, which doubtless must have been very alarming."

The active part which Newton had taken in defending the legal privileges of the university against the encroachments of the crown had probably at least equal weight with his scientific reputation when his friends chose him as a candidate for a seat in parliament as one of the representatives of the university. The other candidates were Sir Robert Sawyer and Mr Finch. Sir Robert stood at the head of the poll with 125 votes, Newton next with 122 and Mr Finch was last with 117 votes. Newton retained his seat only about a year, from January 1689 till the dissolution of the Convention Parliament in February 1690. During this time Newton does not appear to have taken part in any of the debates in the House; but he was not neglectful of his duties as a member. On the 30th of April 1689 he moved for leave to bring in a bill to settle the charters and privileges of the university of Cambridge, just as Sir Thomas Clarges did for Oxford at the same time, and he wrote a series of letters to Dr Lovel, the vice-chancellor of the university, on points which affected the interests of the university and its members.

Some of the members of the university who had lately sworn allegiance to James had some difficulty in swearing allegiance to his successor. On the 12th of February 1689, the day of the coronation of William and Mary, Newton intimated to the vice-chancellor that he would soon receive an order to proclaim them at Cambridge. He enclosed a form of the proclamation, and expressed a hearty "wish that the university would so compose themselves as to perform the solemnity with a reasonable decorum."

During his residence in London Newton had made the acquaintance of John Locke. Locke had taken a very great interest in the new theories of the *Principia*. He was one of a number of Newton's friends who began to be uneasy and dissatisfied at seeing the most eminent scientific man of his age left to depend upon the meagre emoluments of a college fellowship and a professorship.

At one time Newton's friends had nearly succeeded in getting him appointed provost of King's College, Cambridge, but the college offered a successful resistance on the ground that the appointment would be illegal, as the statutes required that the provost should be in priest's orders. Charles Montague, who was afterwards earl of Halifax, was a fellow of Trinity College, and was a very intimate friend of Newton; and it was on his influence that Newton relied in the main for promotion to some post of honour and emolument. His hopes, however, were blighted by long delay. In one of his letters to Locke at the beginning of 1692, when Montague, Lord Monmouth and Locke were exerting themselves to obtain some appointment for him, Newton wrote that he was "fully convinced that Mr Montague, upon an old grudge which he thought had been worn out, was false to him." Newton was now in his fifty-fifth year, and whilst those of his own standing at the university had been appointed to high posts in church or state, he still remained without any mark of national gratitude. But this blot upon the English name was at last removed by Montague in 1694, when he was appointed chancellor of the exchequer. He had previously consulted Newton upon the subject of the recoinage, and on the opportunity occurring he appointed Newton to the post of warden of the mint. In a letter to Newton announcing the news, Montague writes:—

"I am very glad that at last I can give you a good proof of my friendship, and the esteem the king has of your merits. Mr Overton, the warden of the mint, is made one of the Commissioners of Customs, and the king has promised me to make Mr Newton warden of the mint. The office is the most proper for you. 'Tis the chief office in the mint: 'tis worth five or six hundred pounds per annum, and has not too much business to require more attendance than you can spare."

This letter must have convinced Newton of the sincerity of Montague's good intentions towards him; we find them living as friends on the most intimate terms until Halifax's death in 1715.

Newton's chemical and mathematical knowledge proved of great use in carrying out the recoinage. This was completed in about two years. In 1697 Newton was appointed to the mastership of the mint, a post worth between £1200 and £1500 per annum. While he held this office, Newton drew up a very extensive table of assays of foreign coins, and composed an official report on the coinage.

Up to the time of the publication of the *Principia* in 1687 the method of fluxions which had been invented by Newton, and had been of great assistance to him in his mathematical investigations, was still, except to Newton and his friends, a secret. One of the most important rules of the method forms the second lemma of the second book of the *Principia*. Though this new and powerful method was of great help to Newton in his work, he did not exhibit it in the results. He was aware that the well-known geometrical methods of the ancients would clothe his new

creations in a garb which would appear less strange and uncouth to those not familiar with the new method. The *Principia* gives no information on the subject of the notation adopted in the new calculus, and it was not until 1693 that it was communicated to the scientific world in the second volume of Dr Wallis's works.

Newton's admirers in Holland had informed Dr Wallis that Newton's method of fluxions passed there under the name of Leibnitz's *Calculus Differentialis*. It was therefore thought necessary that an early opportunity should be taken of asserting Newton's claim to be the inventor of the method of fluxions, and this was the reason for this method first appearing in Wallis's works. A further account of the method was given in the first edition of Newton's *Optics*, which appeared in 1704. To this work were added two treatises, entitled *Tractatus duo de speciebus et magnitudine figurarum curvilinearum*, the one bearing the title *Tractatus de Quadratura Curvarum*, and the other *Enumeratio linearum tertii ordinis*. The first contains an explanation of the doctrine of fluxions, and of its application to the quadrature of curves; the second, a classification of seventy-two curves of the third order, with an account of their properties. The reason for publishing these two tracts in his *Optics*, from the subsequent editions of which they were omitted, is thus stated in the advertisement:—

"In a letter written to M Leibnitz in the year 1679, and published by Dr Wallis, I mentioned a method by which I had found some general theorems about squaring curvilinear figures on comparing them with the conic sections, or other the simplest figures with which they might be compared. And some years ago I lent out a manuscript containing such theorems; and having since met with some things copied out of it, I have on this occasion made it public, prefixing to it an introduction, and joining a Scholium concerning that method. And I have joined with it another small tract concerning the curvilineal figures of the second kind, which was also written many years ago, and made known to some friends, who have solicited the making it public."

In 1707 William Whiston published the algebraical lectures which Newton had delivered at Cambridge, under the title of *Arithmetica Universalis, sive de Compositione et Resolutione Arithmetica Liber*. We are not accurately informed how Whiston obtained possession of this work; but it is stated by one of the editors of the English edition "that Mr Whiston, thinking it a pity that so noble and useful a work should be doomed to a college confinement, obtained leave to make it public." It was soon afterwards translated into English by Raphson; and a second edition of it, with improvements by the author, was published at London in 1712, by Dr Machin, secretary to the Royal Society. With the view of stimulating mathematicians to write annotations on this admirable work, the celebrated 's Gravesande published a tract, entitled *Specimen Commentarii in Arithmeticam Universalem*; and Maclaurin's *Algebra* seems to have been drawn up in consequence of this appeal.

Newton's solution of the celebrated problems proposed by John Bernoulli and Leibnitz deserves mention among his mathematical works. In June 1696 Bernoulli addressed a letter to the mathematicians of Europe challenging them to solve two problems—(1) to determine the brachistochrone between two given points not in the same vertical line, (2) to determine a curve such that, if a straight line drawn through a fixed point A meet it in two points P_1, P_2, then $AP_1^m + AP_2^m$ will be constant. This challenge was first made in the *Acta Lipsiensia* for June 1696. Six months were allowed by Bernoulli for the solution of the problem, and in the event of none being sent to him he promised to publish his own. The six months elapsed without any solution being produced; but he received a letter from Leibnitz, stating that he had "cut the knot of the most beautiful of these problems," and requesting that the period for their solution should be extended to Christmas next, that the French and Italian mathematicians might have no reason to complain of the shortness of the period. Bernoulli adopted the suggestion, and publicly announced the prorogation for the information of those who might not see the *Acta Lipsiensia*.

On the 29th of January 1696/7 Newton received from France two copies of the printed paper containing the problems, and on the following day he transmitted a solution of them to Montague, then president of the Royal Society. He announced that the curve required in the first problem must be a cycloid, and he gave a method of determining it. He solved also the second problem, and he showed that by the same method other curves might be found which shall cut off three or more segments having the like properties. Solutions were also obtained from Leibnitz and the Marquis de L'Hôpital; and, although that of Newton was anonymous, yet Bernoulli recognized the author in his disguise; "tanquam," says he, "ex ungue leonem."

In 1699 Newton's position as a mathematician and natural philosopher was recognized by the French Academy of Sciences. In that year the Academy was remodelled, and eight foreign associates were created. Leibnitz, Domenico Guglielmini (1655-1710), Hartsoeker, and E. W. Tschirnhausen were appointed on the 4th of February, James Bernoulli and John Bernoulli on the 14th of February, and Newton and Olaus Roemer on the 21st of February.

While Newton held the office of warden of the mint, he retained his chair of mathematics at Cambridge, and discharged the duties of the post, but shortly after he was promoted to be master of the mint he appointed Whiston his deputy with "the full profits of the place." Whiston began his astronomical lectures as Newton's deputy in January 1701. On the 10th of December 1701 Newton resigned his professorship, thereby at the same time resigning his fellowship at Trinity, which he had held with the Lucasian professorship since 1675 by virtue of the royal mandate. Whiston's claims to succeed Newton in the Lucasian chair were successfully supported by Newton himself.

On the 26th of November 1701 Newton was again elected one of the representatives of the university in parliament, but he retained his seat only until the dissolution in the following July. Newton does not seem to have been a candidate at this election, but at the next dissolution in 1705 he was again a candidate for the representation of the university. He was warmly supported by the residents, but being a Whig in politics he was opposed by the non-residents, and beaten by a large majority.

In the autumn of 1703 Lord Somers retired from the presidency of the Royal Society, and Newton on the 30th of November 1703 was elected to succeed him. Newton was annually re-elected to this honourable post during the remainder of his life. He held the office in all twenty-five years, a period in which he has been exceeded by but one other president of the Royal Society, Sir Joseph Banks. As president Newton was brought into close connexion with Prince George of Denmark, the queen's husband, who had been elected a fellow of the Royal Society. The prince had offered, on Newton's recommendation, to be at the expense of printing Flamsteed's observations, and especially his catalogue of the stars. It was natural that the queen should form a high opinion of one whose merits had made such a deep impression on her husband. In April 1705, when the queen, the prince and the court were staying at the royal residence at Newmarket, they paid a visit to Cambridge, where they were the guests of Dr Bentley, the master of Trinity. Her Majesty went in state to the Regent House, where a congregation of the senate was held, and a number of honorary degrees conferred. Afterwards the queen held a court at Trinity Lodge, where (16th of April 1705) she conferred the order of knighthood upon Sir Isaac Newton.

As soon as the first edition of the *Principia* was published Newton began to prepare for a second edition. He was anxious to improve the work by additions to the theory of the motion of the moon and the planets. Dr Edleston, in his preface to Newton's correspondence with Cotes, justly remarks:—

"If Flamsteed the Astronomer-Royal had cordially co-operated with him in the humble capacity of an observer in the way that Newton pointed out and requested of him . . . the lunar theory would, if its creator did not overrate his own powers, have been completely investigated, so far as he could do it, in the first few months of 1695, and a second edition of the *Principia* would probably have followed the execution of the task at no long interval."

Newton, however, could not get the information he wanted from Flamsteed, and after the spring of 1696 his time was much

occupied by his duties at the mint. Rumours, however, of his work, and of a new edition, were heard from time to time. In February 1700 Leibnitz writes of Newton, "J'ai appris aussi (je ne sçai où) qu'il donnera encore quelque chose sur le mouvement de la lune: et on m'a dit aussi qu'il y aura une nouvelle édition de ses principes de la nature."

Dr Bentley, the master of Trinity College, had for a long time urged Newton to give his consent to the republication of the *Principia*. In the middle of 1708 Newton's consent was obtained, but it was not till the spring of 1709 that he was prevailed upon to entrust the superintendence of it to a young mathematician of great promise, Roger Cotes, fellow of Trinity College, who had been recently appointed the first Plumian professor of astronomy and experimental philosophy. On the 21st of May 1709, after having been that day with Newton, Bentley announced this arrangement to Cotes:—"Sir Isaac Newton," he said, "will be glad to see you in June, and then put into your hands one part of his book corrected for the press." About the middle of July Cotes went to London, in the expectation doubtless to bring down with him to Cambridge the corrected portion of the *Principia*. Although Cotes was impatient to begin his work, it was nearly the end of September before the corrected copy was put into his hands.

During the printing of this edition a correspondence went on continuously between Newton and Cotes. On the 31st of March 1713, when the edition was nearly ready for publication, Newton wrote to Cotes:—

"I heare that Mr Bernoulli has sent a Paper of 40 pages to be published in the *Acta Lipsica* relating to what I have written upon the curve Lines described by Projectiles in resisting Mediums. And therein he partly makes Observations upon what I have written & partly improves it. To prevent being blamed by him or others for any disingenuity in not acknowledging my oversights or slips in the first edition, I believe it will not be amiss to print next after the old *Praefatio ad Lectorem*, the following account of this new Edition.

"'In hac secunda Principiorum Editione, multa sparsim emendantur & nonnulla adjiciuntur. In Libri primi Sect. ii. Inventio virium quibus corpora in Orbibus datis revolvi possint, facilior redditur et amplior. In Libri secundi Sect. vii. Theoria resistentiae fluidorum accuratius investigatur & novis experimentis confirmatur. In Libro tertio Theoria Lunae & Praecessio Aequinoctiorum ex Principiis suis plenius deducuntur, et Theoria Cometarum pluribus et accuratius computatis Orbium exemplis confirmatur.

"'28 Mar. 1713. I. N.'

"If you write any further Preface, I must not see it, for I find that I shall be examined about it. The cuts for y^e^ Comet of 1680 & 1681 are printed off and will be sent to Dr Bently this week by the Carrier."

Newton's desire to have no hand in writing the preface seems to have proceeded from a knowledge that Cotes was proposing to allude to the dispute about the invention of fluxions. At last, about midsummer 1713, was published the long and impatiently expected second edition of the *Principia*, and, on the 27th of July, Newton waited on the queen to present her with a copy of the new edition.

In 1714 the question of finding the longitude at sea, which had been looked upon as an important one for several years, was brought into prominence by a petition presented to the House of Commons by a number of captains of Her Majesty's ships and merchant ships and of London merchants. The petition was referred to a committee of the House, who called witnesses. Newton appeared before them and gave evidence. He stated that for determining the longitude at sea there had been several projects, true in theory but difficult to execute. He mentioned four: (1) by a watch to keep time exactly, (2) by the eclipses of Jupiter's satellites, (3) by the place of the moon, (4) by a new method proposed by Mr Ditton. Newton criticized all the methods, pointing out their weak points, and it is due mainly to his evidence that the committee brought in the report which was accepted by the House, and shortly afterwards was converted into a Bill, passed both Houses, and received the royal assent. The report ran "that it is the opinion of this committee that a reward be settled by parliament upon such person or persons as shall discover a more certain and practicable method of ascertaining the longitude than any yet in practice; and the said reward be proportioned to the degree of exactness to which the said method shall reach."

Sir Isaac Newton was a very popular visitor at the court of George I. The princess of Wales, afterwards Queen Caroline, wife of George II., took every opportunity of conversing with him. Having one day been told by Sir Isaac that he had composed a new system of chronology while he was still resident at Cambridge, she requested him to give her a copy. He accordingly drew up an abstract of the system from his papers, and sent it to the princess for her own private use; but he afterwards allowed a copy to be made for the Abbé Conti on the express understanding that it should not be communicated to any other person. The abbé, however, lent his copy to M Fréret, an antiquary at Paris, who translated it, and endeavoured to refute it. The translation was printed under the title *Abrégé de chronologie de M le Chevallier Newton, fait par lui-même et traduit sur le manuscrit anglais*. Upon receiving a copy of this work, Sir Isaac Newton printed, in the *Philosophical Transactions* for 1725, a paper entitled "Remarks on the observations made on a Chronological Index of Sir Isaac Newton, translated into French by the observator, and published at Paris." In these remarks Sir Isaac charged the abbé with a breach of promise, and gave a triumphant answer to the objections which Fréret had urged against his system. Father Souciet entered the field in defence of Fréret; and in consequence of this controversy Sir Isaac was induced to prepare his larger work, which was published in 1728, after his death, and entitled *The Chronology of Ancient Kingdoms amended, to which is prefixed a short Chronicle from the First Memory of Kings in Europe to the Conquest of Persia by Alexander the Great*.

From an early period of his life Newton had paid great attention to theological studies, and it is well known that he had begun to study the subject of the prophecies before the year 1690. M Biot, with a view of showing that his theological writings were the productions of his dotage, has fixed their date between 1712 and 1719. That Newton's mind was even then quite clear and powerful is sufficiently proved by his ability to attack the most difficult mathematical problems with success. For it was in 1716 that Leibnitz, in a letter to the Abbé Conti, proposed a problem for solution "for the purpose of feeling the pulse of the English analysts." The problem was to find the orthogonal trajectories of a series of curves represented by a single equation. Newton received this problem about 5 o'clock in the afternoon as he was returning from the mint, but, though he was fatigued with business, he solved the problem the same evening.

One of the most remarkable of Sir Isaac's theological productions is his *Historical Account of Two Notable Corruptions of the Scripture*, in a letter to a friend. This friend was Locke, who received the letter in November 1690. Sir Isaac seems to have been then anxious for its publication; but, as the effect of his argument was to deprive the Trinitarians of two passages in favour of the Trinity, he became alarmed at the probable consequences of such a step. He therefore requested Locke, who was then going to Holland, to get it translated into French, and published on the continent. Being prevented from going to Holland, Locke copied the manuscript, and sent it, without Newton's name, to Le Clerc, who received it before the 11th of April 1691. On the 20th of January 1692 Le Clerc announced to Locke his intention to publish the pamphlet in Latin; and, upon the intimation of this to Sir Isaac, he entreated him "to stop the translation and impression as soon as he could, for he designed to suppress them." This was accordingly done; but Le Clerc sent the manuscript to the library of the Remonstrants, and it was afterwards published at London in 1754, under the title of *Two Letters from Sir Isaac Newton to M le Clerc*. This edition is imperfect, and in many places erroneous. Dr Horsley therefore published a genuine one, which is in the form of a single letter to a friend, and was taken from a manuscript in Sir Isaac's own hand.

Sir Isaac Newton left behind him in manuscript a work entitled *Observations on the Prophecies of Daniel and the Apocalypse of St John*, which was published in London in 1733, in one volume 4to; another work, entitled *Lexicon Prophcticum*,

with a dissertation on the sacred cubit of the Jews, which was printed in 1737; and four letters addressed to Bentley, containing some arguments in proof of a Deity, which were published by Cumberland, a nephew of Bentley, in 1756. Sir Isaac also left a *Church History* complete, a *History of the Creation, Paradoxical Questions regarding Athanasius*, and many divinity tracts.

Newton devoted much of his time to the study of chemistry; but the greater number of his experiments still remain in manuscript. His *Tabula Quantitatum et Graduum Caloris* contains a comparative scale of temperature from that of melting ice to that of a small kitchen fire. He wrote also another chemical paper *De Natura Acidorum*, which has been published by Dr Horsley. Sir Isaac spent much time in the study of the works of the alchemists. He had diligently studied the works of Jacob Boehme, and there were found amongst his manuscripts copious abstracts from them in his own handwriting. In the earlier part of his life he and his relation Dr Newton of Grantham had put up furnaces, and had wrought for several months in quest of the philosopher's tincture. Among the manuscripts in the possession of the earl of Portsmouth there are many sheets in Sir Isaac's hand of Flamsteed's *Explication of Hieroglyphic Figures*, and in another hand many sheets of William Yworth's *Processus Mysterii Magni Philosophicus*.

In the last few years of his life Newton was troubled with incontinence of urine, which was supposed to be due to stone; but with care he kept the disease under control. In January 1725 he was seized with a violent cough and inflammation of the lungs, which induced him to reside at Kensington; and in the following month he had a severe attack of gout, which produced a decided improvement in his general health. His duties at the mint were discharged by John Conduitt, and he therefore seldom went from home. On the 28th of February 1727, feeling well, he went to London to preside at a meeting of the Royal Society; but the fatigue which attended this duty brought on a violent return of his former complaint, and he returned to Kensington on the 4th of March, when Dr Mead and Dr Chesselden pronounced his disease to be stone. He endured the sufferings of this complaint with wonderful patience. He seemed a little better on the 15th of March, and on the 18th he read the newspapers and conversed with Dr Mead; but at 6 o'clock in the evening he became insensible, and continued in that state till Monday the 20th of March 1727, when he expired without pain between one and two o'clock in the morning. His body was removed to London, and on Tuesday the 28th of March it lay in state in the Jerusalem Chamber, and was thence conveyed to Westminster Abbey, where it was buried.

Raphson, *History of Fluxions, showing in a compendious manner the First Rise of and Various Improvements made in that Incomparable Method* (1715); W. W. R. Ball, *Essay on Newton's Principia* (1893). A complete bibliography of Newton's writings has been given by G. J. Gray (Cambridge, 1880). The collected works of Newton were published in 1779–1785 by Dr Samuel Horsley, F.R.S., under the title *Isaaci Newtoni Opera quae exstant Omnia*. (H. M. T.)

NEWTON, JOHN (1725–1807), English divine, was born in London on the 24th of July 1725 (O.S.). His father, who for a long time was master of a ship in the Mediterranean trade, became in 1748 governor of York Fort, Hudson Bay, where he died in 1751. The lad had little education and served on his father's ship from 1737 to 1742; shortly afterwards he was impressed on board a man-of-war, the "Harwich," where he was made a midshipman. For an attempt to escape while his ship lay off Plymouth he was degraded, and treated with so much severity that he gladly exchanged into an African trader. He made many voyages as mate and then as master on slave-trading ships, devoting his leisure to the improvement of his education. The state of his health and perhaps a growing distaste for the slave trade led him to quit the sea in 1755, when he was appointed tide-surveyor at Liverpool. He began to study Greek and Hebrew, and in 1758 applied to the archbishop of York for ordination. This was refused him, but, having had the curacy of Olney offered to him in April 1764 he was ordained by the bishop of Lincoln. In October 1767 William Cowper settled in the parish. An intimate friendship sprang up between the two men, and they published together the *Olney Hymns* (1779). In 1779 Newton left Olney to become rector of St Mary Woolnoth, London, where he laboured with unceasing diligence and great popularity till his death on the 31st of December 1807.

Like Cowper, Newton held Calvinistic views, although his evangelical fervour allied him closely with the sentiments of Wesley and the Methodists. His fame rests on certain of the *Olney Hymns* (*e.g.* "Glorious things of Thee are spoken," "How sweet the name of Jesus sounds," "One there is above all others,") remarkable for vigour, simplicity and directness of devotional utterance.

His prose works include an *Authentic Narrative of some Interesting and Remarkable Particulars in the Life of John Newton* (1764), a volume of *Sermons* (1767), *Omicron* (a series of letters on religion, 1774), *Review of Ecclesiastical History* (1769) and *Cardiphonia* (1781). This last was a further selection of religious correspondence, which did much to help the Evangelical revival. Thomas Scott, William Wilberforce, Charles Simeon, William Jay and Hannah More all came under his direct influence. His *Letters to a Wife* (1793) and *Letters to Rev. W. Bull* (posthumous, 1847) illustrate the frankness with which he exposed his most intimate personal experiences. A *Life* of Newton by Richard Cecil was prefixed to a collected edition of his works (6 vols., 1808; 1 vol. 1827). See also T. Wright, *The Town of Cowper*.

NEWTON, JOHN (1823–1895), American general and engineer, was born in Norfolk, Virginia, on the 24th of August 1823, and graduated second in his class at the U.S. Military Academy in 1842. From 1842 to 1861 he was engaged in the construction of coast defences and the improvement of waterways; he was assistant professor of engineering in the Military Academy from 1843 to 1846, became a captain in 1856, and took part as chief engineer in the Utah expedition of 1857–1858. He served as an engineer in the Virginian campaign of 1861, and was promoted brigadier-general, U.S.V., in September. He especially distinguished himself in the Seven Days' battle and at Antietam, and after the battle of Fredericksburg was made major-general, U.S.V. In the Chancellorsville campaign Newton took part in the storming of Marye's Heights at Fredericksburg, on the 3rd of May 1863, and at the battle of Gettysburg he was for a time in command of the I. corps. He had already received the brevet of lieutenant-colonel for his services at Antietam, and he now became brevet colonel for his services at Gettysburg. Later he was transferred to Sherman's army, and as a division commander under General Oliver O. Howard took part in the Atlanta campaign. For gallant conduct at Peach Tree Creek he was made brevet brigadier-general, and at the close of the war was made brevet major-general, U.S.A. Returning to regular engineering duty after the war, he was stationed at New York from 1866 to 1884. His most important work there was the improvement of the Hudson river, and especially the removal of the obstructions to shipping in the dangerous entrance to the East river from Long Island Sound, known as Hell Gate. Under two of the largest obstructions—Hallet's Point and Flood Rock, with a surface of three acres and nine acres respectively—shafts were sunk from the shore, and tunnels were bored in every direction. In these tunnels thousands of pounds of explosives were placed, and the rocks were blown into fragments. In March 1884 he became Chief of Engineers, with the rank of brigadier-general, and held this position until his retirement from the army, at his own request, in August 1886. In 1887–1888

he was commissioner of public works in New York City, and from 1888 until his death, on the 1st of May 1895, he was president of the Panama railway.

NEWTON, a city and the county-seat of Harvey county, Kansas, U.S.A., about 27 m. N. of Wichita. Pop. (1905) 6601; (1910) 7862. It is served by the Atchison, Topeka & Santa Fé (of which it is a division point and which has shops here), and the Missouri Pacific railways. Newton is the centre of the settlements of the German-Russian Mennonites, a thrifty people, who immigrated in 1873 and subsequently; Bethel College (opened 1893) is a Mennonite secondary school, and there is a Mennonite hospital. Newton is a supply and distributing point for the surrounding agricultural and stock-raising region, and has various manufactures. The municipality has natural gas for heating, lighting and manufacturing. Newton was first settled in 1871, was chartered as a city in 1872, and in 1910 adopted a commission form of government.

NEWTON, a city of Middlesex county, Massachusetts, U.S.A., 10 m. W. of Boston, on the S. bank of the Charles river, which borders it for 16 m. Pop. (1880) 16,995; (1890) 24,379; (1900) 33,587, of whom 10,068 were foreign-born, 19,006 of foreign parentage and 505 were negroes; (1910, census) 39,806. Newton is served by the Boston & Albany railway. The city, with an area of 17·98 sq. m., contains 15 villages. In Newton, the most prominent of these villages, is a stone terrace monument to John Eliot, erected on the site of Waban's wigwam near Nonantum Hill, where Eliot founded the first Indian Church on the 28th of October 1646—the Nonantum Indians, under their chief Waban, removed to Natick in 1651. On Institution Hill, Newton Centre, is the first Baptist theological seminary in America, Newton Theological Institution, founded in 1825. Here also is the residence of Samuel Francis Smith (1808–1895), author of "America" and several missionary hymns, and pastor here in 1842–1854. In Newton Upper Falls, Echo Bridge (of the Boston Aqueduct) crosses the Charles near the falls in Hemlock Gorge Reservation of the Metropolitan Park system. Auburndale is the seat of Lasell Seminary for Young Women, founded in 1851 by Edward Lasell (1809–1852). Other of the villages are Newtonville, West Newton and Newton Highlands. The city of Newton is primarily a residential suburb of Boston; along the Charles is a part (191·12 acres) of the Charles River Reservation of the Metropolitan Park system, and the city has several attractive public parks, including Norumbega Park, on the banks of the river, with a large open-air theatre; boating, especially canoeing, on the river is very popular. The city has a public library, a high school and a technical high school. Among its manufactures are foundry and machine shop products, worsted goods and electrical apparatus; the factories utilize the water power of the falls. The value of the manufactured product in 1905 was $4,140,996. The region was settled as a part of Cambridge in 1630 and was called South Side (*i.e.* of the Charles), Nonantum (the Indian name), Cambridge Village, Little Cambridge or New Cambridge; in 1688 it was incorporated as a separate town and in 1691 received its present name; it annexed an island in the Charles in 1803; parts of it were annexed to Roxbury (1838) and Waltham (1849); it became a city in 1873; and in 1875 it annexed a part of Boston, with which there have been several more recent boundary adjustments.

NEWTON ABBOT, a market town and seaport in the Ashburton parliamentary division of Devonshire, England, 20 m. S. by W. of Exeter by the Great Western railway. Pop. of urban district (1901) 12,517. Beautifully situated at the head of the Teign estuary, the town grew rapidly in the 19th century. The two parish churches, St Mary's in Wolborough, and All Saints' in Highweek, are Perpendicular in style. St Mary's contains a Norman font, an ancient brass lectern, buried during the Civil Wars, and some interesting heraldic ornaments which date from the 15th century. Of the 14th century chapel of St Leonard, only a tower survives. A large nunnery, called St Augustine's Priory, was erected near the town in 1861; while eastward is the Jacobean Forde House, belonging to the earl of Devon, and visited by Charles I. and William of Orange, who first read his declaration to the people of England at Newton Abbot market-cross. The establishment of large engine works by the Great Western railway has aided the development of local industries, and there is a considerable shipping trade, fine china clay and pipeclay being worked near the towns and exported to the Potteries. Large fairs are held for the sale of agricultural produce and livestock. The portion of Newton Abbot in the parish of Highweek was formerly a separate town, known as Newton Bushel.

Probably both Newton Abbot and Newton Bushel were originally included under the name of Newton. Newton Abbot was given to the abbot of Tor by William Lord Brewer, founder of the monastery (1196). Newton Bushel was so called from Robert Bussell or Bushel, foster-child and kinsman of Theobald de Englishville, who was made lord of the manor by Henry III. in 1246.

NEWTON-IN-MAKERFIELD, or NEWTON-LE-WILLOWS, an urban district in the Newton parliamentary division of Lancashire, England, 15½ m. W. of Manchester by the London & North-Western railway. Pop. (1891) 12,861; (1901) 16,699. At a short distance from the town is a moated Elizabethan half-timbered house, and also an ancient barrow of great extent. The Liverpool farm reformatory school is in the neighbourhood. The industrial establishments include foundries, printing and stationery works, paper mills, glass works and sugar refineries. Coal abounds in the neighbourhood.

The township of Newton-in-Makerfield, gave its name in Saxon times and in the reign of William the Conqueror to one of the hundreds of Lancashire. The barony was held by the Banastres from the conquest to 1286 and passed successively to the Langtons, Fleetwoods and Leghs. It does not seem that the barons were ever summoned to parliament, and the title, like all parliamentary titles, has fallen into disuse since the abolition of feudal tenures. The courts-baron and courts-leet are held twice annually. The township returned two members to parliament from 1559 to 1831, but was disfranchised by the Reform Act of 1832. There was a market here at least as early as 1558 which is now discontinued. Near the town a party of Highlanders were taken prisoners in 1648 by Cromwell's troops, and hanged in an adjoining wood, still called Gallow's Cross.

NEWTOWN, a municipality of Cumberland county, New South Wales, Australia, 3½ m. S.W. of Sydney. It consists chiefly of the residences of the wealthier citizens of Sydney and is connected with the city by rail and tram. As a municipality it dates from 1862. Pop (1901) 22,598.

NEWTOWN (Welsh *Drefnewydd*, with the same meaning, formerly *Llanfair Cedewain*), a market town and contributory parliamentary borough of Montgomeryshire, situated on both sides of the Severn, and on the Cambrian railway, 195 m. from London. Pop. of urban district of Newtown and Llanllwchhaiarn (1901) 6500. It is connected with Shrewsbury (*Amwythig*) by the Montgomeryshire canal. The old Anglican church, partly Decorated and partly Perpendicular, has been superseded by the modern St Mary's, which contains the font and rood-screen of the old building. In the old churchyard lies Robert Owen, born in 1771 at Newtown, where he died in 1858, known as "the patriarch of reason," author of *New Views of Society*, &c., and one of the fathers of communism. Newtown, rather than Welshpool, is the chief seat of Welsh flannel manufacture, together with that of tweeds and shawls. It joins with Welshpool, Llanfyllin, Montgomery (*Trefaldwyn*), Llanidloes and Machynlleth, in returning a member to parliament.

NEWTOWNARDS (pron. *Newtonárds*), a market town of Co. Down, Ireland, beautifully situated near the northern extremity of Strangford Lough, on a branch of the Belfast and Co. Down railway, 9½ m. E. of Belfast. Pop. (1901) 9110. The town is sheltered by the Scrabo Hills on the west and north, and possesses a fine square, in which the pedestal of an ancient cross was erected in 1636. Muslin embroidery is the principal industry. There are also mills for flax and hemp yarns, a weaving factory and a hosiery factory. The remains of the old church, originally erected in 1244, contain good Perpendicular work, and the

family vault of the Londonderrys; there are also the parish church and Presbyterian church, with lofty spires, and a Roman Catholic chapel. In the neighbourhood there are freestone quarries.

The town owes its origin to a Dominican monastery founded in 1244 by Walter de Burgh. It was forfeited by the O'Neills, and given to the Hamiltons and Montgomeries, from whom it passed to the marquess of Londonderry. It received a charter from James I., and until the Union in 1800 returned two members to parliament. The ruined abbey of Moville, 1½ m. N.E., is the most notable of the many ecclesiastical remains in the neighbourhood. It is attributed to St Finian (*c.* 550).

NEW ULM, a city and the county seat of Brown county, Minnesota, U.S.A., on the S. bank of the Minnesota river, 88 m. (by rail) S.W. of Minneapolis, in the south central part of the state. Pop. (1905, state census) 5720 (1287 of German birth); (1910) 5648. New Ulm is served by the Minneapolis & St Louis, and the Chicago & North Western railways. In the south-western part of the city, on a wooded hill called Hermann Heights, there is a statue of Arminius erected by the Grand Lodge of Hermann's Sons of the United States. New Ulm is an important livestock market. The city is the seat of the Dr Martin Luther College (Lutheran, 1884), a secondary school, with a normal and a collegiate department. St Michael's Academy and St Alexander Hospital are under the charge of Roman Catholic sisters. New Ulm was settled about 1853, and was twice attacked and almost destroyed by the Indians during the Sioux uprising of 1862. There is a monument to those who lost their lives in the Sioux massacres.

NEW WASHINGTON, a town of the province of Capiz, island of Panay, Philippine Islands, on the N. coast about 17 m. W. of Capiz, the capital of the province. The town was formed in 1903 by uniting the towns of Batan, Jimeno, Balete and the village or barrio of Lagatic in the town of Calibo; the total population at that time was 24,480. There are about sixty-six barrios, but all of these except Lagatic, the seat of the municipal government, had in 1903 less than 1000 inhabitants. The language is Visayan. The cultivation of rice, sugar cane, hemp, and Indian corn and the raising of cattle and horses are the principal industries.

NEW WESTMINSTER, a city on the north bank of the Fraser river, British Columbia, 15 m. from the mouth. Pop. (1906 estimate) 7900. Founded in 1859 it was the capital of British Columbia when the British possessions on the Pacific coast formed two colonies—*i.e.* British Columbia (the mainland portion) and Vancouver Island. The city is accessible to ocean-going ships of 16 ft. draught. It is the chief centre of the farming country of the lower Fraser and has a small export lumber trade. In 1898 the greater portion of the business part of the city was destroyed by fire, and though much of it was rebuilt, the establishment of the city of Vancouver, only 12 m. distant, seriously affected its growth. It is connected with Vancouver by an electric railway. The Great Northern railway, connecting with Seattle and other points in the state of Washington, here crosses the Fraser river by a fine bridge.

NEW YEAR'S DAY, the first day of the year. In the Gregorian calendar this date occurs twelve days earlier than in the Julian; thus in Russia, Greece, &c., where the latter is still employed, New Year's Day is celebrated on the English 13th of January.

The ancient Egyptians, Phoenicians and Persians began their year at the autumnal equinox (Sept. 21) and the Greeks until the 5th century B.C. at the winter solstice (Dec. 21). In 432 B.C. the latter altered their New Year's Day to the 21st of June. The ancient Romans celebrated the beginning of the year on the 21st of December, but Caesar by the adoption of the Julian calendar postponed it to the 1st of January. The Jews have always reckoned their civil year from the first day of the month of Tishri (Sept. 6-Oct. 5), but their ecclesiastical year begins at the spring equinox (March 21). The 25th of March was the usual date among most Christian peoples in early medieval days. In Anglo-Saxon England, however, the 25th of December was New Year's Day. At the Norman Conquest owing, it is believed, to the coincidence of his coronation being arranged for that date, William the Conqueror ordered that the year should start on the 1st of January. But later England began her year with the rest of Christendom on the 25th of March. The Gregorian calendar (1582), which restored the 1st of January to its position as New Year's Day, was accepted by all Catholic countries at once; by Germany, Denmark and Sweden about 1700, but not until 1751 by England.

The Romans, after the adoption of the Julian calendar, kept the 1st of January as a general holiday. Sacrifices were made to Janus; gifts and visits were exchanged, and masquerading and feasting were general. Congratulatory presents were made to the magistrates who entered upon office on this day. The emperors at the new year exacted from their subjects tribute of a pound of gold. This quasi-present was called *strena*, a term (extended to all New Year's gifts in Rome) traditionally derived from a custom initiated by the legendary King Tatius, to whom branches of vervain gathered in the sacred Grove of Strenua, the goddess of strength, were presented as a good omen on the first day of the year 747 B.C. The imperial *strenae* later became so excessive that Claudius found it necessary to limit the amount by formal decree.

Participation in the ordinary New Year's Day observances as well as in the Saturnalia of December was from the first discouraged by the Church. Christians were expected to spend the day in quiet meditation, reading of scripture and acts of charity. When about the 5th century the 25th of December had become a fixed festival commemorative of the Nativity, the 1st of January assumed a specially sacred character as the octave of Christmas Day and as the anniversary of the Circumcision. As such it still figures in the calendars of the various branches of the Eastern and Western Church, though only as a feast of subordinate importance. The first mention of it in Christian literature as a feast occurs in Canon 17 of a council which met at Tours in 567.

The custom of giving and receiving *strenae* for luck at the New Year survives in France (where New Year's Day is known as *le jour d'étrennes*) and the Continent generally. In England its place has been taken by the Christmas-gift. In Scotland, where New Year's Day is more generally observed than Christmas, the custom is still universal. The Persians celebrated the beginning of the year by exchanging presents of eggs. The Druids distributed as New Year's gifts branches of the sacred mistletoe. In Anglo-Saxon and Norman England New Year's gifts were common. According to Matthew Paris, Henry III. followed the Roman precedent by extorting New Year's gifts from his subjects. These in later reigns became voluntary but none the less obligatory on those who wished to stand well with the throne. The custom reached its climax in Tudor times. Wolsey one New Year gave Henry VIII. a gold cup valued at £117, 17s. 6d. in the coinage of that time. An MS. account is preserved of money gifts given to King Henry by all classes of his subjects on New Year's Day 1533. The total reached many thousands. Bishop Latimer, however, handed Henry instead of a purse a New Testament with a leaf doubled down at Hebrews xiii. 4, as apposite to the king's then impending marriage with Anne Boleyn. In Edward VI.'s time, if not earlier, it was usual for the sovereign to give "rewards" to those who presented New Year's gifts. Elizabeth is related to have been most conscientious in this regard. The custom of offering New Year's gifts to the sovereign became obsolete during the Commonwealth and was not revived at the Restoration.

NEW YORK, one of the original thirteen United States of America, situated between 40° 29′ 40″ and 45° 0′ 2″ N., and between 71° 51′ and 79° 45′ 54·4″ W. Its northern boundary is, for the most part, formed by Lake Ontario and the St Lawrence river, which separate it from the province of Ontario, Canada; but north of the Adirondacks the boundary line leaves the St Lawrence, extending in a due east direction to the lower end of Lake Champlain. Thus the boundary between New York and the province of Quebec, Canada, is wholly artificial. Vermont, Massachusetts and Connecticut bound New York on

the E.; the Atlantic Ocean, New Jersey and Pennsylvania, on the S.; and Pennsylvania, Lake Erie and the Niagara river on the W.

The state has a triangular outline, with a breadth from E. to W. of 326·46 m. and from N. to S., on the line of the Hudson, of 300 m. In addition, it includes Long Island and Staten Island on the Atlantic Coast. Its land area is 47,654 sq. m. and the area of the inland waters is 1550 sq. m., giving a total area of 49,204 sq. m. In addition to this, New York includes 3140 sq. m. of water in Lakes Ontario and Erie.

Topography.—The most notable topographic feature is the roughly circular mountain area of north-eastern New York known as the Adirondack mountains (*q.v.*). This is a very ancient mountain mass of crystalline rocks resembling more the Laurentian mountains of Canada than the Appalachians. Indeed, it is commonly considered to be an extension of the Canadian mountains. Parts of the crystalline area are worn down to a condition of low relief, but in the main mountain mass, although greatly worn, there are still elevations of truly mountainous proportions. The highest peak is Mount Marcy (5344 ft.), though associated with it are several other peaks with an elevation from 4000 to 5000 ft. Even the higher summits are worn to a rounded condition, and are therefore for the most part forest covered up to the timber line which, on Mount Marcy, is at an elevation of about 4900 ft. From the crest of the dome of the Adirondacks proper the surface slopes in all directions to surrounding lowlands: to the St Lawrence valley on the N.; the Champlain-Hudson lowland on the E.; the Mohawk valley on the S.; and Lake Ontario on the W. While igneous and metamorphic crystalline rocks form the bulk of the Adirondack area, it is surrounded by a ring of ancient Palaeozoic sediments in which these peripheral lowlands have been developed. The Adirondack area proper, and much of the surrounding ring of more recent rocks, is either too rugged, or has a soil too thin and rocky for extensive agriculture. It is therefore a sparsely settled region with lumbering for one of the leading industries, though there is some mining, as of iron. Owing to the varied and beautiful scenery, this is a favourite summer resort; the game of the forests and the fishing in the streams and in the multitude of lakes serve as further attractions. In the peripheral ring farming increases, especially dairying; and manufacturing industries connected with the products of forests, farms and mines are developed. These and other manufacturing industries are greatly aided by the extensive water power furnished by the mountain streams which flow out radially from the central area.

South of the Adirondack region, and S. of the Mohawk Valley, rises a high-level plateau which extends westward to the Pennsylvania boundary. Here the rocks are all essentially horizontal and of Palaeozoic age, mainly Devonian. This plateau province, which includes more than half the state, differs greatly from place to place. Its elevation decreases toward the N. by a series of steps, having its lowest elevation on the Ontario plain which skirts the southern shore of Lake Ontario. Similar to this is a narrow plain along the southern shore of Lake Erie, which, in fact, lies in a shallow depression in this Erie plain. Both of these plains are so level, and have so fertile a soil that they are the seats of extensive agriculture, especially fruit raising, which is further encouraged by the influence of the large bodies of lake water that moderate the heat of summer and the cold of winter, and tend to check the late frosts of spring and the early frosts of autumn.

Elsewhere in the plateau province the land is higher and the surface far more irregular, increasing in ruggedness toward both the S. and the E. Elevations of between 1500 and 2000 ft. are common in this region all the way from Chautauqua county in the extreme W. to the Catskill mountains in the E.; and in places the surface becomes so rugged as to simulate the features of mountains and locally to win the name mountain. Valleys are deeply sunk in the plateau, the largest with bottom lands of sufficient width to give rise to strips of fertile farm land. The valley walls rise to undulating, and often fairly level uplands, which are, in large part, cleared of forest; but the uplands are remote from markets, and the soil is thin. In the main they are grazing lands—the seat of important dairy and sheep-raising industries. This is the region of abandoned farm houses. Thousands have been deserted and they may be found along all the upland roads.

Since this plateau region is a northward extension of the Alleghany plateau, which skirts the western base of the Appalachian mountains, it rises as the mountains are approached. Thus, in S.E. New York, where the Appalachians enter the state, the plateau becomes much higher than in the W., reaching its culmination in the Catskills. Here, partly because of elevation, and partly because of the resistant nature of the Catskill sandstones, dissection has so sculptured the plateau as to carve it into a mountainous mass which is generally known as the Catskill mountains. In this part of the plateau, summit elevations of from 3000 to 4000 ft. are common, the highest point being Slide Mountain (4205 ft.). Like the Adirondacks, this region is largely forest covered, and is a favourite summer resort; but it is far less a wilderness than the Adirondacks, and in places is cleared for farming, especially for pasturage.

In the plateau province there are other areas known as mountains, of which the Helderberg mountains are the most conspicuous. This formation is really an escarpment facing the lower Mohawk and the Hudson river S. of Albany, where there is a downward step in the plateau. The steeply rising face of the plateau here is due to the resistance of a durable layer of limestone, known as the Helderberg limestone. There are other lower escarpments in the plateau province, similar in form and cause to the Helderberg escarpment. Of these the most notable is the Niagara escarpment which extends eastward from Canada, past Lewiston and Lockport,—a downward step from the Erie to the Ontario plain, where the Niagara limestone outcrops, and its resistance to denudation accounts for the steeply rising face at the boundary between the two plains.

South and S.E. of the Catskills, although including only a small portion of the state, there are a number of different topographic features, due to the belts of different rock structure which cross the state from S.W. to N.E. First come the low folds of the western Appalachians, which, though well developed in Pennsylvania, die out near the New York boundary. The most pronounced of these upfolded strata in New York form the low Shawangunk mountains, which descend, toward the S.E., to a lowland region of folded strata of limestone, slate and other rocks in Orange and Dutchess counties. This lowland area, due to the non-resistant character of the strata, is a continuation of the Great Valley of the Appalachians, and extends N.E. into Vermont and S.W. across New Jersey, Pennsylvania, Maryland and Virginia. It is bounded on its S.E. side by the Highlands, a belt of ancient crystalline rocks which extends N.E. into Connecticut and Massachusetts, and S.W. into the Highlands of New Jersey and thence to the Blue Ridge. South of the Highlands, in New Jersey, but extending to the very banks of the Hudson, is a belt of Triassic sandstone with intrusions of trap rock, which, on account of its peculiar columnar jointing, has developed a palisade structure—the famous Palisades of the lower Hudson. On the New York side of the Hudson the rocks are crystalline, the surface a region of low hills, a continuation of the crystalline area of Connecticut, and comparable with the Piedmont plateau of the Southern states. Long Island, though modified by extensive glacial deposits, may be considered a N.E. extension of the coastal plains which attain a much more perfect development in New Jersey and the states farther S.

The entire surface of New York, with the exception of a very small area in the extreme W., in Chautauqua and Cattaraugus counties, was covered by the continental glacier. With its source in Canada, it overrode even the highest mountains and spread beyond the boundary of New York into Pennsylvania and New Jersey; but farther E. its front rested on Staten Island and Long Island, whose surface features, and a part of whose area, are due to the deposits along the ice front, including terminal moraines and outwash gravel plains. Elsewhere in the state, also, the work of the glacier is very evident. It broadened and deepened many of the valleys; rounded the hills; turned aside many streams, causing changes in drainage and giving rise to innumerable waterfalls and rapids; and it formed the thousands of lakes, large and small, which dot the surface. As the ice receded, it halted at various points, forming moraines and other glacial deposits. Thus the soil of almost the entire state has been derived by glacial action. After the continental ice sheet entirely disappeared from the state, local valley glaciers lingered in the Adirondacks and the Catskills.

Drainage.—The drainage of New York finds its way to the sea in various directions. The St Lawrence system receives the most, mainly from short streams from the plateau province and from the Adirondacks. A small part of the state, in the W., drains to the Ohio, and thence, by way of the Mississippi, to the Gulf of Mexico; and a much larger area drains into the Susquehanna, entering the head of Chesapeake Bay. A part of the Catskills, and the region farther S., drains into Delaware Bay through the Delaware river. Thus New York is pre-eminently a divide region, sending its drainage, by various courses, into widely separated parts of the ocean. Only the Hudson and a few streams in the extreme S. have independent courses to the sea within the state itself.

The Hudson (*q.v.*) is essentially a New York stream, though it receives some drainage from the New England States through its small eastern tributaries. Its entire course is within New York, from which it receives most of its water supply. It is by far the most important river in the state, for, owing to the sinking of the land, which has admitted the tide as far as Troy, it is navigable for 151 m. from the sea. Thence westward the Mohawk Valley furnishes a highway which is followed by canal, railway and waggon road. Thus there is here a gap, easily traversed, across the Appalachian mountains and plateaus to the more level and fertile plains beyond. A low gap also leads northward from the Hudson to the Champlain Valley across a pass only 147 ft. above sea-level. This was of much importance in early wars; but it is of only minor importance as a commercial highway since it leads to Canada through a region of little economic importance.

The lower Hudson, below Troy, is really a fiord, the stream valley being drowned by the sea through subsidence of the land. It is noted for its remarkable scenery, especially where it crosses the Highlands. The other large river valleys are far less useful as highways, though each is paralleled by one or more railways. The action of the

continental glacier in scouring down the passes between the St Lawrence and southern drainage, and in turning streams southward, has facilitated the building of railways across the divides.

There are thousands of lakes and ponds in the state, most of them very small and all, even including Lakes Erie and Ontario, the result of glacial action. The largest lake apart from Erie and Ontario is the beautiful Lake Champlain, which lies on the eastern boundary, partly in Vermont, and with the N. end in Canada. It occupies the lower portion of the trough between the Adirondacks and the Green Mountains. The largest lake entirely within the state is Lake George, famous for its beautiful scenery. In the central part of the state are a series of peculiar elongated lakes, extending in a nearly N.S. direction, known as the Finger Lakes. The largest of these are Cayuga, Seneca, Keuka, Canandaigua, Owasco and Skaneateles. In the extreme western part of the state is Chautauqua Lake, beautifully situated in the plateau of western New York.

New York is noted for its many falls and rapids, some of them of great beauty. Of these the largest is the cataract of Niagara, about 1 m. wide and 160 ft. high. The American Fall is entirely within the state; but the Canadian boundary-line passes down the centre of the Horseshoe or Canadian Fall. Other notable falls are those of the Genesee at Portage and at Rochester, Trenton Falls, the Falls of Ticonderoga, and a multitude of falls and rapids in the Adirondack region and along the shores of the upper portions of the Finger Lakes. Here the tributary streams tumble down the sides of the lake valleys, whose bottoms have been deepened by glacial erosion, leaving the tributary valleys hanging. There are scores of picturesque glens here, and hundreds of waterfalls, among the most beautiful being in the Cayuga valley—notably Enfield Falls, a few miles S. of Ithaca, Ithaca Falls in the city, and Taughannock, a few miles N. of Ithaca. The last, the highest waterfall in the state, has a vertical fall of 215 ft. Similar glens and falls are found in the Seneca Valley, the best known being the widely renowned Watkins Glen, now reserved as a state park (see WATKINS). Many of the waterfalls of New York, but notably Niagara, are used as a source of power.

The Coast-line.—New York has extensive coast-line along the Great Lakes, 75 m. on Lake Erie and over 200 m. on Lake Ontario. Where the lake waters flood the stream mouths, there are excellent harbours, and lake navigation is therefore of high importance. The largest of the lake ports is at Buffalo at the head of Niagara river, where, owing to the Niagara cataract, lake boats from the W. must transfer their goods to rail or canal. Buffalo lies at the lower end of natural lake navigation, though by the building of a ship canal in Canada, lake steamers can proceed into Lake Ontario and thence to the St Lawrence.

The ocean coast-line, though of limited extent, is by far the most important in the United States. The greater part of the sea coast is on Long Island—a low, sandy coast, the seat of numerous summer resorts and of some fishing. The mainland, opposite the western end of Long Island, is traversed by the lower Hudson and other channels —submerged valleys—which form a branching bay with several islands, the largest of which are Staten and Manhattan Islands. The western bank of the lower Hudson is in New Jersey. This branching bay makes an excellent protected harbour, with an immense water front, at the outlet of the chief natural highway from the E. to the interior of the country. Naturally, therefore, a dense population, engaged mainly in manufacturing and commerce, has gathered around the shores of this harbour, the greatest number on Manhattan Island and the contiguous mainland in New York City, but large numbers also on western Long Island, in Brooklyn, on the smaller islands, and on the New Jersey side. The harbour entrance is somewhat obstructed by sand bars, so that extensive government work has been necessary to open and maintain a channel for large draft ocean vessels. This sand has not been brought by the Hudson itself, for that river drops most of its sediment load far up stream, in its long tidal channel. It is supplied by the tidal- and wind-formed currents, which are drifting sand from the Long Island and New Jersey coasts, extending the barrier beaches, such as Sandy Hook, out across the entrance to New York Bay.

Climate.—In general the climate of New York is typical of that of northern United States, a climate of extremes, hot in summer, and cold in winter, and yet healthful, stimulating, and, on the whole, not disagreeable. In the absence of extensive alluvial plains and marshes, there is little malaria. The average mean annual temperature is not far from 45° F., though it varies from over 50° near New York City, and 48° near the Lake Erie shore, to less than 40° in the high Adirondacks. The average maximum summer heat is about 93°, temperature of 100° being rarely reached. In the winter the temperature descends below zero during exceptionally cold spells. A temperature of −20° or lower is never attained in the southern portion, seldom in the central, but is often passed, by 5 or 10 degrees, in the Adirondacks and in the higher parts of the plateau. The rivers and smaller lakes freeze in winter and navigation on the St Lawrence river is closed by ice on the average from about the middle of December until early in April. The average rainfall is between 40 and 45 in., but it is less than 30 in. in the Lake Champlain Valley and over 55 in. N. of New York City. In most of the state frosts begin from September 1st to October 1st, and end from April 1st to May 1st. In the Adirondack region the snowfall is heavy, the winter long and severe. In central New York it is not uncommon for snow to accumulate to the depth of 3 or 4 ft., apd yet this is not persistent. About New York City, and on Long Island, the snow rarely exceeds 1 ft. in depth. The climate is very variable, owing to the frequent passage of cyclonic storms from the W. and S.W., bringing warmer weather with rain and snow in winter, and causing days of great heat and humidity, with thunderstorms, in summer. Between these cyclonic storms come areas of high pressure, or anticyclones, with dry cool air in summer, and dry cold air in winter, sometimes with such decided changes in temperature as to merit the name cold wave. About New York City, and on Long Island, the ocean softens the rigours of winter, and through the influence of cold surface waters off the coast, tempers the heat of summer. The temperature of the larger valleys is notably higher than that of the uplands; and the temperature along the lake shores is decidedly influenced by the large bodies of water. Lakes Ontario and Erie never freeze completely over in winter.

Although one of the smaller states in the Union, being 30th in area, New York ranks first in population and in wealth, and has won for itself the name Empire State. The physiography has enabled the state to become a great highway of commerce between the central part of the United States and the sea-coast, by rail and by water, along the Mohawk Gap and by other routes. The Great Lakes waterway naturally finds an outlet in New York City. This has made it easy for the states to the west to contribute raw materials, notably coal and iron, adding these to the natural raw products of New York. Thus it happens that from Buffalo to New York City there is a chain of busy manufacturing centres along the natural highway followed by the Erie Canal and the Hudson river. Other parts of the state, where connected with the main highway, are influenced by it to some extent; but away from the great natural route of commerce New York is not especially noteworthy either for its density of population or for extensive manufacturing and commerce. (R. S. T.)

Flora.—When first settled by Europeans New York was a woodland region containing nearly all the varieties of trees, shrubs and plants which were common to the territory lying E. of the Mississippi river, N. of the Ohio, and S. of the St Lawrence. In the Adirondack region the trees were principally white pine, spruce, hemlock and balsam, but mixed with these were some birch, maple, beech and basswood, and smaller numbers of ash and elm; in the swamps of this region were also larch and cedar. The forests of the W. half of the state contained pine, but here such hardwood trees as oak, chestnut, hickory, maple and beech were more common. The tulip tree was common both in the S.W. and N.; and the walnut, butternut, poplar, sycamore and locust were widely distributed. The original varieties of trees still abound, though in less numbers, on lands ill-adapted to agriculture, and in the Adirondack and Catskill Mountains, where the state has established forest preserves, and the Forest, Fish and Game Commissioner began reforesting in 1901, principally with pine, spruce and larch. On the summits of the Adirondacks are a few alpine species, such as reindeer moss and other lichens; on the shores of Long Island, Staten Island and Westchester county are a number of maritime species; and on Long Island are several species especially characteristic of the pine barrens of New Jersey. Laurel, rhododendron, and whortleberry are common shrubs in the mountain districts, and sumac, hazel, sassafras and elder are quite widely distributed elsewhere. Among indigenous fruit-bearing plants the state has the black cherry, red cherry, red plum, yellow plum, grape, black currant, blackberry, dewberry, strawberry and cranberry. Blue flag, snake root, ginseng, lobelia, tansy, wormwood, wintergreen, pleurisy root, plantain, burdock, sarsaparilla and horehound are among its medicinal plants. Cowslips, violets, anemones, buttercups and blood-roots are conspicuous in early spring, the white pond lily and the yellow pond lily in summer, asters and golden-rod in autumn, and besides these there are about 1500 other flowering plants in the state and more than 50 species of ferns.

Fauna.—Of the fur and game animals which were inhabitants of the primeval forests few of the larger species remain except in the Adirondack region. Here the puma ("panther") has become extinct and the Canada lynx is rare. The moose, the elk and the beaver have been placed under the protection of the Forest, Fish and Game Commissioner. There are many deer in the Adirondacks. The porcupine is common, but the Canada pine marten or American sable, fisher, and red fox are rare, and the black bear and grey wolf are found only in small numbers. Rabbits and squirrels are numerous in nearly all parts of the state; skunks, weasels, muskrats and woodchucks are common; there are some racoons; mink are frequently taken in the Adirondacks; and a few otter remain. In the lower counties are some "Virginia" opossums.

Among birds of prey a bald eagle and a golden eagle are occasionally seen in secluded places. Game birds include ducks, geese, plovers, snipe, loons, grebes, terns, rails, the woodcock and the ruffed grouse; quails are scarce except on Long Island, where a number of young birds are liberated each year, and by the same means a supply

of pheasants is maintained in some parts of the state. There is a state game bird farm (1909) near Sherburne in Chenango county. Herons, the brown pelican, bittern, and mud hen frequent the marshes. The robin, song sparrow, chickadee, thrushes, warblers, vireos, orioles, wrens, blue-bird, cat-bird and phoebe are favourite song birds.

There are about 375 species of fish in New York waters (see below under FISHERIES).

Soil.—The soil is mostly glacial drift, but its depth and composition often vary greatly even within small areas. The most widely distributed soil, especially in the W. half of the state, is mainly a clay which was formed by the glacial pulverizing of limestone and shale and is still forming from the decomposition of fragments of these substances. In the larger valleys and along the shores of lakes considerable alluvium is mixed with this clay. In the E. there is some clay formed mainly by the decomposition of slate. A sandy loam is quite characteristic of some of the N. counties, and gravelly loams containing limestone are not uncommon.

Agriculture and Stock-Raising.—Although New York has lost in the competition with the Western States in the production of most of the grains, especially wheat and barley, and in the production of wool, mutton and pork, it has made steady progress in the dairy business and continues to produce great crops of hay. The state has made great advances, too, in the production of flowers, ornamental plants, nursery products, fruits, vegetables, poultry and eggs. In 1900 a little less than three-fourths of the state's total land area was included in farms and a little more than two-thirds of this was improved. The number of farms gradually increased from 170,621 in 1850 to 226,720 in 1900, and the average size decreased from 112·1 acres in 1850 to 97·1 acres in 1890, but increased to 99·9 acres in 1900. More than two-thirds of the farms (152,956) were operated by owners or part owners, 29,900 were operated by share tenants, and 24,303 by cash tenants. Of the total acreage of all crops, 5,154,965 acres (54·1 %) were of hay and 3,125,077 acres (32·8 %) were of cereals. In 1909 the amount of the hay crop (5,002,000 tons) was greater than that of any other state except Iowa, and its value ($71,028,000) was greater than in any other state. The oat crop in 1909 was 37,365,000 bushels; the Indian corn crop, 1,910,000 bushels; the wheat crop, 24,120,000 bushels; the barley crop, 8,820,000 bushels; the rye crop, 2,720,000 bushels; buckwheat, 7,512,000 bushels.

There were less than one-third as many sheep in 1910 (1,177,000) as in 1850; but in the same period the number of dairy cows (1,771,000 in 1910) steadily increased. The number of cattle other than dairy cows was 946,315 in 1850 and 889,000 in 1910. Horses increased from 447,014 in 1850 to 717,000 in 1910.

New York has a larger acreage of vegetables than any other state. Its crop of potatoes in 1909 was 52,560,000 bushels and that of Maine, the next largest, 29,250,000 bushels; and the state is a large producer of onions, turnips, cabbages, cauliflower, sweet Indian corn, cucumbers, rhubarb, parsnips, carrots, green peas and green beans. During the years 1850–1889 New York produced about 70 % of the hop crop of the entire country, but since 1890 hop culture has been rapidly extended in the Pacific Coast states and suffered to decline in New York, and the crop from 1899 to 1907 averaged only about one-half that of 1889 (20,063,029 lb). Tobacco culture was introduced in 1845, and in 1860 the crop was 5,764,582 lb. During 1860–1880 the increase was slight, but in 1899 the crop was 13,958,370 lb; in 1909 the crop was only 7,050,000 lb. The value of the fruit crop in 1899 ($15,844,346) was second only to that of California; and the most productive agricultural lands are those devoted to floriculture and nurseries.

The dairy business and the production of hay are especially prominent in the rugged region W. of the Adirondack Mountains and in the rugged portions of the counties in the S. half of the state. A large portion of the Indian corn, wheat and barley is produced on the Ontario plain. There are large crops of oats here, too, but the culture of this cereal is quite extensive in most of the counties W. of the Adirondacks. The lower valley of the Hudson is noted for its crops of rye. The buckwheat belt extends S.W. across the state from Albany and Saratoga counties. The principal hop-producing counties are Otsego, Schoharie and Madison, all of which are between Albany and Syracuse. Those producing most tobacco are in a district extending from the S.E. shore of Lake Ontario southward across the state. The great orchards are in the tier of counties bordering the S. shore of Lake Ontario and in Dutchess and Ulster counties in the Hudson Valley. Chautauqua county alone produced more than one-half of the state's crop of grapes in 1899, but this fruit is grown extensively also in the region W. of Seneca Lake in the vicinity of Lake Keuka, and in parts of the lower valley of the Hudson. The culture of small fruits and vegetables is widely distributed throughout the W. half of the state and in the valley of the Hudson, and the greater part of Long Island under cultivation is devoted to market gardening, floriculture and nurseries. The largest nurseries, however, are in the vicinity of Rochester.

Forest Products.—The principal forest area is in the Adirondack region where the state has a forest preserve (in Clinton, Essex, Franklin, Fulton, Hamilton, Herkimer, Lewis, Oneida, St Lawrence, Saratoga, Warren and Washington counties) containing (1909) 1,530,559 acres, and there is as much or more in private preserves and in tracts owned by lumbermen. The state has a forest preserve also in the Catskill region (in Delaware, Greene, Sullivan and Ulster counties) of 110,964 acres, and there are wood-lots on many farms throughout the state that produce commercial timber. Originally white pine was the principal timber of the Adirondacks, but most of the merchantable portion has been cut, and in 1905 nearly one-half of the lumber product of this section was spruce, the other half mainly hemlock, pine and hardwoods (yellow birch, maple, beech and basswood, and smaller amounts of elm, cherry and ash). The state is reforesting portions of its preserve chiefly with pine, spruce and larch. In the Catskills and in the farming regions the lumber product consists largely of hardwoods (mostly oak, chestnut and hickory), smaller amounts of hemlock and pine, and a very little spruce. The state's entire timber product in 1905 was 1,212,070,168 ft. (board measure); of this about five-eighths was from the Adirondack region, a little more than one-fourth was from the farming regions, and a little less than one-eighth was from the Catskill region. Maple sugar is an important by-product of the forests, and in the production of this commodity New York ranks second only to Vermont; 3,623,540 lb were made in 1900.

Fisheries.—New York was in 1904 more extensively engaged in oyster culture than any other state, and was making more rapid progress in the cultivation of hard clams. In 1909 there were distributed from state fish hatcheries[1] 531,293,721 fishes (mostly smelt, pike-perch, and winter flatfish); a large number of fish and eggs were also placed in New York waters by the United States Bureau of Fisheries. The products of the marine fisheries decreased nearly 30 % in value from 1891 to 1897, but from 1897 to 1904 they increased from $3,391,595 to $6,230,558, or 80·3 %, and a large part of this increase was due to the extension of the successful oyster culture at the E. end of Long Island; the value of oysters alone rising from $2,050,058 to $3,780,352. The value of hard clams rose during the same period from $198,930 to $303,599. Peconic Bay, at the E. end of Long Island, yields more scallops than all the other waters of the United States. Soft clams, lobsters, hard crabs and soft crabs are other shell-fish obtained in small quantities. Menhaden are caught in much larger quantities in New York than any other fish, but being too bony for food they are used only in the manufacture of oil and fertilizer. The most valuable catches of food fish in 1904 were those of bluefish ($556,527), squeteague ($212,623), flounders ($67,159), eels ($53,832), cod ($52,710), scup ($48,068) and shad ($36,826). The shad fishery is mainly in the lower waters of the Hudson river, and the catch diminished so rapidly from 1901 that in 1904 it was only about one-eighth of the average for the decade from 1890 to 1900. The New York fisheries of Lakes Erie and Ontario and the Niagara and St Lawrence rivers yielded products in 1903 valued at $187,798 and consisting largely of pike-perch, herring, catfish, bullheads and sturgeon, and in 1902 there were commercial fisheries in sixteen interior lakes and rivers which yielded muscallonge, smelt, bullheads, pickerel, pike-perch and several other varieties having a total value of $87,897.

Minerals.—More than thirty mineral substances are obtained in commercial quantities from the mines, quarries and wells of New York, but of the total value of the mineral products in 1908 ($45,660,861), nearly six-sevenths was represented by clay products ($8,929,224), pig iron ($15,879,000), stone ($6,157,279), cement ($2,254,759), salt ($2,136,738), petroleum ($2,071,533), and sand and gravel ($1,349,163). The extensive deposits of clay in the Hudson Valley together with the easy water communications with New York City have made this valley the greatest brick-making region in the world; in 1906 the common bricks made here numbered 1,230,692,000. There are also deposits of clay suitable for making bricks, terra-cotta and tiles in nearly every county outside of this valley, and there are some pottery clays in Albany and Onondaga counties. The common bricks made in New York in 1908 were valued at $5,066,084, an amount in excess of that in any other state; and the total value of brick and tile products was $7,270,981, being less than that of Ohio, Pennsylvania or Illinois. In 1750 the mining of iron ore was begun near Monroe, Orange county. Ore has since been found in most of the eastern counties and as far W. as Wayne county, but the mines in Essex, Clinton and Franklin counties of the Adirondack region are by far the most productive. The ores are principally magnetites (New York is the largest producer of magnetite ore among the states, producing about 45 % of the total for the United States in 1907 and 1908), but red haematites occur in the N. and W. section of the Adirondacks and in the central part of the state, and brown haematites and carbonate ore in the S.E. counties. The total output of the state increased from 651,228 long tons in 1884 to 1,253,393 long tons in 1890, decreased to 179,951 long tons in 1898, again increased to 1,375,020 long tons in 1907, when only three states produced more, and was only 697,473 long tons in 1908 when the state held the same rank as in 1907. Limestone

[1] These include: the Adirondack Hatchery at Upper Saranac, Franklin county; the Caledonia Hatchery at Mumford, Monroe county; the Cold Spring Harbor Hatchery, at Cold Spring Harbor, Suffolk county; the Delaware Hatchery, at Margaretville, Delaware county; the Fulton Chain Hatchery, at Old Forge, Herkimer county; the Linlithgo Hatchery, at Linlithgo, Columbia county; the Oneida Hatchery, at Constantia, Oswego county; and the Pleasant Valley Hatchery, at Taggart, Steuben county.

is widely distributed throughout the state, and great quantities of it are crushed for road-making, railway ballasts, and concrete, but as the prevailing colours are greyish or drab it is little used in the walls of buildings. In 1908 the total value of the output of this stone was $2,584,559. Three distinct varieties of sandstone are quarried extensively. Those popularly known as "bluestones" belong to the Hamilton period of the Devonian formation and occur mainly between the Hudson and Delaware rivers. They are dark blue-grey, fine grained and durable, and are much used for flagging and kerbing and for sills, caps and steps. Medina sandstones occur throughout a belt averaging about 10 m. wide along the S. shore of Lake Ontario and are either red or grey; the red are used for building, the grey for street paving. A more durable and more beautiful stone for building is the reddish or reddish-brown Potsdam sandstone of which there are extensive formations on the N.W. border of the Adirondacks. The value of all sandstones quarried in 1908 was $1,774,843, an amount exceeded by no other state. Several choice marbles are obtained in the eastern counties. From Tuckahoe, Westchester county, has been taken white marble, used in some of the finest buildings in New York City, and a similar marble is obtained in Putnam and Dutchess counties. Near Gouverneur, St Lawrence county, is a large quarry of coarsely crystalline magnesian limestone, used as monumental marble. In the Lower Silurian formation at Plattsburg and Chazy, in Clinton county, are two beautiful grey or grey and pink marbles, one of which is a favourite among domestic marbles for mantels, table tops and other interior decorations. From an extensive deposit of blue-black magnesian limestone at Glens Falls are taken the choicest varieties of black marble quarried in the United States. At Moriah and Port Henry, in Essex county, is a stone known as ophlite marble, a mixture of serpentine, dolomite and calcite interspersed with small flecks of phlogopite. Larger deposits of serpentine occur at several places in St Lawrence county; and at Warwick, in Orange county, is some beautiful marble of a carmine-red colour occasionally mottled with white or showing white veins. The marble quarried in 1908 was valued at $706,858. There are extensive formations of granitic rocks in the Adirondacks, in the lower Hudson Valley, and in the adjacent highlands, but they are not extensively quarried. Rockland county quarries considerable trap rock, used mostly for road-making and concrete, and Ulster county has for more than a century produced most of the domestic millstones used in the United States. Extending from Madison county to the W. border of the state in Erie county is a narrow belt containing large deposits of gypsum, and in 1908 the value of the state's output ($760,759) was greater than that of any other state, although Michigan produced a larger quantity. At or near Chittenango, in Madison county, natural-cement rock was first discovered in the United States, and the first use made of it was in the construction of the Erie Canal. The rock was found in much greater quantities at Rosendale, in Ulster county, in 1823, and the amount of this cement produced by New York rose to 4,689,167 barrels in 1899; the state is still the chief producer but only 947,929 barrels were made in 1908. Limestone and clay suitable for making Portland cement are also found in Ulster county and elsewhere, and the production of this increased from 65,000 barrels in 1890 to 2,290,955 barrels in 1908. Near Talcville, in St Lawrence county, is a large deposit of fibrous talc. In 1908 the total value of the state's talc product was $697,390, almost one-half the total for the entire country.

New York and Michigan are the two principal salt-producing states in the Union. Salt was discovered by the Jesuits in Western New York about the middle of the 17th century, and was manufactured by the Indians in the Onondaga region. The state bought the salt reservation in 1788, and soon afterward the manufacture of salt was begun by the whites. From 1880 to 1885 the first brines were obtained in Wyoming and Genesee counties by boring deep wells into beds of rock salt, and in 1885 the mining of the extensive deposits of rock salt in Livingston county was begun. Salt is also produced in Tompkins and Schuyler counties. In 1908 the total production of the state, 9,076,743 barrels valued at $2,136,738, was exceeded in quantity and (for the first time) in value by that of Michigan.

The Appalachian oil field extends northward from West Virginia and Pennsylvania into Cattaraugus, Allegany and Steuben counties. The first oil well in the state was drilled at Limestone in Cattaraugus county in 1865, and the state's output of oil was 1,160,128 barrels, valued at $2,071,533 in 1908. At Olean it is pumped into pipes which extend as far north as Buffalo and as far east as Long Island City. The village of Fredonia, in Chautauqua county, was illuminated by natural gas as early as 1825, and gas has since been discovered in several of the western counties. The value of the flow in 1908 was $959,280.

There are more than forty mineral springs in New York whose waters are of commercial importance, and in 1908 the waters sold from them amounted to 8,007,092 gals., valued at $877,648; several of the springs, especially those in Saratoga county, attract a large number of summer visitors. Graphite is widely distributed in the Adirondack region, but the mining of it is confined for the most part to Essex and Warren counties; in 1908 the output was 1,932,000 lb. valued at $116,100. Other mineral substances obtained in small quantities are: pyrite, in St Lawrence county; arsenical ore, in Putnam county; red, green and purple slate, in Washington county; garnet in Warren, Essex and St Lawrence counties; emery and felspar, in Westchester county; and infusorial earth in Herkimer county.

Manufactures.—The establishment of a great highway of commerce through the state from New York City to Buffalo by the construction of the Erie Canal, opened in 1825, and later by the building of railways along the line of the water route, made the state's manufactures quite independent of its own natural resources. The factory manufacture of clothing was begun in New York City about 1835, and received a great impetus from the invention of the sewing-machine, the demands created by the Civil War, and the immigration of vast numbers of foreign labourers. It is now the leading manufacturing industry of the state. The value of the clothing was $340,715,921 in 1905. New York City ranks first among American cities in printing and publishing, the products being valued at $137,985,751 in 1905. Knitting by machinery was introduced into America in 1831 at Cohoes Falls, on the Mohawk river; the products, consisting largely of underwear, were valued at $46,108,600 in 1905. Of the other textile industries none except the manufacture of carpets and rugs and silk and silk goods has become very prominent, and yet the total value of all textile products in 1905 was $123,668,177. The refining of sugar was begun in New York City late in the 18th century, but the growth of the industry to its present magnitude has been comparatively recent; the value of the sugar and molasses refined in 1905 was $116,438,838. Foundry and machine-shop products were valued at $115,876,193 in 1905, and electrical machinery, apparatus, and supplies at $35,348,276. The manufacture of paper and wood-pulp products ($37,750,605 in 1905) is an industry for which the state still furnishes much of the raw material, and other large industries of which the same is true are the manufacture of flour and grist-mill products, dairy products, canned fruits and vegetables, wines, clay products, and salt. New York state has ranked first in the Union in the value of its manufactures since 1830, and their value rose to $2,488,345,579 in 1905. More than three-fifths of that of 1905 was represented by the manufactures of New York City alone. Buffalo, the second city in manufactures, shares largely with New York City the business of slaughtering and meat packing, the refining and smelting of copper, and the manufacture of foundry and machine-shop products, and with New York City and Rochester the manufacture of flour and grist-mill products. Rochester ranks first among the cities of the United States in the manufacture of photographic materials and apparatus and optical instruments. Niagara Falls and New York City manufacture a large part of the chemicals, and the value of the state's output rose to $29,090,484 in 1905. Gloversville and Johnstown are noted for leather gloves and mittens.

Transportation and Commerce.—From the very beginning of the occupation of New York by Europeans, commerce was much encouraged by the natural water-courses. The Western Inland Lock Navigation Company, chartered by the state in 1792, completed three canals within about four years and thereby permitted the continuous passage from Schenectady to Lake Ontario of boats of about 17 tons. The Erie Canal was begun by the state in 1817 and opened to boats of about 75 tons burden in 1825. The Champlain Canal, connecting the Erie with Lake Champlain, was also begun in 1817 and completed in 1823. The Oswego Canal, connecting the Erie with Lake Ontario, was begun in 1825 and completed in 1828. Several other tributary canals were constructed during this period, and between 1836 and 1862 the Erie was sufficiently enlarged to accommodate boats of 240 tons burden.

The first railway in the state and the second in operation in the United States was the Mohawk & Hudson, opened from Albany to Schenectady in 1831. The railway mileage in the state increased to 1361 m. in 1850, to 3928 m. in 1870, to 7684·41 m. in 1890, and to 8422·14 m. in January 1909. The first great trunk line in the country was that of the Erie railway, opened from Piermont, on the Hudson river, to Dunkirk, on Lake Erie, in 1853. The New York Central & Hudson River railway, nearly parallel with the water route from New York City to Buffalo, was formed by the union, in 1869, of the New York Central with the Hudson River railway. The West Shore railway, which follows closely the route of the New York Central & Hudson River, was also the result of a consolidation, completed in 1881, of several shorter lines. In 1886 the New York Central & Hudson River Railroad Company leased the West Shore for a term of 475 years, and this company operates another parallel line from Syracuse to Buffalo, a line following closely the entire N. border of the state (the Rome, Watertown & Ogdensburg), and several cross lines. Other important railways are the Lehigh Valley, the Delaware, Lackawanna & Western, and the Pennsylvania in the central and W. sections, the Delaware & Hudson, the Rutland, and the New York Ontario & Western in the E., and the Long Island on Long Island. In competition with the railways, traffic on the existing canals suffered a marked decline. As, however, this decline was accompanied with a considerable decrease in the proportion of the country's exports which passed through the port of New York, interest in the canals revived, and in 1903 the electorate of the state authorized the issue of bonds to the amount of $101,000,000 for the purpose of increasing the capacity of the Erie, the Champlain and the Oswego canals, to make each navigable by barges of 1000 tons burden. A project adopted by the state for the enlargement of the Erie provides for a new route up the Hudson from Troy to Waterford

and thence to the Mohawk river above Cohoes Falls. Up the Mohawk to Rome the old route is for the most part to be retained; but from Rome to Clyde there is to be a diversion so as to utilize Oneida Lake and Oneida and Seneca rivers. Westward from Clyde the new channel, like the old but larger, will pass through Rochester and Lockport to the Niagara river at Tonawanda. Each of the three canals is to have a minimum depth of 12 ft., a minimum bottom width in rivers and lakes of 200 ft., and in other sections a bottom width generally of 75 ft. Their locks are to be 328 ft. in length and 45 ft. in width.

The imports to the port of New York increased in value from $466,527,631 in 1897 to $891,614,678 in 1909, while the exports increased in value from $404,750,496 to $627,782,767. Other ports of entry are Buffalo and Dunkirk, on Lake Erie, Niagara Falls, on the Niagara river, Ogdensburg and Cape Vincent, on the St Lawrence river, Plattsburg, on Lake Champlain, Oswego, on Lake Ontario, Rochester, on the Genesee river, Albany and Syracuse in the interior, and Sag Harbor at the E. end of Long Island.

Population.—New York outstripped Pennsylvania in population in the first decade of the 19th century, and Virginia in the second decade, and since 1820 it has been the most populous state in the Union. In 1880[1] the population was 5,082,871; in 1890, 5,997,853; in 1900, 7,268,894; in 1905, according to the state census, 8,067,308, and in 1910, 9,113,614. The foreign-born population in 1900 was 1,900,425, including 480,026 natives of Germany, 425,553 of Ireland, 182,248 of Italy, 165,610 of Russia, 135,685 of England, 117,535 of Canada, 78,491 of Austria, 69,755 of Poland and 64,055 of Scandinavia. More than two-thirds of the foreign-born were in New York City The coloured population constituted only 1·5% of the total, and was composed of 99,232 negroes, 7170 Chinese, 5257 Indians and 354 Japanese.

Most of the Indians were on eight reservations: the Allegany Reservation (30,469 acres) in Cattaraugus county; the Cattaraugus Reservation (21,680 acres) in Erie, Cattaraugus and Chautauqua counties; the St Regis Reservation (14,030 acres) in Franklin county; the Tonawanda Reservation (7548 acres) in Erie and Genesee counties; the Onondaga Reservation (7300 acres) in Onondaga county; the Tuscarora Reservation (624 acres) in Niagara county; the Oneida Reservation (400 acres) in Madison county; and the Shinnecock Reservation (400 acres) near Southampton, on Long Island.

Of 3,591,974 members of all religious denominations in 1906, 2,285,768 were Roman Catholics, 313,689 Methodist Episcopalians, 199,923 Presbyterians, 193,890 Protestant Episcopalians, 176,981 Baptists, 124,644 Lutherans, 57,351 Congregationalists, 35,342 Jews (heads of families only), 26,183 members of the German Evangelical Synod, 19,302 members of Eastern Orthodox churches and 10,761 Universalists. The urban population (*i.e.* population of places having 4000 inhabitants or more) increased from 3,805,477 in 1890 to 5,176,414 in 1900, or 36%, while the rural population (*i.e.* population outside of incorporated places) decreased during this decade from 1,834,119 to 1,625,859 or 5·9%.

The cities having a population of 15,000 or more in 1905 were: New York City, 4,013,781; Buffalo, 376,587; Rochester, 181,666; Syracuse, 117,503; Albany, 98,374; Troy, 76,910; Utica, 62,934; Yonkers, 61,716; Schenectady, 58,387; Binghamton, 42,036; Elmira, 34,687; Auburn, 31,422; Niagara Falls, 26,560; Newburgh, 26,498; Jamestown, 26,160; Kingston, 25,556; Watertown, 25,447; Poughkeepsie, 25,379; Mt. Vernon, 25,996; Cohoes, 24,183; Amsterdam, 23,943; Oswego, 22,572; New Rochelle, 20,479; Gloversville, 18,672; Lockport, 17,552; Rome, 16,562; and Dunkirk, 15,250.

Government.—Since becoming a state, New York has been governed under four constitutions, adopted in 1777, 1821, 1846 and 1894 respectively. The first state constitution, adopted by a convention at Kingston, made few changes in the provincial system other than those necessary to establish it on a popular basis, but the powers of the governor were curtailed, especially his powers of appointment and veto. These limitations worked unsatisfactorily, and their removal or modification and the extension of the franchise were the principal changes effected in 1821. Under the first constitution the decentralization of administration, which began early in the colonial era, continued without interruption, and under the second it was checked by a few measures only. The third constitution, besides reorganizing the judiciary, transferred to the people the choice of many officers, state and local, who had been appointed by the governor or the legislature; and placed numerous restrictions on the law-making power of the legislature. Under this constitution the theory of local self-government was more fully realized in New York than at any other time.

Since the middle of the 19th century an attempt has been made to meet the problems arising from a rapid industrial and social development by creating bureaus or commissions to exercise a central control over local officials, corporations and even private individuals, and as most of the heads of these bureaus and the commissions are appointed by the governor the importance of that officer has increased. The constitutional changes since 1846 affect principally the judiciary and cities. A constitutional convention met and proposed a new constitution in 1867, but every article was rejected by the people save one relating to the judiciary, which was adopted separately as an amendment in 1869. The constitution of 1894 made further important changes in the judiciary and in the government of cities. The first constitution made no provision for its amendment or revision. The second provided that whenever a majority of the members elected to each house of the legislature voted for an amendment and two-thirds of those elected to the next legislature approved, it should be submitted to the people for their adoption or rejection. The third modified this provision by requiring the approval of only a majority of the members elected to each house of the second legislature, and directed that the legislature should call a convention to revise the constitution at least once in twenty years if the people requested it. The present constitution contains the same clause as the third for the proposal of amendments by the legislature, and makes the unique provision that if the people vote for a convention when the question is submitted to them—this must be as often as once in twenty years—the delegates shall be elected and shall assemble at an appointed time and place without the call of the legislature, this being the result of the governor's veto, in 1887, of a bill for calling a convention in response to an overwhelming vote of the people in favour of it. Under the first constitution there were property qualifications for voting which amounted in the election of the governor and senators to a freehold estate worth £100 ($500) and in the election of assemblymen to a freehold estate worth £20. ($100) or the payment of an annual rent of 40s. ($10). But under the second constitution the most that was required of any white voter was the payment to the state or county of taxes on either personal or real property, and by an amendment of 1826 this requirement was abolished. The second constitution, however, imposed a property qualification on coloured voters amounting to a freehold estate worth $250, and this restriction was not removed until 1874. Since 1874 the aim has been to bestow suffrage on all male citizens who shall have attained the age of twenty-one years and shall have been inhabitants of the state for one year, but for the protection of the ballot citizenship for ninety days,[2] residence in the county for four months, and in the election district for thirty days next preceding the election are required. Conviction for bribery or of an infamous crime disqualifies, and personal identification of voters is required in New York City. A statement of receipts and expenditures of an election campaign, showing the amount received from each contributor and the name of every person or committee to whom more than $5 was paid, must be filed by the treasurer of every political committee within twenty days after the election; each candidate also must file a statement of his contributions. By an Act of 1910 women may vote on financial questions affecting a village in which they hold property.

Executive.—When the state government was first established, the governor and lieutenant-governor were the only state officers elected by the people. The state treasurer was chosen by the legislature, and for the appointment of other state officers as well as county officers and mayors of cities the Assembly chose four senators to constitute a council of appointment, a body

[1] The population at preceding census years was (1790) 340,120; (1800) 589,051; (1810) 959,049. (1820) 1,372,812. (1830) 1,918,608; (1840) 2,428,921; (1850) 3,097,394; (1860) 3,880,735; (1870) 4,382,759.

[2] Increased from ten days in 1894.

in which the governor had only a casting vote. But the constitution of 1821 abolished the council of appointment and gave the choice of the principal state departmental officers to the legislature, and the constitution of 1846 transferred the choice of these officers from the legislature to the people, where it has since remained. Under the constitution of 1821 a great number of local officers were appointed by the governor with the advice and consent of the Senate. The choice of most of these was given to the people in 1846, but since then many new state departments have been created, the heads of which are usually appointed by the governor, subject to the approval of the Senate. Under the present system, therefore, there is a biennial election (in even-numbered years) of a governor, a lieutenant-governor, a secretary of state, a state comptroller, a state treasurer, an attorney-general and a state engineer and surveyor; and the governor appoints, subject to the approval of the Senate, a superintendent of public works, a superintendent of state prisons, a superintendent of insurance, a superintendent of banks, a commissioner of excise, a commissioner of agriculture, a forest, fish and game commissioner, a commissioner of health, a commissioner of labour, a state architect, a state historian, a state librarian, two public service commissions, a civil service commission, a board of charities, a commission of prisons, a commission in lunacy, three tax commissioners and several other boards and commissions. The governor has the power, also, of filling vacancies in certain state offices and on the benches of the supreme court and county courts, and he may remove or suspend certain county and municipal officers on charges.

The first state constitution gave the veto power to a council of revision composed of the governor, the chancellor and the judges of the supreme court, but since 1821 this power has been exercised by the governor alone; and in 1874 it was extended to separate items in appropriation bills. A bill or item of an appropriation bill that has been vetoed by the governor can become a law only with the approval of two-thirds of the members elected to each house of the legislature. So long as the legislature is in session the governor is allowed ten days, besides Sundays, to consider a bill, and if he does not veto it within that time it becomes a law, but no bill becomes a law after the final adjournment of the legislature unless it is actually approved by the governor within thirty days after the adjournment. The governor's power to grant reprieves, commutations or pardons is unrestricted by any board of pardons, but he is required to report to the legislature each case in which he exercises such power. A candidate for the office of governor or lieutenant-governor must be at least thirty years of age and must have resided within the state for five years next preceding his election. The governor's salary is $10,000 a year, and the lieutenant-governor's is $5000.

Legislature.—The legislative power is vested in a Senate of 50 members elected biennially and an Assembly of 150 members elected annually. Since 1846 both senators and assemblymen have been elected by single districts, and ever since the state government was established they have been apportioned according to population, but the present constitution limits the representation of New York City in the Senate by declaring that no county shall have more than one-third of all the senators nor any two adjoining counties more than one-half of them. The first and second state constitutions required that every senator should be a freeholder, but since 1846 no property qualifications have been prescribed for membership in either house; the only persons disqualified are those who at the time of the election or within one hundred days before the election were members of Congress, civil or military officers under the United States, or officers under any city government. The constitution of 1846 limited the pay of members of both houses to three dollars a day and to three hundred dollars for any one session (except in impeachment proceedings) besides an allowance for travelling expenses, but since an amendment of 1874 they have been paid $1500 a year and ten cents a mile for travelling expenses.

The legislature meets in annual sessions, beginning in January. Money bills may originate in either house, but at the final vote on such a bill in either house three-fifths of the members elected to that house must be present and the yeas and nays must be recorded; bills entailing appropriations for local or private purposes must receive a two-thirds majority to pass. The legislature appoints the board of regents of the University of the State of New York. To decrease the evil of lobbying a law was enacted in 1906 which requires that every person employed to promote or oppose the passage of any bill shall file in the office of the secretary of state a written statement showing who has employed him and describing the legislation in respect of which his services are to be rendered; the law also requires the employers of lobbyists to file in the same office within two months after the adjournment of the legislature an itemized statement of all their lobbying expenses, and forbids the employment of a lobbyist for a contingent fee.

Judiciary.— At the close of the colonial era there were a court of chancery, a supreme court, circuit courts and courts of oyer and terminer which were held in the several counties by the justices of the supreme court, a court of common pleas and a court of sessions in each county, and courts held by justices of the peace in the several towns. This system, with the addition of the Senate, the chancellor and the justices of the supreme court occasionally sitting as a court for the correction of errors, was retained with only slight changes until 1846. But the new constitution of that year substituted a court of appeals for the court of errors, merged the court of chancery into the supreme court, established in each county a new county court composed of a single judge, and, taking the appointment of judges from the governor, gave the election of them to the people. Some further alterations in the constitution affecting the courts were made in 1869, 1879, 1888, 1894, 1899 and 1909, and the system as at present constituted comprises a supreme court of ninety-seven justices, an appellate division of the same, a court of appeals, a court of claims and local courts. The highest judicial court in the state is not, as in most states of the Union, the supreme court, but the court of appeals. This court consists of a chief judge and six associate judges elected from the state at large for a term of fourteen years. Its jurisdiction is limited, except where judgment is of death, to a review of questions of law. Vacancies are temporarily filled from among the justices of the supreme court by the governor. To expedite business, at the request of the court, the governor may designate not more than four justices of the supreme court to act temporarily as additional associate judges of the court of appeals. The salary of the chief judge is $14,200, of the associate judges $13,700 a year.

The ninety-seven justices of the supreme court are elected for fourteen years from the nine districts into which the state is divided. Of these thirty are chosen in the first district (New York county) and seventeen in the second district (Long Island and Staten Island). The jurisdiction of each justice extends over the entire state. Vacancies are temporarily filled by the governor. The supreme court has general jurisdiction in law and equity, including all actions both civil and criminal. The salary of the justices in the first district and in Kings county of the second district is $17,500 a year; in the remainder of the second district it is $16,300 a year; in the other districts it is $10,000 a year. The state is divided into four departments for each of which there is an Appellate Division consisting of seven justices in the first department (county of New York) and five in each of the others. The justices and presiding justice are designated from among the justices of the supreme court by the governor; the presiding justice and a majority of the other justices of each department must be residents of the department.

The court of claims consists of three judges, one presiding, appointed by the governor for a term of six years. It has jurisdiction to hear and determine private claims against the state.

The local judiciary includes the usual county and city judges, county surrogates and justices of the peace. New York City (q.v.) has an extensive judiciary system of its own.

Local Government.—The state is divided into sixty-one counties, each (unless wholly included in a city) having a county board of supervisors elected for two years, one from every town or city ward. This board has certain administrative and legislative powers, such as the care of county property, the borrowing of money for the erection of county buildings, the fixing of the salary of the county treasurer and of other county officers, the levying of county taxes and the division of the county into assembly districts and school commissioners' districts. Other county officers are a county judge and a county surrogate elected for a term of six years, a treasurer, a clerk, a district attorney, a sheriff and from one to four coroners elected for a term of three years. Cities are of three classes: (1) those having a population of 175,000 or more; (2) those having a population between 50,000 and 175,000; and (3) those whose population is less than 50,000; the classification is according to the latest state enumeration.

Bills for "special" city laws, as opposed to "general," must be approved (within fifteen days after their passage by both houses of the legislature) by the mayor of the city in first-class cities (in which, however, the state legislature may provide for the concurrence of the municipal legislative body), and in other cities by the mayor and council, before it is laid before the governor: if it is passed by the state legislature over the mayor's veto it goes direct to the governor. All city elections are held in odd numbered years. The organization of cities and villages is provided by the legislature, which may restrict their powers of taxation and of contracting debts and may fix salaries. Town (or township) government in New York somewhat resembles that of New England; the chief executive officer of the town is a supervisor, who represents his town in the county "board of supervisors."

National Guard.—The national guard of the state is commanded under the governor by a major-general. It consists of four brigades each commanded by a brigadier-general. The establishments in 1910 consisted of thirteen regiments and fifty separate companies of infantry, two squadrons and two troops of cavalry, four light batteries, one regiment of engineers, a signal corps of two companies and a naval militia, commanded by a captain and consisting of two battalions and two separate divisions.

Laws.—A married woman has full control of her property whether acquired before or after marriage, and she may carry on any business, trade or occupation in her own right. A husband or a wife may convey real property directly to the other. A widow has a dower right in one-third of the real property to which her husband had absolute title, but a wife may convey or devise her real property free from her husband's right of tenancy by courtesy. The only ground for divorce is adultery. As soon as a divorce has been granted the plaintiff may marry again, but the defendant is not permitted to marry within the state any one except the plaintiff until five years have elapsed, and then only in case the court permits it because of the petitioner's uniformly good conduct in the meantime. Since the 1st of January 1908 a marriage licence has been required for every lawful marriage.

A homestead consisting of a lot of land with one or more buildings, and properly designated as such in the office of the county clerk, but not exceeding $1000 in value, is exempt from forced sale so long as it is owned and occupied as a residence by a householder having a family or by a married woman, except to recover the purchase money, to satisfy a judgment obtained before it was designated as a homestead, or to collect taxes upon it. Personal property consisting of necessary household furniture, working tools and team of horses, professional instruments and a library, not exceeding $250 in value, besides the necessary food for the team for ninety days, provisions for the family, wearing apparel, wages or other income not exceeding $12 a week, and several other things, when owned by a householder or person providing for a family, are also exempt from seizure for debt, unless the debt be for purchase money or for services performed in the family by a domestic.

Eight hours constitute a legal day's work for all employees except those engaged in farm labour or domestic service. The employment of children under fourteen years of age in any factory is forbidden. Until sixteen years of age no child is to be so employed without an employment certificate issued by a commissioner of health, and showing that the child has completed an eight years' course of study in a public school of the state or has had an equivalent schooling elsewhere. For children under sixteen years of age who are so employed the hours of labour are limited to eight a day and the days to six a week, and such children must not begin work before eight o'clock in the morning or continue after five o'clock in the evening. For children between sixteen and eighteen years of age and for women the hours of labour in a factory are limited to ten a day, unless to prepare for a short day or a holiday, and the days to six a week. The employment of children under fourteen years of age in any mercantile establishment, business office, hotel, restaurant or apartment house is also forbidden, except that in villages and in cities of the second or third class children upwards of twelve years of age may be so employed during the summer vacation of the public schools. For both boys and girls sixteen years of age or upward the restrictions are removed for two weeks at Christmas time.[1] The Employers' Liability Act of 1902 (amended and broadened in 1910) holds an employer liable for damages in any case in which one of his employees sustains a personal injury by reason of the negligence of the employer, of a sub-contractor, of a superintendent, or any other person in the employer's service whose duty it was to see that "the ways, works or machinery connected with or used in the business," were in proper condition, or whose duty it was to "direct . . . any employee," if it is not proved that the employee failed in due care and diligence; by another law of 1910 in certain dangerous employments the employer is liable unless the injured employee was negligent.

Although the constitution of 1894 expressly declares that "any lottery or the sale of lottery tickets, pool-selling, book-making, or any other kind of gambling" shall not "hereafter be authorized or allowed within the state" and directs the legislature to pass appropriate laws prohibiting the same, the legislature passed an act in 1895, which in practice permitted pool-selling and book-making at race-tracks, but in 1908 and 1910 bills were enacted prohibiting gambling at race-tracks. License to sell intoxicating liquors is subject to a graduated tax. The sale of liquor on Sunday or between one o'clock and five o'clock in the morning of any other day is unlawful. Any town (but not any city) may at its option wholly forbid the sale of intoxicating liquors, may allow it to be sold only on condition that it be not drunk on the vendor's premises, or may allow it to be sold only by hotel-keepers and pharmacists, or by pharmacists alone.

Administrative Commissions.—The regulation and control of such public service corporations as own or operate steam, electric or street railways, gas or electric plants, and express companies were, in 1907, vested in two public service commissions (the first for New York City and the second for all other parts of the state), each of five members appointed by the governor with the approval of the Senate; in 1910 the regulation of telephone and telegraph companies throughout the state was vested in the second commission.

A state civil service commission (1883) consists of three members (not more than two of the same political party) appointed by the governor with the approval of the Senate. For the classified service of the state and of the minor civil divisions, except cities, the commission makes rules (subject to the governor's approval and to statutory and constitutional provisions) governing the classification of offices, the examination of candidates for office, and the appointment and promotion of employees. In cities the mayor is required to appoint a municipal civil service commission, with similar duties; not more than two-thirds of the members may be of the same political party.

Prisons, Poor Law, Charities, &c.—Penal institutions for sane adults, except reformatories for women, are under the general supervision of a state commission of prisons; hospitals for the insane are under the general supervision of a state commission in lunacy; and all other charitable and penal institutions, maintained wholly or in part by the state, or by any county, city or town within the state, are under the general supervision of a state board of charities. This board of charities consists of one member from each of the nine judicial districts and three additional members from the City of New York, all appointed by the governor with the consent of the Senate for a term of eight years. Its existence dates from 1867, but its authority was very limited, chiefly advisory, until 1895. Since then, however, its powers have been greatly increased. In 1910 the state charitable institutions were as follows: State Soldiers' and Sailors' Home, Bath; State School for the Blind, Batavia; the Thomas Indian School, Iroquois; State Woman's Relief Corps Home, Oxford; State Hospital for the care of Crippled and Deformed Children, West Haverstraw; Syracuse State Institution for Feeble-Minded Children, Syracuse; State Hospital for the treatment of Incipient Pulmonary Tuberculosis, Ray Brook; Craig Colony for Epileptics, Sonyea; State Custodial Asylum for Feeble-Minded Women, Newark; Rome State Custodial Asylum for Unteachable Idiots, Rome; State Agricultural and Industrial School, Industry; State Training School for Girls, Hudson; Western House of Refuge, Albion; New York State Reformatory for Women, Bedford; the State Training School for Boys; and Letchworth Village, a custodial asylum for epileptics and feeble-minded. Eight private institutions for the care or the care and instruction of deaf mutes and one for the care of the blind are supported mainly by the state. Many other charitable institutions receive public money, mostly from counties, cities and towns.

The poor law of the state defines the town poor as those who have gained a settlement in some town or city, by residing there for one year prior to their application for public relief and who are unable to maintain themselves; the county poor as the poor who have not resided in any one town or city for one year before their application for public relief, but have been in some one county for sixty days; and the state poor as all other poor persons within the state. Wherever cared for, each town, city, county and the state must pay the cost of maintaining its own poor. In some counties there is no distinction between town and county poor, but in 1910 only one county had not a county superintendent for the general supervision and care of the poor; towns and cities not subject to special provisions intrusted public relief to one or more overseers of the poor or to commissioners of charities. In counties lacking adequate hospital accommodation a poor person requiring medical or surgical treatment may be sent to the nearest hospital approved by the state board of charities. An Act of 1910 provides that indigent soldiers, sailors or marines of the U.S. and their families be cared for in their homes and not in almshouses.

The first state insane asylum, designed chiefly for recent and curable cases, was opened at Utica in 1843. Since 1896 every public institution for the insane has been maintained and administered as a part of the state system. A state commissioner in lunacy was first appointed in 1874; this officer was replaced in 1889 by a commission in lunacy, which in 1894 was placed at the head of the

[1] For further regulations relating to the employment of women and children see the Labour Law enacted in 1909 and the subsequent amendments.

administration of the state's insanity law. This commission consists of three members appointed by the governor with the consent of the Senate. Its president must be a physician and alienist, and another member must be a lawyer. The commission appoints a board of experts to examine all immigrants suspected of insanity or allied mental disorders in order to prevent the admission of the insane into the country. In 1910 there were fourteen state hospitals (corresponding to fourteen state hospital districts) for the poor and indigent insane; these were at Utica, Willard, Poughkeepsie, Buffalo, Middletown (homoeopathic), Binghamton, Rochester, Ogdensburg, Gowanda (homoeopathic), Flatbush, Ward's Island, King's Park, Central Islip and Yorktown. There were also in 1910 two hospitals for the criminal insane, at Matteawan and Dannemora. Each of these is under the immediate control of a superintendent appointed by the superintendent of state prisons.

The state commission of prisons consists of seven members appointed by the governor with the consent of the Senate for a term of four years, and the institutions under its supervision in 1910 were the Sing Sing State Prison,[1] at Ossining, the Auburn State Prison at Auburn, the Clinton State Prison at Dannemora, the New York State Reformatory at Elmira, the Eastern New York Reformatory at Napanoch, five county penitentiaries, and all other institutions for the detention of sane adults charged with or convicted of crime, or retained as witnesses or debtors. The state prisons are under a superintendent of state prisons, appointed by the governor, with the consent of the Senate, for five years; and the state reformatories are managed by a board of seven managers similarly appointed for seven years. In the state reformatory at Elmira (which, like that at Napanoch, is for men between sixteen and thirty years of age who have been convicted of a state prison offence for the first time only), the plan of committing adult felons on an indetermipate sentence to be determined by their behaviour was first tested in America in 1877, and it has proved so satisfactory that it has been in part adopted for the state prisons. In order to minimize competition between prison labour and free labour, articles manufactured in the state prisons, the reformatories and the penitentiaries, are sold only to the institutions and departments of the state and its political divisions.

Education.—The first school was established by the Dutch at New Amsterdam (now New York City) as early as 1633, and at the close of the Dutch period there was a free elementary school in nearly every settlement. But from the English conquest to the close of the colonial era the chief purpose of the government with respect to education was to prepare leaders for the state church; to this end King's College was founded in 1754, and from 1704 to 1776 the other schools were principally those maintained by the Society for the Propagation of the Gospel in Foreign Parts. Hardly any schools remained in operation throughout the War of Independence. In January 1784 Governor George Clinton recommended legislation for the "revival and encouragement of seminaries of learning," with the result that the legislature passed an act establishing a state university of which Columbia College, formerly King's, was the "mother" portion. In 1787 a second university act was passed which restored to Columbia College the substance of its original charter and made the University of the State of New York an exclusively executive body with authority to incorporate new colleges and academies and to exercise over them the right of visitation. In 1795 an act was passed which formed the basis of the present elementary-school system. This act appropriated £20,000 annually for five years for the establishment and maintenance of elementary schools, required each city and town to raise by taxation a sum for the same purpose equal to one-half of its share from the proceeds of the state fund, and provided for the election of school commissioners in each town and of trustees of each school. The state appropriation was discontinued in 1800; but in 1805 the proceeds of the sale of 500,000 acres of land were set apart for a permanent school fund, and in 1812, when the interest on this fund had become nearly $50,000 a year, the amount required before any of it could be distributed for school purposes, the common school system was permanently established by an act which restored the main features of that of 1795, except that a superintendent of schools chosen by the council of appointment was now placed at its head. Although the interest on the state fund had risen to $70,000 in 1819, this together with an equal sum raised by the cities and towns was insufficient, and to meet the deficiency the patrons in each district were required by a "rate bill" to contribute in proportion to the attendance of their children. The schools were made free only after a memorable contest against the "rate bill." The framers of the constitution of 1846 were nearly equally divided on this question. In 1849 the legislature passed a free-school bill subject to the approval of the people. The people approved by a vote of nearly three to one, but the court of appeals declared the act unconstitutional because of the referendum. In 1851 a compromise measure was substituted, increasing the state appropriation to $800,000 and exempting indigent parents from the "rate bill," which was finally abolished in 1867. The administration of the common school system was in the hands of a state superintendent of schools from 1813 to 1821, of the secretary of state from 1821 to 1854, and of a superintendent of public instruction from 1854 to 1904. In the meantime the functions of the university had been extended to include an oversight of the professional, scientific and technical schools, the administration of laws relating to admission to the professions, the charge of the State Library at Albany, the supervision of local libraries, the custody of the State Museum and the direction of all scientific work prosecuted by the state. This dual system was consolidated by the Educational Unification Act of 1904, in conformity with which the university regents have become a legislative body, subordinate to the state legislature, for determining the general educational policy of the state, and a commissioner of education acts as the chief executive, advisory and supervisory, officer of the whole educational system.

The regents of the University are chosen by the legislature, one retiring each year; and an act of 1909 requires that their number shall at all times be three more than the number of judicial districts. The first commissioner of education was chosen by the legislature for a term of six years, but it was arranged that his successor should be chosen by the regents and continue in office during their pleasure. The commissioner (subject to approval of the regents) appoints three assistant commissioners, for higher, secondary and elementary education respectively. The elementary school is administered by a school commissioner in each of the school commissioner's districts into which a county may be divided, by one trustee or three trustees in each separate school district, and by a board of education in each city, village or union free school district having more than three hundred children. Any two or more adjoining school districts may unite to form a union free school district, and in any village or union free school district having a population of 5000 or more the board of education may appoint a superintendent of schools.

The compulsory education law as amended in 1907 and 1909 requires the full attendance at a public school, or at a school which is an approximate equivalent, of all children who are between seven and fourteen years of age, are in the proper physical and mental condition, and reside in a city or school district having a population of 5000 or more and employing a superintendent of schools; in such a city or district children between fourteen and sixteen years must attend school unless they obtain an employment certificate and are regularly engaged in some useful employment or service; and outside of such a city or district all children between the ages of eight and fourteen years and those between fourteen and sixteen years who are not regularly employed must attend school on all school days from October to June. In a city of the first or second class every boy between fourteen and sixteen years of age who has an employment certificate, but has not completed the course of study prescribed for the elementary public schools or the equivalent, must attend an evening school not less than six hours each week for a period of not less than sixteen weeks each year, or a trade school not less than eight hours a week for sixteen weeks a year. By a law of 1908 the board of education of any city is authorized to establish industrial schools for children who have completed the elementary school course or have attained the age of fourteen years, and trade schools for children who are more than sixteen years old and have completed the elementary school course or a course offered by any of the industrial schools. For the training of teachers for the elementary schools the state maintains ten normal schools at Oswego (1863), Cortland (1866), Fredonia (1866), Potsdam (1866), Geneseo (1867), Brockport (1867), Buffalo (1867), New Paltz (1885), Oneonta (1887) and Plattsburg (1890); it also appropriates $700 annually for each teachers' training class in about one hundred of the secondary schools. The State Normal College at Albany, founded in 1844 as the first state normal school, is designed principally for the training of teachers for the secondary schools, about 800 high schools and academies, supported wholly or in part by the state.

The state controls professional and technical schools through the regents' examinations of candidates for admission to such schools and to the professions, determines the minimum requirements for admission to college by the regents' academic examinations, maintains the large State Library and the valuable State Museum, and occasionally makes a gift to a college or a university for the support of courses in practical industries; but it maintains no college or university that is composed of a teaching body. To Cornell University (*q.v.*), a non-sectarian institution opened at Ithaca in 1868, the state turned over the proceeds from the National land-grant act of 1862 on condition that it should admit free one student annually from each Assembly district, and in 1909 a still closer relation between this institution and the state was established by an act which makes the governor, lieutenant-governor, speaker of the Assembly and commissioner of education *ex-officio* members of its board of trustees, and authorizes the governor with the approval of the Senate to appoint five other members, one each year.

Among the institutions of higher learning in the state, besides Columbia University (*q.v.*) and Cornell University (*q.v.*), are: Union University (1795, non-sectarian), at Schenectady; Hamilton College (1812, non-sectarian), at Clinton; Colgate University (1819, non-sectarian), at Hamilton; Hobart College (1822, non-sectarian), at Geneva; Rensselaer Polytechnic Institute (1824, non-sectarian), at Troy; New York University (1832, non-sectarian), in New York City; Alfred University (1836, non-sectarian), at Alfred; Fordham University (1841, Roman Catholic), in New York City; College of

[1] In 1906 a law was enacted for the establishment of a new state prison in the eastern part of the state to take the place of Sing Sing Prison.

St Francis Xavier (1847, Roman Catholic), in New York City; College of the City of New York (1849, city); University of Rochester (1850, Baptist), at Rochester; Polytechnic Institute of Brooklyn (1854, non-sectarian), at Brooklyn; Niagara University (1856, Roman Catholic), at Niagara Falls; St Lawrence University (1858, non-sectarian), at Canton; St Bonaventure's College (1859, Roman Catholic), at St Bonaventure; St Stephen's College (1860, Protestant Episcopal), at Annandale; Manhattan College (1863, Roman Catholic), at New York City; St John's College (1870, Roman Catholic), at Brooklyn; Canisius College (1870, Roman Catholic), at Buffalo; Syracuse University (1871, Methodist Episcopal), at Syracuse; Adelphi College (1896, non-sectarian), at Brooklyn; and Clarkson School of Technology (1896, non-sectarian), at Potsdam. The United States Military Academy (1802) is at West Point.

Finance.—In New York the direct property tax is levied by and for the benefit of localities. Revenues for state purposes are derived from special taxes collected from the liquor traffic, corporations, transfers of decedents' estates, transfers of shares of stock, recording tax on mortgages, sales of products of state institutions, fees of public officers including fines and penalties, interest on deposits of state funds, refunds from department examinations and revenue from investments of trust funds, the most important of which are the common school fund and the United States deposit fund. A board of three tax commissioners has supervision of methods of assessment within the state, and with the commissioners of the land office constitutes the state board of equalization. The county supervisors, with or without the aid of three commissioners whom they are authorized to appoint for the purpose, constitute a county board of equalization. The recording tax on mortgages, amounting to one-half of 1% of the principal sums secured, is collected by the recording officers under the supervision of the state board of tax commissioners. The administration of the liquor tax law is under the supervision of the state commissioner of excise and his deputies. The tax on corporations, originating as a capital stock tax in 1880 and extended through succeeding years, is administered by the state comptroller. The comptroller also has charge of the enforcement of the stock transfer tax act and of the laws imposing taxes upon the transfer of decedents' estates. The aggregate of taxes received by the state treasury through the comptroller's department for the fiscal year ending September 30, 1909, was $23,000,000.

On the 30th of September 1909 the state debt, most of which was created since 1895 for the purpose of canal improvements, amounted to $41,230,660. The surplus in the treasury was $8,435,848, the total amount in trust and sinking funds was $31,301,501. The constitution prohibits the legislature from lending the state's credit or incurring an indebtedness for current expenses in excess of $1,000,000 or incurring any indebtedness whatever, other than for war purposes, unless such indebtedness be authorized by law for "some single work or object," the law to be approved by the people at a general election and providing for a direct annual tax sufficient to pay the interest and to liquidate the debt within eighteen years. That instrument further prohibits each county, city, town and village from lending its credit and from creating an indebtedness in excess of 10% of the assessed valuation of its real estate.

The first state institution to receive a bank charter was the bank of New York, incorporated in 1791. In 1804 free banking was restricted to such an extent as to give practically a monopoly of the business to associations receiving special charters, and as these charters were generally awarded as favours to politicians the system was a formidable agency of corruption. Chiefly because of these evils the constitution of 1821 required the assent of two-thirds of the members elected to each house of the legislature to pass an act creating a corporation. In 1829 the Safety-Fund Act was passed, which required each bank thereafter chartered or rechartered to pay into the state treasury 3% of its capital stock other than that owned by the state, and from this fund the debts of insolvent banks were to be paid. The fund became exhausted by many failures, and a free banking law was enacted in 1838. The constitution of 1846 prohibited the legislature from granting any special charters for banking purposes, and consequently no more safety-fund banks were established. At the same time the free-banking system has been greatly improved. The state banks still have the right to issue currency, but the heavy tax on currency issue imposed by Congress in 1866 (after the introduction of the National banking system in 1863) put a stop to the practice. In 1851 a state banking department was created, and at the head of this is a superintendent of banks appointed by the governor, with the consent of the Senate, for a term of three years. The superintendent—or examiners appointed by him (from a civil service list)—is required to examine every bank and every trust company at least twice each year, each building and loan association at least once a year, and every savings bank at least once in two years. The law provides specifically as to the investment of deposits made in savings banks with the evident purpose of providing the greatest possible security to depositors. State banks must carry from 15% to 25% reserve and trust companies from 10% to 15% reserve, depending upon location.

The introduction of the National banking system caused a decrease in the number of state banks from 309 in 1863 to 45 in 1868, but their number has increased steadily since 1880 and in 1909 there were 202. In the same year there were 140 savings-banks, 85 trust companies, 46 safe deposit companies, 255 building and loan associations and other miscellaneous corporations, with total resources of $3,833,500,000 under the supervision of the banking department of the state. This is over 21% of the entire banking power of the United States.

To correct abuses in the life insurance business which were discovered in 1905 by a committee of the state legislature, laws were passed in the next year regulating the election of the directors of the insurance companies, and the investments of the companies and the distribution of dividends, limiting the amount of business of the larger companies and prohibiting rebates on insurance premiums. A state superintendent of insurance, (since 1860) appointed by the governor, holds office for three years.

History.—The aboriginal inhabitants of New York had an important influence on its colonial history. Within its limits from the upper Hudson westward to the Genesee river was the home of that powerful confederacy of Indian tribes, the Mohawks, Oneidas, Onondagas, Cayugas and Senecas, known to the French as the Iroquois and to the English as the Five (later Six) Nations. When supplied with firearms by Europeans they reduced a number of other tribes to subjection and extended their dominion over most of the territory from the St Lawrence to the Tennessee and from the Atlantic to the Mississippi. They were at the height of their power about 1700. Of much less influence in New York were several Algonquian tribes in the lower valley of the Hudson and along the sea coast.

New York Bay and the Hudson river were discovered by Giovanni da Verrazano in 1524, and were probably seen by Estevan Gomez in 1525; for many years following French vessels occasionally ascended the Hudson to trade with the Indians. The history of New York really begins, however, in 1609. In July of that year Samuel de Champlain discovered the lake which bears his name and on its shores led his Algonquian Indian allies against the Iroquois, thus provoking against his countrymen the hostility of a people who for years were to hold the balance of power between the English and the French in America. On the 3rd of September Henry Hudson, in the employ of the Dutch East India Company, entered New York Bay in the "Half Moon" in search of the "northwest passage." He conceived that a vast trade with the Iroquois for furs might be established; his report aroused great interest in Holland; and the United Netherlands, whose independence had been acknowledged in the spring, claimed the newly discovered country. In 1610 a vessel was despatched with merchandise suitable for traffic with the Indians, the voyage resulted in profit, and a lucrative trade in peltry sprang up. Early in 1614 Adriaen Block explored Long Island Sound and discovered Block Island. The merchants of Amsterdam and Hoorn soon formed themselves into the New Netherland Company, and on the 11th of October 1614 received from the States-General a three years' monopoly of the Dutch fur trade in New Netherland, *i.e.* that part of America between New France and Virginia, or between latitudes 40° and 45° N. Late in the same year or early in 1615 a stockaded trading post called Fort Nassau was erected on Castle Island, now within the limits of Albany, and a few huts were erected about this time or earlier on the southern extremity of Manhattan Island; but no effort at colonization was as yet made. In 1617 the Dutch negotiated with the Iroquois a treaty of peace and alliance. Fort Nassau was soon removed to the mouth of Tawasentha Creek. On the expiration of the charter of the New Netherland Company (1618) the States-General refused to grant a renewal, and only private ventures were authorized until 1621, when the West India Company (*q.v.*) was chartered for a term of twenty-four years; to this company was given a monopoly of Dutch trade with the whole American coast from Newfoundland to the Straits of Magellan. It was authorized to plant colonies and to govern them under a very limited supervision of the States-General, such as the approval of its appointment of a governor and of its instructions to him; and its own government was vested in five chambers of directors and an executive board or college of nineteen delegates from those chambers, eight of the nineteen representing the Chamber of Amsterdam. New Netherland became one of the more important interests of the Company. In June 1623, however, New Netherland was formally erected into a province and the management of its affairs assigned to the Chamber of

Amsterdam, which in March 1624 despatched the "New Netherland," with the first permanent colonists (thirty families mostly Walloon), under Cornelis Jacobsen Mey, the first governor or director of the colony. Arriving at Manhattan early in May, a few of the men remained there, another small party established a temporary post (Fort Nassau) on the Delaware river, and still another began a fortified settlement on the site of the present Hartford, Connecticut. But more than one-half of the families proceeded up the Hudson to Fort Orange, the successor of Fort Nassau, at the mouth of Tawasentha Creek, and there founded what is now Albany. Three more vessels arrived in 1625, and when in that year Mey was succeeded as director by William Verhulst the colony had a population of 200 or more. The government of the province was fully established in 1626 and was vested mainly in a director-general and council. The director-general was formally appointed by the Company subject to the approval of the States-General, but the Amsterdam Chamber and the College of Nineteen supervised his administration. The members of the council were formally appointed by the Company, but the director-general actually determined who they should be, and as he was not bound by their advice they were no check to an autocratic rule. Peter Minuit, the first director-general, arrived with more colonists in May 1626, and soon afterwards Manhattan Island was bought from the Indians, Fort Amsterdam was erected at its lower end, and the settlement here was made the seat of government.

In 1629, chiefly to encourage agriculture, the Company issued its famous Charter of Privileges and Exemptions, which provided that any member might have anywhere in New Netherland except on Manhattan Island his choice of a tract of unoccupied land extending 16 m. along the seacoast or one side of a navigable river, or 8 m. along the river on both sides "and so far into the country as the situation of the occupyers will permit" by purchasing the same from the Indians and planting upon it a colony of fifty persons, upwards of 15 years old, within four years from the beginning of the undertaking, one-fourth part within one year; and that any private person might with the approval of the director-general and council take up as much land as he should be able to improve. The founder of a colony was styled a *patroon*, and, although the colonists were bound to him only by a voluntary contract for specified terms, the relations between them and the patroon during the continuance of the contract were in several important respects similar to those under the feudal system between the lord of a manor and his serfs. The patroon received his estate in perpetual inheritance and had the exclusive right of hunting and fishing upon it. Each colonist not only paid him a fixed rent, usually in kind, but had to share with him the increase of the stock and to have the grain ground at his mill. The patroon was the legal heir of all his colonists who died intestate. He had civil and criminal jurisdiction within the boundaries of his estate; he could create offices, found cities, and appoint officers and magistrates, and, although the charter permitted an appeal from his court to the director-general and council in any case in which the amount in dispute exceeded fifty guilders ($20), some of the patroons exacted from their colonists a promise not to avail themselves of the privilege. The Company promised to permit the patroons to engage in the fur trade, wherever it had no commissary of its own, subject to a tax of one guilder (40 cents) on each skin, and to engage in other trade along the coast from Newfoundland to Florida subject to a tax of 5% on goods shipped to Europe. The colonists of the patroons were exempted from all taxes for a period of ten years, but were forbidden to manufacture any cloth whatever. The charter did not give the encouragement to agriculture that was expected of it because the status created for colonists of a patroon was no attraction to a successful farmer in the Netherlands. Immediately after the issue of the charter a few of the more adroit directors of the Amsterdam Chamber hastened to acquire for themselves, as patroons, the tracts of land most favourably situated for trade. On both sides of the entrance to Delaware Bay Samuel Godyn, Samuel Blomaert and five other directors who were admitted to partnership in the second year (1630) established the manor and colony of Swaanendael; on a tract opposite the lower end of Manhattan Island and including Staten Island, Michael Pauw established the manor and colony of Pavonia; on both sides of the Hudson and extending in all directions from Fort Orange (Albany) Kilian van Rensselaer established the manor and colony of Rensselaerwyck. The colony of Swaanendael was destroyed by the Indians in 1632. Pauw maintained his colony of Pavonia for about seven years and then sold out to the Company. The colony of Rensselaerwyck was the only one that prospered under the patroon system. In the meantime the patroons had claimed unrestricted rights of trade within the boundaries of their estates. These were stoutly denied by the Company. Director-General Minuit was recalled in 1632 on the ground that he had been partial to the patroons; and Wouter van Twiller, who arrived in 1633, endeavoured to promote only the selfish commercial policy of the Company; at the close of his administration (1637) the affairs of the province were in a ruinous condition.

William Kieft was appointed director-general late in 1637, and in 1638 the Company abandoned its monopoly of trade in New Netherland and gave notice that all inhabitants of the United Provinces, and of friendly countries, might trade there subject to an import duty of 10%, an export duty of 15%, and to the requirement that the goods should be carried in the Company's ships. At the same time the director-general was instructed to issue to any immigrant applying for land a patent for as large a farm as he required for cultivation and pasturage, to be free of all charges for ten years and thereafter subject only to a quit-rent of one-tenth of the produce. Two years later, by a revision of the Charter of Privileges and Exemptions, the prohibition on manufactures was abolished, the privileges of the original charter with respect to patroons were extended to "all good inhabitants of the Netherlands," and the estate of a patroon was limited to 4 m. along the coast or a navigable river and 8 m. back into the country. The revised charter also provided that any one who brought over five colonists and established them in a new settlement should receive 200 acres, and if such a settlement grew to be a town or village it should receive a grant of municipal government. These inducements encouraged immigration not only from the Fatherland but from New England and Virginia. But the freedom of trade promoted dangerous relations with the Indians, and an attempt of Kieft to collect a tribute from the Algonquian tribes in the vicinity of Manhattan Island and other indiscretions of this officer provoked Indian hostilities (1641–1645), during which most of the outlying settlements were laid waste.

Out of this warfare arose an organized movement for a government in which the colonists should have a voice. In August 1641 Kieft called an assembly of the heads of families in the neighbourhood of Fort Amsterdam to consider the question of peace or war. The assembly chose a board of Twelve Men to represent it, and a few months later this board demanded certain reforms, especially that the membership of the director-general's council should be increased from one to five by the popular election of four members. Kieft promised the concessions to gain the board's consent to waging war, but later denied its authority to exact promises from him and dissolved it. At another crisis, in 1643, he was obliged to call a second assembly of the people. This time a board of Eight Men was chosen to confer with him. It denied his right to levy certain war taxes, and when it had in vain protested to him against his arbitrary measures it sent a petition, in 1644, to the States-General for his recall, and this was granted. Peter Stuyvesant (*q.v.*), his successor, arrived at Fort Amsterdam in May 1647. Under his rule there was a return of prosperity; from 1653 to 1664 the population of the province increased from 2000 to 10,000. Stuyvesant was, however, extremely arbitrary. Although he permitted the existence of a board of Nine Men to act as "tribunes" for the people it was originally composed of his selections from eighteen persons chosen at a popular election, and annually thereafter the places of six retiring members were filled by his selections from twelve persons nominated by the board. He treated it with increasing

contempt, and the most that it could do was to remonstrate to the States-General. That body suggested a representative government, but this the Company refused to grant.

Stuyvesant conducted a successful expedition against the Swedes on the southern border of New Netherland in 1655; but he was powerless against the English. The Dutch had long claimed the whole coast from Delaware Bay to Cape Cod, but by the treaty of Hartford (1650), negotiated between himself and the commissioners of the United Colonies of New England, Stuyvesant agreed to a boundary which on the mainland roughly determined the existing boundary between New York and Connecticut and on Long Island extended southward from the west side of Oyster Bay to the Atlantic Ocean. Notwithstanding the good claim to their province which the Dutch had established by discovery and occupancy, the government of Great Britain, basing its claim to the same territory on Cabot's discovery (1498), the patent to the London and Plymouth companies (1606), and the patent to the Council for New England (1620), contended that the Dutch were intruders. In 1653, during the war between England and Holland, the Dutch, fearing an English attack, built a wall, from which the present Wall Street was named, across Manhattan Island at what was then the northern limits of New Amsterdam. In the following year Cromwell actually sent out an expedition which, with the aid of New England, was to attempt the conquest, but before an attack was made peace was announced. The Connecticut Charter of 1662 included in that colony some settlements acknowledged by the treaty of Hartford to belong to New Netherland, and strife was renewed. Finally, in March 1664, Charles II. formally erected into a province the whole territory from the west side of the Connecticut river to the east side of Delaware Bay together with all of Long Island and a few other dependencies of minor importance, and granted it to his brother James, the duke of York and Albany, as its lord proprietor. The duke appointed Colonel Richard Nicolls governor and placed him in command of an expedition to effect its conquest. Nicolls won over the burgomaster of New Amsterdam and other prominent citizens by the favourable terms which he offered, and Stuyvesant was forced, without fighting, into a formal surrender on the 8th of September. The duke's authority was proclaimed and New Netherland became New York. The separation from it of what is now New Jersey (*q.v.*) was begun by the duke's conveyance, in the preceding June, of that portion of his province to Berkeley and Carteret, and among numerous changes from Dutch to English names was that from Fort Orange to Fort Albany. A treaty of alliance with the Mohawks and Senecas procured for the English the same friendly relations with the Iroquois that the Dutch had enjoyed. The transition from Dutch to English institutions was effected gradually and the private rights of the Dutch were carefully preserved. The English executive, consisting of a governor and council, was much like the Dutch, but Nicolls, by his conciliatory spirit, made his administration more agreeable than Stuyvesant's. In the administration of local affairs some of the Dutch settlements were little disturbed until ten years or more after the conquest, but the introduction of English institutions into settlements wholly or largely English was begun in 1665 by the erection of Long Island, Staten Island and Westchester into an English county under the name of Yorkshire, and by putting into operation in that county a code of laws known as the "Duke's Laws." This code was based largely on the laws of New England, and, although a source of popular discontent, it gave to the freeholders of each town a voice in the government of their town by permitting them to elect a board of eight overseers which chose a constable and sat as a court for the trial of small causes. Nicolls resigned the governorship in 1668, but his successor, Francis Lovelace, continued his policy—autocratic government, arbitrary in form but mild in practice, and progressive in the matter of religious toleration. In August 1673, Holland and England being at war, a Dutch fleet surprised New York, captured the city, and restored Dutch authority and the names of New Netherland and New Amsterdam. But by the treaty of Westminster, February 1674, the Dutch title to the province was finally extinguished, and in November the English again took possession. A new charter was issued to the duke to perfect his title and Edmund (later Sir Edmund) Andros, the new governor, was instructed to establish English institutions and enforce English law in all sections. In 1675 Andros established at Albany a commission for Indian affairs which long rendered important service in preserving the English-Iroquois alliance. The imperious manner of Andros made him many enemies. Some of them preferred charges against him relating to his administration of the revenue. He was called to England in 1681 to answer these, and during his absence the demand for a representative assembly was accompanied with a refusal to pay the customs duties and so much other insubordination that the duke appointed Colonel Thomas Dongan to succeed Andros, and instructed him to call the desired assembly. It met at Fort James in the City of New York on the 17th of October 1683, was in session for about three weeks, and passed fifteen acts. The first, styled a charter of liberties and privileges, required that an assembly elected by the freeholders and freemen should be called at least once every three years; vested all legislative authority in the governor, council and assembly; forbade the imposition of any taxes without the consent of the assembly; and provided for religious liberty and trial by jury. Other acts divided the province into counties, established courts of justice, and provided for a revenue. In August 1684 when, by its charter, the western boundary of the province was not definitely extended beyond the Hudson, Dongan laid the basis of New York's claim to the western lands of the Iroquois by a new covenant with them in which they recognized the English as their protectors, and throughout his administration he was busy neutralizing French influence among the Iroquois and in diverting the fur trade of the north-west from the St Lawrence to Albany. The charter of liberties and privileges was approved by the duke, but before the news of this reached its authors the duke became King James II., and in 1686, when a frame of government for New York as a royal province was provided, the assembly was dispensed with. About the same time the new king adopted a policy for strengthening the imperial control over New England as well as for the erection of a stronger barrier against the French, and in 1688 New York and New Jersey were consolidated with the New England colonies into the Dominion of New England and placed under the viceregal authority of Sir Edmund Andros as governor-general. The news of the English revolution of 1688, however, caused an uprising in Boston, and in April 1689 Andros was seized and imprisoned. Francis Nicholson as lieutenant-governor was still in quiet possession of the government of New York, and a majority of the population of the province were satisfied to await the outcome of the revolution in the mother country, but in the southern portion of the province, especially in the City of New York and on Long Island, were a number of restless spirits who were encouraged by the fall of Andros to take matters into their own hands. They found a leader in a German merchant, Jacob Leisler (*q.v.*). Leisler refused to pay duties on a cargo of wine on the ground that the collector was a "papist," and on the 31st of May 1689, during a mutiny of the militia, he and other militia captains seized Fort James. In the following month Nicholson deserted his post and sailed for England, and Leisler easily gained possession of the city. To strengthen his position he called an assembly which conferred upon him the powers of a dictator. Some time after a copy of the order of the new monarchs (William and Mary) to continue all Protestants in their offices in the colonies had been received, Leisler falsely announced that he had received a commission as lieutenant-governor. He then attempted to revive the act of 1683 for raising revenue, but met with so much opposition that he issued writs for the election of another assembly. This, however, brought him chiefly petitions for the redress of grievances. Albany successfully defied his usurped authority until his recognition was necessary to a united front against the French and their Indian allies, who, in February 1690, had surprised and burned Schenectady. Two other French

attacks had at the same time been directed against New England, and to meet the dangerous situation Leisler performed the one statesmanlike act of his public career, notable in American history as the first step toward the union of the colonies. At his call, delegates from Massachusetts, Plymouth, Connecticut and Maryland met in New York City with delegates from New York on the 1st of May 1690 to consider concerted action against the enemy, and although the expedition which they sent out was a failure it numbered 855 men, New York furnishing about one-half the men, Massachusetts one of the two commanders and Connecticut the other. Leisler had proclaimed the new monarchs of Great Britain and had declared that it was his purpose only to protect the province and the Protestant religion until the arrival of a governor appointed by them; but he was enraged when he learned that he had been ignored and that under the new governor, Colonel Henry Sloughter, his enemies, van Cortlandt and Bayard, had again been appointed to the council. When Major Richard Ingoldsby arrived with two companies of the king's soldiers and demanded possession of the fort, Leisler refused although he still professed his willingness to deliver it to Sloughter. On the 17th of March 1691 Leisler's force fired on the king's soldiers, killing two and wounding several. Governor Sloughter arrived two days later, and the revolt terminated in the arrest of Leisler and his chief followers. Leisler and Jacob Milborne, his son-in-law, were pronounced guilty of treason, and were executed on the 16th of May. The execution was regarded even by many who had been indifferent to Leisler's cause, as an act of revenge. The case was carried to England, where in 1695 parliament reversed the attainders of the victims, and for many years the province was rent by the Leislerian and anti-Leislerian factions.

Governor Sloughter, as his commission directed, re-established in 1691 the assembly which James II. had abolished in 1686, and throughout the remainder of the colonial era the history of the province relates chiefly to the rise of popular government and the defence of the northern frontier. At its first session the assembly passed an act declaratory of the rights and privileges of the people, and much like the charter of liberties and privileges enacted in 1683, except that annual instead of triennial sessions of the assembly were now requested and, as was also provided in Sloughter's commission and instructions, religious liberty was denied to Roman Catholics. This act was disallowed by the crown in 1697, and until Governor Cornbury's administration (1702–1708) both the Leislerians and the anti-Leislerians repeatedly bid for the governor's favour by supporting his measures instead of contending for popular rights. But Cornbury's embezzlement of £1500, appropriated for fortifying the Narrows connecting Upper and Lower New York Bay, united the factions against him and started the assembly in the important contest which ended in the establishment of its control over the public purse. In 1706 it won the right to appoint its own treasurer to care for money appropriated for extraordinary purposes, and eight years later the governor assented to an act which gave to this officer the custody of practically all public money. Until 1737 it had been the custom to continue the revenue acts from three to five years, but thereafter the assembly insisted on annual appropriations.

The first newspaper of New York, the *New York Gazette*, was established in 1725 by William Bradford as a semi-official organ of the administration. In 1733 a popular organ, the *New York Weekly Journal*, was established under John Peter Zenger (1697–1746), and in 1735 both the freedom of the press and a great advance toward the independence of the judiciary were the outcome of a famous libel suit against Zenger.

Between the administration of Governor Montgomerie (1728–1731) and Governor Cosby (1732–1736) there was an interregnum of thirteen months during which Rip van Dam, president of the council, was acting-governor, and upon Cosby's arrival a dispute arose between him and van Dam over the division of the salary and fees. Both appealed to the law, and when the chief-justice, Lewis Morris, refused Cosby's request to have the court proceed in equity jurisdiction, and denied the right of the governor to establish courts of equity, he was removed from office. Not long afterwards there appeared in the *Weekly Journal* some severe criticisms of the administration. For printing these Zenger was arrested for libel in November 1734. The case was not brought to trial until August 1735, and in the meantime Zenger was kept in jail. Originally he had for counsel two of the most able lawyers in the province, James Alexander (1690–1756) and William Smith (1697–1769), but when they excepted to the commissions of the chief-justice, James de Lancey (1703–1760) and one of his associates, because by these commissions the justices had been appointed "during pleasure" instead of "during good behaviour," the chief justice disbarred them. Their places, however, were taken by Andrew Hamilton, speaker of the Assembly of Pennsylvania and a lawyer of great reputation in the English colonies. The jury quickly agreed on a verdict of not guilty, and the acquittal was greeted by the populace with shouts of triumph. The further independence of judges became a leading issue in 1761 when the assembly insisted that they should be appointed during good behaviour, and refused to pay the salaries of those appointed during pleasure; but the home government met this refusal by ordering that they be paid out of the quit-rents.

The defence of the northern frontier was a heavy burden to New York, but by its problems the growth of the union of the colonies was promoted. From the destruction of Schenectady to the Peace of Ryswick (1697) hostilities between the French and the English in the New World took the form of occasional raids across the frontier, chiefly by the Indian allies. The main effort of the French, however, was, by diplomacy, to destroy the English-Iroquois alliance. This rested on the fear of the Iroquois for the French and their hope of protection from the English. Therefore, in response to their repeated complaints of the weakness of the English arising from disunion, Governor Fletcher, in 1694, called another intercolonial conference consisting of delegates from New York, Massachusetts, Connecticut and New Jersey, and urged the necessity of more united feelings. Open hostilities were interrupted for a few years by the Peace of Ryswick and for a longer period by the Peace of Utrecht (1713), but French priests continued to dwell among the Iroquois, teaching them and distributing presents, and of the success of this diplomacy the English were ever in danger. To counteract it they, in 1701, prevailed upon the chiefs to deed their territory, said to be 800 m. in length and 400 m. in breadth, to the king of England. The English, also, frequently distributed presents. But the success of the French at the close of the 17th century and the early portion of the 18th was prevented only by the ceaseless efforts of Peter Schuyler (1657–1724) whose personal influence was for years dominant among all the Iroquois except the Senecas. When they had assumed a neutral attitude, he persuaded a number of them to join troops from New York, New Jersey and Connecticut in the unsuccessful expeditions of 1709 and 1711 against the French at Montreal. The English had a decided advantage over the French in that they could furnish goods for the Indian trade much cheaper than their rivals, and when Governor Burnet saw that this advantage was being lost by a trade between Albany and Montreal he persuaded the assembly to pass an act (1720) prohibiting it. Pursuing the same wise policy he established a trading post at Oswego in 1722 and fortified it in 1727, and thereby placed the Iroquois in the desirable position of middlemen in a profitable fur trade with the "Far Indians." London merchants, in their greed, brought about the repeal of the prohibitory act in 1729, but its effects were only in part destroyed. At another intercolonial conference at Albany, called by Burnet, a line of trading posts along the northern and western frontiers was strongly recommended. But neither the other colonies nor the home government would co-operate, and the French were the first to accomplish it. In King George's War the co-operation of all the northern colonies was sought, and New York contributed £3000 and some cannon toward New England's successful expedition against Louisburg. But it was left alone to protect its own frontier against the French, and while the assembly was wrangling with Governor Clinton

for the control of expenditures the French and their Indians were burning farm houses, attacking Saratoga (November 16, 1745), and greatly endangering the English-Iroquois alliance. Even after the Peace of Aix-la-Chapelle (1748) the Iroquois complained bitterly of the fraudulent land speculators, and in 1753 the chiefs of the Mohawks threatened to declare the covenant chain broken. A reconciliation was effected, however, by Colonel William Johnson (1715–1774), who had long been superintendent of Indian affairs. Largely to secure the co-operation of the Iroquois the home government itself now called to meet at Albany (*q.v.*) the most important assembly of colonial deputies that had yet gathered. This body, consisting of twenty-five members and representing seven colonies, met in June 1754, and, besides negotiating successfully with the Iroquois, it adopted, with some modifications, a plan of colonial union prepared by Benjamin Franklin; the plan was not approved, however, either by the home government or by any of the colonies. In the first year of the war (1755) expeditions set out against Fort Duquesne (on the site of Pittsburg) and Fort Niagara and Crown Point, on the New York frontier. None of these was taken but on the 8th of September Major-General William Johnson, in command of the expedition against Crown Point, defeated a French and Indian force under Baron Dieskau in the battle of Lake George. As Johnson thought it unsafe to pursue the routed army his victory had no other effect than the erection here of the useless defences of Fort William Henry, but as it was the only success in a year of gloom parliament rewarded him with a grant of £5000 and the title of a baronet. In August 1756 Montcalm took Oswego from the English and destroyed it, and in 1757 he captured Fort William Henry; but in the latter year the elder Pitt assumed control of affairs in England, and his aggressive, clear-sighted policy turned the tide of war in England's favour. Victory followed victory, Ticonderoga, Crown Point and Niagara were wrested from the French and New York was freed of its foes.

England's attempt to make the colonies pay the expenses of the war by means of the stamp tax thoroughly aroused the opposition of commercial New York, already chafing under the hardships imposed by the Navigation Acts and burdened with a war debt of its own exceeding £300,000. The assembly was almost unanimous in voicing its protest to the governor. It authorized its committee, which had been appointed to correspond with the New York agent in London, to correspond also with the committees in the other colonies and this committee represented New York in the Stamp Act Congress, a body which was called at the suggestion of Massachusetts, met in New York City in October 1765, was composed of twenty-seven members representing nine colonies, and drew up a declaration of rights, an address to the king, and a petition to each house of parliament. When the Sons of Liberty, a society composed largely of unfranchised mechanics and artisans of New York City, which began to dominate the movement immediately after the Congress adjourned, resorted to mob violence—destroying property and burning in effigy the governor and other officers—the propertied classes drew back, and a few years later the popular or patriot party lost its control of the assembly. Since the Zenger trial there had been a court party and a popular party: the former included many wealthy Anglicans and was under the leadership of the De Lanceys, the latter included many wealthy and influential dissenters and was under the leadership of the Livingstons. During the administration of Governor Clinton (1743–1753) a quarrel between the governor and James De Lancey, the chief-justice, had greatly weakened the court party, and nearly all its members supported their rivals in opposition to the Stamp Act. In the series of events which followed the first violence of the Sons of Liberty important changes were made in party lines. Personal rivalry and creed became subordinate to political principles. The court party became the Loyalist party, standing for law as against rebellion, monarchy and the union of the empire as against republicanism; the popular party became the patriot party, determined to stand on its rights at any cost. The Stamp Act was repealed in March 1766, but the Townshend Acts, imposing duties on glass, paper, lead, painters' colours and tea, followed closely. They were met in New York by fresh outbursts of the Sons of Liberty and, as in the other colonies, by an association of nearly all the merchants, the members pledging themselves not to import anything from England until the duties were repealed. New York had also been requested to provide certain supplies for the British troops quartered in the city. This the assembly refused to do but parliament answered (1767) by forbidding it to do any other business until it complied. It was under these conditions that the Loyalists, in the elections of 1768 and 1769, gained control of the assembly and in the latter year passed an act granting the soldiers' supplies. When, in 1770, all the duties except those on tea were repealed, the conservative merchants wished to permit the importation of all goods from England except tea. The Sons of Liberty strongly opposed this, but the conservatives won and went over to the Loyalists. The moderate Loyalists joined in the election of delegates to the first Continental Congress; but the great body of Loyalists in New York strongly disapproved of the "dangerous and extravagant" measures adopted by that body, and the assembly, in January 1775, refused to approve its acts or choose delegates to the second Continental Congress. The patriots met this refusal by calling a provincial convention to choose the delegates. Scarcely had they done this when news of the encounter at Lexington produced a strong reaction in their favour, and in May 1775 they called a Provincial Congress which usurped the powers of the Assembly. Still, conditions were such in New York that a fight for independence was not to be lightly considered. The failure of Montgomery's expedition against Canada at the close of 1775 left the colony exposed to British attacks from the north. In the south the chief city was exposed to the British fleet. Sir William Johnson died in 1774, but under his influence and that of his son, Sir John Johnson, and his nephew Guy Johnson, the Mohawks and other Iroquois Indians had become firmly attached to the British side and threatened the western frontier. In various sections, too, considerable numbers of Loyalists were determined to aid the British. When, in June 1776, a vote on the Declaration of Independence was pending in the Continental Congress, the New York Provincial Congress refused to instruct its delegates in the matter; but a newly elected Provincial Congress, influenced by a Loyalist plot against the life of Washington, adopted the Declaration when it met, on the 9th of July.

The position of New York made it naturally one of the principal theatres of military operations during the War of Independence. It was a settled point of British military policy throughout the war to hold New York City, and from it, as a base, to establish a line of fortified posts along the Hudson by means of which communication might be maintained with another base on Lake Champlain. Such a scheme, if successfully carried out, would have driven a wedge into the line of colonial defence and cut off communication between New England and the southern colonies. A few days after the fight at Lexington and Concord, Connecticut authorized an expedition under Ethan Allen which surprised and captured Ticonderoga and Crown Point. In the following year (1776) the British began their offensive operations for the control of the Hudson; an army under Sir William Howe was to capture New York City and get control of the lower Hudson, while another army under Sir Guy Carleton was to retake Crown Point and Ticonderoga and get control of the upper Hudson. Howe, with a force of British and Loyalists vastly superior in equipment and numbers to Washington's untrained militia, landed in July on Staten Island and late in August defeated Washington at the battle of Long Island within the present limits of Brooklyn borough. In the following month Washington withdrew from New York City which the British entered and held until the close of the war. Washington prepared to withstand the British behind fortifications on Harlem Heights, but discovering that Howe was attempting to outflank him by landing troops in the rear he retreated to the mainland, leaving only a garrison at Fort Washington, and established a line of fortified camps on the hills overlooking

the Bronx river as far as White Plains. This brought on the battle of White Plains late in October, in which Howe gained no advantage; and from here both armies withdrew into New Jersey, the British capturing Fort Washington on the way, the Americans leaving behind garrisons to guard the Highlands of the Hudson. In 1777 General John Burgoyne succeeded in taking Ticonderoga, but in the swampy forests southward from Lake Champlain he fought his way against heavy odds, and in the middle of October his campaign culminated disastrously in his surrender at Saratoga. Colonel Barry St Leger led an auxiliary expedition from Oswego against Fort Stanwix on the upper Mohawk, and on the 6th of August he fought at Oriskany one of the most bloody battles of the war, but a few days later, deserted by his terror-stricken Indian allies, he hastened back to Montreal. The British government intended that Howe should co-operate with Burgoyne by fighting his way up the Hudson, but as the secretary of state for the colonies neglected to send him such instructions this was not undertaken until early in October, and then an expedition for the purpose was placed under the command of Sir Henry Clinton. Clinton met with little difficulty from the principal American defences of the Highlands, consisting of Forts Montgomery and Clinton on the western bank, together with a huge chain and boom stretched across the river to a precipitous mountain (Anthony's Nose) on the opposite bank, and ascended as far as Esopus (now Kingston) which he burned, but he was too late to aid Burgoyne. The year 1778 saw the bloody operations of the Tory Butlers and their Loyalist and Indian allies in the Mohawk and Schoharie valleys and notably the massacre at Cherry Valley. In retaliation a punitive expedition under Generals John Sullivan and James Clinton in 1779 destroyed the Iroquois towns, and dealt the Indian confederacy a blow from which it never recovered. The American cause was strengthened this year also by several victories along the lower Hudson of which General Anthony Wayne's storming of the British fort at Stony Point was the most important. The closing episode of the war as far as New York was concerned was the discovery of Benedict Arnold's attempt in 1780 to betray West Point and other colonial posts on the Hudson to the British. On the 25th of November 1783 the British forces finally evacuated New York City, but the British posts on Lakes Erie and Ontario were not evacuated until some years later.

New York ratified the Articles of Confederation in 1778, and when Maryland refused to ratify unless those states asserting claims to territory west to the Mississippi agreed to surrender them, New York was the first to do so. But under the leadership of George Clinton, governor in 1777–1795, the state jealously guarded its commercial interests. The Confederation Congress appealed to it in vain for the right to collect duties at its port; and there was determined opposition to the new Federal constitution. In support of the constitution, however, there arose the Federalist party under the able leadership of Alexander Hamilton. When a majority of the constitutional convention of 1787 had approved of the new constitution Hamilton alone of the three New York delegates remained to sign it; and when, after its ratification by eight states, the New York convention met at Poughkeepsie (June 17, 1788) to consider ratification, two-thirds of the members were opposed to it. But others were won over by the news that it had been ratified by New Hampshire and Virginia or by the telling arguments of Hamilton, and on the 26th of July the motion to ratify was carried by a vote of 30 to 27.

The constitution having been ratified, personal rivalry among the great families—the Clintons, the Livingstons and the Schuylers—again became dominant in political affairs. The Clintons were most popular among the independent freeholders; the Livingstons had increased their influence by numerous marriage alliances with landed families; and the Schuylers had General Philip Schuyler and Alexander Hamilton, his son-in-law. Originally, the Livingstons, with whom John Jay was connected by marriage, were united with the Schuylers, and yet both together were unable to defeat the Clintons in an election for governor. Later, the Livingstons, piqued at Washington's neglect to give them the offices they thought their due, joined the Clintons, but the Federal patronage was used against the anti-Federalists or Republicans with such effect that in 1792 John Jay received more votes for governor than George Clinton, although the latter was counted in on a technicality. Jay was elected in 1795 and re-elected in 1798, but in 1801 the brief Federalist regime in the state came to an end with the election of George Clinton for a seventh term. The Republican leaders straightway quarrelled among themselves, thus starting the long series of factional strifes which have characterized the party politics of New York state; the bitterness of the factions and the irresponsible council of appointment are also responsible for the firm establishment early in the Republican regime of the "spoils system." The leaders of the several Republican groups were Chancellor Robert R. Livingston, Aaron Burr, then vice-president, Governor George Clinton and his nephew, De Witt Clinton, who in 1802 was elected United States senator. The first break came in the spring of 1804 when Burr, who had incurred the enmity of his Republican colleagues in 1800 by seeking Federalist votes in the electoral college at Jefferson's expense, became an independent candidate for governor against Morgan Lewis. Hamilton's action in counselling Federalists not to vote for Burr for governor just as he had counselled them not to support Burr against Jefferson in 1800, was one of the contributary causes of Burr's hostility to Hamilton which ended in the duel (July 1804) in which Burr killed Hamilton. Hamilton's death marked the end of the Federalists as a power in New York. The election as governor in 1804 of Lewis, a relative of the Livingstons, was followed by a bitter quarrel with the Clintons over patronage, and resulted at the state election of 1807 in the choice of a Clintonian, Daniel D. Tompkins, for governor and the virtual elimination of the Livingstons from New York state politics. Tompkins served as governor by successive re-elections until 1817, his term covering the trying period of the second war with Great Britain. New York, whose growing shipping interests had suffered by the Embargo of 1807, was as a commercial state opposed to the war. Politically this opposition had the effect of temporarily reviving the Federalist party, which secured control of the legislature, and gave the electoral vote of the state in 1812 to De Witt Clinton, whom the Federalists had accepted as a candidate to oppose Madison for re-election on the war issue. During the war New Yorkers served with the regular troops at Niagara, Plattsburg and other places on the western and northern frontiers of the state. For some years after the war political contests in New York state as in the rest of the country were not on party lines. The opposing groups were known as "Bucktails," whose leaders were Governor Tompkins and Martin Van Buren, and "Clintonians" or supporters of De Witt Clinton. In 1817 an act was passed which ten years later ended for ever slavery in New York state; in the same year De Witt Clinton was elected governor and, largely through his efforts, the Erie Canal was begun.

The election of Martin Van Buren as governor in 1828 marked the beginning of the long ascendancy in the state of the "Albany Regency," a political coterie in which Van Buren, W. L. Marcy, Benjamin Franklin Butler (1795–1858) and Silas Wright were among the leaders; Thurlow Weed, their bitterest opponent and the man who gave them their name, declared of them that he "had never known a body of men who possessed so much power and used it so well." Thurlow Weed owed his early political advancement to the introduction into state politics of the anti-Masonic issue (see ANTI-MASONIC PARTY), which also brought into prominence his co-worker W. H. Seward. In 1826 in Genesee county the disappearance of a printer named William Morgan was attributed to Free-Masons and aroused a strong antipathy to that order; and the anti-Masonic movement, through the fostering care of Weed, Francis Granger (1792–1868) and others, spread to other states and led eventually to the establishment of a political organization that by uniting various anti-Jacksonian elements, polled in the New York state election of 1832 more than 156,000 votes for Francis Granger, their

candidate for governor against Marcy, who was chosen by about 10,000 plurality. As the anti-Masonic wave subsided its leaders and most of its adherents found a place in the newly organized Whig party, which was powerful enough in New York to elect William H. Seward governor in 1838, and to re-elect him and to carry the state for W. H. Harrison against Van Buren in 1840. It was during the first administration of Governor Seward that the anti-rent agitation in the Hudson river counties began. The greater part of the land in this section was comprised in vast estates such as Rensselaerwyck, Livingston, Scarsdale, Phillipse, Pelham and Van Cortlandt manors, and on these the leasehold system with perpetual leases, leases for 99 years or leases for one to three lives had become general. Besides rent, many of the tenants were required to render certain services to the proprietor, and in case a tenant sold his interest in a farm to another he was required to pay the proprietor one-tenth to one-third of the amount received as an alienation fine. Stephen van Rensselaer, the proprietor of Rensselaerwyck, had suffered the rents, especially those of his poorer tenants, to fall much in arrears, and when after his death (1839) the agents of his heirs attempted to collect them they encountered violent opposition. Governor Seward called out the militia to preserve order but asked the legislature to consider the tenants' grievances. The legislature appointed an arbitration commission, but this was unsuccessful, and the trouble, spreading to other counties, culminated (1845) in the murder of the deputy-sheriff of Delaware county. Politically, the anti-rent associations which were formed often held the balance of power between the Whigs and the Democrats, and in this position they secured the election of Governor John Young (Whig) as well as of several members of the legislature favourable to their cause, and promoted the passage of the bill calling the constitutional convention of 1846. In the new constitution clauses were inserted abolishing feudal tenures and limiting future leases of agricultural land to a period of twelve years. The courts pronounced the alienation fines illegal. The legislature passed several measures for the destruction of the leasehold system, and under the pressure of public opinion the great landlords rapidly sold their farms.[1] Up to the election of Seward as governor, New York had usually been Democratic, largely through the predominating influence of Van Buren and the "Albany Regency." After the defeat of Governor Silas Wright in 1846, however, the Democratic party split into two hostile factions known as the "Hunkers," or conservatives, and the "Barnburners," or radicals. The factions had their origin in canal politics, the conservatives advocating the use of canal revenues to complete the canals, the radicals insisting that they should be used to pay the state debt. Later when the conservatives accepted the annexation of Texas and the radicals supported the Wilmot Proviso the split became irrevocable. The split broke up the rule of the "regency," Marcy accepting the "Hunker" support and a seat in Polk's cabinet; while Wright, Butler and Van Buren joined the "Barnburners," a step preliminary to Van Buren's acceptance of the "Free Soil" nomination for president in the campaign of 1848. Only once between 1846 and the Civil War did the Democratic party regain control of the state—in 1853–1855 Horatio Seymour was governor for a single term. In 1854 the newly organized Republican party, formed largely from the remnants of the Whig party and including most of the Free Soil Democrats, with the aid of the temperance issue elected Myron Holley Clark (1806–1892) governor. Two years later the Republicans carried the state for Frémont for president, and a succession of Republican governors held office until 1862 when the discouragement in the North with respect to the Civil War brought a reaction which elected Seymour governor.

With the exception of New York City the state was loyal to the Union cause during the war and furnished over a half million troops to the Federal armies. Certain commercial interests of New York City favoured the Confederate cause, but Mayor Wood's suggestion that the city (with Long Island and Staten Island) secede and form a free-city received scant support, and after the sanguinary draft riots of July 1863 (see NEW YORK CITY) no further difficulty was experienced. After the Civil War the state began to reassume the pivotal position in national politics which has always made its elections second only in interest and importance to those of the nation, and the high political tension emphasized the evils of the "spoils system." In 1868 Tammany Hall (*q.v.*), then under the rule of William M. Tweed, forced the Democratic state convention to nominate its henchman, John T. Hoffman, for governor, and by the issue of false naturalization papers and fraudulent voting in New York City on a gigantic scale Hoffman was chosen governor and the electoral vote was cast for Seymour. Tammany and Hoffman were again victorious in 1870; but in 1871 the New York *Times* disclosed the magnitude of Tammany's thefts, amounting in the erection of the New York county court house alone to almost $8,000,000, and Tweed and his "Ring" were crushed in consequence. The Republicans carried the state in 1872, but in 1874 Samuel J. Tilden, a Democrat and the leading prosecutor of Tweed, was elected governor. The Republican legislature had in 1867 appointed a committee to investigate the management of the canal system, but the abuses were allowed to continue until in 1875 Governor Tilden disclosed many frauds of the "Canal Ring," and punished the guilty. In 1876, Tilden having been nominated for the presidency, New York cast its electoral vote for him. In 1880 it was cast for Garfield, the Republican nominee. Two years later the Republicans, having split over a struggle for patronage into the two factions known as "Halfbreeds," or administration party, and "Stalwarts" of whom the leader was Roscoe Conkling, were defeated, Grover Cleveland being chosen governor. In 1884 Cleveland as the Democratic presidential nominee received the electoral vote of his state. Cleveland likewise carried the state in 1892, but in 1888 Benjamin Harrison, the Republican candidate, the factional quarrels being settled, carried the state. Hostility to free silver and "Bryanism" in the large financial and industrial centres put the state strongly in the Republican column in the elections of 1896, 1900, 1904 and 1908. It was carried by the Democrats in the gubernatorial campaign of 1910.

[1] James Fenimore Cooper's novels *Satanstoe* (1845), *The Chainbearer* (1845) and *The Redskins* (1846) preach the anti-rent doctrine.

GOVERNORS OF NEW YORK

Colonial.

Cornelis Jacobsen Mey	1624–1625
William Verhulst	1625–1626
Peter Minuit	1626–1632
Bastiaen Janssen Crol	1632–1633
Wouter Van Twiller	1633–1637
William Kieft	1637–1647
Peter Stuyvesant	1647–1664
Richard Nicolls	1664–1668
Francis Lovelace	1668–1673
Anthony Colve	1673–1674
Edmund Andros	1674–1683
Thomas Dongan	1683–1688
Francis Nicholson, Lieutenant-Governor	1688–1689
Jacob Leisler (de facto)	1689–1691
Henry Sloughter	1691
Richard Ingoldsby (Acting)	1691–1692
Benjamin Fletcher	1692–1698
Richard Coote, earl of Bellomont	1698–1701
John Nanfan (Acting)	1701–1702
Edward Hyde, Lord Cornbury	1702–1708
John, Lord Lovelace	1708–1709
Richard Ingoldsby (Acting)	1709–1710
Gerardus Beekman (Acting)	1710
Robert Hunter	1710–1719
Peter Schuyler (Acting)	1719–1720
William Burnet	1720–1728
John Montgomerie	1728–1731
Rip van Dam (Acting)	1731–1732
William Cosby	1732–1736
George Clarke (Acting)	1736–1743
George Clinton	1743–1753
Sir Danvers Osborne	1753
James de Lancey (Acting)	1753–1755
Sir Charles Hardy	1755–1757
James de Lancey (Acting)	1757–1760
Cadwallader Colden (Acting)	1760–1761
Robert Monckton	1761
Cadwallader Colden (Acting)	1761–1762
Robert Monckton	1762–1763

Government: W. C. Morey, *The Government of New York: Its History and Administration* (New York, 1902) after tracing briefly the development of the governmental system describes its structure and operation. C. Z. Lincoln, *The Constitutional History of New York* (5 vols., Rochester, 1906) is an elaborate and able study of the growth of the constitution. See also J. A. Fairlie, *The Centralization of Administration in New York State* (New York, 1898); *Annual Reports of the State Board of Charities* (Albany, 1867 sqq.); *Annual Reports of the State Education Department* (Albany, 1904 sqq.); and Sidney Sherwood, *History of Higher Education in the State of New York* (Washington, 1900), Circular of Information No. 3 of the United States Bureau of Education. History: E. H. Roberts, *New York: The Planting and Growth of the Empire State* (2 vols., Boston, 1896) is a popular but rather superficial treatment of the entire period. The early historical documents of the state were collected by E. B. O'Callaghan in his *Documentary History of the State of New York* (4 vols., Albany, 1849–1851); and more completely in *Documents Relating to the Colonial History of the State of New York procured by J. R. Brodhead* (15 vols., vols. i.-xi. edited by E. B. O'Callaghan and xii.-xv. by B. Fernow; Albany, 1853–1883). O'Callaghan edited *A Calendar of Historical Manuscripts in the Office of the Secretary of State of New York* (2 vols., Albany, 1865–1866). E. B. O'Callaghan, *History of New Netherland* (2 vols., New York, 1846), and J. R. Brodhead, *History of the State of New York* (2 vols., New York, 1853 and 1871) are the standard works on the early history. Mrs Martha J. Lamb's *History of the City of New York* (2 vols., New York, 1877) and Mrs Schuyler Van Rensselaer's *History of the City of New York in the Seventeenth Century* (2 vols., New York, 1909) include the history of the province. William Smith's *History of the Late Province of New York, from its Discovery to 1762* (1st part, 1757, reprinted in the 1st series of the New York Historical Society *Collections*, 2 vols., 1829–1830) is still the chief authority for the period from the English Revolution of 1688 to the eve of the War of Independence. For the same period, however, consult C. W. Spencer, *Phases of Royal Government in New York, 1691–1719* (Columbus, 1905). John Fiske, *The Dutch and Quaker Colonies in America* (2 vols., Boston, 1900) is admirable in its generalizations but unreliable in its details. G. W. Schuyler, *Colonial New York: Philip Schuyler and his Family* (2 vols., New York, 1885) is a family history, but especially valuable in the study of Indian affairs and the intermarriages of the landed families. A. C. Flick's *Loyalism in New York during the American Revolution* (New York, 1901) and H. P. Johnston's *Campaign of 1776 around New York and Brooklyn* (Brooklyn, 1878) are thorough studies. For the military history of the War of Independence see also Justin Winsor's *Narrative and Critical History of America*, vol. vi. (Boston, 1888). For strictly political history see a series of articles by Carl Becker in the *American Historical Review*, vols. vi., vii. and ix., and the *Political Science Quarterly*, vol. xviii., J. D. Hammond's *History of Political Parties in the State of New York* (2 vols., Albany, 1842) and D. S. Alexander's *Political History of the State of New York* (3 vols., New York, 1906–1909). See also E. P. Cheney, *The Anti-Rent Agitation in the State of New York* (Philadelphia, 1887); Charles McCarthy, "The Anti-Masonic Party" in vol. i. pp. 365-574 of the *Annual Report* for 1902 of the American Historical Association; N. E. Whitford, *History of the Canal System of the State of New York* (Albany, 1906). (N. D. M.; W. T. A.)

NEW YORK (CITY), the largest city of New York state, U.S.A., situated at the junction of the Hudson river, here called the North river, with the narrow East river (actually a strait connecting Long Island Sound with the Upper Bay), and between Long Island Sound and the Atlantic Ocean. It is composed of five boroughs: the Borough of the Bronx on the south-easternmost part of the mainland of New York state; the Borough of Manhattan on Manhattan Island (including also other small islands[1]) immediately S. and S.W. of the Bronx, and bounded on the W. by the North river, on the E. by the East river, and on the S. by New York Bay; the Borough of Richmond (Staten Island, *q.v.*), the southernmost and westernmost part of the city; and on the western end of Long Island, the Borough of Brooklyn (*q.v.*), and, N. of it, the Borough of Queens. The city hall, in the southern part of Manhattan Island, is in lat. 40° 42′ 43″ N. and long. 74° 0′ 3″ W. The greatest width of the city E. and W. is 16 m., and the greatest length N. and S. is 32 m.; its area is about 326·07 sq. m. (285·72 sq. m. more than in 1890), of which Manhattan Borough constitutes nearly 21·93 sq. m., the Borough of the Bronx about 41·7 sq. m., the Borough of Queens about 129·5 sq. m., the Borough of Brooklyn 77·6 sq. m., and the Borough of Richmond 55·2 sq. m.[2] The total waterfront of the city is 341·22 m., and much of it, especially on the lower part of Manhattan, is made ground.

New York harbour is one of the most beautiful, largest and best of the world's great ports. Over the bar (Sandy Hook), about 20 m. S. of the S. end of Manhattan Island, is the "Main Ship Bayside-Gedney channel," 1000 ft. wide and 30 ft. deep. By 1909 the Federal government had completed 7½ m. of the Ambrose channel farther to the E. and 40 ft. deep, and 950–1600 ft. wide (2200 ft. is the projected width).[3] A third

[1] The more important of these small islands are: Blackwell's (about 120 acres) in the East river, Ward's N. of Blackwell's, and Randall's N. of Ward's, separated from it by Little Hell Gate, and in the mouth of the Harlem river; in the Upper Bay, Governor's Island (originally 65 acres; enlarged by the addition of 101 acres to the southwest), a U.S. military reservation, about 1000 yds. S. of the Battery, the southernmost point of Manhattan Island; Bedloe's Island (sometimes called Liberty Island from the Bartholdi statue on it of "Liberty Enlightening the World"), with an area of 13½ acres, lying 2 m. S.W. of the Battery; and Ellis Island, 1½ m. W.S.W. of the Battery, occupied by the Federal government as a landing-place for immigrants. In the Lower Bay, and a part of the Borough of Richmond, are the artificial islands, Swinburne (1866–1870; 8 m. S. of the Battery) and Hoffman (1868–1873; 7 m. S. of the Battery), constructed for quarantine stations.

[2] Manhattan and Bronx boroughs compose New York county; the counties of Queens and Richmond are coterminous respectively with the boroughs of those names; Brooklyn Borough is coextensive with Kings county.

[3] The narrowness of the channel makes the tidal scour more effective, and it was little filled in even when sewage and garbage was dumped in the Bay itself. The river carries little silt and leaves most of it well above the harbour. The natural excellence of the harbour may be inferred from the following figures: in 1895–1903 the Federal

channel, the South and Swash, is used by coasting vessels drawing about 20 ft. The harbour is divided into three parts: the Lower Bay, the Upper Bay and the North and East rivers. The Lower Bay (about 88 sq. m.) of which Raritan Bay on the S.W., Sandy Hook Bay on the S.E., and Gravesend Bay on the N.E. form parts, and to which the channels mentioned afford entrance from the ocean, has Staten Island to the W. and N., Brooklyn to the N. and E., and the New Jersey shore to the S. and W. The Upper Bay has an area of 14 sq. m., is the immediate embouchure of the North and the East river, is connected with the Lower Bay by the Narrows (minimum width 1 m.) and with Newark Bay to the W. by Kill Van Kull, immediately N. of Staten Island, and, except for these four narrow water-ways, is enclosed by land. The North river (maximum depth, 60 ft.) is here about 1 m. wide and the East river (maximum depth more than 100 ft.; in Hell Gate channel about 200 ft.) is about ¾ m. wide and, from the Battery to Throg's Neck and Willett's Point, where Long Island Sound proper begins, about 20 m. long. The north-east entrance to the harbour, from Long Island Sound by the East river, used principally by New England coasting vessels (especially coal barges), was made navigable for vessels of 25–27 ft. draft by the Federal government, which in 1870–1876 and in 1885 widened and deepened the formerly dangerous narrows and removed the reefs of Hell Gate, between Manhattan Island (E. 88th Street), Blackwell's Island, Astoria (on the Long Island shore), and Ward's Island. The third great entry and commercial feeder to the harbour is the North river, by which the great inland water-borne traffic of the Hudson river and the Erie Canal is brought to the port of New York. On the North river are the piers of the transatlantic steamship companies, part of them on the New Jersey side at Hoboken (*q.v.*). The coastwise trade with New England, especially through Long Island Sound, is largely from the East river, to which a part of the Hudson river traffic makes its way by the Harlem river. The Harlem is a place of anchorage for small craft.

The narrow approaches to the harbour from the ocean and from Long Island Sound make its fortification easy. On Sandy Hook, less than 8 m. from the nearest points of Rockaway Beach and Coney Island on the other side of the entrance, is Fort Hancock, established as a military reservation (1366 acres) in 1892; it received its present name in 1895, and has an artillery garrison. Between the lower and upper bays, on the Narrows, are Fort Wadsworth (1827; named in honour of General James S. Wadsworth (1807–1864), killed in the battle of the Wilderness), on the Staten Island side, a reservation of 230 acres, including Fort Tompkins, on higher ground than Fort Wadsworth proper, and, across the Narrows, on the Long Island shore, Fort Hamilton (1831), with a reservation of 167 acres. Older fortifications are Fort Lafayette (1807; called Fort Diamond until 1823), between Forts Hamilton and Wadsworth on an artificial island, now used to store ordnance and supplies, and Fort Columbus (1806), South Battery (1812) and Castle Williams (built in 1811 by Jonathan Williams (1750–1815), who planned all the earlier fortifications of New York harbour; it is now a military prison), all on Governor's Island, where are important barracks and the New York arsenal of the Ordnance Department. The north-eastern approach to the harbour, at the entrance to Long Island Sound, is protected by fortifications, Fort Totten, at Willett's Point (1862), and directly across from this battery by Fort Schuyler (1826; post established 1856) with a reservation of 52 acres on Throg's Neck.

Geology.—Manhattan Island[1] (13¼ m. long; maximum width—at 14th Street—2¼ m.; average width about 2 m.) is a "group of gneissoid islands separated . . . by low levels slightly elevated above tide and filled with drift and alluvium" (L. D. Gale in W. W. Mather's *Geology of New York*, 1843), with a steep west wall from Manhattanville (125th Street W. of 8th Avenue) S. beyond 81st Street, and a much steeper east wall. Upon its first occupation by the Dutch the island was rough and rocky with brooks, ponds, marshes and several swamps.[2] Superficially, the island may be divided into: an area of drift, S. of 21st Street on the East river, of 13th street on Broadway and of 31st Street on the North river; a second, narrow area of drift running from Hell Gate N.W. to Manhattanville in a line parallel to the Harlem; a limestone (Inwood limestone) area on the Harlem from its mouth to the sharp turn in its course; a second and smaller limestone area on the Spuyten Duyvil in the north-westernmost part of the island; and the remainder areas of gneiss, the larger part being in two great "islands," one between the line of E. 21st Street, 13th Street and W. 31st Street, already mentioned, and a line from Hell Gate to Manhattanville, and the other nearly joining the first at Manhattanville and covering all the narrow N.W. part of Manhattan Island except the second limestone area on the Spuyten Duyvil. These two gneiss areas have a southerly tilt; they are named respectively Washington and Morningside Heights. In all these areas, except the limestone, the underlying rock is what is styled Manhattan schist (see *U.S. Geologic Atlas, N.Y. City*, folio No. 83). The waterfront of Manhattan does not correspond in direction with limestone belts, but is probably due to lines of fracture (see W. H. Hobbs, in *Bulletin*, Geological Society of America, xvi. 151-182).

The Borough of the Bronx is made of high N.E. and S.W. ridges, sloping E. to the lower shores of Long Island Sound; and the Boroughs of Brooklyn and Queens form part of the great terminal moraine. Low serpentine hills (300-380 ft.), with a N.E. and S.W. trend, occupy the central part of the northern end of Staten Island; W. of this is Jura-Trias formation, crossed in its centre by a narrow strip of igneous dike rock; the E. and S. part of the island is Cretaceous. Yellow gravel is one of the many evidences of glacial drift; but the S.E. part of the island was not encroached upon by the moraine.

Climate.—A combination of marine and continental influences produces a humid climate subject to sudden changes of temperature. The temperature, however, rises above 90° F. only six days in a year on the average; it rarely falls below zero; and in a period of thirty-eight years, from 1871 to 1908, extremes ranged between 100°, in September 1881, and −6°, in February 1899. The mean winter temperature (December, January and February) is 32°; the mean summer temperature (June, July and August) is 72°; and the mean annual temperature is 52°. The average monthly rainfall ranges from 3·2 in. in May to 4·5 in. in July and in August, and the mean annual precipitation is 44·8 in. The average annual fall of snow amounts to 37 in., of which 11·5 in. falls in February, 8·7 in. in January and 8·2 in. in March. The average number of hours of sunshine ranges from 150 in November to 271 in June. The prevailing winds are N.W., except in June when they are S.W.

Streets.—In the downtown portion of Manhattan Island, a strip about 2 m. long, some streets follow the irregular water-fronts and others cross these; and on the west side this irregularity extends farther N., in the former Greenwich village (W. and N.W. of Washington Square), where West 4th Street, running N.W., crosses West 12th Street, running S.W. north of Houston Street, then North Street, the northernmost limit of the occupied city; in 1807 a commission laid out the island into streets, which were numbered from S. to N. and were called East and West, as they were E. or W. of Broadway, below 8th Street, and of Fifth Avenue, above 8th, and into avenues, which were numbered[3] from E. to W., Twelfth Avenue being on the North river waterfront. East of First Avenue in a bulge of the Island S. of 23rd Street four additional avenues were named A, B, C, and D, Avenue A being one block E. of First Avenue. Afterwards Madison Avenue was laid out midway between Fourth and Fifth Avenues, N. from 23rd Street, and Lexington Avenue, midway between Third and Fourth Avenues, N. from 21st Street. The most important of the avenues is Broadway, an unfortunately narrow street in the busy downtown part of its course. From Bowling Green, immediately N. of the Battery, it goes in a straight line (E. of N.) for about 2½ m. to 10th Street; then bears off to the W. It is called the Boulevard from 78th Street to 162nd Street in its course between Amsterdam Avenue and West End (or Eleventh) Avenue (to 104th Street), and then as a continuation of West End Avenue; and thence to the Yonkers city line is called Kingsbridge Road. The monotonous regularity of the rectangular street plan of Manhattan above 14th Street is partly redeemed by this westward trend of Broadway, the only

expenses for important harbour improvements, principally dredging, were $1,035,300 for New York, $2,710,000 (exclusive of $1,185,000 for the Delaware Breakwater) for Philadelphia, $1,501,169 for Boston, $1,404,845 for New Orleans, and $470,000 for Baltimore.

[1] See Wm. H. Hobbs, *Configuration of the Rock Floor of Greater New York* (Washington, 1905), Bulletin 270 of the U.S. Geological Survey, with an excellent summary of the earlier literature. The study of the underlying rock of Manhattan Island and its vicinity has been stimulated by the great engineering and building enterprises in the city limits.

[2] See a paper, "Old Wells and Water-Courses on the Island of Manhattan," by George Everett Hill and George E. Waring, Jr., in *Historic New York: the First Series of the Half Moon Papers* (New York, 1899).

[3] In the Borough of the Bronx the system of numbered avenues no longer holds, but the cross streets are numbered consecutively. W. 262nd Street being immediately S. of the Yonkers line and E 242nd and 243rd immediately S. of the Mt. Vernon boundary.

old street in this part of the city. The Bowery, extending N. from Chatham Square to East 4th St. (practically continued by Fourth Avenue), is not now a street of commercial importance, being largely taken up with Yiddish tenements. Broadway, in its southernmost part, is a financial and business street; the financial interests centre particularly about Wall Street,[1] which is about one-third of a mile above the Battery, runs E. from Broadway, and was named from a redoubt built here by the Dutch in 1653 on news of a threatened attack by the English. The wholesale dry goods district is on Broadway and the side streets between Reade and Prince Streets and the wholesale grocery district immediately W. of this. In Maiden Lane is the wholesale jewelry trade. The leather and hide trade is centred immediately S. of the approaches to the Brooklyn Bridge. A little farther up-town on the East Side is the tenement district, one of the most crowded in the world. The principal shopping districts are on Broadway from 17th Street to 34th Street; on Sixth Avenue from 14th Street to 34th Street; and to an increasing degree on Fifth Avenue from 23rd Street to 42nd Street, and on the cross-streets in this area, especially 23rd, 34th and 42nd Streets. Next to Broadway the best known of the avenues is Fifth Avenue, which extends from Washington Square to the Harlem river (143rd Street) in a straight line. On Fifth Avenue there are a few residences in its lower part and between 34th and 45th Streets; but N. of 50th and on the E. side of Central Park are many fine residences. The cross streets within one block to the W. and two blocks to the E. of Fifth Avenue, Central Park West, and in general the upper West Side and in particular Riverside Drive, high above the North river, are the newer residential parts of the city.

Parks.—The park system in 1908 included property valued at $501,604,188. The principal parks are: Central Park in Manhattan; Prospect Park in Brooklyn (*q.v.*); and Bronx Park, Van Cortlandt Park and Pelham Bay Park in the Bronx. The first park (as distinguished from "square") of any size in Manhattan was Central Park (840 acres; between 59th and 110th Streets and between 5th and 8th Avenues; about 2½ m. long and ½ m. wide), which was laid out (beginning in 1857) by F. L. Olmsted and Calvert Vaux. Nearly one-half is wooded, with a variety of native and foreign trees and shrubs. The park contains a large pond, the Mere, in the N.E. corner; the Croton retaining reservoir and the receiving reservoir, and other sheets of water. Near the 65th Street entrance from 5th Avenue is the Arsenal, the executive quarters of the Department of Parks, with a meteorological observatory (1869).

Pelham Bay Park (1756 acres), in the north-easternmost corner of the city, lies on Long Island Sound, includes Hunter's Island and Twin Islands, and has a total shore front of about 9 m. Bordering on the city of Yonkers, S. (from 262nd Street) to 242nd Street, is Van Cortlandt Park (1132 acres), in which are the Van Cortlandt Mansion (1748), for a time Washington's headquarters and now a Revolutionary Museum under the Colonial Dames, a parade-ground (75 acres), and Van Cortlandt Lake, a skating pond. East of Van Cortlandt Park is Woodlawn Cemetery. Mosholu Parkway (600 ft. wide and about 6000 ft. long) leads from Van Cortlandt Park to the S.E., and Bronx and Pelham Parkway (400 ft. wide and 12,000 ft. long) from Pelham Bay Park to the S.W. connecting these parks with Bronx Park (719 acres) on either side of the Bronx river, a small stream which here broadens into lakes and ponds and has a fall at the lower end of the park. Bronx Park reaches from 180th Street to 205th Street. The northern part is occupied by the New York Botanical Gardens and the southern part by the Zoological Park.

Battery Park is at the southern end of Manhattan; here are the New York Aquarium (in what was until 1896 Castle Garden, on the site of Fort Clinton) and a children's playground (1903). In City Hall Park are the public buildings mentioned below.

The other down-town open spaces are small; many of them are recreation grounds, some, such as Mulberry Bend Park and Hamilton Fish Park, being on the site of former slums, condemned by the city at great expense. Especially in this part of the city municipal recreation piers and free baths have been constructed. Washington Square (1827), between Waverley Place, Wooster and Macdougal Streets, at the foot of 5th Avenue, became a pauper burial-ground about 1797, and was laid out as a park in 1827; on the N. side of the square there are still a few fine old residences. Union Square, between Broadway and 4th Avenue, is a favourite place for workmen's mass meetings. Madison Square is reclaimed swampy ground on which there was an arsenal in 1806–1815, then a parade-ground, and in 1825–1839 a municipal House of Refuge in the old barracks, and which was then laid out as a park and was a fashionable centre in 1850–1875. Bryant Park on Sixth Avenue, between 40th and 42nd Streets, was a Potter's Field in 1813–1823, and in 1853 was the site of a world's fair with Crystal Palace, which was destroyed in 1858. In De Witt Clinton Park between 52nd and 54th Streets on the North river, there was the first children's farm school[2] in New York. Riverside Park (140 acres; 1872), between 72nd and 129th Streets, on the North river front, is a finely wooded natural terrace with winding paths. Morningside Park (31½ acres), between W. 110th and 123rd Streets, beautifully wooded, and Mount Morris Park (20¼ acres) from 120th to 124th Streets, interrupting Fifth Avenue, are high rough ground, Mount Morris being the highest point on Manhattan Island.

Among the other parks in the north part of Manhattan Island are: Roger Morris Park, between 160th and 162nd Streets, containing the Roger Morris or Jumel Mansion (1763), Washington's headquarters for five weeks in 1776, then the headquarters of Sir Henry Clinton, and after 1777 of the Hessian officers; High Bridge Park (73¼ acres) at the Manhattan end of High Bridge, between W. 170th and 175th Streets; Audubon Park between 155th and 158th Streets, from Broadway to the North river, the home in 1840–1851 of John James Audubon; and Ft. Washington (40¾ acres) from 171st to 183rd Streets on the North river, the site of Ft. Washington in the War of Independence. Along the W. bank of the Harlem river for about 3 m. N. and N.W. is the Harlem River Driveway (or speedway), about 95 ft. wide. Besides the large parks in the Bronx the more important are Crotona (154·6 acres), and Poe Park (2½ acres) on E. 192nd Street, the site of E. A. Poe's Fordham cottage. The great baseball grounds of the National and American leagues furnish amusement to the crowds interested in professional baseball. Coney Island (*q.v.*), similar resorts on Staten Island, on the shores of the North river and on Long Island on the Sound, and on the Hudson river are popular amusement places.

Buildings.—The city's sky-line is broken by the tall business buildings, known as "sky-scrapers,"[3] the construction of which was made necessary by the narrowness of the down-town portion of the island in which the increasing business population had to be accommodated. The ten-storey Tower Building (1889; 21 ft. wide; first 9 then 11 storeys; replaced in 1908–1910 by a taller and wider building) was the first of these, and was soon followed by much taller ones.

The prominent business buildings include the Singer Sewing-Machine Company's Building[4] (612 ft. high, built in 1905–1908 by Ernest Flagg); the Metropolitan Life Insurance Company's Building (693 ft.; completed in 1909); the Produce Exchange (with a 225-ft. tower); the Manhattan Life Building (with a 360-ft tower); the Empire Building (20 storeys); on Wall Street, the Drexel Building, the Trust Company of America (23 storeys) and the National City Bank; on Broad Street, the white marble Stock Exchange (1903), the Broad Exchange Building (276 ft. high), and the Commercial Cable Building (317 ft. high); in Cedar Street, the New York Clearing House; in Liberty Street, the New York Chamber of Commerce (1903), built of white marble and granite, with Ionic columns, the Trinity Building (with a Gothic façade) and the United States Realty Building (both by F. H. Kimball), the City Investing Building (32 storeys; 486 ft. high); in Church Street, the Hudson Terminal Buildings (1909, Clinton & Russell), 22 storeys high, with four storeys below ground (including the terminal of the down-town Hudson tunnels), office buildings with a tenant population of 10,000; in Park Row, the Park Row Building (30 storeys; 390 ft. high), and the office building of the *World* (the Pulitzer Building, with a dome 310 ft. high); the white marble Home Life Insurance Building with its sloping red tiled roof; the Fuller (or "Flatiron") Building (290 ft. high); and the New York *Times* Building (363 ft. high) at 42nd Street and Broadway.

The principal public buildings are: the Custom House (1902–1907; by Cass Gilbert), on the site of Fort Amsterdam, built of granite in the French Renaissance style; in Wall Street, the United States Sub-Treasury, on the site of Federal Hall, in which George Washington was inaugurated first president of the United States; and in and about City Hall Park, the Post

Office, the Italian Renaissance City Hall by John McComb, Jr., 1803–1812 (architecturally the best of the public buildings); the Court House, the Hall of Records (French Renaissance), and a new Municipal Building with a lantern 559 ft. high, the main building of 23 storeys being pierced by an arcade through which Chambers Street runs; a little farther N. and E. of Broadway, the Tombs (1898–1899), the city prison, connected by a flying bridge called "the Bridge of Sighs" with the Criminal Courts; at Madison Avenue and 25th Street, the elaborate Appellate Court House (J. B. Lord); and on Fifth Avenue (40th-42nd Sts.) the new Public Library (1911). There are several large armouries of the state militia in the city, the best known being those of the 7th, 69th and 71st regiments.

Churches.—Historically the foremost religious denomination in New York City is the Dutch Reformed. The consistory of the Collegiate Church, controlling several churches, is the oldest ecclesiastical organization in the city, dating from 1628, when there was a Dutch church "in the Fort." After the city passed into the hands of the English the Protestant Episcopal Church rapidly increased in power, and in 1705 received the grant of the "Queen's Farm" between Christopher and Vesey streets. This immense wealth is held by the corporation of Trinity Church. Its present building (1839–1846; by R. M. Upjohn) is on the site of a church built in 1696, at the head of Wall Street on Broadway. The bronze doors are a memorial to J. J. Astor, and the altar and reredos, to W. B. Astor. In the churchyard are the graves of Alexander Hamilton, Robert Fulton, Captain James Lawrence, Albert Gallatin, William Bradford, the colonial printer, and General Phil Kearny. Many of the largest Episcopalian churches in the city were founded as its chapels, including St Paul's (1766), the oldest church building in the city. Trinity has several important chapels dependent on it. The Presbyterian Church is relatively stronger in New York than in any other city in the country with the possible exceptions of Philadelphia and Pittsburg. The first Methodist Episcopal society in the United States was formed in New York in 1766 and still exists as the John Street Church. The varied immigration to the city had brought in the other Protestant sects; the large Irish immigration of the first two-thirds of the 19th century, and the great Hebrew migration of the last part of the same century, made the Roman Catholic and the Jewish denominations strong. The city became the see of a Roman Catholic bishop in 1808 and of an archbishop in 1850. The Roman Catholic Cathedral, St Patrick's (50th-51st Streets; Fifth-Madison Avenues), is the head of the archdiocese of New York; it is the largest and one of the most elaborately decorated churches in the country, designed by James Renwick and erected in 1850–1879, with a Lady Chapel added in 1903. It is in Decorated style and is built principally of white marble. Behind the Cathedral on Madison Avenue is the archiepiscopal residence. The Protestant Episcopal Cathedral of St John the Divine, on 112th Street near Morningside Park, was begun in 1892; the crypt and St Saviour's Chapel were completed in 1910. Other prominent Episcopalian churches are: Christ Church, organized in 1794, the second parish in age to Trinity; St Mark's, an old parish with a colonial church (1829); Grace Church (organized in 1808), since 1844 in a commanding position at Broadway and 10th Street, at the first turn in Broadway, with a building of white limestone in Decorated style with a graceful stone spire; the Church of the Ascension (1840) with John La Farge's mural painting of the Ascension, a chancel by Stanford White, and Sienese marble walls and pulpit; and the Church of the Transfiguration (1849), nicknamed "The Little Church around the Corner," and famous under the charge of Dr George H. Houghton (1820–1897) as the church attended by many actors. It has a memorial window to Edwin Booth by John La Farge. Of Presbyterian churches the First (organized in 1719) long occupied a brick church on Wall Street, near the old City Hall, and since 1845 has been on Fifth Avenue between 11th and 12th Streets; and the Madison Square Church was organized in 1853, and after 1907 occupied one of the most striking ecclesiastical buildings in the city, in a quasi-Byzantine style, with a golden dome and a façade of six pale green granite Corinthian columns. The First Baptist Church (organized 1762; present building on Broadway and 79th Street) is the oldest and the Fifth Avenue Baptist Church (1841) is the richest society of that denomination in the city; the Memorial Church (1838) is a memorial to Adoniram Judson. The first Congregational Church was built in 1809, but it was soon sold and the congregation disbanded; the Broadway Tabernacle on Broadway, near Worth Street, was a famous church in 1840–1857; the present church is at Broadway and 56th Street. St Peter's (Roman Catholic; 1785) is the oldest Catholic organization in the city; St Patrick's (1815) was formerly the cathedral church, and St Paul the Apostle (Paulist; 1859; rebuilt 1876–1885, with decorations by John La Farge) was established by Isaac Hecker. There are many Jewish synagogues and temples.

Hotels.—The principal hotels, clubs and theatres of New York City have steadily been making their way up-town. Both hotels and clubs had their origin in the taverns of the 17th and 18th centuries, such as Fraunces's Tavern, on the corner of Pearl and Broad Streets, built in 1719, used as a residence of the De Lancey family, sold in 1762 to Samuel Fraunces (Washington's steward after 1789), who opened it as the Queen's Head or Queen Charlotte, used for a time (1768) as the meeting-place of the Chamber of Commerce, and the scene, in its assembly room, of Washington's farewell to his officers in 1783; it was restored in 1907 by the New York State Society of The Sons of the Revolution, which owns the building. There are now few first-class hotels in the down-town district, the Astor House being the principal exception to the rule that the hotel district is bounded by 23rd and 59th Streets, and by Fourth and Seventh Avenues. With the rapid increase in the value of New York City real estate many apartment-hotels have been built, especially on the upper west side. The most widely-known restaurants are Delmonico's and Sherry's, both at Fifth Avenue and 44th Street.

Clubs.—The clubs of New York are even more important to the social life than those of London, and most of them are splendidly housed and appointed. The oldest of the social clubs is the Union Club, organized in 1836. The Union League Club (organized 1863, incorporated 1865) was formed by members of the U.S. Sanitary Commission, and is the club of the leaders of the Republican party in the city. The Democratic organizations corresponding to it are the Manhattan Club (organized 1865, reorganized in 1877), and the Democratic Club, more closely allied with the local organization of Tammany Hall. The Metropolitan Club was formed in 1891 by members of the Union Club, with which the Calumet Club (1879) also is closely connected. The Knickerbocker Club was founded in 1871 by descendants of early settlers; and the St Nicholas Club by descendants of residents of the city or state before 1785. The University Club (1865, for college graduates only) has one of the handsomest club-houses in the world. Among the special clubs chiefly for writers, artists, actors and musicians, are the Century Association (1847, membership originally limited to 100, devoted to the advancement of art and literature); the Lotos Club (1870, composed of journalists, artists, musicians, actors and "amateurs" of literature, science and fine arts); the Salmagundi Club (1871, artists); the Lambs' Club (1874, "for the social intercourse of members of the dramatic and musical professions with men of the world"); the Players' (1887, actors and authors, artists and musicians), whose building was the gift of Edwin Booth, its founder and first president; the Grolier Club (1884, bibliophiles); the Cosmos Club (1885, members must have read von Humboldt's *Cosmos*); and the New York Press Club (1872, journalists). The Sorosis (1868) is a women's club, largely professional. Other clubs are the New York Bar Association (1870), the Engineers' Club (1888), the New York Athletic Club (1868), the Racquet and Tennis Club, the New York Yacht Club (1844, incorporated 1865, the custodian of the "America's" cup); and the Riding Club (1883); the Freundschaft Society (1879) and the Deutscher Verein (1874) for Germans; the Army and Navy Club (1889); several Hebrew clubs, notably the Harmonie and the Progress (1864); the Catholic Club of New York, and the clubs of Harvard (1865), Yale, the University of Pennsylvania, Cornell University and Princeton.

Theatres, &c.—The first dramatic performances[1] in New York City were given in September and December 1732 by a company from London which played at Pearl Street and Maiden Lane; the first playhouse was opened on the 5th of March 1750, but in 1758 became a German Reformed Church; and the second was opened with Rowe's *Jane Shore* on the 28th of December 1758, but remained a theatre only a little more than six years. What has been called the first New York theatre, opened on the 7th of December 1767 in John Street near Broadway, was the Royal Theatre during the British occupation in the War of Independence, and was destroyed in 1798. In that year was built on Park Row the Park Theatre (burnt 1820; rebuilt 1821; burnt 1848) in which George Frederick Cooke (1810), James W. Wallack (1818) and Junius Brutus Booth (1821) made their American débuts, in which Edmund Kean, Charles Kean, Fanny Kemble and Edwin Forrest played, and in which *Il Barbiere di Siviglia*, the first Italian opera given in the United States, was rendered in 1825, and the first ballet was danced by Fanny Ellsler in 1840. Rivals of the Park Theatre were: the Chatham Garden and Theatre in 1823–1831, and later the Bowery Theatre (opened in 1826; burnt in 1828, 1836, 1838 and 1845; named the Thalia in 1879, when it became a German theatre; and since 1892 Yiddish). Among famous theatres of the 19th century the following may be mentioned: Niblo's Garden (built in 1829; burned in 1846; rebuilt in 1849; destroyed in 1895) was long owned by A. T. Stewart, and after 1866 was the scene of many spectacular shows. Palmo's Opera House (1844–1857) was the home first of Italian opera and after 1848, under the management of William E. Burton (1802–1860), of comedy. In Mechanics' Hall (1847–1868) E. P. Christy's minstrels, George Christy's minstrels and the Bryant Brothers appeared. The Astor Place Opera House (on the present site of the Mercantile Library; 1847–1854) is best known because of the riot at Macready's appearance on the 19th of May 1849, in which many were killed by the police and militia. Tripler Hall (1850–1867) was built for Jenny Lind's début but not completed in time. Here Rachel played in

[1] See T. Allston Brown, *A History of the New York Stage* (3 vols., New York, 1903).

1855, and Patti made her début in 1859. The hall was managed in 1855 by Laura Keene and in 1856–1858 by William E. Burton, and in it in 1864 the three Booths played *Julius Cæsar*, and Edwin Booth played Hamlet for one hundred nights. It was burned in March 1867. In Booth's Theatre (1869–1882; managed and afterwards leased by Edwin Booth), Sarah Bernhardt made her American début (November 1880); and in the Park Theatre (Broadway and 21st Street; 1875–1882) Stuart Robson and William H. Crane first played together. Light opera was first introduced in 1864, opera bouffe in 1867, and Gilbert and Sullivan light opera in 1879; and *The Pirates of Penzance* was produced in New York before it was seen in London. Most of the older theatres still in existence have become houses of vaudeville, melodrama or moving pictures, as, for example, the Academy of Music (14th Street and Irving Place; opened in 1854), until about 1883 the home of the best opera, in which Christine Nilsson, Parepa-Rosa, Sálvini and Emma Nevada made their American débuts. The Broadway (1888) was the scene of Edwin Booth's last performance, as Hamlet, in March 1891. In connexion with the Empire Theatre (1893) is the Empire Dramatic School. The two largest places of amusement are the Madison Square Garden (opened in 1890) and the Hippodrome (Sixth Avenue and 43rd–44th Streets). The principal concert halls are Carnegie Music Hall (1891; built by Andrew Carnegie for the Symphony and Oratorio Societies) and Mendelssohn Hall. The Metropolitan Opera House (1882; burnt 1892; immediately rebuilt) gave in 1884 the first season of German opera in America, under the direction of Leopold Damrosch. The Manhattan Opera House (built in 1903 by Oscar Hammerstein as the Drury Lane) was opened as an opera-house in December 1906. In 1910 grand opera ceased to be given except in the Metropolitan. Grand opera in New York has always been dependent for financial success on season subscriptions, and (like the great museums and the zoological and botanical gardens) has been supported by millionaires. The New Theatre (1909) is practically an endowed house.

Music.—Musical societies were formed in the 18th century, an Apollo Society as early as 1750, a St Cecilia Society, which lasted less than ten years, in 1791, and the Euterpean Society, which lived a half century, in 1799. A New York Choral Society was established in 1823, a Sacred Music Society in the same year and a Philharmonic Society in 1824, succeeded in 1828 by the Musical Fund Society. The present Philharmonic Society, composed of professional players, was organized in 1842 by a New York violinist, Uriah C. Hill (d. 1875). In 1847 was formed the Deutscher Liederkranz, which has given much classical German music; a secession from the Liederkranz in 1854 formed the Arion Society, which has been more modern than the Liederkranz, furnished in 1859 the choruses for Tannhäuser, the first Wagner opera performed in America, and brought from Breslau in 1871 Leopold Damrosch (1832–1885) as its conductor. He founded the Oratorio Society in 1873 and the Symphony Society in 1877, and was succeeded as conductor of each of these societies by his son Walter (b. 1862). Musical instruction in the public schools has been under the supervision of Frank Damrosch (b. 1859), another son of Leopold, who formed in 1892 the People's Singing Classes, picked voices from which form the People's Choral Union.

Art.—Many private collections have been given or lent to the public galleries of the city, in which are held from time to time excellent loan collections. The largest public art gallery is the Metropolitan Museum of Art, for which a committee, including art patrons and members of the National Academy of Design, drew up a plan in 1869, and which was chartered in April 1870. General Luigi Palma di Cesnola (*q.v.*) became its director in 1879 and was succeeded (1905–1910) by Sir Caspar Purdon Clarke, director of the South Kensington Museum, and in 1910 by Edward Robinson (b. 1858). In April 1871 the legislature appropriated $500,000 for a building for the Museum in Central Park: in 1878 the trustees took possession of the building in a tract of 18½ acres in Central Park on Fifth Avenue between 80th and 85th Streets; and in March 1880 this building was opened. Additions were made to the south (1888) and the north (1894). In 1902 the central part of the E. front of a new building was opened, and under an appropriation of $1,250,000 in 1904 the building was again enlarged in 1908. Among the benefactors of the Museum have been: its presidents, John Taylor Johnston (1820–1893), Henry G. Marquand (*q.v.*), who gave it his collection (old masters and English school), and J. Pierpont Morgan, and Miss Catharine Lorillard Wolfe, who gave the Museum $200,000 and her collection of paintings, Jacob S. Rogers (1823–1901) who left the Museum about $5,000,000, Frederick T. Hewitt, who gave more than $1,600,000, and John S. Kennedy (1830–1909), who left it $2,500,000. Besides paintings and statuary the Museum has collections of glass, Egyptian antiques, Babylonian and Assyrian seals and cylinders, tapestries, ancient gems, porcelain and pottery, armour, musical instruments, laces and architectural casts. The New York Historical Society since 1858 has had the collection of the New York Gallery of the Fine Arts; in its art gallery are several examples of Van Dyck and Velazquez, the best collection in the United States (except the Jarves collection at Yale) of the primitives and the early Renaissance of Italy and the Low Countries, and a good American collection, rich in portraits and in the work of Thomas Cole. There is a small collection of paintings with some statuary in the Lenox Library and there are many private collections of note. The National Academy of Design (organized in 1826; incorporated in 1828) has an art library, and students' classes. The Society of American Artists (1877) was a secession from the Academy which it rejoined in 1906. This Society with the Art Students' League (1875), and the Architectural League of New York (1881) formed in 1889 the American Fine Arts Society. In its building on W. 57th Street there are good galleries, it is the headquarters of the American Water Color Society (1866), the New York Water Color Club, the National Sculpture Society (1893), the National Society of Mural Painters and the New York Chapter of the American Institute of Architects; and the exhibitions of the National Academy of Design and of the Society of American Artists are held here. The National Arts Club and the Municipal Art Society (1893) have club houses in Gramercy Park. The Decorative Art Association (1878) has classes and sales-rooms for women artists. There are art classes at Cooper Union (*q.v.*). Columbia University has a School of Architecture (1881).

Municipal Art, Monuments, Statuary, &c.—The city charter of 1897 established an art commission consisting of the mayor, the president of the Metropolitan Museum of Art, the president of the New York Public Library, the president of the Brooklyn Institute of Arts and Sciences, one painter, one sculptor, one architect and three lay members, the last six to be appointed by the mayor from a list presented by the Fine Arts Federation of New York. Without the approval of this commission no work of art can become the property of the city either by purchase or by gift. Whenever requested by the mayor and board of aldermen it must act in a similar capacity with respect to the design of any municipal building, bridge or other structure, and no municipal structure that is to cost more than one million dollars can be erected until it has approved the design. The City Hall contains a valuable collection of portraits. In front of the Custom House are groups symbolical of the continents by D. C. French. The Hall of Records has historic and allegorical statues by Philip Martiny, H. K. Bush-Brown and Albert Weinert. In the Criminal Courts Building are mural decorations by Edward Simmons. The statuary of the Appellate Court House is by T. S. Clarke, K. F. T. Bitter, M. M. Schwartzott, D. C. French, F. W. Ruckstuhl, C. H. Niehaus and others; and it has excellent mural paintings by E. H. Blashfield, Kenyon Cox, C. Y. Turner, H. S. Mowbray and others. Of the city's great monuments the greatest is the tomb (1897; designed by John H. Duncan) of General U. S. Grant (*q.v.*); this mausoleum is in Riverside Park, commanding the North river, at 122nd Street. In the same park at 90th Street is the Soldiers' and Sailors' Monument (1900; C. W. Stoughton, A. A. Stoughton and P. E. Duboy), a memorial to those who fought in the Union army during the Civil War; it has marble and granite stairways leading up to a pedestal on which are twelve fluted Corinthian pillars arranged in a circle and covered with a white marble canopy. On Bedloe's Island in the harbour is the colossal bronze "Liberty Enlightening the World" (F. Bartholdi; dedicated 1886; presented to the people of the United States by the people of France), which is 151 ft. 5 in. from its base to the top of the torch held in the uplifted hand of the female figure. On the N. side of Washington Square at the foot of Fifth Avenue is the granite Washington Arch (1889; by Stanford White) commemorating the hundredth anniversary of the inauguration in New York City of George Washington as first president of the United States. Among other public statues and monuments are: Augustus St Gaudens's W. T. Sherman (1903), an equestrian statue in gilt bronze on a polished granite pedestal in Fifth Avenue at the S.E. entrance to Central Park, his D. G. Farragut (1880; with a granite exedra for pedestal, designed by Stanford White) in Madison Square, and his Peter Cooper (1894), a seated figure on a marble pedestal and beneath a marble canopy (designed by Stanford White) immediately below Cooper Union on the Bowery; F. W. MacMonnies's Nathan Hale (1893) in City Hall Park; J. Q. A. Ward's William Shakespeare (1870), Seventh Regiment Memorial (1873), "Indian Hunter" (1868), and "Pilgrim" (1885) in Central Park, his George Washington (1882) on the steps of the sub-treasury, his Greeley in front of the *Tribune* building, and his William Earl Dodge (1885) at Broadway and 34th Street; E. Plassmann's Benjamin Franklin (1872) in Printing House Square; Alexander Doyle's Horace Greeley (1890) in Greeley Square; K. F. T. Bitter's Franz Sigel (1907) in Riverside Park at 106th Street, D. C. French's Memorial to R. M. Hunt (1900), a bust with a semicircular granite entablature at Fifth Avenue and 70th Street; and a Columbus Memorial (1894; by Gaetano Russo; erected by the Italian residents), a tall shaft with a statue of Columbus, at 59th Street and Seventh Avenue. There are many other statues in the city, especially in Brooklyn (*q.v.*) and in Central Park. In Central Park on a knoll S.W. of the Metropolitan Museum stands the Egyptian obelisk, of rose-red Syene granite, the companion of that on the Thames embankment, London, and like it popularly called "Cleopatra's Needle," but actually erected by Thothmes III.; it was presented to the city by Ismail Pasha, Khedive of Egypt, in 1877, was brought to New York at the expense of W. H. Vanderbilt in 1880, and was erected in the park in 1881.

Scientific Collections and Learned Societies.—The New York Aquarium in Battery Park has excellent exhibits of marine life; since 1902 it has been under the direction of the New York Zoological Society (organized 1895), a private corporation which has relations with the Park Department and the city like those of the corporations in control of the Botanical Gardens, the Natural History Museum

and the Metropolitan Museum of Art. Its Zoological Park (opened 1899) forms the southern part of Bronx Park, in which the animals (5528 individuals, 1146 species—246 mammals, 644 birds and 256 reptiles in 1910) are almost perfectly housed—in large houses, flying cages, pools, dens and ranges. The Botanical Gardens (incorporated in 1891 and 1894), occupying the N. part of Bronx Park, contains two large conservatories (the largest in America), the largest botanical museum in the world (1900), with lecture hall and museum of fossil botany in the basement, a collection of economic plants on the main floor, and a library, herbarium, laboratories, type exhibits of vegetation on the upper floors, and a natural hemlock grove and bog garden, pinetum, herbaceous grounds, flower garden, fruticetum and deciduous arboretum. The American Museum of Natural History was incorporated in 1869, and is governed by a board of trustees. On the ground floor of its building (77th–81st Streets; Eighth–Ninth Avenues) are a lecture hall, meteorites, the Jesup collections of the woods of North America and of building stones, and anthropological and ethnological collections, particularly rich in specimens from the North Pacific region, collected by an expedition sent out by Morris K. Jesup (*q.v.*). On the main floor are the mammals, insects and butterflies; on the second floor the palaeontological collections, the Cope collection of fossils and (presented by J. P. Morgan) the Bement collection of minerals and the Tiffany collection of gems; and on the top floor are a collection of shells and the library, including that of the New York Academy of Sciences, which was founded in 1817 and incorporated in 1818 as the Lyceum of Natural History, received its present name in 1876, and publishes *Annals* (1824 sqq.) and *Transactions* (1881 sqq.). Other learned societies are: the New York Historical Society (founded in 1804 and incorporated in 1809), which has a library rich in Americana, the Lenox collection of Assyrian marbles, and the Abbott collection of Egyptian antiquities; the American Geographical Society (founded in 1852; incorporated in 1854), which issues a *Bulletin* (1859 sqq.); the American Numismatic Society (1858), with an excellent numismatic library and collection; the American Society of Civil Engineers (1852; with a club house and library); the American Society of Mechanical Engineers (1880), which occupies with the American Institute of Electrical Engineers and the American Institute of Mining Engineers (1871) a building given by Andrew Carnegie; and the New York Academy of Medicine (1847), with a technical library.

Literature.—In literature[1] New York's position in America is largely due to the city's being the home of the principal publishing houses and, as the American metropolis, the home of many authors. Charles Brockden Brown, the first American professional "man-of-letters," although a Philadelphian by birth, was connected with New York City throughout his literary career; after him came the brilliant Knickerbocker school, including Irving, Cooper, Bryant, James Rodman Drake, Fitz Greene Halleck, Charles Fenno Hoffman (who in 1833 established the *Knickerbocker Magazine*), N. P. Willis, Edgar Allan Poe, J. K. Paulding, George P. Morris and Gulian C. Verplanck. In this early period New York literature centred largely about the *Knickerbocker* and the *Mirror*; and in the later period the monthlies *Harper's* (1850), the *Century* (founded in 1870 as *Scribner's*; present name 1881), and *Scribner's* (1887) were great literary influences under the editorship of such men as George William Curtis, Josiah Gilbert Holland, William Dean Howells, Henry Mills Alden (b. 1836) and Richard Watson Gilder. Richard Henry Stoddard, Richard Grant White, Bayard Taylor, Edmund Clarence Stedman, H. C. Bunner and John Bigelow are other literary names connected with New York City and with its periodical press. The success of the older magazines has brought into the field lower-priced monthlies. The oldest religious weekly still published is the *New York Observer* (1823; Presbyterian); its great editors were Samuel Irenaeus Prime from 1840 to 1885 and afterwards his son-in-law Charles Augustus Stoddard. Others are the *Churchman* (1844; Protestant Episcopal), the *Christian Advocate* (1826; Methodist Episcopal), the *Examiner* (1823; Baptist), the *Christian Herald* (1878) famous for its various charities under the control (1892–1910) of Dr Louis Klopsch (1852–1910), the *Outlook* (founded in 1870 as the *Christian Union* by Henry Ward Beecher and carried on as a household magazine by Lyman Abbott), and the *Independent* (1846) after 1870 edited by William Hayes Ward.

The city's cosmopolitan character is suggested by the great number of its newspapers published in other languages than English: in 1905 of all the periodical publications in New York City almost one-seventh (127 out of 893) were printed in languages other than English, 20 languages or dialects being represented. German, Yiddish and Italian newspapers have large circulations, and there are Bohemian, Greek, French, Croatian, Hungarian and Slavonic dailies. To a degree the New York press is metropolitan, also; but the American press is not dominated by the newspapers of New York as the English press is by that of London (see NEWSPAPERS: *United States*).

Education.[2]—The Dutch West India Company was bound by its charter to provide schoolmasters. Its first schoolmaster emigrated in 1633 and his school still exists in the Collegiate School, the property of the Collegiate (Dutch) Reformed Church. Down to the middle of the 17th century the support and control of the schools remained with the Dutch Church. Later the desire of the English to hasten the substitution of the English for the Dutch language in the colony led to an unsuccessful attempt by the colonial government to reserve to itself the appointment of the schoolmasters. An English public school was established in 1705 under an Act of 1702, and in 1710 was first opened in connexion with the Anglican Church. It still exists as the Trinity School. In 1754 King's College, now Columbia University (*q.v.*), was established; the Dutch Reformed Church made a vain effort to secure control of it, but it became Anglican in its sympathies and its teachers were mostly Loyalists. Before the War of Independence the English language had practically carried the day, and taken possession of the schools and churches.

In 1787 the Manumission Society established a free school for negroes, which was incorporated in 1794. A Quaker society (1798), the "Association of Female Friends for the Relief of the Poor," opened a school in 1801, which soon became a school for white girls only; until 1824 it shared in the school fund and it carried on an infant school only from 1824 to 1846. An association known in 1805–1808 as the Society for Establishing a Free School in the City of New York (afterwards the "Free School Society," and after 1826 the "Public School Society") opened its first school in May 1806; got an appropriation from the state legislature in 1807; in 1819 brought from England a Lancasterian teacher—for the sake of economy the society's schools had always been conducted under the Lancasterian system with student "monitors" or assistant teachers; until 1826 was largely under the control of the Friends, giving religious instruction; and was supported in part by voluntary contributions, in part by subscriptions from those who desired to share in its management, and in a small degree after 1815 by a contribution from the school fund of the state. For fifty years it did virtually all that was done for popular education in New York City, and for nearly thirty years caused the exemption of the city from the operation of the common-school system of the state; and about 600,000 children passed through its schools.

The Roman Catholic parochial schools opposed the Protestant character of the text-books used in these public schools, and in 1840, followed by Hebrew and Presbyterian schools, attempted in vain to secure a part of the common-school fund. In 1842, as a result of this controversy, the city was brought under the general state system, but the Public School Society retained control of its own schools. The Board of Education opened its first schools in 1843. The right of the Public School Society to put up new buildings was definitely withdrawn in 1848; and in 1853 the Society was voluntarily dissolved, and its seventeen schools and property (valued at $454,422) were handed over to the city authorities; from its trustees fifteen commissioners were appointed to hold office through 1854, and in each ward where there had been a school of the Society three trustees were chosen. After 1856 the control of the schools was entirely in the hands of the Board of Education. A compulsory education law came into effect in 1875. Since 1874 the Board has controlled a Nautical School, a training ship being lent to the city by the Federal Navy Department. The separate schools for negroes were abolished in 1884; free lecture courses were established in 1888; in 1893 seven kindergarten classes were established, and after 1896 a supervisor of kindergartens was appointed by the Board; and in 1894 a teachers' retirement fund was established, the first in any American city.

In Brooklyn also the early Dutch schools were under the clergy. In 1815 the schools first received a part of the state common-school fund. There were separate district schools until 1843 when a Board of Education was organized.

By the consolidation of 1898 the Boroughs of Manhattan and the Bronx became a unit for school purposes, the former city Board of Education becoming the School Board for these two boroughs; the former Brooklyn Board remained in control in that borough; and there was a Central Board of Education for the entire city consisting of eleven delegates from the Manhattan and Bronx Board, six delegates from the Brooklyn Board, and one each (the president) from the Richmond Board and the Queens Board. The revised charter of 1901 abolished the borough school boards and established a single board with 46 members (22 from Manhattan, 14 from Brooklyn, 4 from the Bronx, 4 from Queens and 2 from Richmond), and 46 local school boards (distributed as above) of seven members each, who took the place of the former inspectors in Manhattan and the Bronx. In the City Board there is an executive committee of 15 members. The borough superintendents were done away with in 1901; the powers of the city superintendent were increased, and a board of superintendents (the city superintendent and eight associate superintendents) was created. A board of examiners, nominated by the city superintendent and appointed by the Board of Education, supervises examinations taken by candidates for teaching positions, appointments to which are governed by rigid civil service rules. The development of public high schools has been rapid since the consolidation. In 1909–1910 trade schools and schools for the anaemic were established. There is an excellent system of evening and vacation schools.

A Free Academy founded in 1848 for advanced pupils who had left the common schools was empowered to grant degrees in 1854,

[1] See Charles Hemstreet, *Literary New York, Its Landmarks and Associations* (New York, 1903).

[2] See A. Emerson Palmer, *The New York Public School* (New York, 1905).

and in 1866 became the College of the City of New York, with the Board of Education as its Board of Trustees. In 1900 a separate Board of Trustees (nine members appointed by the mayor) was created. Before 1882 no one was eligible for entrance unless he had attended the city's public schools for one year. In 1907 the College removed to new buildings on St Nicholas Heights between 138th and 140th Streets, the old buildings at Lexington Avenue and 23rd Street being used for some of the lower classes of the seven years' course. The retention of the secondary school in connexion with college, although there are now well-equipped public high schools, is one of the anomalies of the New York educational system. In 1871 a Normal School for Girls, since 1910 the Woman's College of the City of New York, was established as a part of the public system. Since 1888 public lectures for adults have been given under the auspices of the Board of Education, usually in school-houses; and in 1899 the Board opened evening recreation centres in school-houses, in which literary, debating and athletic clubs meet. For the charitable schools see § *Charities*.

The oldest institution of higher education is Columbia University (*q.v.*). New York University was chartered in 1831 as the University of the City of New York, and in 1896 received its present name. The University Council is the corporation; it consists of 32 members, eight going out of office annually. The University Senate has immediate control; it is composed of the chancellor,[1] two professors of the University College, and the dean and a professor from each of the following schools—law, medicine, pedagogy, graduate and applied science. The work of the collegiate department was begun in 1832; a university building at Washington Square was erected in 1832–1835; a law school, on a plan submitted by B. F. Butler of New York, was established in 1835, a medical school in 1841, the School of Applied Science in 1862, a graduate school in 1886, a school of pedagogy in 1890, a veterinary college (formed by the union of two previously existing schools) in 1899, and a School of Commerce, Accounts and Finance in 1900. In 1894 the College of Arts and Pure Science and the School of Applied Science were removed to a commanding and beautiful site on Washington Heights (about E. 181st Street) above the Harlem river, the schools of law and pedagogy remaining at Washington Square where a Collegiate Division was opened in 1903; in 1895 the Metropolis Law School was consolidated with the University; in 1898 the Bellevue Hospital Medical College became a part of the University school of medicine. On the Washington Heights Campus the principal buildings are the library (1900), around a part of which extends an open colonnade, 500 ft. long, which is known as the Hall of Fame for Great Americans, and in which the names of great Americans (chosen at intervals by the ballots of 100 prominent educators, historians, &c.) are inscribed on memorial tablets; and Gould Hall, a dormitory, which like the library and the Hall of Fame was the gift of Miss Helen Miller Gould. In 1909–1910 the University library contained about 65,000 vols. and the law library 22,000, and there were 254 instructors and 4036 students (966 in the School of Commerce and 739 in the Law School).

For Fordham University see FORDHAM. Other Roman Catholic colleges are: the College of St Francis Xavier (Society of Jesus; opened 1847; chartered 1861); and Manhattan College (Brothers of the Christian Schools; opened 1853; chartered 1863) at Broadway and 131st Street, in the district formerly known as Manhattanville.

Among the technical and professional schools, excluding those of Columbia University and New York University, are: the General Theological Seminary of the Protestant Episcopal Church (opened 1819; in 1820–1822 in New Haven; then re-established in New York City), beautifully situated in "Chelsea Village" on a block (Ninth-Tenth Avenues and 20th-21st Streets) given for the purpose by Clement Clarke Moore (1779–1863)[2] in buildings largely the gift of Eugene Augustus Hoffman (1829–1902), dean of the Seminary in 1879–1902, and of his family, who put it on a sound financial basis; the Union Theological Seminary (1836; Presbyterian), which is representative of the most liberal tendencies in American Presbyterianism (*q.v.*), especially in regard to text-criticism; the Jewish Theological Seminary of America (1886), chiefly supported by the synagogues of New York, Philadelphia and Baltimore; the College of Physicians and Surgeons in the City of New York (1892; see COLUMBIA UNIVERSITY); the Cornell University Medical College (1897; see CORNELL UNIVERSITY); the Eclectic Medical College (1865); the New York Post-Graduate Medical School and Hospital (1882); the New York Polyclinic Medical School and Hospital (1882); the New York Medical College and Hospital for Women (1863); the New York College of Dentistry (1865); and the College of Dental and Oral Surgery of New York (1892). Among the normal schools are: the Teachers' College of Columbia University (*q.v.*); the School of Pedagogy and the kindergarten training school of New York University; the kindergarten training school of Pratt Institute in Brooklyn (*q.v.*); the Kraus Seminary for Kindergarteners; and the Kindergarten Normal Department of the Ethical Culture School under the Ethical Culture Society. Of the many private secondary schools in New York the oldest are the Collegiate School and Trinity School (see above). The Columbia Grammar School (1764) was originally a preparatory department of Columbia College.

Other educational institutions of a popular character are Cooper Union (*q.v.*) and the People's Institute[3] (incorporated in 1897), which holds its meetings and lectures in the Cooper Union Building. Its most active promoter and long its managing director was Charles Sprague Smith (1853–1910), who was professor of modern languages at Columbia University in 1880–1891, and in 1896 organized the Comparative Literature Society; he was especially assisted by Richard Heber Newton (b. 1840), a Protestant Episcopal clergyman of broad and radical religious and social views, and by Samuel Gompers. The aim was to supply a "continuous and ordered education in social science, history, literature and such other subjects as time and demand shall determine" and "to afford opportunities for the interchange of thought upon topics of general interest . . . to assist in the solution of present problems." The Institute is primarily a free evening school of social science and a forum for the discussion of questions of the day. There are, besides, Sunday evening ethical services, "a people's church," which has attracted much attention, and several "Institute Clubs" of a social nature, some of them for children. The People's Institute organized a censorship of "moving pictures" to which most American manufacturers of these films voluntarily submit. Cheap concerts are given in Cooper Union by the People's Symphony Concert Association in conjunction with the People's Institute.

For the Brooklyn Institute see BROOKLYN. The Young Men's and Young Women's Christian Associations have classes, especially for working people.

Libraries.—"The New York Public Library, Astor, Lenox and Tilden Foundations," was the result of the consolidation in May 1895 of the Astor Library (founded by the bequest of $400,000 by John Jacob Astor; incorporated in 1849; opened in 1854; further endowed by William B. Astor, who gave it about $550,000 and by John Jacob Astor, the younger, who gave it about $800,000 and built the hall in Lafayette Street in which the library, for general reference, was housed until 1911), the Lenox Library (originally the private collection, particularly rich in incunabula, Americana, genealogy and music, of James Lenox (1800–1880), a bibliophile and art amateur, given by him to the city in 1870 and until 1911 housed as a special reference library, in a building designed by R. M. Hunt, on Fifth Avenue, between 70th and 71st streets), and the Tilden Trust (to which Samuel J. Tilden left his private library and about $4,000,000 (most of his estate) for the establishment of a public library, but which, owing to a contest by the heirs, was unable to secure the entire bequest and received only about $2,000,000 from one of the heirs). In 1902–1911 a new building was erected to house these collections. With the Public Library the New York Free Circulating Library (incorporated in 1880; re-incorporated in 1884) was consolidated in 1901; and in the next two years several other free libraries, including one for the blind. In 1901 Andrew Carnegie gave more than $5,000,000 for about 65 branch libraries, the city to furnish sites for them and maintain them. The largest and best equipped of the college libraries is that of Columbia University. The library of Cooper Union has a complete set of patent office reports and files of newspapers. The Mercantile Library (1820; established by an association of merchants' clerks) is a subscription library at Astor Place; the New York Society Library[4] (on University Place) is a subscription library, the oldest in the city, being the outgrowth of a reading room established in the City Hall in 1700 by the earl of Bellomont; it was incorporated in 1754 as the City Library and in 1772 under its present name. The General Society of Mechanics and Tradesmen (founded in 1785) since 1820 has had a circulating library; which with the DeMilt (reference) and the Slade (architectural collections), contains about 99,000 volumes.

Charities.—The city has a commissioner and two deputy commissioners of public charities, but this municipal department works largely through private organizations, the municipal appropriations to which exceed the amount actually expended through institutions controlled by the city.[5] Municipal institutions include: Bellevue Hospital (opened 1816), which in 1869 established the first hospital ambulance service in the world, near which there is an Emergency Hospital (1878) for maternity cases, and in connexion with which

[1] The chancellors have been: in 1831–1839 James H. Mathews (d. 1870); in 1839–1850, Theodore Frelinghuysen (d. 1862); in 1852–1870, Isaac Ferris (1798–1873); in 1870–1880, Howard Crosby; in 1881–1891, John Hall; and in 1891–1910, Henry Mitchell MacCracken (b. 1840). Dr Ferris was a minister of the (Dutch) Reformed Church and the three chancellors since his time have been Presbyterian clergymen; but the University is not sectarian.

[2] C. C. Moore (1779–1863), son of Benjamin Moore (1748–1816), who was Protestant Episcopal bishop of New York and president of Columbia College in 1801–1811, was professor of Biblical learning in the Seminary in 1821–1850, compiled a *Hebrew and English Lexicon* (1809) and wrote some poetry including the popular juvenile verses beginning "'Twas the night before Christmas."

[4] See A. B. Keep, *History of the New York Society Library* (New York, 1909).

[5] See H. R. Hurd (ed.) *New York Charities Directory* (19th ed., 1910), published annually by the Charity Organization Society: and W. H. Tolman and Charles Hemstreet, *The Better New York* (1904), published by the American Institute of Social Service.

are the Gouverneur Reception Hospital (1885), the Harlem Reception Hospital and Dispensary (1887); and the Fordham Reception Hospital and Dispensary (1892); the City Hospital (1853) and the Metropolitan Hospital (1875), both on Blackwell's Island; for contagious diseases Willard Parker Hospital (1866) and Riverside Hospital (1885; on North Brother Island in the East river); and for the sick, crippled and idiotic destitute children, the New York City Children's Hospitals and Schools (1837; on Randall's Island). The Manhattan State Hospital on Ward's Island (1871; now used for patients from New York and Richmond counties only) Central Islip State Hospital, on Long Island, in Suffolk county (for Queens county and outside of New York City, Suffolk county) and the Long Island State Hospital (for the county of Kings) are the state insane asylums for the population of New York City.

The Charity Organization Society (organized and incorporated in 1882) investigates claims for charities and secures employment for applicants, has a bureau of information and a sociological library, has done much effective work through its Tenement House Committee and its Committee on Prevention of Tuberculosis, has a school of philanthropy begun as a summer school in 1898 but with a two-year course since 1904, and publishes a weekly journal, the *Survey*. In the United Charities Building (1891–1893; in E. 22nd Street), a gift of John S. Kennedy, there is housed, besides the Charity Organization Society, the Children's Aid Society (1853), which was founded by Charles Loring Brace (1826–1890), its first secretary, has established industrial schools and lodging houses (the earliest 1854, being a Newsboys' Lodging House in New Chambers Street), vacation schools, kindergartens, evening classes, summer houses at Bath Beach (for crippled girls) and West Coney Island, and a farm school at Kensico, and finds homes for orphans and homeless children. In the same building are the New York City Mission and Tract Society (1822, incorporated in 1867; undenominational), the first American organization to introduce district nursing, whose work is all done below 14th street, and the Association for Improving the Condition of the Poor (1843; incorporated in 1848), which has a department of relief, does fresh-air work at West Coney Island, supports people's baths, and has founded the Hartley House (a memorial to Robert M. Hartley, who established the Association), a neighbourhood settlement. The Society of St Vincent de Paul in the City of New York (organized 1835; chartered 1872) is the local Roman Catholic charitable organization. The United Hebrew Charities was formed in 1874 by the union of four Hebrew societies. The Russell Sage Foundation (1907) has headquarters in New York, but is not merely local in its work; it has a charity organization department, a child helping department, and a school hygiene department. "Institutional work" by the churches is well developed.

Trade and domestic schools include the Hebrew Technical Institute and the Hebrew Technical School for Girls; the New York Trade School; Grace Institute, endowed by W. R. Grace (twice Mayor of New York City) for the instruction of women in trades; the Manhattan Trade School for Girls; the American Female Guardian Society and Home for the Friendless; the Baron de Hirsch Trade Schools, in connexion with which there are day and evening schools for the instruction of immigrants (Russian, Galician and Rumanian) in the English language, and a colony with an agricultural and industrial school at Woodbine, N.J.; the Clara de Hirsch Home and Trade Training School for Working Girls; the New York Cooking School; and the Association of Practical Home Making Centres. The New York Diet Kitchen Association (1873) has established diet kitchens in connexion with many dispensaries. The City and Suburban Home Company (1896) provides good apartments at cheap rentals; the Society for Ethical Culture has promoted the same work; and the Mills Hotels, erected by D. O. Mills (1825–1910), are low-priced but self-supporting lodging houses.

There are many orphanages and day nurseries and there are about thirty permanent homes for adults in the boroughs of Manhattan and the Bronx. The New York Society for the Prevention of Cruelty to Children was incorporated in 1875, and the children's court movement in the city has been connected with this society; in its work and in that of the Society for the Prevention of Cruelty to Animals Henry Bergh (1820–1888) was the American pioneer. The Society for the Reformation of Juvenile Delinquents (1824) maintains a House of Refuge on Randall's Island; and the New York Catholic Protectory (1862), under the Brothers of the Christian Schools and the Sisters of Charity, is of a similar character. An important work has been done by the Society for the Suppression of Vice (1873), and by the Society for the Prevention of Crime, organized in 1877 and re-organized in 1891 by its president Charles Henry Parkhurst (b. 1842), a Presbyterian clergyman.

The New York Institution for the Blind was incorporated in 1831 and originated the New York point system of tangible writing and printing for the blind; the Society for the Relief of the Destitute Blind (1869) and the New York Association for the Blind (1906) are noteworthy. The New York Institute for the Instruction of the Deaf and Dumb (1817), of which Harvey Prindle Peet (1794–1873) was principal in 1831–1867, is a free state school and the first oral school for the deaf in America; the Institution for the Improved Instruction of Deaf Mutes (1867) is a free city school; St Joseph's Institute for the Improved Instruction of Deaf Mutes (Roman Catholic; 1869) has a school for boys and one for girls.

Among special hospitals the foremost are: the New York Eye and Ear Infirmary (1820), the New York Ophthalmic Hospital (1852), the Manhattan Eye and Ear and Throat Hospital (1869), the New York Orthopaedic Dispensary and Hospital (1866), the New York Skin and Cancer Hospital (1882), the General Memorial Hospital for the Treatment of Cancer (1884), the New York Bacteriological Institute (1890; maintaining the New York Pasteur Institute), and the Neurological Institute (1909). Important research is undertaken by the richly endowed Rockefeller Institute for Medical Research. The St John's Guild (1866, non-sectarian) maintains floating hospitals for tuberculosis patients and a sea-side hospital at New Dorp, Staten Island. There is a roof camp for tuberculous patients on the Vanderbilt Clinic (1886), a free dispensary, connected with the College of Physicians and Surgeons.

Many of the general hospitals have already been mentioned in the list of medical schools; others are: the New York Hospital (1771), St Luke's (1850), Mt. Sinai (1852), the Roosevelt (opened 1871), the Presbyterian (opened 1872; undenominational), the J. Hood Wright Memorial (1862; called the Manhattan Dispensary until 1895), the Hahnemann (1875), and the Flower (1890; homoeopathic; surgical).

Population.—New York is by far the largest city in the United States in population, the census of 1910 returning its numbers as 4,766,883, and in the whole world is second to London only. Seven-eighths of the present area was annexed in the decade 1890–1900; and in those years the population increased from 1,515,301 (for an area of which the population in 1900 was 2,050,600) to 3,437,202. In 1905 the population by the state census was 4,000,403; of the separate boroughs: Manhattan, 2,102,928 (in 1900, 1,850,093; in 1890, 1,441,216); Bronx, 271,592 (in 1900, 200,507; in 1890, 88,908); Brooklyn, 1,355,106 (in 1900, 1,166,582; in 1890, 838,547); Queens, 197,838 (in 1900, 152,999; in 1890, 87,050); Richmond, 72,939 (in 1900, 67,021; in 1890, 51,693). In 1900 there was a slight preponderance of females (1,731,497 females; 1,705,705 males); the ratio of native born to foreign born was about as 176 to 100 (2,167,122 native born; 1,270,808 foreign born); less than 1·8% (60,666) were negroes; and less than 0·19% (6321) were Chinese. Of the native population seven-eighths (1,892,719 out of 2,167,122) were natives of New York state. Of the foreign-born population (1,270,080) in 1900, more than one-fourth (322,343) were Germans; more than one-fifth (275,102) were Irish, nearly one-eighth (155,201) were Russians, principally Jews; more than one-ninth (145,433) were Italians; and the next largest numbers were: 71,427 from Austria, 68,836 from England, 31,516 from Hungary, 28,320 from Sweden, 25,230 from Russian Poland,[1] 19,836 from Scotland, 19,399 English Canadians, 15,055 from Bohemia, 11,387 from Norway, 10,499 from Rumania, 8371 from Switzerland and 5621 from Denmark. In 1900 more than two-thirds of the entire population was of foreign parentage, 2,643,057 being the number of all the persons of foreign parentage and 2,339,895 the number of persons having both parents foreign-born; of this latter number 658,912 were German, 595,267 were Irish, 237,875 were Russians, 214,799 were Italians and 103,497 were Austrians—these numbers as compared with the figures just given for the foreign-born furnish a hint as to priority of the Irish and German immigration to that of the Russian Jews, who like the southern Europeans and the Slavs came to New York in comparatively few numbers more than a generation before 1900. There are in New York City more Germans than in any city of Germany, save Berlin, and more Irish than in Dublin. There are many well-defined foreign communities in the city, such as "Little Italy" about Mulberry Street, "Chinatown" on Mott, Pell and Doyers Streets, the Hebrew quarter on the Upper Bowery and east of it, a "German Colony" east of Second Avenue below 14th Street, French quarters south of Washington Square about Bleecker Street and on the west side between 20th and 34th Streets; a Russian quarter near East Broadway, a "Greek Colony" about Sixth Avenue in the 40's, and negro quarters on Thompson Street and on the west side in the 50's; and there are equally well-defined Armenian and Arab quarters. In 1900 35% of the total working population were employed in trade and transportation (in Boston 34%, in Chicago 32%, in Philadelphia 24%) and 37% in manufacturing and mechanical

[1] The immigrants from Russian Poland, from Austria Hungary, from Russia and Rumania are largely Jews, and it is estimated that one-fourth of the inhabitants of Manhattan are Jews.

arts (in Philadelphia 41%; in Chicago 35%; in Boston 32%). In 1661 the population of Manhattan Island was about 1000. In 1700 it was probably about 5000, the Dutch and English being about equally divided, and there being a few French, Swedes and Jews. In 1732 the population was 8624. During the War of Independence the city lost heavily; but the recovery at the close of the war was rapid, and although the population probably fell during the war from 20,000 to 10,000, in 1790 it was 33,131, then first being greater than that of Boston. From 60,515 in 1800 the population increased to 123,706 in 1820; to 312,710 in 1840; to 813,669 in 1860 and to 1,206,299 in 1880. This rapid growth, the large part which immigration plays in the growth, the marked falling-off in the character of the immigrants, and the fact that it is usually the weaker and less enterprising immigrant who stays in New York while the more capable go West—all these circumstances combine to make a serious social problem. The low scale of living of this poorer class operates with the peculiar physical character of the city, especially on the lower East Side, where so many of the more recent immigrants live, to make the question of housing difficult. In Manhattan and the Bronx 66·7% of the population in 1890 and 72·6% in 1900 lived in dwellings in which the minimum number of dwellers was 21; for the whole city in 1900 the percentage was 54·4, the corresponding percentage for Chicago in 1900 was 17·9. For the entire Borough of Manhattan the average density was 149·0 inhabitants per acre; but in the Eighth Assembly District (98 acres; on the lower East Side, bounded S.E. by Henry Street, E. by Clinton Street, N. by Stanton Street, and W. by Chrystie Street), in which more than two-thirds of the population is foreign-born, the density in 1900 was 735·9 per acre, and in 1905 727·9 per acre. In twelve tenement blocks in Manhattan in 1905 the density was over 1000 per acre, the maximum being 1458 per acre in a block bounded by Cherry, Jefferson, Monroe and Rutgers Streets. A Citizens' Association with a "council of hygiene and public health" in 1865 employed sanitary experts to investigate the city's tenements. In 1879 a prize offered for the best plans for tenements was unfortunately awarded to the so-called "dumb bell" tenement, in which the court for air-space gives little air or light, and many of these tenements, which, however, were a great improvement on the older types, were built. In 1902 the further building of "dumb bell" tenements was forbidden and a new Tenement House Commission was appointed. Model apartments have been built: in 1855 by the Workmen's Home Association, organized by the Association for Improving the Condition of the Poor; by the Improved Dwellings Company of Brooklyn and the Improved Dwellings Association of Manhattan (1879); by the City and Suburban Homes Company (1896); and by some individuals. The city is comparatively healthy; for the five years 1901–1905 the average death rate was 18·99 per thousand for the entire city, 20·96 for the Borough of the Bronx, 18·64 for the Borough of Brooklyn, 19·49 for the Borough of Manhattan, 16·12 for the Borough of Queens and 18·98 for the Borough of Richmond.

Communications.—The physical limitations of Manhattan Island and particularly the circumstance that the business area of the city is small and that the movement of passengers is almost entirely in one direction at any one time, have hindered the development of a simple and adequate system of local communications. Between Manhattan and Long Island there were in 1910 four bridges, three of them completed in the decade immediately before 1910, three of them to Brooklyn (*q.v.*) and one to Long Island City; the New York and Brooklyn Bridge (1872–1883), with a Manhattan terminus at Park Row, and the Williamsburg Bridge (1897–1903) from Clinton and Delancey Streets, Manhattan, to South 5th and 6th Streets, Brooklyn, are suspension bridges; for a technical description of them see BRIDGES, vol. iv. pp. 537-538. The Manhattan Bridge (1901–1909) is a wire cable suspension bridge situated between the two just mentioned; its Manhattan terminal is at Canal Street and the Bowery, and its Brooklyn terminal is at Nassau Street. It is the largest of all suspension bridges with a total roadway length of 6855 ft. (Manhattan approach 2067 ft.; Brooklyn approach 1868 ft.; two land spans of 725 ft.; river span 1470 ft.) and a width of 122·5 ft. It has a double deck, the lower for two surface car tracks and a wagon way, and the upper for footways and four elevated railway tracks. The Queensboro Bridge (1901–1909) is a cantilever from Second Avenue, between 59th and 60th Streets, Manhattan, to Long Island City, with sustaining towers on Blackwell's Island. Its total length, including a plaza in Queens 1152 ft. long, is 8601 ft. (Manhattan approach 1052 ft.; Queens approach 2672·5 ft.; west channel span 1182 ft.; island span 630 ft.; east channel span 984 ft.) and its width is 89·5 ft. over all, the roadway being 53 ft. and the two sidewalks each 16 ft. All of these bridges are crossed by electric cars and on the bridges to Brooklyn there run surface cars and elevated trains. In 1909 an average of 4249 trolley cars and 3988 elevated cars crossed the Brooklyn Bridge every week day; for the Williamsburg Bridge the corresponding averages were 4473 trolley cars and 918 elevated train cars. The Harlem river is crossed by about a dozen bridges, including High Bridge, which carries the city aqueduct. The ferries to Brooklyn are less important than in the days when there was only one bridge and no subway connexion between Manhattan and Brooklyn; the opening of the Pennsylvania-Long Island railway tube in 1910 in the same way made the ferry from 34th Street, Manhattan, to Long Island City comparatively unimportant; and the Pennsylvania and the Hudson river subways have to some degree taken the place of ferryboats on the North river for passenger traffic between Manhattan and railways in New Jersey. Between Manhattan and the various islands (to North Brother Island from E. 16th; to Ward's Island from E. 116th; to Randall's Island from E. 125th and E. 120th) of the river and bay including Staten Island the only means of transportation is still by ferryboats; the ferry line to Staten Island is owned and operated by the municipality. In Manhattan the first advance made on the horse car—which was still used to some extent in 1910, especially on streets along the water front—was the elevated railway; on great iron trestles of varying heights the first of these railways was built in 1867–1872 on New Church Street, West Broadway and Ninth Avenue, from the Battery to 59th Street; in 1878 a line was built on Sixth Avenue, branching off on 53rd Street to Ninth Avenue, and on 110th Street to Eighth Avenue and running on Eighth Avenue to the Harlem river (155th Street), a distance of 10¼ m.; soon afterwards the Second and Third Avenue lines were built from the Brooklyn Bridge to the Harlem river, and the line now extends to Fordham (190th Street), a distance of 13 m. In 1902 the motive power of these elevated trains was changed from steam to electricity. In 1886 a cable car line was opened, the cars being operated by a clutch (or "grip") seizing a moving endless cable in a slot beneath the road bed; but in 1898 the "underground trolley" system began to be substituted. Outside Manhattan the overhead trolley is prevalent. In 1900–1904 another era in "rapid transit" in New York was begun: in the latter year was opened the Broadway subway with electric trains from the City Hall, along Broadway (above 42nd Street) to Kingsbridge (230th Street) and by a branch line, turning to the E. from 104th street and running, above 110th Street, on Lenox Avenue to the Harlem river and then through the Bronx to West Farms (180th Street) at the S.E. entrance to Bronx Park. In 1901–1906 the subway was continued to South Ferry and was carried under the East river to the junction of Atlantic and Flatbush Avenues in Brooklyn. The construction company received a fifty years' franchise for the operation of this subway. In 1908–1909 two more underground lines were opened connecting Manhattan with Hoboken (the terminus of the Delaware, Lackawanna & Western) and Jersey City (the terminus of the Erie, the Pennsylvania and the Central of New Jersey railways) by tubes under the North river; one of these extends up Sixth Avenue to 33rd Street, near the new terminal of the Pennsylvania railway, from which by 1910 tubes had been carried immediately E. and under the East river to Long Island and immediately W. to the New Jersey side. The municipality in 1910 contracted for the construction in Manhattan of lines on Broadway and Lexington Avenue and on Canal Street across town and for the continuation in Brooklyn of the subway to Coney Island and Fort Hamilton.

The opening of the Erie Canal made the city the gateway for communication by water from the Atlantic Ocean to the interior of the continent,[1] and when the great railway lines were built westward it became the chief railway terminal on the Atlantic coast. Water communication up the Hudson river and through the canal is still of great importance. The New York Central & Hudson river and West Shore railways follow closely this water route to Buffalo. The Erie, the Lehigh Valley, the Pennsylvania and the Delaware, Lackawanna & Western railways reach Buffalo by routes across New Jersey, Pennsylvania and western New York. The New York, New Haven & Hartford railway affords communication with New England; and the Pennsylvania and the Baltimore & Ohio railways, with the middle western and south-eastern parts of the country. The Central Railroad of New Jersey and the Long Island railway (belonging to the Pennsylvania) are more local. The New York Central & Hudson river and the New York, New Haven & Hartford railways have a terminal in the borough of Manhattan, and the Pennsylvania has a terminal there also, since 1910, with tunnels to Long Island and New

[1] Between 1840 and 1858 the tonnage cleared at New York nearly quadrupled, the increase being from 408,768 to 1,460,998; at the close of the period of the predominance of the canal as a freight carrier, in the decade 1850–1860, New York City had, thanks to the Erie Canal and the canals of Ohio, a monopoly of the trade of the upper Mississippi basin.

Jersey; but the other railways have their terminals on the New Jersey bank of the Hudson and are reached either by ferries or by subways under the river. The New York Central tracks are sunken from the Grand Central Station for about 50 blocks and then run on a trestle (like the "elevated" railways) for the rest of their course in Manhattan. Ten steamboat lines afford communication with the cities and towns on the Hudson. The Old Dominion, the Clyde and the Savannah are among the more important coastwise lines connecting the city with ports on the South Atlantic coast. The Metropolitan line connects it with Boston, and the Portland line with Portland; and there are several lines to ports on Long Island Sound. Among great trans-Atlantic lines which serve the city are the Cunard and the White Star lines to English, French and Mediterranean ports; the North German Lloyd, and the Hamburg-American lines to English, French and German ports; the Compagnie Générale Transatlantique to French ports; and the Holland-American line to the Dutch port of Rotterdam; the docks of some of these lines are on the New Jersey side of the North river, in Hoboken. There are also lines to the West Indies, Central and South America.

Commerce.—The lack of railway lines direct to wharfs and piers in Manhattan is one of the commercial disadvantages of the city. The value of the imports received at the port of New York, which comprises New York Harbor and the Hudson river, increased from $518,796,561 in 1899 to $891,614,678 (or 60·4% of those of the entire country) in 1909; the value of the exports from $476,609,251 in 1899 to $627,782,767 (or 36·3% of those of the entire country) in 1909. The importations of works of art, furs, laces, diamonds, sugar, coffee, spices, cocoa, india-rubber, cigar wrappers, tin, cheese, hemp, hides of cattle and gloves of kid or other leather at New York are especially large as compared with the other ports of the country; and so are the exportations of chemicals and medicines, copper, machinery, illuminating oil and hardware.

The city is the principal centre of the New World for the wholesale grocery and dry-goods businesses. Here are the country's most important "exchanges," including the Stock Exchange (1792), the Produce Exchange (the New York Commercial Association in 1862–1868), the Cotton Exchange (1871) and the Consolidated Stock Exchange (1885); and here are the richest and most powerful banks and trust companies in the New World and the great New York Clearing House. The Chamber of Commerce of the city was first organized and was chartered in 1768, and was reorganized in 1784.

Manufactures.—Many of the manufacturing industries, notably the manufacture of clothing, are favoured by the abundance of immigrant labour. Others, such as the refining of sugar and molasses, derive an advantage from their position with respect to imported raw materials. Still others, *e.g.* the refining of petroleum, derive an advantage from their position with respect to the exportation of the finished products. The growth of manufactures was promoted by the rapid growth in commerce after the opening of the Erie Canal (1825) and by a great stream of immigration, and New York became the foremost manufacturing city in the United States about the middle of the 19th century. The value of its manufactured products increased from $1,084,850,236 in 1890 to $1,371,358,468 in 1900, and the total value of factory products[1] from $1,172,870,261 in 1900 to $1,526,523,006 in 1905 (an increase of 30·2%). Clothing ranked first in value in 1905, and its value ($305,523,795) was greater than the total value of all factory products in any other city in the United States except Chicago and Philadelphia. Printing and publishing, with products valued at $116,877,594, ranked second. In 1905 the highest degree of localization of any industry in the country was in lapidary work, of which 96·5% of the entire output of the country was produced in New York City, more than 60% of the total for the city being produced in Brooklyn. The boroughs of Manhattan and the Bronx produced in that year goods valued at $1,043,251,923, or a little more than two-thirds of that for the entire city; and in this part of the city is made more than 95% of the clothing manufactured in all the city. The Borough of Brooklyn produced nearly three-fourths of the remainder.

Water Supply.—The water supply[2] of the colonial city was derived from wells and from the many fresh-water streams and ponds which have now almost without exception been filled in. A system, drawing water from Collect Pond, was installed in 1774–1776 by Christopher Colles (1738–1821), but this never was in actual operation. In 1799 the Manhattan Company was incorporated ostensibly to supply the city with water, but under an omnibus clause in its charter it devoted itself to the banking business. In 1829 the city built a reservoir on 13th Street. In 1830 De Witt Clinton suggested the Croton river as a source of supply. Between 1837 and 1893 were constructed the first Croton Aqueduct, the Bronx river Conduit and the New Croton Aqueduct (see AQUEDUCT), with maximum discharges respectively of 95,000,000 gals., 28,000,000 gals. and 302,000,000 gals. a day. In 1905 a new Water Supply Commission was created and immediately afterwards work was begun on a new aqueduct[3] to bring water from the Catskills; a great reservoir (the Ashokan) was built more than 85 m. N. of New York, W. of Kingston (on the W. side of the Hudson); thence an aqueduct was constructed which crossed under the Hudson river between Storm King and Bear Mountain to the Kensico storage reservoir at White Plains, to a filtration plant near Scarsdale and to the Hill View distributing reservoir in Yonkers, and from this reservoir to the five boroughs of Greater New York (Queens and Richmond boroughs both being supplied from Brooklyn) by tunnels, the supply for Staten Island only being pumped through pipes. One of the largest of the new reservoirs within the city limits is the Jerome Park. The water supply for the typical New York City "sky-scraper" cannot be forced to the higher storeys of these buildings by the pumps of the municipal service, and such buildings must have each its own installation of engines for this purpose. In 1908 a high pressure water supply system was installed for fire-protection of a part of the city below 23rd Street; induction motors driving multi-stage centrifugal pumps give sufficient power to force the water to a fire in the top of the highest buildings. (See FIRES AND FIRE EXTINCTION.)

Administration.—By the close of the Dutch period the city had become practically self-governing. But in the permanent form of English government that was established by the Dongan charter, granted in 1686 when the English crown was attacking the privileges of municipalities in the mother country, the mayor and sheriff were appointed by the governor and council; the recorder, town clerk and clerk of the market were appointed either by the king or by the governor; and although the aldermen and assistants were elected by the people no ordinances of the common council could remain in force more than three months unless they were confirmed by the governor and council. The Montgomerie charter of 1730 was mainly an enlargement of the Dongan charter. From 1777 to 1821 the mayor was chosen by the state council of appointment, consisting of the governor and four senators; from 1821 to 1834 he was elected by the common council; since 1834 he has been elected by the people. In 1730 the common council was divided into two chambers: the board of aldermen and the board of assistants; and the mayor and recorder were excluded from membership. In 1853 a board of sixty councilmen, in which was vested the sole right to originate acts appropriating money, was substituted for the board of assistants. The latter was restored in 1868, but was abolished in 1873 when the board of estimate and apportionment was created. Until 1849 the common council was an executive as well as a legislative body, and for many years the government was administered chiefly by its committees and by the heads of departments which it created and appointed; and the mayor's veto could be overcome by a bare majority vote of the members elected to each chamber. In 1849 the choice of the heads of departments was given to the people, and in 1853 a two-thirds vote of the members elected to each chamber was required to pass an act over the mayor's veto. In 1857 the state legislature began the appointment of boards and commissions for the performance of various functions, and from this state interference and the popular election of the heads of departments resulted a divided responsibility in the city government. The present state constitution (1894) affords some protection against state interference, and under the Consolidation Act of 1882 and under the present charter of "Greater New York," granted in 1897 and revised in 1901, responsibility centres in the mayor.

The mayor is elected for a term of four years. With the exception of that of finance he appoints the heads of all departments: law, water supply, gas and electricity, fire, street cleaning, bridges, docks and ferries, parks, public charities, tenement house, health, correction, police, education, taxes and assessments. Even in the department of finance he appoints the chamberlain and two commissioners of accounts, who examine the receipts and disbursements in the office of the comptroller and chamberlain and may examine the affairs of such other offices or departments as the mayor may direct. All officers appointed by the mayor may be removed by him, except certain judicial officers, and the members of the board of education.

[1] The census of 1905 was confined to establishments under the factory system; the total for all manufactured products in 1900 (the figure given in the 1900 census) is greater than the value of factory products only (the figure given for 1900 in the 1905 census, so that figures for 1900 and 1905 may be comparable).

[2] See Edward Wegmann, *The Water Supply of the City of New York* (New York, 1896).

[3] See A. D. Flinn, "The World's Greatest Aqueduct" in the *Century Magazine* for September 1909.

The aqueduct commissioners, the trustees of the College of the City of New York, and the trustees of Bellevue and allied hospitals, however, are removable only for cause and after a hearing. The mayor's veto of a franchise passed by the board of aldermen is final; his veto of an ordinance or resolution of the board which involves the expenditure of money, the creation of a debt or the laying of an assessment can be overcome only by a three-fourths vote; and his veto of any other measure of the board can be overcome only by a two-thirds vote. Special city legislation passed by the state legislature is referred to the mayor for his acceptance; if he does not accept it, it may be repassed by both branches of the legislature but must then be marked, when referred to the governor, "passed without the acceptance of the city."

The department of finance is administered under the direction of the comptroller, who, like the mayor, is elected for a term of four years. He prescribes the manner in which the accounts in the other departments shall be kept and rendered, and all such accounts are subject to his inspection. His warrant, drawn on the chamberlain and countersigned by the mayor, is required in making a payment on behalf of the city. He settles claims in favour of or against the city. No real estate can be purchased or leased by the city without his consent. No contract, the expense for the execution of which is not in part covered by assessments on the property benefited, is valid without his signature. Legislation affecting the city's finances is determined mainly by the board of estimate and apportionment consisting of the mayor, comptroller, president of the board of aldermen, with three votes each; the presidents of the boroughs of Manhattan and Brooklyn, with two votes each; and the presidents of the boroughs of Queens, the Bronx and Richmond, with one vote each. Every October this board prepares the budget for the ensuing year. It is required to submit the same to the aldermen for approval, but the aldermen are not permitted to increase an appropriation, to insert any new appropriation or to reduce that for the payment of state taxes, that for the payment of the interest on the city debt or any of those the amounts of which are fixed by law; and in case they reduce others their action is subject to the mayor's veto which they can overcome only by a three-fourths vote.

The city's budget grew from $90,778,972 in 1900 $156,545,148 in 1909; the assessed value of its taxable property, real and personal, from $3,654,122,193 in 1900 to $7,250,500,559 ($5,423,312,599 for Manhattan and the Bronx) in 1909, when the real estate was valued at $6,807,179,704. The net funded debt in December 1909 was $653,270,379, the gross bonded debt being $946,005,728; the floating debt was $60,367,290, and the sinking fund was $232,368,060. Among the large items of the 1909 budget were: $27,470,737 for education; $47,225,078 for redemption and interest of the city debt; $20,235,115 for miscellaneous city and county expenses; $14,160,202 for police; $8,428,596 for borough governments; $8,039,565 for fire protection; $7,418,299 for street cleaning; $6,511,143 for water supply and public lighting; $4,760,651 for charitable institutions; $3,319,065 for parks; $2,512,606 for public charities; and $2,484,859 for health. The state constitution of 1894 fixed the debt limit of all municipalities at 10% of the assessed valuation of their real estate. An amendment of 1899 (in effect 1900) excepted from the debt limit of New York City the previous debt of the counties now wholly included in the city; another amendment adopted in 1905 excepted from this limit debts incurred by the City of New York after the 1st of January 1904 to provide for the supply of water; and an amendment, adopted in 1909, excepted from the debt limit bonds issued after December 31st 1909 for such public improvements owned or to be owned by the city as yield a revenue in excess of what is required to meet the interest and principal of such bonds; also indebtedness incurred prior to January 1st 1910 for rapid transit or dock properties in proportion to the extent to which the revenue meets the interest and the instalments to be paid for the redemption of the bonds, such increase of the debt limit to be used, however, only for rapid transit or dock improvements. The same amendment (1909) also authorizes the city to issue, during any one year, in excess of its former debt limit, bonds to be redeemed out of the tax levy for the ensuing year to the extent of one-tenth of 1% of the assessed value of the real estate of the city subject to taxation.

The board of aldermen, whose power is less than formerly, is composed of a president, elected on the city ticket for a term of four years; the five borough presidents, each elected by his borough for a term of four years; and 73 aldermen, elected by districts for a term of two years. Each head of an administrative department is entitled to a seat in the board but no vote; he is required to attend the board's meeting whenever it requests him to do so and must answer questions relating to his department. The board is required to meet once each month except in August and September. Each administrative department has a single head with the exception of the department of parks, the department of health and the department of education; and each head of a department has full power of appointing and removing subordinates except that a person holding a position in the classified civil service subject to competitive examination can be removed only for cause. The head of the department of parks is a board of three park commissioners: one for the boroughs of Manhattan and Richmond, one for the boroughs of Brooklyn and Queens and one for the Borough of the Bronx; one of the three is designated by the mayor as president of the board. The head of the department of health is also a board of three members; the commissioner of health, who is president of the board, the police commissioner and the health officer of the port. The department of education is described in the paragraph on education. Railway, gas and electric companies doing business within the city are subject to the extensive control of a public service commission of five members who are appointed by the governor of the state (see NEW YORK).

In New York county, which comprises the boroughs of Manhattan and the Bronx, there is no county court, but in its place are a city court and a court of general sessions. The city court is a civil court, having jurisdiction over cases in which the amount involved does not exceed $2000, and is composed of seven justices elected for a term of ten years. The court of general session is a criminal court, having jurisdiction of all crimes including murder, and is composed of the city judge, the recorder and three justices of the sessions, each elected for a term of fourteen years. New York county elects a surrogate for a term of fourteen years, and Kings has two county judges; but in Queens and Richmond the county and surrogate courts are the same as in other counties of the state. In each of twenty-eight districts into which the city is divided a municipal-court justice is elected for a term of ten years and sessions of the municipal court, which has jurisdiction of civil cases in which the amount involved does not exceed $500, are held. For the administration of criminal justice by magistrates (justices of the peace) the boroughs of Manhattan and the Bronx constitute the first division and the other three boroughs constitute the second division. In each division there is a board of magistrates appointed by the mayor for a term of ten years, and the magistrates hold the several courts of their division in rotation according to such rules as they themselves establish. There is also in each division a court of special sessions consisting of six justices appointed by the mayor for a term of ten years; it has jurisdiction in all misdemeanour cases except libel and must be held by three justices. In the first division both the magistrates and the justices of the court of special sessions are required to hold a separate court for hearing charges against children under sixteen years of age.

Each borough has a president with extensive power, and the city is divided into twenty-five local improvement districts, each having a board composed of the president of the borough and the alderman representing the district. The president appoints and removes at pleasure a commissioner of public works, who, subject to his control, directs his administration relating to streets, sewers, public buildings and supplies. The borough president prepares all contracts relating to his borough. In Queens and Richmond he directs the cleaning of the streets. In Manhattan, Brooklyn and the Bronx he is directed by the charter to appoint a superintendent of buildings, who, subject to him and with the aid of inspectors, enforces the ordinances of the aldermen relating to the construction, alteration and removal of buildings; in Queens and Richmond the borough president may appoint such an officer only when authorized to do so by the board of aldermen upon the recommendation of the board of estimate and apportionment. A borough president is chairman of each of the local improvement boards.

History.—The discovery of New York Bay and the Hudson river by Verrazano in 1524 was followed only by occasional visits of trading or exploring vessels until the arrival of Henry Hudson in 1609. Beginning with 1610, Dutch merchants despatched several vessels to engage in the fur trade with the Indians, and in 1614 a ship commander, Adriaen Block, having lost his vessel, built the "Onrust" or "Restless" on the shore of Upper New York Bay. About the same time a few huts were built at the south end of Manhattan Island. When New Netherland had been erected (1623) into a province of the West India Company (see NEW YORK), that body chose the south end of Manhattan Island for a trans-Atlantic shipping station and for the seat of government. In 1626 Peter Minuit, the director-general of the province, bought the entire island from the Indians for goods valued at 60 guilders (about $24) and at what was then its southern extremity began the erection of Fort Amsterdam; and at the close of the year the settlement, New Amsterdam, comprised thirty bark-covered dwellings. For several years it was maintained wholly in the interest of the Company, and to none of the inhabitants, all of whom were its agents or employees, were given any political rights, title to land or right to European trade on his own account. The company divided a large portion of the island into six farms of its own, and when by its Charter of Privileges and Exemption

(1629) it attempted to encourage agriculture in other parts of the province (see NEW YORK STATE) it reserved to itself the whole island. In 1633 New Amsterdam received a grant of "staple right" by which it could compel any vessel passing the port either to offer its cargo for sale or pay a duty; in 1638 the Company extended to all friendly European countries the privilege of trading with the province, and about this time it opened town lots for sale. The town rapidly assumed the cosmopolitan character for which it has ever since been noted, there being, according to a contemporary report, eighteen languages spoken by its 400 or 500 inhabitants in 1643. In 1641, to gain the necessary support to fight the Indians, Kieft had to yield to the demand for a popular voice in the government, and permitted the heads of families to choose a board of Twelve Men to confer with him. In 1643 he permitted the choice of a board of Eight Men, and when he refused its demands it was largely instrumental in effecting his recall. Under his successor, Peter Stuyvesant, a board of Nine Men was chosen, and this body, objecting to the customs duties which he imposed, sent three of its number with a petition to the States-General with the result that in 1653 New Amsterdam was made a city with a government administered by a schout, two burgomasters and five schepens.

Chiefly with a view to protection from roving traders the great burgher-right and the small burgher-right were established in 1657; the great burgher-right being conferred on all who had been magistrates as well as on those then in office, on clergymen, on militia officers and on the male descendants of all such persons; and the small burgher-right being conferred on all native-born citizens, on the husbands of native-born women and on all who had been residents of the city for a year and six weeks. Other persons approved by the magistrates were allowed to buy the great burgher-right for 50 guilders ($20) or the small burgher-right for 20 guilders ($8). Only burghers and employees of the West India Company could engage in commerce, work at a trade or practise a profession, and only great burghers could hold the more important offices. Originally Stuyvesant appointed the city officers, but in 1658 he permitted them to nominate their own successors. Besides engaging in the fur trade, the city was now exporting considerable timber and food-stuffs; in the coast trade it was beginning to reap the advantages of its situation on the coast route through Long Island Sound; and its trade with the Dutch West Indies was of some importance. But the city and the Company were always at odds. The duties exacted by the Company were a heavy burden and yet the Company did not keep the fort in good repair. Stuyvesant's arbitrary rule primarily in the interests of the Company was another grievance, and when in August 1664 there appeared in the harbour an English fleet sent by the duke of York for the conquest of the province, the city was in a defenceless condition. Richard Nicolls, the representative of the duke, easily won over the burgomasters and other prominent citizens; Stuyvesant, practically deserted, was driven to a formal surrender on the 8th of September; and New Amsterdam became New York.

In June 1665 Nicolls reorganized the government, vesting it in a mayor, aldermen and sheriff, to be appointed by the governor of the province for a term of one year; and extended the city's limits to include the whole of Manhattan Island. In 1666 he granted to New Harlem, founded in 1658, a charter which gave to it the status of a town within the city. Nicolls' successor, Governor Francis Lovelace, established a post-route from New York to Boston in 1673. On the 30th of July 1673 the city was surprised and captured by a Dutch fleet under Cornelis Evertsen and Jacob Binckes. The captors renamed the city New Amsterdam and in January 1674 Anthony Colve, the newly appointed governor of the province, re-established the Dutch city government, but under the treaty of Westminster the English again took possession in November. In 1678 Governor Edmund Andros gave the city practically a monopoly within the province of commerce "over seas" and ordered that flour should be inspected nowhere else; two years later he required that all flour for export should be bolted and packed within the city. The duties established by order of the duke of York were still a grievance, and when, in 1681, Governor Andros had sailed for England without renewing the ordinance imposing them, the merchants refused payment and demanded that they should thereafter be imposed by a representative assembly. The duke yielded and the first New York Assembly, called by Governor Thomas Dongan, met in the city on the 17th of October 1683. Less than three years later, on the 20th of April 1686, Dongan gave the city its first real charter, which is a historic instrument in the city government; it was superseded only to a very small extent as late as 1830 (when there was a revision of the charter) and on it as a basis the later charters have been framed.

New York City with its numerous artisans, small traders, sailors and common labourers, such as usually compose the party of discontent, was the centre of the Leisler uprising (see NEW YORK STATE) incited by the English Revolution of 1688, and it was here that Leisler in the spring of 1690 called the first intercolonial assembly to plan an expedition against Canada. During Leisler's rule, too, the freeholders of the city were for the first time permitted to elect their own mayor, a privilege not subsequently granted until 1834. Before the close of the 17th century New York had become a favourite haunt of pirates; leading merchants assisted pirates as well as privateersmen in fitting out their vessels and shared in their plunder or at least welcomed them with their rich cargoes, and public officials, including one or more governors, were also implicated. The home government finally appointed Richard Coote, earl of Bellomont (1636–1701), governor with explicit instructions to suppress the evil. Before he received his commission he and Robert Livingston sent out William Kidd (d. 1701) with a frigate to capture the pirates. Kidd himself turned pirate, but was arrested in Boston in July 1699, was sent to England for trial and was hanged in May 1701. Bellomont met determined opposition among New York officers and merchants; but by the close of his brief administration (1698–1701) he had caught a number of the pirates and broken up the corrupt system by which they had been protected. The importation of negro slaves was begun in 1725 or 1726 and was somewhat encouraged by the States-General. Becoming prized as household servants they so increased in number in the city that during the first half of the 18th century they were not greatly outnumbered by the whites; the whites early began to fear a slave insurrection, and ordinances were passed forbidding negroes to gather on the Sabbath in groups of more than four, or to carry guns, swords or clubs; but one night in April 1712 some slaves met in an orchard near Maiden Lane, set fire to a building and killed nine men besides wounding several others who came to put out the fire. Soldiers then captured all the insurgents except six, who committed suicide, and after trial twenty-one were executed. When early in 1741 nine fires broke out within a few weeks and a negro was seen running from the last, the belief became general that the negroes had formed a plot to burn the town. A reward of £100 was offered for information exposing the plot, and the testimony of an indentured servant-girl, Mary Burton, that her master, mistress, a few other whites and a number of negroes were implicated in such a plot threw the city into a panic. Other confessions were extorted by threats, and on such worthless testimony four whites were executed, fourteen negroes were burned at the stake, twenty were hanged and seventy-one were transported. The frenzy was checked when Mary Burton began to accuse persons of consequence and above suspicion. The *New York Gazette*, the first newspaper of New York, established by William Bradford in 1725, was a semi-official organ. For criticizing the government in the *New York Weekly Journal*, which he established in 1733, John Peter Zenger was charged with libel in 1734, and by securing his acquittal in the following year the popular party established the freedom of the press (see NEW YORK). At the beginning of the Stamp-Act controversy John Holt's *New York Gazette and Weekly Post-Boy*, the successor of Bradford's *Gazette*, was the medium through which the popular leaders stirred the

people to resistance. The Stamp-Act Congress, called at the suggestion of Massachusetts, sat in the city from the 7th to the 28th of October 1765, and on the 31st of October the New York merchants started the non-importation movement which spread to the other colonies. Lieut.-Governor Cadwallader Colden prepared for the enforcement of the Act by strengthening Fort George (a later name for Fort Amsterdam) and increasing its garrison. The ship with the stamps arrived in the evening of the 23rd of October and on the following night threatening notices were posted on the doors of every public office and at the corners of streets. When the day (1st of November) came for the Act to go into effect Governor Colden had retired within the fort. Major James, the commander of the garrison, had threatened to enforce the Act; but the Sons of Liberty gathered a mob, broke into the governor's coach-house, burned his coach and burned him in effigy, destroyed the furniture and other property of Major James and threatened to storm the fort. On the 5th, the governor delivered the stamps to the mayor and aldermen. No serious attempt was subsequently made to enforce the Act, and its repeal (18th of March 1766) was celebrated on the city common with noisy demonstrations and the erection of a liberty pole. The Assembly also made appropriations for the erection of statues of the king and William Pitt. The Sons of Liberty opposed the passage by the Assembly of appropriations for the maintenance of the soldiers, and the latter retaliated by repeatedly cutting down liberty poles erected by the Sons of Liberty. Finally in a skirmish on the 18th of January 1770 the soldiers killed one man and severely wounded several others, and this bloodshed is memorable as the first in the struggle which culminated in the independence of the colonies. The tea shipped to New York for testing the right of parliament to tax the colonies did not arrive until four months after that shipped to Boston had been thrown overboard, but when it did arrive (April 1774) the chests in one vessel were destroyed in the same manner as were those in Boston and the other vessel was forced to carry its cargo back to London. The Port Act for punishing Boston stirred the New York merchants as well as the Sons of Liberty (chiefly mechanics and artisans), and when the latter again threatened violence the merchants resolved to guide the movement, and called a mass meeting and named a committee of correspondence of fifty-one members. This committee, on the 23rd of May 1774, proposed a Continental Congress chiefly with a view to obtaining an effective regulation of non-importation from England; it also named the New York delegates to that body.

During the greater part of the War of Independence the city was occupied by the British. Its capture was a part of the British plan to get control of the Hudson and separate New England from the southern colonies. Early in 1776 the Americans began to throw up fortifications at several points on both banks of the East river in the hope of closing the east water front to the enemy. Other fortifications were erected on Governor's Island and at some points along the west water front to the upper end of Manhattan Island, where an attempt was made to close the passage of the Hudson by building Fort Washington on the New York bank and Fort Lee on the New Jersey bank and connecting them with a line of sunken ships fastened together with chains. To the north of the city proper, also, defences were constructed along the line of the present Grand Street, and to prepare for a retreat from the north end of the island a redoubt, which the British later called Fort George, was built on the prominence overlooking Kingsbridge from the south, and Fort Independence, in what is now Bronx Borough, was built to command the approach from the mainland. After the battle of Long Island, fought within the present limits of Brooklyn Borough, Washington, on the night of the 29th of August 1776, crossed to Manhattan Island. As the city was no longer tenable, some of the generals proposed burning it, but Congress would not give its consent and Washington, although withdrawing the greater part of his army behind fortifications on Harlem (now Washington) Heights, continued to occupy it with about 5000 men under General Israel Putnam until the British general, Sir William Howe, began to show signs of attack. Troops also remained behind the batteries along the east water front, and it was on this occasion that Nathan Hale went on his fatal errand to ascertain Howe's intentions, was discovered within the British lines and was hanged as a spy. On the 15th of September several British ships which had some days before passed the American batteries, as far as Montressor's (now Randall's) Island, entered Kipp's Bay, at the foot of the present 34th Street, routed the militia posted behind the low breastworks there, and after landing narrowly missed cutting off the rear of Putnam's retreating army. One portion of Howe's army took possession of the city and another marched toward Harlem Heights along the east side of what is now Central Park while Putnam's men were marching in nearly parallel columns on the west side of the park. On the 16th, in the battle of Harlem Heights (on what is now Morningside Heights), about 1800 Americans drove a somewhat smaller number of British troops from the field. In October Howe sailed up the East river, and Washington, to avoid being outflanked, retreated to the mainland, leaving only a garrison at Fort Washington. Howe landed at Pell's Point (now within Pelham Bay Park), and on the 28th, a few miles north of the present city limits, was fought the battle of White Plains. Howe then turned westward and southward and on the 16th of November captured Fort Washington. What is now Bronx Borough was within the "Neutral Grounds" which suffered greatly from the foraging parties of both armies. Six days after the British entered the city proper about one-fourth of it was destroyed by fire, and the desolation was extended by another large fire on the 3rd of August 1778. The British crowded their prisoners (who suffered terrible hardships) into several of the churches, the City Hall, the new gaol (later the Hall of Records), King's College, the Livingston sugar house, and a number of ships moored in the harbour. The city was a refuge for Loyalists, but even they were treated with contempt by the British. The homes of Loyalists and Whigs alike were plundered, and when the British finally evacuated (25th of November 1783) they had robbed the city of its wealth and had destroyed its business.

For the first three or four years after the return of peace recovery in some directions was very slow; but only a few months after the British had gone an American merchantman sailed from the port bound for China and opened trade with that country. Trade was speedily resumed with European ports, and by 1788 it was not uncommon to see 100 or more vessels in the port either loading or unloading. On the question of enlarging the powers of the Federal government in 1787–1788, the city strongly supported Alexander Hamilton and John Jay against a determined opposition in other parts of the state, and the ratification of the Federal constitution in the state convention at Poughkeepsie was a triumph for New York City. The city was the Federal capital in 1789–1790 and under its strong Federalist influence the new government of the nation was organized. During the colonial era New York was always the seat of the provincial government and for twenty years it was at times the seat of the state government, but in 1797 Albany was made the permanent capital. In 1807 the success of steam navigation was assured by the trial trip of Robert Fulton's "Clermont" from New York to Albany and return; but the city did not benefit immediately from this invention. On the contrary, the Embargo Act (1807–1809) threatened its commerce with ruin. It revived under the Non-Intercourse Act, but suffered again from the second war with Great Britain. In the first and second years of this war some merchants reaped profits from privateering against the enemy, but in December 1813 the British stopped privateering by a closer blockade of the harbour and in 1814 they threatened to attack the city. In preparing to resist, the city erected or assisted in erecting elaborate fortifications, and Robert Fulton was busy in New York building a steam frigate with cannon-proof sides and heavy guns, but the war closed without a test of the fortifications and before the frigate was ready for action.

In 1817 the Erie Canal was begun and the first line of trans-Atlantic packet-ships was established. The canal, opened in

1825, insured the commercial supremacy of New York among American cities. The years immediately following the close of the second war with Great Britain also mark the beginning of a rapid increase in the number of European immigrants, and this stream of immigration, rising to a flood in the fourth decade and continuing high throughout the century, has been a dominant force in determining the city's social and political conditions. Although the city was a stronghold of the Federalists at the time the National government was organized, the Democrats, owing to the dexterous management of Aaron Burr, were victorious in the elections of 1800 and 1801, and the city has continued to be normally Democratic owing largely to the activities of the Tammany Society or Tammany Hall (*q.v.*). This organization, founded in 1789, early espoused the cause of the unfranchised inhabitants, attended to the wants of the immigrants in various ways, led the movement for universal manhood suffrage and the election of city officers, and, after the office of mayor became elective (1834) and the last property qualifications for city voters were removed (1842), continued strong by reason of the support of the great mass of foreign-born citizens. Fraud and corruption were resorted to by Tammany, and offices were used for the good of the organization rather than for the good of the city. Socially, the immigrants deluged the city with vice, crime, misery and pauperism. The unsanitary conditions had already caused epidemics of yellow fever in 1795, 1798, 1822 and 1823, and the city was visited in 1832, 1834 and 1849 with epidemics of cholera in which several thousand lives were lost. These scourges together with a fire in 1835, which destroyed the East Side below Wall Street, hastened the construction of works for getting a supply of water from the Croton river. The immigrants represented various nationalities and religious sects, and from 1830 to 1871 the city was frequently disturbed by riots arising usually from national or religious antipathy. During the first mayoralty election (1834) there was rioting; and there were an abolitionist riot in the same year, a flour riot during the financial panic of 1837, and labour riots from time to time which were suppressed by the police. In 1857 the state legislature established a state or "metropolitan" police for the better protection of the city. The mayor, Fernando Wood, contending that the act was unconstitutional, resisted with the old municipal police, and another serious riot had begun when the Seventh Regiment of state troops compelled obedience; later, too, the court of appeals decided against the mayor.

Wood was still mayor at the outbreak of the Civil War, and in January 1861 he proposed to the Common Council that Manhattan Island, Long Island and Staten Island should secede and constitute a free city, to be named Tri-Insula. The Council approved. But when, in April, the city had been aroused by the bombardment of Fort Sumter the majority of the Democrats joined with the Republicans in discarding the proposal and in support of the Union. The native-born and loyal citizens joined the Union army in such large numbers that the city was left with inadequate protection from such of its inhabitants as had often constituted the mob. In this state of affairs the drafting of men for the army was begun in July 1863 in conformity with an act of Congress which exempted from its operation all who should make a money payment of $300. The New York proletariat and unscrupulous politicians complained that the measure was peculiarly oppressive to the poor, and the rioting with which it was resisted was protracted and bloody. The rioting began the 13th of July and continued for nearly five days. More than fifty buildings were burned. The mob was especially furious against negroes, a number of whom were hanged or beaten to death. The police fought bravely but were unequal to the emergency, and order was restored only after several regiments had returned to the city and had killed at least 500 of the rioters. In 1871 Irish Catholics threatened to prevent the Orangemen from parading the streets on the anniversary of the Battle of Boyne (12th of July). The superintendent of police also issued an order on the preceding day prohibiting the parade. Public opinion, however, was so strong in favour of the Orangemen that the order was revoked, and five regiments of militia were called out to protect the parade before it started; at the first assault the mob was scattered by a volley which killed 51 persons. The militia suffered a loss of three killed and several wounded.

The character of the population did not improve speedily, for while immigrants were coming in great numbers a large portion of the saving middle class was removing to the suburbs; and although Tammany Hall was discredited during the Civil War, it gained control of the state as well as the city government soon after the war. William M. Tweed, its ruler, organized the "Tweed Ring" which was plundering the city on a gigantic scale, when in 1871 its operations were exposed by the New York *Times*. The thefts of the "Ring" amounted to many millions of dollars, those in the erection of the county court house alone to $8,000,000. Several of the malefactors were sent to prison and Tweed himself died there. Tammany, however, was victorious again in the second election (1874) after Tweed's fall, and in 1884, when rival companies were seeking to obtain a franchise for working a street railway on Broadway, this privilege, so valuable that the city could have sold it for millions of dollars, was given away by the aldermen; and it was afterwards proved that a number of them had shared a cash bribe of $500,000. Some of them were subsequently punished, but Tammany's power was not seriously impaired. In 1874 the city's corporate limits were extended to include about 13,000 acres across the Harlem river; in 1895 there was a further extension in the same county to the southern borders of Yonkers and Mt. Vernon; and in 1898 all of Kings county, all of Richmond county (Staten Island) and a portion of Queens county were consolidated with it. As Tammany's stronghold was in Manhattan, the annexation of these districts diminished the difficulty of holding Tammany in check, or of defeating it at the polls whenever the anti-Tammany forces united as a consequence of a notoriously corrupt administration. In 1894 an investigation of the state Senate brought to light some of the facts respecting an elaborate system of blackmail which had grown up under the joint protection of Tammany Hall and the city government. Under this system large sums were paid for appointments to office and promotions, and money was collected regularly from the keepers of gambling houses, houses of ill-fame and other disorderly resorts, and from liquor sellers for permission to violate certain details of the excise laws, such as midnight and Sunday closing. There followed a great outcry against Tammany and it was driven from power for three years. During the reform administration, Colonel George Edward Waring (1833–1898), as head of the street cleaning department, quite revolutionized New York as respects cleanliness. The police service and the school system were also much improved. Tammany was successful in the election of 1897 when the opposition was divided. It again abused its power and was defeated in 1901. In 1903 and 1905 the Tammany ticket was elected, but the mayor, George Brinton McClellan, administered the government, especially during his second term (1906–1910), independently of Tammany Hall. With the exception of the mayor the Tammany ticket was defeated in 1909, and the mayor, William Jay Gaynor (b. 1851), was little in sympathy with Tammany Hall, having been nominated apparently for the purpose of insuring the election of loyal Tammany men on the county ticket.

BIBLIOGRAPHY.—Special works have been mentioned in the body of the article. Among general descriptive works are Moses King's *Handbook of New York* (Boston, 1895), Rand McNally & Company's *Handy Guide to New York City* (Chicago, 21st ed., 1907), Appleton's *Dictionary of New York* (New York, 1905); and of a more aesthetic quality, John C. van Dyke's *The New New York* (*ib.*, 1909), with illustrations by Joseph Pennell. E. S. Martin edited (*ib.*, 1909) *The Wayfarer in New York*, a book of selections. F. B. Kelley's *Historical Guide to the City of New York* (*ib.*, 1909), compiled under the auspices of the City History Club, is the best summary of old landmarks, places of historical interest, &c. For administration see *The Charter of the City of New York with Amendments* (New York, 1907); F. C. Seckerson, *Manual of Civics: A Text-Book of Municipal Government for the City of New York* (New York, 1908); and G. A. Ingalls, *An Outline of Municipal Government in the City of New York* (Albany, 1904). New York, 1909); J. H. Innes, *New Amsterdam and its People* (New York, 1902); Martha J. Lamb, *History of the City of New York* (2 vols., New York, 1877); *Memorial History of the City of New York* (4 vols., New York, 1892), edited by J. G. Wilson; Theodore Roosevelt, *New York* (New York, 1895) in the "Historic Towns" series; R. R. Wilson, *New York: Old and New; Its Story, Streets and Landmarks* (2 vols., Philadelphia, 1902; new ed., 1909); D. T. Valentine, *History of the City of New York* (New York, 1853); and *Historic New York*, edited by Maud W. Goodwin *et al.* (2 vols., New York, 1899).

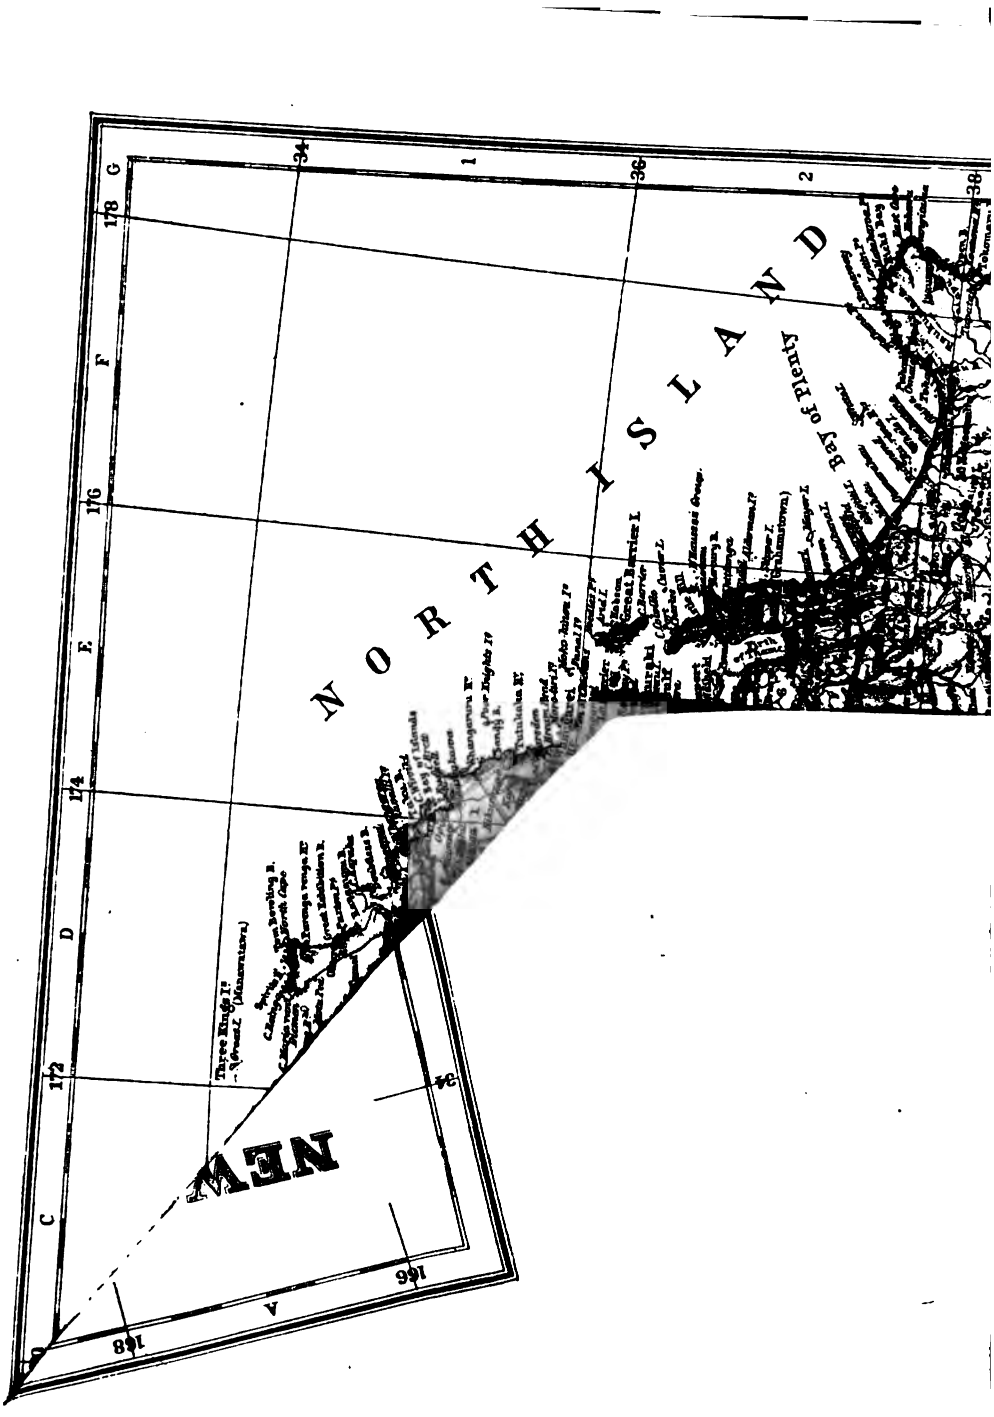
NEW ZEALAND, a British colonial Dominion (so named in 1907), consisting mainly of a group of islands lying in the south Pacific between 34° 25′ and 47° 17′ S., and between 166° 26′ and 178° 36′ E. The group is situated eastward of Tasmania and Victoria, and Wellington, its capital and central seaport, is 1204 m. distant from Sydney. Of certain outlying clusters of small islands belonging to the colony, the Chathams (356 m. E. of Cook Strait), Aucklands and Campbell Island are alone of any value. All these are grassy and the Chathams are inhabited by sheep-farming colonists. The Aucklands contain two of the finest harbours in the Pacific. Six hundred miles north of Auckland, the volcanic Kermadecs, covering 8208 acres, are picturesquely clothed with vegetation. In Polynesia a number of inhabited islands were brought under New Zealand control in 1893. Rarotonga and Mangaia, in the Cook group, and Niué or Savage Island are the largest of these; Penrhyn and Suwarrow, though but small coral atolls, contain excellent harbours. Rarotonga is hilly, well watered, and very beautiful. Apart from these little tropical dependencies New Zealand has an area of 104,471 sq. m., of which its two important islands, called North and South, contain 44,468 and 58,525 respectively, while, divided from South Island by Foveaux Strait, Rakiura or Stewart Island, mountainous and forest-clad, contains 621 sq. m. These three form a broken chain, North and South Islands being cut asunder by Cook Strait. a channel varying in width from 16 to 90 m.

North Island is 515 m. long and varies in breadth 1rom 6 to 200 m. It is almost cleft in twain where the Hauraki Gulf penetrates to within 6 m. of Manukau Harbour. From the isthmus thus formed a narrow, very irregular peninsula reaches out northward for some 200 m., moist and semi-tropical, and beautiful rather than uniformly fertile. Rich strips of alluvial soil, however, seam a cold clay-marl, needing intensive cultivation to become highly productive. Buried in this clay-marl are found large deposits of the fossil resin which becomes the kauri gum of commerce; and on the surface extensive forests are still a great though diminishing source of wealth. Though a species of mangrove fringes much of this peninsula, its presence does not denote malaria, from which the islands are entirely free.

South of the isthmus aforesaid, North Island rapidly broadens out. Its central physical feature is the unbroken mountain chains running N.E. from Cook Strait to East Cape on the Bay of Plenty, ranges seldom under 3000 ft., but never attaining 6000 ft. in height. Ikurangi, their highest summit, though a fine mass, does not compare with the isolated volcanic cones which, rising W. of the main mountain system and quite detached from it, are among the most striking sights in the island. Ruapehu (9100 ft.) is intermittently active, and Ngauruboe (7515 ft.) emits vapour and steam incessantly. Egmont (8340 ft.) is quiescent, but its symmetrical form and dense clothing of forest make it the most beautiful of the three. North of the two first-mentioned volcanoes Lake Taupo spreads over 238 sq. m. in the centre of a pumice-covered plateau from 1000 to 2000 ft. above the sea; and round and beyond the great lake the region of the thermal springs covers 5000 sq. m. and stretches from Mount Ruapehu to White Island, an ever-active volcanic cone in the Bay of Plenty. The most uncommon natural feature of the district, the Pink and White Terraces, was blown up in the eruption of Mount Tarawera in 1886, when for great distances the country was buried beneath mud and dust, and a chasm 9 m. long was opened in the earth. Fine lakes and waterfalls, innumerable pools, in temperature from boiling-point to cold, geysers, solfataras, fumaroles and mud volcanoes still attract tourists in large numbers. The healing virtue of many of the springs is widely known. The government maintains a sanatorium at Lake Rotorua, and there are private bathing establishments in other places, notably near Lake Taupo. In South Island there are hot pools and a state sanatorium at Hanmer Plains. Experience shows that the most remarkable cures effected by the hot waters are in cases of gout, rheumatism, diseases of the larynx and in skin disorders. Though, thanks to the overlaying porous pumice, the Taupo plateau is not fertile, it has a good rainfall and is drained by unfailing rivers running through deep terraced ravines. The Waikato and Waihou flow N., the Rangitaiki N.E., and Mokau, Wanganui and Rangitikei W. or S.W. The first named, the longest river in the colony, though obstructed by a bar like all western,—and most eastern,—New Zealand rivers, is navigable for some 70 m. The Mokau and Wanganui run between ferny and forest-clad hills and precipices, often of almost incomparable beauty.

East of the Taupo plateau and south of Opotiki on the Bay of Plenty the steep thickly-timbered ranges held by the Uriwera tribe still show scenery quite unspoiled by white intrusion. On the southern frontier of this mountainous tract Waikaré Moana extends its arms, the deepest and most beautiful of the larger lakes of the island.

From the mouth of the Waikato southward to about 25 m. from Cape Terawhiti on Cook Strait, and for a distance of from 20 to 40 m. inland, the western coast skirts fertile country well fitted for grazing and dairy-farming, to which it is being rapidly turned as the timber and fern are cleared away from its low hills, downs and rich valleys. On the east coast the same fertility is seen with less forest, and, round Hawkes Bay, a hotter and drier summer. In the south centre, the upland plain of the Wairarapa, ending in a large but commonplace lake, has a climate adapted for both grazing and cereals. The butt-end of the island, of poor, rough, wind-beaten hills, is redeemed by the fine harbour of Port Nicholson, which vies with the Waitemata in utility to New Zealand commerce. Broken as is the surface, poor as is the soil of certain tracts, there is but little of the island which will not ultimately be cultivated with profit as pumice and clay-marl yield to labour. Everywhere the settler may count on a sufficient rainfall, and—except on the plateau and the mountain highlands—mild winters and genial summers. The pleasant climate has certain drawbacks; the coastal farmer finds that blights and insect pests thrive in the comparative absence of hard frosts. Fortunately mosquitoes are not a serious plague outside a few marshy localities. To pass Cook Strait and land in the middle province of South Island is to pass from Portugal to Switzerland; a Switzerland, however, with a sea-coast that in the east centre is a dull fringe of monotonous sand dunes or low cliffs. As a rule, nevertheless, the shores of South Island are high and bold enough. They are not too well served with harbours, except along Cook Strait, in Banks Peninsula, and by the grand but commercially useless fjords of the south-west. In the last-named region some fifteen salt-water gulfs penetrate into the very heart of the mountains, winding amid steep, cloud-capped ranges, and tall, richly-clothed cliffs overhanging their calm waters. The dominating features of south New Zealand are not ferny plateaus or volcanic cones, but stern chains of mountains. There the Southern Alps rise range upon range, filling the whole centre, almost or quite touching the western shore, and stretching from end to end of the island. West of the dividing crest they are forest clad; east thereof their stony grimness is but slightly softened by growths of scrub and tussock grass. Nineteen-twentieths of the colonists, however, live east of the dividing range, for to that side settlement was attracted by the open, grassy character of the country. The rivers are many, even on the drier eastern coast. But, as must be expected in an island but 180 m. across at the widest point and yet showing ridges capped with perpetual snows, the rivers, large or small, are mountain torrents, now swollen floods, anon half dry. Almost useless for communication or transport, they can be easily drawn upon for irrigation where, as in the east centre, water-races are useful. The largest river, the Clutha, though but 80 m. long in its course to the south-east coast, discharges a volume of water



NORTH ISLAND
Bay of Plenty
NEW

estimated at nearly 1,100,000 cubic ft. a minute. On the west the only two rivers of importance are the Buller and the Grey, the former justly famous for the grandeur of its gorges. Large and deep lakes fill many of the mountain valleys. Te Anau and Wakatipu (54 m. long) are the chief, though Manapouri is the most romantic. Aorangi (Mt. Cook) is easily first among the mountain peaks. Its height, 12,349 ft., is especially impressive when viewed from the sea off the west coast. On the north-east a double range, the Kaikouras, scarcely fall short of the Southern Alps in height and beauty. Apart from the fjords and lakes the chief beauties of the Alps are glaciers and waterfalls. The Tasman glacier is 18 m. long and has an average width of 1 m. 15 chains; the Murchison glacier is 10 m. in length. To the west of Aorangi glaciers crawl into the forest as low as 400 ft. above sea-level. Among waterfalls the Sutherland is 1904 ft. high, but has less volume than the Bowen and others. The finest mountain gorge, the Otira, is also the chief route from the east to the west coast. It begins on the western side of Arthur's Pass, a gap the floor of which is 3100 ft. above the sea. Generally the open and readily available region of South Island extends from the Kaikouras along the east and south-east coast to the river Waiau in Southland. It has a mean breadth of some 30 m. In compensation the coal and gold, which form the chief mineral wealth, are found in the broken and less practicable west and centre, and these portions also furnish the water-power which may in days to come make the island a manufacturing country. (W. P. R.)

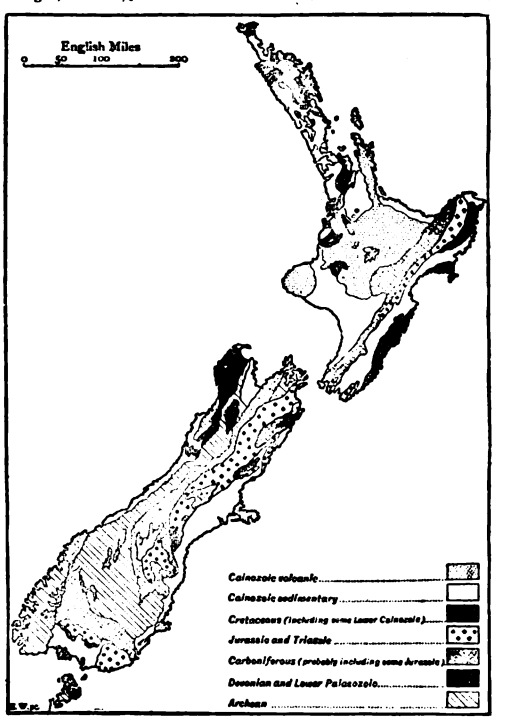
Geology.—New Zealand is part of the Australasian festoon, on the Pacific edge of the Australasian area. Unlike Australia, its geological structure is unusually varied, and owing to its instability, it includes, for its size, an unusually complete series of marine sedimentary rocks. It has, moreover, been a volcanic area of long-continued activity. The physical geography of New Zealand is closely connected with its geological structure, and is dominated by two intersecting lines of mountains and earth movements. The Southern Alps, the backbone of the South Island, rest on a foundation of coarse gneisses and schists, that are quite unrepresented in the North Island. The continuation of this line of old rocks is occupied by the basins of the Wanganui river and Taupo. E. Suess therefore suggested that the northern continuation of the Alps had foundered, and its summits been buried beneath the Pliocene marine rocks of the Wanganui basin and the volcanic rocks of the Taupo area.

The oldest rocks are Archean, represented by the band of gneisses and schists exposed along the western foot of the Southern Alps. To the south of the district in southern Westland, where the Alps have passed out to sea, the Archeans become more extensive; for they spread eastward and underlie the whole of the dissected tableland of Otago. It has been suggested that the jasperoids and diabases of the Tarawera Mountains on the North Island may be of Upper Archean age, from their resemblance to the Heathcotian rocks of Australia. No Cambrian rocks have as yet been discovered, but the Ordovician system is represented by the Aorere beds in the north-western part of the South Island. Here they contain numerous graptolites, including *Tetragraptus*, *Dichograptus* and *Didymograptus*. The Silurian system is represented by the Baton river beds to the west of the Aorere beds, occurring in the basin of the Motueka river, which flows into Tasman Bay. The Devonian system is well exposed in the Reefton mining field. The Carboniferous system includes either the whole or a large part of the Maitai beds. The Maitai beds include a thick mass of slates and sandstones, which form the bulk of the Southern Alps, whence branches extend south-eastward to the coast. The beds take their name from the Maitai river near Nelson; they are largely developed in the mountains of the Tararua-Ruahine-Raukumara chain, on the eastern side of the North Island; they occur in the Kaikoura Mountains, and an outlier forms Mount Torlesse, near the eastern edge of the Southern Alps, west of Christchurch. The Maitai beds have generally been considered to be Carboniferous from the presence of species of *Productus* found in the Permo-Carboniferous of New South Wales. But Professor Park has obtained Jurassic fossils in the Maitai series; so that it will probably be ultimately divided between the Carboniferous and Jurassic. The two systems should, however, be separable by an unconformity, unless the Maitai series also includes representatives of the Kaihiku series (the New Zealand Permian), and of the Wairoa series, which is Triassic.

New Zealand includes representatives of all the three Mesozoic systems. The Hokanui group comprises the Triassic Wairoa and Otapira beds, and the Jurassic Mataura beds. The Wairoa series includes marine limestones characterized by *Monotis salinaria*, and the Otapira series is characterized by *Spiriferina spatulata*. The Mataura beds are largely of estuarine formation; they contain oil shales and gas springs.

The Cretaceous system includes the Waipara series, a belt of chalky limestones with some phosphate beds at Clarendon in eastern Otago. Their fossils include belemnites, ammonites, scaphites and marine saurians, such as *Cimoliosaurus*. These Cretaceous limestones are interbedded with glauconitic greensands, as at Moeraki Point in eastern Otago. The second type of Cretaceous is a terrestrial formation, and is important as it contains the rich coal seams of Greymouth, Westport and Seddonville, which yield a high quality of steam coal. Cretaceous coals have long been worked in the North Island, north of Auckland, on the shores of the Bay of Islands, where the age of the coal is shown by its occurrence under the Whangarei or Waimio limestone.

The Cainozoic system is represented by Oligocene, Miocene, Pliocene and Pleistocene beds. The best-known Oligocene rocks are the limestones of Oamaru and the brown-coal measures of Waikato. The Oamaru limestones have been largely used for building stones; they are a pure white limestone, largely made up of foraminifera, bryozoa and shell fragments, and contain the teeth of sharks (*e.g. Carcharodon*) and of toothed whales such as *Squalodon serratus*. In southern Otago the Oligocene beds are brown coals and lignites with oil shales, which, at Orepuki, contain 47% of oil and gas, with 8% of water. The Miocene Pareora beds occur to



the height of 3000 or 4000 ft. above sea-level, in both the North and South Islands. Some of its fossils also occur in the Oamaru series, but the two series are unconformable. In Westland the Miocene includes the Moutere gravels, which rest on the summit of Mount Greenland, 4000 ft. above sea-level.

Marine beds of the Pliocene are best developed in the Wanganui basin. They consist of fine clays with nodular calcareous concretions rich in fossils. The Pleistocene system in the South Island includes glacial deposits, which prove a great extension of the New Zealand glaciers, especially along the western coast. The glaciers must have reached the sea at Cascade Point in southern Westland. On the eastern side of the Alps the glaciers appear to have been confined to the mountain valleys. The Pleistocene swamp deposits are rich in the bones of the moa and other gigantic extinct birds, which lived on until they were exterminated by the Maori. The Cainozoic volcanic history of New Zealand begins in the Oligocene, when the high volcanic domes of Dunedin and Banks Peninsula were built up. The Dunedin lavas including tephrites and kenytes correspond to the dacite eruptions in the volcanic history of Victoria. The building up of these domes of lavas of intermediate chemical type was followed by the eruption of sheets of andesites and rhyolites in the Thames

Goldfield and the Taupo volcanic district. The volcanic activity of the Taupo district lasted into the Pleistocene, and the last eruptions contributed many of its chief geographical features.[1] (J. W. G.)

Climate.—Diversity of level and latitude cause many varieties of climate in the South Island provinces. The height and regularity of the mountain backbone increase the diversity. Only one pass, the Haast (1716 ft.), crosses from E. to W. at a less height than 3000 ft. Along the whole west coast the climate resembles nothing in the British Islands so much as Cork and Kerry, for there are the same wet gales from a western ocean, the same clouds gathering on the dripping sides of wild mountains, an equal absence of severe frosts and hot sunshine, and a rich and evergreen vegetation. Elsewhere, sheltered Nelson has a more genial air than the Wellington side of Cook Strait. Foveaux Strait is as cold and windy as the Strait of Dover. The Canterbury plain has but 26 ins. of annual rainfall, less than a fourth of that along the western littoral. Very seldom indeed is moisture excessive in the eastern half; there is even a deficiency in unfavourable years, and dry, warm winds do damage to crops. Insect life is relatively not abundant; the air is brisk and bright with ample sunshine. The snow-line, which is at 3000 ft. on the eastern flank of the Alps, is 3700 ft. on the western.

The healthiness of the New Zealand climate in all parts is attested by the death-rate, which, varying (1896–1906) from 9 to 10·50 per 1000, is the lightest in the world. In 1896 it was as low as 9·10. In 1907, however, it was 10·91, the highest figure since the year 1883. Even in the boroughs the average is below 13. The rainfall in most of the settled districts ranges from 30 to 50 ins. a year. Meteorological statistics are collected at Auckland, Wellington, Christchurch, and Dunedin and eight other stations; and observations of rainfall, temperature, and wind-directions are received from eighteen stations of the second class. From the data thus obtained an isobaric map and a report are prepared for each day; and weather warnings are telegraphed to any part of the coast when necessary. A system of inter-colonial weather exchanges has been agreed upon, and telegrams are daily exchanged between Sydney and Wellington.

Flora.—There are about one thousand species of flowering plants, of which about three-fourths are endemic. Most of those not peculiar to the country are Australian; others are South American, European, Antarctic; and some have Polynesian affinities. Ferns and other cryptogamic plants are in great variety and abundance. The New Zealand flora, like the fauna, has been cited in support of the theory of the remote continental period. In appearance the more conspicuous flora differs very greatly from that of Australia, Polynesia, and temperate South America, and helps to give to the scenery a character of its own.

The early colonists found quite half the surface of the archipelago covered with dense, evergreen forest, a luxuriant growth of pines and beeches, tangled and intertwined with palms, ferns of all sizes, wild vines and other parasites, and a rank, bushy, mossed undergrowth. Though much of the timber is of commercial value—notably the kauri, totara, puriri, rimu, matai and kahikatea—this has not saved the forests from wholesale, often reckless, destruction. Two-fifths perhaps have already disappeared, and it is probable that in fifty years the only large tracts still standing will be sub-alpine woods and in state reserves. Meanwhile charred and rotting stumps give a melancholy and untidy air to valleys and denuded hillsides, for hard-wood stumps—and most New Zealand trees are hard-wood—take more than a generation to decay utterly. Compelled by the windy climate the colonists are doing something to repair these ravages by planting European, Californian and Australian shelter-trees; but it is only in the naturally open and grassy regions of the east and south-east that settlement as yet improves the landscape. There, before the colonists came, wide sweeps of dull green bracken or wiry yellow-green tussocks seemed bleak and monotonous enough. The swamps covered with flax and giant bulrushes were often redeemed to the eye by sheets of golden-plumed toé-toé, a kind of pampas grass.

Fauna.—The destruction of the forest is telling fatally on the native avifauna. In their natural state the islands were without land mammals, and the Polynesian immigrants brought but two in their canoes—a dog, now extinct, and a black rat, now rarely seen. Until recent years the forest birds did much to atone for this deficiency, for among them the tui and makomako rank high as songsters, while the apteryxes, kakapo, weka and stitch-bird are of peculiar interest to science. The importation of stoats and weasels, ferrets and cats has resulted in a process of extermination which has already made it necessary to set aside the islets Resolution, Kapiti and Little Barrier as sanctuaries. The place of the vanishing native species is being taken by such European arrivals as sky-larks, finches, blackbirds, sparrows and rooks. Outside the forest country the weka, an almost wingless bird, is numerous, and in the Alps a hawk-like green parrot, the kea, has learned to kill sheep and holds its ground. The pukeko, a handsome rail, abounds in swamps. The native wild ducks are carefully preserved for sportsmen, in whose interests pheasants, red and fallow deer, and brown and rainbow trout have been very successfully acclimatized. Acclimatization, indeed, had played a chief part in the settlement of New Zealand. Coming to a country without useful animals, cereals, rich grasses or fruit trees, the colonists had to bring all these necessaries with them. So far acclimatizers note but few failures; the chief case is that of the salmon. Again and again salmon have been successfully hatched out into rivers, but the young fish hastening down stream to the sea never return thence. This is all the more unfortunate as eels were the only large edible creatures found in the fresh-water lakes and rivers. Tidal waters furnish minute whitebait, and the mud-flats of salt or brackish lagoons and estuaries flounders—both very delicate eating. Oysters, both mud and rock, are good and plentiful. A strange visitor, the frost-fish, never seen at sea, is picked up stranded on sandy beaches in cold weather, and is prized by epicures. The snapper is at once the handsomest and most palatable of a good variety of sea fish. Sharks are found everywhere and are common round the north, though they rarely attack man. The albatross is of course the most conspicuous sea bird. Penguins are found, confined to the islets of the far south. As some compensation for its paucity of useful animals and food plants, New Zealand was, of course, free from wild carnivora, has no snakes, and only one poisonous insect, the katipo, a timid little spider found on certain sea-beaches. Of poisonous plants only the berries of the tutu and the karaka are worth notice. The wild dogs and pigs which now sometimes prey on the sheep-farmers' lambs in outlying districts are the descendants of domestic animals which have escaped into the "bush." Among imported pests the rabbit and sparrow, and a numerous company of European and American thistles and other weeds, have to be systematically contended with. The formidable increase of the rabbit has been arrested, mainly by poison and wire-netting fences.

Population.—In January 1840 there may have been 2000 whites in New Zealand. By 1861 the number was still slightly under 100,000. During the next twenty years the gold discoveries, the public works expenditure, and the development of agriculture, multiplied the number of colonists five times to 498,000 in April 1881. Then increase slackened for many years, and was slowest between 1886 and 1891, when the addition was but 48,000 in five years. In 1901 the whites numbered 773,000; and between that year and the census computation in April 1906 the increase, 115,859, was the largest yet recorded in any quinquennium. In the middle of 1908 the official estimate of white inhabitants was 950,000.

The white population, about nine to the square mile, is very unevenly distributed. In the South Island nine-tenths of the colonists live within 40 m. of the east and south-east coasts; in the North Island the eastern and northern parts of Wellington province, and the southern and broadest part of Auckland province are still very scantily peopled. For all that, Auckland and Wellington are the most populous of the larger districts, while Nelson, Westland and Marlborough have for a long time shown the slowest increase.

Males still exceed females in the proportion of nine to eight. About 70% of the population is New Zealand born. The white foreign element is small; what there is is chiefly Scandinavian, German and Dalmatian. Among the foreigners males greatly outnumber females; even in the case of the German settlers the proportion is two to one.

Between 1880 and 1892 the birth-rate fell by no less than 12·95 points—rather more than 1 a year. It continued to fall for seven years more, though at a much reduced rate, and finally reached 25·12 in the year 1899. In the next eight years there was a slow recovery to 27·30 in 1907. Thanks, however, to the low death-rate, elsewhere referred to the margin of

[1] See the geological map of New Zealand by Sir James Hector (1884). A brief sketch of its geological history is given by Hutton, *Trans: New Zealand Inst.* (1899), xxxii. pp. 159-183. Fullest information about the geology of New Zealand is given in the *Reports of Geological Explorations* issued by the Geological Survey of New Zealand, and the *Annual Reports* of the mines department. A bibliography of the chief literature has been compiled by A. Hamilton, *Trans. New Zealand Inst.* (1903), xxxv. 489-546.

increase in New Zealand is over 17. To that, and to the annual gain by immigration, the fairly rapid rate of increase is due. Between 1885 and 1891 the colony lost more than it gained oversea; but from 1892 to 1908 the gain by immigration was 90,000. Probably, at least half of these represent Australians, impelled to emigrate by years of drought. England and Scotland supply the bulk of the remainder. The government has aided immigrant farmers and farm labourers having a certain sum of money, also female domestics, by paying part of their passage money.

The people of colour in 1906 numbered 53,000, including 2300 Chinese and 6500 Maori half-castes. An apparent increase of 7000 in the Maori and half-castes between 1891 and 1906 is, perhaps, partly due to more accurate computation. It seems probable that the number of Maori and half-castes taken together is about the same as it was thirty years ago, though the infusion of white blood is larger. The Public Health Department has exerted itself to improve the sanitation of native villages and combat the mischievous trickery of Maori wizards and "doctors."

Wealth.—The increase of wealth went on after 1879 in spite of dull times, and was only checked by the especially severe financial depression of 1893 and 1894, caused by low prices and the Australian bank panic. The estimated private wealth of colonists fell from £236 per head in 1890 to £219 in 1895. It was computed in 1905 to have reached £292. After deducting debts owing abroad the public and private wealth of the colony is calculated to be about £270,000,000.

Of the five banks of issue doing business in the dominion three are Australian and New Zealand institutions. Their deposits exceeded £21,000,000 in 1907, as against £12,250,000 in 1890. At the same date more than £10,000,000 stood to the credit of small depositors in post office and private savings banks, nine-tenths in the former. The gross amount insured by policies in life insurance offices (ordinary and industrial) was over £29,000,000, of which the state office claimed two-fifths.

Trade.—The growth of sea-trade in recent years is shown by the larger size of the ocean-going vessels trading with the colony. The number of these only advanced from 589 to 629 between 1896 and 1906. But the increase of tonnage in the eleven years was from 614,000 tons to 1,243,000; while the crews rose from 20,000 to 32,500. The coasting trade and trade with Australia are carried in New Zealand-owned vessels.

External trade has risen from £13,111,000 in 1887 to £37,371,000 in 1907. Before 1886 exports exceeded imports; but in the twenty subsequent years there was an invariable excess of exports, valued in all at £52,000,000.

The re-export trade is stationary and extremely small. Trade with the United States grew from £877,000 in 1891 to £2,140,000 in 1907. Thanks to the tariff of the United States the balance of trade with North America is heavily against New Zealand. The same disparity is shown in her trade with Germany, which is, however, much smaller—less than half a million. Trade with India and Ceylon reached £557,000 in 1906; that with Fiji and other Pacific islands was £622,000 in 1900. With these exceptions New Zealand trade is almost all done with Australia (£5,348,000 in 1907) and the United Kingdom; the latter's share in 1906 was £26,811,000 of the whole.

Production.—Wool (£4,250,000 to £7,657,000 according to prices) remains at the head of the list of exports. The quantity grown increased by 70% in the twenty years 1887–1906. Moreover the export of sheep skins and pelts was valued at £680,000 in the last-mentioned year. But the description changes; there is much less merino, and more of the coarser and longer cross-bred. The number of sheep has increased from 16,564,000 in 1886 to 22,000,000 in 1908, though the increase has been almost all in North Island. The number of the flocks grows, and the average size diminishes even more rapidly. There were 9149 flocks in 1886; in 1906 the number had risen to 18,500—average size of each flock about 1050. The smaller size of the flocks and the breeding of sheep for meat rather than for wool, the cultivation of English grasses and of extensive crops of turnips and other roots on which to fatten sheep and lambs, all tend to change sheep-farming from the mere grazing of huge mobs on wide, unimproved runs held by pastoral licences. The "squatters" still occupy eleven million acres, but even these are more closely subdivided than in former days. How much more extensive is grazing—of the more scientific order—than agriculture, is seen at once from the figures of the amount of land broken up, for crops or other purposes, and the amount under sown grasses. There were about 1,600,000 acres under crop in 1899. This is exclusive of the vast area of native-grass land. The area now occupied and utilized by whites is about 38,000,000 acres.

The character of the soil and the moist cool climate enable English grasses to be sown almost everywhere, and 13,000,000 acres are now laid down with these. The result is seen in the price obtained for New Zealand sheep in Smithfield Market, which is from ½d. to 1d. per lb higher than that given for frozen mutton from other countries. The figures below show the growth of the trade:

Export of Frozen Meat.

Year.	lb.	Year.	lb.
1882	1,707,328	1901	208,045,000
1891	110,199,082	1907	263,738,496

In the market for frozen lambs the colony remains at present without a rival. Frozen beef is also sent to England. In 1907 the export of frozen meat was valued at £3,420,000. The export of butter and cheese has risen in value from £207,687 in 1890, till in 1907 that of butter amounted to £1,615,000. In London, New Zealand cheese fetches as high a price as Canadian; the value of the cheese exported was £662,000 in 1907. Though not yet quite equal in importance to wool or frozen meat, dairy-farming is almost entirely carried on by small farmers and their families, who supply milk to factories. Most of these are co-operative, their shareholders being the farmers themselves. The profits of the industry are thus widely distributed among the producers. The development of dairy-farming has led to the spread of settlement, especially in the west of North Island, where large tracts of fertile soil formerly covered with forest have now been cleared and converted into dairy-farms. Of 1,850,000 cattle in the colony, two-sevenths are dairy cows.

The importance of hemp as an export—increasing from £26,000 in 1898 to £832,000 in 1907—has led to improvements in cleaning and grading it. In consequence its price in London nearly approaches that paid for manila.

Mining.—The export of gold, which was £1,220,000 in 1880, did not exceed that figure until 1898, and, indeed, fell below three-quarters of a million in 1887. Then gold-mining, after being long at a standstill, began again to make headway. For many years the surface alluvial mining in South Island became less and less profitable. As in other countries, however, the working of quartz reefs gradually compensated for this. The cyanide process of gold extraction, and the returns obtained by its means from the great Waihi mine in the Upper Thames, caused an outbreak of gold fever, which led to the opening up of a few good and a great many worthless quartz-mines in the Auckland fields. In South Island the river-beds of Otago province have been successfully worked by means of dredges, and good returns secured. In 1907 the gold exported was valued at £2,027,000. The total value of the gold exported from New Zealand from the discovery of the metal in 1857 to 1907 was, roundly, £70,000,000. Kauri gum still holds its place as an export, over £500,000 worth being dug up annually. The number of Istrians and Dalmatians who came from the Adriatic to dig for kauri gum led to the passing of restrictive laws.

The progressive output of coal from 1880 to 1900 is shown below.

Year.	Raised in the Colony.	Imported.	Exported.[1]
	Tons.	Tons.	Tons.
1880	299,923	123,298	7,021
1890	637,397	110,939	33,404
1900	1,093,990	124,033	36,699
1907	1,831,009		
Four-sevenths of the coal is bituminous.			

[1] Excluding Coal for Fuel by Ocean Steamers.

Excellent as the quality of the best New Zealand coal is, the cost of mining and shipping it prevents the growth of any considerable export trade. Silver is chiefly extracted in the Thames district, but other mines containing silver ores have been found. There are many other valuable ores—copper, iron, lead, zinc, antimony, chrome and manganese. Petroleum springs have been tapped near New Plymouth. Building stones of various kinds and of excellent quality abound. Marble and cement stones occur in many places. There are extensive deposits of iron-sand on the west coast of the North Island, and of iron ore at Parapara in Nelson.

Manufactures.—Protected by a tariff wall which was repeatedly heightened between 1879 and 1907, manufactures made considerable progress. At the end of 1885 about 22,000 work-people were being employed in 1946 workshops, and the aggregate output was valued at six millions and three-quarters. Twenty years later the number of establishments was 4186; the number of hands 56,000; and the output twenty-three millions and a half. A small deduction should be made from this apparent increase to allow for a changed system of classification. Male factory hands greatly outnumbered female, standing in the ratio of four to one. Between 1879 and 1895 wages fell. Between 1895 and 1906 they rose 15% on the average among males of all ages, and as much as 30% among women and girl workers. The disproportionate rise in the case of females is probably due to the policy of the industrial arbitration court. The chief factory industries come under the following heads: meat-freezing and tallow; tanning and wool-scouring; flax mills, saw-mills and grain-mills; boots and shoes; woollen and clothing; butter and

cheese; breweries; printing houses; foundries; agricultural implement and machine shops; soap and candle works; coach-building and furniture; gas-works. Except in meat-freezing, wool-scouring, butter- and cheese-making, flax-milling and timber-sawing, manufacturing is almost entirely for consumption within the colony.

Government.—New Zealand was not colonized in the ordinary manner around one centre. There were in its early years six distinct settlements—Auckland, Wellington, Nelson, New Plymouth, Canterbury and Otago—between which communication was for several years irregular and infrequent. To meet their political wants the Constitution Act of 1852 created them into provinces, with elective councils and superintendents respectively, subordinated to one colonial legislature. In 1876 the provincial system was abolished. The general assembly, as it is called, is composed of the governor, the legislative council, and the House of Representatives. The governor is appointed by the crown, but his salary, £7500, is paid by the colony. The legislative council consists of members appointed for seven years by the governor in council; the number of legislative councillors stays at or near forty-five. The House of Representatives consists of eighty members chosen by the electors. The members of both houses are paid. The franchise is adult suffrage, conditional on a previous residence in the colony for a year, including six months in the electoral district for which a claim to vote is registered. Every elector is qualified for election. Four members of the house must be Maori elected by their own race. The duration of the house is for three years, but it is subject to re-election whenever the governor dissolves the general assembly. Legislation is subject to disallowance by the crown, but that power is seldom exercised. Executive administration is conducted on the principle of English responsible or parliamentary government. The government is represented in England by a high commissioner. Local administration is vested in local elective bodies, such as municipal councils, county councils, road boards, harbour boards, charitable aid boards, and others, with power to levy rates. The colonial revenue is chiefly derived from customs, stamp duties, land tax, income tax, beer excise, postal and telegraphic services, railways, and crown land sales and rents. The proceeds of land sales are applied to surveys and public works. Customs duties, railways and stamps are by far the most important sources of revenue. They yielded £3,103,000, £2,765,000 and £1,550,000 respectively out of a total revenue of £9,056,000 in the financial year 1907–1908. The gross public debt had reached £66,500,000 in 1908. The money has chiefly been spent on railways, telegraphs, roads, bridges, land purchase from the native tribes and private estate owners, on loans to settlers and on native wars. The state railways (2500 m.) return about £800,000 after paying working expenses. This does not quite defray the interest on the cost of their construction and equipment, inasmuch as it barely comes to 3½% thereon, but rates and fares are deliberately kept low to encourage settlement and communication. The debts of the local bodies amount to about nine millions. They raise rather more than a million a year by rates, licence fees and dues.

Education.—Under the Education Act of 1877 state schools are established, in which teaching is free, secular and compulsory, with certain exceptions, for children between the ages of seven and thirteen. A capitation grant is given for every child in average daily attendance at the schools. Grants are also made for scholarships from primary to secondary schools, for training institutions for teachers and for school buildings. Large reserves of public lands have been made for primary, secondary and university education. All primary and some secondary public schools are controlled by provincial education boards elected by school committees of the parents of pupils. The percentage of attendance has rivalled that in the primary schools of Scotland, and in 1905 attained to 86·9%. Native village schools are also provided by the state in native districts. There are, moreover, industrial schools, orphanages and institutions for the deaf and dumb and blind. There are about ninety secondary schools, state-supported or aided by public endowments. The university of New Zealand is an examining body, and grants honours, degrees and scholarships. It is empowered by royal charter to confer degrees entitled to rank and consideration throughout the British dominions, as fully as if they were granted by any university in the United Kingdom. Colleges in the four chief towns and in Nelson are affiliated to the New Zealand University, which has about fifteen hundred undergraduates keeping terms. The state in no way controls or interferes with religious administration. Each denomination attends to the religious instruction of its own adherents, chiefly by means of Sunday schools, which count 108,000 pupils. Roman Catholics support about 150 clerical day schools attended by about 11,500 scholars. State school buildings can be, and sometimes are, used for religious instruction on days and at hours other than those fixed by law for ordinary school work; but no child can be required to attend, except at the wish of its parent or guardian. The government spends £35,000 a year on manual and technical instruction, a branch of teaching which includes about two hundred cookery classes. A school of engineering and an agricultural college are attached to the university college in the province of Canterbury, and there are several schools of mines elsewhere.

About 157,000 white children and 6500 Maori children attend schools of one degree or another. Private schools claim about 10% of these. The annual parliamentary expenditure on education exceeds £700,000. In this connexion it may be claimed that the proportion of policemen to population (1 to 1375) is lower in New Zealand than in any other colony. The fixing of the legal minimum "factory age" for children at fourteen undoubtedly favours school attendance.

Land.—Apart from gold-mining, coal-mining and gum-digging, the industries are still mainly the growing of food and raw material; and the occupation of the land is easily the chief of all economic questions. Sixteen million acres were in 1907 already held in freehold, as against about six million acres rented from the state on permanent leasehold. Crown lands are still alienated, though but little is now sold for cash outright. The number of holdings of one acre and upwards in size rose from 33,332 in 1886 to 58,904 in 1896, and 72,338 in 1906; but the area held in estates of 5000 acres and upwards remains very large and has diminished but slowly despite the severity of the graduated land-tax. Many interesting experiments in settling lands have been tried. The best known of these, perhaps, is the repurchase of large pastoral estates for subdivision and lease in perpetuity. In the fourteen years 1893–1907 about a million and a quarter acres were thus acquired at a cost of somewhat under five millions and a half. Over 13,000 souls had been settled in this area, and the yearly rent received from them, about £220,000, left a substantial balance to the credit of the enterprise in the books of the treasury. The tenants (who had been favoured with good years) were with very few exceptions prospering.

Old Age Pensions.—The Old Age Pensions law, enacted in 1898, provided for the free grant of pensions, not exceeding £18 a year, to persons of sixty-five years and upwards who had lived for twenty-five years in the colony. Pensioners must be British subjects, poor, and not ex-criminals or of notoriously bad character. In 1905 the maximum pension was raised to £26 a year. Official figures show that the total number of applications for pensions up to that date had been 31,271, of which 23,877 had been granted. The number of pensioners then on the books of the Pensions Office was 13,257. In the first three years after enactment of the law the growth of the number of pensioners was very rapid; in the next five it was remarkably slow—only 481 altogether. The proportion of whites qualified by age and residence who were actually drawing pensions was rather less than one-third (it had been 9% more in 1902). The reduction was due to stricter administration. The total sum paid out in eight and a quarter years had been a million and three quarters. The amount paid in pensions in the financial year 1906–1907 was £325,000. The money is found by the central government. The administration of the system, which is in the hands of a special department, costs a little over £5000. Frauds and evasions by applicants and pensioners, though they exist, are not believed to be numerous. Public thrift does not, so far, seem to have been diminished. Since the coming of the system the amount spent on outdoor relief in the colony had by 1906 diminished from £51,000 to £36,500, in face of an increase of nearly 23% in the population.

History.—The date, even the approximate date, of man's arrival in New Zealand is uncertain. All that can be safely asserted is that by the 14th century A.D. Polynesian canoe-men had reached its northern shores in successive voyages. By 1642 they had spread to South Island, for there Abel Jansen Tasman found them when, in the course of his circuitous voyage from Java in the "Heemskirk," he chanced upon the archipelago, coasted along much of its western side, though without venturing to land, and gave it the name it still bears. One hundred and thirty-seven years later, Cook, in the barque "Endeavour," gained a much fuller knowledge of the coasts, which he circumnavigated, visited again and again, and mapped out with fair accuracy. He annexed the country, but the British government disavowed the act. After him came other navigators, French, Spanish, Russian and American; and, as the 18th century neared its end, came sealers, whalers and trading-schooners in quest of flax and timber. English missionaries, headed by Samuel Marsden, landed in 1814, to make for many years but

slow progress. They were hindered by murderous tribal wars in which imported muskets more than decimated the Maori. Still, cruel experience and the persevering preaching of the missionaries gradually checked the fighting, and by the year 1839 it could be claimed that peace and Christianity were in the ascendant. So far the British government had resisted the considerable pressure brought to bear in Downing Street in favour of annexation. In vain Edward Gibbon Wakefield, organizer of colonizing associations, prayed and intrigued for permission to repeat in New Zealand the experiment tried by him in South Australia. Lord Glenelg, the colonial minister, had the support of the missionaries in withstanding Wakefield's New Zealand Company, which at length resolved in desperation to send an agent to buy land wholesale in New Zealand and despatch a shipload of settlers thither without official permission. Before, however, the "Tory" had thus sailed for Cook Strait, it had become known to the English government that a French colonizing company—*La Compagnie Nanto-Bordelaise*—was forming, under the auspices of Louis Philippe, to anticipate or oust Wakefield. Further obstruction was manifestly futile, and the British authorities reluctantly instructed Captain Hobson, R.N., to make his way to northern New Zealand with a dormant commission of lieutenant-governor in his pocket and authority to annex the country to Australia by peaceful arrangement with the natives. Hobson landed in the Bay of Islands on the 22nd of January 1840, hoisted the Union Jack, and had little difficulty in inducing most of the native chiefs to accept the queen's sovereignty at the price of guaranteeing to the tribes by the treaty of Waitangi possession of their lands, forests and fisheries. Some French settlers, convoyed by a man-of-war, reached Akaroa in South Island in the May following. But Hobson had forestalled them, and those who remained in the country became British subjects. Meanwhile, a week after Hobson's arrival, Wakefield's colonists had sailed into Port Nicholson, and proposed to take possession of immense tracts which the New Zealand Company claimed to have bought from the natives, and for which colonists had in good faith paid the company. Other bands of company's settlers in like manner landed at Nelson, Wanganui and New Plymouth, to be met with the news that the British government would not recognize the company's purchases. Then followed weary years of ruinous delay and official inquiry, during which Hobson died after founding Auckland. His successor, Fitzroy, drifted into an unsuccessful native war. A strong man, Captain Grey, was at last sent over from Australia to restore peace and rescue the unhappy colony from bankruptcy and despair. Grey, much the best of the absolute governors, held the balance fairly between the white and brown races, and bought large tracts of land for colonization, including the whole South Island, where the Presbyterian settlement of Otago and the Anglican settlement of Canterbury were established by the persevering Wakefield.

In 1852 the mother-country granted self-government, and, after much wrangling and hesitation, a full parliamentary system and a responsible ministry were set going in 1856. For twenty years thereafter the political history of the colony consisted of two long, intermittent struggles—one constitutional between the central government (first seated in Auckland, but after 1864 in Wellington) and the powerful provincial councils, of which there were nine charged with important functions and endowed with the land revenues and certain rating powers. The other prolonged contest was racial—the conflict between settler and Maori. The native tribes, brave, intelligent and fairly well armed, tried, by means of a league against land-selling and the election of a king, to retain their hold over at least the central North Island. But their kings were incompetent, their chiefs jealous and their tribes divided. Their style of warfare, too, caused them to throw away the immense advantages which the broken bush-clad island offered to clever guerrilla partisans. They were poor marksmen, and had but little skill in laying ambuscades. During ten years of intermittent marching and fighting between 1861 and 1871 the Maori did no more than prove that they had in them the stuff to stand up against fearful odds and not always to be worsted. Round Mount Egmont, at Orakau, at Tauranga and in the Wanganui jungles, they more than once held their own against British regiments and colonial riflemen. The storming of their favourite positions—stockades strengthened with rifle-pits—was often costly; and a strange anti-Christian fanaticism, the Hau-Hau cult, encouraged them to face the white men's bullets and bayonets. But even their fiercest fighting leaders, Rewi and Te Kooti, scarcely deserved the name of generals. Some of the best Maori fighters, such as the chiefs Ropata and Kemp, were enlisted on the white side, and with their tribesmen did much to make unequal odds still more unequal. Had General Pratt or General Cameron, who commanded the imperial forces from 1860 to 1865, had the rough vigour of their successor, General Chute, or the cleverness of Sir George Grey, the war might have ended in 1864. Even as it was the resistance of the Maori was utterly worn out at last. After 1871 they fought no more. The colonists too, taught by the sickening delay and the ruinous cost of the war to revert to conciliatory methods, had by this time granted the natives special representation in parliament. A tactful native minister, Sir Donald McLean, did the rest. Disarmament, roads and land-purchasing enabled settlement to make headway again in the North Island after twelve years of stagnation. Grey quarrelled with his masters in Downing Street, and his career in the imperial service came to an end in 1868. His successors, Sir George Bowen, Sir James Ferguson, the marquess of Normanby and Sir Hercules Robinson, were content to be constitutional governors and to respect strictly the behests of the colonial office. Meanwhile the industrial story of New Zealand may be summed up in the words wool and gold. Extremely well suited for sheep-farming, the natural pastures of the country were quickly parcelled out into huge pastoral crown leases, held by prosperous licensees, the squatters, who in many cases aspired to become a country gentry by turning their leases into freeholds. So profitable was sheep-farming seen to be that energetic settlers began to burn off the bracken and cut and burn the forest in the North Island and sow English grasses on the cleared land. In the South artificial grassing went on for a time hand in hand with cereal-growing, which by 1876 seemed likely to develop on a considerable scale, thanks to the importation of American agricultural machinery, which the settlers were quick to utilize. Even more promising appeared the gold-fields. Gold had been discovered in 1853. Not, however, until 1861 was a permanent field found—that lighted upon by Gabriel Read at Tuapeka in Otago. Thereafter large deposits were profitably exploited in the south and west of South Island and in the Thames and Coromandel districts of the Auckland province. Gold-mining went through the usual stages of alluvial washing, deep sinking and quartz-reef working. Perhaps its chief value was that it brought many thousand diggers to the colony, most of whom stayed there. Pastoral and mining enterprise, however, could not save the settlers from severe depression in the years 1867 to 1871. War had brought progress in the north to a standstill; in the south wool-growing and gold-mining showed their customary fluctuations. For a moment it seemed as though the manufacture of hemp from the native *Phormium tenax* would become a great industry. But that suddenly collapsed, to the ruin of many, and did not revive for a number of years.

In 1870 peace had not yet been quite won; industry was depressed; and the scattered and scanty colonists already owed seven millions sterling. Yet it was at this moment that a political financier, Sir Julius Vogel, at that moment colonial treasurer in the ministry of Sir William Fox, audaciously proposed that the central government should borrow ten millions, make roads and railways, buy land from the natives and import British immigrants. The House of Representatives, at first aghast, presently voted four millions as a beginning. Coinciding as the carrying out of Vogel's policy did with a rising wool market, it for a time helped to bring great prosperity, an influx of people and much genuine settlement. Fourteen millions of borrowed money, spent in ten years, were on the whole well

laid out. But prosperity brought on a feverish land speculation; prices of wool and wheat fell in 1879 and went on falling. Faulty banking ended in a crisis, and 1879 proved to be the first of sixteen years of almost unbroken depression. Still, eight prosperous years had radically changed the colony. Peace, railways, telegraphs (including cable connexion with Europe), agricultural machinery and a larger population had carried New Zealand beyond the primitive stage. The provincial councils had been swept away in 1876, and their functions divided between the central authority and small powerless local bodies. Politics, cleared of the cross-issues of provincialism and Maori warfare, took the usual shape of a struggle between wealth and radicalism. Sir George Grey, entering colonial politics as a Radical leader, had appealed eloquently to the work-people as well as to the Radical "intellectuals," and though unable to retain office for very long he had compelled his opponents to pass manhood suffrage and a triennial parliaments act. A national education system, free, non-religious and compulsory, was established in 1877. The socialistic bent of New Zealand was already discernible in a public trustee law and a state life insurance office. But the socialistic labour wave of later years had not yet gathered strength. Grey proved himself a poor financier and a tactless party leader. A land-tax imposed by his government helped to alarm the farmers. The financial collapse of 1879 left the treasury empty. Grey was manœuvred out of office, and Sir John Hall and Sir Harry Atkinson, able opponents, took the reins with a mission to reinstate the finances and restore confidence.

Roughly speaking, both the political and the industrial history of the colony from 1879 to 1908 may be divided into two periods. The dividing line, however, has to be drawn in different years. Sixteen years of depression were followed, from 1895 to 1908, by thirteen years of great prosperity. In politics nearly twelve years of Conservative government, or at least capitalistic predominance in public affairs, were succeeded by more than seventeen years of Radicalism. Up to January 1891 the Conservative forces which overthrew Sir George Grey in 1879 controlled the country in effect though not always in name, and for ten years progressive legislation was confined to a mild experiment in offering crown lands on perpetual lease, with a right of purchase (1882), a still milder instalment of local option (1881) and an inoffensive Factories Act (1886). In September 1889, however, Sir George Grey succeeded in getting parliament to abolish the last remnant of plural voting. Finance otherwise absorbed attention; by 1880 the public debt had reached £25,000,000, against which the chief new asset was 1300 m. of railway, and though the population had increased to nearly half a million, the revenue was stagnant. A severe property-tax and an increase of customs duties in 1879 only for a moment achieved financial equilibrium. Although taxation was seconded by a drastic, indeed harsh, reduction of public salaries and wages (which were cut down by one-tenth all round) yet the years 1884, 1887 and 1888 were notable for heavy deficits in the treasury. Taxation, direct and indirect, had to be further increased, and as a means of gaining support for this in 1888 Sir Harry Atkinson, who was responsible for the budget, gave the customs tariff a distinctly protectionist complexion.

During the years 1879–1890 the leading political personage was Sir Harry Atkinson. He, however, withdrew from party politics when, in December 1890, he was overthrown by the Progressives under John Ballance. Atkinson's party never rallied from this defeat, and a striking change came over public life, though Ballance, until his death in April 1893, continued the prudent financial policy of his predecessor. The change was emphasized by the active intervention in politics of the trade unions. These bodies decided in 1889 and 1890 to exert their influence in returning workmen to parliament, and where this was impossible, to secure pledges from middle-class candidates. This plan was first put into execution at the general election of 1890, which was held during the industrial excitement aroused by the Australasian maritime strike of that year. It had, however, been fully arranged before the conflict broke out. The number of labour members thus elected to the general assembly was small, never more than six, and no independent labour party of any size was formed. But the influence of labour in the Progressive or, as it preferred to be called, Liberal party, was considerable, and the legislative results noteworthy. Ballance at once raised the pay of members from £150 to £240 a year, but otherwise directed his energies to constitutional reforms and social experiments. These did not interfere with the general lines of Atkinson's strong and cautious finance, though the first of them was the abolition of his direct tax upon all property, personal as well as real, and the substitution therefor of a land-tax of 1d. in the £ on capital value, and also of a graduated tax upon unimproved land values, and an income-tax also graduated, though less elaborately. The graduated land-tax, which has since been stiffened, rises from nothing at all upon the smaller holdings to 3d. in the £ upon the capital value of the largest estates—those worth £210,000 and upwards. Buildings, improvements, and live stock are exempted. In the case of mortgaged estates the mortgagor is exempted from ordinary land-tax in proportion to the amount of his mortgage. On that the mortgagee pays at the rate of ¾d. in the £. In 1896 municipal and rural local bodies were allowed to levy rates upon unimproved land values if authorized to do so by a vote of their electors, and by the end of 1901 some sixty bodies, amongst them the city of Wellington, had made use of this permission. The income-tax is not levied on incomes drawn from land. In 1891 the tenure of members of the legislative council or nominated Upper House, which had hitherto been for life, was altered to seven years. In 1892 a new form of land tenure was introduced, under which large areas of crown lands were leased for 999 years, at an unchanging rent of 4% on the prairie value. Crown tenants under this system had no right of purchase. In the same year a law was also passed authorizing government to repurchase private land for closer settlement.

On Ballance's sudden death in April 1893 his place was taken by Richard Seddon, minister of mines in the Ballance cabinet, whose first task was to pass the electoral bill of his predecessor, which granted the franchise to all adult women. This was adopted in September 1893, though the majority for it in the Upper House was but two votes. In 1893 was enacted the Alcoholic Liquor Control Act, greatly extending local option. In 1894 was passed the Advances to Settlers Act, under which state money-lending to farmers on mortgage of freehold or leasehold land was at once begun. The money is lent by an official board, which deals with applications and manages the finance of the system. In thirteen years the board lent out over five millions and a half, and received repayment of nearly two millions of principal as well as over one million in interest at 5%. Borrowers must repay ½% of their principal half-yearly, and may repay as much more as they choose. Profits are paid over to an assurance fund. No losses were incurred during the thirteen years above mentioned. The net profit made by the board in 1906 was £45,000. The same year also saw the climax of a series of laws passed by the Progressives affecting the relations of employers and workmen. These laws deal with truck, employers' liability, contractors' workmen, the recovery of workmen's wages, the hours of closing in shops and merchants' offices, conspiracy amongst trade unionists, and with factories, mines, shipping and seamen. In 1895 a law controlling servants' registry offices was added. In 1897 all shipowners engaging in the coasting trade of the colony were compelled to pay the colonial rate of wages.

Meanwhile the keystone of the regulative system had been laid by the passing of the Industrial Conciliation and Arbitration Act, under which disputes between employers and unions of workers are compulsorily settled by state tribunals; strikes and lock-outs are virtually prohibited in the case of organized work-people, and the conditions of employment in industries may be, and in many cases are, regulated by public boards and courts. The years 1896,1897 and 1898 were marked by struggles over the Old Age Pensions Bill, which became law in November 1898. In 1898 the divorce law was amended on the lines of the Stephen Act of New South Wales, a change which helped to treble the number of petitions for divorce in the next seven years. In 1898 also the

municipal franchise, hitherto confined to ratepayers, was greatly widened; in 1900 the English system of compensation to workmen for accidents suffered in their trade was adopted with some changes, one of the chief being that contested claims are adjudicated upon cheaply and expeditiously by the same arbitration court that decides industrial disputes. In 1895 borrowing on a larger scale was begun, and in twelve years twice as many millions were added to the public debt. Before this the Ballance ministry had organized two new departments, those of labour and agriculture. The former supervises the labour laws and endeavours to deal with unemployment; the latter has done much practical teaching, inspection, &c. Butter, cheese and New Zealand hemp are by law graded and branded by departmental inspectors before export. For some years the government has worked two coal-mines profitably, chiefly to supply its railways. In 1907 the net profit on these was over £8000. The continued success of the government life insurance office led in 1899 to the setting up of an accidents insurance office, and, in 1903, of a state fire insurance office.

The outbreak of the Boer War in October 1899 was followed in New Zealand by a prompt display of general and persistent warlike enthusiasm: politics ceased to be the chief topic of interest; the general election of 1899 was the most languid held for fifteen years. The desire of New Zealanders to strike a blow for the mother-country took the practical shape of despatching to South Africa ten successive contingents.

After gaining office at the beginning of 1891 the Ballance-Seddon party had to struggle with the last four years of the period of depression. In 1895 began a marked commercial revival, mainly due to the steady conversion of the colony's waste lands into pasture; the development of frozen meat and dairy exports; the continuous increase of the output of coal; the invention of gold-dredging; the revival and improvement of hemp manufacture; the exploiting of the deposits of kauri gum; the reduction in the rates of interest on mortgage money; a general rise in wages, obtained without strikes, and partially secured by law, which has increased the spending power of the working classes. Undoubtedly also commercial confidence was restored by the reconstruction in 1895 of the Bank of New Zealand, and activity has been stimulated by large public loans, while more cautious banking and the systems of taxation and rating on land values, adopted in 1891 and 1896, have done something to check land speculation.

Between 1879 and 1908 seven governors represented the crown in New Zealand. Of these Sir Hercules Robinson and Sir Arthur Gordon had but brief reigns; Sir Arthur Gordon quitted the colony in June 1882. His successor, Sir William Drummond Jervois, arrived in January 1883, and held office until March 1889. The earl of Onslow, who followed, landed in June 1889, and resigned in February 1892. The next governor, the earl of Glasgow, remained in the colony from June 1892 to February 1897, and was succeeded in August of the last-mentioned year by the earl of Ranfurly, who did not retire until 1904. His place was then taken by Lord Plunket. The cabinets which administered the affairs of the colony during these years were those of Sir Frederick Whitaker, Sir Harry Atkinson (3), Sir Robert Stout (2), Mr Ballance, Mr Seddon, Mr Hall-Jones and Sir Joseph Ward. Mr Hall-Jones's short premiership was an interregnum made necessary by the absence of Sir Joseph Ward in England at the moment of Mr Seddon's death. Except in one disturbed month, August 1884, when there were three changes of ministry in eighteen days, executives were more stable than in the colony's earlier years. The party headed by Ballance, Seddon and Ward held office without a break for more than seventeen years, a result mainly due to the general support given to its agrarian and labour policy by the smaller farmers and the working classes. Sir Arthur Gordon differed from his ministers—Hall and Atkinson—on their native policy. Lords Onslow and Glasgow came into collision with Ballance over a proposal to nominate a large batch of Liberals to the then Conservative legislative council. The dispute was by consent referred to the secretary for the colonies, and the decision from Downing Street was in Ballance's favour. The governor's salary, reduced in 1887, was restored to £7500 a year in 1900. An Immigrants Exclusion Act voted by the general assembly in 1896 did not receive the royal assent; but, by arrangement with the colonial office, another measure, giving power to impose a reading test on aliens landing in the colony, became law in 1899.

The presence of New Zealand premiers at the imperial conferences in London in 1897, 1903 and 1907 helped to bring the colony into conscious touch with imperial public questions. Among the results were the increase of the naval contribution (first to £40,000 and then, in 1908, to £100,000), and the imposition in 1903 and again in 1907 of severe discriminating duties against imports from foreign countries.

BIBLIOGRAPHY.—The only lengthy historical account of any note is Rusden's three-volume *History of New Zealand* (2nd ed., Melbourne, 1896), chiefly valuable as a statement of the grievances of the Maori race. Short histories are: R. F. Irvine and O. T. J. Alpers, *The Progress of New Zealand in the Century* (London, 1902), and W. P. Reeves, *The Long White Cloud* (2nd ed., London, 1900). Sir William Fox, *The War in New Zealand* (London, 1866) is the best account of any portion of the native wars. A. S. Thomson's *Story of New Zealand* (London, 1859) is historical as well as descriptive. William Gisborne's *New Zealand Rulers and Statesmen, 1844–1897* (London, 1897), gives many graphic portraits. For early accounts of the Maori race, see Cook's *Voyage* and Booss's translation of Crozet's *Voyage*. On the Maori also note, Sir G. Grey, *Polynesian Mythology and Maori Legends* (New Zealand, 1885); Edward Tregear, *The Maori Race* (New Zealand, 1704); S. Percy Smith, *Hawaiki* (New Zealand, 1903); John White, *The Ancient History of the Maori* (6 vols., London, 1889); and many papers—especially by the three last-named, and Colenso, Stack, Wohlers, Best, von Haast, Travers and Shand—in the *Transactions of the New Zealand Institute* (New Zealand, annual), and the *Journal of the Polynesian Society* (New Zealand, annual). On early events of pioneering and colonization are: E. J. Wakefield, *Adventure in New Zealand* (new ed., New Zealand, 1908); Hon. R. McNab, *Murihuku* (New Zealand, 1907); T. M. Hocken, *Contributions to the Early History of New Zealand* (London, 1898); Samuel Butler, *First Year in the Canterbury Settlement* (1863). For later impressions note: Lady Barker, *Station Life in New Zealand* (London, 1869); Sir Charles Dilke, *Greater Britain* (London, new ed., 1885); Anthony Trollope, *Australia and New Zealand* (London, 1875); J. A. Froude, *Oceana* (London, 1886). The best-known poetic work produced is Domett's *Ranolf and Amohia* (London, 1867). An anthology of New Zealand verse appeared in London in 1907. Sir John Gorst, *New Zealand Revisited* (London, 1908). Among scientific works come papers in the two societies above-mentioned and F. von Hochstetter, *New Zealand* (translation, London, 1861); J. Kirk, *The Forest Flora of New Zealand* (New Zealand, 1889); Sir J. Hooker, *Handbook of the New Zealand Flora* (London, 1864); Laing and Blackwell, *The Plants of New Zealand* (New Zealand, 1906); Professor E. Hutton and James Drummond, *The Animals of New Zealand* (New Zealand, 1905); Sir W. L. Buller, *The Birds of New Zealand*, finely illustrated (new ed., London, 1906); S. Percy Smith, *The Eruption of Tarawera* (New Zealand, 1887). On recent social and political changes and experiments there are: W. P. Reeves, *State Experiments in Australia and New Zealand* (2 vols., London, 1902); H. D. Lloyd, *Newest England* (London, 1901); André Siegfried, *La Démocratie en Nouvelle Zélande* (Paris, 1904). On Alpine climbing the best book is still *The High Alps of New Zealand* by W. S. Green (London, 1883).

(W. P. R.)

NEXT FRIEND, in law, the phrase used for a person who represents in an action another person who is under disability to maintain a suit on his own behalf. This disability arises from infancy or mental incapacity, consequently every application to the court on behalf of an infant or a lunatic must be made through a next friend (*prochein amy, proximus amicus*). Previous to the Married Women's Property Act 1882 it was also usual for a married woman to sue by a next friend, but that act, allowing a married woman to sue in all respects as a *feme sole*, has rendered a next friend unnecessary in her case. In the case of an infant the father is prima facie the proper person to act as next friend; in the father's absence the testamentary guardian if any; but any person not under disability may act as next friend so long as he has no interest in the action adverse to that of the infant. A married woman cannot, however, act as next friend. An infant defends a suit, not by a next friend, but by a guardian *ad litem*. In the case of a lunatic, he sues by his committee, but if he has no committee, or if the committee has some interest adverse to the lunatic, he sues by his next friend. A next friend has full power over the proceedings in the action

as if he were an ordinary plaintiff, but he is not entitled to be heard in person.

NEY, MICHEL, duke of Elchingen, prince of the Moskowa (1769–1815), marshal of France, was born at Saarlouis on the 10th of January 1769. His father was a cooper, and he received only a rudimentary education. In 1788 he went to Metz and enlisted in a regiment of hussars; in 1792 he was elected lieutenant; and in 1794 he became captain and was placed by Kléber at the head of a special corps of light troops. He was soon promoted *chef de brigade*, and in 1796, after repeatedly distinguishing himself in action, general of brigade. He then commanded the right wing of Hoche's army up to the peace of Campo Formio. On the resumption of hostilities he again took the field, and for his surprise of Mannheim in 1799 received the grade of general of division. He distinguished himself and received three wounds in the Swiss campaign of Masséna, and when Masséna turned against the Russians, who were approaching from Italy, Ney was left in command of the holding detachment opposite the Austrians. He displayed great vigour and skill in this work, and was completely successful, although his opponent was the famous Archduke Charles. In 1800 he was present at Hohenlinden. In May 1802 he married Mademoiselle Auguié, whom Josephine had chosen for him at Bonaparte's request. This event marks a change in Ney's political opinions which can only be explained by reference to Napoleon's power of captivating men. He was henceforward as ardent and sincere an admirer of Napoleon as hitherto he had been of revolutionary principles, and was one of the very few officers of the Army of the Rhine who became a trusted lieutenant of the emperor. He soon afterwards carried out an important diplomatic mission in Switzerland, and in 1803 he was placed in command of the camp of Montreuil. It was while there that, in the name of the army, he begged Napoleon to declare himself emperor, and on the establishment of the empire he was made marshal of France, and received the grand eagle of the Legion of Honour. In 1805 he commanded the VI. corps of the Grand Army, and his great victory at Elchingen (for which in 1808 he was made duke of Elchingen) practically secured the surrender of the Austrians at Ulm. He was then ordered to the upper Adige, and missed the battle of Austerlitz, but was present at Jena and Eylau and led the decisive attack at Friedland. His reputation for personal heroism was by now at its height, and after Friedland Napoleon gave him the title by which he is still known, "the bravest of the brave."

In 1808, after the first disaster to the French arms in Spain, Ney accompanied Napoleon thither as commander of the VI. corps. He took part in the Peninsular War from 1808 to 1811, commanding his corps in Napoleon's own operations of 1808–09, in the irregular operations in Galicia 1809–10, and under Masséna in the invasion of Portugal in 1810–11. In the last, however, he quarrelled bitterly with his former chief, and although he distinguished himself very greatly in command of the rearguard during the retreat from Torres Vedras—notably at Redinha—he was recalled to France by Napoleon and censured for his indiscipline. Almost immediately, however, he was re-employed with the *Grande Armée* in central Europe under Napoleon himself. In the 1812 expedition to Russia Ney commanded the centre at Borodino, and was created prince of the Moskowa on the evening of the victory. In the retreat he was a tower of strength, animating the rearguard with his own sublime courage, keeping the harassed and famished soldiers together under the colours and personally standing in the ranks with musket and bayonet. He himself was the last to recross the frontier, and threw the remaining muskets into the Niemen. In 1813 he commanded a corps in the German campaign, fought at Lützen, Bautzen, Dennewitz and Leipzig, and in 1814 he shared in the victories and defeats of the campaign in France. At the fall of the Empire Ney was neither the first nor the last of the marshals to give up the struggle, but that he acted in the negotiations in concert with Macdonald and Caulaincourt is sufficient proof of his desire to avert the unreserved abdication that was forced upon Napoleon by other circumstances. Less satisfactory than his conduct at this crisis was his loud protestation of devotion to the Bourbons, when the Restoration was a *fait accompli*. But he was soon mortified by the disdain of the returned *émigrés*, and retired to his country seat. While on his way thence to take up a command at Besançon, he learned of the return of Napoleon. He hurried at once to pay his respects to Louis XVIII. and to assure him of his fidelity. With the famous remark that the usurper ought to be brought to Paris in an iron cage, he proceeded to Lons-le-Saulnier to bar Napoleon's progress. But instead of doing so, he deserted with his troops, and Napoleon's march became a triumphal progress. Ney's act was undeniably treason to his sovereign, but it was hardly the calculated treason that his *émigré* detractors saw fit to imagine. The first violence of his language, his ineffective efforts to make constitutional guarantees the price of his adhesion to Napoleon, and his final surrender to the dominant personality of his old leader, all show him to have been "out of his depth" in this political crisis. Napoleon received him kindly, but did not give him a command at first. But when the Waterloo campaign was about to begin he summoned Ney to the northern frontier. The marshal gladly obeyed and took up the command of the left wing on June 13. The next day the army moved into Belgium. Ney took part in the campaign successively in the rôles of strategist, tactician and soldier (see WATERLOO CAMPAIGN). Much controversy has raged over his actions of the 15th and 16th of June. At Waterloo he was of course subordinated to the personal command of Napoleon, but his advice as to the conduct of the battle was often offered and sometimes accepted, and he personally led several charges of the French up to the British squares. But when all was lost, his courage, instead of burning brightly as in the Moscow retreat, was extinguished. He made no attempt to second Davout and Grouchy in the last days of Napoleon's reign, and in despair advocated the restoration of the Bourbons. Finding that Louis XVIII. and his allies ignored his advances, he resolved to escape from France, but afterwards, believing himself protected by the terms of the convention concluded on the 3rd of June, he gave up the idea. Soon a fresh order was issued denouncing him by name, and after a half-hearted attempt to conceal himself he was arrested on the 5th of August. King Louis and his minister Decazes realized to the full the lasting unpopularity that would fall on the monarchy in consequence; they had done their best to facilitate the escape of the "traitors"; and when Louis heard of Ney's arrest he exclaimed, "By letting himself be caught he has done us more harm than he did on the 13th of March!" But neither king nor ministers were in a position to resist the clamour of the ultra-royalists for blood. Every fresh delay in the process of Ney's trial raised a new outcry at the court, in the salons and in the Chamber of Deputies; and fiercest of all in demanding immediate execution was the king's niece, the unhappy duchess of Angoulême, who lived to confess that had she known the record of Ney's services to France she would never have consented to his death. The king was powerless against this all but unanimous voice of royalist opinion, backed as it was by that of the powers to whom he owed his crown. Ney was placed on trial before a court-martial composed chiefly of his former brothers-in-arms, whose participation in the tragedy, slight as it was, was probably never forgiven them by their countrymen. Others of the marshal's old comrades refused to serve, and were disgraced in consequence, until public opinion forced their reinstatement. The court, once assembled, was only too glad to take advantage of the plea of Ney's counsel that he was entitled to be tried by his equals in the Chamber of Peers. In spite of the courageous and eloquent appeal of the young duc de Broglie, the result of the trial before the latter body was a foregone conclusion; as to Ney's treason there could be no doubt, and de Broglie was alone in voting for his acquittal. In the early morning of the 7th of December 1815 Ney was shot in the Luxembourg gardens, near the Observatory. He met his death quietly and with a perfect soldierly dignity that effaced the memory of his political extravagances, and made him, next to Napoleon himself, the most heroic figure of the time. Much has been said as to

the share of the duke of Wellington in the trial and execution, and, rightly or wrongly, he has been blamed for allowing the Bourbons, when restored by the foreign bayonets that he controlled, to proscribe the soldiers who as soldiers had been included in the military capitulation to the Allies.

Ney left materials for memoirs, but in an incomplete state. The *Mémoires du maréchal Ney*, published in 1833, were collected from these papers by his brother-in-law Gamot and by General Foy. They cover only the earlier part of his career, and end with the battle of Elchingen (October 1805). An edition in English was published the same year.

See Rouval, *Vie du maréchal Ney* (Paris, 1833); Dumoulin, *Histoire du procès du maréchal Ney* (Paris, 1815, Eng. trans. 1816); Nollet-Fabert, *Éloge du maréchal Ney* (Nancy, 1852); Welschinger, *Le maréchal Ney, 1815* (Paris, 1893); A. Delmas, *Mémoire sur la révision du procès du maréchal Ney* (1832); and *Military Studies by Marshal Ney* (Eng. trans. London, 1833); Vol. I. of General Bonnal's *Life of Ney* appeared in 1910.

NEZ PERCÉS (in allusion to their custom of wearing nose-rings, &c.), a tribe of North American Indians of Sahaptian stock. They call themselves Shaptin (whence the stock name) but to other tribes were known as Chopunnish. Their former range was a large tract in eastern Washington and Oregon and central Idaho. Until 1877 they had been at peace with the whites. In 1875 a portion of their reservation having been taken from them, owing to the allegation that they had not carried out the treaty stipulations, difficulties arose which, two years later, caused the Nez Percés War. The disaffected portion of the tribe, numbering some 400 or 500, held out for several months against all the forces the government could bring up, but were finally captured on the Sweet Grass Hills, northern Montana. They were placed in Indian Territory, but in 1884 transferred, owing to their decrease through disease, to a healthier locality in northern Washington. The main tribe are on a reservation in northern Idaho.

NGAMI, the central point of an inland water system of South Africa, once forming a lake 20 m. long and 10 wide, but now little more than an expanse of reeds growing in a soft treacherous soil, below which brackish water is found. It is cut by 20½° S. and 23° E. Ngami is the lowest point of a large depression in the plateau which comprises nine-tenths of Africa south of the Zambezi. The area which drains to it is bounded S. by the basin of the Orange, E. by the Matabele hills, N. by the western affluents of the Zambezi. The greater part of the Ngami water-system lies, however, N.W. of the lake (which for convenience it may still be called) in the tableland of Angola and German South West Africa. On the high plateau of Bihe, in the hinterland of Benguella, rise two large rivers, the Okavango and the Kwito, which uniting discharged their waters into Ngami. From the N.E. end of Ngami issued the Botletle or Zuga, a stream which runs S.E. and drains towards the Makarikari marsh, from which there is no outlet.

Although Ngami has dried up since 1890 the Okavango and its tributary the Kwito remain large rivers. The Okavango is known in its upper course as the Kubango. Its most remote source lies in about 12½° S. and 16½° E. and its length is over 900 m. It flows first S. then S.E. and E. In about 18° S. and 20½° E. it is joined on the north bank by the Kwito, a large navigable stream rising almost as far north as the Okavango. Its general course is S.E., but between 15° and 17° S. it flows S. and even S.W. Below the Kwito confluence the Okavango, which is also joined by various streams from the S.W. (German territory), is a rapid stream with an average breadth of over 100 yds., and generally navigable as far as the Popa falls, in 21° 50′ E. In the dry season, the water-level is from 4 to 20 ft. below the banks, but these are overflowed during the rains. At this period, April–June, some of the surplus water finds its way (in about 19° S.) by the Magwekwana to the Kwando or Linyanti (Zambezi system), to which, it is conjectured, the whole body of water may have once flowed. Below the Magwekwana outlet the Okavango, now called the Taukhe or Tioghe, turns almost due S., enters a swampy reed-covered plain and is broken into several branches. In this region the effects of desiccation are marked. Through the swamps the river formerly entered Ngami. The last 20 m. of the old channel are now dry and devoted to grain crops. Above this point the waters of the Okavango are diverted eastward through a channel called Tamalakane to the Botletle, the river which, as stated above, formerly flowed out of Ngami. The point of confluence is in about 20° S. 23½° E., the Botletle above this point being merely a succession of pools. Below the junction the river bed is 150 to 200 yds. wide. The banks are 25 to 30 ft. high, and form steep white walls of sand compacted with lime, behind which the dark green forest rises. The stream is fringed with reeds harbouring countless water-fowl. The Botletle, whose bed is about 100 m. in length, loses itself in a system of salt-pans—round or oval basins of varying size sunk to a depth of 30 to 45 ft. in the sandstone, and often bounded by steep banks. The outer pans are dry for a large part of the year, the whole system being filled only at the height of the flood-season in August. The Botletle, which receives in addition the scanty waters of the northern Kalahari, at this season reaches the Makarikari marsh. This marsh, occupying the N.E. corner of Bechuanaland, has also feeders from the Matabele hills in the direction of Bulawayo. During the rains the marsh is converted into a large lake. Much of the water is lost by evaporation; much of it sinks into some subterranean reservoir.

The evidence of travellers is conclusive that the country around Ngami is drying up. The desiccation appears to be rapid. In 1849 when David Livingstone visited Ngami the lake though shallow was of considerable extent. Later travellers reported progressive decrease in the size of the lake and in 1896 Sir F. D. Lugard and Dr Siegfried Passarge found it dry. Dr Passarge was told by the natives that the cessation of the river's flow was caused, about 1890, by a blocking of the channel by thousands of rafts.

Although the river system below the Magwekwana outlet of the Okavango is drying up, above that point there are long stretches of navigable water both on the Okavango and the Kwito, in all considerably over 1000 m. The Popa falls are the last of a series of six in a distance of 40 m., but none present serious engineering difficulties. The Magwekwana connexion with the Zambezi is a little over 100 m. long, and for more than half its course flows through a deep well-defined bed with a minimum width of 100 yards. The fall to the Linyanti affluent of the Zambezi is only a few feet and the country presents no obstacles to the construction of artificial channels.

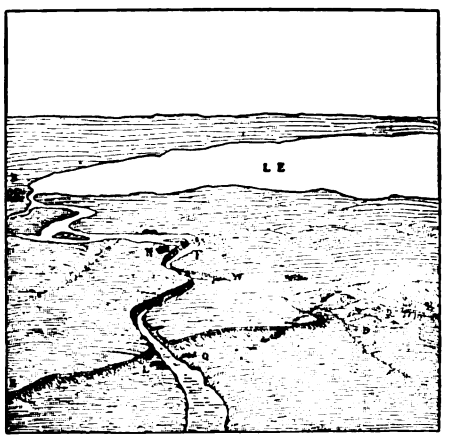
Ngami is within the (British) Bechuanaland protectorate, about 50 m. E. of the frontier of German South-West Africa. The district is the home of the Batawana tribe of Bechuana, with whom is stationed a European magistrate. The tribes living along the lower Okavango are tributary to the Bechuana, and the blocking of the channel referred to was occasioned by their bringing to Ngami their annual tribute of corn.

See BECHUANALAND and KALAHARI. An account of the Ngami district is given in *Die Kalahari* by Dr Siegfried Passarge (Berlin, 1904). Of early books of travel consult C. J. Andersson's *Lake Ngami* (London, 1856) and *The Okavango River* (London, 1861).

NGAN-HUI (AN-HWEI or GAN-HWUY), an eastern province of China, which, together with Kiang-su and Kiang-si, forms the vice-royalty of Kiang-nan. It is bounded N. by Ho-nan, E. by Kiang-su and Cheh-kiang, S. by Kiang-si and W. by Hu-peh and Ho-nan. It covers an area of 48,461 sq. m., and contains a population of 23,600,000. Its principal city is Ngan-k'ing on the Yangtsze Kiang, besides which it numbers seven prefectural cities. One district city, Ho-fei, is noted as having been the birthplace of Li Hungchang (1822–1901). The southern half of the province, that portion south of the Yangtsze Kiang, forms part of the Nan-shan, or hilly belt of the south-eastern provinces, and produces, besides cotton, coal and iron ore, large quantities of green tea. There are also considerable forest areas. Ngan-hui is one of the most productive provinces of China. Over the whole of its southern portion tea is largely grown, notably in the districts of Hui-chow Fu, Tung-liu, Ta-tung and Wu-hu. The Yangtsze Kiang is the principal river of the province, and is of great importance for foreign commerce, supplying direct water communication between some of the principal tea-growing districts and the neighbourhood of Hang-chow. The only other river of importance is the Hwai-ho (see CHINA: *The Country*). Wu-hu on the Yangtsze Kiang is the only open port in this province. From this port a railway runs S.E. to Wen-chow—an open seaport in Cheh-kiang province.

NIAGARA, a river of North America, running northward from Lake Erie to Lake Ontario, and carrying the discharge of all the Laurentian or Great Lakes, except Lake Ontario (see ST LAWRENCE RIVER). It constitutes part of the boundary between the United States and Canada, separating the state of New York from the province of Ontario. It is navigable from its head to Chippawa, 16 m., and from Queenston to its mouth, 6 m. The intervening 9 m. include a series of rapids and the Falls of Niagara. On the right bank are Buffalo, Tonawanda, Niagara Falls, Lewiston and Youngstown, of New York; on the left bank, Chippawa, Niagara Falls, Queenston and Niagara-on-the-Lake, of Ontario.

The Falls of Niagara are justly celebrated for their grandeur and beauty, and are viewed every year by from 800,000 to 1,200,000 visitors. They are in two principal parts, separated by an island. The greater division, adjoining the left bank, is called the Horseshoe Fall; its height is 155 ft., and the length of its curving crest line is about 2600 ft. The American Fall, adjoining the right bank, is 162 ft high and about 1400 ft. broad. The water, being supplied by a lake, is free from sediment, and



Bird's-eye sketch of Niagara river and gorge, from the north.

its clearness contributes to the beauty of the cataract. In recognition of the importance of the waterfall as a great natural spectacle, the province of Ontario and the state of New York have retained or acquired title to the adjacent lands and converted them into parks, which are maintained at public expense for the convenience and pleasure of visitors. The cataract is thus a great aesthetic asset of the people of the world; but its perpetuity has been threatened because it is also a great economic asset of the bordering nations. The flow of water in the river at mean stage is 222,000 cub. ft. per second, at low stage 176,000 cub. ft. The descent of this stream at the Falls, and in the rapids just above them, affords a theoretic water power equal to nearly four million horse power, and it is estimated that three-fourths of this is practically available. The annual value of the power must be reckoned in millions of pounds sterling, at least, and possibly in tens of millions. In the utilization of this natural power a beginning has been made; about 15,000 cub. ft. of water per second are now used for the development of electric power, and much larger appropriations have been authorized. As the full development of the economic value involves the diversion of the river from its channel and the destruction of the cataract as a scenic feature, the economic and aesthetic interests are antagonistic. An agitation started by the champions of scenic beauty led to negotiations looking to the regulation of economic exploitation by international agreement.

The river has no valley. The belt of land it crosses consists of two plains separated by a high cliff or escarpment facing towards Lake Ontario. The stream runs half its length on the upper plain, drops at the falls into a narrow gorge through which it courses 7 m. to the escarpment, and then traverses the lower plain in a deep channel. Under the lower plain are soft shales. The crest of the escarpment is a bed of limestone, nearly level, and this bed is visible in both walls of the gorge to the falls, where it is 60 ft. thick. From this firm brink the cataract plunges down into a deep pool or basin hollowed from the soft shale, and the resulting agitation causes further wear of the shale and the continual undermining of the limestone, which breaks away in blocks. Thus the site of the cataract retreats up stream and the gorge is lengthened; the average rate, measured from 1842 to 1905 being about 5 ft. a year. It is evident that the whole gorge has been dug out by the river, and many attempts have been made to determine the time consumed in the work.

The problem of the river's age is of much interest to geologists, because its solution would aid in establishing a relation between the periods and ages of geologic time and the centuries of human chronology. The great Canadian glacier, which in the Glacial period alternately crowded forward over the Great Lakes region and melted back again, so modified the face of the land by erosion and by the deposit of drift that the waters afterwards had to find new courses. The Niagara river came into existence when the waning of the glacier laid bare the western part of the Ontario basin, and the making of the gorge was then begun. If it were supposable that the lengthening of the gorge proceeded at a uniform rate, the computation of the time would be easy, but there are various modifying conditions. (1) The limestone is not equally thick all along the gorge; in one place it is 90 ft., and in several places as little as 35 ft. (2) The height of the cataract has varied from 155 ft. to more than 300 ft. (3) For a short distance at the whirlpool the limestone and shale were replaced by softer material, sand and clay. The river here touched a more ancient gorge, which had previously been concealed by drift except at the escarpment. The diagram shows the breach in the escarpment at St Davids directed towards the sharp turn of the river gorge at the whirlpool. (4) The size of the river has varied. While the glacier was gradually melting the lakes underwent a complicated series of metamorphoses, and there were two separate epochs when the discharge from all the basins beyond Lake Erie followed other routes, and during these epochs the Niagara drained only one-eighth of its present territory. The variation in the size of the river is the most important of the modifying conditions, and at the same time least amenable to computation.

The parts of the gorge eroded by the full river are now marked by deep pools, the powerful cataract having dug far down into the shale. The parts eroded by the depleted river are comparatively narrow and shallow, the weaker cataract having been unable to clear away the fallen blocks of limestone. The work of the full river is illustrated by the main division of the present cataract, called the Horseshoe Fall, which wore its cliff back 335 ft. in 63 years. The work of the depleted river is less adequately represented by the narrower and shallower American Fall; where the present rate of recession is about one-twenty-fifth as fast. In making two-thirds of the gorge the full river probably consumed between 5000 and 15,000 years. If the depleted river worked one-tenth as fast, the period required for the remaining third was five times as long; but the relative rate is wholly conjectural. A weighing of the evidence now available indicates 25,000 years as a lower limit for plausible estimates of the age of the river, but yields no suggestion of an upper limit.

NIAGARA, FORT, an American fortification, on the E. side and at the mouth of Niagara river, opposite the Canadian village

of Niagara, or Niagara-on-the-Lake. Fort Ningara has a reservation of 288 acres, with fairly modern equipments, several historic buildings of the time of French and of British possession, in one of which, the old magazine (1757), William Morgan was imprisoned in 1826. Fort Niagara was long, especially during the French occupation of Canada, one of the most important forts in North America, being the key to the Great Lakes, beyond Lake Ontario. "This immense extent of inland navigation," says Parkman, "was safe in the hands of France so long as she held Niagara. Niagara lost not only the lakes but also the valley of the Ohio was lost with it." René Robert Cavelier, Sieur de La Salle, wintered here in 1678–9, built his ship the "Griffon," and established a trading post and Fort Conti, destroyed not long afterwards. Fort Denonville, built in 1687 by Jacques René de Brésay, marquis de Denonville, governor-general of Canada, in his cruel campaign against the Iroquois, was abandoned in 1688, after the garrison, commanded by Pierre de Troyes (d. 1687), had been wiped out by an epidemic. The first Fort Niagara, to be so named, was built in 1725–1727 at the instance of Charles le Moyne, 1st baron of Longueil (1656–1729), and became a very important military and trading post; the fort was rebuilt by François Pouchot (1712–1769) in 1756, but in July 1759, after a siege of about sixteen days, it was surrendered to Sir William Johnson by Pouchot, who wrote a *Memoir upon the Late War* (translated and edited by F. B. Hough; 2 vols., 1866). On the 14th of September 1763 a British force marching from Fort Schlosser (about 2 m. above the Falls; built 1750) to Fort Niagara was ambushed by Indians, who threw most of their captives into Devil's Hole, along the Niagara river. In July 1764 a treaty with the Indians was signed here, which detached some of them from Pontiac's conspiracy. Joseph Brant, John Butler, and, in general, the Indians of north-western New York favouring the British during the American War of Independence, made Fort Niagara their headquarters, whence they ravaged the frontier, and many loyalists and Indians took refuge here at the time of General Sullivan's expedition into western New York in 1779. The fort was not surrendered to the United States until August 1796. In the War of 1812 it was bombarded by the guns of Fort George (immediately across the river in the town now called Niagara, then Newark[1]) on the 13th and 14th of October 1812; was the starting-point of the American expedition which took Fort George on the 27th of May 1813; and on the 19th of December 1813 was surprised and taken by assault—most of the garrison being killed or taken prisoners—by British troops under John Murray (1774–1862), who had previously retaken Fort George. After the close of the war, on the 27th of March 1815, Fort Niagara was restored to the United States, and a garrison was kept there until 1826. The fort was regarrisoned about 1836.

See F. H. Severance, *Old Trails on the Niagara Frontier* (Buffalo, 1903), Parkman's works, especially *Montcalm and Wolfe* (2 vols., Boston, 1884), and *The Conspiracy of Pontiac* (2 vols., Boston, 1851), and a pamphlet by Peter A. Porter *A Brief History of Old Fort Niagara* (Niagara Falls, 1896).

NIAGARA FALLS (formerly Clifton or Suspension Bridge), a town and port of entry of Welland county, Ontario, Canada, 40 m. S.S.E. of Toronto, on the west bank of the Niagara river and opposite the Falls. Pop. (1901) 4244. It is a station on the Grand Trunk, Michigan Central and St Catharines & Niagara Central railways, and has electric railway communication with the chief towns in the neighbourhood. Three large steel bridges connect it with the American town of Niagara Falls on the opposite bank. Its importance is chiefly due to the tourist traffic, but the unrivalled water power is being more and more employed. Factories have sprung up, and power is transmitted to Toronto and other cities. A beautiful park, named after Queen Victoria, extends along the bank of the river for 2½ m. above the Falls.

[1] On the night of the 10th of December 1813 the American general George McClure (1771–1851), upon abandoning Fort George, set fire to Newark, almost destroying the town and causing great suffering among the inhabitants. McClure attempted to justify this act by a strained construction of a letter to him from the secretary of war, but it was promptly disavowed by the United States government. The burning of Newark led to severe reprisals on the part of the British.

NIAGARA FALLS, a city of Niagara county, New York, U.S.A., on the E. side of the Niagara river, at the Falls, 22 m. N.N.W. of Buffalo. Pop. (1900) 19,457, of whom 7326 were foreign-born, (1910 census) 30,445. The city is served by the New York Central & Hudson River, the Wabash, the Erie, the Lehigh Valley, the West Shore and the Michigan Central railways, and by the International Electric railway and the Niagara, St Catharines & Toronto (electric) railway. The city extends along the level summit of the cliffs from above the Falls to some 3 m. below. The river is here crossed by three bridges; the (upper) steel arch bridge, built (1895) on the site of the former suspension bridge (built in 1869; blown down in 1889; rebuilt as a suspension bridge) near the Falls, is crossed by double carriageways and footpaths and by an electric railway, and is probably the longest bridge of the kind in the world, being 1240 ft. long with an arch span of 840 ft.; and 1¼ m. farther down the river are two railway bridges, the Michigan Central's cantilever bridge, completed in 1883, and the (lower) single steel arch bridge (completed in 1897, on the site of John A. Roebling's suspension bridge built in 1851–1856) of the Grand Trunk railway, which has a terminus at Niagara Falls (Clifton), Ontario, and connects here with the New York Central & Hudson River and the Lehigh Valley railways.

The principal buildings of the city are the Niagara Falls Memorial Hospital, the Federal Building and the Niagara Falls Power Co. Building. The city has a Carnegie library, De Veaux College (Protestant Episcopal, chartered in 1853), and Niagara University, a Roman Catholic institution, founded in 1856 by the priests of the Congregation of the Mission and incorporated in 1863 as the Seminary of Our Lady of Angels, a name still used for the theological department, but displaced, since the charter of the university in 1883, by the present name. In the extreme S.W. part of the city is Prospect Park, which with Goat Island immediately S., and several smaller islands, has been, since 1885, the "New York State Reservation at Niagara Falls." From the Falls, which gave the city its first importance as a stopping place for tourists, valuable electric and hydraulic power is derived (by a tunnel 29 ft. deep and 18 ft. wide, passing about 200 ft. under the surface of the city, from the upper steel arch bridge to a point 1¼ m. above the Falls, and by the canal of the Niagara Falls Hydraulic Power and Manufacturing Company). Niagara Falls is an important manufacturing city; the value of the factory products increased from $8,540,184 in 1900 to $16,915,786 in 1905, or 98·1%. The city is the shipping centre for the W. part of Niagara county. The village of Niagara Falls was for a time called Manchester. In 1892 the village of Suspension Bridge (formerly Niagara City) was joined with it under a city charter, which has been frequently amended.

NIAM-NIAM (*Zandeh*, *A-Zandeh*), a people of Central Africa, of mixed Negroid descent. With kindred tribes, they stretch from the While Nile above the Sobat confluence to the Shari affluent of Lake Chad, and from the Bahr-el-Arab, about 10° N., nearly to the equator. Their political ascendancy, weakened by the incessant attacks of the Arab-Nubian slave-raiders before the rise of the Sudanese mahdi in 1882, was afterwards broken by the forces of the Congo Free State and the Anglo-Egyptian Sudan.

The term Niam-Niam appears to be of Dinka origin, meaning in that language "great eaters," with reference, as is supposed, to their cannibalistic propensities. They are called Babungera by the Mangbettu (Monbuttu), A-Madyaka by the Diur, Mundo or Manyanya by the Bongo, Makaraka or Kakaraka by the Mittu. But Niam-Niam has been adopted and generalized by the Sudan and Nubian Mahommedans. Their native name is Zandeh (pl. A-Zandeh), which is current throughout the eastern Niam-Niam domain, a region estimated by Georg Schweinfurth, who visited the country in 1870, at about 48,000 sq. m., with a population of at least two millions. But these by no means constitute a uniform ethnical group, for within this area is the large Madi nation, differing altogether in speech and even

in some respects physically from the ordinary Niam-Niam type. Apart also from numerous tribal divisions, the eastern Niam-Niam proper form three very distinct branches. The bleak northern highlands bordering east on the Bongo and north on Dar-Fertit are occupied by the Banda Niam-Niam. To the southwards are the more civilized Belanda Niam-Niam, who hold the fertile hilly territory of the Nile-Congo watershed. Very different from either are the so-called "White" Niam-Niam, neighbours of the Madi of the Makua-Welle river basin. Their complexion is of a lighter bronze tint, and they are distinguished from the other branches of the family by their tall stature, symmetrical figure, long kinky hair and beard and higher social culture. They wear cotton garments, obtained by barter for ivory, copper and iron, and have a tendency to political unity under one chief.[1]

There is, however, a very distinct Niam-Niam type, one of the most marked in the whole of Africa. "These beings," remarks Schweinfurth, on his first introduction to them, "stood out like creatures of another world . . . a people of a marked and most distinct nationality, and that in Africa and amongst Africans is saying much." They are of medium height and powerful build. The great space between the eyes, which are almond-shaped and slightly slanting, gives them a peculiar expression. They have a very short nose, with correspondingly long upper lip; woolly hair; a very round head, agreeing in this respect with the Bongo of the Bahr-el-Ghazal but differing from the great majority of the other African dark races; features generally round, with less jaw-projection and altogether more regular than the typical Negro; of a ruddy brown or chocolate colour, scarcely ever black, but occasionally bronze and even olive.

The average Niam-Niam is distinguished by some excellent qualities, such as frankness, courage, an instinctive love of art, and above all a genuine and lasting affection for his women, such as is betrayed by no other African race. By tribal custom the men are all hunters, armed with long knives and spears and carrying oblong shields of wicker-work; the women all tillers of the soil, which with little toil yields abundant crops of cereals, yams, manioc, colocasia and Virginian tobacco. Both sexes wear large pins of ivory, iron, monkey or human bone stuck in their hair, and stain their skin with red camwood and the oil of a wild berry. The Niam-Niam are intelligent, skilful builders, and proficient in many native industries. Prominent among these are their earthenware vessels, which display considerable symmetry; iron smelting and metal work, such as swords, knives and spears; wood carvings, such as stools, benches, bowls and tobacco pipes, of varied and intricate design and often admirable works of art. They are great smokers, and very fond of music. Of the ox, horse, ass or camel they have no knowledge; the only domestic animals are poultry, and a breed of dogs, like small wolf-hounds, with smooth red hair, twisted tail like a porker's, large ears, pointed nose and four-clawed hind feet. These curious little "greyhounds" join in the chase with small wooden bells round the neck, and are thus soon found when lost in the woods.

The Niam-Niam are distinguished by their elaborate head-dresses (they formerly wore a sort of big full-buttomed wig, and Dr W. Junker actually saw elderly people in these), and peculiar tattoo markings—square patterns on forehead, temples or cheeks, an X-shaped figure in a cartouche below the chest, and various zigzag, straight or dotted lines on the upper arm and breast. Most of them file the incisors. From the malted grain of a species of eleusine they brew good beer, of a sparkling brown or reddish colour and pleasant bitter taste, derived from the stalk of the same cereal.

In this widespread Negroid family are now provisionally grouped the *Makaraka*, intermingled with the *Mundu*, and the *Babukur* in the north-east (Bahr-el-Ghazal); the *Krej*, *Banda* and *N'Sakkara* in the north-west (Dar-Fertit, and thence to the upper Shari); the *Bansiri*, *Ndris*, *Togbo*, *Languassi*, *Dakoa*, *Ngapu*, *Wia-Wia*, *Manja*, *Awaka*, *Akunga* and others about both slopes of the Congo-Chad water-parting. These last, who give such an enormous westward extension to the family, present much the same physical characters as the Zandeh proper, and speak dialects of the widely diffused Ndris language, which is not Bantu, but appears to show affinities with Zandeh

This great division ethnologists are even disposed to connect with the Fula of west and central Sudan, and to substitute for the now exploded "Nuba-Fula" a "Zandeh-Fula" family, resulting from various secular interminglings between the true negroes and the Berbers of North Africa. Such crossings have undoubtedly been in progress since prehistoric times over an enormous area south of the Sahara (AFRICA: *Ethnology*), and are almost everywhere marked by certain constant characters, such as long ringlety or kinky black hair, coppery, reddish or bronze shades of complexion, brachycephalic (round) head, often highly pronounced, and indicated outwardly by an unusually wide space between the orbits, and generally by somewhat softened negro features. But, owing to the different environments and to the different initial ratios of intermixture, the transitional forms are almost endless, so that it becomes difficult to constitute distinct ethnical groups without calling in the aid of language. Where type and speech correspond, as to a large extent is the case with most of the above-mentioned tribes, even strict systematists will be disposed to constitute separate ethnical groups, at least as working hypotheses, always allowing for the somewhat untrustworthy nature of the linguistic factor. In the case under consideration Fula has no kind of connexion with Zandeh speech, but this by no means precludes the possibility of racial connexion.

Beyond a few meagre vocabularies no materials have yet been collected for the study of the Zandeh language, which, except in the Madi country, appears to be everywhere spoken with considerable uniformity in the eastern Niam-Niam lands. Its phonetic system, such as initial *mb* and vowel *auslaut*, affiliates it, not to the Libyan, as has been asserted, but to the Negro linguistic type. Within this order of speech its pronominal prefix inflection points to affinity rather with the southern Bantu than with the Sudan group of languages. Thus the personal plural *a-*, as in A-Zandeh, A-Madi, A-Banga, &c., would appear to be identical in origin and meaning with the Bantu *wa-*, as in Wa-Ganda, Wa-Swaheli, Wa-Sambara, &c. There is also the same dearth of abstract terms, which renders the translation of Scripture into the Negro tongues such a difficult task. Compare *gumbah*, an expression for the Deity, really meaning "lightning," with the Chinyanja *chuula* = *thunder* = *God* (?) and the Zulu *Unkulunkulu* = *great-grandfather*, also adopted by the missionaries as the nearest equivalent for the Deity in that language.

Politically the dismembered Zandeh empire and dependent principalities are divided up between France, which claims the "sultanates" of Rafai, Dinda, Zemio and Tambura in the Mbomu valley, with all the peoples in Fertit and the Shari basin; Belgium, which administers the eastern section between the Mbomu and the upper Welle; and Great Britain, to whose share have fallen the Makaraka and other Niam-Niam groups of the Bahr-el-Ghazal region.

See John Petherick, *Egypt, the Soudan and Central Africa* (1861); Carlo Piaggia's "Account of the Niam-Niam," communicated by the Marchese O. Antinori to the *Bolletino* of the Italian Geographical Society (1868), pp. 91-168; G. A. Schweinfurth, *Heart of Africa* (English edition, 1873); G. Casati, "Journey to the Niam-Niam Country," in *Esploratore* for August 1883, and *Ten Years in Equatoria* (1891); F. R. Bohndorff, *Reisen in Central Africa* (1885); Dr W. Junker, "Rundreise in dem südlichen Niamniam-Lande," in *Petermann's Mittheilungen* for May 1883, English edition, *Travels in Africa* (1890).

[1] About the middle of the 19th century, most of the eastern Niam-Niam lands appear to have been subject to Yapaty, son of Mabengeh. But after his death they were distributed amongst his seven sons, Renjy, Balia, Perkye, Tombo, Bazimbey, Manuba; and in 1870 there were already fourteen reigning princes of this dynasty, besides several of doubtful relationship with the line of Mabengeh. In the Niam-Niam districts visited by the traders from the Egyptian Sudan there were at that time altogether as many as thirty-five independent chiefs. But reports were current of a very powerful "sultan" named Mofio, whose empire lay some 300 m. farther west. Another large state, founded in the Welle region by Kipa (Kifa), brother of Yapaty, also fell to pieces after his death in 1868. The powerful chiefs Bakangoi and Kanna, visited in 1883 by G. Casati, were sons of this Kipa, whose grave near Kanna's village was still watched by twenty-five "vestals," bound, under penalty of death, to keep a fire constantly burning, and to preserve their chastity inviolate (*Esploratore*, August 1883).

NIAS, the largest island in the chain off the west coast of Sumatra, Dutch East Indies, lying about 1° N., 97° 30' E. It is roughly oblong in form, measuring about 80 m. by 28, and appears to be partly of volcanic origin and to consist partly of older rocks corresponding with those of Sumatra. Its extreme elevation is about 2300 ft. A number of islets (Nako, Bunga, &c.) lie off the west and north coasts. The island is thickly populated by a pagan people, who by some authorities, including F. Junghuhn, have been associated with the Battas, but are probably a distinct branch of the pre-Malayan or Indonesian race. Slavery and head-hunting are universal, despite the efforts of Dutch and German missionary societies. The natives are skilled in

such crafts as weaving and metal-work, as well as in agriculture and road-making. Coco-nut oil is produced on Nias and also more especially on the Nako group. A Dutch commissioner is established at Gunong Sitoli on the east coast, a settlement of Malay and Chinese traders.

NIBELUNGENLIED, or DER NIBELUNGE NÔT, an heroic epic written in a Middle High German dialect. The story on which the poem is based belongs to the general stock of Teutonic saga and was very widespread under various forms, some of which are preserved. Thus it is touched upon in *Beowulf*, and fragments of it form the most important part of the northern *Eddas*, the poets of which evidently assumed that the tale as a whole was well known and that their hearers would be able to put each piece in its proper place. In the prose *Edda*, or *Volsungasaga*, which, though largely primitive in spirit, dates from the 13th century, it is set forth in full. The substance of this Norse version is as follows:—

The three Ases—Odin, Loki and Hörnir—saw an otter devouring a salmon beside a waterfall. They killed and skinned the otter and, taking the skin with them, sought shelter for the night with Rodmar the giant. But Rodmar recognized the skin as that of his son, and demanded as *weregild* gold enough to cover it completely. Loki thereupon went back to the stream, where Andvari in the form of a pike was guarding a great treasure, caught him in a net, and forced him to surrender his hoard. But the piled-up gold left one hair exposed; in order to cover it Loki returned to Andvari and forced him to surrender a magic ring which had the virtue of breeding gold. Thereupon Andvari, enraged, laid upon the hoard and all who should possess it a curse. This curse, the *Leitmotif* of the whole story, began to operate at once. Rodmar, for the sake of the treasure, was slain by his sons Fafnir and Regin; and Fafnir, seizing the whole, retired to a desolate heath and, in the form of a snake or dragon, brooded over the hoard. Regin, cheated of his share, plotted vengeance and the conquest of the treasure.

To Regin, a notable smith, was sent Sigurd—son of the slain hero Sigmundr the Volsung and his wife Hiortis, now wife of the Danish king Alf—to be trained in his craft. To him Regin told of Fafnir and the hoard, and the young hero offered to go out against the dragon if Regin would weld him a sword. But every brand forged by the smith broke under Sigurd's stroke; till at last he fetched the fragments of the sword Gram, Odin's gift to his father, which Hiortis had carefully treasured. These Sigurd forged into a new sword, so hard that with it he could cleave the anvil and so sharp that it would sever a flock of wool floating against it down stream; and, so armed, he sought and slew the dragon. But while roasting Fafnir's heart, which Regin had cut out, Sigurd burned his finger with the boiling fat and, placing it to his lips, found that he could understand the language of birds, and so learned from the chattering of the woodpeckers that Regin was planning treachery. Thereupon he slew the smith and loading the treasure on the magic steed Grani, given to him by Odin, set out upon his travels.

On the summit of a fire-girt hill Sigurd found the Valkyrie Brunhild in an enchanted sleep, and ravished by her beauty awakened her; they plighted their troth to each other and, next morning, Sigurd left her to set out once more on his journey. Coming to the court of Giuki, a king in the Rhine country, Sigurd formed a friendship with his three sons, Gunnar, Hogni and Guthorm; and, in order to retain so valuable an ally, it was determined to arrange a match between him and their sister Gudrun. Queen Grimhild, skilled in magic, therefore gave him an enchanted drink, which caused him to forget Brunhild. Gunnar, on the other hand, wished to make Brunhild his wife, and asked Sigurd to ride with him on this quest, which he consented to do on condition of receiving Gudrun to wife. They set out; but Gunnar was unable to pass the circle of fire round Brunhild's abode, the achievement that was the condition of winning her hand. So Sigurd, assuming Gunnar's shape, rode through the flames on his magic horse, and in sign of troth exchanged rings with the Valkyrie, giving her the ring of Andvari. So Gunnar and Brunhild were wedded, and Sigurd, resuming his own form, rode back with them to Giuki's court where the double marriage was celebrated. But Brunhild was moody and suspicious, remembering her troth with Sigurd and believing that he alone could have accomplished the quest.

One day the two queens, while bathing in the river, fell to quarrelling as to which of their husbands was the greater. Brunhild taunted Gudrun with the fact that Sigurd was Gunnar's vassal, whereupon Gudrun retorted by telling her that it was not Gunnar but Sigurd who rode through the flames, and in proof of this held up Brunhild's ring, which Sigurd had given to her. Then Brunhild "waxed as wan as a dead woman, and spoke no word the day long." Maddened by jealousy and wounded pride, she now incited the three kings to murder Sigurd by exciting their jealousy of his power. The two elder, as bound to him by blood-brotherhood, refused; but the youngest, Guthorm, who had sworn no oaths, consented to do the deed. Twice he crept into Sigurd's chamber, but fled when he found the hero awake and gazing at him with flashing eyes. The third time, finding him asleep, he stabbed him; but Sigurd, before he died, had just strength enough to hurl his sword at the murderer, whom it cut in two. Brunhild, when she heard Gudrun wailing, laughed aloud. But her love for Sigurd was great as ever, and she determined not to survive him; distributing her wealth to her hand-maidens, she mounted Sigurd's funeral pyre, slew herself with his sword, and was burnt with him.

In course of time Gudrun married Atli (Attila), king of the Huns, Brunhild's brother. Atli, intent on getting hold of the hoard, which Gudrun's brothers had seized, invited them to come to his court. In spite of their sister's warnings they came, after sinking the treasure in the Rhine. On their refusal to surrender the hoard, or to say where it was concealed, a fierce fight broke out, in which all the followers of Gunnar and Hogni fell. Atli then once more offered to spare Gunnar's life if he would reveal his secret; but Gunnar refused to do so till he should see the heart of Hogni. The heart of a slave was laid before him, but he declared that that could not be Hogni's, since it quaked. Hogni's heart was then cut out, the victim laughing the while; but when Gunnar saw it he cried out that now he alone knew where the hoard was and that he would never reveal the secret. His hands were then bound, and he was cast into a den of venomous serpents; but he played so sweetly on the harp with his toes that he charmed the reptiles, except one adder, by which he was stung to death. Gudrun, however, avenged the death of her brothers by slaying the sons she had borne to Atli and causing him unwittingly to drink their blood and eat their hearts. Finally, in the night, she killed Atli himself and burned his hall; then, leaping into the sea, she was carried by the waves to new scenes, where she had adventures not connected with those recorded in the *Nibelungenlied*.

This story, in spite of the late date of the *Volsungasaga* and of added elements due to the imagination of its author, evidently represents a very primitive version. In the *Nibelungen* story, on the other hand, though its extant versions are of much earlier date, and though it contains elements equally primitive not found in the other, the spirit and the motives of the earlier story have to a large extent been transmuted by later influences, the setting of the story being—though by no means consistently—medieval rather than primitive. Thus the mysterious hoard is all but lost sight of; no mention is made of the curse attached to it; and it is only as an afterthought that Siegfried (Sifrit) is described as its master. Everywhere the supernatural elements are eliminated or subordinated, and the story becomes a drama of human motives, depending for its development on the interplay of human passions and activities:

> To us in ancient story wonders great are told
> Of heroes rich in glory and of adventures bold,
> Of feast and joyous living, of wailing and of woe,
> Of gallant warriors striving may ye now many marvels know.[1]

That is all he gives by way of preface. The gods have vanished from the scene; there is nothing of Loki and his theft of Andvari's hoard, nothing of Odin and his gifts of the sword Gram and the magic horse Grani; and not till the third *Aventiure*, when Siegfried comes to Worms, are we given even a hint that such things as the sword and treasure exist. On the other hand, in the very next stanza we are introduced to what is to be the leading motive of the plot: Kriemhild, the Burgundian princess, on whose account "many a noble knight was doomed to perish." For, as in the legend of Sigurd the Volsung, the plot had turned upon the love and vengeance of Brunhild, so in the song of the Nibelungs it is the love and vengeance of Kriemhild, the Gudrun of the northern saga, that forms the backbone of the story and gives it from first to last an artistic unity which the *Volsungasaga* lacks. Of the story itself it is impossible here to give anything but the barest outline, sufficient to show its contrast with the northern version. We may note at the outset the spirit of pessimism which, like the curse on the hoard, pervades the whole. It appears in the very first *Aventiure*, when Kriemhild, in answer to her mother's interpretation of her dream, declares that she will never marry, since "it has been proved by the experience of many women that joy is in the end rewarded by sorrow"; it is repeated in the last stanza but one of the long poem: "As ever joy in sorrow ends and must end alway." This tragic contrast is emphasized by the pomp and circumstance that surround the ill-fated hero of the story at the beginning.

[1] Uns ist in alten maeren wunders vil gesait
Von heleden lobebaeren von grôzer arebeit
Von freude unt hôchgezîten von weinen unde klagen
Von küener recken strîten muget ir nun wunder hoeren sagen.

The primitive setting of the northern version has vanished utterly. Sigmund is king of the Netherlands; the boy Siegfried is brought up by "wise men that are his tutors" (*Avent.* ii.); and when, attracted by the fame of Kriemhild's beauty, he rides to Worms to woo her, it is as the typical handsome, accomplished and chivalrous king's son of medieval romance.

It is at this point (*Avent.* iv.) that some of the primitive elements of the story are suddenly and awkwardly introduced. As Siegfried approaches Worms, Kriemhild's brothers, the Burgundian kings Gunther, Giselhêr and Gêrnot watch his coming, and to them their faithful retainer, "the grim Hagen," explains who he is. This, he exclaims, can be no other than the hero who slew the two kings of the Nibelungs, Schilbunc and Nibelunc, and seized their treasure, together with the sword Balmunc and the *tarnkappe*, or cape of darkness, which has the virtue of making him who wears it invisible. Another adventure, too, he can tell of him, namely, how he slew a dragon and how by bathing in its blood his skin became horny, so that no weapon could wound him, save in one place, where a linden leaf had fallen upon him as he stooped, so that the blood did not touch this spot.[1] In spite of Hagen's distrust and misgivings, Siegfried now fights as the ally of the Burgundians against the Saxons (*Avent.* iv.), and undertakes, on condition of receiving Kriemhild to wife, to help Gunther to woo Queen Brunhild, who can only be won by the man who can overcome her in three trials of strength (*Avent.* vi.). Siegfried and Gunther accordingly go together to Brunhild's castle of Isenstein in Iceland, and there the hero, invisible in his *tarnkappe*, stands beside Gunther, hurling the spear and putting the weight for him, and even leaping, with Gunther in his arms, far beyond the utmost limit that Brunhild can reach (*Avent.* vii.). Brunhild confesses herself beaten and returns with the others to Worms, where the double marriage is celebrated with great pomp (*Avent.* x.). But Brunhild is ill content; though she saw Siegfried do homage to Gunther at Isenstein she is not convinced, and believes that Siegfried should have been her husband; and on the bridal night she vents her ill humour on the hapless Gunther by tying him up in a knot and hanging him on the wall. "I have brought the evil devil to my house!" he complains to Siegfried next morning; and once more the hero has to intervene; invisible in his *tarnkappe* he wrestles with Brunhild, and, after a desperate struggle, takes from her her girdle and ring before yielding place to Gunther. The girdle and ring he gives to his wife Kriemhild (*Avent.* x.).

One day, while Siegfried and his wife were on a visit to the Burgundian court, the two queens fell to quarrelling on the question of precedence, not in a river but on the steps of the cathedral (*Avent.* xiv.). Kriemhild was taunted with being the wife of Gunther's vassal; whereupon, in wrath, she showed Brunhild the ring and the golden girdle taken by Siegfried, proof that Siegfried, not Gunther, had won Brunhild. So far the story is essentially the same as that in the *Volsungasaga*; but now the plot changes. Brunhild drops out, becoming a figure altogether subordinate and shadowy. The death of Siegfried is compassed, not by her, but by the "grim" Hagen, Gunther's faithful henchman, who thinks the glory of his master unduly overshadowed by that of his vassal. Hagen easily persuades the weak Gunther that the supposed insult to his honour can only be wiped out in Siegfried's blood; he worms the secret of the hero's vulnerable spot out of Kriemhild, on pretence of shielding him from harm (*Avent.* xv.), and then arranges a great hunt in the forest, so that he may slay him when off his guard.

The 16th *Aventiure*, describing this hunt and the murder of Siegfried, is perhaps the most powerful scene in all medieval epic. To heighten the effect of the tragic climax the poet begins with a description of the hunting, and describes the high spirits of Siegfried, who captures a wild boar, rides back with it to camp, and there lets it loose to the great discomfiture of the cooks.

When the hunters sat down to feast, it was found that the wine had been forgotten. Hagen thereupon proposed that they should race to a spring of which he knew some way off in the forest. Siegfried readily agreed, and though handicapped by carrying shield, sword and spear, easily reached the goal first, but waited, with his customary courtesy, until the king had arrived and drunk before slaking his own thirst. Then, laying aside his arms, he stooped and drank. Hagen, seizing the spear, thrust it through the spot marked by Kriemhild on Siegfried's surcoat. The hero sprang up and, finding that his sword had been removed, attacked Hagen with his shield.

> Though to death he was wounded he struck so strong a stroke
> That from the shattered shield-rim forthwith out there broke
> Showers of flashing jewels; the shield in fragments lay.[2]

Then reproaching them for their cowardice and treachery, Siegfried fell dying "amid the flowers," while the knights gathered round lamenting.. At this point two stanzas may be quoted as well illustrating the poet's power of dramatic characterization:—

> The king of the Burgundians he too bewailed his death:
> Then spake the dying hero: "Nay, now you waste your breath!
> You weep for an ill fortune that you yourself have wrought:
> That is a shameful sorrow: it were better you said nought!"
> Then out spake the grim Hagen: "I know not why ye plain:
> This is for us the ending of sorrow and of pain.
> Full few are left of foemen that dare withstand us now.
> Glad am I that the hero was by this hand of mine laid low!"

This account of the death of Siegfried, which embodies the ancient German tradition, is far finer than the northern version, according to which Hogni murders the hero in his bed. The whole spirit of this *Aventiure*, too, is primitive Teutonic rather than medieval. The same is true, indeed, of the whole of the rest of the poem. Siegfried, to be sure, is buried with all the pomp of medieval Catholic rites; but Kriemhild, while praying for his soul like a good Christian, plots horrible vengeance like her pagan prototype. With this significant difference, however: Gudrun revenged upon her husband the death of her brothers; Kriemhild seeks to revenge upon her brothers the death of her husband. The Catholic bond of marriage has become stronger than the primitive Teutonic bond of kinship. Mistress now of the inexhaustible hoard of the Nibelungs, Kriemhild sought to win a following by lavish largesses; but this Hagen frustrated by seizing the treasure, with the consent of the kings, and sinking it in the Rhine, all taking an oath never to reveal its hiding-place, without the consent of the others, so long as they should live (*Avent.* xix.). At last, however, after thirteen years, Kriemhild's chance came, with a proposal of marriage from Etzel (Attila) king of the Huns, whom she consented to marry on condition that he would help her to vengeance (*Avent.* xx.). Then more years passed; old feuds seemed to be forgotten; and the Burgundian kings, in spite of Hagen's warnings, thought it safe to accept their sister's invitation to visit her court (*Avent.* xxiii. xxiv.).

The journey of the Burgundians into Hunland is described by the poet at great length (*Avent.* xxv.-xxvii.). The story is full of picturesque detail and stirring incident, full also of interesting problems in folk-lore and mythology; and throughout it is dominated by the figure of the grim Hagen, who, twitted with cowardice and his advice spurned, is determined that there shall be no turning back and that they shall go through with it to the bitter end. With his own hands he ferries the host over the Danube and then, when the last detachment has crossed, destroys the boat, so that there may be no return. At Attila's court (*Avent.* xxviii.) it is again Hagen who provokes the catastrophe by taunting Kriemhild when she asks him if he has brought with him the hoard of the Nibelungs:

> "The devil's what I bring you!" Hagen then replied,
> "What with this heavy harness and my shield beside,
> I had enough to carry: this helmet bright I brought;
> My sword is in my right hand, and that, be sure, I bring you not!"

The sword was Siegfried's. It is Hagen, too, who after the

[1] Compare the heel of Achilles.

[2] This last fight with the shield seems to have belonged to the common stock of heroic story. Cf. the account of the death of Hereward "the Wake" given by Geoffrey Gaimar in the *Chronicon Anglo-Norm.* and adopted by Freeman in his *Norman Conquest* (1871), iv. 486.

first onslaught of the Huns strikes off the head of Ortlieb, the son of Etzel and Kriemhild, and who, amid the smoke and carnage of the burning hall, bids the Burgundians drink blood if they are thirsty.

Besides Hagen, during the ride into Hunland and in the final fight, another figure comes to the front, that of Volkêr the Fiddler, so far only mentioned as a hero of the Saxon war in *Avent.* ii. He rides fiddling at the head of the host; he plays to the weary warriors in the intervals of the battle in the court of Etzel's palace; but he is also expert at performing other music, with "a strong fiddle-bow, mighty and long, like to a sword, exceeding sharp and broad." He is the type of the medieval knightly minstrel of the age of the Minnesang.

But for all their prowess, after a prolonged struggle (*Avent.* xxix.-xxxvii.), the Burgundians were at last overwhelmed. Most of the chief figures of heroic saga had come up against them: Attila, Hildebrand, the Ostrogoth Theodoric (Dietrich von Bern). To the last-named even Hagen armed with Siegfried's sword had to yield (*Avent.* xxxviii.). Kriemhild came to him as he lay in bonds and demanded the Nibelung treasure. He refused to reveal its hiding-place so long as Gunther, also a prisoner, should live. Gunther was accordingly slain by the queen's orders and his head was brought to Hagen, who cried out when he saw it that all had been accomplished as he had foretold:

"Now none knows where the hoard is save God and I alone:
That to thee, devil-woman, shall nevermore be known!"

Whereupon Kriemhild slew him with Siegfried's sword. But Kriemhild was not destined, like Gudrun, to set out on further adventures. Hildebrand, horrified at her deed, sprang forward and cut her to pieces with his sword.

In sorrow now was ended the king's high holiday,
As ever joy in sorrow ends and must end alway.

To some MSS. of the *Nibelungenlied* is added a supplementary poem called the *Klage* or *Lament*, a sequel of 2160 short-line couplets, describing the lament of the survivors—notably Etzel—over the slain, the burying of the dead, and the carrying of the news to the countries of the Burgundians and others. At the end it is stated that the story was written down, at the command of Bishop Pilgrim of Passau, by a writer named Konrad (Kuonrât) in Latin, and that it had since been sung (*getichtet*) often in the German tongue.

Sources of the Story.—The origin and nature of the various elements that go to make up the story of the *Nibelungenlied* have been, and continue to be, the subject of very lively debate. The view at one time most generally accepted was that first propounded by Karl Lachmann in his "Kritik der Sage von den Nibelungen" (*Rheinisches Museum für Philologie*, Num. 249, 250, 1829, republished in his *Zu den Nibelungen . . . Anmerkungen* in 1836), namely, that the story was originally a myth of the northern gods, modified into a heroic saga after the introduction of Christianity, and intermingled with historical elements. This view is maintained by Richard von Muth in his *Einleitung in das Nibelungenlied* (Paderborn, 1877), who thus sums up the result of his critical researches: "The basis of all is an old myth of a beneficent divine being (Siegfried), who conquers daemonic powers (the Nibelungen), but is slain by them (the Burgundians turned Nibelungen); with this myth was connected the destruction of the Burgundian kingdom, ascribed to Attila, between 437 and 453, and later the legend of Attila's murder by his wife; in this form, after Attila and Theodoric had been associated in it, the legend penetrated, between 555 and 583, to the North, where its second part was developed in detail on the analogy of older sagas, while in Germany a complete change of the old *motif* took place." To this theory the objection is raised that it is but a theory; that it is unsupported by any convincing evidence; and that the process which it postulates, that, namely, of the transformation of the gods into heroes by the popular imagination, is contrary to all that we know of the fate of dethroned deities, who are apt to live on in fairy stories in very unheroic guise. So early as 1783 Johannes von Müller of Göttingen had called attention to the historical figures appearing in the *Nibelungenlied*, identifying Etzel as Attila, Dietrich of Bern as Theodoric of Verona, and the Burgundian kings Gunther, Giselhêr and Gêrnot as the Gundaharius, Gislaharius and Godomar of the *Lex Burgundiorum*; in 1820 Julius Leichtlen (*Neuaufgefundenes Bruchstück des Nibelungenliedes*, Freiburg-im-Breisgau) roundly declared that "the *Nibelungenlied* rests entirely on a historical foundation, and that any other attempt to explain it must fail." This view was, however, overborne by the great authority of Lachmann, whose theory, in complete harmony with the principles popularized by the brothers Grimm, was accepted and elaborated by a long series of critics. It is only of late years that criticism has tended to revert to the standpoint of Müller and Leichtlen and to recognize in the story of the Nibelungen as a whole a misty and confused tradition of real events and people. Mythical elements it certainly contains; and to those figures which—like Siegfried, Brunhild, Hagen and the "good margrave" Ruedegêr of Bechlâren—cannot be traced definitively to historical originals, a mythical origin is still provisionally ascribed. But criticism is still busy attempting to trace these also to historical originals, and Theodor Abeling (*Das Nibelungenlied*, 1907) makes out a very plausible case for identifying Siegfried with Segeric, son of the Burgundian king Sigimund, Brunhild with the historical Brunichildis, and Hagen with a certain Hagnericus, who, according to the *Life of St Columban*, guided the saint (the chaplain of the *Nibelungenlied*), who had incurred the enmity of Brunichildis, safe to the court of her grandson Theuderich, king of the West Franks.

Herr Abeling's theory of the sources of the *Nibelungen* story is one among many; but, as it is one of the latest and not the least ingenious, it deserves mention. That the Icelandic *Eddas* contain the oldest versions of the legend, though divided and incomplete, is universally admitted. It is equally well established, however, that Iceland could not have been its original home. This Herr Abeling locates among the Franks of what is now southern France, whence the stories spread, from the 6th century onwards, on the one hand across the Rhine into Franconia, on the other hand westwards and northwards, by way of Ireland—at that time in close intercourse with continental Europe—and the northern islands, to Iceland. Hence the two traditions, the German and the Icelandic, of which the latter alone is preserved in something of its primitive form,[1] though primitive elements survive in the *Nibelungenlied*.

The basis of the story is then, according to this view, historical, not mythical: a medley of Franco-Burgundian historical traditions, overlaid with mythical fancies.[2] The historical nucleus is the overthrow of the Burgundian kingdom of Gundahar by the Huns in 436; and round this there gathered an accretion of other episodes, equally historical in their origin, however distorted, with a naïve disregard of chronological possibility: the murder of Segeric (*c.* 525), the murder of Sigimund by the sons of Chrothildis, wife of Clovis (identified by Abeling with Kriemhild), the murder of Attila by his Burgundian wife Ildico (see KRIEMHILD). In the *Eddas* the identity of the original Franco-Burgundian sagas is fairly preserved. In the *Nibelungenlied*, on the other hand, the influence of other wholly unconnected stories is felt: thus Hildebrand appears during the final fight at Etzel's court, and Theodoric the Great (Dietrich von Bern; see THEODORIC), for no better reason than that the Dietrich legend had sent him into exile there, and that he must have been there when the Burgundians arrived.

Origin of the Poem.—The controversy as to the underlying elements of the Nibelung legend extends to the question of the authorship and construction of the poem itself. Was it from the first—whatever additions and interpolations may have

[1] The *Eddas* were first written down, as is commonly assumed, by Bishop Saemund Sigfusson (1056–1133)

[2] The process of this overlaying is easy to realize if we remember how usual it was to transfer characteristics and episodes drawn from immemorial folk-lore to successive historical personages. A good example is the "Swan-maiden" myth connected with the house of Bouillon (see LOHENGRIN). See also other interesting cases cited in the chapter on the "Geste of John de Courci" in Mr J. H. Round's *Peerage and Pedigree* (London, 1910).

followed—conceived as a single, coherent story, or is it based on a number of separate stories, popular ballads akin to the *Eddas*, which the original author of the *Nibelungenlied* merely collected and strung together? The answer to these questions has been sought by a succession of scholars in a critical comparison of the medieval MSS. of the poem still surviving. Of these 33 are now known, of which 10 are complete, the rest being more or less fragmentary. The most important are those first discovered, viz. the MSS. lettered C (Hohenems, 1755), B (Schloss Werdenberg, 1769), A (Hohenems, 1779); and round these the others more or less group themselves. They exhibit many differences: put briefly, C is the most perfectly finished in language and rhythm; A is rough, in places barbarous; B stands half-way between the two. Which is nearest to the original? Karl Lachmann (*Zu den Nibelungen und zur Klage, Anmerkungen*, 1836) decided in favour of A. He applied to the *Nibelungenlied* the method which Friedrich August Wolf had used to resolve the *Iliad* and *Odyssey* into their elements. The poem, according to Lachmann, was based on some twenty popular ballads, originally handed down orally, but written down about 1190 or 1200. This original is lost, and A—as its roughness of form shows—is nearest to it; all other MSS., including B and C, are expansions of A. The great authority of Lachmann made this opinion the prevalent one, and it still has its champions. It was first seriously assailed by Adolf Holtzmann (*Untersuchungen über das Nib.*, Stuttgart, 1854), who argued that the original could not have been strophic in form—the fourth lines of the strophes are certainly often of the nature of "padding"—that it was written by Konrad (Kuonrât of the *Klage*), writer to Bishop Pilgrim of Passau about 970–984, and that of existing MSS. C is nearest to this original, B the copy of a MS. closely akin to C, and A an abbreviated, corrupt copy of B. This view was adopted by Friedrich Zarncke, who made C the basis of his edition of the *Nibelungenlied* (Leipzig, 1856). A new hypothesis was developed by Karl Bartsch in his *Untersuchungen über das Nibelungenlied* (Leipzig, 1865). According to this the original was an assonance poem of the 12th century, which was changed between 1190 and 1200 by two separate poets into two versions, in which pure rhymes were substituted for the earlier assonances: the originals of the *Nibelungenlied* and *Der Nibelunge Nôt* respectively. Bartsch's subsequent edition of the *Nibelunge Nôt* (1st ed., Leipzig, 1870) was founded on B, as the nearest to the original. To this view Zarncke was so far converted that in the 1887 edition of his *Nibelungenlied* he admitted that C shows signs of recension and that the B group is purer in certain details.

As a result of all this critical study Herr Abeling comes to the following conclusions. The poem was first written down by a wandering minstrel about 971 to 991, was remodelled about 1140 by Konrad,[1] who introduced interpolations in the spirit of chivalry and was perhaps responsible for the metre; during the wars and miseries of the next fifty years manners and taste became barbarized and the fine traditions of the old popular poetry were obscured, and it was under this influence that, about 1190, a jongleur (*Spielmann*) revised the poem, this recension being represented by group B. After 1190, during the Golden Age of the art poetry (*Kunstdichtung*) of the Minnesingers (*q.v.*), a professional poet (Rudolf von Ems?) again remodelled the poem, introducing further interpolations, and changing the title from *Der Nibelunge Nôt* into *Das Nibelungenliet*, this version being the basis of the group C. The MS. A, as proved by its partial excellence, is based directly on Konrad's work, with additions borrowed from B.

[1] Bartsch and others ascribe its authorship, with much plausibility, to an Austrian knight of the race of Kürenberg, the earliest of the courtly lyric poets, whose lyrics are written in the Nibelung strophe. Thus compare Kürenberg's lyric (Lachmann and Haupt, *Des Minnesangs Frühling*, 4th ed., F. Vogt, Leipzig, 1888)—

"Ich zôch mir einen valken mêre danne ein jâr"

with the *Nibelungen Nôt* (Bartsch) *Av.* i. 13—

"troumte Kriemhilde,
Wie sie zûge einen valken, starc scoen' und wilde."

Theodor Abeling (*Das Nibelungenlied und seine Literatur* (Leipzig, 1907) gives a full bibliography, embracing 1272 references from 1756 to 1905. There are English translations of the poem by A. G. Foster-Barham (1887), Margaret Armour (prose, 1897) and Alice Horton (1898). (W. A. P.)

NICAEA, or **NICE** [mod. *Isnik, i.e. εἰς Νικαίαν*] an ancient town of Asia Minor, in Bithynia, on the Lake Ascania. Antigonus built the city (316 B.C. ?) on an old deserted site, and soon afterwards Lysimachus changed its name from Antigonia to Nicaea, calling it after his wife. Under the Roman empire Nicaea and Nicomedia disputed the title of metropolis of Bithynia. Strabo describes the ancient Nicaea as built regularly, in the form of a square, with a gate in the middle of each side. From a monument in the centre of the city all the four gates were visible at the extremities of great cross-streets. After Constantinople became the capital of the empire Nicaea grew in importance, and after the conquest of Constantinople by the Crusaders became the temporary seat of the Byzantine emperor; the double line of walls with the Roman gates is still well preserved. The possession of the city was long disputed between the Greeks and the Turks. It remained an important city for some time after its final incorporation in the Ottoman empire; but became subsequently an insignificant village.

NICAEA, COUNCIL OF. The Council of Nicaea (A.D. 325) is an event of the highest importance in the history of Christianity. Its convocation and its course illustrate the radical revolution which the position of this religion, within the confines of the Roman empire, had undergone in consequence of the Edict of Milan. Further, it was the first oecumenical council, and this fact invested it with a peculiar halo in the eyes of subsequent ages; while among its resolutions may be found a series of decisions which acquired a lasting significance for the Christian Church. This applies more especially to the reception of the doctrine of the Trinity; for though, immediately after the close of the synod, it was exposed to a powerful opposition, it gained the day, and, in the form which it received at Nicaea and at the council of Constantinople (381), still enjoys official validity in the principal churches of Christendom. Finally, the council marks an epoch in the history of the conception of the Christian religion, in that it was the first attempt to fix the criteria of Christian orthodoxy by means of definitely formulated pronouncements on the content of Christian belief—the acceptance of these criteria being made a *sine qua non* of membership of the Church. Moreover, it admitted the principle that the state might employ the secular arm to bring the Christian subjects of the Roman world-empire under the newly codified faith. Thus the Nicene Council is an important stage in the development of the state-church, though the completion of that edifice was delayed till the reign of Theodosius the Great. The relation of the emperor Constantine to the assembly was in itself a step in the direction of that independent treatment of ecclesiastical affairs, which, in the following centuries, created the peculiar type of the Byzantine state-church.

From his accession Constantine had shown himself the friend of the Christians; and, when his victory over Licinius (A.D. 323) gave him undisputed possession of the crown, he adhered to this religious policy, distinguishing and fortifying the Christian cause by gratuities and grants of privilege. This propitiatory attitude originated in the fact that he recognized Christianity—which had successfully braved so many persecutions—as the most vital and vigorous of religions, and as the power of the future. Consequently he directed his energies toward the establishment of a positive relationship between it and the Roman state. But the Church could only maintain its great value for the politician by remaining the same compact organism which it had proved itself to be under the stormy reign of Diocletian. Scarcely, however, did it find itself in the enjoyment of external peace, when violent feuds broke out in its midst, whose extent, and the virulence with which they were waged, threatened to dismember the whole religious body. Donatism in the West was followed by the Arian struggle in the East. The former movement had been successfully arrested, though it survived in North Africa till the 5th century. The conflict kindled by the

Alexandrian presbyter Arius (*q.v.*) assumed greater dimensions and a more formidable character. Constantine at first attempted to restore quiet in Alexandria by transmission of an epistle by Bishop Hosius of Cordova, but his admonitions were fruitless. Accordingly, since other debatable points were at issue, he had recourse to an institution previously evolved by the Christian Church—the convocation of a synod to pronounce on burning questions—qualifying it, however, to correspond with the altered circumstances. He convened a council, designed to represent the whole Church of the empire, at Nicaea in Bithynia, a town situated no great way from the imperial summer-residence of Nicomedia and within easy reach by sea of the Oriental bishops. Among the various estimates of the number of delegates, the statement of Athanasius, who speaks of 318 members, has dominated the tradition. In consequence of the vast distances, the West was but weakly represented. From Spain, Hosius—the above-mentioned bishop of Cordova—made his appearance; from Gaul, Nicasius of Dijon; from Dalmatia, Domnus of Stridon; from Italy, Marcus of Calabria with two presbyters as deputies of the Roman bishop Silvester; and from North Africa, Caecilian of Carthage. Thus an immense majority of the synod hailed from the East. The bishops of the three most important metropolises were present—Alexander of Alexandria. Eustathius of Antioch and Macarius of Jerusalem—while a prominent rôle was also played by Eusebius, bishop of the imperial city Nicomedia, and his erudite namesake, Eusebius of Caesarea. Of the other prelates not a few had distinguished themselves as confessors in the later persecution, and still bore the honourable traces of their sufferings. Since the bishops were accompanied by priests, Nicaea witnessed an array of clerics such as had never before been mustered in a single place. Among the attendant clergy, the still youthful deacon Athanasius, destined to succeed Alexander in the see of Alexandria, was prominent as the most powerful antagonist of Arianism (see ATHANASIUS). The synod met in the imperial palace from the 20th of May to the 25th of July. What order of procedure obtained, and in whom the presidency was vested, are problems which admit of no certain solution: the one indisputable fact is that Constantine—who, at his appearance, was accorded a ceremonious reception, and himself delivered an address on the occasion—exercised a decided influence on the discussions.

The deliberations on the Arian question passed through several distinct stages before the final condemnation of Arius and his doctrines was reached. A clearly defined standpoint with regard to this problem—the relationship of Christ to God—was held only by the attenuated group of Arians and a far from numerous section of delegates, who adhered with unshaken conviction to the Alexandrian view. The bulk of the members occupied a position between these two extremes. They rejected the formulae of Arius, and declined to accept those of his opponents; that is to say, they were merely competent to establish negations, but lacked the capacity, as yet, to give their attitude of compromise a positive expression. In the main they perpetuated the line of Origen. That the majority of the council should have adopted this neutral tendency is easily intelligible when we consider the state of theology at that period. True, at Nicaea this majority eventually acquiesced in the ruling of the Alexandrians; yet this result was due, not to internal conviction, but partly to indifference, partly to the pressure of the imperial will—a fact which is mainly demonstrated by the subsequent history of the Arian conflicts. For if the Nicaean synod had arrived at its final decision by the conscientious agreement of all non-Arians, then the confession of faith there formulated might indeed have evoked the continued antagonism of the Arians, but must necessarily have been championed by all else. This, however, was not the case; in fact, the creed was assailed by those very bodies which had composed the *laissez-faire* centre at Nicaea; and we are compelled to the conclusion that, in this point, the voting was no criterion of the inward convictions of the council.

In the synod, an Arian confession of faith was first brought forward and read; but it aroused such a storm of indignation that obviously, in the interests of a restoration of ecclesiastical peace, there could be no question of its acceptance. On this, Eusebius of Caesarea submitted the baptismal creed of his community; and this met with the imperial approval. Since the creed dated from a period anterior to the outbreak of the Arian struggle, its reception would have been equivalent to a declaration on the part of the council that it declined to define its position with reference to the controversy of the hour. That the greater number of delegates were not disinclined to adopt this subterfuge, so congenial to their standpoint, and to shelve the actual solution of the whole problems by recognition of this or some similar neutral formula, is extremely probable. But the emperor manifestly saw that, if the difficulties were eluded in any such mode, it was inevitable from the very nature of the case, that they should rise again in an accentuated form, and that consequently no pacification could be expected from this policy. Since the Eastern Church subscribed to the Alexandrian solution of the question, he drew the natural deduction and concluded that he had here a genuine presentment of the feeling of the Church, which, if it received official sanction, might be justly expected to restore peace to the Christian community. But, in pronouncing for this view, he was careful to dissociate himself from the formulation of a new confession: for it was imperative to avoid even an apparent innovation in the articles of faith. Accordingly he proposed that the Caesarean creed should be modified by the insertion of the Alexandrian passwords—as if for the purpose of more accurate definition—and by the deletion of certain portions. That he appreciated the import of these alterations, or realized that this revision was virtually the proclamation of a new doctrine, is scarcely probable. The creed thus evolved—the expression ὁμοούσιος is of Western origin—was finally signed by all the deputies with the exception of the bishops Theonas of Marmarica and Secundus of Ptolemais: even the Arians had submitted. The two recalcitrant prelates, with the presbyter Arius, were banished to Illyria; Eusebius of Nicomedia and Theognis of Nicaea were also driven into exile, and at the same time the works of Arius were condemned to be burned under pain of death.

But this artificial unity was no ratification of peace: in fact, it paved the way for a struggle which convulsed the whole empire. For it was the proclamation of the Nicene Creed that first opened the eyes of many bishops to the significance of the problem there treated; and its explanation led the Church to force herself, by the arduous path of theological work, into compliance with those principles, enunciated at Nicaea, to which, in the year 325, she had pledged herself without genuine assent.

In addition to the Arian *impasse*, there was the schism of Bishop Meletius of Lycopolis in the Thebaid, whose settlement Constantine had added to the programme of the council. He and Peter, bishop of Alexandria, had come into conflict over the treatment of the "backsliders" (*lapsi*) in the Diocletian persecution; and their strife acquired additional bitterness from the fact that it was extended to cover the prerogatives of the Alexandrian bishopric. Peter had composed a treatise advocating moderate principles and censuring the courtship of martyrdom for its own sake, then gone so far as to save himself by flight. Meletius, on the other hand, represented the most rigorous school, and allowed himself high-handed infringements of the law. When this had resulted in his deposition by a synod, a faction still adhered to him, and the Meletians became a schismatic community; and such they remained even after the death of Peter (311), who demonstrated by his martyrdom that his counsels of moderation were not prompted by cowardice. This Meletian schism made for disorder in the ecclesiastical life of Egypt all the more because its followers sided with Arius. The Nicene Council broke the strength of the movement by great concessions to the Meletian bishops, and, at the same time, expressly recognized the supreme rights of the Alexandrian see over Egypt, Libya and the Pentapolis. Since, in the resolution dealing with this point (canon vi.), reference was made to the analogous and undisputed suzerainty of the Roman see—over

the ten suburbican provinces, attached to the diocese of Rome and including middle and lower Italy, with the islands of Sicily, Corsica and Sardinia—this decision enshrines an important piece of evidence for the history of the papacy. On this opportunity, his ancient privileges were restored to the bishop of Jerusalem, who, in consequence of the political history of the Holy Land, had been subordinated to the metropolitan of Caesarea (canon vii.). The path was smoothed for the readmittance of the Novatians (*Cathari*) into the church, by recognizing, in this case, their clergy, with the bare stipulation that the laying-on of hands should follow their written promise to be faithful to the doctrine of the Catholic Church (canon viii.).

With regard to the much-debated question as to the termination of the Easter festival, the synod committed itself so far as to pronounce in favour of the Alexandrian cycle—a settlement which entailed such important results in practical life that it was communicated to the Christian churches by Constantine in a circular letter. The problem, whether a baptism, performed by heretics in the name of Christ or the Trinity, should rank as a baptism or not, had given rise to an animated controversy between the Roman bishop Stephen, who answered in the affirmative, and Cyprian of Carthage, who gave an equally decided negative. The council followed the Roman practice, merely declaring the nullity of baptisms imparted by the adherents of Paul of Samosata (canon xix.). An important provision, in point of ecclesiastical law, was that the chirotony of a bishop required the presence of at least three other bishops of his province, while the confirmation of the choice remained at the disposal of the metropolitan (canon iv.). A further regulation was that two provincial synods should be held annually (canon v.); but a law enacting the celibacy of the clergy was rejected at Nicaea, since Paphnutius, an aged bishop of Egypt who had been tested in persecution, warned his colleagues against the danger of imposing too arduous a yoke upon the priesthood, and defended the sanctity of marriage.

As Constantine had convened the synod, so he determined its conclusion. A brilliant banquet in the imperial palace—of which Eusebius of Caesarea gives an enthusiastic account—marked its close, after which the bishops were granted their return. The admonitions to peace with which he dismissed them proved unavailing for the reasons indicated above: but the reputation of the first oecumenical council suffered no abatement in consequence.

(ed. 3, Leipzig, 1897); also Bernoulli, "Nicaenisches Konzil," *ib.*, vol. xiv. (1904), pp. 9 sqq. (C. M.)

NICANDER (2nd cent. B.C.), Greek poet, physician and grammarian, was born at Claros, near Colophon, where his family held the hereditary priesthood of Apollo. He flourished under Attalus III. of Pergamum. He wrote a number of works both in prose and verse, of which two are preserved. The longest, *Theriaca*, is an hexameter poem (958 lines) on the nature of venomous animals and the wounds which they inflict. The other, *Alexipharmaca*, consists of 630 hexameters treating of poisons and their antidotes. In his facts Nicander followed the physician Apollodorus. Among his lost works may be mentioned: *Aetolica*, a prose history of Aetolia; *Heteroeumena*, a mythological epic, used by Ovid in the *Metamorphoses* and epitomized by Antoninus Liberalis; *Georgica* and *Melissourgica*, of which considerable fragments are preserved, said to have been imitated by Virgil (Quintilian x. 1. 56). The works of Nicander were praised by Cicero (*De oratore*, i. 16), imitated by Ovid, and frequently quoted by Pliny and other writers. His reputation does not seem justified; his works, as Plutarch says (*De audiendis poetis*, 16), have nothing poetical about them except the metre, and the style is bombastic and obscure; but they contain some interesting information as to ancient belief on the subjects treated.

The Scholia (from the Göttingen MS.) have been edited by G. Wentzel, in *Abhandlungen der k. Gesellschaft der Wiss. zu Göttingen*, xxxviii. (1892). See also W. Vollgraff, *Nikander und Ovid* (Groningen, 1909 foll.).

NICANOR, Greek grammarian, son of Hermeias of Alexandria (or Hierapolis), lived during the reign of Hadrian. He chiefly devoted himself to the study of punctuation and the difference of meaning caused by it. Hence he was nicknamed "the Punctuator" (ὁ στιγμαρίας). He is known to have written on the punctuation of Homer and Callimachus. He was possibly the author of a work Περὶ Μετονομασιῶν (*On the Change of Names of Places*), of which some fragments are preserved in C. W. Müller, *Fragmenta Historicorum Graecorum*, iii. 632.

Edition of the *Iliad* and *Odyssey* fragments by L. Friedländer (1850) and O. Carnuth (1875) respectively.

NICARAGUA, a republic of Central America, bounded on the N. by Honduras, E. by the Caribbean Sea, S. by Costa Rica, and W. by the Pacific Ocean (for map, see CENTRAL AMERICA). Pop. (1905), about 550,000; area, 49,200 sq. m. Nicaragua forms an irregular equilateral triangle with its base stretching for 280 m. along the Caribbean Sea from Cape Gracias à Dios southwards to the San Juan delta, and its apex at the Coseguina volcano, on the Bay of Fonseca, which separates Nicaragua on the Pacific side from Salvador. The frontier which separates the republic from Honduras extends across the continent from east-north-east to west-south-west. It is defined by the river Segovia for about one-third of the distance, or from Cape Gracias à Dios to 86° W.; it then deflects across the watershed on the east and south of the Hondurian river Choluteca, crosses the main Nicaraguan cordillera (mountain chain), and follows the river Negro to the Bay of Fonseca. In accordance with the treaty of 1858, which was confirmed in 1888 by the United States president, acting as arbitrator, and more fully defined in 1896, the boundary towards Costa Rica is drawn 2 m. S. of the San Juan river and Lake Nicaragua, as far as a point parallel to the centre of the western shore of the lake. It is then continued south-westward for the short distance which intervenes between this point and the northernmost headland of Salinas Bay, on the Pacific.

Physical Features.—The coasts of Nicaragua are strikingly different in configuration. The low, swampy and monotonous shore of the Caribbean, with its numerous lagoons and estuaries, and its fringe of reefs and islets, contains only three harbours: Gracias à Dios, Bluefields or Blewfields, and Greytown (San Juan del Norte). Its length, from Cape Gracias à Dios to the San Juan delta, is nearly 300 m. The Pacific coast, measuring some 200 m. from the Bay of Fonseca to Salinas Bay, is bold, rocky and unbroken by any great indentation; here, however, are the best harbours of the republic—the southern arm of the Bay of Fonseca (*q.v.*), Corinto, Brito and San Juan del Sur.

The surface of the country is naturally divided into five clearly distinct zones: (1) the series of volcanic peaks which extend parallel to the Pacific at a little distance inland; (2) the plains and lakes of the great depression which lies to the east of these mountains and stretches from sea to sea, between the Bay of Fonseca and the mouths of the San Juan; (3) the main cordillera, which skirts the depression on the east, and trends north-west from Monkey Point or Punta Mico on the Caribbean Sea, until it is merged in the ramifications of the Hondurian and Salvadorian highlands; (4) the plateaus which slope gradually away from the main cordillera towards the Caribbean; (5) the east or Mosquito coast, with its low-lying hinterland. The last-named region has to a great extent had a separate history; and it was only in 1894 that the Mosquito Reserve, a central enclave which includes more than half of the littoral and hinterland, was incorporated in the republic and renamed the department of Zelaya. (See MOSQUITO COAST.)

Though situated almost on the western edge of the country, and greatly inferior, both in continuity and in mean altitude, to the main cordillera, the chain of volcanic cones constitutes a watershed quite equal in importance to the cordillera itself. It consists for the most part of isolated igneous peaks, sometimes connected by low intervening ridges. It terminates in the extreme north-west with Coseguina (2831 ft.), and in the extreme south-east with the low wooded archipelagos of Solentiname and Chichicaste near the head of the San Juan river. Between these two extremes the chief cones, proceeding southwards, are: the Maribios chain, comprising El Viejo (5840 ft.), Santa Clara, Telica, Orota, Las Pilas, Axosco, Momotombo (4127 ft.), all crowded close together between the Bay of Fonseca and Lake

Managua; Masaya or Popocatepec (which was active in 1670, 1782, 1857 and 1902, and attains a height of 2972 ft.), and Mombacho (4593 ft.), near Granada; lastly, in Lake Nicaragua the two islands of Zapatera and Ometepe or Omotepec with its twin peaks Ometepe (5643 ft.) and Madera. On the 20th of January 1835 Coseguina was the scene of one of the most tremendous eruptions on record. The outbreak lasted four days and the volcanic dust and ashes erupted fell over a vast area, which comprised Jamaica, southern Mexico and Bogotá. After a long repose Ometepe also burst into renewed activity on the 19th of June 1883, when the lavas from a new crater began to overflow and continued for seven days to spread in various directions over the whole island. In the Maribios district occur several volcanic lakelets, such as that of Masaya, besides numerous *infernillos*, low craters or peaks still emitting sulphurous vapour and smoke, and at night often lighting up the whole land with bluish flames.

In the great lacustrine depression of Nicaragua is collected all the drainage from the eastern versant of the volcanic mountains, from the sheer western escarpment of the main cordillera, and from a large area of northern Costa Rica. The only river which flows out of the depression on the north enters the Bay of Fonseca at Tempisque. The accumulated waters which pour down into the depression are gathered into the two basins of Lake Managua and Lake Nicaragua. Both basins have a maximum depth of some 260 ft. Lake Managua, the more northerly, has a length of 30 m. and varies in breadth from 8 to 16 m. Its area is about 575 sq. m. After the rains a portion of its overflow escapes southwards into the lower and larger Lake Nicaragua, through the Panaloya channel. Steamers ply on both lakes, but the channel is rendered impassable by a rapid near the town of Tipitapa, at its northern extremity. Here there is a waterfall of 13 ft. The existence of ancient lacustrine beaches, upheaved between the two basins by volcanic agencies or left dry by some enlargement of the San Juan outfall, and a consequent subsidence of the water-level, seems to indicate that the lakes were formerly united. Now, however, Lake Managua is almost a closed basin in the dry season, when the stream in parts of the Panaloya channel sinks to a mere rivulet. The surface of Lake Nicaragua after the rains is 110 ft. above sea-level. The lake is 100 m. long, and has a maximum breadth of 45 m. and an area of 2970 sq. m. It is thus the largest sheet of fresh water between Lake Michigan and Lake Titicaca on the borders of Bolivia and Peru. Towards the San Juan outlet its depth decreases to 6 or 8 ft., owing to the vast accumulation of the silt washed down into the lake by its principal Costa Rican affluent, the Rio Frio. Much of this silt is again carried away by the San Juan. Under the influence of the intermittent trade-winds Lake Nicaragua rises and falls regularly, whence the popular notion that it was a tidal lake. It is also exposed to the dangerous Papagayos tornadoes, caused by the prevailing north-easterly winds meeting opposite currents from the Pacific. It is drained on the south by the San Juan river, which flows generally east by south to the Caribbean Sea. The distance from the lake to the principal or Colorado mouth of the river is 95 m., and the average width of the channel 1500 ft. Near its mouth the main stream branches out into a wide delta. Navigation is greatly impeded by shifting banks of silt, and especially by five rapids which can only be traversed when the river is in full flood. It is often asserted that these rapids were artificially formed by the Spaniards themselves to prevent the buccaneers from penetrating to Lake Nicaragua. But Herrera (*Dec.* iii. book 2, chap. 3) speaks of the "great rocks and falls" which prevented Cordova, the first circumnavigator of the lake, from descending the San Juan in 1522; and although the English traveller Gage states that in his time (17th century) vessels reached Granada direct from Spain, there can be little doubt that the rapids are natural obstructions. The various schemes which have been put forward for the conversion of the San Juan and the lacustrine depression into an interoceanic waterway are fully discussed under PANAMA CANAL.

The main Nicaraguan cordillera, which flanks the depression on the east, has often been called the Cordillera de los Andes, from its supposed continuity with the mountain-chains of Panama and the west coast of South America. There is in fact no such continuity, for the San Juan valley completely separates the mountains of Panama from the main Nicaraguan system. This severance, it is true, may be geologically recent, and some geologists see, in the five rapids of the San Juan, remnants of a connecting ridge which the river has swept away. But the evidence for past continuity is inconclusive, while there can be no doubt about the present severance of the two mountain systems. The main cordillera bears different names in different parts of Nicaragua. Thus the important section which terminates at Monkey Point is commonly called the Cordillera de Yolaina. The summits of the main cordillera seem nowhere to exceed 7000 ft. in altitude; the mean elevation is probably less than 2000 ft.; the declivity is sheer towards the lakes, and gradual towards the Caribbean. Along the shores of the lakes the cordillera may be described as a double range, consisting of two series of ridges divided by a great longitudinal valley. The lower series, which adjoins the lakes, rises near Lake Managua, and marches parallel to the main crest of the cordillera as far as the northern base of the Yolaina section; it then diverges, trending south-east nearly as far as Greytown, while the axis of the Yolaina section has a more easterly direction.

On the east, the main cordillera abuts upon the region of plateaus and savannas, which occupies nearly half of the area of Nicaragua. It is likely that this region was once a single uniform tableland, sloping by degrees to the flat Mosquito Coast, in which direction its level still sinks. But the relief of the tableland has been wholly changed by fluvial action. The great rivers which flow eastward to the sea have fissured and moulded the surface into deep ravines alternating with high plateaus, ridges and isolated hills. Large tracts of these uplands have never been adequately explored, and consist of virgin forest and prairie. The principal river is the Segovia, which rises in the main cordillera due north of Lake Managua, winds E.N.E. as far as 85° W., and constitutes the frontier until it reaches the sea at Cape Gracias à Dios, after a course of more than 450 m., during which it receives many tributaries. Its basin is narrow and its volume not remarkable, but in length it surpasses all other Central American rivers. Its nomenclature, like that of many lesser streams in the plateau region, is somewhat confusing; for while the Spanish colonists were settling beside its headwaters the mid-stream was hardly known except to the native Indians, and the lower reaches were frequented by buccaneers, often of British or Dutch origin. In addition to the three names of Segovia, Coco or Cocos, and Wanks, which are applicable to the whole river, different parts have from time to time received the names of Cabullal, Cabrugal, Cape River, Encuentro, Gracias, Herbias, Oro, Pantasma, Portillo Liso, Tapacac, Telpaneca, Somoro, Yankes, Yare and Yoro. Other important streams, all flowing to the Caribbean in a direction E. by S., are the Hueso, Wawa, Cuculala, Prinzapolca, Rio Grande, Bluefields and Rama. The Rio Grande or Amaltara, which receives one large tributary, the Tuma, is navigable for about 100 m. The Bluefields, Blewfields, Escondida, or Rio del Desastre, which derives its best-known name from that of Blieveldt, a Dutch corsair, is navigable for 65 m. The hydrography of Nicaragua is curious in two respects: as in the Amazonian region all the large rivers flow east, none escaping to the Pacific; and the main watershed does not correspond with the main cordillera, which is inferior in this particular both to the volcanic mountains and to the plateau region.

The geology, fauna and flora of Nicaragua may be studied in connexion with those of the neighbouring countries (see CENTRAL AMERICA).

Climate.—The climate is mild and healthy for Europeans on the uplands, such as those of Segovia and Chontales, which have a mean elevation of 2000 to 3000 ft. above sea-level. But elsewhere it is distinctly tropical, with two seasons—wet from May to November on the Pacific slope, and from June to December on the Caribbean, and dry throughout the winter months. The mean annual temperature is about 80° Fahr., falling to 70° at night and rising to 90° at noon in summer. Nicaragua comes within the zone of the wet north-east trade-winds, which sweep inland from the Atlantic. The rainfall is heavy along the west side of the lacustrine basin, with an annual mean at Rivas of 102 in., but this figure is sometimes greatly exceeded on the east coast, where rain is common even in the dry season. Observations made at Greytown in 1890 showed the extremes of temperature to be 89° Fahr. in September for the maximum and 70° Fahr. in January for the minimum; the rainfall for the whole year amounted to 297 in., the rainiest month having been July (52·5 in.) and the driest, May (4·9 in.). Earthquakes are felt at times on the Pacific slope, but in Nicaragua they are less violent than in the neighbouring countries.

Inhabitants.—Accurate statistics as to the growth and distribution of the population cannot be obtained, and the figures given below are based on estimates which can only be approximately correct. The census of 1882 gave the total as 275,816; this appears to have risen in 1890 to 375,000, in 1900 to 500,000, and in 1905 to 550,000, or 11 inhabitants per sq. m. There can thus be no doubt that the population is increasing with extraordinary rapidity, although there is hardly any immigration. The number of Europeans and their pure-blooded descendants is about 1200, and tends to increase. Spanish and German elements preponderate in the foreign colonies. The most densely peopled region and the focus of civilization is the lacustrine depression and the surrounding uplands. Here are all the large towns, and hither European settlers were attracted from the first by the temperate climate, rich soil, and natural waterways. The development of Nicaragua, unlike that of most American countries (notably Brazil and the United States), has been from west to east. The great mass of the population is a composite race, descended chiefly from the native "Indians," their Spanish conquerors, many of whom were Galicians, and the negro slaves introduced during the colonial period. Intermarriage with British, Dutch, and French with Caribs and Creoles has further complicated the ethnology of the country, producing "Indians" with fair hair and blue eyes, and half-castes with European features and Indian or negroid coloration, or with European

coloration and Indian or negroid features. The prevailing language is a degenerate form of Spanish, nearer to Galician than to Castilian. Most of the native dialects have ceased to exist, but a corrupt form of English is spoken on parts of the east coast. All who speak Spanish are classed as Ladinos; the half-castes generally are termed Mestizos; and the name of Sambos or Zambos is confined to the descendants of Indian and negro parents; these are also incorrectly called Caribs. The number of the uncivilized Indians, whose camps or villages are situated in open glades among the forests of the plateau region, is usually estimated at 30,000; but this would seem to be an exaggeration. Pure-blooded Indians are not numerous, as whole districts were depopulated and whole tribes exterminated by the Spanish colonists and the buccaneers. A few may be descendants of the Aztecs and Mayas, whose temples, sculptures, burial-grounds, &c., have not yet been fully explored. For a general account of this ancient civilization and of the Indian tribes see CENTRAL AMERICA and MEXICO: *Archaeology*. A collection of Nicaraguan antiquities is preserved in the National Museum at Washington, U.S.A.; and the archaeological collection brought to Europe by Dr W. Lehmann in 1910 was exhibited in the Berlin Museum of Fine Arts.

Chief Towns and Communications.—The capital is Managua (pop. 1905, about 30,000); other important towns are Leon (45,000), Granada (25,000), Masaya (20,000), Chinandega (12,000), and the seaports of Corinto (3000) and Greytown (2500). These are described in separate articles. At the beginning of the 20th century, Nicaragua had few good roads, and none at all east of the main cordillera. Transport in the plateau region was mainly effected by means of pack mules, over the roughest of tracks. But between 1900 and 1905 contracts were signed for the construction of three highways, leading respectively from Matagalpa, from Nueva Segovia and from the Pis Pis mining district to the head of steam navigation on the Segovia, about 160 m. above Cape Gracias. These highways were to be linked to the western system by 79 m. of road connecting Matagalpa with Momotombo. For the construction and upkeep of roads a tax varying from one to ten pesos is levied on all males over eighteen years old. There are 160 m. of state railways, running from Corinto to Leon, Managua, Granada and Diriamba, with branches to El Viejo and Momotombo. Contracts for additional lines were signed between 1900 and 1905. The steamers which ply on the great lakes and the San Juan, besides other vessels which visit the principal Caribbean and Pacific ports, are national property; but from the 1st of January 1905 all the state railways were leased to a syndicate for fifteen years and the steamers for twenty-five years. There are also 20 m. of private railway near the mouth of the Rio Grande, and private steam tramways on the western shore of Lake Nicaragua. Corinto is the headquarters of shipping; it is visited by two-thirds of the 2100 vessels of 550,000 tons (including coasters) which annually enter the ports of the republic. The coasting trade is restricted to vessels under the Nicaraguan flag. At the beginning of the 20th century most of the ocean-going steamers were owned in Germany or the United States; British enterprise being chiefly represented by schooners trading from Jamaica to Bluefields and Greytown. Nicaragua joined the postal union in 1882, and the western provinces have a fairly complete telegraphic and telephonic system.

Industries and Commerce.—The principal agricultural product is coffee, the yield of which increased from 4,528,300 lb in 1880 to 11,382,000 lb in 1890, and 26,400,000 lb in 1900. Coffee is grown principally in the Matagalpa region, on the uplands of the interior. The plantations are chiefly owned and managed by Germans, and the product is of good quality; but coffee-planting, like most Nicaraguan industries, suffers from the scarcity of labour. On the Caribbean coast bananas are cultivated and largely exported to the United States. In 1903 more than 2,000,000 bunches were consigned to New Orleans. The cultivation of cotton has been often attempted, but with little success. Sugar is grown and there are many small sugar factories, but little of the output is exported. The cocoa export is also small; tobacco, rice, beans and other crops are grown for local use. Rubber is collected in the forests, and plantations have been formed. Dye-woods and indigo are exported, but the demand for vegetable dyes has decreased. Cattle-rearing is successfully pursued, live cattle and hides being important articles of export. Cheese and butter are manufactured in large quantities for home consumption. Horses and pigs are also reared, but not sheep. In 1899 the government sold about 52,000 acres of public land lying about 18 m. E. of Lake Nicaragua for the purpose of colonization. The purchaser undertook to introduce settlers from northern Europe, to import cattle for the improvement of the Nicaraguan breed, to plant rubber and vanilla, and to provide schools for agricultural instruction. The sale of Nicaraguan spirits is a state monopoly. From the 1st of January 1904 it was leased to a syndicate of distillers for six years. Gold-mining is carried on along the Caribbean littoral. In 1898 the gold dust and bar exports from Bluefields were of the value of £25,760; in 1900, £62,000; and in 1907, £65,000. Copper, coal, petroleum, silver and precious stones are also found, and there seems little reason to doubt that the mineral resources of Nicaragua, though undeveloped, are nearly as rich as those of Honduras. Other industries include manufactures of leather, boots and shoes, furniture, bricks and pottery, cigars and cigarettes, beer, wine and spirits, candles and soap. The largest and most numerous commercial firms are German, but there are also French, British, and even Chinese establishments, although the immigration of Chinese is prohibited by law. The principal exports are (in order of value) coffee, bananas, gold, rubber, cattle and hides, dye-woods and cabinet woods. The principal imports are cotton and woollen goods, machinery and hardware, flour, beer, wine, spirits and drugs. The United States and Great Britain send respectively 60% and 20% of the imports, receiving 60% and 8% of the exports. The average yearly value of the foreign trade is about £1,200,000—exports, £700,000; imports, £500,000.

Money, Weights and Measures.—There is one bank of issue, the Bank of London and Central America, which has a capital of £260,000 (£130,300 paid). The monetary unit is the silver peso or dollar of 100 cents, which weighs 25 grammes, ·900 fine. The current coin consists largely of Mexican and Central and South American dollars; but little coin is in circulation. The currency is mostly paper, notes being issued directly by the treasury and by the bank. The notes issued by the bank must be covered to the extent of 40% by gold and silver; the actual bank reserve is stated to be from 65 to 100% of the notes issued. The value of the paper peso fluctuates; in 1904 the premium on gold stood at 640%. The value of the silver peso in fractional silver money is about nineteen pence; in a single coin about twenty pence. The exportation of silver pesos is prohibited. In 1899 a nickel coinage was introduced. The metric system of weights and measures was legalized in January 1893.

Finance.—The revenue of the republic is derived mainly from customs duties, liquor, tobacco and slaughter taxes, railways and steamers, the postal and telegraph services, and the gunpowder monopoly. The principal spending departments are those of war and marine, internal development, and finance. The published accounts, however, present no continuous or clear view of the national receipts and disbursements. Revenue and expenditure vary considerably, but neither often falls below £300,000 or rises above £500,000. In 1886 the republic contracted a railway loan in London to the amount of £285,000 at 6% interest, and in July 1894 the interest fell into default. In 1895 an arrangement was made for the reduction of interest to 4%, the beginning of amortization, and the creation of "coffee warrants" to be used in the payment of export duties on coffee assigned for the service of the debt. In the four years 1897–1900 the sales of these warrants amounted to 1,028,990 gold pesos or (at 23d., the average rate for this period) £98,610. In July 1905 the outstanding amount of the debt was £253,600. In 1905 a further loan of 12,500,000 francs (£500,000) was raised in Paris at 5%. The internal debt amounts to about £400,000.

Constitution and Administration.—The former constitution, proclaimed on the 4th of July 1894 and amended on the 10th of December 1896, was superseded on the 30th of March 1905, when a new constitution was promulgated. By this instrument the legislative power is vested in a single chamber of 36 members (instead of 40, as under the old constitution), elected by universal male suffrage for six years (instead of two). The executive is entrusted to a president similarly chosen for six years (instead of four) and aided by a cabinet representing the five ministries of foreign affairs and education, finance, internal administration and justice, war and marine, and public works. For administrative purposes the republic is divided into 13 departments and 2 comarcas, each under a political head who acts as military commandant and controls education, finance, &c. The administration of justice is entrusted to numerous courts of first instance, three courts of appeal, and a supreme court. The active army of 4000 men can be increased to 40,000 in war. All able-bodied citizens between the ages of seventeen and fifty-five are compelled to serve one year with the colours and are then enrolled in the reserve. Roman Catholicism is the prevailing creed, but all religions are tolerated, and none receives any endowment or other special privilege from the state. The bishop of Leon, whose diocese is included in the archiepiscopal province of Guatemala, is the spiritual head of the Roman Catholics. There are numerous elementary schools, at which the teaching is free and compulsory, besides ten colleges for secondary or technical education, and two universities.

History.—For a general account of the Spanish administration during the colonial period, *i.e.* up to 1821, and of the subsequent attempts to unite all the Central American republics in a single

federal state, see CENTRAL AMERICA. The history of the Mosquito Reserve and of the relations between Nicaragua and Great Britain is told in full under MOSQUITO COAST.

First discovered by Columbus in 1502, Nicaragua was not regularly explored till 1522, when Gil Gonzalez Davila penetrated from the Gulf of Nicoya to the western provinces and sent his lieutenant Cordova to circumnavigate the great lake. The country is said to take its name from Nicaras or Nicaragua (also written Micaragua), a powerful Cholutec chief, ruling over most of the land between the lakes and the Pacific, who received Davila in a friendly spirit and accepted baptism at his hands. Nicaragua's capital seems to have occupied the site of the present town of Rivas. The Spaniards overran the country with great rapidity, both from this centre northwards, and southwards from the Honduras coast. The occupation began with sanguinary conflicts between the two contending waves of intrusion. Granada was founded in 1524 on the isthmus between the two lakes as the capital of a separate government, which, however, was soon attached as a special province to the captaincy general of Guatemala, which comprised the whole of Central America and the present Mexican state of Chiapas. Hence, during the Spanish tenure, the history of Nicaragua is merged in that of the surrounding region. Of its five earliest rulers "the first had been a murderer, the second a murderer and rebel, the third murdered the second, the fourth was a forger, the fifth a murderer and rebel" (Boyle). Then came the hopeless revolts of the Indians against intolerable oppression, the abortive rebellions of Hernandez de Contreras and John Bermejo (Bermudez) against the mother country (1550), the foundation of Leon, future rival of Granada, in 1610, its sack by the buccaneers under William Dampier in 1685, and, lastly, the declaration of independence (1821), not definitively acknowledged by Spain till 1850.

In 1823 Nicaragua joined the Federal Union of the five Central American states, which was dissolved in 1839. While it lasted Nicaragua was the scene of continual bloodshed, caused partly by its attempts to secede from the confederacy, partly by its wars with Costa Rica for the possession of the disputed territory of Guanacaste between the great lake and the Gulf of Nicoya, partly also by the bitter rivalries of the cities of Leon and Granada, respective headquarters of the Liberal and Conservative parties. During the brief existence of the Federal Union no fewer than three hundred and ninety-six persons exercised the supreme power of the republic and the different states. The independent government of Nicaragua was afterwards distinguished almost beyond all other Spanish-American states by an uninterrupted series of military or popular revolts, by which the whole people was impoverished and debased. One outstanding incident was the filibustering expedition of William Walker (*q.v.*), who was at first invited by the Liberals of Leon to assist them against the Conservatives of Granada, and who, after seizing the supreme power in 1856, was expelled by the combined forces of the neighbouring states, and on venturing to return was shot at Trujillo in Honduras on the 12th of September 1860.

Under the administration of Chamorro, who became president in 1875, a difficulty with Germany occurred. The German government asserted that one of its consuls had been insulted, and demanded an indemnity of $30,000 (about £2800), a demand to which Nicaragua only submitted after all her principal ports had been blockaded. The successor of President Chamorro was General Zavala, whose administration brought Nicaragua to a higher degree of prosperity than she had ever known. He was succeeded in 1883 by Dr Cárdenas, during whose presidency the attempt of General Barrios to unite the five Central American states was a cause of war between Guatemala and Honduras on one side, and Salvador, Nicaragua, and Costa Rica on the other. Cárdenas had taken command of the united Nicaraguan and Costa Rican army when Barrios died, and on the 11th of April 1885 a treaty of peace was signed. Don Evaristo Carazo succeeded Dr Cárdenas as president of the republic in 1887, but died when he had served a little over two years, and was succeeded by Dr Roberto Sacasa. Under Carazo's administration the boundary question between Nicaragua and Costa Rica had been settled by arbitration, the president of the United States acting as arbitrator. While Dr Sacasa was president of Honduras, Salvador and Guatemala signed a treaty, under which the United States of Central America were to be formed. The president of Nicaragua adhered to this treaty, but the National Congress refused to ratify it. Sacasa was overthrown by a revolution in 1893, and was succeeded by a provisional government, which in its turn was deposed soon after by another uprising, at the head of which was General José Santos Zelaya. His position was regularized by the constitution of 1894, and he was re-elected president in 1898 for another term of four years. Under his government the incorporation of the Mosquito Reserve into the territory of Nicaragua took place. In 1895 occurred the Hatch incident, which led to the occupation of the port of Corinto by a British fleet. Mr Hatch, British pro-vice-consul at Bluefields, being accused of conspiracy against the Nicaraguan government, was arrested, along with other British subjects, and expelled. For this action Nicaragua was required to pay an indemnity of $15,000. An attempt to overthrow Zelaya was made in February 1896, but it was crushed after several months of severe fighting. There were occasional disturbances subsequently, but none sufficient to overturn President Zelaya, who was again re-elected in 1902 and 1906. In 1907 he carried to a successful issue the war which broke out in that year between Nicaragua and Honduras (*q.v.*). But he was believed to be planning the conquest of other Central American states, and his policy of granting monopolies and commercial concessions to his own supporters aroused widespread discontent. In October 1909 an insurrection broke out in the Atlantic departments. The execution (after alleged torture) of two citizens of the United States named Grace and Cannon, who were said to have fought in the revolutionary army under General Estrada, led to the despatch of United States warships to Nicaragua; but in the absence of full evidence President Zelaya's responsibility for the execution could not be proved.[1] On the 1st of December the United States broke off diplomatic relations with Nicaragua, and in an official note Secretary Knox described the Zelayan administration as a "blot on the history" of the republic. Fighting at Bluefields was prevented by the U.S. cruiser "Des Moines" (18th December), an example followed at Greytown by the British cruiser "Scylla"; but elsewhere along the Atlantic coast the insurgents gained many victories. In the battle of Rama (23rd December) they captured the greater part of the government troops. On the following day Zelaya took refuge on board a Mexican gunboat, and sailed for Mexico. Dr Madriz, one of his supporters, had already succeeded him as president.

NICASTRO, a town and episcopal see of Calabria, Italy, in the province of Catanzaro, 17 m. W.N.W. of Catanzaro by rail, and 5½ m. E. of S. Eufemia, a station on the line along the

[1] General Medina and other officers were tried by a Nicaraguan court-martial for the murder of Grace and Cannon, but were acquitted on the 28th of January 1910.

west coast from Naples to Reggio di Calabria. Pop. (1901) 13,671 (town), 18,150 (commune). It is situated on the isthmus between the gulfs of S Eufemia and of Squillace, the narrowest part of Calabria, 970 ft. above sea-level, and commands a fine view. The ruined castle served as the place of imprisonment of Frederick II.'s son Henry. The place suffered greatly from the earthquake of 1638, which also destroyed the Benedictine abbey of S Eufemia, founded by Robert Guiscard.

NICCOLI, NICCOLO DE' (1363–1437), Italian humanist, was born and died at Florence. He was one of the chief figures in the company of learned men which gathered round Cosimo de' Medici, who played the part of Augustus to Niccoli's Maecenas. Niccoli's chief services to classical literature consisted in his work as a copyist and collator of ancient MSS.; he corrected the text, introduced divisions into chapters, and made tables of contents. His lack of critical faculty was compensated by his excellent taste; in Greek (of which he knew very little) he had the assistance of Ambrogio Traversari. Many of the most valuable MSS. in the Laurentian library are by his hand, amongst them those of Lucretius and of twelve comedies of Plautus. Niccoli's private library was the largest and best in Florence; he also possessed a small but valuable collection of ancient works of art, coins and medals. He regarded himself as an infallible critic, and could not bear the slightest contradiction; his quarrels with Filelfo, Guarino and especially with Traversari created a great sensation in the learned world at the time. His hypercritical spirit (according to his enemies, his ignorance of the language) prevented him from writing or speaking in Latin; his sole literary work was a short tract in Italian on Latin Orthography, which he withdrew from circulation after it had been violently attacked by Guarino.

See the *Life* in *Traversarii Epistolae* (ed. L. Mehus, 1759); G. Voigt, *Die Wiederbelebung des klassischen Alterthums* (1893); G. Zippel, *Niccolò Niccoli* (Florence, 1890).

NICCOLITE, a mineral consisting of nickel arsenide, NiAs, containing 43·9% nickel and 56·1% arsenic. Crystals are hexagonal, but are rare and indistinct. It usually occurs as compact masses. A characteristic feature is the pale copper-red colour, with metallic lustre, on the uneven fractured surfaces. It is opaque and brittle, and the streak is brownish-black. The specific gravity is 7·5, and the hardness 5½. Small quantities of sulphur, iron and cobalt are usually present, and sometimes the arsenic is largely replaced by antimony. Antimonial varieties are known as arite, and form a passage to the isomorphous species breithauptite (nickel antimonide). Niccolite occurs with ores of cobalt, silver and copper at Annaberg and Schneeberg in Saxony, at Sangerhausen and Mansfeld in Prussian Saxony and other localities; it has occasionally been found in Cornwall and Scotland. The original arite (aarite) is from Mount Ar (Aar) near Pic du Midi d'Ossau in the Pyrenees.

The names niccolite (J. D. Dana, 1868) and nickeline (F. S. Beudant, 1832) refer to the presence of nickel (Lat. *niccolum*). Owing to its copper-red colour the mineral is commonly called "copper-nickel," the German equivalent of which, *Kupfernickel*, was used as early as 1694. (L. J. S.)

NICE, a city of France, the chief town of the department of the Alpes Maritimes, and previous to 1860 the capital of the county of Nice (Nizza) in the kingdom of Sardinia, 739 m. by rail from Paris. Pop. (1901) 127,027, of whom 105,109 were permanent residents; in winter-time there is a large influx of visitors. It occupies a fine position at the mouth of the Paillon (Paglione), a stream (often dried up in summer) which, after a course of 20 m., enters the northern end of the Baie des Anges. A steep isolated limestone hill, 308 ft. in height, running back for some distance from the shore, forms the historical nucleus of the town. Formerly crowned by a castle, which, previous to its destruction by the duke of Berwick in 1706, was one of the strongest fortresses on the coast, it is now laid out as a public pleasure-ground, and planted with aloe, cactus, agave and palm. Towards its south-west corner stands a tower (Tour Bellanda or Clérissy) dating, it is said, from the 5th century. The old town stretches along the western base of the hill; the "town of the 18th century" occupies the ground farther west, which slopes gently towards the Paillon; and away to the north-east and north and west beyond the stream lie the ever-growing quarters of the modern city. To the east of the hill, and thus out of sight of the more fashionable districts, the commercial quarter surrounds the port. The whole frontage of Nice is composed of fine embankments: the Quai des Ponchettes, constructed in 1770 round the base of the castle hill, is continued westward by the Quai du Midi to the public gardens and the municipal casino, whence the Promenade des Anglais (so called because it was begun in 1822–1824 at the cost of the English colony), a boulevard 85 ft. wide, extends for more than a mile to the mouth of the Magnan, and in 1904 was prolonged to the Var. A pier projecting into the sea from the promenade contains a "crystal palace." The course of the Paillon also is embanked on both sides, and at one part the Place Masséna, one of the largest public squares in the city, and the principal resort of foreign visitors, and the Avenue Masséna (leading thence to the Promenade des Anglais) have been laid out across the stream. Besides a Roman Catholic cathedral—Ste Réparate, dating from 1650—Nice possesses two Russian churches, two synagogues and an Anglican chapel. Architecturally the most remarkable church is Notre Dame du Voeu, a modern Gothic building with two towers 213 ft. high, erected by the town in 1835 to commemorate its preservation from cholera. The secular buildings include the town hall, the prefecture, the theatres, the hospitals, the lycée (founded by the Jesuits in the 17th century), the natural history museum, the library (especially rich in theology), and, at some distance from the town, the astronomical and meteorological observatory on Mont Gros (1220 ft.). The industrial establishments comprise perfumery factories, distilleries, oil-works, furniture and wood-work factories, confectionery works, soap-works, tanneries and a national tobacco factory employing several hundred persons. Besides the vine, the trees principally cultivated in the neighbourhood are the olive, the orange, the mulberry and the carob; and the staple exports are oil, agricultural produce, fruits and flowers.

Nice now joins on the north-east the ancient episcopal town of Cimiez, in which are situated the largest and most elegantly appointed hotels. Reckoning from east to west the town is surrounded by a girdle of beautiful towns—Carabacel, St Etienne, St Philippe and Les Beaumettes. On the east of the port lie Montboron, Riquier and St Roch, the last partly occupied by barracks. The entrances to the port of Nice and the outer pier have been improved; that of the outer port is 300 ft. wide, and that of the inner 220 ft. The area of the port is about 15 acres, the length of quayage available 3380 ft., the depth of water 20 ft., its trade, mostly coastal, being shared principally between French and Italian vessels, the arrivals being about 1235 vessels of some 300,000 tons annually. Nice is an episcopal see (first mentioned at the end of the 4th century) which since 1860 is in the ecclesiastical province of Aix en Provence. It is the headquarters of a military division forming part of the corps d'armée of Marseilles. Protected towards the north by hills which rise stage behind stage to the main ridge of the Alps, Nice is celebrated for the mildness of its climate. The mean temperature is 60° Fahr., that of winter being 49°, of spring 56°, of summer 72° and of autumn 63°. For a few nights in winter the mercury sinks below freezing point, but snow is practically unknown, falling, on an average, only half a day in the year. The highest reading of the thermometer is rarely above 90°. There are sixty-seven days with rain in the course of the year; but it usually falls in heavy showers which soon leave the sky clear again, though the whole annual amount exceeds 32 in. Fine days and rainy days are almost equally distributed throughout the different seasons. The winds are very variable, sometimes changing several times a day. Apart from the ordinary land and sea breezes, the most frequent is the east wind, which is especially formidable during autumn. The south-west wind (called *Libeccio*, or wind of Lybia) is moist and warm; the north-east (or *Gregaou*, Greek), which is happily

rare, brings storms of hail and even snow in winter. The mistral (from the north-west) and the tramontane (from the north) are generally stopped by the mountains; but when they do reach the city they raise intolerable dust-storms. For two thousand years the climate of Nice has been considered favourable in chest complaints. Those who are requiring rest, and those suffering from gout, asthma, catarrhs, rachitic affections, scrofula, stone, also experience benefit; but the reverse is the case when heart disease, nervous disorders or ophthalmia are concerned. Autumn is the best season; in spring the sudden changes of temperature demand great care. Means of passing the time pleasantly are fairly abundant. The city is at its liveliest during the carnival festivities, in which, as at Rome, battles are waged with sweetmeats and flowers.

History.—Nice (*Nicaea*) was founded about two thousand years ago by the Phocaeans of Marseilles, and received its name in honour of a victory (*νίκη*) over the neighbouring Ligurians. It soon became one of the busiest trading stations on the Ligurian coast; but as a city it had an important rival in the town of Cemenelum, which continued to exist till the time of the Lombard invasions, and has left its ruins at Cimiez, 2½ m. to the north. In the 7th century Nice joined the Genoese league formed by the towns of Liguria. In 729 it repulsed the Saracens; but in 859 and 880 they pillaged and burned it, and for the most of the 10th century remained masters of the surrounding country. During the middle ages Nice had its share in the wars and disasters of Italy. As an ally of Pisa it was the enemy of Genoa, and both the king of France and the emperor endeavoured to subjugate it; but in spite of all it maintained its municipal liberties. In the course of the 13th and 14th centuries it fell more than once into the hands of the counts of Provence; and at length in 1388 it placed itself under the protection of the counts of Savoy. The maritime strength of Nice now rapidly increased till it was able to cope with the Barbary pirates; the fortifications were largely extended and the roads to the city improved. During the struggle between Francis I. and Charles V. great damage was caused by the passage of the armies invading Provence; pestilence and famine raged in the city for several years. It was in Nice that the two monarchs in 1538 concluded, through the mediation of Paul III., a truce of ten years; and a marble cross set up to commemorate the arrival of the pope still gives its name, Croix de Marbre, to part of the town. In 1543 Nice was attacked by the united forces of Francis I. and Barbarossa; and, though the inhabitants, with admirable courage, repulsed the assault which succeeded the terrible bombardment, they were ultimately compelled to surrender, and Barbarossa was allowed to pillage the city and to carry off 2500 captives. Pestilence appeared again in 1550 and 1580. In 1600 Nice was taken by the duke of Guise. By opening the ports of the countship to all nations, and proclaiming full freedom of trade, Charles Emmanuel in 1626 gave a great stimulus to the commerce of the city, whose noble families took part in its mercantile enterprises. Captured by Catinat in 1691, Nice was restored to Savoy in 1696; but it was again besieged by the French in 1705, and in the following year its citadel and ramparts were demolished. The treaty of Utrecht in 1713 once more gave the city back to Savoy; and in the peaceful years which followed the "new town" was built. From 1744 till the peace of Aix-la-Chapelle (1748) the French and Spaniards were again in possession. In 1775 the king of Sardinia destroyed all that remained of the ancient liberties of the commune. Conquered in 1792 by the armies of the French Republic, the county of Nice continued to be part of France till 1814; but after that date it reverted to Sardinia. By a treaty concluded in 1860 between the Sardinian king and Napoleon III. it was again transferred to France, and the cession was ratified by over 25,000 electors out of a total of 30,700.

See L. Durante, *Histoire de Nice* (3 vols., Turin, 1823–1824); J. N. Fervel, *Histoire de Nice et des Alpes Maritimes depuis 21 siècles* (Paris, 1862); E. Tisserand, *Histoire civile et religieuse de la cité de Nice* (2 vols., Nice, 1862); *Cartulaire de l'ancienne cathédrale de Nice* (Turin, 1888).

NICE, an adjective which in present usage has two main meanings: (1) fastidious, particular, precise or scrupulous, and (2) pleasant, kind or agreeable. The first meaning has been common since the 16th century, the second only since the end of the 18th. In O. Fr., from which the English form was adapted, the word is *niche* or *nice*, which are derivatives of Lat. *nescius*, not knowing, ignorant. The development in meaning is doubtful; some authorities take it as (1) foolish, (2) foolishly precise, (3) delicate, (4) pleasant. Skeat suggests an early confusion with the word "neah," soft, delicate, still surviving dialectically.

NICEPHORUS, the name of three emperors of the East.

NICEPHORUS I., emperor 802–811, was a native of Seleucia in Pisidia, who was raised by the empress Irene to the office of *logothetes* or lord high treasurer. With the help of the patricians and eunuchs he contrived to dethrone and exile Irene, and to be elected emperor in her stead. His sovereignty was endangered by Bardanes, one of his ablest generals, who revolted and received support from other commanders, notably the later emperors Leo the Armenian and Michael the Amorian. But Nicephorus gained over the latter two, and by inducing the rebel army to disperse achieved the submission of Bardanes, who was relegated to a monastery. A conspiracy headed by the patrician Arsaber had a similar issue. Nicephorus, who needed large sums to strengthen his military force, set himself with great energy to increase the empire's revenue. By his rigorous imposts he alienated the favour of his subjects, and especially of the clergy, whom he otherwise sought to control firmly. In 803 and 810 he made a treaty with Charlemagne, by which the limits of the two empires were amicably fixed. Venice, Istria, the Dalmatian coast and South Italy were assigned to the East, while Rome, Ravenna and the Pentapolis were included in the Western realm. By withholding the tribute which Irene had agreed to pay to Harun al-Rashid, Nicephorus committed himself to a war with the Saracens. Compelled by Bardanes's disloyalty to take the field himself, he sustained a severe defeat at Crasus in Phrygia (805), and the subsequent inroads of the enemy into Asia Minor induced him to make peace on condition of paying a yearly contribution of 30,000 gold pieces. By the death of Harun in 809, Nicephorus was left free to deal with the Bulgarian king, Krum, who was harassing his northern frontiers. In 811 Nicephorus invaded Bulgaria and drove Krum to ask for terms, but in a night attack he allowed himself to be surprised and was slain along with a large portion of his army. Krum is said to have made a drinking-cup of Nicephorus's skull.

NICEPHORUS II. (Phocas), emperor 963–969, belonged to a Cappadocian family which had produced several distinguished generals. He was born about 912, joined the army at an early age, and, under Constantine VII., became commander on the eastern frontier. In the war with the Saracens he began with a severe defeat (956), which he retrieved in the years following by victories in Syria. In 960 he led an expedition to Crete, stormed Candia after a ten months' siege, and wrested the whole island from the Saracens. After receiving the unusual honours of a triumph, he returned to the east with a large and well-equipped army. In the campaigns of 962–63 by brilliant strategy he forced his way through Cilicia into Syria and captured Aleppo, but made no permanent conquests. Upon the death of Romanus II. he returned to Constantinople to defend himself against the intrigues of the minister Bringas. With the help of the regent Theophano and the patriarch, he received supreme command of the eastern forces, and being proclaimed emperor by these marched upon the capital, where meanwhile his partisans had overthrown his enemy Bringas. Thanks to his popularity with the army, Nicephorus was crowned emperor by the side of Romanus's infant sons, and in spite of the patriarch's opposition married their mother Theophano. During his reign he continued to wage numerous wars. In 964–966 he definitely conquered Cilicia and again overran Mesopotamia and Syria, while the patrician Nicetas recovered Cyprus. In 968 he reduced most of the fortresses in Syria, and after the fall of Antioch and Aleppo (969), which were recaptured by his lieutenants, secured his conquests by a peace. On his northern frontier he began a war against the Bulgarians, to whom the Byzantines had of late been paying tribute (967), and by instigating an attack from the

Russians distracted their attention effectively. Nicephorus was less successful in his western wars. After renouncing his tribute to the Fatimite caliphs, he sent an expedition to Sicily under Nicetas (964–65), but was forced by defeats on land and sea to evacuate that island completely. In 967 he made peace with the Saracens of Kairawan and turned to defend himself against their common enemy, Otto I. of Germany, who had attacked the Byzantine possessions in Italy; but after some initial successes his generals were defeated and driven back upon the southern coast. Owing to the care which he lavished upon the proper maintenance of the army, Nicephorus was compelled to exercise rigid economy in other departments. He retrenched the court largesses and curtailed the immunities of the clergy, and although himself of an ascetic disposition forbade the foundation of new monasteries. By his heavy imposts and the debasement of the coinage he forfeited his popularity with the rest of the community, and gave rise to riots. Last of all, he was forsaken by his wife, and, in consequence of a conspiracy which she headed with his nephew John Zimisces, was assassinated in his sleeping apartment. Nicephorus was the author of an extant treatise on military tactics which contains valuable information concerning the art of war in his time.

NICEPHORUS III. (Botaniates), emperor 1078–1081, belonged to a family which claimed descent from the Roman Fabii and rose to be commander of the troops in Asia. He revolted in 1078 from Michael VII., and with the connivance of the Turks marched upon Nicaea, where he assumed the purple. In face of another rebellious general, Nicephorus Bryennius, his election was ratified by the aristocracy and clergy. With the help of Alexius Comnenus he drove out of the field Bryennius and other rivals, but failed to clear the invading Turks out of Asia Minor. Nicephorus ultimately quarrelled with Alexius, who used his influence with the army to depose the emperor and banish him to a monastery. In the years of his reign he had entirely given himself over to debauchery.

See Gibbon, *Decline and Fall* (ed. Bury, 1896); Finlay, *Hist. of Greece*; G. Schlumberger, *Nicéphore Phocas* (Paris, 1890); K. Leonardt, *Kaiser Nicephorus II.* (Halle, 1887).

NICEPHORUS CALLISTUS XANTHOPOULOS, of Constantinople, the last of the Greek ecclesiastical historians, flourished 1320–1330. His *Historia Ecclesiastica*, in eighteen books, brings the narrative down to 610; for the first four centuries the author is largely dependent on his predecessors, Eusebius, Socrates, Sozomen, Theodoret and Evagrius, his additions showing very little critical faculty; for the later period his labours, based on documents now no longer extant, to which he had free access, though he used them also with small discrimination, are much more valuable. A table of contents of other five books, continuing the history to the death of Leo the Philosopher in 911, also exists, but whether the books were ever actually written is doubtful. Some modern scholars are of opinion that Nicephorus appropriated and passed off as his own the work of an unknown author of the 10th century. The plan of the work is good and, in spite of its fables and superstitious absurdities, contains important facts which would otherwise have been unknown. The history of the Latin Church receives little attention. Only one MS. of the history is known; it was stolen by a Turkish soldier from the library at Buda during the reign of Matthias Corvinus of Hungary and taken to Constantinople, where it was bought by a Christian and eventually reached the imperial library at Vienna. Nicephorus was also the author of lists of the emperors and patriarchs of Constantinople, of a poem on the capture of Jerusalem, and of a synopsis of the Scriptures, all in iambics; and of commentaries on liturgical poems.

Works in J. P. Migne, *Patrologia Graeca*, cxlv.-cxlvii.; see also F. C. Baur, *Die Epochen der kirchlichen Geschichtsschreibung* (1852); C. Krumbacher, *Geschichte der byzantinischen Litteratur* (1897); Wetzer and Welte's *Kirchenlexikon*, ix. (Freiburg im Breisgau, 1895).

NICEPHORUS PATRIARCHA (*c.* 758–829), Byzantine historian and patriarch of Constantinople (806–815). His father Theodorus, one of the secretaries of the emperor Constantine Copronymus, had been scourged and banished for his zealous support of image-worship, and the son inherited the religious convictions of the father. He was secretary to the imperial commissaries at the council of Nicaea in 787, which witnessed the triumph of his opinions; but, feeling dissatisfied with court life, he retired into a convent. In 806 he was suddenly raised by the emperor Nicephorus I. to the patriarchate of Constantinople, and this office he held until 815, when he accepted deposition rather than assent to the iconoclastic edict promulgated by Leo the Armenian in the previous year. He retired to the cloister of St Theodore, which he himself had founded, and died there in 829. After his death he was included among the saints of the orthodox church.

Nicephorus is the author of a valuable compendium (*Breviarium historicum*) of Byzantine history from 602 to 770, of a meagre *Chronologia compendiaria* from Adam to the year of his own death. The former contains an interesting account of the origin and migrations of the Bulgarians. Both will be found, together with some controversial writings and his biography by his pupil Ignatius, also patriarch of Constantinople, in J. P. Migne, *Patrologia Graeca*, c.; edition of the compendia and life by C. de Boor (1880, Teubner series); see also F. Hirsch, *Byzantinische Studien* (1876); J. Hergenröther, *Photius* (1867); C. Krumbacher, *Geschichte der byzantinischen Litteratur* (1897); Wetzer and Welte's *Kirchenlexikon*, ix. (Freiburg im Breisgau, 1895).

NICHE (through Fr. *niche* from Ital. *nicchia*, *nicchio*, shell; possibly from Lat. *mitulus*, a sea-mussel; cf. "napkin" from *mappa*), in architecture a recess sunk in a wall, generally for the reception of a statue. The niche is sometimes terminated by a simple label, but more commonly by a canopy, and with a bracket or corbel for the figure, in which case it is often called a "tabernacle."

NICHOL, JOHN (1833–1894), Scottish man of letters, son of the astronomer J. P. Nichol (1804–1859), was born on the 8th of September 1833, and educated at Glasgow and Balliol College, Oxford, where he had a brilliant career. After taking his first-class in classics, he remained at Oxford as a coach. With Albert Venn Dicey, Thomas Hill Green, Swinburne and others, he formed the Old Mortality Society for discussions on literary matters. In 1862 he was made professor of English literature at Glasgow. He had already made a reputation as an acute critic and a successful lecturer, and his influence at Glasgow was very marked. He visited the United States in 1865, and in 1882 he wrote the article on American literature for the ninth edition of the *Encyclopædia Britannica*—an article which is a good example of his pungent (sometimes unduly pungent) style. He left Glasgow for London in 1889, and died on the 11th of October 1894. Among his best works were his drama *Hannibal* (1873), *The Death of Themistocles, and other Poems* (1881), his *Byron* in the "English Men of Letters" series (1880), his *Robert Burns* (1882) and *Carlyle* (1892).

A *Memoir* by Professor Knight was published in 1896.

NICHOLAS, ST, bishop of Myra, in Lycia, a saint honoured by the Greeks and the Latins on the 6th of December. His cult is as celebrated as his history is obscure. All the accounts that have come down to us are of a purely legendary character, and it is impossible to find any single incident confirmed historically. The main facts of his life are usually given as follows. He was bishop of Myra in the time of the emperor Diocletian, was persecuted, tortured for the faith, and kept in prison until the more tolerant reign of Constantine, and was present at the council of Nicaea. It should be observed that this last circumstance is ignored by all the historians, and that St Athanasius, who knew all the notable bishops of the period, never mentions Nicholas, bishop of Myra. The oldest known monument of the cult of St Nicholas seems to be the church of SS Priscus and Nicholas built at Constantinople by the emperor Justinian (see Procopius, *De aedif.* i. 6). In the West, the name of St Nicholas appears in the 9th century martyrologies, and churches dedicated to him are to be found at the beginning of the 11th century. It is more especially, however, from the time of the removal of his body to Bari, in Apulia, that his cult became popular. The inhabitants of Bari organized an expedition, seized his remains by means of a ruse, and transported them to Bari, where they were received in triumph on the 9th of May

1087, and where the foundations were laid of a new basilica in his honour. This was the origin of a famous and still popular pilgrimage. There are nearly 400 churches in England dedicated to St Nicholas. He is the patron saint of Russia; the special protector of children, scholars, merchants and sailors; and is invoked by travellers against robbers. In art St Nicholas is represented with various attributes, being most commonly depicted with three children standing in a tub by his side. Of the various interpretations of this, none is absolutely certain. One explanation has been sought in the legend of St Nicholas miraculously restoring to life three rich youths, who had been murdered, cut up and concealed in a salting tub by a thievish innkeeper or butcher, in whose house they had taken lodging.

A legend of his surreptitious bestowal of dowries upon the three daughters of an impoverished citizen, who, unable to procure fit marriages for them, was on the point of giving them up to a life of shame, is said to have originated the old custom of giving presents in secret on the Eve of St Nicholas, subsequently transferred to Christmas Day. Hence the association of Christmas with "Santa Claus," an American corruption of the Dutch form "San Nicolaas," the custom being brought to America by the early Dutch colonists. (For the ceremony of the boy-bishop elected on St Nicholas's Day see BOY-BISHOP.)

Nicola di Bari* (Bari, 1901); Charles Cahier, *Caractéristiques des saints* (Paris, 1867), p. 354; Frances Arnold-Forster, *Studies in Church Dedications* (London, 1899), i. 495-501 and iii. 21.

NICHOLAS, the name of five popes, and one anti-pope.

NICHOLAS I., sometimes called The Great, and certainly the most commanding figure in the series of popes between Gregory I. and Gregory VII., succeeded Benedict III. in April 858. According to the annalist Prudentius of Troyes, "he owed his election less to the choice of the clergy than to the presence and favour of the emperor Louis II. and his nobles"—who can hardly have foreseen with what ability and persistency the rights of the Holy See as supreme arbiter of Christendom were to be asserted even against themselves by the man of their choice. Of the previous history of Nicholas nothing is recorded. His pontificate of nine years and a half was marked by at least three memorable contests which have left their mark in history. The first was that in which he supported the claims of the unjustly degraded patriarch of Constantinople, Ignatius; the history of the conflict cannot be related here, but two of its incidents, the excommunication of Photius, the rival of Ignatius, by the pope in 863, and the counter-deposition of Nicholas by Photius in 867, were steps of serious moment towards the permanent separation between the Eastern and the Western Church. The second great struggle was that with Lothair, the king of Lorraine (second son of the emperor Lothair I., and brother of the emperor Louis II.), about the divorce of his wife Theutberga or Thietberga. The king, who desired to marry his mistress Waldrada, had brought a grave charge against the life of his queen before her marriage; with the help of Archbishops Gunther of Cologne and Thietgaud of Treves, a confession of guilt had been extorted from Thietberga, and, after the matter had been discussed at more than one synod, that of Aix-la-Chapelle finally authorized Lothair, on the strength of this confession, to marry again. Nicholas ordered a fresh synod to try the cause over again at Metz in 863; but Lothair, who was present with his nobles, anew secured a judgment favourable to himself, whereupon the pope not only quashed the whole proceedings, but excommunicated and deposed Gunther and Thietgaud, who had been audacious enough to bring to Rome in person the "libellus" of the synod. The archbishops appealed to Louis II., then at Benevento, to obtain the withdrawal of their sentence by force; but, although he actually occupied the Leonine city (864), he was unsuccessful in obtaining any concession, and had to withdraw to Ravenna. Thietberga herself was now induced to write to the pope a letter in which she declared the invalidity of her own marriage, and urged the cause of Lothair, but Nicholas, not without reason, refused to accept statements which had too plainly been extorted, and wrote urging her to maintain the truth steadfastly, even to the death if need were, "for, since Christ is the truth, whosoever dies for the truth assuredly dies for Christ." The imminent humiliation of Lothair was prevented only by the death of Nicholas. The third great ecclesiastical cause which marks this pontificate was that in which the indefeasible right of bishops to appeal to Rome against their metropolitans was successfully maintained in the case of Rothad of Soissons, who had been deposed by Hincmar of Reims. It was in the course of the controversy with the great and powerful Neustrian archbishop that papal recognition was first given (in 865) to the False Decretals, which had probably been brought by Rothad to Rome in the preceding year (see DECRETALS). At an early period in his reign it also became necessary for Nicholas to administer discipline to John of Ravenna, who seems to have relied not only on the prestige of his famous see but also on the support of Louis II. After lying under excommunication for some time he made a full submission. Nicholas was the pope to whom Boris, the newly converted king of Bulgaria, addressed himself for practical instruction in some of the difficult moral and social problems which naturally arise during a transition from heathenism to Christianity. The pope's letter in reply to the hundred and six questions and petitions of the barbarian king is perhaps the most interesting literary relic of Nicholas I. now extant. He died on the 13th of November 867, and was succeeded by Adrian II.

The *epistolae* of Nicholas I. are printed in Migne, *Patrologia Lat.* vol. 119, p. 769 seq. See F. Gregorovius, *Rome in the Middle Ages*, vol. iii. (Eng. trans., London, 1900–1902); H. Lämmer, *Nikolaus I. und die byzantinische Staatskirche seiner Zeit* (Berlin, 1857); J. Roy, *Saint-Nicolas I.* (Paris, 1900); J. Richterich, *Papst Nikolaus I.* (Bern, 1903); A. Greinacher, *Die Anschauungen des Papstes Nikolaus I. über das Verhältnis von Staat und Kirche* (1909). (X.)

NICHOLAS II., pope from December 1058 to July 1061, was a Burgundian named Gerard, who at the time of his election was bishop of Florence. He was set up by Hildebrand, with the support of the empress-regent Agnes and of the powerful Duke Godfrey of Lorraine, against Benedict X., the nominee of the Roman nobles, and was crowned at Rome, after the expulsion of Benedict, on the 24th of January 1059. His pontificate was signalized by the continuance of the policy of ecclesiastical reform associated with the name of Hildebrand (afterwards Gregory VII.). To secure his position he at once entered into relation with the Normans, now firmly established in southern Italy, and later in the year the new alliance was cemented at Melfi, where Nicholas II., accompanied by Hildebrand, Cardinal Humbert and the abbot Desiderius of Monte Cassino, solemnly invested Robert Guiscard with the duchies of Apulia, Calabria and Sicily, and Richard of Aversa with the principality of Capua, in return for oaths of fealty and the promise of assistance in guarding the rights of the Church. The first fruits of this arrangement, which was based on no firmer foundation than the forged "Donation of Constantine" (*q.v.*), but destined to give to the papacy a position of independence towards both the Eastern and Western Empires, was the reduction in the autumn, with Norman aid, of Galera, where the anti-pope had taken refuge, and the end of the subordination of the papacy to the Roman nobles.

Meanwhile, Peter Damian and Bishop Anselm of Lucca had been sent by Pope Nicholas to Milan to adjust the difference between the Patarenes and the archbishop and clergy. The result was a fresh triumph for the papacy, Archbishop Wido, in face of the ruinous conflict in the Church of Milan, being forced to submit to the terms proposed by the legates, which involved the principle of the subordination of Milan to Rome; the new relation was advertized by the unwilling attendance of Wido and the other Milanese bishops at the council summoned to the Lateran palace in April 1059. This council not only continued the Hildebrandine reforms by sharpening the discipline of the clergy, but marks an epoch in the history of the papacy by its famous regulation of future elections to the Holy See (see

LATERAN COUNCILS, and CONCLAVE). Its most important immediate result was the revival of strained relations with the empire, due to the fact that the emperor's traditional rights in the matter of papal elections had been completely ignored. Stephen, cardinal priest of S. Chrysogonus, was sent to the German court to attempt to allay the consequent ill-feeling, but was not received. Pope Nicholas, moreover, had offended the German bishops by what they regarded as arbitrary interference with their rights: he had refused to send the pallium of Archbishop Siegfried of Mainz; he had sent a sharp letter of admonition to Archbishop Anno of Cologne. The resulting opposition culminated in a synod of German bishops, perhaps early in 1061 (its date and place of meeting are unknown), at which the decrees of the pope, including the new electoral law, were annulled, while he himself was deposed and his name ordered to be expunged from the canon of the Mass. That these resolutions were not followed by any further action was due to the war of parties in Germany, which enabled the papacy to ignore a demonstration of opinion to which no effect could be given.

Nicholas II. died at Florence in July 1061. Personally he was one of the least important of the popes, and the great importance of the events of his pontificate is due to the fact that, as Peter Damian wrote (*Epist.* i. 7), he possessed in Hildebrand, Cardinal Humbert and Bishop Boniface of Albano *acutissimi et perspicacis oculi*.

His *Diplomata, epistolae, decreta* are in Migne, *Patrolog. Lat.* 143, pp. 1301-1366. See the article "Nikolaus II." by C. Mirbt in Herzog-Hauck, *Realencyklopädie* (3rd ed., Leipzig, 1904), with bibliography. Other lists of authorities are in Potthast, *Biblioth. Hist. Med. Aev.* (2nd ed., Berlin, 1896), p. 854; and Ulysse Chevalier, *Répertoire des sources hist. biobibliogr.* (Paris, 1905), vol. 3347; *s.v.* "Nicolas II." (X.)

NICHOLAS III. (Giovanni Gaetano Orsini), pope from the 25th of November 1277 to the 22nd of August 1280, was a Roman nobleman who had served under eight popes, been made cardinal-deacon of St Nicola in carcere Tulliano by Innocent IV., protector of the Franciscans by Alexander IV., inquisitor-general by Urban IV., and succeeded John XXI., largely through family influence, after a six-months' vacancy in the Holy See. His brief pontificate was marked by several important events. A born politician, he greatly strengthened the papal position in Italy. He concluded a concordat with Rudolph of Habsburg in May 1278, by which the Romagna and the exarchate of Ravenna were guaranteed to the pope; and in July he issued an epoch-making constitution for the government of Rome, which forbade foreigners taking civil office. Nicholas issued the bull *Exiit* on the 14th of August 1279 to settle the strife within the Franciscan order between the parties of strict and loose observance. He repaired the Lateran and the Vatican at enormous cost, and erected a beautiful country house at Soriano near Viterbo. Nicholas, though a man of learning and strength of character, brought just reproach on himself for his efforts to found principalities for his nephews and other relations. He died from a stroke of apoplexy and was succeeded by Martin IV.

NICHOLAS IV. (Girolamo Masci), pope from the 22nd of February 1288 to the 4th of April 1292, a native of Ascoli and a Franciscan monk, had been legate to the Greeks under Gregory X. in 1272, succeeded St Bonaventura as general of his order in 1274, was made cardinal-priest of Sta Prassede and Latin patriarch of Constantinople by Nicholas III., cardinal-bishop of Palestrina by Martin IV., and succeeded Honorius IV. after a ten-months' vacancy in the papacy. He was a pious, peace-loving monk with no ambition save for the church, the crusades and the extirpation of heresy. He steered a middle course between the factions at Rome, and sought a settlement of the Sicilian question. In May 1289 he crowned Charles II. king of Naples and Sicily after the latter had expressly recognized papal suzerainty, and in February 1291 concluded a treaty with Alphonso III. of Aragon and Philip IV. of France looking toward the expulsion of James of Aragon from Sicily. The loss of Ptolemais in 1291 stirred the pope to renewed enthusiasm for a crusade. He sent the celebrated Franciscan missionary, John of Monte Corvino, with some companions to labour among the Tatars and Chinese. He issued an important constitution on the 18th of July 1289, which granted to the cardinals one-half of all income accruing to the Roman see and a share in the financial management, and thereby paved the way for that independence of the college of cardinals which, in the following century, was to be of detriment to the papacy. Nicholas died in the palace which he had built beside Sta Maria Maggiore, and was succeeded by Celestine V.

Kirsch, "Die Finanzverwaltung des Kardinalkollegiums im 13. u. 14. Jahrhunderte" in *Kirchengeschichtliche Studien* (1895). (C. H. HA.)

NICHOLAS V. (Tomaso Parentucelli or Tomaso da Sarzana), pope from the 6th of March 1447 to the 24th of March 1455, was born at Sarzana, where his father was a physician, in 1398. He early studied at Bologna, where the bishop, Nicholas Albergati, was so much struck with his ardour for learning that he gave him the chance to pursue his studies further, by sending him on a tour through Germany, France and England. He distinguished himself at the council of Ferrara-Florence, and in 1444 was made bishop of Bologna by Pope Eugenius IV., who soon afterwards named him as one of the legates charged to negotiate at the convention of Frankfort an understanding between the Holy See and the Empire with regard to the reforming decrees of the council of Basel. His successful diplomacy was rewarded, on his return to Rome, with the title of cardinal priest of Sta Susanna (December 1446). He was elected pope in succession to Eugenius IV. on the 6th of March of the following year, taking the name of Nicholas in honour of his early benefactor.

The eight years of his pontificate were important in the political, scientific and literary history of the world. With the German king, Frederick III., he made the Concordat of Vienna, or Aschaffenburg (February 17, 1448), by which the decrees of the council of Basel against papal annates and reservations were abrogated so far as Germany was concerned; and in the following year he secured a still greater triumph when the resignation of the anti-pope Felix V. (April 7), and his own recognition by the rump of the council of Basel, assembled at Lausanne, put an end to the papal schism. The next year, 1450, Nicholas held a jubilee at Rome; and the offerings of the numerous pilgrims who thronged to Rome gave him the means of furthering the cause of culture in Italy, which he had so much at heart. In March 1452 he crowned Frederick III. as emperor in St Peter's, the last occasion of the coronation of an emperor at Rome.

Under the generous patronage of Nicholas humanism made rapid strides. He employed hundreds of copyists and scholars, giving as much as ten thousand *gulden* for a metrical translation of Homer, and founded a library of nine thousand volumes. Nicholas himself was a man of vast erudition, and his friend Aeneas Silvius (later Pope Pius II.) said of him that "what he does not know is outside the range of human knowledge." He was compelled, however, to add that the lustre of his pontificate would be for ever dulled by the tragic fall of Constantinople, which the Turks took in 1453. The pope bitterly felt this catastrophe as a double blow to Christendom and to Greek letters. "It is a second death," wrote Aeneas Silvius,

"to Homer and Plato." Nicholas preached a crusade, and endeavoured to reconcile the mutual animosities of the Italian states, but without much success.

Nicholas conceived great plans for beautifying and developing Rome. He restored the walls and numerous churches, and began the rebuilding of the Vatican and St Peter's. In undertaking these works Nicholas was moved by no vulgar motives, his idea being "to strengthen the weak faith of the people by the greatness of that which it sees." The Romans, however, appreciated neither his motives nor their results, and in 1452 a formidable conspiracy for the overthrow of the papal government, under the leadership of Stefano Porcaro, was discovered and crushed. This revelation of disaffection, together with the fall of Constantinople, darkened the last years of Nicholas; "As Thomas of Sarzana," he said, "I had more happiness in a day than now in a whole year." He died on the 24th of March 1455.

See Herzog-Hauck, *Realencyklopädie für protestantische Theologie und Kirche*, vol. xiv. (1904), with full references; *Cambridge Modern History*, i. 76-78; and M. Creighton, *History of the Papacy* (London, 1882), vol. ii.

NICHOLAS V. (Pietro Rainalducci), antipope in Italy from 1328 to 1330 during the pontificate of John XXII. at Avignon, was a native of Corbara in the Abruzzi. He joined the Franciscan order after separating from his wife in 1310, and became famous as a preacher. He was elected through the influence of the excommunicated emperor, Louis the Bavarian, by an assembly of priests and laymen, and consecrated at St Peter's on the 12th of May 1328 by the bishop of Venice. After spending four months in Rome, he withdrew with Louis to Viterbo and thence to Pisa, where he was guarded by the imperial vicar. He was excommunicated by John XXII. in April 1329, and sought refuge with Count Boniface of Donoratico near Piombino. Having obtained assurance of pardon, he presented a confession of his sins first to the archbishop of Pisa, and then (25th of August 1330) to the pope at Avignon. He remained in honourable imprisonment in the papal palace until his death in October 1333.

See F. Gregorovius, *Rome in the Middle Ages*, vol. 6, trans. by Mrs G. W. Hamilton (London, 1900–1902); Baluzius, *Vitae paparum Avenionensium*, vol. 1 (Paris, 1693); J. B. Christophe, *Histoire de la papauté pendant le XIVième siècle*, vol. 1 (Paris, 1853); E. Marcour, *Anteil der Minoriten am Kampfe zwischen König Ludwig IV. von Bayern und Papst Johann XXII.* (Emmerich, 1874); Eubel, "Der Gegenpapst Nicolaus V. u. seine Hierarchie," in *Hist. Jahrbuch*, vol. 12 (1891). (C. H. HA.)

NICHOLAS (1841–), King of Montenegro and the Berda, was born at the village of Niegush, the ancient home of the reigning family of Petrovitch-Niegush, on the 25th of September 1841. His father, Mirko Petrovitch, a celebrated Montenegrin warrior, was elder brother to Danilo II., who left no male offspring. After 1696, when the dignity of *vladika*, or prince-bishop, became hereditary in the Petrovitch family, the sovereign power had descended from uncle to nephew, the vladikas belonging to the order of the "black clergy" who are forbidden to marry. A change was introduced by Danilo II., who declined the episcopal office, married and declared the principality hereditary in the direct male line. Mirko Petrovitch having resigned his claim to the throne, his son was nominated heir, and the old system of succession was thus accidentally continued. Prince Nicholas, who had been trained from infancy in martial and athletic exercises, spent a portion of his early boyhood at Trieste in the household of the Kuetitch family, to which his aunt, the princess Darinka, wife of Danilo II., belonged. The princess was an ardent advocate of French culture, and at her suggestion the young heir of the vladikas was sent to the academy of Louis le Grand in Paris. Unlike his contemporary, King Milan of Servia, Prince Nicholas was little influenced in his tastes and habits by his Parisian education; the young mountaineer, whose keen patriotism, capability for leadership and poetic talents early displayed themselves, showed no inclination for the pleasures of the French capital, and eagerly looked forward to returning to his native land. He was still in Paris when, in consequence of the assassination of his uncle, he succeeded as prince (August 13, 1860). In 1862 Montenegro was engaged in an unfortunate struggle with Turkey; the prince distinguished himself during the campaign, and on one occasion narrowly escaped with his life. In the period of peace which followed he carried out a series of military, administrative and educational reforms. In 1867 he met the emperor Napoleon III. at Paris, and in 1868 he undertook a journey to Russia, where he received an affectionate welcome from the tsar, Alexander II. He afterwards visited the courts of Berlin and Vienna. His efforts to enlist the sympathies of the Russian imperial family were productive of important results for Montenegro; considerable subventions were granted by the tsar and tsaritsa for educational and other purposes, and supplies of arms and ammunition were sent to Cettigne. In 1871 Prince Dolgorouki arrived at Montenegro on a special mission from the tsar, and distributed large sums of money among the people. In 1869 Prince Nicholas, whose authority was now firmly established, succeeded in preventing the impetuous mountaineers from aiding the Krivoshians in their revolt against the Austrian government (see CATTARO); similarly in 1897 he checked the martial excitement caused by the outbreak of the Greco-Turkish War. In 1876 he declared war against Turkey; his military reputation was enhanced by the ensuing campaign, and still more by that of 1877–78, during which he captured Nikshitch, Antivari and Dulcigno. The war resulted in a considerable extension of the Montenegrin frontier and the acquisition of a seaboard on the Adriatic. In 1883 Prince Nicholas visited the sultan, with whom he subsequently maintained the most cordial relations; in 1896 he celebrated the bicentenary of the Petrovitch dynasty, and in the same year he attended the coronation of the tsar Nicholas II.; in May 1898 he visited Queen Victoria at Windsor. In 1900 he assumed the title of "Royal Highness." On the 28th of August 1910, during the celebration of his jubilee, he assumed the title of king, in accordance with a petition from the *Skupshtina*. He was at the same time gazetted field-marshal in the Russian army, an honour never previously conferred on any foreigner except the great duke of Wellington. The descendant of a long line of warriors, gifted with a fine physique and a commanding presence, a successful military leader and a graceful poet, King Nicholas possessed many characteristics which awoke the enthusiasm of the impressionable Servian race, while his merits as a statesman received general recognition. His system of government, which may be described as a benevolent despotism, was perhaps that best suited to the character of his subjects. His historical dramas, poems and ballads hold a recognized place in contemporary Slavonic literature; among them are—*Balkanska Tzaritsa* and *Kniaz Arvanili* (dramas); *Haidana*, *Potini Abenserage* and *Pesnik i Vila* (poems); *Skupliene Pesme* and *Nova Kola* (miscellaneous songs). In November 1860 Prince Nicholas married Milena, daughter of the *voievode* Petar Vukotitch. Of his three sons, the eldest, Prince Danilo, married (July 27, 1899) Duchess Jutta (Militza) of Mecklenburg-Strelitz; of his six daughters, Princess Militza married the Grand Duke Peter Nikolaievitch, Princess Stana, Duke George of Leuchtenberg, Princess Helena, King Victor Emmanuel III. of Italy, and Princess Anka, Prince Francis Joseph of Battenberg. (J. D. B.)

NICHOLAS I. [NIKOLAI PAVLOVICH], emperor of Russia (1796–1855), eighth child of the emperor Paul I. and his wife Maria Feodorovna, was born at Tsarskoe-Selo on the 25th of June (July 6, N.S.) 1796. He was only five years old when his father's murder brought his brother Alexander I. to the throne (1801). In the following year his education was entrusted to M. von Lambsdorff, director of the 1st cadet corps and ex-governor of Courland, a man of character and wide knowledge, who superintended it for the next fifteen years. But Nicholas had as little taste for learning as his brother Constantine. The royal pupils spent their lesson hours, as Nicholas afterwards confessed, "partly in dreaming, partly in drawing all sorts of nonsense," in the end "cramming" just enough to scrape through their examinations without discredit. Their chief bent was in the direction of everything connected with military

matters. Religious training was confined to instruction in the forms of the Orthodox Church and the repetition of prayers by rote; dogmatic questions Nicholas neither understood nor cared about; and, in spite of his reverence for his brother Alexander, the latter's mysticism had not the faintest influence upon him.

Though a colonel in his cradle and a general since 1808, the grand-duke Nicholas did not see any active service until 1814, when he was allowed to join the Russian head-quarters in France but not to take part in any fighting. It is characteristic of him that from this time onwards he never wore civilian dress. In 1815 he was with the Allies in Paris, and in the following year set out on the *grand tour*, visiting Moscow and the western provinces of Russia, Berlin (where his engagement to Princess Charlotte Louise, daughter of Frederick William III., was arranged) and England, where his handsome presence and charming address created a profound impression.[1] On the 1/13th of July 1817 took place at St Petersburg his marriage to Princess Charlotte (Alexandra Feodorovna), the beginning of those intimate relations between the courts of Berlin and St Petersburg which were later to become of great international importance. On the 17/29th of April 1818 their first child, the future emperor Alexander II., was born. In the autumn Nicholas was placed in command of the 2nd brigade of the 1st division of the Guard. In 1819 the emperor Alexander first mentioned his intention to abdicate in favour of Nicholas, Constantine consenting to stand aside; but he took no steps to initiate his prospective heir in affairs of state, and the grand-duke continued to be confined to his military duties. In 1820 a further important step in the matter of the succession was taken in the divorce of Constantine from the grand-duchess Anne and his re-marriage to Johanna Grudzinska (see CONSTANTINE PAVLOVICH). In January 1822 it was decided in a family council, with the knowledge though not in the presence of Nicholas, that Constantine's petition to be relieved of the burden of the crown, for which he felt himself unfitted, should be granted. It was not, however, until August 1823 that the emperor drew up the necessary papers, in the presence of the metropolitan Philaret and other witnesses, and deposited them in sealed packets, to be opened at his death, with the council of state, the senate and the holy synod. For some reason, which can only be conjectured, Constantine was not made a party to this proceeding.

Alexander I. died at Taganrog on the 1st of December 1825. When, some days later, the news reached St Petersburg, all was confusion and uncertainty. Constantine was at Warsaw; Nicholas, who on the 3rd of May of the same year had become chief of the 2nd division of the infantry of the Guard, was too conscious of his unpopularity in the army—the fruit of his drastic discipline—to dare to assume the crown without a public abdication on the part of the legitimate heir. No steps were taken to open the sealed packets, and he himself took the oath to Constantine, and, with characteristic contempt for constitutional forms, usurped the functions of the senate and council of state by himself ordering its imposition on the regiments stationed in St Petersburg. But Constantine refused to come to St Petersburg, or to do more than himself take the oath to Nicholas as emperor, and write assuring him of his loyalty. The result was a three weeks' interregnum, of which the discontented spirits in the army took advantage to bring to a head a plot that had long been hatching in favour of constitutional reform. When on the 14th of December the troops who had already taken the oath to Constantine were ordered to take another to Nicholas, it was easy to persuade them that this was a treasonable plot against the true emperor. The Moscow regiment refused to take the oath, and part of it marched, shouting for Constantine and "Constitution,"[2] to the square before the Senate House, where they were joined by a company of the Guard and the sailors from the warships. In this crisis Nicholas showed high personal courage, if little decision and initiative. It was entirely uncertain how many, and which, regiments could be trusted. For hours he stood, or sat on horseback, amid the surging crowd, facing the mutinous soldiers—who had loaded their muskets and formed square—while effort after effort was made to bring them to reason, sometimes at the cost of life—as in the case of Count Miloradovich, military governor of St Petersburg, who was mortally wounded by a pistol shot while arguing with the mutineers. Nicholas was saved by the very belief of the conspirators in the universal sympathy of the army with their aims. Had the mutinous troops early in the day received the order to attack, they would have carried the waverers with them; but they hesitated to fire on comrades whom they expected to see march over to their side; and when at last the emperor had steeled his heart to use force, a few rounds of grape-shot sufficed to quell the mutiny. The chief conspirators—Prince Sherepin-Rostovski, Suthoff, Ryleyev, Prince Sergius Trubetskoi, Prince Obolenski and others—were arrested the same night and interrogated by the emperor in person. A special commission, consisting entirely of officers, was then set up; and before this, for five months, the prisoners were subjected to a rigorous inquisition.[3] It was soon clear that the Decabrist[4] rising was but one manifestation of a vast conspiracy permeating the whole army. A military rising on a large scale in the south was only averted by the news of the failure of the mutiny at St Petersburg; and at Moscow there were many arrests, including that of Colonel Paul Pestel, the chief of the revolutionary southern league. The prisoners were finally brought to trial before a supreme criminal court established by imperial *ukas* on the 1st of June 1826; there were 121 of them and their trial had concluded by the 12th of June. Some were condemned to death, others to solitary confinement in fortresses, others to the Siberian mines and colonies. Of the latter many were accompanied by their wives, though the Russian law allows divorce in the case of such sentences; the emperor unwillingly allowed the devoted women to go, but decreed that any children born to them in Siberia would be illegitimate.

Firmly seated on his throne, Nicholas proceeded to fill up the gaps in his education by studying the condition of his empire. In spite of his reverence for his brother's memory, he made a clean sweep of "the angel's" Bible Society,[5] and other paraphernalia of official hypocrisy; as for Alexander's projects of reform, the pitiful legacy of a life of unfulfilled purposes, these were reported upon by committees, considered and shelved. Nicholas too saw the need for reform; the Decabrist conspiracy had burnt that into his soul; but he had his own views as to the reform needed. The state was corrupt, disorganized; what was wanted was not more liberty but more discipline. So he put civil servants, professors and students into uniform, and for little offences had them marched to the guard-house; thought was disciplined by the censorship, the army by an unceasing round of parades and inspections. The one great gift of Nicholas I. to Russia, a gift which he really believed would be welcome because it would bring every subject into immediate contact with the throne, was—the secret police, the dreaded Third Section.[6]

The crowning fault of Nicholas was, however, that he would not delegate his authority; whom could he trust but himself? In this he resembled his contemporary the emperor Francis I. But Francis would "sleep upon" a difficult problem; Nicholas never slept. His constitution was of iron, his capacity for work prodigious; reviews and parades, receptions of deputations, visits to public institutions, then eight or nine hours in his

[2] They had been told that this was the name of Constantine's wife.

[3] The prisoners were kept in solitary confinement in the casemates of the inner fortress of St Peter and St Paul. They were brought blindfolded before the commission, and then suddenly confronted with their interrogators. Many went mad under the ordeal, one died, and one starved himself to death (Schiemann, ii. 73).

cabinet reading and deciding on reports and despatches—such was his ordinary day's work. Yet, in spite of all this, his activity could not but prove the narrow limits of autocratic power. Under the "Iron Tsar" the outward semblance of authority was perfectly maintained; but behind this imposing façade the whole structure of the Russian administrative system continued to rot and crumble. The process was even hastened; for the emperor's stern discipline crushed out all independence of initiative and silenced all honest criticism. The secret police provided but a poor substitute for the assistance which an argus-eyed and articulate public opinion gives to the efficient working of a constitutional system; for the greatest of autocrats has but two eyes, and it is no difficult task to deceive him. Thus it came about that, as Professor Schiemann puts it, "Potemkin's scenery was brought out again," and Nicholas walked with conscious self-approval through a Russia seemingly well ordered, but in fact merely temporarily prepared for each stage of his progress.

War is the ultimate and sharpest test of the soundness of a state, and to this test Russia was submitted soon after the accession of Nicholas, who could not be blind to the revelations that resulted, though he drew the wrong moral. These revelations had, indeed, begun before the outbreak of the war with Turkey in 1828. The new tsar had devoted especial attention to the reform and reconstruction of the navy, which under Alexander I. had been suffered to decay. Yet the newly organized squadron which in 1827 set out on the cruise which ended at Navarino only reached Plymouth with difficulty, and there had to be completely refitted. The disastrous Balkan campaign of 1828 was an even more astounding revelation of corruption, disorganization and folly in high places; and the presence of the emperor did nothing to mitigate the attendant evils. He was indefatigable, in war as in peace, in parading and inspecting; the weary and starving soldiers were forced to turn out amid the marshes of the Dobrudscha as spick and span as on the parade grounds of St Petersburg; but he could do nothing to set order in the confusion of the commissariat, which caused the troops to die like flies of dysentery and scurvy; or to remedy the scandals of the hospitals, which inflicted on the wounded unspeakable sufferings. On the other hand, his presence was sufficient to hamper the initiative of Prince Wittgenstein, the nominal commander-in-chief; for Nicholas was constitutionally incapable of leaving him a free hand. This was one reason for the failure of the opening campaign.[1] Another was more creditable to the tsar's heart than to his head; he turned from the sight of wounds and blood, and would not make up his mind to sanction operations which, at the cost of a few hundred lives, would have saved thousands who perished miserably of disease.[2]

These then were the leading principles which underlay Nicholas's domestic and foreign policy from first to last: to discipline Russia, and by means of a disciplined Russia to discipline the world. So far as the latter task was concerned, he again sharply divided the issues which Alexander had confused. The mission of Russia in the West was, in accordance with the principles of the Holy Alliance as Nicholas interpreted them, to uphold the cause of legitimacy and autocracy against the Revolution; her mission in the East was, with or without the co-operation of "Europe," to advance the cause of Orthodox Christianity, of which she was the natural protector, at the expense of the decaying Ottoman empire. The sympathy of Europe with the insurgent Greeks gave the tsar his opportunity. The duke of Wellington was sent to St Petersburg in 1826 to congratulate the new tsar on his accession and arrange a concert in the Eastern Question. The upshot proved the diplomatic value of Nicholas's apparent sincerity of purpose and charm of manner; the "Iron Duke" was to the "Iron Tsar" as soft iron to steel; Great Britain, without efficient guarantees for the future, stood committed to the policy which ended in the destruction of the Ottoman sea-power at Navarino and the march of the Russians on Constantinople. By the treaty of Adrianople in 1829 Turkey seemed to become little better than a vassal state of the tsar, a relation intensified, after the first revolt of Mehemet Ali, by the treaty of Unkiar-Skelessi in 1833 (see MEHEMET ALI). In the West, meanwhile, the revolutions of 1830 had modified the balance of forces. Nicholas himself proposed an armed intervention of the Alliance in order "to restore order" in Belgium and France;[3] and when his allies held back even proposed to intervene alone, a project rendered impossible by the outbreak of the great insurrection in Poland, which tied the hands of all three powers (see POLAND: *History*). In the circumstances, Nicholas was forced to give a grudging recognition to the title of Louis Philippe as king of the French; his recognition of that of Leopold, king of the Belgians, was postponed until King William of the Netherlands had finally resigned his rights. Then, the insurrection in Poland once crushed, and Poland itself scarce surviving even as a geographical expression,[4] he drew the three eastern autocratic powers together in a new "Holy Alliance" by the secret convention of Berlin (3rd Oct. 1833) reaffirming the right and duty of intervention at the request of a legitimate sovereign. The cordial understanding with Austria, cemented at Münchengrätz and Berlin, was renewed, after the accession of the emperor Ferdinand, at Prague and Töplitz (1835); on the latter occasion it was decided "without difficulty" to suppress the republic of Cracow, as a centre of revolutionary agitation.[5] The Triple Alliance was now, in the tsar's opinion, "the last anchor of safety for the monarchical cause." To its maintenance he had sacrificed "his religious convictions" and "the traditions of Russian policy" in consenting to uphold the integrity of Turkey; a sacrifice perhaps the less hard to make since, as he added, the Ottoman empire no longer existed.[6] He allowed himself to be persuaded by Metternich to support the cause of Don Carlos in Spain,[7] and so early as May 1837, in view of the agitation in Hungary, he announced that "in every case" Austria might count on Russia.

These cordial ties were loosened, however, by the fresh crisis in the Eastern Question after 1838. Metternich was anxious to summon a European conference to Vienna, with a view to placing Turkey under a collective guarantee. To Nicholas this seemed to be a blow aimed at Russia, and he refused to be a party to it.[8] Moreover, in view of the tendency of Austria to forget the conventions of Münchengrätz and Töplitz, and to approach the maritime powers, he determined to checkmate her by himself coming to an agreement with Great Britain, in order to settle the Eastern Question according to his own views: a double gain, if by this means Queen Victoria (a "legitimate" sovereign) could be drawn away from her unholy alliance with the Jacobin Louis Philippe. This is the explanation of those concessions in the Eastern Question which ended in the Quadruple Alliance of 1840 and the humiliation of Louis Philippe's government (see MEHEMET ALI).

The new Anglo-Russian *entente* led in 1844 to a visit of the

[1] Nicholas remained in Russia in 1829, and Diabitsch had a free hand.

[2] He once sentenced an unhappy Jew to run the gauntlet of 10,000 strokes, exclaiming as he signed the warrant, "Thank God, we have no capital punishment in Russia!" Yet his nature had its kindly side: "He *feels* kindness deeply—and his love for his wife and children, and for all children, is *very* great" (Queen Victoria, *loc. cit*). He also spent much personal effort in organizing the charitable institutions of the dowager empress Maria, and founded a great number of institutions for technical education.

[3] Martens, *Recueil*, viii. 164, &c., especially the autograph mem. of the tsar on the situation (p. 168): "But apart from *honour*, is it to our interest to consent to this fresh iniquity? . . . . Even if France invade Austria, Prussia says she will give her *moral* support! Is that—Great God!—the alliance created by the immortal emperor? . . . . Let us preserve the sacred fire for the moment of the struggle with the infernal powers!"

[4] Nicholas himself ascribed his hatred of Poles and Jews to the stories told him by his English nurse, Miss Lyon, of her sufferings during the siege of Warsaw in 1794.—Schiemann, i. 181.

[5] This convention was not acted upon till 1846.

tsar to the English court. This visit, in spite of the favourable personal impression made by the emperor, was the starting-point of a fresh and fateful divergence; for it was now that the tsar first openly raised the question of the eventual partition of the inheritance of the "Sick Man," as he called Turkey. The whole question, however, was indefinitely postponed by the events culminating in the revolutions of 1848. Nicholas foresaw the troubles brewing, and warned Frederick William IV. of Prussia, in a tone of lofty and paternal remonstrance, of the inevitable results of his constitutional experiments. When the storm burst, he remained entrenched behind the barriers of his own disciplined empire; sovereigns truckling in a panic to insurgent democracies he would not lift a finger to help;[1] it was not till Francis Joseph of Austria in 1849 appealed to him in the name of autocracy, reasserting its rights, that he consented to intervene, and, true to the promise made at Münchengrätz in 1833, crushed the insurgent Hungarians and handed back their country as a free gift to the Habsburg king. Scarcely less valuable to Austria was the tsar's intervention in the quarrel between Austria and Prussia arising out of the Hesse incident and the general question of the hegemony of Germany. In October 1850 he had a meeting with Francis Joseph at Warsaw, at which Count Brandenburg and Prince Schwarzenberg were present. Prussia, he declared, must in the German question return to the basis of the treaties of 1815 and renew her *entente* with Austria; this was the only way of preserving the old friendship of Prussia and Russia. In face of the threat conveyed in this, the Prussian government decided to maintain peace (Nov. 2), Radowitz resigning as a protest. Thus Nicholas, who refused to believe in the perfidy ascribed by Frederick William to Austria,[2] was the immediate cause of Prussia's humiliation at Olmütz.

Nicholas was soon to have personal experience of the perfidy of Austria. It was a small matter that Count Prokesch-Osten, the Austrian ambassador, was discovered to be supplying a "foul Jew" editor with copy; more serious was Austria's attitude in the troubles that led up to the Crimean War. Gratitude, in the tsar's opinion, should have made her neutral if not friendly; the revelation of her ingratitude came upon him with the shock of a painful surprise. The first cause of all the evils that followed was his attitude towards Napoleon III. He was forced to recognize the new French empire, but he would recognize no more than the fact of its existence (*du fait en lui-même*); he refused to address the emperor of the French as a brother sovereign. He attempted, moreover, to revive the function of the triple alliance as guardian of Europe against French aggression. The resentment of Napoleon awakened the slumbering Eastern Question by reviving the obsolescent claims of France to the guardianship of the Holy Places, and this aroused the pride of the Orthodox tsar, their guardian by right of faith and in virtue of a clause of the treaty of Kuchuk Kainardji (1774), as interpreted in the light of subsequent events. Nicholas could not believe that Christian powers would resent his claim to protect the Christian subjects of the sultan; he believed he could count on the friendship of Austria and Prussia; as for Great Britain, he would try to come to a frank understanding with her (hence the famous conversations with Sir Hamilton Seymour on the 9th and 14th of January 1853, reviving the "Sick Man" arguments of 1844), but in any case he had the assurance of Baron Brunnow, his ambassador in London, that the influence of Cobden and Bright, the eloquent apostles of peace, was enough to prevent her from appealing to arms against him.

The disillusionment that followed was profound. In October 1853 Nicholas met his brother monarchs of the triple alliance at Warsaw for the last time. In December, at the conference of Vienna, Austria had already passed over to the enemy. Prussia was wavering, neutral indeed, but joining the other powers in a guarantee of the integrity of Turkey (9th April 1854), urging the tsar to accept the decisions of the Vienna conference, and on his refusal signing a defensive alliance with Austria (April 20, 1854), which included among the *casus belli* the incorporation in Russia of the banks of the Danube and a Russian march on Constantinople. Thus Nicholas, the pillar of the European alliance, found himself isolated and at war, or potentially at war, with all Europe. The invasion of the Crimea followed, and with it a fresh revelation of the corruption and demoralization of the Russian system. At the outset Nicholas had grimly remarked that "Generals January and February" would prove his best allies. These acted, however, impartially; and if thousands of British and French soldiers perished of cold and disease in the trenches before Sevastopol, the tracks leading from the centre of Russia into the Crimea were marked by the bones of Russian dead. The revelation of his failure broke the spirit of the Iron Tsar, and on the 2nd of March 1855 he threw away the life which a little ordinary care would have saved.
