The character of the emperor Nicholas was summed up with great insight by Queen Victoria in a letter to the king of the Belgians, written during the tsar's visit to England (June 11, 1844). "He is stern and severe—with fixed principles of *duty* which *nothing* on earth will make him change; very *clever* I do *not* think him, and his mind is an uncivilized one; his education has been neglected; politics and military concerns are the only things he takes great interest in; the arts and all softer occupations he is insensible to, but he is sincere, I am certain, *sincere* even in his most despotic acts, from a sense that that *is* the *only* way to govern; he is not, I am sure, aware of the dreadful cases of individual misery which he so often causes, for I can see by various instances that he is kept in utter ignorance of *many* things, which his people carry out in most corrupt ways, while he thinks that he is extremely just ... and I am sure *much* never reaches his ears, and (as you observed) how can it? He is, I should say, too frank, for he talks so openly before people, which he should not do, and with difficulty restrains himself. His anxiety *to be believed* is very great, and I must say his personal promises I *am inclined* to believe; then his feelings are very strong; he *feels* kindness deeply. ... He is *not* happy, and that melancholy which is visible in the countenance made me sad at times; the sternness of the eyes goes very much off when you know him, and changes according to his being put out or not.... He is bald now, but in his chevalier Garde uniform he is *magnificent* still, and very *striking*."

The emperor was a kind husband and father, and his domestic life was very happy. He had seven children: (1) the emperor Alexander II. (*q.v.*); (2) the grand-duchess Maria (1819–1876), duchess of Leuchtenberg; (3) the grand-duchess Olga (1822–1892), consort of King Charles of Württemberg; (4) the grand-duchess Alexandra (1825–1844), married to Prince Frederick of Hesse-Cassel; (5) the grand-duke Constantine Nikolayevich (1827–1892); (6) the grand-duke Nicholas Nikolayevich (1831–1891); (7) the grand-duke Michael Nikolayevich (b. 1832). The second son of the latter, the grand-duke Michael Mikhailovich (b. 1861), who was morganatically married, his wife bearing the title of Countess Torby, took up his residence in England.

[1] "Russia cannot aid a power which has abjured its traditions and is under the empire of revolutionary institutions."—Nicholas to Frederick William IV., Sept. 26, 1848. Martens, *Recueil*, viii. 376.

AUTHORITIES.—All other works on Nicholas I. have been more or less superseded by Professor Theodor Schiemann's *Geschichte Russlands unter Kaiser Nikolaus I.*, of which the 1st vol., *Kaiser Alexander I. und die Ergebnisse seiner Lebensarbeit*, was published at Berlin in 1904; the 2nd, carrying the history of Nicholas's reign down to the revolutions of 1830, in 1908. It is based on a large mass of unpublished material, and considerably modifies, *e.g.* the account of the accession of Nicholas and of the Decabrist conspiracy given in chapter xiii. of vol. x. of the *Cambridge Modern History*, and tells for the first time the secret history of the Russo-Turkish War of 1828–29. The great *Recueil des traités conclus par la Russie* of T. T. de Martens (St Petersburg, 1874–1909) contains admirable introductory essays, based on the unpublished Russian archives, and giving much material for the study of Nicholas's character and policy. Many documents are published for the first time in Schiemann's work; some, from the archives of Count Nesselrode, are published in the *Lettres et papiers du Chancelier Comte de Nesselrode*, t. vi. seq. For other works see bibliographies attached to the chapters on Russia in vol. x. and xi. of the *Cambridge Modern History*. (W. A. P.)

NICHOLAS II. (1868–), emperor of Russia, eldest son and successor of Alexander III., was born at St Petersburg on the 18th of May 1868. He received the ordinary education of Russian grand-dukes, under the direction of General Danilovitch, assisted by M. Pobĕdonostsev and other eminent professors. Among these was an Englishman, Mr Charles Heath, for whom he had great respect and affection. By the death of his grandfather, Alexander II., in 1881, he became heir-apparent (cesarevich). Though he received, like all the heirs-apparent to the Russian throne, a certain amount of military training, his personal tastes did not lie in that direction, nor did he show any inclination for the boisterous amusements of the *jeunesse dorée* of St Petersburg. Like his father, he was nowhere happier than in the family circle, and he was particularly attached to his sister, the grand-duchess Xenia, who was seven years younger than himself. In 1890–1891 he made a tour in Greece, Egypt, India, Ceylon and Japan, where he narrowly escaped assassination at the hands of a Japanese fanatic. On the return journey by Siberia, at Vladivostok, he turned the first sod of the eastern section of the Siberian railway, and two years afterwards (1893) he was appointed president of the imperial committee for that great undertaking. By the death of his father on the 1st of November 1894 he became emperor, and on the 26th of that month he married Princess Alix of Hesse (a grand-daughter of Queen Victoria), to whom he had been betrothed in the presence of his father during the latter's last illness. Eighteen months later the coronation took place at Moscow with great pomp, but a gloom was thrown over the festivities by the unfortunate incident of the Khodinskoe Polye, a great open space near the city, where a popular fête had been prepared and where, from defective police arrangements, a large number of men, women and children, roughly estimated at 2000, were crushed and trampled to death. Nicholas II. followed in the footsteps of his father, seeking to preserve peace in foreign relations, and continuing in home affairs, though in a much milder form, the policy of centralization and Russification which had characterized the previous reign. His pacific tendencies were shown by his systematic opposition to all bellicose excitement, by his maintaining M. de Giers in the post of minister of foreign affairs, by his offering the post, on the death of that statesman, to M. de Staal, by his restraining France from dangerous adventures, and by initiating the Peace Conference at the Hague. To these ought perhaps to be added the transformation of the Franco-Russian *entente cordiale* into a formal alliance, since the alliance in question might be regarded as favourable to the preservation of the *status quo* in Europe. In the internal administration during the first years of his reign he introduced by his personal influence, and without any great change in the laws, a more humane spirit towards those of his subjects who did not belong by language and tradition to the dominant nationality, and who were not members of the Eastern Orthodox Church; but he disappointed the men of liberal views by giving it to be clearly understood soon after his accession that he had no intention of circumscribing and weakening the autocratic power by constitutional guarantees or parliamentary institutions. In spite, however, of his desire for peace he let his country drift into the disastrous war with Japan; and notwithstanding his sincere attachment to the principles of bureaucratic autocracy, it was he who granted the constitutional reforms which altered the whole political outlook in Russia (see RUSSIA).

NICHOLAS OF BASEL (d. 1397), a prominent member of the Beghard community, who travelled widely as a missionary and propagated the teachings of his sect. Though vigorously sought after by the Inquisition he eluded its agents for many years until in 1397 he was seized in Vienna, and burned at the stake as a heretic, together with two of his followers, John and James. A considerable legend has attached itself to Nicholas through the persistent but mistaken identification of him with the mysterious "Friend of God from the Oberland," the "double" of Rulman Merswin, the Strassburg banker who was one of the leaders of the 14th-century German mystics known as the Friends of God. In Merswin's *Story of the First Four Years of a New Life*, he writes: "Of all the wonderful works which God had wrought in me I was not allowed to tell a single word to anybody until the time when it should please God to reveal to a man in the Oberland to come to me. When he came to me God gave me the power to tell him everything." The identity and personality of this "Friend of God," who bulks so largely in the great collection of mystical literature, and is everywhere treated as a half supernatural character, is one of the most difficult problems in the history of mysticism. The tradition, dating from the 15th century and supported by the weighty authority of the Strassburg historian Karl Schmidt (*Nicolaus von Basel*, Vienna, 1866), identified him with Nicholas, but is now discredited by all scholars. A. Jundt (*Les Amis de Dieu*, 1879) shared Preger's view that the Friend was a great unknown who lived in or near Chur (Coire) in Switzerland. But since Denifle's researches (see especially *Der Gottesfreund im Oberlande und Nikolaus von Basel*, 1870) the belief has gained ground that the "Friend" is not a historical personage at all. Apart from the collection of literature ascribed to him and Merswin there is no historical evidence of his existence. The accounts of his life say that about 1343 he was forbidden to reveal his identity to anyone save Rulman Merswin. And as all the writings bear the marks of a single authorship it has been assumed, especially by Denifle, that "the Friend of God" is a literary creation of Merswin and that the whole collection of literature is the work of Merswin (and his school), tendency-literature designed to set forth the ideals of the movement to which he had given his life. Thus "the great unknown" from the Oberland is the ideal character, "who illustrates how God does his work for the world and for the church through a divinely trained and spiritually illuminated layman," just as William Langland in England about the same time drew the figure of Piers Plowman.

To rescue Merswin from the charge of deceit involved in this theory, Jundt puts forward the suggestion, more ingenious than convincing, that Merswin was a "double personality," who in his primary state wrote the books ascribed to him, and in his secondary state became "the Friend of God from the Oberland," writing the other treatises. A third hypothesis is that advanced by Karl Rieder (*Der Gottesfreund von Oberland*, Innsbruck, 1905), who thinks that not even Merswin himself wrote any of the literature, but that his secretary and associate Nicholas of Löwen, head of the House of St John at Grünenwörth, the retreat founded by Merswin for the circle, worked over all the writings which emanated from different members of the group but bore no author's names, and to glorify the founder of the house attached Merswin's name to some of them and out of his imagination created "the Friend of God from the Oberland," whom he named as the writer of the others. As his design took shape he expanded the supernatural element and made the narratives autobiographical. There is much in this contention that is sound, but Rieder seems to go unnecessarily far in denying altogether that Merswin wrote any of the mystical books. The conclusion remains that the literature must be treated as tendency-writing and not as genuine biography and history.

See besides the works cited, Rufus M. Jones, *Studies in Mystical Religion*, ch. xiii. (London, 1909). (A. J. G.)

NICHOLAS OF GUILDFORD (fl. 1250), English poet, the supposed author of *The Owl and the Nightingale*, an English poem of the 13th century. This work, which displays genuine poetical and imaginative qualities, is written in the south-western dialect, and is one of the few 13th-century English poems not devoted entirely to religious topics. The nightingale sitting on a branch covered with blossom sees the owl perched on a bough overgrown with ivy, and proceeds to abuse him for his general habits and appearance. The birds decide to refer the consequent dispute to Master Nicholas de Guildford, who is skilled in such questions, but they first of all engage in a regular *débat* in the French fashion. The owl is the best logician, but the nightingale has a fund of abuse that equalizes matters. Finally, when the argument threatens to become a fight, the wren

interferes, and the two go to the house of Master Nicholas at Portisham in Dorset. He judges, they say, many right judgments, and composes and writes much wisdom, and it is lamentable that so learned and worthy a man should gain no preferment from his bishop. The poet, whoever he was, wrote the octosyllabic couplet with ease and smoothness. He borrows something from Alexander of Neckham's *De naturis rerum*, and was certainly familiar with contemporary French poetry. The piece is a general allegory of the contest between asceticism and a more cheerful view of religion, and is capable of a particular application to the differences between the regular orders and the secular clergy. The nightingale defends her singing on the ground that heaven is a place of song and mirth, while the owl maintains that much weeping for his many sins is man's best preparation for the future.

There are two MSS. of the *Hule amd the Nightingale*, MS. Cotton Caligula A ix. (British Museum), dating from the first half of the 13th century, and MS. Arch. I. 29, Jesus College, Oxford, written about half a century later. In the Jesus College MS. the poem is immediately preceded by a religious poem entitled *La Passyun Jhu Christ*, which, according to a note on it, once possessed an additional quatrain implying that it was written by John of Guildford, perhaps a relation of Nicholas.

The Owl and the Nightingale has been edited from the Cotton MS. chiefly for the Roxburghe Club (1838) by Joseph Stevenson, and for the Percy Society (1843) by T. Wright; the best edition is by F. H. Stratmann (Krefeld, 1868), who collated the two MSS. See also B. Ten Brink, *Early English Literature* (trans. H. M. Kennedy, pp. 214-218); Courthope, *History of English Poetry*; and J. W. H. Atkins in the *Cambridge History of Literature*, vol. i. For some textual criticism see A. E. Egge in *Modern Language Notes* (Baltimore, January, 1887).

NICHOLAS, SIR EDWARD (1593–1669), English statesman, eldest son of John Nicholas, a member of an old Wiltshire family, was born on the 4th of April 1593. He was educated at Salisbury grammar school, Winchester College and Queen's College, Oxford. After studying law at the Middle Temple, Nicholas became secretary to Lord Zouch, warden and admiral of the Cinque ports, in 1618, and continued in a similar employment under the duke of Buckingham. In 1625 he became secretary to the admiralty; shortly afterwards he was appointed an extra clerk of the privy council with duties relating to admiralty business, and from 1635 to 1641 he was one of the clerks in ordinary to the council. In this situation Nicholas had much business to transact in connexion with the levy of ship-money; and in 1641, when Charles I. went to Scotland, a heavy responsibility rested on the secretary who remained in London to keep the king informed of the proceedings of the parliament. On the return of Charles to the capital Nicholas was knighted, and appointed a privy councillor and a secretary of state, in which capacity he attended the king while the court was at Oxford, and carried out the business of the treaty of Uxbridge. Throughout this troubled period he was one of Charles's wisest and most loyal advisers; he it was who arranged the details of the king's surrender to the Scots, though he does not appear to have advised or even to have approved of the step; and to him also fell the duty of treating for the capitulation of Oxford, which included permission for Nicholas himself to retire abroad with his family. He went to France, being recommended by the king to the confidence of the prince of Wales. After the king's death Nicholas remained on the continent concerting measures on behalf of the exiled Charles II. with Hyde and other royalists, but the hostility of Queen Henrietta Maria deprived him of any real influence in the counsels of the young sovereign. He lived at the Hague and elsewhere in a state of poverty which hampered his power to serve Charles, but which the latter did nothing to relieve. He returned to England at the Restoration; but although Charles had formally appointed him secretary of state in 1654, this office was now conferred on another, and Nicholas had to content himself with a grant of money and the offer of a peerage, which his poverty compelled him to decline. He retired to a country seat in Surrey which he purchased from a son of Sir Walter Raleigh, and here he lived till his death in 1669. By his wife Jane, a daughter of Henry Jay, an alderman of London, he had several sons and daughters; his younger brother MATTHEW NICHOLAS (1594–1661) was successively dean of Bristol, canon of Westminster and dean of St Paul's.

See *The Nicholas Papers*, edited by G. F. Warner (Camden Society, London, 1886–1897), containing Nicholas's correspondence and some autobiographical memoranda. Private correspondence between Nicholas and Charles I. will be found in the *Memoirs of John Evelyn*, edited by W. Bray (London, 1827); *The Edgerton MSS.* and the *Ormonde Papers* contain many references to Nicholas.

NICHOLAS (or NICLAES), **HENRY** (or HENDRIK) (*c.* 1501–*c.* 1580), founder of the sect called "the Family of Love," was born in 1501 or 1502, at Münster, where he was married and carried on the business of a mercer. As a boy he was subject to visions, and at the age of twenty-seven charges of heresy led to his imprisonment. About 1530 he removed with his family to Amsterdam, where he was again imprisoned on a charge of complicity in the Münster revolution of 1534–1535. About 1539 he experienced a call to found his "Familia Caritatis." Removing to Embden, he lived there and prospered in business for twenty years, though he travelled with commercial as well as missionary objects into the Netherlands, England and elsewhere. The date of his sojourn in England has been placed as early as 1552 and as late as 1569. In 1579 he was living at Cologne, where probably he died a year or two later. His doctrines seem to have been derived largely from the Dutch Anabaptist David Jöris or George, who died in 1556; but they have mainly to be inferred from the jaundiced accounts of hostile writers. The outward trappings of his system were merely Anabaptist; but he anticipated a good many later speculations, and his followers were accused of asserting that all things were ruled by nature and not directly by God, of denying the dogma of the Trinity, and repudiating infant baptism. They held that no man should be put to death for his opinions, and apparently, like the later Quakers, they objected to the carrying of arms and to anything like an oath; and they were quite impartial in their repudiation of all other churches and sects, including Brownists and Barrowists.

Nicholas's principal disciple in England was one Christopher Vitel, and towards 1579 the progress of the sect especially in the eastern counties provoked literary attacks, proclamations and parliamentary bills. But Nicholas's followers escaped the gallows and the stake, for they combined with some success the wisdom of the serpent and the harmlessness of the dove. They would only discuss their doctrines with sympathizers; they showed every respect for authority, and considered outward conformity a duty. This quietist attitude, while it saved them from molestation, hampered propaganda; and though the "Family" existed until the middle of the 17th century, it was then swallowed up by the Quakers, Baptists and Unitarians, all of which denominations may have derived some of their ideas through the "Family" from the Anabaptists.

The list of Nicholas's works occupies nearly six columns in the *Dict. Nat. Biogr.* See also Belfort Bax, *Rise and Fall of the Anabaptists*, pp. 327-380 (1903); and Strype's Works, General Index. (A. F. P.)

NICHOLS, JOHN (1745–1826), English printer and author, was born at Islington on the 2nd of February 1745. He edited the *Gentleman's Magazine* from 1788 till his death, and in the pages of that periodical, and in his numerous volumes of *Anecdotes and Illustrations*, he made invaluable contributions to the personal history of English men of letters in the 18th century. He was apprenticed in 1757 to "the learned printer," William Bowyer, whom he eventually succeeded. On the death of his friend and master in 1777 he published a brief memoir, which afterwards grew into the *Anecdotes of William Bowyer and his Literary Friends* (1782). As his materials accumulated he compiled a sort of anecdotical literary history of the century, based on a large collection of important letters. *The Literary Anecdotes of the 18th Century* (1812–1815), into which the original work was expanded, forms only a small part of Nichols's production. It was followed by the *Illustrations of the Literary History of the 18th Century, consisting of Authentic Memoirs and Original Letters of Eminent Persons*, which was begun in 1817 and completed by his son John Bowyer Nichols (1779–1863) in 1858.

The *Anecdotes* and the *Illustrations* are mines of valuable information on the authors, printers and booksellers of the time.

Nichols's other works include: A *Collection of Royal and Noble Wills* (1780); *Select Collection of Miscellaneous Poems* (1782), with subsequent additions, in which he was helped by Joseph Warton and by Bishops Percy and Lowth; *Bibliotheca Topographica Britannica* (1780–1790); with Richard Gough, *The Progresses and Public Processions of Queen Elizabeth* (1788); and the important *History and Antiquities of the Town and County of Leicester* (1795–1815). Nichols was a fellow of the Society of Antiquaries, a trustee of many city institutions, and in 1804 he was master of the Stationers' Company. He died on the 26th of November 1826. JOHN BOWYER NICHOLS continued his father's various undertakings, and wrote, with other works, *A Brief Account of the Guildhall of the City of London* (1819). His eldest son, JOHN GOUGH NICHOLS (1806–1873), was also a printer and a distinguished antiquary, who edited the *Gentleman's Magazine* from 1851 to 1856, and the *Herald and Genealogist* from 1863 to 1874, and was one of the founders of the Camden Society.

A full *Memoir* of John Nichols by Alexander Chalmers is contained in the *Illustrations*, and a bibliography in the *Anecdotes* (vol. vi.) is supplemented in the later work. See also R. C. Nichols, *Memoirs of J. G. Nichols* (1874).

NICHOLSON, HENRY ALLEYNE (1844–1899), British palaeontologist and zoologist, son of Dr John Nicholson, a biblical scholar, was born at Penrith on the 11th of September 1844. He was educated at Appleby Grammar School and at the universities of Göttingen (Ph.D., 1866) and Edinburgh (D.Sc., 1867; M.D., 1869). Geology had early attracted his attention, and his first publication was a thesis for his D.Sc. degree *On the Geology of Cumberland and Westmoreland* (1868). In 1871 he was appointed professor of natural history in the university of Toronto, in 1874 professor of biology in the Durham College of Science and in 1875 professor of natural history in the university of St Andrews. This last post he held until 1882, when he became regius professor of natural history in the university of Aberdeen. He was elected F.R.S. in 1897. His original work was mainly on fossil invertebrata (graptolites, stromatoporoids and corals); but he did much field work, especially in the Lake district, where he laboured in company with Professor R. Harkness and afterwards with Dr J. E. Marr. He was awarded the Lyell Medal by the Geological Society in 1888. He died at Aberdeen on the 19th of January 1899.

PUBLICATIONS.—*Ancient Life-History of the Earth* (1877); *Manual of Zoology* (of which there were 7 editions) and other text-books of Zoology; *Manual of Palaeontology* (1872, 3rd ed., 2 vols., with R. Lydekker, 1889); *Monograph of the Silurian Fossils of the Girvan District in Ayrshire* (with R. Etheridge, jun.) (1878–1880); *Monograph of the British Stromatoporoids* in Palaeontograph. Soc. (1886–1892).

Obituary, with portrait, by Dr G. J. Hinde, in *Geol. Mag.* (March 1899).

NICHOLSON, JOHN (1822–1857), Anglo-Indian soldier and administrator, son of Alexander Nicholson, a north of Ireland physician, was born on the 11th of December 1822 and educated at Dungannon College. He was presented with a cadetship in the Bengal infantry in 1839 by his uncle Sir James Hogg, and served in the first Afghan War of 1839–42; he distinguished himself in the defence of Ghazni, and was one of the prisoners who were carried to Bamian and escaped by bribing the guard upon General Pollock's successful advance. It was in Afghanistan that Nicholson first met Sir Henry Lawrence, who got him the appointment of political officer in Kashmir and subsequently on the Punjab frontier. In 1847 he was given charge of the Sind Sagar district, and did much to pacify the country after the first Sikh War. On the seizure of Multan by Mulraj, he rendered great service in securing the country from Attock, and was wounded in an attack upon a tower in the Margalla Pass, where a monument was subsequently erected to his memory. On the outbreak of the second Sikh War he was appointed political officer to Lord Gough's force, when he rendered great service in the collection of intelligence and in furnishing supplies and boats.

On the annexation of the Punjab he was appointed deputy commissioner of Bannu. There he became a kind of legendary hero, and many tales are told of his stern justice, his tireless activity and his commanding personality. In the course of five years he reduced the most turbulent district on the frontier to such a state of quietude that no crime was committed or even attempted during his last year of office, a condition of things never known before or since. On one occasion, being attacked by a *ghasi*, he snatched the musket from the hand of a sentry and shot the man dead; on another occasion he put a price on the head of a notorious outlaw, and finding every one afraid to earn it, rode single-handed to the man's village, met him in the street and cut him down. But besides being a severe ruler, Nicholson was eminently just. A criminal had no chance of escaping him, so able and determined was his investigation; and a corrupt official could not long evade his vigilance; but he was deliberate in his punishments, and gave offenders a chance to redeem their character. He would go personally to the scene of a crime or a legal dispute and decide the question on the spot. Every man in his district, whether mountain tribesman or policeman, felt that he was controlled by a master hand, and the natives said of him that "the tramp of his war-horse could be heard from Attock to the Khyber." Lord Roberts says of him in *Forty-One Years in India*: "Nicholson impressed me more profoundly than any man I had ever met before, or have ever met since. I have never seen any one like him. He was the *beau idéal* of a soldier and a gentleman." It is little wonder that the natives worshipped him as a god under the title of Nikalsain. Nicholson, however, had a fiery temper and a contempt for red tape, which made him a somewhat intractable subordinate. He had a serious quarrel with Sir Neville Chamberlain, and was continually falling out with Sir John Lawrence, who succeeded his brother Henry as ruler of the Punjab.

It was when the Mutiny broke out in May 1857 that Nicholson was able to show the metal that was in him, and he did more than any other single man to keep the Punjab loyal and to bring about the fall of Delhi. When the news of the rising at Meerut arrived, Nicholson was with Edwardes at Peshawar, and they took immediate steps to disarm the doubtful regiments in that cantonment. Together they opposed Sir John Lawrence's proposal to abandon Peshawar, in order to concentrate all their strength on the siege of Delhi. In June Nicholson was appointed to the command of a movable column, with which he again disarmed two doubtful regiments at Phillaur. In July he made a forced march of 41 m. in a single day in the terrific heat of the Punjab summer, in order to intercept the mutineers from Sialkot, who were marching upon Delhi. He caught them on the banks of the Ravi near Gurdaspur, and utterly destroyed them, thus successfully achieving what hardly any other man would have attempted. In August he had pacified the Punjab and was free to reinforce General Wilson on the Ridge before Delhi. An officer who served in the siege gives the following word picture of him as he appeared at this time:—

"He was a man cast in a giant mould, with massive chest and powerful limbs, and an expression ardent and commanding, with a dash of roughness; features of stern beauty, a long black beard, and a deep sonorous voice. There was something of immense strength, talent and resolution in his whole frame and manner, and a power of ruling men on high occasions which no one could escape noticing. His imperial air, which never left him, and which would have been thought arrogant in one of less imposing mien, sometimes gave offence to the more unbending of his countrymen, but made him almost worshipped by the pliant Asiatics."

Before Nicholson's arrival the counsels of the commanders before Delhi, like those at Meerut, suffered from irresolution and timidity. As General Wilson's health declined, his caution became excessive, and Nicholson was specially sent by Sir John Lawrence to put more spirit into the attack. His first exploit after his arrival was the victory of Najafgarh, which he won over the rebels who were attempting to intercept the British siege train from Ferozepore. After marching through a flooded country scarcely practicable for his guns, Nicholson, with a force of 2500 troops, defeated 6000 disciplined sepoys after an hour's fighting, and thenceforth put an end to all attempts of the enemy to get in the rear of the British position on the Ridge. Nicholson grew fiercely impatient of General Wilson's

procrastination, and at one time was thinking of appealing to the army to set Wilson aside and elect a successor; but at last, on the 13th of September, he forced Wilson to make up his mind to the assault, and he himself was chosen to lead the attacking column. On the morning of the 14th he led his column, 1000 strong, in the attack on the Kashmir gate, and successfully entered the streets of Delhi. But in trying to clear the ramparts as far as the Lahore Gate, he undertook a task beyond the powers of his wearied troops. In encouraging them as they hesitated, he turned his back on the enemy and was shot in the back. The wound was mortal, but his magnificent physique allowed him to linger for nine days before finally succumbing on the 23rd of September.

His best epitaph is found in the words of Sir John Lawrence's Mutiny Report:—

"Brigadier-General John Nicholson is now beyond human praise and human reward. But so long as British rule shall endure in India, his fame can never perish. He seems especially to have been raised up for this juncture. He crowned a bright, though brief, career by dying of the wound he received in the moment of victory at Delhi. The Chief Commissioner does not hesitate to affirm that without John Nicholson Delhi could not have fallen."

See J. L. Trotter, *Life of John Nicholson* (1904); Sir John Kaye, *Lives of Indian Officers* (1889); Bosworth Smith, *Life of Lord Lawrence* (1883); Lady Edwardes, *Memorials of Sir Herbert Edwardes* (1886); and S. S. Thorburn, *Bannu* (1876).

NICHOLSON, WILLIAM (1753–1815), English writer on natural philosophy, was born in London in 1753, and after leaving school made two voyages as midshipman in the East India service. He subsequently entered an attorney's office, but, having become acquainted, in 1775, with Josiah Wedgwood, he lived for some years at Amsterdam as agent for the sale of pottery. On his return to England he was induced by Thomas Holcroft to devote himself to the composition of light literature for periodicals, assisting that writer also with some of his plays and novels. Meanwhile he employed himself on the preparation of *An Introduction to Natural Philosophy*, which was published in 1781 and was at once successful. A translation of Voltaire's *Elements of the Newtonian Philosophy* soon followed, and he now entirely devoted himself to scientific pursuits and philosophical journalism. In 1784 he was appointed secretary to the General Chamber of Manufacturers of Great Britain, and he was also connected with the Society for the Encouragement of Naval Architecture, established in 1791. He bestowed much attention upon the construction of various machines for comb-cutting, file-making, cylinder printing, &c.; he also invented an areometer. In 1800 he began in London a course of public lectures on natural philosophy and chemistry, and about this period he made the discovery of the decomposition of water by the voltaic current. In 1797 the *Journal of Natural Philosophy, Chemistry and the Arts*, generally known as *Nicholson's Journal*, the earliest work of the kind in Great Britain, was begun; it was carried on till 1814. During the later years of his life Nicholson's attention was chiefly directed to waterworks engineering at Portsmouth, at Gosport and in Southwark. He died in London on the 21st of May 1815.

Besides considerable contributions to the *Philosophical Transactions*, Nicholson wrote translations of Fourcroy's *Chemistry* (1787) and Chaptal's *Chemistry* (1788), *First Principles of Chemistry* (1788) and a *Chemical Dictionary* (1795); he also edited the *British Encyclopaedia, or Dictionary of Arts and Sciences* (6 vols., 8vo, London, 1809).

NICHOLSON, WILLIAM (1784–1844), Scottish painter, was born at Newcastle-on-Tyne. Having settled in Edinburgh, he painted portraits both in oil and water-colour; and along with Thomas Hamilton the architect he was one of the founders and most vigorous promoters of the Scottish Academy, of which he became the first secretary (1826–1833). In 1818 he published a series of etchings entitled *Portraits of Distinguished Living Characters of Scotland*, including Sir Walter Scott, Lord Jeffrey, Robert Burns and Professor Wilson.

NICIAS (d. 414 B.C.), a soldier and statesman in ancient Athens, inherited from his father Niceratus a considerable fortune invested mainly in the silver mines of Laurium. Evidence of his wealth is found in the fact that he had no less than 1000 slaves whom he hired out. He gravitated naturally to the aristocratic party, and was several times colleague with Pericles in the strategia. On the death of Pericles he was left leader of the aristocrats against the advanced party of Cleon (*q.v.*). He made use of his wealth both to buy off enemies (especially informers) and to acquire popularity by the magnificent way in which he discharged various public services, especially those connected with the state religion, of which he was a strong supporter. In the field he displayed extreme caution, and prior to the great Sicilian expedition achieved a number of minor military successes. In 421 he took a prominent part in the arrangement of the "Peace of Nicias," which terminated the first decade of the Peloponnesian War (*q.v.*). He now entered with varying success upon a period of rivalry with Alcibiades, the details of which are largely matters of conjecture. So bitter was the strife that the ostracism of one seemed inevitable, but by a temporary coalition they secured instead the banishment of the demagogue Hyperbolus (417). In 415 he was appointed with Alcibiades and Lamachus to command the Sicilian expedition, and, after the flight of Alcibiades (*q.v.*) and the death of Lamachus, was practically the sole commander, the much more capable Demosthenes, who was sent to his aid, being apparently of comparatively little weight. How far it is just to attribute to his excessive caution and his blind faith in omens the disastrous failure it is difficult to say. At all events it is clear that the management of so great an enterprise was a task far beyond his powers. He was a man of conventional respectability and mechanical piety, without the originality which was required to meet the crisis which faced him. His popularity with the aristocratic party in Athens is, however, strikingly shown by the lament of Thucydides over his death: "He assuredly, among all Greeks of my time, least deserved to come to so extreme a pitch of ill-fortune, considering his exact performance of established duties to the divinity" (vii. 86, Grote's version).

Besides Thucydides see Plutarch's *Nicias* and Diod. xii. 83; also the general authorities on the history of Greece, and the article PELOPONNESIAN WAR.

NICIAS, son of Nicomedes, an Attic painter of the 4th century B.C. Pliny (xxxv. 131) gives a list of his works. He was associated with Praxiteles, whose statues he coloured, thus adding to their value.

NICKEL (symbol Ni, atomic weight 58·68 (O = 16)), a metallic element. It has been known from the earliest times, being employed by the Chinese in the form of an alloy called pakfong. It was first isolated in an impure condition in 1751 by A. F Cronstedt from niccolite, and his results were afterwards confirmed by T. O. Bergman in 1775 (*De niccolo, opusc.* 2, p. 231; 3, p. 459; 4, p. 374).[1] It occurs in the uncombined condition and alloyed with iron in meteorites; as sulphide in millerite and nickel blende, as arsenide in niccolite and cloanthite, and frequently in combination with arsenic and antimony in the form of complex sulphides. In recent years it has been found in considerable quantities in New Caledonia in the form of a hydrated silicate of nickel and magnesia approximating to the constitution $(NiO, MgO)SiO_2 \cdot nH_2O$ (J. Garnier, 1865), and in Canada in the form of nickeliferous pyrrhotines, which consist of sulphides of iron associated with sulphides of nickel and copper, embedded in a matrix of gneiss. At the present time nickel is obtained practically entirely from garnierite and the nickeliferous pyrrhotines. When the former is used it is roasted with calcium sulphate or alkali waste to form a matte which is then blown in a Bessemer converter or heated in a reverberatory furnace with a siliceous flux with the object of forming a rich nickel sulphide. This sulphide is then by further heating converted into the oxide and finally reduced to the state of metal by ignition with carbon in clay crucibles. The process adopted for the Canadian ores, which are poor in copper and nickel, consists in a preliminary roasting in heaps and smelting in a blast furnace in order to obtain a matte, which is then further smelted with a siliceous flux for a rich matte. This rich matte is then mixed with coke and salt-cake and melted down in an open hearth furnace. The nickel sulphide so obtained is then roasted to oxide and reduced to metal. For a wet method of extraction

of the matte see Christofle and Bouilhet, *French Patent* 111591 (1876). L. Mond (*Jour. Soc. Chem. Ind.* 1895, p. 945) has obtained metallic nickel from the Canadian mattes by first roasting them and then eliminating copper by the action of sulphuric acid, the product so obtained being then exposed to the reducing action of producer gas at about 350° C. The reduced metal is then passed into a "volatilizer" and exposed to the action of carbon monoxide at about 80° C., the nickel carbonyl so formed being received in a chamber heated to 180–200° C., where it decomposes, the nickel being deposited and the carbon monoxide returned to the volatilizer. For an electrolytic method of treating mattes, see T. Ulke, *Moniteur scient.*, 1897, 49, p. 450. The metal as obtained by industrial methods rarely contains more than about 99–99·5% of nickel, the chief impurities being copper, iron, cobalt, silicon and carbon.

The following tables show the output of nickel from Canada and the shipments of nickel ore from New Caledonia in recent years:—

CANADA

	Production (lb).	Export (lb).		Production (lb).	Export (lb).
1900	7,080,227	13,493,239	1905	18,876,315	11,970,557
1901	9,189,047	9,537,558	1906	21,490,955	20,653,845
1902	10,693,410	3,883,264	1907	21,189,793	19,376,335

(See Rothwell's *Mineral Industry* (1908), pp. 666, 670).

The metal may also be obtained on the small scale by the reduction of the oxide by hydrogen or by carbon, by ignition of the oxalate or of nickel ammonium oxalate (J. J. Berzelius), by reduction of the chloride in a current of hydrogen (E. Péligot), by electrolysis of nickel ammonium sulphate (Winkler, *Zeit. anorg. Chem.* 1894, 8, p. 1), and by reduction of the chloride with calcium carbide.

It is a greyish white metal, and is very malleable and ductile. Its specific gravity varies according to the method employed for its preparation, the extreme values being 8·279 and 9·25. It melts between 1400–1600° C. Its specific heat increases with rise of temperature, the mean value from 15° to 100° C. being 0·1084 (A. Naccari, *Gazz.*, 1888, 18, p. 13). It is magnetic, but loses its magnetism when heated, the loss being complete at about 340-350° C. On the physical constants see H. Copaux, *Comptes rendus*, 1905, 140, p. 651. Nickel occludes hydrogen readily, is attacked by the halogen elements, and oxidizes easily when heated in air. In the massive state it is unacted upon by dry air, but if moistened with acidified water, oxidation takes place slowly. When obtained by reduction processes at as low a temperature as possible the finely divided metal so formed is pyrophoric, and according to P. Schutzenberger (*Comptes rendus*, 1891, 113, p. 177) dry hydrochloric acid gas converts this form into nickel chloride and a volatile compound of composition NiHCl. It decomposes water at a red heat. According to E. St Edme (*Comptes rendus*, 1886, 106, p. 1079) sheet nickel is passive to nitric acid, and the metal remains passive even when heated to redness in a current of hydrogen. On the reduction of organic compounds by hydrogen in the presence of metallic nickel see P. Sabatier and J. B. Senderens, *Ann. Chim. Phys.*, 1905 [8], 4, pp. 319, 433.

It rapidly oxidizes when fused with caustic soda, but is scarcely acted upon by caustic potash (W. Dittmar, *Jour. Soc. Chem. Ind.*, 1884, 3, p. 103). Hydrochloric and sulphuric acids are almost without action on the metal, but it dissolves readily in dilute nitric acid. Nickel salts are antiseptic; they arrest fermentation and stop the growth of plants. Nickel carbonyl, however, is extremely poisonous. On the toxic properties of nickel salts see A. Riche and Laborde, *Jour. Pharm. Chem.*, 1888, [5], 17, pp. 1, 59, 97.

Nickel is used for the manufacture of domestic utensils, for crucibles, coinage, plating, and for the preparation of various alloys, such as German silver, nickel steels such as invar (nickel, 35·7%; steel, 64·3%), which has a negligible coefficient of thermal expansion, and constantan (nickel, 45%; copper, 55%), which has a negligible thermal coefficient of its electrical resistance.

Compounds.

Nickel Oxides.—Several oxides of nickel are known. A suboxide, Ni_2O (?), described by W. Muller (*Pogg. Ann.*, 1869, 212, p. 59), is not certainly known. The *monoxide*, NiO, occurs naturally as bunsenite, and is obtained artificially when nickel hydroxide, carbonate, nitrate or sulphate is heated. It may also be prepared by the action of nickel on water, by the reduction of the oxide Ni_2O_3 with hydrogen at about 200° C. (H. Moissan, *Ann. Chim. Phys.*, [5], 21, p. 199), or by heating nickel chloride with sodium carbonate and extracting the fused mass with water. It is a green powder which becomes yellow when heated. It dissociates at a red heat, and is readily reduced to the metal when heated with carbon or in a current of hydrogen. It is readily soluble in acids, forming salts, the rate of solution being rapid if the oxide is in the amorphous condition, but slow if the oxide is crystalline. The *hydroxide*, $Ni(OH)_2$, is obtained in the form of a greenish amorphous powder when nickel salts are precipitated by the caustic alkalis. It is readily soluble in acids and in an aqueous solution of ammonia. *Nickel sesquioxide*, Ni_2O_3, is formed when the nitrate is decomposed by heat at the lowest possible temperature, by a similar decomposition of the chlorate, or by fusing the chloride with potassium chlorate. It is a black powder, the composition of which is never quite definite, but approximates to the formula given above. When heated with oxy-acids it dissolves, with evolution of oxygen, and with hydrochloric acid it evolves chlorine. Numerous hydrated forms of the oxide have been described (see W. Wernicke, *Pogg. Ann.*, 1870, 217, p. 122). A *peroxide*, NiO_2, has been obtained in the form of dinickelite of barium, $BaO{\cdot}2NiO_2$, by heating the monoxide with anhydrous baryta in the electric furnace (E. Dufau, *Comptes rendus*, 1896, 123, p. 495). G. Pellini and D. Meneghini (*Zeit. anorg. Chem.*, 1908, 60, p. 178) obtained a greyish green powder of composition $NiO_3{\cdot}xH_2O$, by adding an alcoholic solution of potassium hydrate to nickel-chloride and hydrogen peroxide at −50°. It has all the reactions of hydrogen peroxide, and S. Tanatar (*Ber.*, 1909, 42, p. 1516) regards it as $NiO{\cdot}H_2O_2$. An oxide, Ni_3O_4, has been obtained by heating nickel chloride in a current of moist oxygen at about 400° C. (H. Baubigny, *Comptes rendus*, 1878, 87, p. 1082), or by heating the sesquioxide in hydrogen at 190° C. (H. Moissan, *Ann. Chim. Phys.*, 1890 [5], 21, p. 199). The former method yields greyish, metallic-looking, microscopic crystals, the latter a grey amorphous powder. A hydrated form, $Ni_3O_4{\cdot}2H_2O$, is obtained when the monoxide is fused with sodium peroxide at a red heat and the fused mass extracted with water.

Nickel Salts.—Only one series of salts is known, namely those corresponding to the monoxide. In the anhydrous state they are usually of a yellow colour, whilst in the hydrated condition they are green. They may be recognized by the brownish violet colour they impart to a borax bead when heated in an oxidizing flame. The caustic alkalis added to solutions of nickel salts give a pale green precipitate of the hydroxide, insoluble in excess of the precipitant. This latter reaction is hindered by the presence of many organic acids (tartaric acid, citric acid, &c.). Potassium cyanide gives a greenish yellow precipitate of nickel cyanide, $Ni(CN)_2$, soluble in excess of potassium cyanide, forming a double salt, $Ni(CN)_2{\cdot}2KCN$, which remains unaltered when boiled with excess of potassium cyanide in presence of air (cf. COBALT). Ammonium sulphide precipitates black nickel sulphide, which is somewhat soluble in excess of the precipitate (especially if yellow ammonium sulphide be used), forming a dark-coloured solution. Ammonium hydroxide gives a green precipitate of the hydroxide, soluble in excess of ammonia, forming a blue solution. Numerous methods have been devised for the separation of nickel and cobalt, the more important of which are:—the cobaltinitrite method by which the cobalt is precipitated in the presence of acetic acid by means of potassium nitrite (the alkaline earth metals must not be present); the cyanide method (J. v. Liebig, *Ann.*, 1848, 65, p. 244; 1853, 87, p. 128), in which the two metals are precipitated by excess of potassium cyanide in alkaline solution, bromine being afterwards added and the solution warmed, when the nickel is precipitated. The latter method has been modified by adding potassium cyanide in slight excess to the solution of the mixed salts, heating for some time and then adding mercuric oxide and water, the whole being then warmed on the water bath, when a precipitate of mercuric oxide and nickel hydroxide is obtained

(Liebig). M. Ilinski and G. v. Knorre (*Ber.*, 1885, 18, p. 169) separate the metals by adding nitroso-β-naphthol in the presence of 50% acetic acid, a precipitate of cobalti nitroso-β-naphthol, $[C_{10}H_6O(NO)]_3Co$, insoluble in hydrochloric acid, being formed, whilst the corresponding nickel compound dissolves in hydrochloric acid. E. Pinerua separates the metals by taking advantage of the fact that cobalt chloride is soluble in ether which has been saturated with hydrochloric acid gas at low temperature. For an examination of the above and other methods see E. Hintz, *Zeit. anal. Chem.*, 1891, 30, p. 227.

Nickel fluoride, NiF_2, obtained by the action of hydrofluoric acid on nickel chloride, crystallizes in yellowish green prisms which volatilise above 1000° C. It is difficultly soluble in water, and combines with the alkaline fluorides to form double salts. *Nickel chloride*, $NiCl_2$, is obtained in the anhydrous condition by heating the hydrated salt to 140° C., or by gently heating the finely divided metal in a current of chlorine. It readily sublimes when heated in a current of chlorine, forming golden yellow scales. It is easily reduced when heated in hydrogen. It forms crystalline compounds with ammonia and the organic bases. It is soluble in alcohol and in water. Three hydrated forms are known, viz. a mono-, di-, and hexa-hydrate; the latter being the form usually obtained by the solution of the oxide or carbonate in hydrochloric acid. *Nickel chloride ammonia*, $NiCl_2.6NH_3$, is obtained as a white powder when anhydrous nickel chloride is exposed to the action of ammonia gas (H. Rose, *Pogg. Ann.*, 1830, 96, p. 155), or in the form of blue octahedra by evaporating a solution of nickel chloride in aqueous ammonia. When heated to 100° C. it loses four molecules of ammonia. Two hydrated forms have been described, one containing three molecules of water and the other half a molecule. Numerous double chlorides of nickel and other metals are known. The bromide and iodide of nickel resemble the chloride and are prepared in a similar fashion.

Several sulphides of the element have been obtained. A *subsulphide*, Ni_3S(?), results when the sulphate is heated with sulphur or when the precipitated monosulphide is heated in a current of hydrogen. It forms a light yellow amorphous mass which is almost insoluble in acids. The *monosulphide*, NiS, is obtained by heating nickel with sulphur, by heating the monoxide with sulphuretted hydrogen to a red heat, and by heating potassium sulphide with nickel chloride to 160-180° C. When prepared by dry methods it is an exceedingly stable, yellowish, somewhat crystalline mass. When prepared by the precipitation of nickel salts with alkaline sulphide in neutral solution it is a greyish black amorphous compound which readily oxidizes in moist air, forming a basic nickel sulphate. The freshly precipitated sulphide is soluble in sulphurous acid and somewhat soluble in hydrochloric acid and yellow ammonium sulphide (see H. Baubigny, *Comptes rendus*, 1882, 94, pp. 961, 1183; 95, p. 34). *Nickel sulphate*, $NiSO_4$, is obtained anhydrous as a yellow powder when any of its hydrates are heated. When heated with carbon it is reduced to the metal. It forms hydrates containing one, two, five, six and seven molecules of water. The heptahydrate is obtained by dissolving the metal or its oxide, hydroxide or carbonate in dilute sulphuric acid (preferably in the presence of a small quantity of nitric acid), and allowing the solution to crystallize between 15° and 20° C. It crystallizes in emerald-green rhombic prisms and is moderately soluble in water. It effloresces gradually on exposure to air and passes into the hexahydrate. It loses four molecules of water of crystallization when heated to 100° C. and becomes anhydrous at about 300° C. The hexahydrate is dimorphous, a tetragonal form being obtained by crystallization of a solution of the heptahydrate between 20° and 30° C., and a monoclinic form between 50° and 70° C. Nickel sulphate combines with many metallic sulphates to form double salts, and also forms addition compounds with ammonia aniline and hydroxylamine. The *nitrate*, $Ni(NO_3)_2.6H_2O$, is obtained by dissolving the metal in dilute nitric acid and concentrating the solution between 40° and 50° C. It crystallizes in green prisms which deliquesce rapidly on exposure to moist air.

Nickel carbonyl, $Ni(CO)_4$, is obtained as a colourless mobile liquid by passing carbon monoxide over reduced nickel at a temperature of about 60° C. (L. Mond, Langer and Quincke, *Jour. Chem. Soc.*, 1890, 57, p. 749). It boils at 43° C. (751 mm.), and sets at −25° C. to a mass of crystalline needles. It is readily soluble in hydrocarbon solvents, in chloroform and in alcohol. Its critical pressure is 30 atmospheres and its critical temperature is in the neighbourhood of 195° C. (J. Dewar, *Proc. Roy. Soc.*, 1903, 71, p. 427). It decomposes with explosive violence when heated rapidly. Dewar and Jones (*Journ. Chem. Soc.*, 1904, p. 203) have made an exhaustive study of its reactions, and find that it is decomposed by the halogens (dissolved in carbon tetrachloride) with liberation of carbon monoxide and formation of a nickel halide. Cyanogen iodide and iodine mono- and tri-chloride effect similar decompositions with simultaneous liberation of iodine; sulphuric acid reacts slowly, forming nickel sulphate and liberating hydrogen and carbon monoxide. Hydrochloric and hydrobromic acids are without action; hydriodic acid only reacts slowly. With aromatic hydrocarbons in the presence of anhydrous aluminium chloride, in the cold, there is a large evolution of hydrochloric acid gas, and an aldehyde is formed; at 100° C., on the other hand, anthracene derivatives are produced. Thus by using benzene, benzaldehyde and anthracene are obtained. Dewar and Jones suggest that in the latter reaction it is the metallic nickel which is probably the reducing agent effecting the change, since it is only dissolved in any quantity when the anthracene hydrocarbon is produced. When mesitylene is used, the reaction does not proceed beyond the aldehyde stage since hydrocarbon formation is prevented by the presence of a methyl group in the ortho-position to the -CHO group. Acids and alkalis are in general without action on nickel carbonyl. The vapour of nickel carbonyl burns with a luminous flame, a cold surface depressed in the flame being covered with a black deposit of nickel. It is an extremely powerful poison. Mond and his assistants have discovered several other carbonyls. For example cobalt gives $Co(CO)_4$, as orange crystals which melt at 51°, decomposing at a higher temperature, giving $Co(CO)_3$ and CO at 60°; $Co(CO)_3$ forms jet black crystals. For iron carbonyls see IRON; also L. Mond, H. Hirtz and M. D. Cowap, *Jour. Chem. Soc.*, 1910, 97, p. 798. *Nickel carbonate*, $NiCO_3$, is obtained in the anhydrous state by heating nickel chloride with calcium carbonate in a sealed tube to 150° C. (H. de Sénarmont, *Ann. Chim. Phys.*, 1850 [3], 30, 138). It crystallizes in microscopic rhombohedra insoluble in cold acids. By precipitation of nickel salts with solutions of the alkaline carbonates, basic carbonates of variable composition are obtained.

Numerous determinations of the atomic weight of nickel have been published, the values obtained varying from 58·0 to approximately 59·5. The more recent work of T. W. Richards and Cushman (*Chem. News*, 1899, 79, 163, 174, 185) gives for the atomic weight of the metal the values 58·69 and 58·70.

NICKNAME, a name given to a person in addition to his personal names, Christian and surname, either as a playful or familiar form of address or as a mark of ridicule, contempt or hatred. The Middle English form of the word, *nekename*, shows that it is a corruption of "an ekename" (*i.e.* "added" name; *eke*, earlier *eche*, from the root seen in Lat. *augere*, Gr. αὐξάνω), and is therefore equivalent to the Lat. *agnomen*.

There is an interesting list of national nicknames in *Notes and Queries*, 9th series, 4, 212-214.

NICOBAR ISLANDS, a British group of twelve inhabited and seven uninhabited islands in the Bay of Bengal, between Sumatra and the Andaman Islands, to which latter they are administratively appended. They have an aggregate area of about 635 sq. m., Great Nicobar (*Loëng*), the largest and southernmost of any size, covering 333 sq. m. Six others range in area from about 20 sq. m. to 62 sq. m.; the rest are mere islets. A careful census of the natives, taken by Mr E. H. Man in 1901, gave a total population of some 6700, at about which figure the estimates of the number of inhabitants have always stood. Car Nicobar (*Pu*), the most northerly island, with an area of 49 sq. m., was by far the most densely populated, and had 3500 inhabitants, Great Nicobar containing only 450. The marine surveys of these islands are still meagre and unsatisfactory, but the whole of the Nicobars and outlying islands were surveyed topographically by the Indian Survey Department in 1886–1887, when a number of maps on the scale of 2 in. to the mile were produced, giving an accurate coast-line. Some of the islands have mere flat, coral-covered surfaces; others, again, are hilly, the Great Nicobar rising to 2105 ft. On that island there are considerable and beautiful streams, but the others generally are badly off for fresh surface water. There is one good harbour, a magnificent land-locked shelter called Nancowry Harbour, formed by the islands of Camorta and Nancowry (both known to natives as *Nankauri*).

Geology.—The Nicobars form part of a great submarine chain, of which the Andamans are a continuation. Elaborate geological reports were issued by a Danish scientific expedition in 1846 and an Austrian expedition in 1858. Dr Rink of the former found no trace of true volcanic rocks, though the chain as a whole is known for its volcanic activity, but features were not wanting to indicate considerable upheavals in the most recent periods. He considered that the islands belonged to the Tertiary age. Von Hochstetter of the Austrian expedition classified the most important formations thus: eruptive, serpentine and gabbro; marine deposits, probably late Tertiary, consisting of sandstones, slates, clay, marls, and plastic clay, recent corals. He considered the whole group connected geologically with the great islands of the Malay Archipelago farther south. The vexed question of the presence of coal and tin in the Nicobars has so far received no decided scientific support. The white clay marls of Camorta and Nancowry have become famous as being true polycistinan marls like those of Barbados. Earthquakes of great violence were recorded in 1847 and 1881 (with tidal wave), and mild shocks were experienced in December 1899.

Meteorology.—It has always been held to be important to maintain a meteorological station on the Nicobars, for the purpose of

supplementing the information obtained from the Andamans regarding cyclones in the Bay of Bengal. From 1869 to 1888 an observatory was properly maintained in Nancowry harbour, but after the latter year observations were recorded only in a more or less desultory way until 1897, when the station was removed to Mus in Car Nicobar. The climate is unhealthy for Europeans. The islands are exposed to both monsoons, and smooth weather is only experienced from February to April, and in October. Rain falls throughout the year, generally in sharp, heavy showers. During the five years ending 1888 the annual rainfall varied from 91 in. to 133 in., and the number of wet days per annum from 148 to 222. The highest temperature in the shade was 98·2° F., and the lowest 64° F.

Flora and Fauna.—Although the vegetation of the Nicobars has received much desultory attention from scientific observers, it has not been subjected to a systematic examination by the Indian Forest Department like that of the Andamans, and indeed the forests are quite inferior in economic value to those of the more northerly group; besides fruit trees—such as the coco-nut (*Cocos nucifera*), the betel-nut (*Areca catechu*), and the mellori (*Pandanus leeram*)—a thatching palm (*Nipa fruticans*) and various timber trees have some commercial value, but only one timber tree (*Myristica irya*) would be considered first-class in the Andamans. The palms of the Nicobars are, however, exceedingly graceful. Instances of the introduction of foreign economic plants are frequently mentioned in the old missionary records, and nowadays a number of familiar Asiatic fruit-trees are carefully and successfully cultivated. As with the geology and the flora, certain phases of the fauna of the islands have been extensively reported. The mammals are not numerous. In the southernmost islands are a small monkey, rats and mice, tree-shrews (*Cladobates nic.*), bats, and flying-foxes, but it is doubtful if the "wild" pig is indigenous; cattle, when introduced and left, have speedily become "wild." There are many kinds of birds, notably the megapod (*Megapodius nic.*), the edible-nest-building swift (*Collocalia nidifica*), the hackled and pied pigeons (*Calaenas nic.* and *Carpophaga bicolor*), a paroquet (*Palaeornis caniceps*) and an oriole (*Oriolus macrourus*). Fowls, snipe and teal thrive after importation or migration. Reptiles—snakes, lizards and chameleons, crocodiles, turtles and an enormous variant of the edible Indian crab—are numerous; butterflies and insects, the latter very troublesome, have not yet been systematically collected. The fresh-water fish are reported to be of the types found in Sumatra.

Natives.—The Nicobarese may be best described as a Far Eastern race, having generally the characteristics of the less civilized tribes of the Malay Peninsula and the south-eastern portion of the Asiatic continent, and speaking varieties of the Mon-Annam group of languages, though the several dialects that prevail are mutually unintelligible. Their figure is not graceful, and, owing to their habit of dilating the lips by betel-chewing, the adults of both sexes are often repulsive in appearance. Though short according to the standard of whites (average height, man, 5 ft. 3¾ in.; woman, 5 ft.), the Nicobarese are a fine, well-developed race, and live to seventy or eighty years of age. Their mental capacity is considerable, though there is a great difference between the sluggish inhabitant of Great Nicobar and the keen trader of Car Nicobar. The religion is an undisguised animism, and all their frequent and elaborate ceremonies and festivals are aimed at exorcising and scaring spirits. Though for a long time they were callous wreckers and pirates, and cruel, and though they show great want of feeling in the "devil murders"—ceremonial murders of one of themselves for grave offences against the community, which are now being gradually put down—still on the whole the Nicobarese are a quiet, inoffensive people, friendly to each other, and not quarrelsome, and by inclination friendly and not dangerous to foreigners. The old charge of cannibalism may be generally said to be quite untrue. Tribes can hardly be distinguished, but there are distinctions, chiefly territorial. All the differences observed in the several kinds of Nicobarese may with some confidence be referred to habitat and the physical difficulties of communication. Such government as there is, is by the village; but the village chiefs have not usually much power, though such authority as they have has always been maintained by the foreign Powers who have possessed the islands. The clothing, when not a caricature of European dress, is of the scantiest, and the waggling tags in which the loin-cloths are tied behind early gave rise to fanciful stories that the inhabitants were naked and tailed. The houses are good, and often of considerable size. The natives are skilful with their hands, and though they never cultivate cereals, exercise some care and knowledge over the coco-nut and tobacco, and have had much success with the foreign fruits and vegetables introduced by the missionaries. The staple article of trade has always been the ubiquitous coco-nut, of which it is computed that 15 million are produced annually, 10 million being taken by the people, and 5 million exported about equally from Car Nicobar and the rest of the islands. The usual cheap European goods are imported, the foreign trade being carried on with the native traders of the neighbouring Asiatic countries. There is an old-established internal trade, chiefly between the older islands and Chowra, for pots (which are only made there) and racing and other canoes.

History.—The situation of the Nicobars along the line of a very ancient trade route has caused them to be reported by traders and seafarers through all historical times. In the 17th century the islands began to attract the attention of missionaries. At various times France, Denmark, Austria and Great Britain all had more or less shadowy rights to the islands, the Danes being the most persistent in their efforts to occupy the group, until in 1869 they relinquished their claims in favour of the British, who at once began to put down the piracies of the islanders, and established a penal settlement, numbering in all about 350 persons, in Nancowry harbour. The health of the convicts was always bad, though it improved with length of residence and the adoption of better sanitary measures; and an attempt to found a Chinese colony having failed in 1884 through mismanagement, the settlement was withdrawn in 1888. There are native agencies at Nancowry harbour and on Car Nicobar, both of which places are gazetted ports. At the latter is a Church of England mission station under a native Indian catechist attached to the diocese of Rangoon.

NICOL, JAMES (1810–1879), Scottish geologist, was born at Traquair, near Innerleithen, in Peeblesshire, on the 12th of August 1810. His father, the Rev. James Nicol (1769–1819), was minister of Traquair, and acquired some celebrity as a poet. Educated at Edinburgh University (1825), James Nicol attended the lectures of Jameson, and thereby gained a keen interest in geology and mineralogy; and he pursued their study in the universities of Bonn and Berlin. After returning home he worked zealously at the local geology and obtained prizes from the Highland Society for essays on the geology of Peeblesshire and Roxburghshire; he subsequently extended his researches over various parts of Scotland, and in 1844 published his able *Guide to the Geology of Scotland*. In 1847 he was appointed assistant secretary to the Geological Society of London, in 1849 professor of geology in Queen's College, Cork, and in 1853 professor of natural history in the University of Aberdeen, a post which he retained until a few months before he died, on the 8th of April 1879. During these years he carried out important researches on the southern uplands of Scotland and on the structure of the Highlands. In the former region he gave the first clear account of the succession of the fossiliferous Lower Palaeozoic rocks (1848–1852); and when he came to deal with the still older Highland rocks he made out the position of the Torridon sandstone and Durness limestone and their relations to the schists and gneisses. His matured views, although contested by Murchison, have subsequently been substantiated by Professor C. Lapworth and others.

The more important of his papers were: "On the Structure of the North-Western Highlands" (*Quart. Journ. Geol. Soc.*, 1861), and "On the Geological Structure of the Southern Grampians" (*ib.*, 1863). He contributed the article "Mineralogy" to the ninth edition of the *Encyclopaedia Britannica*. Among his other works were *Manual of Mineralogy* (1849); *Elements of Mineralogy* (1858, 2nd ed., 1873); *Geological Map of Scotland* (1858); and *Geology and Scenery of the North of Scotland* (1866).

NICOL, WILLIAM (? 1768–1851), Scottish physicist, was born about 1768, and died at Edinburgh on the 2nd of September

1851. Nothing is known of his early history beyond the fact that, after amassing a small competence as a popular lecturer on natural philosophy, he settled in Edinburgh to live a very retired life in the society of his apparatus alone. Besides the invention of the prism known by his name ("A method of increasing the divergence of the two rays in calcareous spar, so as to produce a single image," *New Edin. Journ.*, 1828), he devoted himself chiefly to the examination of fluid-filled cavities in crystals, and of the microscopic structure of various kinds of fossil wood. His skill as a working lapidary was very great; and he prepared a number of lenses of garnet and other precious stones, which he preferred to the achromatic microscopes of the time.

NICOLAI, CHRISTOPH FRIEDRICH (1733–1811), German author and bookseller, was born on the 18th of March 1733 at Berlin, where his father, Christoph Gottlieb Nicolai (d. 1752), was the founder of the famous Nicolaische Buchhandlung. He received a good education, and in 1749 went to Frankfort-on-Oder to learn his father's business, finding time also to become acquainted with English literature. In 1752 he returned to Berlin, and began to take part in literary controversy by defending Milton against the attacks of J. C. Gottsched. His *Briefe über den jetzigen Zustand der schönen Wissenschaften in Deutschland*, published anonymously in 1755 and reprinted by G. Ellinger in 1894, were directed against both Gottsched and Gottsched's Swiss opponents, Johann Jakob Bodmer and Johann Jakob Breitinger; his enthusiasm for English literature won for him the friendship of Lessing and Moses Mendelssohn. In association with Mendelssohn he established in 1757 the *Bibliothek der schönen Wissenschaften*, a periodical which he conducted until 1760. With Lessing and Mendelssohn Nicolai founded in 1759 the famous *Briefe, die neueste Literatur betreffend*; and from 1765 to 1792 he edited the *Allgemeine deutsche Bibliothek*. This latter periodical served as the organ of the so-called "popular philosophers," who warred against authority in religion and against what they conceived to be extravagance in literature. The new movement of ideas represented by Herder, Goethe, Schiller, Kant and Fichte, Nicolai was incapable of understanding, and he made himself ridiculous by foolish misrepresentation of the aims of these writers. Of Nicolai's independent works, perhaps the only one which has some historical value is his *Anekdoten von Friedrich II.* (1788–1792). His romances are forgotten, although *Das Leben und die Meinungen des Herrn Magister Sebaldus Nothanker* (1773–1776), and his satire on Goethe's Werther, *Freuden des jungen Werthers* (1775), had a certain reputation in their day. Between 1788 and 1796 Nicolai published in 12 vols. a *Beschreibung einer Reise durch Deutschland und die Schweiz*, which bears witness to the narrow conservatism of his views in later life. He died in Berlin on the 11th of January 1811.

Nicolai's *Bildniss und Selbstbiographie* was published by M. S. Löwe in the *Bildnisse jetzt lebender Berliner Gelehrter*, in 1806. See also L. F. G. von Göckingk, *F. Nicolai's Leben und literarischer Nachlass* (1820); J. Minor, *Lessings Jugendfreunde*, in J. Kürschner's *Deutsche Nationalliteratur*, vol. lxxii. (1883); O. Hoffmann, *Herders Briefwechsel mit Nicolai* (1887); E. Friedel, *Zur Geschichte der Nicolaischen Buchhandlung* (1891); and E. Altenkrüger, *F. Nicolais Jugendschriften* (1894).

NICOLAI, OTTO (1810–1849), German composer, was born on the 9th of June in Königsberg. He studied music in Berlin and in 1833 became organist to the German embassy in Rome. There his operas *Enrico II* (1839) and *Il Templario* (1840) were produced, besides some church music, a series of songs, and a number of compositions for the pianoforte. He was subsequently appointed Hof Kapellmeister at the Berlin Opera House; and there, only two days before he died (on the 11th of March 1849), was performed his brilliant opera, *The Merry Wives of Windsor*, the work by which he is now remembered.

NICOLAS, SIR NICHOLAS HARRIS (1799–1848), English antiquary, fourth son of John Harris Nicolas (d. 1844), was born at Dartmouth on the 10th of March 1799. Having served in the navy from 1812 to 1816, he studied law and was called to the bar at the Inner Temple in 1825. His work as a barrister, however, was confined principally to peerage cases before the House of Lords, and his time was mainly devoted to genealogical and historical studies. In 1831 he was made a knight of the order of the Guelphs, and in 1832 chancellor and knight-commander of the order of St Michael and St George, being advanced to the grade of the grand cross in 1840. He became a member of the council of the Society of Antiquaries in 1826, but soon began to criticize the management of the society's affairs, and withdrew in 1828. He then criticized the Record Commission, which he regarded as too expensive. These attacks, which brought him into controversy with Sir Francis Palgrave, led in 1836 to the appointment of a select committee to inquire into the public records. He was also responsible for several reforms at the British Museum. In 1822 Nicolas married Sarah (d. 1867), daughter of John Davison of Loughton, Essex, a reputed descendant of the Tudor statesman William Davison. By her he left two sons and six daughters. Pecuniary difficulties compelled him to leave England, and he died near Boulogne on the 3rd of August 1848. Although a sharp and eager controversialist Nicolas was a genial and generous man, with a great knowledge of genealogical questions.

The most important of the works of Nicolas is his *History of the Orders of Knighthood of the British Empire; of the Order of the Guelphs; and of Medals, Clasps, &c., for Naval and Military Services* (London, 1841–1842). Among his numerous other writings are, *The Chronology of History* (London, 1833); *Life of William Davison* (London, 1823); *Synopsis of the Peerage of England* (London, 1825); *Life and Times of Sir Christopher Hatton* (London, 1847); and an uncompleted *History of the Royal Navy* (London, 1847). He edited *Proceedings and Ordinances of the Privy Council of England, 1386–1542* (London, 1834–1837), and *Despatches and Letters of Lord Nelson* (London, 1844–1846); wrote lives of Chaucer, Burns, Cowper, Thomson, Collins, Kirke White and others for Pickering's Aldine edition of the poets; lives of Izaak Walton and Charles Cotton for an edition of the *Compleat Angler*; and several elaborate works on genealogical and kindred subjects printed for private circulation only.

NICOLAUS DAMASCENUS, Greek historian and philosopher of Damascus, flourished in the time of Augustus and Herod the Great, with both of whom he was on terms of friendship. He instructed Herod in rhetoric and philosophy, and had attracted the notice of Augustus when he accompanied his patron on a visit to Rome. Later, when Herod's conduct aroused the suspicions of Augustus, Nicolaus was sent on a mission to bring about a reconciliation. He survived Herod, and it was through his influence that the succession was secured for Archelaus; but the date of his death, like that of his birth, is unknown. Fragments of his universal history (Ἱστορία καθολική), from the time of the Assyrian empire to his own days, his autobiography, and his life of Augustus (Βίος Καίσαρος) have been preserved, chiefly in the extracts of Constantine Porphyrogenitus. Nicolaus also wrote comedies and tragedies, paraphrased and wrote commentaries on parts of Aristotle, and was himself the author of philosophical treatises.

Fragments in C. Müller, *Fragmenta historicorum Graecorum*, iii.; see also F. Navet, *Nikolaus von Damascus* (1853), containing an account of his life and writings, and translation of the fragments.

NICOLAUS OF LYRA (*c.* 1265–1349), French commentator, was born in Lire, now Vieille-Lyre, in the department of Eure, Normandy. He entered the Franciscan order at Verneuil about 1300, and studied at Paris, where, becoming a doctor some time before 1309, he taught for many years. From 1319 he was provincial of his order in France, and was present in that capacity at the general chapter at Pérouse (1321). In 1325 he was provincial of Burgundy, and as executor of the estate of Jeanne of Burgundy, widow of King Philip VI., he founded the college of Burgundy at Paris, where he died in the autumn of 1340, being buried in the chapter hall of the convent of the Cordeliers. Among the authentic works of Nicolaus of Lyra are: (1) two commentaries on the whole Bible, one (*Postilla litteralis*, 1322–1331) following the literal sense, the other (*Postilla mystica seu moralis*, 1339) following the mystic sense. There are numerous editions (Rome, 1471–1472; Douai, 1617; Antwerp, 1634). (2) *Tractatus de differentia nostrae translationis* (*i.e.* Vulgate) *ab Hebraica veritate*, 1333. (3) Two treatises against the Jews. (4) A theological treatise on the Beatific Vision, directed against pope John XXII. (1334), unpublished. (5)

Contemplatio de vita S. Francisci, a book of devotions. Nicolaus was above all a commentator. His exegesis, which was dominated by his polemics against the Jews, is characterized by a fidelity to the literal sense, the comparison with the Hebrew text, the direct use of Jewish commentators, a very independent attitude towards traditional interpretations, and a remarkable historical and critical sense. In all this he resembled Roger Bacon. His works, especially the *Postilla litteralis*, were very popular in the 14th and 15th centuries, but produced few imitators.

In addition to the notices in Wadding, du Moustier, Sbaraglia and Fabricius, see C. Siegfried, in *Archiv. f. wissenschaftliche Erforschung des A.T.*, vols. i., ii.; A. Merx, *Die Prophetie des Joel und ihre Ausleger* (1879, pp. 305-366); M. Fischer in *Jahrbücher f. protestantische Theologie*, xv.; F. Maschkowski, in *Zeitschrift f. alttestamentliche Wissenschaft*, xv.; Neumann in *Revue des études juives*, vols. 26 and 27; H. Labrosse in *Positions des thèses de l'École des Chartes* (1906).

NICOLAY, the name of a French family of Vivarais which came rapidly into legal prominence at the end of the 15th century. Jean Nicolay (d. 1527), son of a *bailli* of Bourg Saint-Andéol, became councillor at the parlement of Toulouse and afterwards at the Grand Council, chancellor of the kingdom of Naples, Maître des Requêtes, and, finally, first president of the Chambre des Comptes of Paris (1506). This last post was filled continuously up to the Revolution by his descendants. Antoine Chrétien de Nicolay (1712–1777) became marshal of France in 1775. His brother, Aymar Chrétien François Michel (1721–1769), bishop of Verdun, was first almoner of Marie Josephe of Saxony, wife of the dauphin Louis (d. 1765), and her influential counsellor.

See A. de Boislisle, *Pièces justificatives pour servir à l'histoire des premiers présidents de la Chambre des Comptes* (1873), and *Histoire de la maison de Nicolay* (1875).

NICOLE, PIERRE (1625–1695), one of the most distinguished of the French Jansenists, was the son of a provincial barrister, and was born at Chartres. Sent to Paris in 1642 to study theology, he soon entered into relations with the Jansenist community at Port Royal (*q.v.*) through his aunt, Marie des Anges Suireau, who was for a short time abbess of the convent. Some scruple of conscience forbade him to proceed to the priesthood, and he remained throughout life a "clerk in minor orders," although a profound theological scholar. For some years he was a master in the "little school" for boys established at Port Royal, and had the honour of teaching Greek to young Jean Racine, the future poet. But his chief duty was to act, in collaboration with Antoine Arnauld, as general editor of the controversial literature put forth by the Jansenists. He had a large share in collecting the materials for Pascal's *Provincial Letters* (1656); in 1658 he translated the *Letters* into Latin, under the pseudonym of Nicholas Wendrock. In 1664 he himself began a series of letters, *Les Imaginaires*, intended to show that the heretical opinions commonly ascribed to the Jansenists really existed only in the imagination of the Jesuits. His letters being violently attacked by Desmaretz de Saint-Sorlin, an erratic minor poet who professed great devotion to the Jesuits, Nicole replied to him in another series of letters, *Les Visionnaires* (1666). In the course of these he observed that poets and dramatists were no better than "public poisoners." This remark stung Racine to the quick; he turned not only on his old master, but on all Port Royal, in a scathing reply, which—as Boileau told him—did more honour to his head than to his heart. About the same time Nicole became involved in a controversy about transubstantiation with the Huguenot Claude; out of this grew a massive work, *La Perpétuité de la foi de l'église catholique touchant l'eucharistie* (1669), the joint effort of Nicole and Antoine Arnauld. But Nicole's most popular production was his *Essais de morale*, a series of short discussions on practical Christianity. The first volume was published in 1671, and was followed at irregular intervals by others; altogether the series numbers fourteen volumes. In 1679, on the renewal of the persecution of the Jansenists, Nicole was forced to fly to Belgium in company with Arnauld. But the two soon parted. Nicole was elderly and in poor health; the life of a fugitive was not to his taste, and he complained that he wanted rest. "Rest," answered Arnauld, "when you have eternity to rest in!" In 1683 Nicole made a rather ambiguous peace with the authorities, and was allowed to come back to Paris. There he continued his literary labours up to the last; he was writing a refutation of the new heresy of the Quietists, when death overtook him on the 16th of November 1695.

Nicole was one of the most attractive figures of Port Royal. Many stories are told of his quaint absent-mindedness and unreadiness in conversation. His books are distinguished by exactly opposite qualities; they are neat and orderly to excess. Hence they were exceedingly popular with Mme de Sévigné and readers of her class. No other Jansenist writer, not even Pascal, was so successful in putting the position of Port Royal before the world. And although a modern appetite quails before fourteen volumes on morality, there is much solid sense and practical knowledge of human nature to be found in the *Essais de morale*. Several abridgments of the work exist, notably a *Choix des essais de morale de Nicole*, ed. Silvestre de Saci (Paris, 1857).

Nicole's life is told at length in the 4th volume of Sainte Beuve's *Port-Royal*. (ST. C.)

NICOLL, ROBERT (1814–1837), Scottish poet, was born on the 7th of January, 1814, at the farm of Little Tullybeltane, in the parish of Auchtergaven, Perthshire. When Robert was five years old his father was reduced to poverty. He became a day-labourer, and was only able to give his son a very slight education. At sixteen the boy was apprenticed to a grocer and wine-merchant at Perth. In 1833 he began to contribute to *Johnstone's Magazine* (afterwards *Tait's Magazine*), and in the next year his apprenticeship was cancelled. He visited Edinburgh, and was kindly received there, but obtained no employment. He opened a circulating library at Dundee, but in 1836 he became editor of the *Leeds Times*. He held pronounced Radical opinions, and overtaxed his slender physical resources in electioneering work for Sir William Molesworth in the summer of 1837. He was obliged to resign his editorship, and died at the house of his friend William Tait, at Trinity, near Edinburgh, on the 7th of December 1837, in his twenty-fourth year. He had published a volume of *Poems* in 1835; and in 1844 appeared a further volume, *Poems and Lyrics*, with an anonymous memoir of the author by Mrs C. I. Johnstone. The best of his lyrics are those written in the Scottish dialect. They are simple in feeling and expression, genuine folk-songs.

An eloquent appreciation of his character and his poetry was included in Charles Kingsley's article on "Burns and his School" in the *North British Review* for November 1851. See also P. R. Drummond, *Life of Robert Nicoll, Poet* (1884).

NICOLL, SIR WILLIAM ROBERTSON (1851–), Scottish Nonconformist divine and man of letters, was born at Auchindoir, Aberdeenshire, on the 10th of October 1851, the son of a Free Church minister. He graduated M.A. at Aberdeen in 1870, and studied for the ministry at the Free Church College there until 1874, when he was ordained minister of the Free Church at Dufftown. Three years later he moved to Kelso, and in 1884 became editor of the *Expositor*. In 1886 he founded the *British Weekly*, a Nonconformist organ which obtained great influence over opinion in the free churches. Robertson Nicoll secured many writers of exceptional talent for his paper, to which he was himself a considerable contributor, the papers signed "Claudius Clear" being among those from his hand. He also founded and edited the *Bookman* (1891, &c.), and acted as chief literary adviser to the publishing firm of Hodder & Stoughton. Among his other enterprises were *The Expositor's Bible* and *The Theological Educator*. He edited *The Expositor's Greek Testament* (1897, &c.), and a series of *Contemporary Writers* (1894, &c.), and of *Literary Lives* (1904, &c.). He wrote a history of *The Victorian Era in English Literature*, and edited, with T. J. Wise, *Literary Anecdotes of the Nineteenth Century*. The knighthood bestowed on him among the birthday honours in 1909 was an apt recognition of his long and able devotion to the "journeyman work" of literature.

A list of his publications is included in a monograph on Dr Nicoll by Jane T. Stoddart ("New Century Leaders," 1903).

NICOLLS, RICHARD (1624–1672), American colonial governor, was born probably at Ampthill, Bedfordshire, England, in 1624. He commanded a royalist troop of horse during the Civil War, and on the defeat of the king went into exile. Soon after the Restoration he became groom of the bedchamber to the duke of

York, through whose influence he was appointed in 1664 on a commission with Sir Robert Carr (d. 1667), George Cartwright and Samuel Maverick, to conquer New Netherland from the Dutch and to regulate the affairs of the New England colonies and settle disputes among them. The expedition set sail from Portsmouth on the 25th of May 1664, and New Amsterdam was surrendered to Nicolls on the 8th of September. Under authority of a commission from the duke of York, Nicolls assumed the position of deputy-governor of New Netherland (New York). His policy was vigorous but tactful, and the transition to the new regime was made smoothly and with due regard to the interests of the conquered people. They were guaranteed in the possession of their property rights, their laws of inheritance, and the enjoyment of religious freedom. The English system of law and administration was at once introduced into Long Island, Staten Island and Westchester, where the English element already predominated, but the change was made much more slowly in the Dutch sections. A code of laws, known as the "Duke's Laws," drafted by the governor with the help of his secretary, Matthias Nicolls[1] (*c.* 1630–1687), and dated the 12th of March, was proclaimed at Hempstead, Long Island, on the 1st of March 1665 and continued in force until 1683; the code was compiled from the codes of the New England colonies, and it provided for trial by jury, for proportional taxation on property, for the issuance of new patents for land and for land tenure only by licence from the duke. Nicolls returned to England in the summer of 1668 and continued in the service of the duke of York. He was killed in the naval battle of Southwold Bay on the 28th of May 1672.

See J. R. Brodhead, *History of the State of New York* (2 vols., rev. ed., 1872). For the "Duke's Laws" see *Laws of Colonial New York*, i. 6-100.

NICOLSON, WILLIAM (1655–1727), English divine and antiquary, was educated at Queen's College, Oxford (M.A., 1679; fellow, 1679–1682). After visiting Leipzig to learn German he was made prebendary of Carlisle in 1681, archdeacon in 1682. Twenty years later he was appointed bishop of the same diocese, where he remained until his translation to Derry in 1718. In 1727 he was nominated archbishop of Cashel and Emly, but died before he could assume charge. Nicolson is remembered by the impulsiveness of his temperament, which led him into a good deal of strife as a bishop, and more happily by his zeal in collecting and guarding manuscripts and other official documents. For this purpose he had special rooms built at Derry. His chief works were the *Historical Library* (English, 1696–97–99; Scottish, 1702; Irish, 1724; complete later editions, 1732 and 1776), and *Leges Marchiarum or Border Laws* (1705, new ed., 1747).

NICOMACHUS, a Neo-pythagorean philosopher and mathematician, born at Gerasa in Arabia Petraea, flourished about A.D. 100. In his musical treatise he mentions Thrasyllus (d. 36), the astrologer and confidant of Tiberius, and his *Arithmetic* was translated by Apuleius, who wrote under Antoninus Pius and Marcus Aurelius. He is the author of two extant treatises: (1) Ἀριθμητικὴ εἰσαγωγή (*Introduction to Arithmetic*), a metaphysical account of the theory and properties of numbers, and the first work in which arithmetic was treated quite independently of geometry. It was extremely popular, was the subject of commentaries by Iamblichus (ed. H. Pistelli, 1894) and others, was translated into Latin by Apuleius (according to Cassiodorus, the translation itself being lost) and Boëtius, and used as a schoolbook down to the Renaissance. (2) Ἐγχειρίδιον ἁρμονικῆς (*Manual of Harmony*), complete in one book, to which are erroneously appended as a second book some fragments probably belonging to a larger treatise *On Music* now lost. It is the oldest authority on the Pythagorean theory of music. Photius (*cod.* 187) also mentions a work by Nicomachus called Ἀριθμητικὰ θεολογούμενα (*The Theology of Arithmetic*), written in a spirit of Pythagorean mysticism and Oriental superstition, and setting forth the application of arithmetic, or rather of the first ten numbers, to the origin and attributes of the gods. But the extracts in Photius are now generally attributed to Iamblichus. Other works of Nicomachus were: a *Life of Pythagoras* and a *Collection of Pythagorean Doctrines*, the chief source of the life of Pythagoras and the account of his philosophy by Iamblichus.

EDITIONS.—*Introd. to Arith.*, by R. Hoche (1866); *Manual of Harmony*, by C. de Jan in *Musici scriptores Graeci* (1895), with account of Nicomachus and his works, and French translation, with bibliography and notes, by C. E. Ruelle (1881); *Theology of Arithmetic*, by F. Ast (1817); see W. Christ, *Geschichte der griechischen Literatur* (1898); M. Cantor, *Vorlesungen über Geschichte der Mathematik*, i. (1894) p. 400, and J. Gow, *A Short History of Greek Mathematics* (1884), p. 88, both of whom give summaries of the *Arithmetic*.

NICOMACHUS, of Thebes, Greek painter, of the early part of the 4th century, was a contemporary of the greatest painters of Greece; Vitruvius observes that if his fame was less than theirs, it was the fault of fortune rather than of demerit. Pliny (xxxv. 108) gives a list of his works; among them a "Rape of Persephone," "Victory in a Quadriga," a group of Apollo and Artemis, and the "Mother of the Gods seated on a Lion." Pliny tells us that he was a very rapid worker and used but four colours (the last seems impossible). Plutarch mentions his paintings as possessing the Homeric merit of ease and absence of effort.

NICOMEDES I., son of Zipoetes, king of Bithynia (*c.* 278–248 B.C.). He made himself master of the whole country and put to death his brother, who had set himself up as an independent ruler. He enlarged and consolidated the kingdom, founded the great city of Nicomedia as the capital, and fought successfully for some time with Antiochus of Syria. His reign seems to have been prosperous and uneventful; the year of his death is uncertain.

Livy xxxviii. 16; Justin xxv. 2; Memnon in C. Müller, *Frag. hist. Graec.* iii. 535.

NICOMEDES II., Epiphanes, king of Bithynia, 149–91 B.C., fourth in descent from Nicomedes I., was the son of Prusias II. He was so popular with the people that his father sent him to Rome. Here he was so much favoured by the senate that Prusias sent an emissary to Rome with secret orders to assassinate him. But the emissary revealed the plot, and persuaded the prince to rebel against his father. Supported by Attalus II., king of Pergamum, he was completely successful, and ordered his father to be put to death at Nicomedia. During his long reign Nicomedes adhered steadily to the Roman alliance, and assisted them against Aristonicus of Pergamum. He made himself for a time master of Paphlagonia, and in order to have a claim on Cappadocia married Laodice (the widow of Ariarathes VI.), who had fled to him when Mithradates the Great endeavoured to annex the country. When her two sons died, Nicomedes brought forward an impostor as a claimant to the throne; but the plot was detected. The Romans refused to recognize the claim, and required Nicomedes to give up all pretensions to Cappadocia and to abandon Paphlagonia.

Appian, *Mithrad.* 4-7; Strabo xiii. 624, 646; Diod. Sic. xxxii. 20, 21; Justin xxxiv. 4, xxxvii. 4, xxxviii. 1, 2.

NICOMEDES III., Philopator, king of Bithynia, 91–74 B.C., was the son and successor of Nicomedes II. His brother Socrates, assisted by Mithradates, drove him out, but he was reinstated by the Romans (90). He was again expelled by Mithradates, who defeated him on the river Amneus (or Amnias) in Paphlagonia. This led to the first Mithradatic War, as the result of which Nicomedes was again restored (84). At his death he bequeathed his kingdom to the Romans, a legacy which subsequently brought about the third Mithradatic War.

Justin xxxvii. 4, xxxviii. 1, 2; Appian, *Mithrad.* 7, 10-20, 57, 60; Memnon in C. Müller, *Frag. hist. Graec.* iii. 541; Plutarch, *Sulla*, 22, 24; Eutropius vi. 6.

NICOMEDIA [mod. *Ismid*], an ancient town at the head of the Gulf of Astacus, which opens on the Propontis, was built in 264 B.C. by Nicomedes I. of Bithynia, and has ever since been one of the chief towns in this part of Asia Minor. It was the metropolis of Bithynia under the Roman empire (see NICAEA), and

[1] Matthias may have been a cousin of Richard Nicolls; his family were of Islip, Oxford; he was secretary of the province, held various judicial positions, and was mayor of New York City in 1672. Matthias's son William (1657–1723), a lawyer, was a member of the New York Assembly from 1702 until his death and was speaker in 1702–1718; he received a royal patent for what is now the town of Islip on Long Island. Descendants of Richard and of Matthias Nicolls spell the name "Nicoll."

Diocletian made it the chief city of the East. Owing to its position at the convergence of the Asiatic roads to the new capital, Nicomedia retained its importance even after the foundation of Constantinople and its own capture by the Turks (1338).

See C. Texier, *Asie mineure* (Paris, 1839); V. Cuenet, *Turquie d'Asie* (Paris, 1894).

NICOPOLIS, or ACTIA NICOPOLIS, an ancient city of Epirus, founded 31 B.C. by Octavian (Augustus) in memory of his victory over Antony and Cleopatra at Actium. The colony, composed of settlers from a great many of the towns of the neighbouring countries (Ambracia, Anactorium, Calydon, Argos Amphilochicum, Leucas, &c.), proved highly successful, and the city was considered the capital of southern Epirus and Acarnania, and obtained the right of sending five representatives to the Amphictyonic council. On the spot where Octavian's own tent had been pitched he erected a sanctuary to Neptune adorned with the beaks of the captured galleys; and in further celebration of his victory he instituted the so-called Actian games in honour of Apollo Actius. The city was restored by the emperor Julian, and again after the Gothic invasion by Justinian; but in the course of the middle ages it was supplanted by the town of Prevesa. The ruins of Nicopolis, now known as Palaeoprevesa (Old Prevesa), lie about 3 m. north of that city, on a small bay of the Gulf of Arta (Sinus Ambracius) at the narrowest part of the isthmus of the peninsula which separates the gulf from the Ionian Sea. Besides the acropolis, the most conspicuous objects are two theatres (the larger with twenty-seven rows of seats) and an aqueduct which brought water to the town from a distance of 27 m.

Nicopolis was also the name of (1) a city in Cappadocia in the valley of the Lycus, founded by Pompey on the spot where he defeated Mithradates; (2) a city in Egypt, founded by Octavian 24 B.C. to commemorate his final victory over Antony; and (3) a city in Thrace (Nikup) at the junction of the Iatrus with the Danube, founded by Trajan in memory of his victory over the Dacians.

NICOSIA, the capital of Cyprus, situated in the north central part of the island. Pop. (1901) 14,752 (Moslem, 6013; Christian, 8739). Its earliest name was Ledra, but Leucos, son of Ptolemy Soter (280 B.C.), is said to have restored it and changed its name to Leuteon, Leucotheon or Levcosia. A mile S.W. of the town lies the very large Bronze Age necropolis known as Hagia Paraskevi, which has been repeatedly explored with valuable results. The circuit of the city was reduced in 1567, under the direction of the Venetian engineer G. Savorgnano, from 9 m. to 3 m.; eighty churches and a number of fine houses were sacrificed. The new walls were given a circular shape, with eleven bastions and three gates. Water is supplied by two aqueducts. Government House, the residence of the high commissioner, the government offices, hospital, central prison and the new English church are without the walls. The fosse has been planted, and part of it used as an experimental garden. Carriage roads have been completed to Kyrenia, Kythraia, Famagusta, Larnaca, Limasol and Morphou. The principal monuments of the Lusignan period are the fine cathedral church of St Sophia, an edifice of French Gothic, at once solid and elegant (the towers were never completed); the church of St Catherine, an excellent example of the last years of the 14th century (both these are now mosques); and the church of St Nicolas of the English (now a grain store), built for the order of the Knights of St Thomas of Acre. A gateway of no great importance is nearly all that remains of the palace last used by the Venetian *provveditori*. It dates from the end of the 15th century. There is a museum, with a valuable catalogue. The chief industries are tanning and hand weaving, both silk and cotton.

NICOSIA, a city and episcopal see (since 1816) of Sicily, in the province of Catania, 21 m. by road N. of the railway station of Leonforte (which is 49 m. W. of Catania) and 42 m. W.N.W. of Catania direct, 2840 ft. above sea-level. Pop. (1901) 16,004. The town retains a thoroughly medieval appearance, with a fine Norman cathedral and some other interesting churches, among them S. Maria Maggiore, with a reredos by Antonio Gagini. A Lombard dialect is still spoken here, and the town is less modernized in every respect than any other in Sicily. The Sicel town of *Herbita* is usually placed here, but without sufficient reason, and the origin of Nicosia is unknown. It was destroyed by the Saracens and repopulated by the Normans.

NICOTERA, GIOVANNI (1828–1894), Italian patriot and politician, was born at San Biagio on the 9th of September 1828. Joining the party of young Italy he was among the combatants at Naples in May 1848, and was at San Pancrazio with Garibaldi during the defence of Rome. After the fall of Rome he fled to Piedmont, where he organized the expedition to Sapri in 1857, but shortly after his arrival there he was defeated and severely wounded by the Bourbon troops. Condemned to death, but reprieved through the intervention of the British minister, he remained a prisoner at Naples and at Favignana until 1860, when he joined Garibaldi at Palermo. Sent by Garibaldi to Tuscany, he attempted to invade the Papal States with a volunteer brigade, but his followers were disarmed and disbanded by Ricasoli and Cavour. In 1862 he was with Garibaldi at Aspromonte; in 1866 he commanded a volunteer brigade against Austria; in 1867 he invaded the Papal States from the south, but the defeat of Garibaldi at Mentana put an end to his enterprise. His parliamentary career dates from 1860. During the first ten years he engaged in violent opposition, but from 1870 onwards he joined in supporting the military reforms of Ricotti. Upon the advent of the Left in 1876, Nicotera became minister of the interior, and governed with remarkable firmness. He was obliged to resign in December 1877, when he joined Crispi, Cairoli, Zanardelli and Baccarini in forming the "pentarchy" in opposition to Depretis, but he only returned to power thirteen years later as minister of the interior in the Rudini cabinet of 1891. On this occasion he restored the system of uninominal constituencies, resisted the socialist agitation, and pressed, though in vain, for the adoption of drastic measures against the false bank-notes put in circulation by the Roman bank. He fell with the Rudini cabinet in May 1892, and died at Vico Equense, near Naples, on the 13th of June 1894.

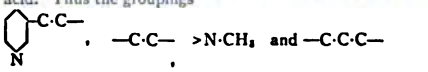
See V. Giordano, *La Vita ed i discorsi di Giovanni Nicotera* (Salermo, 1878); Mauro, *Biografia di Giovanni Nicotera* (Rome, 1886; German trans., Leipzig, 1886); and Mario, *In memoria di Giovanni Nicotera* (Florence, 1894).

NICOTINE, $C_{10}H_{14}N_2$, an alkaloid, found with small quantities of nicotimine, $C_{10}H_{14}N_2$, nicoteine, $C_{10}H_{12}N_2$, and nicotelline, $C_{18}H_2N_2$, in tobacco. The name is taken from *Nicotiana*, the tobacco plant, so called after Jean Nicot (1530–1600), French ambassador at Lisbon, who introduced tobacco into France in 1560. These four alkaloids exist in combination in tobacco chiefly as malates and citrates. The alkaloid is obtained from an aqueous extract of tobacco by distillation with slaked lime, the distillate being acidified with oxalic acid, concentrated to a syrup and decomposed by potash. The free base is extracted by ether and fractionated in a current of hydrogen. It is a colourless oil, which boils at 247° C. (745 mm.), and when pure is almost odourless. It has a sharp burning taste, and is very poisonous. It is very hygroscopic, dissolves readily in water, and rapidly undergoes oxidation on exposure to air. The free alkaloid is strongly laevo-rotatory. F. Ratz (*Monats.*, 1905, 26, p. 1241) obtained the value $[\alpha]_D = -169{\cdot}54°$ at 20°; its salts are dextro-rotatory. It behaves as a di-acid as well as a di-tertiary base.

On oxidation with chromic or nitric acids, or potassium permanganate, it yields nicotinic acid or β-pyridine carboxylic acid, $C_5H_4N{\cdot}CO_2H$; alkaline potassium ferricyanide gives nicotyrine, $C_{10}H_{10}N_2$, and hydrogen peroxide oxynicotine, $C_{10}H_{14}N_2O$. Oxidation of its isomethylhydroxide with potassium permanganate yields trigonelline, $C_7H_7NO_2$ (A. Pictet and P. Genequand, *Ber.*, 1897, 30, p. 2117). It gives rise to various decomposition products such as pyridine, picoline, &c., when its vapour is passed through a red-hot tube. The hydrochloride on heating with hydrochloric acid gives methyl chloride (B. Blau, *Ber.*, 1893, 26, p. 631). Hydriodic acid and phosphorus at high temperature give a dihydro-compound, whilst sodium and alcohol give hexa- and octo-hydro derivatives. Nicotine may be recognized by the addition of a drop of 30 % formaldehyde, the mixture being allowed to stand for one hour and the solid residue then moistened by a drop of concentrated

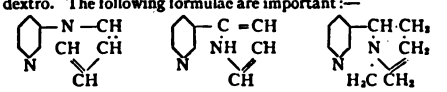
sulphuric acid, when an intense rose-red colour is produced (I. Schindelmeiser, *Pharm. Zentralhalle*, 1899, 40, p. 704).

The constitution of nicotine was established by A. Pinner (see papers in the *Berichte*, 1891 to 1895). With bromine in acetic acid solution at ordinary temperature, nicotine yields a perbromide, $C_{10}H_{16}Br_2N_2O{\cdot}HBr_3$, which with sulphur dioxide, followed by potash, gives dibromcotinine, $C_{10}H_{10}Br_2N_2O$, from which cotinine, $C_{10}H_{12}N_2O$, is obtained by distillation over zinc dust. By heating nicotine with bromine in hydrobromic acid solution for some hours at 100° C., dibromticonine hydrobromide, $C_{10}H_4N_2Br_2O_2{\cdot}HBr$, results. Dibromcotinine on hydrolysis yields oxalic acid, methylamine and β-methyl pyridyl ketone: $C_{10}H_{10}Br_2N_2O+3H_2O+O=H_2C_2O_4+CH_3NH_2+C_5H_4N{\cdot}COCH_3+2HBr$; whilst dibromticonine yields methylamine, malonic acid and nicotinic acid: $C_{10}H_4Br_2N_2O_2+4H_2O=CH_3NH_2+CH_2(CO_2H)_2+C_5H_4N{\cdot}CO_2H+2HBr$, or if heated with zinc and caustic potash, methylamine and pyridyl-βγ-dioxybutyric acid. Thus the groupings



exist in the molecule, and the alkaloid is to be represented as α-pyridyl-N-methyl-pyrollidine.

This result has been confirmed by its synthesis by A. Pictet and P. Crépieux (*Comptes rendus*, 1903, 137, p. 860) and Pictet and Rotschy (*Ber.*, 1904, 37, p. 1225): β-aminopyridine is converted into its mucate, which by dry distillation gives N-β-pyridylpyrrol. By passing the vapour of this compound through a red-hot tube, it yields the isomeric αβ-pyridylpyrrol, the potassium salt of which with methyl iodide gives a substance methylated both in the pyridine and pyrrol nuclei. By distillation over lime, the methyl group is removed from the pyridine ring, and the resulting α-pyridyl-N-methylpyrrol gives *i*-nicotine on reduction. This base is resolved into its active components by *d*-tartaric acid, *l*-nicotine-*d*-tartrate crystallizing out first. The natural (laevo) base is twice as toxic as the dextro. The following formulae are important:—



N-β-Pyridylpyrrol, αβ-pyridylpyrrol, nicotine.

Acetyl and benzoyl derivatives of nicotine on hydrolysis do not yield nicotine, but an isomeric, inactive oily liquid (metanicotine). It is a secondary base, and boils at 275°-278° C.

Nicotimine is a colourless liquid which boils at 250°-255° C. Its aqueous solution is alkaline. *Nicoteine* is a liquid which boils at 267° C. It is separated from the other alkaloids of the group by distilling off the nicotine and nicotimine in steam and then fractionating the residue. It is soluble in water and is very poisonous. *Nicotelline* crystallizes in needles which melt at 147° C. and is readily soluble in hot water.

NICTHEROY, or NITEROY, a city of Brazil and capital of the state of Rio de Janeiro, on the E. shore of the Bay of Rio de Janeiro, opposite the city of that name. Pop. (1890) 34,269, (1900 estimate) 35,000. A railway connects the city with the interior—the old Cantagallo line, now a part of the Leopoldina system, a branch of which runs north-eastward to Macahé, on the coast, and another northward from Nova Friburgo to a junction with the railway lines of Minas Geraes. Nictheroy is practically a residential suburb of Rio de Janeiro. It occupies, in great part, the low alluvial plain that skirts the shores of the bay and fills the valleys between numerous low wooded hills. The site is shut off from the sea coast by a range of high rugged mountains. The shore line of the bay is broken by large, deeply indented bays (that of Jurujuba being nearly surrounded by wooded hills), shallow curves and sharp promontories. Within these bays are beaches of white sand, called *praias*, such as the Praia da Icarahy, Praia das Flechas and Praia Grande, upon which face low tile-covered residences surrounded with gardens. The city consists of a number of these partially separated districts—Praia Grande, São Domingos, Icarahy, Jurujuba, Santa Rosa, São Lourenço, Ponta d'Areia and Barreto—all together covering 8 or 9 m. of the shore. An electric street railway connects all the outlying districts with the ferry stations of Praia Grande and São Domingos. The city is characteristically Portuguese in the construction and style of its buildings—low, heavy walls of broken stone and mortar, plastered and coloured outside, with an occasional facing of glazed Lisbon tiles, and covered with red tiles. Among the public buildings are several churches and hospitals (including the Jurujuba yellow-fever hospital and the Barreto isolation hospital), the government palace, a municipal theatre and a large Salesian college situated in the suburbs of Santa Rosa on an eminence overlooking the lower bay. Several large islands fill the upper bay near the eastern shore; some are used as coal deposits for the great steamship companies, and one (Flores) is used as an immigrants' depôt. There is a small, rocky and picturesque island nearer the harbour entrance, which is crowned by a small chapel, dedicated to Nossa Senhora da Boa Viagem. Manufactures include cotton and woollen fabrics, tobacco, spirits, soap and tiles.

The first settlement on the east side of the Bay of Rio de Janeiro dates from 1671, when a chapel was erected at Praia Grande, in the vicinity of an Indian village. The settlement did not become a village until 1819, when it was named Villa Real da Praia Grande. In 1834 the city and municipal district of Rio de Janeiro was separated from the province, and Praia Grande became the capital of the latter in the following year. In 1836 it was raised to the dignity of a city and received the appropriate name of Nictheroy, from the Indian name *Nyterõi*, "hidden water." In the naval revolt of 1893–94 the older districts of the city suffered much damage from desultory bombardments, but the insurgents were too few to take possession. Soon afterwards the seat of government was removed to Petropolis, where it remained until 1903, when Nictheroy again became the capital of the state.

NIDIFICATION (from Lat. *nidus*), the process of making a nest (*q.v.*). Nidification is with most birds the beginning of the breeding season, but with many it is a labour that is scamped if not shirked. Some of the auk tribe place their single egg on a bare ledge of rock, where its peculiar conical shape is but a precarious safeguard when rocked by the wind or stirred by the thronging crowd of its parents' fellows. The stone-curlew and the goatsucker deposit their eggs without the slightest preparation of the soil on which they rest; yet this is not done at haphazard, for no birds can be more constant in selecting, almost to an inch, the very same spot which year after year they choose for their procreant cradle. In marked contrast to such artless care stand the wonderful structures which others, such as the tailor-bird, the bottle-titmouse or the fantail-warbler, build for the comfort or safety of their young. But every variety of disposition may be found in the class. The apteryx seems to entrust its abnormally big egg to an excavation among the roots of a tree-fern; while a band of female ostriches scrape holes in the desert-sand and therein promiscuously drop their eggs and leave the task of incubation to the male. Some megapodes bury their eggs in sand, leaving them to come to maturity by the mere warmth of the ground, while others raise a huge hotbed of dead leaves wherein they deposit theirs, and the young are hatched without further care on the part of either parent. Some of the grebes and rails seem to avail themselves in a less degree of the heat generated by vegetable decay and, dragging from the bottom or sides of the waters they frequent fragments of aquatic plants, form of them a rude half-floating mass which is piled on some growing water-weed—but these birds do not spurn the duties of maternity.

Many of the gulls, sandpipers and plovers lay their eggs in a shallow pit which they hollow out in the soil, and then as incubation proceeds add thereto a low breastwork of haulm. The ringed plover commonly places its eggs on shingle, which they so much resemble in colour, but when breeding on grassy uplands it paves the nest-hole with small stones. Pigeons mostly make an artless platform of sticks so loosely laid together that their pearly treasures may be perceived from beneath by the inquisitive observer. The magpie, as though self-conscious that its own thieving habits may be imitated by its neighbours, surrounds its nest with a hedge of thorns. Very many birds of almost every group bore holes in some sandy cliff, and at the end of their tunnel deposit their eggs with or without bedding. Such bedding, too, is very various in character; thus, while the shelduck and the sand-martin supply the softest of materials—the one of down from her own body, the other of feathers collected

by dint of diligent search—the kingfisher forms a couch of the undigested spiny fish bones which she ejects in pellets from her own stomach. Other birds, such as the woodpeckers, hew holes in living trees, even when the timber is of considerable hardness, and therein establish their nursery. Some of the swifts secrete from their salivary glands a fluid which rapidly hardens as it dries on exposure to the air into a substance resembling isinglass, and thus furnish the "edible birds' nests" that are the delight of Chinese epicures. In the architecture of nearly all the passerine birds, too, some salivary secretion seems to play an important part. By its aid they are enabled to moisten and bend the otherwise refractory twigs and straws, and glue them to their place. Spiders' webs also are employed with great advantage for the purpose last mentioned, but perhaps chiefly to attach fragments of moss and lichen so as to render the whole structure less obvious to the eye of the spoiler. The tailor-bird deliberately spins a thread of cotton and therewith stitches together the edges of a pair of leaves to make a receptacle for its nest. Beautiful, too, is the felt fabricated of fur or hairs by the various species of titmouse, while many birds ingeniously weave into a compact mass both animal and vegetable fibres, forming an admirable non-conducting medium which guards the eggs from the extremes of temperature outside. Such a structure may be open and cup-shaped, supported from below as that of the chaffinch and goldfinch, domed like that of the wren and bottle-titmouse, slung hammock-wise as in the case of the golden-crested wren and the orioles, or suspended by a single cord as with certain grosbeaks and humming-birds.

Certain warblers (*Aedon* and *Thamnobia*) invariably lay a piece of snake's slough in their nests—to repel, it has been suggested, marauding lizards who may thereby fear the neighbourhood of a deadly enemy. The clay-built edifices of the swallow and martin are known to everybody, and the nuthatch plasters up the gaping mouth of its nest-hole till only a postern large enough for entrance and exit, but easy of defence, is left. In South America the oven-birds (*Furnariidae*) construct on the branches of trees globular ovens, so to speak, of mud, wherein the eggs are laid and the young hatched. The flamingo erects in the marshes it frequents a mound of earth sometimes 2 ft. in height, with a cavity atop. The females of the hornbills submit to incarceration during this interesting period, the males immuring them by a barrier of mud, leaving only a small window to admit air and food.

But though in a general way the dictates of hereditary instinct are rigidly observed by birds, in many species a remarkable degree of elasticity is exhibited, or the rule of habit is ruthlessly broken. Thus the falcon, whose ordinary eyry is on the beetling cliff, will for the convenience of procuring prey condescend to lay its eggs on the ground in a marsh, or appropriate the nest of some other bird in a tree. The golden eagle, too, remarkably adapts itself to circumstances, now rearing its young on a precipitous ledge, now on the arm of an ancient monarch of the forest and again on a treeless plain, making a humble home amid grass and herbage. Herons will breed according to circumstances in an open fen, on sea-banks or (as is most usual) on lofty trees. Such changes are easy to understand. The instinct of finding food for the family is predominant, and where most food is there will the feeders be gathered together. This explains, in all likelihood, the associated bands of ospreys or fish-hawks, which in North America breed (or used to breed) in large companies where sustenance is plentiful, though in the Old World the same species brooks not the society of aught but its mate. Birds there are of eminently social predilections. In Europe, apart from sea-fowls—whose congregations are universal and known to all—only the heron, the fieldfare and the rook habitually flock during the breeding season; but in other parts of the world many birds unite in company at that time, and in none possibly is this habit so strongly developed as in the anis of the neotropical region, the republican swallow of North America and the sociable grosbeak of South Africa, which last joins nest to nest until the tree is said to break down under the accumulated weight of the common edifice.

In the strongest contrast to these amiable qualities is the parasitic nature of the cuckoos of the Old World and the cowbirds of the New. The egg of the parasite is introduced into the nest of the dupe, and after the necessary incubation by the fond fool of a foster-mother the interloper successfully counterfeits the heirs, who perish miserably, victims of his superior strength. The whole process has been often watched, but the reflective naturalist will pause to ask how such a state of things came about, and there is not much to satisfy his inquiry. Certain it is that some birds whether by mistake or stupidity do not infrequently lay their eggs in the nests of others. It is within the knowledge of many that pheasants' eggs and partridges' eggs are often laid in the same nest, and gulls' eggs have been found in the nests of eider-ducks and vice versa; a redstart and a pied flycatcher will lay their eggs in the same convenient hole—the forest being rather deficient in such accommodation; an owl and a duck will resort to the same nest-box, set up by a scheming woodsman for his own advantage; and the starling, which constantly dispossesses the green woodpecker, sometimes discovers that the rightful heir of the domicile has to be brought up by the intruding tenant. In all such cases it is not possible to say which species is so constituted as to obtain the mastery, but it is not difficult to conceive that in the course of ages that which was driven from its home might thrive through the fostering of its young by the invader, and thus the abandonment of domestic habits and duties might become a direct gain to the evicted householder. (A. N.)

Nests and Coloration.—The correlation between nests and the coloration of the birds has been investigated by A. R. Wallace. Accordingly he divides birds into two main groups, first those in which the sexes are alike and of conspicuous or showy colours, and which nidificate in a covered site; secondly, those in which the males are showy and the females sombre, and which use open sites for their nests. The many exceptions to these generalizations caused J. A. Allen (*Bull. Nutt. Orn. Club*, 1878) to write an adverse criticism. C. Dixon (H. Seebohm's *Hist. Brit. Birds*, ii., 1884, introduction) has reviewed the question from Wallace's point of view. He established the following categories.

1. Birds in which the plumage of the male is bright and conspicuous in colour, and that of the female dull and sombre, and which nidificate in open sites. In these very common cases, the female alone incubates, and obviously derives protection from its inconspicuous plumage.

2. Birds in which the plumage of both sexes is showy or brilliant in colour, and which nidificate in open nests. This group forms one of those exceptions which at first sight appear seriously to affect the validity of Wallace's theory. In most of the cases, however, the birds, as, for instance, crows, gulls, herons, are either well able to defend themselves and their nests or, as, for instance, the sandpipers, they seek safety for themselves in flight, relying upon the protective tints of their eggs or young.

3. Birds in which the male is less brilliant than the female, and which nidificate in open nests. Such birds are exceedingly few, *e.g.* the Phalaropes, the common cassowary, the emu, a carrion hawk (*Milvago leucurus*) from the Falkland Islands, an Australian tree-creeper (*Climacteris erythrops*) and an Australian goatsucker (*Eurystopodus albigularis*). In all these cases the male performs the duty of incubation. The male tinamous do the same, although they do not differ from their mates, but the conspicuously coloured male ostrich takes this duty upon himself during the night.

4. Birds in which both sexes are brightly coloured, and which rear their young in holes or covered nests. For instance, the gaudy coloured rollers, bee-eaters, kingfishers, the hoopoe, hornbills, toucans, parrots, tits, the sheldrake and many others.

5. Birds in which both sexes are dull in colour, and which build covered nests from motives of safety other than concealment. For example, the swifts (*Cypselus*), the sand-martin (*Cotyle riparia*), wrens, dippers and owls.

6. Birds in which the female is duller in colour than the male, and which nidificate in covered nests; *e.g.* the redstart (*Ruticilla phoenicura*), the pied flycatcher (*Muscicapa atricapilla*), rock-thrushes (*Monticola*), chats (*Saxicola*) and robin-chats (*Thamnobia*), and birds of the genus *Malurus*. In some of these cases the showy male bird assists in incubation, the kind of nest allowing him to do so with safety.

Similar difficulties beset the generalizations concerning the correlation of the colour of the eggs and the exposed or hidden condition of the nest. The eggs of most birds which breed in holes, or even in covered nests, are white, but the number of exceptions is so great that no general rule can be laid down to this effect. Conversely the number of birds which lay purely white eggs in open nests, *e.g.* pigeons, is also large. The eggs of owls are always white,

whether they be deposited in holes on the bare ground or in open nests in a tree. The eggs of the goshawk are white, but those of its small relation, the sparrowhawk, are always blotched, the nest of both being built precisely in the same kind of position, &c. In regard to the almost countless cases of spotted eggs in holes or covered nests, of which so many groups of birds furnish examples either wholly or in part, it has been suggested that the species in question has taken to hiding its eggs in times comparatively recent, and has not yet got rid of the ancestral habit of secreting and depositing pigment.

Length of Time of Incubation.—Most of the smaller Passeres seem to hatch their young in from 13-15 days. The shortest period, only 10 days, is recorded of the small *Zosterops coerulescens*; the largest, amounting to about 8 weeks, is that of some of the larger Ratitae, penguins and the condor. The best list, comprising birds of most groups, is that by W. Evans (*Ibis*, 1891, pp. 52-93; and 1892, pp. 55-58). Speaking broadly, the largest birds lay the largest eggs and require the longest time for incubation, but there are very many exceptions, and only birds of the same group can be compared with each other. The domestic fowl takes 21 days, but the pheasant, though so very nearly allied, takes 2 or 3 days longer, and even the small partridge requires 24 days. The mallard takes 26, the domestic duck 27, the musk duck 35 days, like most of the swans. The cuckoo, with 13 to 14 days, seems to have adapted itself to the short period of its foster parents.

The whole question still affords ample opportunities of experimental investigation and comparison. The condition of the newly hatched birds also varies extremely. The *Nidifugae* are born with their eyes open, are thinly clothed with neossoptiles of simple structure, leave the nest on the first day and feed themselves. The *Nidicolae* are born blind, remain a long time in the nest and have to be fed by their parents. Taken as a whole, the *Nidifugae* comprise most of the phylogenetically older groups; but many of these may include some closely allied members which have reached the developmental level of the *Nidicolae*: for instance, some Alcidae, the pigeons, Sphenisci, Tubinares, Ciconiae. For detail see BIRDS: *Classification*. While in the first category the sense organs, tegumentary and locomotory organs are far advanced, these are retarded in the *Nidicolae*, the development of these structures being shifted on to the postembryonic period. Yet the length of the incubation is by no means always longer in the *Nidifugae*, when compared with equal-sized *Nidicolae*.

NIEBUHR, BARTHOLD GEORG (1776–1831), German statesman and historian, son of Karsten Niebuhr (*q.v.*), was born at Copenhagen on the 27th of August 1776. From the earliest age young Niebuhr manifested extraordinary precocity, and from 1794 to 1796, being already a finished classical scholar and acquainted with several modern languages, he studied at the university of Kiel. After quitting the university he became private secretary to Count Schimmelmann, Danish minister of finance. But in 1798 he gave up this appointment and travelled in Great Britain, spending a year at Edinburgh studying agriculture and physical science. In 1799 he returned to Denmark, where he entered the state service; in 1800 he married and settled at Copenhagen. In 1804 he became chief director of the National Bank, but in September 1806 quitted this for a similar appointment in Prussia. He arrived in Prussia on the eve of the catastrophe of Jena. He accompanied the fugitive government to Königsberg, where he rendered considerable service in the commissariat, and was afterwards still more useful as commissioner of the national debt and by his opposition to ill-considered schemes of taxation. He was also for a short time Prussian minister in Holland, where he endeavoured without success to contract a loan. The extreme sensitiveness of his temperament, however, disqualified him for politics; he proved impracticable in his relations with Hardenberg and other ministers, and in 1810 retired for a time from public life, accepting the more congenial appointment of royal historiographer and professor at the university of Berlin.

He commenced his lectures with a course on the history of Rome, which formed the basis of his great work *Römische Geschichte*. The first two volumes, based upon his lectures, were published in 1812, but attracted little attention at the time owing to the absorbing interest of political events. In 1813 Niebuhr's own attention was diverted from history by the uprising of the German people against Napoleon; he entered the *Landwehr* and ineffectually sought admission into the regular army. He edited for a short time a patriotic journal, the *Prussian Correspondent*, joined the headquarters of the allied sovereigns, and witnessed the battle of Bautzen, and was subsequently employed in some minor negotiations. In 1815 he lost both his father and his wife. He next accepted (1816) the post of ambassador at Rome, and on his way thither he discovered in the cathedral library of Verona the long-lost *Institutes* of Gaius, afterwards edited by Savigny, to whom he communicated the discovery under the impression that he had found a portion of Ulpian. During his residence in Rome Niebuhr discovered and published fragments of Cicero and Livy, aided Cardinal Mai in his edition of Cicero *De Republica*, and shared in framing the plan of the great work on the topography of ancient Rome by Christian C. J. von Bunsen and Ernst Platner (1773–1855), to which he contributed several chapters. He also, on a journey home from Italy, deciphered in a palimpsest at St Gall the fragments of Flavius Merobaudes, a Roman poet of the 5th century. In 1823 he resigned the embassy and established himself at Bonn, where the remainder of his life was spent, with the exception of some visits to Berlin as councillor of state. He here rewrote and republished (1827–1828) the first two volumes of his *Roman History*, and composed a third volume, bringing the narrative down to the end of the First Punic War, which, with the help of a fragment written in 1811, was edited after his death (1832) by Johannes Classen (1805–1891). He also assisted in August Bekker's edition of the Byzantine historians, and delivered courses of lectures on ancient history, ethnography, geography, and on the French Revolution. In February 1830 his house was burned down, but the greater part of his books and manuscripts were saved. The revolution of July in the same year was a terrible blow to him, and filled him with the most dismal anticipations of the future of Europe. He died on the 2nd of January 1831.

Niebuhr's *Roman History* counts among epoch-making histories both as marking an era in the study of its special subject and for its momentous influence on the general conception of history. "The main results," says Leonhard Schmitz, "arrived at by the inquiries of Niebuhr, such as his views of the ancient population of Rome, the origin of the plebs, the relation between the patricians and plebeians, the real nature of the ager publicus, and many other points of interest, have been acknowledged by all his successors." Other alleged discoveries, such as the construction of early Roman history out of still earlier ballads, have not been equally fortunate; but if every positive conclusion of Niebuhr's had been refuted, his claim to be considered the first who dealt with the ancient history of Rome in a scientific spirit would remain unimpaired, and the new principles introduced by him into historical research would lose nothing of their importance. He suggested, though he did not elaborate, the theory of the myth, so potent an instrument for good and ill in modern historical criticism. He brought in inference to supply the place of discredited tradition, and showed the possibility of writing history in the absence of original records. By his theory of the disputes between the patricians and plebeians arising from original differences of race he drew attention to the immense importance of ethnological distinctions, and contributed to the revival of these divergences as factors in modern history. More than all, perhaps, since his conception of ancient Roman story made laws and manners of more account than shadowy lawgivers, he undesignedly influenced history by popularizing that conception of it which lays stress on institutions, tendencies and social traits to the neglect of individuals.

Niebuhr's personal character was in most respects exceedingly attractive. His heart was kind and his affections were strong;

he was magnanimous and disinterested, simple and honest. He had a kindling sympathy with everything lofty and generous, and framed his own conduct upon the highest principles. His chief defect was an over-sensitiveness, leading to peevish and unreasonable behaviour in his private and official relations, to hasty and unbalanced judgments of persons and things that had given him annoyance, and to a despondency and discouragement which frustrated the great good he might have effected as a philosophic critic of public affairs.

The principal authority for Niebuhr's life is the *Lebensnachrichten über B. G. Niebuhr, aus Briefen desselben und aus Erinnerungen einiger seiner nächsten Freunde*, by Dorothea Hensler (3 vols., 1838–1839). In the English translation by Miss Winkworth (1852) a great deal of the correspondence is omitted, but the narrative is rendered more full, especially as concerns Niebuhr's participation in public affairs. It also contains interesting communications from Bunsen and Professor Loebell, and select translations from the *Kleine Schriften*. See also J. Classen, *Barthold Georg Niebuhr, eine Gedächtnisschrift* (1876), and G. Eyssenhardt, *B G. Niebuhr* (1886). The first edition of his *Roman History* was translated into English by F. A. Walter (1827), but was immediately superseded by the translation of the second edition by Julius Hare and Connop Thirwall, completed by William Smith and Leonhard Schmitz (last edition, 1847–1851). The *History* has been discussed and criticized in a great number of publications, the most important of which, perhaps, is Sir George Cornwall Lewis's *Essay on the Credibility of the Early Roman History*. See further J. E. Sandys, *History of Classical Scholarship* (1908), iii., pp. 78–82.

NIEBUHR, KARSTEN (1733–1815), German traveller, was born at Lüdingworth, Lauenburg, on the southern border of Holstein, on the 17th of March 1733, the son of a small farmer. He had little education, and for several years of his youth had to do the work of a peasant. His bent was towards mathematics, and he managed to obtain some lessons in surveying. It was while he was working at this subject that one of his teachers, in 1760, proposed to him to join the expedition which was being sent out by Frederick V. of Denmark for the scientific exploration of Egypt, Arabia and Syria. To qualify himself for the work of surveyor and geographer, he studied hard at mathematics for a year and a half before the expedition set out, and also managed to acquire some knowledge of Arabic. The expedition sailed in January 1761, and, landing at Alexandria, ascended the Nile. Proceeding to Suez, Niebuhr made a visit to Mount Sinai, and in October 1762 the expedition sailed from Suez to Jeddah, journeying thence overland to Mocha. Here in May 1763 the philologist of the expedition, van Haven, died, and was followed shortly after by the naturalist Forskål. Sana, the capital of Yemen, was visited, but the remaining members of the expedition suffered so much from the climate or from the mode of life that they returned to Mocha. Niebuhr seems to have saved his own life and restored his health by adopting the native habits as to dress and food. From Mocha the ship was taken to Bombay, the artist of the expedition dying on the passage, and the surgeon soon after landing. Niebuhr was now the only surviving member of the expedition. He stayed fourteen months at Bombay, and then returned home by Muscat, Bushire, Shiraz and Persepolis, visited the ruins of Babylon, and thence went to Bagdad, Mosul and Aleppo. After a visit to Cyprus he made a tour through Palestine, crossing Mount Taurus to Brussa, reaching Constantinople in February 1767 and Copenhagen in the following November. He married in 1773, and for some years held a post in the Danish military service which enabled him to reside at Copenhagen. In 1778, however, he accepted a position in the civil service of Holstein, and went to reside at Meldorf, where he died on the 26th of April 1815.

Niebuhr was an accurate and careful observer, had the instincts of the scholar, was animated by a high moral purpose, and was rigorously conscientious and anxiously truthful in recording the results of his observation. His works have long been classics on the geography, the people, the antiquities and the archaeology of much of the district of Arabia which he traversed. His first volume, *Beschreibung von Arabien*, was published at Copenhagen in 1772, the Danish government defraying the expenses of the abundant illustrations This was followed in 1774–1778 by two other volumes, *Reisebeschreibung von Arabien und anderen umliegenden Ländern*. The fourth volume was not published till 1837, long after his death, under the editorship of Niebuhr's daughter. He also undertook the task of bringing out the work of his friend Forskål, the naturalist of the expedition, under the titles of *Descriptiones animalium*, *Flora Aegyptiaco-Arabica*, and *Icones rerum naturalium* (Copenhagen, 1775–1776). To a German periodical, the *Deutsches Museum*, Niebuhr contributed papers on the interior of Africa, the political and military condition of the Turkish empire, and other subjects.

French and Dutch translations of his narratives were published during his lifetime, and a condensed English translation, by Robert Heron, of the first three volumes in Edinburgh (1792). His son Barthold (see above) published a short *Life* at Kiel in 1817; an English version was issued in 1838 in the *Lives of Eminent Men*, published by the Society for the Diffusion of Useful Knowledge. See D. G. Hogarth, *The Penetration of Arabia* ("Story of Exploration" series) (1904).

NIEDERBRONN, a town of Germany, in the imperial province Alsace-Lorraine, on the Falkensteiner Bach, situated under the eastern slope of the Vosges, 12 m. N.W. from Hagenau by rail. Pop. (1905) 3120. It contains an Evangelical and a Roman Catholic church, a convent of the Sisters of the Divine Redeemer, and a high-grade and other schools. Niederbronn is one of the best-known watering-places in the Vosges. Its brine springs, with a hydropathic establishment attached, are specific in cases of gout, obesity and liver disorders. Here, on the 26th of July 1870, the first engagement between the Germans and the French in the Franco-German war took place. There are several ruined castles in the neighbourhood, the most noteworthy of which is one on the Wesenburg (1415 ft. high) erected in the 14th century. Various Celtic and Roman antiquities have been found around Niederbronn.

See Kuhn, *Les Eaux de Niederbronn* (3rd ed., Strassburg, 1860); Mathis, *Aus Niederbronns alten Zeiten* (Strassburg, 1901); and Kirstein, *Das Wasgaubad Niederbronn* (Strassburg, 1902).

NIEDERLAHNSTEIN, a town of Germany, in the Prussian province of Hesse-Nassau, situated on the right bank of the Rhine at the confluence of Lahn, 3 m. S.E. from Coblenz by the railway to Ems, and at the junction of lines to Hochheim and Cologne. Pop (1905) 4351 It has two Roman Catholic churches. The chief industries are the making of machinery and shipbuilding. Niederlahnstein obtained civic rights in 1332, and was until 1803 on the territory of the electors of Trier. Here on the 1st of January 1814 a part of the Russian army crossed the Rhine. In the vicinity are the Johanniskirche, a Romanesque church restored in 1857, and the Allerheiligenberg, whereon stands a chapel, once a famous place of pilgrimage.

NIEDER-SELTERS, a village of Germany, in the Prussian province of Hesse-Nassau, situated in a well-wooded country on the Ems, 12 m. S E. from Limburg by the railway to Frankfort-on-Main. Pop (1900) 1339. Here are the springs of the famous Selters or Seltzer water, employed as specific in cases of catarrh of the respiratory organs, the stomach and bladder. Until 1866 the springs belonged to the duke of Nassau; since this date they have been the property of Prussia. They became famous in the earlier part of the 19th century, although they had been known many years previously

See Grossmann, *Die Heilquellen des Taunus* (Wiesbaden, 1887).

NIEDERWALD, a broad hill in Germany, in the Prussian province of Hesse-Nassau, on the right bank of the Rhine, between that river and the Wisper, opposite Bingen, forming the south-western apex of the Taunus range. Its summit is clothed with dense forests of oak and beech, while its southern and western sides, which descend sharply to Rüdesheim and Assmannshausen on the Rhine, are covered with vineyards, and produce some of the finest wines of the district At the edge of the forest, on the crest of the hill above Rüdesheim, stands the gigantic "Germania" statue, the national monument of the war of 1870–71, which was unveiled on the 28th of September 1883 by the emperor William I., in the presence of all the rulers in Germany or their representatives. It was designed by Johannes Schilling, and the bronze figure of Germania is 33 ft. high; the

pedestal is adorned with allegorical figures and portraits of German princes and generals. Cogtooth mountain railways run up the hill from Rüdesheim and Assmannshausen.

See Spielmann, *Niederwald und Nationaldenkmal* (Wiesbaden, 1898).

NIEHAUS, CHARLES HENRY (1855–), American sculptor, of German parentage, was born at Cincinnati, Ohio, on the 24th of January 1855. He was a pupil of the McMichen School of Design, Cincinnati, and also studied at the Royal Academy, Munich, returning to America in 1881; in 1885, after several years in Rome, he established his studio in New York City. In 1906 he became a National Academician. His principal works are: a statue of President Garfield, for Cincinnati; the Hahnemann Memorial, in Washington; "Moses" and "Gibbons," for the Congressional Library, and "James A. Garfield," "John J. Ingalls," "William Allen," and "Oliver P. Morton," for Statuary Hall, Capitol, Washington; "Hooker" and "Davenport," State House, Hartford, Connecticut; the Astor Memorial doors, Trinity Church, New York; "General Forrest," Memphis, Tennessee; Generals Sherman and Lee, and William the Silent; "The Scraper; or Greek Athlete using a Strigil"; statues of Lincoln, Farragut and McKinley, at Muskegon, Michigan; a statue of McKinley and a lunette for McKinley's tomb, at Canton, Ohio, and "The Driller," at Titusville, Pennsylvania, in memory of Colonel E. L. Drake, who, in 1859, sank the first oil well in Pennsylvania.

NIEL, ADOLPHE (1802–1869), marshal of France, was born at Muret on the 4th of October 1802, and entered the École Polytechnique in 1821, whence he passed to the engineer school at Metz, becoming lieutenant in the Engineers in 1827 and captain in 1833. At the storming of Constantine he led the engineer detachment with one of the storming parties, and his conduct gained for him the rank of *chef de bataillon* (1837). In 1840 he was promoted lieutenant-colonel, and in 1846 colonel, and his next war service was as chief of staff to General Vaillant during the siege of Rome (1849), after which he was made general of brigade and director of engineer services at headquarters. In 1851 he became a member of the Committee of Fortifications, in the following year a member of the council of state, and in 1853 general of division. In the first part of the Crimean War he was employed in the expedition to the Baltic, and directed engineer operations against Bomarsund, but early in 1855 he was sent to the Crimea, where he succeeded General Bizot as chief of engineers. For some years he had been the most trusted military adviser of Napoleon III., and he was now empowered to advise the generals on the spot in accordance with the wishes of the sovereign and the home government. This delicate and difficult task Niel managed to carry out with as much success as could be expected, and he had the credit of directing the siege operations against the Malakoff (see CRIMEAN WAR). His reward was the grand cross of the Legion of Honour. From 1855 to 1859 he was employed at headquarters, and also served in the senate. In the war against the Austrians in the latter year (see ITALIAN WARS) Niel commanded the IV. corps, and took a brilliant part in the battles of Magenta and Solferino. On the field of battle of Solferino he was made a marshal of France. After service for some years in a home command, he became minister of war (1867). In this capacity he drafted and began to carry out a far-reaching scheme of army reform, based on universal service and the automatic creation of large reserves, which needed only time to mature. He also rearmed the whole of the army with the chassepôt rifle. But he did not live to complete the development of his system. He died on the 13th of August 1869 in Paris, and a year later the Franco-German War destroyed the old imperial army upon which the new formations were to have been grafted.

NIELLO (the Italian form of Lat. *nigellum*, diminutive of *niger*, "black"; Late Gr. *μελανόν*), a method of producing delicate and minute decoration on a polished metal surface by incised lines filled in with a black metallic amalgam. In some cases it is very difficult to distinguish niello from black enamel; but the black substance differs from true enamel in being metallic, not vitreous. Our knowledge of the process and materials employed in niello-work is derived mainly from four writers,—Eraclius the Roman (a writer probably of the 11th century), Theophilus the monk, who wrote in the 12th or 13th century,[1] and, in the 16th century, Benvenuto Cellini[2] and Giorgio Vasari.[3] The design was cut with a sharp graving tool on the smooth surface of the metal, which was usually silver, but occasionally gold or even bronze. An alloy was formed of two parts silver, one-third copper and one-sixth lead; to this mixture, while fluid in the crucible, powdered sulphur in excess was added; and the brittle amalgam, when cold, was finely pounded, and sealed up in large quills for future use. A solution of borax to act as a flux was brushed over the metal plate and thoroughly worked into its incised lines. The powdered amalgam was then shaken out of the quills on to the plate, so as to completely cover all the engraved pattern. The plate was now carefully heated over a charcoal fire, fresh amalgam being added, as the powder fused, upon any defective places. When the powder had become thoroughly liquid, so as to fill all the lines, the plate was allowed to cool, and the whole surface was scraped, so as to remove the superfluous niello, leaving only what had sunk into and filled up the engraved pattern. Last of all the nielloed plate was very highly polished, till it presented the appearance of a smooth metal surface enriched with a delicate design in fine grey-black lines. This process was chiefly used for silver work, on account of the vivid contrast between the whiteness of the silver and the darkness of the niello. As the slightest scratch upon the metal received the niello, and became a distinct black line, ornament of the most minute and refined description could easily be produced.

The earliest specimens of niello belong to the Roman period. Two fine examples are in the British Museum. One is a bronze statuette of a Roman general, nearly 2 ft. high, found at Barking Hall in Suffolk. The dress and armour have patterns partly inlaid in silver and partly in niello. The dark tint of the bronze rather prevents the niello from showing out distinctly. This statuette is apparently a work of the 1st century.[4] The other example is not earlier than the 4th century. It is a silver casket or lady's toilet box, in which were found an ampulla and other small objects, enriched with niello-work.[5]

From Roman times till the end of the 16th century the art of working in niello seems to have been constantly practised in some part at least of Europe, while in Russia and India it has survived to the present day. From the 6th to the 12th century a large number of massive and splendid works in the precious metals were produced at Byzantium or under Byzantine influence, many of which were largely decorated with niello; the silver dome of the baldacchino over the high altar of S. Sophia was probably one of the most important of these. Niello is frequently mentioned in the inventories of the treasures belonging to the great basilicas of Rome and Byzantium. The Pala d'Oro at S. Mark's, Venice, 10th century, owes much of its refined beauty to niello patterns in the borders. This art was also practised by Bernward, artist-bishop of Hildesheim (*ob.* 1023); a fine silver paten, decorated with figures in niello, attributed to his hand, still exists among the many rich treasures in the church of Hanover Palace. Other nielli, probably the work of the same bishop, are preserved in the cathedral of Hildesheim. In France, too, judging both from existing specimens of ecclesiastical plate and many records preserved in church inventories, this mode of decoration must have been frequently applied all through the middle ages: especially fine examples once existed at Notre Dame, Paris, and at Cluny, where the columns of the sanctuary were covered with plates of silver in the 11th century, each plate being richly ornamented with designs in niello. Among the early Teutonic and Celtic races, especially from the 8th to the 11th centuries, both in Britain and other countries, niello was

[5] See Visconti, *Una Antica Argentaria* (Rome, 1793).

frequently used to decorate the very beautiful personal ornaments of which so many specimens enrich the museums of Europe. The British Museum possesses a fine fibula of silver decorated with a simple pattern in niello and thin plates of repoussé gold. This, though very similar in design to many fibulae from Scandinavia and Britain, was found in a tomb at Kerch (Panticapaeum). Several interesting gold rings of Saxon workmanship have been found at different times, on which the owner's name and ornamental patterns are formed in gold with a background of niello. One with the name of Ethelwulf, king of Wessex (836–838), is now in the British Museum (see figure). Another in the Victoria and Albert Museum has the name of Alhstan, who was bishop of Sherborne from 823 to 867. The metal-workers of Ireland, whose skill was quite unrivalled, practised largely the art of niello from the 10th to the 12th century, and possibly even earlier. Fine croziers, shrines, fibulae, and other objects of Irish workmanship, most skilfully enriched with elaborate niello-work, exist in considerable numbers. From the 13th to the 16th century but little niello-work appears to have been produced in England. Two specimens have been found, one at Matlask, Norfolk, and the other at Devizes, which from the character of the design appear to be English. They are both of gold, and seem to be the covering plates of small pendant reliquaries about 1 in. long, dating about the end of the 15th century. One has a crucifix between St John the Baptist and a bishop; the other, that found at Devizes, has the two latter figures, but no crucifix.[1] It is, however, in Italy that the art of niello-work was brought to greatest perfection. During the whole medieval period it was much used to decorate church plate, silver altar-frontals, and the like. The magnificent frontals of Pistoia cathedral and the Florence baptistery are notable instances of this. During the 15th century, especially at Florence, the art of niello-work was practised by almost all the great artist-goldsmiths of that period. Apart from the beauty of the works they produced, this art had a special importance and interest from its having led the way to the invention of printing from engravings on metal plates (see LINE-ENGRAVING). Vasari's account of this invention, given in his lives of Pollaiuolo and Maso Finiguerra, is very interesting, but he is wrong in asserting that Maso was the first worker in niello who took proofs or impressions of his plates. An important work of this sort, described at length by Vasari and wrongly ascribed by him to Maso Finiguerra (*q.v.*), still exists in the Opera del Duomo at Florence. It is a pax with a very rich and delicate niello picture of the coronation of the Virgin; the composition is very full, and the work almost microscopic in minuteness; it was made in 1452. Impressions from it are preserved in the British Museum, the Louvre and other collections. The British Museum possesses the finest existing example of 15th-century German niello. It is a silver beaker, covered with graceful scroll-work, forming medallions, in which are figures of cupids employed in various occupations (see Shaw's *Dresses and Decorations of the Middle Ages*, 1858, vol. ii.).

Gold and Niello Ring.

NIEM [NYEM, or NIEHEIM], **DIETRICH OF** (*c.* 1345–1418), medieval historian, was born at Nieheim, a small town subject to the see of Paderborn. He became a notary of the papal court of the rota at Avignon, and in 1376 went with the Curia to Rome. Urban VI. here took particular notice of him, made him an abbreviator to the papal chancery, and in 1383 took him with him on his visit to King Charles at Naples, an expedition which led to many unpleasant adventures, from which he escaped in 1385 by leaving the Curia. In 1387 he is again found among the abbreviators, and in 1395 Pope Boniface IX. appointed him to the bishopric of Verden. His attempt to take possession of the see, however, met with successful opposition; and he had to resume his work in the chancery, where his name again appears in 1403. In the meantime he had helped to found a German hospice in Rome, which survives as the Instituto dell' Anima, and had begun to write a chronicle, of which only fragments are extant. His chief importance, however, lies in the part he took in the controversies arising out of the Great Schism. He accompanied Gregory XII. to Lucca in May 1408, and, having in vain tried to make the pope listen to counsels of moderation, he joined the Roman and Avignonese cardinals at Pisa. He adhered to the pope elected by the council of Pisa (Alexander V.) and to his successor John XXIII., resuming his place at the Curia. In view of the increasing confusion in the Church, however, he became one of the most ardent advocates of the appeal to a general council. He was present at the council of Constance as adviser to the German "nation." He died at Maastricht on the 22nd of March 1418.

Niem wrote about events in which he either had an intimate personal share or of which he was in an excellent position to obtain accurate information. His most important works are the *Nemus unionis* and the *De schismate*. Of these the first, compiled at Lucca after the breach with Gregory XII., is a collection of documents which had fallen into his hands during the negotiations for union: papal pronouncements, pamphlets, letters written and received by himself, and the like. The *De schismate libri III.*, completed on the 25th of May 1410, describes the history of events since 1376 as Niem himself had seen them. It was continued in the *Historia de vita Johannis XXIII.* Other works are *De bono regimine Rom. pontificis*, dedicated to the new pope (John XXIII.); *De modis uniendi ac reformandi ecclesiam* and *De difficultate reformationis in concilio universali*, advocating the convocation of a council, to which the pope is to bow; *Contra dampnatos Wiclivitas Pragae*, against the Hussites; *Jura ac privilegia imperii*, a glorification of the empire in view of the convocation of the council of Constance; *Avisamenta pulcherrima de unione et reformatione membrorum et capitis fienda*, a programme of church reform based on his experiences of the evils of the papal system.

For bibliography see Potthast, *Bibl. hist. medii aevi* (2nd ed., Berlin, 1896), p. 1051, s.v. "Theodoricus de Niem"; and generally see the article on Niem by Theodor Lindner in *Allgemeine deutsche Biographie* (Leipzig, 1886); and Erler, *Dietrich von Nieheim* (Leipzig, 1887).

NIEMCEWICZ, JULIAN URSIN (1758–1841), Polish scholar, poet and statesman, was born in 1757 in Lithuania. In the earlier part of his life he acted as adjutant to Kosciusko, was taken prisoner with him at the fatal battle of Macicjowice (1704), and shared his captivity at St Petersburg. On his release he travelled for some time in America, where he married. After the Congress of Vienna he was secretary of state and president of the constitutional committee in Poland, but in 1830–1831 he was again driven into exile. He died in Paris on the 21st of April 1841. Niemcewicz tried many styles of composition. His comedy *The Return of the Deputy* (1790) enjoyed a great reputation, and his novel, *John of Tenczyn* (1825), in the style of Scott, gives a vigorous picture of old Polish days. He also wrote a *History of the Reign of Sigismund III.* (3 vols., 1819), and a collection of memoirs for ancient Polish history (6 vols., 1822–1823). But he is now best remembered by his *Historical Songs of the Poles* (Warsaw, 1816), a series of lyrical compositions in which the chief heroes are of the golden age of Sigismund I., and the reigns of Stephen Bathori and Sobieski.

His collected works were published in 12 vols. at Leipzig (1838–1840).

NIENBURG ON THE SAALE, a town of Germany, in the duchy of Anhalt, situated at the influx of the Bode into the Saale, 6 m. N. of Bernburg on the railway Calbe-Könnern. Pop. (1905) 5748. It contains a beautiful Gothic Evangelical church, an old castle, once a monastery (founded 975, dissolved 1546), and now devoted to secular uses, and a classical school. The industries embrace iron-founding and machine-making, malting and tanning

NIENBURG ON THE WESER, a town of Germany, in the Prussian province of Hanover, situated on the Weser, 33 m. N.W. from Hanover by the railway to Bremen. Pop. (1905) 9638. It has an Evangelical and a Roman Catholic church, a classical school and an agricultural college. Its industries consist chiefly in glass-blowing, distilling, biscuit-making and the manufacture of manures. The town is mentioned as early as 1025. It was fortified in the 12th century, obtained municipal rights in 1569, and passed in 1582 to the house of Lüneburg. It was occupied by the imperialists from 1627 to 1634, and by the French during the Seven Years' War. The walls were dismantled by order of Napoleon I. in 1807.

See Gade, *Geschichte der Stadt Nienburg an der Weser* (1862).

NIEPCE, JOSEPH NICÉPHORE (1765–1833), French physicist, and one of the inventors of photography, was born at Châlon-sur-Saône on the 7th of March 1765. In 1792 he entered the army as a sub-lieutenant, and in the following year he saw active service in Italy. Ill-health and failing eyesight compelled him to resign his commission before he had risen above the rank of lieutenant; but in 1795 he was nominated *administrateur* of the district of Nice, and he held the post until 1801. Returning in that year to his birthplace, he devoted himself along with his elder brother Claude (1763–1828) to mechanical and chemical researches; and in 1811 he directed his attention to the rising art of lithography. In 1813 the idea of obtaining sun pictures first suggested itself to him in this connexion; and in 1826 he learned that L. J. M. Daguerre was working in the same direction. In 1829 the two united their forces, "pour coopérer au perfectionnement de la découverte inventée par M. Niepce et perfectionnée par M. Daguerre" (see also PHOTOGRAPHY). Niepce died at Gras, his property near Châlon, on the 3rd of July 1833. A nephew, CLAUDE FÉLIX ABEL NIEPCE DE SAINT-VICTOR (1805–1870), served with distinction in the army, and also made important contributions towards the advancement of the art of photography; he published *Recherches photographiques* (Paris, 1855) and *Traité pratique de gravure héliographique sur acier et sur verre* (Paris, 1866).

NIEREMBERG, JUAN EUSEBIO (1595–1658), Spanish Jesuit and mystic, was born at Madrid in 1595, joined the Society of Jesus in 1614, and subsequently became lecturer on Scripture at the Jesuit seminary in Madrid, where he died on the 7th of April 1658. He was highly esteemed in devout circles as the author of *De la afición y amor de Jesús* (1630), and *De la afición y amor de María* (1630), both of which were translated into Arabic, Flemish, French, German, Italian and Latin. These works, together with the *Prodigios del amor divino* (1641), are now forgotten, but Nieremberg's version (1656) of the *Imitation* is still a favourite, and his eloquent treatise, *De la hermosura de Dios y su amabilidad* (1649), is the last classical manifestation of mysticism in Spanish literature. Nieremberg has not the enraptured vision of St Theresa, nor the philosophic significance of Luis de León, and the unvarying sweetness of his style is cloying; but he has exaltation, unction, insight, and his book forms no unworthy close to a great literary tradition.

NIERSTEIN, a village of Germany, in the grand duchy of Hesse-Darmstadt, on the left bank of the Rhine, 8 m. S. from Mainz by the railway to Worms. Pop. (1905) 4445. It contains a Roman Catholic and a Protestant church, an old Roman bath—Sironabad—and sulphur springs. It is famous for its wines, in which a large export trade is done. Nierstein was originally a Roman settlement, and was a royal residence under the Carolingian rulers. Later it passed from the emperor to the elector palatine of the Rhine.

NIETZSCHE, FRIEDRICH WILHELM (1844–1900), German philosopher, was the son of the pastor at Röcken, near Leipzig, where he was born on 15th October 1844. He was educated at Schulpforta, and studied the classics at the universities of Bonn and Leipzig. In 1869, while still an undergraduate, he was, on F. W. Ritschl's recommendation, appointed to an extraordinary professorship of classical philology in the university of Basel, and rapidly promoted to an ordinary professorship. Here he almost immediately began a brilliant literary activity, which gradually assumed a more and more philosophical character. In 1876 eye (and brain) trouble caused him to obtain sick leave, and finally, in 1879, to be pensioned. For the next ten years he lived in various health resorts, in considerable suffering (he declares that the year contained for him 200 days of pure pain), but dashing off, at high pressure, the brilliant essays on which his fame rests. Towards the end of 1888, after recovering from an earlier attack, he was pronounced hopelessly insane, and in this condition he remained until he died on the 25th of August 1900. Nietzsche's writings must be understood in their relation to these circumstances of his life, and as the outcome of a violent revolt against them on the part of an intensely emotional and nervous temperament. His philosophy, consequently, is neither systematic in itself nor expounded in systematic form. It is made up of a number of points of view which successively appeared acceptable to a personality whose self-appreciation verges more and more upon the insane, and exhibits neither consecutiveness nor consistency. Its natural form is the aphorism, and to this and to its epigrammatic brilliance, vigour, and uncompromising revolt against all conventions in science and conduct it owes its persuasiveness. Revolt against the whole civilized environment in which he was brought up is the keynote of Nietzsche's literary career. His revolt against Christian faith and morals turns him into a proudly atheistic "free-thinker," and preacher of a new "master" morality, which transposes the current valuations, deposes the "Christian virtues," and incites the "over-man" ruthlessly to trample under foot the servile herd of the weak, degenerate and poor in spirit. His revolt against the theory of state supremacy turns him into an anarchist and individualist; his revolt against modern democracy into an aristocrat. His revolt against conventional culture leads him to attack D. F. Strauss as the typical "Philistine of culture"; his revolt against the fashion of pessimism to demand a new and more robust affirmation of life, not merely *although*, but *because*, it is painful. Indeed, his very love of life may itself be regarded as an indignant revolt against the toils that were inexorably closing in around him. He directs this spirit of revolt also against the sources of his own inspiration; he turns bitterly against Wagner, whose intimate friend and enthusiastic admirer he had been, and denounces him as the musician of decadent emotionalism; he rejects his "educator" Schopenhauer's pessimism, and transforms his will to live into a "Will to Power." Nevertheless his reaction does not in this case really carry him beyond the ground of Schopenhauerian philosophy, and his own may perhaps be most truly regarded as the paradoxical development of an inverted Schopenhauerism. Other influences which may be traced in his writings are those of modern naturalism and of a somewhat misinterpreted Darwinism ("strength" is generally interpreted as physical endowment, but it has sometimes to be reluctantly acknowledged that the physically feeble, by their combination and cunning, prove stronger than the "strong"). His writings in their chronological order are as follows: *Die Geburt der Tragödie aus dem Geiste der Musik* (1872); *Unzeitgemässe Betrachtungen* (1873–1876) (*Strauss—Vom Nutzen und Nachteil der Historie für das Leben—Schopenhauer als Erzieher—Richard Wagner in Bayreuth*); *Menschliches, Allzumenschliches* (1876–1880); *Morgenröte* (1881); *Die fröhliche Wissenschaft* (1882); *Also sprach Zarathustra* (1883–1884); *Jenseits von Gut und Böse* (1886); *Zur Genealogie der Moral* (1887); *Der Fall Wagner* (1888); *Götzendämmerung* (1888); *Nietzsche contra Wagner*, *Der Antichrist*, and *Poems* first appeared in the complete edition of his works, which also contains the notes for *Der*

zur Macht, in which Nietzsche had intended to give a more systematic account of his doctrine (1895–1901). (F. C. S. S.)

An edition of Nietzsche's complete works began to appear in 1895; there are also two popular editions, 1899 ff. (15 vols. have been published) and 1906 (10 vols.). In 1900 Nietzsche's *Briefe* began to be published. An English translation in 18 vols., edited by Oskar Levy, reached the 13th vol. in 1910. His biography, by his sister, Elisabeth Förster-Nietzsche (*Das Leben Friedrich Nietzsches*, 1895 ff.), reached its third volume in 1907. There are also lives by D. Halévy (1909) and M. A. Mügge (*F. Nietzsche: his Life and Work*, 1908), the latter of a somewhat popular character. G. Brandes first drew European attention to Nietzsche by his famous essay in 1889; since then an enormous literature has grown up round the subject. See especially L. Andreas Salomé, *F. Nietzsche in seinen Werken* (1894); A. Riehl, *F. Nietzsche* (1897; 3rd ed., 1901); F. Tönnies, *Nietzsche-Katus* (1897); H. Ellis, *F. Nietzsche* (in *Affirmations*, 1898); H. Lichtenberger, *La Philosophie de Nietzsche* (1895; German trans., 1899); E. Horneffer, *Vorträge über F. Nietzsche* (1900); T. Ziegler, *F. Nietzsche* (1900); J. Zeitler, *Nietzsches Ästhetik* (1900); P. Deussen, *Erinnerungen an F. Nietzsche* (1901); R. Richter, *F. Nietzsche, sein Leben und sein Werk* (1903); G. Simmel, *Schopenhauer und Nietzsche* (1907). For an estimate of his moral theory see ETHICS, *ad fin.*

NIEUPORT (Flem. *Nieuwpoort*), a town of Belgium in the province of West Flanders. Pop. (1904) 3780. It was the port of Ypres, and is situated on the Yser about 10 m. S. of Ostend. It was strongly fortified in the middle ages and its siege by the French in 1488–1489 is an episode of its heroic period. Under its walls in 1600 Maurice of Nassau defeated the Archduke Albert and the Spaniards. It contains an ancient cloth market, a fine town-hall and an old church, and outside is a lighthouse dating from 1289. Nieuport Bains, 2 m. from the town, is a fashionable seaside resort dating only from 1869. It has a fine pier extending 1500 yds. out to sea and flanking the entrance to the Yser, which has been canalized. The bathing is excellent, and in the season the place is largely frequented by visitors.

NIÈVRE, a department of central France, formed from the old province of Nivernais with a small portion of the Orléanais. It is bounded N.W. by Loiret, N. by Yonne, E. by Côte d'Or, E. and S.E. by Saône-et-Loire, S. by Allier and W. by Cher. Pop. (1906) 313,972. Area, 2659 sq. m. Nièvre falls into three regions differing in elevation and in geological formation. In the east are the granitic mountains of the Morvan, one of the most picturesque portions of France, containing Mont Prénelay (2789 ft.) and several lesser heights. The north and centre are occupied by plateaus of jurassic limestone with a maximum elevation of 1400 ft. The west and south-western part of the department is a district of plains, composed mainly of tertiary formations with alluvial deposits, and comprising the valleys of the Loire and the Allier. The lowest level of the department is 446 ft., at the exit of the Loire. Nièvre belongs partly to the basin of the Loire, partly to that of the Seine. The watershed dividing these two basins follows the general slope of the department from S.E. to N.W.—from Mont Prénelay to the Puisaye, the district in the extreme north-west. Towards the west the limits of Nièvre are marked by the Allier-Loire valley—the Loire striking across the south-west corner of the department by Decize and Nevers and then continuing the line of its great affluent the Allier northwards by Fourchambault, La Charité, Pouilly and Cosne. Secondary feeders of the Loire are the Nièvre, which gives its name to the department, and the Aron, whose valley is traversed by the Nivernais Canal. The largest tributary of the Seine in Nièvre is the Yonne, which rises in the south-east, passes by Clamecy, and carries along with it the northern part of the Nivernais Canal. The Cure, the principal affluent of the Yonne (with which, however, it does not unite until after it has left the department), is the outlet of a lake, Lac des Settons, which serves as a reservoir for the regulation of the river and the canal. Owing to its greater elevation and the retention of the rain-water on its impermeable surface in the type of ponds and streams, Morvan shows a mean temperature 2° F. lower than that of the western district, which, in the valley of the Loire, is almost identical with that of Paris (52° F.). At Nevers the annual rainfall amounts to only 21 in., but in Morvan it is nearly three times as great.

The principal cereals are oats and wheat; potatoes are also largely grown. Much land is given over to pasture and the cultivation of various kinds of forage, and the fattening of cattle is a thriving agricultural industry. The Nivernais and *Charolais* are the chief breeds. The rearing of sheep and draught-horses is also of importance. Vines are grown in the valley of the Loire and in the neighbourhood of Clamecy. The white wines of Pouilly on the Loire are widely known. Nièvre abounds in forests, the chief trees being the oak, beech, hornbeam, elm and chestnut. Coal is mined at Decize, and gypsum, building stone, and kaolin are among the quarry products. The best-known mineral springs are those of Pougues and St Honoré. Of the iron-works for which Nièvre is famous, the most important are those of Fourchambault. At Imphy there are large steel-works. The government works of La Chaussade at Guérigny make chain-cables, anchors, armour-plates, &c. There are also manufactories of agricultural implements and hardware, potteries, manufactories of porcelain, and faïence (at Nevers), tile-works, chemical works, paper-mills and saw-mills, as well as numerous tanneries, boot and shoe factories, cask manufactories and oil works (colza, poppy and hemp). In the Morvan district a large part of the population is engaged in the timber industry; the logs carried down by the streams to Clamecy are then put into boats and conveyed to Paris.

A great deal of the traffic is by water: the canal along the left bank of the Loire runs through the department for 38 m., and the Nivernais canal for 78 m. The chief railway is that of the Paris-Lyons-Méditerranée Company, whose main line to Nîmes follows the valley of the Loire and Allier throughout the department. Nièvre is divided into 4 arrondissements (Nevers, Château-Chinon, Clamecy and Cosne being their capitals), 25 cantons, 313 communes. It forms the diocese of Nevers, and part of the educational district of Dijon and of the region of the VIII. *corps d'armée*. Its court of appeal is at Bourges. The most noteworthy towns are Nevers, the capital, Clamecy, Fourchambault, Cosne, La Charité and Decize. Varzy and Tannay have fine churches of the 14th, and the 12th, 13th and 16th centuries respectively, and there is an interesting church, chiefly Romanesque in style, at St Pierre-le-Moûtier.

NIFO, AGOSTINO [AUGUSTINUS NIPHUS] (*c.* 1473–1538 or 1545), Italian philosopher and commentator, was born at Japoli in Calabria. He settled for a time at Sezza and subsequently proceeded to Padua, where he studied philosophy. He lectured at Padua, Naples, Rome and Pisa, and won so high a reputation that he was deputed by Leo X. to defend the Catholic doctrine of Immortality against the attack of Pomponazzi and the Alexandrists. In return for this he was made Count Palatine, with the right to call himself by the name Medici. In his early thought he followed Averroes, but afterwards modified his views so far as to make himself acceptable to the orthodox Catholics. In 1495 he produced an edition of the works of Averroes; with a commentary compatible with his acquired orthodoxy. In the great controversy with the Alexandrists he opposed the theory of Pomponazzi that the rational soul is inseparably bound up with the material part of the individual, and hence that the death of the body carries with it the death of the soul. He insisted that the individual soul, as part of absolute intellect, is indestructible, and on the death of the body is merged in the eternal unity.

His principal philosophical works are *De immortalitate animi* (1518 and 1524); *De intellectu et daemonibus*; *De infinitate primi motoris quaestio* and *Opuscula moralia et politica*. His numerous commentaries on Aristotle were widely read and frequently reprinted, the best-known edition being one printed at Paris in 1654 in fourteen volumes (including the *Opuscula*).

NIGDEH (Arab. *Nakidah*), the chief town of a sanjak of the same name in the Konia vilayet of Asia Minor, situated on the Kaisarieh-Cilician Gates road. It is remarkable for the beauty of its buildings, dating from almost all ages of the Seljuk period. After the fall of the sultanate of Rum (of which it had been one of the principal cities), Nigdeh became independent, and, according to Ibu Batuta, ruinous, and did not pass into Ottoman hands till the time of Mahommed II. It represents no classical town, but, with Bor, has inherited the importance of Tyana,

whose site lies about 10 m. S.W. A Hittite-inscribed monument, brought perhaps from Tyana, has been found at Nigdeh. The population (20,000) includes a large Greek and a small Armenian community. The Orthodox metropolitan of Iconium resides here.

NIGEL (d. 1169), bishop of Ely, head of the exchequer in the reigns of Henry I. and Henry II., was brought into the exchequer in early life (1130). Soon after his uncle Roger of Salisbury secured him the bishopric of Ely, much to the disgust of the monks. Nigel was at first retained in Stephen's service; but, like his uncle and his brothers, incurred the suspicion of leaning towards the Angevin interest, when Roger of Salisbury and Alexander of Lincoln were arrested by Stephen (January 1139). Nigel attempted to maintain himself in his see by force of arms, but he was forced to fly to the empress at Gloucester He was reconciled to Stephen in 1142 and restored to his see; but he now became involved in a quarrel with the powerful Henry of Winchester. Ranulph, his first treasurer and representative at Ely, had been extortionate and dishonest, and the monks accused Nigel, probably with some justification, of spending the estates and treasures of the see in maintaining knights and gaining court influence. Henry of Winchester, who can have had little sympathy with bishops of Nigel's type, took up their quarrel, and Nigel was forced to go to Rome. Fortunately, both in these quarrels and in all his difficulties with Stephen, he secured the strong and uniform support of the Roman Curia. At the accession of Henry II. (1154) Nigel was summoned to reorganize the exchequer. He was the only surviving minister of Henry I., and his knowledge of the exchequer business was unrivalled. This was the great work of his life. It is to the work of his son Richard, the *Dialogus de Scaccario*, that we are indebted for our knowledge of the procedure of the exchequer as it was left by Nigel. The bishop took little part in politics, except as an administrator. In 1166 his health was broken by a paralytic seizure. Except for another quarrel with his monks, who accused him of despoiling their church and gained the ear of Pope Adrian, the last part of his life was laborious and uneventful.

See Dr Liebermann's *Einleitung in den Dialogus de Scaccario*; J. H. Round's *Geoffrey de Mandeville*.

NIGER, GAIUS PESCENNIUS, governor of Syria under the emperor Commodus. On the death of Pertinax (A.D. 193), he was saluted emperor by the troops at Antioch, but unaccountably delayed marching on Rome until he learned that Septimius Severus, one of the rival claimants, had assumed the offensive. He then strongly garrisoned Byzantium and the principal towns of Asia Minor, but after his legate Aemilianus had been defeated and slain near Cyzicus he himself was driven from Nicaea and routed near the Cilician Gates. Having failed in an effort to escape towards the Euphrates, he was brought back and put to death in 194.

Aelius Spartianus, *Pescennius Niger*; Dio Cassius lxxii. 8; lxxiii. 13, 14.

NIGER, a great river of West Africa, inferior only to the Congo and Nile among the rivers of the continent, and the only river in Africa which, by means of its tributary the Benue, affords a waterway uninterrupted by rapids, and available for shallow-draught steamers, to the far interior. Rising within 150 m. of the sea in the mountainous zone which marks the N.E. frontiers of Sierra Leone and French Guinea, it traverses the interior plateaus in a vast curve, flowing N.E., E. and S.E., until it finally enters the Gulf of Guinea through an immense delta. Its total length is about 2600 m. About 250 m. from its mouth it is joined by the Benue, coming from the east from the mountainous region of Adamawa. From its mouth to the limit of navigability from the sea the river is in British territory; above that point it flows through French territory.

The source of the Niger lies in 9° 5′ N. and 10° 47′ W., and the most northerly point of the great bend is about 17° N. The area of the Niger basin, excluding the arid regions with a slope towards the stream, has been calculated by Dr. A. Bludau at 584,000 sq. m. The river is known locally under various names, the most common being Joliba (a Mandigo word meaning Great River) and Kworra or Quorra. By the last name the Niger was known in its lower reaches before its identity with the upper river was established. The stream considered the chief source of the Niger is called the Tembi. A narrow watershed separates it from the headwaters of the streams flowing south-west through Sierra Leone. The birthplace of the Niger is in a deep ravine 2800 ft. above sea-level. From a moss-covered rock a tiny spring issues and has made a pool below. This little stream is the Tembi, which within a short distance is joined by two other rivulets, the Tamincono and Falico, which have their origin in the same mountainous district. After flowing north for about 100 m., the river turns eastward and receives several tributaries from the south. At its confluence with the Tankisso (a northern tributary), 210 m. from its source, the river has attained dimensions sufficient to earn for itself the title Joliba. Taking at this point a decided trend northward, the Niger, 100 m. lower down, at Bamako—the first considerable town on its banks—has a depth of 6 ft. with a breadth of 1300 ft. Seven or eight miles below Bamako the Sotuba rocks mark the end of what may be considered the upper river. From this point the navigable portion of the Niger begins. Thirty miles below Sotuba are the rapids of Tulimandio, but these are navigable when the river is at its highest, namely from July to October. A little lower down is Kulikoro, from which point the bed of the stream for over 1000 m. is fairly free from impediments.

The birthplace of the river.

The river here turns more directly to the east and increases in volume and depth. At Sansandig the stream is deep enough to permit of steamers of considerable size plying upon the river. After Sansandig is passed the banks of the stream become low and the Niger is split up into a number of channels. Mopti is at the junction of the main stream with a large right-hand backwater or tributary, the Bani or Mahel Balevel, on which is situated the important town of Jenné. The banks of the Niger below Mopti become swampy and treeless, and the first of a series of lakes (Debo) is reached. These lakes are chiefly on the left of the main stream, with which they are connected by channels conveying the water in one direction or the other according to the season. At high water most of these are united into one general inundation. The largest lake, Faguibini, is nearly 70 m. long by 12 m. broad, has high shores and reaches a depth exceeding, in parts, 160 ft. It is not until Kabara, the port of Timbuktu, is reached, a distance of 450 m. from Sansandig, that the labyrinth of lakes, creeks and backwaters ceases. Below Kabara the river reaches its most northerly point. At Bamba it is shut in by steep banks and narrows to 600 to 700 yds., again spreading out some distance down. At Barka (200 m. from Timbuktu) the stream turns south-east and preserves that direction throughout the remainder of its course. At Tosaye, just before the bend becomes pronounced, the Baror and Chabar rocks reduce the width of the river to less than 500 ft., and at low water the strength of the current is a serious danger to navigation. Below Timbuktu for a considerable distance the Niger receives no tributaries; from the north none until the region of the Sahara is passed. In places the desert approaches close to the river on both banks and immense sand dunes fill the horizon.

The middle Niger and lake region.

At Ansongo, 430 m. below Timbuktu, the navigable reach of the middle Niger, in all 1057 m., ends. Four huge flint rocks bar the river at Ansongo and effectually prevent further navigation except in very small vessels. From Ansongo to Say, some 250 m., the river flows through several rocky passes, the current attaining great velocity. Throughout this distance the river is a hopeless labyrinth of rocks, islands, reefs and rapids. From Say, where the stream is about 700 yds. in breadth, to Bussa, there is another navigable stretch of water extending 300 m. After the desert region is past the Niger receives the waters of the river Sokoto, a considerable stream flowing from the north-east. Some distance below this confluence are the Bussa rapids, which can only be navigated with considerable difficulty. These

Bussa rapids and lower river.

rapids—though not such a hindrance to navigation—are of a more dangerous character than any encountered between Ansongo and Say. "In one pass, some 54 yds. wide, shut in between two large reefs, a good half of the waters of the Niger flings itself over with a tremendous roar" (Hourst). The rapids extend for 50 m. or more; in a less obstructive form they continue to Rabba, but light-draught steamers ascending the stream during flood season experience little difficulty in reaching Bussa. A little above Rabba the river makes a loop south-west, at the head of the loop being (right bank) Jebba. Here the river is bridged by the railway from Lagos. Sixty miles lower down is the mouth of the (left hand) tributary the Kaduna, a river of some magnitude which gives access to Zungeru, the headquarters of the British administration in Northern Nigeria. The head waters of the Kaduna are not far from Kano. Below the mouth of the Kaduna, on the right bank of the Niger, is Baro, the starting-point of a railway to Kano. In 7° 50′ N. 6° 45′ E. the Niger is joined by its great tributary the Benue. At their confluence the Niger is about three-quarters of a mile broad and the Benue rather more than a mile. The united stream forms a lake-like expansion about 2 m. in width, dotted with islands and sandbanks; the peninsula at the junction is low, swampy, and intersected by numerous channels. On the western bank of the Niger at this point is situated Lokoja (*q.v.*), an important commercial centre. The stream, as far south as Iddah (Ida), a town on the east bank, rushes through a valley cut between the hills, the sandstone cliffs at some places rising 150 ft. high. Between Iddah and Onitsha, 80 m., the banks are lower and the country flatter, and to the south of Onitsha the whole land is laid under water during the annual floods. Here may be said to begin the great delta of the Niger, which, extending along the coast for about 120 m., and 140 or 150 m inland, forms one of the most remarkable of all the swampy regions of Africa. The river breaks up into an intricate network of channels, dividing and subdividing, and intercrossing not only with each other but with the branches of other streams, so that it is exceedingly difficult to say where the Niger delta ends and another river system begins. The Rio Nun is a direct continuation of the line of the undivided river, and is thus the main mouth of the Niger

The Delta.

From the sea the only indication of a river mouth is a break in the dark green mangroves which here universally fringe the coast. The crossing of the bar requires considerable care, and at ebb tide the outward current runs 5½ knots per hour. For the first 20 m. (or as far as Sunday Island, the limit of the sea tide in the dry season) dense lines of mangroves 40, 50, or 60 ft in height shut in the channel; then palm and other trees begin to appear, and the widening river has regular banks. East of the Nun the estuaries known as the Brass, Sombrero, New Calabar, Bonny, Opobo (or Imo), &c. (with the exception, perhaps, of the first-named), seem to derive most of their water from independent streams such as the Orashi, rising in about 6° N., which is, however, linked with the Niger by the Onita Creek in 5½° N. Behind the town of Okrika, some 30 m. up the Bonny river, the swampy ground gives place to firm land, partially forest-clad West of the Nun all the estuaries up to the Forcados seem to be true mouths of the great river, while the Benin river, though linked to the others by transverse channels, may be more properly regarded as an independent stream. (See BENIN.) In this direction the largest mouth is the Forcados, a noble stream with a safe and relatively deep bar Its banks in its lower course are densely wooded, but the beach is sandy and almost free from marsh and malaria. The mouth is 2 m. wide. It has supplanted the Nun river as the chief channel of communication with the interior. There are 17 to 19 ft. of water over the Forcados bar, as against 13 ft. at the Nun mouth. Moreover the Forcados bar shifts little laterally, and within the bar is a natural harbour with an area of 3 to 4 sq. m. having a depth of 30 ft. at low water spring tides. From the mouth of the Forcados to the main stream is 105 m., with a minimum depth in the dry season of 7 ft. A northern arm affords ocean-going vessels access to Wari and Sapele. The other western mouths of the Niger have as a rule shallow and difficult bars. The delta is the largest in Africa and covers 14,000 sq. m.

The Benue is by far the most important of the affluents of the Niger. The name signifies in the Batta tongue "Mother of Waters." The river rises in Adamawa in about 7° 40′ N. and 13° 15′ E., a little north of the town of Ngaundere, at a height of over 3000 ft. above the sea, being separated by a narrow water parting from one of the headstreams of the Logone, whose waters flow to Lake Chad. In its upper course the Benue is a mountain torrent falling over 2000 ft. in some 150 m. With the Chad system it is connected by the Kebbi or Mayo Kebbi, a right-hand tributary whose confluence is in about 9½° N., 13½° E. The Kebbi, fed by many torrents rising in the eastern versant of the Mandara Hills, issues from the S.W. end of the Tuburi marshes. These marshes occupy an extensive depression in the moderately elevated plateau east of the Mandara Hills, and are cut by 10° N., 15° E. The central part of the marshes forms a deep lake, whence there is a channel going northward to the Logone and navigable for some months during the year. The Kebbi flows west, and soon after leaving Tuburi passes through a rocky barrier marked by a series of rapids and a fall at Lata of 165 ft. Below these obstructions the Kebbi to its junction with the Benue has a depth of not less than 6 ft. In places, as at Lere and Bifara, it widens into lake-like dimensions.

The Benue.

Below the Kebbi confluence the Benue, now a considerable river, turns from a northerly to a westerly direction and is navigable all the year round by boats drawing not more than 2½ ft. For some 40 m. below the confluence the river has an average width of 180 to 200 yds., and flows with a strong steady current, although a broad strip of country on each side is swampy or submerged. It is here joined by the Faro, which, rising in the Adamawa Mountains S.E. of Ngaundere, flows almost due north. About 50 m. below the junction of the Faro is Yola, the capital of Adamawa. It lies on the southern side of the Benue, some 850 m. by river from the sea and at an altitude of 600 ft. Here the width of the stream increases at flood time to 1000 or 1500 yds., and though it narrows at the somewhat dangerous rapids of Rumde Gilla to 150 or 180 yds., it soon expands again. About 50 m. below Yola the Benue receives, on the right bank, the Gongola, which rises in the Bauchi highlands and after a great curve north-east turns southward. It is over 300 m. long, and at flood time is navigable for about half of its course. The Benue receives several other tributaries both from the north and the south, but they are not of great importance. It flows onwards to the Niger with comparatively unobstructed current, its valleys marked for the most part by ranges of hills and its banks diversified with forests, villages and cultivated tracts. But though exceptionally free from obstruction by rapids, the river falls very low in the dry season, and for seven to eight months is almost useless for navigation. The Benue lies within British territory to a point 3 m. below the mouth of the Faro, in about 13° 8′ E. East of that point the river is in the German colony of Cameroon.

As the Niger and the Benue have different gathering grounds, they are not in flood at the same time. The upper Niger rises in June as the result of the tropical rains, and decreases in December, its breadth at Turella expanding from between 2000 and 2500 ft. to not less than 1½ m. The middle Niger, however, reaches its maximum near Timbuktu only in January; in February and March it sinks slowly above the narrows of Tosaye, and more rapidly below them, the level being kept up by supplies from backwaters and lakes; and by April there is a decrease of about 5 ft. In August the channel near Timbuktu is again navigable owing to rain in the southern highlands. The Benue reaches its greatest height in August or September, begins to fall in October, falls rapidly in November and slowly in the next three months, and reaches its lowest in March and April, when it is fordable in many places, has no perceptible flow and at the confluence begins to be covered with the water-weed *Pistia Stratioles*. The flood rises with great rapidity, and reaches 50, 60, or even 75 ft. above the low-water mark.

Flood and low seasons.

The two confluents being so unlike, the united river differs from each under the influence of the other. Here the river is at its lowest in April and May; in June it is subject to great fluctuations; about the middle of August it usually begins to rise; and its maximum is reached in September. In October it sinks, often rapidly. A slight rise in January, known as the *yangbe*, is occasioned by water from the upper Niger. Between high- and low-water mark the difference is as much as 35 ft.

The geological changes which have taken place in the Niger basin are imperfectly known. The French scientists E. F. Gautier and R. Chudeau, summing up the evidence available in 1909, set forth the hypothesis that the existing upper Niger and the existing lower Niger were distinct streams. According to this theory the upper Niger, somewhat above where Timbuktu now stands, went north and north-west and emptied into the Juf, which in the beginning of the quaternary age was a salt-water lake, the remnant of an arm of the sea which in the tertiary age covered the northern Sudan and southern Sahara as far east as Bilma. Lake Fagubini is regarded as a remnant of the

Geological changes.

ancient course of the upper river. When the upper Niger had this direction, the Wadi Taffasassent, now a dried-up river of the central Sahara, which rose in the Ahaggar mountains, is believed to have formed the upper course of the existing lower Niger. While the upper and lower parts of the Niger have all the appearance of ancient streams, the middle Niger is the result of a "recent" capture: "it has no past, it scarcely has a present" (see R. Chudeau, *Sahara soudanais*, Paris, 1909).

Vague ideas of the existence of the river were possessed by the ancients. The great river flowing eastward reached by the Nasamonians as reported by Herodotus can be no other than the Niger. Pliny mentions a river Nigris, of the same nature with the Nile, separating Africa and Ethiopia, and forming the boundary of Gaetulia; and it is not improbable that this is the modern Niger. In Ptolemy, too, appears along with Gir (possibly the Shari) a certain Nigir (Νίγειρ) as one of the largest rivers of the interior; but so vague is his description that it is impossible definitely to identify it with the Niger.[1] Arabian geographers, such as Ibn Batuta, who were acquainted with the middle course of the river, called it the Nile of the Negroes. At the same time contradictory opinions were held as to the course of the stream. It was supposed by some geographers to run west, an opinion probably first stated by Idrisi in the 12th century. Idrisi gave the Nile of Egypt and the Nile of the Negroes a common source in the Mountain of the Moon. Fountains from the mountain formed two lakes, whence issued streams which united in a very large lake. From this third lake issued two rivers—the Nile of Egypt flowing north, and that of the Negroes flowing west (see R. Dozy and M. J. de Goeje's *Edrisi*, Leiden, 1866: Premier Climat, 1st 4 sections). From Idrisi's description it would appear that he regarded the Shari, Lake Chad, the Benue, Niger and Senegal as one great river which emptied into the Atlantic.[2] That the Niger flowed west and reached the ocean was also stated by Leo Africanus. The belief that a western branch of the Nile emptied itself into the Atlantic was held by Prince Henry of Portugal, who instructed the navigators he despatched to Guinea to look for the mouth of the river, and when in 1445 they entered the estuary of the Senegal the Portuguese were convinced that they had discovered the Nile of the Negroes (see Azurara's *Discovery and Conquest of Guinea*, Beazley and Prestage's translation, vol. ii., London, 1899, chaps. lx. and lxi., and introduction and notes). The Senegal being proved an independent river and the eastward flow of the Niger assumed, the theory that it ran into the Nile was revived, and almost to the very year in which the course of the river was actually demonstrated geographers and travellers, such as J. G. Jackson in his *Empire of Marocco*, first published in 1809, fought zealously for the identity of the Nile of the Negroes with the river of Egypt. The highest scientific authority of the day, Major James Rennell, believed, however, that the Niger ended, *by evaporation*, in the country of "Wangara"—a region located by him, through a misreading of Idrisi, far too much

History and exploration.

[1] Sir Rufane Donkin in a curious and learned work, *A Dissertation on . . . the Niger* (1829), made the Niger join the Gir, which last stream he calls the Nile of Bornu. The united river ran north, disappeared underground in the Sahara and reached the Mediterranean at "the quicksands of the gulph of Sidra." Donkin believed that the desert, advancing eastwards, would overwhelm the Egyptian Nile also in its lower course. "The Delta," he exclaims, "shall become a plashy quicksand, a second Syrtis! and the Nile shall cease to exist from the Lower Cataract downwards."

[2] The hydrography of northern central Africa as now known largely explains the medieval belief in a connexion between the western rivers and the Egyptian Nile. Leaving out of account the Welle-Ubangi (and Idrisi's description of the two Niles may infer a knowledge of that stream, which was supposed by Schweinfurth to form part of the Chad system), there is an almost continuous waterway from the mouth of the Senegal to that of the Nile. The upper waters of the Bakoy branch of the Senegal and those of the navigable Niger are less than 40 m. apart; the Niger communicates directly through the Benue, Lake Tuburi and the Logone with the Shari; the easternmost affluents of the Shari and the most western tributaries of the Bahr el Ghazel affluent of the Nile are within 20 m. of one another. With but three short porterages a boat could be navigated the whole of this distance. Moreover, from the confluence of the Ghazel the Nile is navigable (at high water) the entire distance to the Mediterranean. (See also SHARI.)

to the east, between 15° and 20° E. (see Rennell's map in Hornemann's *Travels*, 1802). To Rennell the Benue was an east-flowing continuation of the Niger.[3] The imagined existence of mountains—called Kong in the west and Komri (Lunar) in the east—stretching in a high and unbroken chain across Africa about 10° N. long prevented geographers from thinking of a possible southern bend to the Niger.

That the vast network of rivers on the Guinea coast, of which the Nun was the chief, known as the Oil Rivers, formed the delta of the Niger does not appear to have been suspected before the beginning of the 19th century. Consequently it was from the direction of its source that the river was first explored in modern times. In 1795 Mungo Park (*q.v.*) was sent out by the African Association, and was the first European to see and describe the upper river. Park landed at the Gambia, and struck the Niger near Segu (a town some distance above Sansandig) on the 20th of July 1796, where he beheld it "glittering in the morning sun as broad as the Thames at Westminster and flowing slowly to the eastward" (*Travels*, 1st ed. p. 194). He descended the river some distance, and on his return journey went up stream as far as Bamako. In 1805 Park returned to Africa for the purpose of descending the Niger to its mouth. He started as before from the Gambia, reached the Niger, sailed down the river past Timbuktu, and on the eve of the successful accomplishment of his undertaking lost his life during an attack on his boat by the natives at Bussa (Nov. or Dec. 1805). Park held to the opinion that the Niger and Congo were one river, though in 1802 C. G. Reichard, a German geographer, had suggested that the Rio Nun was the mouth of the Niger.[4] Owing to Park's death the results of his second journey were lost, and the work had to be begun afresh. In 1822 Major A. G. Laing (who had reached Timbuktu by way of Tripoli) obtained some accurate information concerning the sources of the river, and in 1828 the French explorer René Caillié went by boat from Jenné to the port of Timbuktu. In 1826 Bussa was reached from Benin by Hugh Clapperton, and his servant Richard Lander. On Clapperton's death Richard Lander and his brother John led in 1830 an expedition which went overland from Badagry to the Niger. Canoeing down the river from Yawri—60 m. above Bussa—to the mouth of the Rio Nun they finally settled the doubt as to the lower course of the stream. In 1832 Macgregor Laird established the African Steamship Company, and Richard Lander and R. A. K. Oldfield (as members of its first expedition) ascended the Niger to Rabba, and the Benue as far as Dagbo (80 m.). In 1841 an expedition, consisting of three steamers of the British navy, under Captain (afterwards Admiral) H. D. Trotter, went up to Egga (Egam), but was forced to return owing to sickness and mortality.

Heinrich Barth (1851–1854) made known to Europe the course of the river from Timbuktu to Say. Barth sailed down from Saraiyamo (situated on a tributary stream south-west of Timbukutu) to Kabara; then skirted the left bank to a small town called Bornu in 16° N., and the right thence to Say. In 1880–1881 the German E. R. Flegel ascended the Niger to Gomba opposite the confluence of the Sokoto river with the main stream, and about 70 m. below Barth's southmost point. Zweifel and Moustier, sent out by M. Verminck, a Marseilles merchant, discovered (1879) the sources of the Falico, &c., and in 1885 the Tembi source was visited by Captain Brouet, a French officer. Indeed the additions to the knowledge of the Niger during the last two decades of the 19th century were largely the work of French officers engaged in the extension of French influence throughout the western Sudan. From 1880 onwards Colonel (afterward General) Gallieni took a leading part in the operations on the upper river, where in 1883 a small gunboat, the *Niger*, was launched for the protection of the newly established French posts. In 1885 a voyage was made by Captain Delanneau

[3] In 1816 James McQueen correctly divined that there was a great west-flowing tributary (the Benue) to the Niger, and that after its confluence the river ran south to the Atlantic. See his *View of Northern Central Africa* (1821) and *Geographical Survey of Africa* (1840).

[4] See *Éphémérides géographiques*, vol. xii. (Weimar, Aug. 1803).

past the ruins of Sansandig, as far as Diafarabe. In 1887 the gunboat made a more extended voyage, reaching the port of Timbuktu, and correcting the mapping of the river down to that point. In 1894–1895 attention was directed to the middle and lower Niger, to which several expeditions started from the coast of Guinea. A still more important expedition was that of Lieutenant Hourst, who, starting from Timbuktu in January 1896, navigated the Niger from that point to its mouth, executing a careful survey of the river and the various obstructions to navigation. A voyage made in 1897 by Lieutenant de Chevigné showed that at low water the section between Timbuktu and Ansongo presents great difficulties, but the voyage from Timbuktu to Say was again successfully accomplished in 1899 by Captain Granderye. In 1901 Captain E. Lenfant ascended the river with a flotilla from its mouth to Say, and he demonstrated the "normal practicability" of the route, despite the Bussa rapids. The delta of the Niger has been partially surveyed since it became British territory by various ship captains, officials of the Royal Niger Company and others, including Sir Harry Johnston, sometime British consul for the Oil Rivers.

In addition to the main stream, the Niger basin was made known by exploration during the last quarter of the 19th century and the early years of the 20th. The journeys of the German traveller G. A. Krause (north from the Gold Coast, 1886–1887) and the French Captain Binger (Senegal to Ivory Coast, 1887–1889) first defined its southern limits by revealing the unexpected northward extension of the basins of the Guinea coast streams, especially the Volta and Komoe, a fact which explained the absence of important tributaries within the Niger bend. This was crossed for the first time, in its fullest extent, by Colonel P. L. Monteil (French) in 1890–1891. At the eastern end of the basin much light has been thrown on the system of the Benue. In 1851 Barth crossed the Benue at its junction with the Faro, but the region of its sources was first explored by Flegel (1882–1884), who traversed the whole southern basin of the river and reached Ngaundere. Other German travellers added to the knowledge of the southern tributaries, the Tarabba, Donga and others, which in the rains bring down a large body of water from the highlands of southern Adamawa. British travellers who have done work in the same region are Sir W. Wallace, L. H. Moseley, W. P. Hewby, P. A. Talbot and Captain Claud Alexander. The last-named two were members of an expedition led by Lieut. Boyd-Alexander, who himself crossed Africa from the Niger to the Nile. Messrs Talbot and Claud Alexander surveyed the country between Ibi on the Benue and Lake Chad, mapping (*1904*) a considerable part of the Gongola.[1] In 1854 the Benue itself was ascended 400 m. by the "Pleiad" expedition, and in 1889 to 13½° E., and the Kebbi to Bifara by Major (afterwards Sir Claude) Macdonald, further progress towards the Tuburi marsh being prevented by the shallowness of the water. The upper basin of the Benue was also traversed by the French expeditions of Mizon (1892) and Maistre (1892–1893), the latter passing to the south of the Tuburi marsh without definitely settling the hydrographical question connected with it. This was accomplished by Captain Lenfant in 1903. He ascended the Kebbi and discovered the Lata Fall, continuing up the river to its point of issue from Tuburi. Crossing the marshes he found and navigated the narrow river leading to the Logone. Save for the porterage round the Lata Fall the whole journey from the mouth of the Niger to Lake Chad was made by water. The Benue in the neighbourhood of Yola was mapped in 1903–1904 by an Anglo-German boundary commission.

From 1904 onwards the French undertook works on the Niger between Bamako—whence there is railway communication with the Senegal—and Ansongo with a view to deepening the channel and removing obstructions to navigation. In 1910 the British began dredging with the object of obtaining from the mouth of the river to Baro a minimum depth of 6 ft. of water.

[1] Captain Claud Alexander died of fever in northern Nigeria on the 30th of November 1904. His brother, Lieut. Boyd Alexander, in a subsequent expedition across Africa was murdered in Wadai on the 2nd of April 1910.

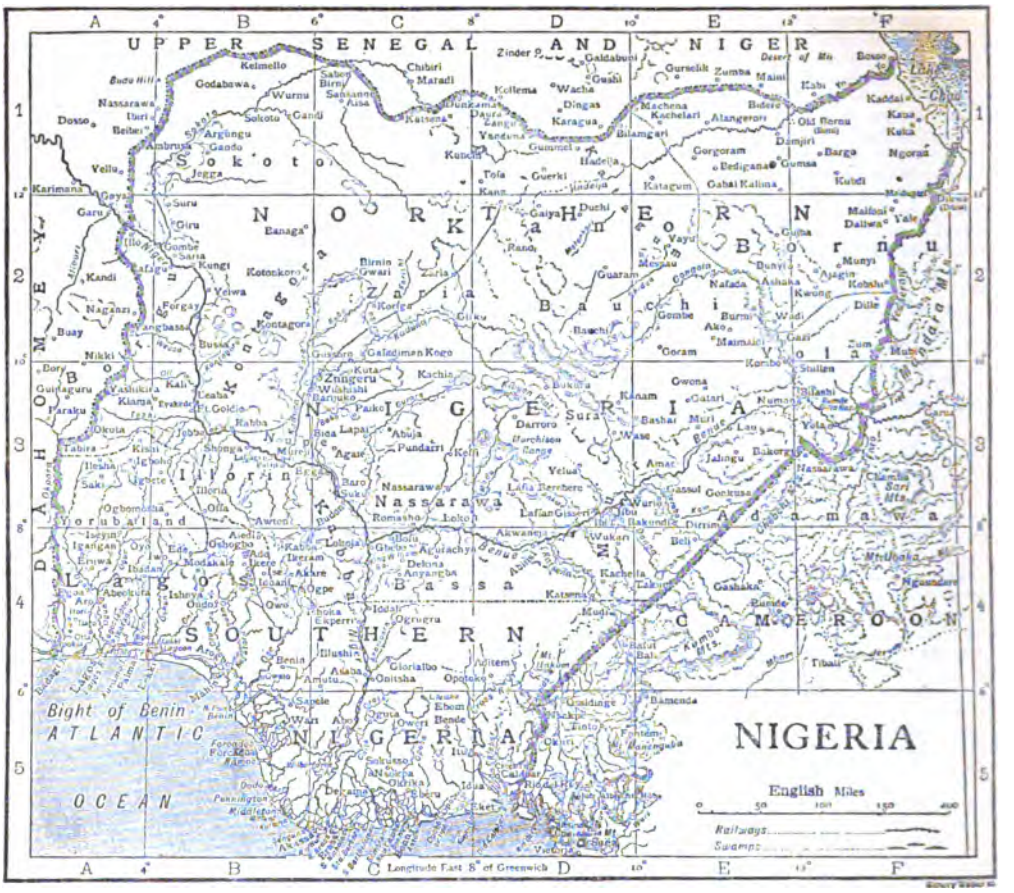
AUTHORITIES.—Mungo Park, *Travels in the Interior Districts of Africa . . . in the Years 1795, 1796 and 1797* (London, 1799). A geographical appendix by Major James Rennell summarizes the information then available about the Niger. R. and J. Lander, *Journal of an Expedition to explore the Course and Termination of the Niger* . . . (3 vols. London, 1833); H. Barth, *Travels and Discoveries in North and Central Africa* . . . 3 vols. iv. and v. (London, 1857–1858); Gen. J. S. Gallieni, *Mission d'exploration du Haut Niger* . . . (Paris, 1885); E. Caron, *De Saint Louis au Port de Tombouktou; Voyage d'une canonière française* (Paris, 1891); M. Hourst, *Sur le Niger et au pays des Touaregs* (Paris, 1898), English translation, *French Enterprise in Africa . . . Exploration of the Niger* (London, 1898). The political references in this book are marked by jealous hostility to the British. Col. J. K. Trotter, *The Niger Sources* . . . (London, 1897); Sir H. H. Johnston, "The Niger Delta," *Proc. R.G.S.* (December 1888); Sir F. Lugard, "An Expedition to Borgu on the Niger," *Geo. Jnl.* (September 1895); E. Lenfant, *Le Niger; voie ouverte à notre empire africain* (Paris, 1903), chiefly a demonstration that the Bussa rapids are not an absolute bar to navigation.

The foregoing books deal almost entirely with the Niger. For the Benue see, besides Barth's *Travels*, A. F. Mockler Ferryman, *Up the Niger; Narrative of Major Claude Macdonald's Mission to the Niger and Benue Rivers* . . . (London, 1892); L. Mizon, "Itinéraire de la source de la Benoué au confluent des rivières Kadei et Mambéré" and other papers in the *Bull. Soc. Géog. Paris* for 1895 and 1896; C. Maistre, *A travers l'Afrique central du Congo au Niger* (Paris, 1895); E. Lenfant, *La Grande Route du Chad* (Paris, 1905); Col. L. Jackson, "The Anglo-German Boundary Expedition in Nigeria," *Geo. Jnl.* (July 1905); P. A. Talbot, "Survey Work by the Alexander Gosling Expedition: Northern Nigeria 1904–1905," *idem* (February 1906); Boyd Alexander, *From the Niger to the Nile*, vol. i. (London, 1907). The British Blue Books, *Correspondence relating to Railway Construction in Nigeria* (1905) and *Further Correspondence*, &c. (1909), contain information about the navigability of the lower Niger and of the Kaduna. The best maps are those published by the French and British War Offices; an *Atlas du cours du Niger de Tombouctou aux rapides de Boussa* in 50 sheets on the scale of 1:50,000, by Lieut. Hourst and others, was published in Paris in 1899. (F. R. C.)

NIGERIA, a British protectorate in West Africa occupying the lower basin of the Niger and the country between that river and Lake Chad, including the Fula empire (*i.e.* the Hausa States) and the greater part of Bornu. It embraces most of the territory in the square formed by the meridians of 3° and 14° E. and the parallels of 4° and 14° N., and has an area of about 338,000 sq. m. The protectorate is bounded W., N. and N.E. by French possessions (Dahomey, Upper Senegal and Niger colony, and Chad territory), S.E. by the German colony of Cameroon and S. by the Atlantic.

Physical Features.—The country is divisible, broadly, into three zones running parallel with the coast: (1) the delta, (2) forest region, giving place to (3) the plateau region. The coast line, some 500 m. in length, extends along the Gulf of Guinea from 2° 46′ 55″ E. to 8° 45′ E. ending at the Rio del Rey, the point where the great bend eastwards of the continent ceases and the land turns south. The Niger (*q.v.*), which enters the protectorate at its N.W. corner and flows thence S.E. to the Atlantic, receives, 250 m. from the sea, the Benue, which, rising in the mountains of Adamawa south of Lake Chad, flows west across the plateau. Into the huge delta of the Niger several other rivers (the "Oil Rivers") empty themselves; the chief being, on the west, the Benin (*q.v.*), and on the east the Brass. East of the Niger delta is that formed by the Imo or Opobo, Bonny and other streams, and still farther east is the Calabar estuary, mainly formed by the Cross river (*q.v.*). West of the Niger delta are several independent streams discharging into lagoons, which here line the coast. The most westerly of these streams, the Ogun, enters the Lagos lagoon, which is connected by navigable waterways with the Niger (see LAGOS).

The delta region is swampy, and forms, for a distance of from 40 to 70 m. inland, a network of interlacing creeks and broad sluggish channels fringed with monotonous mangrove forests. The main rivers are navigable for ocean-going steamers for a distance of from 15 to 40 m. from their mouths. Beyond the delta firm ground takes the place of mud and the mangroves disappear. The land rises gradually at first, becoming, however, in many districts very hilly, and is covered with dense forests. The Niger at its confluence with the Benue is not more than 250 ft. above the sea. North of this point are hills forming the walls of the plateau which extends over the centre of the



protectorate and is part of the great plateau of North Africa. This plateau, broken only by the valleys of the rivers, does not attain an elevation approaching that of the plateaus of the southern half of the continent, the culminating point (apart from particular mountain districts), situated in about 10° N., reaching a height of 3000 ft. only. The valleys of the Niger and Benue, especially the latter, are very much lower, the town of Yola on the Benue, some 400 m. inland, lying at an altitude of little over 600 ft. The surface is generally undulating, with isolated "table mountains" of granite and sandstone often rising abruptly from the plain. It is clothed largely with thin forest, but becomes more open to the north until, near the French frontier, the arid steppes bordering the Sahara are reached. Much of the country north of Zaria (11° N.) is covered with heavy loose sand. The most mountainous districts are northern Bauchi (a little north of 10°), where heights of 6000 to 7000 ft. occur; parts of Muri, along the north bank of the Benue; and the southern border of the Benue basin, where the hills (consisting of ironstone, quartz and granite) appear rich in minerals. The mountainous area covers some 50,000 sq. m. On the east the plateau sinks to the plains of Bornu (*q.v.*), which extend to Lake Chad. Tributaries of the Niger traverse the western portion of the country, the most noteworthy being the Gulbin Kebbi or Sokoto river and the Kaduna, which flows through a valley not more than 500 ft. above the sea. The north-eastern part of the country drains to Lake Chad by the Waube or Yo, an intermittent stream, which in its lower course forms the Anglo-French boundary. The western portion of Lake Chad (*q.v.*) belongs to the protectorate, which contains no other large lake. The water parting between the Chad and Niger systems runs N.W. and S.E. from about Katsena in 13° N. to the Bauchi hills. Of the tributaries of the Benue the most important is the Gougola. During the dry season most of the small rivers cease running and the water in the larger streams is low. The great rise of the Niger within the protectorate takes place in August and September and there is a second rise about the beginning of the year.

Geology.—The fundamental formation consists of crystalline rocks. From the edge of the coast belt to near the confluence of the Benue and Niger they are overlain by unfossiliferous sandstones, lying undisturbed and possibly of the age of the sandstones of the Congo basin. Limestones, with fossils indicating a Tertiary age, have been found near Sokoto. Superficial deposits occupy the coast belt. Recent alluvium and a thick deposit of black earth border the upper reaches of the Benue and cover wide areas around Lake Chad.

Climate.—The country lies wholly within the tropics. The climate of the coast-lands is moist and hot, and extremely unhealthy, malarial fever being prevalent and deadly. The annual rainfall in the delta regions varies between 100 and 140 or more inches; the mean temperature is over 80° F. The heat does not vary greatly, rarely

sinking below 70°, and not often exceeding 100° in the shade. The direction of the prevailing wind is S.W. Though unfavourable for the permanent residence of white men, the interior is much less deadly than the coast-lands. The northern part is a land of tornadoes. At the close of the dry season (end of February) cyclones from the N.E., usually accompanied by rain and thunder, burst over the land. They increase in frequency until they merge in the heavy rains which last from July to October. Then the "hamattan," or hot, dry wind from the Sahara, begins and brings with it clouds of impalpable dust. At this period the nights are cold, and in the north January and February are cold even in the day-time, while frosts are experienced in the neighbourhood of Lake Chad. The temperature in the central part of the protectorate is much the same average as at the coast, but the range is far greater, varying from a shade minimum of 59° to a shade maximum of 107°.[1] The rainfall is much scantier on the plateaus than in the maritime regions, averaging in Northern Nigeria about 50 in. a year. There is evidence of the increasing desiccation of the whole country north of the forest belt. This desiccation is partly attributable to the unrestricted felling of wood practised for many centuries by the inhabitants. Along the northern border of the protectorate this has resulted in the encroachment of the Saharan desert over once fertile districts.

The natives of the northern regions do not suffer to any extent from fever unless they move to a part of the country some distance from their home. Leprosy is common, especially in the inland towns; while ophthalmia is prevalent in the north, especially among the poorer classes, who are compelled to expose themselves to the blinding dust from the deserts and the excessive glare of the sun reflected from the burning sand.

Fauna and Flora.—The animals of Nigeria include the elephant, lion, leopard, giraffe, hyena, West-African buffalo, many kinds of antelope and gazelle and smaller game. Monkeys are numerous in the forests, and snakes are common. The camel is found in the northern regions bordering the Sahara. In the rivers are rhinoceros, hippopotamus and crocodile. The manatus is also found. The birds include the ostrich, marabout, vultures, kites, hawks, ground hornbill, great bustard, guinea fowl, partridge, lesser bustard, quail, snipe, duck, widgeon, teal, geese of various kinds, paraquets, doves, blue, bronze and green pigeons, and many others. Domestic animals include the horse and donkey in the plateaus, but baggage animals are rare in the coast-lands, where the tsetse fly is found. Mosquitoes are also abundant throughout the delta. Herds of cattle and flocks of sheep and goats are numerous throughout the country.

The mangrove is the characteristic tree of the swamps. North of the swamps the oil palm (*Elaeis guineensis*) flourishes abundantly. It is common as far as about 7° N. Rubber vines, mahogany, ebony and many valuable timber trees are found in the forest zone. Other trees, found chiefly on the plateaus, are the baobab, the shea-butter tree, the locust tree, gambier, palms, including the date and dum palm (Hyphaene), the tamarind, and, in the arid regions, the acacia and mimosa.

Inhabitants.—The population of Nigeria is estimated at 15,000,000. The Europeans (mostly British) number about a thousand, and are civil servants, soldiers, traders or missionaries. In the delta district and the forest zone the inhabitants are typical negroes. Besides the people of Benin, the coast tribes include the Jekri, living on the lower part of the Benin river and akin to the Yoruba, the Ijos, living in the delta east of the main mouth of the Niger, and the Ibos, occupying a wide tract of country just above the delta and extending for 100 m. east from the Niger to the Cross river. South of the Ibos live the Aros, a tribe of relatively great intelligence, who dominated many of the surrounding tribes and possessed an oracle or *ju-ju* of reputed great power. On the middle Cross river live the Akuna-kunas, an agricultural race, and in the Calabar region are the Efiks, Ibibios and Kwas. All these tribes are fetish worshippers; though Christian and Moslem missionaries have made numerous converts. The Efiks, a coast tribe which has come much into contact with white men, have adopted several European customs, and educated Efiks are employed in government service. The great secret society called Egbo (*q.v.*) is an Efik institution. Each tribe has a different *ju-ju*, and each speaks a separate language or dialect, the most widely diffused tongues being the Ibo and Efik, which have been reduced to writing. In general little clothing is worn, but none of the tribes go absolutely nude. In colour the majority are dark chocolate, others are coal-black (a tint much admired by the natives themselves) or dark yellow-brown. Cannibalism, human sacrifices and other revolting practices common to the tribes, are being gradually stamped out under British control. Trial by ordeal and domestic slavery are still among the recognized institutions.

In the northern parts of Nigeria the inhabitants are of more mixed blood, the negro substratum having been to a great extent driven out by the northern races of the continent. The most important race in Northern Nigeria is that of the Hausa (*q.v.*), among whom the superior classes adopted Mahommedanism in the 13th and 14th centuries. While the lower classes remained pagan, a fairly civilized system of administration, with an efficient judicial and fiscal organization, was established in the Hausa territories. The Hausa are keen traders and make excellent soldiers.

At the beginning of the 19th century the Hausa territories were conquered by another dominant Mahommedan race, the Fula (*q.v.*), who form a separate caste of cattle-rearers. Arab merchants are settled in some of the larger Hausa towns.

In general the people living in the river valleys have been unaffected by Moslem propaganda either in blood or religion. Thus along the banks of the Niger, Benue and other streams, the inhabitants are negro and pagans, and generally of a purely savage though often rather fine type. Of these the Munshi, who inhabit the district nearest the junction of the Benue with the Niger, were long noted for their intractability and hostility to strangers, whom they attacked with poisoned arrows. The Yoraghums, their neighbours, were cannibals. Nearer Yola live the Battas, who also had a bad reputation. These tribes, under British influence, are turning to trade and agricultural pursuits. In the central hilly region of Kachia are other pagan tribes. They wear no clothes and their bodies are covered with hair. South of the Benue, near the Niger confluence, dwell the savage and warlike Okpotos, Bassas and other tribes. In the districts of Illorin and Borgu, west of the Niger, the inhabitants are also negroes and pagan, but of a more advanced type than the tribes of the river valleys. To attempt any complete list of the tribes inhabiting Northern Nigeria would be vain. In the one province of Bauchi as many as sixty native languages are spoken.

In Bornu (*q.v.*) the population consists of (1) Berberi or Kanuri, the ruling race, containing a mixture of Berber and negro blood, with many lesser indigenous tribes; (2) so-called Arabs, and (3) Fula. The country to the back of Lagos is largely inhabited by Yorubas (*q.v.*), and the people of Borgu according to some native traditions claim to have had a Coptic origin.

Towns.—A large proportion of the population dwells in towns. The chief ports are Lagos (*q.v.*), capital of Southern Nigeria, with a population of about 50,000; Calabar (*q.v.*), pop. about 15,000, known as Old Calabar and Duke Town, on the Calabar river; Opobo, Bonny Town and Brass Town, all on the rivers of the same name. Brass Town contains a fine church, the gift of a native chief. These places are east of the Nun or main mouth of the Niger, where, on the western bank, is Akassa. Here are important engineering works and a slip for repairing ships. Further west at the Forcados mouth of the Niger is a town of the same name, which is the principal port of entry for the river. Benin (*q.v.*), about 60 m. inland from the mouth of the Benin river, and Bende, about 50 m. N.W. of Calabar, were noted *ju-ju* towns and have large populations. Wari and Sapele are towns in the Benin district. Owo, some 50 m. N. of Benin city, is an important trade centre for the Yoruba country, in which are the large cities of Abeokuta, Ibadan and Illorin, all separately noticed. On the Niger at the head of the delta are Asaba (west bank) and Onitsha (east bank); Iddah (Ida), in the palm-oil zone; Lokoja on the west bank opposite the confluence with the Benue, and the headquarters of the protectorate's military force; Baro, on the east bank, 70 m. above Lokoja, the river terminus of the Northern Nigeria railway; Egga, Mureji (at the Kaduna confluence), Jebba and Bussa (*q.v.*). The administrative headquarters of Northern Nigeria are at Zungeru, on the Kaduna river, in 6° 09′ 40″ E., 9° 48′ 32″ N.

Apart from the sea and river ports and the towns in Yorubaland, the chief centres of population are in the open plains east of the Niger. They are the capitals of various states founded by the Hausa. Of these cities the most important is Kano (*q.v.*), the great emporium of trade for the central Sudan, where Tuareg and Arab from the north meet merchants from the Niger, Lake Chad and the far southern regions. It is situated in 12° N. and 8° 32′ E. Some 220 m. W.N.W. of Kano is Sokoto, on a tributary of the Niger of the same name. Sokoto is the religious and political centre of the Fula. Next in importance among the Hausa towns are Bauchi (or Yakoba), pop. over 50,000, 140 m. S.E. of Kano; Zaria (*q.v.*), pop.

[1] Returns at Zungeru for 1903.

about 60,000, 82 m. S.S.W. of Kano; Katsena (*q.v.*), 84 m. N.W. of Kano; Hadeija, near the N. eastern frontier; Gando, 60 m. S.W. of Sokoto; Bida (*q.v.*), 25 m. N.W. of Egga on the Niger; and Yola (*q.v.*) on the Benue near the German frontier. Jegga, 85 m. S.W. of Sokoto, is an important entrepôt for trade from the hinterland of the Guinea coast and the Hausa states. The chief towns of Bornu are Kuka (*q.v.*) on Lake Chad, and Maidugari, some 70 m. S.W. of that lake. Most of these towns are capitals of provinces and residences of native princes subordinate to the British administration. They are nearly all surrounded by strong mud walls and outer dry moats. Their interior is divided into a series of compounds, each entered through a flat-roofed audience chamber. Inside are the beehive-shaped huts of the household. The gateways are strongly fortified. In addition to the towns mentioned there are many others containing populations of from 10,000 to 20,000, the bulk of the inhabitants of the Hausa countries being town dwellers.

Communications.—The rivers are the great highways of communication, but, in consequence of the lowness of the water between October and May, navigation is then only possible for shallow draught stern-wheel steamers and launches. From the Forcados mouth of the Niger steamers can ascend the main stream as far as Jebba, a distance of 530 m. and, at some risk, to Fort Goldie, 30 m. farther up at the foot of the Bussa rapids. Steamers can also ascend the Benue to Yola, 480 m., above the confluence of that river with the Niger at Lokoja. It is also possible by this route to proceed by small boat via the Shari system to Lake Chad. The Kaduna from its confluence with the Niger can be ascended by steamer 50 m. to Barijuko, which is 22 m. by rail from Zungeru. The Gongola is navigable at high water for 130 m. from its junction with the Benue.

In the delta region every place of importance is easily reached by river steamers, and there is a regular service between Forcados and Lagos by the lagoons. The Cross river is navigable 240 m. up to and beyond the frontier of Cameroon.

A 3 ft. 6 in. gauge railway from the port of Lagos to Ibadan was completed in 1900, the distance by rail being 123 m. Only about half that distance intervenes between Ibadan and the sea. This line was, during 1906–1910, extended via Oshogbo, Illorin and Jebba to Zungeru, whence it is continued to Shc, 40 m. E. of Zungeru and about 450 m. from Lagos, where a junction is effected with the Baro-Kano line. A small light surface line 22 m. long, 2 ft. 6 in. gauge was built (1901–1902) in Northern Nigeria between Barijuko on the Kaduna and the capital, Zungeru, and proved most successful and lucrative. In 1907 the construction was begun of a 3 ft. 6 in. railway from Baro on the Niger via Bida and Zaria to Kano—a distance of about 400 m.

Good roads connect some of the great Hausa cities, and Kano and Kuka are starting-points for caravans across the Sahara to the Mediterranean. There are also old established caravan routes from Kano to Ashanti and neighbouring countries.

Regular communication is maintained with Europe by steamers running between Liverpool and Forcados, Bonny and Calabar, the steamers calling at other West African ports *en route*. The time occupied between Liverpool and Forcados is about seventeen days. Other steamers ply between the ports named (and others in the protectorate) and London and Hamburg. There is telegraphic communication between Brass and Bonny and Europe by submarine cable, and land lines from Calabar to Lagos and from Lagos to Jebba, Lokoja, Zungeru, Kano, &c., a connexion being also effected with the telegraph system of French West Africa.

Agriculture.—The natives of the coast region cultivate yams and other food plants, but in that district agriculture proper scarcely exists, the fruit of the oil-palm supplying an easy means of obtaining almost everything that the natives require. In the plains of the north, inhabited by Hausa and by agricultural pagan tribes, and in the fertile river valleys, agriculture is regularly carried on. Rice and wheat are cultivated in many parts, though the staple food is guinea corn. Sweet potatoes, ground nuts, yams, onions and other vegetables are largely grown. Of fruits, dates, pomegranates, citrons and bananas abound in certain areas. The shea-butter tree supplies an excellent oil for lamps, and also for cooking, though it is only used by the poorer classes. The most important vegetable products are cotton and indigo, which are universally grown. Tobacco and kola nuts are also grown.

Mineral Products.—Tin ore of excellent quality is found in the province of Bauchi, alkali salts are abundant in Kano province, iron ore and red and yellow ochres are found in Kontagora and other provinces, kaolin (china clay) and limestone in the west central regions. Silver and lead have been found in the Benue area.[1]

Trade.—Throughout Nigeria local trade is active and has shown rapid increase under British rule. Its further development will be fostered by the improvement of communications which is taking place. Export trade in the delta and forest regions is almost entirely confined to "jungle produce," the most important articles being palm oil and palm kernel. Rubber, ebony and other timber, cocoa and gum copal, come next in importance. Cotton is also grown for export. The quantity of palm oil exported annually exceeds 12,000,000 gallons, and is worth over £600,000. Of palm kernels 50,000 to 70,000 tons are shipped yearly, with an average value of £500,000 a year. The principal imports are cotton goods (nearly all from the United Kingdom), and in the southern region spirits—gin and geneva—almost wholly from Holland and Germany, salt, rice and other provisions, tobacco, hardware, cutlery and building material, &c., mostly from the United Kingdom. The value of the trade (imports and exports) of Southern Nigeria (exclusive of Lagos) increased from £1,566,000 in 1894–1895 to £3,464,000 in 1905. In 1906 the total trade, inclusive of Lagos, was valued at £6,299,000—imports, £3,148,000; exports, £3,151,000.

In Northern Nigeria up to the moment of the British occupation the foreign trade was chiefly in the hands of Tripoli Arabs whose caravans crossed the desert at great risk and expense, and carried to the markets of Kuka and Kano tea, sugar and other European goods, taking away the skins and feathers which constituted the principal articles of export to the Mediterranean coast. There was also a very considerable caravan trade in native goods which the industrious Hausa population carried for great distances through the western and central states of the Sudan. The principal articles of this trade are salt, kola nuts, ivory, leather, sodium carbonates and spices. The centre of the cloth manufacture is Kano. The cloth is made of the cotton grown in the country, woven on small hand-looms and dyed either with indigo or with a magenta dye obtained from the bark of a tree. If the Hausa history, which exists in written form, be correct, the manufacture of this cloth has been carried on in Kano since the 9th century. Kano and the district around it clothes half the population of the Sudan. The kola nut, chewed by almost every native of the country, is brought from west of the Niger, traders from Ashanti, Accra and Yorubaland frequenting the markets of Jegga. Salt and "potash" are imported from Absen in the Sahara; and ivory, ostrich feathers and leather goods are exported to Tripoli. The principal exports to Great Britain have come hitherto from the forest regions, and are of the same class as the forest products of the south. Rubber constitutes at present the most important export. The cultivation of cotton is however indigenous to the country. Inquiries made under the auspices of the British Cotton Growing Association have led to the conclusion that Northern Nigeria offers the most promising field contained within the empire for the growth of cotton required to render Lancashire looms independent of foreign supplies. Steps have been taken to stimulate the native industry, and it is hoped that cotton may take the place in Northern Nigeria which palm oil and kernels occupy in the coast zone. Any great expansion in the cotton trade is however dependent on the development of cheap and efficient means of transport—hence the importance, commercially, of the Baro-Kano railway, with its base on the navigable Niger. With the increase of transport facilities it is probable that the trade with the Mediterranean coasts will also be diverted to the south, and profitable minor branches of trade would be formed in leather, ostrich feathers, gums, fibres, &c. The imports from Great Britain, which come via Forcados, are mostly cotton goods, provisions and hardware. The importation of spirits is prohibited north of 7° N.

Currency and Banking.—The legal currency, and that in general use, is British sterling. There is a subsidiary coinage (introduced in 1908) consisting of a nickel penny and a nickel tenth of a penny (the last-named was first coined in aluminium, but this metal proved unsuitable and was withdrawn). Cowries (1000 = 3d.) are still occasionally employed, and on the coast, accounts are sometimes kept in gallons of palm oil. Banking is in the hands of the Bank of British West Africa and the Bank of Nigeria. There is also a government savings bank.

History.

Of the early history of the races inhabiting the coast lands little is known. The Beni appear to have been the most powerful race at the time of the discovery of the coast by the Portuguese in the 15th century, and the kings of Benin in the 17th century ruled a large part of the south-western portion of the existing British protectorate (see BENIN). The Benin influence does not seem to have reached east of the Forcados mouth of the Niger. In the greater part of the delta region each town owned a different chief and there was no one dominant tribe. Among these people, who occupied a low position even among the degenerate coast negroes, and who were constantly raided by the more virile tribes of the interior, trading stations were established by the Portuguese, and later on by other Europeans, British traders appearing as early as the 17th century. There was no assertion of political rights by the white men, who were largely at the mercy of the natives, and who rarely ventured far from their ships or the "factories" established on the various rivers and estuaries.

By the end of the 18th century British enterprise had almost entirely displaced that of other nations on the Niger coast. But the principal trade of all Europeans was still in slaves

[1] See Colonial Office Reports, *Northern Nigeria Mineral Survey 1906–1907*; *Southern Nigeria Mineral Survey 1905–1907* (Miscellaneous, Nos. 59, 67, 68).

After the abolition of the slave-trade in the 19th century palm oil formed the staple article of commerce, and the various streams which drain the Niger coast near the mouth of the great river became known as the "Oil Rivers." The opening up of the interior was in the meantime promoted, chiefly by the efforts of British travellers and merchants. Mungo Park traced the Niger from Segu to Bussa, where he lost his life in 1805. From Bussa to the sea the course of the river was first made known in 1830 by the brothers Richard and John Lander. Major Dixon Denham and Captain Hugh Clapperton entered the country now known as Northern Nigeria from the north in 1823, crossing the desert from Tripoli. Clapperton in 1826–1827 made a second journey, approaching the same territory from the Guinea coast. Dr Barth, travelling under the auspices of the British government, entered the country from the north and made the journeys, lasting over two years between 1852 and 1855, of which he has left the record that still remains the principal standard work for the interior. Macgregor Laird first organized in 1832 the navigation of the river Niger from its mouth to a point above the Benue confluence. During the next twenty-five years expeditions were despatched into the interior, and a British consul was posted at Lokoja. Possession was also taken, in 1861, of Lagos island, with the object of checking the slave trade still being carried on in that region But the deadly climate discouraged the first efforts of the British government, and, after the parliamentary committee of 1865 had recommended a policy which would render possible the ultimate withdrawal of British official influence from the coast, the consulate of Lokoja was abandoned.

It was re-established a few years later to meet the still steadily growing requirements of British trade upon the river. In 1880 the influence of the international "scramble for Africa" made itself felt by the establishment under the recognized protection of the French government of two French firms which opened upwards of thirty trading stations on the Lower Niger. The establishment of these firms was admittedly a political move which coincided with the extension of French influence from Senegal into the interior. Nearly at the same time a young Englishman, George Goldie-Taubman, afterwards better known as Sir George Goldie (*q.v.*), having some private interests on the Niger, conceived the idea of amalgamating all local British interests and creating a British province on the Niger. To effect this end the United African Company was formed in 1879, and trade was pushed upon the river with an energy which convinced the French firms of the futility of their less united efforts. They yielded the field and allowed themselves to be bought out by the United African Company in 1884. At the Berlin Conference held in 1884–1885 the British representative was able to state that Great Britain alone possessed trading interests on the Lower Niger, and in June 1885 a British protectorate was notified over the coast lands known as the Oil Rivers. Germany had in the meantime established itself in Cameroon, and the new British protectorate extended along the Gulf of Guinea from the British colony of Lagos on the west to the new German colony on the east, where the Rio del Rey marked the frontier. In the following year, 1886, the United African Company received a royal charter under the title of the Royal Niger Company. The territories which were placed by the charter under the control of the company were those immediately bordering the Lower Niger in its course from the confluence at Lokoja to the sea. On the coast they extended from the Forcados to the Nun mouth of the river Beyond the confluence European trade had not at that time penetrated to the interior.

Formation of the Royal Niger Company.

The interior was held by powerful Mahommedan rulers who had imposed a military domination upon the indigenous races and were not prepared to open their territories to European intercourse. To secure British political influence, and to preserve a possible field for future development, the Niger Company had negotiated treaties with some of the most important of these rulers, and the nominal extension of the company's territories was carried over the whole sphere of influence thus secured. The movements of Germany from the south-east, and of France from the west and north, were thus held in check, and by securing international agreements the mutual limits of the three European powers concerned were definitely fixed. The principal treaties relating to the German frontiers were negotiated in 1886 and 1893: the Anglo-French treaties were more numerous, those of 1890 and 1898, which laid down the main lines of division between French and British possessions on the northern and western frontiers of Nigeria, having been supplemented by many lesser rectifications of frontier. (See AFRICA, § 5.) It was not until 1909 that the whole of the frontier between Nigeria and the French and German possessions had been definitely demarcated. Thus, mainly by the action of the Royal Niger Company, a territory of vast extent, into which the chartered company itself was not able to carry either administrative or trading operations, was secured for Great Britain. In 1897, at a time when disputes with France upon the western frontier had reached a very active stage, the company entered upon a campaign against the Mahommedan sovereign of Nupe. This campaign would, no doubt, have led to important results had the company retained its administrative powers. In the expedition a force of 500 Hausa, drilled and trained by the company, and led by thirty white officers—of whom some were lent for the occasion by the War Office—decisively defeated a force of some thousands of native troops, led by the emir of Nupe himself The capital town of Bida was taken and the emir deposed. From Bida the expedition marched to Illorin, where again the whole district submitted to the authority of the company. In Illorin the campaign had some lasting effect. In Nupe, on the northern side of the river, as the company was unable to occupy the territory conquered, things shortly reverted to their previous condition. When the company's troops were withdrawn the deposed emir returned and reoccupied the throne, leaving the situation to be dealt with after the territories of the company had been transferred to the crown.

The complications to which the pressure of foreign nations, and especially of France, on the frontiers of the territories gave rise, became at this period so acute that the resources of a private company were manifestly inadequate to meet the possible necessities of the position. Relations with France on the western border became so strained that in 1897 Mr Chamberlain, who was then secretary of state for the colonies, thought it necessary to raise a local force, afterwards known as the West African Frontier Force, for the special defence of the frontiers of the West African dependencies. In these circumstances it was judged advisable to place the territories of the Royal Niger Company, to which the general name of Nigeria had been given, under the direct control of the crown. It was therefore arranged that in consideration of compensation for private rights the company should surrender its charter and transfer all political rights in the territories to the Crown. The transfer took place on the 1st of January 1900, from which date the company, which dropped the name of "royal," became a purely trading corporation. The southern portion of the territories was amalgamated with the Niger Coast Protectorate, the whole district taking the name of the Protectorate of Southern Nigeria, while the northern portion, extending from a line drawn slightly above 7° N to the frontier of the French possessions on the north and including the confluence of the Niger and the Benue at Lokoja, was proclaimed a protectorate under the name of Northern Nigeria.

Transfer of authority to the crown.

The company, during its tenure of administrative power under the charter, had organized its territories south of the confluence, into trading districts, over each of which there was placed a European agent. The executive powers in Africa were entrusted to an agent general with three provincial and twelve district superintendents. There was a small judicial staff directed by a chief justice, and there was a native constabulary of about 1000 men, trained and drilled by white officers. The company kept also upon the river a fleet of about

thirty steamers. The entire direction of the proceedings of the company was, however, in the hands of the council in London, and the administrative control of the territories was practically from first to last vested in the person of Sir George Goldie. The local work of the representatives of the company was mainly commercial. When, on the surrender of the charter, Sir George Goldie withdrew from the company, the administrative element disappeared No administrative records were handed over, and very little machinery remained. Two enactments, however, bore testimony to the legislation of the company. One, which by force of circumstances remained inoperative, was the abolition of the legal status of slavery, proclaimed in the year of Queen Victoria's jubilee (1897) The other, more practical, which has remained in operation to the present day, confirmed and enforced by the succeeding administration, was the absolute prohibition of the trade in spirits beyond the parallel of 7° N

Progress in Southern Nigeria, 1885-1906.

While the development of the Royal Niger Company's territories was proceeding in the manner described, the regions under direct British control were also being opened up and law and order introduced. In 1893, when the title Oil Rivers Protectorate was changed to that of Niger Coast Protectorate, a regular administration was established (subject to the Foreign Office in London) under Sir Claude Macdonald, who was succeeded as commissioner and consul-general in 1896 by Sir Ralph Moor (1860–1909). Under these officials peace was gradually established between various tribes, trade routes opened and progress made in civilization. The work was one of extreme difficulty, largely because there was no central native authority with which to deal. Small military expeditions had constantly to be employed to break up slave-raiding gangs or reduce to order tribes which blocked trade routes or made war on other tribes living peaceably under British protection The most serious military operations were against the Benî, a peaceful mission to the king of Benin having been massacred in the bush in January 1897 The operations were completely successful and the Benin country was added to the protectorate (see BENIN). In 1900, as stated, the southern portion of the Niger Company's territories was added to the protectorate, the change in administration being effected without difficulty of any kind. Sir Ralph Moor continued until 1904 to govern the country under the style of high commissioner. The efforts of the administration to better the condition of the natives without undue interference with customary law met with encouraging results, and the submission of the Aros to the government in 1902 brought to an end the system of tribal warfare for the purpose of making slaves, while the enforcement of a proclamation of 1901 prohibiting the buying, pawning or selling of slaves had a salutary effect. Trade steadily developed, and owing to the large sums paid as duty on imported spirits, the revenue of the protectorate was sufficient to cover the expenditure.

In Northern Nigeria in 1900 the establishment of British authority remained still to be effected. The man selected for the post of first high commissioner was Colonel—afterwards better known as Sir Frederick—Lugard, who had conducted one of the Royal Niger company's most successful expeditions into the western portion of the interior and had already been employed by the British government to raise and organize the West African Frontier Force.

Northern Nigeria brought under control.

The transference of influence from the company to the government was officially effected on the 1st of January 1900, on which day the Union Jack was hoisted at Lokoja, and the formation of a local administration was entered upon. The number of civilians in the employ of the government was very small, and the administrative machinery had to be evolved under the pressure of a somewhat acute military situation. The headquarters of the West African Frontier Force had been at Jebba, not far from the point at which Mungo Park had lost his life upon the river. Neither Jebba nor Lokoja was considered suitable for the permanent capital of the protectorate, and survey parties were sent out, with strict orders to avoid conflict with the nominally friendly natives, to find a more suitable site. This was selected on a branch of the Kaduna river in the south-western corner of the province of Zaria, at a place of which the native name of Zungeru was retained. The ruler of Zaria, while professing friendliness, was, however, unable or unwilling to restrain the rulers of Kontagora and Nupe from aggression. These two potentates raided for slaves to the borders of the rivers and openly threatened the British position on the Niger. The Ashanti War of 1900 claimed the despatch of a strong detachment of the West African Frontier Force, and it was not until the return of the troops in February 1901 that Nupe and Kontagora could be effectively dealt with. In that year both provinces were subdued, their emirs deposed, and letters of appointment given to new emirs, who undertook to rule in accordance with the requirements of humanity, to abolish slave-raiding and slave dealing, and to acknowledge the sovereignty of Great Britain. Illorin and Borgu with a portion of Kabba were already under British rule. The rulers of other neighbouring provinces offered their allegiance, and by the end of the year 1901 nine provinces, Illorin, Kabba, Middle Niger, Lower Benue, Upper Benue, Nupe, Kontagora, Borgu and Zaria had accepted the British occupation. These territories, with the exception of Zaria, were all in the more or less immediate neighbourhood of the valleys of the Niger and the Benue, and Zaria bordered upon the Kaduna. For all these territories an initial system of administration was organized, and British residents were appointed to each province. Seventeen legislative proclamations were enacted in the first year dealing with the immediate necessities of the position, and providing for the establishment of a supreme and provincial court of justice, for the legalization of native courts of justice, and dealing with questions of slavery, importation of liquor and firearms, land titles, &c. In the autumn of 1901 the emir of Yola, the extreme eastern corner of the territories bordering upon the Benue, was, in consequence of the aggressions upon a trading station established by the Niger Company, dealt with in the same manner as the emirs of Nupe and Kontagora, and a new emir was appointed under British rule. In 1902 Bauchi and Bornu were brought under British rule. In Bauchi the emir was deposed and a new emir was appointed. In Bornu the extension of British authority was very willingly accepted as a guarantee against other European encroachments, and the legitimate Sheïu was restored to the throne under British protection. Military stations were established in Bornu and in Bauchi, and both provinces were included in the system of British administration. Later in the same year an act of treachery culminating in the murder of a British resident, Captain Moloney, in the province of Nassarawa, led to the military subjugation of that province. The murderer fled northwards through Zaria to Kano, which was still an independent Mahommedan state. The emir of Zaria was found to be in treasonable correspondence with the emir of Kano. It was thought desirable to arrest and dethrone him, and his prime minister was temporarily appointed to administer the province under British protection. To all these provinces British residents were appointed, and British legislative enactments became applicable to them all. By the end of the year 1902 British administration had been extended to the whole of the provinces in the south, east and west of the protectorate. The important Mahommedan states of Sokoto, Gando, Kano and Katsena remained independent. These states were regarded as the stronghold of Fula supremacy. The emir of Sokoto held the position of religious as well as political head of all the lesser states of Northern Nigeria, and in response to friendly overtures on the part of the British administration had declared that between Sokoto and Great Britain there could be nothing but war. Katsena was the centre of local learning, while Kano was at once the commercial and the military centre of power. By the end of 1902 it had become evident that a trial of strength between the Mahommedan powers and the new British administration was inevitable. The Mahommedan rulers were themselves of comparatively recent date. In fighting them there was no question of fighting the whole country. On the contrary it was presumed with justice that their overthrow would be hailed

with satisfaction by many of the subject peoples. Every attempt was made to settle the question at issue by conciliatory methods, but these having failed, a campaign against Kano and Sokoto was entered upon in January 1903. It was entirely successful. The capital of Kano, a walled and fortified town of great extent and formidable strength, fell to a British assault in February of 1903. Sokoto submitted after a battle which took place on the 17th of May. The sultan fled, and on the 21st of May a new sultan, chosen by the council of elders, was installed by the British high commissioner, after he had publicly accepted the conditions imposed by the British government. These conditions were that all rights of conquest acquired by the Fulani throughout Northern Nigeria passed to Great Britain, that for the future every sultan and emir and principal officer of state should be appointed by Great Britain, that the emirs and chiefs so appointed should obey the laws of the British government, that they should no longer buy and sell slaves, nor enslave people, that they should import no firearms, except flint-locks, that they should enforce no sentences in their courts of law which were contrary to humanity, and that the British government should in future hold rights in land and taxation. When these conditions were accepted by the Fulani chiefs the supremacy of Great Britain was established over the entire country. Katsena and Gando followed the example set to them by Kano and Sokoto. Throughout Northern Nigeria all chiefs, Mahommedan and Pagan, now hold their appointments under the British crown and take the oath of allegiance to the British sovereign.

It remained to organize the territories for British rule, to institute a reformed system of taxation, to establish courts of justice, and to open the country to civilized occupation.

The following account of the legislation carried into force up to 1907 shows in effect what was done in that direction. After the conquest of the Hausa States in 1902–1903 the king's writ ran—with the exception of a few districts inhabited by primitive savages—through the whole area known as Northern Nigeria. The temporary enactments of the earlier days were then superseded by laws based upon a more accurate knowledge of local conditions and rendered possible by the effective administration which had been set up throughout the country.

Courts of Law and Administration of Justice.—A superior court was set up with jurisdiction over all non-natives and government employés. Its jurisdiction over natives was limited to the two centres of administration named "cantonments," and to such neighbouring territories as might be included by regulation within a feasible distance of those centres. It could, however, try any case in any province by special warrant of the high commissioner. The whole country was divided into seventeen provinces, in each of which there was a provincial court presided over by the resident in charge, whose assistants were commissioners of the court. They submitted their lists of criminal trials to the high commissioner, who, advised by the attorney-general, acted as a court of appeal, and no sentence exceeding six months could take effect without his confirmation. Cases could be referred by him for re-trial in the superior court if he so decided. A criminal code was drawn up, together with a criminal procedure proclamation. Native courts were established by warrant at all the chief native towns with varying powers. They were of two classes, the "Alkalis' Court," presided over by trained Mahommedan jurists, and "Judicial Councils," under the leading chiefs and natives presided over by the emir or other native ruler. In these courts native law and customs (principally the Mahommedan law) were administered with the proviso that no penalty could be enforced which was contrary to the laws of humanity or opposed to any specific proclamation of the protectorate. With the exception of two or three of the most enlightened courts, the criminal powers of these courts were restricted, but in civil actions they had full scope. No native court could carry a sentence of death into execution without the concurrence of the resident.

Cantonment courts were also set up in the two chief government centres (Zungeru and Lokoja), chiefly for the purpose of enforcing sanitary and municipal regulations. These were affiliated to the superior courts.

Lands and Minerals.—These constitute the main asset of the government. In the first instance, as following upon conquest or potential conquest, the Fulani emirs who were appointed by government to each of the great native states were installed under a letter of appointment in which (in addition to rights of legislation, taxation and other powers inherent in suzerainty) the ultimate title to all land was transferred from the Fulani dynasty and vested in the British. Private ownership was not interfered with, but all waste lands became the property of the crown, and no non-native could acquire title except as from the government. Similarly the sole title to minerals (subject to the share of profits assigned to the Niger Company by the deed of transfer) was vested in the government, and the terms upon which licences to prospect or mine could be acquired, together with full regulations regarding mining, were enacted by law. The right of natives to smelt iron and the question of compensation for any other existing mining industry or for surface disturbance was left to the discretion of government.

Slavery.—Practical effect was given to the abolition of the legal status of slavery, in so far as all British courts were concerned. This decree had been promulgated before the transfer of the administration, but had existed merely on paper. Every slave could thereby assert his freedom if he desired to do so, but it was not made illegal for a native to own a slave, and no penalty attached to mere possession in such a case. Slave-dealing and transactions of every kind in slaves were now made illegal. Civil questions arising from the institution of domestic slavery remained justiciable by the native courts; which in this matter were very carefully supervised by the British administration.

Taxation.—In the earlier years of the administration the tolls upon trade in transit, which had existed from time immemorial and had become the means of much extortion, were made a monopoly of the government, and were reorganized on an equitable and popular basis. To these were added certain licences (*e.g.* on canoes, &c.). In 1905 a complete reorganization of the direct taxation of the country was introduced. The innumerable taxes upon agriculture and industry of all kinds were consolidated into two principal taxes, viz. the land and general tax—in its nature an income tax—and the jangali or cattle tax upon nomad herdsmen. The imposition of this tax involved a rough and ready assessment of every village in the protectorate. Under this system the oppression and extortion practised under native rule gave place to a carefully regulated method of assessment. At its initiation the proceeds were divided in approximately equal shares between the central government and the native administration, and a means was thus found of creating a legitimate revenue for the native chiefs to supersede the proceeds of slave-raiding and slave-dealing, and of oppression and extortion, by which they had hitherto supplied their needs. As in India, the village with its lands and cultivation was constituted the unit of assessment, and the provinces were divided into districts under native headmen responsible for the collection of the tax, and its payment to the paramount chief, who in turn rendered the assigned share to district and village chiefs, to the officers of state recognized by government and to the government itself. The administrative officers were entrusted with the assessment and acted as arbitrators and referees in case of illegal exactions. In the Pagan districts where no native machinery existed and no previous taxation had been in force, a nominal impost was levied and collected by the officers of the government through the agency of the village chiefs. The taxation of the great cities formed a separate and very difficult problem. The law laid down the method to be employed in this case, but pending the completion of the rural taxation this detailed application of the system was allowed to remain in suspense. It was hoped that so soon as the scheme could be effectively put into operation the taxes on trade in transit could be largely if not completely abolished, and the traders and merchants—the wealthiest class of the community—would be assessed in their city domiciles. By these means a large and rapidly increasing revenue is being secured to government; while the condition of the peasantry and people is being greatly ameliorated, an adequate but not excessive income is being secured to the native rulers; and the class of middlemen who lived by extortion and absorbed a great part of the wealth of the country is being abolished.

Native Rulers.—By the operation of the native courts proclamation, the taxation proclamation, and finally by the enforcement of native authority proclamations, the status of the native rulers, their powers and authority, were defined and legalized. They receive the support of the government within the limits of their recognized sphere of action. The great chiefs are appointed by the government in consultation with the principal men, and in accordance with native customs and laws of succession. Minor chiefs are nominated by their paramount chiefs, subject to the approval of the high commissioner.

Military and Police.—The defensive force—the Northern Nigeria Regiment of the West African Frontier Force—is constituted by law, and the proclamation contains a military code based on the Army Act with modifications necessary in local circumstances. A police force is similarly organized and controlled by a second enactment. The military force is divided into three regiments and two batteries of artillery under the supreme command of a commandant. The distribution of the garrisons is under the direction of the high commissioner. The police, on the other hand, are more or less equally divided between the provinces (including the establishment at each cantonment), and while their interior economy and organization rests in the hands of a commissioner, they are for purposes of duty under the control of the resident of the province. A district superintendent is appointed to each province.

Miscellaneous Enactments.—A variety of other enactments deals with minor matters of administration. Commissions of inquiry may be appointed by the high commissioner to investigate the conduct

of an individual or department and take evidence on oath. Discipline on board of steamers is prescribed by the Marine Discipline Act. The preservation of wild animals and birds in accordance with international agreements is enforced by law. The importation or possession of arms of precision is forbidden, except by permits in conformity with the Brussels Act, and in further application of that act the importation of spirits for sale to natives is wholly prohibited. The cantonments are regulated by a municipal ordinance, establishing rates and laying down various regulations for order and sanitation. In order to prevent hydrophobia dogs may only be kept under certain restrictions. Patents, marriages (of non-natives), &c., &c., form the subject of other laws.

Administrative Divisions.—For administrative purposes the territories were at first divided into seventeen provinces: Sokoto, Gando, Kano, Katsena, Bornu East, Bornu West, Zaria, Bauchi, Borgu, Kontagora, Nassarawa, Muri, Yola, Bassa, Kabba, Illorin, Nupe. Of these Sokoto and Gando, Kano and Katsena, Bornu East and Bornu West have been carried a step further in organization and now form three double provinces, each under the charge of a first-class resident. Illorin, Nupe and Kabba have been formed into one province called the Niger province, and also placed under the charge of a first-class resident, and it is intended to continue this process so as to make finally eight first-class provinces of the whole territory. The first-class residents of the double provinces are assisted by about twelve residents and assistant residents of subordinate rank. In the Mahommedan states the native system of administration remains intact, and is carried on under British supervision by native emirs and officials. In the Pagan states there is no organized system of native administration, and the British residents are responsible for good government.

Amalgamation of Lagos and Southern Nigeria.—The political reasons which had resulted in the Nigerian territories being divided into three distinct administrations no longer existing, it was decided to unite them under one government, and as a first step in that direction Sir Walter (then Mr) Egerton was in 1904 appointed both governor of Lagos and high commissioner of Southern Nigeria. This was followed in February 1906 by the amalgamation of the two administrations under the style of "the Colony and Protectorate of Southern Nigeria," with headquarters at Lagos town. The former colony and protectorate of Lagos (*q.v.*) became the western or Lagos province of the new administration. In the year the amalgamation was effected the revenue reached a record figure, the amount collected being £1,088,000, to which Lagos province contributed £424,000. Over 80% of the revenue was derived from customs. In the same year the expenditure from revenue was £1,056,000.

Northern Nigeria Railway.—In Northern Nigeria, which continued for the time to be a separate protectorate, Sir Frederick Lugard was, at the beginning of 1907, succeeded as high commissioner by Sir Percy Girouard. In August of that year the British government, on administrative, strategic and commercial grounds, came to a decision to build a railway which should place the important cities of Zaria and Kano in direct communication with the perennially navigable waters of the Lower Niger. In view of the approaching unification of Southern and Northern Nigeria, the money needed, about £1,250,000, was raised as a loan by Southern Nigeria. The route chosen for the line was that advocated by Sir Frederick Lugard. This important work, essential for the welfare of the northern territories, was begun under the superintendence of Sir Percy Girouard,[1] the builder of the Wadi Halfa-Khartum railway. At the same time the decision was taken to continue the Lagos railway till it effected a junction with the Kano line near Zungeru, the Niger being bridged at Jebba.

Land Tenure.—Sir Percy Girouard devoted much attention to land tenure, probably the most important of the questions concerning imperial policy in West Africa. He adopted the land policy of Sir F. D. Lugard, and recommended "a declaration in favour of the nationalization of the lands of the Protectorate." This was in accord with native laws—that the land is the property of the people, held in trust for them by their chiefs, who have not the power of alienation. Thereafter the secretary for the colonies appointed a strong committee, which, after hearing much evidence, issued a report in April 1910 in substantial agreement with the governor's recommendations. This policy was adopted by the Colonial Office. By this means the natives of Nigeria were secured in the possession of their land—the government imposing land taxes, which are the equivalent of rent. This exclusion of the European land speculator and denial of the right to buy and sell land and of freehold tenure was held by all the authorities to be essential for the moral and material welfare of the inhabitants of a land where the duty of the white man is mainly that of administration and his material advantages lie in trade. (See an article on "Land Tenure in West Africa" in *The Times*, May 24, 1910.)

[1] In 1909 Sir Percy Girouard was succeeded by Sir H. H. J. Bell. The title High Commissioner had meantime been changed to that of Governor.

AUTHORITIES.—Of early books dealing with large areas of Nigeria, H. Barth's *Travels and Discoveries in North and Central Africa* (London, 1857–1858) is a standard authority. See also Lady Lugard, *A Tropical Dependency* (London, 1905); Boyd Alexander, *From the Niger to the Nile* (London, 1907); C. Larymore, *A Resident's Wife in Nigeria* (London, 1908); the annual *Reports* on Southern and Northern Nigeria issued by the Colonial Office; E. D. Morel, *Affairs of West Africa* (London, 1902); C. H. Robinson, *Hausaland* (London, 1896); S. Vandeleur, *Campaigning on the Upper Nile and Niger* (London, 1898), with introduction by Sir George Goldie; Major A. G. Leonard, *The Lower Niger and its Tribes* (London, 1906); C. Partridge, *The Cross River Natives* (London, 1905); E. Dayrell, *Folk Stories from Southern Nigeria* (London, 1910). Maps of the country on the scale of $\frac{1}{1,000,000}$ and $\frac{1}{250,000}$ are published by the War Office. The Blue Books, Cd. 2325 (1904), 2787 (1905) and 4523 (1909), deal with railway construction, harbours and river navigation. (F. L. L.)

NIGHT, that part of the natural day of twenty-four hours during which the sun is below the horizon, the dark part of the day from sunset to sunrise (see DAY). The word in O. Eng. takes two forms, *neaht* and *niht*, the latter form apparently being established by about the 10th century. The word is common in varying forms to Indo-European languages.' The root is usually taken to be *nak-*, to perish, the word meaning the time when the light fails (cf. Gr. *νύκτος*, Lat. *nex*, death, *nocere*, to hurt). It was customary to reckon periods of time by nights, and we still use "fortnight" (O. Eng. *feowertyne niht*, fourteen nights), but "se'n-night" (seven nights) has been displaced by "week" (*q.v.*).

NIGHTINGALE, FLORENCE (1820–1910), younger daughter of William Edward Nightingale of Embley Park, Hampshire, and Lea Hurst, Derbyshire, was born at Florence on the 15th of May 1820, and named after that city, but her childhood was spent in England, chiefly in Derbyshire. From her earliest years her strong love of nature and animals manifested itself. Her games, too, were characteristic, for her great delight was to nurse and bandage her dolls. Her first living patient was a shepherd's dog. From tending animals she passed to human beings, and wherever there was sorrow or suffering she was sure to be found. Her most ardent desire was to use her talents for the benefit of humanity. She had a natural shrinking from society; and though her social position necessitated her presentation at Court, her first season in town was spent in examining into the working of hospitals, reformatories and other charitable institutions. This was followed by a tour of inspection of foreign hospitals. At that time England was sadly behind-hand in matters of nursing and sanitation, and Miss Nightingale, who desired to obtain the best possible teaching for herself, went through a course of training in the Institute of Protestant Deaconesses at Kaiserswerth. She remained there six months, learning every detail of hospital management with a thoroughness rarely equalled. Miss Nightingale neglected nothing that could make her proficient in her self-chosen task. From Kaiserswerth she went to Paris, where she studied the system of nursing and management in the hospitals under the charge of the sisters of St Vincent de Paul. After her return to England she devoted herself to reorganizing the Governesses' Sanatorium in Harley Street (now the Home for Gentlewomen during Temporary Illness), which was at that time badly managed and in great need of funds. Miss Nightingale grudged neither time nor money to this work, and she had the satisfaction of placing it on a thoroughly satisfactory basis.

In the year 1854 England was stirred to its depths by the report of the sufferings of the sick and wounded in the Crimea. There was an utter absence of the commonest preparations to carry out the first and simplest demands in a place set apart

to receive the sick and wounded of a large army. The condition of the large barrack-hospital at Scutari was deplorable. A royal commission of inquiry was appointed, a patriotic fund opened, and money flowed in fast. To Miss Nightingale this proved the trumpet-call of duty. She wrote to Sidney Herbert, secretary at war, and offered her services. Her letter crossed with one from him inviting her to proceed to the Crimea. She set out on the 24th October with a staff of thirty-seven nurses, partly volunteers, partly professionals trained in hospitals. They reached Scutari on the 4th of November, in time to receive the Balaklava wounded. A day or two later these were joined by 600 from Inkerman. The story of Miss Nightingale's labours at Scutari is one of the brightest pages in English annals. She gave herself, body and soul, to the work. She would stand for twenty hours at a stretch to see the wounded accommodated. She regularly took her place in the operation-room, to hearten the sufferers by her presence and sympathy, and at night she would make her solitary round of the wards, lamp in hand, stopping here and there to speak a kindly word to some patient. Soon she had 10,000 men under her charge, and the general superintendence of all the hospitals on the Bosporus. Gradually the effects of the measures adopted were seen in a lowered death-rate. In February 1855 it was as high as 42%, before many months it had sunk to 2. For a time Miss Nightingale was herself prostrated with fever, but she refused to leave her post, and remained at Scutari till Turkey was evacuated by the British in July 1856. The enthusiasm aroused in England by Miss Nightingale's labours was indescribable. A man-of-war was ordered to bring her home, and London prepared to give her a triumphant reception; but she returned quietly in a French ship, crossed to England, and escaped to her country home before the news of her return could leak out. The experiences of those terrible months permanently affected Miss Nightingale's health, but the quiet life she afterwards led was full of usefulness. With the £50,000 raised in recognition of her services she founded the Nightingale Home for training nurses at St Thomas's and King's College Hospitals. She also turned her attention to the question of army sanitary reform and army hospitals, and to the work of the Army Medical College at Chatham. In 1858 she published her *Notes on Nursing*, which gave an enormous stimulus to the study of this subject in England. According to Miss Nightingale nursing ought to signify the proper use of fresh air, light, warmth, cleanliness, quiet, and the selection and administration of diet—all at the least expense of vital force to the patient.

Miss Nightingale followed with interest all the later improvements in sanitation, and was frequently consulted about hospital plans both at home and abroad. With the help of the County Council Technical Instruction Committee she organized in 1892 a health crusade in Buckinghamshire. Teachers were sent round among the cottagers to give practical advice on such points as ventilation, drainage, disinfectants, cleanliness, &c., a plan which, if widely carried out, would bring the most valuable knowledge to every home in England. She is understood to have drawn up a confidential report for the government on the working of the Army Medical Corps in the Crimea, and to have been officially consulted during the American Civil War and the Franco-German War. In 1907 she received the Order of Merit from King Edward VII. She died in London on the 13th of August 1910. She is the subject of a beautiful poem by Longfellow, "Santa Filomena," and the popular estimate of her character and mission was summed up in a particularly felicitous anagram, *Flit on, cheering angel.*

NIGHTINGALE (O. Eng. *Nihtegale*, literally "singer of the night"), the bird celebrated beyond all others by European writers for the admirable vocal powers which, during some weeks after its return from its winter-quarters in the south, it exercises at all hours of the day and night. The song itself is indescribable, though several attempts, from the time of Aristophanes to the present, have been made to express in syllables the sound of its many notes. Poets have descanted on the bird (which they nearly always make of the feminine gender) leaning its breast against a thorn and pouring forth its melody in anguish. But the cock alone sings, and there is no reason to suppose that the cause and intent of his song differ in any respect from those of other birds' songs (see SONG). In great contrast to the nightingale's pre-eminent voice is the inconspicuous coloration of its plumage, which is alike in both sexes, and is of a reddish-brown above and dull greyish-white beneath, the breast being rather darker, and the rufous tail showing the only bright tint.

The range of the European nightingale, *Daulias luscinia*, is peculiar. In Great Britain it is abundant in suitable localities to the south-east of a line stretching from the valley of the Exe, in Devonshire, to York, but it does not visit Ireland, its occurrence in Wales is doubtful or intermittent, and it is extremely improbable that it has ever reached Scotland. On the continent of Europe it does not occur north of a line stretching irregularly from Copenhagen to the northern Urals, and it is absent in Brittany; over south Europe otherwise it is abundant. It reaches Persia, and is a winter visitor to Arabia, Nubia, Abyssinia, Algeria and as far south as the Gold Coast. The larger eastern *D. philomela*, sometimes called the thrush-nightingale or *Sprosser* of German bird-catchers, is russet-brown in both sexes, and is a native of eastern Europe. *D. hafizi* of Persia, a true nightingale, is probably the Perso-Arabic bulbul of poets.

The nightingale reaches its English home about the middle of April,[1] the males (as is usual among migratory birds) arriving some days before the females. On the cocks being joined by their partners, the work for which the long and hazardous journey of both has been undertaken is speedily begun, and before long the nest is completed. This is of a rather uncommon kind, being placed on or near the ground, the outworks consisting chiefly of a great number of dead leaves ingeniously applied together so that the plane of each is mostly vertical. In the midst of the mass is wrought a deep cup-like hollow, neatly lined with fibrous roots, but the whole is so loosely constructed, and depends for lateral support so much on the stems of the plants, among which it is generally built, that a very slight touch disturbs its beautiful arrangement. Herein from four to six eggs of a deep olive colour are duly laid, and the young hatched. The nestling plumage of the nightingale differs much from that of the adult, the feathers above being tipped with a buff spot, just as in the young of the redbreast, hedge-sparrow and redstart, thereby showing the natural affinity of all these forms. Towards the end of summer the nightingale disappears to its African winter haunts.

The name nightingale has been vaguely applied to several other birds. The so-called "Virginian nightingale" is a species of grosbeak (*q.v.*); the "Pekin nightingale" or "Japanese nightingale" is a small babbler (*Liothrix luteus*) inhabiting the Himalayas and China, not Japan at all.

The nightingale holds a place in classical mythology. Procne and Philomela were the daughters of Pandion, king of Attica, who in return for warlike aid rendered him by Tereus, king of Daulis in Thrace, gave him the first-named in marriage. Tereus, however, being enamoured of her sister, feigned that his wife was dead, and induced Philomela to take her place. On her discovering the truth he cut out her tongue to hinder her from revealing his deceit; but she depicted her sad story on a robe which she sent to Procne; and the two sisters then contrived a horrible revenge for the infidelity of Tereus, by killing and serving to him at table his son Itys. Thereupon the gods interposed, changing Tereus into a hoopoe, Procne into a swallow, and Philomela into a nightingale, while Itys was restored to life as a pheasant, and Pandion (who had died of grief at his daughters' dishonour) as a bird of prey (see OSPREY). The fable has several variants. Ovid's version may be seen in the 6th book of his *Metamorphoses* (lines 412-676). (A. N.)

NIGHTSHADE, a general term for the genus of plants known to botanists as *Solanum*. The species to which the name of nightshade is commonly given in England is *Solanum Dulcamara* which is also called bittersweet or woody nightshade (see fig. 1). It is a common plant in damp hedgebanks and thickets, scrambling over underwood and hedges. It has slender slightly woody stems, with alternate lanceolate leaves more or less heart-shaped and auriculate at the base. The flowers are arranged in drooping clusters and resemble those of the potato in shape, although

[1] Poets and novelists are apt to command at will the song of this bird, irrespective of season. If the appearance of truth is to be regarded, it is dangerous to introduce a nightingale as singing in England before the 15th of April or after the 15th of June. The "early nightingale" of newspaper paragraphs is generally a thrush.

much smaller. The flower clusters spring from the stems at the side of, or opposite to, the insertion of a leaf. The corolla is rotate, of a lilac-blue colour with a green spot at the base of each segment, or sometimes white, and bears the yellow sessile anthers united at their margins so as to form a cone in the centre of the flower. The flowers are succeeded by ovate scarlet berries, ½ in. long, which in large doses appear to be poisonous or, to say the least, dangerous to children, cases of poisoning by them having occurred. *Solanum Dulcamara* is subject to the same parasitic fungus (*Phytophthora infestans*) as the potato, and may serve as a medium for communicating the spores to the potato if not removed from the hedges of the fields where potatoes are grown. The plant derives its names of "bittersweet" and *Dulcamara* from the fact that its taste is at first bitter and then sweet. It is a native of Europe, North Africa and temperate Asia, and has been introduced into North America. The dried young branches are known in pharmacy under the name *dulcamara*.

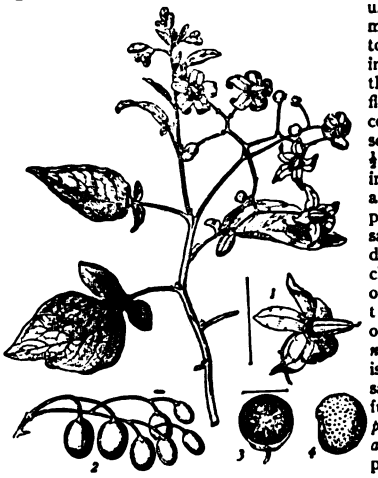


FIG. 1.—Bittersweet (*Solanum Dulcamara*), 1, Flower; 2, fruits, 3, berry, cut across, enlarged; 4, seed, much enlarged.

FIG. 2.—Deadly Nightshade (*Atropa belladonna*). Flowering branch. 1, Flower, after removal of the corolla; 2 corolla, with stamens, cut open and flattened; 3, cross section of ovary, much enlarged.

Dulcamara contains a bitter principle yielding by decomposition a sugar dextrose and the alkaloid solanine. It also contains another glucoside dulcamarin, which when boiled with dilute acid splits up into sugar and dulcamaretin. Solanine appears to exert a depressant action on the vagus nerve and an excitant action on the medulla oblongata.

Solanum nigrum differs from *S. Dulcamara* in having white flowers in small umbels and globose black berries. It is a common weed in gardens and waste places, growing about 12 or 18 in. high, and has ovate, entire or sinuate or toothed leaves. Two varieties of the plant, one with red and the other with yellow berries, are sometimes met with, but are comparatively rare. The berries have been known to produce poisonous effects when eaten by children, and owe their properties to the presence of solanine. In Réunion and Mauritius the leaves are eaten like spinach.

Deadly nightshade, dwale or belladonna (*Atropa belladonna*) is a tall bushy herb of the same natural order (fig. 2). It grows to a height of 4 or 5 ft., having leaves of a dull green colour, with a black shining berry fruit about the size of a cherry, and a large tapering root. The plant is a native of central and south Europe, extending into Asia, and is found locally in England, chiefly on chalk and limestone, from Westmorland and southwards. The entire plant is highly poisonous, and accidents not infrequently occur through children and unwary persons eating the attractive-looking fruit. Its leaves and roots are largely used in medicine, on which account the plant is cultivated, chiefly in south Germany, Switzerland and France (see BELLADONNA).

The name nightshade is applied to plants of different genera in other countries. American nightshade is *Phytolacca decandra* (pokeweed, *q.v.*). The three-leaved nightshade is an American species of *Trillium*. The Malabar nightshade is *Basella*, which is widely used as a pot-herb in India. Enchanter's nightshade is *Circaea lutetiana*, a small, glandular, softly-hairy plant, common in damp woods, with slender, erect or ascending stems, paired ovate leaves with long stalks, and small white flowers in terminal racemes, succeeded by a small fruit covered with hooked bristles; it is a member of the natural order Onagraceae, and is not known to possess any poisonous property; the name seems to have been given to it in the first place in mistake for a species of *Mandragora* (see MANDRAKE).

NIGRA, COSTANTINO, COUNT (1828–1907), Italian diplomatist, was born at Villa Castelnuovo, in the province of Turin, on the 11th of June 1828. During the war of 1848 he interrupted his studies to serve as a volunteer against Austria, and was wounded at the battle of Rivoli. On the conclusion of peace he entered the Piedmontese foreign office; he accompanied Victor Emmanuel and Cavour to Paris and London in 1855, and in the following year he took part in the conference of Paris by which the Crimean War was brought to an end. After the meeting at Plombières between Cavour and Napoleon III. Nigra was sent to Paris again to popularize a Franco-Piedmontese alliance, Nigra being, as Cavour said, "the only person perhaps who knows all my thoughts, even the most secret." He was instrumental in negotiating the marriage between Victor Emmanuel's daughter Clothilde and Napoleon's nephew, and during the war of 1859 he was always with the emperor. He was recalled from Paris when the occupation of the Marche and Umbria by the Piedmontese caused a breach in Franco-Italian relations, and was appointed secretary of state to the prince of Carignano, viceroy of the Neapolitan provinces. When Napoleon recognized the kingdom of Italy in 1861, Nigra returned to France as minister-resident, and for many years played a most important part in political affairs. In 1876 he was transferred to St Petersburg with the rank of ambassador, in 1882 to London, and in 1885 to Vienna. In 1899 he represented Italy at the first Hague Peace Conference. In 1904 he retired, and he died at Rapallo on the 1st of July 1907. He was created count in 1882 and senator in 1890. Nigra was a sound classical scholar, and published translations of many Greek and Latin poems with valuable comments; he was also a poet and the author of several works of folk-lore and popular poetry, of which the most important is his *Canti popolari del Piemonte*.

NIHILISM, the name commonly given to the Russian form of revolutionary Socialism, which had at first an academical character, and rapidly developed into an anarchist revolutionary movement. It originated in the early years of the reign of Alexander II., and the term was first used by Turgueniev in his celebrated novel, *Fathers and Children*, published in 1862. Among the students of the universities and the higher technical schools Turgueniev had noticed a new and strikingly original type—young men and women in slovenly attire, who called in question and ridiculed the generally received convictions and respectable conventionalities of social life, and who talked of reorganizing society on strictly scientific principles. They reversed the traditional order of things even in trivial matters of external appearance, the males allowing the hair to grow long and the female adepts cutting it short, and adding sometimes the

additional badge of blue spectacles. Their appearance, manners and conversation were apt to shock ordinary people, but to this they were profoundly indifferent, for they had raised themselves above the level of so-called public opinion, despised Philistine respectability, and rather liked to scandalize people still under the influence of what they considered antiquated prejudices. For aesthetic culture, sentimentalism and refinement of every kind they had a profound and undisguised contempt. Professing extreme utilitarianism and delighting in paradox, they were ready to declare that a shoemaker who distinguished himself in his craft was a greater man than a Shakespeare or a Goethe, because humanity had more need of shoes than of poetry. Thanks to Turgueniev, these young persons came to be known in common parlance as "Nihilists," though they never ceased to protest against the term as a calumnious nickname. According to their own account, they were simply earnest students who desired reasonable reforms, and the peculiarities in their appearance and manner arose simply from an excusable neglect of trivialities in view of graver interests. In reality, whatever name we may apply to them, they were the extreme representatives of a curious moral awakening and an important intellectual movement among the Russian educated classes (see ALEXANDER II., of Russia).

In material and moral progress Russia had remained behind the other European nations, and the educated classes felt, after the humiliation of the Crimean War, that the reactionary regime of the emperor Nicholas must be replaced by a series of drastic reforms. With the impulsiveness of youth and the recklessness of inexperience, the students went in this direction much farther than their elders, and their reforming zeal naturally took an academic, pseudo-scientific form. Having learned the rudiments of positivism, they conceived the idea that Russia had outlived the religious and metaphysical stages of human development, and was ready to enter on the positivist stage. She ought, therefore, to throw aside all religious and metaphysical conceptions, and to regulate her intellectual, social and political life by the pure light of natural science. Among the antiquated institutions which had to be abolished as obstructions to real progress, were religion, family life, private property and centralized administration. Religion was to be replaced by the exact sciences, family life by free love, private property by collectivism, and centralized administration by a federation of independent communes. Such doctrines could not, of course, be preached openly under a paternal, despotic government, but the press censure had become so permeated with the prevailing spirit of enthusiastic liberalism, that they could be artfully disseminated under the disguise of literary criticism and fiction, and the public very soon learned the art of reading between the lines. The work which had perhaps the greatest influence in popularizing the doctrines was a novel called *Shto Dyelati?* (What is to be done?), written in prison by Tchernishevski, one of the academic leaders of the movement, and published with the sanction of the authorities!

Since the time of Peter the Great, Russia had been subjected to a wonderful series of administrative and social transformations, and it seemed to many people quite natural that another great transformation might be effected with the consent and co-operation of the autocratic power. The doctrines spread, therefore, with marvellous rapidity. In the winter of 1861–1862 a high official wrote to a friend who had been absent from Russia for a few months: "If you returned now you would be astonished at the progress which the opposition—one might say, the revolutionary party—has made. . . . The revolutionary ideas have taken possession of all classes, all ages, all professions, and they are publicly expressed in the streets, in the barracks, and in the government offices. I believe the police itself is carried away by them." Certainly the government was under the influence of the prevailing enthusiasm for reform, for it liberated all the serfs, endowed them liberally with arable land, and made their democratic communal institutions independent of the landed proprietors; and it was preparing other important reforms in a similar spirit, including the extension of self-government in the rural districts and the towns, and the reorganization of the antiquated judicial system and procedure according to the modern principles adopted in western Europe

The programme of the government was extensive enough and liberal enough to satisfy, for the moment at least, all reasonable reformers, but the well-intentioned, self-confident young people to whom the term Nihilists was applied were not reasonable. They wanted an immediate, thorough-going transformation of the existing order of things according to the most advanced socialistic principles, and in their youthful, reckless impatience they determined to undertake the work themselves, independently of and in opposition to the government. As they had no means of seizing the central power, they adopted the method of endeavouring to bring about the desired political, social and economic changes by converting the masses to their views. They began, therefore, a propaganda among the working population of the towns and the rural population in the villages. The propagandists were recruited chiefly from the faculty of physical science in the universities, from the Technological Institute, and from the medical schools, and a female contingent was supplied by the midwifery classes of the Medico-Surgical Academy. Those of each locality were personally known to each other, but there was no attempt to establish among them hierarchical distinctions or discipline. Each individual had entire freedom as to the kind and means of propaganda to be employed. Some disguised themselves as artisans or ordinary labourers, and sought to convert their uneducated fellow-workmen in the industrial centres, whilst others settled in the villages as school-teachers, and endeavoured to stir up disaffection among the recently emancipated peasantry by telling them that the tsar intended they should have all the land, and that his benevolent intentions had been frustrated by the selfish landed proprietors and the dishonest officials. Landed proprietors and officials, it was suggested, should be got rid of, and then the peasants would have arable, pastoral and forest land in abundance, and would not require to pay any taxes. To persons of a certain education the agitators sought to prove that the general economic situation was desperate, that it was the duty of every conscientious citizen to help the people in such a dilemma, and that the first step towards the attainment of this devoutly to be wished consummation was the limitation or destruction of the uncontrolled supreme power. On the whole the agitators had very little success, and not a few of them fell into the hands of the police, several of them being denounced to the authorities by the persons in whose interest they professed to be acting; but the great majority were so obstinate and so ready to make any personal sacrifices, that the arrest and punishment of some of their number did not deter others from continuing the work. Between 1861 and 1864 there were no less than twenty political trials, with the result that most of the accused were condemned to imprisonment, or to compulsory residence in small provincial towns under police supervision.

The activity of the police naturally produced an ever-increasing hostility to the government, and in 1866 this feeling took a practical form in an attempt on the part of an obscure individual called Karakozov to assassinate the emperor. The attempt failed, and the judicial inquiry proved that it was the work of merely a few individuals, but it showed the dangerous character of the movement, and it induced the authorities to take more energetic measures. For the next four years there was an apparent lull, during which only one political trial took place, but it was subsequently proved that the Nihilists during this time were by no means inactive. An energetic agitator called Netchaiev organized in 1869 a secret association under the title of the Society for the Liberation of the People, and when he suspected of treachery one of the members he caused him to be assassinated. This crime led to the arrest of some members of the society, but their punishment had very little deterrent effect on the Nihilists in general, for during the next few years there was a recrudescence of the propaganda among the labouring classes. Independent circles were created and provided with secret printing-presses in many of the leading provincial towns—notably in Moscow,

Nijni-Novgorod, Penza, Samara, Saratov, Kharkof, Kiev, Odessa, Rostov-on-the-Don and Taganrog; and closer relations were established with the revolutionary Socialists in western Europe, especially with the followers of Bakunin, who considered that a great popular rising should be brought about in Russia as soon as possible. Bakunin's views did not, it is true, obtain unanimous acceptance. Some of the Nihilists maintained that things were not yet ripe for a rising of the masses, that the pacific propaganda must be continued for a considerable time, and that before attempting to overthrow the existing social organization some idea should be formed as to the order of things which should take its place. The majority, however, were too impatient for action to listen to such counsels of prudence, and when they encountered opposition on the part of the government they urged the necessity of retaliating by acts of terrorism. In a brochure issued in 1874 one of the most influential leaders (Tkatchev) explained that the object of the revolutionary party should be, not the preparation of revolution in general, but the realization of it at the earliest possible moment, that it was a mistake to attach great importance to questions of future social organization, and that all the energies of the party should be devoted to "a struggle with the government and the established order of things, a struggle to the last drop of blood and to the last breath." In accordance with the fashionable doctrine of evolution, the reconstruction of society on the *tabula rasa* might be left, it was thought, to the spontaneous action of natural forces, or, to use a Baconian phrase, to *natura naturans*.

To this and similar declarations of irreconcilable hostility the government replied by numerous arrests, and in the winter of 1877–1878 no less than 193 agitators, selected from 2000 arrested on suspicion, were tried publicly in St Petersburg by a tribunal specially constituted for the purpose. Nearly all of them were condemned to imprisonment or exile, and the revolutionary organization in the northern provinces was thereby momentarily paralysed, but a few energetic leaders who had escaped arrest reorganized their scattered forces and began the work anew. They constituted themselves into a secret executive committee, which endeavoured to keep in touch with, and partially direct, the independent groups in the provincial towns. Though they never succeeded in creating an efficient centralized administration, they contrived to give to the movement the appearance of united action by assuming the responsibility for terrorist crimes committed by persons who were in reality not acting under their orders. During the years 1878, 1879 and 1880 these terrorist crimes were of frequent occurrence. General Trepov, prefect of St Petersburg, was shot by Vera Zasulitch under pretence of presenting a petition to him; General Mezentsov, chief of the political police, was assassinated in broad daylight in one of the principal streets of St Petersburg, and an attempt was afterwards made on the life of his successor, General Drenteln; Prince Krapotkin, governor of the province of Kharkof, was assassinated for having introduced stricter prison discipline with regard to political prisoners; a murderous attack was made on the emperor in front of the Winter Palace by an ex-student called Soloviev; repeated attempts were made to blow up the train conveying the Imperial family from the Crimea to St Petersburg; and a dynamite explosion, by which ten people were killed and thirty-four wounded, took place in the Winter Palace, the Imperial family owing their escape to the accident of not sitting down to dinner punctually at the usual hour. Assassination was used also by the agitators against confederates suspected of giving information to the police, and a number of gendarmes were murdered when effecting arrests. After each of these crimes a proclamation was issued by the executive committee explaining the motives and accepting the responsibility.

When repressive measures and the efforts of the police were found insufficient to cope with the evil, Alexander II. determined to try a new system. Count Loris Melikof was entrusted with semi-dictatorial powers, relaxed the severity of the police régime, and endeavoured to obtain the support of all loyal Liberals by holding out the prospect of a series of reforms in a liberal sense. His conciliatory methods failed signally, and were repaid by an attack on his life. A semblance of parliamentary institutions was not what the Anarchists wanted. They simply redoubled their activity, and hatched a plot for the assassination of the emperor. In March 1881 the plot was successful. Alexander II., when driving in St Petersburg, was mortally wounded by the explosion of small bombs, and died almost as soon as he had reached the Winter Palace. On the following day the executive committee issued a bombastic proclamation, in which it declared triumphantly that the tsar had been condemned to death by a secret tribunal on 26th August 1879, and that two years of effort and painful losses had at last been crowned with success.

These facts put an end to the policy of killing Anarchism by kindness, and one of the first acts of the new reign was a manifesto in which Alexander III. announced very plainly that he had no intention of limiting the autocratic power, or making concessions of any kind to the revolutionary party. The subsequent history of the movement presents little that is interesting or original, merely a continual but gradually subsiding effort to provoke local disturbances with a view to bringing about sooner or later a general rising of the masses and the overthrow not only of the government, but also of the existing social and economic regime. A serious manifestation on the part of the terrorists took the shape of a plot to assassinate the emperor by bombs in the streets of St Petersburg in March 1887. It was the work of a very small group, the members of which were being watched by the police, and were all arrested on the day when the crime was to be perpetrated. The movement afterwards showed occasionally signs of revival. In 1901, for example, there were troubles in the universities, and in 1902 there were serious disturbances among the peasantry in some of the central rural districts; and the assassination of M. Sipiaguine, the minister of the interior, was a disquieting incident; but the illusions and enthusiasm which produced Nihilism in the young generation during the early years of the reign of Alexander II. had been largely shattered and dispelled by experience. The revolutionary propaganda temporarily led to a serious situation in the early years of the reign of Tsar Nicholas II., but a new era opened for Russia with the inauguration of parliamentary government.

The following criminal statistics of the movement during six and a half years of its greatest activity (from 1st July 1881 to 1st January 1888) are taken from unpublished official records:—

Number of affairs examined in the police department	1500
Number of persons punished	3046

These 3046 punishments may be divided into the following categories:—

Death	20
Penal servitude	128
Exile in Siberia	681
Exile under police supervision in European Russia	1500
Lesser punishments	717
	3046

From the beginning of the movement up to 1902 the number of Anarchists condemned to death and executed was forty-eight, and the number of persons assassinated by the Anarchists was thirty-nine. There is no reason to suspect the accuracy of these statistics, for they were not intended for publication. They are taken from a confidential memorandum presented to the emperor.

(D. M. W.)

NIIGATA, the chief town of the province of Echigo, Japan. Pop. (1903) 58,821. It lies on the west coast of the island of Nippon, on a narrow strip of sandy ground between the left bank of the Shinano and the sea, which though close at hand is shut out from view by a low range of sandhills. It occupies an area of rather more than 1 sq. m., and consists of five long parallel streets intersected by cross-streets, which in most cases have canals running down the middle and communicating with the river, so that the internal traffic of the city is mainly carried on by water. The houses are usually built with gables to the street, and roofs and verandas project so as to keep the windows and footpaths from being blocked up by the heavy winter snows. Niigata was originally chosen as one of the five open ports—Nagasaki, Kobe, Yokohama, Niigata and Hakodate—but it failed, chiefly owing to a bar which prevents the entry of vessels

of any size. The town has been brought within the railway circuit, and the production of petroleum has been developed in the district. Ebisa, on the island of Sado, was opened as a supplementary harbour of refuge, but not as a trading port. There is a large manufacture of lacquer-ware in the town. The foreign trade is entirely in the hands of Japanese merchants. During winter Niigata suffers from a terribly severe climate; the summers, moreover, are excessively hot.

NIJAR, a town of south-eastern Spain, in the province of Almeria; on the southern slope of the Sierra Alhamilla, and on the small river Artal, which flows into the Mediterranean Sea 6 m. S.W. Pop. (1900) 12,497. Diespite the lack of railway communication, Nijar is a place of some commercial importance. Lead, iron and manganese are mined in the neighbouring mountains; the fertile plain watered by the Artal yields an abundance of wheat, fruit, olives and esparto grass; and fine porcelain and woollen and cotton goods are manufactured in the town.

NIJMWEGEN, NIMEGUEN, NYMEGEN or NIMWEGEN, a town in the province of Gelderland, Holland, on the left bank of the Waal, 24½ m. by rail E. by S. of Tiel. It has regular steamboat communication with Rotterdam, Cologne and Arnhem, and steam-tramways connect it with the popular resorts of Neerbosch, Beek and Berg-en-Dal in the vicinity. Pop. (1904) 49,342. Nijmwegen is very prettily situated on the slopes of five low hills rising from the river-side. It stands up with a boldness quite unusual in a Dutch town, and steps are even necessary to lead to the higher portions of the town. In 1877–1884 the old town walls were demolished, a promenade and gardens taking their place, and since then a new quarter has grown up on the south side with a fine open place called the Emperor Charles's Plain. On the east of the town is the beautiful park called the Valkhof, which marks the site of the old palace of the Carolingian emperors. The palace was still inhabitable in 1787, but was ruined by the French bombardment of 1794, and only two portions of it remain. These are a part of the choir of the 12th-century palace-church, and a sixteen-sided baptistry originally consecrated by Pope Leo III. in 799 and rebuilt in the 12th or 13th century. Close by is the lofty tower of the Belvedere, dating from 1646. The Groote Kerk of St Stephen forms with its tall square tower one of the most striking features in the general views of the town. Originally built about 1272, it dates in its present condition mainly from the 15th and 16th centuries. In the choir is the fine monument of Catherine of Bourbon (d. 1469), wife of Adolphus of Egmont, duke of Gelderland, with a brass of the duchess, and the heraldic achievements of the house of Bourbon. There is also a fine organ. The interesting Renaissance town-hall was built in 1554 (restored in 1879). It is adorned with the effigies of kings and emperors who were once benefactors of Nijmwegen. Inside are to be found some fine wood-carving, tapestries, pictures and a cumbrous safe in which the town charters were so jealously preserved that the garrison used to be called out and the city gates closed whenever they were consulted. There is also an interesting museum of antiquities. Other buildings of note are the theatre (1839), the Protestant hospital, the Roman Catholic or Canisius hospital (1866), and the old weigh-house and Flesher's Hall, probably built in 1612 and restored in 1885. Between 1656 and 1678 Nijmwegen was the seat of a university. Beer, Prussian blue, leather, tin, pottery, cigars, and gold and silver work are the chief industrial products, and there is a considerable trade by rail and river.

NIKĀYA ("collection"), the name of a division of the Buddhist canonical books. There are four principal Nikāyas, making together the Sutta Piṭaka ("Basket of Discourses"), the second of the three baskets into which the canon is divided. The fifth or miscellaneous Nikāya is by some authorities added to this Piṭaka, by others to the next. The first two Nikāyas, called respectively *Dīgha* and *Majjhima* (Longer and Shorter), form one book, a collection of the dialogues of the Buddha, the longer ones being included in the former, the shorter ones in the latter. The third, called the Anguttara (Progressive Addition), rearranges the doctrinal matter contained in the Dialogues in groups of ethical concepts, beginning with the units, then giving the pairs, then the groups of three, four, five, &c., up to ten. In the Dialogues the arrangement in such numbered groups is frequent. In an age when books, in our modern sense, were unknown, it was a practical necessity to invent and use aids to memory. Such were the repetition of memorial tags, of cues (as now used for a precisely similar purpose on the stage), to suggest what is to come. Such were also these numbered lists of technical ethical terms. Religious teachers in the West had similar groups—the seven deadly sins, the ten commandments, the four cardinal virtues, the seven Sacraments, and many others. These are only now, since the gradual increase of books, falling out of use. In the 5th century B.C. in India it was found convenient by the early Buddhists to classify almost the whole of their psychology and ethics in this manner. And the Anguttara Nikāya is based on that classification. In the last Nikāya, the *Saṃyutta* (The Clusters), the same doctrines are arranged in a different set of groups, according to subject. All the Logia (usually of the master himself, but also of his principal disciples) on any one point, or in a few cases as addressed to one set of people, are here brought together. That was, of course, a very convenient arrangement then. It saved a teacher or scholar who wanted to find the doctrine on any one subject from the trouble of repeating over, or getting some one else to repeat over for him, the whole of the Dialogues or the Anguttara. To us, now, the *Saṃyutta* seems full of repetitions; and we are apt to forget that they are there for a very good reason.

During the time when the canon was being completed there was great activity in learning, repeating to oneself, rehearsing in company and discussing these three collections. But there was also considerable activity in a more literary direction. Hymns were sung, lyrics were composed, tales were told, the results of some exciting or interesting talk were preserved in summaries of exegetical exposition. A number of these have been fortunately preserved for us in twenty-two collections, mostly of very short pieces, in the fifth or miscellaneous Nikāya, the *Khuddaka Nikāya*.

The text of the Dialogues fills about 2000 pages 8vo in the edition prepared for the Pali Text Society, of which five vols. out of six had been published in 1909, and the first had been translated into English. The *Saṃyutta*, of about the same size, and the Anguttara, which is a little smaller, have both been edited. Of the twenty-two miscellaneous books twenty have been edited (see Rhys Davids, *American Lectures* (1896), pp. 66-79), five have been translated into English and two more into German.

See *Dīgha Nikāya*, ed. Rhys Davids and Carpenter (3 vols.); *Saṃyutta Nikāya* (5 vols.), ed. Léon Feer, vol. vi. by Mrs Rhys Davids, containing indices; *Anguttara Nikāya*, ed. R. Morris and E. Hardy (5 vols.); all published by the Pali Text Society. Also Rhys Davids, *Dialogues of the Buddha*, vol. i. (Oxford, 1899); A. J. Edmunds, "Buddhist Bibliography," in *Journal of the Pali Text Society* (1903), pp. 5-12. (T. W. R. D.)

NIKĒ, in Greek mythology, the goddess of victory (Gr. νίκη). She does not appear personified in Homer; in Hesiod (*Theog.* 384) she is the daughter of the giant Pallas and Styx, and is sent to fight on the side of Zeus against the Titans. Nikē does not appear to have been the object of a separate cult at Athens. She was at first inseparably connected and confounded with Pallas Athena, the dispenser of victory, but gradually separated from her. As an attribute of both Athena and Zeus she is represented as a small figure carried by those divinities in their hand. Athena Nikē was always wingless, Nikē as a separate goddess winged. In works of art she appears carrying a palm branch or a wreath (sometimes a Hermes staff as the messenger of victory); erecting a trophy or recording a victory on a shield; frequently hovering with outspread wings over the victor in a competition, since her functions referred not only to success in war, but to all other human undertakings. In fact, Nikē gradually came to be recognized as a sort of mediator of success between gods and men.

At Rome the goddess of victory (Victoria) was worshipped from the earliest times. Evander was said to have erected a temple in her honour on the Palatine before the foundation of Rome itself (Dion. Halic. i. 32, 33). With the introduction of the Greek gods, Victoria became merged in Nikē. She always had a

firm hold over the Roman mind, and her popularity lasted till the end of paganism. Special games were held in her honour in the circus, and generals erected statues of her after a successful campaign. She came to be regarded as the protecting goddess of the senate, and her statue (originally brought from Tarentum and set up by Augustus in memory of the battle of Actium) in the Curia Julia (Dio Cassius li. 22; Suetonius, *Aug.* 100) was the cause of the final combat between Christianity and paganism towards the end of the 4th century. Victoria had altars in camp, a special set of worshippers and colleges, a festival on the 1st of November, temples at Rome and throughout the empire. The Sabine goddess Vicuna and Vica Pota, one of the *dii indigetes* (both of them goddesses of victory), are earlier varieties of Victoria (Livy xxix. 14). Representations of Nikē-Victoria in Greek and Graeco-Roman art are very numerous. The statue of Nikē at Olympia by Paeonius has been in great part recovered.

See A. Baudrillart, *Les Divinités de la victoire en Grèce et en Italie* (1894), whose view that in the 5th century Nikē became detached from Athena, although Athena Nikē still continued to exist, is supported by Miss J. E. Harrison (*Classical Review*, April 1895) and L. R. Farnell (*Cults of the Greek States*, i., 1896), but opposed by E. Sikes (*C.R.*, June 1895), who holds that "while Nikē was a late conception, Athena Nikē was still later, and that the goddess of victory cannot have originated, either at Athens or elsewhere, from an aspect of Athena"; F. Studniczka, *Die Siegesgöttin* (Leipzig, 1898); Preller-Robert, *Griechische Mythologie* (1894); O. Benndorf, *Über das Cultusbild der Athena Nike* (Vienna, 1879); G. Boissier, *La fin du paganisme* (1891); Gibbon, *Decline and Fall*, ch. 28.

In the article GREEK ART, fig. 32 represents Nikē pouring water over a sacrificial ox; fig. 36 the floating Nikē of Paeonius; figs. 61, 62 (Pl. iii.), the winged Nikē of Samothrace; the running or flying figure (fig. 19) is also possibly a Nikē.

NIKISCH, ARTHUR (1855–), Hungarian conductor, became known as a musical prodigy at an early age, making a public performance as a pianist at eight years old. He studied at the Vienna Conservatoire from 1866 to 1873, and while there he composed a symphony and other works. For a time he was engaged as a violinist, but in 1877 he began as assistant conductor at the Leipzig opera and two years later became chief conductor. His success there, and his reputation as the producer of the more modern types of music as well as of classical masterpieces led to his being appointed conductor of the symphony orchestra at Boston, U.S.A., from 1889 to 1893; and subsequently, after having been director at the Budapest opera, he was made conductor at the Leipzig Gewandhaus. His fame was now widespread, and he made successful visits to London, Paris and other capitals, his ability as a pianoforte accompanist being recognized as no less marked than his brilliance as director of an orchestra.

NIKITIN, ATHANASIUS, of Tver (fl. 1468–1474), Russian merchant, traveller and writer, the earliest known Russian visitor to India. He started in 1468 on his "wanderings beyond the Three Seas" (Caspian, Euxine and Indian Ocean), and descended the Volga, passing by Uglich, Kostroma, Nizhniy Novgorod, Kazan, Sarai and Astrakhan. Near the latter he was attacked and robbed by Tatars; but he succeeded in reaching Derbent, where he joined Vasili Papin, the envoy of Ivan III. of Moscow to the shah of Shirvan; from Nizhniy Novgorod he had travelled with Hasan Bey, the Shirvan shah's ambassador, returning to his master with a present of falcons from Ivan. At Derbent Nikitin vainly endeavoured to get means of returning to Russia; falling in this, he went on to Batu, where he notices the "eternal fires," and thence over the Caspian to Bokhara. Here he stayed six months, after which he made his way southward, with several prolonged stoppages, to the Persian Gulf, through Mazandaran province and the towns of Amul, Demavend, Ray (near Tehran), Kashan, Nain, Yezd, Sirjan, Tarun, Lar and Bandar, opposite New (or insular) Hormuz. From Hormuz he sailed by Muscat to Gujarat, Cambay and Chaul in western India. Landing at Chaul, he seems to have travelled to Umrut in Aurangabad province, south-east of Surat, and thence to Beder, the modern Ahmedabad. Here, and in adjacent regions, Nikitin spent nearly four years; from the little he tells us, he appears to have made his living by horse-dealing. From Beder he visited the Hindu sanctuary ("their Jerusalem") of Perwattum. He returned to Russia by way of Calicut, Dabul, Muscat, Hormuz, Lar, Shiraz, Yezd, Isfahan, Kashan, Sultanieh, Tabriz, Trebizond and Kaffa (Theodosia) in the Crimea. He has left us descriptions of western Indian manners, customs, religion, court-ceremonies, festivals, warfare and trade, of some value; but the text is corrupt, and the narrative at its best is confused and meagre. His remarks on the trade of Hormuz, Cambay, Calicut, Dabul, Ceylon, Pegu and China; on royal progresses and other functions, both ecclesiastical and civil, at Beder; and on the wonders of the great fair at Perwattum—as well as his comparisons of things Russian and Indian—deserve special notice.

Two MSS. are known: (1) in the library of the cathedral of St Sophia in Novgorod; (2) in the library of the Troïtsa Monastery (Troitsko-Sergievskaya Lavra) near Moscow. See also the edition by Pavel Mikhailovich Stroev in *Sofiiskiĭ Vremennik* (A.D. 862–1534), pt. ii. pp. 145-164 (Moscow, 1820–1821); and the English version in *India in the 15th Century*, pp. lxxiv.-lxxx.; 1-32 (separately paged, Nikitin's being the third narrative in the volume, translated and edited by Count Wielhorski; London, Hakluyt Society, 1857). (C. R. B.)

NIKKO, one of the chief religious centres of Japan. The name belongs properly to the district, but is as commonly applied to the principal village, Hachi-ishi, which is 91 m. N. of Tokyo by rail. The district is high-lying, mountainous and beautiful, and is in favour for summer residence. The chief mountain range is known as Nikko-Zan (Mountains of the Sun's Brightness). A Shinto temple seems to have existed at Nikko from time immemorial, and in 767 its first Buddhist temple was founded by Shodo Sho-nin (the subject of many strange legendary adventures); but the main celebrity of the place is due to the sepulchres and sanctuaries of Iyeyasu and Iyemitsu, the first and third shoguns of the Tokugawa dynasty. Iyeyasu was buried with amazing pomp in 1617, and Iyemitsu, his grandson, was slain in 1650 while visiting his tomb. From 1644 to 1868 the "abbots" of Nikko were always princes of the imperial blood; thirteen of them are buried within the sacred grounds. Though the magnificent abbots' residence was destroyed by fire in 1871, and the temples have lost most of their ritual and much of their material splendour, enough remains to astonish by excellence and bewilder by variety of decorative detail. Of the numerous structures which cluster round the shrine of Iyeyasu, it is sufficient to mention the cylindrical copper column (1643), a guardian against evil influences, 42 ft. high, adorned at the top with a series of lotus flowers, from the petals of which hang small bells; a five-storied pagoda (1659), 104 ft. high, with the signs of the zodiac carved round the base; the gate of the Two Kings, with its figures of unicorns, lions, tigers, elephants, mythical animals and tree-peonies; the vermilion-coloured timber enclosure to which this gate gives entrance, with three great storehouses, a sumptuous stable for the sacred horses, and a finely fashioned granite cistern (1618) for holy water; and the Yo-mei-mon gate, which with the contiguous cloister is covered with the most elaborate carving, and gives access by way of another gate (Kara-Mon) to the court in the midst of which stands the last and most sacred enclosure. This, known as the *Tamagaki*, is a quadrangle of gilt trellis-work 50 yds. square; within it stands the "chapel" or oratory (or rather a series of chambers), in the decoration of which gilding and black lacquer have been lavishly employed. The tomb of Iyeyasu lies apart about two hundred steps higher up the hills, in the shadow of tall cryptomerias—a single light-coloured bronze urn or casket standing on a circular base of three steps with a stone table in front on which rest a censer, a lotus-cluster and a stork with a candlestick in its mouth, the whole enclosed by a high stone wall. Somewhat similar are the tomb of Iyemitsu and its surroundings; and though the art displayed is of an inferior character, the profusion of buildings and embellishments is even more remarkable. Hotoké Iwa, the hill on which the tomb stands, is completely covered to the summit with trees of various tints. There are numerous temples and shrines of minor interest in the locality.

NIKOLAYEV, a town, seaport and chief naval station of Russia on the Black Sea, in the government of Kherson, 40 m. N.W. of the city of Kherson. Pop. (1881) 35,000; (1891) 77,210; (1897) 92,060. Nikolayev stands a little above the

confluence of the Ingul with the Bug, at the head of the *liman*, or estuary, of the Bug, and is the natural outlet for the basin of that river. The estuary, which is 25 m. long, enters that of the Dnieper. The entrance to the double estuary is protected by the fortress of Ochakov and by the fort of Kinburn, erected on a narrow headland opposite, while several forts surround Nikolayev on both sides of the Bug and protect it from an attack by land. Over the bar at Ochakov the water has been deepened to 25 ft., and over the bar of the Dnieper to 20 ft. by dredging. The town, which occupies two flat peninsulas between the Bug and the Ingul, extends up the banks of the latter, while its suburbs reach still farther out into the steppe. The streets are wide, and intersect one another at right angles. The bank of the Ingul is taken up with shipbuilding yards, docks, slips and various workshops of the admiralty for the construction of armour-plates, guns, boilers, &c. On the river there is a floating dock for armoured ships. Before the Crimean War the activity of the dockyards was very great; the suburbs—which belong to the admiralty—were bound to supply the necessary hands to the number of 3000 every day, and all the inhabitants had to perform compulsory service. Since 1870 the construction of armoured ships and torpedo-boats has been carried on here. From 1893 Nikolayev was the chief port for the Russian volunteer fleet, which sailed to and fro between this port and Vladivostok until the Russo-Japanese War of 1904–05. Nikolayev has steam flour-mills, iron and machinery works, saw-mills, soap, tobacco, vinegar, carriage and agricultural machinery works. The foreign exports consist almost entirely of cereals, especially wheat and rye, with a little sugar, iron and manganese ore and oilcake. The total value reaches £7,000,000 to £9,000,000 annually. Navigation is maintained during the whole winter by the aid of a powerful ice-breaker. Nikolayev is the chief market for the governments of Kherson, Poltava, Kharkov, Ekaterinoslav and parts of Kiev, Kursk and Podolia. In addition to the naval harbour, there are the harbour of the Russian Steamship Company and the coasting harbour, made in 1893; while large storehouses stand close to the commercial port, 2 m. from the town, at Popovaya-Balka on the Bug. The educational institutions include an artillery school, a school of navigation, two technical schools, an astronomical and meteorological observatory, museums and libraries, and a hydrographical institute. Amongst the public buildings, the cathedral, which contains some good Italian pictures, the theatre, the artillery arsenal, the admiralty and other state buildings are worthy of mention.

The remains of the Greek colony *Olbia* have been discovered close to the confluence of the Ingul with the Bug, 10 m. S. of Nikolayev. In medieval times the country was under the Lithuanians, and subsequently under the Zaporogian Cossacks. Russian colonists settled in the locality about the end of the 18th century, and after the fall of Ochakov, Prince Potemkin established (1789) a wharf on the Ingul which received the name of Nikolayev. (P. A. K.; J. T. Bz.)

NIKOLAYEVSK, a town of East Siberia, in the Maritime province, on the left bank of the Amur, 20 m. above its outflow into the Gulf of Amur, in 53° 8′ N. Pop. (1897) 8200. It is defended by a fort and batteries. Founded in 1851, Nikolayevsk was formerly the capital of the Maritime province.

NIKOLAYEVSK, a town of Russia, in the government of Samara, on the right bank of the Irgiz, 40 m. from the Volga and 100 m. S.W. of the town of Samara. Pop. (1897) 12,524. Its inhabitants are mostly Raskolniks (*i.e.* Nonconformists), who have numerous monasteries along the river, and members of the United Greek Church, with about 2000 Tatars. The chief occupations are agriculture and live stock breeding.

Under the name of Mechetnoye, Nikolayevsk was founded in 1762 by Raskolniks who had fled to Poland and returned when Catherine II. undertook to grant them religious freedom. In 1828 serious persecutions began, with the result that the monasteries were closed with the exception of three, which were handed over in 1829 and 1836 to the United Greek Church. In 1835 the name of the town was changed to Nikolayevsk.

NIKOLAYEVSKAYA, SLOBODA, a town of Russia in the government of Astrakhan, 3 m. from the left bank of the Volga, opposite Kamyshin, and 110 m. N. of Tsaritsyn. Pop. (1897) 20,000. It dates from the end of the 18th century, when a number of Little Russians settled there for the transport of salt from Lake Elton. It is one of the chief centres on the lower Volga for the trade in corn and salt.

NIKOLSBURG (Czech, *Mikulov*), a town of Austria, in Moravia, 53 m. S. of Brünn by rail. Pop. (1900) 8091. It is situated at the foot of the Polau Mountains and near the border of Lower Austria. It possesses a château of Prince Dietrichstein-Mensdorff, which contains an extensive library, with some valuable manuscripts. The Heiliger Berg, in the immediate vicinity, has sixteen chapels, and a church in the Byzantine style. The principal resources are viticulture, the manufacture of cloth, and trade in lime and limestone. On the 31st of December 1621 peace was concluded here between the emperor Ferdinand II. and Bethlen Gabor, prince of Transylvania; and on the 26th of July 1866 a preliminary treaty of peace between the Prussians and the Austrians was signed here.

NIKON [Nikita Minin] (1605–1681), 6th patriarch of Moscow, Russian reformer and statesman, son of a peasant farmer named Mina, was born on the 7th of May 1605 in the village of Valmanovo, 90 versts from Nizhny Novgorod. Misery pursued the child from his cradle, and prematurely hardened a character not naturally soft; he ran away from home to save his life from an inhuman stepmother. But he gave promise betimes of the energy and thoroughness which were to distinguish him throughout life, and contrived to teach himself reading and writing. When he was but twenty his learning and talents obtained for him a cure of souls. His eloquence attracted attention, and, through the efforts of some Moscow merchants, he was transferred to a populous parish in the capital. Shortly afterwards, seeing in the loss of his three little children a providential warning to seek the higher life, he first persuaded his wife to take the veil and then withdrew himself first to a desolate hermitage on the isle of Anzersky on the White Sea, and finally to the Kozhuzersky monastery, in the diocese of Novgorod, of which he became abbot in 1643. On becoming a monk he took the name of Nikon. In his official capacity he had frequently to visit Moscow, and in 1646 made the acquaintance of the pious and impressionable Tsar Alexius, who fell entirely under his influence. Alexius appointed Nikon archimandrite, or prior, of the wealthy Novospassky monastery at Moscow, and in 1648 metropolitan of Great Novgorod. Finally (1st of August 1652) he was elected patriarch of Moscow. It was only with the utmost difficulty that Nikon could be persuaded to become the archpastor of the Russian Church, and he only yielded after imposing upon the whole assembly a solemn oath of obedience to him in everything concerning the dogmas, canons and observances of the Orthodox Church.

Nikon's attitude on this occasion was not affectation, but the wise determination of a would-be reformer to secure a free hand. Ecclesiastical reform was already in the air. A number of ecclesiastical dignitaries, known as the party of the protopopes (deans), had accepted the responsibility for the revision of the church service-books inaugurated by the late Patriarch Joasaf, and a few other very trivial rectifications of certain ancient observances. But they were far too timid to attempt anything really effectual. Nikon was much bolder and also much more liberal. He consulted the most learned of the Greek prelates abroad; invited them to a consultation at Moscow; and finally the scholars of Constantinople and Kiev opened the eyes of Nikon to the fact that the Muscovite service-books were heterodox, and that the ikons actually in use had very widely departed from the ancient Constantinopolitan models, being for the most part imitations of later Polish and Frankish (West European) models. He at once (1654) summoned a properly qualified synod of experts to re-examine the service-books revised by the Patriarch Joasaf, and the majority of the synod decided that "the Greeks should be followed rather than our own ancients." A second council, held at Moscow in 1656, sanctioned the revision of the

service-books as suggested by the first council, and anathematized the dissentient minority, which included the party of the protopopes and Paul, bishop of Kolomna. Heavily weighted with the fullest ecumenical authority, Nikon's patriarchal staff descended with crushing force upon the heterodox. His scheme of reform included not only service-books and ceremonies but the use of the "new-fangled" ikons, for which he ordered a house-to-house search to be made. His soldiers and servants were charged first to gouge out the eyes of these "heretical counterfeits" and then carry them through the town in derision. He also issued a *ukas* threatening with the severest penalties all who dared to make or use such ikons in future. This ruthlessness goes far to explain the unappeasable hatred with which the "Old Ritualists" and the "Old Believers," as they now began to be called, ever afterwards regarded Nikon and all his works.

From 1652 to 1658, Nikon was not so much the minister as the colleague of the tsar. Both in public documents and in private letters he was permitted to use the sovereign title. Such a free use did he make of his vast power, that some Russian historians have suspected him of the design of establishing "a particular national papacy"; and he himself certainly maintained that the spiritual was superior to the temporal power. He enriched the numerous and splendid monasteries which he built with valuable libraries. His emissaries scoured Muscovy and the Orient for precious Greek and Slavonic MSS., both sacred and profane. But his severity raised up a whole host of enemies against him, and by the summer of 1658 they had convinced Alexius that the sovereign patriarch was eclipsing the sovereign tsar. Alexius suddenly grew cold towards his "own familiar friend." Nikon thereupon publicly divested himself of the patriarchal vestments and shut himself up in the Voskresensky monastery (19th of July 1658). In February 1660 a synod was held at Moscow to terminate "the widowhood" of the Muscovite Church, which had now been without a pastor for nearly two years. The synod decided not only that a new patriarch should be appointed, but that Nikon had forfeited both his archiepiscopal rank and his priest's orders. Against the second part of this decision, however, the great ecclesiastical expert Epifany Slavenitsky protested energetically, and ultimately the whole inquiry collapsed, the scrupulous tsar shrinking from the enforcement of the decrees of the synod for fear of committing mortal sin. For six years longer the Church of Muscovy remained without a patriarch. Every year the question of Nikon's deposition became more complicated and confusing. Almost every contemporary orthodox scholar was consulted on the subject, and no two authorities agreed. At last the matter was submitted to an ecumenical council, or the nearest approach to it attainable in the circumstances, which opened its sessions on the 18th of November 1666 in the presence of the tsar. On the 12th of December the council pronounced Nikon guilty of reviling the tsar and the whole Muscovite Church, of deposing Paul, bishop of Kolomna, contrary to the canons, and of beating and torturing his dependants. His sentence was deprivation of all his sacerdotal functions; henceforth he was to be known simply as the monk Nikon. The same day he was put into a sledge and sent as a prisoner to the Therapontov Byelozersky monastery. Yet the very council which had deposed him confirmed all his reforms and anathematized all who should refuse to accept them. Nikon survived the tsar (with whom something of the old intimacy was resumed in 1671) five years, expiring on the 17th of August 1681.

NIKOPOL, a town of Russia, in the government of Ekaterinoslav, on the right bank of the Dnieper, 70 m. S.S.W. of the town of Ekaterinoslav. It was formerly called Nikitin Rog, and occupies an elongated peninsula between two arms of the Dnieper at a point where its banks are low and marshy, and has been for centuries one of the places where the middle Dnieper can most conveniently be crossed. Its inhabitants, 21,282 in 1900, are Little Russians, Jews and Mennonites, who carry on agriculture and shipbuilding. The old *secha*, or fortified camp of the Zaporogian Cossacks, brilliantly described in N. V. Gogol's novel *Taras Bulba* (1834), was situated a little higher up the river. Numbers of graves in the vicinity recall the battles which were fought for the possession of this important strategic point. One of them, close to the town, contained, along with other Scythian antiquities, the well-known precious vase representing the capture of wild horses. Even now Nikopol, which is situated on the highway from Ekaterinoslav to Kherson, is the point where the "salt-highway" of the Chumaks (Little Russian salt-carriers) to the Crimea crosses the Dnieper. Nikopol is, further, one of the chief places on the lower Dnieper for the export of corn, linseed, hemp and wool.

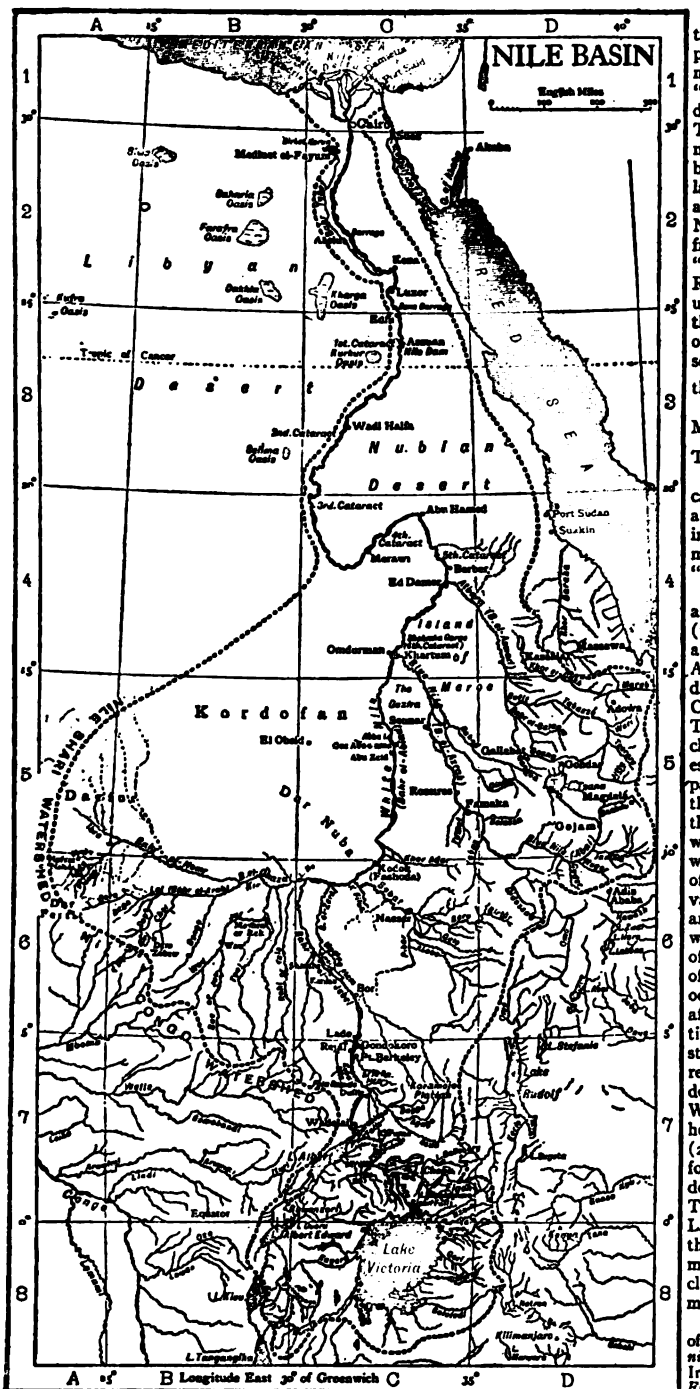
NIKOPOLI, or NICOPOLIS (Turkish, Nighebolu or Nebul), the chief town of a sub-prefecture in the district of Plevna (Pleven), Bulgaria. Pop. (1908) 5236, including 3339 Turks and 1615 Bulgarians. Nikopoli is picturesquely situated on the south bank of the Danube, where it receives the Osem. Until the creation of a new port at Somovit, in the neighbourhood, Nikopoli served as an outlet for the trade of Plevna, Lovtcha and other towns in the interior, the principal export being cereals. The chief industries are tanning and fishing. As a military post the town has for centuries been important. A ruined castle still dominates the place, and fortifications stretch down to the river.

Nikopoli occupies the site of the ancient Asamus, but by some medieval confusion bears the name of Nicopolis ad Istrum, which was founded by Trajan several miles down the river, at the inflow of the Iatrus or Yantra, at the spot still called Nikup. The following are the chief points in the modern history of the place:—capture of the fortress by Sigismund of Hungary in 1392 and 1395; defeat of Sigismund and his hosts in 1396 by Bayezid I.; siege of the town by King Ladislaus I. of Hungary in 1444; defeat of the Turks by Bathori in 1595 and by Michael of Walachia in 1598; capture of the town by Pasvan-oglu in 1797; occupation of the fortress by the Russians under Kamensky in 1810; destruction of the Turkish flotilla and storming of the Turkish camp by Govarov in 1829; capture and burning of the town by the Russians under Krüdener on the 15th of June 1877.

NIKSHICH (also written NIKSHITCH and NIKSHITI; Croatian, *Nikšić*), a town of Montenegro, lying in a flat plain enclosed by lofty mountains on the north-west, and watered by the river Zeta. Pop. (1900) about 3500. Owing to the prevalence of floods, a long viaduct, a gift from Russia, was raised between the town and the mountain road which leads to Podgoritsa, 60 m. S.E. Nikshich consists of a mass of white houses, dominated by the belfry and the pale yellow cupola of its cathedral, another gift from Russia. This building is chiefly Byzantine in style, and, though hardly beautiful, is the most impressive and by far the largest of Montenegrin churches. Close by stands a barrack-like royal palace; and a little beyond the town are the ruins of an old castle. As Nikshich possesses a brewery and a clothmill, besides being the chief mart of Western Montenegro for timber, hides, farm-produce and livestock, it ranks second in commercial importance to Podgoritsa. About 12 m. S.E. is the celebrated shrine of Ostrog (see MONTENEGRO). Nikshich was included in the Turkish province of Herzegovina until 1876, in which year it was stormed by the Montenegrins, led by Prince Nicholas in person. In 1878 the Montenegrin possession was ratified by the treaty of Berlin.

NILE, the longest river of Africa, and second in length of all the rivers of the globe, draining a vast area in north-east Africa from the East African lake plateau to the shores of the Mediterranean. Although falling short of the length of the Mississippi-Missouri (4194 m. according to the estimate of General Tillo[1]) the Nile is at the head of all rivers as regards the length of its basin, which extends through 35° of latitude or 2450 m. in a direct line, with a waterway of about 4000 m. The Nile proper, *i.e.* from the outlet at Victoria Nyanza to the sea, is 3473 m. long.

[1] General Alexi A. Tillo (1839–1900), Russian scientist and geographer, author of works on geodesy, meteorology, &c.



The Name.—The early Egyptians called this river by a name which was probably pronounced Hap. It seems to be connected with a root meaning "concealed," "mysterious." This survived as a religious designation down to the fall of paganism. The "great river" was also a frequent name for the main stream, and this became the usual name of the Nile in late times as Ier-'o and continued in use amongst the Copts. In the Bible the Nile is regularly named Yeôr (יְאֹר, יְאוֹר), from the contemporary Egyptian Yor, "river." The origin of the Greek and Roman name Νεῖλος, *Nilus*, is quite unknown. Αἴγυπτος in the *Odyssey* is the name of the Nile (masc.) as well as of the country (fem.). The Arabs preserved the classical name of the Nile in the proper name En-Nîl النيل, or Nîl-Misr نيل مصر, the Nile of Misr (Egypt). The same word signifies indigo.[1]

The modern Egyptians commonly call the river El-Bahr, "the sea," a term also applied to the largest rivers, and the inundation "the Nile," En-Nîl; and the modern Arabs call the river Bahr-en-Nîl "the river Nile."

Basin of the River.—The Nile system is a simple one with three principal divisions: (1) the main stream running south to north, and fed by the great lakes of East Central Africa; (2) the equatorial tributary rivers draining the country north-east of the Congo basin; (3) the Abyssinian affluents. The extent of the basin of the Nile is clearly indicated on the map. Its area is estimated at 1,107,227 sq. m., which compares with the 1,425,000 sq. m. area of the Congo basin. The smaller basin of the longer river is due to its narrowness when passing through the Sahara. Southward the basin includes the northern part of the plateau between the two "Rift" valleys which traverse that part of Africa, and also that portion of the Albertine (or western) "Rift" valley which lies north of the Mfumbiro mountains. That part of the plateau within the Nile basin is occupied by the Victoria Nyanza and its affluents. These affluents drain a comparatively small part of this plateau, which stretches south to Lake Nyasa. The most remote feeder of the Nile in this direction does not extend farther than 3° 20′ S. West and W.S.W. of Victoria Nyanza, however, the Nile basin reaches 3° 50′ S. (264 m. south of the equator) and 29° 15′ E., following the crest of the hills which dominate the north-eastern shores of Lake Tanganyika and the eastern shores of Lake Kivu. Turning north-westward from this point the Nile basin crosses the mountainous region of Mfumbiro and includes that of Ruwenzori. Its limit is marked by the western wall of the

[1] "*En-Nîl* is the river (lit. the inundation) of Egypt: Es-Saghânî says—'But as to the *nîl* [indigo] with which one dyes, it is an Indian word Arabicized'" (*The Misbâh of El-Fayûmi*).

Albertine Rift valley, in which lie the Albert Edward and Albert Nyanzas. For a considerable distance the water-parting between the Congo and the Nile is close to the Albert Nyanza and to the Nile as it flows from that lake, but not far north of Wadelai (2° 46′ N.) the hills recede and the Nile basin expands westward, over the wide area drained by the Bahr-el-Ghazal and its tributaries. In this region there is no well-marked watershed between the Congo and Nile systems, which interlace. Farther north the limit of the valley is marked by the hills of Darfur. Below that point the valley of the Nile extends but a mile or two into the desert.

The south-eastern limits of the Nile basin extend nearly to the western escarpment of the eastern Rift valley—the dividing plateau being a narrow one. North of the equator a bend is made westward to Mt. Elgon, which on the north-east sends its water towards Lake Rudolf. From Mt. Elgon the Nile watershed is some distance to the west of that lake, while to its north a turn is made again, the watershed including a great part of the Abyssinian highlands. Beyond 15° N. it follows a line generally parallel to the west shore of the Red Sea, except where diverted to the west by the basin of the Khor Baraka.

Sources of the Nile.—The question of the sources of the Nile opens up a time-honoured controversy (see under *Story of Discovery* below). Victoria Nyanza (*q.v.*) is the great reservoir whence issues the Nile on its long journey to the Mediterranean. But if the source of the river be considered to be the most remote headstream (measured by the windings of the stream), the distinction belongs to one of the upper branches of the Kagera. Among the feeders of Victoria Nyanza the Kagera is by far the most important, both for length of course and volume of water carried, draining the region of greatest rainfall round Lake Victoria. Three chief branches unite to form the Kagera, and of these the most important for the volume of water carried is said to be the Nyavarongo. The Nyavarongo is formed by the union of various mountain streams, the Rukarara and the Mhogo being the chief. The Rukarara rises in about 2° 20′ S., 29° 20′ E., at an elevation of some 7000 ft., in a picturesque and bracing region immediately east of the Albertine Rift valley. The Nyavarongo first flows north to about 1° 40′ S., then turning in a sharp bend east and south, and on again reaching 2° 20′ S., unites with the Akanyaru just west of 30° E. The Akanyaru, which comes from the south-west, has been sometimes considered the larger stream, but according to Dr Richard Kandt it carries decidedly less water, while its course is shorter than that of the Nyavarongo. The combined stream takes an easterly and southerly direction, flowing in a swamp valley and joining a little west of 31° E. the third branch of the Kagera, the Ruvuvu, coming from the south. The source of the Ruvuvu is in about 2° 55′ S., 29½° E., but its most southern tributary, and the most distant stream sending its waters towards the Nile, is the Lavironza. The Lavironza rises in about 3° 45′ S., 29° 50′ E., and flows north-east, joining the Ruvuvu, which has hitherto had an easterly direction, in about 30° 25′ E., 3° 10′ S. From this point the Ruvuvu flows east and north to its junction with the Nyavarongo. From this confluence the combined stream of the Kagera flows north and north-west in a level valley strewn with small lakes until almost 1° S., when it turns east, and finally empties itself into Victoria Nyanza just north of 1° S., the mouth forming a small projecting delta. Its lower course is navigable by shallow draught steamers. The total length of the Kagera, reckoning from the source of the Nyavarongo, is some 430 m. Its volume is stated to vary between 21,000 and 54,000 cub. ft. per second. All the other feeders of Victoria Nyanza are small and often intermittent rivers, the largest being probably the Nzoia, which enters on the north-east from the plateaus south of Mount Elgon. (The rivers which enter Albert Edward and Albert Nyanzas and, with those lakes, form the western sources of the Nile, are dealt with under ALBERT NYANZA and ALBERT EDWARD NYANZA.)

The Victoria or Somerset Nile.—The ridge of high land which forms the northern shore of Victoria Nyanza is broken at its narrowest part, where the pent-up waters of the lake—through which a drift from the Kagera inlet to the Nile outlet is just perceptible—have forced a passage at the northern end of a beautiful bay named Napoleon Gulf. At this spot, 30 m. north of the equator, at an altitude of 3704 ft., the Nile issues from the lake between cliffs 200 and more ft. high with a breadth of some 500 yds. The scene is one of much grandeur. The escaping water precipitates itself over a rocky ledge with a clear fall of 16½ ft. The falls, some 300 yds. across, and divided into three channels by two small wooded islands, are named the Ripon Falls, after Earl de Grey and Ripon (afterwards 1st marquess of Ripon), president of the Royal Geographical Society in 1859. The Victoria or Somerset Nile, as this section is called, has at first the character of a mountain stream, racing swiftly through a rocky channel often walled in by cliffs (at times 180 ft. high) and broken by picturesque islands and countless rapids. It receives the waters of several streams, which, rising within a few miles of the Victoria Nyanza, flow north. For 133 m. its course is N.N.W., when, on being joined by the river Kafu (on which Fort Mruli stands), about 1° 39′ N., 32° 20′ E., it takes the north-east direction of that channel, and it is not till 2° N. that the river again turns westward towards the Albert Nyanza. Seventy miles below the Ripon Falls the Nile enters a marshy lake of irregular outline, running mainly east and west, and known as Kioga (or Choga). The current of the Nile is clearly discernible along the western shore of this lake, which is 3514 ft. above the sea. Eastwards the lake breaks into several long arms, which receive the waters of other lakes lying on the plain west of Mount Elgon. One of these, named Lake Salisbury, lies in 1° 40′ N. and 34° E.; east of this lake and connected with it is Lake Gedge. Lake Kioga also receives the Mpologoma, a river which rises in the foothills of Elgon and flows east and north, attaining a width of 1½ m.; and from the south (west of the Nile) a broad lacustrine river, the Seziwa. The Kioga lake system, lying north of the ridge which separates it from Victoria Nyanza, owes its formation in part to the waters pouring down from the Nyanza, and is in the nature of a huge Nile backwater. The lake itself is rarely more than 20 ft. deep; its greatest length is 85 m.; its greatest width 10 m. Below Mruli, the fall in the bed levels of the Nile, which up to this point has been comparatively gradual, increases considerably. At Karuma, where the western bend to the Albert Nyanza is made, the river falls over a wall-like ledge of rock, 5 ft. high, which extends across its bed. But the great feature of the Victoria Nile are the Murchison Falls (named by Sir Samuel Baker, their discoverer, after Sir Roderick Murchison, the geologist), situated in 2° 18′ N. and 31° 50′ E. At this point the river rages furiously through a rock-bound pass, and, plunging through a cleft less than 18 ft. wide, leaps about 130 ft. into a spray-covered abyss. Downstream from these falls the river flows for some 14 m. between steep forest-covered hills, a wide and noble stream with a current so slow and steady that, at certain seasons, it is only from the scarcely perceptible drifting of the green water-plants called *Pistia Stratiotes* that it can be observed. About 24 m. below the Murchison Falls and 254 m. from the Victoria Nyanza the river enters, through a wide delta, and across a formidable bar, the N.E. end of Albert Nyanza. In its passages from the one lake to the other the Nile falls altogether about 1400 ft. Taking its name from a fort which once existed there, the delta district is known as Magungo.

From Albert Nyanza to the Plains.—Issuing from the north-west corner of Albert Nyanza some 5 m. from the spot where it entered that lake, the Nile, which is now known as the Bahr-el-Jebel, or Mountain river, flows in a generally northerly direction. As far as Dufile, 130 m. below Magungo, it has a gentle slope, a deep channel and a current generally slight. It forms a series of lake-like reaches often studded with reedy islands. Immediately below Dufile the Kuku mountains on the west and the Arju range on the east close in upon the river, which, from an average width of 700 yds., narrows to 230 yds. Here the hills cause the stream to make a sharp bend from the north-east to the north-west. Four or five miles lower down the river widens to 400 yds., and a large island divides the stream, the eastern channel carrying the main volume of water. This island marks the beginning of the Fola Rapids. At its southern end the water falls some 20 ft., and then, like a gigantic mill-race, rushes through a gorge 330 ft. long and nowhere more than 52 ft. wide, to leap into a deep cavity not more than 40 ft. across. Escaping from this "cauldron" the waters thunder on in a succession of rapids, which extend beyond the northern end of the island. In all the Fola Rapids are nearly 2 m. long. For the next 80 m. the Nile, save for the great volume of water, resembles a mountain torrent, its course interrupted by continual rapids. The last of these occurs at Bedden, where the river breaks through a line of low hills running athwart its channel. One of these hills forms an island in mid-stream. Below Bedden various stations are established upon the river. Fort Berkeley, in 4° 40′ N. (on the right bank), is the nearest to the rapids. Then follow Rejaf (left bank), Gondokoro (right bank) and Lado (left bank), all within 30 m. of one another. A striking feature of the scenery at Rejaf is a cone-shaped hill, about 370 ft. high, crowned by rocks which have the appearance of the ruins of an ancient castle. At Gondokoro the Nile is clear of the hill country, and enters a vast swamp-like expanse through which it flows with a very low slope and a very tortuous channel.

Between Albert Nyanza and the swamp region the Bahr-el-Jebel is joined by many streams. The most important of these affluents is the Asua (nearly 200 m. long), which enters the main stream from the east in 3° 50′ N. (19 m. N. of Dufile), but has little water in the dry season. The Asua and its subsidiary streams rise on the western versant of the Karamojo plateau and among the mountain ranges which run off from that plateau to the north-west, the most remote head-stream running originally due south.

The Region of Swamps.—The wide valley which the Nile enters at Gondokoro slopes so gradually towards the north that the river falls only some 182 ft. in a stretch of 475 m. Through this valley the river winds in an extremely tortuous course. Its channel has no banks, and the overflow has caused extensive swamps which are covered by a mass of papyrus and tall reeds, and are traversed by numerous shallow lagoons or "mayyas." The shape of these lagoons is constantly altering, as also is that of the channels connecting them with the river. About 8 m. below Bor, many of the eastern "spills" unite and form a stream of considerable breadth, with a strong

current. This stream, which is known to the Dinkas as the Atem, follows a course generally parallel to the Jebel, being bounded eastward by forest land. Opposite Kanisa (6° 46′ N.), on the main river, the Atem divides into two channels, marshy land extending at this point a great distance to the east. The western branch, or Awai, rejoins the Jebel near Shambé 7° 6′ N. The eastern branch or Myding continues through the marshes, eventually joining the Bahr-el-Zeraf (see below) in its lower course.

Except for the Atem divergence the Nile, despite the swamps through which it passes, maintains a fairly definite course, with a considerable depth of water as far as Shambé, where, to the west, is a large lagoon. Five miles lower down the river splits into two great channels. That to the left, the main stream, continues to be known as Bahr-el-Jebel, but is sometimes called by its Dinka name Kir. The right branch, or Bahr-el-Zeraf (Giraffe river), has a more easterly direction, and does not rejoin the main river until 50 m. below its confluence with the Bahr-el-Ghazal (*q.v.*). From the point of bifurcation the Bahr-el-Jebel flows for 230 m. in a general north-westerly direction until it is joined by the Bahr-el-Ghazal coming from the south-west. The whole region is a vast expanse of low land crossed by secondary channels, and flooded for many miles in the rainy season. At the junction of the Bahr-el-Ghazal and the Bahr-el-Jebel in 9° 29′ N. the permanently submerged area is usually named Lake No, but the Arabs call it *Moghren-el-Bohur* (meeting of the rivers). Lake No in the rains covers about 50 sq. m. In the Bahr-el-Jebel occur the great accumulations of "sudd" (*q.v.*), masses of floating vegetation which obstruct and, if not removed, prevent navigation. The aspect of the river throughout the sudd region is monotonous and depressing. On all sides stretch reaches of the reed known as *um suf* or mother of wool (*Vossia procera*), ambach, Bus and papyrus. These grasses rise 15 to 20 ft. above the water, so as often to close the view like a thick hedge. The level of the flat expanse is broken only at intervals by mounds of earth, erected by the white ants and covered with a clump of brushwood or trees; the moisture in the air is excessive; mosquitoes and other swamp flies swarm in myriads. And yet touches of beauty are not wanting. Water-lilies (*Nymphaea stellata* and *Nymphaea Lotus*)—white, blue and crimson—often adorn the surface of the stream. Occasionally the rare and odd-looking whale-headed stork or *Balaeniceps rex* is met with among the reeds, and at night the scene is lit up by innumerable fire-flies.

The White Nile.—From the confluence with the Bahr-el-Ghazal at Lake No, the main stream, which here takes the name of Bahr-el-Abiad, or White river, adopts the easterly course of the tributary stream. Forty miles below the point where the Bahr-el-Zeraf reunites with the main branch, the Nile receives its first great eastern affluent—the Sobat (*q.v.*), whose head-streams rise in the mountains of south-west Abyssinia and the region north of Lake Rudolf. Just above the Sobat junction the Nile resumes its northern course. It passes through a great alluvial plain, stretching from the spurs of the Abyssinian highlands in the east, to the hilly districts of Kordofan in the west, and covered with high grass and scattered bush. The swamps still bound it on either bank, but the river again flows in a well-marked channel with defined banks. About 56 m. below the Sobat mouth, in 9° 55′ N., lies (on the left bank) Fashoda (renamed in 1904 Kodok), an Egyptian town founded in 1867 on the site of Denab, the old "capital" of the Shilluks, and famous for the crisis between England and France in 1898 through its occupation by the French officer Marchand. For the next 270 m. the scenery is very monotonous. The river flows in a wide channel between broad swamps bordered by a belt of forest on either bank. At Abu Zeid (about 13° 5′ N.) for a distance of nearly 4 m. the river is extremely broad and shallow, being fordable at low water. Fifteen miles lower down, at Goz Abu Goma—which is the northern limit of the sudd vegetation—the river is divided into two channels by Abba Island, wooded, narrow and 28 m. long. On Abba Island lived, for some years before 1881, Mahommed Ahmed, the Mahdi.

The Blue Nile.—Five hundred and twenty miles below the Sobat mouth and 1652 m. from Ripon Falls, in 15° 37′ N., the White Nile is joined by its greatest eastern confluent the Bahr-el-Azrak or Blue Nile. In the fork of the two rivers stands Khartum,[1] the capital of the Anglo-Egyptian Sudan, whilst on the western bank of the White Nile is Omdurman, the former Mahdist capital. The Blue Nile, or Abai as it is called in Abyssinia, rises in the Gojam highlands in 11° N. and 37° E., and flowing northwards 70 m. enters Lake Tsana (*q.v.*) near its south-west corner, to issue again at the south-east end. The Abai and its tributaries drain a great part of the Abyssinian plateau. The complicated river system is best understood by a study of the map. The Abai itself on leaving Lake Tsana makes a great semicircular sweep S.E. to N.W., from the highlands of Ethiopia to the plains of Sennar. In this section of its course its swirling waters rush over a long series of cataracts and rapids, descending from a height of 5770 ft. at the outlet to about 1400 ft. at Fazokl or Famaka (11° 17′ N., 35° 10′ E.), where it crosses the Abyssinian frontier, and flows through the plains of Sennar to its confluence with the White Nile at Khartum, 1300 ft. above sea-level. Of the tributaries of the Abai the majority join it on its left bank. The Bashilo, Jamma and Muger, which reach the Abai in the order named, drain the country east of the main stream between the basins of the Takazze and the Hawash. The Guder, with a south to north course, rises in the mountains which form the watershed between the Nile and the Lake Rudolf basin. Next comes the Didessa, a large stream rising near the head-waters of the Baro (the main upper branch of the Sobat) and flowing N.W. to the Abai, the confluence being in about 10° N., 35° 40′ E. It has an early rise and a long flood period, being by far the most important tributary of the Blue Nile. The Dabus or Yabus rises about 9° N., 34° 30′ E., and flowing north joins the Abai near the spot where that river breaks through the Abyssinian hills. All these affluents are perennial, as is the Bolassa or Yesien, a right-hand tributary which reaches the Abai below the Yabus. Four miles below Famaka the river is joined on its left bank by the auriferous Tumat, an intermittent stream. In Sennar it receives on its right bank two considerable tributaries from the Abyssinian heights, the Dinder, a very long but not perennial stream, and the Rahad, waterless in the dry season, copious and richly charged with sediment during the rains from June to September. At this period the discharge of the Blue Nile rises from less than 200 to over 10,000 cub. metres per second, thus greatly exceeding that of the White Nile itself, which is only about 800 cub. metres during the floods above the confluence. The length of the Blue Nile is about 850 m. The country, El Gezira, enclosed in the triangle formed by the junction of the White and Blue Niles forms the most fertile portion of the Sudan. It only requires irrigation to render it one of the finest grain-producing areas in the world.

The Atbara.—Two hundred miles below Khartum—at Ed-Damer—the Nile is joined by the last of its tributary streams—the Atbara or Bahr-el-Aswad (Black river). The Atbara, some 800 m. long, rises in the tableland north of Lake Tsana, being formed by the junction of the Angreb, Salaam, Aradeb, Goang and other mountain streams. Making its way towards the Nubian plains, the river flows in a north-westerly direction, joining, in 14° 10′ N., 36° E., the Bahr Setit or Takazze (see ABYSSINIA), a river coming from the east and having a volume of water as large as, if not larger than, the Atbara. The united stream preserves, however, the name of Atbara, and at its confluence with the Nile has a breadth in flood time of over 600 yds. The Atbara and its tributaries, like many of those which feed the Blue Nile, rapidly dwindle after the rains into the smallest limits. In its lower course the Atbara runs completely dry, but higher up water may be found in deep pools, hollowed out of the sand bed of the stream by the river when in flood. These pools are full of fish, turtles, crocodiles and hippopotami, which remain imprisoned until the return of the flood. The country comprised between the Nile proper, the Atbara and the Blue Nile is identified with the island of Meroë of ancient history.

The Cataracts.—Downstream of the Atbara junction the Nile continues its course to the Mediterranean, traversing a distance of over 1600 m. without receiving a single tributary on either bank. Below Khartum the river makes a great S-shaped bend, and leaving behind the cultivable land pierces the Nubian desert. In its progress the volume of water suffers continual diminution from evaporation, owing to the extreme dryness of the air. The valley of the river is here very narrow, and the desert land in places comes right to the water's edge. Elsewhere high and barren cliffs shut in the valley. Between Khartum and Wadi Halfa (the northern end of the great bend), a distance of over 900 m., occurs a series of cataracts, known as the 2nd, 3rd, 4th, 5th and 6th (the 1st cataract is lower down the river at Assuan). That first met with on descending the river from Khartum is the 6th (or Shabluka) cataract. The river here (53 m. below Khartum) is narrow and picturesque. The rapid is 11 m. in length, in which distance the Nile falls some 20 ft.[2] After 188 m. of smooth water the 5th cataract is reached. It begins 28 m. below Berber (a town on the right bank at the head of a caravan route to the Red Sea), and with three principal rapids extends for 100 m.—the drop in this distance being rather more than 200 ft. At the foot of this cataract is the town of Abu Hamed, at the eastern end of the middle of the S bend. The 4th cataract begins 60 m. down stream from Abu Hamed. It is 69 m. long and has a drop of 160 ft. Between the 4th and 3rd cataracts there is a stretch of 194 m. on a very gentle slope ($\frac{1}{12000}$). This reach constitutes the province of Dongola, and here the cultivable land on the western side of the river is of greater extent than usual in the desert zone. The 3rd cataract, 45 m. long, has a drop of some 36 ft. After another smooth reach extending 73 m. the 2nd cataract, which ends just above Wadi Halfa, the northern frontier town of the Anglo-Egyptian Sudan, is reached. This cataract is 124 m. long and has a fall of 216 ft. Between the 2nd cataract and Assuan are 214 m. of smooth water with a scarcely perceptible slope, $\frac{1}{13000}$. The average breadth of the river here is 1640 ft. It runs through a sandstone bed, and the current is guided in many places by spurs of masonry built by the ancient Egyptians.

Lower River and Delta.—For some distance above Assuan the river is studded with islands, including those of Philae and Elephantine. The rapids south of the town used to form the 1st cataract, where,

[1] At Khartum the water of the one river is of a greenish-grey colour, that of the other is clear and blue, except when in flood, when it gains a chocolate brown from its alluvial burden.

[2] The fall in the river-bed, as given in these pages, is an approximation derived from barometric readings only.

in a length of 3 m., the river fell 16½ ft. Since the completion of the great dam and locks at the head of these rapids (Dec. 1902) they have to a certain extent disappeared, and a navigable channel has been formed. The dam, pierced by 180 sluices, stretches across the river—a wall 2000 yds. long and 26 ft. wide at the top. Below the water rushes between rocks in many channels (this being the relics of the cataract). Upstream from the dam a lake some 100 m. in length has been formed. The Assuan Dam was opened on the 10th of December 1902 (see under IRRIGATION). A ladder of four locks on the western side of the dam permits navigation between the upper and lower reaches. At Assuan the banks of the river are bordered by high granite hills. From this point to the apex of the delta the length of the Nile is 605 m. with a slope (1/8700) even slighter than that above Assuan. The valley is comparatively narrow, being an almost level depression in a limestone plateau—the area of fertility ends where the land ceases to be irrigated by the river. At Edfu, 68 m. below Assuan, a barrage, known as the Esna barrage, regulates the flow of the water, and at Assiut, 274 m. below Edfu, is another barrage fulfilling the same purpose. Cairo, the capital of Egypt, is built on the eastern bank of the Nile 12 m. north of the apex of the delta.

At the beginning of the delta the Nile separates into two channels, the Rosetta and the Damietta, which join the Mediterranean at its south-east angle. At the bifurcation is a double barrage, by means of which the water can be dammed to the height required for forcing the river into the canals which irrigate the delta. Of the two branches the Damietta is the more easterly. Both are about the same length—146 m.[1] Behind the coast-line, which is low and sandy, are a number of salt marshes or lagoons. Whilst the Damietta branch is gradually silting up, the Rosetta branch is scouring out a wider channel. In time of full flood the depth of the water in either branch is about 23 ft.

Hydrography.—The fertility and prosperity of Egypt and the northern part of the Sudan being entirely dependent on the irrigation of the land by the waters of the Nile, the variation in the supply at different seasons of the year is of vital importance. (In Egypt the height of the flood has been recorded annually, as the chief event of the year, since at least 3600 B.C.) Above the Sobat confluence the Nile traverses a region of heavy rainfall and the water-supply is superabundant. It is from Victoria, Albert and Albert Edward Nyanzas and their feeders, and in a lesser degree from the Bahr-el-Ghazal, that this river obtains its constant supply of water throughout the year. The great lakes and the region of swamps, retaining a large proportion of the water they receive, act as natural reservoirs and prevent the lower Nile from ever running dry in summer. The Abyssinian affluents are the chief cause of the Nile flood. In the equatorial regions rainfall varies from 30 to 80 in. during the year with a mean of about 50. It is heaviest in the months of January, February, March and April, and again in October and November. The most rainy portions of the lake plateau (where alone occurs a rainfall of 60 in. and over) lie along the eastern edge of the Albertine Rift valley, and west and north of Victoria Nyanza. These rains feed Albert Edward and Albert Nyanzas, and, through the Kagera, supply a great part of the water of Victoria Nyanza. The water in the Victoria Nyanza begins to rise in January, the rise becomes marked in June, is at its height in July, the level of the water reaching its lowest at the end of November. The Bahr-el-Jebel is at its lowest in March and April and at its highest in September. The seasonal supply of the Bahr-el-Ghazal does not vary very greatly, the maximum levels occurring in November and December. The Ghazal has but a slight discharge. The Sobat, from December to March, is at its lowest, and is in flood from June to October, during which period the water (milky coloured) which it pours into the Nile equals in volume that of the main stream. It is the colour of the Sobat water which gives its name to the White Nile. The Blue Nile, at its confluence at Khartum, begins to rise in June and is in flood from July to October; the Atbara is also in flood during the same months. The great difference in the supply of water from the equatorial regions and from Abyssinia arises from the fact that the first-named district is one of heavy rain practically all the year round; whereas in Abyssinia the season of heavy rain is usually limited to the months of June to September. Reduced to its simplest expression, the Nile system may be said to consist of a great steady flowing river fed by the rains of the tropics, controlled by the existence of a vast head reservoir and several areas of repose, and annually flooded by the accession of a great body of water with which its eastern tributaries are flushed.

At Khartum the Nile is lowest in April and May and highest in August and September. Its minimum depth is 18 ft. and its maximum depth 25 ft. At Assuan the Nile is at its lowest at the end of May, then rises slowly until the middle of July, and rapidly throughout August, reaching its maximum at the beginning of September; it then falls slowly through October and November. At Cairo the lowest level is reached about the middle of June, after which the rise is slow in July and fairly rapid in August, reaching the maximum at the beginning of October. By using the water stored by the Assuan dam in the months following high Nile, the river lower down has been, since 1902, replenished at times of low water to meet the needs of cultivators (see IRRIGATION: *Egypt*). At Assuan the average rise of the Nile is 26 ft., at Cairo it is 23 ft. A rise of 21 ft. only at Assuan is a "bad Nile"; on the other hand, a rise of 30 ft. causes a danger of flood, or rather it used to do so previous to the building of the dam. When the Nile below the swamps is at its lowest, the water acquires a green colour and a putrid taste and smell. This is caused by innumerable microscopic green algae, which are brought into the White Nile from the marshes of the Bahr-el-Jebel and Bahr-el-Ghazal, and descend the river when it is clear of all suspended matter. This "green water" is seen at Cairo about the end of June or beginning of July, and passes away with the first rise in the later month, the algae being unable to live in turbid water. By August the river in lower Egypt is full of dark red-brown sediment brought down by the Blue Nile and the Atbara from the plateaus of Abyssinia. It is estimated to be then carrying 8 cub. yds. per second; by September this has been reduced to half the amount, and then diminishes rapidly. It has been calculated[2] that the time taken by the water to travel from Khartum to the delta barrage varies from 14 days in September to 42 in May. On the island of Elephantine at Assuan is the famous Nilometer, dating from ancient Egyptian times, altered and extended in Roman times and repaired in 1870 by the Khedive Ismail. It is a well built of hewn stones, marked with scales to record the level of the water, which rises and falls with that of the river. The remains of other ancient Nilometers exist at Philae, Edfu and Esna, together with inscriptions recording about forty high Niles in the XXVth Dynasty, discovered on a quay wall of the temple of Karnak. The data furnished by these give about 4½ in. per century as the rate at which the Nile is silting up its bed north of the 1st cataract. The level of high Nile at the Semna rapids, between the 2nd and 3rd cataracts, is 24 ft. lower than that indicated by the marks sculptured *c.* 2500 B.C. This fall is attributed to the erosive action of the water as it passes over the hard gneiss which at Semna forms a barrier across the stream. The vertical extent of such erosion is equal to about two millimetres a year.

It is noteworthy that from the mouth of the Sobat to the Mediterranean the current of the Nile is generally deepest and strongest on its right (eastern) bank; the Nile in this respect resembling other great rivers of the northern hemisphere. The pressure of the water on the right bank is attributed to the prevailing N.W. winds.[3]

There are now gauges for registering the rise of the water at Cairo, Assuan, Berber and Khartum on the main river; at Wad Medani, Sennar and Roseires on the Blue Nile; El Duem and Taufikia on the White Nile; Nasser on the Sobat; Gondokoro on the Bahr-el-Jebel; and Ugowe, Jinja and Entebbe on Victoria Nyanza.

Navigation.—At high Nile there is uninterrupted water-communication from the sea to Fort Berkeley in 4° 40′ N.—a distance of 2900 m. Owing to the cataracts, navigation between Assuan and Khartum is impossible during low Nile, and from the 1st of March to the 1st of August the upper courses of the Damietta and Rosetta branches are closed to navigation; the water being utilized for summer irrigation in the delta. As far as Mansura (60 m.) on the Damietta branch and Kafr-el-Zayat (70 m.) on the Rosetta branch, and between Khartum and Fort Berkeley (1090 m.) the river is navigable all the year round, though between the Sobat confluence and Bor, navigation is dependent on the channel being kept clear of sudd. Above Fort Berkeley navigation is interrupted by the rapids and cataracts which extend to Dufile, but from the last-named town to Fajao at the foot of the Murchison Falls (a distance of 150 m.) the river is navigable throughout the year. There is a further navigable stretch between Foweira (just above the Karuma rapids) and the southern end of Lake Kioga. The Blue Nile is navigable for steamers during flood time from its confluence at Khartum to Roseires at the foot of the Abyssinian hills, a distance of 426 m. At low water small boats only can go up stream. The Atbara is never navigable, the current during flood time being too swift for boats. Including the Sobat and the Bahr-el-Ghazal the navigable waters of the Nile and its affluents exceed 4000 m.

Owing to the cataracts and the partial closing of the Damietta and Rosetta branches for irrigation purposes, the Nile below Khartum is subsidiary, as a means of communication, to the railways and highroads.[4] Above Khartum the river is

[1] In ancient times the delta was watered by seven branches; five of these branches are now canals not always navigable. The ancient branches were, beginning at the west, the Canopic, Bolbitine, Sebennytic, Phatnitic, Mendesian, Tanitic and Pelusiac, of which the modern Rosetta and Damietta branches represent the Bolbitine and Phatnitic

[2] By Sir Hanbury Brown, inspector-general of irrigation, Lower Egypt, 1892–1903.

[3] *Egyptian Irrigation* (p. 29), by Sir W. Willcocks (London, 1899).

[4] Between Assuan (Shellâl) and Wadi Halfa the river is, however, the main highway, there being no railway between the places named

the chief channel of trade and commerce. Steamers first ascended the Nile above the cataracts (to Korosko) in 1820. It was not till 1846 that a steamboat was placed on the White Nile. (W. E. G.; F. R. C.)

Story of Discovery.—Few problems in geographical research exercised for so long a period so potent an influence over the imaginations of man as that of the origin of the Nile. The ancient Egyptians, as is apparent from the records on their monuments, were acquainted with the main stream as far south as the junction of the White and Blue Niles. They appear also to have known the Blue Nile up to its source and the White Nile as far south as the Bahr-el-Ghazal confluence. Beyond that point the sudd probably barred progress. The knowledge acquired by the Egyptians passed to the Persians and Greeks. Herodotus (about 457 B.C.) ascended the Nile as far as the First Cataract. He was led to believe that the source of the river was far to the west—in the region of Lake Chad. Eratosthenes, superintendent of the Alexandrian library, in a map made about 250 B.C., showed, with fair accuracy, the course of the river as far as where Khartum now stands. He showed also the Atbara and Blue Nile. Eratosthenes was the first writer to hint at equatoria' lakes as the sources of the river. Juba II., king of Mauretania (who died about A.D. 20), in his *Libyca*, quoted by Pliny, makes the Nile rise in western Mauretania, not far from the ocean, in a lake presenting characteristic Nile fauna, then pass underground for several days' journey to a similar lake in Mauretania Caesariensis, again continue underground for twenty days' journey to the source called Nigris on the borders of Africa and Ethiopia, and thence flow through Ethiopia as the Astapus. This remarkable story received considerable credence, and may be connected with the theory which made the Niger a branch of the Nile (see below). Strabo (a contemporary of Juba), who ascended the river as far as Syene, states that very early investigators had connected the inundation of the Lower Nile with summer rains on the far southern mountains, and that their theory had been confirmed by the observations of travellers under the Ptolemies. About the same time Dalion, a Greek, is believed to have ascended the White Nile. Nero despatched two centurions on an expedition for the express purpose of exploring the Nile, and Seneca states that they reached a marshy impassable region, which may be easily identified with the country of the White Nile above the mouth of the Sobat. To what they referred when they reported a great mass of water falling from between two rocks is not so readily determined. During this period more accurate knowledge concerning the Nile sources was obtained from the reports of Greek traders who visited the settlements on what is now called the Zanzibar coast. A merchant named Diogenes returning (about A.D. 50) from the east coast of Africa told a Syrian geographer, Marinus of Tyre, that journeying inland for twenty-five days he reached the neighbourhood of two great lakes and a range of snow mountains whence the Nile drew its sources. Marinus published this report in his geographical works. This book is lost, but the information is incorporated in the writings of Ptolemy, who in his book and map sums up all that was known or surmised of the Nile in the middle of the 2nd century of the Christian era. Ptolemy writes that two streams issuing from two lakes[1] (one in 6° and the other in 7° S.) unite in 2° N. to make the Nile, which, in 12° N., receives the Astapus, a river flowing from Lake Coloe (on the equator). His two southern lakes, he conceived, were fed by the melting of snows on a range of mountains running east and west for upwards of 500 m. —the Mountains of the Moon, *τὸ τῆς σελήνης ὄρος, Lunae Montes*. It will be seen that, save for placing the sources too far to the south, Ptolemy's statements were a near approximation to the facts. The two southern lakes may be identified with Victoria and Albert Nyanzas, and Lake Coloe with Lake Tsana. The snow-capped range of Ruwenzori occupies—at least in part—the position assigned to the Mountains of the Moon, with which chain Kilimanjaro and Kenya may also be plausibly identified. On all the subsequent history of the geography of the Nile Ptolemy's theory had an enormous influence. Mediæval maps and descriptions, both European and Arabian, reproduce the Mountains of the Moon and the equatorial lakes with a variety of probable or impossible modifications. Even Speke (see below) congratulated himself on identifying the old Ptolemian range with the high lands to the north of Tanganyika, and connected the name with that of Unyamwezi, the "country of the moon."

In the fourteen centuries after Ptolemy virtually nothing was added to the knowledge of the geography of the Upper Nile. Arab writers of the 12th and 13th centuries make mention of the great lakes, and their reports served to revive the interest of Europe in the problem of the Nile. Idrisi made both the Nile and the Niger issue from a great lake, the Niger flowing west, the Nile north. Hence arose much confusion, the Senegal estuary being regarded by its discoverers (1445) as the mouth of a western branch of the Nile. Even until the early years of the 19th century the belief persisted in a connexion between the Nile and the Niger (see further NIGER). Portuguese explorers and missionaries, who in the 15th and 16th centuries visited the east coast of Africa and Abyssinia, gained some information about the equatorial lake region and the Nile,[2] the extent of the knowledge thus acquired being shown in the map of Africa of Filippo Pigafetta, Italian traveller and historian (1533–1603) published in 1580. It was not, however, till the 17th century that the sources of the Blue Nile were visited by Europeans. In 1615 Pedro Paez, a Portuguese priest, was shown them by the Abyssinians. Ten years later another Portuguese priest, Jeronimo Lobo, also visited the sources and left a vivid description of the rise of the river and its passage through Lake Tsana. An English version of the accounts of Paez and Lobo—written by Sir Peter Wyche—was published in 1669 by order of the Royal Society, of which Sir Peter was an original Fellow. Between 1625 (the date of Lobo's visit) and 1770, some attempts were made by French and other travellers to explore the Blue Nile, but they ended in failure. In the last-named year James Bruce (*q.v.*) reached Abyssinia, and in November 1772 he arrived in Egypt, having visited the source of the Blue Nile and followed it, in the main, to its confluence with the White Nile. On returning to Europe Bruce was mortified to find that whilst he was still in Egypt the French geographer D'Anville had (1772) issued a new edition of his map of Africa in which by a careful study of the writings of Paez and Lobo he had anticipated Bruce's discoveries, D'Anville's map is singularly accurate, if we remember the scanty information at his disposal. To Bruce, nevertheless, belongs the honour of being the first white man to trace the Blue Nile to its confluence with the White Nile. He himself, considering that the Blue Nile was the main branch of the river, claimed to be the discoverer of the long-sought *caput Nili*.[3]

From the time of Bruce, interest in the Nile problem grew rapidly. The Englishman W. G. Browne (*q.v.*) when in Darfur (1794–1796) heard that the Abiad rose far south in the Mountains of the Moon, but he makes no mention of the great lakes, and in Major Rennell's map of 1802 there is no hint of equatorial lakes at the Abiad sources. During the French occupation of Egypt the river from the sea to Assuan was accurately surveyed, the results being embodied in Jacotin's *Atlas de l'Égypte* (1807). In 1812–1814 J. L. Burckhardt, the Orientalist, went up the Nile to Korosko, travelled thence across the desert to Berber and Shendi, and crossing the Atbara made his way to the Red Sea. It was, however, due to the initiative of Mehemet Ali, Pasha of Egypt, that the While Nile was explored. In 1820–22 a military expedition under Ismail Pasha, a son of Mehemet Ali, which was joined by the French scientist Frédéric Cailliaud (who had visited Meroë in 1819) ascended the river to the

[1] The two lakes afterwards received the names Lake of Crocodiles and Lake of Cataracts.

[2] Francisco Alvarez, a priest, who was in Abyssinia 1520–1526, afterwards wrote (about 1550) an account of Abyssinia in which he refers to the Atbara as the main Nile.

[3] Bruce, however, acknowledged in his *Travels* that the Abiad (White Nile) at its confluence with the Blue Nile was the larger river. The Abiad, he writes, "preserves its stream always undiminished, because rising in latitudes where there are continual rains, it therefore suffers not the decrease the Nile does by the six months' dry weather."

confluence of the White and Blue Niles, founded the city of Khartum, and ascended the Blue Nile to Fazokl. In 1827 Adolphe Linant, a Belgian in the service of the British African Association, ascended the White Nile 132 m. above Khartum, being the first white man to do so since the 1st century A.D. Then followed three Egyptian expeditions sent in 1839–41 and 1842 by Mehemet Ali up the White Nile. The first expedition reached, on the 28th of January 1840, a point 6° 30′ N., the second and third pressed further south, reaching 4° 42′ N.—or the foot of the rapids above Gondokoro. A Turkish officer, Selim Bimbashi, commanded the expeditions, and among the members were the Frenchmen Thibaut (a convert to Islam and for nearly forty years French consular agent at Khartum), D'Arnaud and Sabatier, and a German, Ferdinand Werne. The last-named wrote a scientific account of the second expedition and drew a map of the Nile between Khartum and Gondokoro. An Austrian Roman Catholic mission was established in the Sudan, and in 1850 one of its members, Dr Ignatz Knoblecher, sent to Europe reports, gleaned from the natives, of the existence of great lakes to the south. About the same time two Protestant missionaries, Ludwig Krapf and John Rebmann, stationed on the Zanzibar coast, sent home reports of a vast inland sea in the direction where the Nile sources were believed to be. This sea was supposed to extend from 0° 30′ N. to 13° 30′ S. These reports revived interest in Ptolemy's Geography. The exploration of the Bahr-el-Ghazal by John Petherick, Miss Tinne and her companions, and others followed the opening up of the White Nile (see BAHR-EL-GHAZAL). The general result of the work carried on from the north was that by 1858 the Nile system was known as far south as the rapids at Bedden.

On the 3rd of August 1858 the English explorer J. H. Speke (*q.v.*) discovered the large *nyanza* (lake), which he rightly conceived to be the head reservoir of the White Nile, and which in honour of the queen of England he named Victoria Nyanza. Captain (Sir Richard) Burton and Speke had gone inland from Zanzibar to investigate the reports concerning the vast lake which Rebmann and Krapf had called the Sea of Unyamwezi. These reports proved to be exaggerated accounts of three distinct lakes—Nyasa, Tanganyika and Victoria Nyanza. In 1860 Speke returned to Zanzibar accompanied by J. A. Grant (*q.v.*), bent on solving the problem of the Nile. In spite of great difficulties he made his way to Uganda, on the north-west of Victoria Nyanza, and (without exploring the lake) succeeded in reaching its outlet. On the 28th of July 1862 Speke stood by the Ripon Falls—the birthplace of the Nile. In his journey he had discovered the Kagera river, now known to be the most remote headstream of the Nile, a fact of which Speke was uncertain, though he recognized that it was the largest river entering the nyanza. Speke and Grant paddled down the Nile a short distance, but before reaching Lake Kioga they were stopped by hostile natives and compelled to go westward to Unyoro. There they heard of another great lake further west, but the king of Unyoro refused them permission to visit it. In the end they descended the Kafu river to its confluence with the Nile and then down the main stream to the Karuma Rapids. Here Speke and Grant left the river, and travelled overland east of the stream, which they did not strike again until just above the Ausa confluence. Thence they travelled down the Nile to Gondokoro, reached on the 15th of February 1863.

This remarkable journey virtually solved the Nile problem so far as the source of the main stream was concerned, but there remained much to be done before the hydrography of the whole Nile basin was made known. At Gondokoro Speke and Grant met Mr (afterwards Sir Samuel) Baker[1] and his wife—a Hungarian lady—who had journeyed thither to afford the explorers help. To Baker Speke communicated the news he had heard concerning the western lake, and this lake Baker determined to find. On the 26th of March 1863 Baker and his wife left Gondokoro, and despite much opposition, especially from slave-dealers, followed, in the reverse direction, the route of Speke and Grant as far as Unyoro, whence they journeyed west. On the 14th of March 1864 they struck the lake (Albert Nyanza) on its S.E. side. They paddled up the lake to the point where a large river coming from the east poured its waters into the lake. This stream, which they rightly conjectured to be Speke's Nile, they followed up to the Murchison Falls. Thence they went overland to the Karuma Rapids, and so back to Gondokoro by their old tracks. It fell to the lot of General C. G. Gordon (when that officer administered the Egyptian Equatorial provinces) and his assistants to fill up the gap left by Speke and Baker in the course of the main stream. In 1874–75 two English engineer officers—Lieut. (afterwards Colonel Sir Charles M.) Watson and Lieut. H. Chippendall—followed the river between Gondokoro and Albert Nyanza; in 1876 an Italian, Romolo Gessi Pasha, circumnavigated that lake, proving Baker's estimate of its size to be vastly exaggerated; Gordon in the same year traced the river between Murchison Falls and Karuma Rapids, and an American, Colonel C. Chaillé-Long followed (1874) the Nile from the Ripon Falls to the Karuma Rapids, discovering in his journey Lake Kioga (which he named Ibrahim). In this manner the identity of the Victoria Nile with the river which issued from the Albert Nyanza was definitely established.

In 1874 H. M. Stanley (*q.v.*) went to Africa with the object of completing the work left unfinished by David Livingstone, who believed, erroneously, that the ultimate sources of the Nile were far to the south (see CONGO). Stanley, in 1875, circumnavigated Victoria Nyanza, setting at rest the doubt thrown on Speke's statement that it was a huge sheet of water,[2] but proving Speke mistaken in believing the nyanza to have more than one outlet. On the same journey Stanley encamped at the foot of the Ruwenzori range, not knowing that they were the "Mountains of the Moon," whose streams are the chief feeders of Albert Nyanza. (At the time of his visit the snow-peaks and glaciers were hidden by heavy clouds.) In 1888, however, Stanley saw the mountains in all their glory of snow and ice, discovered Albert Edward Nyanza, and traced the river (Semliki) which connects it with Albert Nyanza. The Semliki had been discovered, and its lower course followed in 1884 by Emin Pasha. Thus at length the riddle of the Nile was read, though much was still to do in the matter of scientific survey, and in the exploration of the valley of the Sobat (*q.v.*). The Kagera had been partly explored by Stanley (1875), by whom it was called the Alexandra Nile, and between 1891–98 its various branches were traced by the German travellers Oscar Baumann, Richard Kandt and Captain H. Ramsay, and by Lionel Décle, a Frenchman. A British officer, Colonel C. Delmé-Radcliffe, made the first accurate survey (1900–1901) of the Nile between Albert Nyanza and Gondokoro. In 1903 an Anglo-German commission under Colonel Delmé-Radcliffe and Captain Schlobach made a detailed survey of the Kagera from 30° E. to its mouth. The Kioga system was surveyed in 1907–1908 by Lieut. C. E. Fishbourne. A trigonometrical survey of the upper river was begun by Colonel M. G. Talbot, director of Sudan surveys, in 1900, and other surveys were made by Captain H. G. Lyons, director-general of the Egyptian survey department. A fish-survey of the waters of the Nile was also undertaken.

The Removal of Sudd.—As already stated, the sudd above the Sobat confluence seems to have stopped the Roman centurions sent by the emperor Nero to explore the Nile. When the river above the Sobat was again reached by white men (1840) the stream was clear of sudd, and so continued until 1863–1864, when both the Bahr-el-Jebel and the Bahr-el-Zeraf became blocked by floating masses of vegetation. When Baker proceeded to Gondokoro in 1870 he thus described the increase that neglect had caused in the obstruction: "The immense number of floating islands that were constantly passing down the stream of the White Nile had no exit; thus they were sucked under the original obstruction by the force of the stream, which passed through some mysterious channel, until the subterranean passage became choked with a wondrous accumulation of vegetable matter. The entire river became a marsh, through which, by the great pressure of water, the stream oozed through innumerable small channels. In fact, the White Nile had disappeared." Baker, who had to cut through 50 m. of sudd in his passage to Gondokoro, urged to Khedive

[1] Baker and his wife had in 1861–1862 explored the Atbara (to its upper waters) and other eastern tributaries of the Nile.

[2] In the map issued in 1873 to illustrate Schweinfurth's book, *The Heart of Africa*, Victoria Nyanza is shown as five small lakes.

Ismail to reopen the Nile. This work was efficiently done by Ismail Ayub Pasha, and the White Nile was clear for large vessels when Gordon reached Khartum in 1874. The river did not long remain free, for in 1878 Emin Pasha was unable to ascend the Bahr-el-Jebel from the south on account of sudd. It was cleared in 1879–1880 by officials in the Egyptian service, but had again accumulated in 1884. In consequence of the Mahdist movement nothing could then be done to clear the river, and the work was not taken in hand again until 1899, when, by direction of Sir William Garstin, the Egyptian inspector-general of irrigation, an expedition under Major Malcom Peake, R.A., was sent to cut through the sudd, which then extended from the Bahr-el-Ghazal confluence almost to Gondokoro. During 1900 a channel was cut through the northern and heaviest portion of the sudd. The work was one of much difficulty, some of the blocks being 1 m. long and 20 ft. deep; the water beneath flowed with great velocity. To remove the obstruction the surface was first burnt; then trenches were cut dividing the sudd into blocks 10 ft. square, and each of these was hauled out with wire hawsers and chains by gunboats working from below. For a distance of 172 m. N. of Shambe (*i.e.* about midway between the Ghazal confluence and Gondokoro) the true bed of the river could not, in many places, be found, but Major Peake forced a passage to Gondokoro through a spill channel or series of shallow lakes lying west of the main stream. In 1901 Lieut. Drury, a British naval officer, removed many of the remaining blocks of sudd, opening to navigation a further 147 m. of the river. Beyond this point for a distance of 25 m. the Bahr-el-Jebel could not be traced, so completely was the channel choked by sudd. In 1902, however, Major G. E. Matthews discovered the true bed of the river, which by 1904 was completely freed from obstructions, and freedom of navigation between Khartum and Gondokoro was permanently secured. The effect of the sudd-cutting operations on the supply of water available for irrigation purposes in the lower river was slight. Nevertheless, Sir William Garstin reported that the removal of the sudd "undoubtedly checked the fall in the river levels which would otherwise have taken place."

Political Relations.—Explored in part by Egyptian government expeditions, the upper Nile as far south as Albert Nyanza became subject, between 1840 and 1882, to Egypt. Possession of the greater part of the river above Wadi Halfa then fell to the followers of the Mahdi. In 1896–98 an Anglo-Egyptian army reconquered the country, and from Victoria Nyanza to the Mediterranean the main river came under British or Egyptian administration. The west bank of the Bahr-el-Jebel, as far north as 5° 30′ N., was in 1894 taken on lease from Great Britain by the Congo Free State during the sovereignty of Leopold II., the territory leased being known as the Lado enclave (*q.v.*). The Kagera, the main headstream, lies almost wholly in German East Africa.

AUTHORITIES.—For the story of exploration see the works of Bruce, Speke, Grant, Baker and other travellers (whose books are mentioned in the biographical notices). Their achievements, and those of ancient and medieval explorers, are ably summarized in *The Story of Africa*, vols. ii. and iii., by Dr Robert Brown (London, 1893–1894), and *The Nile Quest*, by Sir Harry Johnston (London, 1903). See also J. Partsch, *Des Aristotel's Buch*: "*Über das Sleigen des Nil*" (Leipzig, 1909). For the Kagera region consult *Caput Nili*, by Richard Kandt (Berlin, 1904). Latest additions to geographical knowledge are recorded in the *Geographical Journal* (London) and the *Cairo Scientific Journal*. For the hydrography, geology and climate see: *The Physiography of the River Nile and its Basin*, by Captain H. G. Lyons, director-general, survey department, Egypt (Cairo, 1906), an authoritative work, and numerous other publications of the Survey and Public Works Departments; "Notes on the History of the Nile and its Valley," by W. F. Hume, in *Geog. Jnl.* (Jan. 1906); *Egyptian Irrigation* (2nd ed., London, 1899) and the *Nile Reservoir Dam at Assuan and After* (London, 1901), both by Sir William Willcocks; the *Annual Reports* (1899 and after) of the Egyptian Public Works Department, by Sir William Garstin and others, and those on Egypt and the Sudan by Lord Cromer and Sir Eldon Gorst (London; official publications). Of special value is the Blue Book *Egypt No. 2, 1904*, which is a report by Sir William Garstin on the basin of the upper Nile, dealing at length with the lake area, the Nile affluents and the main river as far south as Khartum, from the topographical as well as the hydrographical aspect. Sir W. Garstin and Captain Lyons give full bibliographical notes.

The study of the zoology of the Nile valley was the special object of a Swedish scientific expedition in 1901, under the direction of Prof. L. A. Jägerskiöld. The *Results* were published at Upsala, pt. iii. appearing in 1909. For the botanical and other aspects of the Nile valley, see the works of Petherick, Heuglin, Schweinfurth, Junker and Emin. An orographical map of the Nile basin was published by the Survey Department, Cairo, in 1908. It is in six sheets on a scale of 1:2,500,000, with inset maps showing political divisions, distribution of rainfall and of vegetation. (F. R. C.)

NILE, BATTLE OF THE. This was fought between the British and French fleets on the 1st of August 1798 in the roadstead of Aboukir. The peace of Campo Formio, signed on the 17th of October 1797, had left France without an opponent in arms on the continent. War with Great Britain still continued, and for a time the Directory appeared to be intent on its schemes for an invasion of Ireland. Napoleon, fresh from his Italian victories, was appointed to command, and he made a round of inspection of Brest and the Channel ports. But all this show of activity was designed to cover the preparations for an attack on Great Britain "from behind"—in India and by way of Egypt. The French naval forces at Toulon were got ready slowly in spite of Napoleon's urging and with the defects inevitable in the impoverished state of the arsenal. Thirty-six thousand soldiers, including the best of the army of Italy, were to be embarked from the southern French ports, from Italy and from Corsica. Information that a great offensive movement was about to be made by the French reached both Earl St Vincent, the commander-in-chief of the Mediterranean fleet, and the British government. Since Spain had entered into alliances with France in 1796, the British fleet had not cruised in the Mediterranean but had been occupied in blocking the Spanish ships at Cadiz. On the 2nd of May 1798 St Vincent detached Nelson, then the junior rear-admiral, with his flag into the Mediterranean, with three sail of the line and frigates to make a reconnaissance at Toulon. On the 17th of May a small French corvette was captured near Cape Sicié, and from the crew Nelson learnt that the French were still in the harbour. He could gain no information as to the aim of the armament. Napoleon enforced strict secrecy by not letting even the most important officers of the dockyard know whither he was bound. On the 2nd of May the British government had written to St Vincent stating their wish that a part of his fleet should be sent into the Mediterranean. The first lord of the admiralty, Lord Spencer, told him that he might either go himself or send a subordinate. If the latter course was followed Nelson was indicated as the officer to be chosen. Reinforcements were sent to him to enable him to provide both for the cruise in the Mediterranean and for the blockade of Cadiz. St Vincent had already selected Nelson, and when the reinforcements arrived he despatched Captain Troubridge with the inshore squadron engaged in watching Cadiz—"the choice fellows," as he described them, of his fleet—to join Nelson at Toulon. The ships were replaced by others similarly painted, so that the Spaniards might see no difference and therefore be unable to send news to their ally. Troubridge left on the 24th of May with as many vessels as would bring Nelson's whole command up to thirteen 74's and one 50-gun ship.

While these measures were being taken to intercept him, Napoleon had put to sea on the 19th of May with fifteen sail of the line, twelve frigates and some two hundred transports. He sailed down the eastern side of Corsica and Sardinia to pick up the detachments which were to join him from the first-named island and from Civita Vecchia. On the evening of the 20th a gale from the N.W. brought some confusion on his flock of ships, but it also drove Nelson to the S.W. His flagship the "Vanguard" (74) was dismasted and compelled to anchor at San Pietro to refit. His frigates were separated from him by the weather, and the captains made for Gibraltar, concluding that the admiral would go there to refit. The departure of his frigates left Nelson without vessels for scouting and had a material influence on the campaign. The "Vanguard" was made ready by the 27th of May, and resumed her station off Toulon. On the 7th of June Nelson was joined by Troubridge. Calms hampered his pursuit of the French, whom he now knew to be at sea, but on the 14th he was off Civita Vecchia; on the 17th he was at Naples, where he heard that the French had been seen going south, and made arrangements to obtain water and stores in the Neapolitan ports. On the 20th he was at Messina, where he first got definite information of the movements of the enemy. The French had appeared off Malta on the 9th and had occupied the island, which was surrendered to them on the 12th by the treachery of the French and Italian members of the order. Pushing on in the hope of finding them on the coast of the island, Nelson was off Cape Passaro on the 22nd, and there learnt that the French had sailed from the island. His instructions directed him to guard against possible French attacks on Sicily, or even an attempt to pass the Straits of Gibraltar and sail for Ireland,

But Nelson knew that the Neapolitan government had no fears for Sicily and that the westerly winds would prevent the French from going to Gibraltar. On a view of all the circumstances, and after consultation with those of his captains in whose judgment he had the most confidence, he came to the just conclusion that they were bound for Egypt. He therefore sailed for Alexandria on the most direct route eastward along the coast of Africa. The information given him at Cape Passaro was that the French had left Malta on the 16th; the actual date was the 19th. Napoleon, whose frigates had sighted the British squadron, and who knew that he might be pursued, did not take the direct route, but steered to the north-east along the south shore of Crete. Thus it happened that on the night of the 22nd of June the fleets crossed one another's tracks. Want of look-out vessels prevented Nelson from detecting the neighbourhood of his enemy. The French with their convoy going more slowly on the longer route to the north, and the active British squadron on the direct route to the south, both headed for Egypt, with barely 60 m. of sea between them, but neither aware of the position of the other.

On the 28th of June Nelson reached Alexandria to find the port occupied only by a few Turkish ships. It was from Nelson that the Turkish authorities gained their first knowledge of the impending invasion. Nelson, misled by the false date given him at Cape Passaro, and being unable to reconnoitre the position of the enemy, came to the erroneous conclusion that he was mistaken in supposing that the French were on the way to Egypt, and that they must be bound for some other part of the eastern Mediterranean. On the 29th of June he sailed from Alexandria, standing to the north-east. His topsails were still in sight to the north-east when the French appeared coming from the north-west. They sighted the coast on the 29th to the west of Alexandria, and on the 1st of July they occupied the anchorage and town. While Nelson was ranging along the coast of Asia Minor, seeking for news of them and finding none, on his way back to Sicily, the French were landing their army. The British squadron reached Syracuse on the 19th of July. Here Nelson was able to obtain water and stores and clear indications that the French had gone to Egypt. On the 24th he sailed, and on the 1st of August was again off Alexandria. The battle of the Pyramids had been fought on the 21st, and Napoleon was master of Egypt. The fear of the British admiral was that the French fleet had left the coast in the interval of his absence. Brueys, the French admiral, had had a choice of three courses open to him—to enter the old harbour of Alexandria, to sail for Corfu then occupied by the French or to take a strong anchorage on the coast and prepare to repel attack. To enter the harbour was difficult for large ships, and to leave it by its one narrow entrance in the presence of even an inferior force would have been impossible. Brueys therefore decided against that course. He did not sail for Corfu, partly because some of the army stores were still in his ships and partly because his squadron, ill fitted from the first, was short of provisions, and no more could as yet be obtained from the shore. He therefore stationed himself with thirteen of his ships of the line in the roadstead of Aboukir, some 15 m. north-east of Alexandria, between the island of Aboukir and the Rosetta mouth of the Nile. Here he was found on the evening of the 1st of August when the British fleet came in sight. The French line of thirteen ships was anchored to the east of Aboukir, now called Nelson's Island, in a curve stretching to the south-east. It consisted of the "Guerrier" (74), the "Conquérant" (74), the "Spartiate" (74), the "Aquilon" (74), "Souverain Peuple" (74), "Franklin" (80), "Orient" (120), Admiral Bruey's flagship "Tonnant" (80), "Heureux" (74), "Timoléon" (74), "Guillaume Tell" (80), "Mercure" (74) and "Généreux" (74), counting from the west end. The French ships had begun the voyage short-handed and many men were absent on shore filling the water-casks. They fought with a half to two-thirds of their complements, which suffered from the bad training and inexperience of the French republican navy. A council of flag officers and captains was being held in the "Orient" when the British squadron appeared.

When the enemy was sighted Nelson at once gave the order to attack. All the possibilities of battle had been fully discussed between him and his captains. Much controversy of a rather idle character has taken place as to assigning the credit for the actual course adopted; it was almost dictated to men so experienced and capable as the British captains and their admiral by the position of the enemy. If the French had been anchored so near the shore that it was not possible to pass between them and it, the British ships, coming from the west with a westerly wind, would have passed outside of them, endeavouring to anchor one on the bow and the next on the quarter of each French ship in succession. Those in the van might have been crushed before the ships in the rear and to leeward could come to their assistance. As it was, the French were so placed that there was room for the British ships to pass between them and the land. Therefore it was possible for the first comers of the British squadron to pass inside the French ships, to anchor there, and to allow the next comers to anchor outside so as to put the enemy's van between two fires. This disposition was not without its drawbacks, for it entailed the risk that the British ships might fire into one another while directing their guns on an object between them. The risk was the greater because the battle began at sundown and was continued in the dark. Yet it had the advantage that it produced an intense concentration of fire. In the circumstances it had the peculiar advantage, of which, however, the British captains may not have been aware, that as the French were very short-handed they were unable to work both broadsides to the full. It is to this fact that we must attribute the comparatively small loss suffered by the British ships in an attack which, if made against a well-appointed enemy, must have been extremely costly. Whether by previous arrangement with Nelson, or because he acted on the facts before him, the first British captain to come into action, Captain Foley of the "Goliath" (74), passed inside the French, and anchored abreast of the second of them, the "Conquérant." The "Zealous" (74), under Captain Hood, anchored on the bow of the first Frenchman, the "Guerrier." The "Audacious" (74), under Captain Davidge Gould, anchored between the "Zealous" and "Goliath." The "Theseus" (74), under Captain Miller, anchored inside of the third French ship, the "Spartiate." The "Orion" (74), under Captain Saumarez, anchored abreast of the fifth French vessel, the "Souverain Peuple." Then Nelson, in his flagship the "Vanguard" (74), the sixth British ship to come into action, anchored on the outside of the French line abreast of the "Spartiate" already engaged with the "Theseus." The "Minotaur" (74), under Captain Thomas Louis, and the "Defence" (74), under Captain Peyton, anchored next to the "Vanguard" and opposite the fourth French ship, the "Aquilon," and the "Souverain Peuple," already engaged with the "Orion." Thus eight British 74's which had only to fight one broadside at a time were thrown on five undermanned French 74's, which had to fight both and were speedily crushed. One British vessel, the "Culloden" (74), under Captain Troubridge, grounded on the shoal at Aboukir, and could not get into action. She served as a beacon to the vessels coming behind her. As the French van was silenced, and the fresh vessels came up from the British rear, the attack was carried down the French line. About 9.30 P.M. the "Orient" was seen to be in flames, and at 10 P.M. she blew up. The explosion imposed a brief suspension of battle, but the fire was soon renewed. By midnight the battle was over. In the course of the next day the "Guillaume Tell," the "Généreux" and two frigates succeeded in escaping, but they were the only survivors of the fleet attacked in the roadstead of Aboukir.

The destruction of the French fleet, which isolated Napoleon in Egypt, had profound political influence in Europe. The total loss of the British squadron was 218 killed and 678 wounded. The loss of the French was never exactly ascertained, but it was certainly very much greater. Admiral Brueys was killed on the quarter-deck of his flagship, and Nelson received a wound in the head from a langridge shot which disabled him.

See Captain Mahan's *Life of Nelson* (2nd. ed., 1899). (D. H.)

NILES, a city of Trumbull county, Ohio, U.S.A., on the Mahoning river, at the mouth of the Meander and Mosquito creeks, about 55 m. E.S.E. of Cleveland. Pop. (1890) 4289; (1900) 7468 (2104 foreign-born); (1910) 8361. It is served by the Baltimore & Ohio, the Erie and the Pennsylvania railways, and by an interurban electric system. Coal and iron-ore are abundant in the vicinity, and the city's principal manufactures are sheet steel, sheet iron, tin, metal lath, boilers and railway cars. The municipality owns and operates its waterworks and electric-lighting plant. Niles was settled in 1832, laid out in 1834, incorporated as a village in 1865 and chartered as a city in 1895. It was named (1834) in honour of Hezekiah Niles (1777–1839), the founder and editor of the weekly *Niles's Register* (1811–1849).

NILGAI, or NYLGHAU ("blue bull"), the largest antelope (*Boselaphus tragocamelus*) found in India, where it represents the kudu and eland group of Africa. Only the bulls have horns, and these are short and insignificant. The general colour of the old bulls is bluish grey, but younger bulls and cows are browner. The nilgai is about the size of a mule (see ANTELOPE).

NILGIRIS, THE, or NEELGHERRIES (Blue Mountains), a range of hills in southern India, which gives its name to a district of the Madras Presidency. The Nilgiris are really a plateau rather than a range, rising abruptly from the plains on most sides, with a general elevation of about 6500 ft. above the sea.

The DISTRICT OF THE NILGIRIS is the smallest administrative district in Madras. It formerly consisted exclusively of a mountain plateau lying at an average elevation of 6500 ft., with an area of about 725 sq. m. In 1873 this was increased by the addition of the Ochterlony valley in the south-east Wynaad, and again, in 1877, by other portions of the Wynaad, making a total area of 958 sq. m. The administrative headquarters is at Ootacamund, which is also the summer capital of the government of Madras. The summit of the Nilgiri hills is an undulating plateau, frequently breaking into lofty ridges and steep rocky eminences. The descent to the plains is sudden and abrupt, the average fall from the crest to the general level below being about 6000 ft., save on the north, where the base of the mountains rests upon the elevated land of Wynaad and Mysore, standing between 2000 and 3000 ft. above sea-level. The Ochterlony valley and Wynaad country consist of a series of broken valleys, once forest-clad throughout, but now studded with tea and coffee-gardens. The highest mountain peaks are—Dodabetta, 8760 ft.; Kudiakad, 8502; Bevoibetta, 8488; Makurti, 8402; Davarsolabetta, 8380; Kunda, 8353; Kundamoge, 7816; Ootacamund, 7361; Tambrabetta, 7292; Hokabetta, 7267. There are six well-known passes or *ghats* by which the district communicates with the neighbouring plains, three of which are practicable to wheeled traffic. The chief rivers are the Moyar, Paikara and Calicut, none of which are navigable. The forests consist of fine timber trees, such as *sál* (*Shorea robusta*), *kino* (*Pterocarpus Marsupium*), jack (*Artocarpus integrifolia*), blackwood (*Dalbergia latifolia*) and teak. Eucalyptus and Australian wattle have been extensively planted in the higher grounds of the Wynaad. The hills were first explored by British officers in 1814, and in 1821 the first English house was built on the plateau. The hill tribes include the Todas, the Badagas, the Kotas, the Kurumbas and the Irulas (*q.v.*). The total population of the district in 1901 was 111,437, showing an increase of 11·7% in the decade. The commercially important products are coffee, tea and cinchona. Coffee cultivation was introduced about 1844. One of its chief seats is the Ochterlony valley. The Madras government commenced the experimental cultivation of cinchona on the Nilgiris in 1860, and several private cinchona gardens were laid out, owing to the success of the government experiment. The climate of the Nilgiri hills is almost unrivalled for equability of temperature. The average is 58° F. The approach from the plains is by the branch of the Madras railway from Podanur to Mettapolliem, whence a metre-gauge line on the rack principle has been constructed to Coonoor, with an extension to Ootacamund. The chief educational institution is the Lawrence Asylum at Ootacamund maintained by government. The military quarters are at Wellington.

See *Nilgiris District Gazetteer* (Madras, 1908).

NILSSON, CHRISTINE (1843–), Swedish singer, was born at Wederslöff, near Wexiö, Sweden, on the 20th of August 1843. Her father was a poor working man, and she used as a girl to sing and perform on the violin at popular gatherings. In 1857 a wealthy man, M. Tornérhjelm, perceiving the unusual beauty of her voice while she was performing at a fair in Ljungby, provided the means for giving her a proper musical education, and in 1860 she was heard in the concert halls in Stockholm and Upsala, and then went to Paris, where, after four years' study, she made her début in the rôle of Violetta at the Théâtre Lyrique on the 27th of October 1864. Between that date and 1872, when she married M. Auguste Rouzaud, she was the leading prima donna. Her first appearance in London was in 1867. A year later, on the 9th of March, she made her first appearance in the Paris Opera House as Ophélie in *Hamlet*; and she visited the United States in 1870. She sang in St Petersburg in 1872; in America in 1873–1874 and in 1882; in Germany and Austria between 1876 and 1877; and in the next few years in Spain and Scandinavia; but after her marriage her appearances in public were rare. M. Rouzaud died in 1882, and five years afterwards Madame Nilsson married Count A. de Casa Miranda, and finally retired from the stage.

NIMAR, a district of British India, in the Nerbudda division of the Central Provinces. The administrative headquarters are at Khandwa; but the capital in Mahommedan times was Burhanpur. Area, 4273 sq. m. Pop. (1901) 329,615, showing an increase of 14·2% in the decade. The district consists of two portions of the Nerbudda and Tapti valleys, separated by a section of the Satpura range, about 15 m. in breadth. On the highest peak, about 850 ft. above the plain and 1800 above sea-level, stands the fortress of Asirgarh, commanding a pass which has for centuries been the chief highway between Upper India and the Deccan. The district contains extensive forests, but the only tract reserved by government is the Punasa forest, which extends for about 120 m. along the south bank of the Nerbudda, and contains young teak, besides *sáj* (*Terminalia tomentosa*) and *anjan* (*Hardwickia binata*). The staple crops are cotton and millet; *ganja* or Indian hemp is also allowed to be grown under government supervision. The Great Indian Peninsula railway runs through the district, and a branch of the Rajputana line from Indore joins it at Khandwa. There are factories for ginning and pressing cotton at Khandwa, and manufacture of gold-embroidered cloth at Burhanpur.

The name Nimar, derived from that of the ancient province, is also applied to a district in the state of Indore, lying W. of the British district on both banks of the Nerbudda. Area, 3871 sq. m.; pop. (1901) 257,110. From 1823 onwards this tract, then belonging to Sindhia, was under British management; in 1861 it was ceded in full sovereignty to the British, but in 1867 it passed to Holkar as the result of an exchange of territory.

See *Nimar District Gazetteer* (Allahabad, 1908).

NÎMES, a city of southern France, capital of the department of Gard, 174 m. S. by W. of Lyons on the Paris-Lyon railway, between Avignon and Montpellier. Pop. (1906) 70,708. Nîmes, important alike for its industries and for its archaeological treasures, lies at the foot of the Garrigues, a range of stony and barren hills which limit it on the north and west. The most prominent of these is the Mont Cavalier, the summit of which is crowned by the Tour Magne, a ruined Roman tower commanding a fine view of the town and its surroundings. To the south and east the town overlooks the monotonous plain traversed by the Vistre, and for the most part given over to the cultivation of the vine. Nîmes covers a large area, owing to the fact that its population is housed in low buildings, not in the lofty tenements which are found in most of the industrial towns of France. The central and oldest part is encircled by shady boulevards, which occupy the site of the old fortifications. Here are to be found the majority of the Roman remains for which Nîmes is remarkable. The most celebrated is the amphitheatre, the best preserved

though not the largest in France. It dates from the 1st or 2nd century A.D., and was used as a fortress for some time during succeeding centuries. Occupied during the middle ages by a special quarter, with even a church of its own, it was cleared in 1809, and since then has been well kept in repair. It is built of large stones fitted together without mortar. In form it is elliptical, measuring approximately 440 by 336 ft. externally; the arena is 227 by 126½ ft. The elevation (70 ft. in all) consists of a ground story of 60 arches, an upper story of 60 arches and an attic with consoles pierced with holes for supporting the *velarium* or awning. The building, which was capable of holding nearly 24,000 persons, has 4 main gates, one at each of the cardinal points; and 124 doorways gave exit from the 35 tiers of the amphitheatre to the inner galleries. Originally designed for gladiatorial shows, naval spectacles, chariot races, wolf or boar hunts, the arena has in recent times been used for bull-fights. The celebrated Maison Carrée, a temple in the style of the Parthenon, but on a smaller scale, 82 ft. long by 40 wide, is one of the finest monuments of the Roman period, and according to an inscription is dedicated to Gaius and Lucius Caesar, adopted sons of Augustus, and dates from the beginning of the Christian era. It contains a collection of antique sculptures and coins. The so-called temple of Diana, which adjoins the Fountain Gardens, was probably a building connected with the neighbouring baths of which remains are visible. Two Roman gates, the Porte d'Auguste, consisting of two large archways flanked by two smaller ones and dating from A.D. 16, and the Porte de France are still preserved. The Tour Magne (Turris Magna) is still 92 ft. in height, and was formerly a third higher. Admittedly the oldest monument of Nîmes, it has been variously regarded as an old signal tower, a treasure house or a mausoleum. Attached to the ramparts erected by Augustus, and turned into a fortress in the middle ages by the counts of Toulouse, the Tour Magne was restored about 1840. Near the Tour Magne has been discovered the reservoir from which the water conveyed by the Pont du Gard (see AQUEDUCT) was distributed throughout the city.

When it still possessed its capitol, the temple of Augustus, the basilica of Plotina erected under Hadrian, the temple of Apollo, the baths, the theatre, the circus, constructed in the reign of Nero, the Campus Martius and the fortifications built by Augustus, Nîmes must have been one of the richest of the Roman cities of Gaul. The cathedral (St Castor), occupying, it is believed, the site of the temple of Augustus, is partly Romanesque and partly Gothic in style. The church of St Paul, a modern Romanesque building, is adorned with frescoes by Hippolyte and Paul Flandrin; St Baudile (modern Gothic) is of note for the two stone spires which adorn its façade; and the court-house has a fine Corinthian colonnade and a pediment. Other buildings of note are the old citadel (dating from 1687, and now used as a central prison), and the former lycée, which contains the public library and the museums of epigraphy, of archaeological models of the Roman and Romanesque periods, and of natural history. The town also has a collection of paintings. The esplanade in front of the court-house has in the centre a handsome fountain with five marble statues by James Pradier. The Fountain Gardens, in the north-west of the town, owe their peculiar character as well as their name to a spring of water which after heavy rains is copious enough not only to fill the ornamental basins (constructed in the 18th century with balustrades and statues on ancient foundations) but also to form a considerable stream. Neither the spring, however, nor the Vistre into which it discharges, is sufficient for the wants of the city, and water has consequently been brought from the Rhone, a distance of 17 m. A beautiful avenue, the Boulevard de la République, runs south for nearly 1 m. from the middle walk of the garden. Nîmes has erected monuments to the "Children of Gard" (by A. Mercié), to Alphonse Daudet and to the Provençal poet Jean Reboul, natives of the town.

The city is the seat of a bishop, a prefect, a court of appeal and a court of assizes, and has tribunals of first instance and of commerce, a board of trade-arbitrators, an exchange, a chamber of commerce and a branch of the Bank of France. Its educational establishments include lycées and training colleges for both sexes, and schools of music and art.

At the close of the middle ages the industries of Nîmes were raised to a state of great prosperity by a colony from Lombardy and Tuscany; and, though the plague, the Wars of Religion and the revocation of the edict of Nantes were all sufficiently disastrous in their effects, before the Revolution about half of the whole community, or from 10,000 to 12,000 persons, had come to be engaged in manufactures, chiefly that of silk. Upholstery materials, shawls, carpets, handkerchiefs, tapes and braidings, brandy, hosiery, leather, clothes, candles, machinery and boots and shoes are now manufactured, and there are a number of foundries. Nîmes is, besides, one of the great southern markets for wine and brandy, and there is a good trade in grain, groceries and colonial wares. Quarries of hard limestone, used as the material for the amphitheatre and other buildings by the Romans, are still worked in the vicinity.

Nîmes, the ancient *Nemausus*, derived its name from the sacred wood in which the Volcae Arecomici (who of their own accord surrendered to the Romans in 121 B.C.) were wont to hold their assemblies. Strabo states that it was the metropolis of a district containing twenty-four dependent towns, and that it was independent of the proconsuls of Gallia Narbonensis. Constituted a colony of veterans by Augustus, and endowed with numerous privileges, it built a temple and struck a medal in honour of its founder. The medal, which afterwards furnished the type for the coat of arms granted to the town by Francis I., bears on one side the heads of Caesar Augustus and Vipsanius Agrippa (the former crowned with laurel), while on the other there is a crocodile chained to a palm-tree, with the legend COL. NEM. It was Agrippa who built the public baths at Nîmes, the temple of Diana and the aqueduct of the Pont du Gard. The city-walls, erected by Augustus, were nearly 4 m. in circuit, 30 ft. high and 10 ft. broad, flanked by ninety towers and pierced by ten gates. Hadrian on his way back from Britain erected at Nîmes two memorials of his benefactress Plotina. In the very height of its prosperity the city was ravaged by the Vandals; the Visigoths followed, and turned the amphitheatre into a stronghold, which at a later date was set on fire along with the gates of the city when Charles Martel drove out the Saracens. Nîmes became a republic under the protection of Pippin the Short; and in 1185 it passed to the counts of Toulouse, who restored its prosperity and enclosed it with ramparts whose enceinte, less extensive than that of Augustus, may still be traced in the boulevards of the present day. The city took part in the crusade against the Albigenses in 1207. Under Louis VIII. it received a royal garrison into its amphitheatre; under Louis XI. it was captured by the duke of Burgundy, and in 1420 was recovered by the dauphin (Charles VII.). On a visit to Nîmes Francis I. enriched it with a university and a school of arts. By 1558 about three-fourths of the inhabitants had become Protestants, and in 1567 a massacre of Catholics took place on St Michael's day. From the accession of Henry IV. till the revocation of the edict of Nantes (1685) the Protestant community devoted itself to active industry; but after that disastrous event great numbers went into exile or joined the Camisards. Louis XIV. built a fortress (1687) to keep in check the disturbances caused by the rival religious parties. Nîmes passed unhurt through the storms of the Revolution; but in 1815 Trestaillon and his bandit followers pillaged and burned and plundered and massacred the Bonapartists and Protestants. Since then the city has remained divided into two strongly marked factions—Catholics and Protestants—though with no repetition of such scenes.

See H. Bazin, *Nîmes Gallo-Romain* (Nîmes, 1891); L. Menard, *Histoire civile, ecclésiastique et littéraire de la ville de Nismes*; R. Peyre, *Nîmes, Arles et Orange* (Nîmes, 1903).

NÎMES, COUNCILS OF (*Concilia Nemausensia*). Of the four councils held at Nîmes those of 886 and 1284 are relatively unimportant. The synod of 394 adopted seven canons on discipline, which were first printed in 1743 and have not as yet

made their way into the great collections. At the council of July 1096 Pope Urban II. presided, and sixteen disciplinary canons were adopted, which have many points of contact with the canons of the council of Clermont.

See, for the first council of Nîmes, Lauchert, pp. 183-185; for the others, Hardouin vi. 1. 397, vi. 2. 1747 ff., vii. 903 ff.; full titles under COUNCIL. (W. W. R.*)

NIMROD (נִמְרֹד, נִמְרֹד; Septuagint, Νεβρώδ: various reading in Gen. x. 8, Νεβρών: Vulg. *Nemrod*). Nimrod is only mentioned in three passages in the Bible; in Micah v. 6 Assyria is called "the land of Nimrod," and 1 Chron. i. 10 quotes a portion of the third, the most important reference, Gen. x. 8-12. The last-named is ascribed to one of the oldest writers of the Pentateuch, the Yahwist; but not perhaps to the oldest stratum of his work (Ball, *Sacred Books of the Old Testament*). In Gen. x. 8, as Jabal was the inventor of music, so Nimrod was the first warrior, *gibbôr*, the first hunter, "he became a mighty hunter, *gibbôr ṣayidh*, before Yahweh, so that it is said, A mighty hunter before Yahweh like Nimrod"; the first builder of cities and ruler of a widespread dominion, "the beginning of his kingdom was Babel, Erech, Accad and Calneh in the land of Shinar. Out of that land he went forth into Assyria,[1] and built Nineveh, Rehoboth-Ir, Calah and Resen between Nineveh and Calah (the same is the great city)." The general statement that Assyria was originally an offshoot and dependence of Babylon is substantially in accordance with Assyrian and Babylonian authorities. As the chapter stands, Nimrod is a descendant of Ham, cf. verses 6 and 8; but as Babylon and Assyria were Semitic, cf. verses 21, 22, and as verses 6, 7, on the one hand, and verses 8-12, on the other, come from different documents, we must dissociate the two consecutive paragraphs, and regard the "Cush" of verse 8 as the Babylonian Cash or Cassites, a people quite distinct from the Cush of verse 6, which is Ethiopia; the text and interpretation of portions of Gen x. 8-12 are doubtful.[2] The "mighty hunter before Yahweh" has been variously explained as "a divinely great hunter" (Spurrell); "a hunter in defiance of Yahweh" (Holzinger); "a hunter with the help of Yahweh" or "of some deity whose name has been replaced by Yahweh" (Gunkel, *Genesis*, p. 82).

The name Nimrod has not been found in any ancient (say older than 500 B.C.) non-Israelite document or inscription; and there is no conclusive evidence for identifying Nimrod with any of the names found in such documents. In the absence of evidence, the theories are naturally endless, especially as both the legendary and the historical heroes of the ancient East were often "mighty hunters." Nimrod would suggest to a Jew or Syrian the idea of "rebel," *mrd*=rebel; but this is not likely to be the etymology. By regarding the "N" as performative, Nimrod has been identified with Merodach, the god of Babylon (Pinches, Hastings's *Bible Dict.*). He has also been identified with Gilgamesh, the hero of the epic which contains the Babylonian Deluge story (Jeremias, *Das A.T. im Lichte des alten Orients*), with various historical kings of Babylonia, with Orion, &c., &c. As the name *Nmrt* (Petrie, *Nemart*) frequently occurs in Egyptian documents of the XXIInd Dynasty, *c.* 972–749 (Petrie, *Hist. of Egypt*, iii. 242, &c.), the story of Nimrod is sometimes (E. Meyer *ap.* Holzinger, *Genesis*) conjectured to be of Egyptian origin. Some support might be obtained for this view by supposing Cush in verse 8 to be Ethiopia as in verse 6; but it seems impossible to reconcile it with the statements in Genesis and Micah which connect Nimrod with Babylon and Assyria. It is possible that the *Nebrod* of the Septuagint (similarly Philo and Josephus) is the more ancient form of the name (Cheyne, *Ency. Bibl.*).

[1] So Revised Version text with Kautzsch, Dillmann, Gunkel, Holzinger, &c.; Revised Version marg., "Out of that land went forth Asshur," less probably following Septuagint, Vulgate, Authorized Version, &c.

[2] Dr Cheyne's reconstructions in *Ency. Bibl.*, article "Nimrod," are generally regarded as far too sweeping. Ball, *Sacred Books of the Old Testament*, marks verse 9, which describes Nimrod as "a mighty hunter," as a later addition, giving a mistaken explanation of the *gibbôr* of verse 8.

Many later legends gathered round Nimrod; Philo, *De gigantibus*, § 15, allegorises *more suo*. Nimrod stands for treachery or desertion, according to the derivation from *mrd* mentioned above. According to Josephus, *Ant.* I. iv. 2, vi. 2, Nimrod built the Tower of Babel. According to the Rabbis (Tzeenah u Reenah, Hershon's tr., p. 59), Nimrod cast Abraham into the fire because he refused to worship idols. God, however, delivered him.

Nimrod, in the form *Nimrud* or *Nimroud*, is an element in many modern place-names in western Asia. (W. H. Bx.)

NINE MEN'S MORRIS, known also as *Morelles* and *Merelles*, an ancient English game played with 9 counters a side on a board marked with four squares, one within the other. The middle points of the three inside squares are connected by straight lines, and, in a variation of the game, the corners also. The players, whose counters are of different colours, place these alternately one by one upon the intersections of the lines, the object of each being to get three of his own men in line, in which case he has the privilege of pounding, *i.e.* removing from the board, any one of his opponent's men; although he may not take one of a row of three, unless there are no others. When all 18 counters have been placed on the board they are moved to adjacent unoccupied intersections. When all but three of a player's men have been captured he is allowed to jump or hop to any vacant point he chooses. As soon as a player is reduced to two men he loses. In the time of Shakespeare (*Midsummer Night's Dream*, Act ii. Scene 1) the game was commonly played out of doors.

NINEVEH (Heb. נִינְוֵה, in classical authors Νῖνος, Ninus; LXX. Νινευη, Νηρευη: Assyrian *Ninâ* or *Ninûa*), the best known and highly renowned capital of the Assyrian empire. There was a quarter or suburb of the old Babylonian city of Lagash whose name was written in the same way; this may possibly have been the home of those settlers from Babylonia who gave its name to the Assyrian city. The name was carried elsewhere, probably by Assyrian settlers, and we meet with Ninoe in Asia Minor (Th. Nöldeke, *Hermes*, v. 464, n. 2). Philostratus calls a Hierapolis, ἡ ἀρχαῖα Νῖνος but it must not be confounded with the Egyptian Nî-y, Assur-bani-pal Nî, the frontier city to the east of Egypt's greatest extension, where Tethmosis (Thothmes) III. hunted elephants, probably situated on the Euphrates. This, however, may be the origin of Ctesias's statement (*ap.* Diod. ii. 3) that Nineveh stood on the Euphrates; the Arabic geographer Yaqut places a Nineveh on the lower Euphrates near Babylon, and this may be a colony from the great Nineveh, or possibly the Ninâ of Lagash.

The derivation of the name is uncertain. The name Ninâ was borne also by the goddess Ishtar, whose worship was the special cult of Nineveh, and Ninûa may well be a hypocoristicon of Ninâ. The ideogram for Nineveh, as also for the Lagash city,  , is a fish enclosed in the sign for house, possibly indicating a fish-pond, sacred to Ishtar. As the Semitic *nûnu* means a fish, a play upon *nûnu* and *Ninâ* is suggested, but the name may be pre-Semitic. A derivation from the root נוּ with a meaning like "lowland" is doubtful, unless we are sure that the name is Semitic, and that the Lagash city also lay low.

Nineveh was situated at the N.W. angle of an irregular trapezium of land which lay between the rivers Husur (Khausar, Choser) on the N.W., Gômal on the N.E. and E., Upper Zâb on the S.E. and S. and Tigris on the S. and W. In extent this plain is 25 m. by 15 m., and contains the ruins of Nineveh at Kuyunjik and Nebi Yûnus, of Dûr Sargon at Khorsabad to the N.E. of Calah at Nimrud to the S. as well as of other towns not yet identified. The whole plain has a gradual slope from the low range of Jebel Maqtub and the hill of Ain-es-safra on the N.E. to the Tigris on the S.W. This plain was, for those days, amply protected on three sides by the two rapid broad streams of the Tigris and its tributary Zâb, by the hills on the N.E. and the river Gômal at their base. The weak N.W. side was partly covered by the Husur, an impassable flood in winter but easily fordable in summer. The floods caused by the Husur were frequent and destructive, on one occasion sweeping away the palace terrace at Nineveh and exposing the tombs of the kings, on another isolating Khorsabad. A great series of dams was therefore constructed (mapped and described in "Topography

of Nineveh," *J.R.A.S.* xiv. 318 ff.) which controlled the floods and filled the ditches and moats of Nineveh. One of these ditches can be traced over 2 m. with a breadth of 200 ft., and was lined with a rampart on the city side.

The city on the river side of the Tigris extended about 2½ m., its north wall measured 7000 ft., the eastern wall was nearly 3 m. long and the southern about 1000 ft. The city thus formed a long narrow strip along the Tigris, pierced at right angles by the Husur, the waters of which, by closing the great dam in the eastern wall, could be sent round the moats to the N. and S. The Tigris may have swept the western wall, though now a wide belt of sand has accumulated between the ruins and its present channel which is perpetually shifting. The actual extent of the city may be reckoned at about 1800 acres, or about two-thirds the size of Rome within Aurelian's Wall. At the rate of 50 sq. yds. to a person, it would have held a population of 175,000; but the extent of the palaces, gardens, &c., forbid us to imagine any such multitude except as refugees during a siege. Outside this city proper lay wide outskirts (*kablu*) which were divided into quarters each with a separate governor (*šaknu*). Further afield lay the Rêbit-Ninûa, in which some have recognized the Rehoboth-Ir of Gen. x. 11 (Ninûa is often replaced by *ir* or *alu* in the inscriptions), a less closely populated area which extended to and included the site of Khorsabad, before Sargon II. built his city of Dûr-Sargon there. Across the Tigris, connected by a bridge, lay an extensive district, probably now replaced by Môsul. As Esarhaddon entered Nineveh, on his triumphal return from Sidon, through Rêbit-Ninûa, it is probable that this name covered the western suburbs. The walled city formed a sort of Acropolis, and it is difficult to say exactly how far the name of Nineveh should be extended. Few traces of private houses have been found within the walls, but as deeds of sale speak of houses *in* Nineveh, which were bounded on three sides by other houses, there must have been continuous streets within the area denoted by that name. Great emphasis has been laid on the agreement of a tetrapolis, formed by Nineveh, Khorsabad, Calah and Keramlis, with the dimensions given by Diodorus and with the phrase "an exceeding great city of three days' journey" (Jonah iii. 3). Admitting that this whole area was thickly inhabited and might be regarded by those at a distance as one city, and that the district may well have had a common name, which could hardly be Assur, there is yet no native evidence that Nineveh extended so far. There is no trace of a common wall, each city was as strongly fortified towards the interior as on the outside. Each had its own *šaknu*, and the governor of Nineveh stands below the governors of Assur and Calah in official lists. In deeds of sale "the road to Calah" is as often named as the "king's highway" to Arbela or Assur.

The history of Nineveh is, of course, bound up with that of Assyria in general. Later Assyrian writers professed to carry back its foundation to the creation of the world, but we lack any historical evidence of its age or early history. We may conjecture that it was founded by settlers from Babylonia Ninâ, and the statement that Nimrod founded it from Babylonia, along with Calah, Rehoboth-Ir and Resen, shows that this opinion was early held. We are, however, still without evidence that this was its first occupation. The mention of Gudea's building a temple for Ishtar in Ninâ (2800 B.C.) may refer to the Lagash city and an inscription of Dungi, king of Ur (2700 B.C.), said to have been found at Nineveh, might have been carried there by some antiquary king. We reach firm ground with the statement of Khammurabi (2285 B.C.) that he "made the waters of Ishtar to be glorious in Nineveh in Ê-MEŠ-MEŠ," the temple of Ishtar there (Code IV. 60-62). As he had just spoken of "returning the gracious protecting god to Assur," and spells the name *Ni-nu-a*, there can be no doubt that Nineveh is meant. Shalmaneser I., in his *sikâti* inscriptions (L. W. King, *Records of the Reign of Tukulti-Ninib I.* p. 131), *c.* 1300 B.C., records his restoration of the temple of Ishtar of Nineveh, which had been built by Samsi-Hadad (Shamshi-Adad) and restored once before by Assur-uballit. Which Samsi-Hadad (out of six at least) this was, and which Assur-uballit we are not told; the first of the former name known to us was a contemporary of Khammurabi and, if he built the temple first, Khammurabi may have plundered it and then restored it again; but an even earlier Samsi-Hadad may be meant. Dushratta, king of Mitanni, about 1400 B.C., in the Tell el-Amarna letters offers to send to the king of Egypt an image of Ishtar of Nineveh; from which it has been inferred that Nineveh was then under foreign rule. The same letters mention Shaushbi as goddess of Nineveh. A statue of a female nude figure found at Nineveh bears an inscription showing it to have been in the palace of Assur-bêl-kala (1080 B.C.), who is therefore supposed to have resided in Nineveh. Assur-rêsh-ishi, Mutakkil Nusku and Tiglath-pileser I. restored a temple of Ishtar, probably in Nineveh. Assur-narâin-apli (885 B.C.) restored the temple Ê-MAŠ-MAŠ of Ishtar at Nineveh, but removed his residence to Calah. Shalmaneser II. set out on several of his expeditions from Nineveh, but in the latter part of his reign resided at Calah, and when rebellion broke out under his son Assur-danin-apli Nineveh sided with the rebel prince. Sennacherib records that several of his royal ancestors had been buried in Nineveh and they presumably had resided there. At the commencement of his reign Sennacherib found Nineveh a poor place. A storehouse, the ancient and renowned temple, an armoury or storehouse, were the chief buildings. Two lofty platforms along the Tigris front had served as foundations of the palaces hitherto built, but the platforms had been wrecked and the palaces were in decay. Sennacherib restored and enlarged the northern platform now covered by the Kuyunjik mound and built his palace on the south-western portion of it. It has been only partially excavated, though seventy-one rooms were opened, and it is the grandest architectural effort of Assyria. The bas-reliefs with which the walls are adorned are unrivalled in antiquity, for variety of subject, breadth of composition, truth of presentation and artistic treatment. The accuracy with which building operations are portrayed, and a sense of landscape, are great advances even on the superb work of Sargon's palace at Khorsabad. On the adjoining platform to the south, now Nebi-Yunus, Sennacherib erected an arsenal for military supplies. Nineveh was badly supplied with water for drinking; the inhabitants had to "turn their eyes to heaven for the rain," but Sennacherib conducted water by eighteen canals from the hills into the Husur and distributed its waters round the moats and into store tanks, or ponds, within the city. He laid out a fine park or Paradise, for pleasure and the chase, to the east of his palaces, and built up a magnificent "triumphal way" sixty-two cubits broad and forbade any householder to encroach upon the street. Sennacherib made Nineveh his court residence and, after his destruction of Babylon and the influx of the enormous booty brought back from his conquests, it must have been the most magnificent and wealthiest city of the East.

Esarhaddon began to rebuild Babylon and so departed from his father's purpose to make Nineveh the metropolis of the empire, but he did not altogether neglect the city. He rebuilt the temple of Assur at Nineveh, and a palace for himself now covered by the Nebi-Yunus mound and so inefficiently explored. Thither Assur-bani-pal brought the rebel Egyptian vassals Necho and Sharru-ludari, the Elamite kings, the booty and captives of his continual conquests. He rebuilt the temples and a palace for himself north of Sennacherib's on the site of the latter's harem; which was adorned with extraordinary variety and richness. His sculptures are at the highest range of original and effective delineation in antiquity. Especially is his palace famous for the celebrated library, of which Sennacherib had made a commencement. Tens of thousands of clay tablets, systematically arranged on shelves, contained the classics of the Babylonian literature for which his scribes ransacked and copied the treasures of all then known centres of literary life.

Very little trace is left of the fortunes of Nineveh during the reigns of the sons of Assur-bani-pal. Nineveh, according to Herodotus, was besieged by Cyaxares and the Medes but saved by Madyes and the Scythians some twenty or more years before the Medes in alliance with Nabopolassar, king of Babylon,

finally took it, *c.* 606 B.C. Much conjecture has been lavished upon the varying accounts which have reached us of the capture, but it seems probable that a heavy flood or the besiegers burst the great dam and while thus emptying the moats launched a flood against the west wall on the inside and thus breached the defences.

It may be of interest to record the names of the governors of Nineveh: Nergal-mudammik. 835 B.C.; Ninib-mukin-ahi, 790–761 B.C.; Mahdê, 725 B.C.; Nabû-dini-epush, 704 B.C.; Ahi-ilai, 649 B.C., officiated as Eponyms for the year.

If, as generally admitted, the ruins of Mespila and Larissa "described" by Xenophon, *Anab.* iii. 4, 7 sq. were those of Kuyunjik and Nimrud, we may conclude that there was no inhabited city on the spot at the time of the march of the Greeks with Cyrus (cf. Strabo xvi. p. 745). The name of Nineveh (Syriac Nīnwē; Arabic Nīnawā, Nūnawā) continued, even in the middle ages, to be applied to a site opposite Mōsul on the east bank of the Tigris, where huge mounds and the traces of an ancient city wall bore witness of former greatness. Copious references to these mentions are collected in Tuch, *De Ninò Urbe* (Leipzig, 1845). Ibn Jubair, p. 237 sq., followed by Ibn Batuta, ii. 137, gives a good description of the ruins and the great shrine of Jonah as existing in the 12th century. The name of Nīnawā applied, not to the ruins, but to the Rustak (fields and hamlets) on the site (Balādhurī, p. 331; Ibn Haukal, p. 145; Yaqut, ii. 694).

A very complete summary of the traditions will be found in Lincke, "Asayrien und Nineveh," in *Geschichte und Sage der Mittelmeervölker nach 607–606.*

The explorations of Sir A. H. Layard at Kuyunjik (1845–1847 and 1849–1851) definitely located the city, in confirmation of ancient tradition and the identifications of Rich and others. Excavations were carried on by Rawlinson, 1853–1855; H. Rassam, 1854; G. Smith, 1873–1874 and 1876; Rassam again, 1877–1883; E. A. Wallis Budge, 1888–1889; and King, 1902. The enormous mound of Kuyunjik now separated from that of Nebi-Yunus by the deep and rapid Khausar, marks the site of the palace of Sennacherib and Assur-bani-pal. The mound of Nebi-Yunus is crowned by the "Tomb of Jonah," a sacred shrine to the modern inhabitants, and could not be explored; but by sinking a shaft within the walls of a private house, some sculptured slabs were recovered, and the Turkish government later opened out part of a palace of Esarhaddon. Excavations at two of the great city gates showed them to have been erected by Sennacherib.

BIBLIOGRAPHY.—The architecture of these palaces is exhaustively treated in Ferguson's *Palaces of Nineveh and Persepolis Restored*, and in Perrot and Chipiez, *Art in Chaldea and Assyria*. Each palace was in itself a fort, and the external walls are still 80 ft. high in places. The many topographical details furnished by exploration when compared with the building inscriptions and the indications given by deeds of sale will doubtless enable us ultimately to map out the principal features of the ancient city, but much more systematic exploration is needed, as well as further publication of existing documents. (C. H. W. J.)

NING-PO (NING-PO-FU, *i.e.* City of the Peaceful Waves), a great city of China, the principal emporium of trade in the province of Chehkiang, standing in a fine plain bounded by mountains towards the west, on the left bank of the Ning-po river, about 16 m. from its mouth, in 29° 49′ N., 121° 35′ E. It was visited by Portuguese traders as early as 1522, and is one of the five seaports which were thrown open to foreign trade in 1842 by the treaty of Nanking. The population of the city and suburbs is estimated from 400,000 to 500,000. Ning-po is surrounded by a fine old wall, 25 ft. high and 16 ft. broad, pierced by six gates and two passages for ships in its circuit of 4 to 5 m. Just within the walls there is a considerable belt of open ground, and in many places the ramparts are thickly covered with jasmine and honeysuckle. In ascending the river a stranger's eye is first caught by the numerous huge ice-houses with high thatched roofs and by a tall white tower—the T'ien-fêng-t'a or Ning-po pagoda or obelisk—which rises to a height of 160 ft. and has fourteen stories and seven tiers of windows, but has unfortunately been stripped of its galleries and otherwise damaged. Another striking structure in the heart of the city is the Drum Tower, dating from before the 15th century. As is natural in a place long celebrated for its religious and educational pre-eminence, there is no lack of temples, monasteries and colleges, but few of these are of any architectural significance. Brick is the ordinary building material, and the dwelling-houses are mostly of one storey. Silks, cottons, carpets, furniture, white-wood carvings and straw hats are the chief products of the local industry. Large salt-works are carried on in the vicinity, and thousands of fishermen are engaged, mainly between April and July, in catching cuttle-fish. In spite of the powerful competition of Shanghai, Ning-po has a valuable foreign trade. It is regularly visited by the vessels of the China Navigation Company and the Chinese Merchants' Steam Navigation Company. From 216,191 register tons in 1873 the tonnage of the port had increased to 303,109 in 1880, and in 1904 the figures rose to 532,869 tons. The value of the trade passing through the custom house in 1904 was £3,052,629, as compared with £2,312,000 in 1900 and £3,405,000 in 1880. Straw or grass hats, straw mats, samshu (from the Shao-sing district), Chinese drugs, vegetable tallow and fish are among the chief exports; in 1904 the hats numbered 2,125,566, though in 1863 they had only amounted to 40,000, and the mats, mainly despatched to south China, average from 1,000,000, to 2,000,000. Missions are maintained in Ning-po by the Roman Catholic church, by the Church Missionary Society (1848), the American Presbyterians, the Reformed Wesleyans, the China Inland Mission (1857), &c. A mission hospital was instituted in 1843. After the storming of Chenhai—the fortified town at the mouth of the river—on the 10th of October 1841, the British forces quietly took possession of Ning-po on the 12th. In 1864 the T'aip'ings held the town for six months.

NINIAN, ST, a Briton, probably from Strathclyde, who was trained at Rome and founded a church at Whithorn on the west side of Wigtown Bay. Whithorn has been identified with the Leukopibia of Ptolemy, but this is uncertain. Bede, writing three centuries after Ninian, ascribes the name Ad Candidam Casam to the fact that the church of Ninian was built of stone. We are told by Bede that St Ninian dedicated his church to St Martin of Tours, who died between 397 and 400, but Ailred of Rievaulx is our only authority for the statement that St Martin supplied him with masons. The population of the north shore of the Solway Firth at the beginning of the 5th century were probably either Picts or Goidels or a blend of both, and naturally hostile to the Romanized Britons. Bede records that Ninian preached among the Picts within the Mounth, which indicates that he was acquainted with the Pictish language. The legends of his work in Ireland probably arise from the influence exercised in that country by the church of Whithorn. The date of Ninian's death is given by Archbishop Ussher as 432, but there is no authority for this statement.

See Bede, *Hist. Eccl.* (ed. C. Plummer, Oxford, 1896), iii., iv.; Ailred of Rievaulx, "Life of St Ninian," in the *Historians of Scotland* vol. v. (Edinburgh, 1874); W. F. Skene, *Celtic Scotland* (Edinburgh, 1877), ii. 2 ff.; and J. Rhys, *Celtic Britain* (London, 1904), p. 173.

NINIB, the ideographic designation of a solar deity of Babylonia. The phonetic designation is uncertain—perhaps Annshit. The cult of Ninib can be traced back to the oldest period of Babylonian history. In the inscriptions found at Shirgulla (or Shirpurla, also known as Lagash), he appears as Nin-girsu, that is, "the lord of Girsu," which appears to have been a quarter of Shirgulla. He is closely associated with Bel (*q.v.*), or En-lil of Nippur, as whose son he is commonly designated. The combination points to the amalgamation of the district in which Ninib was worshipped with the one in which Bel was the chief deity. This district may have been Shirgulla and surrounding places, which, as we know, fell at one time under the control of the rulers of Nippur.

Ninib appears in a double capacity in the epithets bestowed on him, and in the hymns and incantations addressed to him. On the one hand he is the healing god who releases from sickness and the ban of the demons in general, and on the other he is the god of war and of the chase, armed with terrible weapons. It is not easy to reconcile these two phases, except on the assumption

that he has absorbed in his person various minor solar deities, representing different phases of the sun, just as subsequently Shamash absorbed the attributes of practically all the minor sun-deities.

In the systematized pantheon, Ninib survives the tendency towards centralizing all sun cults in Shamash by being made the symbol of a certain phase of the sun. Whether this phase is that of the morning sun or of the springtime with which beneficent qualities are associated, or that of the noonday sun or of the summer solstice, bringing suffering and destruction in its wake, is still a matter of dispute, with the evidence on the whole in favour of the former proposition. At the same time, the possibility of a confusion between Ninib and Nergal (*q.v.*) must be admitted, and perhaps we are to see the solution of the problem in the recognition of two diverse schools of theological speculation, the one assigning to Ninib the rôle of the spring-tide solar deity, the other identifying him with the sun of the summer solstice. In the astral-theological system Ninib becomes the planet Saturn. The swine seems to have been the animal sacred to him, or to have been one of the symbols under which he is represented. The consort of Ninib was Gula (*q.v.*). (M. Ja.)

NINUS, in Greek mythology, the eponymous founder of Nineveh (*q.v.*), and thus the city itself personined. He was said to have been the son of Belos or Bel, to have conquered in seventeen years the whole of western Asia with the help of Ariaeus, king of Arabia, and to have founded the first empire. During the siege of Bactra he met Semiramis, the wife of one of his officers, Onnes, whom he took from her husband and married. The fruit of the marriage was Ninyas, *i.e.* "The Ninevite." After the death of Ninus, Semiramis, who was accused of causing it, erected to him a temple-tomb, nine stades high and ten stades broad, near Babylon. According to Castor (*ap. Syncell.* p. 167) his reign lasted fifty-two years, its commencement falling 2189 B.C. according to Ctesias. Another Ninus is described by some authorities as the last king of Nineveh, successor of Sardanapalus.

See J. Gilmore, *Fragments of the Persika of Ktesias* (1888).

NIOBE, in Greek mythology, daughter of Tantalus and Dione, wife of Amphion, king of Thebes. Proud of her numerous family, six daughters and six sons, she boasted of her superiority to her friend Leto, the mother of only two children, Apollo and Artemis. As a punishment, Apollo slew her sons and Artemis her daughters. Their bodies lay for nine days unburied, for Zeus had changed the people to stone; on the tenth day they were buried by the gods. Out of pity for her grief, the gods changed Niobe herself into a rock on Mount Sipylus in Phrygia, in which form she continued to weep (Homer, *Iliad*, xxiv. 602-617; Apollodorus iii. 5; Ovid, *Metam.* vi. 146-312). The names and number of her children, and the time and place of their death, are variously given. This "Niobe," described by Pausanias (i. 21) and Quintus Smyrnaeus (i. 293-306), both natives of the district, was the appearance assumed by a cliff on Sipylus when seen from a distance and from the proper point of view (see Jebb on Sophocles, *Antigone*, 831). It is to be distinguished from an archaic figure still visible, carved in the northern side of the mountain near Magnesia, to which tradition has given the name of Niobe, but which is really intended for Cybele.

According to some, Niobe is the goddess of snow and winter, whose children, slain by Apollo and Artemis, symbolize the ice and snow melted by the sun in spring; according to others, she is an earth-goddess, whose progeny—vegetation and the fruits of the soil—is dried up and slain every summer by the shafts of the sun-god. Burmeister regards the legend as an incident in the struggle between the followers of Dionysus and Apollo in Thebes, in which the former were defeated and driven back to Lydia. Heffter builds up the story round the dripping rock in Lydia, really representing an Asiatic goddess, but taken by the Greeks for an ordinary woman. Enmann, who interprets the name as "she who prevents increase" (in contrast to Leto, who made women prolific), considers the main point of the myth to be Niobe's loss of her children. He compares her story with that of Lamia, who, after her children had been slain by Zeus, retired to a lonely cave and carried off and killed the children of others. The appearance of the rock on Sipylus gave rise to the story of Niobe having been turned to stone. The tragedians used her story to point the moral of the instability of human happiness; Niobe became the representative of human nature, liable to pride in prosperity and forgetfulness of the respect and submission due to the gods.

The tragic story of Niobe was a favourite subject in literature and art. Aeschylus and Sophocles wrote tragedies upon it; Ovid has described it at length in his *Metamorphoses*. In art, the most famous representation was a marble group of Niobe and her children, taken by Sosius to Rome and set up in the temple of Apollo Sosianus (Pliny, *Nat. Hist.* xxxvi. 4). What is probably a Roman imitation of this work was found in 1583 near the Lateran, and is now in the Uffizi gallery at Florence. In ancient times it was disputed whether the original was the work of Praxiteles or Scopas, and modern authorities are not agreed as to its identity with the group mentioned by Pliny.

On the whole subject see C.E. Burmeister, *De fabula quae de Niobe ejusque liberis agit* (Wismar, 1836); L. Curtze, *Fabula Niobes Thebanae* (Corbach, 1836); W. Heffter in *Zeitschrift für Gymnasialwesen*, ix. (1855); C. B. Stark, *Niobe und die Niobiden* (1863), the standard work; E. Thrämer, *Pergamos* (1888); C. Friederichs, *Praxiteles und die Niobegruppe* (1865); A. Mayerhöfer and H. Ohlrich, *Die Florentiner Niobegruppe* (1881 and 1888); for the Niobe on Mount Sipylus, see C. B. Stark, *Nach dem griechischen Orient* (1874); G. Weber, *Le Sipylos et ses monuments* (1880); W. Ramsay, "Sipylos and Cybele," in *Journal of Hellenic Studies*, iii. (1882); Frazer's *Pausanias*, iii. 555; for vase-paintings, see H. Heydemann, *Niobe und Niobiden auf griechischen Vasenbildern* (1875). For further literature on the subject, see A. Preuner's mythological bibliography in C. Bursian's *Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft*, vol. xxv. (1891); the various derivations of the name and interpretations of the legend are given in Enmann's article in Roscher's *Lexikon der Mythologie*.

In GREEK ART, fig. 29 (from an Orvieto vase) represents the slaying of the children of Niobe by Apollo and Artemis; fig. 78 (Pl. VI.), Niobe shielding her youngest daughter.

NIORT, a city of western France, chief town of the department of Deux-Sèvres, 42 m. E.N.E. of La Rochelle on the railway to Saumur. Pop. (1906) 20,538. Niort is situated on the left bank of the Sèvre Niortaise, partly in the valley and partly on the slopes of the enclosing hills. The tower of the church of Notre-Dame (15th and 16th centuries) has a spire 246 ft. high, with bell-turrets adorned with statues of the evangelists, and at the base a richly decorated dais in the Renaissance style; and the north doorway shows a balustrade, of which the balusters form the inscription *O Mater Dei, memento mei*. St André, with a fine window in the apse, and St Hilaire, which contains some beautiful frescoes, both date from the 19th century. Of the old castle, whose site is partly occupied by the prefecture, there remains the donjon—two large square towers united by a central building, flanked by turrets, built, it is said, by Henry II. of England or Richard Cœur de Lion. The platform on the top affords a fine view of the public garden (one of the most picturesque in France) and the valley of the Sèvre. The old town-hall, Renaissance in style, is wrongly known as the Aliénor palace, after Eleanor of Guienne; it contains a collection of antiquities. The house is still shown in which Madame de Maintenon is erroneously stated to have been born. Near Niort are the fine feudal ruins of the fortress of Coudray-Salbart.

Niort is the seat of a prefect and a court of assizes, and has tribunals of first instance and of commerce, a board of trade-arbitration, lycées for both sexes, a school of drawing, a chamber of commerce and a branch of the Bank of France. Tanning, currying, shammy-dressing, glove-making and the manufacture of brushes and boots and shoes are the staple industries.

Up to the 7th century the Niort plain formed part of the Gulf of Poitou; and the mouth of the Sèvre lay at the foot of the hills now occupied by the town which grew up round the castle erected by Henry Plantagenet in 1155. The place was captured by Louis VIII. in 1224. By the peace of Brétigny it was ceded to the English; but its inhabitants revolted against the Black Prince, and most of them were massacred when his troops recovered the town by assault. In 1373 Duguesclin regained

possession of the town for the French. Protestantism made numerous proselytes at Niort, and Gaspard de Coligny made himself master of the town, which successfully resisted the Catholic forces after the Battle of Jarnac, but surrendered without striking a blow after that of Moncontour. Henry IV. rescued it from the League. It suffered severely by the revocation of the edict of Nantes.

NIPIGON [NEEPIGON, OR NEPIGON], a lake and river of Thunder Bay district, Ontario, Canada. The lake is 30 m. N. of the bay of the same name on Lake Superior, at an altitude of 852 ft. above the sea. It is 70 m. long and 50 m. wide; contains over 1000 islands, is very deep, and has a much-indented shore-line measuring upwards of 580 m. The river, which drains the lake, descends several hundred feet in the 40 m. of its course and is the largest stream flowing into Lake Superior. It is widely known for the excellence of its trout fishing.

NIPISSING, a lake of the district of the same name in Ontario, Canada, situated nearly midway between Lake Huron and the Ottawa river, at an altitude of 644 ft. above the sea. It is of irregular shape, with bold shores, and contains many islands; from the north it receives the waters of Sturgeon river. It is 50 m. in length and 20 in breadth; discharges its waters by French river into Lake Huron, and is separated by a low watershed from the Mattawa river, a tributary of the Ottawa. It has been proposed as the summit level of the projected Ottawa and Georgian Bay canal, an important project rendered difficult by the numerous rapids both on French river and on the Ottawa. With the Ottawa, Mattawa and French, it formed the old *voyageur* route from Montreal to the Great Lakes.

NIPPUR, one of the most ancient of all the Babylonian cities of which we have any knowledge, the special seat of the worship of the Sumerian god, En-lil, lord of the storm demons. It was situated on both sides of the Shatt-en-Nil canal, one of the earliest courses of the Euphrates, between the present bed of that river and the Tigris, almost 100 m. S.E. of Bagdad, in 32° 7′ N. 45° 10′ E. It is represented by the great complex of ruin mounds known to the Arabs as Nuffar, written by the earlier explorers Niffer, divided into two main parts by the dry bed of the old Shatt-en-Nil (Arakhat). The highest point of these ruins, a conical hill rising about 100 ft. above the level of the surrounding plain, N.E. of the canal bed, is called by the Arabs Bint el-Amir or "prince's daughter." Here very brief and unsatisfactory excavations were conducted by Sir A. H. Layard in 1851, which served, however, by means of the inscribed bricks discovered, to identify the site. The university of Pennsylvania began systematic excavations in 1889 under the directorship of Dr John P. Peters. With some intermissions these excavations were continued until 1900 under the original director and his successors, Dr John Henry Haynes and Dr H. V. Hilprecht. The result of their work is a fairly continuous history of Nippur, and especially of its great temple, E-kur, from the earliest period.

Originally a village of reed huts in the marshes, similar to many of those which can be seen in that region to-day, Nippur underwent the usual vicissitudes of such villages—floods and conflagrations. For some reason habitation persisted at the same spot, and gradually the site rose above the marshes, partly as a result of the mere accumulation of débris, consequent on continuous habitation, partly through the efforts of the inhabitants. As these began to develop in civilization, they substituted, at least so far as their shrine was concerned, buildings of mud-brick for reed huts. The earliest age of civilization, which we may designate as the clay age, is marked by rude, hand-made pottery and thumb-marked bricks, flat on one side, concave on the other, gradually developing through several fairly marked stages. The exact form of the sanctuary at that period cannot be determined, but it seems to have been in some way connected with the burning of the dead, and extensive remains of such cremation are found in all the earlier, pre-Sargonic strata. There is evidence of the succession on this site of different peoples, varying somewhat in their degrees of civilization. One stratum is marked by painted pottery of good make, similar to that found in a corresponding stratum in Susa, and resembling the early pottery of the Aegean region more closely than any later pottery found in Babylonia. This people gave way in time to another, markedly inferior in the manufacture of pottery, but superior, apparently, as builders. In one of these earlier strata, of very great antiquity, there was discovered, in connexion with the shrine, a conduit built of bricks, in the form of an arch. Somewhere, apparently, in the 4th millennium B.C., we begin to find inscriptions written on clay, in an almost linear script, in the Sumerian tongue. The shrine at this time stood on a raised platform and apparently contained, as a characteristic feature, an artificial mountain or peak, a so-called *ziggurat*, the precise shape and size of which we are, however, unable to determine. So far as we can judge from the inscriptions, Nippur did not enjoy at this time, or at any later period for that matter, political hegemony, but was distinctively a sacred city, important from the possession of the famous shrine of En-lil. Inscriptions of Lugal-zaggisi and Lugal-kigub-nidudu, kings of Erech and Ur respectively, and of other early pre-Semitic rulers, on door-sockets and stone vases, show the veneration in which the ancient shrine was then held and the importance attached to its possession, as giving a certain stamp of legitimacy. So on their votive offerings some of these rulers designate themselves as *patesis*, or over-priests, of En-lil. Early in the 3rd millennium B.C. the city was conquered and occupied by the Semitic rulers of Akkad, or Agade, and numerous votive objects of Alu-usharsid (Urumush or Rimush), Sargon and Naram-Sin testify to the veneration in which they also held this sanctuary. En-lil was in fact adopted as the Bel or great lord of the Semitic pantheon. The last monarch of this dynasty, Naram-Sin, rebuilt both the temple and the city walls, and in the accumulation of débris now marking the ancient site his remains are found about half way from the top to the bottom. To this Akkadian occupation succeeded an occupation by the first Semitic dynasty of Ur, and the constructions of Ur-Gur or Ur-Engur, the great builder of Babylonian temples, are superimposed immediately upon the constructions of Naram-Sin. Ur-Gur gave to the temple its final characteristic form. Partly razing the constructions of his predecessors, he erected a terrace of unbaked bricks, some 40 ft. high, covering a space of about 8 acres, near the north-western edge of which, towards the western corner, he built a *ziggurat*, or stage-tower, of three stages of unburned brick, faced with kiln-burned bricks laid in bitumen. On the summit of this artificial mountain stood, apparently, as at Ur and Eridu, a small chamber, the special shrine or abode of the god. Access to the stages of the *ziggurat*, from the court beneath, was had by an inclined plane on the south-east side. To the north-east of the *ziggurat* stood, apparently, the House of Bel, and in the courts below the *ziggurat* stood various other buildings, shrines, treasure chambers and the like. The whole structure was roughly orientated, with the corners towards the cardinal points of the compass. Ur-Gur also rebuilt the walls of the city in general on the line of Naram-Sin's walls.

The restoration of the general features of the temple of this and the immediately succeeding periods has been greatly facilitated by the discovery of a sketch map on a fragment of a clay tablet. This sketch map represents a quarter of the city to the eastward of the Shatt-en-Nil canal, which was enclosed within its own walls, a city within a city, forming an irregular square, with sides roughly 2700 ft. long, separated from the other quarters of the city, as from the surrounding country to the north and east, by canals on all sides, with broad quays along the walls. A smaller canal divided this quarter of the city itself into two parts, in the south-eastern part of which, in the middle of its S.E. side, stood the temple, while in the N.W. part, along the Shatt-en-Nil, two great storehouses are indicated. The temple proper, according to this plan, consisted of an outer and inner court (each covering approximately 8 acres), surrounded by double walls, with *ziggurat* on the north-western edge of the latter.

The temple continued to be built upon or rebuilt by kings of various succeeding dynasties, as shown by bricks and votive objects bearing the inscriptions of the kings of various dynasties of Ur and Isin. It seems to have suffered severely in some

manner at or about the time of the Elamite invasions, as shown by broken fragments of statuary, votive vases and the like, from that period, but at the same time to have won recognition from the Elamite conquerors, so that Eriaku (Sem. *Rim-Sin*, biblical *Arioch*), the Elamite king of Larsa, styles himself "shepherd of the land of Nippur." With the establishment of the Babylonian empire, under Khammurabi, early in the 2nd pre-Christian millennium, the religious as well as the political centre of influence was transferred to Babylon, Marduk became the Bel or lord of the pantheon, many of En-lil's attributes and myths were transferred to him, and E-kur was to some extent neglected. Under the succeeding Cossaean dynasty, however, shortly after the middle of the 2nd millennium, E-kur was restored once more to its former splendour, several monarchs of that dynasty built upon and adorned it, and thousands of inscriptions, dating from the time of those rulers, have been discovered in its archives. After the middle of the 12th century follows another long period of comparative neglect, but with the conquest of Babylonia by the Assyrian Sargon, at the close of the 8th century B.C., we meet again with building inscriptions, and under Assur-bani-pal, about the middle of the 7th century, we find E-kur restored with a splendour greater than ever before, the *ziggurat* of that period being 190 ft. by 128 ft. After that E-kur appears to have gradually fallen into decay, until finally, in the Seleucid period, the ancient temple was turned into a fortress. Huge walls were erected at the edges of the ancient terrace, the courts of the temple were filled with houses and streets, and the *ziggurat* itself was curiously built over in a cruciform shape, and converted into an acropolis for the fortress. This fortress was occupied and further built upon until the close of the Parthian period, about A.D. 250; but under the succeeding rule of the Sassanids it in its turn fell into decay, and the ancient sanctuary became, to a considerable extent, a mere place of sepulture, only a little village of mud huts huddled about the ancient *ziggurat* continuing to be inhabited. The store-house quarter of the temple town had not been explored as late as 1909.

As at Tello, so at Nippur, the clay archives of the temple were found not in the temple proper, but on an outlying mound. South-eastward of the temple quarter, without the walls above described, and separated from it by a large basin connected with the Shatt-en-Nil, lay a triangular mound, about 25 ft. in average height and 13 acres in extent. In this were found large numbers of inscribed clay tablets (it is estimated that upward of 40,000 tablets and fragments have been excavated in this mound alone), dating from the middle of the 3rd millennium B.C. onward into the Persian period, partly temple archives, partly school exercises and text-books, partly mathematical tables, with a considerable number of documents of a more distinctly literary character. For an account of one of the most interesting fragments of a literary or religious character, found at Nippur, see below.

The great complex of ruin mounds lying S.W. of the Shatt-en-Nil canal, larger in extent and mass than the N.E. complex, had not up to 1909 been so fully explored as the mounds to the N.E. Almost directly opposite the temple, however, a large palace was excavated, apparently of the Cossaean period, and in this neighbourhood and further southward on these mounds large numbers of inscribed tablets of various periods, including temple archives of the Cossaean and commercial archives of the Persian period, were excavated. The latter, the "books and papers" of the house of Murashu, commercial agents of the government, throw light on the condition of the city and the administration of the country in the Persian period, the 5th century B.C. The former give us a very good idea of the administration of an ancient temple. The whole city of Nippur appears to have been at that time merely an appanage of the temple. The temple itself was a great landowner, possessed of both farms and pasture land. Its tenants were obliged to render careful accounts of their administration of the property entrusted to their care, which were preserved in the archives of the temple. We have also from these archives lists of goods contained in the temple treasuries and salary lists of temple officials, on tablet forms specially prepared and marked off for periods of a year or less.

On the upper surface of these mounds was found a considerable Jewish town, dating from about the beginning of the Arabic period onward to the 10th century A.D., in the houses of which were large numbers of incantation bowls. Jewish names, appearing in the Persian documents discovered at Nippur, show, however, that Jewish settlement at that city dates in fact from a much earlier period, and the discovery on some of the tablets found there of the name of the canal Kabari suggests that the Jewish settlement of the exile, on the canal Chebar, to which Ezekiel belonged, may have been somewhere in this neighbourhood, if not at Nippur itself. Hilprecht indeed believes that the Kabari was the Shatt-en-Nil. Of the history and conditions of Nippur in the Arabic period we learn little from the excavations, but from outside sources it appears that the city was the seat of a Christian bishopric as late as the 12th century A.D.

The excavations at Nippur were the first to reveal to us the extreme antiquity of Babylonian civilization, and, as already stated, they give us the best consecutive record of the development of that civilization, with a continuous occupancy from a period of unknown antiquity, long ante-dating 5000 B.C., onward to the middle ages. But while Nippur has been more fully explored than any other old Babylonian city, except Babylon and Lagash, still only a small part of the great ruins of the ancient site had been examined in 1909. These ruins have been particularly fruitful in inscribed material, especially clay tablets, many of them from the very earliest periods; but little of artistic or architectural importance has been discovered. Excavation at Nippur is particularly difficult and costly by reason of the inaccessibility of the site, and the dangerous and unsettled condition of the surrounding country, and still more by reason of the immense mass of later débris under which the earlier and more important Babylonian remains are buried.

See A. H. Layard, *Nineveh and Babylon* (1853); John P. Peters, *Nippur* (1897); H. V. Hilprecht, *Excavations in Assyria and Babylonia* (1904); Clarence S. Fisher, *Excavations at Nippur* (1st part 1905, 2nd part 1906); *Babylonian Expedition of the University of Pennsylvania*, a monumental edition of the cuneiform texts found at Nippur, with brief introductions and notes of a more general character (1893 foll.). For a plan of the Parthian palace see ARCHITECTURE, vol. ii. p. 381. (J. P. Pe.)

The Nippur Deluge Fragment.—From among the many tablets and fragments of tablets discovered at Nippur one of more than ordinary interest was published in 1910. Though mutilated portions of only a few of its lines have been preserved, and the text contains no proper name, it is clear that the tablet represents part of a Babylonian version of the Deluge Legend.[1] The portion of the story covered by the text relates to the warning given by Ea to Ut-napishtim, the Babylonian equivalent of the Hebrew Noah. The god here states that he is about to send a deluge, which will cause destruction to all mankind, and he gives directions for the building of a great ship in which "the beasts of the field and the birds of heaven" may be saved, along with Ut-napishtim and his family; he fixes the size of the ship and directs that it should be covered with a strong roof or deck. The text bears a general resemblance to the two well-known Assyrian versions on tablets in the British Museum, but it has been claimed that its phraseology presents a closer parallel to the biblical version of the Deluge story in the "Priestly Code." For several years the existence of Babylonian versions of the legend had been detected among collections of tablets dating from the earlier historical periods. A fragment of one such version belongs to the period of the First Dynasty of Babylon,[2] and part of a still earlier Semitic version of another portion of the Gilgamesh Epic has also been recovered.[3] The new fragment from Nippur has given rise to considerable discussion, in view of the light it

[1] See Hilprecht, *The Babylonian Expedition of the University of Pennsylvania*, ser. D, vol. v. fasc. 1.

[2] It is dated in the reign of Ammizaduga; cf. Scheil, *Recueil de travaux*, xx. 55 ff. For another fragment of the Atar-khasis legend of the same period, see *Cuneiform Texts in the British Museum*, pt. vi. and cf. Zimmern, *Zeits. für Assyr.* xiv. 278 f.

[3] See Meissner, *Mitteil. der Vorderas. Gesellschaft* (1902), i. For other Semitic legends of this early period, see *Cuneiform Texts in the British Museum*, pt. xv. (1902), Pls. I.-VI., and cf. King, *The Seven Tablets of Creation*, p. lxxvii. f.

is said to throw upon a disputed problem of biblical criticism. According to its discoverer it represents the oldest account of the Babylonian Deluge story extant; and he considers it of fundamental importance for determining the age of Israel's earliest traditions, since he would regard it as having been written "before Abraham had left his Babylonian home in Ur of the Chaldees."

Beyond the fact that it was found at Nippur during the fourth of the American expeditions, there does not appear to be any exact record of its provenance; and, in order to determine its date, it is necessary to rely on the external and internal evidence furnished by the tablet itself. A number of hymns and prayers addressed to the chief Babylonian gods, and written throughout in the Sumerian language, have been found at Nippur, and these may be dated in the era of the kings of Ur and Isin, since some of them are mentioned by name in the petitions. To the latter part of this period Professor Hilprecht would assign the new Deluge fragment. It is natural that under the Sumerian revival, which characterized the united kingdom of Sumer and Akkad, the ancient ritual should have been revived and the Sumerian service-books adapted for the use of the reigning monarch. Sumerian, in fact, predominated, not only on the historical monuments, but also throughout the religious literature, a fact which militates against assigning the newly discovered Semitic legend to the period of these early Sumerian texts. It has already been noted that the earliest deluge-fragment previously recovered dates from the latter half of the First Dynasty of Babylon, when the Western Semites had succeeded in establishing their authority throughout the greater part of the country. But, to judge from the photographic reproduction of the Nippur tablet, the characters upon it do not appear to resemble those in use at the time of the First Dynasty, nor those of the period of the Dynasties of Ur and Isin. On purely epigraphic grounds the suggestion has indeed been made that it should be assigned to the Kassite period (not earlier than 1700 B.C.), during which a very large number of the tablets found at Nippur were inscribed.[1]

But, even so, the fragment is one of the most interesting that has been recovered on the site of Nippur. For it strikingly illustrates the fact that the temple of En-lil, like that of the Sun-god at Sippar and the other great temples in Babylonia, possessed a body of mythological and religious texts, which formed subjects for study and comment among the priestly scribes. It was by the collection and reproduction of such documents, preserved in the ancient religious centres, that Assur-bani-pal was enabled to form his unique library of tablets at Nineveh. The temple of E-kur thus formed no exception to the rule that the great temples of Babylonia were centres of literary, as well as of religious, activity.

The text of this Deluge fragment also furnishes one more proof of the existence of parallel versions of the same legend. In some instances, as in the great Creation Series of Babylon, the later scribes subjected the different versions to processes of editing, with the result that the earlier forms gave place to the redactions of a militant priesthood. But where no theological nor local prejudices were involved, the tendency to a faithful reproduction of the earlier texts prevailed. Thus the resemblances which have been claimed between the Nippur Deluge fragment and the version of the "Priestly Code" in Genesis, in themselves furnish no significant evidence as to the latter's date. The possibility that Hebrew traditions were subject to Babylonian influence from the period of the Canaanite conquest has long been recognized, and to the Exilic and post-Exilic Jew the mythology of Babylon may well have presented many familiar features. (L. W. K.)

NĪRĪZ, or NAIRĪZ, a district and town in the province of Fars, Persia. The district has 24 villages and extends from near Istahbamat, south of the Bakhtegan lake, to about 50 m. E. Water is scarce and the plain is not much cultivated in consequence. The produce consists of some grain, cotton, tobacco, &c., but fruit is more abundant. Here, as in the neighbouring Darab district, villages situated in the hills are called madan (mine), and some travellers have in their itineraries indicated a mine in localities where there is none.

[1] It has also been pointed out that the employment of the sign PI for *wa* and the use of *z* for *s*, cited in support of the earlier date, survived in the Kassite period.

The town of NĪRĪZ is situated in a plain 7 m. from the south-eastern point of the lake, and about 130 m. from Shiraz, and has a population of about 9000. The people of NĪRĪZ were stanch followers of the Bāb (see BĀBISM), and rose against the government in 1850 and in 1852, with disastrous results. NĪRĪZ was formerly known for its manufacture of steel from iron ore brought from Parpa, 40 m. E.

NIRVANA, the term in Buddhist theology, meaning literally "blowing out" or "dying out," Skt. *nirvā*, "to blow," for a calm or sinless state or condition of the mind reached by a dying out or extinction of sin (see BUDDHISM).

NISARD, JEAN MARIE NAPOLEON DÉSIRÉ (1806–1888), French author and critic, was born at Châtillon-sur-Seine on the 20th of March 1806. In 1826 he joined the staff of the *Journal des Débats*, but subsequently transferred his pen to the *National*. Under the empire he was inspector-general of education (1852) and director of the *École normale* (1857–1867). His literary reputation was effectually established by his *Histoire de la littérature française* (1844–1861), which secured his election to the Academy (1850). His other works include *Études d'histoire et de littérature* (1859–1864), and *Les Quatres grands historiens latins* (1875). In all his books he vigorously supported the claims of classicism against romanticism. He died at San Remo on the 27th of March 1888.

NISBETT, LOUISA CRANSTOUN (1812–1858), English actress, was the daughter of Frederick Hayes Macnamara, an actor, whose stage name was Mordaunt. As Miss Mordaunt she had considerable experience, especially in Shakesperean leading parts, before her first London appearance in 1829 at Drury Lane as Widow Cheerly in Andrew Cherry's (1762–1812) *Soldier's Daughter*. Her beauty and high spirits made her at once a popular favourite in a large number of comedy parts, until in 1831 she was married to Captain John Alexander Nisbett and retired. Her husband, however, was killed the same year by a fall from his horse, and she was compelled to reappear on the stage in 1832. She was the original Lady Gay Spanker of *London Assurance* (1841). In 1844 she withdrew again from the stage to marry Sir William Boothby, Bart., but on his death (1846), returned to play Lady Teazle, Portia, Constantine in the *Love Chase*, Helen and Julia in the *Hunchback*. It was in the first of these parts that she made her final appearance in 1851. She died on the 15th of January 1858.

NISH (also written NISCH and NIŠ), the capital of the Nish department of Servia, lying in a plain among the southern mountains, on the left shore of the Nishava, a tributary of the Morava. Pop. (1900) 24,451. Among Servian cities, Nish is only surpassed by Belgrade in commercial and strategic importance; for it lies at the point where several of the chief Balkan highroads converge, and where the branch railway to Salonica leaves the main line between Belgrade and Constantinople. The administration of the Servian railways has its factory for repairing engines and principal store of materials in the city, which also possesses an iron foundry. The king and the government reside for at least three months in the year in Nish, where also the national assembly, before the constitution of 1901, was regularly held. It is the see of a bishop, the seat of the district prefecture and a tribunal, and the headquarters of the territorial militia corps, having besides a large number of regular troops in garrison. There is a small obsolete fortress on the right bank of the Nishava, believed to have been erected on the site of the Roman Naissus. The surrounding hills (Vinik, Goritsa, Kamenitsa) were, after 1886, fortified by modern earthworks.

After the Turks were driven from the city in 1878, it was in many respects modernized; but something of its former character is preserved in the ancient Turkish palace, mosque and fountain, the maze of winding alleys and picturesque houses in the older quarters, and, on market days, by the medley of peasant costumes —Bulgarian, Albanian and Rumanian, as well as Servian.

The ancient Roman city Naissus was mentioned as an important place by Ptolemy of Alexandria. Under its walls was fought in A.D. 269 the great battle in which Emperor Claudius destroyed the army of the Goths. It was at Naissus that

Constantine the Great was born in A.D. 274. Though the emperor Julian improved its defences, the town was destroyed by the Huns under Attila, in the 5th century, but Justinian did his best to restore it. In the 9th century the Bulgarians became masters of Naissus, but had to cede it to the Hungarians in the 11th century, from whom the Byzantine emperor Manuel I. reconquered it in 1173. Towards the end of the 12th century the town was in the hands of the Servian prince Stephen Nemanya, who there received hospitably the German emperor Frederic Barbarossa and his Crusaders. In 1375 the Turks captured Naissus for the first time from the Servians. In 1443 the allied armies of the Hungarians under Hunyady and the Servians under George Brankovich, retook it from the Turks, but in 1456 it again came under Turkish dominion, and remained for more than 300 years the most important Turkish military station on the road between Hungary and Constantinople. In the frequent wars between Austria and Turkey during the 17th and 18th centuries the Austrians captured Naissus twice (in 1689 and 1737), but were not able to retain it long. The Servians having, in the beginning of the 19th century, successfully cleared Servia of Turks, were emboldened to attack Nish in 1809, but were repulsed with great loss. The Turks raised as a monument of their victory a high tower composed entirely of the heads of the Servians slain in the battle of Nish. The remnants of this monument are still kept up. It stands half a mile to the east from Nish, and is called to this day by the Turkish name "Tyele-Koula," "the Tower of Skulls." In the Russo-Turkish War the Servian army, under the personal command of King Milan, besieged Nish, and forced it to capitulate on the 10th January 1878. The Berlin congress decided that it should remain with Servia. (C. Mi.)

NISHĀPŪR, a province of Persia, situated between Meshed and Sabzevar, in northern Khorasan. The older name of the district was Abarshehr. It has a population of from 130,000 to 140,000, is divided into twelve districts, and pays a yearly revenue of about £12,000. It produces much grain and cotton, and is considered one of the most fertile districts of Persia. One of its subdivisions is that of Bār-i-Mādan, with chief place Mādan (situated 32 m. N.W. of the city of Nishāpūr, at an elevation of 5100 ft., in 36° 28′ N., 58° 20′ E.), where the famous mines are which have supplied the world with turquoises for at least 2000 years. The province used to be one of the administrative divisions of Khorasan, but is now a separate province, with a governor appointed by the shah.

NISHĀPŪR (Old Pers. *Nēv-shāpūr-nēv*, New Pers. *nēv*, *nīk* = good; Arab. *Naisābūr*), the capital of the province of Nishāpūr, Persia, situated at an elevation of 3920 ft., in 36° 12′ N., and 58° 40′ E., about 49 m. west of Meshed. The second element of the name is that of the traditional founder Shāpūr, or Sapor of the Western historians. Some accounts name the first (241–272), others the second Shāpūr (309–379). It was once one of the four great cities of Khorasan, rivalling Rai (Rhages), "the mother of cities," in importance and population, but is now a small and comparatively unimportant place with a population of barely 15,000. It has post and telegraph offices and a lively trade in wool, cotton and dry fruits (almonds, pistachios).

Eastward of the present city, amongst the mounds and ruins of the old town, in a dilapidated chamber adjoining a blue-domed building over the grave of an imamzadeh, is the tomb of the astronomer-poet Omar Khayyām, an unsightly heap of plaster without inscription, and probably fictitious. Near it is the grave of the celebrated poet and mystic Farīd ud dīn Attār, who was killed by the Mongols when they captured the city *c.* 1229.

Nishāpūr was an important place during the 5th century, for Yazdegerd II. (438–457) mostly resided there. During the latter Sassanids it is seldom mentioned, and when the Arabs came to Khorasan (641–642) it was of so little importance that, as Tabari relates, it did not even have a garrison. Under the Tahirids (820–872) it became a flourishing town and rose to great importance during the Samanids (874–999). Toghrul, the first ruler of the Seljuk dynasty, made Nishapur his residence in 1037. In 1153 the Ghuzz Turkomans overran the country and partly destroyed town and suburbs. In 1208 most of the town was destroyed by an earthquake. The town was hardly rebuilt when it was again destroyed, this time by the Mongols (April 1221) and so effectually that, completely levelled to the ground, it was turned into a vast barley field. The city was again rebuilt, suffered again at the hands of the Mongols (1269) and from another great earthquake (1280), and never again rose to its former greatness. (A. H.-S.)

NISIBIS (*Nasibina* in the Assyrian inscriptions), an ancient city and fortress in the north of Mesopotamia, near the point where the Mygdonius (mod. Jaghjagha) leaves the mountains by a narrow defile. The modern Nezib or Nasibin consists of some 4000 inhabitants, largely Jews, who pay tribute to the Shammar Bedouins. The neighbourhood, we are informed by Arab writers, was at one time richly wooded, but is now somewhat marshy and unhealthy. According to the Arabian geographer, Yaqut, Persian scorpions were thrown into the place when it was besieged by Anushirwan; hence their number to-day. The church of St James, belonging to a small community of Jacobite Christians, and a few pillars and blocks of masonry are the only remains of the former greatness of the town.

The site of Nisibis, on the great road between the Tigris and the Mediterranean, and commanding alike the mountain country to the north and the then fertile plain to the south, gave it an importance which began during the Assyrian period and continued under the Seleucid empire. From 149 B.C. to A.D. 14 Nisibis was the residence of the kings of Armenia, and there Tigranes had his treasure-houses. The place figured frequently as a frontier fortress in the wars of the Romans and the Parthians, its brick walls being unusually thick and its citadel very strong. Ceded to the Parthians by Hadrian, it became a Roman colony (Septimia Colonia Nisibis) under Septimius Severus. It was heroically defended against Shapur (Sapor) II., who unsuccessfully besieged it thrice. In the peace made by Jovian, however, it passed into the hands of the Persians, who established a strong colony there (A.D. 364). Nisibis early became the seat of a Jacobite bishop and of a Nestorian metropolitan, and under the Arabs (when it continued to flourish and became the centre of the district of Diyār Rebī'a) the population of the town and neighbourhood was still mostly Christian, and included numerous monasteries. Arab geographers and travellers of the middle ages speak in high terms of the gardens of Nisibis, and the magnificent returns obtained by the agriculturist. According to Mokaddasi (ob. 1024), acorns, preserved fruits and manufactured articles such as carriages and inkstands were exported. The town was so heavily taxed by the Hamdanid princes at Mosul that the Arab tribe of the Banu Habīb, although blood relations of the Hamdanids, migrated into Byzantine territory, where they were well received, accepted Christianity, attracted other emigrants from Nisibis, and at last began to avenge themselves by yearly raids upon their old home. Ibn Haukal goes on to say that finally the Hamdanids took possession of the town, confiscated the estates of those who had emigrated, and compelled those who remained to substitute corn for their profitable fruit crops. This destroyed the prosperity of Nisibis, and the district, no longer protected against nomad tribes, became a wilderness. Nisibis (Nezib) appeared for the last time in history in 1839, when the Egyptians under Ibrahim Pasha defeated the Turkish army under Hafiz Pasha on the 24th of June in a battle at which von Moltke was present.

NISI PRIUS, in English law, a term used to denote generally all actions tried before judges of the king's bench division. For the history and meaning of this term see ASSIZE. As a rule actions only are tried at *nisi prius*, and a judge is said to sit at *nisi prius* when he sits, usually in the king's bench division, for the trial of actions. By a resolution passed by the judges of the king's bench division in 1894 it was declared of the utmost importance that there should be at least three courts of *nisi prius* sitting continuously throughout the legal year—one for special jury causes, one for common jury causes, and one for causes without juries (see the *Annual Practice*).

Nisi Prius Record was before the Judicature Acts the name of the formal copy of proceedings showing the history of the case up to the time of trial. After the trial it was endorsed with the *postea*, showing the result of the trial, and delivered by the officer of the court to the successful party, whose possession of the *postea* was his title to judgment. Since the Judicature Acts there is no *nisi prius* record in civil actions, the nearest approach to it being the deposit of copies of the pleadings for the use of the judge, and there is no *postea*, the certificate of the associate or master as to the result of the trial superseding it.

NISUS, in Greek mythology, king of Megara, brother of Aegeus, king of Athens. When Minos, king of Crete, was on his way to

attack Athens to avenge the murder of his son Androgeus, for which Aegeus was directly or indirectly responsible, he laid siege to Megara. He finally gained possession of the city through the treachery of the king's daughter Scylla, who, enamoured of Minos, pulled out the golden (or purple) lock from her father's head, on which his life and the safety of the city depended (for similar stories, see Frazer, *Golden Bough*, iii. 1900, p. 358). Megara was captured, and Nisus, who died fighting (or slew himself), was changed into a sea-eagle. Minos, disgusted at Scylla's treachery, tied her to the rudder of his ship, and afterwards cast her body ashore on the promontory called after her Scyllaeum; or she threw herself into the sea and swam after Minos, constantly pursued by her father, until at last she was changed into a *ciris* (a bird or a fish). In Virgil, Scylla, the daughter of Nisus, is confused with the sea-monster, the daughter of Phorcys. Nisus was the eponymous hero of the harbour of Nisaea, and local tradition makes no mention of his betrayal by his daughter. According to Roscher (in his *Lexikon der Mythologie*), who identifies the *ciris* with the heron, the story of Nisus and Scylla (like these of Aëdon, Procne, Philomela and Tereus) was invented to give an aetiological explanation of the characteristics of certain birds. The birds were regarded as originally human beings, whose acts and characters were supposed to account for certain habits of the birds into which they had been changed. E. Siecke, *De Niso et Scylla in aves mutatis* (progr. Berlin, 1884), holds that the purple or golden hair of Nisus is the sun, and Scylla the moon, and that the origin of the legend is to be looked for in a very ancient myth of the relations between the two, which he endeavours to explain with the aid of Indian and German parallels.

NITHARD (d. 844), Frankish historian, was the illegitimate son of Angilbert, the friend of Charlemagne, by Bertha, a daughter of the great emperor. He was educated at the imperial court and became abbot of St Riquier *in commendam*, never taking the vows. Little else is known about his life, but he appears to have served his cousin, Charles the Bald, on peaceful errands and also on the field of battle. He fought for Charles at Fontenoy in June 841, and died as the result of wounds received whilst fighting for him against the Northmen near Angoulême. The date of his death was probably the 14th of June 844. In the 11th century his body, with the fatal wound still visible, was found in the grave of his father, Angilbert. Nithard's historical work consists of four books on the history of the Carolingian empire under the turbulent sons of the emperor Louis I., especially during the troubled period between 840 and 843. This *Historiae* or *De dissensionibus filiorum Ludovici pii* is valuable for the light which it throws upon the causes which led to the disintegration of the Carolingian empire. Although rough in style, partisan in character and sometimes incorrect in detail, the books are the work of a man who had an intimate knowledge of the events which he relates, who possessed a clear and virile mind, and who above all was not a recluse but a man of action. They are dedicated to Charles the Bald, at whose request they were written.

The *Historiae* has been printed several times. Perhaps the best edition is in Band ii. of the *Monumenta Germaniae historica. Scriptores*; it has also been edited by A. Holder (Freiburg, 1882). It has been translated into German by J. von Jasmund (Berlin, 1851; new edition by W. Wattenbach, Leipzig, 1889); and into French in tome iii. of Guizot's *Collection des mémoires* (Paris, 1824).

See O. Kuntzemüller, *Nithard und sein Geschichtswerk* (Jena, 1873); G. Meyer von Knonau, *Über Nithards vier Bücher Geschichten* (Leipzig, 1866); and W. Wattenbach, *Deutschlands Geschichtsquellen*, Band i. (Berlin, 1904).

NITHSDALE, WILLIAM MAXWELL, 5TH EARL OF (1676–1744), Jacobite leader, was a member of the family of Maxwell (*q.v.*), being a son of Robert the 4th earl (d. 1696) and a collateral relation of Robert Maxwell (d. 1646) who was created earl of Nithsdale in 1620. He became famous by his loyalty to the royalist tradition of his family, and by the heroism of his wife Winifred, daughter of William Herbert, 1st marquess of Powis. After becoming earl in 1698 he served the exiled house of Stuart in secret, was suspected as a Jacobite conspirator, and was much molested on that account. In 1712 he resigned his estate to his son William (d. 1776), reserving a life rent to himself. When the Jacobite rising took place in 1715 he joined his friends in the north of England and was taken prisoner at Preston, being sent to London for trial. The countess of Nithsdale, who was at Terregles when she heard of the capture of her husband, followed him to London, making part of the journey on horseback in bitter winter weather. The earl and the other Jacobites were brought to trial in Westminster Hall on the 19th of January 1716, and condemned to death on the 9th of February. The execution was fixed for the 24th. The countess presented a petition to George I. which he refused to receive, and when she knelt before him and took hold of the skirts of his coat he dragged her half across the room before he could break away. Finding that no pardon could be obtained the countess laid a plan to rescue her husband from the Tower of London. With the help of two Jacobite ladies, Mrs Morgan and Mrs Mills, she very cleverly extricated her husband from his cell on the night before the day fixed for the execution by disguising him as a woman. The earl escaped from England and was followed by the countess, but not till she had gone back to Scotland to rescue important legal papers which proved the transfer of the estate to their son. The earl and countess went to Rome after a short stay in France. In Rome they were attached to the court of the Pretender and lived in poverty and obscurity. The earl died on the 20th of March 1744, and the countess in 1749. Their son, William Maxwell, regained the possession of the family property after his father's death in 1744, since the government could only confiscate his father's life-interest; but the title was forfeited, and he died childless.

See Sir A. Fraser, *The Book of Carlaverock* (Edinburgh, 1873).

NITRE, the name given to naturally occurring potassium nitrate; "cubic nitre" is sodium nitrate. The word is adapted from Lat. *nitrum*, which is itself adapted from Gr. νίτρον. These words were originally applied to the naturally occurring sodium carbonate; the connexion with potassium nitrate (*sal petrae* or *sal petrosum*) may be traced to Raimon Lull's name *sal nitri*, which substance, however, he distinguished from *nitrum*. In the 16th century the ancient nitrum became altered to natron, a term still used for native sodium carbonate, while *nitrum*, and its adaptation nitre, were retained for potassium nitrate or saltpetre (*q.v.*).

NITRIC ACID (*aqua fortis*), HNO_3, an important mineral acid. It is mentioned in the *De inventione veritatis* ascribed to Geber, wherein it is obtained by calcining a mixture of nitre, alum and blue vitriol. It was again described by Albert le Grand in the 13th century and by Raimon Lull, who prepared it by heating nitre and clay and called it "eau forte." Glauber devised the process in common use to-day, viz. by heating nitre with strong sulphuric acid. Its true nature was not determined until the 18th century, when A. L. Lavoisier (1776) showed that it contained oxygen, whilst in 1785 H. Cavendish determined its constitution and showed that it could be synthesized by passing a stream of electric sparks through moist air. The acid is found to exist to a slight extent in the free condition in some waters, but chiefly occurs in combination with various metals, as nitrates, principally as nitre or saltpetre, KNO_3, and Chile saltpetre, $NaNO_3$. It is formed when a stream of electric sparks is passed through moist air, and in the oxidation of nitrogenous matter in the presence of water.

For experimental purposes it is usually obtained by distilling potassium or sodium nitrate with concentrated sulphuric acid. The acid so obtained usually contains more or less water and some dissolved nitrogen peroxide which gives it a yellowish red colour. It may be purified by redistillation over barium and silver nitrates, followed by treatment of the distillate with a stream of ozonized air. The product so obtained is then redistilled under diminished pressure and finally distilled again from a sealed and evacuated apparatus (V. Veley and Manley, *Phil. Trans.*, 1898, A. 291, p. 365). On the large scale it is obtained by distilling Chile saltpetre with concentrated sulphuric acid in horizontal cast iron stills, the vapours being condensed in a series of

stoneware Woulfe's bottles. In practice the theoretical quantity of acid and Chile saltpetre is not used, but the charge is so regulated that the mixture of acid and neutral sodium sulphate formed in the retort remains liquid at the temperature employed, and consequently can be readily removed. Various modifications have been made in the form of the condensing apparatus, the Guttmann condenser (*Jour. Soc. Chem. Ind.*, 1893, p. 203) being now frequently employed. This consists of a series of vertical earthenware condensing tubes through which compressed air is passed in order to reduce the quantity of nitrogen peroxide to a minimum. The temperature of the condenser is so regulated as to bring about the condensation of the nitric acid only, which runs out at the bottom of the pipe, whilst any uncondensed steam, nitrogen peroxide and other impurities pass into a Lunge tower, where they meet a descending stream of water and are condensed, giving rise to an impure acid. F. Valentiner [Eng. Pat. 610 (1892), 19192 (1895)] recommends distillation and condensation of nitric acid in a partial vacuum. For the production of nitric acid from air see NITROGEN. Fuming nitric acid consists of a solution of nitrogen peroxide in concentrated nitric acid and is prepared by distilling dry sodium nitrate with concentrated sulphuric acid.

Nitric acid is a colourless strongly fuming liquid, having a specific gravity of 1·50394 (24·2° C.) (V. Veley, *Proc. Roy. Soc.*, 62, p. 223). It is exceedingly hygroscopic and corrosive. On distillation, the pure acid begins to boil at 78·2° C. (W. Ramsay), partial decomposition into water, oxygen and nitrogen peroxide taking place. The acid solidifies when strongly cooled, the solid melting at −47° C. Concentrated nitric acid forms with water a constant boiling mixture which boils at 120·5° C., contains 68% of acid and possesses a specific gravity of 1·414 (15·5° C.). If a more dilute acid than this be distilled, water passes over in excess and the residue in the retort reaches the above composition and boiling point; on distillation of a stronger acid, excess of acid passes into the distillate and the boiling point rises until the values of the constant boiling mixture are reached. On the hydrates of nitric acid see V. Veley, *Jour. Chem. Soc.*, 1903, 83, p. 1015, and F. W. Kuster, *Zeit. anorg. Chem.* 1904, 41, p. 1. On mixing nitric acid with water there is a rise of temperature and a contraction in volume. The acid is a powerful oxidizing agent. It attacks most metals readily, usually with production of a nitrate or hydrated oxide of the metal and one or other of the oxides of nitrogen, or occasionally with the production of ammonium salts; magnesium, however, liberates hydrogen from the very dilute acid. Its action on metals depends in most cases on the temperature, strength of the acid, and the nature of the products of reaction. Thus in the case of copper, it is found that the diluted acid acts very slowly upon the metal at first, but as the reaction proceeds the copper dissolves more rapidly up to a certain point and then the rate of solution again diminishes. This is possibly due to the accelerating action of the nitrous acid which is produced in the direct action of the copper on the nitric acid and which, when a certain amount has been formed in the system, begins to decompose, thus $3HNO_2 = HNO_3 + 2NO + H_2O$ (V. Veley, *Phil. Trans.*, 1891, 182, p. 279; G. O. Higley, *Amer. Chem. Jour.*, 1893, 15, p. 71, 1895, 17, p. 18, 1896, 18, p. 587). Iron when brought into contact with nitric acid under certain conditions, remains passive to the acid. Thus at 55° C. it is passive to an acid of specific gravity 1·42, and at 31° C. to an acid of specific gravity 1 38. No satisfactory explanation of this passivity has been given (see J. B. Senderens, *Bull. Soc. Chem.*, 1896 [3], 15, p. 691; A. Finkelstein, *Zeit. phys. Chem.*, 1901, 39, p. 91; W. J. Müller, *ibid.* 1904, 48, p. 577). Nitric acid is without action on gold, platinum, iridium and rhodium.

The salts of nitric acid, known as *nitrates*, are mostly readily soluble in water and crystallize well. They are all decomposed when heated to a sufficiently high temperature, with evolution for the most part of oxygen and nitrogen peroxide, leaving a residue of oxide of the metal. They may be recognized by the fact that on the addition of a solution of ferrous sulphate, followed by that of concentrated sulphuric acid (the mixture being kept quite cold), the ferrous sulphate solution becomes of a deep brown colour, owing to the reducing action of the ferrous sulphate on the nitric acid which is liberated by the action of the sulphuric acid on the nitrate. As an alternative method the nitrate may be warmed with some fragments of copper and sulphuric acid which has been diluted with its own volume of water, when characteristic brown vapours will be seen.

Nitric acid finds extensive application in the manufacture of sulphuric acid, certain coal-tar colouring matters, explosives, and in the production of various nitrates.

In medicine, nitric acid is used externally in a pure state as a caustic to destroy chancres, warts and phagadenic ulcers; and diluted preparations are employed in the treatment of dyspepsia, &c. Poisoning by strong nitric acid produces a widespread gastro-enteritis, burning pain in the œsophagus and abdomen and bloody diarrhœa. There may also be blood in the urine. Death occurs from collapse or from secondary destructive changes in the intestinal canal. Characteristic yellow staining of the skin round the mouth from the formation of xanthoproteic acid serves to distinguish it from poisoning by other acids. The antidotes are mild alkalis, together with the use of opium to relieve pain.

NITROBENZENE, $C_6H_5NO_2$, the simplest aromatic nitro compound. It was first isolated in 1834 by E. Mitscherlich (*Pogg. Ann.*, 1834, 31, p. 625), and is prepared commercially by the gradual addition of benzene to a well-cooled mixture of concentrated nitric and sulphuric acids, the oily product being separated, washed with alkali, and then distilled. It also results in the oxidation of aniline by monopersulphuric acid (H. Caro, *Zeit. angew. Chem.*, 1898, p. 845) or by potassium permanganate (E. Bamberger, *Ber.*, 1893. 26, p. 496); by the oxidation of nitrosobenzene (below) with atmospheric oxygen; or by the decomposition of benzene diazonium nitrate mercury nitrite, $Hg(NO_3)_2{\cdot}2C_6H_5N_2{\cdot}NO_3$, with copper powder (A. Hantzsch, *Ber.*, 1900, 33, p. 2551). It is a yellowish liquid possessing a strong smell of oil of bitter almonds. It boils at 209°C., and melts at 3·6° C. (C.E. Linebarger, *Amer. Chem. Jour.*, 1896, 18, p. 437). The products of its electrolytic reduction vary with the conditions: in sulphuric acid solution it yields para-aminophenol (L. Gattermann, *Ber.*, 1893, 26, p. 1844); in alcoholic alkaline solution it yields azoxybenzene; in acid alcoholic solution, benzidine; in ammoniacal alcoholic solution, phenylhydrazine. With chlorine, in the presence of iodine or antimony chloride, it yields meta-chlornitrobenzene. Hydrobromic acid at 185°-190°C. converts it into di- and tri-bromaniline. It occasionally acts as an oxidizing agent, as in the preparation of quinoline and fuchsine. It is used commercially for the preparation of aniline and of benzidine; and in perfumery (oil of mirbane).

Dinitrobenzenes, $C_6H_4(NO_2)_2$.—Ortho-dinitrobenzene is formed in small quantity in the preparation of meta-dinitrobenzene, and also results from the action of nitro-sulphuric acid on bismuth triphenyl (A. Gillmeister, *Ber.*, 1897, 30, p. 2844). It forms colourless crystals which melt at 116·5° C. and boil at 319° C. (773 mm.). On boiling with aqueous caustic soda, it yields ortho-nitrophenol. Meta-dinitrobenzene is formed by the direct nitration of nitrobenzene with fuming nitric acid, the product being poured into water and recrystallized from dilute alcohol. It forms practically colourless needles which melt at 89·7° C., and boil at 302·8° C. It is used for the preparation of meta-phenylene diamine. Para-dinitrobenzene results from the action of nitrogen peroxide on an ethereal solution of quinone dioxime (R. Oliveri-Tortorici, *Gazz.*, 1900, 30, i. p. 533). It crystallizes in colourless needles, which melt at 171°-172° C. It is only slightly soluble in cold water and cold alcohol.

Trinitrobenzenes, $C_6H_3(NO_2)_3$.—Asymmetrical (1.2.4) trinitrobenzene results from the action of fuming nitric and sulphuric acids on para-dinitrobenzene. It forms yellow crystals, which melt at 57·5° C. When boiled with dilute aqueous caustic soda it yields 2·4 dinitrophenol. Symmetrical (1.3.5) trinitrobenzene is formed by the further nitration of meta-dinitrobenzene with fuming sulphuric and nitric acids; by the action of hydrochloric acid on sodium malonyl aldehyde (H. B. Hill and J. Torray, *Ber.*, 1895, 28, p. 2543) or by the action of water on 2.4.6-trinitrobenzoic acid (German patent 77353). It crystallizes in prisms which melt at 121° C. It yields addition compounds with aniline and naphthalene, and combines directly with potassium methylate, sodio-malonic ester and hydrocyanic ester. Alkaline potassium ferricyanide oxidizes it to picric acid.

Nitrosobenzene, C_6H_5NO, was first obtained by the action of nitrosyl bromide or chloride on mercury diphenyl (A. Baeyer, *Ber.*, 1874, 7, p. 1638). It results, with other products, in the oxidation of phenyl diazonium chloride with alkaline potassium ferricyanide; of phenylhydroxylamine with chromic acid mixture (E. Bamberger, *Ber.*, 1893, 26, pp. 473, 483, 1894, 27, p. 1349), or of aniline by monopersulphuric acid (German patent 110575). It exists in two crystalline forms. Nitric acid passed into its chloroform solution

gives phenyl diazonium nitrate. With aniline and acetic acid it yields azobenzene. It combines with aromatic amines to form azo-compounds, with arylhydroxylamines to form azoxy compounds, and with hydroxylamine it gives isodiazobenzene.

NITRO COMPOUNDS, in organic chemistry, compounds containing the monovalent radical $-NO_2$ directly combined with carbon.

Aliphatic Nitro Compounds.—The nitroparaffins may be obtained by the action of the alkyl iodides on silver nitrite (V. Meyer, *Ann.* 1874, 171, p. 1 et seq.). When methyl iodide is used, nitromethane is the sole product, but the higher homologues give more or less of the isomeric nitrous esters. Nitroparaffins may also be obtained by the action of sodium nitrite on the α-halogen fatty acids, the α-nitro fatty acids first formed readily eliminating carbon dioxide (H. Kolbe, *Jour. prak. Chem.*, 1872 [2] 5, p. 427). Tertiary nitro compounds may also be obtained by the oxidation of the corresponding amino-, hydroxylamino-, and nitroso-hydrocarbons with monopersulphuric acid (E. Bamberger, *Ber.*, 1903, 36, p. 385):

$$\rightarrow C\cdot NH_2 \rightarrow \quad \rightarrow C\cdot NHOH \rightarrow \quad \rightarrow C\cdot NO \rightarrow \quad \rightarrow C\cdot NO_2.$$

The nitro compounds of the lower members of the paraffin series cannot be prepared by the direct action of nitric acid on the hydrocarbons themselves, but, in the case of some of the higher members of the series direct nitration is possible (M. Konowalow, *Comptes rendus*, 1892, 114, p. 26; *Ber.*, 1895, 28, p. 1852; R. A. Worstall, *Amer. Chem. Jour.*, 1898, 20, p. 202).

The nitro compounds are colourless, somewhat pleasant smelling liquids, which distil without decomposition and possess boiling points much higher than those of the isomeric nitrous esters. Reduction with acid-reducing agents gives amines. The primary and secondary nitro compounds (*i.e.* those containing the groupings $\cdot CH_2NO_2$ and $>CH\cdot NO_2$) form metallic derivatives; for example, sodium salts, which according to A. Hantzsch (*Ber.*, 1899, 32, pp. 577 et seq.) are probably derived from the isomeric *iso-nitro* compounds R : NO(OH), and thus the nitro derivatives are to be looked upon as *pseudo-acids*. These sodium salts are crystalline solids which are readily soluble in water and are very explosive. Stannous chloride and hydrochloric acid reduce the nitroparaffins to β-alkyl hydroxylamines, amines and some ammonia being simultaneously produced (V. Meyer, *Ber.*, 1891, 24, p. 3530), whilst the primary nitro compounds on heating with hydrochloric acid yield hydroxylamine and an acid:

$$CH_3\cdot CH_2\cdot NO_2 + H_2O = CH_3\cdot CO_2H + NH_2OH$$

(V. Meyer, *Ann.*, 1876, 180, p. 163). When reduced by the Sabatier and Senderens' method (*Comptes rendus*, 1902, 135, p. 225) they are converted into amines, provided the temperature be kept at 150°-200° C., a higher temperature leading to the formation of paraffins and ammonia. The hydrogen in the primary and secondary nitro compounds which is attached to the same carbon atom as the nitro group is readily replaced by bromine in alkaline solution. The reactions of the nitroparaffins with nitrous acid are very characteristic and have been used as a method for discriminating between the primary, secondary and tertiary alcohols (*q.v.*) (V. Meyer, *Ann.*, 1875, 175, p. 93). The primary compounds form *nitrolic acids* of the type $R\cdot C(:NOH)NO$, the secondary yield *pseudo-nitrols* of the type $RR^1:C(NO)(NO_2)$, whilst the tertiary nitro compounds are not acted upon by nitrous acid. The primary nitroparaffins combine with nitric oxide in the presence of sodium ethylate, to form nitroalkylisonitramines, $R\cdot CH(NO_2)\cdot N_2O_2H$ (W. Traube, *Ann.*, 1898, 300, p. 95).

Nitromethane, CH_3NO_2, is a colourless oil which boils at 101° C. Fuming sulphuric acid decomposes it into carbon monoxide and hydroxylamine. It combines with aromatic aldehydes in the presence of alcoholic potash to form addition products which are converted by acids into styrol derivatives (J. Thiele, *Ber.*, 1899, 32, p. 1293). *Nitroethane*, $C_2H_5NO_2$, is a colourless liquid which boils at 114° C. *Nitroform* (trinitromethane), $CH(NO_2)_3$, is obtained in the form of its ammonium salt by the decomposition of trinitroacetonitrile with water (L. Schischkoff, *Ann.*, 1857, 103, p. 364). It is a colourless crystalline solid which melts at 15° C. and has the properties of a strong acid. The potassium salt is formed by the action of potassium ethylate on tetranitromethane (A. Hantzsch, *Ber.*, 1899, 32, p. 631). It is a deep yellow coloured solid, which is readily soluble in water. It explodes when heated. The silver salt, obtained by shaking an ether solution of nitroform with freshly prepared, slightly moist silver oxide, reacts with methyl iodide to form *trinitroethane*, a crystalline solid which melts at 56° C. Concentrated caustic potash decomposes the latter compound, forming the potassium salt of dinitroethane, $CH_3\cdot C(NO_2)_2K$. *Tetranitromethane*, $C(NO_2)_4$, obtained by adding nitroform to a hot mixture of nitric and sulphuric acids, is a crystalline solid which melts at 13° C. *Chlorpicrin*, CCl_3NO_2, is a liquid of suffocating odour obtained by the action of nitric acid and chloride of lime on many organic compounds. It boils at 112°.

Aromatic Nitro Compounds.—The aromatic nitro compounds are generally obtained by the direct action of nitric acid. Substitution takes place usually in the nucleus and only rarely in the side chain, and according to the conditions of the experiment and the nature of the compound acted upon, one or more nitro groups enter the molecule. The reaction is generally carried out in the presence of sulphuric acid, which is used to absorb the water formed during the process of nitration. Nitro compounds have also been prepared by the action of cuprous oxide on diazonium salts (T. Sandmeyer, *Ber.*, 1887, 20, p. 1494); by the action of copper powder on the double salt formed by the addition of potassium mercuric nitrite to diazonium nitrites; and by the oxidation of primary aromatic amines (E. Bamberger, *Ber.*, 1893, 26, p. 496). The mono-nitro compounds are stable and distil without decomposition; they have a pale yellow colour and possess an agreeable odour. Most of the poly-nitro compounds are not volatile, but undergo decomposition on heating. The nitro group in the aromatic series is bound very firmly in the molecule and is not readily exchanged for other groups. Several different products may be obtained by the reduction of the aromatic nitro compounds, the substances formed in any particular case depending on the conditions of experiment. In acid solution, amines are obtained, in alkaline solution, azoxy, azo and hydrazo compounds, and in neutral solution hydroxylamino compounds. The electrolytic reduction of the aromatic nitro compounds gives rise to substituted hydroxylamines which are immediately transformed into aminophenols or amines

For the nitrobenzenes see NITROBENZENE. *Nitrotoluenes*, $C_6H_4(CH_3)(NO_2)$. Three isomers exist, the ortho- and para-compounds being the chief products of the direct nitration of toluene. They may be separated by fractional distillation. The ortho-compound melts at 10·5° C. and boils at 218° C., the para-compound melts at 54° C. and boils at 230° C. Meta-nitrotoluene (melting at 16° C.) is obtained by nitrating acetparatoluidide and then replacing the amino group by hydrogen.

Phenylnitromethane, $C_6H_5\cdot CH_2\cdot NO_2$, isomeric with the nitrotoluenes, is prepared by the action of benzyl chloride on silver nitrite. It is a colourless oily liquid which boils at 225°-227° C., is somewhat soluble in water, and does not give a coloration with ferric chloride. It readily forms a sodium salt, from the aqueous solution of which on the addition of a mineral acid an isomeric solid form of the nitro compound (melting at 84° C.) is precipitated. This solid form gradually passes, on standing, into the oily variety. It is probably a hydroxy-compound, since it gives a red-brown colour with ferric chloride, reacts with phenyl isocyanate and with phosphorus pentachloride, and with benzoyl chloride yields dibenzhydroxamic acid, $C_6H_5CO\cdot NH\cdot O\cdot COC_6H_5$. Thus the solid form is probably to be represented as $C_6H_5CH:NO\cdot OH$ or $C_6H_5\cdot CH<\begin{matrix}N\cdot OH\\ O\end{matrix}$ (see further, A. Hantzsch on Pseudo-acids, *Ber.*, 1899, 32, p. 575, 1902, 35, pp. 210, 226, 1001, 1906, 39, pp. 139, 1073 et seq.).

The *nitrolic acids*, $R\cdot C(:NOH)NO_2$, may be prepared by the action of nitrous acid on the primary nitroparaffins; by the action of hydroxylamine on the dibromnitroparaffins; and by the action of nitrogen peroxide on the α-isonitroso fatty acids (G. Ponzio, *Gazz.*, 1903, 33 (1), p. 508). They are colourless solids which are readily soluble in water and possess the character of weak acids. They are characterized by the deep red colour of their solutions in alkalis. When strongly heated they decompose, forming fatty acids, nitrogen peroxide and nitrogen. By passing hydrochloric acid gas into an ethereal solution of the acids, the nitro group is eliminated and the hydrochloride of an oximido-acid is obtained (A. Werner and H. Buss, *Ber.*, 1895, 28, p. 1282): $CH_3\cdot C(:NOH)NO_2 + 2HCl = HNO_2 + CH_3\cdot C(:NOH)Cl\cdot HCl$.

When heated with water and mineral acids, the nitrolic acids are completely decomposed, yielding fatty acids and nitrous oxide.

A. Hantzsch and O. Graul (*Ber.* 1898, 31, p. 2854) described several series of salts of the nitrolic acids, with particular reference to ethylnitrolic acid. They discriminate between the red or *erythro*-salts, which are well crystallized, very explosive and unstable compounds, and which regenerate the colourless nitrolic acid on the addition of dilute mineral acids, and the *leuco*-salts, which are colourless salts obtained by warming the erythro-salts or by exposing them to direct sunlight. These salts cannot be converted either into the red salts or into the free acid. An intensely yellow acid salt is described, as is also a very unstable colourless salt which could not be examined further owing to its very labile nature. The following structural formulae are assigned to these compounds:—

nitrolic acid; erythro-salt; leuco-salt.

The acid salts are obtained by the addition of one molecule of alkali to two molecules of the acid in concentrated alcoholic solution at a low temperature. They are unstable compounds which readily split into the red salt and the free acid on standing.

The *pseudo-nitrols*, $RR':C(NO)(NO_2)$, may be obtained by the action of nitrous acid on the secondary nitroparaffins; by the action of silver nitrite on such bromnitrosoparaffins as contain the bromine and the nitroso group united to the same carbon atom (O. Piloty, *Ber.*, 1902, 35, p. 3093); and by the action of nitrogen peroxide on ethereal solutions of ketoximes (R. Scholl, *Ber.*, 1888, 21, p. 508; G. Born, *Ber.* 1896, 29, p. 93). They exhibit an intense blue colour when in the liquid condition or dissolved in alkali and possess a very sharp smell. On oxidation with chromic acid they yield dinitrohydrocarbons, and on reduction with hydroxylamine (in alkaline solution) or with potassium sulphydrate give ketoximes, RR':C:NOH (R. Scholl and K. Landsteiner, *Ber.*, 1896, 29, p. 87).

$$RR':C(NO)\cdot NO^a \rightarrow RR':C(NH\cdot OH)_2 \rightarrow RR':C:N\cdot OH + NH_2OH.$$

Nitrosohydrocarbons have been prepared in the aliphatic series by the oxidation of the corresponding hydroxylamino compounds. Nitroso-tertiary butane, $(CH_3)_3C\cdot NO$, is formed when the corresponding hydroxylamine is oxidized by sulphuric monoper acid (E. Bamberger, *Ber.*, 1903, 36, p. 686). A nitrosooctane $(CH_3)_3C(NO)\cdot[CH_2]_2\cdot CH(CH_3)_2$, has been obtained by O. Piloty and O. Ruff (*Ber.*, 1898, 31, p. 457) from nitro-di-isobutyl by reducing it to the corresponding hydroxylamino compound with aluminium amalgam and oxidizing this with chromic acid mixture. It is a colourless solid which melts at 54° C. to a deep blue liquid. Numerous nitroso compounds are met with in the aromatic series.

NITROGEN [symbol N., atomic weight 14·01, O=16]. A non-metallic chemical element, first isolated in 1772 by D. Rutherford, who showed that on removing oxygen from air a gas remained, which was incapable of supporting combustion or respiration. Nitrogen forms approximately 79% by volume (or 77% by weight) of the atmosphere; actual values are: % by volume—79·07 (Regnault), 79·20 (Dumas); % by weight—76·87 (Regnault), 77·00 (Dumas), 77·002 (Lévy), 76·900 (Stas), 77·010 (Marignac). No absolutely accurate determinations appear to have been made recently. Free nitrogen is also found in some natural waters and has been recognized in certain nebulae. In the combined state nitrogen is fairly widely distributed, being found in nitre, Chile saltpetre, ammonium salts and in various animal and vegetable tissues and liquids. It is invariably present in soils, where compounds are formed by nitrifying bacteria.

Nitrogen may be obtained from the atmosphere by the removal of the oxygen with which it is there mixed. This may be effected by burning phosphorus in a confined volume of air, by the action of an alkaline solution of pyrogallol on air, by passing air over heated copper, or by the action of copper on air in the presence of ammoniacal solutions.

It is also prepared by heating ammonium nitrite (or a mixture of sodium nitrite and ammonium chloride): $NH_4NO_2=2H_2O+N_2$; by heating a mixture of ammonium nitrate and chloride (the chlorine which is simultaneously produced being absorbed by milk of lime or by a solution of sodium hydroxide): $4NH_4NO_3+2NH_4Cl=5N_2+Cl_2+12H_2O$; by heating ammonium dichromate (or a mixture of ammonium chloride and potassium dichromate): $(NH_4)_2Cr_2O_7=Cr_2O_3+4H_2O+N_2$; by passing chlorine into a concentrated solution of ammonia (which should be present in considerable excess): $8NH_3+3Cl_2=6NH_4Cl+N_2$; by the action of hypochlorites or hypobromites on ammonia: $3NaOBr+2NH_3=3NaBr+3H_2O+N_2$; and by the action of manganese dioxide on ammonium nitrate at 180-200° C. It is also formed by the reduction of nitric and nitrous oxides with hydrogen in the presence of platinized asbestos at a red heat (G. v. Knorre and K. Arndt, *Ber.*, 1899, 32, p. 2136); by the oxidation of hydroxylamine (*ibid.*, 1900, 33, p. 30); and by the electrolysis of hydrazine and its salts (E. Ch. Szarvasy, *Jour. Chem. Soc.*, 1900, 77, p. 603).

The chief importance of nitrogenous compounds depends upon their assimilation by living plants, which, in their development, absorb these compounds from the soil, wherein they are formed mainly by the action of nitrifying bacteria. Since these compounds are essential to plant life, it becomes necessary to replace the amount abstracted from the soil, and hence a demand for nitrogenous manures was created. This was met in a very large measure by deposits of natural nitre and the products of artificial nitrières, whilst additional supplies are available in the ammoniacal liquors of the gas-manufacturer, &c. The possible failure of the nitre deposits led to attempts to convert atmospheric nitrogen into manures by processes permitting economic success. Combination can be made in five directions, viz. to form (1) oxides and nitric acids, (2) ammonia, (3) readily decomposable nitrides, (4) cyanides, (5) cyanamides. The first three will be treated here; for the others see PRUSSIC ACID and CYANAMIDE.

The combination of nitrogen with oxygen was first effected by Cavendish in 1785, who employed a spark discharge. The process was developed by Madame Lefebre in 1859; by Meissner in 1863, who found that moist gases gave a better result; and by Prim in 1882, who sparked the gases under pressure; it was also used by Lord Rayleigh in his isolation of argon (*q.v.*). It was not, however, a commercial success, and the same result attended Siemens and Halske's application of the silent discharge. More effective was the electric arc. In 1892 Sir W. Crookes showed that the arc brought about combination; and in 1897 Lord Rayleigh went into the process more fully. But the first careful working-out of the conditions was made in 1900 by A. McDougall and F. Howles, who, employing a high tension alternating arc, showed that the effectiveness depended upon the temperature. The commercial manufacture of nitric acid was attempted by C. S. Bradley and D. R. Lovejoy at Niagara Falls, who passed atmospheric air, or air enriched with oxygen, about a high tension arc made as long as possible; but the company (the Atmospheric Products Company) was a failure. Better results have attended the process of K. Birkeland and S. Eyde, which is being worked on a large scale at Notodden, Norway. The arc is produced by leading a current of about 5000 volts equatorially between the poles of an electromagnet; this produces what is practically a disk of flame, 6½ ft. in diameter and having a temperature of about 3000°. The disk really consists of a series of successive arcs which increase in size until they burst. The first product of the reaction is nitric oxide, which on cooling with the residual gases produces nitrogen peroxide. The cooled gases are then led into towers where they meet a stream of water coming in the contrary direction. Nitric acid (up to 50%) is formed in the first tower, and weaker acids in the successive ones; the last tower contains milk of lime which combines with the gases to form calcium nitrite and nitrate (this product, being unsuitable as a manure, is decomposed with the acid, and the evolved gases sent back). It was found advantageous not to work for acid but for a basic calcium nitrate (normal calcium nitrate being very deliquescent); for this purpose the acid is treated with the requisite amount of milk of lime. In the process of the Badische Anilin- und Soda-Fabrik, the arc, which is said to be 30 to 50 ft. long or more, is formed in a long tube, and the gases are sent round the arc by obliquely injecting them. A 30% acid is said to be formed. I. Moscicki and J. von Kowalski have patented a process wherein the arc is formed at two vertical

concentric copper electrodes and rotated by an electromagnet; it is worked at Vevey, Switzerland. The Rankin process, of which very little is known, produces the arc with much lower current.

The conversion of nitrogen into ammonia by electricity has received much attention, but the commercial aspect appears to have been first worked out by de Hemptinne in 1900, who used both the spark and silent discharge on mixtures of hydrogen and nitrogen, and found that the pressure and temperature must be kept low and the spark gap narrow. J. Schlutius in 1903 employed Dowson gas as a source of hydrogen, and induced combination by means of platinum and the silent discharge. Several non-electrical processes have been devised. In 1862 Fleck passed a mixture of steam, nitrogen and carbon monoxide over red-hot lime, whilst in 1904 Woltereck induced combination by passing steam and air over red-hot iron oxide (peat is used in practice). In de Lambilly's process air and steam is led over white-hot coke, and carbon dioxide or monoxide removed from the escaping gases according as ammonium formate or carbonate is wanted. The residual gas is then passed through a tube containing porous materials, such as wood- or bone-charcoal, platinized pumice or spongy platinum, then mixed with steam and again forced through the tube. The reactions are represented as
(1) $N_2+3H_2+2CO+2H_2O=2H\cdot CO_2NH_4$ (Ammonium formate).
(2) $N_2+3H_2+2CO_2+2H_2O=2HO\cdot CO_2NH_4$ (Ammonium carbonate).
The best temperature for the first reaction is between 80°C. and 130°C. and for the second between 40° C. and 60° C. In another process, which originated with C. Kaiser (*Abst. J.C.S.*, 1907, ii. p. 862), calcium is heated in a current of hydrogen, and nitrogen passed over the hydride so formed; this gives ammonia and calcium nitride, the latter of which gives up its nitrogen as ammonia and reforms the hydride when heated in a current of hydrogen.

The fixation of nitrogen as a nitride has not been attended with commercial success. H. Mehner patented heating the oxides of silicon, boron or magnesium with coal or coke in an electric furnace, and then passing in nitrogen, which forms, with the metal liberated by the action of the carbon, a readily decomposable nitride.

For an extended bibliography see Bulletin No. 63 of the Bureau of Soils, U.S. Department of Agriculture (Washington, 1910).

Nitrogen is a colourless, tasteless and odourless gas, which is only very slightly soluble in water. It is slightly lighter than air. Lord Rayleigh in 1894 found that the density of atmospheric nitrogen was about ½% higher than that of chemically prepared nitrogen, a discovery which led to the isolation of the rare gases of the atmosphere (see ARGON). The values obtained are shown below.

Atmospheric Nitrogen.	Chemical Nitrogen.	
0·97209	0·96727	Lord Rayleigh, *Chem. News*, 1897, 76, p. 315.
0·9720	0·9671	A. Leduc, *Comptes rendus*, 1896, 123, p. 805.

Nitrogen is a very inert gas: it will neither burn nor support the combustion of ordinary combustibles. It combines directly with lithium, calcium and magnesium when heated, whilst nitrides of the rare earth metals are also produced when their oxides are mixed with magnesium and heated in a current of nitrogen (C. Matignon, *Comptes rendus*, 1900, 131, p. 837). Nitrogen has been liquefied, the critical temperature being −149° C. and the critical pressure 27·54 atmospheres. The liquefied gas boils at −195·5° C., and its specific gravity at its boiling point is 0·8103 (E. C. C. Baly and F. G. Donnan, *Jour. Chem. Soc.*, 1902, 81, p. 912).

Compounds.

Nitrogen combines with hydrogen to form ammonia, NH_3, hydrazine, N_2H_4, and azoimide, N_3H (*q.v.*); the other known hydrides, N_4H_4 and N_5H_5, are salts of azoimide, viz. $NH_4\cdot N_3$ and $N_2H_4\cdot N_3H$.

Nitrogen trichloride, NCl_3, discovered by P. L. Dulong in 1811 (*Schweigg. Journ.*, 1811, 8, p. 302), and obtained by the action of chlorine or sodium hypochlorite on ammonium chloride, or by the electrolysis of ammonium chloride solution, is a very volatile yellow oil. It possesses an extremely pungent smell, and its vapour is extremely irritating to the eyes. It is a most dangerous explosive (see D. L. Chapman and L. Vodden, *Jour. Chem. Soc.*, 1909, 95, p. 138). Chlorine azide, $Cl\cdot N_3$, was discovered by F. Raschig in 1908 (see AZOIMIDE); the corresponding iodine compound had been obtained in 1900 by A. Hantzsch (*Ber.*, 33, p. 522). For the so-called nitrogen iodide see AMMONIA.

Nitrogen forms five oxides, viz. nitrous oxide, N_2O, nitric oxide, NO, nitrogen trioxide, N_2O_3, nitrogen peroxide, NO_2, and nitrogen pentoxide, N_2O_5, whilst three oxyacids of nitrogen are known: hyponitrous acid, $H_2N_2O_2$, nitrous acid, HNO_2, and nitric acid, HNO_3 (*q.v.*). The first four oxides are gases, the fifth is a solid.

Nitrous oxide, N_2O, isolated in 1776 by J. Priestley, who obtained it by reducing nitrogen peroxide with iron, may be prepared by heating ammonium nitrate at 170-260° C., or by reducing a mixture of nitric and sulphuric acid with zinc. It is a colourless gas, which is practically odourless, but possesses a sweetish taste. It is somewhat soluble in water. When liquefied it boils at −89·8° C., and by further cooling may be solidified, the solid melting at −102·3° C. (W. Ramsay, *Chem. News*, 1893, 67, p. 140). It does not burn, but supports the combustion of heated substances almost as well as oxygen. It is used as an anaesthetic, principally in dentistry, producing when inhaled a condition of hysterical excitement often accompanied by loud laughter, whence it is sometimes called "laughing gas."

Nitric oxide, NO, first obtained by Van Helmont, is usually prepared by the action of dilute nitric acid (sp. gr. 1·2) on copper. This method does not give a pure gas, varying amounts of nitrous oxide and nitrogen being present (see NITRIC ACID). In a purer condition it may be obtained by the action of sulphuric acid on a mixture of potassium nitrate and ferrous sulphate, or of hydrochloric acid on a mixture of potassium nitrate and ferric chloride. It is also formed by the action of concentrated sulphuric acid on sodium nitrite in the presence of mercury. It is a colourless gas which is only sparingly soluble in water. It may be liquefied, its critical temperature being −93·5°, and the liquid boils at −153·6° C. It is not a supporter of combustion, unless the sustance introduced is at a sufficiently high temperature to decompose the gas, when combustion will continue at the expense of the liberated oxygen. If the gas be mixed with the vapour of carbon disulphide, the mixture burns with a vivid lavender-coloured flame. Nitric oxide is soluble in solutions of ferrous salts, a dark brown solution being formed, which is readily decomposed by heat, with evolution of nitric oxide. It combines with oxygen to form nitrogen peroxide. Nascent hydrogen reduces it to hydroxylamine (*q.v.*), whilst solutions of hypochlorites oxidize it to nitric acid. In some instances it reacts as a reducing agent, *e.g.* silver oxide is reduced to metallic silver at 170° C., lead dioxide to the monoxide and manganese dioxide to sesquioxide.

Nitrogen trioxide, N_2O_3, was first mentioned by J. R. Glauber in 1648 as a product of the reaction between nitric acid and arsenious oxide. Sir W. Ramsay (*Jour. Chem. Soc.*, 1890, 57, p. 590), by distilling arsenious oxide with nitric acid and cooling the distillate, obtained a green liquid which consisted of nitrogen trioxide and peroxide in varying proportions, and concluded that the trioxide could not be obtained pure. He then tried the direct combination of nitric oxide with liquid nitrogen peroxide. A dark blue liquid is produced, and the first portions of gas boiling off from the mixture correspond fairly closely in composition with nitrogen trioxide. H. B. Baker (*Jour. Chem. Soc.*, 1907, 91, p. 1862) obtained nitrogen trioxide in the gaseous form by volatilizing the liquid under special conditions. L. Francesconi and N. Sciacca (*Gazz.*, 1904, 34 (i.), p. 447) have shown that liquid nitric oxide and oxygen, or gaseous nitric oxide and liquid oxygen, mixed in all proportions and yielded nitrogen trioxide, whilst gaseous nitric oxide mixed with excess of oxygen always gave the trioxide if the mixture was kept below −110° C. They also state that nitrogen trioxide is stable at ordinary pressure up to −21° C. N. M. v. Wittorf (*Zeit. anorg. Chem.*, 1904, 41, p. 85) obtained blue crystals of the trioxide (melting at −103° C.) on saturating liquid nitrogen peroxide with nitric oxide and cooling the mixture. The liquid prepared by Baker is green in colour, and has a specific gravity 1·11 at ordinary temperature, but below −2° C. becomes of a deep indigo blue colour. It forms a mass of deep blue crystals at the temperature of liquid air. It is exceedingly soluble in concentrated sulphuric acid.

Nitrogen peroxide, NO_2 or N_2O_4, may be obtained by mixing oxygen with nitric oxide and passing the red gas so obtained through a freezing mixture. The production of this red gas when air is mixed with nitric oxide was mentioned by R. Boyle in 1671. Nitrogen peroxide is also prepared by heating lead nitrate and passing the products of decomposition through a tube surrounded by a freezing mixture, when the gas liquefies. At low temperatures it is a colourless crystalline solid which melts at −10·14° C. (W. Ramsay, *Chem. News*, 1900, 61, p. 91). As the temperature increases the liquid becomes yellowish, the colour deepening with rise of temperature until at +15° C. it has a deep orange tint. The liquid boils at about 22° C. This change of colour is accompanied by a change in the vapour density, and is explained by the fact that nitrogen peroxide consists of a mixture of a colourless compound N_2O_4, and a red-brown gas NO_2, the latter increasing in amount at the expense of the former as the temperature is raised (G. Salet, *Comptes rendus*, 1868, 67, p. 488; see also E. and L. Natanson, *Wied. Ann.*, 1885, 24,

p. 454; 1886, 27, p. 606). M. Berthelot and J. Ogier (*Bull. Soc. Chim.*, 1882 [2], 37, p. 434; 38, p. 60) have also shown that the specific heat of the gas decreases with increase of temperature until it reaches a minimum at about 198-253° C. Cryoscopic determinations of the molecular weight of nitrogen peroxide dissolved in glacial acetic acid show that it corresponds to the molecular formula N_2O_4 at low temperatures (W. Ramsay, *Jour. Chem. Soc.* 1888, 53, p. 621). Nitrogen peroxide is the most stable oxide of nitrogen. It is decomposed by water, giving at 0° C. a mixture of nitric and nitrous acids: $2NO_2+H_2O=HNO_3+HNO_2$. It combines with sulphuric acid to form nitro-sulphonic acid, $SO_2(OH)(NO_2)$. It does not support the combustion of a taper, but burning phosphorus and red-hot carbon will continue to burn in the gas. It converts many metallic oxides into mixtures of nitrates and nitrites, and attacks many metals, forming nitrates and being itself reduced to nitric oxide. It is an energetic oxidizing agent.

Nitrogen pentoxide, N_2O_5, was first obtained in 1849 by H. Sainte-Claire-Deville (*Ann. Chim. Phys.*, 1850 [3], 28, p. 241) by the action of dry chlorine on silver nitrate: $4AgNO_3+2Cl_2=4AgCl+2N_2O_5+O_2$. It may also be obtained by distilling nitric acid over phosphorus pentoxide. It crystallizes in large prisms which melt at 29-30° C. to a yellowish liquid, which boils at 45-50° C. with rapid decomposition. It is very unstable, decomposing slowly even at ordinary temperatures. It dissolves in water, forming nitric acid.

Hyponitrous acid, $H_2N_2O_2$, was first obtained in the form of its salts by E. Divers in 1871 (*Chem. News*, 23, p. 206) by reducing a solution of potassium nitrite with sodium amalgam, and subsequent precipitation as silver salt. Hyponitrites also result when hydroxy-amido-sulphonates, *e.g.* $HO{\cdot}NH{\cdot}SO_3Na$, are hydrolysed by caustic alkalis (E. Divers and T. Haga, *Jour. Chem. Soc.*, 1889, 55, p. 760), or when benzsulphohydroxamic acid, $C_6H_5SO_2{\cdot}NH{\cdot}OH$, is treated in the same manner (O. Piloty, *Ber.*, 1896, 29, p. 1560). They may also be prepared by the action of mercuric or cupric oxides on alkaline solutions of hydroxylamine (A. Hantzsch, *Ann.*, 1896, 292, p. 317); by the action of hydroxylamine sulphate on alkaline nitrites in the presence of lime or calcium carbonate, the mixture being rapidly heated to 60° C.; or by the hydrolysis of dimethyl nitroso-oxyurea, $(CH_3)_2N{\cdot}CO{\cdot}N(NO){\cdot}OH$ (A. Hantzsch, *Ber.*, 1897, 30, p. 2356). The free acid, which crystallizes in brilliant scales, is best prepared by decomposing the silver salt with an ethereal solution of hydrochloric acid. It is very explosive, dissolves readily in water and behaves as a dibasic acid. It does not liberate iodine from potassium iodide, neither does it decolorize iodine solution. Bromine oxidizes it to nitric acid, but the reaction is not quantitative. In acid solution, potassium permanganate oxidizes it to nitric acid, but in alkaline solution only to nitrous acid. It decomposes slowly on standing, yielding water and nitrous oxide. The silver salt is a bright yellow solid, soluble in dilute sulphuric and nitric acids, and may be crystallized from concentrated solutions of ammonia. It slowly decomposes on exposure or on heating. The calcium salt, $CaN_2O_2{\cdot}4H_2O$, formed by the action of calcium chloride on the silver salt in the presence of a small quantity of nitric acid, is a lustrous crystalline powder, almost insoluble in water but readily soluble in dilute acids. It is decomposed by sulphuric acid, with evolution of nitrous oxide.

Nitrous acid, HNO_2, is found to some extent in the form of its salts in the atmosphere and in rain water. The pure acid has not yet been obtained, since in the presence of water it decomposes with formation of nitric acid and liberation of nitric oxide: $3HNO_2=HNO_3+2NO+H_2O$. Its salts may be obtained in some cases by heating the corresponding nitrates, but the method does not give good results. Sodium nitrite, the most commonly used salt of the acid, is generally obtained by heating the nitrate with metallic lead; by heating sodium nitrate with sulphur and sodium hydroxide, the product then being fractionally crystallized (Read, Holliday & Sons): $3NaNO_3+S+2NaOH=Na_2SO_4+3NaNO_2+H_2O$; by oxidizing atmospheric nitrogen in an electric arc, keeping the gases above 300° C., until absorption in alkaline hydroxide solution is effected (German Pat. 188188); or by passing air, or a mixture of oxygen and ammonia, over heated metallic oxides (*ibid.*, 168272). The salts of the acid are colourless or faintly yellow. In aqueous solution the free acid acts as an oxidizing agent, bleaching indigo and liberating iodine from potassium iodide, or it may act as a reducing agent since it readily tends to pass into nitric acid: consequently it discharges the colour of acid solutions of permanganates and chromates. The acid finds considerable use in organic chemistry, being employed to discriminate between the different types of alcohols and of amines, and also in the production of diazo, azo and diazo-amino compounds. It may be recognized by the blue colour it gives with diphenylamine sulphate and by its reaction with potassium iodide-starch paper.

Nitrosyl chloride, NOCl, is obtained by the direct union of nitric oxide with chlorine; or by distilling a mixture of concentrated nitric and hydrochloric acids, passing the resulting gases into concentrated sulphuric acid and heating the so-formed nitrosyl hydrogen sulphate with dry salt: $HNO_3+3HCl=NOCl+Cl_2+H_2O$; $NOCl+H_2SO_4=HCl+NO{\cdot}SO_4H$; $NO{\cdot}SO_4H+NaCl=NOCl+NaHSO_4$ (W. A. Tilden, *Jour. Chem. Soc.*, 1860, p. 630). It is also prepared by the action of phosphorus pentachloride on potassium nitrite or on nitrogen peroxide. It is an orange-coloured gas which may be readily liquefied and by further cooling may be solidified. The liquid boils at −5° C. and the solid melts at −65° C. It forms double compounds with many metallic chlorides, and finds considerable application as a means of separating various members of the terpene group of compounds. It is readily decomposed by water and alkaline hydroxides, yielding a mixture of nitrite and chloride. On treatment with silver fluoride it yields *nitrosyl fluoride*, NOF (O. Ruff, *Zeit. anorg. Chem.*, 1905, 47, p. 190). *Nitroxyl fluoride*, NO_2F, is formed by the action of fluorine on nitric oxide at the temperature of liquid oxygen (H. Moissan and P. Lebeau, *Comptes rendus*, 1905, 140, pp. 1573, 1621). It is a gas at ordinary temperature; when liquefied it boils at −63·5° C. and on solidification melts at −139° C. Water decomposes it into nitric and hydrofluoric acids. *Nitramide*, NH_2NO_2, is obtained by the action of sulphuric and nitric acids on potassium imidosulphonate, or by the action of ice-cold sulphuric acid on potassium nitro-carbamate (J. Thiele and A. Lachmann, *Ann.*, 1895, 288, p. 297): $NO_2{\cdot}NK{\cdot}CO_2K+H_2SO_4=NH_2NO_2+K_2SO_4+CO_2$. It crystallizes in prisms or leaflets which melt at 72-75°C. and are readily soluble in water and in all organic solvents except ligroin. It is somewhat volatile at ordinary temperature, and its aqueous solution possesses a strongly acid reaction. It is very unstable, decomposing into nitrous oxide and water when mixed with copper oxide, lead chromate or even powdered glass. On reduction it gives a strongly reducing substance, probably hydrazine. According to A. Hantzsch (*Ann.*, 1896, 292, pp. 340 et seq.) hyponitrous acid and nitramide are to be regarded as stereo-isomers, being the anti- and syn- forms of the same compound. Thiele, however, regards nitramide as imidonitric acid, $HN:NO(OH)$.

Nitrogen sulphide, N_4S_4, first obtained by W. Gregory (*Jour. pharm.*, 1835, 21, p. 315) by the action of ammonia on sulphur chloride, has been investigated by O. Ruff and E. Geisel (*Ber.*, 1904, 37, p. 1573; 1905, 38, p. 2659), who also obtained it by dissolving sulphur in liquid ammonia. It is a reddish-yellow crystalline solid, insoluble in water and melting at 178° C. It explodes readily when melted or subjected to shock. Dry hydrochloric acid gives ammonia but no nitrogen; with ammonia it gives $N:SNH_2$ and $S:S(NH_2)_2$; and with secondary amines it forms thiodiamines, $S(NR_2)_2$, nitrogen and ammonia being liberated. When heated with CS_2 to 100° C. under pressure, it forms liquid nitrogen sulphide, N_2S_5, a mobile red liquid which solidifies to an iodine-like mass of crystals which melt at 10-11° C. Water, alkalis and acids decompose it into sulphur and ammonia (W. Muthmann, *Zeit. anorg. Chem.*, 1897, 13, p. 200).

For sulphonic acids containing nitrogen see AMMONIA.

Numerous determinations of the atomic weight of nitrogen have been made by different observers, the values obtained varying somewhat according to the methods used. These methods have been purely chemical (either gravimetric or volumetric), physical (determinations of the density of nitrogen, nitric oxide, &c.) or physico-chemical. P. A. Guye has given a critical discussion of the relative accuracy of the gravimetric and physico-chemical methods, and favours the latter, giving for the atomic weight a value less than 14·01. The more important papers dealing with the subject are: J. Stas, *Œuvres complètes*, i. pp. 342 et seq.; Lord Rayleigh, *Proc. Roy. Soc.* (1894), 55, p. 340; (1904) 73, p. 153; G. Dean, *Jour. Chem. Soc.* (1901), 79, p. 147; R. W. Gray, *Jour. Chem. Soc.* (1906), 88, p. 1174; A. Scott, *Proc. Chem. Soc.* (1905), 21, p. 309; P. A. Guye, *Chem. News* (1905), 92, pp. 261 et seq.; (1906) 93, p. 13 et seq.; D. Berthelot, *Comptes rendus* (1907), 144, p. 269.

NITROGLYCERIN, $C_3H_5(NO_3)_3$ or $CH_2NO_3{\cdot}CHNO_3{\cdot}CH_2NO_3$ glyceryl trinitrate, an explosive first obtained in 1846 by Ascanio Sobrero (*Mem. Acad. Torino*, 1847) by acting with a mixture of strong nitric and sulphuric acids on glycerin at the ordinary temperature. The reaction proceeds in several stages, mono-, di- and finally tri-nitrate being produced, the final stage requiring sulphuric acid as a dehydrator. When pure it is a very pale yellow oil of sp. gr. 1·614 at 4° C. and 1·60 at 15° C. One gram requires for solution between 800 and 1000 c.c. of water, 4 c.c. of absolute alcohol or 18 c.c. of wood spirit, and it is scarcely at all soluble in glycerin itself, but mixes in all proportions with ether, acetone, ethyl acetate and benzene.

In the manufacture glycerin is dropped in a very thin stream into a mixture of 3 parts of nitric (sp. gr. 1·5) and 5 parts of sulphuric acid (sp. gr. 1·84), the containing vessel being cooled by a water jacket and the acid mixture agitated by a stream of cooled air, the temperature being kept at about 15° C. A considerable excess of acids is necessary for the completion and safety of the reaction, usually about 8 parts of the acid mixture to 1 of glycerin. The higher the strength of the acids the higher the yield of nitroglycerin and the smaller the loss by solution in the waste acids. In recent practice some sulphin trioxide, or fuming sulphuric acid, is added, so that the mixture of acids contains less than 1% of water. The action is very rapid, and the product, which rises to the top of the acids, is separated and washed successively with cold and then tepid water, and finally with water made slightly alkaline with sodium carbonate or hydroxide, to remove all adhering or dissolved acids which would otherwise render the product very unstable. Nitroglycerin dissolves a little water and then appears thick or milky. Generally it is either

dried, after being separated from the wash water, by means of common salt, upon a layer of which the moist nitroglycerin is gently run and allowed to drain or filter through, or it is filtered through a mass of dry sponge or similar dry and porous material.

Under ordinary pressure it boils at above 200° C. (L. de Bruyn). If gradually heated it begins to vaporize and decompose at about 130°, and as a rule it detonates when heated slightly above this temperature, previously giving off some red fumes. A little vapour is given off at ordinary temperatures and pressures, and when under a few millimetres pressure only it rapidly vaporizes below 100° C. The freezing-point is uncertain, owing perhaps to the existence of two modifications, as suggested by Kast (*Zeits. f. ges. Schiess- u. Sprengstoff*, 1-225; see also S. Nauckhoff, *Zeits. f. ang. Chem.*, 18, Heft 1 and 2). It is frequently given as 43° to 46° F. (about 6° to 8° C.), and it is stated to be more sensitive to percussion when frozen (Beilstein). It crystallizes (in long needles) more easily when gently agitated during the cooling, or when mixed with such substances as kieselguhr. At one time it was transported all over America in a frozen condition without serious accidents, and according to Sir F. Nathan (*Jour. Soc. Chem. Ind.*, 1908, 27, p. 5) it is safer to export in the frozen state. To prevent the freezing of nitroglycerin in dynamite it has been proposed to add various substances, such as chlordinitroglycerin, nitrated diglycerin or tetranitrodiglycerol, and also mono-and di-nitroglycerin. The latter two have been studied by C. W. Will (*Ber.*, 1908, 7, p. 407), who obtained two isomeric dinitroglycerins, one of which is eminently crystallizable and the other fluid. Both are sensitive to percussion, but a little less so than nitroglycerin. The mononitroglycerin also exists in two forms, neither of which is strictly speaking explosive. It appears that an addition of dinitroglycerin to nitroglycerin would materially retard its freezing or lessen its sensitiveness (see also C. Claessen, Ger. Pat. 210990 (1909)).

	Mono.	Di.	Tri.
Specific gravity	1·40	1·47	1·6
Melting-point . .	α 58°	α hydrate, 26°	labile, 2·2°
	β 54°	β hydrate (fluid)	stable, 12·2°
Boiling-point 18 mm.	155-160°	145° about	160°
Solubility . .	70%	7·7%	·16%

The liquid when soaked into a porous combustible substance like blotting-paper burns rapidly and quietly, and when struck with a hammer on a hard surface violently detonates; when a little of the liquid is spread on an anvil and struck, the portion immediately under the hammer only will, as a rule, detonate, the remainder being scattered. Some solutions of nitroglycerin (in ether, acetone, &c.) burn quietly, and the same is the case when it is held in solution or suspension in a colloid substance, as gelatinized guncotton, &c.

Strong sulphuric acid dissolves nitroglycerin, and this solution on being poured into water yields dinitroglycerin (see Will, *loc. cit.*) and also some mononitroglycerin. When the solution in the strong acid is allowed to stand, some nitric acid is first evolved, and as the temperature rises this is followed by a general decomposition of the substance, though not necessarily an explosive one. Shaken with mercury and sulphuric acid, nitroglycerin yields its nitrogen as nitric oxide; the measurement of the volume of this gas is a convenient mode of estimating nitroglycerin. Ammonium hydroxide has no appreciable action at ordinary temperatures, but strong solutions of sodium or potassium hydroxides start a decomposition, with rise of temperature, in which some nitrate and always some nitrite is produced. Some glycerin may be re-formed, but with very strong alkaline solutions little of the glycerin molecule escapes destruction, oxalic acid and several other products resulting. Alcoholic solutions of the alkalis also produce much nitrite along with some formate and acetate. Calcium or potassium sulphides and potassium hydrosulphides completely reduce nitroglycerin to glycerin, some of the sulphur being oxidized and some precipitated. Hydriodic acid reduces it to glycerin and nitric oxide. Aniline and similar bases are oxidized and partially nitrated by nitroglycerin, with the production of non-explosive compounds.

The first attempts to utilize the explosive power of nitroglycerin were made by Nobel in 1863; they were only partially successful until the plan, first applied by General Pictot in 1854, of developing the force of gunpowder in the most rapid manner and to the maximum extent, through initiative detonation, was applied by Nobel to nitroglycerin. Even then, however, the liquid nature of the substance, though advantageous in one or two directions, constituted a serious obstacle to its safe transport and storage and to its efficient employment; it was therefore not until Nobel produced plastic solid preparations by mixing the liquid with porous substances, such as gunpowder, or carbon and sulphur, and finally kieselguhr in a fine state of division, capable of absorbing and retaining considerable quantities of it, that it could be employed as a blasting agent (see EXPLOSIVES, DYNAMITE, CORDITE). (W. R. E. H.)

Therapeutics.—Nitroglycerin has a sweet burning taste and is decidedly poisonous. Its vapour produces violent headache, and the same effect is often caused by handling compositions containing it. Prior to its use as an explosive, its alcoholic solution found application in medicine under the name of glonoin. Although a nitrate, its pharmacological actions resemble those of nitrites such as amyl nitrite, taken internally. The explanation is that in an alkaline medium at body heat nitroglycerin yields a nitrite, probably as a preliminary stage of resolution. Nitroglycerin shaken up with warm very dilute alkaline solutions, as sodium carbonate, for a few minutes only, always yields sufficient nitrite to give the diazoreaction; and, as stated, strong alkaline solutions always produce some nitrite as one of the decomposition products. This gradual conversion in the tissues is a valuable property of nitroglycerin, as its effects take longer to manifest themselves than is the case with amyl and other nitrites. Nitroglycerin is valuable as a preventive in cases of cardiac pain, such as angina pectoris, and it is also used in other conditions where it is desirable to reduce the arterial tension. The British Pharmacopoeia contains a *liquor trinitrini* (1%), and tablets made up with chocolate, each containing one-hundredth of a grain.

NITZSCH, GREGOR WILHELM (1790–1861), German classical scholar, brother of Karl Immanuel Nitzsch, was born at Wittenberg on the 22nd of November 1790. In 1827 he was appointed professor of ancient literature at Kiel, but in 1852 was dismissed by the Danish government for his German sympathies. In the same year he accepted a similar post at Leipzig, which he held till his death on the 22nd of July 1861. Nitzsch is chiefly known for his writings on the Homeric epic. In opposition to Wolf and Lachmann, he maintained that the *Iliad* and *Odyssey* were not an aggregate of single short poems, but long complete poems, composed by one and the same author according to a uniform plan with a central dramatic idea.

His son, KARL WILHELM NITZSCH (1818–1880), became professor of history at Königsberg in 1862, and at Berlin in 1872.

The most important of his works were: *Erklärende Anmerkungen zu Homer's Odyssee*, i.-xii. (1826–1840); *Die Sagenpoesie der Griechen* (1852); *Beiträge zur Geschichte der epischen Poesie der Griechen* (pub. 1862, ed. C. W. Nitzsch). See memoir by F. Lübker (1864); C. Bursian, *Geschichte der klassischen Philologie in Deutschland* (1883) and J. E. Sandys, *Hist. of Class. Schol.* iii. (1908), p. 105.

NITZSCH, KARL IMMANUEL (1787–1868), Lutheran divine, was born at the small Saxon town of Borna near Leipzig on the 21st of September 1787. His father, Karl Ludwig Nitzsch (1751–1831), who at that time was pastor and superintendent in Borna, and afterwards (1790) became professor at Wittenberg and director (1817) of the seminary for preachers, has also left a name of some distinction in the theological world by a number of writings, among which may be mentioned a work entitled *De discrimine revelationis imperatoriae et didacticae prolusiones academicae* (2 vols., 1830). Theologically, he represented a combination of supernaturalism and rationalism (supernatural rationalism or a Kantian rational supernaturalism). Karl Immanuel was sent to study at Schulpforta in 1803, whence he proceeded to the university of Wittenberg in 1806. In 1809 he graduated, and in 1810 he became a *Privatdozent* at the university. Having become *diaconus* at the Schlosskirche in 1811, he showed remarkable energy and zeal during the bombardment and siege of the city in 1813. In 1817 he was appointed one of the preceptors in the preachers' seminary which had been established at Wittenberg after the suppression of the university. From 1820 to 1822 he was superintendent in Kemberg, and in the latter year he was appointed professor ordinarius of systematic and practical theology at Bonn. Here he remained until called to succeed Marheineke at Berlin in 1847; subsequently he became university preacher, rector of the university, provost of St Nicolai (in 1854) and member of the supreme council of the church, in which last capacity he was one of the ablest and most active promoters of the Evangelical Union. He died on the 21st of August 1868. He represented the *Vermittelungstheologie* of the school of Schleiermacher.

His son, FRIEDRICH AUGUST NITZSCH (b. 1832), was made professor ordinarius of theology at Giessen in 1868 and at Kiel in 1872. He was the author of *Grundriss der christl. Dogmengeschichte* (1870, incomplete) and *Das System des Boëthius* (1860), amongst other works.

Karl Nitzsch's principal works are: *System der christlichen Lehre* (1829; 6th ed., 1851; Eng. trans., 1849), *Praktische Theologie* (1847–1860; 2nd ed., 1863–1868), *Akademische Vorträge über christliche Glaubenslehre* (1858) and several series of *Predigten*. "He took as his starting-point the fundamental thought of Schleiermacher, that religion is not doctrine but life, direct consciousness, feeling. At the same time he sought to bring religious feeling into closer connexion with knowledge and volition than Schleiermacher had done; he laid special stress—and justly—on the recognition of a necessary and radical union of religion with morality, treating both dogmatics and ethics together accordingly in his *System der christlichen Lehre*" (Otto Pfleiderer, *Development of Theology*, p. 123). His *Protestantische Beantwortung*, a reply to the *Symbolik* of Johann Adam Möhler (1796–1838), which originally appeared in the *Studien u. Kritiken*, of which he was one of the founders, may also be mentioned.

See Herzog-Hauck, *Realencyklopädie*, and the *Allgemeine deutsche Biographie*; F. Lichtenberger, *History of German Theology in the Nineteenth Century*, pp. 185-196.

NIU-CHWANG, a city of China, in the Manchurian province of Shêng-king (Liao-tung), in 40° 53′ N. and 122° 7′ E., about 35 m. (90 m. by water) from the coast of the Gulf of Liao-tung, on what is now a small branch of the main eastern affluent of the Liao-ho. The population is estimated at 80,000. The city proper is a comparatively unimportant place with broken-down walls, but it is surrounded by a number of large and flourishing suburbs. About the beginning of the Ta-ts'ing dynasty (1644) Niu-chwang was the chief port on the river, but in the reign of K'ien-lung, owing mainly to physical changes, it was supplanted by T'ien-chwang-tai farther down the stream, and towards the close of the 18th century this had in turn to give place to Ying-tsze still nearer the mouth. In ignorance of these facts Niu-chwang (now scarcely to be reached by a flat-bottomed river boat) was chosen as one of the ports to be opened to foreign trade by the treaty of Tien-tsin; and, though Ying-tsze had of necessity to be adopted as the site of the foreign settlements, Europeans still continue to speak of it as the port of Niu-chwang. Ying-tsze (otherwise known as Ying-k'ou, Niu-k'ou and in Mandarin as Muh-k'ou-ying) lies on the left bank of the Liao-ho on the lowest dry portion of the plain, not much above high-water mark. The British settlement immediately above the town has a river frontage of 1000 yds. opposite the deepest of the reaches, and runs back to the highway leading to Niu-chwang. Off the mouth of the river there is an extensive bar of hard mud which can only be crossed by certain channels at high tide, when it is covered by from 18 to 20 ft. of water; and the port is altogether closed by ice for four or five months of the year, between November and May. Niu-chwang has shown considerable vigour as a port of trade, sharing in the general prosperity of the provinces of Manchuria, of which it is the outlet. It was opened to foreign trade in 1858. In 1864 the total value of trade was £934,374, in 1878 £2,606,134, in 1898 £4,634,470, while in 1904 the figures reached £5,950,895. The principal exports (29%) are beans, bean-cake, bean-oil and wild silk. The bean-cake is a popular article of food with the natives of Kwang-tung and Fuh-kien, and is also largely employed for manuring the rice and sugar fields in the neighbourhood of Shanghai, Amoy, Swatow, &c. Of imports (71%) the principal are cotton yarn and cotton cloth, most of the latter being drawn from the United States in preference to English-made goods. The number of resident foreigners is about 150. Railways connect the port with Tientsin and Peking on the one hand, and with the Russian territories lying to the north on the other. In 1895 Niu-chwang was occupied by Japanese troops, and the town was included in the cession of territory originally granted by the treaty of peace. By a supplementary convention it was retroceded by the Japanese under pressure of France and Russia. Niu-chwang suffered considerably from the disturbances of 1900 and again during the Russo-Japanese war. In 1900 the Russians defeated the Chinese troops who attacked the town, and took possession of the port, and administered affairs until they in their turn were driven out by Japanese. At the conclusion of the war the Japanese restored the port to China.

NIUÉ (SAVAGE ISLAND or NIUÉ-FEKAI, as the natives call it), an island in the South Pacific Ocean, 14 m. long by 10 m wide, in 19° 10′ S., 169° 47′ W. The entire island is an old coral reef upheaved 200 ft., honeycombed with caves and seamed with fissures. The soil, though thin, is, as in other limestone islands, very rich, and coco-nuts, tara, yams and bananas thrive. There is an abundant rainfall, but owing to the porous nature of the soil the water percolates into deep caves which have communication with the sea, and becomes brackish. The natives, a mixed Polynesian and Melanesian people of Samoan speech, are the most industrious in the Pacific, and many of the young men go as labourers to other islands. The consequent minority of men has been destructive of the sexual morality of the women, which formerly stood high. The natives are keen traders, and though uncouth in manners when compared with their nearest neighbours, the Tongans and Samoans, are friendly to Europeans. Their hostility to Captain Cook in 1774, which earned from him the name of Savage for the island, was due to their fear of foreign disease, a fear that has since been justified. The population (4079 in 1901) is slightly decreasing. The natives are all Christians, and the majority have learned to read and write, and to speak a little English, under the tuition of the London Missionary Society. They wear European clothes. The island became a British protectorate on the 20th of April 1900, and was made a dependency of New Zealand in October 1900, the native government, of an elected "king" and a council of headmen, being maintained. In 1900 there were thirteen Europeans on the island The exports are copra, fungus and straw hats, which the women plait very cleverly.

See T. H. Hood, *Notes of a Cruise in H.M.S. "Fawn"* (Edinburgh, 1863); J. L. Brenchley, *Jottings during the Cruise of the "Curaçoa"* (London, 1873); B. H. Thomson, *Savage Island* (London, 1902).

NIVELLES (Flem. *Nyvel*), a town of Belgium in the province of Brabant, situated on the Thines 19 m. S. of Brussels. Pop. (1904) 12,109. It is a busy little place with many industries, notably the manufacture of parchment. The town is supposed to owe its origin to the foundation of a convent on the spot by Itta or Iduberge, wife of Pippin of Landen. The Romanesque church of St Gertrude, named after Itta's daughter, dates from the 11th century, but has been badly restored and is disfigured by a heavy tower. On the top of the tower is the effigy of a man in iron who strikes the hours with a hammer. He is called by the townspeople Jean de Nivelles, a celebrated baron of the 15th century whose title eventually became merged in that of the count de Hornes (Horn). The church is supposed to occupy the site of Itta's convent. Close to Nivelles is Seneffe, where Condé defeated William of Orange in 1674, and at Nivelles itself the French under Marceau defeated the Austrians in 1794.

NIVERNAIS, LOUIS CHARLES BARBON MANCINI MAZARINI, DUC DE (1716–1798), French diplomatist and writer, was born in Paris on the 16th of December 1716, son of Philippe Jules François, duc de Nevers, and Maria Anne Spinola, and great-nephew of Cardinal Mazarin. He was educated at the Collège Louis le Grand, and married at the age of fourteen. He served in the campaigns in Italy (1733) and Bohemia (1740), but had to give up soldiering on account of his weak health. He was subsequently ambassador at Rome (1748–1752), Berlin (1755–1756) and London, where he negotiated the treaty of Paris (10th of February 1763). From 1787 to 1789 he was a member of the Council of State. He did not emigrate during the Revolution, but lost all his money and was imprisoned in 1793. He recovered his liberty after the fall of Robespierre, and died in Paris on the 25th of February 1798. In 1743 he was elected to the Academy for a poem entitled *Délie*, and from 1763 he devoted the greater part of his time to the administration of the duchy of Nevers and to *belles-lettres*. He wrote much and with great facility; but his writings are of little value, his *Fables* being his best pro-

ductions. His *Œuvres complètes* were published in Paris in 1796; an edition of his *Œuvres posthumes* was brought out in Paris by François de Neufchâteau in 1807, and his *Correspondance secrète* was published in Paris by de Lescure in 1866.

See L. Perey (pseud. for Mlle. Luce Herpin), *Un Petit-Neveu de Mazarin* (Paris, 1890); *La Fin du XVIII^e siècle: le duc de Nivernais* (Paris, 1891), by the same writer; Sainte-Beuve, *Causeries du lundi* (vol. xiii.); Dupin, *Éloge du duc de Nivernais* (1840); Abbé Blampignon, *Le Duc de Nivernais, d'après sa correspondance inédite* (1888).

NIXIE, or NIXY, a female water-sprite. The word is adapted from Ger. *Nixe*, the male water-sprite being *Nix*. The general term covering both the male and female is "nicker," a kelpie. This also appears in Dutch *nikker*. The Old Teutonic *nikus* may be connected with the root which appears in Gr. *νίζειν* or *νίπτειν*, "to wash."

NIXON, JOHN (1815–1899), English mining engineer and colliery proprietor, was born at Barlow, Durham, on the 10th of May 1815, the son of a farmer. He was educated at the village school, and at an academy in Newcastle-on-Tyne, where he distinguished himself in mathematics. Leaving school at fourteen, he worked on his father's farm for two years, and then apprenticed himself to Mr Joseph Gray, one of the leading mining engineers in the north of England, and agent to the second marquis of Bute; subsequently he obtained employment as "overman" at one of the Bute collieries in Durham. In 1839 an advertisement drew him to the South Wales coalfield, where he was engaged in mine-surveying, and whence he proceeded to France as engineer to a coal and iron company. Returning to England, he noticed while travelling on one of the Thames steamers that the Welsh coal in use gave off no smoke and was preferred to north country coal both on this ground and because of its greater power-producing efficiency. His experience in France now suggested to him that a profitable market for this coal might be established among the French iron-founders and manufacturers generally who had hitherto imported English north country coal. For some time he was unable to procure any of this special Welsh coal. Eventually, however, by expending all his small savings he secured a cargo, freighted a small craft, and sent it across to Nantes, where with some difficulty he persuaded the local manufacturers to try it on the understanding that he bore the expense of the experiments. These tests, carried out under Nixon's personal directions, proved highly successful, and in due course the French government gave him a contract for Welsh coal for the French navy. Nixon's visit to Nantes laid the foundations of the Welsh steam-coal trade, English manufacturers and shipowners imitating the example of their French rivals. At first Nixon only sold the coal on commission, but eventually acquired what appeared to him a prospective field for steam-coal in the Aberdare valley, and after seven years' working at last struck a rich seam. This property is now known as Nixon's Navigation Collieries. Nixon subsequently acquired or developed other South Wales steam collieries, which yielded him a considerable fortune. He was also the inventor of many mechanical improvements in colliery working. He died in London on the 3rd of June 1899.

See J. E. Vincent, *John Nixon, Pioneer of the Steam Coal Trade in South Wales* (London, 1900).

NIZAM, the hereditary title of the reigning prince of Hyderabad (*q.v.*) in India, derived from an Arabic word meaning order, or administration. The same word is found in *Nazim*, applied to the Nawab of Bengal, and in *Nizamat*, the old term for criminal jurisdiction. Nizam-ul-Mulk (="administrator of the kingdom") was the title of Asaf Jah, the founder of the dynasty, a very able soldier and minister of the court of Aurangzeb, who was appointed governor of the Deccan in 1713, and established his independence before his death in 1748.

NIZĀMĪ (1141–1203). Nizām-uddīn Abū Mahommed Ilyās bin Yūsuf, Persian poet, was born 535 A.H. (1141 A.D.). His native place, or at any rate the abode of his father, was in the hills of Kum, but as he spent almost all his days in Ganja in Arrān (the present Elizavettpol) he is generally known as Nizāmī of Ganja or Ganjawī. The early death of his parents, which illustrated to him in the most forcible manner the unstableness of all human existence, threw a gloom over his whole life, and fostered in him that earnest piety and fervent love for solitude and meditation which have left numerous traces in his poetical writings, and served him throughout his literary career as a powerful antidote against the enticing favours of princely courts, for which he, unlike most of his contemporaries, never sacrificed a tittle of his self-esteem. The religious atmosphere of Ganja, besides, was most favourable to such a state of mind; the inhabitants, being zealous Sunnites, allowed nobody to dwell among them who did not come up to their standard of orthodoxy, and it is therefore not surprising to find that Nizāmī abandoned himself at an early age to a stern ascetic life, as full of intolerance to others as dry and unprofitable to himself. He was rescued at last from this monkish idleness by his inborn genius, which, not being able to give free vent to its poetical inspirations under the crushing weight of bigotry, claimed a greater share in the legitimate enjoyments of life and the appreciation of the beauties of nature, as well as a more enlightened faith of tolerance, benevolence, and liberality. The first poetical work in which Nizāmī embodied his thoughts on God and man, and all the experiences he had gained, was necessarily of a didactic character, and very appropriately styled *Makhzanul Asrār*, or "Storehouse of Mysteries," as it bears the unmistakable stamp of Sūfic speculations. It shows, moreover, a strong resemblance to Nāsir Khosrau's ethical poems and Sanā'ī's *Hadikat-ulhakikat*, or "Garden of Truth." The date of composition, which varies in the different copies from 552 to 582 A.H., must be fixed in 574 or 575 (1178–1179 A.D.). Although the *Makhzan* is mainly devoted to philosophic meditations, the propensity of Nizāmī's genius to purely epic poetry, which was soon to assert itself in a more independent form, makes itself felt even here, all the twenty chapters being interspersed with short tales illustrative of the maxims set forth in each. His claim to the title of the foremost Persian romanticist he fully established only a year or two after the *Makhzan* by the publication of his first epic masterpiece *Khosrau and Shīrīn*, composed, according to the oldest copies, in 576 A.H. (1180 A.D.). As in all his following epopees the subject was taken from what pious Moslems call the time of "heathendom"—here, for instance, from the old Sassānian story of Shāh Khosrau Parwiz (Chosroes Parvez), his love affairs with the princess Shīrīn of Armenia, his jealousy against the architect Ferhād, for some time his successful rival, of whom he got rid at last by a very ingenious trick, and his final reconciliation and marriage with Shīrīn; and it is a noteworthy fact that the once so devout Nizāmī never chose a strictly Mahommedan legend for his works of fiction. Nothing could prove better the complete revolution in his views, not only on religion, but also on art. He felt, no doubt, that the object of epic poetry was not to teach moral lessons or doctrines of faith, but to depict the good and bad tendencies of the human mind, the struggles and passions of men; and indeed in the whole range of Persian literature only Firdusī and Fakhr-uddīn As'ad Jorjānī, the author of the older epopee *Wīs u. Rāmīn* (about the middle of the 11th century), can compete with Nizāmī in the wonderful delineation of character and the brilliant painting of human affections, especially of the joys and sorrows of a loving and beloved heart.

Khosrau and Shīrīn was inscribed to the reigning atābeg of Azerbaijān, Abū Ja'far Mahommed Pahlavān, and his brother Kizil Arslān, who, soon after his accession to the throne in 582 A.H., showed his gratitude to the poet by summoning him to his court, loading him with honours, and bestowing upon him the revenue of two villages, Hamd and Nijān. Nizāmī accepted the royal gift, but his resolve to keep aloof from a servile court-life was not shaken by it, and he forthwith returned to his quiet retreat Meanwhile his genius had not been dormant, and two years after his reception at court, in 584 A.H. (1188 A.D.), he completed his *Dīwān*, or collection of kasīdas and ghazals (mostly of an ethical and parenetic character), which are said to have numbered 20,000 distichs, although the few copies which have come to us contain only a very small number of

verses. About the same time he commenced, at the desire of the ruler of the neighbouring Shīrvān, his second romantic poem, the famous Bedouin love-story of *Laila and Majnūn*, which has so many points in common with Ariosto's *Orlando Furioso*, and finished it in the short space of four months. A more heroic subject, and the only one in which he made a certain attempt to rival Firdousī, was selected by our poet for his third epopee, the *Iskandarnāma*, or "Book of Alexander," also called *Sharafnāma* or *Iqbālnāma-i-Iskandarī* ("The Fortunes of Alexander"), which is split into two divisions. The first or semi-historical part shows us Alexander the Great as the conqueror of the world, while the second, of a more ethical tendency, describes him in the character of a prophet and philosopher, and narrates his second tour through the world and his adventures in the west, south, east and north. There are frequent Sūfic allegories, just as in the *Makhzan*; and quite imbued with pantheistic ideas is, for instance, the final episode of the first part, the mysterious expedition of Alexander to the fountain of life in the land of darkness. As for the date of composition, it is evident, from the conflicting statements in the different MSS., that there must have been an earlier and a later recension, the former belonging to 587–589 A.H., and dedicated to the prince of Mosul, 'Izz-uddīn Mas'ūd, the latter made for the atābeg Nusrat-uddīn Abū Bakr of Azerbaijan after 593 A.H., since we find in it a mention of Nizāmī's last romance *Haft Paikar*, or the "Seven Beauties," which comprises seven tales related by the seven favourite wives of the Sassānian king Bahrāmgūr. In this poem, which was written 593 A.H., at the request of Nūr-uddīn Arslān of Mosul, the son and successor of the above-mentioned 'Izz-uddīn, Nizāmī returned once more from his excursion into the field of heroic deeds to his old favourite domain of romantic fiction, and added a fresh leaf to the laurel crown of immortal fame with which the unanimous consent of Eastern and Western critics has adorned his venerable head. The most interesting of the seven tales is the fourth, the story of the Russian princess, in which we recognize at once the prototype of Gozzi's well-known *Turandot*, which was afterwards adapted by Schiller for the German stage. The five mathnawīs, from the *Makhzan* to the *Haft Paikar*, form Nizāmī's so-called "Quintuple" (*Khamsa*) or "Five Treasures" (*Panj Ganj*), and have been taken as pattern by all the later epic poets in the Persian, Turkish, Chaghatāi and Hindustānī languages. Nizāmī died at Ganja in his sixty-fourth year, 599 A.H. (1203 A.D.).

The fullest account of Nizāmī is given in Dr W. Bacher's *Nizāmī's Leben und Werke* (Leipzig, 1871; English translation by S. Robinson, London, 1873; reprinted in the same author's *Persian Poetry for English Readers*, 1883, pp. 103-244). All the errors of detail in Bacher's work have been corrected by Dr Rieu in his *Catalogue of the Persian MSS. in the British Museum* (1881), ii. 563 sqq.

Principal Editions.—The whole *Khamsa* (lithographed, Bombay, 1834 and 1838; Teheran, 1845); *Makhzan-ul Asrār* (edited by N. Bland, London, 1844; lithographed, Cawnpore, 1869; English translation in MS. by Hatton Hindley, in the British Museum Add. 6961); *Khosrau and Shīrīn* (lithographed, Lahore, 1871; German translation by Hammer in *Shīrīn, ein persisches romantisches Gedicht*, Leipzig, 1809); *Laila and Majnūn* (lithographed, Lucknow, 1879; English translation by J. Atkinson, London, 1836); *Haft Paikar* (lithographed, Bombay, 1849; Lucknow, 1873; the fourth tale in German by F. von Erdmann, *Behramgur und die russische Fürstentochter*, Kasan, 1844); *Iskandarnāma*, first part, with commentary (Calcutta, 1812 and 1825; text alone, Calcutta, 1853; lithographed with marginal notes, Lucknow, 1865; Bombay, 1861 and 1875; English translation by H. Wilberforce Clarke, London, 1881; compare also Erdmann, *De expeditione Russorum Berdaam versus*, Kasan, 1826, and Charmoy, *Expédition d'Alexandre contre les Russes*, St Petersburg, 1829); *Iskandarnāma-i-Bahrī*, second part, edited by Dr Sprenger (Calcutta, 1852 and 1869). (H. E.)

NIZHNE-TAGILSK, popularly known as TAGIL, a town and ironworks of Russia, in the government of Perm, stands in a longitudinal valley on the eastern slope of the Ural Mountains, within a few miles of the place where the Tagil, cutting through the eastern wall of the valley, escapes to the lowlands to join the Tura, a tributary of the Tobol. The southern part of this valley is occupied by the upper Tagil, and its northern portion by the upper Tura, from which the Tagil is separated by a low watershed. Pop. (1897) 30,000, all Great-Russians and chiefly Nonconformists. The town is connected by railway (the first in Siberia) with Perm and Ekaterinburg, the latter distant 88 m. to the S.S.E. It was founded in 1725 by the Russian mine-owner Demidov, and is still the property of his family. Nizhne-Tagilsk is a central foundry for a number of iron-mines and other works scattered in the valley of the Tagil and its tributary the Salda. Gold, platinum and copper are also mined at Nizhne-Tagilsk. The town carries on a brisk corn trade. The inhabitants make wooden boxes and trays, which are sent to the fairs of Irbit and Nizhniy-Novgorod.

NIZHNE-UDINSK, a town of East Siberia, in the government of Irkutsk, 315 m. by rail W.N.W. of Irkutsk, on the Siberian railway, and on the Uda river. It is a centre for the Biryusa gold mines, and in winter the head of a line of communication with the Lena and Bratsky Ostrog, on the Angara. Pop. (1897) 5803.

NIZHNIY-NOVGOROD or NIJNI-NOVGOROD, abbreviated into NIZHEGOROD, a government of Central Russia, bounded by the governments of Vladimir on the W., Kostroma and Vyatka on the N. and N.E., Kazan and Simbirsk on the E., and Penza and Tambov on the S., with an area of 19,792 sq. m., two-thirds being on the right and the rest on the left bank of the Volga. The smaller portion, with the exception of the better-drained lands close to the river, is a low, flat, marshy region, covered with thick forests and sandy hills, and thinly peopled. The space between the Oka and the Volga, in the west, is also flat and forest-grown. The best part of the government is that to the east of the Oka; it is hilly, trenched by deep ravines and better drained, and has patches of fertile black earth in the south. The government is drained by the Volga with its tributaries, the Kerzhenets and the Vetluga on the left, and the Sura (with the Pyana) and the Oka on the right. These and their numerous tributaries offer great facilities both for navigation and for the transportation of timber. Numerous small lakes dot the government, especially in the north, and close upon two-fifths of its entire surface is still covered with forests, which occupy nearly the whole of the Zavolyi (to the north of the Volga), and extend without a break for 50 and 80 m. to the west and south-west respectively. The climate is severe, especially in the Zavolyi, where the average yearly temperature is 5·6° Fahr. lower than at Nizhniy. Besides the Carboniferous, Permian and Triassic deposits ("variegated marls"), Jurassic deposits are found in patches, chiefly in the south-east, as also in the south-west and north. They are overlain with Cretaceous black clays and sandstones. Thick strata of Tertiary sands, containing petrified wood, are found in the Ardatov district, and over the whole lie Glacial deposits, sandy gravels and clays.

Black earth, known as the "black earth of the plateau," prevails on the high plains between the river valleys in the south-east; the "valley black earth," even more fertile than the former, covers the gently-sloping portions of the territory, also in the south-east. More or less sandy clays are met with elsewhere, and there are large patches of sand. Iron ores (brown and spherosideritic), alabaster, limestone, sand (used for glass), salt and phosphorites are the chief useful minerals. There are also extensive deposits of peat.

The population increased from 1,376,000 in 1880 to 1,602,292 in 1897; of these 841,245 were women, and 140,347 lived in towns. The estimated pop. in 1906 was 1,823,600. They consist of Russians, to the extent of 88%; Mordvinians, to the number of 53,100; Cheremisses, 6700; with Tatars and Chuvashes. Of the total number in 1897 1,525,735 were Orthodox and Old Believers, 75,848 Raskolniks (Nonconformists), 51,236 Mussulmans and 3388 Jews. Both the birth-rate (53 in 1000) and the death-rate (42 in 1000) are high. A little over 53% of the area is available for agriculture, and of this 59% is owned by noblemen and 16% only by the peasantry, the remainder being owned by merchants and others. Of the cultivable land owned by the peasantry 55% is under crops, but of similar land owned by noblemen only 30% is cultivated. The principal crops are wheat, rye, oats, barley, pease and potatoes. In some years the yield is quite insufficient for the population, and every year over 100,000

persons quit their villages in quest of temporary work in neighbouring governments. The *semstvo* or district council of Nizhniy-Novgorod supports an agricultural school, an experimental farm and an agency for the purchase of improved seeds and machinery. The live-stock industry is inferior, as many as 41% of the peasant families having no horses, and 24% no cows. The domestic trades, such as the making of cutlery, felts, woollens, leather goods, wooden wares (sledges, spoons, boxes, window-frames, &c.), gloves, wirework, hardware, mats and sacks, are widely practised; 70% of the male working population among the peasants earn their livelihood in this way, as well as by shipping. This last is an industry of considerable magnitude, goods being shipped and unshipped to the annual value of over £5,000,000. Many of the villages and towns have each its own speciality, those in the district of Semenov being famous for wooden spoons, in Gorbatov for cutlery and locks, in Balakhna for spindles, in Makaryev for fancy boxes, in Arzamas, Knyaginin and Sergach for furs and leather goods. The Mordvinians and Cheremisses keep bees. Fruit and vegetables are cultivated along the Oka and the Volga. The factories are steadily developing, iron and machinery works, flour-mills, potteries, tanneries, shipbuilding yards, sawmills and distilleries are the more important. Education, owing to the efforts of the *semstvo*, is in a better condition than in many other governments of Russia. (P. A. K.; J. T. Bz.)

NIZHNIY-NOVGOROD, or simply NIZHNIY, a town of Russia, capital of the above government, situated at the confluence of the Oka and the Volga, 272 m. by rail E. of Moscow. It occupies an advantageous position on the great artery of Russian trade, at a place where the manufactured and agricultural products of the basin of the Oka meet the metal wares from that of the Kama, the corn and salt brought from the south-eastern governments, the produce of the Caspian fisheries, and the various wares imported from Siberia, Central Asia, Caucasia and Persia. It has thus become the seat of the great Makaryevskaya fair (see below), and one of the chief commercial centres of Russia. Its importance was still further increased during the latter part of the 19th century in consequence of the growth of manufacturing industry in the Oka basin, the rapid development of steamboat traffic on the Volga and its tributaries, the extension of the Russian railway system and the opening of Central Asia for trade.

Nizhniy-Novgorod consists of three parts: the upper city, including the Kremlin; the lower town, or Nizhniy Bazaar; and "the Fair," with the suburb of Kunavino. The upper city is built on three hills, which rise as steep crags 400 ft. (490 ft. above sea-level) above the right bank of both the Oka and the Volga. The Kremlin, or old fort, occupies one of these hills facing the Volga. It was begun in the second half of the 14th century, but was erected chiefly in the beginning of the 16th, on the site of the old palisaded fort, and has a wall 2300 yds. long, and 65 to 95 ft. high, with eleven towers; it contains the law-courts, the governor's residence, the arsenal, barracks, the military gymnasium of Count Arakchéev (transferred from old Novgorod), a small museum and two cathedrals, Preobrazhenski and Arkhangelski. These last were erected in 1225 and 1222 respectively, and have been rebuilt more than once; the present structures, in somewhat poor taste, date from 1829–1834 and 1732 respectively. The Preobrazhenski cathedral retains several relics of the past, such as holy pictures of the 14th and 17th centuries and a Bible of 1408; Minin, the hero of Nizhniy (see below) lies buried there. The Kremlin is adorned with a square, containing a monument to Minin and Pozharsky erected in 1826, and pretty boulevards have been laid out along its lower wall. The view from the Kremlin of the broad Volga, with its low-lying and far-spreading left bank, is very striking. The Pechersky monastery, close by, is archaeologically interesting; it was built in the first half of the 16th century—instead of the old monastery founded in 1330 and destroyed by a land-slip in 1596—and has several antiquities and a library which formerly contained very valuable MSS., now at St Petersburg. Another monastery, that of Blagovyeshchensk (1370, rebuilt 1647), is situated on the right bank of the Oka. Its old churches have been destroyed by fire, but it has a very ancient holy picture—probably the oldest in Russia, dating from 993, which attracts many pilgrims. In 1904 a town-house and a monument to Tsar Alexander II. were built in the principal square of the upper town. Besides the Kremlin, the upper town contains the best streets and public buildings. Five descents lead from it to the lower town, planted on the alluvial terrace, 30 to 35 ft. above the banks of the Oka and the Volga, and in the centre of a very lively traffic. Piles of salt line the salt wharves on the Oka; farther down are the extensive storehouses and heaps of grain of the corn wharves; then comes the steamboat quay on the Volga, opposite the Kremlin, and still farther east the timber wharves. The fair is held on the flat sandy tongue of land between the Oka and the Volga, connected with the town by only a bridge of boats, 1500 yds. long, which is taken to pieces in winter. The shops of the fair, 4000 in number, built of stone in regular rows, are surrounded by a canal, and cover half a square mile. Outside this inner fair are nearly 4000 more shops. Several buildings have been erected, and institutions established, in connexion with the fair, *e.g.* the house of the committee (1890), banks, a theatre, a circus, a new semicircular canal and a second floating bridge, underground galleries, a water-supply, an electrical tramway, temperance tea-shops and restaurants kept by the Society of Tradesmen. The Siberian harbour is conspicuous during the fair on account of its accumulations of tea boxes and temporary shelters, in which the different kinds of tea are tried and appraised by tasters. The point of the peninsula is occupied by the storehouses of the steamboat companies, while metal wares and corn are discharged on a long island of the Oka, at the iron harbour and in Grebnovskaya harbour. An island in the Volga is the place where various kinds of rough wares are landed. The railway from Moscow has its terminus close to the fair buildings, to the south of which is the suburb of Kunavino, widely known throughout the East as a place for amusements of the lowest kind during the fair. On the fair side the Alexander Nevski cathedral was erected in 1881, and there too is the older "Fair" cathedral of 1822.

The climate of Nizhniy is harsh and continental, the yearly average temperature being 39° Fahr. (10·6° in January and 64° in July), and the extreme thermometric readings −40° and 104° Fahr. The town has a settled population of (1897) 90,053 inhabitants, who are nearly all Great-Russians, and many of them Nonconformists. The mortality exceeds the birth-rate. The educational institutions include a military school, a technical school, a theological seminary, and two schools for sons and daughters of the clergy.

The manufactures include steam flour-mills, iron and machinery works, manufactories of ropes and candles, distilleries and potteries. Shipbuilding, especially for the transport of petroleum on the Caspian Sea, and steamboat building, have recently advanced considerably. Nizhniy is the chief station of the Volga steamboat traffic. The first steamer made its appearance on the Volga in 1821, but it was not till 1845 that steam navigation began to assume large proportions. The merchants carry on a brisk trade, valued (apart from that of the fair) at more than £2,000,000 of purchases and £1,800,000 of sales; the principal items are corn (£200,000 to £500,000), salt, iron, tea, fish, groceries and manufactured goods.

The chief importance of the city is due to its fair, which is held from the 29th of July to the 10th of September. From remote antiquity Russian merchants were wont to meet in summer with those from the East at different places on the Volga, between the mouths of the Oka and the Kama—the fair changing its site with the increasing or decreasing power of the nationalities which struggled for the possession of the middle Volga. Bolgari, Nizhniy-Novgorod, Kazan and Vasilsursk have successively been its seat since the 10th century. From 1641 its seat was at a monastery 55 m. below Nizhniy and close to Makaryev (whence its present name). The situation, however, being in many ways inconvenient, and a conflagration having destroyed the shops at Makaryev, the fair was transferred in 1817 to its present locality at Nizhniy-Novgorod.

The goods mostly dealt in are cotton, woollen, linen and silk stuffs (35 to 38 % of the whole), iron and iron wares, furs and skins, pottery, salt, corn, fish, wine and all kinds of manufactured goods. The Russian goods constitute four-fifths of the whole trade; those brought from Asia—tea (imported via Kiakhta and via Canton and Suez), raw cotton and silk, leather wares, madder and various manufactured wares—do not exceed 10 or 11%. Manufactured wares, groceries and wines are the goods principally imported from western Europe. The total turnover of goods sold and "ordered" amounts to nearly 36½ millions sterling annually. The former category dropped, however, from 26 millions in 1881 to 14 millions in 1905.

In 1880, the Russian manufacturers depending chiefly on the barter-trade in tea at Kiakhta, their production was regulated principally by the prices of tea established at the fair; but now cotton takes the lead, and the prospective output for the year of the mills of central Russia is determined at the fair by the price of raw cotton imported from Asia, by that of madder, and by the results of the year's crop, which became known during the fair. The same holds good with regard to all other stuffs, the prices of wool (provisionally established at the earlier fairs of south-western Russia) being ultimately settled at Nizhniy, as well as those of raw silk. The whole of the iron production of the Urals depends also on the same fair. The "caravans" of boats laden with iron-ware, starting from the Urals works in the spring, reach Nizhniy in August, after a stay at the fair of Laishev, which supplies the lower Volga; and the purchases of iron made at Nizhniy for Asia and middle Russia determine the amount of credit that will be granted for the next year's business to the owners of the ironworks, on which credit most of them entirely depend. The fair thus influences directly all the leading branches of Russian manufacture. It exercises a yet greater influence on the corn and salt trades throughout Russia, and still more on the whole of the trade in Siberia and Turkestan, both depending entirely on the conditions of credit which the Siberian and Turkestan merchants obtain at the fair.

The Makaryevskaya fair attracts no fewer than 400,000 people from all parts of Russia, and partly from Asia.

Two other fairs of some importance are held at Nizhniy—one for wooden wares on the ice of the Oka, and another, in June, for horses.

History.—The confluence of the Oka and the Volga, inhabited in the 10th century by Mordvinian tribes, began to be coveted by the Russians as soon as they had occupied the upper Volga, and as early as the 11th century they established a fort, Gorodets, 20 m. above the mouth of the Oka. In 1221, the people of Suzdal, under Yuri Vsevolodovich, prince of Vladimir, erected a fort on the hill now occupied by the Kremlin of Nizhniy. Until the beginning of the 14th century Nizhniy-Novgorod, which grew rapidly as the Russians colonized the banks of the Oka, remained subject to Suzdal; it enjoyed, however, almost complete independence, being ruled by its popular assembly. In the 14th century, until 1390, it elected its own princes. Ill-protected by its palisaded walls, it was plundered in 1377 and 1378 by the Tatars, supported by the Mordvinians. In 1390 Prince Vasili of Moscow, in alliance with Toktamish, khan of the Golden Horde of the Mongols, took Nizhniy and established his own governors there; in 1417 it was definitely annexed to Moscow, becoming a stronghold for the further advance of that principality towards the east. It was fortified in 1508–1511, and was able to repel the Tatars in 1513, 1520 and 1536. The second half of the 16th century was for the city a period of peaceful and rapid development. It became a depôt for all merchandize brought from the south-east, and even English merchants established warehouses there. With the fall of Kazan, and the opening of free navigation on the Volga, it became the starting-place for the "caravan" of boats yearly sent to the lower Volga under the protection of a military force, whilst the thick forests of the neighbourhood favoured the development of shipbuilding. In 1606–1611 the trading classes of Nizhniy took an active part in the expeditions against the revolted serfs, and it was a Nizhniy dealer in cattle, Kozma Minin Sukhorukov, who took the initiative in sending an army for the delivery of Moscow from the Poles in 1612. In 1667 the robber chieftain, Stenka Razin, made an unsuccessful attempt to capture the city. During the 17th century the country around Nizhniy became the seat of a vigorous religious agitation, and in its forests the Raskolniks established hundreds of their monasteries and communities, those of the Kerzhenets playing an important part in the history of Russian Nonconformity even to the present time.

Nizhniy-Novgorod had at one time two academies, Greek and Slav, and took some part in the literary movement of the end of the 18th century; its theatre also was of some importance in the history of the Russian stage. (P. A. K; J. T. Bz.)

NOAH (נֹחַ, rest; Septuagint, New Testament, Philo, Josephus, Νῶε, Νῶχος, Νώεος: Vulg. *Noë*). According to Gen. v.–x. the tenth patriarch in direct descent from Adam, counting Adam as the first; the son of Lamech; the father of Shem, Ham and Japheth; and the builder of the Ark, in which he and his family, &c. &c., were saved from a universal flood (see Deluge). After the flood subsided God made a covenant with Noah permitting the use of animal food, on condition that the flesh is not eaten with the blood; and forbidding homicide (ix. 1-7, cf. i. 29 f., both P.). Noah was the first to cultivate the vine and to experience the consequences of over-indulgence in its products, an occasion which called forth the filial respect of two of his sons and the irreverence of the third. Through his sons he became the ancestor of the whole human race. The name is mentioned in the genealogy in 1 Chron. i. 4; the "waters of Noah" occur in Isaiah liv. 9; and Noah is mentioned with Daniel and Job as an ancient worthy in Ezek. xiv. 14, 20. The story is referred to in the New Testament in Matt. xxiv. 37 f.; Luke iii. 36, xvii. 26 f.; Heb. xi. 7; 1 Pet. iii. 20; 2 Pet. ii. 5.

The name Noah is explained in Gen. v. 29 as connected with the root *nḥm* "comfort," but this is etymologically impossible. As a Hebrew word it might connect with *nûaḥ*, "rest"; and the Septuagint has, "he will give us rest," instead of "he will comfort us"; and this is sometimes accepted as the original reading.

As the tenth patriarch Noah corresponds to the tenth prehistoric Babylonian king, Xisuthros in Berossus, Ut-napistim or Atrahasis in the cuneiform tablets, the hero of the Babylonian flood story.

Gen. ix. 20-27 is a distinct episode, and has no necessary connexion with the narrative of the Deluge. Probably, as Gunkel, Dillmann and others suggest, it came originally from a cycle of stories different from that which contained the account of the Flood. There are some apparent inconsistencies. Noah is called "the husbandman." The proper rendering of verse 20 is "and Noah, the husbandman, was the first to plant a vineyard," the E.V.: "And Noah began to be an husbandman, and he planted a vineyard," is incorrect. It seems, therefore, that in the original context Noah had been described as "the husbandman," a title in no way suggested by Gen. vi. 9–ix. 19. Moreover, even after making allowance for lack of experience as to the effect of the new product, drunkenness and exposure hardly tally with the statement that "Noah was a just man and perfect in his generations, and Noah walked with God," vi. 9. This indeed comes from the late Priestly Code; but we are also told in the earlier story that "Noah found favour in the eyes of the Lord," vi. 8.

The name also occurs in the Bible (נֹעָה, Nová, *Noa*) for the daughter of Zelophehad, of the tribe of Manasseh. Zelophehad having only daughters, the case is made the occasion of laying down the law that where there are no sons daughters inherit, but must marry within their own tribe (Num. xxvi. 33, xxvii. 1. xxxvi. 11; Josh. xvii. 3, all Priestly Code). (W. H. Bz.)

NOAILLES, the name of a great French family, derived from the castle of Noailles in the territory of Ayen, between Brive and Turenne in the Limousin, and claiming to date back to the 11th century. It did not obtain fame until the 16th century, when its head, Antoine de Noailles (1504–1562), became admiral of France, and was ambassador in England during three important years, 1553–1556, maintaining a gallant but unsuccessful rivalry with the Spanish ambassador, Simon Renard. Henri (1554–1623), son of Antoine, was a commander in the religious wars, and was made comte d'Ayen by Henry IV. in 1593. Anne (d. 1678), the grandson of the first count, played an important part in the Fronde and the early years of the reign of Louis XIV., became captain-general of the newly won province of Roussillon, and in 1663 was made duc d'Ayen, and peer of France. The sons of the first duke raised the family to its greatest fame. The eldest son, Anne Jules (1650–1708), was one of the chief generals

of France towards the end of the reign of Louis XIV., and, after raising the regiment of Noailles in 1689, he commanded in Spain during the war of the Spanish succession, and was made marshal of France in 1693. A younger son, LOUIS ANTOINE (1651–1729), was made archbishop of Paris in 1695, holding this high dignity until his death; he was made a cardinal in 1699. The name of Noailles occurs with almost confusing reiteration throughout the 18th century. ADRIEN MAURICE (1678–1766), the third duke, served in all the most important wars of the reign of Louis XV. in Italy and Germany, and became a marshal in 1734. His last command was in the war of the Austrian succession, when he was beaten by the English at the battle of Dettingen in 1743. He married Françoise d'Aubigné, a niece of Madame de Maintenon and two of his sons also attained the rank of marshal of France. The elder, LOUIS (1713–1793), who bore the title of duc d'Ayen till his father's death in 1766, when he became duc de Noailles, served in most of the wars of the 18th century without particular distinction, but was nevertheless made a marshal in 1775. He refused to emigrate during the Revolution, but escaped the guillotine by dying in August 1793, before the Terror reached its height. On the 4th Thermidor (July 22) the aged duchesse de Noailles was executed with her daughter-in-law, the duchesse d'Ayen, and her granddaughter, the vicomtesse de Noailles. JEAN PAUL FRANÇOIS (1739–1824), the fifth duke, was in the army, but his tastes were scientific, and for his eminence as a chemist he was elected a member of the Academy of Sciences in 1777. He became duc d'Ayen in 1766 on his grandfather's death, and duc de Noailles on his father's in 1793. Having emigrated in 1792, he lived in Switzerland until the Restoration in 1814, when he took his seat as a peer of France. He had no son, and was succeeded as duc de Noailles by his grand-nephew, PAUL (1802–1885), who won some reputation as an author, and who became a member of the French Academy in the place of Chateaubriand in 1849. The grandfather of Paul de Noailles, and brother of the fifth duke, EMMANUEL MARIE LOUIS (1743–1822), marquis de Noailles, was ambassador at Amsterdam from 1770–1776, at London 1776–1783, and at Vienna 1783–1792.

One other branch of the family deserves notice. PHILIPPE (1715–1794), comte de Noailles, afterwards duc de Mouchy, was a younger brother of the fourth duke, and a more distinguished soldier than his brother. He served at Minden and in other campaigns, and was made a marshal on the same day as his brother. He was long in great favour at court, and his wife was first lady of honour to Marie Antoinette, and was nicknamed by her Madame Étiquette. This court favour brought down punishment in the days of the Revolution, and the old marshal and his wife were guillotined on the 27th of June 1794. His two sons, the prince de Poix and the vicomte de Noailles, were members of the Constituent Assembly.

PHILIPPE LOUIS MARC ANTOINE, duke of Noailles and prince of Poix (1752–1819), was born on the 21st of November 1752. In 1789 he was elected deputy of the States-General by the nobility of the *bailliages* of Amiens and Ham, but was compelled to resign in consequence of a duel with the commander of the Garde Nationale at Versailles. He left the country for some time, but returned to France and took part in the revolution of the 10th of August 1792. He was, however, forced to quit the country once more to evade the fate of his father and mother. Returning to France in 1800, he lived quietly at his residence at Mouchy during the empire. At the Restoration he was brought again into favour and became a peer of France. He died at Paris on the 17th of February 1819.

LOUIS MARIE (1756–1804), vicomte de Noailles, was the second son of the marshal. He served brilliantly under La Fayette in America, and was the officer who concluded the capitulation of Yorktown. He was elected to the States-General in 1789. He began the famous "orgie," as Mirabeau called it, on the 4th of August, when all privileges were abolished, and with d'Aiguillon proposed the abolition of titles and liveries in June 1790. When the revolution became more pronounced he emigrated to America, and became a partner in Bingham's bank at Philadelphia. He was very successful, and might have lived happily had he not accepted a command against the English in San Domingo, under Rochambeau. He made a brilliant defence of the mole St Nicholas, and escaped with the garrison to Cuba; but in making for Havana his ship was attacked by an English frigate, and after a long engagement he was severely wounded, and died of his wounds on the 9th of January 1804.

NOAKHALI, a town and district of British India, in the Chittagong division of eastern Bengal and Assam. The town, also known as Sudharam, is on a small river channel 10 m. from the sea. Pop (1901) 6520. The DISTRICT OF NOAKHALI has an area of 1644 sq. m.; pop. (1901) 1,141,728. The district consists of an alluvial tract of mainland, together with several islands at the mouth of the Meghna. In general, each homestead is surrounded by a thick grove of betel- and coco-nut palms, and in the north-western tracts dense forests of betel-nut palms extend for miles. Rice is the great staple of cultivation. The district is very fertile; and, with the exception of some sandbanks and recent accretions, every part of it is under continuous cultivation. The process of alluvion is gradually but steadily going on, the mainland extending seawards. Noakhali is peculiarly liable to destructive floods from the sea, generally caused by southerly gales or cyclones occurring at the time when the Meghna is swollen by heavy rains, and at flood-tides—the tidal bore being sometimes 20 ft. high, and moving at the rate of 15 m. an hour. The cyclone and storm-wave of the 31st of October 1876 was terribly disastrous, sweeping over the whole delta of the Meghna. The loss of human life was estimated at 100,000. The east of the district is served by the Assam-Bengal railway.

The Mahommedan population of the islands at the mouth of the Meghna practised piracy up to a comparatively recent date, and at the beginning of the 17th century Portuguese pirates, under Sebastian Gonzales, occupied Sandwip. They were ultimately reduced to subjection by Shaista Khan, the governor of Bengal, about the middle of the century; and their descendants have sunk to the level of the natives surrounding them, whose dress, customs and language they have, for the most part, adopted. They are Christians, and retain the old Portuguese names. About 1756 the East India Company established factories in Noakhali and Tippera, the ruins of some of which still remain.

NOBEL, ALFRED BERNHARD (1833–1896), Swedish chemist and engineer, was the third son of Emmanuel Nobel (1801–1872), and was born at Stockholm on the 21st of October 1833. At an early age he went with his family to St Petersburg, where his father started torpedo works. In 1859 these were left to the care of the second son, Ludvig Emmanuel (1831–1888), by whom they were greatly enlarged, and Alfred, returning to Sweden with his father, devoted himself to the study of explosives, and especially to the manufacture and utilization of nitroglycerin. He found that when that body was incorporated with an absorbent, inert substance like kieselguhr it became safer and more convenient to manipulate, and this mixture he patented in 1867 as dynamite. He next combined nitroglycerin with another high explosive, gun-cotton, and obtained a transparent, jelly-like substance, which was a still more powerful explosive than dynamite. Blasting gelatin, as it was called, was patented in 1876, and was followed by a host of similar combinations, modified by the addition of potassium nitrate, wood-pulp and various other substances. Some thirteen years later Nobel produced ballistite, one of the earliest of the nitroglycerin smokeless powders, containing in its latest forms about equal parts of gun-cotton and nitroglycerin. This powder was a precursor of cordite, and Nobel's claim that his patent covered the latter was the occasion of vigorously contested law-suits between him and the British Government in 1894 and 1895. Cordite also consists of nitroglycerin and gun-cotton, but the form of the latter which its inventors wished to use was the most highly nitrated variety, which is not soluble in mixtures of ether and alcohol, whereas Nobel contemplated using a less nitrated form, which is soluble in such mixtures. The question was complicated by the fact that it is in practice impossible to prepare either of these two forms without admixture of the other; but eventually the courts decided against Nobel. From the manufacture of dynamite and other explosives, and from the exploitation of the Baku oil-fields, in the development of which he and his brothers, Ludvig and Robert Hjalmar (1829–1896), took a leading part, he amassed an immense fortune; and at his death, which occurred on the 10th of December 1896 at San Remo, he left the bulk of it in trust for the establishment of five prizes, each worth several thousand pounds, to be awarded annually without distinction of nationality.

The first three of these prizes are for eminence in physical science, in chemistry and in medical science or physiology; the fourth is for the most remarkable literary work *dans le sens d'idéalisme*; and the fifth is to be given to the person or society that renders the greatest service to the cause of international brotherhood, in the suppression or reduction of standing armies, or in the establishment or furtherance of peace congresses.

See *Les Prix Nobel en 1901* (Stockholm, 1904).

NOBILI, LEOPOLDO (1784–1835), Italian physicist, born at Reggio nell' Emilia in 1784, was in youth an officer of artillery, but afterwards became professor of physics in the archducal museum at Florence, the old habitat of the Accademia del Cimento. His most valuable contributions to science consist in the suggestion of the astatic combination of two needles for galvanometers, and in the invention of the so-called thermo-multiplier used by him and M. Melloni. In 1826 he described the prismatically-coloured films of metal, known as Nobili's rings, deposited electrolytically from solutions of lead and other salts when the anode is a polished iron plate and the cathode is a fine wire placed vertically above it. His papers were mostly published in the *Bibliothèque universelle* of Geneva. He died at Florence in August 1835.

NOBILIOR, MARCUS FULVIUS, Roman general, a member of one of the most important families of the plebeian Fulvian gens. When praetor (193 B.C.) he served with distinction in Spain, and as consul in 189 he completely broke the power of the Aetolian league. On his return to Rome, Nobilior celebrated a triumph (of which full details are given by Livy) remarkable for the magnificence of the spoils exhibited. On his Aetolian campaign he was accompanied by the poet Ennius, who made the capture of Ambracia, at which he was present, the subject of one of his plays. For this Nobilior was bitterly attacked by Cato the Censor, on the ground that he had compromised his dignity as a Roman general. He restored the temple of Hercules and the Muses in the Circus Flaminius, placed in it a list of Fasti drawn up by himself, and endeavoured to make the Roman calendar more generally known. He was a great enthusiast for Greek art and culture, and introduced many of its masterpieces into Rome, amongst them the picture of the Muses by Zeuxis from Ambracia.

NOBILITY. To form a true understanding of what is strictly implied in the word "nobility," in its social as opposed to a purely moral sense, it is needful to distinguish its meaning from that of several words with which it is likely to be confounded. In England nobility is apt to be confounded with the peculiar institution of the British peerage. Yet nobility, in some shape or another, has existed in most places and times of the world's history, while the British peerage is an institution purely local, and one which has actually hindered the existence of a nobility in the sense which the word bears in most other countries. Nor is nobility the same thing as aristocracy. This last is a word which is often greatly abused; but, whenever it is used with any regard to its true meaning, it is a word strictly political, implying a particular form of government. But nobility is not necessarily a political term; the distinction which it implies may be accompanied by political privileges or it may not. Again, it is sometimes thought that both nobility and aristocracy are in some special way connected with kingly government. To not a few it would seem a contradiction to speak of nobility or aristocracy in a republic. Yet, though many republics have eschewed nobility, there is nothing in a republican, or even in a democratic, form of government inconsistent with the existence of nobility; and it is only in a republic that aristocracy, in the strict sense of the word, can exist. Aristocracy implies the existence of nobility; but nobility does not imply aristocracy; it may exist under any form of government. The peerage, as it exists in the three British kingdoms, is something which is altogether peculiar to the three British kingdoms, and which has nothing in the least degree like it elsewhere.

Nobility, then, in the strict sense of the word, is the hereditary handing on from generation to generation of some acknowledged pre-eminence, a pre-eminence founded on hereditary succession, and on nothing else. Such nobility may be immemorial or it may not. There may or there may not be a power vested somewhere of conferring nobility; but it is essential to the true idea of nobility that, when once acquired, it shall go on for ever to all the descendants—or, more commonly, only to all the descendants in the male line—of the person first ennobled or first recorded as noble. The pre-eminence so handed on may be of any kind, from substantial political power to mere social respect and precedence. It does not seem necessary that it should be formally enacted by law if it is universally acknowledged by usage. It may be marked by titles or it may not. It is hardly needful to prove that nobility does not imply wealth, though nobility without wealth runs some risk of being forgotten. This definition seems to take in all the kinds of nobility which have existed in different times and places. They have differed widely in the origin of the noble class and in the amount of privilege implied in membership of it; but they all agree in the transmission of some privilege or other to all the descendants, or to all the male descendants, of the first noble. *Definition.*

In strictness nobility and gentry are the same thing. This fact is overshadowed in England, partly by the habitual use of the word "gentleman" (*q.v.*) in various secondary uses, partly by the prevalent confusion between nobility and peerage. But that they are the same is proved by the use of the French word *gentilhomme*, a word which has pretty well passed out of modern use, but which, as long as it remained in use, never lost its true meaning. There were very wide distinctions within the French *noblesse*, but they all formed one privileged class as distinguished from the *roturier*. Here, then, is a nobility in the strictest sense. If there is no such class in England, it is simply because the class which answers to it has never been able to keep any universally acknowledged privileges. The word "gentleman" has lost its original meaning in a variety of other uses, while the word "nobleman" has come to be confined to members of the peerage and a few of their immediate descendants. *Nobility and gentry.*

That the English peerage does not answer to the true idea of a nobility will be seen with a very little thought. There is no handing on of privilege or pre-eminence to perpetual generations. The peer holds a great position, endowed with substantial powers and privileges, and those powers and privileges are handed on by hereditary succession. But they are handed on only to one member of the family at a time. The peer's children, in some cases his grandchildren, have titles and precedence, but they have no substantial privileges. His remoter descendants have no advantage of any kind over other people, except their chance of succeeding to the peerage. The remote descendant of a duke, even though he may chance to be heir presumptive to the dukedom, is in no way distinguished from any other gentleman, it is even possible that he may not hold the social rank of gentleman. This is not nobility in the true sense; it is not nobility as nobility was understood either in the French kingdom or in the Venetian commonwealth.

Nobility thus implies the vesting of some hereditary privilege or advantage in certain families, without deciding in what such privilege or advantage consists. Its nature may differ widely according to the causes which have led to the establishment of the distinction between family and family in each particular case.

The way in which nobility has arisen in different times and places is very various, and there are several nations whose history will supply us with examples of a nobility of one kind giving way to a nobility of another kind. The history of the Roman commonwealth illustrates this perhaps better than any other.[1] What we may call the nobility of earlier occupation makes way for the nobility of office. Our first glimpses of authentic Roman history set before us two orders in the same state, one of which is distinguished from the other by many exclusive privileges. The privileged *Roman Populus.*

[1] For the ethnological problems raised by the relations of *populus* and *plebs*, see ROME: *History*, § 1.; also PATRICIANS.

order—the *populus*, *patres*, patricians—has all the characteristics which we commonly expect to find in a privileged order. It is a minority, a minority strictly marked out by birth from other members of the commonwealth, a minority which seems further, though this point is less clearly marked, to have had on the whole the advantage in point of wealth. When we are first entitled to speak with any kind of certainty, the non-privileged class possess a certain share in the election of magistrates and the making of laws. But the privileged class alone are eligible to the greatest offices of the state; they have in their hands the exclusive control of the national religion; they have the exclusive enjoyment of the common land of the state—in Teutonic phrase, the *folkland*. A little research shows that the origin of these privileges was a very simple one. Those who appear in later times as a privileged order among the people had once been the whole people. The patricians, *patres*, housefathers, goodmen—so lowly is the origin of that proud name—were once the whole Roman people, the original inhabitants of the Roman hills. They were the true *populus Romanus*, alongside of whom grew up a secondary Roman people, the *plebs* or commons. As new settlers came, as the people of conquered towns were moved to Rome, as the character of Romans was granted to some allies and forced upon some enemies, this *plebs*, sharing some but not all of the rights of citizens, became a non-privileged order alongside of a privileged order. As the non-privileged order increased in numbers, while the privileged order, as every exclusive hereditary body must do, lessened, the larger body gradually put on the character of the nation at large, while the smaller body put on the character of a nobility. But their position as a nobility or privileged class arose solely because a class with inferior rights to their own grew up around them. They were not a nobility or a privileged class as long as there was no less privileged class to distinguish them from. Their exclusive possession of power made the commonwealth in which they bore rule an aristocracy; but they were a democracy among themselves. We see indeed faint traces of distinction among the patricians themselves, which may lead us to guess that the equality of all patricians may have been won by struggles of unrecorded days, not unlike those which in recorded days brought about the equality of patrician and plebeian. But at this we can only guess. The Roman patricians, the true Roman *populus*, appear at our first sight of them as a body democratic in its own constitution, but standing out as an order marked by very substantial privileges indeed from the other body, the *plebs*, also democratic in its own constitution, but in every point of honour and power the marked inferior of the *populus*.

Patricians.

The old people of Rome thus grew, or rather shrank up, into a nobility by the growth of a new people by their side which they declined to admit to a share in their rights, powers and possessions. A series of struggles raised this new people, the *plebs*, to a level with the old people, the *populus*. The gradual character of the process is not the least instructive part of it. There are two marked stages in the struggle. In the first the plebeians strive to obtain relief from laws and customs which were actually oppressive to them, while they were profitable to the patricians. When this relief has been gained by a series of enactments, a second struggle follows, in which the plebeians win political equality with the patricians. In this second struggle, too, the ground is won bit by bit. No general law was ever passed to abolish the privileges of the patricians; still less was any law ever passed to abolish the distinction between patrician and plebeian. All that was done was done step by step. First, marriage between the two orders was legalized. Then one law admitted plebeians to one office, another law to another. Admission to military command was won first, then admission to civil jurisdiction; a share in religious functions was won last of all. And some offices, chiefly those religious offices which carried no political power with them, always remained the exclusive property of the patricians, because no special law was ever passed to throw them open to plebeians. In this gradual way every practical advantage on the part of the patricians was taken away. But the result did not lead to the abolition of all distinctions between the orders. Patricians and plebeians went on as orders defined by law, till the distinction died out in the confusion of things under the empire, till at last the word "patrician" took quite a new meaning. The distinction, in truth, went on till the advantage turned to the side of the plebeians. Both consuls might be plebeians, both could not be patricians; a patrician could not wield the great powers vested in the tribunes of the commons. These were greater advantages than the exclusive patrician possession of the offices of *interrex*, *rex sacrorum* and the higher flamens. And, as the old distinction survived in law and religion after all substantial privileges were abolished, so presently a new distinction arose of which law and religion knew nothing, but which became in practice nearly as marked and quite as important as the older one.

This was the growth of the new nobility of Rome, that body, partly patrician, partly plebeian, to whom the name *nobilitas* strictly belongs in Roman history. This new nobility gradually became as well marked and as exclusive as the old patriciate. But if differed from the old patriciate in this, that, while the privileges of the old patriciate rested on law, or perhaps rather on immemorial custom, the privileges of the new nobility rested wholly on a sentiment of which men could remember the beginning. Or it would be more accurate to say that the new nobility had really no privileges at all. Its members had no legal advantages over other citizens. They were a social caste, which strove to keep, and which largely succeeded in keeping, all high offices and political power in its own hands. Such privileges, even of an honorary kind, as the nobles did enjoy by law belonged to them, not as nobles, but as senators and senators' sons. Yet practically the new nobility was a privileged class; it felt itself to be so, and it was felt to be so by others. This nobility consisted of all those who, as descendants of curule magistrates, had the *jus imaginum*—that is, who could point to forefathers ennobled by office. That is to say, it consisted of the remains of the old patriciate, together with those plebeian families any members of which had been chosen to curule offices. These were naturally those families which had been patrician in some other Italian city, but which were plebeian at Rome. Many of them equalled the patricians in wealth and antiquity of descent, and as soon as inter-marriage was allowed they became in all things their social equals. The practical result of the Licinian reform was that the great plebeian families became, for all practical purposes, patrician. They separated themselves from the mass of the plebeians to form a single body with the surviving patricians. Just as the old patricians had striven to keep plebeians out of high offices, so now the new nobles, patrician and plebeian alike, strove to keep "new men," men who had not the *jus imaginum*, out of high office. But there was still the difference that in the old state of things the plebeian was shut out by law, while in the new state of things no law shut out the new man. It needed a change in the constitution to give the consulship to Lucius Sextius; it needed only union and energy in the electors to give it to Gaius Marius.

The Roman case is often misunderstood, because the later Roman writers did not fully understand the case themselves. Livy could never get rid of the idea that the old struggle between patrician and plebeian was something like the struggle between the nobility and the people at large in the later days of the commonwealth. In a certain sense he knew better; at any rate, he often repeats the words of those who knew better; but the general impression given by his story is that the plebeians were a low mob and their leaders factious and interested ringleaders of a mob. The case is again often misunderstood because the words "patrician" and "plebeian," like so many other technical Roman and Greek words, have come in modern language to be used in a way quite unlike their original sense. The word "plebeian," in its strict sense, is no more contemptuous than the word *commoner* in England. The *plebs*, like the English commons, contained families differing widely in rank and social position, among them those families which, as soon as an artificial barrier broke down, joined with the patricians to form the new

nobility. The whole lesson is lost if the words "patrician" and "plebeian" are used in any but their strict sense. The Catuli and Metelli, among the proudest nobles of Rome, were plebeians, and as such could not have been chosen to the purely patrician office of *interrex*, or *flamen* of Jupiter. Yet even in good writers on Roman history the words "patrician" and "plebeian" are often misapplied by being transferred to the later disputes at Rome, in which they are quite out of place.

We may now compare the history of nobility at Rome with its history in some other of the most famous city-commonwealths.

Comparison between Roman and Athenian nobilities.

Thus at Athens [1] its history is in its main outlines very much the same as its history at Rome up to a certain point, while there is nothing at Athens which at all answers to the later course of things at Rome. At Athens, as at Rome, an old patriciate, a nobility of older settlement, a nobility which had once been the whole people, was gradually shorn of all exclusive privilege, and driven to share equal rights with a new people which had grown up around it. The reform of Cleisthenes (*q.v.*) answers in a general way to the reform of Licinius, though the different circumstances of the two cities hinder us from carrying out the parallel into detail. But both at Rome and at Athens we see, at a stage earlier than the final reform, an attempt to set up a standard of wealth, either instead of or alongside of the older standard of birth. This same general idea comes out both in the constitution of Servius and in the constitution of Solon, though the application of the principle is different in the two cases. Servius made voting power depend on income; by Solon the same rule was applied to qualification for office. By this change power is not granted to every citizen, but it is put within the reach of every citizen. No man can change his forefathers, but the poor man may haply become richer. The Athenian *εὐπατρίδαι*, who were thus gradually brought down from their privileged position, seem to have been quite as proud and exclusive as the Roman patricians; but when they lost their privileges they lost them far more thoroughly, and they did not, as at Rome, practically hand on many of them to a new nobility, of which they formed part, though not the whole. While at Rome the distinction of patrician and plebeian was never wiped out, while it remained to the last a legal distinction even when practical privilege had turned the other way, at Athens, after the democracy had reached its full growth, the distinction seems to have had no legal existence whatever. At Rome down to the last it made a difference whether the candidate for office was patrician or plebeian, though the difference was in later times commonly to the advantage of the plebeian. At Athens, at any rate after Aristides, the eupatrid was neither better nor worse off than another man.

But, what is of far greater importance, there never arose at Athens any body of men which at all answered to the *nobilitas* of Rome. We see at Athens strong signs of social distinctions, even at a late period of the democracy; we see that, though the people might be led by the low-born demagogue—using that word in its strict and not necessarily dishonourable meaning—their votes most commonly fell on men of ancient descent. We see that men of birth and wealth often allowed themselves a strange licence in dealing with their low-born fellow-citizens. But we see no sign of the growth of a body made up of patricians and leading plebeians who contrived to keep office to themselves by a social tradition only less strong than positive law. We have at Athens the exact parallel to the state of things when Appius Claudius shrank from the thought of the consulship of Gaius Licinius; we have no exact parallel to the state of things when Quintus Metellus shrank from the thought of the consulship of Gaius Marius. The cause of the difference seems to be that, while the origin of the patriciate was exactly the same at Rome and at Athens, the origin of the commons was different. The four Ionic tribes at Athens seem to have answered very closely to the three patrician tribes at Rome; but the Athenian *demos* grew up in a different way from the Roman *plebs*. If we could believe that the Athenian *demos* arose out of the union of the other Attic towns with Athens, this would be an exact analogy to the origin of the Roman *plebs*; the *εὐπατρίδαι* would be the Athenians and the *demos* the Atticans (Ἀττικοί). But from such glimpses of early Attic history as we can get the union of the Attic towns would seem to have been completed before the constitutional struggle began. That union would answer rather to the union of the three patrician tribes of Rome. Such hints as we have, while they set before us, just as at Rome, a state of things in which small landed proprietors are burthened with debt, also set before us the Attic *demos* as, largely at least, a body of various origins which had grown up in the city. Cleisthenes, for instance, enfranchised many slaves and strangers, a course which certainly formed no part of the platform of Licinius, and which reminds us rather of Gnaeus Flavius somewhat later. On the whole it seems most likely that, while the kernel of the Roman *plebs* was rural or belonged to the small towns admitted to the Roman franchise, the Attic *demos*, largely at least, though doubtless not wholly, arose out of the mixed settlers who had come together in the city, answering to the *μέτοικοι* of later times. If so, there would be no place in Athens for those great plebeian houses, once patrician in some other commonwealth, out of which the later Roman *nobilitas* was so largely formed.

Thus the history of nobility at Athens supplies a close analogy to the earlier stages of its history at Rome, but it has nothing answering to its later stages. At Sparta we have a third instance of a people shrinking up into a nobility, but it is a people whose position differs altogether from anything either at Rome or at Athens. Sparta is the best case of a nobility of conquest. This is true, whether we look on the *περίοικοι* as Achaeans or as Dorians, or as belonging some to one race and some to the other (see PERIOECI). In any case the Spartans form a ruling body, and a body whose privileged position in the land is owing to conquest. The Spartans answer to the patricians, the *περίοικοι* to the *plebs*; the helots are below the position of *plebs* or *demos*. The only difference is that, probably owing to the fact that the distinction was due to conquest, the local character of the distinction lived on much longer than it did at Rome. We hardly look on the Spartans as a nobility among the other Lacedaemonians; Sparta rather is a ruling city bearing sway over the other Lacedaemonian towns. But this is exactly what the original Roman patricians, the settlers on the three oldest hills, were in the beginning. The so-called cities (*πόλεις*) of the *περίοικοι* answered pretty well to the local plebeian tribes; the difference is that the *περίοικοι* never became a united corporate body like the Roman *plebs*. Sparta to the last remained what Rome was at the beginning, a city with a *populus* (*δῆμος*) but no *plebs*. And, as at Rome in early times, there were at Sparta distinctions within the *populus*; there were *ὅμοιοι* and *ὑπομείονες*, like the *majores* and *minores gentes* at Rome. Only at Rome, where there was a *plebs* to be striven against, these distinctions seem to have had a tendency to die out, while at Sparta they seem to have had a tendency to widen. The Spartan patriciate could afford to disfranchise some of its own members.

The other old Greek cities, as well as those of medieval Italy and Germany, would supply us with endless examples of the various ways in which privileged orders arose. Venice, a city not exactly belonging to any of these classes, essentially a city of the Eastern empire and not of the Western, gives us an example than which none is more instructive. The renowned patriciate of Venice was as far removed as might be from the character either of a nobility of conquest or of a nobility of older settlement. Nor was it strictly a nobility of office, though it had more in common with that than with either of the other two. As Athens supplies us with a parallel to the older nobility of Rome without any parallel to the later, so Venice supplies us with a parallel to the later nobility of Rome without any parallel to the earlier. Athens has Fabii and Claudii, but no Catuli or Metelli; Venice has Catuli and Metelli, but no Fabii or Claudii.

In one point, however, the Venetian nobility differed from either the older or the newer nobility of Rome, and also from the older nobilities of the medieval Italian cities. Nowhere else did nobility so distinctly rise out of wealth, and that wealth gained

[1] See further ATHENS: *History*, and EUPATRIDAE.

by commerce. In the original island territory of Venice there could be no such thing as landed property. The agricultural plebeian of old Rome and the feudal noble of contemporary Europe were both of them at Venice impossible characters. The Venetian nobility is an example of a nobility which gradually arose out of the mass of the people as certain families step by step drew all political power into their own hands. The *plebs* did not gather round the *patres*, neither were they conquered by the *patres;* the *patres* were developed by natural selection out of the *plebs*, or, more strictly, out of the ancient *populus*. The *commune* of Venice, the ancient style of the commonwealth, changed into the *seigniory* of Venice. Political power was gradually confined to those whose forefathers had held political power. This was what the later nobility of Rome was always striving at, and what they did to a great extent practically establish. But, as the exclusive privileges of the nobility were never recognized by any legal or formal act, men like Gaius Marius would ever and anon thrust themselves in. The privileges which the Venetian nobility took to themselves were established by acts which, if not legal, were at least formal. The Roman nobility, resting wholly on sufferance, was overthrown by the ambition of one of its own members. The Venetian nobility, resting also in its beginnings on sufferance, but on sufferance which silently obtained the force of law, lasted as long as Venice remained a separate state.

The hereditary oligarchy of Venice was established by a series of changes which took place between the years 1297 and 1319. All of them together really go to make up the "Shutting of the Great Council," a name which is formally given to the act of the first of those years. In 1172 the Great Council began as an elective body; it gradually ousted the popular assembly from all practical power. It was, as might be looked for, commonly filled by members of distinguished families, descendants of ancient magistrates, who were already beginning to be looked on as noble. The series of revolutions already spoken of first made descent from former councillors a necessary qualification for election to the council; then election was abolished, and the council consisted of all descendants of its existing members who had reached the age of twenty-five. Thus the *optimates* of Venice did what the *optimates* of Rome strove to do: they established a nobility whose one qualification was descent from those who had held office in past times. This is what the nobility of office, if left unchecked, naturally grows into. But the particular way in which oligarchy was finally established at Venice had some singular results. Some of the great families which were already looked on as noble were not represented in the council at the time of the shutting; of others some branches were represented and others not. These families and branches of families, however noble they might be in descent, were thus shut out from all the political privileges of nobility. When one branch of a family was admitted and one shut out we have an analogy to the patrician and plebeian Claudii, though the distinction had come about in quite another way. And in the Great Council itself we have the lively image of the aristocratic popular assembly of Rome, the assembly of the *populus*, that of the *curiae*, where every man of patrician birth had his place. The two institutions are the same, only the way in which they came about is exactly opposite. The assembly of *curiae* at Rome, originally the democratic assembly of the original people, first grew into an aristocratic assembly, and then died out altogether as a new Roman people, with its own assembly, grew up by its side. It was a primitive institution which gradually changed its character by force of circumstances. It died out, supplanted by other and newer powers, when it became altogether unsuited to the times. The Great Council of Venice was anything but a primitive institution; it was the artificial institution of a late age, which grew at the expense of earlier institutions, of the prince on the one side and of the people on the other. But the two different roads led to the same result. The Great Council of Venice, the *curiae* of Rome, were each of them the assembly of a privileged class, an assembly in which every member of that class had a right to a place, an assembly which might be called popular as far as the privileged class was concerned, though rigidly oligarchic as regarded the excluded classes. But, close as the likeness is, it is merely a superficial likeness, because it is the result of opposite causes working in opposite directions. It is like two men who are both for a moment in the same place, though their faces are turned in opposite ways. If the later *nobilitas* of Rome had established an assembly in which every one who had the *jus imaginum* had a vote and none other, that would have been a real parallel to the shutting of the Venetian Great Council; for it would have come about through the working of causes which are essentially the same.

The Roman Curiae and the Great Council of Venice.

The nobility which was thus formed at Venice is the very model of a civic nobility, a nobility which is also an aristocracy. In a monarchy, despotic or constitutional, there cannot in strictness be an aristocracy, because the whole political power cannot be vested in the noble class. But in the Venetian commonwealth the nobility was a real aristocracy. All political power was vested in the noble class; the prince sank to a magistrate, keeping only some of the outward forms of sovereignty; the mass of the people were shut out altogether. And, if no government on earth ever fully carried out the literal meaning of aristocracy as the rule of the best, these civic nobilities come nearer to it than any other form of government. They do really seem to engender a kind of hereditary capacity in their members. Less favourable than either monarchy or democracy to the growth of occasional great men, they are more favourable than either to the constant supply of a succession of able men, qualified to carry on the work of government. Their weak point lies in their necessary conservatism; they cannot advance and adapt themselves to changed circumstances, as either monarchy or democracy can. When, therefore, their goodness is gone, their corruption becomes worse than the corruption of either of the other forms of government.

The nobility of Venice and aristocracy.

All this is signally shown in the history both of Venice and of other aristocratic cities. But we are concerned with them now only as instances of one form of nobility. The civic aristocracies did not all arise in the same way. Venice is the best type of one way in which they rose; but it is by no means the only way. In not a few of the Italian cities nobility had an origin and ran a course quite unlike the origin and the course which were its lot at Venice. The nobles of many cities were simply the nobles of the surrounding country changed, sometimes greatly against their will, into citizens. Such a nobility differed far more widely from either the Roman or the Venetian patriciate than they differed from one another. It wanted the element of legality, or at least of formality, which distinguished both these bodies. The privileges of the Roman patriciate, whatever we may call them, were not usurpations; and, if we call the privileges of the Venetian nobility usurpations, they were stealthy and peaceful usurpations, founded on something other than mere violence. But in many Italian cities the position of the nobles, if it did not begin in violence, was maintained by violence, and was often overthrown by violence. They remained, in short, as unruly and isolated within the walls of the cities as they had ever been without. A nobility of this kind often gave way to a democracy which either proved as turbulent as itself, or else grew into an oligarchy ruling under democratic forms. Thus at Florence the old nobles became the opposite to a privileged class. The process which at Rome gradually gave the plebeian a political advantage over the patrician was carried at Florence to a far greater length at a single blow. The whole noble order was disfranchised; to be noble was equivalent to being shut out from public office. But something like a new nobility presently grew up among the commons themselves; there were *popolani grossi* at Florence just as there were noble plebeians at Rome. Only the Roman commons, great and small, never shut out the patricians from office; they were satisfied to share office with them. In short, the shutting out of the old nobility was, if not the formation of a new nobility, at least the formation of a

Civic aristocracies.

new privileged class. For a certain class of citizens to be condemned, by virtue of their birth, to political disfranchisement is as flatly against every principle of democracy as for a certain class of citizens to enjoy exclusive rights by reason of birth. The Florentine democracy was, in truth, rather to be called an oligarchy, if we accept the best definition of democracy (see Thucydides vi. 39), namely, that it is the rule of the whole, while oligarchy is the rule of a part only.

It is in these aristocractic cities, of which Venice was the most fully developed model, that we can best see what nobility really is. It is in these only that we can see nobility in its purest form—nobility to which no man can rise and from which no man can come down except by the will of the noble class itself. In a monarchy, where the king can ennoble, this ideal cannot be kept. Nor could it be kept in the later nobility of Rome. The new man had much to strive against, but he could sometimes thrust himself through, and when he did his descendants had their *jus imaginum*. But at Venice neither prince nor people could open the door of the Great Council; only the Great Council itself could do that. That in the better times of the aristocracy nobility was not uncommonly granted to worthy persons, that in its worse times it was more commonly sold to unworthy persons, was the affair of the aristocratic body itself. That body, at all events, could not be degraded save by its own act. But these grants and sales led to distinctions within the ranks of the noble order, like those of which we get faint glimpses among the Roman patricians. The ducal dignity rarely passed out of a circle of specially old and distinguished families. But this has often been the case with the high magistracies of commonwealths whose constitutions were purely democratic.

From this purest type of nobility, as seen in the aristocratic commonwealths, we may pass to nobility as seen in states of greater extent—that is, for the most part in monarchies. There are two marked differences between the two. They are differences which seem to be inherent in the difference between a republic and a monarchy, but which it would be truer to say are inherent in the difference between a body of men packed close together within the walls of a city and a body of men—if we can call them a body—scattered over a wide territory. The member of a civic nobility is more than a member of an order; he is a member of a corporation; he has no powers, he has hardly any being, apart from the body of which he is a member. He has a vote in making the laws or in choosing those who make them; but when they are made he is, if anything, more strictly bound by them than the citizen of the non-privileged order. To be a fraction of the corporate sovereign, if it had its gains, had also its disadvantages; the Venetian noble was fettered by burthens, restrictions and suspicions from which the Venetian citizen was free. The noble of the large country, on the other hand, the rural noble, as he commonly will be, is a member of an order, but he is hardly a member of a corporation; he is isolated; he acts apart from the rest of the body and wins powers for himself apart from the rest of the body. He shows a tendency—a tendency whose growth will be more or less checked according to the strength of the central power—to grow into something of a lord or even a prince on his own account, a growth which may advance to the scale of a German elector or stop at that of an English lord of a manor. Now many of these tendencies were carried into those Italian cities where the civic nobility was a half-tamed country nobility; but they have no place in the true civic aristocracies. Let us take one typical example. In many parts of western Europe the right of private war long remained the privilege of every noble, as it had once been the privilege of every freeman. And in some Italian cities, the right, or at least the privilege, of private war was continued within the city walls. But no power of imagination can conceive an acknowledged right of private war in Rome, Venice or Bern.

Rural nobility.

The other point of difference is that, whatever we take for the origin and the definition of nobility, in most countries it became something that could be given from outside, without the need of any consent on the part of the noble class itself. In other words, the king or other prince can ennoble. We have seen how much this takes away from the true notion of nobility as understood in the aristocratic commonwealths. The nobility is no longer all-powerful; it may be constrained to admit within its own body members for whose presence it has no wish. Where this power exists the nobility is no longer in any strictness an aristocracy; it may have great privileges, great influence, even great legal powers, but it is not the real ruling body, like the true aristocracy of Venice.

In the modern states of western Europe the existing nobility seems to have for the most part had its origin in personal service to the prince. And this nobility by personal service seems commonly to have supplanted an older nobility, the origin of which was, in some cases at least, strictly immemorial. In this way the later nobility of the thegns was in England substituted for the older nobility of the *eorls*. Now the analogy between this change and the change from the Roman patriciate to the later Roman *nobilitas* is obvious. In both cases the older nobility gives way to a newer; and in both cases the newer nobility was a nobility of office. Under a kingly government office bestowed by the sovereign holds the same place which office bestowed by the people holds in a popular government. This new nobility of office supplanted, or perhaps rather absorbed, the older nobility, just as the later *nobilitas* of Rome supplanted or absorbed the old patriciate. In our first glimpse of Teutonic institutions, as given us by Tacitus, this older nobility appears as strictly immemorial (see Waitz, *Deutsche Verfassungsgeschichte*, i. 185 sq.), and its immemorial character appears also in the well-known legend in the *Rigsmal-saga* of the separate creation of jarl, karl and thrall. These represent the three classes of mankind according to old Teutonic ideas—the noble, the simple freeman and the bondman. The kingly house, where there is one, is not a distinct class; it is simply the noblest of the noble. For, as almost everywhere else, this Teutonic nobility admits of degrees, though it is yet harder to say in what the degrees of nobility consisted than to say in what nobility consisted itself. The older nobility is independent of the possession of land; it is independent of office about the sovereign; it is hard to say what were the powers and privileges attached to it; but of its existence there is no doubt. But in no part of Europe can the existing nobility trace itself to this immemorial nobility of primitive days; the nobility of medieval and modern days springs from the later nobility of office. The nobles of modern Europe are rather *thegnas* than *eorlas*. The eorl of the old system would doubtless commonly become a thegn under the new, as the Roman patrician took his place in the new *nobilitas*; but others could take their place there also. The Old-English laws point out ways by which the churl might rise to thegn's rank, and in the centuries during which the change went on we find mention—complaining mention—both in England and elsewhere, at the court of Charles the Simple and at the court of Æthelred, of the rise of new men to posts of authority. The story that Earl Godwine himself was of churlish birth, whether true or false, marks the possibility of such a rise. A still wilder tale spoke of Hugh Capet as the son of a butcher of Paris. Stories like these prove even more than the real rise of Hagano and Eadric.

Nobilities in early Western Europe.

In England the nobility of the thegns was to a great extent personally displaced, so to speak, by the results of the Norman Conquest. But the idea of nobility did not greatly change. The English thegn sometimes yielded to, sometimes changed into, the Norman baron, using that word in its widest sense, without any violent alteration in his position. The notion of holding land of the king became more prominent than the notion of personal service done to the king; but, as the land was held by the tenure of personal service, the actual relation hardly changed. But the connexion between nobility and the holding of land comes out in the practice by which the lord so constantly took the name of his lordship. It is in this way that the prefixes *de* and *von*, descriptions in themselves essentially local, have become in other lands badges of nobility. This notion has died out in England by the dropping of the

England.

preposition; but it long lived on wherever Latin or French was used. And before long nobility won for itself a distinguishing outward badge. The device of hereditary coat-armour, a growth of the 12th century, did much to define and mark out the noble class throughout Europe. As it could be acquired by grant of the sovereign, and as, when once acquired, it went on from generation to generation, it answers exactly to the *jus imaginum* at Rome, the hereditary badge of nobility conferred by the election of the people. Those who possessed the right of coat-armour by immemorial use, or by grant in regular form, formed the class of nobility or gentry, words which, it must again be remembered, are strictly of the same meaning. They held whatever privileges or advantages have attached in different times and places to the rank of nobility or gentry. In England indeed a variety of causes hindered nobility or gentry from ever obtaining the importance which they obtained, for instance, in France. But perhaps no cause was more important than the growth of the peerage. That institution at once set up a new standard of nobility, a new form of the nobility of office. The peer—in strictness, the peer in his own person only, not even his children—became the only noble; the ideas of nobility and gentry thus became divorced in a way in which they are not in any other country. Those who would elsewhere have been counted as the nobility, the bearers of coat-armour by good right, were hindered from forming a class holding any substantial privilege. In a word, the growth of the peerage hindered the existence in England of any nobility in the continental sense of the word. The esquires, knights, lesser barons, even the remote descendants of peers, that is, the *noblesse* of other countries, in England remained gentlemen, but not noblemen—simple commoners, that is, without legal advantage over their fellow-commoners who had no *jus imaginum* to boast of. There can be no doubt that the class in England which answers to the *noblesse* of other lands is the class that bears coat-armour, the gentry strictly so called.[1] Had they been able to establish and to maintain any kind of privilege, even that of mere honorary precedence, they would exactly answer to continental nobility. That coat-armour has been lavishly granted and often assumed without right, that the word "gentleman" has acquired various secondary senses, proves nothing; that is the natural result of a state of things in which the *status* of gentry carries with it no legal advantage, and yet is eagerly sought after on social grounds. If coat-armour, and thereby the rank of gentry, has been lavishly granted, some may think that the rank of peerage has often been lavishly granted also. In short, there is no real nobility in England; for the class which answers to foreign nobility has so long ceased to have any practical privileges that it has long ceased to be looked on as a nobility, and the word nobility has been transferred to another class which has nothing answering to it out of the three British kingdoms.[2] This last class in strictness takes in only the peers personally; at the outside it cannot be stretched beyond those of their children and grandchildren who bear the courtesy titles of lord and lady.

No attempt has been here made to trace out the history of nobility in the various countries and, we must add, cities of Europe. All that has been attempted has been to point out some general truths, and to refer to some specially striking instances. Once more, it must be borne in mind that, while it is essential to the idea of nobility that it should carry with it some hereditary privilege, the nature and extent of that privilege may vary endlessly. In the 18th century the nobility of France and the nobility of Poland alike answered to the very strictest definition of nobility; but the political positions of the two were as broadly contrasted as the positions of any two classes of men could be. The nobility of France, keeping the most oppressive social and personal privileges, had been shorn of all political and even administrative power; the tyrants of the people were the slaves of the king. In Poland sixty thousand gentlemen, rich and poor, famous and obscure, but all alike gentlemen, rode out to choose a king by a unanimous vote, and to bind him when chosen by such conditions as they thought good. Those sixty thousand, like the *populus* of Rome, formed a narrow oligarchy as regarded the rest of the nation, but a wild democracy among themselves. Poland, in short, came nearer than any kingdom or country of large extent to the nature of an aristocracy, as we have seen aristocracy in the aristocratic cities. The chief power of the state was placed neither in the prince nor in the nation at large; it was held by a noble class. The kingly power in Poland, like the ducal power at Venice, had been so narrowed that Poland, though she still kept a king, called herself a republic no less than Venice. And whatever was taken from the king went to the gain of the noble order. But the nobility of a large country, even though used to act politically as an order, could never put on that orderly and legal character which distinguishes the true civic patriciates. It never could come so nearly as a civic patriciate could to being something like the rule of the best in any sense of those words.

France.

Poland.

The tendency of modern times has been towards the breaking down of formal hereditary privileges. In modern commonwealths, above all, they have been thought to be essentially inconsistent with republican institutions. The truth of the matter is rather that the circumstances of most modern commonwealths have been unfavourable to the preservation, and still more to the growth, of privileged bodies. Where they existed, as in Switzerland, they have been overthrown. Where they did not exist, as in America, everything has made it more and more impossible that they should arise. And, as modern changes have commonly attacked the power both of kings and of nobles, the common notion has come that kingship and nobility have some necessary connexion. It has seemed as if any form of nobility was inconsistent with a republican form of government, while nobility, in some shape or other, has come to be looked on as a natural, if not a necessary, appendage to a monarchy. And as far as regards the social side of kingship this is true. A court seems more natural where a chain of degrees leads gradually up from the lowest subject to the throne than when all beneath the throne are nearly on a level. And from one point of view, that from which the kingly house is but the noblest of the noble, kingship and nobility are closely allied. But in the more strictly

[1] This statement is mainly interesting as expressing the late Professor Freeman's view; it is, however, open to serious criticism. Coat-armour was in itself not necessarily a badge of nobility at all; it could be, and was, worn by people having no pretensions to be "gentlemen," and this is true both of England and the continent. In its origin it was a mere personal mark of distinction, in the primary sense of this word. No "grant" was necessary; it was assumed by all and sundry who had occasion to use it, though a reasonable convention forbade one man to assume the device of another. Later arose the custom of granting arms as a mark of personal favour or gratitude. This again was not at the outset an exclusive right of the crown; it was common for a leader in battle to grant to some one not of his family, who had specially distinguished himself, the right to bear the whole or part of his coat of arms, differenced or undifferenced. On the other hand, many undoubted "gentlemen" never assumed arms at all. The claim of the heralds to make "gentry" depend on the bearing of coat-armour, and the right to this depend on grant or recognition by themselves as officers of the crown, is of comparatively late growth. See further the article GENTLEMAN.—W. A. P.

[2] Compare *e.g.* the social conditions of Great Britain and Germany. In Germany there are two classes of nobility: (1) the *hoher Adel*, members of the mediatized, formerly sovereign families, who rank as the equals in blood (*ebenbürtig*) of the royal houses of Europe; (2) the *niederer Adel*, to which every one having the nobiliary prefix *von* belongs. In England "presentation at court" is the privilege of no particular class as such; and the wives of ministers of the crown, even if of quite humble origin, are "commanded" to court functions with their husbands. The strictness of the principle of admission or exclusion differs at the various German courts, and has tended to be modified by the growth of a new aristocracy of wealth; but a single instance known to the present writer may serve to illustrate the fundamental divergence of German (a fortiori Austrian) ideas from English in this matter. A wealthy publisher of European reputation attended the court of his native town, the capital of a small grand-duchy, in virtue of the honorary title *Hofrat*; his wife, not being noble, did not accompany him. His elder daughter married a cabinet minister, but, as he was not a noble, this did not confer on her the right to go to court. His younger daughter married a subaltern in a line regiment, belonging to the lesser nobility; as ennobled by marriage (according to the liberal rule of this particular court), she was duly "presented."—W. A. P.

political view monarchy and nobility are strongly opposed. Even the modified form of absolute monarchy which has existed in some Western countries, while it preserves, perhaps even strengthens, the social position of a nobility, destroys its political power. Under the fully-developed despotisms of the East a real nobility is impossible; the prince raises and thrusts down as he pleases. It is only in a commonwealth that a nobility can really rule; that is, it is only in a commonwealth that the nobility can really be an aristocracy. And even in a democratic commonwealth the sentiment of nobility may exist, though all legal privilege has been abolished or has never existed. That is to say, traditional feeling may give the members of certain families a strong preference, to say the least, in election to office. We have seen that this was the case at Athens; it was largely the case in the democratic cantons of Switzerland; indeed the nobility of Rome itself, after the privileges of the patricians were abolished, rested on no other foundation. (E. A. F.)

AUTHORITIES.—Selden's *Titles of Honor* (London, 1672) remains the best comparative account in the English language of the nobility of various countries up to his date. For England see E. P. Shirley, *Noble and Gentle Men* (1860); Gneist, *Adel und Ritterschaft in England* (Berlin, 1853); Sir George Sitwell, "The English Gentleman," in the *Ancestor* (No. 1, April 1902); and J. H. Round's works, *passim*. A. C. Fox-Davies's *Armorial Families* (Edinburgh, 1895, and subsequent editions) represents an unhistorical attempt to create the idea of a *noblesse* in the United Kingdom. For the origin and growth of the nobility in France, see A. Luchaire, *Manuel des institutions françaises* (Paris, 1892), and P. Guilhiermoz, *Essai sur l'origine de la noblesse en France au moyen âge* (1902); for their later status and privileges, A. de Tocqueville, *L'Ancien Régime et la Révolution* (1856 ff.), and H. A. Taine, *Les Origines de la France contemporaine*, pt. i., *L'Ancien Régime* (1875 ff.). For the German and Austrian nobility, see v. Strantz, *Gesch. des deutschen Adels* (2nd ed., Waldenburg, 1851); von Maurer, *Über das Wesen des ältesten Adels der deutschen Stämme* (Munich, 1846); Rose, *Der Adel Deutschlands und seine Stellung im deutschen Reich* (Berlin, 1883); G. Meyer, *Lehrbuch des deutschen Staatsrechts* (5th ed., Leipzig, 1899), and the Gotha *Genealogische Taschenbücher*. For the Italian nobility see the eight magnificent folio volumes of Count Pompeo Litta, *Celebri famiglie italiane*, continued by various editors (Milan, 1819–1907); for Spanish, Fernandez de Béthencourt, *Hist. genealógica*, t. i.-vii. (1897–1907). The authoritative manual for the royal houses and the "higher nobility" of Europe is the *Almanach de Gotha*, published yearly. See also the articles TITLES OF HONOUR, PEERAGE, FEUDALISM, GENTLEMAN, DUKE, COUNT, &c.

NOBLE, SIR ANDREW (1832–), British physicist and artillerist, was born at Greenock on the 15th of September 1832, and was educated at Edinburgh Academy and at the Royal Military Academy, Woolwich. In 1849 he entered the Royal Artillery, attaining the rank of captain in 1855, and in 1857 he became secretary to the Royal Artillery Institution. About this time the question of the supersession of the old smooth-bores by rifled guns was coming to the fore, and on the appointment of the Select Committee on Rifled Cannon in 1858 to report on the matter, he was chosen its secretary, a capacity in which he devised an ingenious method for comparing the probable accuracy of the shooting attainable with each type of gun. In 1859 he was appointed Assistant-Inspector of Artillery, and in the following year he became a member of the Ordnance Select Committee and of the Committee on Explosives, serving on the latter for twenty years, until its dissolution. About the same time he was prevailed upon by Sir William, afterwards Lord, Armstrong to leave the public service and take up a post at Elswick. Here, in the first instance, he was put in charge of the ordnance department, but it was not long before his organizing and administrative ability and scientific attainments enlarged the sphere of his influence, until finally he became chairman of the company. Immediately on his appointment he began a systematic investigation of the phenomena which occur when a gun is fired, some of his first experiments being designed to discover with accuracy the pressures attained in the largest guns of that time. About 1862 he invented his chronoscope for the measurement of exceedingly small intervals of time, and began to apply it in ballistic experiments for ascertaining the velocity with which the shot moves along the barrel of a gun with different powders and different charges. Then he joined Sir Frederick Abel in a classical research on "Fired Gunpowder," the experimental work being largely carried on at Elswick, and the conclusions they arrived at had a great effect on the progress of gunnery, for they showed how increased muzzle velocities were to be attained without increased pressures in the gun. These inquiries, in fact, enabled Elswick in 1877 to turn out the 6-in. and 8-in. guns, with velocities of over 2000 ft. per second, that obliged the British government finally to give up the antiquated muzzle-loaders to which it had so obstinately adhered. Later, when the era of nitro or "smokeless" powders had begun, Captain Noble was an early advocate of their advantages, and when at length the British government awoke to the necessity of selecting a powder of that character for the naval and military services of Great Britain, Elswick extended its hospitality to the committee that invented cordite, and gave the members facilities, which were not offered by the government, for the necessary experimental work. Even after the powder was invented and the committee dissolved, inquiries—which it was nobody's official business to make, and which therefore were not made officially—were continued at Elswick to ascertain how by suitable modifications in form, composition, &c., cordite might the better perform the varied duties required of it. Noble became a member of the committee appointed in 1900 by Lord Lansdowne to consider, among other things, the excessive erosion alleged by some of the powder's critics to be produced by it in the barrels of the guns in which it is used. He was made C.B. in 1881, promoted to be K.C.B. in 1893, and was created a baronet among the Coronation honours in 1902; he was also the recipient of many foreign decorations and scientific honours, including a Royal medal from the Royal Society in 1880, and the Albert medal of the Society of Arts in 1909. He published a number of his scientific papers in a collected form as *Artillery and Explosives* in 1906.

NOBLESVILLE, a city and the county-seat of Hamilton county, Indiana, U.S.A., on the White river, about 20 m. N. by E. of Indianapolis. Pop. (1890) 3054; (1900) 4792 (226 negroes); (1910) 5073. It is served by the Lake Erie & Western, the Central Indiana and the Indiana Union (electric) Traction railways. It is in the natural gas region of the state, and has various manufactures. It was settled about 1825 and incorporated as a town in 1851.

NOCERA INFERIORE, formerly NOCERA DEI PAGANI (anc. *Nuceria Alfaterna*, *q.v.*), a town and episcopal see of Campania, Italy, in the province of Salerno, at the foot of Monte Albino, 23 m. E.S.E. of Naples by rail, 135 ft. above sea-level. Pop. (1901) 11,933 (town); 20,064 (commune). Nocera is connected with Codola on the line from Naples to Avellino by a branch railway (3 m.). In the old castle Helena, the widow of Manfred, died after the battle of Benevento, and here Urban VI. imprisoned the cardinals who favoured the antipope Clement VII. Two miles to the E. near the village of Nocera Superiore is the circular church of Sta Maria Maggiore, dating from the 4th century. Its chief feature is its dome, ceiled with stone internally, but covered externally with a false roof. It is supported by 40 ancient columns, and in its construction resembles S Stefano Rotondo in Rome. The walls are covered with frescoes of the 14th century.

At an early date the city became an episcopal see, and in the 13th century it sided with Innocent II. against Roger of Sicily and suffered severely for its choice. A colony of Saracens introduced by Frederick II. probably gave rise to the epithet ("of the pagans") by which it was so long distinguished, as well as to the town of Pagani, which lies about 1 m. to the west. In 1385 Pope Urban VI. was besieged in the castle of Charles of Durazzo. Nocera was the birthplace of Solimena the painter and of Hugo de' Pagani, the founder of the Templars, and in the list of its bishops appears the name of Paulus Jovius.

NOCERA UMBRA (anc. *Nuceria Camellaria*), a town and episcopal see in the province of Perugia, Italy, 12 m. by rail N. by E. of Foligno, 1706 ft. above sea-level. Pop. (1901) 5655 (town), 7848 (commune). It has some old churches, containing pictures and frescoes; in the cathedral is a large altarpiece by Nicolo Alunno. Three miles to the south-east of the town are mineral springs.

NOCTURN, or NOCTURNE (Lat. *nocturnus*, of or belonging to the night, *nox*), in the Roman Church, one of the three divisions of the office of matins, corresponding with the vigils, beginning at 9 P.M. midnight and 3 A.M. respectively. The service consists of psalms, lessons and antiphons (see BREVIARY). The term "nocturne" is applied to a musical composition, answering to the earlier "serenade," of a quiet, dreamy and romantic character. The name and style are said to have originated with John Field (1782–1837). The best-known compositions of this kind are the pianoforte pieces of Chopin. J. McNeill Whistler also introduced the term into painting by using the name for some of his night-pieces. A "nocturnal" is an instrument for finding the hour of the night by observation of the relative positions of the pole-star and other stars, generally the pointers of Ursa Major. The British Museum contains a fine nocturnal made about 1560 by Humfray Cole (see NAVIGATION).

NODDY, the name applied, originally by sailors, to a sea-bird, from its showing so little fear of man as to be accounted stupid. It is the *Sterna stolida* of Linnaeus, and the *Anous stolidus* of modern ornithology, having the figure of a TERN (*q.v.*), and belonging to the sub-family *Sterninae*, but is heavier in flight, with shorter wings and the tail less deeply forked. The plumage is of a uniform sooty hue, excepting the crown of the head, which is light grey. The Noddy is very generally distributed throughout the tropical or nearly tropical oceans, but occasionally wanders into colder climates, and has been met with even in the Irish Sea. It breeds, often in astounding numbers, on low cays and coral-islets, commonly making a shallow nest of sea-weed or small twigs. Howard Saunders (*Proc. Zool. Society*, 1876, pp. 669-672) admits four other species of the genus: *Anous tenuirostris*, supposed to be confined to the southern part of the Indian Ocean, from Madagascar to West Australia; *A. melanogenys*, often confounded with the last, but having nearly as wide a range as the first; and *A. leucocapillus*, hitherto known only from Torres Strait and the Southern Pacific. These three have much resemblance to *A. stolidus*, but are smaller in size, and the two latter have the crown white instead of grey. The fourth species, *A. caeruleus* (with which he includes the *A. cinereus* of some authors), differs not inconsiderably, being of a dove-colour, lighter on the head and darker on the back, the wings bearing a narrow white bar, with their quill-feathers blackish-brown, while the feet are reddish and the webs yellow. Three more species—*A. superciliosus* from the Caribbean Sea and Gulf of Mexico, *A. plumbeigularis* from the Red Sea, and *A. galapagensis* from the Galapagos—have been added by R. Bowdler Sharpe (*Philos. Transactions*, clxviii. pp. 468, 469), according to whom (*Proc. Zool. Society*, 1878, p. 272) *A. cinereus* of the Eastern Pacific is distinct from *A. caeruleus* of Australia and the Western Pacific. (A. N.)

NODE (Lat. *nodus*, a loop), in astronomy, one of two opposite points at which a heavenly body passes through the principal co-ordinate plane to which its motion is referred. In the case of the heavenly bodies this plane is commonly that of the ecliptic, but, in special cases, the plane through the origin parallel to the earth's equator or the plane of a planet's orbit is used. The ascending node is that at which the body moves from the south or negative towards the north or positive side of the plane. The moon's nodes are the points in which its path intercepts the plane of the ecliptic. In the geometry of curves, a node is the name given to the loop formed by a continuous curve crossing itself, the point of crossing is termed a "double point," and at it there are two non-coincident tangents to the curve; the remaining species of double points, termed "acnode," "spinode" or "cusp," admits of two coincident tangents (see CURVE).

NODIER, CHARLES (1780–1844), French author, was born on the 29th of April 1780 at Besançon. His father, on the outbreak of the Revolution, was appointed mayor of Besançon and consequently chief police magistrate; he seems to have rather lent himself as an instrument to the tyranny of the Jacobins than to have shared their principles; but his son was for a time an ardent citizen, and is said to have been a club member when he could at the most have been twelve years old. In 1793 Charles saved the life of a lady guilty of sending money to an *émigré*, by declaring to his father that if she were condemned he would take his own life. He was sent to Strassburg, where he lived in the house of Eulogius Schneider, the notorious Jacobin governor of Alsace, but a good Greek scholar. During the Terror his father put him under the care of Girod de Chautrans, with whom he studied English and German. His love of books began very early, and he combined with it a strong interest in natural science. He became librarian in his native town, but his exertions in the cause of suspected persons brought him under suspicion. An inspection of his papers by the police, however, revealed nothing more dangerous than a dissertation on the antennae of insects. Entomology continued to be a favourite study with him, but he varied it with philology and pure literature and even political writing. For a skit on Napoleon, in 1803, he was imprisoned for some months. He then quitted Paris, whither he had gone after losing his position at Besançon, and for some years lived a very unsettled life at Besançon, Dôle, where he married, and in other places in the Jura. During these wanderings he wrote *Le Peintre de Salzbourg, journal des émotions d'un cœur souffrant, suivi des Méditations du clottre* (1803). The hero, Charles, who is a variation of the Werther type, desires the restoration of the monasteries, to afford a refuge from the woes of the world. In 1811 Nodier appears at Laibach as editor of a polyglot journal, the *Illyrian Telegraph*, published in French, German, Italian and Slav. On the evacuation of the Illyrian provinces he returned to Paris, and the restoration found him a royalist, though he retained something of republican sentiment. In 1824 he was appointed to the librarianship of the Bibliothèque de l'Arsenal. He was elected a member of the Academy in 1833, and made a member of the Legion of Honour in 1843, a year before his death on the 27th of January 1844. These twenty years at the arsenal were by far the most important and fruitful of Nodier's life. He had much of the Bohemian in his composition. But he had the advantage of a settled home in which to collect and study rare books; and he was able to supply a centre and rallying place to a knot of young literary men of greater individual talent than himself—the so-called Romanticists of 1830—and to colour their tastes and work very decidedly with his own predilections. Victor Hugo, Alfred de Musset and Sainte-Beuve all acknowledged their obligations to him. He was a passionate admirer of Goethe and of Shakespeare, and had himself contributed to the personal literature that was one of the leading traits of the Romantic school.

His best and most characteristic work, some of which is exquisite in its kind, consists partly of short tales of a more or less fantastic character, partly of nondescript articles, half bibliographic, half narrative, the nearest analogue to which in English is to be found in some of the papers of De Quincey. The best examples of the latter are to be found in the volume entitled *Mélanges tirés d'une petite bibliothèque*, published in 1829 and afterwards continued. Of his tales the best are *Smarra, ou les démons de la nuit* (1821); *Trilby, ou le lutin d'Argail* (1822); *Histoire du roi de Bohême et de ses sept châteaux* (1830); *La Fée aux miettes* (1832); *Inès de las Sierras* (1838); *Légende se Sœur Béatrix* (1838), together with some fairy stories published in the year of his death, and *Franciscus Columna*, which appeared after it. The *Souvenirs de jeunesse* (1832) are interesting but untrustworthy, and the *Dictionnaire universel de la langue française* (1823), which, in the days before Littré, was one of the most useful of its kind, is said to have been not wholly or mainly Nodier's. There is a so-called collection of *Œuvres complètes*, in 12 vols. (1832), but at that time much of the author's best work had not appeared, and it included but a part of what was actually published. Nodier found an indulgent biographer in Prosper Mérimée on the occasion of the younger man's admission to the academy.

An account of his share in the Romantic movement is to be found in Georg Brandes's *Main Currents in Nineteenth Century Literature*. His *Description raisonnée d'une jolie collection de livres* (1844), which is a catalogue of the books in his library, contains a life by Francis Wey and a complete bibliography of his numerous works. See also Sainte-Beuve, *Portraits littéraires*, vol. ii.; Prosper Mérimée, *Portraits historiques et littéraires* (1874); and A. Estignard, *Correspondance inédite de Charles Nodier, 1796–1844* (1876), containing his letters to Charles Weiss.

NOEGGERATH, JOHANN JACOB (1788–1877), German mineralogist and geologist, was born at Bonn on the 10th of

October 1788. In 1814–1815 he became commissioner of mines for some of the Rhine Provinces, and in 1818 professor of mineralogy and afterwards professor of geology, director of the Museum of Natural History and chief of the mining department in the university at Bonn. He obtained a very fine collection of minerals for the museum, was eminently successful as a teacher, and achieved a wide reputation among mining engineers. The following are his more important publications: *Über aufrecht im Gebirgsgestein eingeschlossene fossile Baumstämme und andere Vegetabilien* (1819–1821); *Das Gebirge in Rheinland-Westphalen, nach mineralogischem und chemischem Bezuge* (4 vols., 1822–1826); *Die Entstehung der Erde* (1843); and *Der Laacher See und seine vulkanischen Umgebungen* (1870). The Carboniferous plant *Noeggerathia*, allied to the Zamias and Cycads, was named after him. He died at Bonn on the 13th of September 1877.

NOEL, RODEN BERKELEY WRIOTHESLEY (1834–1894), English poet, son of Noel, Lord Barham, afterwards earl of Gainsborough, was born on the 27th of August 1834. He was educated at Trinity College, Cambridge, where he graduated M.A. in 1858. He then spent two years travelling in the East. He married in 1863 Alice de Broë, daughter of the director of the Ottoman Bank in Beirout. The third child of this marriage, Eric, who died at the age of five, is commemorated in Roden Noel's best-known book of verse, *A Little Child's Monument* (1881). His other volumes are *Behind the Veil, and other Poems* (1863), not included in his collected works, *Beatrice, and other Poems* (1868), *The Red Flag* (1872), *Livingstone in Africa* (1874), *Songs of the Heights and Deeps* (1885), *A Modern Faust, and other Poems* (1888), *Poor People's Christmas* (1890) and *My Sea, and other Poems* (1896). Roden Noel's versification was unequal and sometimes harsh, but he has a genuine feeling for nature, and the work is permeated by philosophic thought. The latter part of his life was spent at Brighton, but he died at Mainz, on the 26th of May 1894. His other works include a drama in verse, *The House of Ravensburg* (1877), a *Life of Byron* (1890, "Great Writers" series), a selection of Thomas Otway's plays (1888) for the "Mermaid" series, and critical papers on literature and philosophy.

His *Collected Poems* were edited (1902) by his sister, Victoria Buxton, with a notice by J. Addington Symonds, which had originally appeared in the *Academy* (19th of Jan. 1899) as a review of *The Modern Faust*. The selection (1892) in the series of *Canterbury Poets* has an introduction by Robert Buchahan.

NOETUS, a presbyter of the church of Asia Minor about A.D. 230, was a native of Smyrna, where (or perhaps in Ephesus) he became a prominent representative of the particular type of Christology now called modalistic monarchianism or patripassianism. His views, which led to his excommunication from the Asiatic Church, are known chiefly through the writings of Hippolytus, his contemporary at Rome, where he settled and had a large following. He accepted the fourth Gospel, but regarded its statements about the Logos as allegorical. His disciple Cleomenes held that God is both invisible and visible; as visible He is the Son.

NOGARET, GUILLAUME DE (d. 1313), councillor and keeper of the seal to Philip IV. of France, was born between 1260 and 1270. His father was a citizen of Toulouse, and was, so it was claimed, condemned as a heretic during the Albigensian crusade. The family held a small ancestral property of servile origin at Nogaret, near Saint Felix de Caramon, from which it took its name. In 1291 Guillaume was professor of jurisprudence at the university of Montpellier, and in 1296 he became a member of the Curia Regis at Paris. His name is mainly connected with the quarrel of Philip IV. with Pope Boniface VIII. In 1300 he was sent with an embassy to Boniface, of which he has left a picturesque but highly coloured account. His real ascendancy over the king dates from February 1303, when he persuaded Philip to consent to the bold plan of seizing Boniface and bringing him forcibly from Italy to a council in France which should depose him. On the 7th of March he received, with three others, a secret commission from the royal chancery to "go to certain places . . . and make such treaties with such persons as seemed good to them." On the 12th of March a solemn royal assembly was held in the Louvre, at which Guillaume de Nogaret read a long series of accusations against Boniface and demanded the calling of a general council to try him. Soon afterwards he went to Italy. By the aid of a Florentine spy, Nogaret gathered a band of adventurers and of enemies of the Gaetani (Boniface's family) in the Apennines. The great Colonna house, at bitter feud with the Gaetani, was his strongest ally, and Sciarra Colonna accompanied Nogaret to Anagni, Boniface's birthplace. On the 7th of September, with their band of some sixteen hundred men, Nogaret and Colonna surprised the little town. Boniface was taken prisoner. Sciarra wished to kill him, but Nogaret's policy was to take him to France and compel him to summon a general council. The tide soon turned, however. On the 9th a concerted rising of the townsmen in Boniface's favour put Nogaret and his allies to flight, and the pope was free. His death at Rome on the 11th of October saved Nogaret. The election of the timid Benedict XI. was the beginning of that triumph of France which lasted through the Avignon captivity. Early in 1304 Nogaret went to Languedoc to report to Philip IV., and was rewarded by gifts of land and money. Then he was sent back with an embassy to Benedict XI. to demand absolution for all concerned in the struggle with Boniface VIII. Benedict refused to meet Nogaret, and excepted him from the general absolution which he granted on the 13th of May 1304, and on the 7th of June issued against him and his associates at Anagni the bull *Flagitiosum scelus*. Nogaret replied by apologies for his conduct based upon attacks upon the memory of Boniface, and when Benedict died on the 7th of July 1304 he pointed to his death as a witness to the justice of his cause. French influence was successful in getting a Frenchman, Bertrand de Got (Clement V.) elected as Benedict's successor. The threat of proceedings against the memory of Boniface was renewed to force Clement to absolve Nogaret, and Clement had given way on this point when the further question of an inquiry into the condition of the Templars was brought forward by Philip as a preliminary to their arrest and the seizure of their property in October 1307. Nogaret was active in getting the renegade members of the order to give evidence against their fellows, and the whole proceedings against them bear traces of his unscrupulous and merciless pen. Clement's weak and ineffective resistance to this still further delayed the agreement between him and Philip. Nogaret had become keeper of the seal this year in succession to Pierre de Belleperche. His talents as an *advocatus diaboli* were given still further employment in the trial of Guichard, bishop of Troyes, charged with various crimes, including witchcraft and incontinence, which was begun in 1308 and lasted till 1313. The trial was a hint to Clement as to what might happen if the oft repeated threat of a trial of Boniface were fulfilled. Absolution was obtained from Clement on the 27th of April 1311. Guillaume de Nogaret was to go on the next crusade and visit certain places of pilgrimage in France and Spain as a penance, but never did so. He died in 1313 "with his tongue horribly thrust out," according to the chronicler Jean Desnouelles. He retained the seals till his death and was occupied with the king's affairs concerning Flanders as late as the end of March 1313.

See E. Renan in *Histoire littéraire de la France*, xxvii. 233; R. Holzmann, *Wilhelm von Nogaret* (Freiburg, 1898). For the sources consult Dom Bouquet, *Recueil de historiens des Gaules et de la France*, vols. xx.-xxiii.; *Annales regis Edwardi primi* in Rishanger ("Rolls" series), pp. 483-491, which gives the fullest account of the affair at Anagni.

NOGENT-LE-ROTROU, a town of northern France, formerly capital of the district of Perche and now capital of an arrondissement in the department of Eure-et-Loir on the Huisne, 38 m. W.S.W. of Chartres by rail. Pop. (1906) 6884. In the early part of the 17th century the overlordship was acquired by the duke of Sully, financial minister of Henry IV. In the courtyard of the hospital, originally founded at the end of the 12th century, there is a small building containing the tomb of Sully and his wife. On the hill overlooking the town stands the château of the counts of Perche, of which the donjon dating from the first half of the 11th century is the oldest portion. To Rotrou I., founder of the château, the town owes the second part of its name.

Nogent preserves three Gothic churches and the remains of the old priory of St Denis, and there are statues of General St Pol, killed at Sevastopol, and of the poet Rémy Belleau (16th century), a native of the town. The town has a sub-prefecture, a tribunal of first instance, a communal college and institution for deaf mutes.

NOGENT-SUR-MARNE, a town of northern France, in the department of Seine, on a hill on the right bank of the Marne, 6 m. E. of Paris by rail. Pop. (1906) 11,463. The Eastern railway here crosses the Marne valley by a viaduct 875 yds. in length. Nogent has a Gothic church, with a tower of the Romanesque period, in front of which there is a monument to Watteau, who died here in 1721. Chemical products are manufactured. The fine situation of the town gained it the name of Beauté, and Charles V. built a château here (demolished in the 18th century) which was presented by Charles VII. to Agnes Sorel with the title of Dame de Beauté. An island in the Marne to the south of the town is still known as the Île de Beauté.

NOGENT-SUR-SEINE, a town of north-central France, capital of an arrondissement in the department of Aube, on the left bank of the Seine, 35 m. N.W. of Troyes on the Paris-Belfort line. Pop. (1906) 3791. The river at this point forms an island, which supports a stone bridge of the 17th century. The chief building is the church of St Laurent (1421–1554). A lateral portal in the flamboyant style and the Renaissance tower at the west end are of great beauty. The town is the seat of a sub-prefect and has a tribunal of first instance. There is trade in grain, flour, fodder, wood and cattle. Nogen-sur-Seine was in 1814 the scene of fighting between the French and Austrians.

NOGI, KITEN, COUNT (1849–), Japanese general, was born in Choshu. He commanded a brigade at the battle of Kinchow (1894) and the subsequent capture of Port Arthur from the Chinese; but the most memorable events of his career were the siege of Port Arthur by the third army corps of Japan under his command in the Russo-Japanese War (1904–5), and the great flanking march made by the same army in the battle of Mukden.

NOIRMOUTIER, an island of western France, belonging to the department of Vendée, and protecting the Bay of Bourgneuf on the south-west. Pop. (1906) 8388. The area amounts to 22 sq. m., one-sixth dunes. Between the island and the mainland is a sandbank laid bare at low water, and crossed by an embankment and carriage road some 2¼ m. long. It was not till about 1766 that it was found possible to walk across to the island, which lies from N.N.W. to S.S.E., and is 12 m. long, its breadth varying from 1 m. in the south part to 3 or 4 m. in the north. It appears to be formed of alluvial deposits gradually accumulated round a rock of no great size situated at the meeting-place of the Gascony and Brittany currents. Fishing, agriculture, oyster-breeding and work in the salt marshes also occupy the inhabitants. There are two communes, Noirmoutier and Barbâtre. Noirmoutier, which has a small port, has about 2165 of its 6644 inhabitants gathered together in a little town with narrow and winding streets. Its castle was once the residence of the abbot of Her. In the church (12th, 14th and 19th centuries) there is a crypt of the 11th century. A mile to the north of the town lies a pleasant watering-place, rendered picturesque by the La Chaise woods (evergreen oaks and pines), and a grand confusion of rocks, among which lie charming beaches. A dolmen, several menhirs, and the ruins of a Gallo-Roman villa with its hot baths show that the island must have been occupied at an early date; but the first fact in its recorded history is the foundation of the Benedictine monastery of Her by St Philibert about 680. From this monastery the name Noirmoutier (*Heri monasterium, Hermoutier*) is derived. It had already attained to great prosperity when it was pillaged by the Normans in 825 and 843. In 1205 the abbey of Notre Dame la Blanche was built at the north extremity of the island to take the place of a Cistercian convent established in the Île du Pilier, at that time attached to Noirmoutier by a dike. This abbey was ruined by the Protestants in 1562. In the 15th, 16th and 17th centuries the island belonged to the family of La Tremoille, and in 1650 the territory was made a duchy. In 1676 the island was captured by the Dutch. Having been seized by Charette during the war of Vendée, it was recovered by the Republican general, Haxo, who caused the Vendean leader, d'Elbée, to be shot.

NOISE (a word of doubtful origin; O. Fr. *nogse* or *nose*; Prov. *nausa*, which points to Lat. *nausea*, sickness, as the origin; others take Lat. *noxia*, harm, as the source), an excessive, offensive, persistent or startling sound. By the common law of England freedom from noise is essential to the full enjoyment of a dwelling house, and acts which affect that enjoyment may be actionable as nuisances. But it has been laid down that a nuisance by noise, supposing malice to be out of the question, is emphatically a question of degree (*Gaunt* v. *Finney*, 1872, 8 Ch. Ap. 8). The noise must be exceptional and unreasonable. The ringing of bells, building operations, vibration of machinery, fireworks, bands, a circus, merry-go-rounds, collecting disorderly crowds, dancing, singing, &c., have been held under certain circumstances to constitute nuisances so as to interfere with quiet and comfort, and have been restrained by injunction. Noise occasioned by the frequent repetition of street cries is frequently the subject of local by-laws, which impose penalties for infringement.

NOISOME, harmful, offensive, especially of that which causes physical disgust. The word is formed from the obsolete "noy," trouble, a shortened form of "annoy," now only used as a verb, to cause trouble, the usual substantive being "annoyance." The O. Fr. *anoi*, *anui* (modern *ennui*) is an adaptation of Lat. *in odio esse*, *venire* or *habere*, to be sick, tired of anything (*odium*, disgust, hatred). The word has no connexion with Lat. *nocere*, to hurt.

NOKES (NOKE, NOAK, NOAKES), **JAMES** (d. 1692), an English actor, whose laughter-arousing genius is attested by Cibber and other contemporaries. Sir Martin Mar-all, Sir Davy Dunce and Sir Credulous Easy were among his favourite parts. His success as the Nurse in Nevil Payne's *Fatal Jealousy* was so great that he was thereafter nicknamed "Nurse Nokes."

NOLA, a city and episcopal see of Campania, Italy, in the province of Caserta, pleasantly situated in the plain between Mount Vesuvius and the Apennines, 16¾ m. E.N.E. of Naples, 121 ft. above sea-level. Pop. (1901) 11,927 (town); 14,511 (commune). It is served by the local railway from Naples to Baiano, and is 22 m. from Naples by the main line via Cancello. The more conspicuous buildings are the ancient Gothic cathedral (restored in 1866, and again in 1870 after the interior was destroyed by fire), with its lofty tower, the cavalry barracks, the ex-convent of the Capuchins at a little distance from the city, and the seminary in which are preserved the famous Oscan inscription known as the Cippus Abellanus (from Abella, the modern Avella, *q.v.*) and some Latin inscriptions relating to a treaty with Nola regarding a joint temple of Hercules. Two fairs are held in Nola, on the 14th of June and the 12th of November; and the 26th of July is devoted to a great festival in honour of St Paulinus, one of the early bishops of the city, who invented the church bell (*campana*, taking its name from Campania). The church erected by him in honour of St Felix in the 4th century is extant in part. There is a monument (restored in 1887) to Giordano Bruno, the free-thinker, who was born at Nola in 1548.

Nola (Νῶλα) was one of the oldest cities of Campania, variously said to have been founded by the Ausones, the Chalcidians and the Etruscans. The last-named were certainly in Nola about 500 B.C. At the time when it sent assistance to Neapolis against the Roman invasion (328 B.C.) it was probably occupied by Oscans in alliance with the Samnites. The Romans made themselves masters of Nola in 313 B.C., and it was thenceforth faithful to Rome. In the Second Punic War it thrice bade defiance to Hannibal; but in the Social War it was betrayed into the hands of the Samnites, who kept possession till Marius, with whom they had sided, was defeated by Sulla, who in 80 B.C. subjected it with the rest of Samnium. Seven years later it was stormed by Spartacus. Whatever punishment Sulla may have inflicted, Nola, though it lost much of its importance, remained a

municipium with its own institutions and the use of the Oscan language. It became a Roman colony under Augustus, who died at Nola. Sacked by Genseric in 455, and by the Saracens in 806 and 904, captured by Manfred in the 13th century, and damaged by earthquakes in the 15th and 16th, Nola lost much of its importance. The revolution of 1820 under General Pepe began at Nola. The sculptor Giovanni Marliano was a native of the city; and some of his works are preserved in the cathedral.

Nola lay on the Via Popillia from Capua to Nuceria and the south, and a branch road ran from it to Abella and Abellinum. Mommsen (*Corp. inscr. Lat.* x. 142) further states that roads must have run direct from Nola to Neapolis and Pompeii, but Kiepert's map annexed to the volume does not indicate them. In the days of its independence it issued an important series of coins, and in luxury it vied with Capua. Its territory was very fertile, and this was the principal source of its wealth. A large number of vases of Greek style were manufactured here and have been found in the neighbourhood. Their material is of pale yellow clay with shining black glaze, and they are decorated with skilfully drawn red figures. Of the ancient city, which occupied the same site as the modern town, hardly anything is now visible, and the discoveries of the ancient street pavement have not been noted with sufficient care to enable us to recover the plan. Numerous ruins, an amphitheatre, still recognizable, a theatre, a temple of Augustus, &c., existed in the 16th century, and have been since used for building material. They are described by A. Leone, *De Nola* (Venice, 1514). A few tombs of the Roman period are preserved. The neighbourhood was divided into pagi, the names of some of which are preserved to us (Pagus Agrifanus, Capriculanus, Lanitanus). (T. As.)

NÖLDEKE, THEODOR (1836–), German Semitic scholar, was born at Harburg on the 2nd of March 1836, and studied at Göttingen, Vienna, Leiden and Berlin. In 1859 his history of the Koran won for him the prize of the French Académie des Inscriptions, and in the following year he rewrote it in German (*Geschichte des Korans*) and published it with additions at Göttingen. In 1861 he began to lecture at the university of this town, where three years later he was appointed extraordinary professor. In 1868 he became ordinary professor at Kiel, and in 1872 was appointed to the chair of Oriental languages at Strassburg, which he resigned in 1906. Nöldeke's range of studies has been wide and varied, but in the main his work has followed the two lines already indicated by his prize essay, Semitic languages, and the history and civilization of Islam. While a great deal of his work (*e.g.* his *Grammatik der neusyrischen Sprache*, 1868, his *Mandäische Grammatik*, 1874, and his translations from the Arabian of Tabarī, 1881–1882) is meant for specialists, many of his books are of interest to the general reader. Several of his essays first appeared in the *Encyclopædia Britannica*, and his article on the Koran, with some others, was republished in a volume called *Oriental Sketches*. The articles dealing with Persia were republished in a German volume, *Aufsätze zur persischen Geschichte* (Leipzig, 1887). Among his best-known works are: *Das Leben Mohammeds* (1863); *Beiträge zur Kenntnis der Poesie der alten Araber* (1864); *Die alttestamentliche Literatur* (1868); *Untersuchungen zur Kritik des Alten Testaments* (1869); *Zur Grammatik des klassischen Arabisch* (1896); *Fünf Mo'allaqat, übersetzt und erklärt* (1899–1901); and *Beiträge zur semitischen Sprachwissenschaft* (1904). He has contributed frequently to the *Zeitschrift der deutschen morgenländischen Gesellschaft*, the *Göttingische gelehrte Anzeigen* and the *Expositor*.

NOLI, a coast village of Liguria, Italy, in the province of Genoa, from which it is 36 m. S.W. by rail, 13 ft. above sea-level. Pop. (1901) 1985. It is a town of considerable antiquity, now decayed, and has an ancient church of S. Paragorio, once the cathedral, a Romanesque basilica dating from the 11th century, with interesting works of art. The diocese has been united with that of Savona.

See A. d'Andrade, *Relazione dell' Ufficio Regionale per la conservazione dei monumenti del Piemonte e della Liguria* (Turin, 1899), 100 seq.

NOLLEKENS, JOSEPH (1737–1823) British sculptor, was born on the 11th of August 1737 in Dean Street, Soho, London, where his father, a native of Antwerp, the "old Nollekens" of Horace Walpole, was a painter of some repute. In his thirteenth year he entered the studio of the sculptor Peter Scheemakers, and practised drawing and modelling with great assiduity, ultimately gaining various prizes offered by the Society of Arts. In 1760 he went to Rome, and he executed a marble bas-relief, "Timoclea before Alexander," which obtained a prize of fifty guineas from that society in 1762. Garrick and Sterne were among the first English visitors who sat to him for busts; among his larger pieces belonging to this early period perhaps the most important is the "Mercury and Venus chiding Cupid." Having returned to England in 1770, he was admitted an associate of the Royal Academy in 1771, and elected a member in 1772, the year in which he married Mary, the second daughter of Saunders Welch. By this time he had become known to George III., whose bust he shortly afterwards executed, and henceforward, until about 1816, he was the most fashionable portrait sculptor of his day. He himself thought highly of his early portrait of Sterne. Among many others may be specially named those of Pitt, Fox, the prince of Wales (afterwards George IV.), Canning, Perceval, Benjamin West and Lords Castlereagh, Aberdeen, Erskine, Egremont and Liverpool. He elaborated a number of marble groups and statues, amongst which may be mentioned those of "Bacchus," "Venus taking off her Sandal," "Hope leaning on an Urn," "Juno," "Paetus and Arria," "Cupid and Psyche" and (his own favourite performance) "Venus anointing Herself"; all, however, although remarkable for delicacy of workmanship, are deficient in vigour and originality, and the drapery is peculiarly weak. The most prominent personal characteristic of Nollekens seems to have been his frugality, which ultimately developed into absolute miserliness. Mrs Nollekens died in 1817, and the sculptor himself died in London on the 23rd of April 1823, leaving a large fortune.

NOLLE PROSEQUI (sometimes shortened into *nol. pros.*), a technical term of English law, the meaning of which varies as it is used with reference to civil or criminal cases. In civil cases it applied only to actions in the king's bench division, and there signified a formal undertaking by the plaintiff that he intended to proceed no further with the action (*se ulterius nolle prosequi*). The more modern practice in such cases is to proceed by way of discontinuance. In proceedings either by indictment or by information, a *nolle prosequi* or stay of proceedings may be entered by the attorney-general. The *nolle prosequi* is a matter purely for his discretion, and will not be granted unless very good ground be shown for his interference. The object of it generally is to obtain a stay of proceedings against an accomplice in order to procure his evidence. This object is, however, more usually effected by the prosecution offering no evidence and the judge directing an acquittal.

In the United States the term bears the same meaning as in England, with one exception. The attorney-general has not the same discretion with which English law invests him. Although in some states the prosecuting officer may enter a *nolle prosequi* at his discretion, in others the leave of the court must be obtained.

NOLLET, JEAN ANTOINE (1700–1770), French physicist, of peasant origin, was born near Noyon (Oise) on the 19th of November 1700. He entered holy orders and ultimately attained the rank of abbé; but his tastes all lay in the direction of experimental research, especially on the subject of electricity. In 1734 he was admitted a member of the London Royal Society, four years later he entered the Academy of Sciences at Paris, and in 1753 he was appointed to the newly-instituted chair of experimental physics in the Collège de Navarre. In addition to many memoirs he wrote *Leçons de physique expérimentale* (1743), *Essai sur l'électricité des corps* (1747), *Recherches sur les causes particulières des phénomènes électriques* (1749 and 1754), *Recueil de lettres sur l'électricité* (1753), *L'Art de faire les chapeaux* (1764) and *L'Art des expériences* (1770). He died at Paris on the 24th of April 1770.

NOMAD (Gr. *νομάς, νομάδες*, wandering), a wanderer. The word is particularly used of tribes who shift continually from place to place in search of pasture (Gr. *νέμειν*). The *νομάδες* of ancient Greek writers meant particularly the pastoral tribes of North Africa; hence the Latin name of the Numidians (see NUMIDIA).

NOME, a mining town about 12 m. W. of Cape Nome, on the S. shore of Seward Peninsula, Alaska, in 1900 the largest settlement in the district. Pop. (1900) 12,488; (1910) 2600. Gulch gold was found near Nome on Anvil Creek in September 1898, and diggings in the ocean beach were first worked in July 1899. The rush to Nome in 1900 was one of the most remarkable stampedes in American mining history; the town soon had hotels, banks, stores, several newspapers and weekly mails from the States, and for part of the year there were, it was estimated, 20,000 inhabitants. This rapidity of growth and the isolation of the settlement raised prices to extraordinary heights, and in other respects created economic conditions remarkable even among Alaskan mining camps. By 1903 the population had greatly decreased, and in subsequent years the winter population averaged about 3500, the summer population from 7000 to 8000. In 1905 the gold output of the Nome region amounted to about $2,500,000, nearly all from placers, though some quartz mining was done. A municipal government and local police force were early organized after the fashion of American mining communities, and United States soldiers from the St Michael reservation aided in the preservation of order. The greatest drawback to the town's prosperity is the lack of any good harbour nearer than Point Clarence, 80 m. W. The winter ice-floes, sometimes 30 ft. high on the beach, render harbour improvements at Nome almost impossible. There is connexion with Seattle by steamer (since 1904) in about 8½ days. In 1901 the town was incorporated under the laws of the United States. It is the north-western terminus of the United States military telegraph. It was first called Anvil City; the name "Nome" is derived from Cape Nome, first so called on a chart dated 1849, and said to have been a draughtsman's mistake for the query "? Name" on the original chart.

NOMENOË, or NOMINOË (d. 851), duke of Brittany. The date of his birth is not known, and his origin is obscure; all that is known is that he was of Breton race. In the hope of pacifying Brittany, Louis the Debonair named him count of Vannes in 819 and governor or duke of Brittany in 826. Throughout the reign of Louis, Nomenoë's fidelity to the emperor never flagged; he put down several attempted insurrections, and maintained peace in Brittany for fifteen years. But in 841 he resolved to make himself independent of Charles the Bald. In 843 Charles made a vain attempt to subdue Brittany. In 844 Nomenoë invaded Maine, and in 845 the emperor was completely defeated at Ballon near Bain-de-Bretagne. In the following year Charles recognized the independence of Brittany. Having resolved to detach the duchy from the ecclesiastical province of Tours, Nomenoë accused the Frankish bishops of Vannes, Quimper, Dol and Léon of simony at the council of Coëtlouh in 848, replaced them by Bretons, and erected Dol into a metropolitan see. In 849 Nomenoë attacked the Frankish county of Anjou. Charles retaliated by establishing a garrison at Rennes; but Nomenoë seized Rennes, Nantes and, finally, the whole of Upper Brittany, and ravaged Maine. In 851 he seized Anjou and invaded Beauce; but he died suddenly, leaving as his successor his son Erispoë.

See A. de la Borderie, *Histoire de Bretagne*, vol. ii. (1898); R. Merlet, "Guerres d'indépendance de la Bretagne," in the *Revue de Bretagne, de Vendée et d'Anjou* (1891).

NOMENTANA, VIA, an ancient road of Italy, leading N.E. from Rome to Nomentum (*q.v.*), a distance of 14 m. It originally bore the name Via Ficulensis, from the old Latin village of Ficulea, about 8 m. from Rome. It was subsequently prolonged to Nomentum, but never became an important highroad, and merged in the Via Salaria (see SALARIA, VIA) a few miles beyond Nomentum. It is followed as far as Nomentum by the modern highroad, but some traces of its pavement still exist.

See T. Ashby in *Papers of Brit. School at Rome*, iii. 38 sqq. (T. As.)

NOMENTUM (mod. *Mentana*), an ancient town of Italy, 14 m. N.E. of Rome by the Via Nomentana. It was a Latin town, but was by some considered to be Sabine, and, like Fidenae and Ficulea, was excluded from the first region by Augustus, who made the Anio its northern boundary. Nomentum received the *civitas sine suffragio* after the last war of the Latins against Rome (338 B.C.); in its municipal constitution the chief magistrate even in imperial times bore the title of dictator. Pliny and Martial often praise the fertility of its neighbourhood. The site of the town is well protected by ravines except on the east; no ancient remains exist *in situ*, but inscriptions and other relics have been found.

See T. Ashby in *Papers of the British School at Rome*, iii. 68 sqq. (T. As.)

NOMINALISM (from Lat. *nomen*, name), the name of one of the two main tendencies of medieval philosophy, the other being Realism. The controversy between nominalists and realists arose from a passage in Boëthius' translation of Porphyry's *Introduction to the Categories of Aristotle*, which propounded the problem of genera and species, (1) as to whether they subsist in themselves or only in the mind; (2) whether, if subsistent, they are corporeal or incorporeal; and (3) whether separated from sensible things or placed in them. The Realists held that universals alone have substantial reality, existing *ante res*; the Nominalists that universals are mere names invented to express the qualities of particular things and existing *post res*; while the Conceptualists, mediating between the two extremes, held that universals are concepts which exist in our minds and express real similarities in things themselves. Though a strong realist tendency is evident in the system of Erigena (9th century), the controversy was not definitely started till the 11th century: it lasted till the middle of the 12th, when the first period of scholastic philosophy ends. Under an appearance of much vain subtlety the controversy about universals involved issues of the greatest speculative and practical importance: realism represented a spiritual, nominalism an anti-spiritual, view of the world; while realism was evidently favourable, and nominalism unfavourable, to the teaching of the Church on the dogmas of the Trinity and the Eucharist. Nominalism was a doctrine of sceptics and suspected heretics, such as Berengar of Tours and Roscellinus. Even Abelard's mediating doctrine of conceptualism (*q.v.*) was sufficiently near to obnoxious ideas to involve him in lifelong persecution. The principles of the great orthodox philosophers of the later scholastic period which begins in the 13th century, Albertus Magnus and Thomas Aquinas, were those of moderate realism. When nominalism was revived in the 14th century by the English Franciscan, William of Occam, it gave evidence of a new tendency in thought, a distrust of abstractions and an impulse towards direct observation and inductive research, a tendency which had its fulfilment in the scientific movement of the Renaissance. Occam's dictum "Entia non multiplicanda sunt praeter necessitatem" was inspired by a spirit similar to that of Bacon. Though nominalism is properly a medieval theory, the tendency has passed over into modern philosophy: the term "nominalist" is often applied to thinkers of the empirical, sensationalist school, of whom J. S. Mill may be taken as the chief representative. (H. ST.)

NONCONFORMIST, a term denoting historically (*a*) those persons who at the beginning of the 17th century refused to conform to certain practices, *e.g.* the wearing of the surplice, kneeling at the reception of the Sacrament, &c., of the Church of England; (*b*) those who, after the passing of the Act of Uniformity 1662, refused to conform to that act and ceased to be members of the church. In current usage the term "nonconformist" is applied in Great Britain to any member of a church not conforming to the ceremonies, worship and doctrines ("forms") of the Church of England, but is generally used of a member of the so-called Free Churches, or Protestant Dissenters, and is not usually applied to Roman Catholics. The name can also be applied, in other countries, to those who do not belong to the established religion. Strictly a "dissenter" is one who dissents from the church as an "established" body, or who

dissents from the establishment of a state church, while conforming or not to its forms, ceremonies or practice.

NONCONFORMITY, LAW RELATING TO. For the history of the gradual relief of nonconformists in England from their disabilities see ENGLISH HISTORY, BAPTISTS, CONGREGATIONALISM, METHODISM, FRIENDS, SOCIETY OF, &c.; also OATH. It is proposed here to note simply the present legal aspects of nonconformity apart from its history, that is, the matters in which the law as to nonconformists still differs from that applicable to members of the Church of England. The differences may be conveniently grouped under six heads.

(1) *Judicial Notice.*—The courts, both temporal and spiritual, take judicial notice of the tenets and authorities of the Church of England, the crown being head of the law and of the church. Where the tenets and authorities of a nonconformist body come in question, they must be proved by evidence. By Lord Lyndhurst's act, the Nonconformist Chapels Act 1844, where no particular religious doctrine or mode of worship has been prescribed by the deed or instrument of trust the usage of the congregation for twenty-five years is to be taken as conclusive evidence of the doctrine and worship which may be properly observed in such meeting-houses. (2) *Tribunal.*—Offences against the law ecclesiastical (not being crimes) committed by clergy of the Church of England as a rule come by letters of request from the bishop of the diocese before the arches court of Canterbury or the chancery court of York (of both of which the same person is judge). Similar matters arising in nonconformist bodies can only be tried by the ordinary secular courts, and generally depend upon the question whether a minister has done any act which is not in accordance with the rules governing the particular body of which he is a minister. A nonconformist body is in law nothing more than a voluntary association, whose members may enforce discipline by any tribunal assented to by them, but must be subject in the last degree to the courts of the realm. Brawling in a church was an offence which formerly fell solely under the cognizance of the spiritual courts, but by the Ecclesiastical Courts Jurisdiction Act 1860 any person guilty of brawling in churches or chapels of the Church of England or Ireland, or in any chapel of any religious denomination, is liable on conviction to a fine or imprisonment (see BRAWLING), while clergymen of the Church of England may also be dealt with under the Clergy Discipline Act 1892. (3) *Status of Ministers.*—A nonconformist minister is not in holy orders, and his chapel is not a consecrated building. His status is, however, recognized to a limited extent. By the Toleration Act, 1 Will. & Mar., c. 18, a minister, preacher or teacher of a nonconformist congregation is exempt from certain parochial offices, as that of churchwarden. He is also exempt from serving in the reserve forces or on a jury. These privileges only attach where the place of worship of which he is a minister has been duly registered (the Places of Worship Registration Act 1855), unless in the case of bodies subject to special legislation, as Quakers. Registration is not required in the case of consecrated buildings. By the Municipal Corporations Act 1882, s. 12, a nonconformist minister (as is a clerk in holy orders) is disqualified from being elected an alderman or councillor of a town council, but under the Local Government Act 1888 a clerk in holy orders, or other minister of religion, may be a councillor or alderman of a county council, and, under the London Government Act 1899, of a metropolitan borough. He cannot take a degree in divinity at Oxford, Cambridge or Durham (Universities Tests Act 1871), and so is debarred from holding any professorship of divinity in those universities. (4) *Marriage.*—Marriage by a person in holy orders was probably necessary at common law, at any rate from the Reformation up to 1836. (See MARRIAGE.) And from the date of Lord Hardwicke's Marriage Act, 1753, up to 1836 the ceremony must have been performed in a consecrated building. The first act of parliament that relieved dissenters (other than Jews and Quakers) from these restrictions was the Marriage Act of 1836. By that act the ceremony of marriage might be performed in a nonconformist place of worship, but it must be after due notice to the superintendent registrar and in his presence or in that of a registrar, and the building must be one that is duly certified for marriages. The Marriage Act 1898 dispensed with the necessity of the attendance of a registrar at marriages celebrated at a nonconformist place of worship, substituting in place thereof a person duly authorized by the trustees of the place of worship, if the persons intending to be married so desire; but the parties may, if they wish, still require the presence of the registrar. Marriage by banns, licence or special licence cannot take place except in a church. (5) *Burial.*—By the Burial Laws Amendment Act 1880 burial may take place in a churchyard without the rites of the Church of England. But in such a case notice must be given in a specified form, which is unnecessary where the burial service is conducted by a clergyman of the Church of England. (6) *Parish Offices.*—By 1 Will. & Mar. c. 18, s. 5, a dissenter chosen churchwarden and scrupling to take the oaths may execute his office by deputy. His acceptance of office is made optional by the act; there is nothing to prevent his discharging it if he see fit to do so. This seems to be still the law, although a declaration was substituted for the oath by the Statutory Declarations Act 1835, s. 9.

British Colonies.—In crown colonies ecclesiastical jurisdiction may be conferred by the sole authority of the crown. In colonies which have parliamentary representation the crown cannot give to a metropolitan bishop jurisdiction or coercive legal authority over suffragan bishops or over any other person. In colonies of the former kind the Church of England may still preserve the privileges which attach to her in the mother country; in colonies of the latter kind she is in the same position as any other religious body, simply a voluntary association. Since the Irish Church Act 1869 the Church of Ireland has been practically in the same position as the Church of England in colonies which have representative government.

NONFEASANCE, MISFEASANCE, MALFEASANCE. The expressions "nonfeasance" and "misfeasance," and occasionally "malfeasance," are used in English law with reference to the discharge of public obligations existing by common law, custom or statute. The rule of law laid down is that no action lies for nonfeasance, *i.e.* for failure or refusal to perform the obligation, but that an action does lie for misfeasance or malfeasance, *i.e.* for negligently and improperly performing the obligation. The doctrine was formerly applied to certain callings carried on publicly (see *R.* v. *Kilderby*, 1669, 1 Will. Saund. 311, 312*c*). At present the terms misfeasance and nonfeasance are oftenest used with reference to the conduct of municipal authorities with reference to the discharge of their statutory obligations; and it is an established rule that an action lies in favour of persons injured by misfeasance, *i.e.* by negligence in discharge of the duty; but that in the case of nonfeasance the remedy is not by action but by indictment or *mandamus* or by the particular procedure prescribed by the statutes. This rule is fully established in the case of failure to repair public highways; but in other cases the courts are astute to find evidence of carelessness in the discharge of public duties and on that basis to award damages to individuals who have suffered thereby. Misfeasance is also used with reference to the conduct of directors and officers of joint-stock companies. The word malfeasance is sometimes used as equivalent to *mala praxis* by a medical practitioner. (W. F. C.)

NONIUS MARCELLUS, Latin grammarian and lexicographer, flourished at the end of the 3rd or the beginning of the 4th century A.D. He is often called the "Peripatetic of Thubursicum" (in Numidia, probably his birth-place). He is the author of a sort of lexicon called *De compendiosa doctrina*, in 20 sections or chapters, the first twelve of which deal with language and grammar, the remaining eight with special subjects (navigation, costume, food, arms). The work is a compilation from commentaries on the authors quoted (whom Nonius only knows at second hand) and from existing dictionaries and grammars. Nonius is especially indebted to Verrius Flaccus and Aulus Gellius. The *Doctrina* is valuable as preserving fragments from old dramatists, annalists, satirists and antiquarian writers. It is remarkable that in the quotations from the authors cited Nonius always follows the same order, beginning with Plautus and ending with Varro and Cato. The grammarians Priscian and Fulgentius borrowed largely from his book; and in the 5th century a certain Julius Tryphonianus Sabinus brought out a revised and annotated edition.

Editions by L. Müller (1888); J. H. Onions, bks. i.-iii. (1895); W. M. Lindsay (1903) (reviewed in *Classical Review*, October 1904). NONJURORS, the name given to those beneficed clergy of the Church of England who refused to take the oaths of allegiance to William and Mary in 1689. They were about four hundred in number, and included William Sancroft, archbishop of Canterbury, and four others of the "Seven Bishops," Thomas Ken of Bath and Wells, John Lake of Chichester, Thomas White of Peterborough and Francis Turner of Ely, together with three other bishops, Robert Frampton of Gloucester, William Thomas of Worcester and William Lloyd of Norwich (who is sometimes confused with his namesake, the bishop of St Asaph, one of the

"Seven Bishops"). Other distinguished nonjurors among the clergy were: William Sherlock, master of the Temple, Jeremy Collier, the ecclesiastical historian, Charles Leslie, the controversialist, George Hickes, dean of Worcester, Nathanael Spinckes, John Fitzwilliam, canon of Windsor, and John Kettlewell, the devotional writer. The most famous nonjurors among the laity were Henry Dodwell, Camden professor of history at Oxford, Robert Nelson, Henry Hyde, second earl of Clarendon, and Roger North, the lawyer. Afterwards their number was augmented by the refusal of William Law, author of *The Serious Call*, Thomas Carte, the historian, Thomas Hearne, the antiquary, and others, to take the oaths of allegiance to George I. Ken, the most eminent of the nonjurors, disapproved of their subsequent proceedings, and Sherlock and Dodwell afterwards took the required oaths, the former becoming dean of St Paul's.

Believing in the doctrine of non-resistance to establisned authority, the nonjurors argued that James II. was still the rightful king, and likened the position of William to that of Cromwell. Taking examples from the Old Testament and from the practice of the early church, their antagonists traversed these arguments, and a long and voluminous controversy followed. Many have thought that the position of the nonjurors was inconsistent, and Dr Johnson said, "I never knew a nonjuror who could reason," although he appears to have excepted Leslie from this general condemnation. The government did not treat the nonjurors harshly. With the approval of William III., Gilbert Burnet, bishop of Salisbury, attempted to reconcile them to the new order; and it was only when the generous terms offered by Burnet had been refused, that, in February 1690, they were deprived of their sees and other benefices. Although they had only a small following among the mass of the people, who were not required to take the oaths of allegiance, Sancroft and his colleagues claimed to represent the true Church of England, and requested James II. in his exile to nominate two new bishops to carry on the episcopal succession. James chose Hickes and Thomas Wagstaffe (1645–1712), who were consecrated in 1694 as bishops of Thetford and Ipswich respectively. A further consecration took place in 1713 when Collier, Spinckes and Samuel Hawes (d. 1722), were consecrated "bishops at large." In 1718 the introduction of a new communion office with some "usages" taken partly from primitive liturgies, and partly from the first prayer-book of Edward VI. caused a schism among the nonjurors, dividing them into "Usagers" and "Non-Usagers." The four "usages" were: The mixed chalice, prayers for the faithful departed, prayer for the descent of the Holy Ghost on the consecrated elements, and the Oblatory Prayer, offering the elements to the Father as symbols of His Son's Body and Blood. Accepting the "usages" the two bodies united in 1731, but other dissensions followed, although the episcopal succession was maintained until the death of a bishop named Charles Booth in 1805. The last nonjuror is supposed to have been James Yeowell, who died in 1875. Public worship was conducted in chapels or "oratories," and sometimes in private houses.

In Scotland the nonjurors included the greater part of the clergy of the Episcopal Church, which ceased to be the state church in 1689. Many of these men and some of their English colleagues were ardent Jacobites, and were punished for sharing in the risings of 1715 and 1745, and in other Jacobite movements. The Scottish clergy maintained their attitude of resistance to the government until the death of Prince Charles Edward Stuart in 1788, when the bishops met at Aberdeen, and unanimously agreed to submit to the government of King George III. A large number of the Presbyterians in Scotland, principally found among the Cameronians, also refused to take the oaths of allegiance to William and Mary; but as their reasons for this refusal were quite different from those of the episcopalian nonjurors, they are not usually referred to by this name (see CAMERONIANS).

For the history of the nonjurors, see Macaulay, *History of England* vol. ii. (London, 1895); T. Lathbury, *History of the Nonjurors* (London, 1845); and especially J. H. Overton, *The Nonjurors* (London, 1902), a defence of the sect. (A. W. H.*)

NONNUS (Egyptian for "saint"), Greek epic poet, a native of Panopolis (Akhmim) in the Egyptian Thebaid, probably lived at the end of the 4th or the beginning of the 5th century A.D. His principal work is the *Dionysiaca*, an epic in forty-eight books, the main subject of which is the expedition of Dionysus to India and his return. The earlier portions treat of the rape of Europa, the battle of the giants, the mythical history of Thebes, and it is not until the eighth book that the birth of the god is described. Other poets had already treated the subject, and since the time of Alexander it had gained popularity from the favourite comparison of the king with the god and of his enemies with the giants. In its vast and formless luxuriance, its beautiful but artificial versification, its delineation of action and passion to the entire neglect of character, the poem resembles the epics of India. Like his countryman Claudian, Nonnus is a writer of copious learning and still more copious fancy, whose faults are those of the age in which he lived. His chief merit consists in the systematic perfection to which he brought the Homeric hexameter. But the very correctness of the versification renders it monotonous. His influence on the vocabulary of his successors was likewise very considerable.

We also possess under his name a paraphrase (*μεταβολή*) of the Gospel of St John, which is chiefly interesting as apparently indicating that Nonnus in his later years was a convert to Christianity. The style is not inferior to that of his epic, but, employed in embellishing the simple narrative of the evangelist, it produces an impression of extreme bombast and want of taste. According to an epigram in the Palatine Anthology (ix. 198), Nonnus was also the author of a *Battle of the Giants*, and four lines of the *Bassarica* (also on the subject of Dionysus) have been preserved in Stephanus of Byzantium.

Editio princeps (1569); H. Köchly ("Teubner" series, with critical introduction and full index of names, 1858); the most generally useful edition is that by the comte de Marcellus (1856), with notes and prolegomena, and a French prose translation. On the metre, see J. G. Hermann, *Orphica* (1805), p. 690; A. Ludwich, *Beiträge zur Kritik des Nonnus* (1873), critical, grammatical and metrical; C. Lehrs, *Quaestiones epicae* (1837), pp. 255-302, chiefly on metrical questions; on the sources, R. Köhler, *Über die Dionysiaka des Nonnus* (1853), a short and connected analysis of the poem, with a comparison of the earlier and later myths; see also I. Negrisoli, *Studio critico . . . Nonnus Panopolita*, with short bibliography (1903). The paraphrase on St John (editio princeps, *c.* 1505) is edited by F. Passow (1834) and A. Scheindler (1881), with complete index.

NONPAREIL, the name under which, from its supposed matchless beauty, a little cage-bird, chiefly imported from New Orleans, has long been known to English dealers (cf. Edwards, *Gleanings*, i. 132). It is the *Emberiza ciris* of Linnaeus, and the *Cyanospiza ciris* of most recent ornithologists, belonging to a small group, now included with the buntings and finches, although some authors have regarded it as a tanager (*q.v.*). The cock has the head, neck and lesser wing-coverts bright blue, the upper part of the back yellow, deepening into green, and the lower parts generally, together with the rump, bright scarlet, tinged on the latter with purple. This gorgeous colouring is not assumed until the bird is at least two years old. The hen is green above and yellow beneath; and the younger cocks present an appearance intermediate between the adults of both sexes. The species, which is often also called the painted bunting, after wintering in Central America or Mexico, arrives in the Southern states of the American Union in April, but does not ordinarily proceed to the northward of South Carolina. In Louisiana, where it is generally known to the French-speaking inhabitants as the *Pape*—as it was to the Spaniards of Florida as the *Mariposa pintada* (painted butterfly)—it is said to be very abundant; and on its appearance in spring advantage is, or was, taken of the pugnacious disposition of the males to capture them alive in great numbers by means of the stuffed skin of one so placed in connexion with a cage-trap that they instantly fall into the latter on attacking what they conceive to be a rival. Belonging to the same genus as the nonpareil is the indigo-bird, *Cyanospiza cyanea*, which, as a summer visitant, is widely diffused from the Missouri to the Atlantic, and extends into the provinces of

Ontario and New Brunswick, being everywhere regarded with favour. Though wanting most of the bright hues of its congener, the indigo-bird has yet much beauty, the adult cock being nearly all over of a deep blue, changing, according to the light, to green. The hen is brown above and ochreous-white beneath. The "pintailed nonpareil" of aviculture (*Erythrura prasina*) is a somewhat similarly coloured but really very different bird; the male has a long sharp tail, and the species belongs to the *Ploceidae* (see WEAVER-BIRD).

NONPAREIL (Fr. *non*, and *pareil*, like, Lat. *par*), having no equal, unrivalled. Apart from its uses as a descriptive name for particularly fine kinds of fruit, &c., and of certain birds, moths and butterflies, the chief application of the word in English is, in printing, to a size of type between "emerald" and "ruby," in the United States of America between "minion" and "agate" (see TYPOGRAPHY).

NONSUIT (Fr. *non suit*, he does not pursue), in law the name given to a judgment whereby an issue is determined against the plaintiff. It was a term peculiar to the English common-law courts before the Judicature Acts, and was simply the expression of the opinion of the court that, apart from the merits, the plaintiff's case was incomplete. It did not in any way act as a bar to his bringing another action for the same cause. It might be entered either at the wish of the plaintiff himself (to whom it was of course much more beneficial than judgment for the defendant) or by direction of the court against the will of the plaintiff. Although judgment of nonsuit still exists, it has, since the Judicature Acts, the same effect as a judgment on the merits, unless the court otherwise directs. This effect of a nonsuit was specially provided for by the rules of the Supreme Court of 1875.

NOODT, GERHARD (1647–1725), Dutch jurist, was born at Nijmwegen in 1647. Educated at Leiden, Utrecht and Franeker, he became a professor of law at Leiden. As a writer on jurisprudence he acquired a wide reputation. His Latin style was modelled after the best writers, and his numerous works soon rose to the rank of standard authorities. Two of his political treatises were translated into French by Jean Barbeyrac, and appeared at Amsterdam in 1707 and 1714, under the respective titles of *Pouvoir des souverains* and *Liberté de conscience*.

The first edition of his collected works was published at Leiden in 1724 and the last in 1767. That of 1735 and those subsequent contain a life of the author by Barbeyrac.

NOON, midday, twelve o'clock. The O. Eng. *nón*, Nor. *non*, Dutch *noen*, are all from Lat. *nona* sc. *hora*, the ninth hour, *i.e.* according to the Roman system, three o'clock P.M. (see DAY). The early uses of noon till the 13th and 14th centuries are either as translating the Latin, especially with reference to the Crucifixion, or as equivalent to the canonical hour of "nones" (see BREVIARY). The ordinary word for twelve o'clock was *middæg*, midday, also the equivalent of the canonical hour "sext." Both the office and the meal taken about that time were shifted to an earlier hour, and by the 14th century the ordinary use of "noon" is that current to-day.

For "nones" (*i.e. nonae*, sc. *dies*) in the Roman calendar, see CALENDAR.

NORA, an ancient town of Sardinia, 22 m. by road S.S.W. of Carales. It was founded, according to Pausanias (x. 17. 5), by the Iberians under Norax, son of Hermes, and was the most ancient town in the island. The discoveries made on the site have, however, shown that it was certainly of Phoenician origin. In Roman times too, we find the milestones on the road from Nora to Bitia and even on that from Nora to Carales reckoned from Nora (*Corp. inscr. Lat.* x. 831; *Ephemeris epigraphica*, viii. 180); but the authors and the sepulchral inscriptions found here give us no information as to its juridical condition. The town occupies a characteristically Phoenician site, a small peninsula joined to the mainland by an isthmus, low, narrow and sandy. Excavations have led to the discovery of a few Phoenician buildings, the foundations of a temple of Tanit, of a road, of quay walls at the water's edge and of a watch-tower on the extremity of the peninsula, which rises to some 150 ft. above the sea. Two cemeteries were found, one of the 7th-6th century B.C., consisting of tombs cut in the rock for inhumation, while in the other, going down to the 4th century B.C., cremation is the rule; there are ossuaries placed in holes in the sand, with a sculptured *stele* over each. A quantity of small objects, gems, ivories, glass, vases, terra-cottas, &c., were found; in some of them Egyptian, in others Greek, influence and importation are apparent. To the Roman period belong an aqueduct, bringing the water from the neighbouring hills—one pier of it rests upon a destroyed *nuraghe*—scanty remains of an amphitheatre, a theatre, considerable ruins of concrete foundations (perhaps of villas by the sea) and a watch-tower on the promontory close to the Phoenician tower. A full description of the site and the excavations is given by G. Patroni in *Monumenti dei Lincei*, xiv. (1905), 111. On the isthmus is the curious small old church of S Efisio, with a nave and two aisles divided by heavy square pillars. At the festival of the saint (May 1-4), his body is brought in procession from the cathedral at Cagliari; the festival is much frequented by people from all parts of Sardinia. (T.As.)

NORBA, an ancient town of Latium (*Adjectum*), Italy. It is situated 1 m. N.W. of the modern Norma, 1575 ft. above sea-level, on the west edge of the Volscian Mountains or Monti Lepini, above a precipitous cliff, with a splendid view over the Pomptine Marshes. It was a member of the Latin League of 499 B.C., and became a Latin colony in 492 B.C., as an important fortress guarding the Pomptine Marshes. It served in 199 as a place of detention for the Carthaginian hostages, and was captured and destroyed by Sulla's troops during the civil wars at the end of 82 B.C. Some revival in prosperity took place later. From excavations begun in 1901 it seems clear that the remains now visible on the site are entirely Roman. The well-preserved walls are in the polygonal style, 1½ m. in circuit, and are entirely embankment walls, not standing free above the internal ground level. Remains of a massive tower, and of several gateways (notably the Porta Grande, defended by a tower) exist. Within, the remains of several buildings, including the substructions of two temples, one dedicated to Juno Lucina, have been examined. At the foot of the cliff are the picturesque ruins of the medieval town of Nainfa (12th-13th centuries) abandoned owing to the malaria. The remains of a primitive settlement, on the other hand, have been discovered on the mountain-side to the S.E., above the 13th-century abbey of Valvisciolo, where there is a succession of terraces supported by walls of polygonal work, and approached by a road similarly supported. Here a quantity of primitive Latin pottery has been found. The necropolis of this settlement was probably the extensive one situated at Caracupa (8th-6th century B.C.), near the railway station of Sermoneta, which belongs also to the 8th-6th century B.C., terminating thus at the precise date at which the Roman city of Norba began to exist.

See L. Savignioni and R. Mengarelli in *Notizie degli scavi* (1901), 514; (1903) 299, 289; (1904) 407; and *Atti del Congresso Storico* (Rome, 1903), vol. v. (Archaeologia) 255. (T. As.)

NORBANUS, GAIUS, surnamed BULBUS (or BALBUS), Roman politician, was a seditious and turbulent democrat. In 103 B.C., when tribune of the people, he accused Q. Servilius Caepio of having brought about the defeat of his army by the Cimbri through rashness, and also of having plundered the temple of Tolosa. Caepio was condemned and went into exile. About ten years later Norbanus himself was accused of treason on account of the disturbances that had taken place at the trial of Caepio, but the eloquence of M. Antonius, grandfather of the triumvir, procured his acquittal. In 89 Norbanus as praetor successfully defended Sicily against the Italian socii. During the civil war between Marius and Sulla he sided with the former, but was defeated by Sulla at mount Tifata near Capua, and again by Metellus at Faventia in Cisalpine Gaul (82). He fled to Rhodes, where he committed suicide, while the Rhodians were debating whether to hand him over to Sulla.

See Mommsen, *Hist. of Rome*, bk. iv. ch. v.; Greenidge, *Hist. of Rome*.

NORCIA (anc. *Nursia*), a town and episcopal see of the province of Perugia, Italy, 29 m. E.N.E. of Spoleto by road, and 40 m. W.

of Ascoli Piceno, 1980 ft. above sea-level, on the south-west foot-slopes of the Monti Sibillini, still surrounded by old walls. Pop. (1901) 4261 (town), 9584 (commune). There are a cathedral, the church of St Benedict and other churches, with Romanesque 14th-century façades; the town-hall; and the prefecture, with Romanesque arcades. Much injury was done by earthquakes in 1730 and 1859. The ancient Nursia was a Sabine city, though close to the Umbrian border. Its inhabitants fought in 43–41 B.C. against Octavian, and were punished by him for erecting a monument in honour of those who fell. It was governed by *octoviri* like other Sabine towns and became a *municipium* under the empire. At Ancarano near Norcia was situated a small *pagus*; remains of a temple were found there in 1880, which from the character of the objects seems to have been destroyed in the 5th century B.C. The tombs of the district have also produced interesting early bronzes, &c., some of which go back to the 7th century B.C., and a fine funeral couch decorated with sculptured pieces of bone. M. Guardabassi in *Notizie degli scavi*, 1878, 13 sqq.; 1880, 6 sqq.; A. Pasqui in *Monumenti dei Lincei*, i. (1891) 239. The town was the birthplace of Q. Sertorius (d. 72 B.C.), of Vespasia, mother of the emperor Vespasian of Plotina, wife of the emperor Trajan, and of St. Benedict, founder of the Benedictine order, and of his sister Scholastica. The town is famous for its pork and its cloth (the term *norcineria* for a pork butcher's shop is indeed used in Rome) and produces bricks and earthenware.

See F. Patrici Forti, *Memorie storiche di Norcia* (Norcia, 1869).

NORD, the most northern of the departments of France, formed chiefly out of Flanders, French Hainault and the district of Cambrai (Cambrésis). Area 2229 sq. m. Its population (1,895,861 in 1906), which includes a large proportion of Belgians, ranks next to that of Seine among French departments. Its length from south-east to north-west is 112 m.; its breadth nowhere exceeds 40 m., and contracts to 4 where it is crossed by the Lys. Bounded N.W. and N. for 21 m. by the North Sea, it has Belgian territory on the N.E. and E., the departments of Aisne and Somme on the S. and Pas-de-Calais on the W. The Flanders portion west of the Scheldt is very flat, the isolated hill at Cassel, only 535 ft. high, looking north towards Dunkirk over a stretch of fertile lowlands, the Wateringues and the Moëres, separated by a line of sand-dunes from the sea, by which about a thousand years ago they were still covered. The reclamation of this district, now covered by a network of canals, was begun as early as the 12th century. South-east of the Scheldt the country resembles the neighbouring Ardennes, is better wooded, and contains the highest point in the department (873 ft.). The greater part of Nord is in the Scheldt basin, but certain portions belong to those of the Sambre (Meuse), the Oise (Seine) and the little coast-streams the Aa and the Yser. The Scheldt, flowing by Cambrai, Bouchain, Valenciennes and Condé, receives the Scarpe, which touches Douai, Marchiennes and St Amand. The Lys, which does not join the Scheldt till it has entered Belgium, passes Armentières, and receives the Deule, on which Lille, the capital, is situated. The Sambre passes Landrecies and Maubeuge. The Aa falls into the port at Gravelines. The climate of Nord is colder than that of France in general, the mean temperature being 49° or 50° F. The average annual rainfall is about 28 in.

In agricultural and industrial importance Nord is the first of French departments. In the hilly region of the south-east stock-raising flourishes; in the central zone beetroot is the characteristic crop, while mixed farming prevails in the north-west. Cereals (especially wheat and oats) and potatoes are grown in abundance. Among minor crops, flax, tobacco, chicory and hops may be mentioned. Market-gardening and horticulture are practised on a considerable scale in some localities. The mineral wealth of the department lies principally in its coal mines forming part of the Valenciennes basin, the most important in France, which extends into Belgium and Pas-de-Calais. The textile industry is particularly active around Lille, Roubaix and Tourcoing which spin and weave cotton and wool, as also around Fourmies which is especially a weaving town. Other important centres are Armentières (cloth-weaving), Dunkirk (flax, jute and hemp-spinning), Cambrai (batiste and other delicate fabrics), Douai, Avesnes, le Cateau and Caudry. Other great industries are brewing, flour-milling, glass, brick, pottery and sugar manufacture, alcohol-distilling, dyeing, iron-founding and steel production and other branches of the metallurgical industry carried on at Denain, Hautmont, Maubeuge, Valenciennes, Douai, Raismes, &c. Dunkirk and Gravelines equip fleets for the cod and herring fisheries. Dunkirk is the chief port of the department, which is served by the Northern railway. Its system of inland navigation is highly developed and attains a length of 320 m., comprising a line of waterways from the Scheldt to the North Sea at Dunkirk, with which the coal basin of Valenciennes is linked up by way of the canalized Scheldt and the textile region of Lille by means of the Deûle canal and the canalized Lys. To these must be added the canalized Sambre and other less important waterways.

The department is divided into seven arrondissements (Avesnes, Cambrai, Douai, Dunkirk, Hazebrouck, Lille, Valenciennes) with 67 cantons and 667 communes. It forms the archiepiscopal diocese of Cambrai and part of the region of the I. army corps (headquarters at Lille) and of the educational division of Lille. Its court of appeal is at Douai. The most noteworthy places are Lille, Cambrai, Douai, Dunkirk, Valenciennes and Anzin, Tourcoing, Roubaix, Avesnes, Halluin, Armentières, Maubeuge, Condé-sur-Escaut, Fourmies, Hazebrouck, Gravelines, St Amand-les-Eaux, Bergues, Le Cateau, Comines, Denain, Cassel and Bavai, which are separately noticed. Other populous industrial towns not mentioned above are Loos (pop. 9294) and Haubourdin (7897) near Lille, Caudry (10,947), near Cambrai, and Aniche (7855), a coal mining centre, near Douai. Other places of interest are Bailleul (pop. in 1906, 7128), Bavai and Bergues, which have fine belfries of the 16th century, structures characteristic of the architecture of the department; Hondschoote, scene of a victory of the French over the allies in 1793, which has a church of the 15th and 16th centuries with a fine tower and spire; and Famars which preserves a curious ruined stronghold of the period of the Roman occupation.

NORDAU, MAX SIMON (1849–), German author and philosopher, was born of Jewish parents at Budapest on the 29th of July 1849. He studied medicine and travelled widely through Europe until 1878, when he settled down as a practitioner in his native town. In 1880 he removed to Paris, and in addition to his professional work took up the study of art, literature and social questions. His investigations were marked by a critical accuracy which endeavoured to weigh data and deduce results with a fearless disregard of conventional ideas. In his *Entartung* he applied the theory of physical degeneration to the intellectual side of civilized man, and endeavoured to show that in art, literature and social evolution there is decadence and hysteria; confused aesthetic theory, mysticism in thought, so-called "realism" in art, all alike indicate the vain spasmodic struggling of an effete civilization. In *Die konventionellen Lügen der Kulturmenschheit* (1884), the same destructive method is applied to politics and to social science. Yet Nordau was not a pessimist. In the *Paradoxes psychologiques* (1885) he expressed his profound and reasoned conviction that the "Degeneration" of the time was only temporary. This optimism was seen in his enthusiastic support of Dr Herzl's Zionist movement. In connexion with the British government's offer of land for a Jewish settlement in East Africa, there was a fundamental difference of opinion among the various Jewish societies. Herzl and Nordau were accused of giving up the idea of returning to Palestine, and substituting the African scheme. This idea provoked great hostility, and at a Zionist Ball in Paris (19th of December 1903) a Jew named Louban Chain Selik fired two shots at Nordau unsuccessfully. The outrage drew from Herzl a letter (*The Times*, 22nd of December) which clearly set forth the view held by himself and Nordau as to the ultimate destiny of the Zionist Movement.

WORKS.—Novels and Stories: *Seifenblasen*, *Federzeichnungen und Geschichten* (1879); *Die Krankheit des Jahrhunderts* (1889);

Gefühlskomödie (1892); *Die Drohnenschlacht* (1897); *Morganatisch* (1904). Dramas: *Die neuen Journalisten* (in collaboration with F. Gross, 1880); *Der Krieg der Millionen* (1882); *Das Recht zu lieben* (2nd ed., 1894); *Die Kugel* (1894); and *Doktor Kohn* (1898). He published also *Vom Kreml zur Alhambra* (1880), an account of his travels, and three works descriptive of Paris and the Parisians—*Pariser Studien aus dem wahren Millliardenlande* (1878); *Paris unter der dritten Republik* (1881); *Ausgewählte Pariser Briefe* (1887); two further volumes of criticism, *Zeitgenössische Franzosen*, literaturgeschichtliche essays (Berlin, 1901); and *Von Kunst und Künstlern* (Leipzig, 1905).

NORDEN, JOHN (1548–1625?), English topographer, was the first Englishman who designed a complete series of county histories and geographies. His earliest known work of importance was the *Speculum Britanniae, first part . . . Middlesex* (1593); the MS. of this in the British Museum (Harl. 570) has corrections, &c., in Lord Burleigh's handwriting. In 1595 he wrote a *Chorographical Description of . . . Middlesex, Essex, Surrey, Sussex, Hampshire, Wight, Guernsey and Jersey*, dedicated to Queen Elizabeth; the MS. of this is in the British Museum, Addit. MSS. 31,853. In 1596 he published his *Preparative to . . . Speculum Britanniae*, dedicated to Burleigh, and in 1598 his *Hertfordshire* (Lambeth Libr. MSS. 521). Before his death he had completed in manuscript his account of five other counties; three of these studies were printed long after his death, viz. *Essex*, edited for the Camden Society in 1840 by Sir Henry Ellis from a MS. at Hatfield (see also British Museum Addit. MSS. 33, 769); *Northamptonshire*, known to have been finished in 1610, but only published in 1720; *Cornwall*, likewise finished in 1610, published in 1728 (see Harl. MSS. 6252). Of *Kent* and *Surrey* even the MSS. are now lost; parts of the latter are perhaps identical with sections of the *Chorographical Description* of 1595. In 1600 Norden was appointed surveyor of the crown woods and forests in Berkshire, Devon, Surrey, &c.; in 1605 he obtained the surveyorship of the duchy of Cornwall; in 1607, after a careful survey, he composed his valuable *Description of the Honour of Windsor*, with fine maps and plans in colour, dedicated to James I. (see Harl. MSS. 3749). In 1608 he was mainly occupied with the surveying of crown woods, especially in Surrey, Berkshire and Devon, and with the writing of his works on forest culture—*Considerations touching . . . raising . . . of Coppices*, and . . . *Relation of . . . Proceedings upon . . . Commission concerning new forests*, to which he added in 1613 his *Observations concerning Crown Lands and Woods* (see Egerton MSS. 806; Ashmole MSS. 1148; and Lansdowne MSS. 165). In 1612 he was made surveyor of the royal castles in Kent, Surrey, Sussex, Hampshire, Berkshire, Dorset, Wiltshire, Somerset, Devon and Cornwall; in 1616 and 1617 he appears surveying the soke of Kirketon in Lindsey, as well as various manors and lands belonging to Prince Charles, afterwards Charles I. (see Cambridge University Library, Ff. iv. 30; London, British Museum Addit. MSS. 6027); his last works were a survey of Sheriff Hutton manor, Yorks, in 1624 (Harl. MSS. 6288), and *England, an intended guide for English travellers*, a series of tables to accompany Speed's county maps, executed in 1625, shortly before his death.

Norden's maps of London and Westminster (in his *Speculum Britanniae* of 1593) are the best representations known of the English metropolis under the Tudors; his maps of Middlesex (also from the *Spec. Brit.* of 1593), of Essex (1594, 1840), of Hertfordshire (1598, 1723) and of Cornwall (published in 1728; see above) are also noteworthy; in the last-named the roads are indicated for the first time in English topography. Norden also executed maps of Hampshire, Hertfordshire, Kent, Middlesex, Surrey and Sussex, for the fifth edition (1607) of Camden's *Britannia*, also maps of Middlesex, Essex, Sussex, Surrey and Cornwall for J. Speed (1610). Several important cartographical works of his are lost: *e.g.* his *Map . . . of . . . Battles fought in England from . . . William the Conqueror to . . . Elizabeth*, in 16 sheets, formerly in the Bodleian Gallery, Oxford, of which some part is probably preserved in the *Invasions of England*, an appendix to the *Prospect of the most Famous Parts of the World*, by J. Speed (1635); and his *View of London*, in 8 sheets, made *c.* 1604–1606, and *View of London Bridge*, published in 1624; in the Crace collection at the British Museum is an earlier *View of London* by Norden (1600), and an 1804 reprint of the *View of London Bridge*; a map of Surrey by Norden, said to have been copied by Speed and Kip in Camden's *Britannia* of 1607, has also disappeared.

Besides the works noticed above, see the accounts of Norden by C. Bateman in *Speculum Britanniae, pars Cornwall* (1728), and by Sir H. Ellis in *Spec. Brit., pars Essex* (Camden Society, 1840); also H. B. Wheatley in Harrison's *Description of England* (New Shakspere Society, 1877), and C. H. Coote's article in the *Dict. Nat. Biog.* (C. R. B.)

NORDEN, a town of Germany, in the Prussian province of Hanover, 4 m. from the North Sea and 20 m. by rail N. of Emden. Pop. (1905) 6717. It has a 16th-century town hall and its parish church was built in 1445. Gin, sugar, chocolate, yeast, beer, tobacco and machinery are manufactured. Norddeich, a small port 4 m. N.W., is the shipping place for passengers bound for Norderney. Norden was first mentioned in 842.

NORDENSKIÖLD, NILS ADOLF ERIK, BARON (1832–1901), geographer and Arctic explorer, was born at Helsingfors, 18th November 1832. His ancestors came originally from Sweden, but for some generations had been settled in Finland. His father, Nils Gustav Nordenskiöld, was both a mineralogist and a traveller. Nordenskiöld entered the university of Helsingfors in 1849, and applied himself specially to chemistry and mineralogy. In 1853 he accompanied his father to the Ural Mountains and studied the iron and copper mines at Tagilsk. On his return he received minor appointments both at the university and the mining office, but an unguarded speech at a convivial entertainment in 1855 drew the attention of the Russian authorities to his political views, and led to his dismissal. He then visited Berlin, continuing his mineralogical studies, and in 1856 obtained the Alexander travelling stipend at the university of Helsingfors and planned to expend it in geological research in Siberia and Kamchatka. Before starting he took his master's and doctor's degrees (1857), but he again aroused the suspicion of the authorities, so that he was forced to leave the country and was deprived of the right of ever holding office in the university. Settling at Stockholm he thenceforward became practically a Swedish citizen. He soon received an offer from Otto Torell, the geologist, to accompany him on an expedition to Spitsbergen. To the observations of Torell on glacial phenomena Nordenskiöld added the discovery at Bell Sound of remains of Tertiary plants, and on the return of the expedition he received the appointment of professor and curator of the mineralogical department of the Swedish State Museum. In 1861 he took part in Torell's second Spitsbergen expedition, which yielded even more important geological results. Of the further expedition to the same quarter promoted by the Swedish academy of science in 1864, Nordenskiöld was the leader. Three years later, chiefly through the support of the Swedish government and Oscar Dickson, who contributed largely towards the later expeditions of 1872 and 1875, he headed a well-organized expedition in the iron steamer "Sofia," and reached the highest northern latitude (81° 42′) then attained in the eastern hemisphere. Arctic exploration had now become his all-absorbing object in life, and in 1870, with three young naturalists, he visited the vast inland ice-sheet of Greenland. His next expedition in 1872 did not answer expectation, for the tenders were caught in the ice, and the crews of the three vessels were forced to winter in Spitsbergen. In 1875–1876, however, a successful voyage eastwards, including the ascent of the Yenisei, led him to attempt the discovery of the long-sought North-East Passage. This he accomplished in the voyage of the "Vega," navigating for the first time the northern coasts of Europe and Asia. Starting from Karlskrona on the 22nd of June 1878, the "Vega" doubled Cape Chelyuskin in the following August, and after being frozen in at the end of September near Bering Strait, completed the voyage successfully in the following summer. He edited a monumental record of the expedition in five octavo volumes, and himself wrote a more popular summary in two volumes.

On his return to Sweden he received an enthusiastic welcome, and in April 1880 was made a baron and a commander of the Order of the Nordstjerna. In 1883 he again visited the east coast of Greenland, and succeeded in taking his ship through the great ice barrier, a feat attempted in vain during more than three centuries. Baron Nordenskiöld also made a notable reputation

in the field of historical geography by his *Facsimile Atlas* (1889) and *Periplus* (1897). The former contains reproductions of the most important geographical documents printed during the 15th and 16th centuries, and the latter, a work of far greater research, deals with the history of early cartography and the sailing charts in use among mariners during the middle ages. He died at Stockholm on the 12th of August 1901.

NORDERNEY (*i.e.* "northern island"), an island of Germany, in the North Sea, the largest of the East Friesland group, belonging to the Prussian province of Hanover. Pop. (1905) 3888. It is 8 m. long and about 1½ m. broad, and supports a seafaring and fishing population. It is reached by steamer from Geestemünde, Emden, Bremen or Hamburg, and at low tide by road from the mainland. The village at the S.W. end of the island is one of the most popular sea-bathing places in Germany, and is visited annually by some 26,000 visitors. On the S. side rises a lighthouse 175 ft. high, while the E. end of the island is filled with sand dunes ranging in height from 50 to 75 ft. Norderney is immortalized by its association with Heinrich Heine's *Nordseebilder*.

See Berenberg, *Das Nordseebad Norderney* (Norden, 1895); C. Herquet, *Geschichte der Insel Norderney 1398–1711* (1890); and the article FRISIAN ISLANDS.

NORDFJORD, an inlet of the west coast of Norway, penetrating the land for 50 m in an easterly direction, its mouth being 115 m. by sea N. of Bergen (61° 50′ N.). No part of Norway affords finer scenery than the inner ramifications of this fjord among the snowy mountains of the northern Jostedalsbrae. Driving-roads penetrate the mountains from Visnaes eastward to the Gudbrandsdal, from Utvik southward to Vadheim on the Sogne Fjord, and from Faleide northward to Hellesylt (Geiranger Fjord) and Öje (Jorundsfjord). Nordfjordeid is a large village on the outer fjord, at the mouth of Hornindalen. Olden and Loen are other favourite centres on the inner part of the fjord. A small but powerful breed of horses is peculiar to the Nordfjord district.

NORDHAUSEN, a town of Germany, in the province of Prussian Saxony. It is situated on the Zorge at the south base of the Harz Mountains, and at the west end of the Goldene Aue (Golden Plain), a fruitful valley watered by the Helme, 60 m. by rail W. of Halle, on the main line to Frankfort-on-Main and Cassel, and at the junction of railways to Erfurt and Blankenheim. Pop. (1885) 27,083; (1905) 29,882. It is built partly on the slope of the mountains and partly on the plain, and the upper and lower parts of the town are connected by flights of steps. Among its eight churches the most noteworthy are the Roman Catholic cathedral, late Gothic with a Romanesque crypt, and the Protestant church of St Blasius, containing two pictures by Lucas Cranach. Near the medieval town hall stands a Roland's column, the ancient symbol of free commercial intercourse and civic liberty. The town has a museum of antiquities and various public monuments, notably a fountain by Ernst Rietschel in the corn market, and another to Luther in the market square. There are statues of the emperor Frederick III. and of Prince Bismarck. The chief importance of the place arises from its distilleries, which annually yield about 10,000,000 gallons of "Korn Schnapps," a spirit somewhat akin to whisky. The breweries are also important and there are manufactures of leather, tobacco and cigars, cotton, linen goods, carpets, chicory, malt and chemicals. Nordhausen is sometimes called the Cincinnati of Germany on account of its extensive export trade in pork, corned beef, ham and sausages. There is also a large trade in corn.

Nordhausen is one of the oldest towns in North Germany. It possessed a royal palace in 874 and a convent was founded here in 962. It was destroyed by Henry the Lion, duke of Saxony, in 1180, but was soon rebuilt and was made a free imperial town in 1253. In this and the following century several diets and other assemblies were held here. The protector (*Vogt*) of the town was the elector of Saxony and later for a few years (1702–1715) the elector of Brandenburg. Nordhausen accepted the reformed doctrines in 1522. It was annexed by Prussia in 1803 and again in 1815, having in the meantime belonged to the kingdom of Westphalia.

See Förstemann, *Urkundliche Geschichte der Stadt Nordhausen bis 1250* (Nordhausen, 1828–1840) and *Kleine Schriften zur Geschichte der Stadt Nordhausen* (Nordhausen, 1855); Lesser, *Historische Nachrichten von Nordhausen*, edited by Förstemann (Nordhausen 1860); J. Schmidt, *Bau- und Kunstdenkmäler der Stadt Nordhausen* (Halle, 1886); T. Eckart, *Gedenkblätter aus der Geschichte der ehemaligen freien Reichsstadt Nordhausen* (Leipzig, 1895); Heine, *Nordhausen und Preussen* (Nordhausen, 1902); and Girschner, *Lokalführer für Nordhausen und Umgebung* (1891).

NORDICA, LILIAN (1859–), American operatic soprano, *née* Norton, was born at Farmington, Maine, and trained as a singer at Boston, and later at Milan. As Madame Nordica she made her operatic début at Brescia in 1879, and from that time took high rank among the prima donnas, appearing in all the principal capitals in Europe, and also in America.

NORDIN, CARL GUSTAF (1749–1812), Swedish statesman, historian and ecclesiastic. In 1774 he was made *docent* of Gothic antiquities at Upsala University in consequence of his remarkable treatise, *Monumenta svio-gothica vetustioris aevi falso meritoque suspecta*. Summoned to Stockholm in 1782 by Gustavus III. to edit a Swedish *Corpus diplomaticum*, half an hour's private conversation with the young priest convinced Gustavus that Nordin's proper place was by his side in the political arena. But he employed Nordin quite differently from his episcopal colleague Olaf Wallqvist. While the bishop publicly defended the royal measures, Nordin became the king's private adviser. In politics Nordin was a royalist from pure conviction. To him a parliament seemed little better than a mob. He was one of the king's secret managers during the troublesome and dangerous *riksdag* of 1789, but advised caution and compared the estate of clergy, which at one time held the balance between the jarring orders, to ice which might be walked upon but could not be driven over. He was appointed a member of an ecclesiastical commission for reforming the church in 1787, in which capacity he was virtually minister of public worship. In 1791–1792 he became a leading member of the financial and general committees of the *riksdag*. After the king's death Nordin shared in the general disgrace of the Gustavians and lived in retirement at the little town of Hernösand, where he held the post of *lector* at the gymnasium. But he reappeared prominently on the political scene during the *riksdag* of 1800, and in 1805 was consecrated bishop of Hernösand. Though he lacked the brilliant qualities of his rival Wallqvist, Nordin had the same alertness and penetration, and was infinitely more stable and disinterested. One of the most learned men of his day, he devoted his spare time to history, and discovered that many of the oldest and most cherished Scandinavian MSS. were clever forgeries. Like Jean Hardouin he got to believe that a great deal of what is called classical literature was compiled by anonymous authors at a much later date, and he used frequently to startle his colleagues, the Gustavian academicians, by his audacious paradoxes.

He left behind him a colossal collection of MSS., the so-called *Nordinska Samlingarna*, which were purchased and presented to Upsala university by Charles XIV. and form the groundwork of the well-known *Scriptores rerum Suecicarum medii aevi*. Nordin published during his lifetime *Handlingar till upplysning af svenska krigshistorien* (Stockholm, 1787–1788). His academical addresses came out at Stockholm in 1818 under the title *Minnen öfver namnkunniga svenska män*. His *Dagbok* did not appear till 1868.

See *Sveriges historia* (Stockholm, 1877, &c.), vol. v.; C. T. Odhner, *Sveriges politiska historia under Gustaf III.'s regering* (Stockholm, 1885, &c.); R. N. Bain, *Gustavus III.* vol. 2 (London, 1896).

NÖRDLINGEN, a town of Germany, in the kingdom of Bavaria, on the Eger, 40 m. N. of Augsburg by rail and at the junction of lines to Buchloe and Dombühl. Pop. (1905) 8512. It was formerly a free imperial town, owning a territory 35 sq. m. in extent, and is still surrounded with walls and towers. The Evangelical church of St George is a Gothic structure erected in the 15th century and restored in 1880. It has paintings by Hans Schäufelein, who was a native of Nördlingen, and a tower 290 ft. high. The Late Gothic town hall has a collection of pictures and antiquities. The chief manufactures of the town

are linen goods, soap, malt, and agricultural implements, and a brisk trade is carried on in cattle, grain and geese. From 898, when first mentioned, to 1215 Nördlingen was subject to the bishops of Regensburg, but about 1215 it became a free city of the Empire. It was annexed to Bavaria in 1803.

Nördlingen was the scene of two great battles in the Thirty Years' War (*q.v.*). In the first, which was fought on the 5th and 6th of September 1634, the hitherto invincible Swedish army, commanded by Duke Bernhard of Saxe Weimar and Marshal Horn, was defeated with great loss by a somewhat superior army of Imperialists and Spaniards under General Gallas, Horn and 3000 men being made prisoners and 6000 killed or mortally wounded. In the second battle, fought eleven years later (3rd August 1645), Condé (then duke of Enghien) and Turenne were the leaders on the one side, and Mercy and Johann von Weert, the dashing cavalry commander whose onset had decided the battle of 1634, on the other. The Germans were posted some 5 m. to the east of Nördlingen, about Allerheim, with their right resting on a hill and the left on a castle, the guns with an infantry escort being placed on these points, and the village itself in the centre being also garrisoned and entrenched. In rear of the village the plain was occupied by Mercy's army in the customary two lines, foot in the centre, horse in the wings. The French army, similarly arrayed, but with a few battalions attached to the cavalry wings, was more heterogeneous than the German, being composed of French, Hessian, German mercenaries, and Liégeois. After a cannonade in which it suffered more severely than its entrenched enemy, the French centre furiously attacked the village of Allerheim; the fighting here was very heavy, and on the whole in favour of the Germans, although Mercy was killed. The right wing of the French cavalry was swept off the field by Johann von Weert's charge, but the German troopers, intoxicated with success, dispersed to plunder. On the French left, meanwhile, Turenne saved the day. Fighting cautiously at first with his leading line to gain time for his second to come up, he then charged and broke up the hostile right wing of cavalry, while some battalions of infantry scaled the hill and captured the Bavarian guns. Unlike Weert the marshal kept his troops in hand, and swung round upon the Bavarian infantry behind Allerheim, who were at the same time cannonaded by their lost guns. A prolonged fight now ensued, in which the Bavarians had the worst of it, and Weert, returning at last to the field, dared not attempt to engage afresh. The armies faced one another all night with their sentries fifty paces apart, but in the morning the Bavarians were found to have retreated. Nothing was gained by the victors but the trophies and the field of battle, and the losses of both sides had been enormous. Enghien had only 1500 of his foot in hand next day. Nördlingen, therefore, is a classical instance of the unprofitable and costly *bataille rangée* of the 17th century.

See Beyschlag, *Geschichte der Stadt Nördlingen* (Nördlingen, 1851), and Mayer, *Die Stadt Nördlingen, ihr Leben und ihre Kunst im Lichte der Vorzeit* (Nördlingen, 1856).

NORE, THE, a sandbank at the mouth of the river Thames, England, marked by various buoys and by a lightship, with revolving light. This ship lies 3 m. from the nearest point on the Kent coast, about the same distance from the Essex coast, and 47¾ m. below London Bridge. The first light was placed here as an experiment by Mr Hamblin, its patentee, in 1731. In 1797 the neighbouring anchorage was the scene of a mutiny in the British fleet then lying here, well known in history as the Mutiny of the Nore.

NORFOLK, EARLS AND DUKES OF. The 1st earl of Norfolk was RALPH DE GUADER, a follower of William the Conqueror, who forfeited the earldom when he revolted against William in 1075; the 2nd was HUGH BIGOD (d. 1177), one of Stephen's supporters, to whom the earldom was granted by this king before 1141. Hugh's grandson, HUGH (d. 1225), the 3rd earl of this line, married Matilda, daughter of William Marshal, earl of Pembroke, and from the Marshals their son ROGER 1270), the 4th earl, inherited the office of marshal of England. This powerful family of Bigod retained the earldom until ROGER, the 5th earl, died childless in December 1306.

The next earl of Norfolk was THOMAS OF BROTHERTON (1300–1338), a younger son of Edward I., to whom the earldom was granted in 1312 by his half-brother, Edward II. In addition to the estates which had formerly belonged to the Bigods Thomas received the office of marshal. He joined Queen Isabella when she landed in England in 1326, and was one of the group of nobles who brought about the deposition of Edward II. He died in August 1338, leaving no son. The survivor of his two daughters, Margaret (*c.* 1320–1400), who was countess of Norfolk in her own right, married John de Segrave, 3rd Lord Segrave (d. 1353), and their only child Elizabeth (d. *c.* 1375) became the wife of John de Mowbray, 4th Lord Mowbray (d. 1368), and the mother of two sons John and Thomas. In 1397 the countess Margaret was created duchess of Norfolk, and at the same time her grandson Thomas Mowbray was made duke of Norfolk.

THOMAS MOWBRAY, 1st duke of Norfolk (*c.* 1366–1399), became Baron Mowbray and Baron Segrave when his elder brother John died in February 1382; about the same time Richard II. created him earl of Nottingham, a title held by his dead brother, and in 1385 made him marshal of England for life. For some years he enjoyed the favour and companionship of the king, but differences arose between them, and in 1387 Nottingham began to act with Thomas of Woodstock, duke of Gloucester, his own brother-in-law, Richard Fitzalan, earl of Arundel, and the party of nobles who wished to deprive the king of his power. They routed the royal favourite Robert de Vere, earl of Oxford, at Radcot Bridge, and Richard was at their mercy. Owing partly to Nottingham's moderate counsels the suggestion to depose him was not carried out, but in the "merciless parliament" of 1388 his favourites were "appealed" of treason and were sentenced to death. For nearly two years the chief power was in the hands of the lords appellant, as Nottingham and his friends were called, but in 1389 the king regained his authority. He detached Nottingham from his colleagues and made him warden of the Scottish marches; later he became captain of Calais and the royal lieutenant in the north-east of France. Richard took him to Ireland in 1394 and soon afterwards sent him to arrange a peace with France and his marriage with Isabella, daughter of King Charles VI. But the earl's supreme service to the king was in 1397 when Richard took a tardy but severe vengeance upon three of the appellants. In their turn these lords were "appealed" of treason before the parliament, and as on the former occasion Nottingham was one of the accusers. He was present when Gloucester was arrested at Pleshey, and Froissart says that he actually beheaded Arundel himself. Gloucester was entrusted to his keeping at Calais, and in September 1397 he reported that his prisoner was dead. The duke had been murdered, and Nottingham was probably responsible, although the evidence against him is not conclusive. As a reward he received most of Arundel's lands in Surrey and Sussex, and was created duke of Norfolk. He now began to fear for his own safety, and took the duke of Hereford, afterwards King Henry IV., into his confidence. Hereford carried his words to the king, who summoned him to his presence, and at Oswestry Norfolk accused Hereford of speaking falsely. A court of chivalry decided that the dispute should be referred to the arbitrament of single combat and Coventry was the place appointed for the duel; but when on the 16th of September 1398 everything was ready for the fight Richard interposed and ordered both combatants into banishment. Norfolk was deprived of his offices, but not of his titles; his "heavier doom" was exile for life, and he was ordered to confine himself to Germany, Hungary and Bohemia. At once he left England for Dordrecht, and after passing some months in wanderings he reached Venice, where he died on the 22nd or 27th of September 1399. The concluding scene of the duke's life in England forms the staple material of act i. of Shakespeare's *Richard II.* Norfolk left estates in nearly all the English counties. His wife was Elizabeth (*c.* 1372–1425),

Mowbray Bros.

daughter of Richard Fitzalan, earl of Arundel, by whom he had two sons, Thomas and John, and two daughters.

His elder son, THOMAS MOWBRAY (1385–1405), became earl of Nottingham and earl marshal on his father's death, but he was not allowed to assume the title of duke of Norfolk. He quarrelled with Richard Beauchamp, earl of Warwick, over the precedence of their respective earldoms, and left the court in anger when Henry IV. decided in favour of Warwick. At this time (1405) Richard le Scrope, archbishop of York, and other northern potentates were preparing to rise against the king. The earl marshal joined them, was taken prisoner at Shipton Moor, and was beheaded at York on the 8th of June 1405.

JOHN MOWBRAY (1390–1432), 2nd duke, brother of the last-named, now became earl marshal and earl of Nottingham. He sat in judgment upon Richard, earl of Cambridge, and the other rebels in 1415, and went to France with Henry V. He took part in the siege of Harfleur, but illness prevented him from fighting at Agincourt. He saw service in France in subsequent years, and after Henry's death he was a member of the English governing council. In 1424 he followed Humphrey, duke of Gloucester, on his campaign in Hainaut, and in 1425 he secured his recognition as duke of Norfolk. He died on the 19th of October 1432 at Epworth, where his father had founded a Cistercian priory. By his wife Catherine, daughter of Ralph Neville, 1st earl of Westmorland, he left an only son, the 3rd duke.

JOHN MOWBRAY, 3rd duke (1415–1461), became warden of the Scottish marches; he also served as a soldier and an ambassador in France. Upon the outbreak of the fierce rivalry between the houses of York and Lancaster about 1450 he joined Richard, duke of York, to whom he was related; he aided the Yorkist cause in Norfolk and in London, and it was he who in November 1453 demanded an inquiry into the administration of Edmund Beaufort, duke of Somerset. In 1459 he appeared on the Lancastrian side and took the oath of allegiance to Henry VI. and to his son Edward at Coventry, but soon he was again figuring as an active Yorkist. He was a member of the deputation which in March 1461 asked the duke of York (Edward IV.) to take the crown, and he fought at the second battle of St Albans and also at Towton, where one authority says he saved the day for the Yorkists.

JOHN MOWBRAY, 4th duke (1444–1476), who had already been created earl of Surrey, a title formerly held by his ancestors, the Fitzalans, was the only son of the preceding. The names both of John and of his father appear frequently in the Paston Letters, as both dukes in turn seized Caister castle, which had been left by Sir John Fastolf to John Paston, and the 4th duke held it against the Pastons for some years. On his death in 1476 the dukedom became extinct, but the earldom passed to his daughter Anne (1472–1481), who married Richard, duke of York, the younger son of Edward IV. Richard was created duke of Norfolk and made earl marshal, but when he was murdered in 1483 the dukedom again became extinct, the earldom having reverted to the crown on the death of Anne.

Howard line.

The illustrious family of Howard (*q.v.*), members of which have been dukes of Norfolk from 1483 to the present day, with the exception of two periods during which the title was forfeited, was connected with the family of Mowbray.

JOHN HOWARD, 1st duke of Norfolk (*c.* 1430–1485), was the son of Sir Robert Howard by his wife Margaret, daughter of Thomas Mowbray, the first duke of that family. In 1455 John Howard was sent to parliament as member for Norfolk, although he "hadde no lyvelode in the shire"; in 1461 he was knighted; and in 1470, although he appears to have been a consistent Yorkist, he was created a baron by Henry VI. He was treasurer of the royal household from 1467 to 1474, and went to France with Edward IV. in 1475. After Edward's death, however, he supported Richard III., who created him duke of Norfolk and made him earl marshal of England in June 1483. He was killed at Bosworth whilst fighting for this king on the 22nd of August 1485, and the title thus suffered attainder. He is frequently mentioned in the *Paston Letters*.

His son, THOMAS HOWARD, afterwards 2nd duke (1443–1524), shared his father's fortunes; he fought at Barnet for Edward IV. and was made steward of the royal household and created earl of Surrey in 1483. Taken prisoner at Bosworth he was attainted and remained in captivity until January 1489, when he was released and restored to his earldom but not to the dukedom of Norfolk. He was then entrusted with the maintenance of order in Yorkshire and with the defence of the Scottish borders; he was made lord treasurer and a privy councillor in 1501, and he helped to arrange the marriage between Margaret, the daughter of Henry VII., and James IV. of Scotland. Henry VIII., too, employed him on public business, but the earl grew jealous of Wolsey, and for a short time he absented himself from court. He commanded the army which defeated the Scots at Flodden in September 1513, and was created duke of Norfolk in February of the following year, with precedency as of the creation of 1483. In his later years Norfolk worked more harmoniously with Wolsey. He was guardian of England during Henry's absence in France in 1520, and he acted as lord high steward at the trial of his friend Edward Stafford, duke of Buckingham, in 1521. Among his sons were William, 1st Lord Howard of Effingham, and Sir Edward Howard (*c.* 1477–1513), lord high admiral, who defeated the French fleet off Brest in August 1512, and lost his life during another engagement in April 1513.

THOMAS HOWARD, 3rd duke (1473–1554), eldest son of the 2nd duke, married in 1495 Anne (1475–1512), daughter of Edward IV., thus becoming a brother-in-law of Henry VII., who had married Anne's sister Elizabeth. He became lord high admiral in 1513, and led the van of the English army at Flodden in September, being created earl of Surrey in February 1514. In 1513 he took for his second wife Elizabeth (d. 1558), daughter of Edward Stafford, duke of Buckingham. In 1520 Surrey went to Ireland as lord-deputy, but soon vacated this post to command the troops which sacked Morlaix and ravaged the neighbourhood of Boulogne in 1522; afterwards he raided and devastated the south of Scotland. He succeeded his father in May 1524, and as the most powerful nobleman in England he headed the party hostile to Cardinal Wolsey. He favoured the divorce of Henry VIII. from Catherine of Aragon, and the king's marriage with his niece Anne Boleyn. In 1529 he became president of the council, but in a few years his position was shaken by the fate of Anne Boleyn, at whose trial and execution he presided as lord high steward. But his military abilities rendered him almost indispensable to the king, and in 1536, just after the rising known as the Pilgrimage of Grace had broken out, he was despatched into the north of England; he temporized with the rebels until the danger was past, and then, as the first president of the council of the north, punished them with great severity. Sharing in the general hatred against Thomas Cromwell, Norfolk arrested the minister in June 1540. He led the English army into Scotland in 1542 and into France in 1544; but the execution of Catherine Howard, another of his nieces who had become the wife of the king, had weakened his position. His son Henry Howard, earl of Surrey (*q.v.*), was arrested on a charge of treason; Norfolk himself suffered the same fate as accessory to the crime. In January 1547 Surrey was executed; his father was condemned to death by a bill of attainder, but owing to the death of the king the sentence was not carried out. Norfolk remained in prison throughout the reign of Edward VI., but in August 1553 he was released and restored to his dukedom. Again taking command of the English army he was sent to suppress the rebellion which had broken out under Sir Thomas Wyat, but his men fled before the enemy. He acted as lord high steward at the trial of John Dudley, duke of Northumberland; and he died on the 25th of August 1554. Norfolk was a brutal and licentious man, but was a supporter of the Roman church, being, as he himself admits, "quick against the sacramentaries." As a soldier he was serviceable to Henry VIII., but as a diplomatist he was a failure, being far inferior to Wolsey and to Cromwell. He had two sons, Henry, earl of Surrey, and Thomas (*c.* 1528–1582), who in 1559 was created Viscount Howard of

Bindon, a title which became extinct in 1611. His only daughter Mary (d. 1557) married Henry, duke of Richmond, the natural son of Henry VIII.

THOMAS HOWARD, 4th duke (1536–1572), son of Henry Howard, earl of Surrey, was born on the 10th of March 1536. His tutor was John Foxe, the martyrologist. Soon after Elizabeth became queen in 1558 she sent the young duke to take part in the war against the Scots and their French allies, but the conclusion of the treaty of Edinburgh in July 1560 enabled him to return to the court in London. Having married and lost three wives, all ladies of wealth and position; Norfolk was regarded as a suitable husband for Mary queen of Scots, who had just taken refuge in England. He presided over the commission appointed by Elizabeth to inquire into the relations between the Scottish queen and her subjects; and although he appears to have believed in Mary's guilt he was anxious to marry her. Among the Scots Maitland of Lethington favoured the proposed union; Mary herself consented to it; but Norfolk was unwilling to take up arms, and while he delayed Elizabeth ordered his arrest and he was taken to prison in October 1569. In August 1570, after the suppression of the rising in the north of England, the duke was released; but he entered into communication with Philip II. of Spain regarding the proposed invasion of England by the Spaniards. After some hesitation Norfolk placed himself at the head of the conspirators; and in return for his services he asked the king of Spain "to approve of my own marriage with the Queen of Scots." But the plot failed; Norfolk's treachery was revealed to Lord Burghley, and in September 1571 he was arrested. He was beheaded on the 2nd of June 1572. It is noteworthy that he always regarded himself as a Protestant. Norfolk's first wife, Mary (1540–1557), daughter and heiress of Henry Fitzalan, 12th earl of Arundel, bore him a son, Philip, who in consequence of his father's attainder was not allowed to succeed to the dukedom of Norfolk, but became 13th earl of Arundel in succession to his maternal grandfather in 1580. Norfolk left two other sons, Thomas Howard, created earl of Suffolk in 1603, and Lord William Howard (*q.v.*).

In 1660 the dukedom was restored by act of parliament to THOMAS HOWARD, 4th earl of Arundel (1627–1677), a descendant of the 4th duke. The 5th duke was succeeded by his brother Henry (1628–1684), the friend of John Evelyn, who had been already created earl of Norwich; in 1672 he was made earl marshal, and this dignity was entailed on his male heirs.

CHARLES HOWARD, 11th duke (1746–1815), was the son of Charles Howard (1720–1786), who succeeded his cousin, Edward Howard (1686–1777), as 10th duke of Norfolk in 1777, and who wrote *Historical Anecdotes of some of the Howard Family* (1769 and 1817). Born in March 1746, the earl of Surrey, as Charles was called from 1777 until he became duke of Norfolk in 1786, represented Carlisle in the House of Commons, where he acted with the Whigs; unlike his father he was a Protestant. In 1780 he was a lord of the treasury. In 1789 at a dinner held in London the duke gave the toast "Our sovereign's health—the majesty of the people"; this greatly offended George III., who deprived him of some of his public offices.

When he died on the 16th of December 1815 he left no sons, and the dukedom passed to his kinsman, BERNARD EDWARD HOWARD (1765–1842), a descendant of the 4th duke.

Bernard's only son, HENRY CHARLES HOWARD (1791–1856), became 13th duke in 1842. As earl of Surrey he was the first Roman Catholic since the Reformation to sit in the House of Commons, of which he was a member from 1829 to 1841; as duke of Norfolk he was master of the horse from 1846 to 1852 and lord steward from 1853 to 1854. The second of his three sons, Edward George Fitzalan (1818–1883), was a member of the House of Commons from 1848 to 1868, and was created Baron Howard of Glossop in 1869. Lord Howard rendered great service to the cause of Roman Catholic education.

The 13th duke's eldest son, HENRY GRANVILLE FITZALAN HOWARD (1815–1860), succeeded to the title. He was a devoted Roman Catholic, left the Liberal party and resigned his seat in parliament rather than support the Ecclesiastical Titles Bill of 1850. He edited the *Lives of Philip Howard, earl of Arundel, and of Anne Dacres, his wife* (1857 and 1861). He was succeeded by his son Henry Fitzalan Howard, 15th duke (b. 1847), who was postmaster-general from 1895 to 1900, first Lord Mayor of Sheffield in 1895, went out to the South African War in 1900, and whose position as head of the English Roman Catholics and as premier duke and Earl Marshal made him for many years conspicuous in public life. His only son by his first wife, a daughter of Baron Donington, died in early life; but by his second marriage (1904) to the daughter and heiress of Lord Herries he had a son born in 1908.

NORFOLK, an eastern county of England, bounded N. and E. by the North Sea, S.E. and S. by Suffolk and W. by Cambridgeshire and Lincolnshire. The area is 2044·4 sq. m., the county being the fourth in size in England. The surface falls into two divisions. The eastern and central portions consist of an undulating plain with rising ground skirting the river valleys and low chalk downs in the north. For the most part this section is fertile and well wooded, but there are some expanses of heath land. The principal rivers are the Yare and its tributaries the Wensum, Bure and Waveney, the last forming a large part of the boundary with Suffolk. In the west the county includes part of the Fen country (*q.v.*), where the principal rivers are the Great Ouse and its tributaries the Little Ouse or Brandon river, which also forms part of the Suffolk boundary, the Wissey and the Nar. The flat fens are crossed by innumerable drainage channels. They are comprised within that portion of the whole district known as the Bedford Level, and extend from Welney and Hilgay Fens near the junction of the Great and Little Ouse northward to the Wash.

The watershed is nearly in the centre of the county. The middle eastern portion is a low-lying flat area lifted slightly towards the coast in such a way that some of the tributary streams of the Bure rise very near the sea but flow at first inland or parallel to the coast. Here occur the well-known *Norfolk Broads*, shallow meres, having their low banks massed with luxuriant reeds and other water-plants, and possessing much quiet beauty of an individual character. Most of them abound with pike, bream and other coarse fish, and harbour innumerable waterfowl, including the water-hen, heron, bittern, king-fisher, mallard, teal and snipe. They are thus frequented by sportsmen, but still more by boating parties, and at Yarmouth, Wroxham Bridge, Acle and elsewhere sailing boats with cabins, and other boats, are hired in large numbers. Annual regattas are held on several Broads. The Broads are generally not widenings of the main river, but are connected with it by short channels. Their formation is probably due to a slight uprising of the land, whereupon the depressions in the undulated surface continued to carry water. The average depth of the Broads is only some eight feet, and their tendency is to become choked with sedges and bulrushes and to decrease in size. The Bure joins the Yare at Yarmouth, at the seaward end of Breydon Water, which does not rank among the Broads. Following the Bure upwards, a small stream is found uniting it with Filby, Rollesby and Ormsby Broads to the north, which form one sheet of water of irregular shape. The Thurne stream then enters from the same direction, draining Heigham Sound, Hickling Broad, Horsey Mere and Martham Broad. The second of these is the largest of all, measuring some 3 m. in length by one at its widest part. The next tributary, the Ant, drains Barton and Stalham Broads. Closely adjoining the upper Bure itself, there are Ranworth Broad, Horning Broad, and Salhouse, Hoveton and Wroxham Broads almost adjoining. South of Ranworth, on a tributary, is South Walsham Broad. Adjacent to the Yare towards Norwich is Rockland Broad. Between the Waveney and Lowestoft Oulton Broad is formed (in Suffolk; see LOWESTOFT).

Nearly two-thirds of the boundary of the county is formed by tidal water. There are few bays or inlets, and on the northern coast no river mouths. For the most part the coast-line is flat and low, and has been greatly encroached on by the sea, several villages having been engulfed since the Conquest. From the

mouth of the Yare to Happisburgh the shore is skirted by sand-banks. Thence for 20 m. it is formed of cliffs consisting of clay and masses of embedded rocks, the average height being about 50 ft., although in some cases an altitude of 200 ft. is reached. These cliffs are succeeded by a low shingly or sandy coast stretching as far as St Edmund's Point. The shores of the Wash are formed of mudbanks, which are left dry at low water. West of Lynn a considerable extent of land has been reclaimed from the sea in modern times, and farther south an old Roman embankment stretches into Lincolnshire. At various points off the coast there are submarine forests, especially in Brancaster Bay and in the neighbourhood of Cromer and Happisburgh. Fossilized remains of large mammals are sometimes dragged up by the nets of fishermen, and mammoth tusks measuring from 6 to 9 ft. have been found at Knole Sand off Happisburgh. The fine sandy beaches and healthy climate have contributed to the growth of such popular watering-places as Cromer, Yarmouth and Hunstanton, while Mundesley and Wells-next-the-Sea are lesser resorts.

Geology.—The prevailing rock formation in Norfolk is the Chalk, which occupies a broad tract in the central and western portions of the county and underlies the Tertiary deposits in the eastern part, the general dip of the rocks being towards that direction. Pliocene beds predominate in the eastern third of the county; while a narrow belt of Lower Cretaceous and Jurassic rocks lies along the western border. Oxford Clay and Corallian beds have been proved by boring at Lynn, but the oldest formation to appear at the surface is the Kimeridge Clay, which stretches along the coast of the Wash from Hunstanton to King's Lynn and south to Downham, where it has been dug for bricks and tiles. The Lower Greensand, which forms the picturesque escarpment overlooking the Fen-land and the Wash, is represented in its upper part by the brown, iron-stained sandstone, the Carstone (up to 40 ft.), locally known as the "Gingerbread stone," which is quarried at Snettisham and elsewhere as a building stone. Below the Carstone are the Snettisham Clay beds, dug for brick-making at that village and at Dersingham and Heacham; these pass southwards into sandstones and ironstones. The lowest division of the Greensand, the Sandringham beds, highly-coloured sands and sandstones, are exposed at Sandringham Warren, Downham Market and Grimston Common. Overlying the Lower Greensand is the Gault Clay which extends from Shouldham northwards to Dersingham, where it begins to change in character and finally passes into the Red Chalk (4 ft.), so conspicuous in the cliffs at Hunstanton. In the same cliffs the Lower Chalk is exposed resting on the Red Chalk (which does not belong to the Chalk proper but the Gault); it is a hard grey or white limestone; at Marham and other places it is quarried for building and for lime. The Middle Chalk (about 300 ft.), with flints in the upper part and occasional marl beds, is exposed at Docking, Hillington and Methwold. The Upper Chalk (about 800 ft.) is much softer, with many flints, including the peculiar forms known as "paramoudras"; it has been largely exploited for lime and whiting, and the flints have been worked from prehistoric times. Dressed flints are still used for facing walls in churches and other buildings. At Trimingham occurs the highest horizon of the Chalk known in England. Eocene strata, Reading Beds (46 ft.) and London Clay (310 ft.) have been proved to lie beneath younger deposits at Yarmouth. Pliocene deposits, sands, gravels and clays are exposed along the coast from Weybourne and Cromer to Happisburg and in the river valleys over most of the eastern part of the country. The lower subdivision, the Norwich Crag Series (25-100 ft.), exhibits numerous local peculiarities to which distinctive names have been applied, as the "Fluvio-Marine beds" of Bramerton and Thorpe, the "mammaliferous crag," the "Weybourne Crag" and the "Chillesford Clays," &c. The upper subdivision, the Cromer Forest-Bed (10-30 ft.), contains the bones of the mammoth, rhinoceros, giant beaver, sabre-toothed tiger and many others, as well as the transported stumps of trees. Next in order come the glacial clays, sands and gravels, which cover and obscure so much of the older stratified rocks of the county and hence greatly influence the scenery. There is a lower "till" with boulders and an upper chalky boulder clay, sometimes with sands and gravels between; glacial gravels overlie the clays in large sheets as at Norwich, Mousehold Heath, Dereham, Fakenham. The drift is thicker in the east than in the west—very interesting exposures occur on the cliffs about Cromer. Later valley gravels occupy some of the stream courses, and among the more recent deposits are the Fen beds and blown sands.

Climate and Agriculture.—On account of the exposed position of the coast to east and north-east winds, the climate, especially in winter and early spring, is much colder than in the adjacent counties. The air is, however, generally dry, and unhealthy fogs are not common, except in the marshy districts. The *cynd* is a characteristic mist which sometimes rolls up like smoke from the sea over the eastern parts. Norfolk contains a greater variety of soil than any other county in England. In the north and west the soil is generally chalky; towards the south-east it is a light sand, assuming occasionally the form of blowing sand, but elsewhere capable of cultivation and of average fertility. In the centre and east the prevailing soil is loam, chiefly light and workable, but sometimes composed of stiff chalky boulder clay. Alluvial clays and loams occur on the borders of Lincolnshire and Cambridgeshire, and stretch along the river valleys. The marsh lands along the coast are subject to inundation, but afford capital pasturage. Farming is in an advanced condition, and, by means of draining, subsoil ploughing, &c., excellent crops are raised. The farms are for the most part large and the farm buildings superior. About four-fifths of the total area is under cultivation. Of this area corn crops occupy some two-fifths and consist mainly of wheat and barley, but in the production of oats also Norfolk is one of the first counties in England. As much attention is paid to the grazing of cattle and to the rearing and fattening of sheep, turnips and swedes are extensively grown. Large numbers of lean cattle, principally Irish shorthorns, are brought into the county mainly for winter grazing. The old Norfolk polled stock is recognized as a distinct breed. Good pasture lands are found in many districts of the county, especially along the river-beds and near the fens. A large acreage is under beans and a fair quantity of small fruit is grown.

Other Industries.—At an early period Norfolk was one of the principal seats of the cloth trade in England, worsted deriving its name from having been first manufactured at Worstead. The weaving of silk and wool is still carried on at Norwich and also shawl weaving, although the staple trade of the town is now boots and shoes. Silk is also manufactured at Yarmouth, Wymondham and North Walsham. Flour-mills are numerous all over the county, and there are agricultural implement works at Norwich, Lynn, Thetford, East Harling, North Walsham, Walsingham, and East Dereham. Lime-burning, brick-making, tanning, malting and brewing are carried on in various districts. There are extensive mustard and starch works at Norwich. One of the chief hindrances to commercial progress is the dangerous nature of the sea-coast, and the lack of harbours. A large trade, however, is carried on at Yarmouth. The other principal port is Lynn, and there is a small trade at Cromer and Wells.

Railway communication is provided principally by the Great Eastern railway, the principal lines of which are those from London and Ipswich to Norwich and Yarmouth, from Ely to Norwich and Yarmouth, Ely to Lynn, Lynn to Swaffham and Dereham, Norwich to Dereham and Wells and Norwich to Cromer. There are numerous branch lines. The Midland & Great Northern joint line, from Lynn, serves Cromer, Norwich, North Walsham and Yarmouth. The eastern rivers afford water communication with the port of Yarmouth and the Great and Little Ouse, with many of the drainage-cuts which are navigable, with Lynn.

Population and, Administration.—The area of the ancient county is 1,308,439 acres, with a population in 1891 of 454,516, and in 1901 of 460,120. The area of the administrative county is 1,314,612. The county contains 33 hundreds. The municipal boroughs are—King's Lynn (pop. 20,288); Norwich, a city and county borough and the county town (111,733); Thetford (4613); and Yarmouth, properly Great Yarmouth, a county borough (51,316). The urban districts are Cromer (3781), Diss (3745), Downham Market (2472), East Dereham (5545), Hunstanton (1893), North Walsham (3981), Sheringham (2359), Swaffham (3371), Walsoken (3250), Wells-next-the-Sea (2494). Among other towns may be mentioned Fakenham (2907), Holt (1844), Wymondham (4733). The county is in the south-eastern circuit, and assizes are held at Norwich. There are two courts of quarter sessions, and 25 petty sessional divisions. Each of the four municipal boroughs has a separate commission of the peace and a separate court of quarter sessions. The total number of civil parishes is 700. Norfolk is mainly in the diocese of Norwich, with small parts in those of Ely and Lincoln; it contains 607 ecclesiastical parishes or districts, wholly or in part. For parliamentary purposes the county is divided into six divisions (North-Western, South-Western, Northern, Eastern, Mid, and Southern), and also includes the parliamentary

boroughs of King's Lynn and Norwich, and part of the parliamentary borough of Great Yarmouth; each returning one member, except the city of Norwich, which returns two members.

History.—The district which is now Norfolk was invaded in the second half of the 5th century by Angle tribes from north Germany, who, having secured the coast districts, worked their way inland along the river valleys. In the 7th century the land of the North-folk formed the northern half of East Anglia which at the time owned the supremacy of Kent, and later appears successively as a dependency of Mercia and Northumbria, until in 827 the whole land was united under the rule of Ecgbert. In 867 the Danes under Inguar and Ubba defeated and killed King Edmund at Thetford, but, although it formed an integral part of the Danelaw, Norfolk remained thickly settled by an almost exclusively Teutonic population. In the renewed Danish attacks of the 11th century Norwich and Thetford were destroyed. At the time of the Norman invasion Norfolk formed part of Harold's earldom, but it offered no active resistance to the Conqueror, who built a castle at Norwich, and bestowed the earldom of East Anglia on Ralf Guader. The forfeited estates of Earl Ralf had passed at the time of the Domesday Survey to Roger Bigod, ancestor of the earls of Norfolk, whose line expired in 1306. The Norfolk fief of Count Alan later formed part of the honour of Richmond; Robert Malet's fief became the honour of Eye; Hermer de Ferrière's fief became the barony of Wormegay, afterwards held by the Bardolfs; Hugh de Montfort's fee, as the honour of Haughley, was afterwards attached to the office of constable of Dover. The Howards were settled in the county from the 13th century, Thomas Howard being created duke of Norfolk for his services at Flodden. Castle Acre was a seat of the earls of Warenne; Paston of the Pastons; Attleborough of the Mortimers; Caister of the Fastolfs.

The shire-system was not definitely established in East Anglia before the Conquest, but the Domesday boundaries of Norfolk were practically those of the present day. The thirty-six Domesday hundreds were subdivided into leets, of which no trace remains, and the boroughs of Norwich and Thetford ranked as separate hundreds, while Yarmouth was the chief town of three hundreds. The Domesday hundred of Emneth is now included in Freebridge, and Docking in that of Smithdon, and the boundary between Brothercross and Gallow hundred has been considerably changed. Norfolk and Suffolk were united under one sheriff until the reign of Elizabeth, the shire court for the former being held at Norwich. The hundred court of Humbleyard hundred was held in the parish of Swardeston; that of Clackclose at Clackclose hill on Stradsett common; Taverham at Frettenham Hill; Grimeshoe at a tumulus between Brandon and Norwich; Forehoe in the parish of Carleton Forehoe; Greenhoe by the tumuli on the London road to Swaffham; Smithdon in the parish of Bircham Magna; Freebridge at Flitcham Burgh, afterwards at an oak at Gaywood and still later at an oak at Wiggenhall St German's; Gallow in the 15th century at Fakenham; in the 16th century at Longfield Stone; Brothercross, at the cross by the ford over the Burnham; Eynsford at Reepham; Depwade, at the Deep ford over the Tas; Mitford, in 1639, at "Brokpit"; North Erpingham, at Guneby Gate, near Gunton; South Erpingham, at Cawston Park Gate; Launditch, at the crossing of the Norwich road with the long ditch between Longham and Beeston; Earsham, at an encampment near the church.

Norfolk formed part of the diocese of East Anglia from its foundation in 630, and in 1075 the bishop's see was placed at Thetford, whence it was transferred to Norwich in 1093. In 1121 the Norfolk portion of the diocese included the 12 deaneries of Norwich (or Taverham), Blofield, Ingworth, Sparham, Holt, Walsingham, Toftrees, Brisley, Breckles, Lynn, Thetford and Flegg—all in the archdeaconry of Norwich, and the 12 deaneries of Repps, Humbleyard, Depwade, Waxham, Brooke, Redenhall, Rockland, Cranwich, Fencham, Hitcham, Burnham and Hengham—in the archdeaconry of Norfolk. From this date the deaneries underwent little change, until the creation of the archdeaconry of Lynn in 1894, when they were entirely reconstituted.

In the wars between John and his barons Roger Bigod garrisoned Norwich castle against the king, who in 1216 on his retreat from Lynn lost his baggage in the Wash. In the rising of 1381 Norwich was plundered by the insurgents under Sir Roger Bacon of Baconsthorpe, and in the rising of 1549 against enclosures Norwich was again captured by the rebels under Ket. In the Civil War of the 17th century Norfolk as a whole adhered to the parliamentary cause, forming one of the six counties of the Eastern Association. Lynn, however, was held for the king by Sir Hamon Lestrange, and Norwich was one of the first cities to welcome back Charles II.

At the time of the Domesday Survey sheep-farming flourished almost throughout Norfolk, a flock of 1300 being mentioned at Walton, and horses were extensively bred; numerous beehives, nearly 600 water-mills and valuable river-fisheries are mentioned; and salt was made in the hundreds of Freebridge and East Flegg. The worsted trade was introduced by Flemish immigrants as early as the 12th century, and the woollen trade became especially prosperous in the hundreds adjoining the Wash. Linen was manufactured at Aylsham in the 14th century. Fuller, writing in the 17th century, describes Norfolk as abounding in all good things, and especially rabbits, herrings and worsteds. The leather industry flourished in Norman times.

Norfolk returned members to parliament in 1290, and in 1298 the county and the boroughs of Lynn, Norwich and Yarmouth returned each two members. Thetford acquired representation in 1529, and Castle Rising in 1558. Under the Reform Act of 1832 the county returned four members in two divisions, and Castle Rising was disfranchised. Under the act of 1868 the county returned six members in three divisions, and Thetford and Yarmouth were disfranchised, the latter for notorious corruption.

Antiquities.—There are few traces of Saxon architecture in the county, unless the towers of Dunham-Magna and Newton-by-Castleacre be assigned to this period. The round towers which are specially characteristic of the district are probably Norman. Although there are several fine specimens of Norman architecture in the county in addition to Norwich cathedral, and a few good examples of Early English, the majority of the churches are Decorated or Perpendicular, or a mixture of both styles. The most notable features of the churches are the flint and stone panels, the fine rood screens and the numerous brasses. The churches of the marshes in the N.W. are noteworthy, especially those of Tilney All Saints and Walsoken (Norman) and West Walton (Early English); the rich Norman church of Castle Rising should also be mentioned. At Northwold remains one of the rare Easter sepulchres. Apart from the churches in the towns, those of Worstead, Hingham, Cawston and Terrington St Clement may be quoted as typical examples of the numerous fine later Gothic village churches. Norfolk possessed an unusually large number of monastic foundations, but of these the remains are few and comparatively unimportant. The cathedral church of Norwich was originally connected with a very richly endowed Benedictine monastery. A foundation of almost equal importance was that of Augustinian canons at Walsingham, where there are remains of an Early English and Decorated church, a Decorated refectory and a Perpendicular gateway. The shrine of Our Lady of Walsingham was the resort of great numbers of pilgrims. Other monastic remains are Bromholm Priory near North Walsham; slight Early English fragments of Beeston Augustinian priory, W. of Cromer; good Norman and later remains at Binham (Benedictine) N.E. of Walsingham; the Benedictine nunnery of Carrow near Norwich; the fine church (Norman and later) of the Benedictine priory at Wymondham; and the remains at Castle Acre and Thetford.

Of Norman keeps there are remains of the building at Castle Acre; there is a magnificent ruin at Castle Rising N.E. of Lynn; and Norwich Castle is kept in restoration. There are several old mansions of interest, such as the Jacobean brick building of Blickling Hall, Barningham Hall (1612), Hunstanton, the moated Oxburgh Hall, and Cressingham Manor, both of the 15th century. The larger mansions, however, such as Sandringham

(a seat of King Edward VII.), Holkham, Rainham, Costessey, Gunton, Houghton and Shadwell, are of more modern date. The Holkham estate was the scene of the agricultural work of Thomas William Coke, earl of Leicester (d. 1842), who successfully proved that wheat could be profitably grown in this part of the county, and also made great improvements in live stock. Among sites of other various interests are Burnham Thorpe, the birthplace of Nelson; Paston and Oxnead, successive seats of the Paston family whose Letters are famous; and Ket's Oak near Hethersett, W. of Norwich, where Robert Ket took oath as leader of the agrarian rebellion of 1549.

NORFOLK, a city of Madison county, Nebraska, U.S.A., on the north branch of the Elkhorn river, 2 m. from its mouth, and about 75 m. S.W. of Sioux City. Pop. (1900) 3883 (622 foreign-born); (1910) 6025. It is served by the Union Pacific, the Chicago & North Western (of which it is a division headquarters), and the Chicago, St Paul, Minneapolis & Omaha railways. The city is the seat of the Northern Nebraska Insane Asylum. Cereals, alfalfa and fruit are raised in the surrounding country. The site was first permanently settled in 1866. Norfolk was incorporated as a village in 1881 and chartered as a city in 1886; it became a city of the first class in 1909.

NORFOLK, a city and port of entry of Norfolk county, Virginia, U.S.A., on the northern side of the Elizabeth river (an arm of the Chesapeake Bay) and at the mouth of its eastern branch, and on the Albemarle and Chesapeake and the Dismal Swamp canals, about 90 m. S.E. of Richmond. Pop. (1890) 34,871; (1900) 46,624, of whom 1705 were foreign-born and 20,230 were negroes; (1910 census) 67,452. It is served by the Atlantic Coast Line, the Seaboard Air line, the Southern, the New York, Philadelphia & Norfolk, the Chesapeake & Ohio, the Norfolk & Western, the Norfolk & Southern and the Virginian railways, by many steamship lines, by ferry to Portsmouth (immediately opposite), Newport News, Old Point Comfort and Hampton, and by electric lines to several neighbouring towns. The Norfolk and Portsmouth Belt Line encircles the two cities, and connects the various trunk lines. Among the prominent buildings and institutions are the Custom House, the Federal Building, Marine Hospital, St Christopher's Hospital, St Vincent's Hospital, Norfolk Protestant Hospital, Sara Leigh Hospital, Norfolk Public Library, Norfolk Academy, Cotton Exchange, City Market, Bank of Commerce Building, Citizens' Bank Building, Board of Trade Building, Law Building, Virginia Bank & Trust Company Building, Norfolk National Bank, Atlantic Hotel, Monticello Hotel, Lynnhaven Hotel, Norfolk Mission College (Presbyterian) for negroes and the historic St Paul's church, which was built in 1737 and was struck by a cannon-ball and partly burned in 1776; in the yard is one of the oldest cemeteries in the country. Norfolk is the see of a Protestant Episcopal bishopric. The city has a public park of 110 acres and various smaller ones, and in the vicinity are several summer resorts, notably Virginia Beach, Ocean View, Old Point Comfort, Pine Beach and Willoughby Beach. The "Norfolk" navy yard is in the southern part of the city of Portsmouth. The harbour is deep, easily accessible through a channel 30 ft. in depth, and well protected by forts Monroe and Wool. The city has immense coal piers. It is the largest peanut market in the world, is in a great truck-gardening region, and makes large shipments of cotton (822,930 bales in 1905), oysters, coal, fertilizers, lumber, grain, fruits, wine, vegetables, fish and live stock. Norfolk is combined with Portsmouth in one customs district, the foreign trade of which in 1908 amounted to $11,326,817 in exports and $1,150,044 in imports. One of the most important manufacturing industries is grading, roasting, cleaning and shelling peanuts (in 1905 valued at $791,760). In 1900 the value of the factory products was $4,691,779; in 1905 it was $5,900,129, the city ranking third among the cities of the state in value of factory products.

Norfolk was founded in 1682 in pursuance of an act of the Virginia Assembly passed in 1680 to establish towns for the encouragement of trade; it was incorporated as a borough in 1736 by a royal charter, was chartered as a city in 1845, its charter being revised in 1882 and 1884, and received a new charter in 1906 (amended in 1908), under which there are a mayor (elected for four years), a common council, a board of aldermen and a board of control of three members, which has charge of public works, streets, sewers, drains and water supply, the police and fire departments, the work of the board of health, &c. Norfolk is administratively independent of Norfolk county. In 1906 the town of Berkley (incorporated in 1890; pop. in 1900, 4988) was annexed. During the War of Independence Norfolk was bombarded on the 1st of January 1776 by the British under John Murray, 4th earl of Dunmore (1732–1809); much of the town was burned by the American troops to prevent Dunmore from establishing himself here. In 1855 it suffered severely from yellow fever. At the outbreak of the Civil War the city was abandoned, and the navy yard was burned by the Federals in April 1861; Norfolk was then occupied until the 9th of May 1862 by Virginia troops, first under General William Booth Taliaferro (1822–1898) and later under General Benjamin Huger (1806–1877). Five miles from Norfolk and with Norfolk as its headquarters was held from the 26th of April to the 30th of November 1907 the Jamestown Ter-Centennial Exposition, celebrating the first permanent English settlement in America at Jamestown, Virginia.

NORFOLK ISLAND, an island in the Pacific Ocean, about 800 m. E. of the nearest point of New South Wales, in 29° S., 167° 56′ E. It stands on a submarine tableland extending about 18 m. to the N. and 25 m. to the S., and has itself an area of 8528 acres or 13·3 sq. m. The islets of Nepean and Philip lie near it. Its high cliff-bound coast is difficult of access. With a general elevation of 400 ft. above the sea the island rises in the N.W. to 1050 ft. in the double summit of Mount Pitt. The soil, of decomposed basalt, is wonderfully fertile. The rich undulating pasture-land with clumps of trees and copses resembles a park. Oranges, lemons, grapes, passion fruit, figs, pine-apples, guavas and other fruits grow abundantly; while potatoes, onions, maize and arrowroot can be cultivated. The Norfolk Island pine (*Araucaria excelsa*) is a magnificent tree, with a height sometimes exceeding 200 ft. and a girth of 30. A small species of palm is known as the Norfolk Island cabbage. Tree-ferns are abundant. The flora is most closely associated with that of New Zealand, and the avifauna indicates the same connexion rather than one with Australia, as those birds which belong to Australian genera are apparently immigrants, while those which occur on the island in common with New Zealand would be incapable of such distant migration. The climate is healthy, the thermometer rarely sinking below 65° F. The island is a station of the British Pacific cable. It was discovered in 1774 by Captain Cook, and was taken by Philip King of the "Stirling" and twenty-four convicts from New South Wales. This settlement was abandoned in 1805, but in 1826 the island was made a penal settlement from New South Wales. In 1856, 194 Pitcairn islanders took the place of the convicts. Forty of them soon returned to Pitcairn Island, and the remainder deteriorated owing to intermarriage. The administration of justice by an elected magistrate was unsatisfactory. Crime was rarely punished, and debts were not recoverable. A remedy was attempted in 1896 by an improvement in the government. The island was brought under the immediate administration of New South Wales; a chief magistrate, appointed by the governor of New South Wales, took the place of the elected magistrate, and an elected council of twelve elders superseded the general gathering of the adult population. In 1867 a Melanesian mission station was established at St Barnabas, and in 1882 a church was erected to the memory of Bishop Patteson, with windows designed by Burne-Jones and executed by William Morris.

NORICUM (*Noricus ager*), in ancient geography, a district bounded on the N. by the Danube, on the W. by Raetia and Vindelicia, on the E. by Pannonia, on the S. by Pannonia and Italy, corresponding to the greater part of the modern Styria and Carinthia, and part of Austria, Bavaria and Salzburg. The original population appears to have consisted of Illyrians, who after the great emigration of the Gauls became subordinate to various Celtic tribes, chief amongst them being the Taurisci, probably called Norici by the Romans from their capital Noreia (Neumarkt). The country is mountainous and the soil poor, but it was rich in iron, and supplied material for the manufactories of arms in Pannonia, Moesia and northern Italy. The famous Noric steel was largely used for the Roman weapons ("Noricus ensis," Horace, *Odes*, i. 16. 9). The inhabitants were a brave and warlike people, who paid more attention to cattle-breeding than to agriculture, although it is probable that the Romans, by draining the marshes and cutting down timber, increased the fertility of the soil. Gold and salt were also found in considerable quantities; the plant called *saliunca* (the wild or Celtic nard) grew in abundance, and was used as a perfume (Pliny, *Nat. Hist.* xxi. 20. 43). Noricum was the southern outpost of the northern or Celtic peoples and the starting-point of their attacks upon Italy. It is in Noricum that we first hear of almost all these Celtic invaders. Archaeological researches, particularly in the cemeteries of Hallstatt (*q.v.*), less than 40 m. from Noreia, have shown that for centuries before recorded history there was a vigorous civilization. The Hallstatt cemeteries contained weapons and ornaments from the Bronze age, through the period of transition, up to the fully-developed Iron age. Professor Ridgeway (*Early Age of Greece*, i. ch. 5) has made out a strong case for the theory that in Noricum and the neighbouring districts was the cradle of the Homeric Achaeans. For a long time the Noricans enjoyed independence under princes of their own, and carried on commerce with the Romans. In 48 B.C. they took the side of Caesar in the civil war against Pompey. In 16, having joined with the Pannonians in invading Histria, they were defeated by Publius Silius, proconsul of Illyricum. From this time Noricum is called a province, although not organized as such, but remaining a kingdom with the title *regnum Noricum*. It was under the control of an imperial procurator. It was not until the reign of Marcus Antoninus that the Legio II. Pia (afterwards called *Italica*) was stationed at Noricum, and the commander of the legion became the governor of the province. Under Diocletian, Noricum was divided into *Noricum ripense* (along the Danube) and *mediterraneum* (the southern mountainous district). Each division was under a *praeses*, and both belonged to the diocese of Illyria in the prefecture of Italy. The Roman colonies and chief towns were Virunum (near Mariasaal), Ovilava (Wels), Celeia (Cilli), Juvavum (Salzburg), Lauriacum (Lorch, at the mouth of the Enns, the ancient Anisus).

(2nd ed., 1881) p. 290; Smith's *Dict. of Gk. and Roman Geog.* (1873); Mary B. Peaks, *The General Civil and Military Administration of Noricum and Raetia* (Chicago, 1907); full references to ancient authorities in A. Holder, *Alt-celtischer Sprachschatz*, ii. (1904). (J. H. F.)

NORMAN, SIR HENRY WYLIE (1826–1904), field-marshal and colonial governor, was born on the 2nd of December 1826, and entered the Indian army at the age of seventeen. In 1840 his father, who had been for many years a merchant in Cuba, became a partner in a mercantile house in Calcutta, where he was joined by his son in 1842. In 1844 the latter obtained a cadetship. He went through the second Sikh campaign and having attracted the favourable notice of Sir Colin Campbell was selected by him to accompany an expedition against the Kohat Pass Afridis in 1850 as officiating brigade-major. The subaltern of twenty-four was given a substantive appointment in this capacity for a splendid deed of gallantry, which is recorded by Sir Charles Napier in the following terms: "In the pass of Kohat a sepoy picket, descending a precipitous mountain under fire and the rolling of large stones, had some men killed and wounded. Four of the latter, dreadfully hurt, crept under some rocks for shelter. They were not missed until the picket reached the bottom, but were then discovered by our glasses, high up and helpless. Fortunately the enemy did not see them, and some sepoys volunteered a rescue, headed by Norman of the 31st Native Infantry and Ensign Murray of the 70th Native Infantry. These brave men—would that the names of all were known to me for record!—ascended the rocks in defiance of the enemy, and brought the wounded men down." Norman served in numerous frontier expeditions between 1850 and 1854, and in the suppression of the Sonthal rebellion of 1855–56. In the Mutiny campaign he was constantly engaged, being present at the siege of Delhi, the relief of Lucknow and a number of other affairs. As adjutant-general of the Delhi Field Force, he was one of the leading spirits of the siege, and afterwards became its chief chronicler. Altogether he was mentioned twenty-five times in despatches. He afterwards became assistant military secretary for Indian affairs at the Horse Guards, military secretary to the government of India, military member of the viceroy's council and member of the secretary of state for India's council. In 1883 Sir Henry began his colonial career as governor of Jamaica, an appointment from which he was transferred in 1888 to the governorship of Queensland. Here he remained until 1895, when he came home to act as agent-general for the colony in London. In 1893 he was offered the viceroyalty of India, but, after first accepting, declined it. In 1897 he was chairman of the royal commission of inquiry into the condition of the West Indies. In April 1901 he was appointed governor of the Royal Hospital, Chelsea, in succession to Sir Donald Stewart. In 1902 he was made a field-marshal. He died on the 26th of October 1904.

See Sir William Lee Warner, *Memoirs of Field-marshal Sir Henry Wylie Norman* (1908).

NORMAN, a city and township (coextensive) and the county-seat of Cleveland county, Oklahoma, U.S.A., about 2 m. N. of the Canadian river, and 18 m. S. by E. of Oklahoma City. Pop. (1890) 787; (1900) 2225; (1910) 3724. It is served by the Atchison, Topeka & Santa Fé railway. It is the seat of the university of Oklahoma (chartered, 1892; opened 1894; coeducational), which includes a college of arts and sciences, schools of applied science, medicine, pharmacy, mines and fine arts, and a preparatory school, and in 1908 had 56 instructors and 790 students. The Oklahoma Insane Asylum is in the city. Cottonseed oil, flour and ice are manufactured, and the neighbouring region produces much cotton, Indian corn, oats, alfalfa and wheat. Hogs, cattle and sheep are raised. The first settlement here was made in 1889, and Norman was chartered as a city in 1902.

NORMANBY, CONSTANTINE HENRY PHIPPS, 1ST MARQUESS OF (1797–1863), British statesman and author, son of Henry, 1st earl of Mulgrave (1755–1831), was born on the 15th of May 1797. The 1st earl (who was created baron in 1794 and earl in 1812), was a distinguished soldier, and Pitt's chief military adviser; and he held the offices of chancellor of the duchy of Lancaster (1804), secretary for foreign affairs (1805), first lord of the admiralty (1807–1810), and master of the ordnance (1810–1818). In 1792 he inherited the earlier Irish barony of Mulgrave—created in 1767 for his father, Constantine (1722–1775) grandson of Sir Constantine Phipps (1656–1723), the lord chancellor of Ireland—from his elder brother Constantine (1744–1792), a distinguished naval captain. His son, the future marquess, passed through Harrow and Trinity College, Cambridge, and sat for the family borough of Scarborough as soon as he attained his majority. But, speaking in favour of Catholic emancipation, and dissenting in other points from the family politics, he resigned his seat, and went to live in Italy for some two years. Returning in 1822, he was elected for Higham Ferrers, and made a considerable reputation by political pamphlets and by his speeches in the house. He was returned for Malton at the general election of 1826, becoming a supporter of Canning. He was already known as a writer of romantic tales, *The English in Italy* (1825); in the same year he made his appearance as a novelist with *Matilda*, and in 1828 he produced

another novel, *Yes and No*. Succeeding his father as earl of Mulgrave in 1831, he was sent out as governor of Jamaica, and was afterwards appointed lord-lieutenant of Ireland (1835–1839). He was created marquess of Normanby in 1838, and held successively the offices of colonial secretary and home secretary in the last years of Lord Melbourne's ministry. From 1846 to 1852 he was ambassador at Paris, and from 1854 to 1858 minister at Florence. The publication in 1857 of a journal kept in Paris during the stormy times of 1848 (*A Year of Revolution*), brought him into violent controversy with Louis Blanc, and he came into conflict with Lord Palmerston and Mr Gladstone, after his retirement from the public service, on questions of French and Italian policy. He died in London on the 28th of July 1863. He had married in 1818 the daughter of Lord Ravensworth, and was succeeded as 2nd marquess by his son George (1819–1890), a liberal politican, who became governor of Queensland (1871–1874), New Zealand (1874–1879), and Victoria (1879–1884).

NORMANDY, a province of old France, bounded on the N.E. by the river Bresle, which falls into the Channel at Tréport and separates Normandy from Picardy, and then roughly by the Epte, which divides the Vexin into two parts. From the confluence of the Epte and Seine to Ivry, the boundary between Normandy and the Ile-de-France is artificial; it is afterwards practically determined by the course of the Eure and the Sarthe. But from there to the sea Normandy is separated by no natural boundary either from Maine or afterwards from Brittany; it lies fairly regularly in the direction from E. to W. The boundary between the coast of Normandy and that of Brittany is formed by the mouth of the Couesnon. Normandy is washed by the English Channel and lies opposite to England. The northern part of the coast consists of cliffs, which cease at the mouth of the Seine, the estuary of which is 12 km. wide from Havre to Trouville; the coast of Calvados consists of rocks and beaches; that of the peninsula of Cotentin is sandy on the eastern side and granite on the west; in the north it forms between the point of Barfleur and the cape of La Hague a kind of concave arc in which lies the harbour of Cherbourg.

Historical Geography.—In the time of Caesar the country which has since gone to form Normandy was inhabited by several tribes of the Gauls, the *Caleti*, who lived in the district of Caux, the *Veliocassi*, in the Vexin, the *Lexovii*, in the Lieuvin, the *Unelli* in Cotentin; these are the only ones whose names have been preserved for us by Caesar. At the beginning of the 5th century, when the *Notitia provinciarum* was drawn up, Normandy corresponded to the *Provincia Lugdunensis Secunda*, the chief town of which was Rouen (*Civitas Rotomagensium*); it included seven *civitates* with that of Rouen: those of Bayeux (*C. Bajocassium*), Lisieux (*C. Lexoviorum*), Coutances (*C. Constantia*), Avranches (*C. Abrincatum*), Séez (*C. Sagiorum*) and Evreux (*C. Ebroicorum*). For ecclesiastical purposes it formed the ecclesiastical province of Rouen, with six suffragan sees. For civil purposes, the province was divided into a number of *pagi*: the *civitas* of Rouen formed the *pagus Rotomagensis* (Roumois), the *p. Caletus* (pays de Caux), the *p. Vilcassinus* (Vexin), the *p. Tellaus* (Talou); that of Bayeux the *pagus Bajocassinus* (Bessin), and the *Otlinga Saxonia*; that of Lisieux the *pagus Lexovinus* (Lieuvin); that of Coutances the *p. Corilensis* and *p. Constantinus* (Cotentin); that of Avranches the *p. Abrincatinus* (Avranchin); that of Séez the *p. Oximensis* (Hiémois), the *p. Sagensis* and *p. Corbonensis* (Corbonnais); and that of Evreux the *p. Ebroicinus* (Evrecin) and *p. Madriacensis* (pays de Madrie). It is to the settlement of the Normans in the country that Normandy owes its name; from the 10th century onwards it formed a duchy, roughly coextensive with the ecclesiastical province of Rouen. Under the feudal regime, the energy of the Norman dukes prevented the formation of many powerful lordships, and there are few worthy of note, save the countships of Eu, Harcourt, Le Perche and Mortain.

The duchy of Normandy, which was confiscated in 1204 by King Philip Augustus of France, formed in the 16th century the *gouvernement* of Normandy; the extent of this *gouvernement* did not, as a matter of fact, correspond exactly to that of the duchy, for Le Perche, which had been part of the duchy, was annexed to the *gouvernement* of Maine, while the Thimerais, which had belonged to the countship of Blois, was joined to the *gouvernement* of Normandy. In the 17th century this *gouvernement* was divided into three *généralités* or *intendances*: those of Rouen, Caen and Alençon. For judicial purposes Normandy was under the jurisdiction of the parlement of Rouen, created in 1499. Since 1791 the territory of the old duchy has composed, roughly speaking, the departments of Seine-Inférieure, Eure, Calvados, Manche and Orne.

History.—The prosperity of Normandy in Roman times is proved by the number and importance of the towns which existed there at that time. The most important was Lillebonne (*Juliobona*), chief town of the Caletes, the Roman antiquities of which are famous. The evangelization of Normandy did not take place before the 3rd century: the first bishop of Rouen, about 260, seems to have been St Mallonus; it is possible, however, that before this date there were a few Christian communities in Normandy, as seems to be proved by the existence of St Nicasius, who was martyred in the Vexin.

The province of *Lugdunensis Secunda*, which at the end of the 5th century formed part of the kingdom of Syagrius, was conquered by Clovis before 506, and during the Merovingian times followed the fortunes of Neustria. In the 9th century this country was ravaged by the Northmen, who were constantly going up and down the Seine, and later on it was formally ceded to them. During these incursions Rouen was occupied several times, notably in 876 and 885.

The definitive establishment of the Normans, to whom the country owes its name, took place in 911, when by the treaty of Saint-Clair-sur-Epte, concluded between King Charles the Simple of France and Rolf or Rollo, chief of the Normans, the territory comprising the town of Rouen and a few *pagi* situated on the sea-coast was ceded to the latter; but the terms of the treaty are ill-defined, and it is consequently almost impossible to find out the exact extent of this territory or to know whether Brittany was at this time made a feudal dependency of Normandy. But the chronicler Dudo of Saint-Quentin's statement that Rollo married Gisela, daughter of Charles the Simple, must be considered to be legendary. In 924 Rollo received from the king of France Bessin and Maine. Although baptized, he seems to have preserved certain pagan customs. The history of Normandy under Rollo and his immediate successors is very obscure, for the legendary work of Dudo of Saint-Quentin is practically our only authority.

Rollo died in 927, and was succeeded by his son William "Long Sword," born of his union *more danico* with Poppa, daughter of count Bérenger; he showed some attachment to the Scandinavian language, for he sent his son William to Bayeux to learn Norse. The first two dukes also displayed a certain fidelity to the Carolingian dynasty of France, and in 936 William "Long-Sword" did homage to Louis IV. d'Outremer. He died on the 17th of December 942, assassinated by the count of Flanders.

During the minority of his successor, Duke Richard, King Louis IV., who was making an expedition into Normandy, was captured by the inhabitants of Rouen and handed over to Hugh the Great. From this time onwards the dukes of Normandy began to enter into relations with the dukes of France; and in 958 Duke Richard married Hugh the Great's daughter. He died in 996. At the beginning of the reign of his son, Richard II. (996–1026), there was a rising of the peasants, who formed assemblies with a view to establishing fresh laws for the management of the forests. This attempt at insurrection, described by William of Jumièges, and treated by many historians, on the authority of the poet Wace, as a sort of democratic movement, was put down with a firm hand. Richard III. reigned from 1026–1027; he seems to have been poisoned by his brother, Robert the Magnificent, or the Devil (1027–1035), who succeeded him. In 1031 Robert supported King Henry I. of France against his brother Robert, who was laying claim to the throne, and in return for his services received the French Vexin. The duke died on a pilgrimage to Jerusalem, leaving as his heir an illegitimate son, William, born of his union with the daughter of a tanner of Falaise.

William was very young when his father started for the Holy Land, leaving him under the protection of the king of France. In 1047 Henry I. had to defend the young duke against an army of rebellious nobles, whom he succeeded in beating at Val-ès-dunes. In the following year the king of France was in his turn supported by the duke of Normandy in his struggle against Geoffrey Martel, count of Anjou; the two allies besieged

Mouliherne (1048); and the war was continued between the duke of Normandy and the count of Anjou by the siege of Alençon, which was taken by Geoffrey Martel, then retaken by William, and that of Domfront, which in 1049 had to surrender to Duke William.

In 1054 William the Bastard married Matilda, daughter of Baldwin V., count of Flanders, in spite of the opposition of Pope Leo IX., who only gave his consent on condition that William and Matilda should each build an abbey: under these conditions were built the Abbaye-aux-Hommes and the Abbaye-aux-Dames at Caen. The king of France had at first protected William, but before long became alarmed at his ambitions; the first sign of his feeling of rivalry with the duke was the encouragement he gave to the revolt of William Busas, count of Eu and Montreuil, who claimed the ducal crown. In 1054 he invaded Normandy with his brother Odo and this count, but Odo was beaten at Mortemer. In 1058 the king of France, joined by Geoffrey Martel, count of Anjou, tried to revenge himself, but was beaten at the ford of Varaville (1058).

Towards the same time took place the annexation of Maine to Normandy, for a short period only. Herbert II., the young count of Maine, who was a vassal of the count of Anjou, did homage to William the Bastard between 1055 and 1060, perhaps after the defeat of Geoffrey Martel; he promised to marry one of William's daughters, and betrothed his sister Margaret to the duke's son, Robert Curthose, on the understanding that, if he died leaving no children, the countship was to fall to William. After his death, the people of Maine revolted (1063), choosing as their lord Walter of Mantes, count of Vexin; but William the Bastard, after one campaign, succeeded in imposing the authority of Normandy. Three years later, William took possession of England, of which he was crowned king in 1066. Normandy now became the scene of William's quarrels with his son, Robert Curthose, who laid claim to Normandy and Maine, and with the aid of King Philip I. of France succeeded in defeating his father at Gerberoi in 1079.

William the Conqueror died on the 7th of September 1087, and was buried in the church of St Etienne at Caen. After his death his eldest son, Robert Curthose, kept Normandy and Maine, and his second son, William Rufus, became king of England. In 1091 William Rufus made a vain attempt to recover Normandy; but in 1096 Robert departed on a crusade and pledged the duchy to his brother for 10,000 livres. When Robert returned, William Rufus had just died, and his youngest brother, Henry Beauclerc, had already taken possession of the crown. Henry was ambitious of uniting Normandy to England; in 1105, with the aid of Helias, count of Maine, and the son of Geoffrey Martel, count of Anjou, he took and burnt Bayeux, but failed to take Falaise. On the 28th of September 1106, by the help of William, count of Evreux, Robert, count of Meulan, Robert de Varenne, and Helias, count of Maine, he defeated his brother at Tinchebrai, took him prisoner, and seized Normandy. Duke Robert passed the rest of his life in captivity and died in 1134.

From 1106 to 1204 Normandy remained united to England. According to Ordericus Vitalis, whose *Historia ecclesiastica* is a chronicle of the greatest interest for the history of Normandy in the 11th and 12th centuries, Henry Beauclerc governed the two kingdoms wisely, checking the nobles, and protecting the Church and the common people. He carried on hostilities against the king of France and William Clito, son of Robert Curthose, whose claim to the duchy of Normandy was upheld by Louis VI., and won an important victory over his opponents at Brémule in Normandy (1119). After the disaster of the White Ship (1121), in which the Atheling William lost his life, Henry's only surviving child was a daughter, Matilda, widow of the emperor Henry V. In 1127 Matilda married Geoffrey the Fair, eldest son of Fulk V., count of Anjou. After the death of Henry I. in 1135, a struggle arose between Matilda, who claimed the kingdom of England and the duchy of Normandy in the name of her son Henry Plantagenet, and Theobald, count of Champagne, grandson of William the Conqueror on the side of his mother Adela, the candidate of the Normans of Normandy, while the Norman party in England supported Stephen, brother of Theobald. In 1144 Theobald, whose position had been much weakened since the taking of the castle of Rouen, gave up his rights in Normandy to Matilda's husband Geoffrey, count of Anjou, in favour of Henry Plantagenet. Between 1139 and 1145 Geoffrey, with French and Flemish help, gradually subdued Normandy, and on his death, in 1151, his son Henry Plantagenet was master of Normandy as well as count of Anjou. In 1152, by his marriage with Eleanor, duchess of Aquitaine, the divorced wife of Louis VII. of France, Aquitaine also was secured to himself and his descendants. Finally, in 1153, he was recognized by Stephen of Blois as heir to the throne of England. The duchy of Normandy, though nominally in feudal dependence on the king of France, thus became part of the great Angevin empire, of which the power and resources were more than equal to that of the French kings. The perennial struggle, dating from this period, between the kings of England and France is dealt with elsewhere (see FRANCE: *History*, and ENGLISH HISTORY).

From the first the French kings were fully conscious of the menace of the Angevin power. The reign of Louis VII. was occupied by the struggle against Henry II. In 1158 he committed the blunder of concluding a treaty with Henry, by which he was to give his daughter Margaret in marriage to Henry Short Mantle, eldest son of Henry II., with the French Vexin as her dowry. The Vexin was consequently the scene of hostilities in 1159 and 1165. In 1173 Louis VII., resuming the policy of his grandfather and father, took advantage of the strife which broke out in the family of the king of England, and took the part of Henry II.'s sons who were in revolt against their father. He negotiated with Henry Short Mantle, duke of Normandy, as though he were king of England, but owing to his weakness did not gain any serious advantage. In 1173 he abandoned the siege of Verneuil, in 1174 that of Rouen, and was no more successful in 1176.

Philip Augustus (1180–1223) pursued the same policy with greater tenacity and success. He began by taking part against Henry II. with his son and successor, Richard Cœur de Lion, who obtained the throne on the death of Henry II. in 1189. From the point of view of Normandy, the most important events of Richard's reign were: the truce of Issoudun, by which Philip Augustus kept the Norman Vexin which he had just conquered (1195), the building by Richard of Château-Gaillard (1196), and finally the defeat of Philip Augustus by Richard at Courcelles, near Gisors (1198). On the death of Richard at Chalus in 1199 the position of Philip Augustus was critical. This situation was modified under the reign of John Lackland, Richard's brother, who had himself crowned duke of Normandy at Rouen (April 25, 1199). Philip Augustus set up in opposition to him Arthur of Brittany, son of Geoffrey and grandson of Henry II., and the first phase of the struggle between the kings of France and England continued until the treaty of Goulet (1200). But in 1202 Philip made a fresh attempt to seize the continental possessions of the kings of England. An excuse for reopening hostilities offered itself in the abduction, by John, of Isabel of Angoulême, the betrothed of Hugh le Brun, son of the count of La Marche. The barons appealed to Philip Augustus, who summoned John to appear before the royal judges; he failed to appear, and was consequently condemned by default, as a disloyal vassal, to have all the fiefs which he held in France confiscated (April 1202). The confiscation, a purely legal and formal operation, was followed by the actual conquest.

In June 1202 Philip Augustus invaded Normandy and besieged the castle of Arques, near Dieppe; at the same time Arthur of Brittany was taken prisoner by John at Mirebeau in Poitou, and imprisoned in the castle of Falaise, from which he was removed to Rouen and died, probably assassinated by John's orders. The conquest of Normandy began with the occupation of Château-Gaillard after an eight months' siege (September 1203–April 1204); the rest of Normandy was taken during the following months, Rouen surrendering in 1204 but

obtaining a guarantee of her privileges. The conquest of Normandy by the French was not, however, recognized officially till the treaty of Paris (1259).

Normandy enjoyed a time of comparative prosperity under French rule, up to the time of the Hundred Years' War. The institution of the Estates of Normandy even assured her a sort of independence. In 1329 the duchy of Normandy was revived in favour of John, son of King Philip VI.

Owing to her geographical position, Normandy suffered heavily during the Hundred Years' War. In 1346 Edward III., at the instance of Godefroi d'Harcourt lord of Saint-Sauveur, invaded Normandy, landing at Saint-Vast-la-Hougue (July 12); and arriving at Caen on the 25th of July, he laid waste the country as far as Poissy. After the accession of John II. (1350), Normandy was again separated from the crown and given as an appanage to the dauphin Charles. The treaty of London (1359) stipulated for its cession to England, but the provisions of the treaty were modified by those of the treaty of Brétigny (1360), and it remained in the possession of France.

John II. died in 1364, and was succeeded by his son Charles V. One of the chief feudatories of Normandy, Charles the Bad, grandson of Louis X. le Hutin, and a claimant to the crown of France, was in 1365, owing to his continued treachery, deprived of the countship of Longueville, and in 1378 of all his other possessions in Upper and Lower Normandy. The most striking event of the war between the French and English which took place in Normandy during the reign of Charles V. was the siege of Saint-Sauveur-le-Vicomte, which was occupied by the English, and only surrendered after a siege of several years.

The opening years of the reign of Charles VI. (1380–1422) were disturbed by a revolt which broke out at Rouen against the *aides* which the royal government had tried to impose (1381), a cloth-merchant was proclaimed king of Rouen, and Charles was obliged to go in person to Rouen to put down the insurrection. In 1415 the war with England was resumed: an English army of 60,000 men landed on the 14th of August at the mouth of the Seine, took Harfleur on the 16th of September, and finally defeated the army of the king of France at Agincourt. During the following years the whole of Normandy was occupied, Rouen holding out for nearly six months (July 29, 1418–January 13, 1419), and Henry V. of England entrusted the administration of Normandy to a special council. In spite of the moderation of the duke of Bedford's government, Normandy, ruined by the war, was in a state of great distress, and in the years following the treaty of Troyes (1420) there was a continual resistance offered to the English. This resistance became general after the expeditions of Joan of Arc and the treaty of Arras; at the end of 1435 the whole district of Caux, and in 1436 that of the Val de Vire revolted; Mont-Saint-Michel, which had never been taken by the English, continued to resist, and in order to keep guard over it the English built Granville. But Normandy was not recovered by the French till after the sack of Fougères (1449). Cotentin was reconquered by Richmond (see ARTHUR, duke of Brittany) and the duke of Brittany; Rouen surrendered on the 29th of October 1449. In face of these successes of the French, an English army was sent into Normandy under the leadership of Thomas Kyriel; it landed at Cherbourg and marched across Cotentin to Bayeux, but was met at Formigny (April 15, 1450) by the count of Clermont and utterly routed. Shortly afterwards Caen, and finally Cherbourg, capitulated.

After the French conquest, the history of Normandy is less eventful. In 1465 Normandy was given as an appanage to Charles, brother of King Louis XI., who was deprived of it in 1467. The kings of France tried to win the support of Normandy by certain favours, such as maintaining the provincial Estates and the University of Caen, founded by the kings of England, and transforming the Exchequer of Normandy into a permanent court of justice (1499) which was called the Parlement of Normandy and sat at Rouen in the famous Palais de Justice. Among the measures which contributed to the increase of the prosperity of Normandy should be noted the construction in 1752 of the Hâvre de Grace.

During the 16th century the Protestant Reformation met with some success in Normandy, where the Wars of Religion caused a certain amount of disturbance. The Reforming movement began with Pierre Bar in 1528, and the first apostle of the Reformation at Rouen was François Legay, called Boisnormand. In 1562 the town of Rouen was taken by the Calvinists, but retaken in the same year by the Catholics. Caen received the Reformed religion in 1531, and Alençon in 1582. In the massacre of Saint Bartholomew's day (1572) more than 500 victims were slaughtered by the Catholics.

In spite of the success of Protestant ideas, however, the Catholic party of the League succeeded after 1588 in establishing itself in Normandy, and King Henry IV. had to conquer it by force of arms. The most famous engagements during this expedition were the victories of Henry IV. at Arques and Ivry, but he failed to take Rouen, which was defended by Alexander Farnese, duke of Parma, and only surrendered after the abjuration of the king.

The history of Normandy in the 17th and 18th centuries contains few events of note, except for a few attempts at landing made by the English during the Seven Years' War (1756–1763); in 1758 the English admiral Anson attacked Cherbourg, and in 1759 Admiral Rodney bombarded Havre. From 1790 dates the creation of the departments, when Normandy ceased to have a separate political existence, and her history becomes one with that of France.

(R. LA.)

NORMANS, the softened form of the word "Northman," applied first to the people of Scandinavia in general, and afterwards specially to the people of Norway. In the form of "Norman" (*Northmannus, Normannus, Normand*, &c.) the name of those colonists from Scandinavia who settled themselves in Gaul, who founded Normandy, who adopted the French tongue and French manners, and who from their new home set forth on new errands of conquest, chiefly in the British Islands and in southern Italy and Sicily. From one point of view the expeditions of the Normans may be looked on as continuations of the expeditions of the Northmen. As the names are etymologically the same, so the people are by descent the same, and they are still led by the old spirit of war and adventure. But in the view of general history Normans and Northmen must be carefully distinguished. The change in the name is the sign of a thorough change, if not in the people themselves, yet in their historical position. Their national character remains largely the same; but they have adopted a new religion, a new language, a new system of law and of war, new thoughts and feelings on all matters. Like as the Norman still is to the Northman, the effects of the settlements of Normans are utterly different from the effects of the settlements of Northmen. There can be no doubt that the settlement of the Norman power in England was, like the settlement of the Danish power, greatly helped by the essential kindred of Normans, Danes and English. But it was helped silently. To all outward appearance the Norman conquest of England was an event of an altogether different character from the Danish conquest. The one was a conquest by a people whose tongue and institutions were still palpably akin to those of the English. The other was a conquest by a people whose tongue and institutions were palpably different from those of the English. The Norman settlers in England felt no community with the earlier Danish settlers in England. In

fact the Normans met with the steadiest resistance in a part of England which was largely Danish. But the effect of real, though unacknowledged, kindred had none the less an important practical effect. There can be no doubt that this hidden working of kindred between conquerors and conquered in England, as compared with the utter lack of all fellowship between conquerors and conquered in Sicily, was one cause out of several which made so wide a difference between the Norman conquest of England and the Norman conquest of Sicily.

Character of the Normans.

These two conquests, wrought in the great island of the Ocean and in the great island of the Mediterranean, were the main works of the Normans after they had fully put on the character of a Christian and French-speaking people, in other words, after they had changed from Northmen into Normans. The English and the Sicilian settlements form the main Norman history of the 11th century. The 10th century is the time of the settlement of the Northmen in Gaul, and of the change in religion and language of which the softening of the name is the outward sign. By the end of it, any traces of heathen faith, and even of Scandinavian speech, must have been mere survivals. The new creed, the new speech, the new social system, had taken such deep root that the descendants of the Scandinavian settlers were better fitted to be the armed missionaries of all these things than the neighbours from whom they had borrowed their new possessions. With the zeal of new converts they set forth on their new errand very much in the spirit of their heathen forefathers. If Britain and Sicily were the greatest fields of their enterprise, they were very far from being the only fields. The same spirit of enterprise which brought the Northmen into Gaul seems to carry the Normans out of Gaul into every corner of the world. Their character is well painted by a contemporary historian of their exploits.[1] He sets the Normans before us as a race specially marked by cunning, despising their own inheritance in the hope of winning a greater, eager after both gain and dominion, given to imitation of all kinds, holding a certain mean between lavishness and greediness—that is, perhaps uniting, as they certainly did, these two seemingly opposite qualities. Their chief men, he adds, were specially lavish through their desire of good report. They were, moreover, a race skilful in flattery, given to the study of eloquence, so that the very boys were orators, a race altogether unbridled unless held firmly down by the yoke of justice. They were enduring of toil, hunger, and cold whenever fortune laid it on them, given to hunting and hawking, delighting in the pleasure of horses, and of all the weapons and garb of war. Several of these features stand out very vividly in Norman history. The cunning of the Normans is plain enough; so is their impatience of restraint, unless held down by a strong master. Love of imitation is also marked. Little of original invention can be traced to any strictly Norman source; but no people were ever more eager to adopt from other nations, to take into their service and friendship from any quarter men of learning and skill and eminence of every kind. To this quality [illegible] be attributed the fact that a people who did so much, who settled and conquered in so large a part of Europe, has practically vanished from the face of the earth. If Normans, as Normans, still exist anywhere, it is certainly only in that insular fragment of the ancient duchy which still cleaves to the successors of its ancient dukes. Elsewhere, as the settlers in Gaul became French, the emigrants from Gaul became English, Irish, Scottish, or whatever we are to call the present inhabitants of Sicily and southern Italy. Everywhere they gradually lost themselves among the people whom they conquered; they adopted the language and the national feelings of the lands in which they settled; but at the same time they often modified, often strengthened the national usages and national life of the various nations in which they were finally merged.

Their faculty of adaptation.

But Geoffrey hardly did justice to the Normans if he meant to imply that they were simple imitators of others. Their position was very like that of the Saracens. Hasty writers who forget the existence of the eastern Rome are apt to claim for the Saracens of Bagdad, or more commonly for those of Cordova, a monopoly of science and art at some time not very clearly defined by dates. In so doing they slur over the real position and the real merit of the Saracens with regard to science and art. In neither department did any Saracen, strictly speaking, invent anything; but they learned much both from Constantinople and from Persia, and what they learned they largely developed and improved. The Normans did just the same. They adopted the French tongue, and were presently among the first to practise and spread abroad its literature. They adopted the growing feudal doctrines of France, and worked them, both in Normandy and in England, into a harmonious system. From northern Italy, as it would seem, they adopted a style of architecture which grew in their hands, both in Normandy and in England, into a marked and living form of art. Settled in Gaul, the Scandinavian from a seafaring man became a landsman. Even in land-warfare he cast aside the weapons of his forefathers; but he soon learned to handle the weapons of his new land with greater prowess than they had ever been handled before. He welcomed the lore of every stranger. Lanfranc brought law and discipline; Anselm brought theology and philosophy. The gifts of each were adopted and bore fruit on both sides of the Channel. And no people ever better knew how to be all things to all men. The Norman power in England was founded on full and speedy union with the one nation among whom they found themselves. The Norman power in Sicily was founded on a strong distinction between the ruling people and the many nations which they kept in peace and prosperity by not throwing in their lot with any one among them.

The quality which Geoffrey Malaterra expresses by the word "effrenatissima" is also clearly marked in Norman history. It is, in fact, the groundwork of the historic Norman character. It takes in one case the form of ceaseless enterprise, in another the form of that lawlessness which ever broke out, both in Normandy and in every other country settled by Normans, when the hand of a strong ruler was wanting. But it was balanced by another quality which Geoffrey does not speak of, one which is not really inconsistent with the other, one which is very prominent in the Norman character, and which is, no less than the other, a direct heritage from their Scandinavian forefathers. This is the excessive litigiousness, the fondness for law, legal forms, legal processes, which has ever been characteristic of the people. If the Norman was a born soldier, he was also a born lawyer. Ranulf Flambard, working together the detached feudal usages of earlier times into a compact and logical system of feudal law, was as characteristic a type of the people as any warrior in the Conqueror's following. He was the organizer of an endless official army, of an elaborate technical system of administration, which had nothing like it in England before, but which grew up to perfection under Norman rulers.[2] But nothing so well illustrates this formal side of the Norman character as the whole position of William the Conqueror himself. His claim to the crown of England is something without earlier precedent, something as far as possible removed from the open violence of aggressors who have no pretexts with which to disguise their aggression. It rested on a mass of legal assumptions and subtleties, fallacious indeed, but ingenious, and, as the result proved, effective. His whole system of government, his

[1] Geoffrey Malaterra, i. 3 "Est quippe [illegible] injuriarum ultrix, spe alias plus lucrandi, patrios [illegible] quaestus et dominationis avida, cujuslibet rei simulatrix, inter largitatem et avaritiam quoddam medium habens. Principes vero delectatione bonae famae largissimi, gens adulari sciens, eloquen[illegible] in studiis inserviens in tantum, ut etiam ipsos pueros quasi rhetores attendas, quae quidem, nisi jugo justitiae prematur, effrenatissima est; laboris, inediae, algoris, ubi fortuna expedit, patiens, venationi accipitrum exercitio inserviens. Equorum, caeterorumque militiae instrumentorum, et vestium luxuria delectatur. Ex nomine itaque suo terrae nomen indiderunt. North quippe Anglica lingua aquilonaris plaga dicitur. Et quia ipsi ab aquilone venerant terram ipsam etiam Normanniam appellarunt."

[2] This view of Ranulf Flambard's work, which on Freeman's authority superseded the older view, which attributed the feudal organization of England to the Conqueror himself, was subjected to a destructive criticism by Mr J. H. Round in his *Feudal England*. (Ed.)

[redacted] grants, all that he did, was a logical deduction from one of two legal principles, arbitrary certainly in their conception, but strictly carried out to their results. Even Norman lawlessness in some sort took a legal shape. In the worst days of anarchy, in the minority of William or under the no-government of Robert, the robber-baron could commonly give reasons for every act of wrong that he did.

[redacted]ps less wonderful that this characteristic should [redacted]ft out in a picture of the Normans in Apulia and [redacted]f it had been left out in a picture of the Normans [redacted]y and England. The circumstances of their Apulian [redacted] conquests certainly did not tend to bring out this [redacted]heir character so strongly as it was brought out by [redacted]tances of their English conquest. Possibly the same [redacted] have kept the chronicler from enlarging on their [redacted]haracter; yet in Sicily at least they might pass for [redacted] Crusaders in fact they were before crusades were [redacted] Norman warriors had long before helped the Christians [redacted] their warfare with the Saracens of the Peninsula, [redacted]y it was from the same enemy that they won the [redacted]erranean island. Others had done a kindred work [redacted]stant field as helpers of the Eastern emperors against [redacted]f Asia. All these might pass for religious wars, and [redacted] really be so; it needed greater ingenuity to set [redacted]asion of England as a missionary enterprise designed [redacted]tual good of the benighted islanders. The Norman, [redacted]strict observer of forms in all matters, attended to [redacted]e forms of religion with special care. No people [redacted]re more bountiful to ecclesiastical bodies on both [redacted]es of the Channel; the foundation of a Benedictine [redacted]n the 11th century, of a Cistercian monastery in [redacted]med almost a matter of course on the part of a [redacted]aron. The Conqueror beyond doubt sincerely aimed [redacted]igious reformer both in his duchy and in his kingdom, [redacted]s needless to say that his immediate successor was [redacted]ally ungodly, whether among Normans or among other [redacted]t among their countrymen generally strict attendance [redacted]s observances, a wide bounty to religious foundations, [redacted]t down as national characteristics. On the other hand, [redacted]e less inclined to submit to encroachments on the part [redacted]clesiastical power, the Conqueror himself least of all.

[redacted]s see in the Scandinavian settlers in Gaul, after they [redacted]on the outward garb of their adopted country, a people [redacted] restless and enterprising above all others, adopting [redacted] and spreading abroad all that they could make their [redacted] own in their new land and everywhere else—a people [redacted] in many ways highly gifted, greatly affecting and [redacted]. modifying at the time every land in which they settled, [redacted] but, wherever they settled, gradually losing themselves [redacted]the people of the land. The Norman, as a visible [redacted] in the country, has vanished from England, and [redacted]vanished from Sicily. The circumstances of his settle- [redacted]h his two great fields of conquest were widely different; [redacted]ition when he was fully established in his two insular [redacted] was widely different; but the end has been the same [redacted] cases. Neither island has for ages been in any sense a [redacted]n land, and the tongue which the Norman brought with [redacted]to both has not for ages been spoken in either. Norman [redacted]ce has been far stronger in England than in Sicily, and [redacted]of Norman presence are far more easily recognized. But the Norman, as a distinct people, is as little to be seen in the one island as in the other. His disappearance in both cases is an illustration of one of the features which we have spoken of in the Norman character, the tendency which in fact made Normans out of Northmen, the tendency to adopt the language and manners of the people among whom they found themselves. But, as far as outward circumstances are concerned, we may say that the same effect has been brought about by different and almost opposite causes. The whole circumstances of the conquest of England constrained the conquerors to become Englishmen in order to establish themselves in the conquered land. If William's theory, the forcible conquest of England by strangers was an untoward accident. The lawful heir of the English crown was driven against his will to win his rights by force from outside. But he none the less held his crown as an English king succeeding according to English law. Moreover, every Norman to whom he granted lands and offices held them by English law in a much truer sense than the king held his; he was deemed to step into the exact position of his English predecessor, whatever that might be. This legal theory worked together with other causes to wipe out all practical distinction between the conquerors and the conquered in a wonderfully short time. By the end of the 12th century the Normans in England might fairly pass as Englishmen, and they had largely adopted the use of the English language. The fashionable use of French for nearly two centuries longer was far more a French fashion than a Norman tradition. When the tradition of speaking French had all but died out, the practice was revived by fashion. Still the tradition had its effect. The fashion could hardly have taken root except in a land where the tradition had gone before it.

The Normans in England therefore became Englishmen, because there was an English nation into which they could be absorbed. The Normans in Sicily could hardly be said to become Sicilians, for there assuredly was no Sicilian nation for them to be absorbed into. While the Normans in England were lost among the people of the land, the Normans in Sicily were lost among their fellow-settlers in the land. The Normans who came into Sicily must have been much less purely Norman than the Normans who came into England. The army of Duke William was undoubtedly very far from being wholly made up of Normans, but it was a Norman army; the element which was not Norman, though considerable, was exceptional. But we may doubt whether the Norman invaders of Sicily were Norman in much more than being commanded by Norman leaders. They were almost as little entitled to be called pure Scandinavians as the Saracens whom they found in the island were entitled to be called pure Arabs. The conquest of England was made directly from Normandy, by the reigning duke, in a comparatively short time, while the conquest of Sicily grew out of the earlier and far more gradual conquest of Apulia and Calabria by private men. The Norman settlements at Aversa and Capua were the work of adventurers, making their own fortunes and gathering round them followers from all quarters. They fought simply for their own hands, and took what they could by the right of the stronger. They started with no such claim as Duke William put forth to justify his invasion of England; their only show of legal right was the papal grant of conquests that were already made. The conquest of Apulia, won bit by bit in many years of what we can only call freebooting, was not a national Norman enterprise like the conquest of England, and the settlement to which it led could not be a national Norman settlement in the same sense. The Sicilian enterprise had in some respects another character. By the time it began the freebooters had grown into princes. Sicily was won by a duke of Apulia and a count of Sicily.[1] Still there was a wide difference between the duke of the Normans and the duke of Apulia, between an hereditary prince of a hundred and fifty years' standing and an adventurer who had carved out his duchy for himself. And, besides this, warfare in Sicily brought in higher motives and objects. Though crusades had not yet been preached, the strife with the Mussulman at once brought in the crusading element; to the Christian people of the island they were in many cases real deliverers; still, the actual process by which Sicily was won was not so very different from that by which Apulia had been won. Duke William was undisputed master of England at the end of five years; it took Count Roger thirty years to make himself undisputed master of Sicily. The one claimed an existing kingdom, and obtained full possession of it in a comparatively short time; the other formed for himself a dominion bit by bit, which rose to the rank of a kingdom

[1] Roger de Hauteville, the conqueror of Sicily, was a brother of the first four dukes or counts of Apulia, and was invested with the countship of Sicily by the pope before starting on his adventure.

in the next generation. When Count Roger at last found himself lord of the whole island, he found himself lord of men of various creeds and tongues, of whom his own Norman followers were but one class out of several. And the circumstances of his conquest were such that the true Normans among his following could not possibly lose themselves among the existing inhabitants of the island, while everything tended to make them lose themselves among their fellow-adventurers of other races, among whom, by the time the conquest was ended, they could hardly have been even a dominant element.

As far then as concerned the lands in which the settlements were made, the difference lay in this, that, as has been already said, while there was an English nation, there was no Sicilian nation. The characteristic point of Norman rule in Sicily is that it is the rule of princes who were foreign to all the inhabitants of the island, but who were not more foreign to the inhabitants of the island than different classes of them were to one another. The Norman conqueror found in Sicily a Christian and Greek-speaking people and a Mussulman and Arabic-speaking people. The relations between the two differed widely in different parts of the island, according to the way in which the Saracens had become possessed of different towns and districts. In one place the Christians were in utter bondage, in another they were simply tributary; still, everywhere the Mussulman Saracen formed the ruling class, the Christian Greek formed the subject class. We speak of the Saracen very much as we speak of the Norman; for of the Mussulman masters of Sicily very many must have been only artificial Arabs, Africans who had adopted the creed, language and manners of Arabia. In each case the Arab or the Norman was the kernel, the centre round which all other elements gathered and which gave its character to the whole. Besides these two main races, Greek and Saracen, others came in through the Norman invasion itself. There were the conquerors themselves; there were the Italians, in Sicily known as Lombards, who followed in their wake; there were also the Jews, whom they may have found in the island, or who may have followed the Norman into Sicily, as they certainly followed him into England. The special character of Norman rule in Sicily was that all these various races flourished, each in its own fashion, each keeping its own creed, tongue and manners, under the protection of a common sovereign, who belonged to none of them, but who did impartial justice to all. Such a state of things might seem degradation to the Mussulman, but it was deliverance to the native Christian, while to settlers of every kind from outside it was an opening such as they could hardly find elsewhere. But the growth of a united Sicilian nation was impossible; the usual style to express the inhabitants of the island is "omnes" or "universi Siciliae populi." In the end something like a Sicilian nation did arise; but it arose rather by the dying out of several of the elements in the country, the Norman element among them, than by any such fusion as took place in England. That is, as has been already said, the Norman as such has vanished in two different ways. In England the Norman duke came in as a foreign intruder, without a native supporter to establish his rule over a single nation in its own land. He could not profess to be, as the count of Sicily could honestly profess to be, a deliverer to a large part of the people of the land. But, coming in by a title which professed to be founded on English law, establishing his followers by grants which professed no less to be founded on English law, he planted a dynasty, and established a dominant order, which could not fail to become English. The Normans in England did not die out; they were merged in the existing nation. The Normans in Sicily, so far as they did not die out, were merged, not in a Sicilian nation, for that did not exist, but in the common mass of settlers of Latin speech and rite, as distinguished from the older inhabitants, Greek and Saracen. The Norman conquest of England was at the moment a curse; the Norman conquest of Sicily was at the moment a blessing. But the gradual and indirect results of the Norman conquest of England are easily to be seen to this day, and they have been largely, though indirectly, results for good. Its chief result has been, not so much to create anything new as at once to modify and to strengthen what [illegible] up older institutions to a new life under other [illegible] whatever it has done it has done silently; there ha[illegible] any time any violent change of one set of institution[illegible] In Sicily and southern Italy there is hardly any vis[illegible] influence, except the great historic fact which we [illegible] creation of Sicily and southern Italy in their mo[illegible] The coming of the Norman ruled that these land[illegible] neither Saracen nor Greek, nor yet Italian in the [illegible] as northern Italy, but that they should politically [illegible] the same group of states as the kingdoms and princ[illegible] feudal Europe. William assuredly did not create th[illegible] of England; Roger assuredly did create the kingdom[illegible] And yet, notwithstanding all this, and partly beca[illegible] this, real and distinct Norman influence has been [illegible] extensive and far more abiding in England than it h[illegible] Sicily.

In Sicily then the circumstances of the conquest [illegible] Norman settlers to remain far more distinct from the o[illegible] of the land than they did in England, and in the e[illegible] themselves, not in those older races of the land, b[illegible] settlers of other races who accompanied and follow[illegible] So far as there ever was a Sicilian nation at all, it mig[illegible] to be called into being by the emperor-king Frederi[illegible] his day a Latin element finally triumphed; but it [illegible] Norman or French-speaking element of any kind. [illegible] of the Lombards at last got the better of Greek, A[illegible] French; how far its ascendancy can have been bu[illegible] survival of an earlier Latin speech which had lived o[illegible] of Greek and Arabic this is not the place to inquire.

The use of language and nomenclature during the time [illegible] rule in the two countries forms a remarkable contrast, and [illegible] the circumstances of the two as they have just bee[illegible] sketched. The chroniclers of the conquest of Apulia [illegible] and Sicily use the Norman name in every page as the nam[illegible] of the followers of the conquerors from Hauteville. [illegible] was the natural name for a body of men who must, by [illegible] the time the conquest of Sicily was over, have been [illegible] very mixed, but whose kernel was Norman, whose stren[illegible] feelings and traditions all came from a Norman source. B[illegible] turn to Hugo Falcandus, the historian of Sicily in the 12th [illegible] the Norman name is hardly found, unless when it is used his[illegible] to point out (as in Muratori vii. 260) that the royal house [illegible] was of Norman descent. Of the various "Siciliae populi," we[illegible] Greeks, Saracens, Lombards, sometimes of Franci, for by th[illegible] there were many French-speaking settlers in Sicily who were [illegible] Norman descent. There is a distinction between Christia[illegible] Saracens; among Christians there seems to be again a dist[illegible] between Greeks and Latins, though perhaps without any [illegible] use of the Latin name; there is again a further distinction be[illegible] "Lombardi" and "Franci"; but Normans, as a separate [illegible] do not appear. In England there is no room for such subt[illegible] The narratives of the conquest of England use both the Norm[illegible] the French names to express the followers of William. In the English chronicles "French" is the only name used. It appears also i[illegible] Bayeux Tapestry, and it is the only word used when any [illegible] distinction had to be drawn between classes of men in the E[illegible] kingdom. "Franci" and "Angli" are often opposed in Dom[illegible] and other documents, and the formula went on in charters lon[illegible] all real distinction had passed away. That is to say, there [illegible] several purposes for which it was convenient to distinguish "En[illegible] and "French"—the last name taking in all the followers [illegible] Conqueror; there were no purposes for which there was any ne[illegible] distinguish Normans as such, either from the general mass [illegible] people or from others who spoke the French tongue. We ca[illegible] also that, though several languages were in use in England d[illegible] the time of Norman rule, yet England was not a land of [illegible] languages in the same sense in which Sicily was. In the 12th century three languages were certainly spoken in London; yet London could not call itself the "city of threefold speech," as Palermo did. English, French, Latin, were all in use in England; but the distinction was rather that they were used for three different purposes than that they were used by three distinct races or even classes. No doubt there was a class that knew only English; there may have been a much smaller class that knew only French; any man who pretended to high cultivation would speak all as a matter of course: Bishop Gilbert Foliot, for instance, was eloquent in all three. But in Sicily we see the quite different phenomenon of three, four, five classes of men living side by side, each keeping its own nationality and speaking its own tongue. If a man of one people knew the speech of any of the others, he knew it strictly as a foreign language. Before the Norman Conquest England had two official tongues; documents

were drawn up sometimes in English, sometimes in Latin, now and then in both. And the same usage went on after the Conquest; the use of English becomes gradually rarer, and dies out under the first Angevins, but it is in favour of Latin that it dies out. French, the language which the Normans brought with them, did not become an official language in England till after strictly Norman rule had passed away. French documents are unknown till the days of French fashion had come in, that is, till deep in the 13th century. So it was in Sicily also; of all the tongues of Sicily French was the most needful in the king's court ("Francorum lingua quae maxime necessaria esset in curia," says Hugo Falcandus, 321); but it was not an official tongue. The three tongues of Palermo are Greek, Arabic and Latin. King Roger's clock is commemorated in all three. Documents were drawn up in such and so many of these tongues as was convenient for the parties concerned; not a few private documents add a fourth tongue, and are drawn up in Greek, Arabic, Latin and Hebrew. In neither case is the actual speech of the conquerors one of the tongues in formal use. French, as a separate tongue from Latin, already existed as a literary speech, and no people had done more than the Normans to spread it as a literary speech, in both prose and verse. But neither in England nor in Sicily did official formalism acknowledge even French, much less Italian, as a fit tongue for solemn documents. In England, English, French, Latin, were the three tongues of a single nation; they were its vulgar, its courtly and its learned speeches, of which three the courtly was fast giving way to the vulgar. In Sicily, Greek, Arabic, Latin and its children were the tongues of distinct nations; French might be the politest speech, but neither Greek nor Arabic could be set down as a vulgar tongue, Arabic even less than Greek.

The different positions then which the conquering Norman took in his two great conquests of England and of Sicily amply illustrate the way in which he could adapt himself to any circumstances in which he found himself, the way in which he could adopt whatever suited his purpose in the institutions of any other people, the way in which he commonly lost his national being in that of some other people. From England, moreover, he spread into Scotland, Wales and Ireland, and in each land his settlement put on a somewhat different character, according to the circumstances of the land. In Scotland he was not a conqueror, but a mere visitor, and oddly enough he came as a visitor along with those whom he had himself overcome in England. Both Normans and English came to Scotland in crowds in the days of Margaret, Edgar and David, and Scottish national feeling sometimes rose up against them. In Scotland again the Norman settlers were lost in the mixed nationality of the country, but not till they had modified many things in the same way in which they modified things in England. They gave Scotland nobles and even kings; Bruce and Balliol were both of the truest Norman descent; the true Norman descent of Comyn might be doubted, but he was of the stock of the Francigenae of the Conquest. In Wales the Norman came as a conqueror, more strictly a conqueror than in England; he could not claim Welsh crowns or Welsh estates under any fiction of Welsh law. The Norman settler in Wales, therefore, did not to any perceptible extent become a Welshman; the existing relations of England and Wales were such that he in the end became an Englishman, but he seems not unnaturally to have been somewhat slower in so doing in Wales than he was in England. At least Giraldus Cambrensis, the Norman Welshman or Welsh Norman, was certainly more alive to the distinction between Normans and English than any other of his contemporaries. In Ireland the Norman was more purely a conqueror than anywhere else; but in Ireland his power of adaptation caused him to sink in a way in which he sank nowhere else. While some of the Norman settlers in Ireland went to swell the mass of the English of the Pale, others threw in their lot with the native Irish, and became, in the well-known saying, *Hibernis ipsis Hiberniores* (see *e.g.* the article BURGH).

Normans in Scotland.

Wales.

Ireland.

There is yet one point in which we may profitably go back to our comparison between England and Sicily. Both countries are rich in works of architecture raised during the time of Norman rule. And the buildings of both lands throw an instructive light on the Norman national character, as we have described it. Few buildings, at least few buildings raised in any reasonable style of architecture which makes use of the arched construction, can be less like one another than the buildings of the Norman kings in England and the buildings of the Norman kings in Sicily. In Sicily the Normans found the two most outwardly civilized of the nations of Europe, the two which had as yet carried the arts to the highest pitch. The Greek had created the column; the Roman had developed it; the Roman Greek or Greek Roman had taught the column to bear the cupola; the Saracen had taught it to bear arches of his own favourite pointed shape. Out of these elements the Saracens of Sicily had formed a noble and beautiful style, grand and simple in its construction, rich and graceful in its characteristic detail. With the Saracen and the Greek as his subjects, the Norman had really no need to innovate; he had simply to bid the men of the land to go on working for him instead of for any other. The palaces and churches of the Norman kings at Palermo and Monreale and Cefalu and Messina are in style simply Saracenic; they were most likely the work of Saracen builders; they were beyond doubt built after Saracenic models. In these buildings, as in those of Aquitaine, the pointed arch is the surest sign of Saracenic influence; it must never be looked on as marking the approach of the Gothic of the North. With that form of art the pointed style of Sicily has nothing in common. A Sicilian church has nothing in common with a French or an English church; it is sometimes purely Oriental, sometimes a basilica with pointed arches. But, if the Saracen gave the lines of the building, the Greek gave the mosaic decorations of its walls. In such a case the ruling people, rather the ruling dynasty, had really nothing to add to what they found ready for them. They had simply to make Saracen and Greek work in partnership. In England, on the other hand, the Normans did really bring in a new style of their own, their own form of Romanesque, differing widely indeed from the Saracenic style of Sicily. This Norman form of Romanesque most likely had its origin in the Lombard buildings of northern Italy. But it took firm root on Norman soil; it made its way to England at an early stage of its growth, and from that time it went on developing and improving on both sides of the Channel till the artistic revolution came by which, throughout northern Europe, the Romanesque styles gave way to the Gothic. Thus the history of architecture in England during the 11th and 12th centuries is a very different story from the history of the art in Sicily during the same time. There were no Greeks or Saracens in England; there was no Greek or Saracen skill. England indeed had, possibly in a somewhat ruder form, the earlier style of Romanesque once common to England with Italy, Gaul and Germany. To this style it is no wonder that the Normans preferred their own, and that style therefore supplanted the older one. A comparison of Norman buildings in England and in Normandy will show that the Norman style in England really was affected by the earlier style of England; but the modification was very slight, and it in no way affected the general character of the style. Thus, while the institutions of England in the 12th century were English with very considerable Norman modifications, the architecture of England in that century was Norman with a very slight English modification. The difference then is plain. Where, as in Sicily, the Normans felt that they could not improve, they simply adopted the style of the country. Where, as in England, they felt that they could improve, they substituted for the style of the country their own style—that is, a style which they had not created but which they had adopted, which they had made thoroughly their own, and which they went on improving in England no less than in Normandy. That is, the discerning Norman, as ever, adapted himself, but adapted himself in an intelligent way, to the circumstances of each land in which he found himself. And this comes out the more clearly if we compare Norman work in England and in Sicily with Norman work in at least some parts of Apulia. At Bari, Trani and Bitonto we see a style in which Italian and strictly Norman elements are really mingled. The great churches of those cities are wholly unlike those of Sicily; but, while some features show us that we are in Italy, while some features even savour of the Saracen, others distinctly carry us away to Caen and Peterborough. It is plain that the Norman settlers in Apulia were not so deeply impressed with the local style as they were in Sicily, while they thought much more of it than they thought of the local style of England. In each of the three cases there is adaptation, but the amount of adaptation differs in each case according to local circumstances. In Normandy itself, after the separation from England, architecture becomes French, but it is French of a remarkably good type. The buildings of the latest French style keep a certain purity and sobriety in Normandy which they do not keep elsewhere. (E. A. F.)

Norman architecture in England and in Sicily.

For a bibliography of the Normans and Northmen see Ulysse Chevalier, *Répertoire des sources hist. du moyen-âge. Topobibliogr.* (Montbéliard, 1903), ii. 2140; also, for sources for the Norman invasion of France, Molinier, *Sources de l'hist. de France* (Paris, 1901), i. 264. Many sources for the history of the Normans were collected by André Du Chesne in his *Hist. Normannorum scriptores antiqui . . . 838–1220*, &c. (Paris, 1619). Of modern works may be mentioned H. Dondorff, *Die Normannen und ihre Bedeutung für das europäische Kulturleben im Mittelalter* (Berlin, 1875); A. H. Johnson, *The Normans in Europe* (1877); E. A. Freeman, *Hist. of the Norman Conquest* (Oxford, 1867–1879) and *Hist. of Sicily* (1891–1894); O. Delarc, *Les Normands en Italie, 859–1073* (Paris, 1883); J. W. Barlow, *Short Hist. of the Normans in S. Europe* (London, 1886); A. F. von Schack, *Gesch. der Normannen in Sicilien* (Stuttgart, 1889); L. von Heinemann, *Gesch. der Normannen in Unteritalien und Sicilien* (Leipzig, 1894); W. Vogel, *Die Normannen und das*

fränkische Reich, 799–911 (1906); F. Chalandon, *La Dominion normande en Italie et Sicile, 1009–1154* (Paris, 1907); F. Lot, "La Grande Invasion normande, 856–862," in t. 69 of the *Bibliothèque de l'École des Chartes* (Paris, 1908).

NORMANTON, a town of Normanton county, Queensland, Australia, on the river Norman, 25 m. E. by S. of the Gulf of Carpentaria, and 1382 m. direct N.W. of Brisbane. Pop. (1901) 838. It is the centre of the Carpentaria district, one of the chief sheep and cattle farming districts in the colony. Normanton is also the outlet of the Croydon and Etheridge goldfields, and of the Cloncurry copper mines. It is the terminus of the railway to Croydon, and has large meat-packing works.

NORMANTON, an urban district in the Normanton parliamentary division of the West Riding of Yorkshire, England, on the river Calder, 3 m. N.E. of Wakefield on the Midland, North Eastern and Lancashire & Yorkshire railways. Pop. (1901) 12,352. The church of All Saints is Norman and Perpendicular, with a square tower rebuilt in 1717, and contains a number of interesting monuments; the ancient stained glass is good. The grammar-school was founded about the end of the 16th century. Traces remain of a moat surrounding the town. A mound in the neighbourhood called Haw Hill is supposed to be a barrow. Altofts, a neighbouring parish, was the home of Sir Martin Frobisher in the 16th century. There are numerous collieries in the neighbourhood.

NORNS (O. Norse, *Nornir*), in Northern mythology, the female divinities of fate, somewhat similar to the Gr. *Μοῖραι* and the Roman *Parcae*. Like them they are generally represented as three in number, and they are said to spin, or weave, the destiny of men. Their dwelling is beside the "Spring of fate," beneath the "world-tree," Yggdrasil's ash, which they water with draughts from the spring. In some cases the Norns are not easily to be distinguished from the Valkyries (*q.v.*). Sometimes again they appear as prophetesses (*völur*) at the birth of children, whose destiny they foretell. The most famous of these stories is contained in the *Thâttr af Nornagesti*, and has a curious resemblance to the Greek legend of Althaea and Meleager. Similar beings seem to have been known among other Teutonic peoples in early times. (See TEUTONIC PEOPLES, § 7). (H. M. C.)

NORRIS, FRANK (1870–1902), American novelist, was born in Chicago, Illinois, on the 5th of March 1870. He studied art in Paris in 1887–1889; studied at the University of California (1890–1894), and at Harvard University (1894–1895); in 1895–1896 served in South Africa as war correspondent for the San Francisco *Chronicle*; in 1896–1897 was associate editor of the San Francisco *Wave*; and in 1898 was sent to Cuba as war correspondent for *McClure's Magazine*. He died in San Francisco on the 25th of October 1902. He wrote *A Deal in Wheat, and Other Stories* (1903), *Responsibilities of the Novelist, and Other Literary Essays* (1903), and the following novels: *Moran of the Lady Letty* (1898), a story of adventure off the California coast; *McTeague* (1899), a story of the San Francisco slums; *Blix* (1899), a love story; *A Man's Woman* (1900); *The Octopus* (1901) and *The Pit* (1903). The last two were powerful stories, which made his reputation. *The Octopus* deals with wheat-raising in California and with the struggle between the growers and the railroad trust; *The Pit* with wheat-speculation in the Chicago market. His complete works were published in seven volumes in 1903.

NORRIS, HENRY NORRIS or NORREYS, BARON (*c.* 1525–1601), belonged to an old Berkshire family, many members of which had held positions at the English court. His father, Henry Norris, was a grandson of Sir William Norris, who commanded the royal troops against Lambert Simnel at the battle of Stoke in 1487. Like his brother John (d. 1564), the elder Henry Norris obtained a post at the court of Henry VIII.; he gained the king's favour and was rewarded with many lucrative offices. He belonged to the party which favoured the elevation of Anne Boleyn; but in May 1536 he was arrested on the charge of intriguing with her, and though he was probably innocent of any serious offence he was beheaded on the 17th of May 1536. His son Henry regained some of his father's lands and entered upon court life, being a member of parliament under Edward VI. During Mary's reign he was one of those who were entrusted with the custody of the princess Elizabeth, and when the princess became queen she amply repaid the kindness which Norris had shown to her when he was her guardian at Woodstock. In 1566 he was knighted and was sent as ambassador to France, where he remained until 1570, and in 1572 he was created Baron Norris of Rycote. He died in June 1601. By his wife Margaret (d. 1599), daughter of John, Lord Williams of Thame, Norris had six sons, all of whom distinguished themselves in the field. The Norris monument, with figures of Lord and Lady Norris and their six sons, is in St Andrew's Chapel in Westminster Abbey.

The eldest son, Sir WILLIAM NORRIS, died in Ireland in December 1579, leaving a son Francis (1579–1623), who succeeded to his grandfather's barony and also to the estates of his uncle Sir Edward Norris. In 1621 Francis was created earl of Berkshire. He left no sons and the earldom became extinct, but the barony descended to his daughter Elizabeth (d. 1645), the wife of Edward Wray (d. 1658). Their daughter Bridget (1627–1657) married as his second wife Montagu Bertie, 2nd earl of Lindsey, and their son James Bertie (1654–1699) became Baron Norris (or Norreys) in 1657, and was created earl of Abingdon in 1682. His descendants the Berties, earls of Abingdon, still hold this barony, and are the present representatives of the family of Norris.

Sir EDWARD NORRIS (d. 1603), the 1st Lord Norris's third son, served with the English troops in the Netherlands from 1585 to 1588. He is chiefly remembered owing to his fierce quarrel with Philip, count of Hohenlohe (1550–1606), called Hollock by the English, in August 1586 at Gertruydenberg (see J. L. Motley, *The United Netherlands*, vol. ii.). In 1589 he sailed with his brother Sir John and Sir Francis Drake on the expedition to Spain and Portugal, and from 1590 to 1599 he was governor of Ostend.

Sir THOMAS NORRIS (1556–1599), another son of the first lord, went as a soldier to Ireland in 1579 and acted for a few months as president of Connaught. He fought against the Fitzgeralds and also in Ulster; in 1585 he became vice-president of Munster, and in 1597 he succeeded his brother, Sir John Norris, as president. The three remaining brothers were: Sir Henry Norris (1554–1599), who fought in the Netherlands and then in Ireland, where he was killed in 1599; Maximilian Norris, who was killed in Brittany in 1593, and Sir John Norris (*q.v.*).

Two other members of another branch of this family remain to be mentioned, namely, Sir William Norris and his brother Sir John.

Sir WILLIAM NORRIS (*c.* 1657–1702), having been created a baronet, was sent in 1699 to the Mogul emperor in India to secure trading privileges for the new company which had been just formed to compete with the old East India Company. He reached India in September 1699, and after overcoming many difficulties he arrived at the emperor's residence in April 1701. The embassy, however, was a total failure; Norris was unable to make terms, and he died on the voyage to England.

Sir JOHN NORRIS (*c.* 1660–1749) entered the navy and saw a good deal of service during the war with France under William III. and Anne. Under George I. he was sent several times with a fleet into the Baltic Sea to forward the policy of this king by giving the northern nations some idea of the strength of England. In 1734 he became an admiral and commander-in-chief. Norris, who was known as "foul-weather Jack," was a member of parliament from 1708 until his death.

NORRIS, JOHN (1657–1711), English philosopher and divine, was born at Collingbourne-Kingston in Wiltshire. He was educated at Winchester and Exeter College, Oxford, being subsequently elected to a fellowship at All Souls'. His first original work was *An Idea of Happiness* (1683), in which, with Plato, he places the highest happiness or fruition of the soul in the contemplative love of God. Malebranche's *Recherche de la vérité*, which had appeared in 1674, made a strong impression upon him. Malebranche, he says, "is indeed the great Galileo of the intellectual world." He had also studied the works of Descartes himself, and most of what had been written for and against Cartesianism. Of English thinkers, More and Cudworth,

the so-called Cambridge Platonists, had influenced him most; and in 1685 his study of their works led to a correspondence with the former, published after his death by Norris as an appendix to his Platonically conceived essay on *The Theory and Regulation of Love* (1688). He also corresponded with Mrs Astell (*q.v.*) and Lady Masham, the friend of Locke, to whom he addressed his *Reflections upon the Conduct of Human Life* (1689). Some time before this Norris had taken orders, and in 1689 he was presented to the living of Newton St Loe, in Somersetshire. In 1690 he published a volume of *Discourses upon the Beatitudes*, followed by three more volumes of *Practical Discourses* between 1690 and 1698. The year 1690 is memorable as the year of the publication of Locke's *Essay*, and the book came into Norris's hands just as his volume of *Discourses* was passing through the press. He at once appreciated its importance, but its whole temper was alien from the modes of thought in which he had been reared, and its main conclusions moved him to keen dissent. He hastened to "review" it in an appendix to his sermons. These *Cursory Reflections* constitute Norris the first critic of the *Essay*; and they anticipate some of the arguments that have since been persistently urged against Locke from the transcendental side. Though holding to the "grey-headed, venerable doctrine" of innate ideas as little as Locke himself, Norris finds the criticism in the first book of the *Essay* entirely inconclusive, and points out its inconsistency with Locke's own doctrine of evident or intuitively perceived truths. He also suggests the possibility of subconscious ideation, on which Leibnitz laid so much stress in the same connexion. He next complains that Locke neglects to tell us "what kind of things these ideas are which are let in at the gate of the senses." In other words, while giving a metaphorical account of how we come by our ideas, Locke leaves unconsidered the intellectual nature of the ideas or of thought in itself. Unless we come to some conclusion on this point, Norris argues, we have little chance of being right in our theory of how ideas "come to be united to our mind." He also saw the weakness of Locke's doctrine of nominal essences, showing how it ignores the relation of the human mind to objective truth, and instancing mathematical figures as a case "where the nominal essence and the real essence are all one." The last twenty years of Norris's life were spent at Bemerton, near Salisbury, the former home of George Herbert, to the living of which he had been transferred in 1691. In 1691–1692 he was engaged in controversy with his old enemies the "Separatists," and with the Quakers, his Malebranchian theory of the divine illumination having been confounded by some with the Quaker doctrine of the light within. In 1697 he wrote *An Account of Reason and Faith*, one of the best of the many answers to Toland's *Christianity not Mysterious*. Norris adopts the distinction between things contrary to reason and things above reason, and maintains that the human mind is not the measure of truth. Reason, according to him, is nothing but the exact measure of truth, that is to say, divine reason, which differs from human reason only in degree, not in nature. In 1701 appeared the first volume of the systematic philosophical work by which he is remembered, *An Essay towards the Theory of the Ideal or Intelligible World*. The first volume treats the intelligible world absolutely; the second, which appeared in 1704, considers it in relation to human understanding. It is a complete exposition of the system of Malebranche, in which Norris refutes the assertions of Locke and the sensualists. In 1708 Norris wrote *A Philosophical Discourse concerning the Natural Immortality of the Soul*, defending that doctrine against the assaults of Dodwell. After this he wrote little. He died at Bemerton, and a monument was erected to his memory in the parish church, with an inscription in which he is spoken of as one who "bene latuit."

Norris was neither an original thinker nor a master of style. His philosophy is hardly more than an English version of Malebranche, enriched by wide reading of "Platonic" thinkers of every age and country. His style is too scholastic and self-involved. His *Theory of the Intelligible World* is an attempt to explain the objective nature of truth, which he blamed Locke for leaving out of regard. By the intelligible world Norris understands the system of ideas eternally existent in the mind of God, according to which the material creation was formed. This ideal system he identifies with the Logos—the second person of the Trinity, the light that lighteth every man that cometh into the world. For it is these ideas and their relations that are alone the object-matter of science; whenever we know, it is because they are present to our mind. Material things are wholly dark to us, except so far as the fact of their existence is revealed in sensation. The matter which we say that we know is the idea of matter, and belongs, like other ideas, to the intelligible world. When stripped of its semi-mythical form of statement, Norris's emphatic assertion of the ideal nature of thought and its complete distinction from sense as such may be seen to contain an important truth. As the disciple and correspondent of More, he is, in a sense, the heir of the Cambridge Platonists, while, as the first critic of Locke's *Essay*, he may be said to open the protest of the church against the implicit tendencies of that work. He occupies a place, therefore, in the succession of churchly and mystical thinkers of whom Coleridge is the last eminent example.

See Wood, *Athenæ Oxonienses* (ed. Bliss), iv.; *Biographia Britannica*; Leslie Stephen in *Dictionary of National Biography*; J. Tulloch, *Rational Theology and Christian Philosophy in England in the 17th Century* (1874), who calls Norris "as striking and significant a figure in the history of English philosophy" as another idealist, Berkeley.

NORRIS, SIR JOHN (*c.* 1547–1597), English soldier, was the second son of Henry Norris, Baron Norris of Rycote, and gained his earliest military experience in the civil wars in France. In 1573 he went to Ulster with Walter Devereux, earl of Essex, winning fame by his conduct in the guerilla wars against the Irish, and being responsible for the massacre on the island of Rathlin in July 1575; and in July 1577 he crossed over to the Netherlands to assist the Dutch against the Spaniards. Having added to his reputation by his valour at the battle of Rymenant, Norris returned to England in March 1584, and in the following July he was sent to Ireland as lord president of Munster; he accompanied the lord deputy, Sir John Perrot, on a campaign in Ulster, and spoke eloquently in the Irish parliament; but he disliked his work and soon obtained his recall. In August 1585 he was again in the Netherlands, commanding the English army of 4400 men which Elizabeth had sent to serve against the Spaniards. During his successful relief of Grave in April 1586 he was wounded, and just after this event he was knighted by the governor-general, the earl of Leicester; but he and Leicester were soon at variance, and many complaints of his conduct were sent to England. After taking part in the battle of Zutphen in October 1586 Sir John was recalled to England, but in 1587 he went again to the Netherlands and was soon quarrelling with his new superior, Peregrine Bertie, Lord Willoughby de Eresby, and with Sir William Stanley. In 1588, when the Spanish Armada was expected, he was marshal of the camp at Tilbury; later in the same year he served the queen as ambassador to the Dutch states, and in 1589 he and Sir Francis Drake led the fleet which ravaged the coasts of Spain and Portugal. In 1591, and again in 1593, he aided Henry IV. of France in his struggle with the League in Brittany; and in May 1595 he landed again in Ireland, where he was still lord president of Munster. But this time he was entrusted with more extensive powers and was to assist the lord deputy, Sir William Russell, in subjugating Ulster. He did not, however, work harmoniously with Russell; his health was failing and the gigantic task was too much for him. After fighting and negotiating with the O'Neills in Ulster, and warring in Connaught, he asked for his recall. This was not granted, but he was supplanted in his military command; and he retired to Munster and died at Mallow on the 3rd of July 1597. His monument is in the church of Tattendon, Berkshire.

See J. L. Motley, *The United Netherlands*, vol. ii. (1904); and R. Bagwell, *Ireland under the Tudors*, vol. iii. (1890).

NORRIS, WILLIAM EDWARD (1847–), English novelist, was born on the 18th of November 1847, the son of Sir W. Norris, chief justice of Ceylon. He was educated at Eton, and called to the bar at the Inner Temple in 1874. His first story, *Heaps of Money*, appeared in 1877, and was followed by a long series of novels, many of which first appeared in the *Temple Bar* and *Cornhill* magazines. The best of his numerous novels are *Mademoiselle de Mersac* (1880), *Matrimony* (1881), *No New*

Thing (1883), *My Friend Jim* (1886), *The Rogue* (1888), *The Despotic Lady* (1895), *Matthew Austin* (1895), *The Widower* (1898), *Nature's Comedian* (1904), *Pauline* (1908).

NORRISTOWN, a borough and the county-seat of Montgomery county, Pennsylvania, U.S.A., on the Schuylkill river, at the mouth of Stony Creek, opposite Bridgeport, and about 18 m. N.W. of Philadelphia. Pop. (1910 census) 27,875. Norristown is served by the Pennsylvania, the Philadelphia & Reading and the Stony Creek railways, by interurban electric railway to Philadelphia and Reading, and by the Schuylkill canal, and is connected by bridge with the borough of Bridgeport (pop. in 1910, 3860), where woollen and cotton goods are manufactured. Norristown is a residential suburb of Philadelphia, and commands fine views of the Schuylkill Valley. It has a State Hospital for the Insane (opened 1880), a fine County Court House, a general hospital, a Friends' Home, a home for aged women, St Joseph's Protectory (Roman Catholic) for girls, and the Norristown and McCann public libraries; in Montgomery cemetery are the tombs of General Winfield Scott Hancock and General John Frederick Hartranft (1830–1889), a distinguished Federal officer in the Civil War and governor of Pennsylvania in 1873–1879. Valley Forge is less than 6 m. distant to the W. The borough has a large trade with the surrounding country, which is well adapted to agriculture and abounds in limestone. Among Norristown's manufactures are hosiery and woollen goods; in 1905 its total factory product was valued at $5,925,243, an increase of 44·3% over the value in 1900. Norristown was founded in 1785, and was named in honour of Isaac Norris (*c.* 1671–1735), a friend of William Penn and a member of the Pennsylvania legislature, who had owned the land on which the borough is built. Norristown was incorporated as a borough in 1812, and its boundaries were extended in 1853.

NORRKÖPING, a town and port of Sweden, in the district (*län*) of Östergötland, 113 m. S.W. of Stockholm by the Malmö railway. Pop. (1880) 26,735; (1900) 41,008. It occupies both banks of the Motala, the wide and rapid emissary of lake Vetter, close to its outlet in the Bråvik, an inlet of the Baltic. Having been burned by the Russians in 1719 and visited by further fires in 1812, 1822 and 1826, the whole town has a modern appearance, with wide and regular streets. Among the more conspicuous buildings are St Olaf's church (erected by Gustavus Adolphus in 1616 and rebuilt in 1765–1767); St Hedvig's, built by the German colony in 1670; the town hall, dating from the beginning of the 19th century; the high school (1868), and technical and weaving schools. Norrköping is the fourth town in population and industrial importance in Sweden. The falls in the river afford motive power to the cloth and cotton mills (spinning and weaving)—the staple industries—and to factories for sugar, paper, lithography, tobacco and carpets, joinery works and breweries. There are also shipbuilding yards and docks. Fine granite is quarried at Grafversfors, 7½ m. N. The inlet of Bråvik affords excellent harbour accommodation, with from 33 ft. to 17½ ft. of water below the bridges in the town. The town returns two members to the second chamber of the *Riksdag* (parliament).

A bull of Pope Lucius III. shows that Norrköping existed in 1185. At the meeting of the states in 1604 Duke Charles assumed the Swedish crown as Charles IX.; and not long afterwards Duke John of Östergötland introduced German craftsmen into Norrköping, and thus originated its industrial activity. Under Charles XII. the town suffered not only from war but from pestilence, 2700 of its inhabitants perishing in 1710–1711. After the Russian invasion of 1719 the population was only 2600.

NORTH, BARONS. The English title of Lord North of Kirtling was created for Edward North (*c.* 1496–1564), son of Roger North, a London citizen, in 1554; he was a successful lawyer, clerk of the parliament (1531) and chancellor of the court of augmentations (1545). His second son was Sir Thomas North (*q.v.*), and he was succeeded as 2nd baron by his son Roger (1530–1600), a prominent courtier and soldier of Queen Elizabeth's day, who married the daughter of Lord Chancellor Rich, and whose eldest son, Sir John (*c.* 1551–1597), predeceased him.

DUDLEY NORTH, 3rd Baron North (1581–1666), son of Sir John North and of Dorothy, daughter and heiress of Sir Valentine Dale, was born in 1581 and succeeded his grandfather, the 2nd Baron North, at the age of nineteen. He was educated at Cambridge, and married in 1599 Frances, daughter of Sir John Brockett of Brockett Hall in Hertfordshire. He travelled in Italy, took part in the campaign of 1602 in the Netherlands, and on his return became a conspicuous figure at court, excelling in athletic exercises as well as in poetry and music, and gaining the friendship of Prince Henry. In 1606, while returning from Eridge to London, he discovered the springs of Tunbridge Wells, which cured North himself of a complaint and quickly became famous. He also recommended the Epsom springs to the public. He supported and subscribed to the expedition to Guiana made by his brother Roger North (*c.* 1582–*c.* 1652) in 1619, and when Roger departed without leave Dudley was imprisoned for two days in the Fleet. In 1626 he attached himself to the party of Lord Saye and Sele in the Lords, who were in sympathy with the aims of the Commons; and when the civil war broke out he was on the side of the parliament. In 1641 he was a member of the Lords' committee on Religion, and served on the committee to consider Laud's attainder in 1644, finally voting for the ordinance in January 1645. He was placed on the admiralty commission in 1645, and acted as lord lieutenant for Cambridgeshire. He was one of the small group of Lords who continued attendance in the House of Peers, and on the 19th of December 1648, with three others, visited Fairfax, when they "cast down their honours at his Excellency's feet" and protested their desire not to retain any privileges prejudicial to the public interest.[1] He passed the rest of his life in retirement at Kirtling in Cambridgeshire, with his sons, daughters and grandchildren, finding "employment with many airy entertainments as poetry, writing essays, building, making mottoes and inscriptions as well as in music."[2] He wrote *A Forest of Varieties* (1645), a miscellany of essays and poems, another edition of which was published in 1659 under the title of *A Forest promiscuous of various Seasons' Productions*. He died on the 16th of January 1666. North is described as "full of spirit and flame," of imperious temper but of well-balanced judgment, Lord Holland declaring that "he knew no man less swayed with passion and sooner carried with reason and justice." He left, besides one daughter, two sons, the elder of whom, Sir Dudley, succeeded him as 4th Baron North.

DUDLEY NORTH, 4th Baron North (1602–1677), increased the family fortune by marrying the daughter of Sir Charles Montagu, brother of the 1st earl of Manchester. He was an accomplished man, of studious bent, and had fourteen children, of whom the third son, Francis, became lord chancellor as Lord Guilford; the fourth was Sir Dudley North (*q.v.*), the economist; the fifth, John (1645–1683), master of Trinity, Cambridge, and professor of Greek in the university; and the sixth, Roger (*q.v.*), the lawyer and historian.

The eldest son, Charles (d. 1691), was created Lord Grey of Rolleston during his father's life, and succeeded his father as 5th Baron North; and on the death of his son, William, 6th Lord North, without issue, in 1734, the barony of North went to a cousin, Francis North, 3rd baron, afterwards 1st earl of Guilford. The title of Lord North is that by which the 2nd earl of Guilford, prime minister from 1770 to 1782, is best known in history (see GUILFORD, BARONS AND EARLS OF).

George Augustus, 3rd earl of Guilford (d. 1802), left three daughters, and the barony of North fell into abeyance till 1841 when it vested in Susan, Baroness North (1797–1884), wife of John Sidney Doyle, who took the name of North; at her death her son William Henry John North (b. 1836) succeeded as 11th baron, the title now being separate from that of Guilford.

NORTH, SIR DUDLEY (1641–1691), English economist, was 4th son of Dudley, 4th Lord North, who published, besides other things, *Passages relating to the Long Parliament*,

[1] Gardiner's *Civil War*, iv. 285.

[2] Roger North's *Autobiography*, ed. by A. Jessopp, 68.

of which he had himself been a member. He was born on the 16th of May 1641. In his early years he was carried off by gipsies and recovered with some difficulty by his family—an incident curiously similar to that which befell Adam Smith in his infancy. He engaged in foreign trade, especially with Turkey, and spent a number of years at Constantinople and Smyrna. Some notices of the manners and customs of the east were printed from his papers by his brother. Having returned to London with a considerable fortune, he continued to prosecute trade with the Levant. His ability and knowledge of commerce attracted the attention of the government, and he was further recommended by the influence of his brother Lord Guilford. During the Tory reaction under Charles II. he was one of the sheriffs forced on the city of London with an express view to securing verdicts for the crown in state trials. He was knighted, and was appointed a commissioner of customs, afterwards of the treasury, and again of the customs. Having been elected a member of parliament under James II., "he took," says Roger North, "the place of manager for the crown in all matters of revenue." After the Revolution he was called to account for his alleged unconstitutional proceedings in his office of sheriff. He died on the 31st of December 1691.

His tract entitled *Discourses upon Trade, principally directed to the cases of the interest, coinage, clipping and increase of money*, was published anonymously in 1691, and was edited in 1856 by J. R. M'Culloch in the *Select Collection of Early English Tracts on Commerce* printed by the Political Economy Club of London. In this thorough-going and emphatic assertion of the free-trade doctrine against the system of prohibitions which had gained strength by the Revolution, North shows that wealth may exist independently of gold or silver, its source being human industry, applied either to the cultivation of the soil or to manufactures. It is a mistake to suppose that stagnation of trade arises from want of money; it must arise either from a glut of the home market, or from a disturbance of foreign commerce, or from diminished consumption caused by poverty. The export of money in the course of traffic, instead of diminishing, increases the national wealth, trade being only an exchange of superfluities. Nations are related to the world just in the same way as cities to the state or as families to the city. North emphasizes more than his predecessors the value of the home trade. With respect to the interest of capital, he maintains that it depends, like the price of any commodity, on the proportion of demand and supply, and that a low rate is a result of the relative increase of capital, and cannot be brought about by arbitrary regulations, as had been proposed by Sir Josiah Child and others. In arguing the question of free trade, he urges that every advantage given to one interest over another is injurious to the public. No trade is unprofitable to the public; if it were, it would be given up; when trades thrive, so does the public, of which they form a part. Prices must determine themselves, and cannot be fixed by law; and all forcible interference with them does harm instead of good. No people can become rich by state regulations,—only by peace, industry, freedom and unimpeded economic activity. It will be seen how closely North's view of things approach to that embodied some eighty years later in Adam Smith's great work. North is named by Wilhelm Roscher as one of that "great triumvirate" which in the 17th century raised the English school of economists to the foremost place in Europe, the other members of the group being Locke and Petty.

NORTH, MARIANNE (1830–1890), English naturalist and flower-painter, was born at Hastings on the 24th of October 1830, the eldest daughter of a Norfolk landowner, descended from Roger North (1653–1734). She trained as a vocalist under Madame Sainton Dolby, but her voice failed, and she then devoted herself to painting flowers. After the death of her mother in 1855 she constantly travelled with her father, who was then member of parliament for Hastings; and on his death in 1869 she resolved to realize her early ambition of painting the flora of distant countries. In 1871–1872 with this object she went to Canada, the United States and Jamaica, and spent a year in Brazil, where she did much of her work at a hut in the depths of a forest. In 1875, after a few months at Teneriffe, she began a journey round the world, and for two years was occupied in painting the flora of California, Japan, Borneo, Java and Ceylon. The year 1878 she spent in India, and after her return she exhibited a number of her drawings in London. Her subsequent offer to present the collection to the botanical gardens at Kew, and to erect a gallery for their reception, was accepted, and the new buildings, designed by James Ferguson, were begun in the same year. At Darwin's suggestion she went to Australia in 1880, and for a year painted there and in New Zealand. Her gallery at Kew was opened in 1882. In 1883, after a visit by her to South Africa, an additional room was opened at the Kew gallery, and in 1884–1885 she worked at Seychelles and in Chile. Miss North died at Alderly in Gloucestershire on the 30th of August 1890. The scientific accuracy with which she represented plant life in all parts of the world gives her work a permanent value.

NORTH, ROGER (1653–1734), English lawyer and biographer, was the sixth son of the 4th Baron North. He acquired a good practice at the bar, being helped by his elder brother Francis, who became lord chancellor and was created Baron Guilford (*q.v.*), and in 1684 he became solicitor-general. But the Revolution stopped his advancement, and he retired to his estate of Rougham in Norfolk, and increased his fortune by marrying the daughter of Sir Robert Gayer. He collected books, and was constantly occupied in writing. But he is best known for his *Lives of the Norths*, published after his death, together with his own autobiography (see the edition in Bohn's *Standard Library*, 1890, by Jessopp), a classic authority for the period. He died at Rougham on the 1st of March 1734, leaving a family from whom the Norths of Rougham are descended.

He is to be distinguished from Roger North (1585–1652), brother of the 3rd baron, one of the captains who sailed with Raleigh in 1617, who projected the plantation of Guiana with an English colony.

NORTH, SIR THOMAS (1535?–1601?), English translator of *Plutarch*, second son of the 1st Baron North, was born about 1535. He is supposed to have been a student of Peterhouse, Cambridge, and was entered at Lincoln's Inn in 1557. In 1574 he accompanied his brother, Lord North, on a visit to the French court. He served as captain in the year of the Armada, and was knighted about three years later. His name is on the roll of justices of the peace for Cambridge in 1592 and again in 1597, and he received a small pension (£40 a year) from the queen in 1601. A third edition of his *Plutarch* was published, in 1603, with a supplement of other translated biographies. He translated, in 1557, Guevara's *Reloj de Principes* (commonly known as *Libro Aureo*), a compendium of moral counsels chiefly compiled from the *Meditations* of Marcus Aurelius, under the title of *Diall of Princes*. The English of this work is one of the earliest specimens of the ornate, copious and pointed style for which educated young Englishmen had acquired a taste in their Continental travels and studies. North translated from a French copy of Guevara, but seems to have been well acquainted with the Spanish version. The book had already been translated by Lord Berners, but without reproducing the rhetorical artifices of the original. North's version, with its mannerisms and its constant use of antithesis, set the fashion which was to culminate in Lyly's *Euphues*. His next work was *The Morall Philosophie of Doni* (1570), a translation of an Italian collection of eastern fables. The first edition of his translation of *Plutarch*, from the French of Jacques Amyot, appeared in 1579. The first edition was dedicated to Queen Elizabeth, and was followed by other editions in 1595 and 1603, containing in each case fresh *Lives*. It is almost impossible to over-estimate the influence of North's vigorous English on contemporary writers, and some critics have called him the first master of English prose. The book formed the source from which Shakespeare drew the materials for his *Julius Caesar*, *Coriolanus* and *Antony and Cleopatra*. It is in the last-named play that he follows the *Lives* most closely, whole speeches being taken direct from North.

North's *Plutarch* was reprinted for the "Tudor Translations" (1895), with an introduction by George Wyndham.

NORTH ADAMS, a city of Berkshire county, Massachusetts, U.S.A., situated at the junction of the N. and S. branches of the Hoosac river, and the Boston & Maine (at the W. terminus of the Hoosac Tunnel) and the Boston & Albany railways, in the extreme N.W. part of the state. Pop. (1905) 22,150; (1910) 22,019. Area, 19·9 sq. m. In the city are the villages of North Adams, Greylock and Blackinton. Within the city limits are a natural bridge across Hudson Brook, 50-60 ft. high, and ruins of Fort Massachusetts, which was captured in 1746 by French and Indians under the command of Pierre François de Rigaud, Chevalier de Vaudreuil (1704–1772). North Adams is the seat of a state Normal School (1897). Among its manufactures are cotton (especially print) and woollen goods, and boots and shoes. In 1900 the factory products of the city were valued at $10,741,495, and in 1905 at $8,035,705. North Adams secured incorporation as an independent township in 1878. Township government was abandoned and city government was organized in 1895; in 1900 part of Williamstown was annexed.

NORTHALLERTON, a market town in the Richmond parliamentary division of the North Riding of Yorkshire, England, 30 m. N.N.W. from York by the North Eastern railway, on which it is an important junction. Pop. of urban district (1901) 4909. It lies in a plain west of the Cleveland and Hambleton Hills, on the Sun Beck, a small tributary of the river Wiske. The church of All Saints is a large cruciform structure, Norman, Early English and Perpendicular, with a central tower 80 ft. in height. There is a grammar-school. Among the charities are a hospital founded in 1476 by Richard Moore. There are no traces of the fortified palace of the bishops of Durham, of the White Friars' monastery founded in 1354, or of the Austin priory founded in 1341. The town has a considerable agricultural trade, and there are motor-engineering works. In the neighbourhood of Northallerton is the priory of Mount Grace, a Carthusian foundation of 1397. It consists of an outer court entered through a gatehouse, the church and chapter-house, with other buildings lying on the north side, partly surrounded by monastic dwelling-houses. These houses, with gardens attached, also surround three sides of the cloister court, which lies north of the outer court. In the vicinity are a monks' well and a ruined chapel of the 16th century.

Northallerton (Alvetune, Allerton) is said to have been a Roman station and afterwards a Saxon "burgh," but nothing is known with certainty about it before the account given in the Domesday Survey, which shows that before the Conquest Earl Edwin had held the manor, but that the Normans had destroyed it so utterly that it was still waste in 1086. Soon after his accession William Rufus gave it to the bishop of Durham, whose successors continued to hold it until it was taken over by the ecclesiastical commissioners in 1865. As a borough by prescription Northallerton returned two members to the parliament of 1298, but was not represented again until 1640, when its ancient privileges were restored. The Municipal Reform Act of 1832 reduced the number of members to one, and in 1885 the town was disfranchised. The first account of the borough and its privileges is contained in an inquisition taken in 1333 after the death of Anthony, bishop of Durham, which shows that the burgesses held the town with the markets and fairs at a fee-farm rent of 40 marks yearly, and that they had two reeves who sat in court with the bishop's bailiff to hear the disputes of the townspeople. This form of government continued until 1851, when a local board was formed, which in 1894 was superseded by an urban district council. A weekly market on Wednesday was granted by King John to the bishop in 1205. A subsequent bishop obtained a grant of a fair on St Bartholomew's day, which according to Camden (*circa* 1585), had become almost "the most thronged" cattle fair in England, but is no longer held. In 1317 the town was burnt by the Scots under Robert Bruce, although the burgesses paid 3000 marks that it might be spared. In consequence they were exempted from taxes in 1319.

See *Victoria County History, Yorkshire*; C. J. D. Ingledew, *The History and Antiquities of Northallerton in the County of York* (1858); J. L. Saywell, *The History and Annals of Northallerton* (1885).

NORTH AMERICA. In the article AMERICA a brief geographical survey is taken of the two continents which bear this name; and their points of similarity and contrast are broadly indicated. When North America is compared with the northern continents of the Old World, an important correspondence is found between it and the greater part of Eurasia; but here the corresponding parts are reversed, right and left, like the two hands. The Laurentian highlands agree with Scandinavia and Finland, both having escaped deformation since very ancient times. A series of water bodies (the Great lakes in North America; the southern Baltic, with Onega, Ladoga, &c. in Europe) occupy depressions that are associated with the boundary between the very ancient lands and their less ancient covering strata. The old worn-down and re-elevated Appalachian mountains of south-eastern North America agree well with the Hercynian mountains of similar history in middle Europe (Ardennes, Slate mountains of the middle Rhine, &c.), each range entering the sea at its Atlantic end (in Nova Scotia and Newfoundland; in Brittany, Wales and Ireland), and dipping under younger formations at its inland end. Certain younger ranges—seldom recognized as mountains because they are mostly submerged in the American mediterraneans (Gulf of Mexico and Caribbean Sea), but of great absolute relief and with crests rising in the larger West Indian islands—may be compared with the younger ranges of southern Europe (Pyrences, Alps, Caucasus) bordering the classic Mediterranean and the seas farther east. The central plains of North America correspond well with the plains of Russia and western Siberia; both stretch from great enclosed water bodies on the south to the Arctic Ocean, and both are built of undisturbed Palaeozoic strata toward the axis of symmetry and of younger strata away from it. Finally, the Western highlands of North America may be compared with the great mountain complex of central and eastern Asia. In this remarkable succession of resemblances we find one of the best proofs of the continental unity of Eurasia. Moreover, the resemblances thus described controvert the idea, prevalent when geology was less advanced than to-day, that the New World of civilized discovery is an "old world" geologically, and that the Old World of history is geologically "new." Both worlds are so old, and both share so well the effects of successive geological changes from the most ancient to the most modern periods, that neither can regard the other as older or younger than itself.

Comparison of North America and Eurasia.

There are several climatic similarities between North America and Eurasia. The Appalachians and the Hercynian mountains of middle Europe both contain extensive coal deposits of similar geological age, thus indicating a climatic and geographic resemblance at a time of great antiquity. The Laurentian highlands and the Scandinavian highlands were both heavily and repeatedly glaciated in recent geological times, and the ice sheets that crept out on all sides from those centres spread far over the lower lands to the south and away from the axis of symmetry towards the continental interior, scouring the highlands and leaving them rocky and barren, strewing extensive drift deposits over the peripheral areas, and thus significantly modifying their form and drainage; while the much loftier mountain ranges of western America and central Asia suffered, singularly enough, a far less extensive glaciation. At the present time, the plentiful and well-distributed rainfall of the continental border on either side of the Atlantic is succeeded by an increasing aridity towards the continental interior, until the broad plains that rise towards the distant mountain complexes are comparatively barren or even desert. Within each greater mountain area extensive interior drainage basins are found holding salt lakes, and the recently determined former extension of these lakes in Central Asia agrees with the well-proved extension of Pleistocene lacustrine conditions in western North America.

The following sketch of the geological development of North America considers the larger physiographic divisions already indicated.

The extensive area of ancient crystalline rocks (Archean), stretching from Labrador past Hudson Bay to the Arctic Ocean, is of greatly disordered structure, and hence must have once had a

mountainous form. Moreover, the crystalline texture and deformed foliation of the rocks prove that the surface now seen was once buried deep beneath the surface of an earlier time, for only at great depths can such texture and foliation be acquired. Both these lines of evidence lead to the conclusion that the moderate relief prevalent over the existing Laurentian region is the work of persevering erosion during a long continuance of dry land conditions, and hence that the region must be regarded as a worn-down mountain system. The worn-down old land is gently overlapped, chiefly around the south and west, and south of Hudson Bay, by very early Palaeozoic strata which rest upon the eroded surface of the crystallines, thus proving that the destruction of the ancient mountains had already been accomplished before some of the oldest fossiliferous formations of the world had been deposited. All the evidence goes to prove that from then to now the Laurentian region has been relatively quiescent. In all subsequent time there have been here only moderate oscillations of level, one of which allowed the transgression of the ancient sea in which the overlapping strata were deposited, while another of much more modern date gave the region its present highland altitude (1000 to 2000 ft.; mountains near the Labrador coast, 8000 ft.), again offering it to the forces of erosion.

Laurentian highlands.

It is this ancient Laurentian area that the earlier geologists named the "Continental Nucleus," as if it had been the first part of North America to rise from the primeval waters of an assumed universal ocean. The "Archean V," formed by the two arms of the Laurentian oldland stretching from Labrador to the Arctic, between which Hudson Bay is included, has been repeatedly described as the oldest area of the continent, the beginning around which many later additions have built the existing outlines; and as such it has been adduced in favour of the theory of the permanence of continents. But when thus stated, the half of the story in favour of this theory is not told. Hudson Bay is not due to a primitive failure of elevation between the arms of the "Archean V"; it is not a deep basin whose floor has never emerged from the primeval ocean, but an ancient and comparatively shallow depression in a pre-existent land, over which the sea flowed as the surface sank below sea-level. South and west from the "Archean Nucleus," the Cambrian strata of the medial plains of North America are found to lie, wherever their base is discovered, on a foundation that possesses all the essential features of the Laurentian oldland. This relation is found all around the Adirondack mountains in New York, along the Appalachians southward to Georgia, through the Mississippi basin in Wisconsin and Missouri, and beyond in Texas, and farther west in the Black Hills, as well as certain points in the Rocky Mountains region. Hence the pre-Cambrian land surface of the continent must have had not only a vastly greater area than was formerly attributed to it, but also an earlier origin; for at the time when it was thought by the older geologists to be first rising from the primeval ocean, it is now proved to have been slowly sinking after a prolonged land existence. The crystalline Archaean rocks in the Laurentian region and its scattered fellows cannot possibly be explained as a primitive sea bottom, rising above sea-level to make the beginning of a continent and receiving Cambrian strata upon its still submerged borders, but only as portions of an already old and deeply-denuded land area, which was in pre-Cambrian time much larger than the visible Laurentian area of to-day, and which was reduced to perhaps half its primeval dimensions by a gradual submergence beneath the transgressing sea in which the Cambrian sediments were laid down. We are thus led to believe that much of the continent of to-day was a continent in the earliest geological times, and that the seas which partly covered it in Palaeozoic and Mesozoic time were due to partial submergence, not to partial emergence. Furthermore, all the marine strata that now stretch over a large part of what is believed to have been the ancient continental surface are of relatively shallow water origin; none of them bears any close resemblance to the deposits of the deep oceans that have been so well studied of late years. Hence the Palaeozoic and Mesozoic seas of North America were not deep oceans, and as far as this continent is concerned it is by no means admissible to assume, as some of the earlier geologists did, that the position of continents and oceans have repeatedly changed places. The testimony of the rocks is decidedly in favour of Dana's view that continental masses are relatively permanent.

The early history of the Laurentian region has been dwelt upon because of its great importance in the history of the continent, and because its history has so generally been misunderstood. To these reasons may be added a third: through Palaeozoic and Mesozoic time the history of the Laurentian region is for the most part a blank. Records are wanting from the early Palaeozoic to the Pleistocene, when the Laurentian uplands became the centres from which the ice sheets of the Glacial period spread out on all sides. As a result of this late chapter in the history of the region, the weathered soils of earlier periods were swept away along with an unknown amount of firm rock, leaving bare ledges, scattered boulders and gravelly drift to-day upon a rugged upland without mountains (except in north-east Labrador), but diversified by innumerable knobs and hollows. The drainage of the region has thus been thrown into disorder; large and small lakes and marshy hollows abound; the streams are repeatedly interrupted by rapids, and frequently split into two or more channels, enclosing islands many miles in length. They are the only highways of this thinly inhabited region.

The Appalachian province is a generally hilly and mountainous belt, stretching from Newfoundland to Alabama. It seems for the most part to have belonged in the earliest times to the great pre-Cambrian land area, of which the Laurentian highland is the more manifest representative; for wherever the basal members of the Palaeozoic sedimentary series are found in the Appalachians, they rest upon a floor of denuded Archean rocks, and the lowest layers are largely composed of Archaean detritus. This province must, however, be set aside from the undisturbed Laurentian region because of the repeated movements of depression, deformation and elevation that it has suffered, generally along a north-east south-west trend, causing the successive alternations of heavy deposition, and almost equally heavy denudation that have prevailed with varying intensity during the whole stretch of geological time covered by the fossiliferous record. The earliest important mountain-making disturbances interrupted the conditions of deposition in Cambrian time, and produced what has been called the Green Mountain system. A later, and probably greater, disturbance, with its climax at the close of Carboniferous time, established the Appalachian Mountain system; but, as understood to-day, the "Appalachian revolution" of the older geologists should be regarded as a long-lasting process, perhaps intermittently enduring as long as the whole of Carboniferous time. A subordinate period of deposition and deformation occurred early in Mesozoic time, marked by the accumulation and disturbance of several basins of the Newark formation, roughly corresponding to the Triassic of Europe.

Appalachian highlands.

The Appalachian mountains of to-day were formerly regarded as the unconsumed remnants of the chief Appalachian uplift; but it is now generally agreed that Mesozoic erosion reduced the greater part of the range to a lowland of moderate or small relief, leaving only isolated groups of subdued mountains in the areas of the most resistant rocks, and that the altitude and form of the mountains of to-day are chiefly the result of the Tertiary elevation and dissection of the previously worn-down mass—the additional height thus given in Tertiary time to the pre-existent subdued mountain groups making them now the loftiest areas of the range, as in the White Mountains of New Hampshire (Mount Washington, 6293 ft.) and the Black Mountains of North Carolina (Mount Mitchell, 6711 ft.). It is interesting to note that the axis of Tertiary elevation is nearly parallel to and closely associated with the axes of the earlier disturbances, but it lies somewhat to the north-west of its predecessors, and therefore involves considerable areas of flat-lying Palaeozoic strata on the inner side of the previously disturbed belt from New York to Alabama, thus producing what is known as the Alleghany plateau (altitudes, 2000 to 4000 ft.). It should be added that the Ozark plateau of Missouri and the Ouachita mountains on the south, in Arkansas and farther west, are related to one another in much the same way as the Alleghany plateau and the middle ranges of the Appalachians—the two pairs corresponding to a remarkable degree in regard to conditions of ancient accumulation, medieval deformation and denudation, and more modern uplift and dissection; it is, therefore, admissible to classify this western group of uplifts as an annex to the normal Appalachians. Numerous and extensive coal seams occur in the worn-down Appalachians of Nova Scotia, Pennsylvania and Alabama, as well as in the Alleghany plateau from Pennsylvania to Alabama, and in the extension of the same strata through the Ohio and middle Mississippi basins.

The eastern coast of the continent has a rocky and ragged shore line from Maine to Greenland, with numerous submerged lowlands and valleys forming bays, and as many uplands and ridges outstretching in promontories and islands; this being the result of the summation of many movements of the land, whose total gives an increasing measure of depression to the north, where an archipelago at last replaces what was probably once a corner of the continent; but the measure of the depression is uncertain, because of the doubt regarding the depth beneath sea-level to which the Pleistocene glaciers may have worn the pre-Glacial valleys. South of New England, along the Atlantic coast, and around the border of the gulf into Mexico, the dominating movement of the land in late geological periods has been upward with respect to sea-level, whereby a former sea bottom, on which the land waste of Cretaceous and Tertiary times had been outspread, was revealed as a coastal plain, across which the rivers of the former land area now extend their courses, from the old shore line to the new. Part of the same plain, still submerged, forms the "continental shelf" of the mid-Atlantic border. Florida seems to be a projecting swell of this shelf, around whose extremity coral reefs have been added, but whose greater mass is still under a shallow sea cover. Along the ragged coast in the north a moderate and very modern movement of elevation has laid bare clay-floored lowlands that were lately beneath the sea, as in the plain of the lower St Lawrence valley, while along the coastal plain of the south a slight movement of depression has drowned a number of low valley floors, producing shallow arms of the sea, as Chesapeake Bay, Albemarle and Pamlico Sound and Mobile Bay. All the coast south of New York is low, and a great part of it is fringed with wave-built sand-reefs.

The great complex of mountains in the Western highlands,

sometimes styled the Cordilleras of North America (the Rocky Mountains being the eastern members of the system in the United States and Canada), differ from the Laurentian and Appalachian regions in having suffered numerous disorderly movements at dates so recent that the existing relief of the region bears a significant relation to its irregular uplifts; a relation that doubtless once obtained in the older mountain areas of the east, where it has now been obliterated by erosion. It is not, however, only in modern geological periods that mountain-making disturbances have prevailed in the regions of the Western highlands; their geological history is one of repeated and long-continued movement—the ruins of the more ancient upheavals supplying materials for the strata of newer ranges. For example, in Canada an axial belt of ancient rocks is bordered on the east and west by stratified formations of enormous thickness (40,000 to 60,000 ft.), those on the west including a large share of contemporaneous volcanic materials; all three belts having been deformed and upheaved, as well as deeply dissected in the later chapters of geological time. It is, however, important to note that the interval between Palaeozoic and Mesozoic time, in which mountain-making disturbances were so general in western Europe and eastern North America that the older geologists thought them to be of world-wide extent, was here generally passed over in relative quiet, so that continuous sedimentation produced in certain districts a conformable series of deposits from Silurian to Cretaceous time. Furthermore, the Carboniferous period, which gained its name from the extensive coal deposits that were then formed in western Europe and eastern North America, was a marine limestone-making period in the Cordilleran region.

The Cordilleras of North America.

There is here exemplified, as might be expected in a region extending over 3000 m. from Alaska to southern Mexico, and measuring over 1000 m. in breadth at its middle, a great variety of plateau and mountain structures. The broad upheaval of adjacent blocks of earth-crust without significant tilting or disturbance has produced the plateaus of Arizona and Utah. Some of the simplest and youngest mountain ridges in the world are to be found in the broken and tilted lava blocks of southern Oregon. Tilted blocks on a larger scale, much more affected by processes of sculpture, are found in the lofty St Elias Alps of Alaska, the site of some of the greatest glaciers in the world. The wall of a huge fracture, now elaborately carved, constitutes the western slope of the Wahsatch range, facing the desert basin of Utah. Ranges of a relatively simple arch structure are seen in the Uinta mountains of Wyoming and Utah. Arched upheavals also characterize the front range of the Rocky Mountains proper in Colorado and Wyoming and in the Black Hills of South Dakota, bending up the strata of the adjacent plains in the simplest fashion, and producing dome-like mountains, now deeply dissected by outflowing consequent streams. A remarkable change in the structure of the Rocky Mountains occurs north of the Missouri river in Montana and northward into Canada, where the front range is of synclinal or trough structure, with the youngest instead of the oldest rocks along the axis, while the strata of the plains are bent down and overridden in the most abnormal manner. Indeed, mountain structure occurs of so great diversity in various parts of the Cordilleran region as to elude general description. The disturbances extend directly to the western coast line, including not only the coast range of California, but the peninsular area of Lower California (belonging to Mexico) and the detached mountainous islands of British Columbia and Alaska.

Volcanoes of commanding form here and there dominate the plateaus and mountains. Orizaba, Popocatepetl and their neighbours, terminating the Cordilleran system in Mexico; Mount San Francisco, bearing snow and Arctic plants above the nearly desert plateau of Arizona; Mount Shasta, with small glaciers in northern California: Mount Rainier, with extensive glaciers surmounting the Cascade range of Washington; Mount Wrangell in Alaska, and farther on the many cones in the curved chain of the Aleutian islands: all these have been heaped up around vents through which their lavas rose from some deep source. Vast lava floods have been poured out at different times. The southern part of the Mexican plateau is built up in large measure of lava sheets, capped with volcanoes. Extensive lava beds, barren and rugged, cover large areas in north-eastern California. The basins of Snake and Columbia rivers in Idaho and Washington are flooded with older and more extensive lava sheets, whose borders lap around promontories and islands of the "mainland." Still older lava-flows in British Columbia are now deeply dissected by the branches of Frazer river, and remain only in disconnected upland areas. High plateaus in Utah are protected by a heavy lava capping, the result of great eruptions before the plateaus were uplifted. Here and there rise dome-like mountains, the result of the underground intrusion of lavas in cistern-like spaces, forming "laccoliths," and blistering up the overlying strata. Thus, by mountain upheaval or volcanic eruption, great altitudes have been gained. Where the uplift has been strong, ranges of truly Alpine form with extensive snow-fields and glaciers occur, as in the Selkirk range of Canada (now traversed by the Canadian Pacific railway), and again in Alaska. Heights of 12,000 and 14,000 ft. are exceeded by numerous summits in the central part of the system; but the dominating peaks are found far in the north-west and in the south. Several mountains in Alaska exceed 18,000 ft. (Mount McKinley, 20,300 ft.; Mount Logan, 19,540 ft.; Mount St Elias, 18,000 ft.); and the great Mexican volcanoes rise nearly as high (Orizaba, 18,250 ft.). Widespread plateaus maintain upland altitudes of more than a mile over vast areas.

As in all regions of great altitude, the erosion of valleys has progressed on a magnificent scale in the Cordilleran region, and the actual form of many of its parts is more the result of sculpturing than of uplifting. The plateaus of Arizona are traversed by the deep cañons of the Colorado river and its branches, at places 1 m. deep, and with elaborately carved walls. Upon the plateaus themselves, long and ragged cliffs of recession attest an even greater work of erosion than the cañons. In all the mountain ranges except those of youngest uplift, valleys have been actively eroded, sometimes producing steep peaks as in Mount Assiniboine (11,500 ft.) in the Canadian Rockies, rivalling the Swiss Matterhorn in sharpness of form; but the greater number of summits have been worn to roughly pyramidal form between wide-flaring valleys, and the mountain flanks have thus come to be extensively covered with rock waste lying on slopes of relatively uniform declivity. Some of the ranges are in a second cycle of dissection, having been once worn down to moderate relief and now being elevated for renewed erosion; the Sierra Nevada of California is believed to be, in part, of this history, having at least in its central and northern parts been well reduced and now again enjoying a mountainous character in virtue of a later slanting uplift *en bloc*, with rapid descent on its eastern fractured face. Other ranges, almost completely worn down, still remain low, as in south-eastern California, where they are now represented by gently sloping rock floors veneered with gravel and retaining only small remnants of their original mass still unconsumed; thus the end, as well as the beginning, of the cycle of erosion, together with many complications of its progress, are illustrated in different parts of this great and varied mountain system. In the fjorded coast of Alaska, as well as in the higher northern ranges, signs of intense glacial erosion are seen in the cirques at the valley heads and in the discordant junction of the "hanging" lateral valleys and the deep trunk valleys—the floors of the former being cut off on the walls of the latter.

Fitting complements of the deeply-eroded mountains are found in the great accumulations of mountain waste now occupying basins of depression between the various ranges, as in Mexico, Utah, Nevada, Montana and elsewhere. Erosion and transportation here combine to build up the floors of the basins with the waste of the surrounding highlands; a result that is peculiarly beneficial in Mexico where the climate of the plateau basins is rendered relatively temperate by reason of its altitude, and where the surface is easily habitable by reason of its small relief. In the larger depressions, as along the boundary of the United States and Mexico, isolated ranges frequently rise like islands over the plain of waste that has been built up on their flanks. Shallow saline lakes or playas (wet-weather lakes) without outlets lie on the lowest parts of the waste-filled basins; their failure to overflow in rivers discharging to the sea being less the result of enclosure by barriers than of deficiency of rainfall; for it is chiefly in the arid region that the waste-floored basins are best developed. Indeed, the rainfall is often so scanty that the streams from the mountains—where most of the little precipitation occurs—often fail even to form lakes, withering away on the waste plains. In all these cases, the wash of rock waste from the mountains remains on the continent and builds up the basin plains, instead of being carried away from the land to form stratified sediments on the sea floor. The habit of gathering mountain waste in interior basins that characterizes so much of the Cordilleran region to-day is only the continuation of an earlier practice, for extensive basin deposits of Tertiary date are found in many parts of the Cordilleran region; some of them are famous for preserving vertebrate fossils, such as those of the many-toed ancestors of the horse.

Between the loftier western highlands and the lower eastern highlands (Laurentian and Appalachian) lies a great extension of medial plains, stretching in moderate altitude from the Arctic Ocean to the Gulf of Mexico, and having in their middle a breadth of 1500 m. They are composed throughout of nearly horizontal strata and mark a region long exempt from strong disturbance. Although for the most part floored by marine formations, their structure and composition indicate, as has already been said, relatively shallow water. The ancient sea that once occupied the middle belt of the continent therefore had little likeness to the abysmal oceans, but resembled rather the shallow ocean margins that to-day overlap various continental masses—the largest example of this kind now existing being between Asia and Australia. The eastern part of the plains is underlaid by Palaeozoic strata, already mentioned as having been laid down upon the subsiding Archaean continent or folded in the making of the Appalachians; coal beds are here included in the Ohio and middle Mississippi basins. The area of the western plains remained submerged to a later date, preserving a stretch of marine waters to the end of Mesozoic time, and thus resembling the lowland belt of western Asia, which was similarly covered by a broad and a shallow arm of the ocean extending from the Arctic to the European mediterraneans until a late geological date. The surface of the medial plains is not always so even as might be inferred from their name. Both

the eastern and the western areas have been extensively denuded, even to the point of being reduced to peneplains. Their present altitude is not so much the result of their original uplift from the sea as of a later elevatory movement. The great river basins, for which North America is famous, have thus been formed between the eastern and western highlands—the Mississippi receiving the drainage of a vast area (about 1,240,000 sq. m.) for discharge to the south, while the Saskatchewan and Mackenzie gather their waters from somewhat less extensive areas in the north. Pleistocene glaciation covered the plains of the Ohio, upper Mississippi and Winnipeg districts with extensive deposits of ice-laid or water-laid drift, furnishing a generally smooth surface and a fertile soil: here are the true prairies—treeless, but richly grassed.

Central America and the West Indies.

The traditional continuity of the Cordilleras of North and South America has been broken by investigations in the isthmian portion of the northern continent. The structural peculiarities of the western highlands of North America may be traced only to the east and west belt of great volcanoes by which the plateau of central Mexico is terminated on the south. The ranges of the Andes fail to reach Panama, from which the nearest one is separated by the valley of the Atrato. The two Cordilleras are out of line with each other, and their ends are some 1200 m. apart. Central America, the West Indies and various submarine ridges by which the islands are connected with one another and with the mainland to the west, as well as certain ranges along the northern margin of South America, all belong together in what has been termed the Antillean mountain system, in which east and west trends of late geological date predominate, with abundant volcanic additions on the Pacific border of Central America, and along the eastern end of the system in the Windward islands of the Lesser Antilles. The unity of this system has been until recently overlooked partly because the Antillean ranges are for the most part still under water, and yet further because the volcanoes which form the strongest reliefs of the isthmian region are so arranged along the Pacific coast as to suggest the continuity of the Cordilleran systems on the north and south; but these volcanoes are really only superadded to a foundation of quite another kind. Geological studies on the mainland and on the islands have shown that both fundamental structure and surface form are not Cordilleran; and numerous soundings in the adjacent mediterraneans suggest that the islands are best interpreted as the somewhat denuded crests of great crustal ridges. The warm waters that bathe the West Indies come with a high temperature from the equatorial Atlantic, and favour the growth of corals along the shores. Fringing and elevated reefs are known on many of the islands. The Bahamas are the slightly overtopping parts of a broad platform of coral and other calcareous marine deposits, of which the greater area constitutes extensive shallow banks, which descend by a steep slope on the north-east to great depths in the Atlantic. The lowlands of Yucatan resemble Florida in being the emerged part of a much larger mass, of which an equal portion is still under water in the shelf around the Gulf of Mexico. All this region is luxuriantly productive and is advantageously surrounded by waters which would be barren and desert, like the Sahara, if replaced by lowlands. The active volcanoes on the Pacific slope have built many cones and uplands, some of their historic eruptions having been of terrible violence. Thus Lake Nicaragua, once a bay of the Pacific, has been cut off by volcanic deposits, leaving only the Gulf of Fonseca open to the western ocean, raising the level of the lake behind the barrier and turning its discharge eastward to the Caribbean Sea across what was once the inter-oceanic watershed.

Rivers.

The successive crustal movements by which the land area of what we now know as North America has been increased and connected have determined the growth of several great river systems through which the broader part of the continent is drained. The movements that resulted in the emergence of the Plains had the effect of engrafting many ancient rivers of moderate size upon trunks of unusual dimensions. The Mississippi system, some of whose eastern branches probably date from early Mesozoic time, received great reinforcements by the addition of many long western branches in Tertiary time, roughly contemporaneous with the uplift of the Gulf coastal plain by which the lower trunk of the river was extended to the sea. The present headwaters of that river-trunk to which the name of Mississippi is applied, and which for that reason have gained an undue subjective importance, are of relatively modern date, as they are controlled by the abundant glacial deposits of northern Minnesota. The evolution of the Mackenzie resembles that of the Mississippi in a very general way, although some of its eastern branches may be the descendants of ancestors more ancient than those flowing westward from the Appalachians; but the regime of the great northern river is strikingly unlike that of its still greater southern analogue on account of its course being from a warmer to a colder climate: hence ice-dams, obstructed discharge, and overflows recur every spring. The Nelson and the St Lawrence systems, draining eastward to Hudson Bay and St Lawrence Gulf, receive drainage from areas that would belong to the Mackenzie and the Mississippi systems under a simpler plan of continental growth; and there is much reason for thinking that this simpler plan obtained until the occurrence of those changes, in association with the Glacial period, whereby sea waters gained access to the depressions that now hold the bays and sounds of the north-eastern coast. In exemplification of the rule that the larger ocean receives the drainage of the smaller continental area, the rivers that flow into the Pacific rank below those belonging to the Atlantic. The greatest is the Yukon, of farther Canada and inner Alaska, one of the great rivers of the world, little known until the active exploration of its basin for gold-fields. The Frazer drains much of the mountainous area of southern British Columbia, as the Columbia drains that of the north-western United States; the latter is peculiar in that one of its headwaters rises at the *eastern* base of the Rocky Mountains in northern Montana and flows westward through the ranges. The Colorado discharges a muddy current into the Gulf of California; but for the aridity of its large drainage area its volume would be much larger. The same is true of the Rio Grande, whose name would be better justified if so much of its basin were not semi-arid.

Lakes.

The most remarkable lacustrine region of the continent, rivalling that of Central Africa, forms a belt around the border of the Laurentian highland; here, in addition to ten large lakes, there are hundreds of medium size, and many thousand small lakes. They are peculiar in occupying a region of moderate relief, in which no strong dislocations have taken place in recent geological time (unless in the case of Lake Superior), and thus in contrasting with the great African lakes which occupy rift-valleys or *graben* of comparatively recent fracture. The Laurentian lakes are further characterized by an intimate association with the ice-sheets of the Glacial period; but while glacial erosion and drift obstruction suffice to account for the smaller lakes, it is very probable that broad crustal warping and drainage reversal have been potent aids to the other processes in producing the great lakes. The northern Cordilleran region contains many beautiful lakes of moderate size in deep valleys among the crowded ranges of the narrowed mountain belt. Their origin has not been closely studied. The basins among the spaced ranges of the middle and southern Cordilleras, in the United States and Mexico, contain many lakes that occupy shallow depressions in desert plains; they are usually without outlet and saline; many of the basins were formerly occupied by lakes of much greater size, some of which overflowed, implying a climate moister than that of to-day, probably correlated with the glacial climate of the regions farther north. Lakes in volcanic craters or behind volcanic barriers occur in Central America, while Florida possesses many small lakes in limestone basins. The following table is taken from Russell's *Lakes of North America*:—

Lake.	Altitude.	Area.	Depth.
	Ft.	Sq. m.	Ft.
Ontario	247	7,200 (?)	738
Erie	573	9,900	210
Huron	582	22,322	750
Michigan	582	21,729	870
Superior	602	31,000	1008

Climate.

The climatic features of North America are best appreciated when considered as exhibiting modifications of those general climatic conditions which prevail in consequence of the globular form of the earth as a whole. In January, when the isotherms of 65° to 75° F. stretch almost directly across land and sea in the north torrid zone, a mean temperature of zero or less invades the region north-west of Hudson Bay, which thus resembles north-eastern Asia in departing greatly from the mean prevailing in similar latitudes on the northern oceans, and in bringing upon the northern lands an extension of frigid conditions that have no analogue in the southern or oceanic hemisphere. In July, when the isotherms of 40° and 50° have a tolerably direct course around the latitude circles that border the continent on the north, a great middle area of North America becomes warmer than the seas on the east and west, having a mean of over 80°, and in part over 90°. In January the Hudson Bay region is 30° colder than the mean of its own latitude, about 60° colder than the mean of the corresponding southern latitude; while in July the Arizona-Mexican region is 20° above the mean of its own latitude, or about 40° above the mean of the corresponding southern latitude. In both winter and summer the isotherms are more closely crowded while crossing the continent than while crossing the adjacent oceans; or, in other words, the poleward temperature gradient is stronger on the land than on the oceans; and all these features should be regarded as inherent characteristics of the climate of North America in virtue of its being a continent chiefly in temperate latitudes.

An associated feature of continental climate is found in the strong annual range of temperature of the central land area. The range between the means of January and July exceeds 40° for the largest part of the lands, and 70° for much of the northern lands; the range of extreme temperatures is much greater. On corresponding oceanic areas in the northern hemisphere the range is little more than 20°, and in the southern hemisphere it is probably less than 10°. It must appear from this that if the largest part of North America is said to be in the north temperate zone, "temperate" must be taken as having little of the meaning originally given to it in southern Europe, for the winter cold is severe and the summer heat is excessive over much of the North American continent.

The several members of the terrestrial wind system, including

therein the trade winds of a broadened torrid zone, the stormy westerly winds of middle latitudes and the irregular winds of the polar regions, are well exemplified over North America; but, as is usually the case on land, the systematic movement of the atmosphere is better seen in the drift of the clouds than in the movement of the surface winds, which are much modified by the changes from hill to valley, from mountain to plain. Nevertheless the prevalence of the general atmosphere currents has much to do with the control of certain values of annual temperature range, as well as with the distribution of rainfall. The former are small (about 20°) along a great stretch of the Pacific coast, even as far north as Alaska, where the moderating influences of the ocean are brought upon the land by the westerly winds; while a range appropriate to a continental interior (30° or 40°) is experienced over most of the eastern side of the continent in temperate latitudes, and even upon the North Atlantic ocean near the American coast, where strong seasonal changes of temperature are carried forward by the westerly winds. It is particularly in this respect that the general climatic resemblances between North America and Eurasia, above referred to, are broken; for eastern Canada and western Europe are strikingly unlike in seasonal variations of temperature. Labrador is about 10° cooler than northern Germany in July, but nearly 40° colder in January.

The distribution of rainfall is in general controlled by the prevailing course of the winds. The West Indies receive abundant rain from the passing trades. In Mexico and Central America the eastern slopes are for the most part better watered than the western, because the winds there come chiefly from the east (maximum over 100 in. in Guatemala and adjacent parts). Farther north the reverse holds true; the Pacific slope north of 40° latitude has an abundant rainfall (maximum over 100 in.), and its mountains are clothed with dense forests. There are large areas of deficient rainfall (less than 20 in.) in the interior of the continent, where the intermontane basins and the piedmont plains that slope eastward from the Rocky Mountains in middle latitudes are treeless. The areas afflicted with dryness are unsymmetrically distributed, being west of the medial meridian (95°), because of the ranges near the Pacific by which rain is withheld from the basins and from the plains farther east. The dryness is induced not only by light precipitation, but also by active evaporation in the warm season—a rule that holds true until a high latitude is reached. East of the medial meridian great profit is received from the warm and moist winds that are drawn inland from the water surface of the mediterraneans (Gulf of Mexico and Caribbean Sea) which so advantageously occupy the latitudes that are given up to the Sahara in the Old World. It is largely on this account that the central and eastern parts of the Mississippi basin enjoy a sufficient and well-distributed rainfall, producing forests or fertile prairies over great areas (rainfall over 40 in.). Regions of prevailing snowfall are chiefly in the north-west and north-east; the former includes the higher ranges of the western highlands in Canada and Alaska, where the snowfall from the Pacific winds is heavy, and extensive snowfields and glaciers are formed; the former includes Greenland, where a heavy ice-sheet shrouds the land, the snowfall of moderate measure being probably supplied mostly from the North Atlantic. In the northern continental interior snow covers the ground during the winter season, not that the snowfall is heavy but that the persistent cold weather preserves the moderate amount that falls.

The extension of the continent across the belts of the terrestrial wind system tends to turn branch winds from the westerlies toward the trades on the Pacific border, and from the trades toward the westerlies on the Atlantic border. This effect is strengthened in summer, when the higher temperature prevalent over the continent causes the air to flow away from above the lands, and to accumulate over the neighbouring oceans, on each of which a vast anticyclone is thereby established—the circulation of the atmosphere over the North Atlantic and North Pacific thus coming to simulate the circulation of the surface waters of the oceans themselves. It is partly on account of this deflection of the summer winds up the Mississippi valley that the eastern interior of the continent receives a beneficent rainfall as already stated. In winter when the inflow from the south is replaced by an outflow, little rain or snow would fall but for the indraft winds of cyclonic storms by which the outflow appropriate to the cold season of the continent is temporarily reversed. The free play of the cyclonic winds north and south over the great medial plains permits indrafts from torrid and frigid sources, which sometimes succeed each other rapidly, producing abrupt and frequent weather changes. Something of the same contrasts is produced by winds drawn in upon the eastern coast alternately from over the moist and warm waters of the Gulf Stream, and from over the moist and cold waters of the Labrador current.

The southerly flow of the branching winds along the Pacific coast gives them a drying quality, and thus still further broadens the western arid region towards the ocean until it reaches the coast in southern California and north-western Mexico (rainfall less than 10 in.), there joining the arid belt of western Mexico and presenting a strong contrast to the rainy forested coast farther north; but although unfavourably dry, the southern California coast is one of the most truly temperate regions of the world, in respect of mildness and constancy of temperature. The drying winds cover all California in summer, but they migrate southward in the winter, giving place to the stormy westerlies. Thus California has a subtropical climate of wet winters and dry summers; while north in British Columbia and Alaska there is plentiful rainfall all the year round, and farther south there is persistent aridity.

Fauna.

The fauna of North America (Nearctic) is more closely related to that of Europe-Asia (Palaearctic) than to that of any other zoo-geographical province; the two being united by many writers in one faunal province (Holarctic). The reindeer (caribou), beaver and polar bear are common to both provinces. The moose, wapiti, bison and grizzly bear of North America are closely related to the elk, red deer or stag, aurochs and brown bear of Eurasia; and the following groups are well represented in both provinces: cats, lynxes, weasels, bears, wolves, foxes, seals, hares, squirrels, marmots, lemming, sheep and deer. On the other hand the following forms are characteristic of North America: (*rodents*) pouched rats or gophers, musk rat, prairie dog, Canadian porcupine; (*carnivora*) raccoon and skunk; (*ungulates*) musk ox, bighorn, Rocky Mountains goat, pronghorn; (*marsupial*) opossum. Among birds there is a close resemblance to those of Eurasia, with some admixture of South American forms, as in the humming birds. The forms especially characteristic of the northern continent are the Baltimore oriole, bobolink, cowbird, flycatchers, wood-warblers, Californian quail, tree grouse, sage grouse, wild turkey and turkey buzzard. The house sparrow of Europe has been introduced, and has become very common, especially in the cities, where it is known as the English sparrow. Reptilian and amphibian groups are well represented; turtles are especially numerous; salamanders are varied and large; rattlesnakes are among the more peculiar forms. Among fish, the characteristic forms are the cyprinoids (carp), sturgeon, salmon, pike and especially the suckers, sunfish, mudfish (*Amia*) and gar pike (*Lepidosteus*). The most characteristic group of invertebrates is the Unionidae or river mussels.

Flora.

The floral areas of North America, limited by the geographic divisions of the continent, may be divided into five belts: the eastern forested area, the western forested area, the interior unforested area, the northern barren lands and the Gulf coast. The eastern forested area extends from the Laurentian highland in Canada to the Great Lakes, and southward east of the Mississippi to the Gulf coast. In the north and along the mountains southward, the forests are largely coniferous, with a mixture of birches, poplars and maples. Southward, especially in the interior and at low altitudes, the conifers largely disappear, and oaks, hickories, plane-trees, tulip-trees, walnuts and other valuable deciduous species abound. The western forested area begins in the eastern Rocky Mountains and extends to the Pacific. Eastward in the mountains the forests are interspersed with arid districts which increase in area southward. Northward, in Canada, the mountains of the middle Cordilleras are densely wooded with continuous forest up to the timber line. Near the middle Pacific coast the forests attain a luxuriant development, the redwood (*Sequoia*) of California and Oregon sometimes reaching a height of from 300 to 400 ft. The unforested area of the interior consists of two very dissimilar portions. The vast fertile prairies extend from the Great Lakes westward to the Great Plains, and southward west of the Mississippi, with occasional eastward lobes at low altitudes. On these plains grasses and other herbaceous vegetation abound, and throughout this fertile belt agriculture is largely followed, the grain and hay crops being especially important. Northward in Canada the plains become wooded, the western mountains and the eastern highlands being thus connected by a narrow strip of forest. South-westward and westward the fertile prairie gives way to a vast arid region beginning on the Great Plains and extending as far as south-eastern California, and thence southward into Mexico. On this broad desert few trees are found, although piñons grow on the cliffs and ledges, and cottonwoods occur along the watercourses; but the various ranges that surmount the desert frequently carry forests. The desert vegetation as a whole consists of cacti, agaves, sage-brush (*Artemisia*) and other plants adapted to arid conditions. North of the eastern forested area and east of the northern Cordilleras are the "barren lands," with frozen subsoil, extending to the Arctic coast. The growing season here is short and the climate forbidding, so that trees cannot develop, although birches, poplars, willows and other genera, which southward attain large size, are present as dwarf shrubs. The vegetation of this northern barren district, like that of bleak mountain summits southward, is very similar in character to that of other extreme boreal regions. Blueberries, crowberries and some other small fruits are abundant, but the brief summer will not mature most crops of the temperate zone. The Gulf coast, on the other hand, supports a vegetation decidedly tropical in its nature. Somewhat developed in Florida and the other southern states, this flora becomes the prevailing one on the coast of Mexico and Central America, especially from the region of Vera Cruz southward, where the forests are largely composed of palms and live oaks, and where giant bamboos often attain a height of 40 ft. In these tropical forests many orchids and other showy plants of northern conservatories are native.

North America, with an area of about 8,000,000 sq. m. (16% of all the lands, or 4·12% of the whole earth's surface), and a mean altitude of about 2000 ft., at present plays a part in human history that is of greater importance than is warranted

by its size alone, although it has not in this respect the extraordinary importance of Europe. The continent has the good fortune to lie chiefly in a temperate rather than a torrid zone, and in temperate latitudes to be much nearer to Europe than to Asia. Whatever may have been the first home of the aboriginal inhabitants, the dominating people of to-day are derived from the leading countries of the Old World. Not only so; temperate North America has become the most progressive part of the continent because of receiving its new population chiefly from the most advanced nations of middle western Europe—Great Britain, France and Germany; while the torrid islands and the narrowing southern mainland of North America have been settled chiefly from the less energetic peoples of southern Europe; and the inhospitable northern lands are hardly entered at all by newcomers, except in the recently discovered goldfields of the far north-west. From the plantation of colonies on the eastern coast, the movement inland has been governed to a remarkable degree by physiographic factors, such as form, climate and products. The cities of the Atlantic harbours and of the adjacent lowlands still take a leading part in industry and commerce, because of their longer establishment and of their relation to Europe. The uplands, ridges and mountains of the Appalachian system—the "Backwoods" of a century ago—remain rather thinly occupied except at certain centres where coal or other earth-product attracts an industrial population. Beyond the Appalachians the middle interior contains a very large proportion of habitable land. It was long ago recognized as a land of great promise, and it is to-day a land of great performance, covered with a network of railways, yielding an enormous product of grain, and developing industries of all kinds. Indeed, within and closely around an area marked by the St Lawrence system on the north, the Ohio on the south, and stretching from the Atlantic coast between the Gulf of St Lawrence and Chesapeake Bay inland to the middle prairies, there is a remarkable concentration of the population, industry, progress, wealth and power of North America—the focus of attention from all other parts of the continent. The regions of the far north and north-east, including the greater part of the Laurentian highland and the extreme northern stretch of the medial plains and the western highlands, remain and will long remain thinly populated. The furs of wild animals are their characteristic product. Timber is taken from their more accessible forests; but only in mining districts does the population notably increase, as in the iron region around Lake Superior and in the Klondike gold region.

Economic Development of the Continent.

In the south-eastern United States lies a belt of coastal lowlands skirting the Appalachians, still affected by negro slavery and its consequences. The descendants of the early French settlers of Canada stand in political rights as well as in loyalty to the Government on an equal footing with the British citizens of the Dominion. The Italians of the cities, the Hungarians of the mines, the Scandinavians of the northern prairies, the Irish and Germans everywhere are "Americanized" in the second or third generation, rapidly entering local and national politics, and hardly less rapidly attaining an honourable social standing as tested by intermarriage with English and other stocks. But the negro is set aside, even though he has adopted the language and the religion of his former masters: political and social rights are denied him, and intermarriage with whites is practically excluded, although illegitimate mulattos are numerous. Thus has slavery left upon a people, amongst whom political rights and social opportunities should be equal for all, the heavy burden that always retards progress where strongly contrasted races are brought together. Farther south still are the tropical islands and the narrowing mainland, rich in possible productiveness, but slowly developed because of a prevailing diversity and instability of government and lack of progressive spirit among the people. Here also there is a considerable proportion of negroes, but they live under less unhappy conditions than those now obtaining in the United States. In Mexico and Central America, the proportionate number of aborigines is much greater than farther north.

West of the Mississippi in middle latitudes the population rapidly decreases in density, and over a large extent of the semi-arid plains it must long remain sparse. The settlements bordering the plains on the east for a long time marked the "Frontier" of civilization, for the vast stretch of dry country was a serious barrier to farther advance. But the plains are now crossed by many railways leading to the Cordilleran region—the "Far West"—in large part too rugged or too arid for occupation, but rich in minerals from one end to the other, the seat of many mining camps of unstable population, and containing numerous permanent settlements in the intermontane basins. Great irrigation enterprises, conducted under the National Reclamation Service of the United States, are employing all available water supplies for agriculture; but large areas must remain permanently desert. On nearing the farther ocean the climatic conditions improve, and the population is rapidly increasing in number and wealth; this district not being content to take its name with respect to the east, not considering itself as included in the "Far West," but choosing the distinctive designation of the "Pacific Slope," and, while maintaining an active intercourse all across the breadth of the continent, already opening relations with the distant Orient by a new approach. Among the earliest results of the latter movement was the arrival of Chinese labourers, a humble, industrious and orderly class of men, but one which stands apart in language, religion and race from the dominant population, lives largely without domestic ties, and gains neither political nor social standing in the New World.

Two centuries ago the aboriginal population of North America would have deserved description before the immigrant population. To-day the aborigines are displaced from nearly all the valuable parts of the continent. Never very numerous, they are now decreasing; many tribes are already extinct, many more are almost so. Those which remain less diminished are in the Far North or North-West where nature is rigorous; or in the tropical forests of Central America where nature is over bounteous; or in the more desert parts of the Middle West where nature is arid. The replacement of the native races by the foreign has too often been harsh, cruel and unjust; yet it has resulted in an advance of civilization. Many savage tribes, speaking many different languages, holding little intercourse with each other, and frequently engaged in intertribal wars, have given place in little more than two centuries to a great population of European origin, whose dominant parts speak one language, whose arts are highly advanced, whose home intercourse is most active, and whose foreign commerce had attained unexpected proportions at the opening of the 20th century. (W. M. D.)

NORTHAMPTON, EARLS AND MARQUESSES OF. The Northampton title has been held in various English families. About 1080 Simon de Senlis (d. 1109), a Norman noble, and the builder of Northampton Castle, was created earl of Northampton as well as earl of Huntingdon by William the Conqueror; his son Simon (d. 1153) was also recognized in the title about 1141, though his stepfather, David, king of Scotland (1084–1153), had meanwhile obtained the earldom in right of his wife. The second Simon died childless. In 1337 William de Bohun (*c.* 1310–1360), a distinguished soldier, son of Humphrey de Bohun, 4th earl of Hereford and 3rd earl of Essex, was created earl of Northampton; and his son Humphrey, who succeeded, fell heir in 1361 to the earldoms of Hereford and Essex, which thus became united under that of Hereford. The titles, however, became extinct at his death in 1372.

In 1547 William Parr (1513–1571), son of Sir Thomas Parr and brother of Catherine Parr, was created marquess of Northampton, and though attainted in 1553 was recreated marquess in 1559. He took part in suppressing the rising in the north of England in 1537, and after serving as member of parliament for Northamptonshire was made Baron Parr in 1539. In December 1543, just after his sister had married the king, he was created earl of Essex, a title formerly held by his father-in-law, Henry Bourchier, who had died in March 1540. Under Edward VI., who called him "his honest uncle," Parr was equally prominent, being lord-lieutenant of five of the eastern counties, and being great chamberlain from 1550 to 1553. He favoured the claim of Lady Jane Grey to the English throne and consequently the accession of Queen Mary was quickly followed by his attainder. Although sentenced to death he was pardoned

and released from prison at the end of 1553. After enjoying the favour of Queen Elizabeth, Northampton died at Warwick on the 28th of October 1571. He left no children and his marquessate became extinct. In 1604 Henry Howard (see below) was created earl of Northampton, his title dying with him. It next passed into the Compton family, where it has since remained. The 1st earl of Northampton in this line, William Compton (d. 1630), who received the title in 1618, was a great-grandson of the Sir William Compton (1482–1528) who was with Henry VIII. at the Field of the Cloth of Gold, and his son the 2nd earl is noticed below. The 9th earl, Charles Compton (1760–1828), was created a marquess in 1812, receiving at the same time the titles of Earl Compton and Baron Wilmington. His son Spencer Joshua Alwyne, the 2nd marquess (1790–1851), was president of the Royal Society from 1838 to 1848; the latter's son Lord Alwyne Compton (1825–1906) was bishop of Ely from 1886 to 1905. The 5th marquess (b. 1851), son of the 4th marquess (1818–1897), was, as Earl Compton, a Liberal member of parliament from 1889 to 1897.

HENRY HOWARD, earl of Northampton (1540–1614), was the second son of Henry Howard, earl of Surrey, the poet, and of Lady Frances Vere, daughter of the 15th earl of Oxford, and younger brother of Thomas Howard, 4th duke of Norfolk. He was educated first by Foxe the martyrologist, afterwards by John White, bishop of Lincoln, with whom he acquired Romanist opinions, and finally at the charge of Queen Elizabeth at King's College and Trinity Hall, Cambridge, where he obtained his M.A. degree in 1564, subsequently in 1568 being incorporated M.A. at Oxford. The discovery of his brother's plot to marry Mary, Queen of Scots, and of his own correspondence with her, deprived him of Elizabeth's favour, and he was arrested more than once on suspicion of harbouring treasonable designs. In 1583 he published a work entitled *A Defensative against the Poyson of supposed Prophecies*, an ostensible attack upon astrology, which, being declared to contain heresies and treason, led to his imprisonment. On regaining his liberty he is said to have travelled in Italy. His flattery of the queen in lengthy epistles met with no response, and his offer to take part in the national defence against the Spanish invasion was refused. He attached himself, however, both to Essex and to Robert Cecil, and through the influence of the latter was in 1600 again received by Elizabeth. At the close of the queen's reign he joined with Cecil in courting the heir to the throne in Scotland, the main object of his long letters of advice, which James termed "Asiatic and endless volumes," being to poison the royal mind against Sir Walter Raleigh and other rivals, whom he at the same time hoped to ensnare into compromising relations and correspondence with Spain. These methods, which could not influence Elizabeth, were completely successful with James, and on the latter's accession Howard received a multitude of favours. In 1603 he was made a privy councillor, on the 1st of January 1604 lord warden of the Cinque Ports, and on the 13th of March earl of Northampton and Baron Howard of Marnhull in Dorset; on the 24th of February 1605 he was given the Garter and on the 29th of April was appointed Lord Privy Seal. In 1609 he was elected high steward of the university of Oxford, and in 1612 chancellor of Cambridge university. The same year he was appointed one of the commissioners of the treasury.

He was one of the judges at the trials of Raleigh and Lord Cobham in 1603, of Guy Fawkes in 1605, and of Garnet in 1606, in each case pressing for a conviction. In 1604 he was one of the commissioners who composed the treaty of peace with Spain, and from that date he received from the Spanish Court a pension of £1000. The climax of his career was reached when he assisted his great-niece, Lady Essex, in obtaining her divorce from her husband in order to marry the favourite Somerset, whose mistress she already was, and whose alliance Northampton was eager to secure for himself. He obtained the divorce by the decree of a special commission, and when Sir Thomas Overbury's influence seemed likely to prevent Somerset completing the marriage project, he caused the former to be imprisoned in the Tower. Shortly afterwards Overbury died from the effects of poison administered by the direction of Lady Essex; and the close intimacy which existed between the latter and Northampton, together with his appointment of Sir Gervase Elwes or Helwys, a friend of his own, as the keeper of the victim, leaves his name tarnished with the blackest suspicions. The discovery of the crime was not made till some little time after Overbury had succumbed, and meanwhile Northampton's own death anticipated his fall, together with that of Somerset, from power. He advised against the summoning of parliament in 1614, and then fomented disputes to compel James to dissolve it. He died unmarried on the 15th of June 1614, when his title became extinct, and was buried in the chapel of Dover Castle, the monument erected above his grave being subsequently removed to the chapel at Greenwich College. His will shows that he died a Roman Catholic.

Northampton, who was one of the most unscrupulous and treacherous characters of the age, was nevertheless distinguished for his learning, artistic culture and his public charities. He built Northumberland House in London and superintended the construction of the fine house of Audley End. He founded and planned several hospitals. Bacon included three of his sayings in his "Apophthegms," and chose him as "the learnedest councillor" in the kingdom to present to the king his *Advancement of Learning*. He was the author of a *Treatise of Natural and Moral Philosophy* (1569; MS. in the Bodleian Library); of a pamphlet supporting the union between Elizabeth and the duke of Anjou (1580; Harleian MSS. 280); *A Defensative against the Poyson of supposed Prophecies* (1583); a reply to a pamphlet denouncing female government (1589; Harleian MS. 7021); *Duello Foiled*, printed in T. Hearne's *Collection of Curious Discourses* (1775), ii. 225, and ascribed there to Sir Edward Coke; *Translation of Charles V.'s Last Advice to Philip II.*, dedicated with a long epistle to the queen (Harl. 836, 1506 and elsewhere in Stowe 95, King's MSS. 106); devotional writings (Arundel MSS. 300); speeches at the trials of Guy Fawkes and Garnet in *State Trials*, vol. i. In Somers Tracts (ed. 1809), ii. 136, his opinions on the union between England and Scotland are recorded.

See the life in *Surrey's and Wyatt's Poems*, ed. by G. F. Nott (1815), and Sidney Lee's article in the *Dict. Nat. Biog.*

SPENCER COMPTON, 2nd earl of Northampton in the Compton line (1601–1643), was the son of William, 1st earl, lord president of the marches, whose father had been created Baron Compton by Elizabeth, and of Elizabeth, daughter and heir of Sir John Spencer, lord mayor of London. On the 3rd of November 1616 he was created a Knight of the Bath, and was elected for Ludlow in the parliament of 1621, the same year being appointed master of the robes to the prince of Wales and attending the latter in the adventure to Spain in 1623. He warmly supported the king in the Scottish expeditions, at the same time giving his advice for the summoning of the parliament, which "word of four syllables" he declared was "like the dew of heaven."[1] On the outbreak of the Civil War he was entrusted with the execution of the commission of array in Warwickshire. After varying success and failure in the Midlands he fought at Edgehill, and after the king's return to Oxford was given, in November 1642, the military supervision of Banbury and the neighbouring country. He was attacked in Banbury by the parliamentary forces on the 22nd of December, but relieved by Prince Rupert the next day. In March 1643 he marched from Banbury to relieve Lichfield, and having failed there proceeded to Stafford, which he occupied. Thence on the 19th of March, accompanied by three of his sons, he marched out with his troops and engaged Sir John Gell and Sir William Brereton at Hopton Heath. He put to flight the enemy's cavalry and took eight guns, but in the moment of victory, while charging too far in advance, he was surrounded by the parliament soldiers. To these who offered him quarter he answered that "he scorned to take quarter from such base rogues and rebels as they were," whereupon he was despatched by a blow on the head. Clarendon describes his loss as a great one to the cause. Northampton married Mary, daughter of Sir Francis Beaumont, by whom besides two daughters he had six sons, of whom the eldest, James (1622–1681), succeeded him as 3rd earl of Northampton, Henry (1632–1713) became bishop of London, and Charles, William and Spencer all distinguished themselves in the king's cause. The 3rd earl's third

[1] *Hardwicke State Papers*, ii. 210.

son Spencer (1673–1743) was a favourite of George II. and in 1728 was created earl of Wilmington, a title which became extinct at his death.

See the article in the *Dict. of Nat. Biog.* by C. H. Firth; E. B. G. Warburton's *Life of Prince Rupert*: S. R. Gardiner's *Hist. of England and of the Civil War*; *Thomason* Tracts, E 99 (18) [Hopton Heath and Northampton's death], E 103 (11) [elegy], E 111 (11), E 110 (8) 1642 [Proceedings at Banbury], E 83 (47) [speech].

NORTHAMPTON, a municipal, county and parliamentary borough and the county town of Northamptonshire, England, 66 m. N.W. by N. from London by the London & North Western railway; served also by a branch of the Midland railway. Pop. (1891) 75,075, (1901) 87,021. It lies in a slightly undulating district mainly on the north bank of the river Nene. The main roads converging upon the town meet near the centre in a spacious market-place, where stands a fountain on the site of the ancient cross destroyed by the fire of 1675 which levelled a great part of the town. There were formerly seven ancient parish churches, but only four remain. Of these All Saints church was rebuilt after the fire of 1675, but retains its Decorated embattled tower, with which the style of the later building scarcely harmonizes, the principal feature being the fine Ionic portico. The church of St Giles was originally a cruciform structure of the beginning of the 12th century, but has been greatly changed, and besides a rich Norman doorway contains specimens of Early English, Decorated and Perpendicular work. St Peter's, near the site of the ancient castle, is supposed to be of the same date with it, and its interior is a fine specimen of Norman architecture. St Sepulchre's, one of the four round churches still remaining in England, may have been built by the Knights Templars at the close of the 11th century. There are several modern parish churches. Northampton is the seat of a Roman Catholic bishop, and there is a pro-cathedral, designed by A. W. Pugin (1864). In the neighbourhood of the town there were a Cluniac priory of St Andrew, a house (Delapré) for nuns of the same order, and one for Augustinian canons dedicated to St James; but the first has disappeared, the site of the second is occupied by a modern mansion, and of the third there are only slight fragments. Some portions of the castle were re-erected on a new site after their destruction when the Castle station was built by the London & North Western Railway Company. In the populous parish of Hardingstone, S. of the town, is one of the original Eleanor crosses, of which only three remain out of twelve erected by Edward I. to mark the resting-places of his queen's body on its way from Harby (Nottinghamshire) to burial at Westminster. The chief public buildings of Northampton are a town hall, county hall, county council room, corn exchange, antiquarian and geological museum, free library and barracks. The free grammar school was founded in 1552; the Northampton and county modern and technical schools were incorporated with it in 1894. There are a Roman Catholic convent with schools, and various charity schools. The charitable foundations include St John's hospital, founded in the 12th century; St Thomas's hospital, founded in 1450 in honour of Thomas à Becket, an infirmary, asylum, dispensary, &c. There is a race-course north of the town. The staple trade is the manufacture of boots and shoes, which is very large. There are also considerable currying and tanning works, breweries, iron foundries, and brick and tile works. The cattle market is extensive. The county borough was created in 1888. The municipal borough is under a mayor, 8 aldermen and 24 councillors. Area, 3469 acres.

British and Roman remains have been discovered near Northampton (*Hamtune, Northantone*), and it became the chief settlement of the Angle tribes who pushed their way up the Nen in the early part of the 6th century. It was occupied by the Danes in the reign of Edward the Elder and is said to have been burnt by Sweyn in 1010. In the reign of Edward the Confessor there were 60 burgesses in his demesne, and, although the number had decreased to 47 in 1086, a new borough containing 40 burgesses had been formed. The burgesses rendered yearly to the sheriff £30, 10s. "which belonged to his farm," and was probably the beginning of the fee farm which they were allowed to pay directly to the king in 1185 and which was then increased from £100 to £120. Forty marks of this farm were pardoned by Richard III. in 1484 because "the town had come to such ruin" that the bailiffs had to pay more than £53 from their own goods. The mayor was the chief officer in the 13th century, and Henry VI. granted the incorporation charter in 1460 under the title of mayor, bailiffs and burgesses. The town has been represented by two members since 1395. Tanning was an industry of Northampton in the time of Edward I. and in 1675 a law was made by the corporation forbidding strangers to purchase hides in the town except on fair-days. Boots and shoes are known to have been made here in the reigns of John and Edward I., although probably only for the use of the townspeople, and by the 17th century Northampton was one of the most noted places in England for their manufacture.

Northampton has been the meeting-place of several important councils and parliaments. In the wars between John and his barons the castle withstood a siege by the latter, but in 1264 it was occupied by the barons under the earl of Leicester. In the Wars of the Roses it was the scene of the battle in which Henry VI. was defeated and taken prisoner in 1460. During the Civil Wars of the 17th century it was held for the parliament by Lord Brooke. In 1675 the town suffered severely by fire, 600 houses being destroyed.

See *Victoria County History, Northampton*; C. H. Hartshorn, *Historical Memorials of Northampton* (1848).

NORTHAMPTON, ASSIZE OF, a short code of English laws issued in 1176, is drawn up in the form of instructions to six committees of three judges each, which were to visit the six circuits into which England was divided for the purpose. Though purporting to be a reissue of the Assize of Clarendon (1166), it contains in fact many new provisions. As compared with the earlier assize it prescribes greater severity of punishment for criminal offences; arson and forgery were henceforth to be crimes about which the jurors are to enquire; and those who failed at the ordeal were to lose a hand as well as a foot. In what is perhaps the most important section we may probably see the origin of the possessory action of *mort d'ancestor*, an innovation scarcely less striking than the institution of the *novel disseisin* in the winter of 1166. The justices were also ordered to try proprietary actions commenced by the king's writ for the recovery of land held by the service of half a knight's fee or less. In their fiscal capacity they were to enquire into escheats, churches, lands and women in the king's gift. The royal bailiffs were to answer at the exchequer for rents of assize and all the perquisites which they made in their offices, and apparently the duty of enforcing this provision was entrusted to the justices. As a result of the rebellion of 1173–1174 it was provided that an oath of fealty should be taken by all, "to wit, barons, knights, freeholders and even villeins (*rustici*)", and that any one who refused should be arrested as the king's enemy, and the justices were to see that the castles whose demolition had been ordered were completely razed.

AUTHORITIES.—Sir F. Pollock and F. W. Maitland, *History of English Law before the Time of Edward I.* (Cambridge, 1898); W. Stubbs, *Constitutional History of England* (Oxford, 1895). The text of the Assize occurs in *Cronica Rogeri de Howden* (Rolls Series), ii. 89, and *Gesta Henrici Regis Secundi* (Rolls Series), i. 108. It has been reprinted from the latter by W. Stubbs in *Select Charters* (Oxford, 1895). (G. J. T.)

NORTHAMPTON, a city and the county-seat of Hampshire county, Massachusetts, U.S.A., situated on the Connecticut river, about 16 m. N. of Springfield. Pop. (1910 census) 19,431. The city has an area of 35·3 sq. m. The chief village, Northampton, is on the New York, New Haven & Hartford, and the Boston & Maine railways. It lies on the border of the meadow-land, and with its irregular, semi-rural streets, and venerable trees is considered one of the prettiest villages in New England. About 2 m. S.E. of Northampton is Mount Holyoke (954 ft.), which may be ascended by carriage road and mountain railway, and the summit of which commands a magnificent view. The city is the seat of a state hospital for the insane;

of the Clarke School for the Deaf (1867, founded by John Clarke of Northampton); of Smith College, one of the foremost colleges for women in the country; of the Mary A. Burnham School for Girls (1877), a preparatory school chiefly for Smith College, founded by Miss Mary A. Burnham; and of the Miss Capen School (preparatory) for girls. Besides the college library, there are in Northampton two public libraries, the Clarke (1850) and the Forbes (1894). The Forbes library was established with funds left by Charles E. Forbes (1795–1881), from 1848 to 1881 a justice of the state supreme court. The People's Institute was started as a Home-Culture Clubs movement by George W. Cable, who became a resident of Northampton in 1886. The Smith Charities is a peculiar institution, endowed by Oliver Smith (1766–1845) of Hatfield, who left an estate valued at $370,000, to be administered by a board of three trustees, chosen by electors representing the towns of Northampton, Hadley, Hatfield, Amherst and Williamsburg in Hampshire county and Greenfield and Whately in Franklin county—the beneficiaries of the will. The will was contested by Smith's heirs, but in 1847 was sustained by the supreme judicial court of Massachusetts. Of the total sum, $200,000 was to accumulate until it became $400,000. Of this $30,000 was to found Smith's Agricultural School at Northampton, which opened for instruction in 1908; an income of $10,000 was to be paid to the American Colonization Society, but this society failed to comply with the restrictions imposed by the will, and the $10,000 was incorporated with the Agricultural School fund; and $360,000 was devoted to indigent boys and girls, indigent young women and indigent widows. The remainder of Smith's property was constituted a contingent fund to defray expenses and keep the principal funds intact. Florence, a village on the Mill river in the city limits, is a manufacturing village, silk being its principal product, and cutlery and brushes being of minor importance. The value of the city's factory products increased from $4,706,820 in 1900 to $5,756,381 in 1905, or 22·3%. Northampton was first settled in 1654, became a township in 1656, and was incorporated as a city in 1883. In September 1786, at the time of the Shays Rebellion, the *New Hampshire Gazette* (still published; daily edition since 1890) was established here in the interest of the state administration. Jonathan Edwards was pastor here from 1727 to 1750. Caleb Strong (1745–1819), a member of the Federal Constitutional Convention of 1787, and governor of Massachusetts in 1800–1807 and 1812–1816; Joseph Hawley (1723–1788), one of the most prominent patriots of western Massachusetts; Timothy Dwight; Arthur (1786–1865), Benjamin, and Lewis (1788–1873) Tappan, prominent philanthropists and anti-slavery men; and William D. Whitney were natives of Northampton.

See J. R. Trumbull, *History of Northampton* (2 vols., Northampton, 1898–1902).

NORTHAMPTONSHIRE, an east midland county of England, bounded N. by Lincolnshire, N.W. by Rutland and Leicestershire, W. by Warwickshire, S.W. and S. by Oxfordshire, S.E. by Buckinghamshire, and E. by Bedfordshire, Huntingdonshire and Cambridgeshire. The area is 1003·1 sq. m. The surface is undulating and somewhat monotonous, notwithstanding that the country is richly cultivated and in some parts finely wooded. Elevations over 700 ft. are few. The most picturesque scenery is found in the western and south-western districts. For long Northamptonshire has been famed for its ash trees, and there are also some very old oaks, such as that associated with Cowper's posthumous poem "Yardley Oak," in Yardley Chase near Northampton, as well as a few fine avenues of elm. The north-eastern extremity belongs to the great Fen district. The county forms the principal watershed of central England, nearly all the more important rivers of this region having their sources within its boundaries. The Avon, with a westward course, forms for some distance the northern boundary of the county, till near Lilbourne it passes into Warwickshire. The Nene passes southward past Northampton, whence it takes an easterly course, skirting the eastern boundary of the county. The Welland flows in an easterly direction, forming the boundary of the county with Leicester, Rutland and Lincoln. The Cherwell, rising in a spring at Charwelton, where it is crossed by a very ancient bridge, passes into Oxfordshire, and then forms for a considerable distance the southernmost portion of the boundary of Northamptonshire with that county; the Leam forms a portion of the boundary with Warwickshire. The Ouse, which rises near Brackley, soon afterwards leaves the county, but again touches it near Stony Stratford, separating it for some distance from Buckinghamshire.

Geology.—With the exception of the superficial glacial and river deposits, all the rocks exposed in the county are of Jurassic age; they all dip in a general way towards the S.E., the strike of the outcrops being from south-west to north-east. The oldest rocks exposed belong to the Liassic formation; they come to the surface over a large area in the south-west and centre, around Banbury, Daventry and Market Harborough, and by the removal of the overlying Oolitic strata they are exposed along the rivers and stream courses near Towcester, Northampton, Wellingborough and Kettering. The Lower Lias, blue clay with limestone bands and cement stones, has few exposures; it has been cut through by the railways at Kilsby and Catesby, and at Braunston it is dug for brick-making. The Middle Lias consists of grey micaceous marls, sandstones and clays, often ferruginous; ironstone appears near King's Sutton; at the top is the marlstone or "rock bed," used as a building stone and for road metal. The Upper Lias is again a blue argillaceous series of strata, with limestones and cement stones; it is employed for brick-making. Through the middle of the county from north-east to south-west is an elevated tract of Oolitic rocks which contrasts strongly with the low-lying grass-covered Liassic ground. The lowest subdivision of the Inferior Oolite, sands, sandstone and calcareous beds, is an important source of iron ore, with from 9 to 12 ft. of workable beds at Blisworth, Kettering, Northampton, Thrapstone, Towcester and Wellingborough. The flaggy sandstone of Duston (Duston slate) belongs to this series. The upper part of the Northampton sands is known as the Lower Estuarine Beds; these are white and reddish clays and sands. In the north-eastern part of the county from about Maidwell, the Lincolnshire Limestone is developed at the expense of the Northampton Sand; the well-known building stone of Barnack (Barnack Rag) and Weldon belong to this horizon; a hard shelly variety is known as Weldon or Stamford marble. Locally at the base is a series of flaggy strata, the Collyweston slates. The Great Oolite series comprise the Upper Estuarine Beds, the Great Oolite Limestone, Great Oolite Clay, Forest Marble and Cornbrash (very fossiliferous at Rushden). On the south-east border a belt of Oxford Clay occupies the surface; good exposures occur in the brick-fields about Peterborough. Glacial sands and gravels, including the great Chalky Boulder Clay, occur in patches on the older rocks, as at Hillmorton, and fill up old channels of the rivers sometimes to a considerable depth, as in the old valley of the Ouse at Furtho, where the Boulder Clay is 100 ft. thick. Borings have revealed the existence of Rhaetic and Keuper rocks resting on an ancient quartz-porphyrite beneath the Lias at Orton; and at Gayton and Northampton the Carboniferous and possibly Old Red Sandstone strata have been proved, but no Coal Measures were encountered. The water-bearing strata of Northamptonshire include the marlstone of the Lias, the Lincolnshire Limestone, Collyweston beds and ironstone beds of the Inferior Oolite, and the Cornbrash and Great Oolite Limestone.

Climate and Agriculture.—The climate of Northamptonshire is mild and genial, while the absence of lofty hills renders it much drier than many other inland districts. The mean annual rainfall at Wellingborough is 27·2 ins. The prevailing soil is a rich brown but light and crumbling mould, sometimes with a rocky subsoil. The richest soil is the black mould of the fen district, which is specially suited for grass, as are all the heavier soils. Nearly all the land is capable of cultivation, although there is some stiff wet soil on the slopes of the hills. Nearly nine-tenths of the total area, a high proportion, is under cultivation, and of this considerably over three-fifths is in permanent pasture, the acreage devoted to this use increasing steadily. Less than one-fifth is under grain crops, and the area decreases. Wheat and barley are the principal grain crops. The fattening of cattle is the chief occupation of the Northamptonshire farmer. The favourite stock for breeding purposes is the shorthorn, but the most common custom is to buy in Hereford, Scotch, Welsh and Irish cattle in the spring and fatten them on the rich pastures, a few being retained and fed for the Christmas market. In autumn additional cattle are bought in to eat the coarse grass off the pastures, and these are usually retained during winter. The most common breed of sheep on the rich pastures is the improved Leicester, which is preferred on account of its length

of wool; but the Southdown, on account of its superior flesh, is also largely kept.

Manufactures.—The iron industry is of considerable importance, though only a small proportion of the metal is smelted in the county. The industry is carried on in the central part of the county, as in the Kettering, Wellingborough and Thrapston districts, and in the north near Stamford. But Northamptonshire is more famous for its manufacture of boots and shoes, which is chiefly prosecuted in the towns and villages of the central and southern districts, and along the eastern border. This trade occupies some three-quarters of the total number of hands employed in factories in the county.

Communications.—The main line of the London & North Western railway passes through the south-western portion of the county, with an alternative route to Northampton, and branches to Peterborough and elsewhere. With it are connected at Blisworth Junction the East and West Junction railway to Towcester, Woodford and Stratford-on-Avon, and the Northampton and Banbury Junction railway. The Great Central main line, crossing the county in the south, has connexion with the Great Westen railway at Banbury from Woodford. The Midland railway serves Wellingborough, Kettering and Northampton, and an important junction of systems is effected at Peterborough, which is on the main line of the Great Northern railway. Branch lines of this and the Midland system complete the railway communications of the county. The Grand Junction Canal, which is connected with the Oxford Canal, enters the county at Braunston on the borders of Warwickshire, and passes by Daventry and Blisworth into Buckinghamshire, a branch connecting it with Northampton. The Grand Union Canal unites with the Grand Junction near Daventry, and runs north until it joins the Leicester Canal at Foxton, branches passing to Welford and Market Harborough.

Population and Administration.—The area of the county is 641,992 acres, with a population in 1891 of 302,183 and in 1901 of 338,088. The area of the administrative county of Northampton is 585,148 acres, and that of the administrative county of the soke of Peterborough 53,464 acres. In Domesday the county is mentioned as containing 30 hundreds, but it then included a considerable part of Rutland. These divisions were first reduced to 28, and in the reign of Henry II. to 20, their present number. The administrative counties include four municipal boroughs, namely, Brackley (pop. 2467), Daventry (3780), Higham Ferrers (2540) and Peterborough (30,872), together with the municipal and county borough of Northampton (87,021). The urban districts are: Desborough (3573), Finedon (4129), Irthlingborough (4314), Kettering (28,653), Oundle (2404), Raunds (3811), Rothwell (4193), Rushden (12,453), Wellingborough (18,412). There are one court of quarter sessions and nine petty sessional divisions. The borough of Northampton and the liberty of the soke of Peterborough have each a separate court of quarter sessions and a separate commission of the peace. The total number of civil parishes is 346, of which 33 are in the soke of Peterborough. The ancient county contains 297 entire ecclesiastical parishes or districts, wholly or in part, most of them being in the diocese of Peterborough; but small parts of the county fall within the dioceses of Oxford, Ely and Worcester. For parliamentary purposes the county is divided into four divisions (Northern, Eastern, Mid and Southern), and includes the parliamentary borough of Northampton, and part of the parliamentary borough of Peterborough, each returning one member, except the borough of Northampton, which returns two members.

History.—At some time in the 7th century the district which is now Northamptonshire suffered a simultaneous invasion by the West Saxons from the south and the Anglian tribes from the north, and relics discovered in the county testify to a mingling of races, at the same time showing that West Saxon influence never spread farther north than a line from Daventry to Warwick, and with the extension of the Mercian kingdom under Penda and the conversion of the midland districts ceased altogether. The abbey at Medehamstede (now Peterborough) was begun by Peada in 655, and about the same time foundations were established at Peakirk, Weedon Beck, Castor and Oundle. In 870 the district was overrun by the Danes, and Northampton was one of the five Danish boroughs, until in 921 it was recovered by Edward the Elder, who fortified Towcester in that year. In the 11th century Northamptonshire was included in Tostig's northern earldom; but in 1065, together with Huntingdonshire, it was detached from Northumbria and bestowed on Waltheof. The only monastic foundation which survived the Conquest was Peterborough. Norman castles existed at Rockingham, Barnwell, Lilbourne and Northampton.

As a shire Northamptonshire was probably of Danish origin, representing in the 10th century the area which owed allegiance to Northampton as a political and administrative centre. In 921 this area extended to the Welland, the present northern limit of the county, and at the time of the Domesday Survey the boundaries were approximately those of the present day. Northamptonshire is first mentioned by name in the *Historia Eliensis*, in connexion with events which occurred at the close of the 10th century.

The Geld roll of the time of William I. and the Domesday Survey of 1086 mention 28 hundreds in Northamptonshire, and part of Rutland is assessed under this county. By 1316 the divisions had undergone considerable changes, both in name and in extent, and had been reduced to their present number, 20, since which date they have remained practically unaltered. The names of the hundreds point to primitive meeting-places gradually superseded by villages and towns, and the court for Fawsley hundred met under a large beech tree in Fawsley Park until the beginning of the 18th century, when it was transferred to Everdon. The shire-court originally met at Northampton.

Northamptonshire was originally included in the diocese of Lincoln. The archdeaconry of Northampton is mentioned in the 12th century, and in 1291 included the deaneries of Peterborough, Northampton, Brackley, Oundle, Higham, Daventry, Preston, Weldon, Rothwell and Haddon. The diocese of Peterborough was created in 1541, and in 1875 the archdeaconry of Oakham was formed and included in this county the first and second deaneries of Peterborough and the deaneries of Oundle, Weldon and Higham Ferrers. Northampton archdeaconry now includes the first, second and third deaneries of Brackwell and Rothwell; the first and second deaneries of Haddon and Preston, and the deaneries of Daventry, Northampton and Weldon.

At the time of the Domesday Survey the chief lay-tenant in Northamptonshire was Robert, earl of Mortain, whose fief escheated to the crown in 1106. The estates of William Peverel founder of the abbey of St James at Northampton, also escheated to the crown in the 12th century. Holdenby House was built by Sir Christopher Hatton, privy councillor to Queen Elizabeth, and Yardley Hastings was named from the Hastings, formerly earls of Pembroke. Higham Ferrers was the seat of the Ferrers family; Braybrook Castle was built by Robert de Braybrook, a favourite of King John; and Burghley House gave the title of baron to William Cecil.

Northampton was a favourite meeting-place of the councils and parliaments of the Norman and Plantagenet kings. In 1215 John was besieged in Northampton Castle by the barons, and in 1264 Henry III. captured the castle from the younger Simon de Montfort. During the Wars of the Roses Henry VI. was defeated at Northampton in 1460. In the Civil War of the 17th century the county declared almost unanimously for the parliament. A royalist garrison was placed at Towcester by Prince Rupert in 1644, but almost immediately withdrawn.

The iron-mines and stone-quarries of Northamptonshire were worked in Roman times, but the former were entirely neglected from the Plantagenet period until their rediscovery in 1850, while the two most famous quarries, those of Barnack and Stanion, were exhausted about the 16th century. The wool and leather industries flourished in Norman times. In the 17th century the weaving industry declined in the Northampton district, but became very flourishing about Kettering. Other early industries were charcoal-burning, brick and tile manufacture and brewing. The industries of whip-making, pipe-making, silk-weaving and paper-making were introduced in the 17th and 18th centuries.

In 1290 Northamptonshire returned two members to parliament, and in 1295 Northampton also returned two members.

In 1547 Brackley and Peterborough returned each two members, and in 1557 Higham Ferrers returned one member. Under the act of 1832 the county returned four members in two divisions, and Brackley and Higham Ferrers were disfranchised.

Antiquities.—Although Northamptonshire was rich in monastic foundations, remains, except of the abbey-church of Peterborough, afterwards the cathedral, are of small importance. At Geddington, and also at Hardingstone, near Northampton, there is an Eleanor cross, erected by Edward I. to the memory of his queen, in good preservation. For the architecture of its churches Northampton holds a place scarcely inferior to any other English county. To the Saxon period belong the tower of Earls Barton church, which stands on an eminence, probably the mound of an old English strong-house; the tower and other portions at Brigstock; the ground plan and other portions at Wittering; the remarkable tower at Barnack; and Brixworth church, constructed in part of Roman materials, and by some believed to include part of a Roman basilica. Of Norman, besides the cathedral of Peterborough, the finest examples are St Peter's and St Sepulchre's, Northampton, and the tower of Castor church. St Mary's church, Higham Ferrers, formerly collegiate, Early English and Decorated, is one of the finest churches in the county, and, as specially noteworthy among many beautiful buildings, there may be mentioned the churches at Irthlingborough and Lowick, with their lantern towers, Warmington, a very fine specimen of Early English work, Rushden, Finedon, Raunds and Fotheringhay. Of the church at Easton Maudit, Percy, author of the *Reliques*, and afterwards Bishop of Dromore, was rector.

A gateway at Rockingham, and earth-works at Higham Ferrers and Brackley are worthy of mention. Some castellated ruins remain of the castle at Fotheringhay, famous as the scene of the imprisonment, trial and execution of Mary, Queen of Scots. Barnwell Castle, founded by William the Conqueror, an interesting example of the defensive construction of the period, is still a fine ruin, which includes four of the round towers and an imposing gateway. Holdenby Manor House, where Sir Christopher Hatton (1540–1591) was born, and where Charles I. was staying when he was carried away by Cornet Joyce, is largely restored. Among ancient mansions are Castle Ashby, the seat of the Comptons, the oldest portion belonging to the reign of Henry VIII.; Althorp, the seat of the Spencers, of various dates; Drayton House, of the time of Henry VI.; the vast pile of Burghley House, Stamford, founded by Lord Burleigh (1553), but more than once altered and enlarged; and Kirby Hall, a beautiful Elizabethan building once the residence of Sir Christopher Hatton.

Baker, *History and Antiquities of the County of Northampton* (2 vols., London, 1822–1841); John Bridges, *History and Antiquities of Northamptonshire*, compiled by Rev. Peter Whalley (2 vols., Oxford, 1791); John Norden, *Speculi Britanniae, pars altera*, or *A Delineation of Northamptonshire* (London, 1720); Francis Whellan, *History, Topography and Directory of Northamptonshire* (2nd ed., London, 1874).

NORTH BERWICK, a royal and police burgh of Haddingtonshire, Scotland. Pop. (1901) 2614. It is situated on the south shore of the entrance to the Firth of Forth, 22¾ m. E.N.E. of Edinburgh by the North British railway, being the terminus of a branch line from Drem Junction. It was created a royal burgh by Robert III. (d. 1406), and though once a port of some importance it dwindled to a fishing hamlet. In the latter half of the 19th century, however, it gradually became a fashionable watering-place, much frequented for its firm sandy beach and bathing, and especially for its two golf-courses. Near the station are the ruins of the abbey of Cistercian nuns founded by David I. Immediately to the south rises the fine cone of North Berwick Law (612 ft.), which was utilized as a signal point at the period of the Napoleonic scare.

About 3 m. E. stand the strikingly picturesque ruins of Tantallon Castle, which probably dates from the end of the 14th century and was for many generations the stronghold of the Angus Douglases. Though the 6th earl successfully resisted the sieges of James V. in 1528 and 1530, the castle had at last to be surrendered by treaty. It was besieged and captured by General Monk in 1651, and some time after the restoration became the property of Sir Hew Dalrymple, lord president of session, whose family still own it. It was then dismantled and fell into decay.

About 2 m. S.W. of North Berwick is Dirleton, with a castle dating from the 12th century. Edward I. took it in 1298, and in the reign of Robert Bruce it was acquired by the Haliburtons, from whom it passed to the family of Ruthven. On the failure of the Gowrie conspiracy (1600) the castle was forfeited and given to Sir Thomas Erskine (1566–1639), who became Baron Dirleton in 1604, two years later Viscount Fenton, and in 1619 earl of Kellie. Monk laid siege to the castle in 1650, and in 1663 it was purchased by Sir John Nisbet (1609–1687), lord advocate, afterwards a lord of session and Lord Dirleton.

NORTHBROOK, THOMAS GEORGE BARING, 1ST EARL OF (1826–1904), English statesman, eldest son of the first baron (long known as Sir Francis Baring; see BARING), was born on the 22nd of January 1826, and educated at Christ Church, Oxford, where he graduated with honours in 1846. He entered upon a political career, and was successively private secretary to Mr Labouchere (Lord Taunton), Sir George Grey, and Sir Charles Wood (Viscount Halifax). In 1857 he was returned to the House of Commons in the Liberal interest for Penryn and Falmouth, which constituency he continued to represent until he became a peer on the death of his father in 1866. He was a lord of the admiralty in 1857–1858; under-secretary for war, 1861; for India, 1861–1864; for the home department, 1864–1866; and secretary to the admiralty, 1866. When Mr Gladstone acceded to power in 1868, Lord Northbrook was again appointed under-secretary for war, and this office he held until February 1872, when he was appointed governor-general of India. In January 1876, however, he resigned. He had recommended the conclusion of arrangements with Shere Ali which, as has since been admitted, would have prevented the second Afghan war; but his policy was overruled by the duke of Argyll, then secretary of state. Lord Northbrook was created Viscount Baring of Lee in the county of Kent and earl of Northbrook in the county of Southampton. From 1880 to 1885 he held the post of first lord of the admiralty in Mr Gladstone's second government. During his tenure of office the state of the navy aroused much public anxiety and led to a strong agitation in favour of an extended shipbuilding programme. The agitation called forth Tennyson's poem "The Fleet." In September 1884 Lord Northbrook was sent to Egypt as special commissioner to inquire into its finances and condition. The inquiry was largely unnecessary, all the essential facts being well known, but the mission was a device of Mr Gladstone's to avoid an immediate decision on a perplexing question. Lord Northbrook, after six weeks of inquiry in Egypt, sent in two reports, one general, advising against the withdrawal of the British garrison, one financial. His financial proposals, if accepted, would have substituted the financial control of Great Britain for the international control proposed at the London Conference of June-August of the same year. A heavy blow would thus have been struck at internationalism in Egypt. Mr Gladstone was not, however, prepared to give a British guarantee of the interest of the loan, and so Lord Northbrook's mission proved abortive. The £9,000,000 loan issued in 1885 bound Egypt even more securely in international fetters (see Cromer's *Modern Egypt*, 1908, vol. ii. chap. xlv.). When Mr Gladstone formed his third ministry in 1886 Lord Northbrook held aloof, being opposed to the home rule policy of the premier, and he then ceased to take a prominent part in political life. In 1890 he was appointed lord-lieutenant of Hampshire. He died on the 15th of November 1904. He had married in 1848 Elizabeth Sturt, sister of Lord Alington, and was succeeded as 2nd earl by his eldest son, who as Lord Baring had been M.P. for Winchester (1880–1885) and North Bedford (1886–1892).

See B. Mallet, *Thomas George, Earl of Northbrook* (1908).

NORTH CAPE (*Nordkap*), a promontory on the island Magerö off the north coast of Norway in 70° 10′ 40″ N., 25° 45′ E., 78 m. N.E. of Hammerfest. Knivskjaerodden, an island a little to the west, actually reaches a point a little farther north than the North Cape, and Nordkyn, 45 m. E., is the northern extremity of the mainland (71° 7′ N.). The desolate cape, rising abruptly

over 1000 ft. from the sea, is frequently visited during the summer period of the "midnight sun," but travellers are often prevented from seeing this phenomenon by adverse atmospheric conditions.

NORTH CAROLINA, a South Atlantic state of the United States of America, situated between latitudes 33° 51′ 37″ (the southernmost point of the southern boundary—35° is the northernmost) and about 36° 34′ 25·5″ N., and between longitudes 75° 27′ W. and 84° 20′ W. It is bounded N. by Virginia, E. and S.E. by the Atlantic Ocean, S. and S.W. by South Carolina, S. also by Georgia, and W. and N.W. by Tennessee. North Carolina has an extreme length from E. to W. of 503¾ m., which is greater than that of any other state east of the Mississippi river. It total area is 52,426 sq. m., of which 3686 sq. m. are water surface.

Physical Features.—The state lies wholly within the three leading topographical regions of the eastern portion of the United States: the Coastal Plain Region, which occupies approximately the eastern half, the Piedmont Plateau Region, which occupies about 20,000 sq. m. in the middle, and the Appalachian Region, which occupies about 6000 sq. m. in the west. At the eastern extremity of the Coastal Plain Region an outer coast line is formed by a chain of long narrow barrier beaches from which project capes Hatteras, Lookout and Fear, whose outlying shoals are known for their dangers to navigation. Between Hatteras and Lookout is Raleigh Bay and between Lookout and Fear is Onslow Bay; and between the chain of islands and the deeply indented mainland Currituck, Albemarle, Pamlico and other sounds form an extensive area, especially to the northward, of shallow, brackish and almost tideless water. Projecting into these sounds and between the estuaries of rivers flowing into them are extensive tracts of swamp land—the best known of these is Dismal Swamp, which lies mostly in Virginia and is about 30 m. long and 10 m. wide. Through most of the Coastal Plain Region, which extends inland from 80 to 150 m., the country continues very level or only slightly undulating, and rises to the westward at the rate of little more than 1 ft. to the mile. Along the W. border of this region, however, the slope becomes greater and there are some hills. The "Fall Line," the boundary between the Coastal Plain and the Piedmont Plateau, has a very irregular course across North Carolina, but lies in a general S.W. direction from the Falls of Roanoke between Halifax and Northampton counties to Anson county on the South Carolina border and marks a rapid increase in elevation of about 200 ft. The Piedmont Plateau Region extends from this line to the Blue Ridge Escarpment, toward which its mean elevation increases at the rate of about 3½ ft. to the mile. It is traversed from N.E. to S.W. by a series of ridges which in the E. portion produce only a general undulating surface but to the westward become higher and steeper until the country assumes a bold and rugged aspect. The S.E. face of the Blue Ridge Escarpment, which rises precipitously 1200-1500 ft. or more above the Piedmont Plateau, forms the S.E. border of North Carolina's Appalachian Mountain Region, which includes the high Unaka Mountain Range, segments of which are known by such local names as Iron Mountains, Bald Mountains and Great Smoky Mountains. These ranges reach their culmination in this state, and with a series of more or less interrupted cross ranges constitute the greatest masses of mountains in the E. half of the United States. Four peaks along the Blue Ridge have an elevation exceeding 5000 ft.—one of these, the Grandfather, rises 5964 ft.; and about thirty peaks in the Unakas and in the several cross ranges exceed 6000 ft., the highest being Mount Mitchell or Mitchell Dome (6711 ft.), of the Black Mountains, a short cross range extending N. from the Blue Ridge through Yancey County. Other noteworthy peaks are Black Brother (6690 ft.) and Hairy Bear (6681 ft.), the next highest mountains. Many of the neighbouring mountain ridges have uniform crests, but a greater number terminate in numerous peaks, some sharp, rugged and rocky, but more of them rounded domes. Throughout the whole region the slopes vary greatly: the N.W. slope of the Blue Ridge is almost imperceptible, or confused with the numerous mountain slopes that rise above it. As a rule the mountain slopes are well graded and subdued, but a few are steep and some are rocky and precipitous. The numerous valleys are usually narrow and deep, though few, if any, descend to less than 2000 ft. above the sea.

The Blue Ridge is the principal water parting of the state. West of it the Hiwassee, the Little Tennessee and the French Broad rivers flow W. or N.W. into Tennessee. Farther N. are the headwaters of the New river, which flows N.E. and finds its way to the Ohio. On the S.E. slope of the Blue Ridge rise the Broad, the Catawba and the Yadkin, which flow for some distance a little N. of E., then, finding a passage across one of the ridges of the Piedmont Plateau, turn to the S.S.E. and across the boundary line into South Carolina, in which state their waters reach the Atlantic. In the N.W. part of the Piedmont Plateau Region, and a little to the N. of the most N.E. course of the Yadkin rises the Dan, which in its N.E. course crosses the boundary into Virginia, where it becomes a tributary of the Roanoke, in which its waters are returned to North Carolina near the "Fall Line." The other principal rivers—the Cape Fear, the Neuse and the Tar—rise in the N.E. part of the Piedmont Plateau Region, have their S.E. courses wholly within the state, and, with the Roanoke, drain the Coastal Plain Region. In the Mountain Region and in the Piedmont Plateau Region the rivers have numerous falls and rapids which afford a total water power unequalled perhaps in any other state than Maine on the Atlantic Coast, the largest being on the Yadkin, Roanoke and Catawba; and in crossing some of the mountains, especially the Unakas, the streams have carved deep narrow gorges that are much admired for their scenery. In contrast with the rivers of these regions those of the Coastal Plain are sluggish, and toward their mouths expand into wide estuaries.

The Coastal Plain Region is the only part of the state that has any lakes, and these are chiefly shallow bodies of water, with sandy bottoms, in the midst of swamps. In all they number only about fifteen, and have an area estimated at 200 sq. m., about one-half of which is contained in Lake Mattamuskeet in Hyde county.

Flora.—In North Carolina's flora are many species common to sub-tropical regions and many common to temperate regions, and the variety is consequently very great. In the swamps are the bald cypress, the white cedar and the live oak, usually draped in southern long moss; south of Cape Fear river are palmettos, magnolias, prickly ash, the American olive and mock orange; along streams in the Coastal Plain Region are the sour gum, the sweet bay and several species of oak; but the tree that is most predominant throughout the upland portion of this region is the long-leaf or southern pine. In the Piedmont Plateau Region oaks, hickories and elms are the most common. In the Mountain Region at the bases of the mountains are oaks, hickories, chestnuts and white poplars; above these are hemlocks, beeches, birches, elms, ashes, maples and limes; and still higher up are spruce, white pine and balsam; and all but a comparatively few of the higher mountains are forest-clad to their summits. All of the species of pine and of magnolia, and nearly all of the species of oak, of hickory and of spruce, indigenous to the United States, are found in North Carolina. On the dome-like tops of such mountains as are too high for trees are large clusters of rhododendrons and patches of grasses fringed with flowers. The forests throughout most of the state have a luxuriant undergrowth consisting of a great variety of shrubs, flowering plants, grasses, ferns and mosses, and the display of magnolias, azaleas, kalmias, golden rod, asters, jessamines, smilax, ferns and mosses is often one of unusual beauty. Venus's fly-trap (*Dionaea muscipula*), a rare plant, is found only south of the Neuse river; and there are several varieties of *Sarracenia*, carnivorous pitcher plants. Among the fruit-bearing trees, shrubs, vines and plants the grape, the blue-berry, the cherry, the plum and the cranberry are indigenous and more or less common. Aromatic and medicinal herbs, of which the state has several hundred distinct species, have been obtained in larger quantities than from any other state in the Union.

Fauna.—In North Carolina five of the seven life-zones into which North America has been divided are represented, but more of its area belongs to the upper-austral than to any other zone. The species of fauna that are at all characteristic of this part of the United States are found in the Piedmont Plateau Region and the western portion of the Coastal Plain Region. Among the song-birds are the mocking-bird, the Carolina wren and the cardinal grosbeak (or red bird); there are plenty of quail or "bob white" (called partridge in the South). Among the mammals are the opossum, raccoon, star-nosed mole (*Condylura cristata*), grey fox and fox squirrel. The mammals of the Mountain Region include the cotton-tail rabbit, red squirrel, lynx and woodchuck; and there is a considerable variety of migratory song-birds, which are common to the more northern states. In the eastern portion of the Coastal Plain Region are the cotton rat, rice-field rat, marsh rabbit, big-eared bat, brown pelican, swallow-tailed kite, black vulture and some rattlesnakes and cotton-mouth moccasin snakes, all of which are common farther south; and there are some turtles and terrapins, and many geese, swans, ducks, and other water-fowl. Large numbers of shad, blue fish, weak fish (squeteague), alewives, Spanish mackerel, perch, bass, croakers (*Micropogon undulatus*), mullet, menhaden, oysters and

clams are caught in the sounds, in the lower courses of the rivers flowing into them, or in the neighbouring waters of the sea.

Climate.—North Carolina has a climate which varies from that of the S.E. corner, which approaches the sub-tropical, to that of the Mountain Region, which is like the medium continental type, except that the summers are cooler and the rainfall is greater. The mean annual temperature for the state (below an elevation of 4000 ft.) is about 59° F. For the Coastal Plain Region it is 61° F.; for the Piedmont Plateau Region, 60° F.; for the Mountain Region, 56° F.; for Southport, in the S.E. corner of the state, 64° F.; and for Highlands, at an elevation of 3817 ft. in the S.W. corner, 50° F. January, the coldest month, has a mean temperature of 38° F. in the Mountain Region, of 41° F. on the Piedmont Plateau, and of 44° F. on the Coastal Plain; and in July, the warmest month, the mean is about 79° F. on both the Coastal Plain and the Piedmont Plateau and 74° F. in the Mountain Region. Extremes have ranged from − 19° F. at Highlands in 1899 to 107° F. at Chapel Hill, Orange county, in 1900 and again in 1902. The average precipitation for the state is about 52 in. a year, nearly all of it in the form of rain. For the Coastal Plain Region it is 54 in.; for the Piedmont Plateau Region, 48 in.; and for the Mountain Region, 53 in. On the E. slope of some of the mountains the rainfall is exceeded nowhere in the United States, save in the N. part of the Pacific Slope. At Highlands, Macon county, during 1898 it was 105·24 in., and during 1901 it was 106·17 in., 30·74 in. falling here during the month of August. The winds are variable and seldom violent, except along the coast during the sub-tropical storms of late summer and early autumn.

Soil.—On the Coastal Plain the soil is generally sandy, but in nearly all parts of this region more or less marl abounds; south of the Neuse river the soil is mostly a loose sand, north of it there is more loam on the uplands, and in the lowlands the soil is usually compact with clay, silt or peat; toward the western border of the region the sand becomes coarser and some gravel is mixed with it. Throughout much of the Piedmont Plateau and Mountain regions the decomposition of felspar and of other aluminous minerals has resulted in a deep soil of clay with which more or less sand is mixed. It is deeper and more sandy where granite is the underlying rock, deeper and more fertile on the north-western than on the south-eastern mountain slopes, and shallower and more clayey where slate is the underlying rock.

Agriculture.—Until the Civil War agriculture was about the only important industry in the state, and at the close of the 19th century it was still the leading one; but from 1880 to 1900 the ratio of agriculturists to all inhabitants of the state engaged in some gainful occupation decreased from 75·3 to 64·1%. The land included in farms amounted in 1900 to 22,745,356 acres or 73% of the total land surface of the state, and the percentage of farm land that was improved increased from 26·5 in 1870 to 36·6 in 1900. Throughout the colonial era the establishment of small estates was a part of the territorial policy of the government of North Carolina, 640 acres being the largest normal grant to any one person; as a consequence of this policy land holdings have always been much smaller here than in most of the other parts of the South, and since the Civil War the rise in the percentage of improved land, the development of truck farming, and the growth in number of negro holdings, have been accompanied by a further decrease in the average size of farms from 316 acres in 1860 to 101·3 acres in 1900. In the latter year there were in all 224,637 farms: of these 93,097 contained less than 50 acres, 55,028 between 50 and 100 acres, 44,052 between 100 and 175 acres, and 4224 over 500 acres. Of the total number of farms 128,978 were operated by owners or part owners, of whom 17,434 were coloured (including Indians); 19,916, by cash tenants, of whom 10,331 were coloured; and 73,092 by share tenants, of whom 26,892 were coloured. After the Civil War there have been several important changes in the crops raised: the development of cotton manufacturing in the South and the utilization of cotton-seed oil and meal gave impetus to cotton culture; and the discovery of the adaptability of much of the cotton land to the culture of tobacco of a superior quality resulted first in the development of a vast tobacco industry and then to a fluctuation in acreage of the crops of tobacco and of cotton, according as the price of either rose or fell. The destruction of pine forests to meet the demands for naval stores, and the introduction and increased use of the refrigerator car, resulted in much attention to the growth of garden produce for Northern markets. Peanut culture, introduced into the state from Virginia soon after the close of the Civil War, spread rapidly. In the meantime the crops of cereals increased little, and stock raising generally decreased.

The principal crops are cotton, Indian corn, tobacco, hay, wheat, sweet potatoes, apples and peanuts. The yield of cotton increased from 62,901,790 lb in 1869 to 307,500,000 lb in 1909. In 1909 2,898,000 acres were planted to Indian corn, with a crop of 48,686,000 bushels; 570,000 acres to wheat, with a crop of 5,415,000 bushels; and 196,000 acres to oats, with a crop of 3,234,000 bushels. In Caswell county, North Carolina, "lemon yellow" tobacco was first produced in 1852, and the demand for this "bright" variety became so great that except during the interruption of the Civil War its culture spread rapidly. In 1879 the state's crop amounted to 26,986,213 lb, in 1889 to 36,375,258 lb, in 1899 to 127,503,400 lb, and in 1909 to 144,000,000 lb. The hay and forage crop increased from 80,528 tons in 1879 to 246,820 tons in 1899; and in 1909 the hay crop was 242,000 tons. In the production of vegetables and fruits the state ranks high. Potatoes, cabbage and lettuce are much grown for the early Northern markets.

Farmers of the Piedmont Plateau formerly kept large numbers of horses and cattle from April to November in ranges in the Mountain Region, but with the opening of portions of that country to cultivation the business of pasturage declined, except as the cotton plantations demanded an increased supply of mules; there were 25,259 mules in 1850, 110,011 in 1890, 138,786 in 1900, and 181,000 in 1910. The number of horses was 192,000 in 1910; of dairy cows, 297,000; of hogs, 1,356,000; and of sheep, 215,000.

Cotton is grown most largely in the S. portion of the Piedmont Plateau and in a few counties along or near the W. border of the Coastal Plain; tobacco, in the N. portion of the Piedmont Plateau and in the central and N.W. portions of the Coastal Plain; rice, along the banks of rivers near the coast; wheat, in the valley of the Yadkin; orchard fruits, in the W. portion of the Piedmont Plateau and in the Mountain Region; vegetables and small fruits in the middle and S. portion of the Coastal Plain; peanuts, in the N. portion of the Coastal Plain; sorghum cane, almost wholly in Columbus county in the S. part of the Coastal Plain. The state government, through its Department of Agriculture, takes an active interest in the introduction of modern agricultural methods, and in the promotion of diversified farming; in 1899 it established the Edgecombe and in 1902 the Iredell test farm.

Forests.—North Carolina had in 1900 about 35,300 sq. m. of woodland; great quantities of merchantable timber still remained, especially in the Mountain Region and on the Coastal Plain. The trees of the greatest commercial value are oak and chestnut at the foot of the mountains and yellow pine on the uplands of the Coastal Plain. But mixed with the oak and chestnut or higher up are considerable hickory, birch and maple; farther up the mountain sides are some hemlock and white pine; and on the swamp lands of the Coastal Plain are much cypress and some cedar, and on the Coastal Plain south of the Neuse there is much long-leaf pine from which resin is obtained. Several other pines are found, and among the less important timber trees are black spruce, Carolina balsam, beeches, ashes, sycamore or button wood, sweet gum and linden. The value of the lumber and timber products was $1,074,003 in 1860, $5,898,742 in 1890; $14,862,593 in 1900; and $15,731,379 in 1905.

Fisheries.—In the sounds along the coast, in the lower courses of the rivers that flow into them, and along the outer shores fishing is an important industry. The fisheries are chiefly of shad, oysters, mullet, alewives, clams, black bass, menhaden, croakers and blue fish. In 1908 the catch was valued at about $1,750,000. The State Geological and Economic Survey has made a careful study of the fishes of North Carolina, of the shad fisheries, of oyster culture, and of the development of terrapin. At Beaufort the United States Bureau of Fisheries has a marine biological laboratory, established in 19[illegible] for the study of the aquatic fauna of the south-east coast.

Minerals.—At the beginning of the 20th century a great number of minerals were found in the Piedmont Plateau and Mountain regions, but most of them in such small quantities as to be of little or no commercial value, and in 1902 the total value of the product of the mines and quarries was only $927,376; but in 1907 the value was $2,961,381, and in 1908, $2,145,947. During the first half of the 19th century North Carolina was a mining state of the first importance; in 1804 it was the only state in the Union in which gold was obtained. Operations ceased during the Civil War, and although resumed soon after its close, they became somewhat desultory. Probably the earliest large find was a 17-lb nugget on the Reed Plantation in Cabarrus county in 17[illegible] in the same mine a 28-lb nugget, probably the largest found in eastern United States, was discovered in 1803. The production of Rutherford and Burke counties and their vicinity was so great and transportation to the United States Mint at Philadelphia so difficult, that from 1831 to 1857 gold was privately coined in [illegible] and 5 dollar pieces bearing the mark of the coiner "C. Bechtler, Rutherford county, N.C." The coins were of standard purity (or higher); they are now very rare. A branch mint of the United States was established in 1837 at Charlotte. Silver, which is rarer in the state than gold, is found chiefly in the W. portion of the Piedmont Plateau. In 1902 the value of the gold and silver produced combined was $71,287, and in 1908, when the Iola mine 6 m. E. of Troy, Montgomery county, was the most productive, the value of the gold alone was $97,945, that of the silver $668, and that of copper, $2560.

In 1870 North Carolina's mica mines were reopened, and the produce the best grade of sheet mica for glazing and a large percentage of the country's yield of this mineral. Most of it has been found in the N.E. portion of the Mountain Region; and that mica was mined here before any European settlement of the country seems proved by numerous excavations and by huge heaps of which are large oak and chestnut trees, some fallen and decayed. North Carolina is also the leading state in the Union in the production of monazite. The mining of corundum was begun at Corundum Hill in Macon county in 1871, and from 1880 to 1902 the output was considerable, but with the discovery of the Canadian corundum

deposits the importance of those of North Carolina greatly declined. It was along the coast of North Carolina that Europeans in 1585 made the first discovery of iron ore within the present limits of the United States. Iron ores are widely distributed within the state, and there have been times since the eve of the War of Independence when the mining of it was an industry of relatively great importance. In 1908 the product amounted to 48,522 long tons (all magnetite), and was valued at $76,877; almost the entire product is from the Cranberry mines, near Cranberry, Mitchell county. The state has two small areas in which bituminous coal occurs; one in the basin of the Dan and one in the basin of the Deep. Very little coal was produced in the state until the Civil War, when, in 1862 and again in 1863, 30,000 short tons were obtained for the relief of the Confederate government, an amount which up to 1905, when the yield was only 1557 short tons (falling off from 7000 short tons in 1904), had not since been equalled; in 1906, in 1907 and in 1908 no coal was mined in the state. The most valuable immediate product of the state's mines and quarries for nearly every year from 1890 to 1908 was building stones of granite and gneiss, which are found in all parts of the state west of the "Fall Line"; the best grades of granite are quarried chiefly in Gaston, Iredell, Rowan, Surry and Wilkes counties. The value of the building stone increased from $150,000 in 1892 to $800,177 (of which $764,272 was the value of granite) in 1908. Talc also is widely distributed in the state; the most extensive beds are in the south-western counties, Swain and Cherokee.

Manufactures.—During the quarter of a century between 1880 and 1905 a great change was wrought in the industrial life of the state by a phenomenal growth of cotton manufacturing. A cotton mill was erected in Lincoln county about 1813, and by 1840 about 25 small mills were in operation within the state. When the Civil War was over, the abnormally high price of cotton made cotton raising for more than a decade a great assistance to the people in recovering from ruin, but when the price had steadily declined from 23·98 cents a pound in 1870 to 10·38 cents a pound in 1879, they turned to the erection and operation of cotton mills. In 1880 the total value of the manufactured products of the state was $20,095,037; in 1900 the value of the cotton manufactures alone was $28,372,789, and in 1905 $47,254,054. The rapid extension of tobacco culture was accompanied by a corresponding growth in the manufacture of chewing and smoking tobacco and snuff, and some of the brands have a wide reputation. The product increased in value from $4,783,484 in 1890 to $25,488,721 in 1905. In 1890 the lumber and timber products, valued at $5,898,742, ranked second among the state's manufactures; by 1905 their value had increased to $15,731,379. The value of the state's factory product for 1900 was $85,274,083, and that for 1905, $142,520,776, an advance of 67·1%. The cotton mills are mostly in the Piedmont Plateau Region; Durham, Durham county, and Winston, Forsyth county, are leading centres of tobacco manufacture; and High Point (pop. in 1900, 4163) in Randolph is noted for its manufacture of furniture.

Transportation.—Railway building was begun in the state in 1836 with the Raleigh & Gaston line, opened from Raleigh to Gaston in 1844 and extended to Weldon in 1852. A longer line, that from Wilmington to Weldon, was completed in 1840. But the greatest period of building was from 1880 to 1890; during this decade the mileage was increased from 1486 m. to 3128 m., or 1642 m., which was more than one-third of all that had been built up to the year 1909, when the total mileage was 4464·14. The principal systems of railways are the Southern, the Atlantic Coast Line, the Norfolk & Southern and the Seaboard Air Line. By means of its navigable waters and safe harbours the state has an extensive coasting trade. The harbours along the sounds and in the estuaries of the rivers are well protected from the storms of the ocean by the long chain of narrow islands in front, but navigation by the largest vessels is interrupted by shoals in the sounds, and especially by bars crossing the inlets between islands. The channel leading to the harbour of Wilmington has been cleared to a depth of 20 ft. or more by dredging and by the construction of jetties and an immense dam, works which were begun by the state in 1823 but from 1828 were carried on from time to time by the national government. The Roanoke river is navigable to Weldon and the Cape Fear river to Fayetteville; the Neuse is navigable for small vessels only to Newbern.

Population.—The population[1] of North Carolina increased from 1,399,750 in 1880 to 1,617,949 in 1890, or 15·6%; to 1,893,810 in 1900, a further increase of 17·1%; and to 2,206,287 in 1910, an increase of 16·5% since 1900. Of the total in 1900 only 4492, or less than ½ of 1% were foreign-born, nearly half of these being natives of Germany and England, 1,263,664 were whites, 624,469 negroes, 5687 Indians and 51 Chinese. Nearly one-fourth of the Indians are Cherokees, who occupy, for the most part, the Qualla Reservation in Swain and Jackson counties, not far from the south-western extremity of the state. The others, numbering in 1907 nearly 5000, living mostly in Robeson county, are of mixed breed and have been named the Croatans, on the assumption (probably baseless) that they are the descendants of John White's lost colony of 1587. The Cherokees have no ambition to accumulate property, but both they and the Croatans have been generally peaceable and many of them send their children to school—for the Croatans the state provides separate schools. The Baptist and Methodist churches are the leading religious denominations in the state; but there are also Presbyterians, Lutherans, members of the Christian Connexion (O'Kellyites), Disciples of Christ (Campbellites) Episcopalians, Friends, Roman Catholics, Moravians and members of other denominations. Until nearly a century after the founding of the Carolinas there was not a town in North Carolina that had a population of 1000, and the urban population of the state was exceptionally small at the beginning of the rapid rise of the manufacturing industries about 1880. In 1900 the urban population (in places having 4000 inhabitants or more) was 152,019, or 8% of the total; the semi-urban (in incorporated places having less than 4000 inhabitants) was 186,258 or 9·8% of the total; and the rural (outside of incorporated places) was 1,555,533 or 82·1% of the total. But between 1890 and 1900 the urban population increased 56·6% and the semi-urban 61·6%, while the rural increased only 10·6%. The principal cities are Wilmington, Charlotte, Asheville, Raleigh (the capital), Greensboro, Winston and Newbern.

Administration.—North Carolina has been governed under the charters of 1663 and 1665 (1663–1729), under commissions and instructions from the crown (1729–1776), and under the state constitutions of the 18th of December 1776 (amended in 1835, in 1856, and in the Secession Convention of 1861) and of April 1868 (amended in 1872–1873, 1875,[2] 1879, 1888 and 1899). The present constitution, as amended, prescribes that no convention of the people of the state may be called by the legislature unless by the concurrence of two-thirds of all the members of each house followed by an affirmative vote of a majority of the electors voting on the question; and that an amendment to the constitution may be adopted only by a three-fifths vote of each house followed by an affirmative vote of the majority of electors voting on the question. The suffrage provisions containing the famous "grandfather clause" (in Art vi. section 4), were adopted in the form of a constitutional amendment, ratified in August 1900, and in effect on the 1st day of July 1902. All persons otherwise qualified may place their names on the voting register, provided they can read and write any section of the constitution in the English language and have paid on or before the 1st of May the poll tax for the previous year. An exception to the educational requirement is made in favour of any male person who was, on the 1st day of January 1867, or at any time prior thereto, entitled to vote under the laws of any state in the United States wherein he then resided, and in favour of lineal descendants of such persons. This exception remained in force until the 1st of December 1908, after which time all who were on the list became (unless disqualified because convicted of felony) life voters, but new applicants had to stand the educational test.

Perhaps the most notable feature about the administration is the weakness of the governor's position. He is elected by popular vote[3] for four years, and cannot succeed himself in office. His power is limited by a council of state, a relic of colonial days. This body is not, however, a special board, as in Maine, New Hampshire, and Massachusetts, but a kind of administrative cabinet as in Iowa, consisting of the secretary of state, the auditor, the treasurer, and the superintendent of

[1] The population of the state was 393,751 in 1790; 478,103 in 1800; 555,500 in 1810; 638,829 in 1820; 737,987 in 1830; 753,419 in 1840; 869,039 in 1850; 992,622 in 1860; and 1,071,361 in 1870.

[2] The changes made in 1875 were adopted in a convention, were ratified in 1876, and were so numerous that the amended constitution is frequently referred to as the Constitution of 1876.

[3] Up to 1835 he was elected annually by the two houses of the legislature, and no man could serve as governor for more than three years in any six successive years. Under an amendment of 1835 he was elected for two years by popular vote of electors for members of the House of Commons, and no man was eligible to serve for more than four years in any term of six years.

public instruction, and advising the governor in the administration of his office. Judges, heads of departments, and executive boards are elected, and even in the few instances in which the governor appoints to office the confirmation of the Senate is necessary. Furthermore, in North Carolina the governor has no veto power. In addition to the executive officials mentioned above there are a lieutenant-governor, an attorney-general, a Bureau of Labor Statistics, established in 1887, and a Corporation Commission, which in 1899 superseded the Railroad Commission, established in 1891. The governor and the lieutenant-governor must at the time of their election be at least thirty years of age, and must have been citizens of the United States for five years and residents of the state for two years.

Sessions of the General Assembly are held biennially, beginning on the Wednesday after the first Monday in January. The Senate is composed of fifty members elected biennially by senatorial districts as nearly as possible equal to one another in population, and the House of Representatives (in the Constitution of 1776 called the House of Commons) of one hundred and twenty, elected biennially and chosen by counties[1] according to their population, each county having at least one representative, no matter how small its population. A senator must at the time of his election be at least 25 years of age, and must have been a resident and citizen of the state for at least two years, and a resident in his district for one year immediately preceding his election; and a representative must be a qualified elector of the state and must have resided in his county for at least one year immediately preceding his election. The pay for both senators and representatives is four dollars per day for a period not exceeding sixty days; should the session be prolonged the extra service is without compensation. Extra sessions, called by the governor on the advice of the council of state, are limited to twenty days, but may be extended under the same limitations in regard to compensation. The Senate may sit as a court of impeachment to try cases presented by the House, and a two-thirds vote is necessary for conviction.

There is a supreme court consisting of a chief justice and four associates, elected by popular vote for eight years, and a superior or circuit court, composed of sixteen judges elected by the people in each of sixteen districts for a term of eight years.

The county officials are the sheriff, a coroner, a treasurer, a register of deeds, a surveyor and five commissioners, elected for two years. The commissioners supervise the penal and charitable institutions, schools, roads, bridges and finances of the county Subordinate to them are the township boards of trustees, composed of a clerk, and two justices of the peace.

By the constitution personal property to the value of $500 and any homestead to the value of $1000 is exempt from sale for debt, except for taxes on the homestead, or for obligations contracted for the purchase of said premises. Under the revised code (1905) a wife may hold property which she had acquired before marriage free from any obligation of her husband, but in general she is not permitted to make contracts affecting either her personal or real estate without the written consent of her husband. Neither can the husband convey real estate without the wife's consent, and a widow may dissent from her husband's will at any time within six months after the probate of the same, the effect of such dissent being to allow her the right of one-third of her deceased husband's property, including the dwelling house in which they usually resided. The constitution prescribes that "all marriages between a white person and a negro, or between a white person and a white person of negro descent to the third generation inclusive, are hereby forever prohibited." Until 1905 the only grounds for an absolute divorce were adultery, natural impotence, and pregnancy of the wife at the time of marriage; but an amendment of 1907 allows a divorce whenever there has been a separation of husband and wife for ten successive years, provided the parties have lived in the state for that period and no children have been born of the marriage. The working of children under twelve years of age in any factory or manufacturing establishment is unlawful, the working of children between the ages of twelve and thirteen in such places is allowed only on condition that they be employed as apprentices and have attended school for at least four months during the preceding year; and no boy or girl under fourteen is to work in such places during night time. An anti-trust law of 1907 makes it unlawful for any corporation controlling within the state the sale of 50% of an article to raise or lower the price of that article with the intention of injuring a competitor. On the 26th of May 1908 the people of the state voted "against the manufacture and sale of intoxicating liquors" in the state; the prohibition act thus approved went into effect on the 1st of January 1909. State prohibition had been defeated in 1881 by a vote of 100,000; in 1902 the Anti-Saloon League organized in the state; in 1903 the Watts Law enacted rural prohibition, giving towns local option, under which many of the towns voted "no licence"; and in 1905 severe police regulations were provided for towns in which saloons were licensed.

Charitable and Penal Institutions.—In the systematic care of the dependent and defective classes North Carolina was one of the pioneer states of the South. An institute for the deaf and dumb and blind was opened at Raleigh in 1845, and another for the deaf and dumb at Morganton in 1894; by a law of 1907 every deaf child of sound mind must attend, between the ages of eight and fifteen, a school for the deaf at least five terms of nine months each; and by a law of 1908 every blind child (between seven and seventeen), if of sound mind and body, must attend some school for the blind for nine months of each year. The North Carolina State Hospital (for the insane) at Raleigh was opened in 1856 as a result of the labours of Miss Dorothea Lynde Dix (1805–1887); in connexion with it there is an epileptic colony. The State Hospital at Morganton, opened in 1883, completed in 1886, and intended for the use of the western part of the state, is perhaps the best equipped institution of its kind south of the Potomac. In 1901 a department for criminal insane was opened in a wing of the state prison at Raleigh. The Oxford Orphan Asylum at Oxford (1872) is supported partly by the Masonic Order and partly by the state. A movement begun by the Confederate Veterans Association in October 1889 resulted in the establishment in 1890 of a home for disabled veterans at Raleigh; this became a state institution in 1891. In 1908 a state tuberculosis sanatorium was opened near Aberdeen, Moore county. The state also takes good care of the unfortunates among the negro race The Institute for the Colored Deaf, Dumb and Blind (1867) at Raleigh and the Eastern Insane Hospital (1880) near Goldsboro are the oldest institutions of the kind for negroes in the world; in connexion with the last there is an epileptic colony for negroes. There is also (at Oxford) an Orphanage for the Colored (1883), which was established by the "Wake and Shiloh Associations of the Colored Baptist Church," first received state aid in 1891, and is now supported chiefly by the state. The state prison is at Raleigh, although most of the convicts are distributed upon farms owned and operated by the state The lease system does not prevail, but the farming out of convict labour is permitted by the constitution; such labour is used chiefly for the building of railways, the convicts so employed being at all times cared for and guarded by state officials. A reformatory for white youth between the ages of seven and sixteen, under the name of the Stonewall Jackson Manual Training and Industrial School, was opened at Concord in 1909, and in March 1909 the Foulk Reformatory and Manual Training School for negro youth was provided for Charitable and penal institutions are under the supervision of a Board of Public Charities, appointed by the governor for a period of six years, the terms of the different members expiring in different years. Private institutions for the care of the insane, idiots, feeble-minded and inebriates may be established, but must be licensed and regulated by the state board and become legally a part of the system of public charities.

Education.—The public school system was established in 1839, being based on the programme for state education prepared in 1815–1817 by Archibald Debow Murphey (1777–1832), whose educational ideas were far in advance of his day. Calvin Henderson Wiley (1819–1887), the author of several romances dealing with life in North Carolina, such as *Roanoke: or, Where is Utopia?* (1866), and of *Life in the South: a Companion to Uncle Tom's Cabin* (1852), was superintendent of common schools in 1853–1865 (the executive head of the state's educational department having previously been a "literary board"), and won the name of the "Horace Mann of the South" by his wise reforms. He kept the public schools going through the Civil War, having advised against the disturbance of the school funds and their reinvestment in Confederate securities. The present school system is supervised by a state board of education consisting of the governor, lieutenant-governor, secretary of state, treasurer, auditor, attorney-general, and superintendent of public instruction. In the counties there is a board of education and there is also a local school committee of three in each township. The compulsory attendance at school of children between the ages

[1] Under the Constitution of 1776 senators were elected by counties, one for each county, and representatives also by counties, two for each county—in addition, the towns of Edenton, Newbern, Wilmington, Salisbury, Hillsboro and Halifax each elected one representative; and a property qualification—a freehold of 50 acres held for six months before an election—was imposed on electors of senators. Under amendments of 1835 senators were chosen by districts formed on the basis of public taxes paid into the state treasury, representatives were still chosen by counties, and were apportioned among them on the same basis as their Federal representation (*i.e.* counting three-fifths of the slaves), and free negroes or mulattoes "descended from negro ancestors to the fourth generation inclusive" were excluded from the suffrage. In 1856 the property qualification for electors of senators was removed.

of eight and fourteen for sixteen weeks each year by a state law is optional with each county. A state library commission was established in 1909.

At the head of the state system of education is the university of North Carolina at Chapel Hill, chartered in 1789 and opened in 1795, one of the oldest state universities in the country and one of the oldest universities in the South; it consists of the college, the graduate department, the law department, the department of medicine (1890, part of whose work is done at Raleigh) and the department of pharmacy (1897). In 1907–1908 it had 75 instructors and 775 students. Other state educational institutions are the College of Agriculture and Mechanic Arts (1889) at West Raleigh, which in 1907–1908 had 42 instructors and 436 students; the State Normal and Industrial College (1892) for women, at Greensboro; and the East Carolina Teachers' Training School (1907), at Greenville. For the higher education of the negroes the state supports an Agricultural and Mechanical College (1891) at Greensboro, and normal and industrial schools at Fayetteville, Elizabeth City and Winston. The more important sectarian schools are Wake Forest College (Baptist, opened 1834 as a "manual labour and classical institute"; as a college, 1838) at Wake Forest, 16 m. north of Raleigh, with 371 students in 1907–1908; Davidson College (Presbyterian, 1837) at Davidson, with 308 students (1907–1908); Biddle University (Presbyterian) at Charlotte, for negroes; Greensboro Female College (Methodist Episcopal, South; 1846); Guilford College (coeducational; Society of Friends, 1837) near Greensboro; Trinity College (coeducational; Methodist, 1852) at Durham; Lenoir College (Lutheran, 1890) at Hickory; Catawba College (*Reformed, 1851*) at Newton; Weaverville College (Methodist Episcopal, 1873) at Weaverville; Elon College (Christian, 1890) at Elon; St Mary's College (Roman Catholic, 1877), under the charge of Benedictines, at Belmont; Shaw University (Baptist, 1865), for negroes, at Raleigh; and Livingston College (Methodist, 1879), for negroes, at Salisbury.

Finance.—The revenues of the state come from two sources; about two-thirds from taxation and about one-third in all from the earnings of the penitentiary, from the fees collected by state officials, from the proceeds from the sale of state publications, and from the dividends from stock and bonds. The state owned, in 1909, 30,002 shares of stock in the North Carolina Railroad Company,[1] with a market value (1907) of $5,580,372 (the stock being quoted at 186), and an annual income of $210,014 and 12,666 shares of stock in the Atlantic & North Carolina Railroad Company, from which the annual income is $31,665. In addition to the ordinary general property tax, licences and polls, there are a tax on corporations and an income tax. North Carolina is one of the few states to experiment with the inheritance tax, but the last law dealing with that subject was repealed in 1899. The total receipts of the general fund for the fiscal year 1907 were $2,603,293, and the total disbursements for the same year were $2,655,282.

The state debt at the close of the fiscal year 1907 amounted to $6,880,950. It may be divided into three parts: that contracted between 1848 and 1861 for the construction of roads, railways and canals; that contracted during the Civil War for other than war purposes; and that contracted during the Reconstruction era, nominally in the form of loans to railway companies. In their impoverished condition it was impossible for the people to bear the burden, so an act was passed in 1879 scaling part of the debt 60%, part of it 75% and part of it 85%. The remainder, $12,805,000, and all arrears of interest were repudiated outright. This of course impaired the obligation of a contract, but under the Eleventh Amendment to the Constitution of the United States the bondholders could not bring suit against the state in the Federal courts. Another state could do so, however, and in 1904, certain creditors having given ten of their bonds to South Dakota, the case of *South Dakota* versus *North Carolina* came before the Supreme Court. The court decided, four judges dissenting, that North Carolina must pay the amount due or suffer her railway bonds to be seized and sold to satisfy the judgment (192 U.S. Reports, 286. See also 108 U.S. 76).

[1] The North Carolina Railroad from Goldsboro, via Raleigh, Greensboro and Salisbury, to Charlotte, was an extension of the Raleigh & Gaston, which had come into the hands of the state; it was chartered in 1849, the act being passed by the casting vote of the speaker, whose action was the cause of his failure to be re-elected to that, or to be elected to any other office afterwards, since the poverty of the state did not warrant such an expenditure. The original stock of $3,000,000, of which the state was to subscribe $2,000,000, was increased in 1855 to $4,000,000, the state subscribing the added million. The road was leased in 1871 to the Richmond & Danville for thirty years at 6%; and in 1905 to the Southern Railway Company for ninety-nine years at 6½% for the first six years and at 7% for the remainder of the term. The Atlantic & North Carolina, the second great internal improvement undertaken by the state, was chartered in 1853, and was opened from Goldsboro to Morehead City (95 m.) in 1858; it was in 1910 a part of the Norfolk & Southern system. Although the state of North Carolina owns 70·3% of the stock (besides this Craven county holds 7·7%; Lenoir, 2·8%; and Pamlico county, 1·13%), the state casts only 350 votes to the 700 of the private stockholders.

History.—The history of North Carolina may be divided into four main periods: the period of discovery and early colonization (1520–1663); the period of proprietary rule (1663–1729); the period of royal rule (1729–1776); and the period of statehood (from 1776).

It is possible that some of the early French and Spanish explorers visited the coast of North Carolina, but no serious attempt was made by Europeans to establish a settlement until near the close of the 16th century. After receiving from Queen Elizabeth a patent for colonization in the New World, Sir Walter Raleigh, in April 1584, sent Philip Amadas, or Amidas (1550–1618), and Arthur Barlowe (*c.* 1550–*c.* 1620) to discover in the region bordering on Florida a suitable location for a colony. They returned in September with a glowing account of what is now the coast of North Carolina, and on the 9th of April 1585 a colony of about 108 men under Ralph Lane (*c.* 1530–1603) sailed from Plymouth in a fleet of seven small vessels commanded by Sir Richard Grenville. The colony was established at the north end of Roanoke Island on the 17th of August, and about a week later Grenville returned to England. Threatened with famine and with destruction from hostile Indians, the entire colony left for England on the 19th of June 1586 on Sir Francis Drake's fleet. Only a few days after their departure Sir Richard Grenville arrived with supplies and more colonists, fifteen of whom remained when he sailed away. Although greatly disappointed at the return of the first colony, Raleigh despatched another company, consisting of 121 persons under John White, with instructions to remove the plantation to the shore of Chesapeake Bay. They arrived at Roanoke Island on the 22nd of July 1587 and were forced to remain there by the refusal of the sailors to carry them farther. Of the fifteen persons left by Grenville not one was found alive. White's grand-daughter, Virginia Dare (b. 18th August 1587), was the first English child born in America. White soon returned to England for supplies, and having been detained there until 1591 he found upon his return no trace of the colony except the word "Croatan" carved on a tree; hence the colony was supposed to have gone away with some friendly Indians, possibly the Hatteras tribe, and proof of the assumption that these whites mingled with Indians is sought in the presence in Robeson county of a mixed people with Indian habits and occasional English names, calling themselves Croatans. In 1629 Charles I. granted to his attorney-general, Sir Robert Heath, all the territory lying between the 31st and 36th parallels and extending through from sea to sea, but the patent was in time vacated, and in 1663 the same territory was granted to the earl of Clarendon (1609–1674), the duke of Albemarle (1608–1670), and six other favourites of Charles II. By a second charter issued in 1665 the limits were extended to 29° and 36° 30′.

The proprietors had all the powers of a county palatine and proposed to establish a feudal and aristocratic form of government. To this end John Locke drafted for them in 1669 the famous Fundamental Constitutions providing for the division of the province into eight counties and each county into seigniories, baronies, precincts and colonies, and the division of the land among hereditary nobles who were to grant three-fifths of it to their freemen and govern through an elaborate system of feudal courts. But these constitutions, several times revised, actually served only as a theoretical standard for the proprietors and were abrogated altogether in 1693, and the colonists were governed by instructions which granted them much greater privileges. From the very beginning the territory tended to divide into two distinct sections, a northern and a southern. The northern section was first called Albemarle, then "that part of our province of Carolina that lies north and east of Cape Fear," and about 1689 North Carolina. Settled largely by people from Pennsylvania, this section came to be closely associated with the continental colonies. The southern section, influenced by its location, by the early settlers from Barbados, and by its trade connexions, was brought into rather more intimate relations with the island colonies and with the mother country. The proprietors struggled in vain to bring about a closer union. In 1691

1712 again to allow her a governor of her own. So long as the intervening territory was a wilderness no effort was made to define the boundary line. The first steps were taken in that direction just after the close of the proprietary period in 1729, but the work was not completed until 1815.[1]

The first permanent English colony in North Carolina was established at Albemarle on the Chowan river about 1660 by people from Virginia. The colony grew rapidly, and at the close of the colonial period (1776) the population numbered approximately 300,000, including English, Scotch, Scotch-Irish, Swiss, French Protestants, Moravians, and about 40,000 negroes. According to Dr Weeks "the earliest settlers . . . were not religious refugees, . . . they came to the province not from religious but economic motives."

The proprietary period (1663–1729) was a turbulent one, in spite of the supposedly peaceful influence of the Quakers. Six out of sixteen governors or deputy-governors were driven from office between 1674 and 1712, and there were two uprisings which have been deemed worthy of the term rebellion. The first under John Culpeper in 1677 was primarily economic in character, the chief grievance being the payment of an export duty on tobacco. It was evidently influenced by the recent uprising in Virginia under Nathaniel Bacon. The insurrection of dissenters (1708–1711), which was headed by Thomas Carey, who was deputy-governor while the trouble was brewing, was in opposition to the establishment of the Church of England; it was ultimately unsuccessful, the Church was established in 1711, a law was passed which deprived Quakers of the privilege of serving on juries or holding public office, and the establishment was continued until the War of Independence. A war with the Tuscarora Indians, in 1711–1713, resulted in the defeat of the Indians and the removal of the greater part of the tribe to New York, where they became the sixth nation of the Iroquois confederacy.

North Carolina did not join South Carolina in the revolution of 1719 (see SOUTH CAROLINA), but remained under proprietary rule until 1729. In that year an act was passed by parliament establishing an agreement with seven of the Lords Proprietors for the surrender of their claims to both provinces. They were allowed £17,500 for their rights and £5000 for arrears of quit rents. Lord Carteret refused to sell and continued to hold a one-eighth undivided share until 1744, when he gave up his claim in return for a large strip of land in North Carolina lying between latitude 35° 34′ and the Virginia line (36° 30′). So that while the king was governmental head of the whole of North Carolina from 1729 to 1776 he was, after 1744, territorial lord of only the southern half. The political history during the royal period is, like that of the other colonies, the story of a constant struggle between the representatives of the people and the representatives of the crown. The struggle was especially bitter during the administrations of the last three royal governors, Arthur Dobbs (1684–1765), William Tryon (1729–1788) and Josiah Martin (1737–1786). There were disputes over questions of government, of commerce, of finance and of religion. The ship which brought stamps and stamped paper to Wilmington in 1766 was not permitted to land, and the stampmaster was compelled by the people to take an oath that he would not exercise the functions of his office. Through the vigilance of Governor Tryon, however, the Assembly was prevented from sending delegates to the Stamp Act Congress. The colonists were also angered by the attempt to Scotch-Irish among them in particular were aroused by the repeal of an act of 1771 allowing Presbyterian ministers to perform the marriage ceremony and of another act of the same year for the establishment of Queen's College in Mecklenburg county for Presbyterians. In the "back country" extortionate fees, excessive taxes, and the oppressive manner of collecting them brought about a popular uprising, known as the Regulation, which centred in Orange and Anson counties, but was strong also in Brown, Edgecombe, Johnson, Granville and Halifax counties. Hermon Husband (*c.* 1724–1795) was the chief agitator of measures for relief, but, since, as a Quaker, he discouraged violence, the cause was left without a recognized leader. Governor Tryon manifested no sympathy for the oppressed and sought only the thorough suppression of the disturbance, which was organized in the spring of 1768 by Regulators, "for regulating public grievances and abuses of power." The Regulators agreed to pay no more taxes until satisfied that they were in accordance with law, and to pay nothing in excess of the legal fees. Violence speedily followed; the local militia was called out, but since only a few would serve the only means found to quiet the people was an alleged promise from the governor that if they would petition him for redress and go to their homes he would see that justice was done. In reply to their petition the governor denied that he had made any promise in their behalf; and in September he had at his command a military force of 1153, about one-fourth of whom were officers. Although the Regulators assembled to the number of about 3700 they were not prepared to withstand the governor's force and again submitted without bloodshed, there being only a few arrests made. In the following year the Regulators attempted to elect new members to the assembly and petitioned the newly-elected house. But as little had been accomplished when the superior court met at Hillsboro, Orange county, in September 1770, the Regulators became desperate again, whipped the chief offender, Colonel Edmund Fanning, and demolished his residence. These riotous proceedings provoked the second military expedition of the governor, and on the 16th of May 1771, with a force of about 1000 men and officers, he met about twice that number of Regulators on the banks of the Alamance, where, after two hours of fighting, with losses on each side nearly equal, the ammunition of the Regulators was exhausted and they were routed. About fifteen were taken prisoners, and of these seven were executed. This insurrection was in no sense a beginning of the War of Independence; on the contrary, during that war most of Tryon's militia who fought at Alamance were Patriots and the majority of the Regulators, who remained in the province, were Loyalists.

In August 1771 Governor Tryon was succeeded by Governor Josiah Martin, who was soon engaged in spirited controversies with the assembly on questions pertaining to taxes, the southern boundary, and the attachment of property belonging to non-residents. So complete became the breach between them that in 1773 the royal government had nearly ceased to operate, and in 1774 the governor was deserted by his hitherto subservient council. The first Provincial Congress met at Newbern on the 25th of August 1774 and elected delegates to the Continental Congress. When the governor learned that a second Provincial Congress was called to meet in April 1775 he resolved to convene the assembly on the same day. But the assembly, the members of which were nearly the same as those of the congress, refused to interrupt the meeting of the congress, and in the next month the governor sought safety in flight, first to Fort Johnson on the Cape Fear below Wilmington and then to a man-of-war along the coast. On the 31st of May 1775 a committee representing the militia companies of Mecklenburg county passed a series of resolutions which declared that the royal commissions in the several colonies were null and void, that the constitution of each colony was wholly suspended, and that the legislative and executive powers of each colony were vested in its provincial congress subject to the direction of the Continental Congress; and the resolutions requested the

[1] Between 1735 and 1746 the southern boundary was first definitely established by a joint commission of North Carolina, South Carolina and Georgia. The line was resurveyed in 1764, and in 1772 was extended; parts of the line were resurveyed under acts of the assembly of 1803, 1804, 1806, 1813, 1814 and 1815, and by an act of 1819 the last extension, to the Tennessee line, was confirmed and established. According to the charter the northern boundary was to be the line of 36° 30′, but the surveys (of 1728, 1749 and 1779) were not strictly accurate, and the actual line runs irregularly from 36° 33′ 15″ at its eastern to 36° 34′ 25·5″ at its western end. The boundary between North Carolina and Tennessee was surveyed in 1799 and 1821.

territory settlers, many of them from North Carolina, had gone immediately before and during the War of Independence, and had organized a practically independent government. In 1776 this was formally annexed to North Carolina, but in 1784 the state ceded this district to the national government on condition that it should be accepted within two years. The inhabitants of the district, however, objected to the cession, especially to the terms, which, they contended, threatened them with two years of anarchy; declared their independence of North Carolina and organized for themselves the state of Franklin. But the new state was weakened by factions, and after a brief and precarious existence it was forced into submission to North Carolina by which in 1790 the territory was again ceded to the national government with the proviso that no regulation made or to be made by Congress should tend to the emancipation of slaves (see TENNESSEE).

North Carolina sent delegates to the Philadelphia Constitutional Convention of 1787, but the state convention, at Hillsboro, called to pass upon the constitution for North Carolina, did not meet until the 21st of July 1788, when ten states had already ratified. On the first day of this convention the opponents to the constitution, among whom were most of the delegates from the western counties, were ready to reject it without debate, but yielded to a proposal for discussing it clause by clause. In this liscussion, which was continued for nine days, the document was ıost strongly opposed because it contained no bill of rights and on e ground that it would provide for such a strong central govern-ıt that the state governments would ultimately be sacrificed. the conclusion of the debate the convention by a vote of to 84 declared itself unwilling to ratify the constitution until ill of rights had been added and it had been amended in ral other particulars so as to guarantee certain powers to the s. By reason of this rejection the relations of North Carolina the other states were severed upon the dissolution of the deration, and it took no part in the first election or in the zation of the new government. However, there was a reaction against the oppositon which had in no small e been inspired by fear of a requirement that debts be old and silver. A second convention met at Fayetteville mber 1789 and the constitution was speedily ratified 3th) by a vote of 195 to 77.

riod from 1790 to 1835 was marked by a prolonged etween the eastern and the western counties. When onstitution of 1776 was adopted the counties were so l in population that they were given equal representa- General Assembly, but the equality in population l in the general westward movement, and in 1790 gan to urge a new division of the state into repre- tricts according to population and taxation. This ly resisted, and the West assumed a threatening he East opposed its projects for internal improve- ich the West had the greater need. Ten ver, at the election of assemblymen, 33 of the olled an extra-legal vote on the question of ional convention, and 30,000 votes were cast against it. The effect of this was that in legislature passed a bill for submitting the ll the voters of the state, although this bill oposed convention's power relating to re- ding that it should so amend the constitu- chosen by districts according to public ners be apportioned by districts according ion, *i.e.* five slaves to be counted equal to e popular vote was taken, in the following nty gave a majority against the conven- ith the limitation which was decidedly

of July, the East made some concessions: such as the popular election of the governor (who had previously been elected by the two houses of the legislature), the disfranchisement of free negroes, and the abolition of representation from 6 boroughs, 4 of which were in the East. The number of senators was reduced to 50, the number of commoners to 120, and the manner of choosing senators and commoners was changed as directed in the act providing for the convention. The electorate gave its approval to the revision by a vote of 26,771 to 21,606, and with this the agitation over representation ceased.

The fundamental points of difference between North Carolina and South Carolina were exemplified in the slavery conflict. South Carolina led the extreme radical element in the South and was the first state to secede. North Carolina held back, worked for a compromise, sent delegates to the Washington Peace Convention in February 1861, and did not secede until the 20th of May 1861, after President Lincoln's call for troops to preserve the Union. Liberal support was given to the Confederacy, both in men and supplies, but Governor Vance, one of the ablest of the Southern war governors, engaged in acrimonious controversies with President Jefferson Davis, contending that the general government of the Confederacy was encroaching upon the prerogatives of the separate states. Owing to its distance from the border, the state escaped serious invasion until near the close of the war. Wilmington was captured by the Federals in February 1865; General Sherman's army crossed the southern boundary in March; a battle was fought at Bentonville, March 19–21; Raleigh was entered on April 13; and the Confederates under General Joseph E. Johnston surrendered near Durham Station, in Durham county, on the 26th.

Reconstruction was a costly experience here as in other Southern states. Jonathan Worth (1802–1869), elected governor under the presidential plan in 1865, was an honest and capable official, but the government established in accordance with the views of Congress in 1868 was corrupt, inefficient and tyrannical. Carpet-baggers, negroes and unscrupulous native whites, known as scalawags, were in control of affairs, while the people of wealth, refinement and education were disfranchised. Governor William Woods Holden (1818–1892; governor 1868–1870) was so weak and tyrannical that he was impeached by the legislature in December 1870. Under his successor, Tod R. Caldwell (1818–1874), there was some improvement in the condition of affairs, and in 1875 a constitutional convention, in session at Raleigh, with the Democrats slightly in the majority, amended the constitution, their work being ratified by the people at the state election in 1876. The native white element completely regained possession of the government in the following year, when the Democrats came into office under Governor Zebulon B. Vance. Since that time the most interesting feature in the political history has been the rise and fall of the People's party. The hard times which followed the financial panic of 1893 made it possible for them, in alliance with the Republicans, to carry the state in the election of 1894. Afterwards their strength declined, because the people became more prosperous, because the national Democratic party in 1896 and 1900 adopted their views on the money question, and because of the unpopularity of a coalition with Republicans, which made it necessary to give the coloured people a share of the offices. The race question was the chief issue in the election of 1898, the Democrats were successful, and what amounted to a negro-disfranchising amendment to the constitution was adopted in August 1900. In 1907 there was a serious clash between the state authorities and the Federal judiciary, arising from an act of the legislature of that year which fixed the maximum railway fare at 2½ cents a mile and imposed enormous fines for its violation. The two principal railway corporations, the Southern and the Seaboard by the courts was not satisfactory to the state authorities, who arrested a ticket agent of the Southern railway, convicted him of violating the law, and sentenced him to the chain-gang for thirty days. Thereupon the attorneys for the railway applied to Judge Jeter Connelly Pritchard (b. 1857) of the United States Circuit Court for a writ of habeas corpus; this was granted and the prisoner was released. The governor of the state, Robert Brodnax Glenn (b. 1854), nevertheless urged the state courts and attorneys to proceed with the prosecution of other ticket agents, and threatened to resist with the force of the state any further interference of Federal judiciary; but in March 1908 the Supreme Court of the United States declared the North Carolina rate law unconstitutional on the ground that it was confiscatory.

Governors of North Carolina

Proprietary Period (1663–1729).

William Drummond	1663–1667
Samuel Stephens	1667–1669
Peter Carteret	1669–1673
John Jenkins, president of the council	1673–1676
Thomas Eastchurch	1676–1677
Thomas Miller, president of the council	1677–1678
John Harvey, president of the council	1678–1679
John Jenkins	1679–1681
Henry Wilkinson	1681–1683
Seth Sothel	1683–1689
Philip Ludwell	1689–1691
Alexander Lillington, deputy-governor	1691–1694
Thomas Harvey, deputy-governor	1694–1699
Henderson Walker, president of the council	1699–1704
Robert Daniel, deputy-governor	1704–1705
Thomas Carey, deputy-governor	1705–1706
William Glover, president of the council	1706–1707
Thomas Carey, William Glover } contestants (Carey's rebellion)	1707–1710
Edward Hyde, deputy-governor	1710–1712
Thomas Pollock, president of the council	1712–1714
Charles Eden	1714–1722
Thomas Pollock, president of the council	1722
William Reid, president of the council	1722–1724
George Burrington	1724–1725
Edward Mosely, president of the council	1725
Sir Richard Everard	1725–1729

Royal Period (1729–1776).

George Burrington[1]	1731–1734
Nathaniel Rice, president of the council	1734
Gabriel Johnston	1734–1752
Nathaniel Rice, president of the council	1752–1753
Matthew Rowan, president of the council	1753–1754
Arthur Dobbs	1754–1765
William Tryon	1765–1771
James Hasell, president of the council	1771
Josiah Martin	1771–1775

Statehood Period (1776–).

Richard Caswell		1777–1779
Abner Nash		1779–1781
Thomas Burke		1781–1782
Alexander Martin		1782–1784
Richard Caswell		1784–1787
Samuel Johnston		1787–1789
Alexander Martin	Federalist	1789–1792
Richard Dobbs Spaight, Sr.	Dem.-Repub.	1792–1795
Samuel Ashe	"	1795–1798
William Richardson Davie	"	1798–1799
Benjamin Williams	"	1799–1802
James Turner	"	1802–1805
Nathaniel Alexander	"	1805–1807
Benjamin Williams	"	1807–1808
David Stone	"	1808–1810
Benjamin Smith	"	1810–1811
William Hawkins	"	1811–1814
William Miller	"	1814–1817
John Branch	"	1817–1820

[1] Burrington was appointed in 1730, but did not arrive in the province until February 1731. Either Everard held over or the president of the council was acting-governor from 1729–1731.

David Lowry Swain	"	1832–1835
Richard Dobbs Spaight, Jr.	"	1835–1837
Edward Bishop Dudley	Whig	1837–1841
John Motley Morehead	"	1841–1845
William Alexander Graham	"	1845–1849
Charles Manly	"	1849–1851
David Settle Reid	Democrat	1851–1854
Warren Winslow (ex-officio)	"	1854–1855
Thomas Bragg	"	1855–1859
John Willis Ellis	"	1859–1861
Henry Toole Clark (ex-officio)	"	1861–1862
Zebulon Baird Vance	"	1862–1865
William Woods Holden	Provisional	1865
Jonathan Worth	Conservative	1865–1867
Gen. Daniel Edgar Sickles	Military	1867
Gen. Ed. Richard Sprigg Canby	"	1867–1868
William Woods Holden	Republican	1868–1870
Tod R. Caldwell	"	1870–1874
Curtis Hooks Brogden	"	1874–1877
Zebulon Baird Vance	Democrat	1877–1879
Thomas Jordan Jarvis	"	1879–1885
Alfred Moore Scales	"	1885–1889
Daniel Gould Fowle	"	1889–1891
Thomas Michael Holt	"	1891–1893
Elias Carr	"	1893–1897
Daniel Lindsay Russell	Republican	1897–1901
Charles Brantley Aycock	Democrat	1901–1905
Robert Brodnax Glenn	"	1905–1909
William Walton Kitchin	"	1909–

BIBLIOGRAPHY.—For physical description, resources, industries, &c., see State Board of Agriculture, *North Carolina and its Resources* (Raleigh, 1896); *North Carolina Geological Survey Reports* (Raleigh, 1852, sqq.); the publications of the North Carolina Geological and Economic Survey (Raleigh, 1893, sqq.), *e.g. Water Powers in North Carolina* (1899), by G. F. Swain, Joseph H. Holmes and E. W. Myers, *Gold Mining in North Carolina and other Appalachian States* (1897), by H. B. C. Nitze and A. J. Wilkins, *The Tin Deposits of the Carolinas* (1905), by J. H. Pratt and D. B. Sterrett, *Building and Ornamental Stones of North Carolina* (1907), by T. L. Watson and others, *The Fishes of North Carolina* (1907), by Hugh M. Smith, and *History of the Gems found in North Carolina* (1908), by G. F. Kunz; *Report of the Secretary of Agriculture in Relation to the Forests, Rivers and Mountains of the Southern Appalachian Region* (Washington, 1902); *Climatology of North Carolina* (Raleigh, 1892); and H. Thompson, *From the Cotton Field to the Cotton Mill, a Study of the Industrial Transition in North Carolina* (New York, 1906), contains some interesting observations on the changes in social conditions resulting from the growth of the cotton-manufacturing industry. John W. Moore, *History of North Carolina* (2 vols., Raleigh, 1880); S. A'Court Ashe, *History of North Carolina* (2 vols., Greensboro, 1908–) are general surveys. Cornelia P. Spencer, *First Steps in North Carolina History* (6th ed., Raleigh, 1893), is a brief elementary book written for use in the public schools. For the colonial and revolutionary periods there are some excellent studies. C. L. Raper, *North Carolina: a Study in English Colonial Government* (New York, 1904), treats of the royal period (1729–1776) from the legal point of view; J. S. Bassett, *Constitutional Beginnings of North Carolina* (Baltimore, 1894); *The Regulators of North Carolina* (Washington, 1894); and *Slavery in the State of North Carolina* (Baltimore, 1899), are all trustworthy. S. B. Weeks deals with the religious history in his *Religious Development in the Province of North Carolina*, (Baltimore, 1892), *Church and State in North Carolina* (Baltimore, 1893) and *Southern Quakers and Slavery* (Baltimore, 1896); he is anti-Anglican, but judicial. E. W. Sikes, *The Transition of North Carolina from Colony to Commonwealth* (Baltimore, 1898), based on the public records, is accurate, though dull. There is a considerable controversial literature concerning the Mecklenburg Declaration of Independence; W. H. Hoyt's *The Mecklenburg Declaration of Independence* (New York, 1907) is the best presentation of the view generally adopted by competent historians that the alleged Declaration of the 20th of May 1775 is spurious; G. W. Graham, *The Mecklenburg Declaration of Independence* (New York, 1905), and J. W. Moore, *Defence of the Mecklenburg Declaration of Independence* (1909), are perhaps the best of the attempts to prove the same Declaration genuine. The older histories of the colony are: Hugh Williamson, *History of North Carolina* (2 vols. Philadelphia, 1812), which deals with the period before 1771 and is meagre and full of errors; F. X. Martin, *History of North Carolina* (2 vols., New Orleans, 1829), which deals with the period before 1776, contains much irrelevant matter and is of little value; F. L. Hawks, *History of North Carolina* (2 vols. Fayetteville, N.C., 1857–1858), written from the established church point of view, the best and fullest treatment of the proprietary period (1663–1729); and W. D. Cooke (ed.), *Revolutionary* vol. ii. deals with North Carolina); and Hilary A. Herbert et al., *Why the Solid South? or Reconstruction and its Results* (Baltimore, 1890). The chief published sources are *The Colonial Records of North Carolina* (10 vols., Raleigh, 1886–1890); and *The State Records of North Carolina* (vols. 11-20, 1776–1788; other vols., in continuation of the colonial series, Winston (11-15) and Goldsboro (16-20), 1895–1902; the series is to be continued). The best bibliography is S. B. Weeks, *Bibliography of Historical Literature of North Carolina* (Cambridge, 1895).

NORTHCOTE, JAMES (1746–1831), English painter, was born at Plymouth on the 22nd of October 1746. He was apprenticed to his father, a poor watchmaker of the town, and during his spare hours was diligent with brush and pencil. In 1769 he left his father and started as a portrait-painter. Four years later he went to London and was admitted as a pupil into the studio and house of Reynolds. At the same time he attended the Academy schools. In 1775 he left Reynolds, and about two years later, having acquired the requisite funds by portrait-painting in Devonshire, he went to study in Italy. On his return to England, three years later, he revisited his native county, and then settled in London, where Opie and Fuseli were his rivals. He was elected associate of the Academy in 1786, and full academician in the following spring. The "Young Princes murdered in the Tower," his first important historical work, dates from 1786, and it was followed by the "Burial of the Princes in the Tower," both paintings, along with seven others, being executed for Boydell's Shakespeare gallery, The "Death of Wat Tyler," now in the Guildhall, was exhibited in 1787; and shortly afterwards Northcote began a set of ten subjects, entitled "The Modest Girl and the Wanton," which were completed and engraved in 1796. Among the productions of Northcote's later years are the "Entombment" and the "Agony in the Garden," besides many portraits, and several animal subjects, like the "Leopards," the "Dog and Heron," and the "Lion"; these latter were more successful than the artist's efforts in the higher departments of art, as was indicated by Fuseli's caustic remark on examining the "Angel opposing Balaam"—"Northcote, you are an angel at an ass, but an ass at an angel." The works of the artist number about two thousand, and he made a fortune of £40,000. He died on the 13th of July 1831.

Northcote was emulous of fame as an author, and his first essays in literature were contributions to the *Artist*, edited by Prince Hoare. In 1813 he embodied his recollections of his old master in a *Life of Reynolds*. His *Fables*—the first series published in 1828, the second posthumously in 1833—were illustrated with woodcuts by Harvey from Northcote's own designs. In the production of his *Life of Titian*, his last work, which appeared in 1830, he was assisted by William Hazlitt, who previously, in 1826, had given to the public in the *New Monthly Magazine* his recollections of Northcote's pungent and cynical "conversations," the bitter personalities of which caused much trouble to the painter and his friends.

NORTH DAKOTA, one of the North Central states of the American Union, between 45° 55′ and 49° N., and 96° 25′ and 104° 3′ W. It is bounded N. by the Canadian provinces of Saskatchewan and Manitoba, S. by South Dakota, W. by Montana and E. by Minnesota, from which it is separated by the Red river (or Red river of the North). North Dakota has an extreme length, E. and W., of 360 m., an extreme width, N. and S., of 210 m., and a total area of 70,837 sq. m., of which 654 sq. m. are water surface.

Topography.—North Dakota lies in the Prairie Plains and Great Plains physiographic provinces. The escarpment of the Coteau du Missouri is the dividing line, that portion to the N. and E. lying in the Prairie Plains, that to the S.W. in the Great Plains. The surface presents few striking topographic features, and may be subdivided into three vast plains or prairie tablelands rising one above the other from E. to W., the two easternmost together constituting the Prairie Plains portion of the state. The lowest of these plains is the valley of the Red river, and this valley extends along the eastern edge of the state and varies in w[illegible]m 25 to 70 m. Its elevation is 965 ft. at

in the N. This plain is separated from the Red river valley in the N. by an abrupt slope rising to a height of from 300 to 500 ft. above the surrounding country, and called the Manitoba escarpment, because the greater part of it lies in the province of Manitoba. The Pembina Mountains, low hills near the international boundary and about 30 m. W. of the Red river, form a portion of this escarpment. From these hills southward the ridge gradually becomes less abrupt until in Walsh county it vanishes into prairie. The ascent to the upper plain then becomes very gentle, though there is a rise of 400 or 500 ft., until it reaches the south-eastern portion of Sargent county and changes into the more abrupt Coteau des Prairies, a plateau about 2000 ft. above the sea. The second plain, while not so level as the Red river valley, contains but one group of hills, the Turtle Mountains; these rise from 300 to 400 ft. above the general level, near the centre of the northern boundary. The prairies in this second table-land are gently rolling, and are covered with drift from the continental ice-sheet of the glacial period. They are bounded on the W. by a ridge from 300 to 400 ft. in height and from 20 to 50 m. in width, which roughly marks the dividing line between the farming lands of the E. and the grazing lands of the W. The northern portion of this ridge forms the water-parting between the streams that empty into Hudson Bay and those that flow into the Gulf of Mexico. To the W. of this ridge lies the third and highest plain within the state, the so-called Coteau du Missouri. It occupies nearly one half of the state, and rises gradually westward until it attains a general level of about 2700 ft. East of the Missouri river this region is covered with glacial drift, and is noticeably different from the more level lands of the lower plains. The ice-sheet wore down from the hills and filled the valleys with débris until the surface has a billowy appearance. As the Missouri river marks approximately the lower edge of the ice-sheet, the region W. of this stream is almost free from glacial deposits and presents a strong contrast to the rest of the state. The billowy plains still remain in places, but in the vicinity of streams the billows give way to deep ravines. The sands and clays found here are fine and soft, and as there is scant vegetation to protect the hillsides they are easily eroded by the rains. As a result, the surface has been carved into fantastic forms. The early French explorers called the region *les terres mauvaises*, on account of the difficulties that here met the traveller, and in its English equivalent, "the Bad Lands," this appellation still remains. High winds and seams of burning lignite coal have aided the rains in giving the Bad Lands their peculiar configuration. Prairie fires or spontaneous combustion have ignited many coal seams. Some have already burnt out; others still emit smoke and sulphurous fumes from the crevices in the hillsides, and through the fissures may be seen the glowing coal and rock. The earth surface above these natural furnaces has been hardened, cracked and sometimes melted into a reddish slag, called scoria, which, on account of its resemblance to lava, has given rise to an incorrect impression that the region was once the centre of volcanic disturbances. The picturesque effect of this sculpturing by water, wind and fire is greatly enhanced by the brilliant colours along the faces of the hills and ravines—grey, yellow, black and every shade of red and brown. Here too are found petrified forests and other evidences of a vegetable growth that has long ago disappeared. The lands are bad for the traveller and the farmer, but not for the ranchman. A few miles from the streams the country is less broken, and there are deep grassy valleys, in which the animals may find shelter in winter. Cattle sometimes congregate in cold weather around a burning coal seam and enjoy the warmth. The lignite in this region also warms the ranchman's cabin, being easily mined where a seam is exposed in the walls of a ravine or on the side of a hill.

North Dakota has a mean elevation of 1900 ft. The highest

boundary and empties into Lake Winnipeg in Canada, thence reaching Hudson Bay through the Nelson river. Its tributaries are small, and are remarkable chiefly for the fact that they at first flow in a direction almost opposite to that of the main stream, and make a great bend to the N.E. before joining it.[1] The Sheyenne, the Goose, the Park and the Pembina rivers are the most important of these streams. The Mouse, or Souris, river rises in Canada, crosses the international boundary near the meridian of 102° W. long., flows S.E. for about 70 m., then turns to the N. and near the 101st meridian re-enters British territory, after receiving the waters of the Rivière des Lacs and other small streams. The Missouri river, the most important stream within the state, crosses the western boundary near the 48th parallel, and after pursuing a winding course in a general south-easterly direction, leaves the state near the centre of its southern boundary. The James river, flowing southward into South Dakota, is the Missouri's only important eastern tributary within the state. From the W. the Missouri receives the waters of the Little Missouri, Cannon Ball, Heart and Knife rivers. All that portion of the state lying W. of the Pembina Mountains and E. of the Mouse river valley is practically without river drainage, and for its surface and sub-surface drainage, Devils Lake, an irregular body of water about 40 m. in length and with an area of 400 sq. m., forms a natural reservoir. The waters of this lake are strongly saline. The entire region W. of the Red river valley and E. of the valleys of the Mouse and Missouri rivers is dotted with small lakes. The morainic belts and other obstructions in the drift plains hem in the waters in the intervening basins and create what are called "glacial lakes," varying in diameter from a few yards to several miles. All the lakes of the state are of this character, and many are strong with salt and alkali. The drift plains also contain numerous shallow hollows, locally termed "pots and kettles," which receive the drainage of their vicinity and form sloughs.

Fauna and Flora.—Before the advent of the white man, herds of bison roamed the prairies, but these have disappeared,[2] and, with the exception of deer and bears, large game is to be found only in the Bad Lands. Here are found the lynx, the "mountain lion" or puma, the prairie and timber wolves, the jack rabbit, the prairie dog (gopher), the black, the brown and, occasionally, the grizzly bear. A few fur-bearing animals, the mink, beaver and raccoon, still remain. The prairie dog is found everywhere. Among the lakes, sloughs and stubble-fields of the prairies, teal, ducks, coots and geese are found in abundance. Other prairie birds are the prairie chicken, and there are a great many birds that sing while flying; among them are the horned lark, bobolink, Smith's longspur and chestnut collared longspur, lark-sparrow, lark-bunting and Sprague's pipit.

The flora of North Dakota is typical of a semi-arid country. The prevailing plant-colour is a greyish green, due to a hard dry outer covering which serves as a protection from desiccation. All plant life has a remarkably large proportion of subterranean growth, because of the necessity of getting moisture from the earth and not from the air; hence roots and tubers are unusually well developed. The Red river valley is a meeting ground for many species of plants whose principal habitat lies in some other quarter. Many trees of the eastern forest, such as basswood, sugar, river and red maple, red, white and black ash, red and rock elm, black and bur oak, white and red pine and red cedar find their western limit here. Some species characteristic of the more northerly regions—for example, the mountain ash, balsam fir, tamarack and black and white spruce—find here their southern or south-western limits. The same is true of shrubs and herbaceous plants. The prickly ash, Virginian creeper and staff-tree find here their northern limit; and the mountain maple, Canada blueberry, dwarf birch and ground hemlock their southern limit. Of 1500 species of herbaceous plants in the Red river basin, it is estimated that fully half reach here their geographical limit or limit of frequent occurrence. Trees are found

[1] The peculiar bow shape of these western tributaries of the Red river is due to the fact that these streams originally flowed S.E. into Lake Agassiz, now extinct. As the waters of the lake gradually receded, the rivers reached it by pushing their channels eastward through what was once its bed. The southern part of the lake bottom was finally uplifted by a movement of the earth crust, and the outlet was changed from the S. to the N.E. The waters continued to recede, and the tributaries, in cutting their way through the sediment, followed the slope of the land and gradually turned northward.

[2] The early settlers found the bones of the bison scattered over the prairies, and after the construction of railways the gathering and shipping of these for use in sugar refining and in the manufacture of superphosphate became temporarily a profitable industry. Between January and August 1889 a single dealer at Minot shipped 1200 tons, which sold at $8 the ton.

are covered with valuable grasses, and with masses of showy native flowers, which bloom from spring to autumn. The pasque flower is found on all the prairies and is the earliest to appear. The Bad Lands exhibit a vegetation typical of semi-arid regions. Cottonwoods flourish along the Little Missouri river, and in sheltered ravines grow stunted junipers and cedars, which seldom rise above the crest of some protecting bluff. Poplars grow in the valleys, and the cactus and sage brush are common. The faces of buttes and ravines that are turned toward the sun are usually devoid of vegetation.

Climate.—There are no mountains, forests or large bodies of water to moderate the extremes of summer and winter, and the uniformity of topography makes the ranges of temperature for different parts of the state very nearly the same. Between the extreme northern and southern sections there is a range of only 6° F. The mean annual temperature for the state is 39° F., with an extreme of 110° recorded for the summer and a minimum of – 54° for the winter. As a general rule, temperatures are highest in the W. and lowest in the E. In the central region of the state (at Jamestown, Stutsman county) the mean annual temperature is 40°; the mean for the winter, 10°, with a minimum of – 40° recorded in February; the mean for the summer is 67°, with an extreme of 103° recorded in July. The winters are long and severe. The season, however, on account of the dryness of the climate, is not so harsh as the low temperatures would seem to indicate. The seasons are sharply demarked; both winter and summer come suddenly. The summers are short, but as there are sixteen hours of sunlight per day in midsummer, vegetation grows rapidly. Killing frosts often occur in June and return again early in September. High winds are frequent, and prairie houses are often protected by rows of trees called "wind breaks." During the growing season the winds are usually light, but in the late summer and autumn occasional dry, hot, southerly winds ("hot southers") prove very destructive to vegetation. Tornadoes are not unknown, and local hail storms are frequent in the summer, but do little damage. The total precipitation for the state is 17 or 18 in., the heaviest, about 20 in., occurring in the Red river valley, and the lightest, about 14 in., in the extreme W. While the rainfall is always below the normal amount for humid regions, by far the greater part of it occurs in the spring and summer, and growing crops receive the full benefit. The precipitation rarely amounts to 2 in. for the entire winter. The snows are therefore very light, and are quickly swept from the prairies by the high winds, so that cattle may graze in the open plains throughout the year. There are, however, during every winter from one to four severe blizzards, which inflict great damage upon unprotected flocks and herds.

Soils.—As the Red river valley is the bed of the extinct Lake Agassiz, its soil is composed of the fine detritus and silty deposits carried into the lake by its tributaries. Over the whole basin this deposit, to a depth of 1 or 2 ft., is coloured black by decayed vegetation, and constitutes one of the most fertile tracts on the continent. Being remarkably free from trees, rocks and streams, the soil can be turned in furrows that run perfectly straight for miles, and favours the development of "bonanza farms," where thousands of acres are cultivated in a single field. The soils W. of the valley consist of glacial drift, and are well suited to the growing of grain. The drift becomes thinner toward the W., and finally disappears in the semi-arid regions of the Missouri river valley. In this region the soils of sand and clay are much finer than the drift, and are very productive where the water-supply is sufficient.

Irrigation.—Irrigation is confined to the western half of the state, and more especially to the north-west, being employed chiefly in the drainage basin of the Missouri river. The bed of the river is too far below the surrounding country to permit the use of its waters for irrigation purposes by the usual gravity methods. The ordinary process before 1906 was to dam small streams and "coulees" (deep gulches in which water flows intermittently) and flood the surrounding country. The total irrigated area in 1902 was 10,384 acres. The so-called Reclamation Act passed by Congress in 1902 provided for the construction of a system of irrigation works in this and other states by the Federal government. In 1908 the Federal Reclamation Service had five projects in North Dakota. The Buford-Trenton, Williston and Nesson projects are situated in Williams county, on the left bank of the Missouri river. The abundant lignite coal in the region was to operate pumps for raising water from the river into canals crossing the valley. The Washburn project was to irrigate 5000 acres in McLean county with water pumped from the Missouri river. It was estimated that the fourth project, the lower Yellowstone, on the western bank of the river of that name, would furnish water for 66,000 acres of land, of which 20,000 lie in Dawson county, North Dakota, and the rest in Montana. The fifth project, the Bowman, was to irrigate 10,000 acres in North Dakota and the north-western part of South Dakota by storing the waters of the North Fork of Grand river. Water for irrigation purposes is often derived

for the larger fruits, such as apples, pears, peaches, plums and grapes; but such hardy small fruits as currants, gooseberries, raspberries, blackberries and strawberries may be grown in abundance.

The total farm acreage in 1890 was 7,660,333; in 1900, 15,542,640. The value of the farm property in the same decade rose from $100,745,779 to $255,266,751, and the value of farm products from 1889 to 1899 from $21,264,938 to $64,252,494.

The average size of the farms (excluding farms under 3 acres with products valued at less than $500) was 277·4 acres in 1890 and 343·8 acres in 1900. With regard to tenure, 74·7% of the farms were operated by their owners, 15·2% by part owners and 7·2% by share tenants. Hay and grain formed the principal source of income of 88·4% of the farms, live-stock of 6·7% and dairy produce of 2·6%. Wheat is the state's most important product. In the acreage of this cereal in 1909 (according to the *Year-book* of the U.S. Department of Agriculture), North Dakota ranked first, and in the crop second among the states of the Union, its total yield being 90,762,000 bushels, valued at $83,501,000. Next in importance to wheat in 1909 was flaxseed, amounting to 14,229,000 bushels, valued at $22,340,000. In the production of this commodity the state ranked first, and produced about 55% of the entire crop of the United States. The flax is cultivated for the seed, and only slightly for the fibre. Other important crops are oats ($16,368,000 in 1906) barley ($8,913,000), hay, potatoes, rye and Indian corn. The value of the various classes of live-stock on the 1st of January 1910 was as follows: horses, $81,168,000; mules, $1,040,000; cattle, $21,001,000; sheep, $2,484,000; swine, $2,266,000. Very little attention is paid to fruit and vegetable growing.

Minerals.—With the exception of lignite, which underlies a large portion of the western half of the state, North Dakota has few mineral deposits of commercial value. Sandstone occurs in large quantities, and W. of the Red river valley granite and gneiss are found, but these materials are not quarried. The coal is all in the form of brown lignite and is not very valuable as a fuel, as it soon crumbles into a fine powder on being exposed to air. The total area of the coal beds is estimated at 35,000 sq. m. A law enacted in 1896 required the use of lignite in all state buildings and institutions. Mining is carried on along the Northern Pacific railway W. of the Missouri river, in the Mouse river valley along the line of the Minneapolis, St Paul & Sault Ste Marie railway, and at a few places in the same region along the line of the Great Northern railway. Good clays for the manufacture of tile and brick are found at numerous places. The total value of the mineral products (except stone) in 1909 was $738,818, of which $522,116 was the value of coal and $206,222 of clay products.

Manufactures.—Manufacturing in North Dakota is of small importance, being largely confined, with the exception of flour and grist milling, to the supply of local needs. Under the factory system there were 337 establishments in 1900 and 507 in 1905: the capital invested in 1900 was $3,511,968 and in 1905 $5,703,837; and the value of products was $6,259,840 in 1900 and $10,217,914 (or 63·2% more) in 1905. The products of the flour and grist mills increased in value from $4,134,023 in 1900 to $6,463,228 in 1905, and in this last year constituted in value 63·3% of the total factory products of the state. Printing and publishing was next in importance, with products valued at $719,950 in 1900 and at $1,110,439 in 1905. Butter, cheese and condensed milk manufactured were valued at $122,128 in 1900 and at $562,481 in 1905. The chief manufacturing centres are Fargo and Grand Forks.

Transportation.—The total railway mileage within the state on the 31st of December 1908 was 4135·67 m. The main line of the Northern Pacific, from St Paul to Portland, Oregon, enters the state at Fargo and runs almost due W. throughout its length for about 380 m. Parallel with this road, but farther to the N., is the main line of the Great Northern system, running from St Paul to Seattle. The length of its route within the state, from Wahpeton to Buford via Larimore, is about 460 m. Both of these systems have numerous branch lines. The main line of the Minneapolis, St Paul & Sault Ste Marie enters the S.E. corner of the state at Fairmount and ends in the N.W. at Portal, on the international boundary, having in 1909 a length within the state of 361 m. Among its many branches are the "Wheat Line," running from Kenmare, North Dakota, to Thief River Falls, Minnesota, and having a length of 251 m. in the state; and the "Missouri River Line," penetrating the southern and central portions of the state from Hankinson to Garrison, with a length of 282 m. In 1909 the Northern Pacific was building about 140 m. of new track. The Chicago, Milwaukee & St Paul railway, running E. and W. through South Dakota, sends four short branches into the southern part of North Dakota. The Chicago & North-Western also sends a short branch line northward into the state, forming a junction with other lines at Oakes. The Red river is navigable as far S. as Belmont, and the Missouri river is navigable throughout its course within the state, although it requires a skilful pilot.

Population.—In 1870 the population of that portion of Dakota Territory included within the present limits of North Dakota was 2405; in 1880, 36,909. The population of the state in 1890 was 182,719; in 1900, 319,146; in 1905, 437,070; in 1910, 583,888. The number of the foreign-born population in 1900 was 113,091, or 35·4%, the highest proportion to be found in any state of the Union. The principal elements composing the white foreign population were as follows: Norwegians 30,206, English Canadians 25,004, Russians 14,979, Germans 11,546, Swedes 8419. The coloured population consisted of 4692 Indians not taxed, 2276 Indians taxed, 286 negroes, 148 Japanese and 32 Chinese. Most of the Indians not taxed live on reservations, of which there are four: Devils Lake Reservation in 1909 had a total area of 143·97 sq. m., a population of 980, consisting of Sisseton, Wahpeton, and Cut Head (or Pabaksa) Sioux; Turtle Mountain[1] Reservation, in Rolette county, established in 1882, and now allotted (excepting 186 acres for church and school purposes), had a population in 1909 of 2588, being for the most part a mixture of Pembina (or Turtle Mountain) Chippewa with French Canadians; Fort Berthold Reservation in the west central part of the state, on the Missouri river, established in 1870, had in 1909 an area of 1382·4 sq. m., and a population of 399 Arikara (Caddoan), and, of Siouan stock, 453 Hidatsa (or Grosventre) and 252 Mandan Indians; and Standing Rock Reservation, on the western bank of the Missouri river, was established in 1875, and in 1909 contained 2887·2 sq. m. (about three-fifths of which lies in South Dakota and much of which was opened to settlement in 1908–1909) and a population of 3399 Sioux. The population of the state is largely rural. The larger municipalities with the population of each in 1905 were: Fargo (12,512), Grand Forks (10,127), Jamestown (5093), Bismarck, the capital, (4913), Minot (4125), Valley City (4059), Dickinson (3188), Wahpeton (2741), Mandan (2714), Grafton (2423) and Devils Lake (2367); in 1905 there were fifteen other municipalities each with a population of more than 1000. In 1906 the Roman Catholic Church had the largest number of communicants (61,261 out of a total of 159,053 members of all denominations), and there were 59,923 Lutherans.

Administration.—The state is governed under its constitution of 1889, as subsequently amended. The governor is chosen biennially, and has a limited pardoning power. He may veto appropriation bills by items, but any of his vetoes may be overruled by a two-thirds vote of each house. The governor and lieutenant-governor must be at least thirty years old. The other administrative officers are a secretary of state, auditor, treasurer, superintendent of public instruction, commissioner of insurance, three commissioners of railways, attorney general and commissioner of agriculture and labour; each of these officers is chosen biennially and must be at least twenty-five years of age. The legislative department consists of a Senate, with members chosen every four years, and about half chosen at each biennial election; and a House of Representatives, with members chosen biennially. The sessions of the legislature are biennial, and are limited to sixty days. The minimum age for senators is twenty-five years and for representatives twenty-one years. Bills may originate in either house. A lieutenant-governor, chosen biennially, presides over the Senate. In 1907 the legislature proposed an amendment providing for the application of initiative and referendum to statutory laws and constitutional amendments; two years later the legislature passed a substitute resolution, which omits the clause regarding amendments of the constitution, and which, if passed by the legislature of 1911 will be put to popular vote at the general election of 1912. The judicial department consists of the supreme court, district courts, county courts, municipal courts, and justices of the peace. The supreme court consists of three judges (minimum age thirty years), chosen by popular vote for six years. Their number may be increased to five whenever the population of the state shall amount to 600,000. For each judicial district (the tenth district was created in 1907) there is one district judge, elected for four years; the district courts have original jurisdiction (except in probate matters) and certain appellate jurisdiction. The judge of the county court is chosen for two years. This court has exclusive original jurisdiction in probate matters, and in counties with over 2000 inhabitants its jurisdiction may be extended by popular vote to include concurrent jurisdiction with the district courts in civil matters involving amounts less than $1000, and in criminal actions below the grade of felony. Justices of the peace have jurisdiction in civil cases involving no land titles and sums of money not exceeding $200. They may also try misdemeanours in counties without other criminal jurisdiction.

For the administration of local government, the state is divided into counties (46 in 1910). In those counties that have not adopted a township organization county affairs are administered by a board of county commissioners; where the township organization has been adopted the county government is administered by the chairmen of the several township boards. For each county there are a judge, clerk, register of deeds, auditor, treasurer, sheriff and state's attorney.

All citizens of the United States residing in North Dakota are declared to be citizens of the state. The right of suffrage is confined by the constitution to males twenty-one years of age, who are citizens of the United States or have declared their intention of becoming citizens, and who have resided in the state one year, in the county six months, and in the voting precinct ninety days preceding the election. Civilized Indians who have severed their tribal relations two years before an election are entitled to vote. Women may vote for all school officers and upon all questions relating solely to school matters, and are eligible to any school office.

Amendments to the constitution must be passed by both houses of the legislature at two consecutive sessions, and must then be ratified by popular vote. By this arrangement a period of nearly four years usually elapses between the proposal and the final ratification of an amendment.

The amount of homestead exempt from seizure for debt is limited in value to $5000, and may not include more than two acres in a town plot or more than 160 acres elsewhere. The exemption is not valid against a debt created for the purchase money, or against taxes levied on the property, or against mechanics' or labourers' liens for work done or material furnished for improvements, or against a mortgage acknowledged by both husband and wife. The grounds for absolute divorce are adultery, cruelty, desertion (one year), neglect (one year), habitual drunkenness (one year) and conviction for felony; residence in the state for one year is required before application for divorce.

North Dakota is one of the few American states whose constitution forbids the manufacture, importation[2] or sale of intoxicating liquors. Attempts to secure the repeal of this provision have been unsuccessful. Apothecaries may secure a licence to sell liquors for purely medicinal purposes upon a petition signed by twenty-five reputable free-holders and twenty-five reputable women. In 1909 the advertisement of liquors, solicitation of orders for liquors, and the sale of cigarettes to minors were prohibited.

Education.—At the head of the public school system is a superintendent of public instruction, chosen for two years. He, with the governor and the president of the state university, constitutes a high-school board, having supervision of the secondary schools. In each county there is a county superintendent, elected biennially, and in each school district a board of directors. The proceeds of the sale of public lands donated to the state for educational purposes and all escheats to the state, constitute a trust fund, the interest from which, with the proceeds of all fines for the violation of state laws, is annually apportioned among the school districts according to the school population; the total apportionment from the State Tuition Fund in 1908 was $357,238. This income is supplemented by local taxation. The minimum school term allowed by law is six

[1] The Devils Lake Reservation and the Turtle Mountain Chippewa are both under the Fort Totten School, which is on the Devils Lake Reservation.

[2] Before the law passed by the first Legislative Assembly of the state to carry out this provision could come into effect, it was partially annulled by the decision of the United States Supreme Court in the case of *Leisy* v. *Hardin* (1890), in which the court held that liquors might be imported into any state and sold in the original package (*q.v.*) without reference to local prohibitory or restrictive laws.

in 1890) at Valley City and Mayville, an agricultural college and experiment station (1890) at Fargo, a normal and industrial school (opened in 1899) at Ellendale, a school for the deaf (1890) at Devils Lake, a scientific school (opened in 1903) at Wahpeton, and a school of forestry at Bottineau. Fargo College at Fargo, founded in 1887 by Congregationalists, is now non-sectarian. The Methodist Episcopal Church maintains Wesley College near Grand Forks (formerly the Red River Valley University at Wahpeton), affiliated with the state university. There is a state library commission. The state supports a hospital for the insane at Jamestown, an institution for the feeble-minded at Grafton, a home for old soldiers at Lisbon, a blind asylum at Bathgate, a reform school (opened 1902) at Mandan and a penitentiary at Bismarck. There is a state sanatorium for tuberculosis (1909).

Finance.—The chief source of revenue for the state, counties and municipalities is the general property tax. There are no special corporation taxes, but licence-charges are levied upon express and sleeping-car companies, and a tax is laid on the premiums of insurance companies. No poll tax is levied for state purposes, but counties are authorized to levy such a tax for school purposes. There are boards of equalization and review for the state, counties and municipalities. The state board fixes the rate of the state tax. For defraying the expenses of the state government, exclusive of the interest on the bonded debt, the tax rate is limited by the constitution to four mills on the dollar of assessed valuation. The state debt, excluding the amount of Territorial indebtedness assumed when Dakota Territory was divided, may not exceed $200,000. Local indebtedness is limited to 5 % of the assessed value of the local property, but incorporated cities may by special vote increase this limit. The total bonded debt of the state on the 31st of October 1908 was $642,300 and was incurred for the most part for the construction of public buildings during the Territorial period. At the close of the fiscal year ending on the 31st of October 1908, the receipts for the year amounted to $3,259,668, the expenditures to $3,476,073 and the balance in the treasury to $582,905.

History.—The first attempts to establish permanent settlements in what is now North Dakota were made by traders of the Hudson's Bay Company, who began their operations in the Red river valley about 1793.[1] In 1797 C. J. B. Chaboillez, a French trader in the service of the North-West Fur Company, built a trading post on the southern bank of the Pembina river, near its mouth, but this was soon abandoned. Three years later Alexander Henry, the younger (d. 1814), built two trading posts in the present limits of the state for this company, one on the western bank of the Red river near the Park river, where he lived until 1808. David Thompson (1770–1857), an employee at different times of the Hudson's Bay and North-West Fur companies, explored the region of the Missouri river in 1797–1798, and thus anticipated the work of Lewis and Clark, who entered the present limits of the state in 1804 and wintered among the Mandans, constructing Fort Mandan in what is now McLean county. In 1801 John Cameron (d. 1804) erected a trading post for the North-West Fur Company on the site of the present Grand Forks.

The first real homeseekers to enter the state of whom there is any record were a colony of Scottish Highlanders who had first settled at Kildonan (Winnipeg) in 1812 under a grant from the Hudson's Bay Company to Thomas Douglas, 5th earl of Selkirk. A part of the Winnipeg colony soon migrated southward and settled on the site of the present city of Pembina, at the mouth of the Pembina river, which they thought to be in British territory, and named the settlement Fort Daer. When Major Stephen H. Long, commanding an exploring expedition to the Minnesota and Red rivers, reached Fort Daer in 1823, he found there about six hundred persons, a few being Scotch, but the greater part being half-breeds.

North Dakota formed part of the region ceded by France to the United States by the Louisiana Purchase in 1803. From 1803 to 1805 it was included in the District of Louisiana, and from 1805 to 1812 it was a part of the Louisiana Territory, the name of which was changed to Missouri Territory in 1812. In 1834 Missouri, then locally called "Mandan Territory," was included in its limits. After Minnesota entered the Union, in 1858, the country between the Red and the Missouri rivers had no Territorial government for three years, but the inhabitants formed a provisional government. On the 2nd of March 1861 the Territory of Dakota was created, including the present Dakotas and portions of Wyoming and Montana. The seat of the Territorial government was fixed at Yankton, and remained there until 1883, when it was removed to Bismarck. The name of the Territory was derived from the Dakota Indians; the word "Dah-ko-ta" (signifying "allied" or "confederated"), being originally applied to the Sioux Confederation. In 1863 when Idaho Territory was formed, the boundaries of the Dakotas were fixed at practically their present limits. The boundary between Dakota Territory and Nebraska was slightly altered in 1870 and 1882. The Territory had hardly been organized before its settlement was impeded by the Civil War without and by Indian troubles within. In 1862 the Indians began a series of bloody massacres along the frontiers of Minnesota and Dakota. In the following year General Alfred Sully (1821–1879), commanding United States troops, marched up the Missouri river as far as Bismarck, and thence to the valley of the James river. On the 3rd of September 1863 with 1200 men he routed 2000 Sioux near the present town of Ellendale, in Dickey county, in an engagement called the battle of White Stone Hills. Four hundred warriors were slain, and a great number were captured. In 1864 Sully defeated the Sioux at the battle of Takaakwta, or Deer Woods, on the Knife river, and a few days later he again encountered them, and after a desperate struggle of three days administered a crushing defeat; the warriors abandoned their provisions and escaped into the Bad Lands. The Indians still remained hostile, however, and in 1865 Sully found it necessary to conduct his troops N. as far as Devils Lake, and thence W. to the Cannon Ball river. By these operations the Indian frontier was fixed W. of the Missouri river, and forts and garrisons were placed along this stream. The worst of the Indian troubles in northern Dakota were then at an end, though for many years there were occasional outbreaks.

A period of rapid development in the Red river basin followed the entrance of the Northern Pacific railway into this region in 1872. At the election in November 1887 the question of the division of the Territory into two states at the "seventh standard parallel" was submitted to the people, and was carried at the polls. In accordance with the Enabling Act, which received the president's approval on the 22nd of February 1889, a constitutional convention met at Bismarck on the 4th of July following, and drafted a frame of government for the state of North Dakota. In October this was ratified at the polls. The chief interest in the election turned on the prohibition clause in the constitution, which was submitted separately, and received a majority of only 1159 votes. On the 2nd of November 1889 President Harrison issued a proclamation declaring North Dakota a state. By an agreement between North and South Dakota, embodied in their constitutions, each state assumed the debt created for the erection of public buildings within its limits during the Territorial period.

In the development of the state since its admission into the Union the railways have been an important factor. In 1894 they inaugurated the so-called "concentration movement," and began to conduct annual excursions into North Dakota, thus bringing into the state thousands of immigrants. They have also adopted the policy of selecting favourable town-sites on the uninhabited prairie, erecting grain elevators at such points, and furnishing transportation facilities by means of branch roads tapping the main lines of travel. Under this system prosperous towns and villages have sprung up among the prairies.

[1] There seems to be no good authority for the statement often made that the first settlement in North Dakota was made by French Canadians in 1780.

NORTHEIM, a town of Germany, in the Prussian province of Hanover, on the Ruhme, 12 m. by rail N. of Göttingen and at the junction of railways to Cassel and Nordhausen. Pop. (1905) 7984. It has an interesting Evangelical church, containing some old wood-carving and stained glass, a Roman Catholic church, several schools and a training college for schoolmasters. There are manufactures of tobacco, sugar and boots; other industries are flour-milling, tanning and brewing. The place is said to date from the 9th century; it obtained civic rights in 1208, and later became a member of the Hanseatic League. It was stormed by the imperial troops in June 1627. The Benedictine abbey of St Blasius was founded in 1063 and dissolved at the Reformation.

See Wennigerholz, *Beschreibung und Geschichte der Stadt Northeim* (Northeim, 1896).

NORTHER, a winter wind accompanying the "cold wave" that follows the passage of a cyclone across the United States of America. A warm S.E. or S.W. wind on the east of such a cyclone materially slackens or entirely dies away, and is followed, often suddenly, by the piercingly cold norther. The passage

[1] The Territorial government embraced both the present states of North and South Dakota.

Arctic regions, but the body of cold air slides down the eastern slopes of the Rockies and advances as a solid wedge (the "cold wave") under the cyclone itself. "Uncomfortably warm in the lightest clothing," a traveller upon the prairies of Texas may become "uncomfortably cold before he can wrap his blanket around him" (W. Ferrel, *A Popular Treatise on the Winds*). The temperature may fall 50° F. in twenty-four hours.

NORTHFIELD, a city of Rice county, Minnesota, U.S.A., on the Cannon river, about 35 m. S. of St Paul. Pop. (1905) 3438; (1910) 3265. It is served by the Chicago Great-Western, the Chicago, Milwaukee & St Paul, and the Chicago, Rock Island & Pacific railways. It is a shipping centre for the products of the farming and dairying region in which it lies, but it is most widely known for its educational institutions. It is the seat of the Baker School for Nervous and Backward Children, a private institution; of St Olaf College (Norwegian Lutheran), founded in 1874; and of Carleton College (founded in 1866 by Congregationalists but now non-sectarian, opened in 1870), one of the highest grade small colleges in the West, and the first in the North-west to abolish its preparatory academy. Carleton College has the Goodsell Observatory, which gives the time to the railways of the North-west, and publishes a magazine, *Popular Astronomy*. The Scoville Memorial Library (1896) of the College had 23,000 volumes in 1909. Northfield has a public library and the Minnesota Odd Fellows' Widows and Orphans Asylum. Named in honour of John W. North, who laid out Northfield and several other western towns, it was settled about 1851, incorporated as a village in 1868, and chartered as a city in 1875.

NORTHFIELD, a village of Washington county, Vermont, U.S.A., in Northfield township, about 35 m. S.E. of Burlington, in the Green Mountains region. Pop. (1910) of the village 1918; of the township 3226. Northfield is served by the Central Vermont railway. It is the seat of Norwich University, founded in 1819 as the American Literary, Scientific and Military Academy at Norwich, Windsor county, Vermont, by Captain Alden Partridge (1785–1854). Captain Partridge was a professor in the U.S. Military Academy in 1813–1816 and acting superintendent of the Academy in 1816–1817, and was president of Norwich University until 1843; he founded various other military schools besides the one at Norwich. Norwich University was incorporated in 1834 under its present name, and in 1866, when the buildings at Norwich were burned, was removed to Northfield. The charter requires "a course of military instruction, both theoretical and practical," and the discipline of the institution is military in form and principle. In 1898 the university was recognized by the General Assembly of Vermont as the military college of the state. It offers courses leading to the degrees of Bachelor of Arts and Bachelor of Science in civil engineering, in electrical engineering and in chemistry. In 1908 it had 13 instructors and 168 students. Dewey Hall (1902), the administration building, was named in honour of Admiral George Dewey, a former student in the university. In the township there are outcrops of good granite and of verde antique, and along a range of hills E. of the village there is a deposit of very fine black slate. The hills furnish excellent grazing for cattle, and much milk is shipped to New England cities. The township of Northfield was incorporated in 1781; the original settlement on the site of the present village was made in 1785, and the village was incorporated in 1855.

NORTHFLEET, an urban district of Kent, England, within the parliamentary borough of Gravesend, on the Thames, 22 m. E. by S. of London by the South Eastern and Chatham railway. Pop. (1901) 12,006. The church of St Botolph is of Norman foundation, but the nave is principally Decorated and the chancel Perpendicular, and the tower, having fallen down, was rebuilt in 1628. The church contains a brass of the 14th

of Holland; green meadows stretching as far as the eye can see, dotted with windmills and cattle, and slashed by the regular lines of the drainage canals, bordered with pollarded willows.

As in Friesland, cattle-rearing and the making of cheese, chiefly of the Edam description, are the main industries, but agriculture and even a little market-gardening are also practised in the heavier clay lands, such as the Y and Anna Paulowna polders. Purmerend, Alkmaar and Enkhuizen are the chief market centres. Though the country is naturally poor in minerals, springs containing iron have been discovered, such as the Wilhelminabron at Haarlem. The security of the Zuider Zee for trade and fishing purposes was the first factor in the commercial development of North Holland, and the cities of Medemblik, Enkhuizen, Hoorn, Edam and Monnikendam, though now little more than market centres for the surrounding district, possessed a large foreign commerce in the 16th and 17th centuries. This prosperity finally concentrated itself upon the Y (that is, upon Amsterdam) and the series of industrial villages situated on its offshoot the Zaam, of which Zaandam and Wormerveer are the most important.

NORTHINGTON, ROBERT HENLEY, 1ST EARL OF (*c.* 1708–1772), lord chancellor of England, was the second son of Anthony Henley, a member of a well-to-do family in Hampshire, who was a Whig member of parliament, and a well-known wit and writer. Robert was educated at Westminster school and St John's College, Oxford; and after gaining a fellowship at All Souls e was called to the bar in 1732. In 1747 he was elected member parliament for Bath, of which borough he became recorder in 51. He acquired a lucrative practice at the bar, and in 1756 s appointed attorney-general. In the following year he was moted to the office of lord keeper of the great seal, being the person so designated. For three years Henley, though still mmoner, presided over the House of Lords in virtue of his ; but in 1760 he was created Baron Henley of Grainge in ounty of Southampton. The delay in raising him to the e was due to the hostility of George II., who resented 's former support of the prince of Wales's faction, known Leicester House party; and it was in order that he might as lord high steward at the trial of Earl Ferrers for in 1760 that he then received his patent. On the accession e III. the office of lord chancellor was conferred on and in 1764 he was created Viscount Henley and earl of ton. In 1765 he presided at the trial of Lord Byron for illiam Chaworth in a duel. Northington, who was a f the group known as "the king's friends," was al in procuring the dismissal of the marquess of n and the recall of Pitt to office in 1766, and he himself government as lord president of the council, Lord oming chancellor. He resigned office in 1767, and sidence in Hampshire on the 14th of January 1772. in 1743, Jane, daughter of Sir John Huband of ickshire, by whom he had three sons and five is youngest daughter, Elizabeth, married Morton 1799 was created Baron Henley in the peerage of r grandson, the 3rd Baron Henley of this creation, ited earl of Northington.

r Northington was in his youth a man of convivial manners, much addicted to swearing. Horace ed on his undignified bearing at the trial of Lord Eldon considered him "a great lawyer," and his uestioned. His notes of cases tried by himself ncery were published in two volumes in 1818.

r, 2nd earl of Northington (1747–1786), only e lord chancellor, was appointed a teller of 63, and lord lieutenant of Ireland in 1783, an inistered in a spirit of concession to popular encouraging native industries and public made himself beloved by the Irish people. , and died unmarried on the 5th of July ranted to his father became extinct.

and narrows again to 270 m. between Duncansby Head and the coast of Norway. To the north of Scotland it communicates with the Atlantic westwards by the Pentland Firth and the channel between the Orkney and Shetland Islands, and northwards with the Norwegian Sea.

Its total area is given by Murray as 162,600 sq. m., and by Krümmel as 571,910 sq. km., or 220,820 sq. statute m. Murray estimates the volume of the North Sea at 11,200 cub. m., and Krümmel at 53,730 cub. km. or 12,890 cub. m., giving mean depths of 61 and 48 fathoms respectively. The North Sea is thus on the whole shallow; its bed is part of the continental shelf on which the British Isles stand, and it slopes upwards with fair regularity from north to south. In the south and east there is a broad coastal strip over which the depth nowhere exceeds 20 fathoms, and the whole south-eastern part of the area is less than 30 fathoms deep. In about its middle latitude the Dogger Bank crosses the North Sea from east to west, extending for about one-third of the whole distance; near the English coast the depth here is under 10 fathoms and it increases eastwards to about 20 fathoms. South of the Dogger there are local depressions, mostly of small area, in which the depth is as much as 45 fathoms, as in the "Silver Pit." Krümmel points out that a line drawn from the northern edge of the Dogger to the middle of the Skagerrack constitutes a rough boundary of the shallow southern basin, the depth increasing very slowly beyond this line to the "Norwegian Channel"—a deep gully closely following the Scandinavian coast, and extending into the Skagerrack, in which the depth increases to as much as 400 fathoms.

Area and relief.

According to Jukes-Browne, the North Sea, in its present form, first took shape as a result of the tectonic movements indicated by the break between the older and newer Pliocene deposits. The southern end of the North Sea was probably little affected by the general subsidence which occurred during the Glacial period; its boundary in this direction was apparently within the present land area of France and Belgium, while a narrow inlet may have run westwards between France and England in the present position of the Strait of Dover. Meanwhile immense quantities of ice detritus from Scotland and Scandinavia were deposited in the North Sea, to a thickness of perhaps 600 ft., and the whole region was subsequently raised above sea-level, constituting the "structural surface" upon which the present river system was developed as a series of tributaries to a great river which formed a continuation of the Rhine. Finally the land subsided again, the plain of the North Sea was again submerged, and the western inlet of Pleistocene times became the Strait of Dover.

History.

For reasons which will be sufficiently obvious from the historical sketch just given, the coasts of the southern part of the North Sea are of no great height. In England they consist of low cliffs with sandy beaches, while on the continental side are immense flats and marshes, with parts below sea-level protected by sand-dunes and artificial dykes. Suess has shown that no evidence is forthcoming of tectonic movement since the Bronze Age, and the rapid changes of coast-line now taking place in many parts are therefore wholly due to the action of the sea, which is probably specially effective on account of the relatively recent opening of the Strait of Dover. The erosion of the North Sea coasts has been made a subject of minute study (in England especially by the British Association and a committee of the Royal Geographical Society), and Harmer has obtained interesting results by comparing the British and Continental coasts as characteristic "weather" and "lee" shores.

Coasts.

The physical conditions of the waters of the North Sea have been extensively studied by expeditions sent out by the Swedish, Norwegian, Danish, German and British governments; and since

water of 35 *pro mille* salinity or more, (2) water of salinity 34 to 35 *pro mille*, called "North Sea" water; (3) water of salinity 32 to 34 *pro mille*, found along the coasts of Holland, Germany, Denmark, and Norway, and called "bank-water"; (4) water of 32 *pro mille* salinity or less, belonging to the stream flowing out from the Baltic. Of these (1) and (4) are to be regarded as "in-flowing" waters, while the others are due to mixture, which may or may not take place in the North Sea itself. The oceanic water consists of a mixture of waters of Atlantic and Polar origin; it enters the North Sea from the north-west partly from the Norwegian sea, and partly from the Faeroe channel by the passage between the Orkney and Shetland islands, and makes its way southwards along the coast of Scotland, especially during the early summer months.

The International Council, and more particularly the North Sea Fisheries Investigation Committee of the Fishery Board for Scotland, have studied the periodic and irregular variations in the distribution of these waters in minute detail; and the results, extending and confirming the observations of the earlier observers, have established the conclusion that the supply of fresher coastal waters from the land on both sides of the North Sea is greatest in late summer, after the occurrence of the maximum inflow of oceanic water. The autumn and early winter months accordingly represent a period of mixing rather than of inflow, and this mixing is clearly an extremely complicated process, depending on the relative amounts of the mixing waters (which are themselves liable to great variation), on their temperature and salinity, and also on the action of winds and tides. In the southern part of the North Sea area tidal action alone is sufficiently vigorous to ensure complete mixing of the waters from surface to bottom at all times.

The tides of the North Sea are of great complexity, and have not been fully investigated. The tidal wave of the Atlantic enters by the Strait of Dover and by the channels in the north. In the latter place a division into two parts takes place, one wave travelling southwards along the coast of Scotland in comparatively shallow water, while another moves with greater speed across the deeper water to the Norwegian Channel, and thence southwards to the Skagerrack and the Danish coast. The southwards-moving waves are greatly retarded in the shallow water over the Dogger Bank; the trough of the "Silver Pit" accordingly gives the Scottish wave a strong easterly component, and the three systems—the Scottish, Norwegian and Channel waves—meet to the east of the Dogger, producing complicated interference phenomena. Along the English coasts the tidal streams are for the most part normal, the flood stream running south to south-east and the ebb north to north-west, but on the Continental coast the movements become very complex on account of the varying influence of the waves from different sources.

Tides.

The North Sea is particularly rich in organisms of all kinds, and the abundance of food attracts fish in such quantities that the North Sea fisheries are the most productive in the world. Flat fishes, and those feeding at the bottom on smooth ground, are chiefly caught by means of the trawl. The favourite trawling-grounds are the Dogger Bank in winter, and the shallow waters off the Continental coasts in summer; these yield halibut, soles, turbot, brill, plaice, cod, haddock, whiting, &c. In rough ground where the trawl cannot be used, hook- and line-fishing are carried on most successfully, and "mid-water" fish are also taken in this way, although the trawl and line-fishing overlap considerably. Herring and mackerel are caught by means of drift-nets. The herring fishing off the British coasts exhibits a remarkable variation during summer and autumn, beginning in Shetland in June and becoming progressively later southwards, until it ends off the Norfolk coast in November. Various attempts have

It lies on the N. bank of the Tyne, immediately above its mouth, and opposite to South Shields in Durham, 7½ m. E. of Newcastle by a branch of the North Eastern railway. It is a town of modern growth, and contains the municipal offices of the borough, a custom-house and various benevolent institutions for seamen. The harbour is enclosed by north and south piers, and there is a depth of 29 ft. at spring-tides besides the quays. Coal and coke are largely exported, and corn, timber and esparto grass are imported. There is an extensive fish quay, and about 14,000 tons of fish are landed annually. There are engineering, iron, salt and earthenware works, and some shipbuilding is carried on.

NORTH SYDNEY, a municipality in the county of Cumberland, New South Wales, Australia, on the N. shore of Port Jackson. Pop. (1901) 22,050. It is a rapidly growing town, immediately opposite and suburban to the city of Sydney, with which, however, the only connexion is by steam ferry. It is the terminus of a railway system serving the district N. of the town.

NORTH TONAWANDA, a city of Niagara county, New York, U.S.A., on the N. side and at the mouth of Tonawanda Creek (opposite Tonawanda), and on the Niagara river, about 14 m. N. of Buffalo. Pop. (1910 census) 11,955. It is served by the Erie, the Wabash, the Lehigh Valley, the West Shore, and the New York Central & Hudson River railways, by three interurban electric lines and by the Erie Canal. Electric power for its factories is furnished by Niagara Falls. In 1905 the value of its factory product was $6,499,312. The water-supply comes from the Niagara river. North Tonawanda was first settled as a part of Tonawanda in 1809; it became a part of Wheatfield township in 1857; was incorporated as a village in 1865, and chartered as a city in 1897. In 1825 Major Mordecai Manuel Noah (1785–1851), a New York journalist and politician of Portuguese Jewish descent, attempted unsuccessfully to found on Grand Island (area 27 sq. m.; pop. (1910) 914), Erie county, W. of North Tonawanda, the city of Ararat, a temporary refuge for Jews, who should return thence to the Holy Land.

See L. F. Allen in *Publications of the Buffalo Historical Society*, vol. i. (1879), pp. 305 sqq.

NORTHUMBERLAND, EARLS AND DUKES OF. The earldom, and later the dukedom, of Northumberland, famous in English history by its connexion with the noble house of Percy (*q.v.*) is to be traced from an origin anterior to a strictly regulated system of peerage. The Saxon kingdom of Northumbria embraced a far more extensive territory than the modern county of Northumberland; and for at least a century after the Norman conquest Northumberland, as the name imports, comprised great portion of the country north of the Humber, including the es of Durham and of York. The geographical position of this itory, contiguous with the kingdom of Scotland, conferred responsibility as well as power on the earl or governor to m its administration was entrusted; and it appears to have the policy of William the Conqueror and his immediate ssors to acknowledge the rights of the men who, though imes spoken of as earls, were in no strict sense members of idal nobility created by the Norman monarchy. William nqueror found Northumberland in the possession of a younger son of Algar, the Saxon earl of Mercia, who g in his submission was confirmed in the government strict, but was soon afterwards imprisoned for rebellion, replaced by Copsi, an uncle of Morcar's predecessor, Copsi was murdered a few weeks after receiving the id the same fate befell several of his successors; those d it being not infrequently deprived of the post for incapacity. Henry, earl of Huntingdon, only son king of Scotland, was made governor of Northumber-, and was styled "earl of Northumberland" by the v chronicler Roger of Hoveden. It was not for a long er, that the earldom of Northumberland came into title of honour heritable according to peerage law. Conquest the house of Percy (*q.v.*) had been growing mportance, and at the coronation of Richard II. Percy, 4th Baron Percy, who had distinguished nch wars, officiated as marshal of England, and

IV. The quarrel of Northumberland and his son with King Henry over the ransom of their Scottish prisoners taken at Homildon Hill on the 14th of September 1402 has been immortalized by Shakespeare; and in consequence of their rebellion all the earl's honours were forfeited in 1406. He was not himself present at the battle of Shrewsbury in July 1403, when Hotspur was killed, but he was slain, heading a fresh rebellion, at Bramham Moor on the 19th of February 1408.

The 1st earl of Northumberland was succeeded by his grandson, Hotspur's son, Henry (*c.* 1394–1455), who was restored to the earldom and the estates of the Percies in 1414 and was killed at the battle of St Albans in May 1455. The title then descended in the male line till the death of the 6th earl in 1537. During the Wars of the Roses the Percies took the Lancastrian side, which led to the attainder of Henry the 3rd earl (1421–1461) during the time of the Yorkist triumph, his forfeited title being conferred in 1464 by Edward IV. on John Neville, Lord Montagu (see the separate article below), by a patent which was cancelled a few years later. The earldom, together with the barony of Poynings which his father had obtained by marriage, was restored in 1473 to Henry Percy, son of the 3rd earl, who attached himself to Edward IV., acquiesced in the accession of Richard III., and submitted to Henry VII., by whom he was received into favour. His grandson Henry, the 6th earl (*c.* 1502–1537), left no direct heir, and the latter's nephew, Thomas Percy, was debarred from the succession by an attainder passed on his father for his participation in the Pilgrimage of Grace. In 1549, however, Thomas was restored in blood, and in 1557 he became by a new creation earl of Northumberland, 7th of his line. Meantime, in 1551, John Dudley, earl of Warwick, was created duke of Northumberland (see the separate article below), his title being, however, forfeited by attainder in 1553.

The earldom restored to the house of Percy by the creation of 1557 continued without interruption in the male line till 1670. The 7th earl was beheaded in 1572 for sharing in a conspiracy in which he was joined by the earl of Westmorland with the object of securing the release of Mary Queen of Scots and the free exercise of the Catholic religion. By the earl's attainder the baronies of Percy and of Poynings and the earldom of Northumberland of the older creation were forfeited, but owing to a clause in the patent the newer earldom of Northumberland and the other honours conferred in 1557 passed to his brother Henry (*c.* 1532–1585), who, however, is usually known as the 8th and not the 2nd earl.

Henry's grandson, ALGERNON PERCY, 10th earl of Northumberland (1602–1668), son of Henry the 9th earl (1564–1632), became a peer in his father's lifetime as Baron Percy in 1626. During the years immediately preceding the Civil War he served as an admiral, making earnest but unsuccessful efforts to reform the navy, and in 1637 he was made lord high admiral of England. In 1639 Charles I. appointed him general of the forces north of the Trent, and a member of the council of regency. Northumberland played a distinguished and honourable part in the troubled times of the Civil War. He was a friend of Strafford, and gave evidence at his trial which, though favourable on the important point of bringing the Irish army to England, was on the whole damaging; and he afterwards leaned more and more towards the popular party, of which he soon became leader in the House of Lords. He was a member of the committee of safety, and later of the committee of both kingdoms; and he took an active part in the attempts to come to terms with the king, whom he visited at Oxford for that purpose in 1643 and at Uxbridge two years later. Northumberland helped to organize the new model army; and in 1646 he was entrusted by parliament with the charge of the king's younger children. He led the opposition in the House of Lords to the proposal to bring Charles I. to trial, and during the Commonwealth he took no part in public affairs. At the Restoration he was called to make room for Northumberland Avenue. On the death of his son Joceline, the 11th earl, in 1670, the male line became extinct.

George Fitzroy (1665–1716), third son of Barbara, duchess of Cleveland, the wife of Roger Palmer, earl of Castlemaine, by King Charles II., was created by his father earl of Northumberland in 1674, and duke in 1683. This second dukedom of Northumberland became extinct on his death at Epsom on the 3rd of July 1716.

Meanwhile Elizabeth Percy, daughter of Joceline, the 11th earl, had married Charles Seymour, 6th duke of Somerset; and her son Algernon, the 7th duke, was in 1749 created Baron Warkworth and earl of Northumberland, with remainder to his son-in-law, Sir Hugh Smithson, Bart., son of Langdale Smithson of Langdale, Yorkshire. Sir Hugh Smithson (*c.* 1714–1786) took the name and arms of Percy on inheriting the earldom in 1750; in 1766 he was created Earl Percy and duke of Northumberland, and in 1784 he was further created Baron Lovaine of Alnwick, with special remainder to his second son, Lord Algernon Percy. He took a somewhat prominent part in politics as a follower of Lord Bute, and was one of George III.'s confidential advisers, holding the office of lord-lieutenant of Ireland from 1763 to 1765, and that of master of the horse from 1778 to 1780. He was a man of cultivated tastes, and spent large sums of money in repairing and improving Alnwick Castle and his other residences. His wife, Elizabeth (1716–1776), who was a prominent figure in society, inherited in her own right her father's barony of Percy. The duke was succeeded by his eldest son Hugh; and his second son Algernon, Lord Lovaine, was created earl of Beverley in 1790.

Hugh, 2nd duke of this line (1742–1817), first inherited his mother's barony of Percy. He was present at the battle of Minden, and although in parliament, where he was member for Westminster from 1763 to 1776, he had opposed the policy that led to the American war, he proceeded to Boston in 1774 as colonel commanding the 5th Fusiliers, a regiment that has since then been known as the Northumberland Fusiliers. His generosity to his men made him exceedingly popular in the army: he became a general in 1793, and after succeeding to the dukedom in 1786 he exercised considerable influence in politics, though he never obtained office. His son Hugh, 3rd duke (1785–1847), was lord-lieutenant of Ireland in 1829–1830, when the Catholic Emancipation Act was passed, and was pronounced by Sir Robert Peel "the best chief governor that ever presided over the affairs of Ireland." Both he and his brother Algernon, 4th duke (1792–1865), who was created Baron Prudhoe in 1816, died without issue; the barony of Percy devolved on their great-nephew, the duke of Atholl, and the dukedom passed to George (1778–1867), eldest son of Algernon, 1st earl of Beverley, and so to his son, the 6th duke (1810–1899), and grandson, the 7th duke (b. 1846), who married the daughter of the 8th duke of Argyll. The 7th duke's eldest son, Earl Percy (1871–1918), seemed destined to take a great place in public life when he was prematurely cut off; he had a distinguished career at Oxford and from 1895 in the House of Commons, being under-secretary for India in 1902–1903 and under-secretary for foreign affairs in 1903–1905.

See Edward Barrington de Fonblanque, *The House of Percy* (2 vols., London, 1887); G. E. C(okayne), *Complete Peerage*, vol. vi (London, 1895).

NORTHUMBERLAND, JOHN DUDLEY, VISCOUNT LISLE, EARL OF WARWICK, and DUKE OF (*c.* 1502–1553), was the eldest son of Henry VII.'s extortionate minister, Edmund Dudley (*q.v.*), by his second wife Elizabeth, daughter of Edward Grey, Viscount Lisle, and co-heiress of her brother John, Viscount Lisle. He was probably descended from the old baronial house of Sutton *alias* Dudley; but his father's attainder and execution

restored in blood and in 1538 he was made deputy to his step-father, who was governor of Calais, and he does not appear to have suffered by Lisle's temporary disgrace and imprisonment in the Tower. Lisle died early in 1542 and Dudley was created Viscount Lisle on the 12th of March and was made warden of the Scottish marches in November, and lord high admiral of England in 1543 in succession to his future rival, Edward Seymour, earl of Hertford. He was also created a knight of the garter and sworn of the privy council on the 23rd of April 1543. In 1544 he accompanied Hertford to the capture and burning of Edinburgh. On the capture of Boulogne in September Lisle was given command of the town and of the Boulonnais; *in* 1545 he directed the operations of the fleet in the Solent which foiled the French attack on Portsmouth and the Isle of Wight; and he was sent to Paris to ratify the peace concluded in 1546.

Lisle had thrown in his lot with the reforming party, and he took an active share in the struggle at Henry VIII.'s court for control of affairs when Henry should die. Hertford and he were described by the Spanish ambassador as holding the highest places in Henry VIII.'s affections and as being the only noblemen of fit age and ability to carry on the government. The Howards were infuriated by the prospect, and Surrey's hasty temper ruined their prospects. Lisle quarrelled bitterly with Bishop Gardiner, served as commissioner at Surrey's trial, and was nominated one of the body of executors to Henry's will from which Norfolk and Gardiner were excluded. On Henry's death Lisle was raised to the earldom of Warwick and promoted to be lord great chamberlain of England, again in succession to Hertford, who became duke of Somerset and Protector. But he was not long content with Somerset's superiority, though he concealed his resentment and ambition for the time. He accompanied Somerset on his Pinkie campaign, and materially contributed to the winning of that victory. Nor did he exhibit any sympathy with the intrigues of the Protector's brother, Thomas Seymour, the lord high admiral; his subtler policy was to exasperate the brothers and thus weaken the influence of the house of Seymour. He took a leading part in the proceedings which brought the admiral to the block in March 1549; and then used the Protector's social policy to bring about his deposition. Warwick, like most of the privy council, detested Somerset's ideas of liberty and his championship of the peasantry against the inclosure movement; one of his own parks was ploughed up as a result of a commission of inquiry which Somerset appointed; and when the peasants rebelled under Kett, Warwick gladly took the command against them. His victory at Dussindale made him the hero of the landed gentry, and as soon as he had returned to London in September 1549, he organized the general discontent with the Protector's policy into a conspiracy. He played upon the prejudices of Protestants and Catholics alike, holding out to one the prospect of more vigorous reform and to the other hopes of a Catholic restoration, and to all gentry the promise of revenge upon the peasants.

The coalition thus created effected Somerset's deposition and imprisonment in October 1549; and the parliament which met in November carried measures of political coercion and social reaction. But the coalition split upon the religious question. Warwick threw over the Catholics and expelled them from office and from the privy council, and the hopes they entertained were rudely dashed to the ground. But it was difficult to combine coercion of the Catholics with the proscription of Somerset; the duke was therefore released early in 1550 and restored to the privy council; and his daughter was married to Warwick's son. Warwick himself assumed no position of superiority over his colleagues, and he was never made protector. But he gradually packed the council with his supporters, and advantage in Scotland. Nor did the betrothal of Edward to Henry's daughter Elizabeth prevent the French king from intriguing to undermine English influence in Ireland. In domestic affairs Warwick pushed on the Reformation with none of the moderation shown by Somerset; and the difference between the two policies is illustrated by the change effected between the first and second Books of Common Prayer. Warwick, however, was widely distrusted; and the more arbitrary his government grew, the more dangerous became Somerset's rivalry. A parliamentary movement had early been started for Somerset's restoration. Warwick therefore kept parliament from meeting, and the consequent lack of supplies drove him into the seizure of church plate, sale of chantry lands, and other violent financial expedients. At length he resolved to get rid of his opponent; his opposition was magnified into conspiracy, and in October 1551, after Warwick had made himself duke of Northumberland and his ally Dorset, duke of Suffolk, and had scattered other rewards among his humbler followers, Somerset was arrested, condemned by the peers on a charge of felony, and executed on the 22nd of January 1552.

Parliament was permitted to meet on the following day, but for the next eighteen months Northumberland grew more and more unpopular. He saw that his life was safe only so long as he controlled the government and prevented the administration of justice. But Edward VI. was slowly dying, and Northumberland's plot to alter the succession was his last desperate bid for life and power. Its folly was almost delirious. Edward had no legal authority to exclude Mary, and the nation was at least nine-tenths in her favour. Northumberland bullied the council and overawed London for a few days; but the rest of England was in an uproar, and as he rode out to take the field against Mary, not a soul cried "God speed." A few days later he returned as Mary's prisoner. He was tried for treason, professed himself a Catholic in the delusive hope of pardon, and was executed on the 22nd of August. He was a competent soldier and one of the subtlest intriguers in English history; but he had no principles. He was, says a contemporary French account, "de parole affable, se composant à gracieusité et doulceur, mais au dedans felon, orgueilleux, vindicatif s'il en fut jamais." The violence of his rule and of his pretended Protestantism was largely responsible for the reaction of Mary's reign. His best-known son was Robert Dudley, earl of Leicester, Queen Elizabeth's favourite.

NORTHUMBERLAND, JOHN NEVILLE, EARL OF (*c.* 1430–1471), English soldier, was the third son of Richard Neville, earl of Salisbury, and a brother of Richard Neville, earl of Warwick, the "king-maker." At the battle of Blore Heath in 1459 John Neville was taken prisoner by the Lancastrians, although the Yorkists under his father had won the victory; he was among those who were attainted in the parliament of Coventry, and he was not released until 1460 when his own party had gained the upper hand. Just afterwards he was created Lord Montagu and was made chamberlain of the royal household. He was not present at the battle of Wakefield, when his father was taken prisoner, but he was again a captive after the second battle of St Albans in 1461. He was speedily released by Edward IV., whom he served in the north of England, being rewarded with lands and honours. In 1463 he became warden of the east marches towards Scotland, and he was responsible for the Yorkist victories at Hedgeley Moor and at Hexham in April and May 1464; after the latter battle he secured the execution of Henry Beaufort, duke of Somerset, and other captives of high station. In this ye[illegible]) he was created earl of Northumberland, the

Percies being now crushed, and their head, Henry Percy, being in prison. Northumberland did not at first join his brother Warwick and the other Nevilles when they revolted against Edward IV., but neither did he help the king. Edward, doubtless suspecting him, restored the earldom of Northumberland and its vast estates to Henry Percy, while John Neville's only recompense was the barren title of marquess of Montagu. At Pontefract in 1470 he and his men declared for Henry VI., a proceeding which compelled Edward IV. to fly from England, and under the restored king he regained his position as warden, but not the earldom of Northumberland. He did not attempt to resist Edward IV. when this king landed in Yorkshire in March 1471, but he fought under Warwick at Barnet, where he was slain on the 14th of April 1471. His son George (d. 1483) was betrothed to Elizabeth, daughter of Edward IV., and was created duke of Bedford in 1470, but the marriage did not take place and he was deprived of his dukedom in 1477.

NORTHUMBERLAND, the northernmost county of England, bounded N.W. by the Scottish counties of Berwick and Roxburgh, W. by Cumberland, S. by Durham, and E. by the North Sea. The area is 2018 sq. m. It has a general inclination eastward from the hill-borders of Scotland and Cumberland. The Cheviot range partly separates Northumberland from Scotland, and reaches in the Cheviot, its culminating point north-eastward, the greatest elevation in the county, 2676 ft. The elevation of the Cheviots rarely falls below 1300 ft. along the Border, and generally exceeds 1600. A line of high ground, bending southward, forms the watershed between the North and Irish Seas. The boundary with Cumberland crosses the low divide between the Irthing and the South Tyne, after coinciding with the former river for a short distance, and giving Northumberland a small drainage area westward. In the south-west a small area of the Pennine uplands is included in the county, reaching elevations up to 2206 ft. in Kilhope Law. Few eminences break the general eastward incline, which appears as a wide billowing series of confluent hills that for half the year mingle tints of brown, russet, and dun in a rich pattern, and at all times communicate a fine sense of altitude and expanse. The Simonside Hills (1447 ft.) form one not very conspicuous exception. The configuration of much of these uplands has a certain linearity in its details due to groups and ranges of ridges, crags, and terrace-like tiers, termed "edges" (escarpments) by the country folk, and generally facing the interior, like broad ends of wedges. The line of pillared crags and prow-like headlands between the North and South Tynes along the verge of which the Romans carried their wall is a fine specimen. Passing eastwards from the uplands the moors are exchanged for enclosed grounds, "drystone" walls for hedgerows, and rare sprinklings of birch for a sufficiently varied wooding. The hills and moors sink to a coast generally low, a succession of sands, flat tidal rocks and slight cliffs. Its bays are edged by blown sandhills; its borders are severely wind-swept. Several islands lie over against it. Holy Island, the classic Lindisfarne, 1051 acres in extent, but half "links" and sandbanks, is annexed to the mainland and accessible to conveyances every tide. The Farne Islands (*q.v.*) are a group of rocky islets farther south.

Deep glens and valleys, scoring the uplands, and richly wooded except at their heads, are characteristic of the rivers. Of these the chief are the Tweed, forming the north-eastern part of the Scottish border, its tributary the Till (with its feeders the Glen and College), the Aln and the exquisite Coquet, flowing into Alnmouth Bay, the Wansbeck, with its tributary the Font, the Blyth and the Tyne, forming part of the boundary with Durham, the union of the North and South Tynes. Many of the upland streams attract trout-fishermen.

Geology.—The core of the county, in a geological aspect, is the northern Cheviots from Redesdale head nearly to the Tweed. Its oldest rocks are gritty and slaty beds of Silurian age, about the head of the rivers Rede and Coquet and near the Breamish south of Ingram—a part of the great Silurian mass of the southern uplands of Scotland. Volcanic activity about the period of the Old Red Sandstone resulted in the felspathic porphyrites, passing into the syenites and granites, that form the mass of the northern Cheviots. *Round this* core there now lie relays of Carboniferous strata dipping east and south, much faulted and repeated in places, but passing into Coal Measures and Magnesian Limestone in the south-eastern part of the county. The whole system consists of (1) the Carboniferous Limestone series in three divisions; (2) the Millstone Grit; and (3) the Coal Measures. Lowest in Northumberland lies Tate's Tuedian group, the first envelope of sinking Cheviot-land. Some reddish shore-like conglomerates lie in places at its base, as at Roddam Dene; its shales are often tinged with distemper greens; its coals are scarcely worthy of the name; its limestones are thin, except near Rothbury; and its marine fossils are few. The Tuedian group is overlaid by the Carbonaceous group; its shales are carbonaceous-grey, its coals, though mostly small, very numerous, its limestones often plant-limestones, and its calcareous matter much diffused. Upon this lies the Calcareous group; its lime occurs in well-individualized marine beds, cropping up to the surface in green-vested strips; its fossils are found in recurrent cycles, with the limestones and coals forming their extremes. These three groups now range round the northern Cheviots in curved belts broadening southwards, and occupy nearly all the rolling ground between the Tweed and the South Tyne, the sandstones forming the chief eminences. The middle division becomes thinner and more like the Coal Measures in passing northwards, and the upper division, thinning also, loses many of its limestones. The Millstone Grit is a characterless succession of grits and shales. The Coal Measures possess the same zone-like arrangement that prevails in the Limestone series, but are without limestones. They also are divided, very artificially, into three groups. The lowest, from the Brockwell seam downwards, has some traces of Gannister beds, and its coal-seams are thin. The famous Hutton collection of plants was made chiefly from the roof-shales of two seams—the Bensham and the Low Main. The unique Attbey collection of fishes and Amphibia comes from the latter. The Coal Measures lie along the coast in a long triangle, of which the base, at the Tyne, is produced westwards on to the moors south of that river, where it is wedged against lower beds on the south by a fault. The strata within the triangle give signs of departing from the easterly dip that has brought them where they are, and along a line between its apex (near Amble) and an easterly point in its base (near Jarrow) they turn up north-eastwards, promising coal-crops under the sea.

The top of the Coal Measures is wanting. After a slight tilting of the strata and the denudation that removed it, the Permian rocks were deposited, consisting of Magnesian Limestone, a thin fish-bed below it, and yellow sands and some red sandstone (with plants of Coal Measure species) at the base. These rocks are now all but removed. They form Tynemouth rock, and lie notched-in against the 90-fathom dyke at Cullercoates, and again are touched (the base only) at Seaton Sluice. No higher strata have been preserved. The chief faults of the county extend across it. Its igneous rocks, other than the Cheviot porphyrites and a few contemporaneous traps in the lowest Carboniferous, are all intrusive. An irregular sheet of basalt forced between planes of bedding (perhaps at the close of the Carboniferous period) forms the crag-making base of the Great Whinsill, which, with many shifts, breaks and gaps, extends from Greenhead near Gilsland to the Kyloe Hills. Numbers of basalt dykes cross the county, and were probably connected with the plateau of Miocene volcanic rocks in the Hebrides. Everywhere the Glacial period has left rocks rounded and scored, and rock-fragments from far and near rubbed up into boulder-clay. The glaciers at first held with the valleys, but as the ice-inundation grew they spread out into one sheet—the Cheviot tops, heavily ice-capped, alone rising above it. Two great currents met in confluence around these hills—one from across the western watershed, the other skirting the coast from the north. Boulders from Galloway, Criffel, the Lake District and other places adjacent, and from the Lammermuirs and Berwickshire, lie in their track. Of moraines there are only a few towards the hills. Glaciated shell-fragments have been detected at Tynemouth. Laminated brick clays occur among the boulder-clays. Sheets and mounds of gravel of the nature of kames exist here and there on the low grounds, and several in a chain over the low watershed between Haltwhistle and Gilsland, sparsely dotting also some more upland valleys. An upper boulder-clay, containing flints, skirts the coast.

The older valleys are all pre-Glacial, and may date from the Miocene period. They are much choked up with Glacial deposits and lie so deep below the surface that, if they were cleared out, arms of the sea, one of them, 140 ft. deep at Newcastle, would extend for miles inland. After the departure of the glaciers the streams here and there wandered into new positions, and hence arises a great variety of smooth slope and rocky gorge. In the open country atmospheric waste has hollowed out the shales at their outcrops, leaving the sandstones, &c., as protruding "edges," roughened here and there into crags. In the lower grounds, where this subaerial dissection first began, the "edges" have much run together; on the heights, whose turn came last, they are often prominent and crest-like, but have glacier-rounded brows. Many old traces are now sheeted over with peat. The sloping peat-fields are often the sites of straggling birch-woods, now buried.

Climate.—The climate is bracing and healthy, with temperate summers (*e.g.* the average July temperature at Alnwick is 57·7°). In spring east winds prevail over the whole county. The

far as Cumberland, is taken by the shepherd for a sign of wet.

Agriculture, &c.—About five-ninths of the total area is under cultivation, and of this nearly five-sevenths is in permanent pasture. There are also about 470,000 acres under hill pasture. South of the river Coquet there is a broad tract of cultivation towards the coast that sends lessening strips up the valleys into the interior. From the Coquet northwards another breadth of enclosed ground stretches almost continuously along the base of the Cheviot hills. In the basin of the Till it becomes very fertile, and towards the Tweed the two breadths unite. In the porphyritic Cheviots the lower hills show a great extent of sound surface and good grass. The average hill-farms support about one sheep to 2 acres. A coarser pasturage covers the Carboniferous hills, and the proportion of stock to surface is somewhat less. In the highest fells the congeries of bogs, hags and sandstone scars, with many acres dangerous to sheep are worthless to the farmer. The lower uplands are a patchwork of coarse grasses (mown by the "muirmen" into "bent-hay") and heather, or, in the popular terms, heather and "white ground," for it is blanched for eight months in the year. Heather is the natural cover of the sandstones and of the sandy glacier-débris near them. On the uplands they grow bents; lower down they are apt to be cold and strong, but are much relieved by patches and inworkings of gravel, especially north of the Wansbeck. The prevalent stream-alluvium is sandy loam, with a tincture of peat. The arable regions are very variable. Changes of soil are probably as numerous as fields. The bulk of the acreage under corn crops, which has greatly diminished, is under oats and barley, and turnips occupy some five-sixths of the area under green crops. Northumberland is one of the largest sheep-rearing counties in Great Britain. Of these, the half-breds—crosses between the Leicester (or Shropshire) and Cheviot breeds—occupy the lower enclosed grounds, the pure Cheviots are on the uplands and the hardier black-faced breeds lie out on the exposed heathery heights. The cattle are chiefly shorthorns and Galloways. They are very largely raised, chiefly for fattening purposes.

The practice of paying wages in kind has passed greatly into disuse. Some of the shepherds still receive "stock-wages," being allowed to keep forty or fifty sheep and several cows on their employers' farms in lieu of pay. This arrangement, which makes them really copartners, has probably done much to render them the singularly fine class of men they are.

Other Industries.—The manufactures of the county chiefly come from the Tyne, which is a region of ironworks, blast-furnaces, shipbuilding yards, ropeworks, coke-ovens, alkali-works and manufactories of glass, pottery and fire-bricks, from above Newcastle to the sea. Machines, appliances, conveyances and tools are the principal articles of manufacture in metal. There is great activity in all trades concerned in pit-sinking and mine-working. In the other parts of the county there are a few small cloth-mills, a manufactory of tan gloves at Hexham, some potteries and numbers of small brick and tile works. There are several sea-fishing stations, of which North Shields is by far the most important. The salmon fisheries are also valuable.

Communications.—Communications are provided almost wholly by the North-Eastern railway, of which the main line enters the county at Newcastle and runs N. by Morpeth, and near the coast, to Berwick, where a junction on the East Coast route from London to Scotland is effected with the North British railway. Numerous branch railways serve the populous south-eastern district, and there are connexions westward to Hexham and Carlisle, up the Tweed valley into Scotland and (by the North British line) up the North Tyne valley from Hexham. The principal ports besides the Tyne ports are Blyth, Amble (Warkworth Harbour), Alnmouth and Berwick. The Tyne is one of the most important centres of the coal-shipping trade in the world.

Population and Administration.—The area of the ancient county is 1,291,530 acres with a population in 1891 of 506,442, and in 1901 of 603,498. In physique the Northumbrian is stalwart and robust, and seldom corpulent. The people have mostly grey eyes, brown hair and good complexions. The inhabitants of the fishing villages appear to be Scandinavian; and parts of the county probably contain some admixture of the old Brit-Celt, and a trace of the Gipsy blood of the Faas of Yetholm. The natives have fine characteristics: they are clean, thrifty and plodding, honest and sincere, shrewd and very independent. Their virtues lie rather in solidity than in aspiration.

Northumbrian speech is characterized by a "rough vibration [illegible] English forms of speech strike the ear, such as "to butch a beef," *i.e.* to kill a bullock, and curious inversions, such as "they not can help." There is the Old-English distinction in the use of "thou" to familiars and "ye" to superiors.

The area of the administrative county is 1,291,515 acres. The county is divided into nine wards, answering to hundreds. Population is densest in the south-east, where the mining district and the Tyneside industrial area are situated. The municipal boroughs in this district are: Newcastle-upon-Tyne (city, county of a city and county borough; pop. 215,328), Tynemouth (county borough, 51,366), Morpeth (6158), Wallsend (20,918). In this district the following are urban districts: Amble (4428), Ashington (13,956), Bedlington (18,766), Blyth (5472), Cowpen (17,879), Cramlington (6437), Earsdon (9020), Gosforth (10,605), Newbiggin-by-the-Sea (2032), Newburn (12,500), Seghill (2213), Weetslade (5453), Whitley and Monkseaton (7705), Willington Quay (7941). The remainder of the county contains the municipal borough of Berwick-upon-Tweed (13,437) and the urban districts of Alnwick (6716), Hexham (7071) and Rothbury (1303). The county is in the north-eastern circuit, and assizes are held at Newcastle-upon-Tyne. The total number of civil parishes is 523. The ancient county, which is in the diocese of Newcastle-upon-Tyne, with the exception of a small portion in that of Durham, contains 173 ecclesiastical parishes or districts, wholly or in part. The parliamentary divisions of the county are Berwick-upon-Tweed, Hexham, Wansbeck and Tyneside, each returning one member; while the parliamentary borough of Newcastle-upon-Tyne returns two members, and those of Morpeth and Tynemouth one member each.

History.—The first English settlement in the kingdom of Bernicia, which included what is now Northumberland, was effected in 547 by Ida, who, accompanied by his six sons, pushed through the narrow strip of territory between the Cheviots and the sea, and set up a fortress at Bamburgh, which became the royal seat of the Saxon kings. About the end of the 6th century Bernicia was first united with the rival kingdom of Deira under the rule of Æthelfrith, and the district between the Humber and the Forth became known as the kingdom of Northumbria. In 634 Cadwalla was defeated at Hefenfeld (the site of which lies in the modern parish of St John Lee) by Oswald, under whom Christianity was definitely established in Northumbria, and the bishop's see fixed at Hexham, where Bishop Wilfrid erected the famous Saxon church. Oswald also erected a church of stone at Tynemouth, which was destroyed in 865 in an incursion of the Danes under Hinguar and Hubba. The extent of Danish influence in Northumberland has been much exaggerated, however, for though in 876 Halfden, having conquered the whole of Northumbria, portioned out the lands among his followers, the permanent settlements were confined to the southern portion of the kingdom. In the northern half, which is now Northumberland, the English princes continued to reign at Bamburgh as vassals of the Danes, and not a single place-name with the Danish suffix "by" or "thorpe" is found north of the Tyne. In 938 Æthelstan annexed Northumberland to his dominions, and the Danish authority was annulled until its re-establishment by Canute in 1013. The vigorous resistance of Northumbria to the Conqueror was punished by ruthless harrying. The Normans rebuilt the Saxon monasteries of Lindisfarne, Hexham and Tynemouth; Eustace Fitz John founded Alnwick Abbey, and other Norman abbeys were Brinkburn, Hulne, Blanchland and Newminster. Castles were set up at Alnwick, Warkworth, Prudhoe, Dunstanborough, Morpeth, Ford, Chillingham, Langley, Newcastle, Bamburgh, Wark and Norham, a stronghold of the palatine bishops of Durham.

The term Northumberland is first used in its contracted modern sense in 1065 in an entry in the Saxon Chronicle relating to the northern rebellion. The county is not mentioned in the Domesday Survey, but the account of the issues of the county, as rendered by Odard the sheriff, is entered in the Great Roll of the Exchequer for 1131. In the reign of Edward I. the county of Northumber[illegible]s found to comprise the whole district

the Coquet, and Norham beyond the Coquet, all subject to the bishop of Durham; the liberty of Hexham belonging to the archbishop of York; that of Tynedale to the king of Scotland; that of Emildon to the earl of Lancaster; and that of Redesdale to Gilbert de Umfraville, earl of Angus. These franchises were all held exempt from the ordinary jurisdiction of the shire. By statute of 1495–1496 the lordship of Tynedale was annexed to Northumberland on account of flagrant abuses of the liberties of the franchise; the liberty of Hexham was annexed to Northumberland in 1572; Norhamshire, Islandshire and Bedlingtonshire continued to form detached portions of Durham until 1844, when they were incorporated with Northumberland. The division into wards existed at least as early as 1295, the Hundred Roll of that year giving the wards of Coquetdale, Bamburgh, Glendale and Tynedale.

The shire-court for Northumberland was held at different times at Newcastle, Alnwick and Morpeth, until by statute of 1549 it was ordered that the court should thenceforth be held in the town and castle of Alnwick, and under the same statute the sheriffs of Northumberland, who had lately been in the habit of appropriating the issues of the county to their private use, were required to hereafter deliver in their accounts to the Exchequer in the same manner as the sheriffs of other counties. The assizes were held at Newcastle, and the itinerant justices, on their approach to the county, were met by the king of Scotland, the archbishop of York, the bishop of Durham and the prior of Tynemouth, who pleaded their liberties either at a well called Chille near Gateshead, if the justices were proceeding from York, or, if from Cumberland, at Fourstanes. In these franchises the king's writ did not run, and their owners performed the office of sheriff and coroner. Among other Northumbrian landowners claiming privileged jurisdiction in 1293 was Robert de Quonla, who claimed that he and his men were quit of the suits of the shire and wapentake; the prior of St Mary of Carlisle claimed to exclude the king's bailiffs from executing their office in his fee of Corbridge, and that he and his men were quit of the suits of the shire and wapentake. The burgesses of Newcastle claimed return of writs in their borough, and Edmund, the brother of Edward I., claimed return of writs and exemptions from the sheriff's jurisdiction in his manor of Stamford. Newcastle was made a county by itself by Henry IV. in 1400, and has jurisdiction in admiralty cases. Ecclesiastically the county was in the diocese of Durham, and in 1291 formed the archdeaconry of Northumberland, comprising the deaneries of Newcastle, Corbridge, Bamburgh and Alnwick. In 1535 the archdeaconry included the additional deanery of Morpeth. The archdeaconry of Lindisfarne was formed in 1845, and subdivided into the rural deaneries of Alnwick, Bamburgh, Morpeth, Norham and Rothbury; the archdeaconry of Northumberland then including the deaneries of Bellingham, Corbridge, Hexham and Newcastle-upon-Tyne. In 1882 Northumberland was formed into a separate diocese with its see at Newcastle, the archdeaconries and deaneries being unaltered. In 1885 the additional deaneries of Tynemouth and Bedlington were formed in the archdeaconry of Northumberland, and in 1900 the deanery of Glendale in the archdeaconry of Lindisfarne.

Pre-eminent among the great families connected with Northumberland is that of Percy (*q.v.*). Ford and Chipchase were seats of the Heron family. The Widdringtons were established at Widdrington in the reign of Henry I. and frequently filled the office of sheriff of the county. The barony of Prudhoe was granted by Henry I. to the Umfravilles, who also held the castles of Otterburn and Harbottle and the franchise of Redesdale. From the Ridleys of Willimoteswyke was descended Bishop Ridley, who was martyred in 1555. Aydon Castle was part of the barony of Hugh Baliol. The Radcliffes, who held Dilston and Cartington in the 15th century and afterwards acquired the extensive barony of Langley, became very powerful in Northumberland after the decline of the Percies, and were devoted adherents of the Stuart cause.

perpetual inroads and devastations by the Scots. Norham, Alnwick and Wark were captured by David of Scotland in the wars of Stephen's reign, and in 1290 it was at Norham Castle that Edward I. decided the question of the Scottish succession in favour of John Baliol. In 1295 Robert de Ros and the earls of Athol and Menteith ravaged Redesdale, Coquetdale and Tynedale. In 1314 the county was ravaged by Robert Bruce, and in 1382 by special enactment the earl of Northumberland was ordered to remain on his estates in order to protect the county from the Scots. In 1388 Henry Percy was taken prisoner and 1500 of his men slain at the battle of Otterburn, immortalized in the ballad of "Chevy Chase." Alnwick, Bamburgh and Dunstanborough were garrisoned for the Lancastrian cause in 1462, but after the Yorkist victories of Hexham and Hedgley Moor in 1464, Alnwick and Dunstanborough surrendered, and Bamburgh was taken by storm. In 1513 the king of Scotland was slain in the battle of Flodden Field on Branxton Moor. During the Civil War of the 17th century Newcastle was garrisoned for the king by the earl of Newcastle, but in 1644 it was captured by the Scots under the earl of Leven, and in 1646 Charles was led there a captive under the charge of David Leslie. Many of the chief Northumberland families were ruined in the rebellion of 1715.

The early industrial development of Northumberland was much impeded by the constant ravages of internal and border warfare, and in 1376 the commonalty of Northumberland begged consideration for their sheriff, who, although charged £100 for the profits of the county, through death and devastation by the Scots could only raise £53, 3s. 4d. Again Aeneas Sylvius Piccolomini (Pope Pius II.), who passed through the county disguised as a merchant in 1436, leaves a picture of its barbarous and desolate condition, and as late as the 17th century, Camden, the antiquarian, describes the lands as rough and unfit for cultivation. The mineral resources, however, appear to have been exploited to some extent from remote times. It is certain that coal was used by the Romans in Northumberland, and some coal ornaments found at Angerton have been attributed to the 7th century. In a 13th-century grant to Newminster Abbey a road for the conveyance of sea-coal from the shore about Blyth is mentioned, and the Blyth coal-field was worked throughout the 14th and 15th centuries. The coal trade on the Tyne did not exist to any extent before the 13th century, but from that period it developed rapidly, and Newcastle acquired the monopoly of the river shipping and coal-trade. Lead was exported from Newcastle in the 12th century, probably from Hexhamshire, the lead mines of which were very prosperous throughout the 16th and 17th centuries. In a charter from Richard I. to Bishop Pudsey creating him earl of Northumberland, mines of silver and iron are mentioned, and in 1240 the monks of Newminster had an iron forge at Stretton. A salt-pan is mentioned at Warkworth in the 12th century; in the 13th century the salt industry flourished at the mouth of the river Blyth, and in the 15th century formed the principal occupation of the inhabitants of North and South Shields. In the reign of Elizabeth glass-houses were set up at Newcastle by foreign refugees, and the industry spread rapidly along the Tyne. Tanning, both of leather and of nets, was largely practised in the 13th century, and the salmon fisheries in the Tyne were famous in the reign of Henry I.

The county of Northumberland was represented by two members in the parliament of 1290, and in 1295 Bamburgh, Corbridge and Newcastle-upon-Tyne each returned two members. From 1297, however, Newcastle was the only borough represented, until in 1524 Berwick acquired representation and returned two members. Morpeth returned two members from 1553. Under the Reform Act of 1832 the county returned four members in two divisions; Berwick and Newcastle were represented by two members each, and Morpeth and Tynemouth by one member each. Under the act of 1885 the county now returns four members in four divisions.

the line of the Roman wall about 3 m. east of the Irthing, is supposed by some antiquaries to be the continuation of the Catrail at Peel Fell; the latter was the probable boundary-fence between the Saxon Bernicia and the British Strathclyde.

The ecclesiastical buildings of the county suffered greatly at the hands of the Scots. Not a few of the churches were massive structures, tower-like in strength, and fit to defend on occasion. Lindisfarne Priory, the oldest monastic ruin in the country, dates from 1093. Hexham Abbey Church, raised over the crypt of Wilfrid's cathedral, has been termed a "text-book of Early English architecture." Of Brinkburn Priory the church remains, and has been well restored. Hulne Abbey was the first Carmelite monastery in Britain. Besides these there are fragments of Newminster Abbey (1139), Alnwick Abbey (1147) and others. An exquisitely graceful fragment of Tynemouth church is associated with some remains of the older priory. St Nicholas's church, Newcastle (1350), was the prototype of St Giles's, Edinburgh. There is a massive Norman church at Norham, and other Norman and Early English churches at Mitford, Bamburgh, Warkworth (with its hermitage), Alnwick (St Michael's) &c., most of them with square towers. The stone roof of the little church at Bellingham, with its heavy semicircular girders, is said to be now unique.

"It may be said of the houses of the gentry herein," writes Fuller, "'quot mansiones, tot munitiones,' as being all castles or castle-like." Except a few dwellings of the 16th century in Newcastle, and some mansions built after the Union of England and Scotland, the older houses are all castles. A survey of 1460 mentions thirty-seven castles and seventy-eight towers in Northumberland, not probably including all the bastle-houses or small peels of the yeomen. At the Conquest Bamburgh, the seat of the Saxon kings, was the only fortress north of York. Norham Castle was built in 1121. None of the baronial castles are older than the time of Henry I. A grass mound represents Wark Castle. Alnwick Castle is an array of walls and towers covering about five acres. Warkworth, Prudhoe and Dunstanburgh castles are fine groups of ruins. Dilston Castle has still its romantic memories of the earl of Derwentwater. Belsay, Haughton, Featherstone and Chipchase castles are joined with modern mansions. The peel-towers of Elsdon, Whitton (Rothbury) and Embleton were used as fortified rectory-houses. Seaton Delaval was the work of Vanbrugh.

The place-names of the county may be viewed as its etymological antiquities. The Danish test-suffix *by* is absent. Saxon *tons*, *hams*, *cleughs* (clefts or ravines) and various patronymics are met with in great numbers; and the Gaelic *knock* (hill) and Cymric *caer*, *dwr* (water), *cefn* (ridge), *bryn* (brow), &c., mingle with the Saxon. Many curiosities of place-nomenclature exist, some strange, some expressive, *e.g.* Blink-bonny, Blaw-wearie, Skirl-naked, Pity Me.

NORTHUMBRIA (*regnum Northanhymbrorum*), one of the most important of the Anglo-Saxon kingdoms, extended from the Humber to the Forth. Originally it comprised two independent kingdoms, Bernicia and Deira (*q.v.*). Each of these had a dynasty of its own. The first known king of the former was Ida, who, according to tradition, acquired the throne in 547 and reigned twelve years. To him the foundation of Bamburgh is attributed. Four of Ida's sons successively occupied his throne: Glappa 559–560, Adda 560–568, Aethelric 568–572, and Theodoric 572–579. Of the first three nothing is known, but Theodoric is said (*Historia Brittonum*) to have been besieged by the Welsh under Urien in Lindisfarne. Theodoric was succeeded by Frithuwald 579–585 or 586 and Hussa 586–592 or 593. Then Æthelfrith (*q.v.*), son of Æthelric, came to the throne. Saxon Chronicle, which is a less reliable authority for Northumbrian history, places his death in the year 588. The compiler of this work, however, seems to have used a regnal list of the Bernician kings, which differed considerably from most of those found in our early authorities. Æthelfrith eventually acquired possession of Deira, probably in 604 or 605, perhaps on Ella's death, expelling his son Edwin (*q.v.*). Thenceforward, with rare intervals, the two kingdoms remained united. Æthelfrith became involved in war with the Welsh towards the end of his reign and captured Chester, probably about 613. Shortly afterwards, in 616, he was defeated and slain in battle on the river Idle by Edwin, who was assisted by the East Anglian king Raedwald. Edwin now became king over both Northumbrian provinces. By his time the kingdom must have reached the west coast, as he is said to have conquered the islands of Anglesea and Man. Under Edwin the Northumbrian kingdom became the chief power in the country. At his death in 633 the kingdom was again divided, Deira falling to his nephew Osric, while Bernicia was occupied by Eanfrith son of Æthelfrith. Both these kings were slain by Ceadwalla in the following year, but shortly afterwards the Welsh king was overthrown by Oswald (*q.v.*), brother of Eanfrith, who reunited the whole of Northumbria under his sway and acquired a supremacy analogous to that previously held by Edwin. After Oswald's defeat and death at the hands of Penda in 642 Bernicia fell to his brother Oswio, while Oswine son of Osric became king in Deira, though probably subject to Oswio. Oswine's death was compassed by Oswio in 651, and the throne of Deira was then obtained by Æthelwald son of Oswald. He is not mentioned, however, after 655, so it is probable that Deira was incorporated in the Bernician kingdom not long afterwards. After Oswio's victory over Penda in 654–655 he annexed the northern part of Mercia to his kingdom and acquired a supremacy over the rest of England similar to that held by his predecessors. The Mercians, however, recovered their independence in 658, and from this time onward Northumbria played little part in the history of southern England. But Oswio and his son Ecgfrith greatly extended their territories towards the north and north-west, making themselves masters of the kingdoms of Strathclyde and Dalriada, as well as of a large part of the Pictish kingdom. Ecgfrith (*q.v.*), who succeeded on Oswio's death in 671, expelled the Mercians from Lindsey early in his reign, but was in turn defeated by them in 679, his brother Ælfwine being slain. From this time onwards the Humber formed the boundary between the two kingdoms. In 684 we hear of the first English invasion of Ireland, but in the following year Ecgfrith was slain and his army totally destroyed by the Picts at a place called Nechtansmere (probably Dunnichen Moss in Forfarshire). The Picts and Britons now recovered their independence; for Aldfrith, apparently an illegitimate son of Oswio, who succeeded, made no attempt to reconquer them. He was a learned man and a patron of scholars, and during his reign the Northumbrian kingdom partially recovered its prosperity. He was succeeded in 705 by his son Osred, and under him and his successors Northumbria began rapidly to decline through the vices of its kings and the extravagance of their donations. Osred was slain in 716. He was succeeded by Coenred 716–718, and Coenred by Osric 718–729. The next king was Ceolwulf, to whom Bede dedicated his *Historia Ecclesiastica* in 731. In the same year he was deposed and forced to become a monk, but was soon restored to the throne. In 737 he voluntarily retired to a monastery and left the kingdom to his cousin Eadberht. The latter appears to have been a vigorous ruler; in the year 740 we hear of his being involved in war with the Picts. Æthelbald of Mercia seems to have taken advantage of this campaign to ravage Northumbria. In 750 Eadberht is said to have annexed a large part of Ayrshire to his [illegible]. Finally in 756, having now allied himself with

Œngus king of the Picts, he successfully attacked Dumbarton (Alcluith), the chief town of the Britons of Strathclyde. Eadberht showed considerable independence in his dealings with the church, and his brother Ecgberht, to whom the well-known letter of Bede is addressed, was from 734 to 766 archbishop of York. In 758 Eadberht resigned the kingdom to his son Oswulf, and became a monk. After his abdication Northumbrian history degenerates into a record of dynastic murders. Oswulf was slain by his household at a place called Mechil Wongtun in 759. Moll Æthelwald, who may have been a brother of Eadberht, succeeded, and after a victory over a certain Oswine, who fell in the battle, abdicated and became a monk probably under compulsion in 765. His successor Alchred claimed descent from Ida, but Simeon of Durham appears to doubt the truth of his claim. He sent an embassy to Charlemagne in 768 and was deposed in 774, whereupon he fled to Bamburgh and afterwards to the Picts. His deposition has been ascribed to a formal act of the Witan, but this seems an antedating of constitutional methods and the circumstances point to a palace revolution. The successor of Alchred was Æthelred son of Moll Æthelwald. In 778 three high-reeves were slain at the instigation of the king. Æthelred was expelled during the next year, perhaps in consequence of this event, andÆlfwald son of Oswulf became king. Ælfwald was murdered by Sicga in 789, whereupon Osred his nephew the son of Alchred succeeded. In 790 the banished Æthelred returned to the throne and drove out Osred, whom he put to death in 792. Æthelred, who had married Ælflaed the daughter of Offa, also killed Œlf and Œlfwine, the sons of Œlfwald and was murdered himself at Corbridge in 796. Oswald, who is called *patricius* by Simeon of Durham, succeeded, but reigned only twenty-seven days, when he was expelled and eventually became a monk. Eardwulf *dux*, who had apparently fled abroad to escape the wrath of Æthelred, was now recalled and held the crown until 807 or 808. Ælfwald then became king, but Eardwulf was restored in 808 or 809 after appealing to the emperor and the pope. Eanred, son of Eardwulf, probably came to the throne in 809 and reigned until 841. It was during his reign in 827 that Northumbria acknowledged the supremacy of Ecgberht, king of Wessex. Eanred was succeeded by his son Æthelred, who was slain in 850, when Osberht came to the throne and reigned until 863. On the expulsion of Osberht, Ella or Ælle, succeeded. The chroniclers emphasize the fact that this king was not of royal descent. He is said to have slain Ragnarr Loðbrok. In the year 866 Loðbrok's sons Ingwaere (I'varr, *q.v.*), Healfdene, Ubba and others brought a vast army to England to avenge the death of their father. In the following year they obtained possession of York. Ella seems now to have made peace with the exiled king Osberht, and their united forces succeeded in recovering the city. In the great battle which ensued the Northumbrian army was annihilated and both kings slain (the death of Ella, according to Irish tradition, being due to the treachery of one of his followers). The southern part of Northumbria now passed entirely into the hands of the invaders, but they allowed a certain Ecgberht to reign over the portion of the kingdom north of the Tyne. Ecgberht was expelled in 872 and died in the course of the following year. His successor Ricsig died in 876 and was followed by Ecgberht II., who reigned until 878. He was the last English king who reigned in Northumbria. After him the chief power north of the Tyne came into the hands of a certain Eadulf of Bamburgh, who did not take the kingly title, but accepted the overlordship of Alfred the Great perhaps in 886. In the winter of 874–875 Healfdene returned to Northumbria, which he partitioned among his followers. He was probably killed in Ireland in 877. Simeon of Durham makes his death occur about the same time, after he had been expelled from his country and had lost his reason as a punishment for his misdeeds. After an interregnum of a few years a certain Guthred became king in 883. He is said to have been a slave and to have been appointed king at the command of St Cuthbert, who appeared to Eadred the abbot of Carlisle in a dream. There is some reason for the conjecture that he belonged to the family of Loðbrok. He died in 894, after which date little is known of Northumbrian history for a number of years. About the year 919 the country was invaded by Raegenald (Rögnvaldr grandson of I'varr), a Norwegian king from Ireland, who seized York and occupied the lands of St Cuthbert. Aldred, the son of Eadulf, who now ruled north of the Tyne, appealed to Constantine II., king of the Scots, for help, but the Scottish and Northumbrian armies were defeated at Corbridge. Shortly after this, however, all the northern princes submitted to Edward the Elder. Raegenald was succeeded by Sihtric (Sigtryggr, another grandson of I'varr), who married Æthelstan's sister. He died in 926, and his brother and successor Guthfrith was soon afterwards expelled by Æthelstan and fled to Eugenius, king of Strathclyde. The Welsh and Scottish kings, however, both submitted to Æthelstan, and Guthfrith was again driven into exile. He died in 934, leaving a son Anlaf (Olafr), Godfredsson or Godfreyson. In 934 Æthelstan invaded Scotland as far as the Tay. In 937 a great fleet and army were brought together by Constantine and Anlaf, the son of Sihtric, another Norwegian chieftain who had allied himself with the Scots, helped by Anlaf Godfreyson from Ireland. Æthelstan, however, won a complete victory over them at a place called Brunanburh, probably Burnswark in Dumfriesshire. Anlaf Godfreyson returned to Ireland and died in 941–942 in a raiding expedition in the south of Scotland. Anlaf the son of Sihtric again came to England in 940 just after the death of Æthelstan. He became king of Northumbria and extended his territories as far as Watling Street. Peace was made with King Edmund by the capture of King Anlaf, and a good deal later by the confirmation of King Raegenald, brother to Anlaf Godfreyson and cousin to Anlaf Sihtricson. About two years later, however, both these kings were expelled by Edmund, and the whole of Northumbria was brought under his power. About the second year of Eadred's reign there was another revolt and Eric Bloodaxe, the exiled king of Norway, obtained the throne. During the next few years the kingdom alternated between Eric and Anlaf until 954, when Eadred finally succeeded in establishing his power. Eric was killed by Maccus, the son of Anlaf, while Anlaf himself withdrew to Ireland, where he died in 980. Eadred placed Northumbria in the hands of a certain Osulf, who is called high-reeve at Bamburgh. In the reign of Edgar, Oslac was appointed earl of southern Northumbria, but he was banished at the beginning of the following reign. The next earl was Waltheof and after him Uhtred, who defeated Malcolm II., king of the Scots, in 1006. Twelve years later, however, the Northumbrians were completely defeated at Carhan, and Lothian was annexed by the Scots (see LOTHIAN). Uhtred was slain by the orders of Canute, who gave the province to Eric (Eirikr) earl of Lade. Shortly afterwards, however, part of it at least came into the hands first of Eadulf and then Aldred and another Eadulf, the brother and sons respectively of Uhtred. The younger Eadulf was slain by Siward, probably in the reign of Hardacanute. Siward held the earldom till his death in 1055, when it was given to Tostig, son of earl Godwine, and after his banishment to Morkere, son of Ælfgar, earl of Mercia. Tostig's banishment led to the invasion of Harold Hardrada, king of Norway, and the battle of Stamford Bridge, in which both perished.

NORTH WALSHAM, a market town in the eastern parliamentary division of Norfolk, England; 131 m. N.E. by N from London by the Great Eastern railway. Pop. of urban district (1901) 3981. It lies in a pastoral district near the river Ant, a tributary of the Bure. The church of St Nicholas is a fine Perpendicular structure exhibiting the flint-work common to the district, and possessing a beautiful south porch and the ruins of a massive western tower which partly collapsed early in the 18th century. A grammar school was founded in 1606, and reorganized and moved to new buildings in modern times. There

a rough country with but little cultivation, under the political control of Peshawar. West and south-west of the Khyber again is the country of the Afridis and the Orakzais. The boundary of the province here follows the line of the Safed Koh, which overlooks the Afridi Tirah and the upper Kurram valley. Dotted with towered hamlets and stately *chinar* groves the valley of the Kurram runs south-east from the Peiwar Kotal (below the great peak of Sikaram), past Thal in the Miranzai valley, through the southern Kohat hills to Bannu. South of the Kurram is the Tochi valley, separating it from Waziristan, an isolated mountainous district bounded on the south by the Gomal and the gorges that lead to the Wana plain. The lower ridges of the frontier mountain system are usually bare and treeless, but here and there, as in the Kaitu valley, in northern Waziristan and round Kaniguram in the south, are forest clad and enclose narrow but fertile and well-irrigated dales. In places, too, as, for instance, round Shawal, the summer grazing ground of the Darwesh Khel Waziris, and on the slopes of Pir Ghol, there is good pasturage and a fair sprinkling of deodars. The valleys of the Tochi and Wana are both fertile, but are very different in character. The former is a long narrow valley, with a rich fringe of cultivation bordering the river; the latter is a wide open alluvial plain, cultivated only on one side, and for the rest rough stony waste. South of the Gomal the Suliman Range culminates in the famous Takht-i-Suliman in the Largha Sherani country, a political dependency of Dera Ismail Khan district. The Kaisargarh peak of the Takht-i-Suliman is 11,300 ft. above sea-level.

Mountain Systems.—The mountains of the Hindu Kush running from east to west form the northern boundary of the province, and are met at the north-east corner of the Chitral agency by the continuation of an outer chain of the Himalayas after it crosses the Indus above the Kagan valley. From this chain minor ranges run in a south-westerly direction the whole length of Bajour and Swat, till they merge into the Mohmand hills and connect the mid-Himalayas with the Safed Koh. The range of the Safed Koh flanks the Kurram valley and encloses the Kabul basin, which finds its outlet to the Indus through the Mohmand hills. The Suliman system lies south of the Gomal unconnected with the northern hills. To the east the Safed Koh extends its spurs into the Kohat district. The Salt Range crosses the Indus in the Mianwali *tahsil* of the Punjab, and forms the boundary between Bannu and Dera Ismail Khan, merging eventually in the Waziri hills. The chief peaks in the province are Kaisargarh (11,300 ft.) and Pir Ghol (11,580 ft.) in Waziristan; Shekh Budin (4516 ft.), in the small range; Sikaram (15,621 ft.) n the Safed Koh; Istragh (18,900 ft.), Kachin (22,641 ft.) and irach Mir (25,426 ft.), in the Hindu Kush on the northern border the Chitral agency; while the Kagan peaks in Hazara district ı from 10,000 ft. to 16,700 ft.

Rivers.—With the exception of the Kunhar river, which flows m the Kagan valley to the Jhelum, the whole drainage of the ince eventually finds its way into the Indus. The Indus enters province between tribal territory and Hazara district. After ng Hazara it flows in a southerly direction between the Punjab the North-West Frontier Province, till it enters Mianwali t of the Punjab, from which it emerges to form again the ı boundary of the province. From the east it is fed by three rivers of Hazara district (see INDUS). At Attock the Kabul rings down to the Indus the whole drainage of Kafiristan, Panjkora, Swat and Peshawar district (see KABUL RIVER). rram river rises in the southern slopes of the Safed Koh, leaving the Kurram valley passes through the Kohat hills s Bannu district. Three miles below Lakki it is joined by or Gambela, which carries the drainage of North Waziristan. am then empties itself into the Indus. From this point ves the province the Indus receives no tributary of any . The Gomal river drains a large area of central Afghan-rms the most important povindah (or Kafila) route on the

an Races.—The North-West Frontier Province as ted may be described as the country of the Pathans :rue Pathan is possibly of Indian extraction. But ucleus have collected many tribes of foreign origin. e now become blended by the adoption of a common remain tribally distinct; all alike have accepted e invented traditions of common descent which resent association. For centuries these tribes independence in the rugged hills which flank gdom of Afghanistan. In the 15th century ttle in the plains. The 16th century saw the ablished in their present homes. The spirit hich always characterized them soon brought with the Mogul empire. In the 17th century, le, the settlers in the plains wrested from hich left them almost as independent as hills. The invasion in 1738 of Nadir Shah, vince from Peshawar to Dera Ismail Khan.

is a landmark in the history of the frontier. From his death to the rise of Ranjit Singh, the frontier districts remained an appendage of the Durani empire. Little control was exercised by the rulers of Kabul, and the country was administered by local chiefs or Afghan Sirdars very much as they pleased. The Sikh invasions began in 1818, and from that date to the annexation by the British government the Sikhs were steadily making themselves masters of the country. After the Second Sikh War, by the proclamation of the 29th of March 1849, the frontier districts were annexed by the British government. From that time until the creation of the North-West Frontier Province the settled districts formed part of the Punjab, while the independent tribes were controlled at different times by the Punjab government, and the government of India. Their turbulence still continued, and since 1849 they have been the object of over fifty punitive expeditions. The chief tribes, under the political control of the N.W. Frontier agency, besides Chitralis and Bajouris, are the Utman Khel, Yusafzais, Hassanzais, Mohmands, Afridis, Jowakis, Mullagoris, Orakzais, Zaimukhts, Chamkannis, Khattaks, Bangashes, Turis, Waziris, Battannis (Bhitanis) and Sheranis. These tribes are referred to under separate headings.

Creation of the Province.—The North-West Frontier Province differs from the older provinces of India in having been artificially built up out of part of a previous province together with new districts for a definite administrative purpose. The proposal to make the frontier districts into a separate province, administered by an officer of special experience, dates back to the viceroyalty of Lord Lytton, who, in a famous minute of the 22nd of April 1877, said:—

"I believe that our North-West Frontier presents at this moment a spectacle unique in the world; at least I know of no other spot where, after 25 years of peaceful occupation, a great civilized power has obtained so little influence over its semi-savage neighbours, and acquired so little knowledge of them, that the country within a day's ride of its most important garrison is an absolute *terra incognita*, and that there is absolutely no security for British life a mile or two beyond our border."

The result of this minute was that a frontier commissionership, including Sind, was sanctioned by the home government, and Sir Frederick (afterwards Lord) Roberts had been designated as the first Commissioner, when the outbreak of the Second Afghan War caused the project to be postponed. It was afterwards shelved by Lord Ripon. Twenty-three years elapsed before the idea was revived and successfully brought to completion by Lord Curzon, whose scheme was on a more modest scale than Lord Lytton's. It omitted Sind altogether, and confined the new province to the Pathan trans-Indus districts north of the Gomal. The purpose of the change was to subject all the independent tribes from Chitral to the Gomal Pass to the control of a single hand, and to ensure a firm and continuous policy in their management. The administration of the province is conducted by a chief Commissioner and Agent to the Governor-General.

Population.—In the census of 1901 the operations were extended for the first time to the Kurram Valley and the Sherani country, trans-frontier territories containing a population of 66,628 souls, which had not been previously enumerated. The military cantonments and posts in Malakand, Dir, Swat and Chitral were also enumerated, as were those in the Tochi Valley (the Northern Waziristan Agency) and in the Gomal (the Southern Waziristan Agency), the former figures being included in the census returns of Bannu district, and those of the latter in the returns of Dera Ismail Khan. The total population of the province was 2,125,480; but this figure omits the great majority of the frontier tribes. The province is almost wholly agricultural. The urban population is only one-eighth of the total, and shows no tendency to increase. There are no large industries to attract the population to the towns; these, except Peshawar and Dera Ismail Khan, are either expansions of large agricultural villages or bazaars which have grown up round the many cantonments of the province. The great majority of the population are Pathan by race and Mahommedan by religion. The predominant language is Pushtu (*q.v.*). The conquered strata of the population speak servile Indian dialects, called Hindki in the north and Jatki in the south, while Gujari is spoken by the large Gujar population in the hills of Hazara and north of Peshawar.

Crops and Climate.—The area under cultivation represents an average of 1·3 acres per head of the total, and of nearly 1·5 acres per head of the rural population. The limit of profitable cultivation has almost been reached. It is therefore from an improvement in the methods of agriculture rather than to an extension of the area under cultivation that recourse must be had to supply the needs of a rapidly increasing population. The Pathan, however, is a slovenly cultivator and slow to adopt any new methods which involve increased effort. The principal crops are—in the cold weather, maize and *bajra*; in the spring, wheat, barley and gram. Rice and sugar-cane are largely grown on the irrigated lands of Hazara, Peshawar and Bannu districts, and the well and canal irrigated tracts of Peshawar district produce fine crops of cotton and tobacco. In the trans-border agencies the valleys of the Swat, Kurram and Tochi rivers yield abundant rice crops. The province is mainly a mountainous region, but includes the Peshawar valley and the broad riverain tract of the Indus in Dera Ismail Khan district. The climatic conditions are hence extremely diversified. Dera Ismail Khan district is one of the hottest areas in the Indian continent, while over the mountain region to the north the weather is temperate in the summer and intensely cold in the winter. The air is generally dry, and hence the daily and annual range of temperature is frequently very large. There are two seasons of rainfall over the province: the monsoon season, when supplies of moisture are brought up by the ocean winds from the Arabian Sea and the Bay of Bengal; and the winter season, when storms advancing eastwards from Persia and the Caspian districts occasion winds, widespread rain and snowfall. Both sources of supply are precarious, and instances are not infrequent of the almost entire failure of either the winter or the summer rainfall.

Irrigation.—Canals are the main source of irrigation in the province, and fall under three heads: (1) Private canals in the various districts, the property of the people and managed on their behalf; (2) the Michni Dilazak and Shabkadar branch in Peshawar, constructed by the district board, which receives water rates; and (3) the Swat and Kabul river canals, which were constructed by and are the property of government, and are managed by the irrigation department.

About 20% of the cultivated area is irrigated by canals, 2% by wells and 3% by perennial streams. Throughout the province the area in which well-cultivation is possible is extremely limited, and the field has already been covered. In Kohat and Hazara any considerable extension of canal irrigation is out of the question, but in the remaining districts much can still be done to promote irrigation.

Railways.—The railways of the province are mostly intended in the first instance for strategic purposes. The main line of the North-Western railway runs from Rawalpindi to Peshawar, whence it has been extended 9 m. to Jamrud at the entrance to the Khyber Pass. From Nowshera a frontier light line, involving a break of gauge, is carried to Dargai at the foot of the Malakand Pass. From Rawalpindi again another branch extends to the Indus at Kushalgarh. A bridge has been built at this point, and the railway continued through Kohat to Thal at the entrance of the Kurram valley.

See *North-West Frontier Province Gazetteer* (Calcutta, 1906); Sir Thomas Holdich, *The Indian Borderland* (1901); Paget and Mason, *Record of Frontier Expeditions* (1884). (T. H. H.)

NORTH-WEST TERRITORIES. The North-West Territory was at first a general name given to all the districts of British North America lying N.W. of the St Lawrence basin. In the British North America Act of 1867 provision was made for the admission to Canada of "Rupert's Land and the North-West Territory." Manitoba was formed out of this district in 1870. The territory remaining was then called the "North-West Territories," and until other arrangements were made was to be under the governor of Manitoba. In 1876 the district of Keewatin was established; in 1881 the limits of Manitoba were enlarged, and in 1882 four new districts—Assiniboia, Saskatchewan, Alberta and Athabasca—were organized. In 1905 the two first of these with some modification became the province of Saskatchewan, and the two last the province of Alberta. The territories of Canada outside of the eight provinces and Yukon district on the mainland are now organized as the North-West Territories, and are under an administrator or acting governor. They include the districts of Keewatin, Ungava, Mackenzie and Franklin. These territories have an Indian population of about 8500, the

	Feet above Sea-level.	Mean Temperature, F.		Average Precipitation, Inches.
		Summer.	Winter.	
Norway House, Keewatin .	710	..	..	19·26
York Factory . .	0	48·7°	12·6	28·73
Fort Simpson, 41° 51′ N. .	400	59·4°	−10°	..
Fort Franklin, 65° 12′ N. .	500	50·4°	−17°	..

With the exception of southern Keewatin and the district south of James Bay the animals of the North-West Territories are chiefly fur-bearing. Great herds of musk-oxen are found in Mackenzie, and vast flocks of ducks, geese and other migratory birds spend summer in the northern wilds. Except in southern Keewatin and the James Bay district the flora is decidedly northern, becoming Arctic in the far north. Forest trees grow small and ill formed. Sedges abound, exceeding grasses; mustards are abundant, and saxifrages plentiful. Mosses and lichens are numerous.

The history of the north-west follows three different branches. (1) The story of Arctic exploration and the search for the North-West Passage, with a concentration of interest upon the name of Sir John Franklin, whose loss was followed by a great development of investigation in the Arctic regions; (2) the story of the fur trade, connected with the Hudson Bay forts, from the establishment of the first Charles Fort in 1669; (3) the story of immigration, the beginning of which is to be found in the coming of the Selkirk colonists, the real founders of Manitoba (*q.v.*), to Red river by way of Hudson Bay.

NORTHWICH, a market town in the Northwich parliamentary division of Cheshire, England, 171½ m. N.W. of London, on the London and North-Western railway and the Cheshire lines. Pop. of urban district, 17,611. It lies in a low open valley at the confluence of the rivers Weaver and Dane, and is the centre of the principal salt-producing district in the United Kingdom. In its narrow and irregular streets many of the houses are strongly bolted to keep them secure from the subsidences which result not infrequently from the pumping of brine. Despite these precautions many accidents have occurred; some of the houses have sunk or stand at fantastic angles, and in 1892 a portion of the High Street, which had subsided below the level of the Weaver, had to be raised 6 ft. Both rock salt and white salt obtained by evaporation from brine are exported. The amount supplied by the whole district, which includes the neighbouring town of Winsford 6 m. south, is about 1,500,000 tons annually. The white salt is shipped chiefly to America. The principal buildings are the church of St Helen, Witton, noted for its finely carved roof of the 17th century, a museum and free library and market house. The Verdin Park was presented to the town by Robert Verdin, M.P. for Northwich, in 1887. There is a considerable industry in the building of flat boats to convey salt to Liverpool, the river Weaver being navigable, and connected by a hydraulic lift, 1 m. from the town, with the Trent and Mersey Canal on a higher level. Rope- and brick-making, iron and brass-founding, chemical manufactures, brewing and tanning, are also carried on.

NORTON, CAROLINE ELIZABETH SARAH (1808–1877), afterwards Lady Stirling-Maxwell, English writer, was born in London in 1808. One of the three beautiful granddaughters of Richard Brinsley Sheridan, daughters of his son Thomas, the "three Graces" of London society in the reign of George IV., she began to write before she was out of her teens. Her two sisters Helen and Georgina became respectively Lady Dufferin and duchess of Somerset. Lady Dufferin described the sisters to Disraeli with characteristic modesty. 'Georgey's the beauty," she said, "and Carry's the wit, and I ought to be the good one, but I am not." At the age of seventeen, Caroline published a [illegible] on his, she had left his house for her sister's, had "condoned" on further good promises, and had returned, to find matters worse. The husband's persecutions culminated in 1836 in an action brought against Lord Melbourne for seduction of his wife, which the jury decided against Mr Norton without leaving the box. The case against Lord Melbourne was so weak that it was suggested that Norton was urged to make the accusation by Melbourne's political enemies, in the hope that the scandal would prevent him from being premier when the princess Victoria should succeed William IV. In 1853 legal proceedings between Mrs Norton and her husband were again entered on, because he not only failed to pay her allowance, but demanded the proceeds of her books. Mrs Norton made her own experience a plea for addressing to the queen in 1855 an eloquent letter on the divorce laws, and her writings did much to ripen opinion for changes in the legal status of married women. George Meredith, in *Diana of the Crossways*, used her as the model for his "Diana." Mrs Norton was not a mere writer of elegant trifles, but was one of the priestesses of the "reforming" spirit; her *Voice from the Factories* (1836) was a most eloquent and rousing condemnation of child labour. *The Dream, and other Poems* appeared in 1840. *Aunt Carry's Ballads* (1847), dedicated to her nephews and nieces, are written with charming tenderness and grace. Later in life she produced three novels, *Stuart of Dunleath* (1851), *Lost and Saved* (1863), and *Old Sir Douglas* (1868). Mrs Norton's last poem was the *Lady of La Garaye* (1862), her last publication the half-humorous, half-heroic story of *The Rose of Jericho* in 1870. She died on the 15th of June 1877. Mr Norton died in 1875; and Mrs Norton in the last year of her life married Sir W. Stirling-Maxwell.

See *The Life of Mrs Norton*, by Jane G. Perkins (1909).

NORTON, CHARLES BOWYER ADDERLEY, 1ST BARON (1814–1905), English politician, eldest son of Charles Clement Adderley (d. 1818), one of an old Staffordshire family, was born on the 2nd of August 1814, and inherited Hams Hall, Warwickshire and the valuable estates of his great-uncle, Charles Bowyer Adderley, in 1826. He was educated at Christ Church, Oxford, and in 1841 he became one of the members of parliament for Staffordshire, retaining his seat until 1878, when he was created Baron Norton. Adderley's official career began in 1858, when he served as president of the board of health and vice-president of the committee of the council on education in Lord Derby's short ministry. Again under Lord Derby he was under-secretary for the colonies from 1866 to 1868, being in charge of the act which called the Dominion of Canada into being, and from 1874 to 1878 he was president of the board of trade. He died on the 28th of March 1905. Norton was a strong churchman and especially interested in education and the colonies. In 1842 he married Julia (1820–1887) daughter of Chandos, 1st Lord Leigh, by whom he had several sons. His eldest son Charles Leigh (b. 1846) became 2nd Baron Norton. Another son, James Granville Adderley (b. 1861), vicar of Saltley, Birmingham, became well known as an advocate of Christian socialism.

See W. S. Childe-Pemberton, *The Life of Lord Norton* (1909).

NORTON, CHARLES ELIOT (1827–1908), American scholar and man of letters, was born at Cambridge, Massachusetts, on the 16th of November 1827. His father, Andrews Norton (1786–1853) was a Unitarian theologian, and Dexter professor of sacred literature at Harvard; his mother was Catherine Eliot, Charles William Eliot, president of Harvard, being his cousin. Charles Eliot Norton graduated from Harvard in 1846, and started in business with an East Indian trading firm in

Boston, for which he travelled to India in 1849. After a tour in Europe, he returned to America in 1851, and thenceforward devoted himself to literature and art.

In 1881 Norton inaugurated the Dante Society, whose first presidents were Longfellow, Lowell and Norton. He translated the *Vita Nuova* (1860 and 1867) and the *Divina Commedia* (1891–1892, 2 vols.). After work as secretary to the Loyal Publication Society during the Civil War, he edited from 1864–1868 the *North American Review*, in association with James Russell Lowell. In 1861 he and Lowell helped Longfellow in his translation of Dante and in the starting of the informal Dante Club. In 1875 he was appointed professor of the history of art at Harvard, a chair which was created for him and which he held until he became *emeritus* in 1898. The Archaeological Institute of America chose him to be the first president (1879–1890). From 1856 until 1874 Norton spent much time in travel and residence on the continent of Europe and in England, and it was during this period that his friendships began with Carlyle, Ruskin, Edward FitzGerald and Leslie Stephen, an intimacy which did much to bring American and English men of letters into close personal relation. Norton, indeed, had a peculiar genius for friendship, and it is on his personal influence rather than on his literary productions that his claim to remembrance mainly rests. From 1882 onward he confined himself to the study of Dante, his professorial duties, and the editing and publication of the literary memorials of many of his friends. In 1883 came the *Letters of Carlyle and Emerson*; in 1886, 1887 and 1888, *Carlyle's Letters and Reminiscences*; in 1894, the *Orations and Addresses of George William Curtis* and the *Letters of Lowell*. Norton was also made Ruskin's literary executor, and he wrote various introductions for the American "Brantwood" edition of Ruskin's works. His other publications include *Notes of Travel and Study in Italy* (1859), and an *Historical Study of Church-building in the Middle Ages: Venice, Siena, Florence* (1880). He organized exhibitions of the drawings of Turner (1874) and of Ruskin (1879), for which he compiled the catalogues.

He died on the 21st of October 1908 at "Shady-hill," the house where he was born. He bequeathed the more valuable portion of his library to Harvard. In 1862 he had married Miss Susan Sedgwick. He had the degrees of Litt.D. (Cambridge) and D.C.L. (Oxford), as well as the L.H.D. of Columbia and the LL.D. of Harvard and of Yale.

NORTON, THOMAS (1532–1584), English lawyer, politician and writer of verse, was born in London in 1532. He was educated at Cambridge, and early became a secretary to the Protector Somerset. In 1555 he was admitted a student at the Inner Temple, and married Margery Cranmer, the daughter of the archbishop. From his eighteenth year Norton had begun to compose verse. We find him connected with Jasper Heywood; as a writer of "sonnets" he contributed to *Tottel's Miscellany*, and in 1560 he composed, in company with Sackville, the earliest English tragedy, *Gorboduc*, which was performed before Queen Elizabeth in the Inner Temple on the 18th of January 1561. In 1562 Norton, who had served in an earlier parliament as the representative of Gatton, became M.P. for Berwick, and entered with great activity into politics. In religion he was inspired by the sentiments of his father-in-law, and was in possession of Cranmer's MS. code of ecclesiastical law; this he permitted John Foxe to publish in 1571. He went to Rome on legal business in 1579, and from 1580 to 1583 frequently visited the Channel Islands as a commissioner to inquire into the status of these possessions. Norton's Calvinism grew with years, and towards the end of his career he became a rabid fanatic. His punishment of the Catholics, as their official censor from 1581 onwards, led to his being nicknamed "Rackmaster-General." At last his turbulent puritanism made him an object of fear even to the English bishops; he was deprived of his office and thrown into the Tower. Walsingham presently released him, but Norton's health was undermined, and on the 10th of March 1584 he died in his house at Sharpenhoe, Bedfordshire.

The *Tragedie of Gorboduc* was first published, very corruptly, in 1565, and, in better form, as *The Tragedie of Ferrex and Porrex*, in 1570. Norton's early lyrics have in the main disappeared. The most interesting of his numerous anti-Catholic pamphlets are those on the rebellion of Northumberland and on the projected marriage of Mary Queen of Scots to the duke of Norfolk. Norton also translated Calvin's *Institutes* (1561) and Alexander Nowell's *Catechism* (1570).

Gorboduc appears in various dramatic collections, and was separately edited by W. D. Cooper (Shakespeare Soc. 1847), and by Miss Toulmin Smith in Volkmöller's *Englische Sprach- und Literaturdenkmale* (1883). The best account of Norton, and his place in literary history, is that of Sidney Lee in his *Dictionary of National Biography*. (E. G.)

NORWALK, a city of Fairfield county, Connecticut, U.S.A., on the Norwalk river, in the township of Norwalk, adjoining the city of South Norwalk in the same township, and 13 m. W.S.W. of Bridgeport. Pop. (1900) 6125 (1023 foreign-born and 189 negroes); (1910) 6945; of the township (1900) 19,932; (1910) 24,211. The city is served by the New York, New Haven & Hartford railroad, by interurban electric lines, and by steamboats to New York. The city has a green with several old churches and some fine elms, a public library, a hospital, a state armoury and a county children's home. The Norwalk Chapter of the Daughters of the American Revolution has erected here a drinking fountain in memory of Nathan Hale, who obtained in Norwalk his disguise as a Dutch school teacher and then started on his fatal errand to Long Island. Norwalk has some manufactures, including woollen goods and typewriting machines; and there is some coasting trade, oysters especially being shipped from Norwalk.

The site of the township was purchased from the Indians in 1640 by Roger Ludlow and Daniel Patrick, Ludlow giving six fathoms of wampum, six coats, ten hatchets, ten hoes, ten knives, ten scissors, ten jew's harps, ten fathoms of tobacco, three kettles of six hands, and about ten looking-glasses for all the land between the Norwalk and Saugatuck rivers and extending one day's walk N. from the Sound. The first settlement in the township was made in 1650 at what is now the village of East Norwalk by a small company from Hartford, and the township was incorporated in the next year. The village was burned by the British under Governor Tryon on the 12th of July 1779, and the chair in which it is alleged Tryon sat, on Grumman's Hill, as he watched the flames, has been kept as a relic. Norwalk was incorporated as a borough in 1836 and was chartered as a city in 1893.

See C. M. Selleck, *Norwalk* (Norwalk, 1896); and *Norwalk after Two Hundred and Fifty Years, an Account of the Celebrations of the 250th Anniversary of the Charter of the Town* (South Norwalk, 1901).

NORWALK, a city and the county-seat of Huron county, Ohio, U.S.A., about 55 m. W.S.W. of Cleveland. Pop. (1900) 7074, including 762 foreign-born and 101 negroes; (1910) 7858. It is served by the Lake Shore & Michigan Southern, and the Wheeling & Lake Erie railways, and by interurban electric lines. It has a public library in which a small museum is maintained by the Firelands Historical Society. The city is the centre of a rich agricultural district. Among its manufactures are machine-shop products (the Wheeling & Lake Erie has shops here), iron and steel, pianos and automobile fittings.

Norwalk was settled in 1817 and was named from Norwalk, Connecticut; it was incorporated as a town in 1829 and chartered as a city in 1881. Huron county and Erie county immediately N. are the westernmost of the counties created from the "Western Reserve," and comprise the "Fire Lands" grant made in 1792 by the state of Connecticut to the people of Greenwich, Fairfield, Danbury, Ridgefield, Norwalk, New Haven, East Haven and New London to indemnify them for their fire losses during the British expeditions in Connecticut under Governor Tryon in 1779 and Benedict Arnold in 1781. The Connecticut grantees were incorporated in 1803 as "the proprietors of the half-million acres of land lying south of Lake Erie."

so as to include not only the highest land in the peninsula, but a considerable part of the general E. and S.E. slope. The high plateau broadens and follows the S.W. sweep of the coast. Pursuing it S. the Dovre Fjeld is marked off by the valleys of the rivers Driva and Sundal, Laagen (or Laugen) and Rauma, and the fjords of the coastland of Nordmöre. Here Snehætta reaches a height of 7615 ft., and the Romsdal (the name under which the Rauma valley is famous among tourists) is flanked y many abrupt jagged peaks up to 6000 ft. high. The valley ' the Laagen forms the upper part of Gudbrandsdal. East of 's and S.E. of the Dovre is another fjeld, Rondane, in which igronden rises to 6929 ft. South of the Otta valley is Jotunheim Jötun Fjeld, a sparsely peopled, in parts almost inaccessible, rict, containing the highest mountains in Scandinavia, lhöpiggen reaching 8399 ft. On the seaward side of nheim is Jostedalsbræ, a great snow-field in which Lodals-en reaches a height of 6795 ft. South of Sogne Fjord N.) mountains between 5000 and 6000 ft. are rare; but in gskarvet there are points about 6500 ft. high, and in the nger Vidda (waste), a broad wild upland E. of Hardanger Haarteigen reaches 6063 ft. The highland finally sinks the S. extremity of Norway in broken masses and short f hills, separated by valleys radiating S.E., S. and W.

s.—The largest glacier in continental Europe is Jostedals-h an area of 580 sq. m., the snow-cap descending to 500 ft. Several of its branches fall nearly to the sea, iumsbræ above the Fjærland branch of Sogne Fjord. st branch is the Nigardsbræ. Skjærgaard or island-fence.

is pierced through by a vast natural tunnel 400 ft. above the sea; and Hestmandö ("horseman island"), on the Arctic circle, is justly named from its form. The dark blue waters of the inner leads and fjords are clouded, and show a milky tinge on the surface imparted by the glacier-fed rivers. Bare rock is the dominant feature of the coast and islands, save where a few green fields surround a farmstead. In the N., where the snow-line sinks low, the scenery at all seasons has an Arctic character.

Christiania Fjord, opening from the N. angle of the Cattegat and Skagerrack, differs from the great fjords of the W. Its shores are neither so high nor so precipitous as theirs; it is shallower, and contains a great number of little islands. From its mouth, round Lindesnæs, and as far as the Bukken Fjord (Stavanger) there are many small fjords, while the skjærgaard provides an inner lead only intermittently. Immediately S. of Bukken Fjord, from a point N. of Egersund, the flat open coast of Jæderen, dangerous to shipping, fringing a narrow lowland abundant in peat-bogs for some 30 m., forms an unusual feature. Bukken Fjord is broad and island-studded, but throws off several inner arms, of which Lyse Fjord, near Stavanger, is remarkable for its extreme narrowness, and the steepness of its lofty shores. The Hardanger Fjord, penetrating the land for 114 m., is known to more visitors than any other owing to its southerly position; but its beauty is exceeded by that of Sogne Fjord and Nord Fjord farther N. Sogne is the largest and deepest fjord of all; its head is 136 m. from the sea, and its extreme depth approaches 700 fathoms. Stor Fjord opens inland from Aalesund, and one of its head branches, Geiranger Fjord, is among the most celebrated in Norway. Trondhjem Fjord, the next great fjord northward, which broadens inland from a narrow entrance, lacks grandeur, as the elevation of the land is reduced where the Trondhjem depression interrupts the average height of the plateau. The coast N. of Trondhjem, though far from losing its beauty, has not at first the grandeur of that to the south, nor are the fjords so extensive. The principal of these are Namsen, Folden and Vefsen, at the mouth of which is Alsten Island, with the mountains called Syv Söstre (Seven Sisters), and Ranen, not far S. of the Arctic circle. Svartisen sends its glaciers seaward, and the scenery increases in magnificence. Salten Fjord, to the N. of the great snow-field, is connected with Skjerstad Fjord by three narrow channels, where the water, at ebb and flow, forms powerful rapids. The scenery N. of Salten is unsurpassed. The Lofoten and Vesteraalen islands are separated from the mainland by the Vest Fjord, which is continued inland by Ofoten Fjord. If these two be considered as one fjord, its length is about 175 m., but the actual penetration of the mainland is little more than a fifth of this distance. The main fjords N. of Vesteraalen have a general northerly direction; among them is Lyngen Fjord near Tromsö, with high flanking cliffs and glaciers falling nearly to the sea. Alten Fjord is remarkable for the vegetation on its shores. From Lofoten N. there is a chain of larger islands, Senjen, Kvalö, Ringvadsö, Sorö, Stjernö, Seiland, Ingö and Magerö. These extend to the North Cape, but hereafter the skjærgaard ends abruptly. The coast to the E. is of widely different character; flat mountain wastes descend precipitously to the sea without any islands beyond, save Vardö, with two low islets at the E. extremity of Norway. The fjords are broader in proportion to their length. The chief are Porsanger, Laxe and Tana, opening N., and Varanger opening E. N. of this fjord the land is low and the landscape monotonous; on the S. a few island and branch fjords break the line of the shore.

Fjords.

Stavanger Fjord has an extreme depth of 380 fathoms; Hardanger Fjord 355, Sogne Fjord 670, Nordfjord 340, Trondhjem Fjord 300, Ranen Fjord 235, Vestfjord 340, Alten Fjord 225, and Varanger Fjord 230. Marine terraces are met with in the E. of the country, and near Trondhjem, at 600 ft. above sea-level; and they are also seen at a slighter elevation at the heads to be observed in northern Norway (*e.g.* in Alten Fjord), and in some cases there are two lines at different altitudes. The land above the raised beach is generally bare and unproductive, and human habitation tends to confine itself in consequence to the lower levels.

Hydrography.—In S.E. Norway there are long valleys, carrying rivers of considerable size, flowing roughly parallel but sometimes uniting as they approach the sea. The Glommen, rising N. of Roros in Aursund Lake, and flowing with a southerly curve parallel with the frontier for 350 m. to the Skagerrack, is the largest river in the Scandinavian peninsula. Its upper middle valley is called Österdal,[1] the richest timber district in Norway. Its drainage area is 16,000 sq. m. Seven miles above its mouth it forms the fine Sarpsfos, and not far above this it traverses the large lake Öieren. A right bank tributary, the Vormen, has one of its sources (under the name of Laagen) in Lake Lesjekogen, which also drains in the opposite direction by the Rauma. The stream, after watering Gudbrandsdal, enters Mjösen, the largest lake in Norway. It is 60 m. long, but, like most of the greater Norwegian lakes, has no great breadth. It has, however, an extreme depth of 1500 ft. The Drammen river, which enters a western arm of Christiania Fjord below the town of Drammen, is the common outlet of several large rivers. The Hallingdal river drains the valley of that name, and forms Lake Kröderen, which is connected with the Drammen river by the Snarum. A short distance above the junction the Drammen flows out of Lake Tyrifjord, 50 sq. m. in area, into which flow the united waters of the Rand, from the valley district of Valdres, and the Bægna. The whole basin of the Drammen has an area of 6600 sq. m. The rivers between Christiania Fjord and Lindesnæs preserve the characteristics of those of the Glommen and Drammen systems. They rise on the Hardanger Vidda or adjacent uplands. The most important are the Laagen (to be distinguished from the river of that name in Gudbrandsdal), draining the Numedal; the Skien, the Nid and the Otter. Lakes are very numerous, the chief, beyond those already named, being Nordsjö on the Skien river, Tinsjö in the same system, which receives the river Maan, famous as forming the Rjukanfos (smoking fall) of 415 ft., and Nisservand on the Nid. The larger lakes lie, with a certain regularity, at elevations about 400 ft. above the sea, and it is considered that their basins were the heads of fjords when the land lay at a lower level, and were formed during an earlier glacial period than the present fjords. The great Lake Fæmund, lying E. of the Glommen valley and drained by the river of the same name, which becomes the Klar in Sweden, to which country it mainly belongs, is similar in type to the lakes of the northern highlands of Sweden. The streams of the coast of Jæderen reach the sea through sluggish channels, brown with peat.

Not only do the valleys of the W. far surpass in beauty those of the S. and E., but they carry streams of much greater volume in proportion, owing to the heavier average rainfall of the W. slope. The first to be noted is that of the Sand or Logen river, a brilliant, rapid stream, famous for its salmon-fishing, which debouches at Sand into Sands fjord. The valley which opens from Odde at the head of a branch (Sör fjord) of Hardanger Fjord, is noted as containing two of the finest waterfalls in Norway. The one, Lotefos (which is joined by the smaller Skarsfos), is a powerful cataract following a tortuous cleft. The other, Espelandsfos, is formed by a very small stream; it falls quite sheer and spreads out like a fine veil. The only other considerable river entering Hardanger Fjord is the Bjoreia, with its mouth at Vik in Eidfjord. On this stream is the magnificent Vöringsfos. Lesser streams within the basin of the Hardanger form the Skjæggedal and several other beautiful falls. From Hardanger N. to Romsdal the streams of the W. slope are insignificant, but there are several splendid valleys, such as the sombre Nærödal, which descends to the Nærö branch of Sogne Fjord, or the valleys which sink S. and N. from the Jostedalsbræ to the head branches of Sogne Fjord and Nordfjord respectively. Above those of Nordfjord is a series of lakes, Olden, Loen and Stryn, whose milky waters are supplied almost directly from the Jostedal glaciers, while above Eidsfjord a corresponding trough contains Lake Hornindal. The next important valley is the Romsdal, the stream of which, the Rauma, forms the W. outlet of Lake Lesjekogen, as the Laagen forms the E. This lake, which lies 2011 ft. above sea-level, is the most remarkable example of an indefinite watershed to be found in S. Norway. N. from Romsdal the Driva debouches into Sundals Fjord, while the Orkla, draining Orkedal, the Gula draining Guldal, and the Nea or Nid, draining Lake Selbu, and

[1] The middle and upper parts of many valleys in Norway are known by different names from those of the rivers which water them, and such names may extend in common usage over the district on either side of the valley.

flowing generally about N.E. or S.W. in valleys nearly parallel to the coast. Such are the Namsen (85 m. in length) and the Vefsen, discharging into Namsen Fjord and Vefsen Fjord respectively, and the Dunderland, flowing into Ranen Fjord. In the basin of the same fjord is the short Rös river, which drains Rös Vand, second in extent of the Norwegian lakes. In the extreme N., where the coastward slope is longer, there are such large rivers as the Alten, 98 m. long, discharging into the fjord of that name, and the Tana, also giving name to the fjord into which it flows, and forming a great part of the Russo-Norwegian frontier. It is 180 m. long, and drains an area of 4000 sq. m.

Though the lakes of Norway are not comparable with those of Sweden as regards either number or size, they are very numerous and are estimated to cover somewhat less than one-fortieth of the total area.

Glacial Action.—While the coast is considered to owe its fjords and islands to the work of former great glaciers, the results are even more patent inland. The actual tracks of the old glaciers are constantly to be traced. Nowhere are the evidences of glacial action better illustrated than in the barren tract behind the low coastal belt of Jæderen. Here are vast expanses of almost naked rock, often riven and piled up in fantastic forms; numerous small lakes or bogs occupy the rock basins, and vast numbers of perched blocks are seen, frequently poised in remarkable positions. The great valleys of Norway are of U-section and exhibit the irregular erosive action of the glaciers, as distinct from the regular action of the rivers. If a main glacier, after working steadily in the formation of its trough for a considerable distance, be imagined to receive an accretion of power at a certain point, it will begin from that point to erode more deeply. The result of such action is seen in the series of ledges over which the main rivers of Norway plunge in falls or rapids.

Geology.—Norway consists almost entirely of Archaean and Lower Palaeozoic rocks, imperfectly covered by glacial and other recent deposits. The whole of the interval between the Devonian and the Glacial periods is represented, so far as is known, only by a small patch of Jurassic beds upon the island of Andö. An archaean zone stretches along the W. coast from Bergen to Hammerfest, interrupted towards the N., by overlying patches of Palaeozoic deposits. Gneiss predominates, but other crystalline rocks occur subordinately. The Lofoten Islands consist chiefly of eruptive granite, syenite and gabbro. S. of a line drawn from the head of the Hardanger Fjord to Lake Mjösen is another great Archaean area. Here again gneiss and granite form the greater part of the mass, but in Telemarken there are also conglomerates, sandstones and clay-slates which are believed to be Archaean. Between these two Archaean areas the Lower Palaeozoic rocks form a nearly continuous belt which follows approximately the watershed of the peninsula and extends from Bergen and Stavanger on the S. to the North Cape and Vardö in the N. They occur also as a broad strip inlaid in the Archaean floor, from the Christiania Fjord northward to Lake Mjösen. A line drawn from the Nase to the North Cape coincides roughly with a marked change in the character and structure of the Palaeozoic beds. East of this line even the Cambrian beds are free from overfolding, overthrusting and regional metamorphism. They lie flat upon the Archaean floor, or have been faulted into it in strips, and they are little altered except in the neighbourhood of igneous intrusions. W. of the line the rocks have been folded and metamorphosed to such an extent that it is often difficult to distinguish the Palaeozoic rocks from the Archaean. They form in fact a mountain-chain of ancient date similar in structure to the Alps or the Himalayas. The relations of the two areas have been studied by A. E. Törnebohm in the Trondhjem region, and he has shown that the western mass has been pushed over the eastern upon a great thrust-plane. The relations, in fact, are similar to those between the Dalradian schists of the Scottish Highlands and the Cambrian beds of the W. coast of Sutherland. In Scotland, however, it is the eastern rocks which have been pushed over the western. Corresponding with the difference in structure between the E. and the W. regions there is a certain difference in the nature of the deposits themselves. In the Christiania district the Cambrian, Ordovician and Silurian beds consist chiefly of shales and limestones. Farther north sandstones predominate, and especially the Sparagmite, a felspathic sandstone or arkose at the base of the Cambrian; but the deposits are still sedimentary. In the Trondhjem district, on the other hand, belonging to the folded belt, basic tuffs and lavas are interstratified with the normal deposits, showing that in this region there was great volcanic activity during the early part of the Palaeozoic era. In both the E. and the W. region the Devonian is probably represented by a few patches of red sandstone, in which none but obscure remains of fossils have yet been found. It may be noted here that in the extreme N. of Norway, E. of the North Cape, there is a sandstone not unlike the Sparagmite of the S., which is said by Reusch to contain ice-worn pebbles and to rest upon striated pavement of Archaean rocks.

regions. But the most remarkable features produced in recent geological times are the terraces which appear as if ruled on the sides of the valleys and fjords. They are partly platforms cut in the solid rock and partly accumulations of gravel and sand like a modern beach, and they were evidently formed by the action of waves. Some of them contain marine shells of living species and mark the former position of the sea-level; but others are of more doubtful origin and may indicate the shores of lakes formed by the damming

of the lower part of the fjords by means of glaciers, as in the case of the Parallel Roads of Glen Roy. They occur at various levels, and have been observed as high as 3000 ft. above the sea.

No volcanic rocks of modern date are known in Norway, but great intrusions of igneous rock took place in early geological times. Amongst them may be mentioned the gabbro of the Jotunfjeld, and the elaeolite syenites and associated rocks of the Christiania region. The latter form the subject of a valuable series of memoirs by Brögger, who shows that they have all been derived from a single magma, and that the differentiation of this magma led to the production of several different types of rock. (P. LA.)

Meteorology.—The most powerful influence on the climate of Norway is that of the warm drift across the Atlantic Ocean from the S.W. The highest mean annual temperature in Norway is found on the S. and W. coasts, where it ranges from 44·5° to 45·5° F., and the lowest is found at Karasjok and Kautokeino, lying at elevations of 430 and 866 ft. respectively in Finmarken, near the Russian frontier. Here the mean temperature is 26·4°, while at Vardö, on the north coast, it is 33°. At Röros (2067 ft.) at the head of the Glommen valley, and at Fjeldberg (3268 ft.) in the upper Hallingdal, the mean annual temperature is 31°. The longest winter is found in the interior of Finmarken, 243 days with a mean temperature below 32° being recorded at

Temperature.

however, such as Utsire and Skudeness off Bukken Fjord, record frost during some part of 60 days. The lowest winter average temperature is found in a centre of cold in the N. which extends over Swedish and Russian territory as well as Norwegian. The Norwegian station of Karasjok, within it, records 4° during December, January and February, and in this area there have also been observed the extreme minima of temperature in the country, *e.g.* 60·5° below zero at Karasjok. The contrast with the S.W. coast may be continued. Here at some of the island stations, the coldest month, February, has an average about 35°, and the lowest temperature recorded at Ona near Christiansund is 10·5°. It may be noted here that in several cases the lower-lying inland stations in the south show a distinctly lower winter temperature than the higher in the immediate vicinity. Thus the average for Röros (2067 ft.), 13°, contrasts with 11° for Tönset; at Listad in Gudbrandsdal (909 ft.) it is 16·5°, but at Jerkin in the Dovre Fjeld (3160 ft.) it is 17·5°. The summer is hottest in S.E. Norway (Christiania, July, 62·5°). On the other hand, the lowest summer average in the interior of Finmarken is not less than 53·5° in July; but at Vardö it is only 48° in August, usually the warmest month on this coast. In the lofty inland tracts of the S.E. the July temperature ranges, from 50° in the valleys, to as low as 49° at the high station of Jerkin. The interior having a warm summer and a cold winter, and the coast a cool summer and a mild winter, the annual range of temperature is remarkably greater inland than on the coast.

An important result of the warm Atlantic drift is that the fjords are not penetrated by the cold water from the lower depths of the outer ocean, and in consequence are always ice-free, except in winters of exceptional severity in the innermost parts of fjords, and along shallow stretches of coast.

The "midnight sun."

The sun is above the horizon at the North Cape continuously from the 12th of May to the 29th of July, and at Bodö, not far from the Arctic circle, from the 3rd of June to the 7th of July. Even at Trondhjem there is practically full daylight from the 23rd of May to the 20th of July. Even in the extreme S. of Norway there is no darkness from the end of April to the middle of August. In winter, on the other hand, the sun does not rise above the horizon at the North Cape from the 18th of November, to the 23rd of January, and at Bodö from the 15th to the 27th of December. There is only a twilight at midday. In the extreme S. the sun is above the horizon for 6½ hours at mid-winter.

Winds.

The prevailing winter winds are from the land seaward, while the system is reversed in summer. The winds in Norway may therefore be roughly classified according to locality thus:—

	South-east Coast (Skagerrack).	West Coast.	North.
Winter . ..	N.E.	S.	S.W.
Summer . .	S.W. to W.	N.	N.

The force of the wind is greater in winter on the coast; inland, on the contrary, the winter is normally calm; and at all seasons, on the average, the periods of calm are longer inland than on the coast. The average annual number of stormy days, however, ranges from ten to twenty on the S. coast, from forty-five to sixty-two on the coast of Finmarken, and sixty to seventy at Ona; whereas in the interior of Finmarken the average number is four, while in the S. inland districts stormy days are rare. December and January are the stormiest months. Hailstones are rare and seldom destructive. Thunderstorms are not frequent. They reach a maximum average of ten annually in the Christiania district.

The number of days on which rain or snow falls is greatest on the coast from Jæderen to Vardö, least in the S.E. districts and the interior of Finmarken. At the North Cape, in Lofoten, and along the W. coast between the Stad and Sogne Fjord, precipitation occurs on about 200 days in the year, although by contrast in the inner part of Sogne Fjord there is precipitation only on 121 days. On Dovre Fjeld and the S.E. coast the average is about 100 days. Snowfall occurs least frequently in the S. (*e.g.* at Mandal, 25 snowy days out of 116 on which precipitation occurs), increasing to 50 at Christiania, or Dovre Fjeld, and about the mouth of Trondhjem Fjord, to 90 at Vardö, and to 100 at the North Cape. From Vardö to the Dovre Fjeld and in the upland tracts, snow occurs at least as frequently as rain. Snowfall has been recorded in all months on the coast as far S. as Lofoten. The amount of precipitation is greatest on the coast, where, at certain points on the mainland between Bukken Fjord and Nordfjord, an annual average of 83 in. is reached or even exceeded. On the outer islands there is a slight decrease; inland the decrease is rapid and great. In Dovre Fjeld a minimum of 12 in. is found. In the extreme S. of the country the average is 39 in., N. of Trondhjem Fjord 53 in. are recorded, and there is a well-marked maximum of 59 in. at Svolvær in Lofoten, N. of which there is a diminution along the coast to 26 in. at the North Cape. In the northern interior a minimum of 16 in. is recorded. Strongly marked local variations are observed.

The amount of cloudiness is on the whole great. The coast of the heads of the fjords during severe cold or with a breeze from the land.

Flora.—The forests of Norway consist chiefly of conifers. The principal forest regions are the S.E. and S. Here, in the Trondhjem district, and in Nordland there are extensive forests of pine and fir. In the coastal and fjord region of the W. the pine is the only coniferous forest tree, and forests are of insignificant extent. In S. Norway the highest limit of conifers is from 2500 to 3000 ft. above sea-level; in the inland parts of the Trondhjem region it is from 1600 to 2000 ft. (though on the coast only from 600 to 1200); farther N. it falls to 700 ft. about 70° N. The birch belt reaches 3000 to 3500 ft. Next follow various species of willows, and the dwarf birch (*betula nana*), and last of all, before the snow-line, the lichen belt, in which the reindeer moss (*cladonia rangiferina*) is always conspicuous. A few trees of the willow belt sometimes extend close up to the snow-line. In the S. and less elevated districts the lowest zone of forests includes the ash, elm, lime, oak, beech and black alder; but the beech is rare, flourishing only in the Laurvik district. The snow ranunculus and the Alpine heather are abundant. The Dovre Fjeld is noted as the district in which the Arctic flora may be studied in greatest variety and within comparatively narrow limits. On the coastal banks the marine flora is very finely developed.

Fauna.—The great forests are still the haunt of the bear, the lynx, and the wolf. Bears are found chiefly in the uplands N. of Trondhjem, in the Telemark and the W. highlands, but the cutting of forests has limited their range. The wolves decreased very suddenly in S. Norway about the middle of the 19th century, probably owing to disease, but are still abundant in Finmarken, and the worst enemy of the herds of tame reindeer. The elk occurs in the eastern forests, and northward to Namdal and the Vefsen district. The red deer is confined chiefly to the W. coast districts; its principal haunt is the island of Hitteren, off the Trondhjem Fjord. On the high fjelds are found the wild reindeer, glutton, lemming and the fox (which is of wide distribution). The wild reindeer has decreased, though large tame herds are kept in some parts, especially in the N. The lemming is noted for its curious periodic migrations; at such times vast numbers of these small animals spread over the country from their upland homes, even swimming lakes and fjords in their journeys. They are pursued by beasts and birds of prey, and even the reindeer kill them for the sake of the vegetable matter they contain. Hares are very common all over Norway up to the snow-line. The beaver still occurs in the Christiansand district.

Avifauna.

Game birds are fairly abundant in most districts. The most notable are the two sorts of *rype*, the *skov* or *dal rype* (willow grouse, *lagopus albus*) and the *fjeld rype* (*lagopus alpina*). Black grouse are widely distributed; hazel grouse are found mainly in the pine forests of the E. and N., as are capercailzie. Woodcock and snipe are fairly common. The partridge is an immigrant from Sweden, and occurs principally in the E. and S.E. A severe winter occasionally almost exterminates it. A very large proportion of the Norwegian avifauna consists of geese and ducks, various birds of prey, golden plover, &c. These birds, at the autumn migration, leave by three well-defined routes—one from Finmarken into Finland, one by the Christiania valley, and one by the W. coast, where they congregate in large numbers on the lowlands of Jæderen. The Lapland bunting and snow bunting (*plectrophanes lapponica* and *nivalis*), the snowy owl (*nyctea scandiaca*) and rough-legged buzzard (*archibuteo lagopus*) and sea-birds are exceedingly numerous. In some localities such birds as the puffin and kittiwake form great colonies (*fugleberge*, bird cliffs).

Marine fauna.

The common seal is very frequent; and arctic seals and occasionally the walrus visit the northern coasts; among these the harp seal (*phoca groenlandica*) is believed to be particularly destructive to the fisheries. These last are of great importance; a large number of the best food-fisheries occur along the coasts, including cod, herring, mackerel, coal-fish, &c. The basking shark was formerly of some economic importance; the Japanese shark, a strictly local variety, also occurs in the neighbourhood of Vardö. Various small species of whales visit the coast; among these the lesser rorqual may be mentioned, as an antique method of hunting it with bow and arrows is still practised in the neighbourhood of Bergen. In the fjords many invertebrates as well as fish are found. Of fresh-water fish the *salmonidae* are by far the most important. Next to these, perch, pike, gwyniad and eel are most common.

As regards insect life, Norway may be divided into three areas, the S. being richer than the W., while the N. is distinct from either in the number of peculiarly arctic insects.

Sport.—Norway is much frequented by British anglers. Moderate rod-fishing for trout is to be obtained in many parts. But most of the owners of water rights have a full appreciation of the value of good fishing to sportsmen, especially when netting rights are given up for the sake of rod-fishing. The same applies to good shooting. Foreigners may not shoot without a licence, the cost of which is 100 kroner (£5 : 11 : 0) whether on crown lands or on private properties whose owners always possess the shooting rights.

Population.—The resident population of Norway in 1900 was 2,221,477. The Table shows the area and population of each of the administrative divisions (*amt*, commonly translated "county"). Norway is, as a whole, the most thinly populated

Amter.	Population 1900.	Area in sq. m.
Southern—		
Smaalenene	136,167	1,600
Akershus	116,896	2,054
Christiania (city)	229,101	6·5
Buskerud	112,743	5,789
Jarlsberg and Laurvik	101,003	896
Bratsberg	98,298	5,863
Nedenes	75,925	3,608·5
Lister and Mandal	78,259	2,804
South-eastern (inland)—		
Hedemarken	126,703	10,618
Christians	116,280	9,790
Western—		
Stavanger	125,658	3,530·5
South Bergenhus	132,687	6,024·5
Bergen (city)	72,179	5·5
North Bergenhus	88,214	7,130
Romsdal	136,519	5,786
South Trondhjem	134,718	7,182
Northern—		
North Trondhjem	83,449	8,788·5
Nordland	150,637	14,513
Tromsö	72,966	10,131
Finmarken	33,387	18,291

of the political divisions of Europe. It may be noted for the sake of comparison that the density of population in the most sparsely populated English county, Westmorland, is about equalled by that in Smaalenene amt (85 per sq. m.), and considerably exceeded in Jarlsberg and Laurvik amt (112·7 per sq. m.), but is not nearly approached in any other Norwegian county. The two counties named are small and lie almost wholly within the coastal strip along the Skagerrack, which, with the coast-lands about Stavanger, Haugesund, Bergen and Trondhjem, the outer Lofoten Islands and the land about Lake Mjösen, are the most thickly populated portions of the country, the density exceeding 50 persons per sq. m. A vast area practically uninhabited, save in the N. by nomadic Lapps, reaches from the northmost point of the Norwegian frontier as far S. as the middle of Hedemarken, excepting a markedly more populous belt across the Trondhjem depression. Thus of the counties, Finmarken is the least thickly populated (1·8 per sq. m.). In such highland regions as Jotunheim and Hardanger Vidda habitations are hardly less scanty than in the N. About two-thirds of the population, then, dwell by the coast and fjords, and about one-quarter in the inland lowlands, leaving a very small upland population. The rural and urban populations form respectively about 76 and 24% of the whole. Of the chief towns of Norway, Christiania, the capital, had a population in 1900 of 229,101, Bergen of 72,179, Trondhjem of 38,156, Stavanger of 30,541, Drammen of 23,093. The towns with populations between 15,000 and 10,000 are Christiansand, Fredrikstad, Christiansund, Fredrikshald, Aalesund, Skien, Arendal and Laurvik. All these are ports.

The population of Norway in 1801 was returned as 883,038. A rapid increase obtained from 1815 to 1835, a lesser increase thereafter till 1865, and a very slight increase till 1890. The second half of the 19th century, down to 1890, was the period of heaviest emigration from Norway. The vast majority of Norwegian emigrants go to the United States of America. But emigration slackened in the last decade of the 19th century, during which period the movement from rural districts to towns, which had decreased from about the middle of the century, revived. The number of Norwegians abroad may be taken at 350,000. The Lapps, commonly called Finns by the Norwegians, and confined especially to Finmarken (which is named from them), are estimated at 1% of the population. There are also a few Finns (about half the number of Lapps), whom the Norwegians call *Kvæner*, a name of early origin. The excess of births over deaths, about as 1·4 to 1, is much above the European average; the death-rate is also unusually low. The number of marriages is rather low, and the average age of marriage is high. The percentage of illegitimacy has shown some increase, but is not so high as in Sweden or Denmark. The percentage of longevity is high. The preponderance of females over males (about 1073 to 1000) is partly accounted for by the number of males who emigrate. The higher mortality of males is traced in part to the dangers of a seafaring life.

Down to the middle of the 19th century drunkenness was a strongly-marked characteristic of Norwegians. A strict licensing system was then introduced with success. Local boards were given a wide control over the issue of licences, and in 1871 companies (*samlag*) were introduced to monopolize and control the retail trade in spirits. Their profits do not, as in the Gothenburg system, go to the municipal funds, but are applied directly to objects of public utility. In 1894 a general referendum resulted in the entire prohibition of the sale of spirits in some towns for five years. The control of retail trade in beer and wine by the *samlag* has been introduced to some extent.

In Norway a strongly individual national character is to be expected, combined with conservatism of ancient customs and practices. The one finds no better illustration than the individuality of modern Norwegian music and painting. The other is still strong. Such customs as the lighting of the midsummer fires and the attendant celebrations still survive. Peculiar local costumes are still met with, such as those associated with weddings. In the coastwise shipping trade and the fisheries of the north, high-prowed square-sailed boats are frequently employed which are the direct descendants of the vessels of the early vikings. Some examples of the ancient farmstead, composed of a group of wooden buildings each of a single chamber, are preserved, and medieval ornamental woodwork is met with. Wood is the principal building material except in some larger towns where brick and stone have superseded it. Where this is not the case, fires have left few, if any, ancient domestic buildings, but the preservation of ancient models in wooden houses makes Norwegian towns peculiarly picturesque. Norway retains a few highly interesting examples of ecclesiastical architecture. There are the peculiar small wooden churches (*stavekirke*) dating from the 11th to the 14th century, with high-pitched roofs rising in tiers so as to give the building something of the form of a pyramid. The roofs are beautifully shingled in wood. The wall timbers are vertical. To protect them from the weather, the roofs overhang deeply, and the lowest sometimes covers a species of external colonnade. The carving is often very rich. The most famous of these churches is that of Borgund near Lærdalsören; another fine example is at Hitterdal on the Kongsberg-Telemark road. On the other hand there are a few Romanesque and Gothic stone churches. In some of these the influence of English architecture is clear, as in the metropolitan cathedral of Trondhjem and the nave of Stavanger cathedral. St Mary's Church at Bergen, however, tends towards the French models. A good example of the smaller stone church is at Vossevangen, and there are several of Late Romanesque character in the Trondhjem district. There are ruins of a cathedral at Hamar, and a few monastic remains, as at Utstein, north of Stavanger, and on the island of Selje off Statland. Remains of pure Early English work are occasionally found, as at Ogne in Jæderen, but the later Gothic styles were not developed in Norway.

Tourist Traffic and Communications.—During the later decades of the 19th century Norway was rapidly opened up to British, American and German visitors. Passenger communications from Great Britain are maintained chiefly between Hull and Stavanger, Bergen, Aalesund, Christiansund and Trondhjem; Hull, Christiansand and Christiania; Newcastle and Stavanger, Bergen and the North; London and Christiania, &c., and there are also passenger services from Grimsby, Grangemouth and other ports. Yachting cruises to the great fjords and the North Cape are also provided. A daily service of mail steamers works between Christiania and all ports to Bergen; thence the summer service is hardly less frequent to Trondhjem. From each large port small steamers serve the fiords and inner waters in the vicinity, and there are also

Routes.

steamers on several of the larger lakes. The season lasts from June to the middle of September. The voyage to the North Cape is taken by many in order to see the "midnight sun" in June and July. Among the land-routes connecting the great fjords of the west the following may be mentioned. (1) The road from Sand on Sandsfjord (a branch of Bukken Fjord), which follows the Sand river up to the foot of Lake Suldal, near the head of which is Næs. From here a finely engineered road runs up the Bratlandsdal, crosses the Horrebrække and descends past Seljestad to Odde at the head of a branch of Hardanger Fjord. (2) From Eide on another branch of the same fjord a road runs to Vossevangen (which is connected by rail with Bergen) and continues N. to Stalheim, where it descends through the Nærödal to Gudvangen on a branch of Sogne Fjord. (3) From Vadheim on this fjord a road runs N. to Sandene and Utvik on Nordfjord. Routes N. from this fjord are (4) that from Faleide by Grodaas on Lake Hornindal to Hellesylt on Sunelv Fjord and Öje on Norangs Fjord, and (5) that from the same station or from Visnæs, by way of Lake Stryn, to Grotlid, and Merok on Geiranger Fjord. All these routes pass through magnificent scenery. For the same reason there should also be mentioned (6) the road through the Telemark, which branches from the Bratlandsdal road at Breifond, mounts the Haukelidsæter and descends to Dalen, from which the Bandaks canal route gives access to Skien on the S.E. coast, the road continuing from Dalen E. to Kongsberg; also those running E. from the great fjords—from Lærdalsören on Sogne Fjord, branching (7) through Hallingdal, and (8) through Valdres; (9) the road from Grotlid to Otta in Gudbrandsdal, running N. of the Jotunheim; (10) the road from Veblungsnæs on a branch of Molde Fjord, running through the Romsdal and over to Domaas; (11) the N. road across Dovre Fjeld from Domaas to Stören on the railway to Trondhjem. Beyond the districts thus indicated, the Sætersdal, a southern valley, is visited by many, and in the far N. the Lofoten Islands and some of the fjords, as Lyngen and Alten, are very fine. The mountains of Jotunheim have attracted several well-known mountaineers.

Roads.

The main roads of Norway, the construction of which has demanded the highest engineering skill, were not brought into existence until the last half of the 19th century. A Highways Act of 1851 placed the roads under the immediate control of local authorities, but government grants are made for the construction not only of main roads, but in many cases of cross-roads also. In a country where railways are few, posting is of prime importance, and in Norway the system is well developed and regulated. Along all main roads there are posting stations (*skydsstationer*, pronounced shüss-stashōñer), hotels, inns or farms, whose owners are bound to have horses always in readiness; at some stations on less frequented roads time is allowed for them to be procured. Posting stations are under strict control and the tariff is fixed. The vehicles are the *stolkjærre* (pronounced approximately stolchārer) for two passengers, and the *kariol* or *carriole* for one. A similar posting system obtains by rowing-boats on lakes and fjords.

The first railway, that between Christiania and Eidsvold, was constructed by agreement between British capitalists and the Norwegian government, and opened in 1854. The total length of railways is only about 1600 m., Norway having the lowest railway mileage in proportion to area of any European state, though in proportion to population the length of lines is comparatively great. Almost the whole are state lines. Railways are most fully developed in the S.E., both N. and S. of Christiania. The principal trunk line connects Christiania with Trondhjem by way of Hamar and the Osterdal, Röros and Stören. Four lines cross the frontier into Sweden—from Christiania by Kongsvinger (Kongsvinger railway) and by Fredrikshald (Smaalenenes railway), from Trondhjem by Storlien (Meraker railway), and from Narvik on Ofoten Fjord, the most northerly line in the world. Among other important lines may be mentioned that serving Lillehammer, Otta, &c., in Gudbrandsdal, that running S.W. from Christiania to Drammen, Skien and Laurvik; the Sætersdal line N. from Christiansand; the Jæderen line from Stavanger to Egersund and Flekkefjord; the Bergen-Vossevangen line; and the branch from Hell on the Meraker railway northward to Levanger. These local lines form links in important schemes for trunk lines. Norwegian railways are divided between the standard gauge and one of 3 ft. 6 in.; on the N. line a change of gauge is made at Hamar.

Railways.

Some of the large lakes form important channels for inland navigation; the rivers, however, are not navigable for any considerable distance. A canal from Fredrikshald gives access N. to Skellerud, and the Bandaks canal connects Dalen in the Telemark with Skien.

Canals.

The post-office is well administered, and both telegraph and telephone systems are exceptionally extensive.

INDUSTRIES. *Agriculture.*—About 70% of the total area of Norway is barren, and about 21% is forest land, but the small agricultural area employs, directly or indirectly, about 40% of the population. The great majority of the peasantry are freeholders. Legislation has provided for the retention of landed property by families to which it has belonged for any considerable period—thus, under certain conditions, a family which has parted with land can reacquire it at an appraisement—or land alienated by its owner may on his death be acquired by his next of kin. The chief crops are oats barley, potatoes, *mangcorn* (a mixed crop of oats and barley), rye and wheat, the last being little cultivated. Cattle and sheep are kept in large numbers. Farmers commonly hold upland summer pastures together with their lowland farms, and in the open season frequently occupy a *sæter* (upland farmstead) and devote themselves to dairy work. Norwegian horses are small and thick-set, and remarkably sure-footed. In the north large herds of reindeer are kept by Lapps. There is an agricultural college and model farm at Aas near Christiania.

Forestry.—Forest industries are confined chiefly to the S.E. and to the Trondhjem-Namsen district. Lumbering is an important industry. Forestry is controlled by the Department of Agriculture, and its higher branches are taught at the Aas college.

Fisheries.—The sea fisheries are of high economic importance. The principal are the cod fisheries. In March and April the cod shoal on the coastal banks for the purpose of spawning, and this gives rise to the well-known fishery for which the Lofoten Islands are the principal base. In April and May shoals of capelan appear off Finmarken, followed by cod and other fish, small whales, &c., which prey upon them; this affords a second fishery. For herring there is a spring fishery off Stavanger and Haugesund, and one in November and December off Nordland. Mackerel fisheries are important from Trondhjem Fjord S. to the Skagerrack. Salmon and sea-trout fisheries are important in the rivers and still more off the coast. Fishermen from Tönsberg, Tromsö, Hammerfest, Vardö, Vadsö, &c., work with the arctic fisheries, sealing, whaling, &c., from Greenland to Spitsbergen and Novaya Zemlya. A fishery board at Bergen administers the Norwegian fisheries. The annual value of the coast fisheries ranges from £1,000,000 to £1,500,000.

Mining.—Norway is not rich in minerals. Coal occurs only on Andö, an island in Vesteraalen. Silver is mined at Kongsberg; copper at Röros, Sulitelma, and Aamdal in Telemarken; iron at Klodeberg near Arendal and in the Dunderlandsdal (developed early in the 20th century). Granite is quarried near Fredrikstad, Fredrikshald and Sarpsborg, and exported as paving setts and kerbstones, mostly to Great Britain and Germany. Good marble is found near Fredrikshald, and also in the Salten and Ranen districts.

Manufacturing Industries.—The most important are works connected with the timber trade, foundries and engineering shops, spinning and weaving mills, brick and tile works, breweries, paper-mills, tobacco factories, flour-mills, glass works, and potteries, nail works, shipbuilding yards, rope works, factories for preserved food (especially fish), margarine, matches, fish guano, boots, and hosiery, distilleries and tanneries. The chief industrial centres are Christiania, Bergen, Fredrikstad and Sarpsborg, Drammen, Skien and Porsgrund, Trondhjem, Fredrikshald and Stavanger. Large water-power is available in many districts. A powerful impulse was given to industrial enterprise by the non-renewal of the customs treaty with Sweden in 1897, which established a protective system against that country.

Shipping and Commerce.—The Norwegians, in proportion to their numbers, are the first nation in the world in the mercantile marine industry. Actually their mercantile marine is only exceeded by those of Great Britain, Germany and the United States. From 1850 to 1880 the tonnage increased from 289,000 to more than 1,500,000. The tonnage now exceeds the latter figure, but steam has greatly increased the carrying power. In 1880 Norwegian steam vessels had a tonnage of about 52,000; they now exceed 640,000 tons. The annual value of imports is about £16,500,000, and of exports about £10,000,000. The growth of both may be judged from periodic averages—

	1851–1855.	1866–1870.	1886–1890.
Imports .	£2,800,000	£5,600,000	£9,200,000
Exports .	2,400,000	3,000,000	6,600,000

Great Britain and Germany are the countries principally trading with Norway. Great Britain takes about 40% (by value) of Norwegian exports, and sends about 26% of the total imports into Norway. Germany takes 14% of the exports, and sends 28% of the imports. The chief articles of export are timber, wooden wares and wood pulp, principally to Great Britain, and fish products, principally to Germany, Sweden and Spain. These make 65% of the exports—others of importance are paper, ships, ice, stone and nails. Of the imports about 58% by value are for consumption, 42% material for production. Among the first are cereals (principally from Russia), groceries (from Germany), and clothing (from Germany and Great Britain). Among the second are coal (chiefly from Great Britain), hides and skins, cotton and wool, oil and machinery, steamships, and metal goods (from Great Britain, Germany and Sweden).

Government.—Norway is an independent, constitutional and hereditary monarchy, the union with Sweden having been dissolved on the 7th of June 1905, after lasting 91 years. The constitution rests on the fundamental law (*grundlov*) promulgated at Eidsvold on the 17th of May 1814, and altered in detail at various times. The executive is vested in the king, who

comes of age at eighteen. His authority is exercised through, and responsibility for his official acts rests with, a council of state consisting of a minister and councillors, who are the heads of finance, public accounts, church and education, defence, public works, agriculture, commerce, navigation and industry and foreign affairs. The king appoints these councillors and high officials generally in the state, church, army, navy, &c. He can issue provisional ordinances pending a meeting of parliament, can declare war (if a war of offence, only with the consent of parliament) and conclude peace, and has supreme command of the army and navy. The legislative body is the parliament (*storthing*), the members of which are elected directly by the people divided into electoral divisions, each returning one member. Until the election of 1906 the members were chosen by electors nominated by the voters. Elections take place every three years. The franchise is extended to every Norwegian male who has passed his twenty-fifth year, has resided five years in the country, and fulfils the legal conditions of citizenship. Under the same conditions, and if they or their husbands have paid taxes for the past year, the franchise is extended to women under a measure adopted by the Storthing in June 1907. Members of parliament must possess the franchise in their constituency, and must have resided ten years in the country; their age must not be less than thirty. The Storthing meets at Christiania, normally for two months in each year; it must receive royal assent to the prolongation of a session. After the opening of parliament the assembly divides itself into two sections, the upper (*lagthing*) consisting of one-quarter of the total number of members, and the lower (*odelsthing*) of the remainder. Every bill must be introduced in the Odelsthing; if passed there it is sent to the Lagthing, and if carried there also the royal assent gives it the force of law. If a measure is twice passed by the Odelsthing and rejected by the Lagthing, it is decided by a majority of two-thirds of the combined sections. The king has a veto, but if a measure once or twice vetoed is passed by three successive parliaments it becomes law *ipso facto*. This occurred when in 1899 the Norwegians insisted on removing the sign of union with Sweden from the flag of the mercantile marine. Members of parliament are paid 13s. 4d. a day during session and their travelling expenses. Parliament fixes taxation, and has control of the members of the council of state, who are not allowed to vote in either house, though they may speak.

Finance, &c.—The annual revenue and expenditure are each about 5½ millions sterling. Considerable sums, however, have been raised by loans, principally for railways. These amounted, between 1900 and 1906 (the financial year ending the 31st of March) to nearly £4,500,000. The principal sources of revenue are customs, railways, post office and telegraphs, the income tax (which is graduated and not levied on incomes below 1000 kroner or £55, 6s. 8d.), and excise. The principal items of expenditure are railways, defence (principally the army), the post office, interest on debt, the church and education, and justice. The Bank of Norway is a private joint-stock corporation, in which the state has large interests. It is governed by special acts of parliament, and its chief officials are publicly appointed. It alone has the right to issue notes, which are in wide circulation. The Mortgage Bank (*Norges Hypothekbank*) was established by the state to grant loans on real estate. The currency of Norway is based on a gold standard; but the monetary unit is the *krone* (crown), of 1s. 1½d. value, divided into 100 *öre*. The metric system is in use.

Army and Navy.—The army consists of the line, the militia or reserve (*landværn*), and the second reserve (*landstorm*). All capable men of twenty-two years of age and upwards are liable for conscription (except the clergy and pilots), and when called they serve 6 years in the line, 6 years with the reserve and 4 years with the second reserve. In war, men are liable to service from the 18th to the 50th year of age. Only the line can be sent out of the country. The men only meet for military training from 18 to 102 days in each year. The peace establishment of the line is 12,000 men, with 750 officers; its war footing 26,000, or more, but may not exceed 18,000 without the authority of parliament. Of enlisted troops there are only fortress garrisons, and the Christiania garrison of Norwegian Guards. The principal fortresses are Oscarsborg on Christiania Fjord, Agdenes (Trondhjem Fjord), Bergen, Tönsberg and Christiansand. A number of Norwegian forts along the S. Swedish frontier were dismantled under the convention with Sweden of 1905, when a neutral zone was established on either side of the frontier southward from 61° N. The navy consists of about 1200 officers and men on permanent service; but all seafaring men between twenty-two and thirty-eight are liable for maritime conscription, and are put through some preliminary training. The war vessels include four battleships of 3500 to 4000 tons each, and about 16 other vessels, besides a torpedo flotilla—intended for coast defence only. The chief naval station is at Karljohansværn (Horten).

Justice.—Civil cases are usually brought first before a commission of mediation (*forligelseskommission*), from which an appeal lies to the local inferior courts, which are also tribunals of first instance, and are worked by judges on circuit and assessors. There are three superior courts of appeal (*overretter*), at Christiania, Bergen and Trondhjem, and one supreme court (*höiesteret*). Criminal cases are tried either in jury courts (*lagmandsret*) or courts of assize (*meddomsret*). The first is for more serious offences; the second deals with minor offences and is a court of first instance. Military crimes are dealt with by a military judicial organization. Finally there is a high court of impeachment (*rigsret*), before which members of parliament, the government, &c., are tried for misdemeanours committed in their public capacity.

Local Government.—The country is divided into twenty counties (*amter*) (see population), the cities of Christiania and Bergen being included in these. Other towns are formed into communes, governed by representatives, from whom a council (*formænd*) is elected by themselves. Rural communes (*herreder*) are similarly administered, and their chairmen form a county council (*amtsthing*) for each county. At the head is the *amtmand*, the county governor. The electoral franchise for local council election is for men the same as the parliamentary franchise, and, like it, is extended in a limited degree to women.

Religion and Education.—The state religion, to which the king must conform, is Evangelical Lutheran. Only about 2·4% of the population are dissenters. All Christian sects except Jesuits are tolerated. The king nominates the clergy of the established church. Norway is divided into six bishoprics (*stifter*), Christiania, Hamar, Christiansand, Bergen, Trondhjem, Tromsö; and these into deaneries (*provstier*), with subdivisions into clerical districts (*præstegjeld*), parishes and sub-parishes. The clergy take a leading part in primary education, which, in spite of the difficulties arising in a sparsely populated country, reaches a high standard. Education is compulsory, the school-going age being from 6½ to 14 years in towns and 7 to 14 years in the country. About 94% of the children of school-going age attend the primary schools, which are administered by school boards in the municipalities and the counties. Teachers must belong to the established church. Their training colleges include one free public college in each diocese. The municipalities and counties bear the cost of primary education with a state grant. There are continuation schools, evening schools, &c., and for secondary education, communal middle schools, and state *gymnasier*. There is a state-aided university at Christiania.

(O. J. R. H.)

History.

Early History.—Archaeological and geological researches have revealed a fishing and hunting population in Norway, possibly

as far back as *c.* 6000 B.C. Until lately this aboriginal people, which was certainly non-Aryan, was held to be Lappish, but recent investigations seem to show that the Lapps only entered Norway about A.D. 900–1000, and that the original population was probably of Finnish race, though only distantly allied to the Ugro-Finns now inhabiting Finland. To them belong perhaps certain non-Aryan names for natural features of the country, such as Toten, Vefsen, Bukn.

The time of the immigration of a Teutonic element is far from certain. It did not extend N. beyond the Trondhjem district until about the beginning of our era, but there can be little doubt that the immigrants' advance was extremely slow, and it is suggested, on the evidence of archaeology, that the Teutonic element entered S. Norway towards the end of the (Scandinavian) later Stone age, *c.* 1700 B.C. (see SCANDINAVIAN CIVILIZATION). But whatever were the stages of the process, the language of the older race was superseded by Teutonic, and those aborigines who were not incorporated (probably most often as slaves) were driven into the mountains or the islands that fringe the coast. In the highlands the "Finns" maintained some independence down to historical times. The old English poem *Beowulf* mentions a "Finnaland" which should perhaps be located in S. Norway in about the 6th century, and later on the ancient laws of this region forbid the practice of visiting the "Finns" to obtain knowledge of the future. But only in Finmark, which even in the 13th century stretched far into Sweden and included the Norwegian district of Tromsö, could the earlier inhabitants live their old life, and here they finally fell into the utmost want and misery. Their existence is mentioned as a thing of the past by a North Trondhjem writer in 1689.

Teutonic immigration.

The new Teutonic element of population seems to have flowed into Norway from two centres; one western, probably from Jutland, the other eastern, from the W. coast of Sweden. The western stream covered Agder, Rogaland and Hordaland (the modern districts of Christiansand and Söndre Bergenhus), and finally extended N. as far as Söndmöre, while the eastern stream flowed across Romerike and Hadeland through the Dales to the Trondhjem district, where it divided, one stream flowing down the W. coast till it met the western settlements, another penetrating N. into Haalogaland (which included the modern Nordland as well as Helgeland), and a third E. into the N. Swedish districts of Jämtland and Helsingland. The bodies of immigrants were no doubt more or less independent, and each was probably under a king. It is probable that the Horder, who gave their name to Hordaland and Hardanger, were a branch of the Harudes whom Ptolemy in the 2nd century mentions as living in Jutland, where their name remains in the present Hardesyssel. The Ryger, who gave their name to Rogaland, and the modern Ryfylke, are probably akin to the Rugii, an E. Germanic tribe at one time settled in N.E. Pomerania, where we have a reminiscence of their name in Rügenwalde. The first mention of any tribe settled in Norway is by Ptolemy, who speaks of the Chaidenoi or Heiner, inhabiting the W. of his island Scandia. The system of settlement in Norway appears to have been different from that adopted by the same race in other lands. In Denmark, for instance, a group of as many as twenty settlers held land more or less in common, but this system, which demanded that a considerable extent of land should be readily accessible, was not feasible in the greater part of Norway, and except in one or two flatter districts each farm was owned, or at least worked, by a single family.

When history first sheds a faint light over Norway we find each small district or "fylke" (Old Norse *fylkir*, from *folk*, army) settled under its own king, and about twenty-nine *fylker* in the country. At times a king would win an overlordship over the neighbouring tribes, but the character of the country hindered permanent assimilation. The king always possessed a *hird*, or company of warriors sworn to his service, and indeed royal birth and the possession of such a *hird*, and not land or subjects, were the essential attributes of a king. There was no law of primogeniture, and on the death of a king some of his heirs would take their share of the patrimony in valuables, gather a *hird*, and spend their lives in warlike expeditions (see VIKINGS), while one would settle down and become king of the fylke. There are indications that these conditions were fostered by a matriarchal system, and that it would often occur that a wandering king would marry the daughter of a fylkes-king and become his heir. Probably the king's power was only absolute over his own *hird*. He was certainly commander-in-chief and perhaps chief priest of the fylke, but the administrative power was chiefly in the hands of the *herser* and possibly of an earl. The position of earls is vague, but it is noticeable that both those of whom we hear in Harald Haarfager's time take the opposite side to their king. The *herser* (Old Norse *hersir*), of whom there were several in each fylke, united high birth with wealth and political power, and with the *holder*, the class of privileged hereditary landowners from which they sprang, formed an aristocracy of which there seems little trace in the other Scandinavian countries at this period. Its rise in Norway is perhaps due to the fact that the nature of the country, as well as the individualistic system of settlement, left more scope for inequalities of wealth than in Denmark or Sweden. Once a family had become wealthy enough to fit out Viking ships, it must have added wealth to wealth, besides enormously raising its prestige. The lands of almost all the most powerful families were on islands, whence it was easy to set forth on roving expeditions. The family property of the earls of Lade, for instance, whose representative in the latter half of the 9th century was the most powerful man of the district, was on the island of Nærö. These islands had been the refuge of the aborigines, and it is possible that, as A. Hansen has suggested, the rise of the aristocracy depends here, as elsewhere, on a subject population. Among the proper names of thralls in a poem in the Elder Edda are several which can only be explained on the hypothesis that they are Finnish, *e.g.* Klums, Lasmer, Drumba. Harald Haarfager's decree concerning "those who clear forests and burn salt, fishermen and hunters" probably refers to the Finns as a class apart. There can be no doubt that, in Haalogaland for instance, the aristocracy gained its wealth not only from the tribute extorted from the Finns in Finmark, but also from slave labour.

Early kingship.

The eight Trondhjem *fylker* had a common *Thing* or assembly very early, but these districts were remote, while the wealthy western districts were too much cut off from each other to unite effectively, though here also a common Thing was early established. The first successful attempt at unification originated round Vestfold, the modern Jarlsberg and Laurvik Amt on the Christiania fjord. Here also there was a certain degree of union very early, and it is possible that national feeling was fostered by proximity to the Danish and Swedish kingdoms. The district was thickly populated, and a centre of commerce. Tradition made the royal family a branch of the great Yngling dynasty of Upsala, which claimed descent from the god Frey. Through several generations this family had extended its kingdom by marriage, conquest and inheritance, and by the end of the reign of Halfdan the Black, it included the greater part of Hamar and Oslo Stift, and the fylke of Sogn, the district round the modern Sognefjord.

Harald Haarfager.

Halfdan's son, Harald Haarfager, having no brothers, succeeded to the whole kingdom, and was further fortunate in that an uncle helped him to maintain his rights. By 866 his power was so well established in S. Norway that he contemplated the conquest of the whole land. The chief obstacle appears to have been the resistance, not only of the petty kings, but also of the aristocratic families who dreaded the power of a monarchy established by force, and consequently supported the vaguer authority of their own kinglets. There can be no doubt that Harald introduced the feudal view of obligations towards the king, and landowning families, who had regarded their *odel*, or inherited property, as absolutely their own, resented being forced to pay dues or In each district Harald offered the *herser* the opportunity of becoming his vassals, answerable to him for the government

the district. The increased dues and the grants of land made by Harald rendered the position of one of his earls more lucrative than that of king under the older system; and it shows to what a paramount position the old aristocracy must have attained, that numbers of the *herser* and *holder* could not reconcile themselves to the limitation of their independence, but quitted the lands which were their real title to influence, rather than submit to the new order. But the little kingdoms only made futile attempts at combination, except in the western districts of Agde (comprising the modern Lister and Mandal and Nedenæs), Rogaland and Hordaland. Here was the home of the "western Vikings" who for nearly a century had owed wealth and fame to their raids on the British Isles. Attack by land was impossible, and Harald had to gather men and ships for three years before he could meet the fleet of the allied kings at Hafsfjord. The battle (872) resulted in a victory to him, and with it all opposition in Norway was at an end. An expedition to Scotland and the Scottish isles (*c.* 891) dispersed enemies who could harry the Norwegian coast, many of them taking refuge in Iceland; and the earldom of the Orkneys and Shetlands became an appanage of the Norwegian Crown. For the moment the whole country was under a single king, but Harald himself destroyed his work, in accordance with old custom, by giving about twenty of his sons the title of king, and dividing the country among them, only qualifying this retrograde step by installing his favourite son Erik Blodöxe as over-king (930). Moreover, Harald had established no common Thing for the whole of his kingdom. Norway is naturally divided into three parts, and each of these remained more or less separate for centuries, even having separate laws until the second half of the 13th century. The Frostathing district (so called from Frosta near Trondhjem) included the eight Trondhjem *fylker*, and also Naumdal, Nordmöre and Raumsdal. The Gulathing district consisted of Söndmöre, Firdafylke, Sogn, Valdres, Hallingdal, Hordaland and Agde, and met at Gula in Hordaland. The third, the Eidsivathing, met on the shores of Lake Mjösen, and included the Uplands and also the "Vik," *i.e.* all the districts round Christiania fjord, until St Olaf established the Borgarthing at Sarpsborg as a centre for these latter. The king's council was composed of the local *lendermænd*, and thus varied with the district he happened to be visiting, an arrangement that had its advantages, since the local chiefs were acquainted with the laws of their district, though it was another hindrance to unification. It was only in 1319 that a permanent council was formed, the *Rigets Raad*.

Harald died in 933. Erik Blodöxe (Bloody-axe) only managed to rid himself of two rival over-kings, Olaf and Sigfred, his half-brothers, for on hearing of his father's death, another son, Haakon (*q.v.*), called the Good, who had been brought up at Æthelstan's court, came to Norway with a small force and succeeded in ejecting Erik (934). After Haakon's death in 961 at the battle of Fitje, where his long struggle against Erik's sons and their Danish allies terminated, these brothers, headed by Harald Graafeld (grey-cloak) became masters of the W. districts, though the ruling spirit appears to have been their mother Gunhild. Earl Sigurd of Lade ruled the N., and the S. was held by vassal kings whom Haakon had left undisturbed. By 969 the brothers had succeeded in ridding themselves of Sigurd and two other rivals, but the following year Harald Graafeld was lured to Denmark and treacherously killed at the instigation of Earl Haakon, son of Sigurd, who had allied himself with the Danish king Harald Gormssön. With the latter's support Earl Haakon won Norway, but threw off his yoke on defeating Ragnfred Erikssön at Tingenes in 972. The S.E. districts were, however, still held by Harald Grenske, whose father had been slain by the sons of Erik. Haakon ruled ably though tyrannically, and his prestige was greatly increased by his victory over the Jomsvikings, a band of pirates inhabiting the island of Wollin at the mouth of the Oder, who had collected a large fleet to attack Norway. The date of their defeat at Hjörungavaag, now Lidvaag, is uncertain. But finally the earl's disregard of the feelings of the most powerful "bonder," or landed proprietors, worked them up to revolt, and, in 995, there landed in Norway Olaf, great-grandson of Harald Haarfager and son of the king Tryggve of the Vik whom Gudröd Eriksson had slain, and whose father Olaf had been slain by Erik Blodöxe.

Haakon the Good.

The earl was treacherously killed by his thrall while in hiding, and Olaf entered unopposed upon his short and brilliant reign. His great work was the enforced conversion to Christianity of Norway, Iceland and Greenland. In this undertaking both Olaf and his successor and namesake looked for help to England, whence they obtained a bishop and priests; hence it comes that the organization of the early church in Norway resembles that of England. No more than England did Norway escape the struggle between Church and State, but the hierarchical party in Norway only rose to power after the establishment of an archiepiscopal see at Trondhjem in 1152, after which the quarrel raged for over a century. Until the year 1100, when tithes were imposed, the priests depended for their livelihood on their dues, and Adam of Bremen informs us that this made them very avaricious.

Introduction of Christianity by Olaf.

In the year 1000 Olaf fell at the battle of Svolder off Rügen, fighting against the combined Danish and Swedish fleets. The allies shared Norway between them, but the real power lay in the hands of Erik and Svein, sons of Earl Haakon. In 1015, when Erik was absent in England, another descendant of Harald Haarfager appeared, Olaf, the son of Harald Grenske, a great-grandson of Harald Haarfager (see OLAF II. HARALDSSÖN). He defeated Svein at Nesje in 1016, which left him free to work towards a united and Christian Norway. For some years he was successful, but he strained the loyalty of his subjects too far, and on the appearance of Knut the Great in 1029 he fled to Russia. His death at the battle of Stiklestad on his return in 1030 was followed by a few years of Danish rule under Svein Knutssön, which rendered Olaf's memory sweet by contrast, and soon the name of St Olaf came to stand for internal union and freedom from external oppression. In 1035 his young son Magnus, afterwards called the Good, was summoned from Russia, and was readily accepted as king. A treaty was made with Hardeknut which provided that whichever king survived should inherit the other's crown. Hardeknut died in 1042, and Magnus became king of Denmark, but a nephew of Knut the Great, Svein Estridssön, entered into league with Harald Haardraade (see HARALD III.), the half-brother of St Olaf, who had just returned from the East. As soon, however, as overtures were made to him by Magnus, he forsook the cause of Svein, and in 1046 agreed to become joint king of Norway with Magnus. The difficulties arising out of this situation were solved by Magnus's death in 1047.

Relations with Denmark.

Harald's attempts to win Denmark were vain, and in 1066 he set about a yet more formidable task in attacking England, which ended with his death at Stamford Bridge in 1066. His son Olaf Kyrre (the Quiet) shared the kingdom with his brother Magnus until the latter's death in 1069, after which the country enjoyed a period of peace. A feature of this reign is the increasing importance of the towns, including Bergen, which was founded by Olaf. In 1093 Olaf was succeeded by his turbulent son Magnus Barfod (barefoot) and by Haakon, son of Magnus the Good. The latter died in 1095. Besides engaging in an unsuccessful war against the Swedish king Inge, in which he was defeated at Foxerne in 1101, Magnus undertook three warlike expeditions to the Scottish isles. It was on the last of these expeditions, in 1103, that he met his death. He was succeeded by his three sons, Eystein, Sigurd and Olaf. Olaf died young. Sigurd undertook a pilgrimage, from which he gained the name of Jorsalfar (traveller to Jerusalem). He won much booty from the Moors in Spain, from pirates in the Mediterranean, and finally at Sidon, which he and his ally Baldwin I. of Jerusalem took and sacked. Eystein died in 1122. Sigurd lived till 1130, but was subject to fits of insanity in his later years. He was the last undoubted representative of Harald Haarfager's race, for on his death

End of Harald Haarfager's line.

his son Magnus was ousted by Harald Gille, or Gilchrist, who professed to be a natural son of Magnus Barfod.

Harald Gille was slain in 1136 by another pretender, and anarchy ruled during the reign of his sons Eystein, Inge and Sigurd Mund. At last Inge's party attacked and killed first Sigurd (1155) and then Eystein (1157). Inge fell in a fight against Sigurd's son Haakon Herdebred in 1161, but a powerful baron, Erling, succeeded in getting his son Magnus made king, on the plea that the boy's maternal grandfather was King Sigurd Jorsalfar. Descent through females was not valid in succession to the throne, and to render his son's position more secure, Erling obtained the support of the Church. In 1164 the archbishop of Trondhjem crowned Magnus, demanding that the crown should be held as a fief of the Norwegian Church. Owing to such concessions the Church was gaining a paramount position, when a new pretender appeared. Sverre (O.N. Sverrir) claimed to be the son of Sigurd Mund, and was adopted as leader by a party known as the Birkebeiner or Birchlegs. He possessed military genius of a rare order, and in spite of help from Denmark, the support of the Church and of the majority of barons, Magnus was defeated time after time, till he met his death at the battle of Nordnes in 1184. The aristocracy could offer little further opposition. In joining hands with the Church against Sverre, the local chiefs had got out of touch with the small landowners, with whose support Sverre was able to build up a powerful monarchy. Sverre's most dangerous opponent was the Church, which offered the most strenuous resistance to his efforts to cut down its prerogatives. The archbishop found support in Denmark, whence he laid his whole see under an interdict, but Sverre's counter-claim of his own divine right as king had much more influence in Norway.

Disputed successions.

Sverre died in 1202, his last years harassed by the rise of the Baglers, or "crozier-men," with a new claimant at their head. His son Haakon III. died two years later, perhaps of poison, but the Birkebeiner party in 1217 succeeded in placing Haakon's son and namesake on the throne (see HAAKON IV.). In 1240 the last of the rival claimants fell, and the country began to regain prosperity. The acquisition of Iceland was at length realized. Haakon's death occurred after the battle of Largs in the Orkneys in 1263. The war with Scotland was soon terminated by his son Magnus, who surrendered the Hebrides and the Isle of Man at the treaty of Perth in 1268. Magnus saw the worthlessness of a doubtful suzerainty over islands which had lost their value to Norway since the decay of Viking enterprise. He gained his title of Law-Mender from the revision of the laws, which had remained very much as in heathen days, and which were still different for the four different districts. By 1274 Magnus had secured the acceptance of a revised compilation of the older law-books. The new code repealed all the old wergild laws, and provided that the major part of the fine for manslaughter should be paid to the victim's heir, the remainder to the king. Henceforward the council comes more and more to be composed of the king's court officials, instead of a gathering of the *lendermænd* or barons of the district in which the king happened to be. During Magnus's reign we hear of a larger council, occasionally called *palliment* (parliament), which is summoned at the king's wish. The old landed aristocracy had lost its power so completely that even after Magnus's death in 1280 it was unable to reinstate itself during the minority of his son Erik.

Magnus.

Erik was succeeded in 1299 by his brother Haakon V., who in 1308 felt himself strong enough to abolish the dignity of the *lendermænd*. This paralysis of the aristocracy is no doubt partly to be ascribed to the civil wars, but in part also to the gradual impoverishment of the country, which told especially upon this class. Russia had long eclipsed Norway as the centre of the fur trade, and other industries must have suffered, not only from the civil wars, but also from the supremacy of the Hanseatic towns, which dominated the North, and could dictate their own terms. In earlier times the aristocratic families had owed their wealth to three main sources: commerce, Viking expeditions and slave labour. Trade had been a favourite means of enrichment among the aristocracy up to the middle of the 13th century, but now it was almost monopolized by Germans, and Viking enterprise was a thing of the past. The third source of wealth had also failed, for it is clear from the laws of Magnus that the class of thralls had practically disappeared. This must have greatly contributed to shatter the power of the class which had once been the chief factor in the government of Norway.

Paralysis of the aristocracy.

Haakon's daughter Ingeborg had married Duke Erik of Sweden, and on Haakon's death in 1319 their three-year-old son Magnus succeeded to the Norwegian and Swedish thrones, the two countries entering into a union which was not definitely broken till 1371. It was during this reign that Norway was ravaged by the Black Death. In 1343 Magnus handed over the greater part of Norway to his son Haakon VI., who married Margrete, daughter of King Valdemar III. of Denmark. Their young son Olaf V., already king of Denmark, succeeded to his father's throne on Haakon's death in 1380, but died in 1387, leaving the royal line extinct, and the nearest successor to the throne the hostile King Albrecht of Sweden, of the Mecklenburg family. The difficulty was met by filling the throne by election —an innovation in Norway, though it was the custom in Sweden and Denmark. The choice fell on King Haakon's widow Margrete, but a couple of years later, chiefly in order to gain German support in a coming struggle with the Mecklenburgers, the Norwegians elected as king the young Erik of Pomerania, great-nephew of the queen, who henceforth acted as regent. Erik had claims on the Swedish and Danish thrones, and in 1397, at Kalmar, he was solemnly crowned king over the three countries, which entered into a union "never to be dissolved."

Union of Norwegian, Swedish, and Danish thrones.

Reigns of the Kings of Norway.

Hertzberg and

others in the *Historisk Tidskrift* (Christiania) and other periodicals; also the articles by K. v. Amira, O. Bremer, K. Kaalund and V. Gudmundsson in *Pauls Grundriss der germanischen Philologie* (vol. iii., Strassburg, 1900). The above works are published in Christiania except where otherwise stated. In English, there is a history of Norway by H. H. Boyesen in the *Story of the Nations* series (London, 1900), and there are historical notes in G. Vigfússon and F. Y. Powell's *Corpus poëticum Boreale* (Oxford, 1883). The most important original sources are: Snorre Sturlasson's *Heimskringla*, or Lives of the Kings of Norway (up to 1177), of which there is an English translation by W. Morris and E. Magnússon, with a valuable index volume compiled by the latter, in the *Saga Library*, vols. iii.-vi. (London, 1893-1905). The original Icelandic text is edited by F. Jónsson (Copenhagen, 1893-1901). For a critical investigation into the sources of Snorri and the contemporary historians, see G. Storm, *Snorre Sturlasson's Historieskrivning* (Copenhagen, 1873, with map of ancient Norway), and F. Jónsson, *Den oldnorske og oldislandske Litteraturs Historie* (Bd. ii. Del. ii., Copenhagen, 1901). Of later sagas, Sverre's Saga (*Fornmanna Sögur*, vol. viii., Copenhagen) is translated by J. Sephton, *Northern Library* (vol. iv., London, 1899), and *Haakon's Saga* is given with a translation by G. W. Dasent in vols. ii. (text) and iv. (translation) of the *Chronicles and Memorials of Great Britain and Ireland* (London, 1894). Other important sources are: *Diplomatarium Norvegicum*, ed. C. Unger, Christiania, and *Norges Gamle Love indtil 1397*, ed. R. Keyser and P. A. Munch (5 vols., Christiania, 1846-1895). (B. S. P.)

1397-1814.—The history of Norway from 1397 down to the union with Sweden in 1814 falls naturally into four divisions. First, in 1450, the triple bond gave place to a union in which Norway became more firmly joined to Denmark. Next, in 1536, as the result of the Reformation, Norway sank almost to the level of a province. After 1660 she gained something in status from the establishment of autocracy in Denmark, and at the close of the period she became a constitutional kingdom on a footing of approximate equality with Sweden. But for the convulsions to which some of these changes gave rise, Norway possesses during this period but little history of her own, and she sank from her former position as a considerable and independent nation. The kings dwelt outside her borders, her fleet and army decayed, and her language gradually gave place to Danish. Germans plundered her coasts and monopolized her commerce, and after 1450 Danes began to appropriate the higher posts in her administration. When in 1448 Karl Knutsson was chosen king by the Swedes, and Christian of Oldenburg by the Danes, it was by force that Norway fell to the latter. On the 24th of November 1449 the Norwegians protested against Christian's assumption of sovereignty over them, and against separation from the Swedes. Next year, however, the Swedes assented to the separation. Christian I. (1450-1481) gave estates and offices in Norway to his Danish subjects and raised money by pawning her ancient possessions, the Orkneys and Shetland islands, to the king of Scotland. His son Hans (1482-1513) purchased the obedience of the Norwegian nobles by concessions to their power. The imposing union continued in name, but the weakness of the nation and its government was strikingly illustrated when the Germans in Bergen besieged a monastery in which their enemy Olaf Nilsson, a high official, had taken refuge.

15th century.

After the downfall of Christian II. (1513-1524) the position of Norway in relation to Denmark was changed for the worse. She was ruled for a century and a quarter by Danish officials; the churches and monasteries of Norway were sacked by Danes, and Danes were installed as pastors under the Lutheran system, which the Norwegians were compelled to accept in 1539. Soon Norway was dragged by Denmark into the so-called Seven Years' War of the North (1563-70). However, the power of the Hanse League in Bergen was broken. The rule of the Oldenburg dynasty proved neglectful rather than tyrannical, and under it the mass of the peasants was not flagrantly oppressed. Christian IV. (1588-1648), who founded Christiania, may almost be said to have discovered Norway anew. He reformed its government and strove to develop its resources, but his policy involved Norway in the loss of the provinces of Jemtland and Herjedalen, which were ceded to the Swedes by the peace of Brömsebro (1645). The Danish war of revenge against Carl X. of Sweden resulted in further territorial loss by Norway. By the peace of Roskilde (1658) she was compelled to renounce the counties of Trondhjem and Baahus, and although the former was restored by the peace of Copenhagen, two years later, her population fell below half a million. The Swedes had now acquired the rich provinces in the south and south-west of the Scandinavian peninsula, and their ambition to extend their frontiers to the North Sea became more pronounced and more possible of accomplishment. From the middle of the 17th century, however, the Dutch and English made their influence felt, and the political status of Norway could no longer be regarded as a purely Scandinavian affair. The establishment of hereditary autocracy in Denmark by Frederick III. in 1660 conferred many benefits upon Norway. Personal liberty perhaps suffered, but the Norwegian peasant remained a freeman while his counterpart in Denmark was a serf. Norwegian law was revised and codified under Christian V. (1670-1699), who was well served by the Norwegians in his attempt to regain the lost provinces.

16th century.

17th century.

Under the sons of these monarchs, Frederick IV. and Carl XII., Norway was once more compelled to pay for Danish aggression. Her shipping was destroyed, and in 1716, when driven from continental Europe, the Swedish hosts fell upon her. Two years later, however, the death of Carl XII. at the border fortress of Frederikshald averted the danger. During this war Peter Tordenskjold, the greatest among a long series of Norwegian heroes who served in the Danish fleet, won undying fame. Before the close of the 18th century something had been done towards dispelling the intellectual darkness. Holberg, though he flourished outside Norway, was at least born there, and by stemming the tide of German influence he made the future of Norwegian literature possible. At the close of the century Hans Nielson Hauge, the Wesley of Norway, appeared, while the growth of the timber trade with England gave rise to a great increase in wealth and population. In a century and a half the number of the Norwegian people was doubled, so that by 1814 Norway comprised some 900,000 souls. In 1788 the oppressive law that grain should be imported into Norway only from Denmark was repealed, and thanks to Danish policy Norway actually drew financial profit from the wars of the French Revolution.

18th century.

The Norwegian national movement was to render a decade at the beginning of the 19th century more memorable in Norwegian history than any century which had passed since the Calmar Union. In 1800 the Danish government committed the Norwegians to the second Armed Neutrality, and therefore to a share in the battle of Copenhagen, by which it was broken up. It was not until 1807, however, that Norway was fully involved in the Napoleonic wars. Then, after the bombardment of Copenhagen, she was compelled by Danish policy to embrace the cause of Napoleon against both England and Sweden. Commerce was annihilated, and the supply of food failed. The national distress brought into the forefront of politics national leaders, among whom Count Hermann Jasper von Wedel-Jarlsberg was the most conspicuous. As yet, however, patriotism went no further than a demand for an administration distinct from that of Denmark, which was conceded in 1807, and for a university nearer home than Copenhagen. In 1811 the government assented to the foundation of the university of Christiania. (W. F. R.)

Beginning of Norwegian national movement.

1814-1907.—After a union of nearly 400 years between Norway and Denmark, the Danish king, Frederick VI., without consulting the Norwegians, ceded Norway to Sweden by the treaty of Kiel (January 14, 1814). Some time previously Sweden had joined the allies in their struggle against Napoleon, while Denmark had, unwisely, sided with the French. In 1813 the Swedish crown prince, Bernadotte, afterwards King Carl XIV.,[1] proceeded to Germany and took command of one of the armies of the allies. After the power of Napoleon had been broken at

Events leading to the union with Sweden.

[1] In 1810 he was elected heir to the Swedish throne, in succession to the childless king Carl XIII., who died in 1818

the battle of Leipzig, he advanced against Denmark, and King Frederick soon saw himself compelled to accede to the cession of Norway, which had long been the aspiration of the Swedes, especially after the loss of Finland in 1809. In the treaty of Kiel Frederick VI. absolved the Norwegians from their oath of allegiance, and called upon them to become the loyal subjects of the Swedish king. But the Norwegians, who had not been consulted in the matter, refused to acknowledge the treaty, declaring that, while the Danish king might renounce his right to the Norwegian crown, it was contrary to international law to dispose of an entire kingdom without the consent of its people. A meeting of delegates was convened at Eidsvold, not far from the Norwegian capital, where, on the 17th of May 1814, a constitution, framed upon the constitutions of America, of France (1791), and of Spain (1812), was adopted. Among its most important features are that the Storthing, or National Assembly, is a single-chamber institution, and that the king is not given an absolute veto, or the right to dissolve the Storthing. The Danish governor of Norway, Prince Christian Frederick, was unanimously elected king. Soon afterwards the Swedes, under the crown prince, invaded Norway. The hostilities lasted only a fortnight, when Bernadotte opened negotiations with the Norwegians. A convention was held at Moss, where it was proposed that the Norwegians should accept the Swedish king as their sovereign, on the condition that their constitution of the 17th of May should remain intact, except with such alterations as the union might render necessary. An extraordinary Storthing was then summoned at Christiania, and on the 4th of November 1814 Norway was declared to be "a free, independent, and indivisible kingdom, united with Sweden under one king." A month previously Prince Christian Frederick had laid down his crown and left the country.

The union was more fully defined by the "Act of Union," which was accepted by the national assemblies of both countries in the following year. In the preamble to the act it is clearly stated that the union between the two peoples was accomplished "not by force of arms, but by free conviction," and the Swedish foreign minister declared to the European Powers, on behalf of Sweden, that the treaty of Kiel had been abandoned, and that it was not to this treaty, but to the confidence of the Norwegian people in the Swedish, that the latter owed the union with Norway. The constitution framed at Eidsvold was retained, and formed the *Grundlov*, or fundamental law of the kingdom. The union thus concluded between the two countries was really an offensive and defensive alliance under a common king, each country retaining its own government, parliament, army, navy and customs.

In Sweden the people received only an imperfect and erroneous insight into the nature of the union, and for a long time believed it to be an achievement of the Swedish arms. They had hoped to make Norway a province of Sweden, and now they had entered into a union in which both countries were equally independent. During the first fifteen years the king was represented in Norway by a Swedish viceroy, while the government was, of course, composed only of Norwegians. Count Wedel Jarlsberg was the first to be entrusted with the important office of head of the Norwegian government, while several of Prince Christian Frederick's councillors of state were retained, or replaced by others holding their political views. The Swedish Count von Essen was appointed the first viceroy of Norway, and was succeeded two years afterwards by his countryman Count von Mörner, over both of whom Count Wedel exercised considerable influence.

During the first years of the union the country suffered from poverty and depression of trade, and the finances were in a deplorable condition. The first Storthing was chiefly occupied with financial and other practical measures. In order to improve the finances of the country a bank of Norway was founded, and the army was reduced to one half. The paid-up capital of the bank was procured by an extraordinary tax, and this, together with the growing discontent among the peasantry, brought about a rising in Hedemarken, the object of which was to dissolve the Storthing and to obtain a reduction in the taxation. The rising, however, soon subsided, and the bountiful harvest of 1819 brought more prosperous times to the peasantry. Meanwhile, however, the financial position of the country had nearly endangered its independence. The settlement with Denmark with regard to Norway's share of the national debt common to both, assumed threatening proportions. In the interest of Denmark, the allied powers asked for a speedy settlement, and in order to escape their collective intervention, Bernadotte, who had now succeeded to the throne of Sweden and Norway, on the death (February 5, 1818) of the old king Carl XIII., accepted England's mediation, and was enabled in September 1819 to conclude a convention with Denmark, according to which Norway was held liable for only 3,000,000 specie dollars (nearly £700,000). But the Norwegians considered that this was still too much, and the attitude of the Storthing in 1821 nearly occasioned a fresh interference of the powers. The Storthing, however, yielded at last, and agreed to raise a loan and pay the amount stipulated in the convention, but the king evidently had his doubts as to whether the Norwegians really intended to fulfil their obligations. As his relations with the Storthing had already become strained, and as he was occupied at that time with plans, which it is now known meant nothing less than a *coup d'état* in connexion with the revision of the Norwegian constitution, he decided to adopt military preparations, and in July 1821 he collected a force of 3000 Swedish and 3000 Norwegian troops in the neighbourhood of Christiania, ostensibly for the mere purpose of holding some manœuvres. In a circular note (June 1) to the European powers, signed by the Swedish foreign minister, Engström—but it is not difficult to recognize the hand of the king as the real author—the minister complained bitterly of the treatment the king had met with at the hands of the Storthing, and represented the Norwegians in anything but a favourable light to the powers, the intention being to obtain their sympathy for any attempt that might be made to revise the Norwegian constitution. About this time another important question had to be settled by the Storthing. The Storthings of 1815 and 1818 had already passed a bill for the abolition of nobility, but the king had on both occasions refused his sanction. The Norwegians maintained that the few counts and barons still to be found in Norway were all Danish and of very recent origin, while the really true and ancient nobility of the country were the Norwegian peasants, descendants of the old jarls and chieftains. According to the constitution, any bill which has been passed by three successively elected Storthings, elections being held every third year, becomes law without the king's sanction. When the third reading of the bill came on, the king did everything in his power to obstruct it, but in spite of his opposition the bill was eventually carried and became law.

Strained relations between king and Storthing.

In 1822 Count Wedel Jarlsberg retired from the government. He had become unpopular through his financial policy, and was also at issue with the king on vital matters. In 1821 he had been impeached before the Rigsret, the supreme court of the realm, for having caused the state considerable losses. Jonas Collett (1772–1851) was appointed as his successor to the post of minister of finance. The king had by this time apparently abandoned his plan of a *coup d'état*, for in the following August he submitted to the Storthing several proposals for fundamental changes in the constitution, all of which aimed at removing all that was at variance with a monarchical form of government. The changes, in fact, were the same as he had suggested in his circular note to the Powers, and which he knew would be hailed with approval by his Swedish subjects. When the Storthing met again in 1824 the royal proposals for the constitutional changes came on for discussion. The Storthing unanimously rejected not only the king's proposals, but also several others by private members for changes in the constitution. The king submitted his proposals again in the following session of the Storthing, and again later on, but they were always unanimously rejected. In 1830 they were discussed for the last time, with the same result.

Royal proposals for constitutional revision.

The king's insistence was viewed by the people as a sign of absolutist tendencies, and naturally excited fresh alarm. In the eyes of the people the members of the opposition in the Storthing were the true champions of the rights and the independence which they had gained in 1814.

The king's absolutist tendencies.

For several years the Norwegians had been celebrating the 17th of May as their day of independence, it being the anniversary of the adoption of the constitution of 1814; but as the tension between the Norwegians and the king increased, the latter began to look upon the celebration in the light of a demonstration directed against himself, and when Collett, the minister of finance, was impeached before the supreme court of the realm for having made certain payments without the sanction of the Storthing, he also considered this as an attack upon his royal prerogatives. His irritation knew no bounds, and although Collett was acquitted by the supreme court, the king, in order to express his irritation with the Storthing and the action they had taken against one of his ministers, dissolved the national assembly with every sign of displeasure. The Swedish viceroy at the time, Count Sandels, had tried to convince him that his prejudice against the celebration of the 17th of May was groundless, and for some years the king had made no objection to the celebration. In 1827 it was, however, celebrated in a very marked manner, and later in the same year there was a demonstration against a foolish political play called *The Union*, and this being privately reported to the king in as bad a light as possible, he thought that Count Sandels, who had not considered it worth while to report the occurrence, was not fitted for his post, and had him replaced by Count Beltzar Bojilaus Platen (1766–1829), an upright but narrow-minded statesman. Count Platen's first act was to issue a proclamation warning the people against celebrating the day of independence; and in April 1828 the king, against the advice of his ministers, summoned an extraordinary Storthing, his intention being to wrest from the Storthing the supremacy it had gained in 1827. He also intended to take steps to prevent the celebration of the 17th of May, and assembled a force of 2000 Norwegian soldiers in the neighbourhood of the capital. The king arrived in Christiania soon after the opening of the extraordinary Storthing. He did not succeed, however, in his attempt to make any constitutional changes, but the Storthing met the king's wishes with regard to the celebration of the 17th of May by deciding not to continue the celebration, and the people all over the country quietly acquiesced. The following year trouble broke out again. The students had decided to celebrate the 17th of May with a festive gathering, which, however, passed off quietly. But large masses of the people paraded the streets, singing and shouting, and gathered finally in the market-place. There was a little rioting, and the police and the military eventually dispersed the people and drove them to their homes with sword and musket. This episode has become known as the "battle of the market-place," and did much to increase the general ill-feeling against Count Platen. His health eventually broke down from disappointment and vexation at the indignities and abuse heaped upon him. He died in Christiania at the end of the year, and his post remained vacant for several years, the presidency of the Norwegian government in the meantime being taken by Collett, its oldest member.

The "battle of the market-place."

By the July Revolution of 1830 the political situation in Europe became completely changed, and the lessons derived from that great movement reached also to Norway. The representatives of the peasantry, for whom the constitution had paved the way to become the ruling element in political life, were also beginning to distinguish themselves in the national assembly, where they now had taken up an independent position against the representatives of the official classes, who in 1814 and afterwards had played the leading and most influential part in politics. This party was now under the leadership of the able and gifted Ole Ueland, who remained a member of every Storthing from 1833 to 1869. The Storthing of 1833 was the first of the so-called "peasant Storthings." Hitherto the peasantry had never been represented by more than twenty members, but the elections in 1833 brought their number up to forty-five, nearly half of the total representation. The attention of this new party was especially directed to the finances of the country, in the administration of which they demanded the strictest economy. They often went too far in their zeal, and thereby incurred considerable ridicule.

Increased political power of the peasantry.

About this time the peasant party found a champion in the youthful poet Henrik Wergeland, who soon became one of the leaders of the "Young Norway" party. He was a republican in politics, and the most zealous upholder of the national independence of Norway and of her full equality with Sweden in the union. A strong opposition to Wergeland and the peasant party was formed by the upper classes under the leadership of another rising poet and writer, Johan Sebastian Welhaven, and other talented men, who wished to retain the literary and linguistic relationship with Denmark, while Wergeland and his party wished to make the separation from Denmark as complete as possible, and in every way to encourage the growth of the national characteristics and feeling among the people. He devoted much of his time, by writing and other means, to promote the education of the people; but although he was most popular with the working and poorer classes, he was not able to form any political party around him, and at the time of his death he stood almost isolated. He died in 1845, and his opponents became now the leaders in the field of literature, and carried on the work of national reconstruction in a more restrained and quiet manner. The peasant party still continued to exist, but restricted itself principally to the assertion of local interests and the maintenance of strict economy in finance.

Wergeland opposed by Welhaven.

The violent agitation that began in 1830 died away. The tension between the king and the legislature, however, still continued, and reached its height during the session of 1836, when all the royal proposals for changes in the constitution were laid aside, without even passing through committee, and when various other steps towards upholding the independence of the country were taken. The king, in his displeasure, decided to dissolve the Storthing; but before it dispersed it proceeded to impeach Lövenskiold, one of the ministers, before the supreme court of the realm, for having advised the king to dissolve the Storthing. He was eventually sentenced to pay a fine of 10,000 kroner (about £550), but he retained his post. Collett, another minister who had greatly displeased the king by his conduct, was dismissed; but unity in the government was brought about by the appointment of Count Wedel Jarlsberg as viceroy of Norway. From this time the relations between the king and the Norwegian people began to improve, whereas in Sweden he was, in his later years, not a little disliked.

When the king's anger had subsided, he summoned the Storthing to an extraordinary session, during which several important bills were passed. Towards the close of the session an address to the king was agreed to, in which the Storthing urged that steps should be taken to place Norway in political respects upon an equal footing with Sweden, especially in the conduct of diplomatic affairs with foreign countries. The same address contained a petition for the use of the national or merchant flag in all waters. According to the constitution, Norway was to have her own merchant flag, and in 1821 the Storthing had passed a resolution that the flag should be scarlet, divided into four by a blue cross with white borders. The king, however, refused his sanction to the resolution, but gave permission to use the flag in waters nearer home; but beyond Cape Finisterre the naval flag, which was really the Swedish flag, with a white cross on a red ground in the upper square, must be carried. In reply to the Storthing's address the king in 1838 conceded the right to all merchant ships to carry the national flag in all waters. This was hailed with great rejoicings all over the country; but the question of the national flag for general use had yet to be settled With regard to the question raised in the address of the Storthing about the conduct of

The national flag question.

diplomatic affairs, and other matters concerning the equality of Norway in the union, the king in 1839 appointed a committee of four Norwegians and four Swedes, who were to consider and report upon the questions thus raised.

During the sitting of this first "Union Committee" its powers were extended to consider a comprehensive revision of the Act of Union, with the limitation that the fundamental conditions of the union must in no way be interfered with. But before the committee had finished their report the king died (March 8th 1844), and was succeeded by his son Oscar I. According to the constitution the Norwegian kings must be crowned in Throndhjem cathedral, but the bishop of Throndhjem was in doubt whether the queen, who was a Roman Catholic, could be crowned, and the king decided to forego the coronation both of himself and his queen. The new king soon showed his desire to meet the wishes of the Norwegian people. Thus he decided that in all documents concerning the internal government of the country Norway should stand first where reference was made to the king as sovereign of the two kingdoms. After having received the report of the committee concerning the flag question, he resolved (June 20th, 1844) that Norway and Sweden should each carry its own national flag as the naval flag, with the mark of union in the upper corner; and it was also decided that the merchant flag of the two kingdoms should bear the same mark of union, and that only ships sailing under these flags could claim the protection of the state.

Death of King Carl John; succeeded by Oscar I.

The financial and material condition of the country had now considerably improved, and King Oscar's reign was marked by the carrying out of important legislative work and reforms, especially in local government. New roads were planned and built all over the country, the first railway was built, steamship routes along the coast were established, lighthouses were erected and trade and shipping made great progress. The king's reign was not disturbed by any serious conflicts between the two countries. No change took place in the ministry under the presidency of the viceroy Lövenskiold upon King Oscar's accession to the throne, but on the death or retirement of some of its members the vacant places were filled by younger and talented men, among whom was Fredrik Stang, who in 1845 took over the newly established ministry of the interior. During the Schleswig-Holstein rebellion (1848–1850) and the Crimean War King Oscar succeeded in maintaining the neutrality of Norway and Sweden, by which Norwegian shipping especially benefited. The abolition of the English navigation acts in 1850 was of great importance to Norway, and opened up a great future for its merchant fleet.

In 1826 a treaty had been concluded with Russia, by which the frontier between that country and the adjoining strip of Norwegian territory in the Polar region was definitely delimited; but in spite of this treaty Russia in 1851 demanded that the Russian Lapps on the Norwegian frontier should have the right to fish on the Norwegian coast, and have a portion of the coast on the Varanger fjord allotted to them to settle upon. The Norwegian government refused to accede to the Russian demands, and serious complications might have ensued if the attention of Russia had not been turned in another direction. While his father had looked to Russia for support, King Oscar was more inclined to secure western powers as his allies, and during the Crimean War he concluded a treaty with England and France, according to which these countries promised their assistance in the event of any fresh attempts at encroachment on Norwegian or Swedish territory by Russia. In consequence of this treaty the relations between Norway and Sweden and Russia became somewhat strained; but after the peace of Paris in 1856, and the accession of Alexander II., whose government was in favour of a peaceful policy, the Russian ambassador at Stockholm succeeded in bringing about more friendly relations.

Relations with Russia.

Owing to the king's ill-health, his son, the crown prince Carl, was appointed regent in 1857, and two years later, when King Oscar died, he succeeded to the thrones of the two countries as Carl XV. He was a gifted, genial and noble personality, and desired to inaugurate his reign by giving the Norwegians a proof of his willingness to acknowledge the claims of Norway, but he did not live to see his wishes in this respect carried out. According to the constitution, the king had the power to appoint a viceroy for Norway, who might be either a Norwegian or Swede. Since 1829 no Swede had held the post, and since 1859 no appointment of a viceroy had been made. But the paragraph in the constitution still existed, and the Norwegians naturally wished to have this stamp of "provinciality" obliterated. A proposal for the abolishment of the office of viceroy was laid before the Storthing in 1859, and passed by it. The king, whose sympathies on this question were known, had been appealed to, and had privately promised that he would sanction the proposed change in the constitution; but as soon as the resolution of the Storthing became known in Sweden, a violent outcry arose both in the Swedish press and the Swedish estates. Under the pressure that was brought to bear upon the king in Sweden, he eventually refused to sanction the resolution of the Storthing; but he added that he shared the views of his Norwegian counsellors, and would, when "the convenient moment" came, himself propose the abolition of the office of viceroy.

Death of Oscar I.; accession of Carl XV.

Question of Norwegian viceroy.

In the following year the Swedish government again pressed the demands of the Swedish estates for a revision of the Act of Union, which this time included the establishment of a union or common parliament for the two countries, on the basis that, according to the population, there should be two Swedish members to every Norwegian. The proposal was sent to the Norwegian government, which did not seem at all disposed to entertain it; but some dissensions arose with regard to the form in which its reply was to be laid before the king. The more obstinate members of the ministry resigned, and others, of a more pliable nature, were appointed under the presidency of Fredrik Stang, who had already been minister of the interior from 1845 to 1856. The reconstructed government was, however, in accord with the retiring one, that no proposal for the revision of the Act of Union could then be entertained. The king, however, advocated the desirability of a revision, but insisted that this would have to be based upon the full equality of both countries. In 1863 the Storthing assented to the appointment by the king of a Union committee, the second time that such a committee had been called upon to consider this vexatious question. It was not until 1867 that its report was made public, but it could not come on for discussion in the Storthing till it met again in 1871. During this period the differences between the two countries were somewhat thrust into the background by the Danish complications in 1863–1864, which threatened to draw the two kingdoms into war. King Carl was himself in favour of a defensive alliance with Denmark, but the Norwegian Storthing would only consent to this if an alliance could also be effected with at least one of the western powers.

Swedish proposals for revision of Act of Union.

In 1869 the Storthing passed a resolution by which its sessions were made annual instead of triennial according to the constitution of 1814. The first important question which the first yearly Storthing which met in 1871 had to consider was once more the proposed revision of the Act of Union. The Norwegians had persistently maintained that in any discussion on this question the basis for the negotiations should be (1) the full equality of the two kingdoms, and (2) no extension of the bonds of the union beyond the line originally defined in the act of 1815. However, the draft of the new act contained terms in which the supremacy of Sweden was presupposed and which introduced important extensions of the bonds of the union; and, strangely enough, the report of the Union committee was adopted by the new Stang ministry, and even supported by some of the most influential newspapers under the plausible garb of "Scandinavianism." In these circumstances the "lawyers' party," under the leadership of Johan Sverdrup, who was to play such a prominent part in Norwegian politics, and the "peasant party," led by Sven

Jaabœk, a gifted peasant proprietor, who was also destined to become a prominent figure in the political history of the country, formed an alliance, with the object of guarding against any encroachment upon the liberty and independence which the country had secured by the constitution of 1814. This was the foundation of the great national party, which became known as the "Venstre" (the left), and which before long became powerful enough to exert the most decisive influence upon the political affairs of the country. When, therefore, the proposed revision of the Act of Union eventually came before the Storthing in 1871, it was rejected by an overwhelming majority. The position which the government had taken up on this question helped to open the eyes of the Norwegians to some defects in the constitution, which had proved obstacles to the development and strengthening of the parliamentary system.

Foundation of the Norwegian national party.

In 1872 a private bill came before the Storthing, proposing that the ministers should be admitted to the Storthing and take part in its proceedings. After a number of stormy debates, the bill was successfully carried under the leadership of Johan Sverdrup by a large majority, but the government, evidently jealous of the growing powers and influence of the new liberal party in the Storthing, advised the king to refuse his sanction, although the government party itself had several times in the preceding half-century introduced a similar bill for admitting the ministers to the Storthing. At that time, however, the opposition had looked with suspicion on the presence of the ministers in the national assembly, lest their superior skill in debate and political experience should turn the scale too readily in favour of government measures. Now, on the contrary, the opposition had gained more experience and had confidence in its own strength, and no doubt found that the legislative work could better be carried on if the ministers were present to explain and defend their views; but the government saw in the proposed reform the threatened introduction of full parliamentary government, by which the ministry could not remain in office unless supported by a majority in the Storthing. Before the Storthing separated the liberals carried a vote of censure against the government; but the king declared that the ministers enjoyed his confidence and took no further notice of the vote. Two of the ministers, who had advised the ratification of the bill, resigned, however; and a third minister, who had been in the government since 1848, resigned also, and retired from public life, foreseeing the storm that was brewing on the political horizon. Numerous public meetings were held all over the country in support of the proposed reform, and among the speakers was Johan Sverdrup, now the acknowledged leader of the liberal party, who was hailed with great enthusiasm as the champion of the proposed reform.

Question of admittance of ministers to seats in the Storthing.

This was the political situation when King Carl died (18th September 1872). He was succeeded by his brother, who ascended the throne as Oscar II. In the following year he gave his sanction to the bill for the abolition of the office of viceroy, which the Storthing had again passed, and the president of the ministry was afterwards recognized as the prime minister and head of the government in Christiania. Fredrik Stang, who was the president of the ministry at the time, was the first to fill this office. In the same year Norway celebrated its existence for a thousand years as a kingdom, with great festivities.

Death of Carl XV.; accession of Oscar II.

In 1874 the government, in order to show the people that they to some extent were willing to meet their wishes with regard to the great question before the country, laid before the Storthing a royal proposition for the admittance of the ministers to the national assembly. But this was to be accompanied by certain other constitutional changes, such as giving the king the right of dissolving the Storthing at his pleasure, and providing fixed pensions for ex-ministers, which was regarded as a guarantee against the majority of the assembly misusing its new power. The bill which the government brought in was unanimously rejected by the Storthing, the conservatives also voting against it, as they considered the guarantees insufficient. The same year, and again in 1877, the Storthing passed the bill, but in a somewhat different form from that of 1872. On both occasions the king refused his sanction.

Proposals by the Storthing for full popular control.

The Storthing then resorted to the procedure provided by the constitution to carry out the people's will. In 1880 the bill was passed for the third time, and on this occasion by the overwhelming majority of 93 out of 113. Three Storthings after three successive elections had now carried the bill, and it was generally expected that the king and his government would at length comply with the wishes of the people, but the king on this occasion also refused his sanction, declaring at the same time that his right to the absolute veto was "above all doubt." Johan Sverdrup, the leader of the liberal party and president of the Storthing, brought the question to a prompt issue by proposing to the Storthing that the bill, which had been passed three times, should be declared to be the law of the land without the king's sanction. This proposal was carried by a large majority on the 9th of June 1880, but the king and his ministers in reply declared that they would not recognize the validity of the resolution.

The king's veto.

From this moment the struggle may be said to have centred itself upon the existence or non-existence of an absolute veto on the part of the crown. The king requested the faculty of law at the Christiania university to give its opinion on the question at issue, and with one dissentient the learned doctors upheld the king's right to the absolute veto in questions concerning amendments of the constitution, although they could not find that it was expressly stated in the fundamental law of the country. The ministry also advised the king to claim a veto in questions of supply, which still further increased the ill-feeling in the country against the government, and the conflict in consequence grew more and more violent.

Struggle between the king and the Storthing.

In the midst of the struggle between the king and the Storthing, the prime minister, Fredrik Stang, resigned, and Christian August Selmer (1816–1889) became his successor; and this, together with the appointment of another member to the ministry, K. H. Schweigaard, plainly indicated that the conflict with the Storthing was to be continued. In June 1882 the king arrived in Christiania to dissolve the Storthing, and on this occasion delivered a speech from the throne, in which he openly censured the representatives of the people for their attitude in legislative work and on the question of the absolute veto, the speech creating considerable surprise throughout the country. Johan Sverdrup and Björnstjerne Björnson, the popular poet and dramatist, called upon the people to support the Storthing in upholding the resolution of the 9th of June, and to rouse themselves to a sense of their political rights. The elections resulted in a great victory for the liberal party, which returned stronger than ever to the Storthing, numbering 83 and the conservatives only 31. The ministry, however, showed no sign of yielding, and, when the new Storthing met in February 1883, the Odelsthing (the lower division of the national assembly) decided upon having the question finally settled by impeaching the whole of the ministry before the Rigsret or the supreme court of the realm. The jurisdiction of the Rigsret is limited to the trial of offences against the state, and there is no appeal against its decisions. The charges against the ministers were for having acted contrary to the interests of the country by advising the king to refuse his sanction—first, to the amendment of the law for admitting the ministers to the Storthing; secondly, to a bill involving a question of supply; and thirdly, to a bill by which the Storthing could appoint additional directors on the state railways.

Elections of 1882.

Impeachment of ministers by the Storthing, 1883.

The trial of the eleven ministers of the Selmer cabinet began in May 1883 and lasted over ten months: In the end the Rigsret sentenced the prime minister and seven of his ministers to be deprived of their offices, while three, who had either recommended the king to sanction the bill for admitting the ministers to the Storthing, or had

The ministry sentenced by the Rigsret.

entered the cabinet at a later date, were heavily fined. The excitement in the country rose to feverish anxiety. Rumours of all kinds were afloat, and it was generally believed that the king would attempt a *coup d'état*. Fortunately the king after some hesitation issued (11th March 1884) an order in council announcing that the judgment of the supreme court would be carried into effect, and Selmer was then called upon to resign his position as prime minister. King Oscar, however, in his declaration upheld the constitutional prerogative of the crown, which, he maintained, was not impaired by the judgment of the Rigsret. The following month the king, regardless of the large liberal majority in the Storthing, asked Schweigaard, one of the late ministers, whose punishment consisted in a fine, to form a ministry, and the so-called "April ministry" was then appointed, but sent in its resignation in the following month. Professor Broch, a former minister, next failed to form a ministry, and the king was at last compelled to appoint a ministry in accordance with the majority in the Storthing. In June 1884 Johan Sverdrup was asked to form one. He selected for his ministers leading men on the liberal side in the Storthing, and the first liberal ministry that Norway had was at length appointed. The Storthing, in order to satisfy the king, passed a new resolution admitting the ministers to the national assembly, and this received formal sanction.

Acquiescence by the king.

First Liberal ministry 1884.

During the following years a series of important reforms was carried through. Thus in 1887 the jury system in criminal matters was introduced into the country after violent opposition from the conservatives. A bill intended to give parishioners greater influence in church matters, and introduced by Jakob Sverdrup, the minister of education, and a nephew of the prime minister, met, however, with strong opposition, and was eventually rejected by the Storthing, the result being a break-up of the ministry and a disorganization of the liberal party. In June 1889 the Sverdrup ministry resigned, and a conservative one was formed by Emil Stang, the leader of the conservatives in the Storthing, and during the next two years the Storthing passed various useful measures; but the ministry was eventually wrecked on the rock of the great national question which about this time came to the front—that of Norway's share in the transaction of diplomatic affairs. At the time of the union in 1814 nothing had been settled as to how these were to be conducted, but in 1835 a resolution was issued, that when the Swedish foreign minister was transacting diplomatic matters with the king which concerned both countries, or Norway only, the Norwegian minister of state in attendance upon the king at Stockholm should be present. This arrangement did not always prove satisfactory to the Norwegians, especially as the Swedish foreign minister could not be held responsible to the Norwegian government or parliament.

The question of diplomatic representation.

By a change in the Swedish constitution in 1885 the ministerial council, in which diplomatic matters are discussed, came to consist of the Swedish foreign minister and two other members of the cabinet on behalf of Sweden, and of the Norwegian minister at Stockholm on behalf of Norway. The king, wishing to remedy this disparity, proposed that the composition of the council should be determined by an additional paragraph in the Act of Union. The representatives of the Norwegian government in Stockholm proposed that three members of the cabinet of each country should constitute the ministerial council. To this the Swedish government was willing to agree, but on the assumption that the minister of foreign affairs should continue to be a Swede as before, and this the Norwegians, of course, would not accept. At the king's instigation the negotiations with the Swedish government were resumed at the beginning of 1891, but the Swedish Riksdag rejected the proposals, while the Norwegian Storthing insisted upon "Norway's right, as an independent kingdom, to full equality in the union, and therewith her right to watch over her foreign affairs in a constitutional manner." The Stang ministry then resigned, and a liberal ministry, with Steen, the recognized leader of the liberal party after Sverdrup's withdrawal from politics, as prime minister, was appointed.

The Norwegian claim.

The new ministry had placed the question of a separate minister of foreign affairs for Norway prominently in their programme, but little progress was made during the next few years. Another and more important question for the country, as far as its shipping and commerce are concerned, now came to the front. The Storthing had in 1891 appointed a committee to inquire into the practicability of establishing a separate Norwegian consular service, and in 1892 the Storthing, acting upon the committee's report, determined to establish a consular service. The king, influenced by public opinion in Sweden, refused his sanction, and the Norwegian government in consequence sent in their resignation, whereupon a complete deadlock ensued. This was terminated by a compromise to the effect that the ministry would return to office on the understanding that the question was postponed by common consent. The following year the Storthing again passed a resolution calling upon the Norwegian government to proceed with the necessary measures for establishing the proposed consular service for Norway, but the king again refused to take any action in the matter. Upon this the liberal ministry resigned (May 1893), and the king appointed a conservative government, with Emil Stang as its chief. Thus matters went on till the end of 1894, when the triennial elections took place, with the result that the majority of the electors declared in favour of national independence on the great question then before the country. The ministry did not at once resign, but waited till the king arrived in Christiania to open the Storthing (January 1895). The king kept the country for over four months without a responsible government, during which time the crisis had become more acute than ever. A coalition ministry was at last formed, with Professor G. F. Hagerup as prime minister. A new committee, consisting of an equal number of Norwegians and Swedes, was appointed to consider the question of separate diplomatic representation; but after sitting for over two years the committee separated without being able to come to any agreement.

Question of separate consular service.

The elections in 1897 proved again a great victory for the liberal party, 79 liberals and 35 conservatives being returned, and in February 1898 the Hagerup ministry was replaced by a liberal, once more under the premiership of Steen. Soon afterwards the bill for the general adoption of the national or "pure" flag, as it was called, was carried for the third time, and became law without the king's sanction. In 1898 universal political suffrage for men was passed by a large majority, but the proposal to include women received the support of only 33 votes.

In January 1902, on the initiative of the Swedish foreign minister, another committee, consisting of an equal number of leading Norwegians and Swedes, was appointed by the king to investigate the consular question. The unanimous report of the committee was to the effect that "it was possible to appoint separate Norwegian consuls exclusively responsible to Norwegian authority and separate Swedish consuls exclusively responsible to Swedish authority." The further negotiations between the two governments resulted in the so-called *communiqué* of the 24th of March 1903, which announced the conclusion of an agreement between the representatives of the two countries for the establishment of the separate consular service. The terms of the *communiqué* were submitted to a combined Norwegian and Swedish council of state on the 21st of December 1903, when they were unanimously agreed to and were signed by the king, who commissioned the Norwegian and the Swedish governments to proceed with the drafting of the laws and regulations for the separate consular services. In due course the Norwegian government submitted to the Swedish government their draft of the proposed laws and regulations, but no reply was forthcoming for several months. About this time the Swedish foreign minister, Mr Lagerheim, who had zealously worked for a friendly solution of the consular question, resigned, and in November the same year Boström, the Swedish prime minister, suddenly submitted to the Norwegian government a number of new conditions under which the Swedish

The crisis of 1902-1905.

government was prepared to agree to the establishment of separate consuls. This came as a surprise to the Norwegians in view of the fact that the basis for the establishment of separate consuls had already been agreed upon and confirmed by the king in December 1903. According to Boström's proposals the Norwegian consuls were to be placed under the control of the Swedish foreign minister, who was to have the power to remove any Norwegian consul. The Norwegians felt it would be beneath the dignity of a self-governing country to agree to the Swedish proposals, and that these new demands were nothing less than a breach of faith with regard to the terms of agreement arrived at two years before by both governments and approved and signed by the king. The Norwegian government would have been perfectly justified if, after this, they had withdrawn from the negotiations, but they did not wish to jeopardize the opportunity of arriving at a friendly settlement, and Hagerup, the Norwegian prime minister, proceeded to Stockholm to confer with Boström; but no satisfactory agreement could be arrived at. There was therefore nothing left but for the Norwegians to take matters into their own hands.

On the 8th of February 1905 Hagerup announced to the Norwegian Storthing that the negotiations had fallen through, and on the 17th the Storthing decided unanimously to refer the matter to a special committee. Owing to some difference of opinion between the members of his ministry, Hagerup resigned on the 1st of March and was succeeded by Christian Michelsen, who formed a ministry composed of members of both political parties. The special committee decided that a bill should be immediately submitted to the Storthing for the establishment of a Norwegian consular service and that the measure should come into force not later than the 1st of April 1906. An attempt was made by the Swedish crown prince, acting as Prince Regent during the king's illness, to enter into new negotiations with the Norwegian government, but the proposals were not favourably received in Norway. In April 1905 Boström resigned, which was considered to be a move on the part of Sweden to facilitate negotiations with Norway. The bill for the establishment of Norwegian consuls was passed by the Storthing without a dissentient voice on the 23rd of May, and it was generally expected that the king, who again had assumed the reins of government, would sanction the bill, but on the 27th of May, in spite of the earnest entreaties of his Norwegian ministers, the king formally refused to do so. The Norwegian Ministry immediately resigned, but the king informed the ministers that he could not accept their resignation. They, however, declined to withdraw it. A few days afterwards the Norwegian government informed the Storthing of the king's refusal, whereupon the assembly unanimously agreed to refer the matter to the special committee. On the 7th of June the Storthing met to hear the final decision of the government. Michelsen, the prime minister, informed the Storthing that all the members of the government had resigned in consequence of the king's refusal to sanction the consular law, that the king had declined to accept the resignation, and that, as an alternative government could not be formed, the union with Sweden, based upon a king in common, was consequently dissolved. The president of the Storthing submitted a resolution that the resigning ministry should be authorized to exercise the authority vested in the king in accordance with the constitution of the country. The resolution was unanimously adopted.

Declaration of independence.

King Oscar, on receiving the news of the action of the Norwegian Storthing, sent a telegraphic protest to the Norwegian prime minister and to the president of the Storthing. The Swedish government immediately decided to summon an extraordinary session of the Swedish parliament for the 20th of June, when a special committee was appointed to consider what steps should be taken by Sweden. On the 25th of July the report of the committee was laid before the Riksdag, in which it was stated that Sweden could have no objection to enter into negotiations about the severance of the union, when a vote to that effect had been given by a newly-elected Storthing or by a national vote in the form of a referendum by the Norwegian people. The report was unanimously adopted by the Swedish Riksdag on the 27th of July, and on the following day the Norwegian Storthing decided that a general plebiscite should be taken on the 13th of August, when 368,211 voted in favour of the dissolution and only 184 against it. It was thereupon agreed that representatives of Norway and of Sweden should meet at Karlstad in Sweden on the 31st of August to discuss and arrange for the severance of the union. The negotiations lasted till the 23rd of September, though more than once they were on the point of being broken off. The agreement stipulated a neutral zone on both sides of the southern border between the two countries, the Norwegians undertaking to dismantle some fortifications within that zone. The agreement was to remain in force for ten years, and could be renewed for a similar period, unless one of the countries gave notice to the contrary. The Karlstad agreement was ratified by the Norwegian Storthing on the 9th of October and by the Swedish Riksdag on the 16th of the same month. On the 27th of October King Oscar issued a proclamation to the Norwegian Storthing, in which he relinquished the crown of Norway. The Norwegian government was thereupon authorized by the Storthing to negotiate with Prince Charles of Denmark and to arrange for a national vote as to whether or no the country would approve of his election for the Norwegian throne. The plebiscite resulted in 259,563 votes for his election and 69,264 against. On the 18th of November the Storthing unanimously elected Prince Charles as king of Norway, he taking the name of Haakon VII. On the 25th of November the king and his consort, Queen Maud, the youngest daughter of King Edward VII. of England, entered the Norwegian capital. Their coronation took place in the Trondhjem cathedral the following year.

Separation from Sweden.

Election of Haakon VII.

In 1907 parliamentary suffrage was granted to women with the same limitation as in the municipal suffrage granted to them in 1901, viz. to all unmarried women over 25 years, who pay taxes on an income of 300 kroner (about £16) in the country districts and on 400 kroner (about £22) in the towns, as well as to all married women, whose husbands pay taxes on similar incomes. Norway was thus the first sovereign country in Europe where the parliamentary vote was granted to women. (H. L. B.)

Norwegian Literature

Early Norse literature is inextricably bound up with Icelandic literature. Iceland was colonized from Norway in the 9th century, and the colonists were drawn chiefly from the upper and cultured classes. They took with them their poetry and literary traditions. Old Norse literature is therefore dealt with under Iceland (*q.v.*). (See also Edda, Saga, Runes.)

The modern literature of Norway bears something of the same relation to that of Denmark that American literature bears to English. In each case the development and separation of a dependency have produced a desire on the part of persons speaking the mother-tongue for a literature that shall express the local emotions and conditions of the new nation. Two notable events led to the foundation of a separate Norwegian literature: the one was the creation of the university of Christiania in 1811, and the other was the separation of Norway from Denmark in 1814. Before this time Norwegian writers had been content, as a rule, to publish their works at Copenhagen. The first name on the annals of Danish literature, Peder Clausen, is that of a Norwegian; and if all Norse writers were removed from that roll, the list would be poorer by some of its most illustrious names, by Holberg, Tullin, Wessel, Treschow, Steffens and Hauch.

The first book printed in Norway was an almanac, brought out in Christiania in 1643 by a wandering printer named Tyge Nielsen, who brought his types from Copenhagen. But the first press set up definitely in Norway was that of Valentin Kuhn, brought over from Germany in 1650 by the theologian Christian Stephensen Bang (1580–1678) to help in the circulation of his numerous tracts. Bang's *Christianiae Stads Beskrifuelse* (1651), is the first book published in Norway. Christen Jensen (d. 1653)

was a priest who collected a small glossary or *glosebog* of the local dialects, published in 1656. Gerhard Milzow (1629–1688), the author of a *Presbyterologia Norwegica* (1679), was also a Norse priest. The earliest Norwegian writer of any original merit was Dorthe Engelbrechtsdatter (1634–1716), afterwards the wife of the pastor Ambrosius Hardenbech. She is the author of several volumes of religious poetry which have enjoyed great popularity. The hymn-writer Johan Brunsmann (1637–1707), though a Norseman by birth, belongs by education and temper entirely to Denmark. Not so Petter Dass (1647–1708) (*q.v.*), the most original writer whom Norway produced and retained at home during the period of annexation. Another priest, Jonas Ramus (1649–1718), wrote *Norriges Kongers Historie* (History of the Norse Kings) in 1719, and *Norriges Beskrivelse* (1735). The celebrated missionary to Greenland, Hans Egede (1686–1758), wrote several works on his experiences in that country. Peder Hersleb (1689–1757) was the compiler of some popular treatises of Lutheran theology. Frederik Nannestad, bishop of Trondhjem (1693–1774), started a weekly gazette in 1760. The missionary Knud Leem (1697–1774) published a number of works on the Lapps of Finmark, one at least of which, his *Beskrivelse over Finmarkens Lapper* (1767), still possesses considerable interest. The famous Erik Pontoppidan (1698–1764) cannot be regarded as a Norwegian, for he did not leave Denmark until he was made bishop of Bergen, at the age of forty-nine. On the other hand the far more famous Baron Ludvig Holberg (1684–1754), belongs to Denmark by everything but birth, having left Norway in childhood.

A few Norsemen of the beginning of the 18th century distinguished themselves chiefly in science. Of these Johan Ernst Gunnerus (1718–1773), bishop of Trondhjem, was the first man who gave close attention to the Norwegian flora. He founded the Norwegian Royal Society of Sciences in 1760, with Gerhard Schöning (1722–1780) the historian and Hans Strøm (1726–1797) the zoologist. Peder Christofer Stenersen (1723–1776), a writer of occasional verses, merely led the way for Christian Braumann Tullin (1728–1765), a lyrical poet of exquisite genius, who is claimed by Denmark but who must be mentioned here, because his poetry was not only mainly composed in Christiania, but breathes a local spirit. Danish literature between the great names of Evald and Baggesen presents us with hardly a single figure which is not that of a Norseman. The director of the Danish national theatre in 1771 was a Norwegian, Niels Krog Bredal (1733–1778), who was the first to write lyrical dramas in Danish. A Norwegian, Johan Nordahl Brun (1745–1816), was the principal tragedian of the time, in the French taste. It was a Norwegian, J. H. Wessel (1742–1785), who laughed this taste out of fashion. In 1772 the Norwegian poets were so strong in Copenhagen that they formed a *Norske Selskab* (Norwegian Society), which exercised a tyranny over contemporary letters which was only shaken when Baggesen appeared. Among the leading writers of this period are Claus Frimann (1746–1829), Peter Harboe Frimann (1752–1839), Claus Fasting (1746–1791), Johan Wibe (1748–1782), Edvard Storm (1749–1794), C. H. Pram (1756–1821), Jonas Rein (1760–1821), Jens Zetlitz (1761–1821), and Lyder Christian Sagen (1771–1850), all of whom, though Norwegians by birth, find their place in the annals of Danish literature. To these poets must be added the philosophers Niels Treschow (1751–1833) and Henrik Steffens (1773–1845), and in later times the poet Johannes Carsten Hauch (1790–1872).

The first form which Norwegian literature took as an independent thing was what was called "Syttendemai-Poesi," or poetry of the 17th of May, that being the day on which Norway obtained her independence and proclaimed her king. Three poets, called the "Trefoil," came forward as the inaugurators of Norwegian thought in 1814. Of these Conrad Nicolai Schwach (1793–1860) was the least remarkable. Henrik Anker Bjerregaard (1792–1842), born in the same hamlet of Ringsaker as Schwach, had a much brighter and more varied talent. His *Miscellaneous Poems*, collected at Christiania in 1829, contain some charming studies from nature, and admirable patriotic songs. He brought out a tragedy of *Magnus Barfods Sönner* (Magnus Barefoot's Sons) and a lyrical drama, *Fjeldeventyret* (The Adventure in the Mountains) (1828). He became judge of the supreme court of the diocese of Christiania. The third member of the Trefoil, Mauritz Kristoffer Hansen (1794–1842), was a schoolmaster. His novels, of which *Ottar de Bretagne* (1819) was the earliest, were much esteemed in their day, and after his death were collected and edited (8 vols., 1855–1858), with a memoir by Schwach. Hansen's *Poems*, printed at Christiania in 1816, were among the earliest publications of a liberated Norway, but were preceded by a volume of *Smaadigte* (Short Poems) by all three poets, edited by Schwach in 1815, as a semi-political manifesto. These writers, of no great genius in themselves, did much by their industry and patriotism to form a basis for Norwegian literature.

The "Trefoil."

The creator of Norwegian literature, however, was the poet Henrik Arnold Wergeland (1808–1845) (*q.v.*), a man of great genius and enthusiasm, who contrived within the limits of a life as short as Byron's to concentrate the labours of a dozen ordinary men of letters. He held views in most respects similar to those pronounced by Rousseau and Shelley. His obscurity and extravagance stood in the way of his teaching, and his only disciples in poetry were Sylvester Sivertson (1809–1847), a journalist of talent whose verses were collected in 1848, and Christian Monsen (1815–1852).

Wergeland, Welhaven.

A far more wholesome and constructive influence was that of Johann Sebastian Cammermeyer Welhaven (1807–1873) (*q.v.*), who was first brought to the surface by the conservative reaction in 1830 against the extravagance of the radical party. A savage attack on *Henrik Wergeland's Poetry*, published in 1832, caused a great sensation, and produced an angry pamphlet in reply from the father, Nikolai Wergeland. The controversy became the main topic of the day, and in 1834 Welhaven pushed it into a wider arena by the publication of his beautiful cycle of satirical sonnets called *Norges Dæmring* (The Dawn of Norway), in which he preached a full conservative gospel. He was assisted in his controversy with Wergeland by Henrik Hermann Foss (1790–1853), author of *Tidsnornerne* (The Norns of the Age) (1835) and other verses.

Andreas Munch (1811–1884) took no part in the feud between Wergeland and Welhaven, but addicted himself to the study of Danish models independently of either. He published a series of poems and dramas, one of which latter, *Kong Sverres Ungdom* (1837), attracted some notice. His popularity commenced with the appearance of his *Poems Old and New* in 1848. His highest level as a poet was reached by his epic called *Kongedatterens Brudefart* (The Bridal Journey of the King's Daughter) (1861). Two of his historical dramas have enjoyed a popularity greatly in excess of their merit; these are *Solomon de Caus* (1854) and *Lord William Russell* (1857).

Munch.

A group of minor poetical writers may now be considered. Magnus Brostrup Landstad (1802–1880) was born on Maasö, an island in the vicinity of the North Cape, and, therefore, in higher latitudes than any other man of letters. He was a hymn-writer of merit, and he was the first to collect, in 1853, the *Norske Folkeviser* or Norwegian folk-songs. Landstad was ordered by the government to prepare an official national hymn-book, which was brought out in 1861. Peter Andreas Jensen (1812–1867) published volumes of lyrical poetry in 1838, 1849, 1855 and 1861, and two dramas. He was also the author of a novel, *En Erindring* (A Souvenir), in 1857. Aasmund Olafsen Vinje (1818–1870) was a peasant of remarkable talent, who was the principal leader of the movement known as the "maalstræv," an effort to distinguish Norwegian from Danish literature by the adoption of a peasant dialect, or rather a new language arbitrarily formed on a collation of the various dialects. Vinje wrote a volume of lyrics, which he published in 1864, and a narrative poem, *Storegut* (Big Lad) (1866), entirely in this fictitious language, and he even went so far as to issue in it a newspaper, *Dölen* (The Dalesman), which appeared from 1858 to Vinje's death in 1870. In these efforts he was supported by Ivar Aasen and by Kristoffer Janson (b. 1841) the philologist, the author of an historical tragedy, *Jon Arason* (1867); several novels: *Fraa Bygdom* (1865); *Torgrim* (1872); *Fra Dunkehöi* (1875); *Han og Ho* (1878); and *Austanfyre Sol og Vestanfyre Maane* (East of the Sun and West of the Moon) (1879); besides a powerful but morbid drama in the ordinary language of Norway, *En Kvindeskjebne* (A Woman's Fate) (1879). In 1882 he left Norway for America as a Unitarian minister, and from this exile he sent home in 1885 what is perhaps the best of his books, *The Saga of the Prows*. Superior to all the preceding in the quality of his lyrical writing was the bishop of Christiansand, Jörgen Moe (1813–1882). He a

Minor poets.

however, better known by his labours in comparative mythology, in conjunction with P. C. Asbjörnsen (see ASBJÖRNSEN AND MOE).

Modern novelists and dramatists.

The names of the Norwegians Ibsen (*q.v.*) and Björnson (*q.v.*), in the two fields of the drama and the novel, stand out prominently in the European literature of the later 19th century; and two writers of novels who owe much to their example are Jonas Lie (*q.v.*), and Alexander Kielland (1849–1906). Nicolai Ramm Östgaard (1812–1872) to some extent preceded Björnson in his graceful romance *En Fjeldbygd* (A Mountain Parish), in 1852. Frithjof Foss (1830–1899), who wrote under the pseudonym of Israël Dehn, attracted notice by seven separate stories published between 1862 and 1864. Jacobine Camilla Collett (1813–1895), sister of the poet Wergeland, wrote *Amtmandens Döttre* (The Governor's Daughters) (1855), an excellent novel, and the first in Norwegian literature which attempted the truthful description of ordinary life. She was a pioneer in the movement for the emancipation of women in Norway. Anne Magdalene Thoresen (1819–1903), a Dane by birth, wrote a series of novels of peasant life in the manner of Björnson, of whom she was no unworthy pupil. One of her best novels is *Signes Historie* (1864). She also wrote some lyrical poetry and successful dramas. The principal historian of Norway is

History, etc.

Peter Andreas Munch (1810–1863), whose multifarious writings include a grammar of Old Norse (1847); a collection of Norwegian laws until the year 1387 (1846–1849); a study of Runic inscriptions (1848); a history and description of Norway during the middle ages (1849); and a history of the Norwegian people in 8 vols. (1852–1863); Jakob Aall (1773–1844) was associated with Munch in this work. Christian Berg (1775–1852) was another worker in the same field. Jakob Rudolf Keyser (1803–1864) printed and annotated the most important documents dealing with the medieval history of Norway. Carl Richard Unger (b. 1817) took part in the same work and edited *Morkinskinna* in 1867. His edition of the elder Edda (1867) forms a landmark in the study of Scandinavian antiquities. Oluf Rygh (1833–1899) contributed to the archaeological part of history. The modern language of Norway found an admirable grammarian in Jakob Olaus Lökke (1829–1881). A careful historian and ethnographer was Ludvig Kristensen Daa (1809–1877). Ludvig Daae (b. 1834) has written the history of Christiania, and has traced the chronicles of Norway during the Danish possession. Bernt Moe (1814–1850) was a careful biographer of the heroes of Eidsvold. Eilert Lund Sundt (1817–1875) published some very curious and valuable works on the condition of the poorer classes in Norway. Professor J. A. Friis (b. 1821) published the folk-lore of the Lapps in a series of valuable volumes. The German orientalist, Christian Lassen (1800–1876) was a Norwegian by birth. Lorentz Dietrichson (b. 1834) wrote voluminously both on Swedish and Norwegian, chiefly on Norwegian art and literature. In jurisprudence the principal Norwegian authorities are Anton Martin Schweigaard (1808–1870) and Frederik Stang (1808–1884). Peter Carl Lasson (1798–1873) and Ulrik Anton Motzfelt (1807–1865) were the lights of an earlier generation. In medical science, the great writer of the beginning of the 19th century was Michael Skjelderup (1769–1852), who was succeeded by Frederik Holst (1791–1871). Daniel Cornelius Danielsen (b. 1815) was a prominent dermatologist; but probably the most eminent of modern physiologists in Norway is Carl Wilhelm Boeck (1808–1875). The elder brother of the last-mentioned, Christian Peter Bianco Boeck (1798–1877), also demands recognition as a medical writer. Christopher Hansteen (1784–1873) was professor of mathematics at the university for nearly sixty years. Michael Sars (1805–1869) obtained a European reputation through his investigations in invertebrate zoology. He was assisted by his son Georg Ossian Sars (b. 1837). Baltazar Matthias Keilhau (1797–1858) and Theodor Kjerulf (1825–1888) have been the leading Norwegian geologists. Mathias Numsen Blytt (1789–1862) represents botany. His *Norges Flora*, part of which was published in 1861, was left incomplete at his death. Niels Henrik Abel (1802–1829) (*q.v.*) was a mathematician of extraordinary promise; Ole Jakob Broch (1818–1889) must be mentioned in the same connexion. Among theological writers may be mentioned Hans Nielsen Hauge (1771–1824), author of the sect which bears his name; Svend Borchman Hersleb (1784–1836); Stener Johannes Stenersen (1789–1835); Wilhelm Andreas Wexels (1797–1866); a writer of extraordinary popularity; and Carl Paul Caspari (1814–1892), a German of Jewish birth, who adopted Christianity and became professor of theology in the university of Christiania.

The new movement.

The political crisis of 1884–1885, which produced so remarkable an effect upon the material and social life of Norway, was not without its influence upon literature. There had followed to the great generation of the 'sixties, led by Ibsen and Björnson, a race of entirely prosaic writers, of no great talent, much exercised with "problems." The movement which began in 1885 brought back the fine masters of a previous imaginative age, silenced the problem-setters, and encouraged a whole generation of new men, realists of a healthier sort. In 1885 the field was still held by the three main names of modern Norse literature—Ibsen, Björnson and Lie. Henrik Ibsen proceeded deliberately with his labours, and his name at the same time grew in reputation and influence. The advance of Björnstjerne Björnson was not so regular, because it was disturbed by political issues. Moreover, his early peasant tales once more, after having suffered great neglect, grew to be a force, and Björnson's example has done much to revive an interest in the art of verse in Norway. Jonas Lie, the most popular novelist of Norway, continued to publish his pure, fresh and eminently characteristic stories. His style, colloquial almost to a fault, has neither the charm of Björnson nor the art of some of the latest generation. Ibsen, Björnson and Lie continued, however, to be the three representative authors of their country. Kristian Elster (1841–1881) showed great talent in his pessimistic novels *Tora Trondal* (1879) and *Dangerous People* (1881). Kristian Glöersen (b. 1838) had many affinities with Elster. Arne Garborg (1851) was brought up under sternly pietistic influences in a remote country parish, the child of peasant parents, in the south-west corner of Norway, and the gloom of these early surroundings has tinged all his writings. The early novels of Garborg were written in the peasant dialect, and for that reason, perhaps, attracted little attention. It was not until 1890 that he addressed the public in ordinary language, in his extraordinary novel, *Tired Men*, which produced a deep sensation. Subsequently Gargorg returned, with violence, to the cultivation of the peasant language, and took a foremost part in the *maalstræv*. A novelist of considerable crude force was Amalie Skram (1847–1905), wife of the Danish novelist, Erik Skram. Her novels are destitute of literary beauty, but excellent in their local colour, dealing with life in Bergen and the west coast. But the most extravagant product of the prosaic period was Hans Jæger (b. 1854), a sailor by profession, who left the sea, obtained some instruction and embarked on literature. Jæger accepted the naturalistic formulas wholesale, and outdid Zola himself in the harshness of his pictures of life. Several of Jæger's books, and in particular his novel *Morbid Love* (1893), were immediately suppressed, and can with great difficulty be referred to. Knud Hamsun (b. 1860) has been noted for his egotism, and for the bitterness of his attacks upon his fellow-writers and the great names of literature. Hamsun is seen at his best in the powerful romance called *Hunger* (1888). A writer of a much more pleasing, and in its quiet way of a much more original order, is Hans Aanrud (b. 1863). His humour, applied to the observation of the Ostland peasants—Aanrud himself comes from the Gulbrandsdal—is exquisite; he is by far the most amusing of recent Norwegian writers, a race whose fault it is to take life too seriously. His story, *How Our Lord made Hay at Asmund Bergemellum's* (1887), is a little masterpiece. Peter Egge (b. 1869), a young novelist and playwright from Trondhjem, came to the front with careful studies of types of Norwegian temperament. In his *Jacob and Christopher* (1900) Egge also proved himself a successful writer of comedy. Gunnar Heiberg (b. 1857), although older than most of the young generation, has but lately come into prominence. His poetical drama, *The Balcony*, made a sensation in 1894, but ten years earlier his comedy of *Aunt Ulrica* should have awakened anticipation. His strongest work is *Love's Tragedy* (1904). Two young writers of great promise were removed in the very heyday of success, Gabriel Finne (1866–1899) and Sigbjörn Obstfelder (1866–1900). The last mentioned, in *The Red Drops* and *The Cross*, published in 1897, gave promise of something new in Norwegian literature. Obstfelder, who died in a hospital in Copenhagen in August 1900, left an important book in MS., *A Priest's Diary* (1901).

Verse was banished from Norwegian literature, during the years that immediately preceded 1885. The credit of restoring it belongs to Sigurd Bödtker, who wrote an extremely naturalistic piece called *Love*, in the manner of Heine. The earliest real poet of the new generation is, however, Niels Collett Vogt (b. 1864), who published a little volume of *Poems* in 1887. Arne Dybfest (1868–1892), a young anarchist who committed suicide, was a decadent egotist of the most pronounced type, but a poet of unquestionable talent, and the writer of a remarkably

melodious prose. In 1891 was printed in a magazine Vilhelm Krag's (b. 1871) very remarkable poem called *Fandango*, and shortly afterwards a collection of his lyrics. Vogt and V. Krag continued to be the leading lyrical writers of the period, and although they have many imitators, they cannot be said to have found any rivals. Vilhelm Krag turned to prose fiction, and his novels *Isaac Seehusen* (1900) and *Isaac Kapergast* (1901) are excellent studies of Westland life. More distinguished as a novelist, however, is his brother, Thomas P. Krag (b. 1868), who published a series of romantic novels, of which *Ada Wilde* (1897) is the most powerful. His short stories are full of delicate charm. Hans E. Kinck (b. 1865) is an accomplished writer of short stories from peasant life, written in dialect. Bernt Lie (b. 1868) is the author of popular works of fiction, mainly for the young. Sven Nilssen (b. 1864) is the author of a very successful novel, *The Barque Franciska* (1901). With him may be mentioned the popular dramatist and memoir-writer, John Paulsen (b. 1851), author of *The Widow's Son*. Johan Bojer (b. 1872) has written satirical romances, of which the most powerful is *The Power of Faith* (1903). Jakob Hilditch (b. 1864) has written many stories and sketches of a purely national kind, and is the anonymous author of a most diverting parody of banal provincial journalism, *Tranviksposten* (1900–1901).

The leading critics are Carl Nærup (b. 1864) and Hjalmar Christensen (b. 1869), each of whom has published collections of essays dealing with the aspects of recent Norwegian literature. The death of the leading bibliographer and lexicographer of Norway, Jens Braage Halvorsen (1845–1900), inflicted a blow upon the literary history of his country; his *Dictionary of Norwegian Authors* (1885–1900)—left for completion by Halfdan Koht—is one of the most elaborate works of its kind ever undertaken. Among recent historians of Norway much activity has been shown by Ernst Sars (b. 1835) and Yngvar Nielsen (b. 1843). The great historian of northern jurisprudence was L. M. B. Aubert (1838–1896), and in this connexion T. H. Aschehoug (b. 1822) must also be mentioned. The leading philosopher of Norway in those years was the Hegelian Marcus Jakob Monrad (b. 1816), whose *Aesthetics* of 1889 is his masterpiece.

The "maal" controversy.

The close of 1899 and the beginning of 1900 were occupied by a discussion, in which every Norwegian author took part, as to the adoption of the *landsmaal*, or composite dialect of the peasants, in place of the *rigsmaal* or Dano-Norwegian. Political prejudice greatly embittered the controversy, but the proposition that the *landsmaal*, which dates from the exertions of Ivar Aasen (*q.v.*) in 1850, should oust the language in which all the classics of Norway are written, was opposed by almost every philologist and writer in the country, particularly by Björnson and Sophus Bugge (b. 1833). On the other side, Arne Garborg's was almost the only name which carried any literary weight. The *maal* has no doubt enriched the literary tongue of the country with many valuable words and turns of expression, but there the advantage of it ends, and it is difficult to feel the slightest sympathy with a movement in favour of suppressing the language in which every one has hitherto expressed himself, in order to adopt an artificial dialect which exists mainly on paper, and which is not the natural speech of any one body of persons throughout the whole of Norway.

AUTHORITIES.—*La Norvège littéraire*, by Paul Botten-Hansen (1824–1869), is an admirable piece of bibliography, but comes down no farther than 1866. Jens Braage Halvorsen (1845–1900) left his admirable and exhaustive *Norsk Forfatter-Lexikon*, 1814–1880 (Norwegian Dictionary of Authors) incomplete; but the work was continued by Halfdan Koht. See also Henrik Jæger, *Illustreret norsk literaturhistorie* (Christiania, 1892–1896); to which an appendix *Siste Tidsrum 1890–1904* was added by Carl Nærup in 1905; Ph. Schweitzer, *Geschichte der skandinavischen Literatur* (Leipzig, 1889); F. W. Horn, *History of the Literature of the Scandinavian North* (Eng. trans., Chicago, 1884); Edmund Gosse, *Northern Studies* (2nd ed., 1882). (E. G.)

NORWEGIAN SEA, the sea enclosed between Norway, the Shetland and Faeroe Islands, Iceland, Greenland, Spitsbergen and Bear Island. Its basin is bounded on the E. by the Spitsbergen platform, the continental shelf of the Barents Sea and the Norwegian coast: on the S. and S.W. by the North Sea, the Wyville-Thomson ridge, the Faeroe-Iceland ridge and the Iceland-Greenland ridge; on the W. by the coast of Greenland and on the N., so far as is known, by a ridge extending from Greenland to Spitsbergen. The Norwegian Sea is thus placed between the basins of the Atlantic on the one side and of the Arctic Ocean on the other: the mean depth of the submarine ridge separating it from the former being about 300 fathoms, and from the latter probably about 400 fathoms. The basin itself consists of a series of deeps, separated from one another by transverse ridges. Nansen and Helland-Hansen give the following results of measurements of the area:

Area of surface				.	2·58 million sq. km.		
Water area at 600 metres				.	1·79	,,	,,
,,	,,	1000	,,	.	1·65	,,	,,
,,	,,	2000	,,	.	1·05	,,	,,
,,	,,	3000	,,	.	0·30	,,	,,
Volume				.	4·12 million cubic km.		
Mean depth				.	1600 metres.		

The Norwegian Sea forms the meeting-place of waters coming from the Atlantic and Arctic oceans, and it also receives coastal waters from the North Sea and connecting areas, and from the Barents Sea. As communication with other basins is cut off comparatively near the surface, the inflow and outflow of waters must take place entirely in the upper strata, and the isolated water in the deep basin has typical physical characters of its own.

The distribution and circulation of these waters are of great complexity, and have formed the subject of study by oceanographers since the region was first opened up by the Norwegian North Atlantic Expedition, 1876–1878. Much fresh light has been thrown on the subject by the work of the International Council for the study of the sea, and more particularly by the Norwegian investigators Nansen and Helland-Hansen, whose report on Norwegian Fishery and Marine Investigations (vol. ii. No. 2, 1909) contains a complete survey of present knowledge. (H. N. D.)

NORWICH, GEORGE GORING, EARL OF (1583?–1663), English soldier, was the son of George Goring of Hurstpierpoint and Ovingdean, Sussex, and of Anne Denny, sister of Edward Denny, earl of Norwich. He was knighted in 1608, and became a favourite at court, benefiting largely from monopolies granted by Charles I. He became Baron Goring in 1628, and privy councillor in 1639. When the troubles between Charles and his parliament became acute Goring devoted his fortune freely to the royal cause; and the king in November 1644 renewed for him the title of earl of Norwich which had become extinct at his uncle's death. He went with the queen to Holland in 1642 to raise money for the king, and in the autumn of the next year he was seeking arms and money from Mazarin in Paris. His proceedings were revealed to the parliament in January 1644 by an intercepted letter to Henrietta Maria. He was consequently impeached of high treason, and prudently remained abroad until 1647 when he received a pass from the parliament under a pretext of seeking reconciliation. Thus he was able to take a prominent part in the Second Civil War of 1648 (see GREAT REBELLION). He commanded the Kentish levies, which Fairfax dispersed at Maidstone and elsewhere, and was forced to surrender unconditionally at Colchester. He was condemned to exile in November 1648 by a vote of the House of Commons, but in the next month the vote was annulled. Early in the next year a court was formed under Bradshaw to try Norwich and four others. All five were condemned to death on the 6th of March, but petitions for mercy were presented to parliament, and Norwich's life was spared by the Speaker's casting vote. Shortly after his liberation from prison in May he joined the exiled court of Charles II., by whom he was employed in fruitless negotiations with the duke of Lorraine. He became captain of the king's guard at the Restoration, and in consideration of the fortune he had expended in the king's service a pension of £2000 a year was granted him. He died at Brentford on the 6th of January 1663. By his wife Mary Nevill (d. 1648), daughter of the 6th Lord Abergavenny, he had four daughters and two sons: George, Lord Goring (*q.v.*); and Charles, who fought

in the Civil War, succeeded his father in the earldom, and died without heirs in March 1671.

NORWICH, a city and one of the county-seats of New London county, Connecticut, U.S.A., in the township of Norwich, at the point where the Yantic (which expands here in "The Cove") and Shetucket rivers join and form the Thames. Pop. (1900) of the township, 24,637, which included that of the city (17,251, including 4597 foreign-born); (1910) of the city, 20,367, and of the township, 28,219. The city area in 1906 was 5·63 sq. m. Norwich is served by the New York, New Haven & Hartford and the Central Vermont railways, by steamers from New York and New London, and by interurban electric lines connecting with Willimantic, New London and other neighbouring places. The city is at the head of navigation on the Thames river, whose channel is 100-200 ft. wide and 14 ft. deep. The residential and older portion of the city is built on the rising ground between the valleys of the two streams; along their banks lies the business district. In Sachem Street is the grave of Uncas (d. *c.* 1682), a Mohegan Indian chief and friend of the early settlers; the corner-stone of the granite monument over the grave was laid by President Andrew Jackson in 1833. North-east of the Roman Catholic Cemetery, in the extreme eastern part of the city, is a monument to Miantonomo, a sachem of the Narragansett tribe of Indians, who was put to death here. Among the principal buildings and institutions are the Congregational Church, organized in 1660; the Norwich Free Academy (1856) and its Slater Memorial Hall, in which are the Peck Library and an Art Museum, and the Converse Art Annex and Art Collection; the Otis Public Library (1848); the William W. Backus Hospital; a state hospital for the insane and a state armoury. In the 18th century, and early in the 19th, Norwich had a lucrative trade with the Atlantic ports and the West Indies, but later manufacturing became the most important industry; the manufactures including textiles, cutlery, fire-arms, paper, electrical supplies, printing presses, &c. In 1905 the factory products were valued at $6,022,391. With the city's growth in manufacturing there has been a large increase in the foreign element in the population. The municipality owns and operates the waterworks, and gas and electric-lighting plants.

Norwich was settled in 1659 by colonists from Saybrook under the leadership of Captain John Mason (1600–1672), who had crushed the power of the Pequot Indians in Connecticut in 1637, and the Rev. James Fitch (1622–1702), who became a missionary to the Mohegans.[1] The tract was purchased from the Mohegan chiefs, Uncas, Owaneco and Attawanhood, and the settlement was called Mohegan until 1662, when the present name was adopted. During and preceding the War of Independence the citizens of Norwich were ardent Whigs, various members of the well-known Huntington family being among their leaders.[2] In December 1767, in reply to a message from Boston, a town-meeting forbade the use of tea, wines, liquors and foreign manufactures; in 1770 all citizens were forbidden to hold intercourse with a schoolmaster who had continued to drink tea, and in 1776 a town-meeting directed the town clerk to proceed with his duties without reference to the Stamp Act. Norwich was chartered as a city in 1784. Among the early settlers in Ohio many were inhabitants of Norwich. Benedict Arnold was a native of Norwich; Mrs Lydia H. Sigourney was born here in a house still standing; Donald G. Mitchell ("Ik Marvel") was also born here; and Norwich was the home after 1825 of William Alfred Buckingham (1804–1875), war governor of Connecticut.

See F. M. Caulkins, *History of Norwich* (Hartford, 1866).

NORWICH, a city and county of a city, municipal, county and parliamentary borough, and the county town of Norfolk, England; 114 m. N.E. by N. from London. Pop. (1901), 111,733. It is served by the Great Eastern railway and also by the Midland and Great Northern joint line. The Great Eastern company owns the Thorpe and Victoria stations, and the joint line the City station. The city lies in the valley of the Wensum, which joins the Yare immediately below. The ancient city lay in a deep bend of the Wensum, and the walls (1294–1342), with their many towers and twelve gatehouses, of which fragments only remain, were 4 m. in circuit. These narrow limits, however, were long ago outgrown, for Evelyn writes in 1671 that "the suburbs are large, the prospects sweete, with other amenities, not omitting the flower gardens, in which all the inhabitants excel." The castle, standing high upon a steep mound, is still partly surrounded by earthworks and a ditch spanned by a very early bridge. Only the early Norman square keep remains, with four tiers of arcading without, and an ornate doorway into the great tower. The building long served as a prison, but, on the erection of a new gaol without the city, was acquired in 1884 by the corporation and in 1804 adapted as a museum and art gallery.

The cathedral church of the Holy Trinity lies between the castle and the river, on low ground. In 1094 the seat of the East Anglian bishopric was removed by Bishop Herbert de Lozinga or Lorraine from Thetford to Norwich, where in 1096 he laid the foundation of the cathedral and dedicated it in 1101, establishing at the same time a Benedictine monastery. As completed by his successor before the middle of the 12th century the cathedral in style was purely Norman; and it still retains its original Norman plan to a great degree. Changes and additions, however, were made from time to time—the Early English lady chapel (demolished about 1580) belonging to the middle of the 13th century; the Perpendicular spire, erected after the collapse of two previous spires of wood, to the 15th; the west window and porch and the lierne stone vaulting of the nave, with its elaborate 328 bosses, to the 15th, and to the 16th the vaulting of the transepts and Bishop Nix's chantry, whilst the fine cloisters, 175 ft. square, 12 ft. wide, with 45 windows, in style mainly Decorated, were begun in 1297 and not completed till 1430. The following are the dimensions in feet of the cathedral: total length, 407; length of nave, 204; length of transepts, 178; breadth of nave and aisles, 72; total height of spire, 315 (in England exceeded by Salisbury only); height of tower, 140⅝; height of nave, 69½; height of choir, 83½. The chief entrance on the west is a Perpendicular archway, above which is an immense window filled with poor modern stained glass. The nave within is grand and imposing, of great length, divided by fourteen semicircular arches, whose massive piers are in two instances ornamented with spiral mouldings. The triforium is composed of similar arches. The side aisles are low, their vaultings plain. The choir, extending westward some way beyond the crossing, is of unusual length, and terminates in an apse. The oak stalls and *misereres* are very richly carved work of the 15th century. A curious quatrefoil, opening on the north side of the presbytery, beneath the confessio or relic chapel, deserves mention. There is a monumental effigy of Bishop Goldwell (*c.* 1499), and another of Bishop Bathurst (1837) by Sir F. Chantrey. Mural monuments are plentiful. Sir William Boleyn, great-grandfather of Queen Elizabeth, is buried on the south side of the presbytery, in the midst of which

[1] The principal village of the Mohegans was originally, it seems, on the site of Norwich. Subsequently the village of Mohegan (on the W. bank of the Thames, about 3 m. S. of Norwich) became their principal settlement, and the remnant, numbering about 100 individuals of mixed blood in 1904, still live here and in the vicinity.

[2] Norwich was the birthplace of Benjamin Huntington (1736–1800), a member of the Continental Congress in 1780–1784 and 1787–1788, a representative in Congress in 1789–1791, judge of the state superior court in 1793–1798, and first mayor of Norwich in 1784–1796; of Jabez Huntington (1719–1786), a patriot leader and major-general of Connecticut militia during the War of Independence; of his son, Jedediah Huntington (1743–1818), also a patriot leader, a brigadier-general in the Continental Army (1777–1783), and a founder of the Society of the Cincinnati; of Jedediah's brother, Ebenezer Huntington (1754–1834), a soldier and in 1810–1811 and 1817–1819 a representative in Congress; and of Jedediah's nephew, Jabez Williams Huntington (1788–1847), a jurist, a representative in Congress in 1829–1834, and a member of the U.S. Senate in 1840–1847. Samuel Huntington (1731–1796) removed to Norwich about 1758, was a member of the Continental Congress in 1776–1783 and its president in 1779–1781, was a signer of the Declaration of Independence, a justice of the supreme court of Connecticut in 1774–1784, and governor of Connecticut in 1786–1796.

stood the tomb of Bishop Herbert, the founder. Of three circular apsidal chapels two remain; and in one—the Jesus chapel—the ancient colouring has been renewed. Two richly sculptured gateways lead to the cathedral—the Erpingham gate (1420) and the Ethelbert gateway (*c.* 1300). The bishop's palace and the deanery are buildings of high antiquity, but both have undergone many alterations. The latter has a well-restored chapel. A beautiful Early Decorated ruin in the palace garden, known as "Bishop Salmon's gateway," is supposed to have been the porch to the great hall (*c.* 1319). The diocese covers nearly all Norfolk, the greater part of Suffolk, and a small part of Cambridgeshire.

Of the remarkable number of churches, over forty in all, St Peter Mancroft is by many esteemed the finest parish church in England. Measuring 212 by 70 ft., it has a richly ornamented tower and flèche, 148 ft. high, with a beautiful peal of twelve bells, a long, light clerestory of thirty-four windows, a fine carved oak roof, a remarkable font cover, and the tomb of Sir Thomas Browne (d. 1682). The majority of the Norwich churches are of Perpendicular flint work, mostly of the 15th century. St Andrew, St Stephen, St Michael Coslany, with the fine Perpendicular Thorpe chapel, St John Maddermarket, St Lawrence, St Giles, with a tower 126 ft. high, St Gregory, St Helen, St Swithin, and St Michael at Plea (so called from the archdeacon's court held here) are also noticeable. The Roman Catholic church of St John the Baptist, begun in 1884 from designs by Sir G. G. Scott, occupies a commanding position outside St Giles's gate. At Carrow, E. of the city, there remain the hall, a decorated doorway, and other fragments of a Benedictine nunnery.

The grammar school is a Decorated edifice, formerly a chapel of St John, of *c.* 1316, with a "carnary" or crypt below. Among its scholars were Sir Edward Coke, Lord Nelson, Raja Brooke and George Borrow, the traveller and author, in whose work *Lavengro* (chap. xiv.) occurs a noteworthy description of Norwich. St Andrew's Hall (124 by 64 ft.) is the seven-bayed nave of the Black Friars' church, rebuilt with the aid of the Erpinghams between 1440 and 1470. It is a splendid specimen of Perpendicular work, with its twenty-eight clerestory windows and chestnut hammer-beam roof, and has served since the Reformation as a public hall, in which from 1824 have been held the triennial musical festivals. It was restored in 1863. The guildhall, on the site of an earlier tolbooth, is a fine flint Perpendicular structure of 1408–1413; the mayor's council-chamber, with furniture of the time of Henry VIII., is an interesting specimen of a court of justice of that period. The city regalia, kept here, include several objects of historical interest, amongst them a sword of a Spanish admiral captured by Nelson, with his autograph letter presenting it to the city, and a curious figure formerly used in the procession of the mayor elect through the city. Other public buildings include a shire hall, within the castle precincts, corn exchange, agricultural hall, volunteer drill hall, barracks and gaol on Mousehold Heath, the Norfolk and Norwich Library, rebuilt in 1900 after a fire, and a theatre. Educational establishments, besides the grammar school, include the Norwich and Ely Diocesan Training College, and the Municipal Technical Institute. The museum in the castle contains collections of British birds, insects, fossils, antiquities, and MSS. and early books. The chief charitable institutions are the Norfolk and Norwich Hospital, lunatic asylum, blind asylum and schools, Jenny Lind Infirmary for children, a soldiers' and sailors' institute, St Giles's or old men's hospital (an ancient foundation), and Doughty's Hospital (1687).

The principal industries include foundries and engineering works, iron and wire fence works, brewing, brick works, chemical works, tanneries, and the production of mustard, starch, and crêpe, gauze and lace; and there are large boot and shoe factories. The great cattle market lies below the castle. The municipal, county and parliamentary boroughs are coextensive. The parliamentary borough returns two members. The city is governed by a lord mayor (this title having been conferred in 1910), 16 aldermen and 48 councillors. Area, 7905 acres.

History.—There is no conclusive evidence that Norwich (Northwic, Norwic) was an important settlement before the coming of the Angles. Caistor-by-Norwich, 4 m. S. of Norwich, is on the site of what was probably a Romano-British country town. A few Roman remains have been discovered in Norwich, itself, but not enough to indicate any real occupation or habitation. According to tradition Uffa made a fortification here about 570, but its history as a royal borough cannot be traced before the reign of Æthelstan (924–940), when it possessed a mint. After being destroyed by the Danes Norwich enjoyed a period of prosperity under Danish influence and was one of the largest boroughs in the kingdom at the Conquest. Ralph de Guader, earl of East Anglia under William I., formed the nucleus of a French borough with different customs from the English, and after his forfeiture, which involved the ruin of many of the old burgesses, a masonry castle was built and the centre of burghal life gradually transferred to the new community west of it. By 1158, when Henry II. granted the burgesses a charter confirming their previous liberties, the two boroughs seem to have amalgamated. A fuller charter given by Richard I. in 1194 and confirmed by later sovereigns made Norwich a city enjoying the same liberties as London. From Henry IV. the citizens obtained a charter (1404), making their city a county with a mayor and two sheriffs instead of four bailiffs, and Henry V. added twenty-four aldermen and sixty common councilmen (1418). The cathedral precinct became parcel of the city at the Dissolution and in 1556 the neighbouring hamlets were incorporated in the county of Norwich. The charter of Charles II. (1683) remained in force till 1835, when one sheriff was removed and the number of aldermen, common councilmen and wards diminished. Since 1298 Norwich has been represented in parliament by two members. Two annual fairs, existing before 1332, were formally granted to the city in 1482. One was then held in Lent, the other began on the feast of the Commemoration of St Paul (the 30th of June). These have been succeeded by the Maunday Thursday horse and cattle fair, and the pleasure fairs of Easter and Christmas. The market, which must have existed before the Conquest, was held daily in the 13th century, when citizens enclosed stalls by royal licence. Edward III. made Norwich a staple town, and the importance of its trade in wool and worsted dates from his reign.

See *Victoria County History, Norfolk*; W. Hudson, *Records of the City of Norwich* (1906).

NORWICH, a village and the county-seat of Chenango county, New York, U.S.A., on the Chenango river, 42 m. N.E. of Binghamton. Pop. (1910 census), 7422. It is served by the Delaware, Lackawanna & Western and the New York, Ontario & Western railways. The village has three parks, two libraries—the Guernsey Memorial Library and the D. L. Follett Memorial Law Library—and the Chenango Valley Home for Aged Women. Norwich is in a dairying and farming region, where hops especially are grown; and there are bluestone quarries in the vicinity. There are a variety of manufactures, and the New York, Ontario & Western has repair shops and division headquarters here. The first settlement was made in 1792, and the village was incorporated in 1857.

NORWOOD, a southern district of London, England, partly in Surrey and partly in the county of London (metropolitan borough of Lambeth). The district is hilly and well wooded, hence the name. It is divided into Upper, Lower and South Norwood, all consisting principally of villa residences and detached houses inhabited by the better classes. Among numerous institutions are almshouses for the poor of St Saviour's, Southwark, opened at South Norwood in 1863, a Jewish convalescent home in 1869, and the Royal Normal College and Academy of Music for the Blind at Upper Norwood in 1872. At Gipsy Hill, Upper Norwood, lived Margaret Finch, queen of the Gipsies, who died in 1740 at the age of 100, and was buried in the churchyard at Beckenham.

NORWOOD, a township in Norfolk county, Massachusetts, about 14 m. S.W. of Boston. Pop. (1900) 5840 (1497 foreign-born); (1910) 8014; area about 10 sq. m. Norwood is served

by the New York, New Haven & Hartford railway. The township is traversed by the Neponset river. It has the Morrill Memorial Library (12,000 volumes in 1909). Norwood's manufactories include printing-ink and glue factories, tanneries, an iron foundry, and the printing-presses and binderies of J. S. Cushing Co., H. M. Plimpton & Co., and the Norwood Press Co. Originally the South or Second Precinct of Dedham, Norwood was incorporated as a township (with the addition of a part of Walpole) under its present name in 1872.

See D. Hamilton Hurd, *History of Norfolk County, Massachusetts* (Philadelphia, 1864).

NORWOOD, a city of Hamilton county, Ohio, U.S.A., adjoining Cincinnati on the N. E. Pop. (1900), 6480 (718 foreign-born); (1910) 16,185. It is served by the Baltimore & Ohio South Western and the Cincinnati, Lebanon and Northern railways, and by interurban electric railways. Norwood has various manufactures, but as one of the hill suburbs of Cincinnati it is primarily a place of residence. It has a Carnegie library (a branch of the public library of Cincinnati) and a Catholic maternity hospital. Norwood, originally called Sharpsburg, was settled about 1798, laid out as a town in 1873, incorporated as a village in 1888, and chartered as a city in 1903.

NORZAGARAY, a town of the province of Bulacan, Luzon, Philippine Islands, on the Quingua river, about 25 m. N. by E. of Manila. Pop. (1903), 5131. The inhabitants are engaged chiefly in the cultivation of rice and Indian corn, and in lumbering; good timber grows on the neighbouring mountains, and some iron and gold have been found in this region. Near the town there is a sulphur spring. The language is Tagalog.

NOSAIRIS (also known as Ansayrii, sometimes Ansariyeh), the people who inhabit the mountainous country of N. Syria, which is bounded on the S. by the north end of the Lebanon at the Nahr el-Kebīr (Eleutherus), on the N. by Mt Casius, Antioch and the Nahr el-'Asi (Orontes). Various settlements of them are found also in Antioch itself and in Tarsus, Adana, and a few other places, while in harvest time they come down as far as the Biq'a (Buka'a). From the time of Strabo until about two centuries ago, the country was famed for its wine, but now more for its tobacco (especially at Latakia). The total number of Nosairis inhabiting this country is variously estimated at from 120,000 to 150,000.

The origin of the name Nosairi is uncertain. Among the more possible explanations is that the name is derived from that of Mahommed Ibn Nuṣair, who was an Isma'īlite follower of the eleventh imām of the Shiites at the end of the 9th century. This view has been accepted by Nosairi writers, but they transfer Ibn Nuṣair to the 7th century and make him the son of the vizier of Moawiyā I., while another tradition (cf. Abulfeda, *Geog.* vol. ii. p. 11, No. 7) identifies him with Nuṣair, a freedman of the caliph 'Ali. It is, however, noteworthy that Pliny (*Hist. nat.* v. 81) gives the name *Nasorini* to the inhabitants of this district. In this part of Syria paganism remained even up to the middle ages (cf. *Archives de l'Orient latin*, vol. ii. 2, p. 375), and there is a complete absence of churches of the 5th to the 7th centuries in these mountains. In the 7th century the Arabs invaded Syria, but do not seem to have got into these mountains. At the end of the 10th century, however, the Isma'īlite propaganda won some success among the people. Their strongholds were taken by Raymond in 1099, and later Tancred secured the very summits. In 1132–1140 the Assassins (*q.v.*) gained possession of their chief towns, but Saladin recovered them in 1188. In 1317 the sultan Bibars endeavoured to convert them to orthodox Islam, and built many mosques, but Ibn Baṭūṭa (i. 177) says they did not use them. A *fatwa* of Ibn Taimīyya (d. 1327) of this time shows that the Nosairis were regarded with fear and hatred by the orthodox. For the next 500 years they were given over to their own internal disputes, until they came under the power of Ibrahim Pasha in 1832. At the present time they are under the direct administration of the Turks.

The religion of the Nosairis seems to have been almost the same in the first years of the 5th century A.H. (11th century A.D.) as it is to-day, judging by the references in the sacred books of the Druses. As set forth in their own sacred book, the *Majmū'*, it seems to be a syncretism of Isma'īlite doctrines and the ancient heathenism of Harrān. The ages of the world are seven in number, each of these having its own manifestation of deity. But the manifestation of the 7th age is not a Mahdi who is yet to come, but the historical person 'Ali ibn abu Ṭālib. This is stated in the crudest form in *Sura* 11 of the *Majmū'*: "I testify that there is no god but 'Ali ibn abu Ṭālib." 'Ali is also called the *Ma'nā* ("Idea"; cf. the *Logos* of the New Testament), hence the Nosairis are also called the Ma'nawīyya. 'Ali created Mahomet, who is known as the *Ism* ("Name"), and a trinity is formed by the addition of Salmān ul-Fārisī, who is the *Bāb* ("Door"), through whom the propaganda is made, and through whom one comes to God. A mysterious symbol much used in their ceremonies of initiation consists of the three letters *'Ain*, *Mim*, *Sin*, these being the initials of 'Ali, Mahomet and Salmān. Of these three, however, 'Ali is the supreme. In *Sura* 6 of the *Majmū'* the Nosairi says: "I make for the Door, I prostrate myself before the Name, I worship the Idea." Each of the seven manifestations of God in the ages of the world has been opposed by an adversary.

The Nosairis are divided into four sects. (1) The Haidaris (from the name *haidari*, "lion," given to 'Ali on account of his valour) are the most advanced. (2) The Shamālis or Shamsis preserve many traces of the old nature-worship. 'Ali (*i.e.* the supreme god) is the heaven, Mahomet is the sun, Salmān the moon. (3) On the other hand the Kalazis, so named from a sheik Mahommed ibn Kalazi (cf. E. Salisbury in the *Journal of the American Oriental Society*, viii. 237), or Qamaris, hold that the supreme god ('Ali) is the moon, not the sun. Their poetry addressed to the moon is translated by C. Huart in the *Journal asiatique*, ser. vii. vol. xiv. pp. 190 ff. (4) The Ghaibis are worshippers of the air, for God is invisible. In this they come nearer to the ordinary Isma'īlite doctrine. Religion is restricted among the Nosairis to the initiated, who must be adults over fifteen years of age and of Nosairi parentage. The initiator, who must not be a relative, becomes a spiritual father, and the relation cannot be broken except by his consent. The initiation consists of three stages. In the first the novice is received and told to meditate on the three mystic letters; in the second, after a period of forty days, he is taught the titles of the 16 *suras* of the *Majmū'*; in the third, after seven or nine months (intended to correspond with the ordinary period of gestation), he is taught *Suras* 5, 6 and 9, learns the meaning of the three mystic letters and goes through a further period of instruction from his initiator. The initiated are divided into two classes, the sheiks, who are recruited from the families of sheiks only, and the ordinary members.

The Nosairis are believers in metempsychosis. The pious Nosairi takes his rank among the stars, but the body of the impious undergoes many transformations.

The *Kitāb ul Bakuta*, containing the *Majmū'*, was published at Beirut, 1863, and translated for the most part by E. Salisbury in the *Journal of the Amer. Or. Soc.* (viii. 227-308). (G. W. T.)

NOSARI, or NAVSARI, a town in India, in the state of Baroda, on the left bank of the Purna river, 147 m. by rail N. of Bombay. Pop. (1901), 21,451. It is an ancient place, known to Ptolemy as Nasaripa. It was one of the earliest settlements of the Parsees in Gujarat, after their banishment from Persia in the 12th century. It is still the home of their *mobeds*, or sacerdotal class, and contains their most venerated "fire temple." Many small industries are carried on, including the weaving of the *kusti*, or sacred thread of the Parsees. There is also considerable trade by both rail and water, for the river is navigable. The public buildings and the private houses, especially those in the suburbs, are unusually good.

NOSE (O.Eng. *nosu*, cf. Dutch *neus*, Swed. *nos*, snout; the connexion with O.Eng. *nasu* is obscure, cf. Ger. *Nase*, Lat. *nares*, nostrils, *nasus*, nose, Fr. *nez*), the organ of the sense of smell (*q.v.*) in man and other animals (see OLFACTORY SYSTEM). The projecting feature above the mouth, to which the word is usually restricted in man, is, in the case of the lower animals, called snout or muzzle, or, if much prolonged, proboscis or trunk. "Nostril," the external opening into the nose, is from O.Eng. *nosthyrl* (*thyrl* or *thirl*, hole or opening).

NOSOLOGY (Gr. *νόσος*, disease, and *λόγος*, science), that branch of medical science which deals with the classification of diseases; the term is applied also to a collection of diseases, and to the special character of a particular disease and the different opinions concerning it.

NOSSEN, a town of Germany, in the kingdom of Saxony, pleasantly situated on the Freiberger Mulde, 51 m. S.E. from Leipzig by the railway to Dresden via Döbeln, and at the junction of a line to Moldau. Pop. (1905), 4879. It possesses an ancient castle crowning a height above the river, and has extensive manufactures of boots and shoes, leather and paper. In the immediate vicinity are the ruins of the Cistercian monastery of Altenzella, or Altzella, founded in 1145, and a noted school of philosophy during the 13th-15th centuries. In the chapel, which was built in 1347 and restored in 1787, lie the remains of ten margraves of Meissen, members of the family of Wettin. The foundation was secularized in 1544. The valuable annals, *Chronicon vetere Cellense majus* and *Chronicon minus*, giving a history of Saxony during the 13th and 14th centuries, were removed to the university library of Leipzig in 1544. They are printed in Band xvi. of the *Monumenta Germaniae historica. scriptores* (1859).

See E. Beyer, *Das Cistercienstift und Kloster Alt-Celle* (Dresden, 1855).

NOSSI-BÉ, properly Nòsy-bé, *i.e.* "Great island," an island about 8 m. off the N.W coast of Madagascar, in 13° 23′ S., 48° 15′ E. It is 14 m. long by 10 broad, and has an area of 130 sq. m. Nossi-bé is volcanic, the N. and S. parts of older, the central part of more modern date. Besides a number of true volcanic craters (Lòkobé, the highest point, is 1486 ft. above the sea) there are numerous crater-lakes level with the ground (see *Nature*, March 1877, p. 417). The climate is similar to that of Mayotte (see COMORO ISLANDS), and the neighbouring islet of Nossi-komba, about 2000 ft. above the sea, serves for a sanatorium. Pop. (1902), 9291. Hellville, the chief town (so called after De Hell, governor of Réunion at the time of the French annexation), is a port of call for the Messageries Maritimes and a centre for the coasting trade along the western shores of Madagascar. There is excellent anchorage, and a pier 800 ft. long. The soil is very fertile, and there are forests of palms and bamboos. The chief products are coffee, sesame, the sugar-cane, cocoa, vanilla and tobacco. There are numerous sugar factories and rum distilleries.

In 1837 Tsioméko, chieftainess of one of the numerous divisions of the western Malagasy known under the common name of Sàkalàva, was expelled by the Hova and fled to Nossi-bé and Nossi-komba. Failing assistance from the imam of Muscat, she accepted French protection in 1840, ceding such rights as she possessed on the N.W. coast of the mainland. The French took possession in 1841, and in 1849 an unsuccessful attempt was made to expel them. The administration was entrusted to a subordinate of the governor of Mayotte until 1896, when Nossi-bé was placed under the administration of Madagascar (*q.v.*). (J. Si.*)

NOSTALGIA (Gr. *νόστος*, return home, and *ἄλγος*, grief), home-sickness, the desire when away to return home, amounting sometimes to a form of melancholia.

NOSTRADAMUS (1503–1566), the assumed name of MICHEL DE NOTREDAME, a French astrologer, of Jewish origin, who was born at St Remi in Provence on the 13th of December 1503. After studying humanity and philosophy at Avignon, he took the degree of doctor of medicine at Montpellier in 1529. He settled at Agen, and in 1544 established himself at Salon near Aix in Provence. Both at Aix and at Lyons he acquired great distinction by his labours during outbreaks of the plague. In 1555 he published at Lyons a book of rhymed prophecies under the title of *Centuries*, which secured him the notice of Catherine de' Medici; and in 1558 he published an enlarged edition with a dedication to the king. The seeming fulfilment of some of his predictions increased his influence, and Charles IX. named him physician in ordinary. He died on the 2nd of July 1566.

The *Centuries* of Nostradamus have been frequently reprinted, and have been the subject of many commentaries. In 1781 they were condemned by the papal court, being supposed to contain a prediction of the fall of the papacy. Nostradamus was the author of a number of smaller treatises. See Bareste, *Nostradamus* (Paris, 1840).

NOSTRUM (neuter of Lat. *noster*, our), the name given to preparations of which the ingredients are not made publicly known, a patent or "quack" medicine; it is taken from the label ("of our own make") formerly attached to such medicines.

NOTARY, or NOTARY PUBLIC. In Roman law the *notarius* was originally a slave or freedman who took notes (*notae*) of judicial proceedings in shorthand. The modern notary corresponds rather to the *tabellio* or *tabularius* than to the *notarius*. In canon law it was a maxim that his evidence was worth that of two unskilled witnesses.

The office of notary in England is a very ancient one. It is mentioned in the Statute of Provisors, 25 Edward III. stat. 4. The English notary is an ecclesiastical officer, nominated, since the Peterpence Dispensations Act 1533–1534, by the archbishop of Canterbury through the master of the faculties (now the judge of the provincial courts of Canterbury and York), in order to secure evidence as to the attestation of important documents. All registrars of ecclesiastical courts must be notaries. A notary's duties, however, are mainly secular. "The general functions of a notary consist in receiving all acts and contracts which must or are wished to be clothed with an authentic form; in conferring on such documents the required authenticity; in establishing their date; in preserving originals or minutes of them which, when prepared in the style and with the seal of the notary, obtain the name of original acts; and in giving authentic copies of such acts" (Brooke, *On the Office of a Notary*, chap. iii.). The act of a notary in authenticating or certifying a document is technically called a "notarial act." In most countries the notarial act is received in evidence as a semi-judicial matter, and the certificate of a notary is probative of the facts certified. But English law does not recognize the notarial act to this extent. An English court will, in certain cases, take judicial notice of the seal of a notary, but not that the facts that he has certified are true, except in the case of a bill of exchange protested abroad.

The most important part of an English notary's duty is the noting and protest of foreign bills of exchange in case of non-acceptance or non-payment. This must be done by a notary in order that the holder may recover. He also prepares ship protests and protests relating to mercantile matters, and authenticates and certifies copies of documents and attests instruments to be sent abroad. The office of notary is now usually held by a solicitor. In London he must be free of the Scriveners' Company.

In Scotland, before the reign of James III., papal and imperial notaries practised until the 29th of November 1469, when an act was passed declaring that notaries should be made by the king. It would appear, however, that for some time afterwards there were in Scotland clerical and legal notaries—the instruments taken by the latter bearing faith in civil matters. In 1551 an act was passed directing sheriffs to bring or send both kinds of notaries to the lords of session to be examined; and in a statute, passed in 1555, it was ordained that no notary, "by whatsoever power he be created," should use the office "except he first present himself to the said lords, showing his creation, and be admitted by them thereto." It does not appear that this statute vested the right of making notaries in the court of session; but in 1587 it was by law declared that no person should take on him the office, under the pain of death, unless created by the sovereign

special letters, and thereafter examined and admitted by the lords of session. Since then the Court of Session has in Scotland exercised exclusive authority on the admission of notaries in all legal matters, spiritual and temporal. The position of notaries in Scotland is somewhat higher than it is in England.

In the United States, notaries are appointed by the governors of the states, and their authority to act is limited to the state to which they are appointed. They are state officers, and their duties in the main are attesting deeds and other instruments, and taking affidavits and depositions; all such documents which are intended to be used in the federal courts must have the notarial seal affixed. They also protest bills of exchange, and in some states they have the powers of a justice of the peace.

In France, notaries receive all acts and contracts to which the parties thereto must give or desire to give the authenticity attached to the acts of a public authority; they certify the date, preserve the originals and give copies or duplicates. Notaries are nominated by the president of the republic on the recommendation of the keeper of the seals. They cannot act as notaries and practise as advocates, or hold any magisterial office, nor must they engage in business. Notaries are divided into three classes: those of towns which have a court of appeal; those of towns which have a court of first instance; those of the other towns and communes. The first and second classes can practise wherever the jurisdiction of their courts extends; the third class only in their canton. They must obtain the sanction of the minister of justice should they desire to change from one district to another. They must serve an apprenticeship of six years (with exceptions) to a notary of the class to which they desire to belong. Every notary is bound in a certain sum fixed by the government as security for the due discharge of his duties. Since 1896 the remuneration of the more important classes of notaries has been regulated by law. Each district has a chamber of notaries, which exercises disciplinary powers over its members.

In Germany, notaries are appointed by the president of the courts of law and the minister of justice in their respective states; they carry on their profession for their own benefit, and do not, except in Württemberg, receive any fixed salary, but take fees from the parties they represent. They may not refuse their services, save on good and sufficient ground. In some German states, notably Saxe-Weimar and Hesse-Darmstadt, there are no notaries. In Württemberg, Baden, Bavaria, Alsace-Lorraine, Rhenish Prussia and Austria, they form a distinct class, while in the other German states they generally combine the notarial office with that of advocate. There is no code of rules for the whole empire, the new *Bürgerliches Gesetzbuch* leaving it to each state to frame its own regulations.

NOTE (Lat. *nota*, mark, sign, from *noscere*, to know), a mark, particularly a sign by which a musical sound (also called a note) is indicated in writing (see MUSICAL NOTATION). The term is also applied to an abstract or memorandum of documents, speeches, &c. This appears to have been first in legal use, especially in the process of the transfer of land by fine and recovery (see FINE). Further extensions of this meaning are to an explanation, comment or addition, added in the margin or at the foot of the page to a passage in a book, &c., or to a communication in writing shorter or less formal than a letter.

The ordinary distinction between note and letter is reversed in diplomacy. *Diplomatic notes* are written communications exchanged between diplomatic agents or between them and the ministers of foreign affairs of the government to which they are accredited; they differ from ordinary letters in having a more formal character and in dealing with matters of more immediate and definite importance: *e.g.* the notification of adhesion to a treaty, of the re-establishment of diplomatic relations after a war, &c. Sometimes, by agreement, a mere exchange of notes has the force of a convention. *Collective notes* are those signed by the representatives of several powers acting in concert. Sometimes *identical notes* are substituted for collective, *i.e.* notes identical as to form and substance, but signed and delivered separately by the representatives of the several powers. Thus in 1822, at the congress of Verona, in order to overcome the objection of Great Britain to any interference of the European concert in Spain, identical notes were presented to the Spanish government instead of a collective note. *Circular notes* are those addressed by one power to the other powers generally, *e.g.* that addressed by Thiers (November 9, 1870), on the proposed armistice, to the representatives of the great powers accredited to the government of national defence. *Confidential notes* are directed to inspiring confidence by giving an explicit account of the views and intentions of the plenipotentiaries and their governments. Such a note was sent, for instance, by the plenipotentiaries of the allied powers at the conference of Poros, on the 8th of December 1828, to Capo d'Istria, the Greek president, to instruct him confidentially as to the results of their deliberations. The so-called *notes verbales* are unsigned, and are merely of the nature of memoranda (of conversations, &c.). *Notes ad referendum* are addressed by diplomatic agents to their own governments asking for fresh powers to deal with points not covered by their instructions, which they have had to "refer." Diplomatic notes are usually written in the third person; but this rule has not always been observed (see P. Pradier-Fodéré, *Cours de droit diplomatique*, Paris, 1899; vol. ii. p. 524).

For notes of hand or promissory notes see NEGOTIABLE INSTRUMENTS and BILL OF EXCHANGE, and for notes passing as currency see BANKS AND BANKING, BANK-NOTE and POST.

NOTHOMB, JEAN BAPTISTE, BARON (1805–1881), Belgian statesman and diplomat, was born at Messancy in Luxemburg on the 3rd of July 1805. He was educated at the Athenaeum of Luxemburg and the university of Liége. He was in Luxemburg when the revolution of August broke out, but was nominated a member of the commission appointed to draw up the constitution. He was a member of the national congress, and became secretary-general of the ministry of foreign affairs under Surlet de Chokier. He supported the candidature of the duke of Nemours, and joined in the proposal to offer the crown to Prince Leopold of Saxe-Coburg, being one of the delegates sent to London. When the Eighteen Articles were replaced by the Twenty-four less favourable to Belgium, he insisted on the necessity of compliance, and in 1839 he faced violent opposition to support the territorial cessions in Limburg and Luxemburg, which had remained an open question so long as Holland refused to acknowledge the Twenty-four Articles. His *Essai historique et politique sur la révolution belge* (1838) won for him the praise of Palmerston and the cross of the Legion of Honour from Louis Philippe. In 1837 he became minister of public works, and to him was largely due the rapid development of the Belgian railway system, and the increase in the mining industry. In 1840 he was sent as Belgian envoy to the Germanic confederation, and in 1841, on the fall of the Lebeau ministry, he organized the new cabinet, reserving for himself the portfolio of minister of the interior. In 1845 he was defeated, and retired from parliamentary life, but he held a number of diplomatic appointments before his death at Berlin on the 6th of September 1881.

See T. Juste, *Souvenirs du baron Nothomb* (Brussels, 1882).

NOTICE, a term primarily meaning knowledge (Lat. *notitia*), as in "judicial notice"; thence it comes to signify the means of bringing to knowledge, as in "notice to quit"; at last it may be used even for the actual writing by which notice is given. The most important legal uses of the word are judicial notice and the equitable doctrine of notice. Judicial notice is the recognition by courts of justice of certain facts or events without proof. Thus in England the courts take judicial notice of the existence of states and sovereigns recognized by the sovereign of England, of the dates of the calendar, the date and place of the sittings of the legislature, &c. The equitable doctrine of notice is that a person who purchases an estate, although for valuable consideration, after notice of a prior equitable right, will not be enabled by getting in the legal estate to defeat that right. On the other hand, a purchaser for valuable consideration without notice of an adverse title is as a rule protected in his enjoyment of the property. Other common uses of the word are notice to quit, *i.e.* a notice required to be given by landlord to tenant, or by tenant to landlord in order to terminate a tenancy

(see LANDLORD AND TENANT); notice of dishonour, *i.e.* a notice that a bill of exchange has been dishonoured; notice of action, *i.e.* a notice to a person of an action intended to be brought against him, which is required by statute to be given in certain cases; notice of trial, *i.e.* the notice given by a plaintiff to a defendant that he intends to bring on the cause for trial; notice in lieu of personal service of a writ, *i.e.* by advertisement or otherwise; notice given by one party in an action to the other, at a trial, to produce certain documents in his possession or power; notice to treat, given under the Land Clauses Acts by public bodies having compulsory powers of purchasing land as a preliminary step to putting their powers in force. Notice may be either express or constructive. The latter is where knowledge of a fact is presumed from the circumstances of the case, *e.g.* notice to a solicitor is usually constructive notice to the client. Notice in some cases may be either oral or written. It is usually advisable to give written notice even where oral evidence is sufficient in law, as in the case of notice to quit. The American use of notice is practically the same as in England.

NOTKER, a name of frequent occurrence in the ecclesiastical history of the middle ages. NOTKER BALBULUS (*c.* 840–912) was a native of northern Switzerland, and for many years *magister* in the school of St Gall. He compiled a martyrology and other works, but is famous for his services to church music and for the "sequences" of which he was the composer. He was canonized in 1513. His life is in the Bollandist *Acta Sanctorum*, April 6th. NOTKER LABEO (d. June 29th, 1022) was also an instructor at St Gall. His numerous translations, including those of the Old Testament Psalms, the categories of Aristotle, the *De nuptiis Mercurii et Philologiae* of Martianus Capella, and the *De consolatione* of Boëthius, into Old High German, may possibly have been the work of his pupils. They possess considerable philological interest, and have been edited by E. G. Graff (Berlin, 1837–1847), and by P. Piper under the title *Notkers und seiner Schule Schriften* (1883–1884).

See J. Kelle, *Die Sankt Galler deutschen Schriften und Notker Labeo* (Munich, 1888); G. Meyer von Knonau, "Lebensbild des heiligen Notker," in *Mitteil. Antiq. Gesellschaft Zürich* (1877).

NOTO, a city of Sicily, in the province of Syracuse, and 20 m. S.W. of it by rail, 520 ft. above sea-level. Pop. (1901) 22,564. The present town, rebuilt after the earthquake of 1693, has some fine buildings of the early 18th century. The older town lies 5 m. direct to the north (1378 ft.). It was the ancient *Netum*, a city of Sicel origin, left to Hiero II. by the Romans by the treaty of 263 B.C. and mentioned by Cicero as a *foederata civitas* (*Verr.* v. 51. 133), and by Pliny as *Latinae conditionis* (*H.N.* iii. 8. 14). The remains of this city are almost entirely hidden beneath the ruins of the medieval town, except three chambers cut in the rock, one of which is shown, by an inscription in the library at Noto, to have belonged to the gymnasium, while the other two were *heroa*, or shrines of heroes. But explorations have brought to light four cemeteries of the third Sicel period, and one of the Greek period, of the 3rd and 2nd centuries B.C. There are also catacombs of the Christian period and some Byzantine tombs. See P. Orsi in *Notizie degli scavi*, 1897, 69–90. Four miles to the S. of Noto, on the left bank of the Tellaro (*Helorus*) (E. Pais, *Atakta*, Pisa, 1891, p. 75 seq.) stands a stone column about 35 ft. in height, which is believed to be a memorial of the surrender of Nicias. This is uncertain; but, in any case, in the 3rd century B.C. a tomb was excavated in the rectangular area which surrounds it, destroying apparently a pre-existing tomb. The later burial belongs to the necropolis of the small town of *Heloron*, 750 yds. to the S.E., some remains of which have been discovered. It was a small advanced post of Syracuse, belonging probably to the 6th century B.C. See P. Orsi in *Notizie degli scavi*, 1899, 241.

NOTT, ELIPHALET (1773–1866), American divine, was born on the 25th of June 1773 at Ashford, Connecticut. He was left an orphan without resources, but graduated in 1795 at Brown University. In 1804 he became president of Union College, Schenectady, New York, a position which he held till his death on the 29th of January 1866. He found the college financially embarrassed, but succeeded in placing it on a sound footing. He was known also as the inventor of the first stove for anthracite coal. His publications include sermons, *Counsels to Young Men* (1810), and *Lectures on Temperance* (1847).

Life by C. van Santvoord (ed. Tayler Lewis, 1876).

NOTT, SIR WILLIAM (1782–1845), English general, was the second son of Charles Nott, a Herefordshire farmer, who in 1794 became an innkeeper at Carmarthen. William Nott was indifferently educated, but he succeeded in obtaining a cadetship in the Indian army and proceeded to India in 1800. In 1825 he was promoted to the command of his regiment of native infantry; and in 1838, on the outbreak of the first Afghan war, he was appointed to the command of a brigade. From April to October 1839 he was in command of the troops left at Quetta, where he rendered valuable service. In November 1840 he captured Khelat, and in the following year compelled Akbar Khan and other tribal chiefs to submit to the British. On receiving the news of the rising of the Afghans at Kabul in November 1841, Nott took energetic measures. On the 23rd of December the British envoy, Sir William Hay Macnaghten, was murdered at Kabul; and in February 1842 the weak and incompetent commander-in-chief, General Elphinstone, sent orders that Kandahar was to be evacuated. Nott at once decided to disobey, on the supposition that Elphinstone was not a free agent at Kabul; and as soon as he heard the news of the massacre in the Khyber Pass, he urged the government at Calcutta to maintain the garrison of Kandahar with a view to avenging the massacre and the murder of Macnaghten. In March he inflicted a severe defeat on the enemy near Kandahar, and in May drove them with heavy loss out of the Baba Wali Pass. In July he received orders from Lord Ellenborough, the governor-general of India, to evacuate Afghanistan, with permission to retire by Kabul. Nott arranged with Sir George Pollock, now commander-in-chief, to join him at Kabul. On the 30th of August he routed the Afghans at Ghazni, and on the 6th of September occupied the fortress, from which he carried away, by the governor-general's express instructions, the gates of the temple of Somnath; on the 17th he joined Pollock at Kabul. The combined army recrossed the Sutlej in December. Nott's services were most warmly commended; he was immediately appointed resident at Lucknow, was presented with a sword of honour, and was made a G.C.B. In 1843 he returned to England, where the directors of the East India Company voted him a pension of £1000 per annum. He died at Carmarthen on the 1st of January 1845.

See *Memoirs and Correspondence of Sir William Nott*, edited by J. H. Stocqueler (2 vols., London, 1854); Charles R. Low, *The Afghan War 1838–1842* (London, 1879), and *Life and Correspondence of Sir George Pollock* (London, 1873); Sir J. W. Kaye, *History of the War in Afghanistan* (2 vols., London, 1851).

NOTTINGHAM, EARLS OF. The English title of earl of Nottingham has been held by different families, notably by the Mowbrays (1377 to 1475; merged in the Norfolk title from 1397), the Howards (1596–1681), and the Finches (1681; since 1729 united with that of Winchilsea). For the Howard line see the separate article below. Here only the ancestors of the Finch line are dealt with.

HENEAGE FINCH (1621–1682), first earl of Nottingham in the Finch line, lord chancellor of England, was descended from an old family (see FINCH, FINCH-HATTON), many of whose members had attained to high legal eminence, and was the eldest son of Sir Heneage Finch, recorder of London, by his first wife Frances, daughter of Sir Edmund Bell of Beaupré Hall, Norfolk. In the register of Oxford university he is entered as born in Kent on the 23rd of December 1621, and probably his native place was Eastwell in that county. He was educated at Westminster and at Christ Church, Oxford, where he remained till he became a member of the Inner Temple in 1638. He was called to the bar in 1645, and soon obtained a lucrative practice. He was a member of the convention parliament of April 1660 and shortly afterwards was appointed solicitor-general, being created a baronet the day after he was knighted. In May of the following year he was chosen to represent the university at

Oxford, and in 1665 the university created him a D.C.L. In 1670 he became attorney-general, and in 1675 lord chancellor. He was created Baron Finch in 1674, and earl of Nottingham in May 1681. He died in Great Queen Street, London, on the 18th of December 1682, and was buried in the church of Ravenstone in Bucks.

His contemporaries of both sides of politics agree in their high estimate of his integrity, moderation and eloquence, while his abilities as a lawyer are sufficiently attested by the fact that he is still spoken of as "the father of equity." His most important contribution to the statute book is "The Statute of Frauds." While attorney-general he superintended the edition of Sir Henry Hobart's *Reports* (1671). He also published *Several Speeches and Discourses in the Tryal of the Judges of King Charles I.* (1660); *Speeches to both Houses of Parliament* (1679); *Speech at the Sentence of Viscount Stafford* (1680). He left Chancery Reports in MS., and notes on Coke's *Institutes*.

DANIEL FINCH (1647–1730), second earl, son of the preceding, entered parliament for Lichfield in 1679. He was one of the privy councillors who in 1685 signed the order for the proclamation of the duke of York, but during the whole of the reign of James II. he kept away from the court. At the last moment he hesitated to join in the invitation to William of Orange, and after the abdication of James II. he was the leader of the party who were in favour of a regency. He declined the office of lord chancellor under William and Mary, but accepted that of secretary of state, retaining it till December 1693. Under Anne he in 1702 again accepted the same office in the ministry of Godolphin, but finally retired in 1704. On the accession of George I. he was made president of the council, but in 1716 he finally withdrew from office. He succeeded to the earldom of Winchilsea (with which the Nottingham title now became united) on the 9th of September 1729, and died on the 1st of January 1730.

NOTTINGHAM, CHARLES HOWARD, 1ST EARL OF[1] (1536–1624), English lord high admiral (also known as 2nd Lord Howard of Effingham), was the eldest son of William, 1st Baron Howard of Effingham, lord high admiral, by his wife, Margaret, daughter of Sir Thomas Gamage of Coity in Glamorganshire, and was born in 1536. He was nearly connected with Queen Elizabeth, his father's sister, Elizabeth Howard, being mother of Anne Boleyn. During Mary's reign he is said to have served at sea with his father, and on the accession of Elizabeth his kinship, together with his good looks and abilities, secured his early advancement. In 1559 he was sent as ambassador to France to congratulate Francis II. on his accession, and in 1569 was general of the horse under the earl of Warwick for suppressing the Roman Catholic rebellion in the north. The next year he commanded a squadron of ships to watch the Spanish fleet which came to conduct the queen of Spain from Flanders, on which occasion "His lordship, accompanied with 10 ships only of Her Majestie's Navy Royal, environed their Fleet in a most strange and warlike sort, enforced them to *stoop gallant* and to vail their bonnets for the queen of England."[2] In the parliaments of 1563 and 1572 he represented Surrey, and succeeded to his father's title on the 29th of January 1573. He was installed a knight of the Garter on the 24th of April 1574, and made lord chamberlain of the household, an appointment which he retained till May 1585, when he became lord high admiral of England. He also filled the offices of lord lieutenant of Surrey and high steward of Kingston-upon-Thames. He was one of the commissioners at the trial of the conspirators in the Babington Plot and of Mary, queen of Scots, in 1586, and, according to Davison, Elizabeth's secretary of state, it was owing chiefly to his persuasion and influence that Elizabeth signed the death-warrant.[3]

In December 1587 he hoisted his flag on the "Ark." His letters at this time reflect vividly his sense of the impending danger. "For the love of Jesus Christ, Madam," he writes to Elizabeth, "awake thoroughly and see the villainous treasons round about you, against your Majesty and your realm, and draw your forces round about you like a mighty prince to defend you. Truly, Madam, if you do so, there is no cause for fear."[4] On the approach of the Armada on the 6th of July 1588, Howard describes thus the disposal of his forces: "I have divided myself here into three parts, and yet we lie within sight of one another, so as if any of us do discover the Spanish fleet we give notice thereof presently the one to the other and thereupon repair and assemble together. I myself do lie in the middle of the channel with the greatest force. Sir Francis Drake hath 20 ships and 4 or 5 pinnaces which lie beyond Ushant and Mr Hawkins with as many more lieth towards Scilly."[5] He directed the various engagements (see ARMADA), and stayed himself to conduct the attack on the "San Lorenzo," stranded off Calais, arriving in consequence at the great fight off Gravelines some time after the engagement had begun. His tactics have been criticized both by contemporary and by later authorities, but his position was a perilous one, opposed to an overwhelming force of the enemy, and rendered still more difficult by the queen's untimely economy, Howard himself contributing largely to the naval expenses and to the relief of the numerous seamen poisoned by bad food and landed at Margate. "It were too pitiful to have men starve after such a service."[6] Instead of risking all in a pitched battle with the enemy, a course which probably appealed more to his dashing subordinates, he resolved to pursue the less heroic method of "plucking their feathers little by little";[7] and his prudence, while justified by the extraordinary results, was also greatly praised by so good a judge as Raleigh. Shortly afterwards, under Howard's directions, a "Relation of Proceedings" was drawn up (now printed in the *Navy Records Society Publications*, i. 1-18).

In 1596 Howard and Essex commanded the expedition against Cadiz, when a squadron of the enemy's ships was destroyed and two of the number brought home. Howard's intention was to limit the expedition entirely to naval operations, but Essex insisted on landing, and Howard, who had been specially charged by Elizabeth to protect her favourite,[8] was obliged to follow in his support. The town was sacked and the forts destroyed; the naval prizes, however, but for this diversion would have been more numerous. The council of war then refusing to countenance any further attempts on land, Howard and Essex returned with the expedition to England. On the 22nd of October 1596 Howard was created earl of Nottingham.

In February 1598, on a scare of an intended invasion, he was ordered to take measures for the defence of the country, and again in 1599, when he was appointed "Lord Lieut.-general of all England," and exercised full authority both over the army and the navy. He took a leading part in suppressing the rebellion of Essex, and served as a commissioner on his trial in February 1601. In December 1602 he entertained Elizabeth at Arundel House, but made no attempt to rival the gorgeous and expensive entertainments given to the queen by some of his contemporaries. Elizabeth's favour, in his case, required no courting by such methods, and it was to Nottingham that she named James as her successor on her deathbed. He continued to hold his office as lord high admiral under the new king, and in 1605 was despatched as ambassador to Spain, where his great reputation, together with his amiable character, perfect temper and unfailing courtesy, secured the successful negotiation of peace. He served on numerous commissions, including those on the union of the two kingdoms in 1604, for the trial of the conspirators of the Gunpowder Plot and of Henry Garnett in 1606, and for reviewing the articles and rules of the order of the Garter in 1618, and he attended Princess Elizabeth on her marriage to the elector palatine with a squadron to Flushing in 1613. Nottingham, who, unlike many of the Howards, was

after recusants,[1] and in the diocese of Winchester for hearing ecclesiastical causes; he sat on the government commission for discovering and expelling Roman Catholic priests, and was mentioned in 1602 from Douay as one of the three enemies most feared by the recusants.[2]

On the report of the commission on the navy in 1618 and of the abuses then exposed, Lord Nottingham, though no blame was attached to himself, being now an old man over eighty years of age, vacated his office of lord high admiral, receiving the sum of £3000 with a pension of £1000, and being granted a special precedence, limited to his person, as earl of Nottingham of the earlier Mowbray creation, and still keeping the lord-lieutenancy of Surrey. He died at Haling House, near Croydon, on the 14th of December 1624, and was buried at Reigate, a monument being afterwards placed to his memory in St Margaret's church at Westminster. He was a striking and almost heroic figure in the Elizabethan annals, no unworthy leader of such men as Drake, Hawkins and Raleigh, the defender of his country at a time of imminent peril, and by his splendid character and services he was placed beyond the reach of the intrigues and jealousies which troubled the reputation of many of his contemporaries and above even the suspicion of ill-doing.

Lord Nottingham married (1), in July 1563, Catherine, daughter of Henry Carey, 1st Lord Hunsdon, cousin to the queen, by whom he had, besides three daughters, two sons—William, who died in his father's lifetime, and Charles (1579–1642), who succeeded as second earl of Nottingham; and (2), when in his 68th year, Margaret, daughter of James Stuart, earl of Murray, by whom he had two sons, the youngest of whom, on the death of his half-brother without male issue, succeeded as third earl of Nottingham; on his dying childless in April 1681 the earldom became extinct, the barony of Effingham passing to the descendants of the first earl of Nottingham's younger brother, Sir William Howard, from whom the fourth earl of Effingham (creation of 1837) and 14th baron Howard of Effingham (b. 1866), who succeeded in 1898, was descended.

NOTTINGHAM, a city and county of a city, municipal, county and parliamentary borough, and county town of Nottinghamshire, England. Pop. (1901) 239,743. It stands on the left (north) bank of the Trent and its tributary the Leen. It is 125 m. N.N.W. from London by the Midland railway, and is also served by the Great Central and Great Northern railways. Water communications are afforded by the Grantham canal eastward, by the Nottingham and Erewash canals westward, communicating with the Cromford canal in Derbyshire, and by the Trent. The plan of the town is irregular, and the main thoroughfares are generally modern in appearance, many of the old narrow streets having been wholly altered or renewed. About the centre of the town is an open market-place some 5½ acres in area, said to be the largest of its kind in England. Nottingham Castle occupies a fine site to the S., on an abrupt rocky hill. The ancient remains are not large, including only a restored Norman gateway and fragments of the fortifications. In 1878 the site was acquired on lease by the corporation, and the building was opened as the Nottingham and Midland Counties Art Museum. The church of St Mary is a fine Perpendicular cruciform structure, with a central tower. St Peter's church is mainly Perpendicular, but shows traces of an earlier building. St Nicholas' church, near the castle, is a plain building of brick dating from 1676. There are several handsome modern churches, among which is the Roman Catholic cathedral of St Barnabas, from the designs of A. W. Pugin, erected in 1842–1844. There are a large number of Nonconformist places of worship. The principal secular buildings are the guildhall and city sessions court (1887), the shire hall, the Albert Hall and the Exchange; there are two principal theatres, the Theatre Royal and the Empire Theatre. Among educational establishments the principal is University College, for which a fine range of buildings was opened in 1881, history. The free grammar school, founded in 1513, for some time in disuse, was revived in 1807, and on its removal in 1868 to new buildings, became known as the High School. There are also the Nottingham High School for girls; the blue-coat school, founded in 1723; the People's College, founded in 1846; two technical schools; the Congregational Institute; and the Nottingham school of art, for which a fine building was erected in 1865 in the Italian style. The Midland Baptist college was transferred from Chilwell to Nottingham in 1882.

The General Hospital was founded in 1781, and there are the Nottingham and Midland eye infirmary, the county asylum and the Midland institution for the blind. The Arboretum and the Forest are the principal public pleasure-grounds; the county cricket club plays matches on the Trent Bridge ground, and there is a racecourse at Colwick, E. of the city. To the N.W., but within the city boundaries, are the industrial districts of Radford and Basford, beyond which lies Bulwell, with collieries, limestone quarries and earthenware manufactures. Bestwood Park, in the vicinity, contained a hunting lodge of Henry I., being included in Sherwood Forest. To the N., Sherwood is a growing residential district; another extends towards Gedling on the E. Southward, across the Trent, West Bridgford is another large residential suburb. To the W. is Lenton, and Beeston has become a populous suburb mainly owing to the establishment of large cycle and motor works.

Nottingham itself became an important seat of the stocking trade towards the close of the 18th century. It was here that Richard Arkwright in 1769 erected his first spinning frame, and here also James Hargreaves had the year previously removed with his spinning jenny after his machine had been destroyed by a mob at Blackburn. Nottingham has devoted itself chiefly to cotton, silk and merino hosiery. Up to 1815 point lace was also an important manufacture. In 1808 and 1809 John Heathcoat obtained patents for machines for making bobbin net, which inaugurated a new era in the lace manufacture. The industries also include bleaching, the dyeing, spinning and twisting of silk, the spinning of cotton and woollen yarn, tanning, engineering and brewing, while cycle works and tobacco factories are important, and the industries have the advantage of the close proximity of coal-mines. Besides the general market there is a large cattle market.

Nottingham received its style of a city and county of a city by letters patent of the 7th of August 1897. The parliamentary borough returns three members to parliament, being divided into W., E. and S. divisions. The city is governed by a mayor, 16 aldermen and 48 councillors. Area, 10,935 acres.

History.—The advantageous position of Nottingham (*Snotengaham, Notingcham*) on the Trent, where it was crossed by an ancient highway, accounts for its origin, whether in Roman or Saxon times. The Saxon form of the name is taken to refer to the caves, anciently used as dwelling-places, which were hollowed out of the soft sandstone. Examples of these occur in the Castle rock, in the Rock Holes W. of the castle; in the suburb of Sneinton and elsewhere. It was chosen by the Danes for their winter quarters in 868, and constituted one of their five burghs. In 922 it was secured and fortified by Edward the Elder, who in 924 built a second "burgh" opposite the first and connected with it by a bridge over the river. Æthelstan, the successor of Edward the Elder, established there a royal mint. In 1013 the town submitted to Sweyn. William I. erected a castle, and mention of a new borough occurs in Domesday Book, and this seems to be the first evidence of the existence of the "French borough" which grew up in Nottingham under the Normans, and was distinguished from the English borough by the different customs which prevailed in it. Parliaments were held at Nottingham in 1334, 1337 and 1357, and it was the scene of the conference of the judges with Richard II. in August 1387. Several important persons have been imprisoned in the castle, among others David II. of Scotland. Edward IV. assembled his troops at Nottingham in 1461; and it was the headquarters of Richard III. before the battle of Bosworth in 1485. In 1642 Charles I. finally broke with

[1] See esp. his letter to Walsingham, *Naval Record Soc. Pub.* i. 65.

[3] *Cal. St Pap. Dom. 1601–1603*, p. 181.

to the burgesses the liberties they had under Henry I., referred to a market on Saturdays, and forbade the working of dyed cloth, except in Nottingham, within ten leagues of the borough. This was confirmed by John, who also granted a gild-merchant. Henry III. allowed the burgesses to hold the town in fee-farm, and Edward I. granted them a mayor and two bailiffs, one to be chosen from each borough. Henry VI. confirmed all preceding privileges, first incorporated the mayor and burgesses, and granted that the town, except the castle and the gaol, should be a county of itself. Two sheriffs were to replace the two bailiffs. This charter remained, except for temporary surrenders under Charles II. and James II., the governing charter of the corporation until the Municipal Act of 1835. Nottingham returned two members to parliament from 1295 until 1885, when the number was increased to three. Edward I. granted an eight-days' fair in September and a fifteen-days' fair in November, the last altered by Richard II. to a five-days' fair in February. Two other fairs were granted by Anne; one large fair, Goose Fair, is still held. This begins on the first Thursday in October and lasts three days. The markets on Wednesdays and Saturdays are held by prescriptive right. Besides the Reform riots of 1831, Nottingham witnessed in 1811 the Luddite disturbances. In 1870 Nottingham was made the seat of a suffragan bishop of the diocese of Lincoln, but as it is now in the diocese of Southwell there is no suffragan bishopric.

NOTTINGHAMSHIRE, or NOTTS, an inland county of England, bounded N.W. by Yorkshire, W. by Derbyshire, S. by Leicestershire and E. and N.E. by Lincolnshire. The area is 843·4 sq. m. The N. is included in the great plain of York, and in the extreme N. there is some extent of marshes. The valley of the lower Trent and that of the Idle are also very flat. In the S.W. between Nottingham and Warsop, the undulations swell into considerable elevations, reaching near Mansfield a height over 600 ft. This district includes the ancient Sherwood Forest (*q.v.*). Some portions of it are still retained in their original condition, and there are many very old oaks, especially in the portion known as the Dukeries (*q.v.*). The county generally is finely wooded, although to the E. of the valley of the Soar there is a considerable stretch of wolds. The principal rivers are the Trent, the Erewash, the Soar and the Idle. The Trent, which enters the county near Thrumpton in the S.W., where it receives the Erewash from the N. and the Soar from the S., flows N.E. past Nottingham and Newark, where it takes a more northerly direction, forming the N. part of the E. boundary of the county till it reaches the Isle of Axholm (Lincolnshire). The Soar forms for a short distance the boundary with Leicestershire, and the Erewash the boundary with Derbyshire. The Idle, which is formed of several streams in Sherwood Forest, flows N. to Bawtry, and then turns E. to the Trent.

Geology.—All formations, from Lower and Middle Coal Measures, overlain unconformably by Permian, to Lower Lias, crop out successively eastward across the county, with a general but slight dip away from the Pennine uplift. The strike of the Carboniferous rocks veers from S. to E. in the S.; that of younger formations bends to S.W. The Coal Measures, about 3000 ft. thick, continue the Derbyshire Coalfield. A boring at Ruddington proved the lowest measures, underlain by Millstone Grit. The remaining Lower and Middle Measures below the important Top Hard Coal, with the Kilburn, Main, Deep Hard and Soft Coals, crop out in the south and along the Erewash Valley; higher strata farther N. All these consist of shale, clay and little sandstone. They contain *Carbonicola acuta*, *C. robusta*, *Neuropteris heterophylla*, *Alethopteris* and *Lepidodendron*, showing essentially non-marine conditions. But several thin marine beds occur. The highest measures, divisible into red Etruria Marls, Newcastle Sandstones and a red sandy Keele series have been proved underground in eastward succession. A thin basal breccia, a sandy and marly group, the Magnesian Limestone with *Productus horridus* and *Schizodus obscurus* (granular dolomite typically, its upper part locally a dolomitic sandstone, the Mansfield building-stone), red gypsiferous Middle Marls, an Upper Limestone, and Upper Red Marls, collectively 550 ft. thick in the north of Nottingham, glomeratic at the base and containing the fish *Semionotus*) form an undulating wooded district. Higher red and pale green Keuper Marl (700 ft.), with subordinate sandstones and gypsum, makes a low agricultural tract on the E., traversed longitudinally by the Trent. Black Rhaetic shales succeed with *Pteria* (*Avicula*) *contorta*, *Protocardium rhaeticum* and bone-beds, below light-coloured marls and limestones ("White Lias"). Lower Lias, almost up to the *Semicostatus* zone, crops out within the county. The basal *Planorbis* zone contains argillaceous limestones, worked for hydraulic cement at Barnston, and saurian remains. Of two types of Glacial boulder-clay, mainly confined to the Triassic and Jurassic clays on the E. and S.E., one containing Carboniferous and some extraneous boulders probably came with the Pennine ice from the N.W. The other, uppermost where both occur, and full of chalk and flint, belongs to the Chalky Boulder Clay of the North Sea ice. Glacial gravels cap the higher ground of the Triassic sandstones. Church Hole, one of the Magnesian Limestone caves of Creswell Crags, yielded remains of cave-lion, bear, mammoth, rhinoceros, &c. Older river-gravels flank the pasture land of the Trent alluvium.

Climate and Agriculture.—As the higher regions of Derbyshire and Yorkshire attract the rain clouds, the climate of Nottinghamshire is above the average in dryness; thus, the mean annual rainfall at Bawtry is 23·57 in. and at Nottingham 26·83 in. On this account crops ripen nearly as early as in the S. counties. The soil of about one-half the county is gravel and sand, including Sherwood Forest, where it inclines to sterility, and the valley of the Trent, where there is a rich vegetable mould on a stratum of sand or gravel. The land along the banks of the Trent is equally suitable for crops and pasture. The farms generally are of moderate size, the great majority being under 300 acres. Most of the immediate occupants are tenants-at-will. Roughly four-fifths of the total area is under cultivation. Apples and pears are grown in considerable quantities, but there are not many orchards of large size. Shorthorns are the favourite breed of cattle, and dairy farming is considerably prosecuted. The old forest breed of sheep is almost extinct, Leicesters and various crosses being common.

Industries.—Coal is mined chiefly on the S.W. border of the county near Nottingham and near Mansfield; there are also mines near Worksop. Clay, sandstone and limestone are also extensively raised. The lace and hosiery industries are of old establishment in the county, Nottingham being the principal centre. There are silk, worsted and cotton mills. A large number of hands are employed in machinery works, and the cycle and motor manufacture of Beeston is important. The manufacture of tobacco and cigars is considerable at Nottingham and Hucknall Torkard.

Communications.—The main line of the Midland railway touches the S.W. border of the county, with an alternative route through Nottingham, and branches thence N. through Hucknall and Mansfield to Worksop, to Newark and Lincoln, from Mansfield to Southwell and Newark, &c. The main line of the Great Central railway serves Nottingham and Hucknall. That of the Great Northern railway serves Newark and Retford, with a branch to Nottingham and local lines in that vicinity. A branch of the Great Central railway, formerly (till 1908) the main line of the Lancashire, Derbyshire and East Coast railway enters the county on the W. from Chesterfield, and crosses the Dukeries by Ollerton to Dukeries Junction (G.N.R.) and Lincoln. The Sheffield-Grimsby line of the Great Central crosses the N. of the county by Worksop and Retford. The Trent is navigable throughout the county, and the Idle between Bawtry and the Trent. The principal canals centre upon Nottingham.

Population and Administration.—The area of the ancient county is 539,756 acres, with a population in 1901 of 514,578. The area of the administrative county is 540,123. The county contains the city and county and municipal borough of Nottingham (pop. 239,743), and the municipal boroughs of Retford or East Retford (12,340), Mansfield (21,445) and Newark (14,992). The urban districts are Arnold (8757), Beeston (8960), Carlton (10,041), Eastwood (4815), Hucknall Torkard (15,250), Hucknall under Huthwaite (4076), Kirkby in Ashfield (10,318), Mansfield Woodhouse (4877), Sutton in Ashfield (14,862), Warsop (2132), West Bridgford (7018), Worksop (16,112). For parliamentary purposes the ancient county is divided into four divisions (Bassetlaw, Newark, Rushcliffe and Mansfield), each returning one member; and the parliamentary borough of Nottingham returns one member for each of its three divisions. There are one court of quarter sessions and seven petty sessional divisions. The boroughs of Newark and Nottingham have separate commissions of the peace, also separate courts of quarter sessions;

that of East Retford has a separate commission of the peace. The total number of civil parishes is 266. The ancient county contains 231 ecclesiastical parishes and districts, wholly or in part; it is situated principally in the diocese of Southwell and partly in the diocese of York.

History.—The earliest Teutonic settlers in the district which is now Nottinghamshire were an Anglian tribe who, not later than the 5th century, advanced from Lincolnshire along the Fosseway, and, pushing their way up the Trent valley, settled in the fertile districts of the S. and E., the whole W. region from Nottingham to within a short distance of Southwell being then occupied by the vast forest of Sherwood. At the end of the 6th century Nottinghamshire already existed as organized territory, though its W. limit probably extended no farther than the Saxon relics discovered at Oxton and Tuxford. Nottingham after the treaty of Wedmore became one of the five Danish boroughs. On the break-up of Mercia under Hardicanute, Nottinghamshire was included in the earldom of the Middle English, but in 1049 it again became part of Leofric's earldom of Mercia, and descended to Edwin and Morkere. The first mention of the shire of Nottingham occurs in 1016, when it was harried by Canute. The boundaries have remained practically unaltered since the time of the Domesday Survey, and the eight Domesday wapentakes were unchanged in 1610; in 1719 they had been reduced to six, their present number, Oswaldbeck being absorbed in Bassetlaw, of which it forms the North Clay division, and "Side" in Thurgarton. Nottinghamshire was originally included in the diocese and province of York, and in 1291 formed an archdeaconry comprising the deaneries of Nottingham, Newark, Bingham and Retford. By act of parliament of 1836 the county was transferred to the diocese of Lincoln and province of Canterbury, with the additional deanery of Southwell. In 1878 the deaneries of Mansfield, South Bingham, West Bingham, Collingham, Tuxford and Worksop were created, and in 1884 most of the county was transferred to the newly-created diocese of Southwell, the deaneries being unchanged. The deaneries of Bawtry, Bulwell, Gedling, East Newark and Norwell were created in 1888. Until 1568 Nottinghamshire was united with Derbyshire under one sheriff, the courts and tourns being held at Nottingham until the reign of Henry III., when with the assizes for both counties they were removed to Derby. In the time of Edward I. the assizes were again held at Nottingham, where they are held at the present day. The Peverel Court, founded before 1113 for the recovery of small debts, had jurisdiction over 127 towns in Nottinghamshire, and was held at Nottingham until 1321, in 1330 at Algarthorpe and in 1790 at Lenton, being finally abolished in 1849. The most interesting historic figure in the Domesday Survey of Nottinghamshire is William Peverel. His fief represents the honour of Nottingham, and in 1068 he was appointed constable of the castle which William the Conqueror had raised at Nottingham. The Cliftons of Clifton and the Byrons of Newstead held lands in Nottinghamshire at the time of the Survey. Holme Pierrepoint belonged to the Pierrepoints from the time of Edward I.; Shelford was the seat of the Stanhopes, and Langer of the Tibetots, afterwards earls of Worcester. Archbishop Cranmer was a descendant of the Cranmers of Aslockton near Bingham.

The political history of Nottinghamshire centres round the town and castle of Nottingham, which was seized by Robert of Gloucester on behalf of Maud in 1140; captured by John in 1191; surrendered to Henry III. by the rebellious barons in 1264; formed an important station of Edward III. in the Scottish wars; and in 1397 was the scene of a council where three of the lords appellant were appealed of treason. In the Wars of the Roses the county as a whole favoured the Yorkist cause, Nottingham being one of the most useful stations of Edward IV. In the Civil War of the 17th century most of the nobility and gentry favoured the Royalist cause, but Nottingham Castle was garrisoned for the parliament, and in 1651 was ordered to be demolished.

Among the earliest industries of Nottinghamshire were the malting and woollen industries, which flourished in Norman times. The latter declined in the 16th century, and was superseded by the hosiery manufacture which sprang up after the invention of the stocking-loom in 1589. The earliest evidence of the working of the Nottinghamshire coalfield is in 1250, when Queen Eleanor was unable to remain in this county on account of the smoke of the sea-coal. Collieries are scarcely heard of in Nottinghamshire in the 17th century, but in 1620 the justices of the peace for the shire report that there is no fear of scarcity of corn, as the counties which send up the Trent for coal bring corn in exchange, and in 1881 thirty-nine collieries were at work in the county. Hops were formerly extensively grown, and Worksop was famous for its liquorice. Numerous cotton-mills were erected in Nottinghamshire in the 18th century, and there were silk-mills at Nottingham. The manufacture of tambour lace existed in Nottinghamshire in the 18th century, and was facilitated in the 19th century by the manufacture of machine-made net. From 1295 the county and town of Nottingham each returned two members to parliament. In 1572 East Retford was represented by two members, and in 1672 Newark-upon-Trent also. Under the Reform Act of 1832 the county returned four members in two divisions. By the act of 1885 it returned four members in four divisions; Newark and East Retford were disfranchised, and Nottingham returned three members in three divisions.

Antiquities.—At the dissolution of the monasteries there were no fewer than forty religious houses in Nottinghamshire. The only important monastic remains, however, are those at Newstead, but the building is partly transformed into a mansion which was formerly the residence of Lord Byron (see HUCKNALL TORKARD). There are also traces of monastic ruins at Beauvale, Mattersey, Radford and Thurgarton. The finest parish church in the county is that of Newark. The churches of St Mary, Nottingham, and of Southwell were collegiate churches; Southwell, now a cathedral, is a splendid building, principally Norman. The churches of Balderton, Bawtry, Hoveringham, Mansfield and Worksop are also partly Norman, and those of Coddington, Hawton and Upton St Peter near Southwell, Early English. Of the old castles, the principal remains are those at Newark, but there are several interesting old mansions, as at Kingshaugh, Scrooby, Shelford and Southwell. Wollaton Hall, near Nottingham, is a fine old building (*c.*1580). The finest residences of more modern date are Welbeck and others in the Dukeries (*q.v.*).

Thoresby, 3 vols., Lond., 1797); Thomas Bailey, *Annals of Nottinghamshire* (4 vols., Lond., 1852–1856); J. P. Briscoe, *Old Nottinghamshire* (1881); J. Ward, *Descriptive Catalogue of Books relating to Nottinghamshire* (Nottingham, 1892).

NOÜMENON (Gr. νοούμενον, a thing known, from νοεῖν), a philosophical term put into currency by Kant and not much used except in definite reference to his doctrine. In the Kantian system the term "noümena" means things-in-themselves as opposed to "phenomena" or things as they appear to us. According to Kant the human mind is such that it can never penetrate by its speculative powers to things-in-themselves, but can only know phenomena. Thus we have the odd position that noümena, or the contents of the intelligible world, are just the things to which thought can never penetrate. The term, however, is a relic of an early period of Kant's mental development. In his fully mature or critical position he held that the noümenal world was inaccessible to the speculative reason, and yet that we are not altogether excluded from it, since the practical reason, *i.e.* our capacity for acting as moral agents, assures us of the existence of a noümenal world wherein freedom, God and immortality have a real place. The relation of noumena to phenomena in the Kantian system is a most difficult one; and in view of the fact that the acutest intellects of Europe have been engaged vainly for more than a century in reconciling the various passages on the subject, the safest conclusion is that they are irreconcilable. The course adopted by Kant's immediate successors in German idealism was to reject the whole conception of noümena, for the reason that what is essentially unknowable has no existence for our intelligence. Kant, however, protested

as he himself stated it, but it is the expression of a certain principle: we must connect it with his general tendency to recognize the dynamic side of things. He saw, what so many of his successors failed to see, that the world as we know it is an expression of power; and he could not imagine whence the power could come if not from a world beyond phenomena. (See KANT; PHENOMENON.) (H. ST.)

NOVALICHES, MANUEL PAVIA Y LACY, 1ST MARQUIS DE (1814–1896), Spanish marshal, was born at Granada on the 6th of July 1814. He was the son of Colonel Pavia, and after a few years at the Jesuit school of Valencia he entered the Royal Artillery Academy at Segovia. In 1833 he became a lieutenant in the guards of Queen Isabella II., and during the Carlist War from 1833 to 1840 he became general of division in the latter year at the early age of twenty-six. The Moderate party made him war minister in 1847, and sent him to Catalonia, where his efforts to put down a Carlist rising were not attended with success. He had been made a senator in 1845, and marquis in 1848. He was sent out to Manila in 1852 as captain-general of the Philippine Islands. In April 1854 he crushed with much sternness a formidable insurrection and carried out many useful reforms. On his return to Spain he married the countess of Santa Isabel, and commanded the reserves in the Peninsula during the war with Morocco. He refused the war portfolio twice offered him by Marshals O'Donnell and Narvaez and undertook to form a cabinet of Moderates in 1864 that lived but a few days. He volunteered to crush the insurrection in Madrid on the 22nd of June 1866, and when the revolution broke out in September 1868 accepted the command of Queen Isabella's troops. He was defeated by Marshal Serrano at the bridge of Alcolea on the 28th of September 1868, and was so badly wounded in the face that he was disfigured for life He kept apart during the revolution and went to meet King Alfonso when he landed at Valencia in January 1875. The Restoration made the marquis de Novaliches a senator, and the new king gave him the Golden Fleece. He died in Madrid on the 22nd of October 1896.

NOVALIS, the pseudonym of FRIEDRICH LEOPOLD, FREIHERR VON HARDENBERG (1772–1801), German poet and novelist. The name was taken, according to family records, from an ancestral estate. He was born on the 2nd of May 1772 on his father's estate at Oberwiederstedt in Prussian Saxony. His parents were members of the Moravian (*Herrnhuter*) sect, and the strict religious training of his youth is largely reflected in his literary works. From the gymnasium of Eisleben he passed, in 1790, as a student of philosophy, to the university of Jena, where he was befriended by Schiller. He next studied law at Leipzig, when he formed a friendship with Friedrich Schlegel, and finally at Wittenberg, where, in 1794, he took his degree. His father's cousin, the Prussian minister Hardenberg, now offered him a government post at Berlin; but the father feared the influence upon his son of the loose-living statesman, and sent him to learn the practical duties of his profession under the *Kreisamtmann* (district administrator) of Tennstedt near Langensalza. In the following year he was appointed auditor to the government saltworks in Weissenfels, of which his father was director. His grief at the death in 1797 of Sophie von Kühn, to whom he had become betrothed in Tennstedt, found expression in the beautiful *Hymnen an die Nacht* (first published in the *Athenäum*, 1800). A few months later he entered the Mining Academy of Freiberg in Saxony to study geology under Professor Abraham Gottlob Werner (1750–1817), whom in the fragment *Die Lehrlinge zu Sais* he immortalized as the "Meister." Here he again became engaged to be married, and the next two years were fruitful in poetical productions. In the autumn of 1799 he read at Jena to the admiring circle of young romantic poets his *Geistliche Lieder*. Several of these, such as "Wenn alle untreu werden," "Wenn ich ihn nur habe," "Unter tausend frohen Stunden," still retain, as church hymns, great popularity. In 1800 he was

[illegible] Tieck and Friedrich Schlegel (2 vols. 1802; a third volume was added in 1846). They are for the most part fragments, of which *Heinrich von Ofterdingen*, an unfinished romance, is the chief. It was undertaken at the instance of Tieck, and reflects the ideas and tendencies of the older Romantic School, of which Hardenberg was a leading member. Heinrich von Ofterdingen's search for the mysterious "blue flower" is an allegory of the poet's life set in a romantic medieval world. Novalis, however, did not succeed in blending his mystic and philosophical conceptions into a harmonious whole. The "fragments" contain idealistic though paradoxical views on philosophy, art, natural science, mathematics, &c.

There are editions of his collected works by C. Meisner and B. Wille (1898), by E. Heilborn (3 vols., 1901), and by J. Minor (3 vols., 1907). *Heinrich von Ofterdingen* was published separately by J. Schmidt in 1876. Novalis's Correspondence was edited by J. M. Raich in 1880. See R. Haym, *Die romantische Schule* (Berlin, 1870); A. Schubart, *Novalis' Leben, Dichten und Denken* (1887); C. Busse, *Novalis' Lyrik* (1898); J. Bing, *Friedrich von Hardenberg* (Hamburg, 1899), E. Heilborn, *Friedrich von Hardenberg* (Berlin, 1901). Carlyle's fine essay on *Novalis* (1829) is well known.

NOVARA, a town and episcopal see, of Piedmont, Italy, capital of the province of Novara, 31 m. by rail W. of Milan, 538 ft. above sea-level. Pop. (1906) 37,962 (town), 48,694 (commune). Railways diverge hence to Varallo Sesia, Orta, Arona (for Domodossola), Busto Arsizio, Milan, Vigevano and Vercelli. Previous to 1839 Novara was still surrounded by its old Spanish ramparts, but it is now an open, modern-looking town. Part of the old citadel is used as a prison. The cathedral dates from the 4th century (?), but (with the exception of the octagonal dome-roofed baptistery belonging to the first part of the 10th century, and separated from the west end by an atrium) was rebuilt between 1860 and 1870 after designs by Antonelli; the church of S Gaudenzio, dedicated to Bishop Gaudentius (d. 417), who is buried under the high altar, rebuilt by Pellegrino Tibaldi about 1570, has a baroque campanile and a dome 396 ft. high, the latter added by Antonelli in 1875–1878; and San Pietro del Rosario is the church in which the papal anathema was pronounced against the followers of Fra Dolcino. The two first contain pictures by Gaudenzio Ferrari. The city also contains handsome market-buildings erected in 1817–1842, a large hospital dating from the 9th century and a court-house constructed in 1346. The town has also a museum of Roman antiquities. The principal industry is the carding and spinning of silk; there are also iron-works and foundries, cotton mills, rice-husking mills, organ factories, dye-works and printing works.

Novara, the ancient *Novaria*, according to Pliny a place of Celtic origin, according to Cato (but wrongly) of Ligurian origin, was a municipal city, and lay on the road between Vercellae and Mediolanum. Its rectangular plan may well be a survival of Roman days. Dismantled in 386 by Maximus for siding with his rival Valentinian, it was restored by Theodosius; but it was afterwards ravaged by Radagaisus (405) and Attila (452). A dukedom of Novara was constituted by the Lombards, a countship by Charlemagne. In 1110 the city was taken and burned by the emperor Henry V. Before the close of the 12th century it accepted the protection of Milan, and thus passed into the hands, first, of the Visconti, and, secondly, of the Sforzas. In 1706 the city, which had long before been ceded by Maria Visconti to Amadeus VIII. of Savoy, was occupied by the Savoy troops. At the peace of Utrecht it passed to the house of Austria with the duchy of Milan; but, having been occupied by Charles Emmanuel in 1734, it was granted to him in the following year. Under the French it was the chief town of the department of Agogna. Restored to Savoy in 1814, it was in 1821 the scene of the defeat of the Piedmontese by the Austrians, and in 1849 of the more disastrous battle which led to the abdication of

Charles Albert and an Austrian occupation of the city. The painter Gaudenzio Ferrari was a native of Novara; and so was Peter Lombard. (T. As.)

NOVA SCOTIA, a province of the Dominion of Canada, lying between 43° 25′ and 47° N. and 59° 40′ and 66° 25′ W., and composed of the peninsula proper and the adjoining island of Cape Breton (*q.v.*), which is separated from the mainland by the Strait of Canso. The extreme length from S.W. to N.E. is 374 m. (N.S. 268, C.B. 108); breadth 60 to 100 m.; area 21,428 sq. m. The isthmus of Chignecto, 11½ m. wide, connects it with the province of New Brunswick.

Physical Features.—Nova Scotia is intersected by chains of hills. The Cobequid Mountains, stretching from E. to W. and terminating in Cape Chignecto, form the chief ridge. Several of the elevations are as high as 1100 ft., and are cultivable almost to their summits. Lying on each side of this range are two extensive tracts of arable land. A ridge of precipices runs for 130 m. along the Bay of Fundy from Brier Island at the farthest extremity of Digby Neck and culminates in Capes Split and Blomidon. Here and there rocks, from 200 to 600 ft. in height and covered with stunted firs, overhang the coasts. Beyond them lies the garden of Nova Scotia, the valley of the Annapolis. The Atlantic coast from Cape Canso to Cape Sable is high and bold, containing many excellent harbours, of which Halifax (Chebucto Bay) is the chief. The N. shore is, as a rule, low, with hills some distance from the coast. Of its harbours the most important is Pictou. Of the inlets the most remarkable is Minas Basin, the eastern arm of the Bay of Fundy; it penetrates some 60 m. inland, and terminates in Cobequid Bay, where the tides rise sometimes as high as 53 ft., while on the opposite coast, in Halifax Harbour, the spring tides scarcely exceed 7 or 8 ft. The height of the Fundy tides has, however, been often exaggerated, the average being 42·3 ft. Many islands occur along the coast, particularly on the S.E.; of these the most celebrated is Sable Island (*q.v.*). The rivers are, with few exceptions, navigable for coasting vessels for from 2 to 20 m. The principal are the Annapolis, Avon, Shubenacadie, the East, Middle and West rivers of Pictou, the Musquodoboit and the Lahave. The largest of the fresh-water lakes is Lake Rossignol, situated in Queen's county, and more than 20 m. long. Ship Harbour Lake, 15 m. in length, and Grand Lake are in Halifax county.

Geology.—The Lower Cambrian formation forms an almost continuous belt along the Atlantic coast, varying in width from 10 to 75 m. and covering an area estimated at 8500 sq. m. It is interrupted by large masses of intrusive granite, extending from the extreme S.W. of the province as far as Halifax, and cropping out in detached areas as far as Cape Canso. This part of the province is rugged and sterile, and abounds in small lakes and peat bogs. Along the N.E. coast extends a Carboniferous area, including two large and productive coal-fields in Cumberland and Pictou counties, and continued in the coal-fields of Cape Breton. On the S. coast of the Bay of Fundy, and at Minas Basin and Channel, the Triassic Red Sandstone formation predominates, more or less protected by a narrow rim of trap rock, culminating at its E. end in the basaltic promontory of Blomidon (Blow-me-down). The Cobequid Mountains are a mass of slates, quartzites and intrusive rocks (apparently Siluro-Cambrian). At the Joggins, near Cape Chignecto, occurs a splendid exposure, rich in curious minerals and fossils, and very celebrated among geologists.

Climate; Flora and Fauna.—The climate of Nova Scotia is more temperate than that of New Brunswick, and more equable than that of the inland provinces, though not so dry. Spring and winter begin about a fortnight later than in Ontario. Dense fogs often drift in from the Atlantic, but are not considered unhealthy.

Most of the principal birds of North America are to be found, and the game of the country includes moose, caribou, duck, teal, geese, woodcock, partridge, snipe, plover, &c. The game laws are strict and well enforced. The chief wild animals are bears, foxes and wild-cats. Wolves, once numerous, are now extinct. The natural flora does not differ greatly from that of the New England states. The sweet-smelling may-flower, or trailing arbutus (*Epigaea repens*), grows extensively, and has long been the provincial emblem.

Population.—The population increases slowly, having risen only from 440,572 in 1881 to 459,574 in 1901, an average of 21·8 to the square mile (total area, 21,428 sq. m.). The rural population is grouped along the river valleys, and the natural increase is normal, but there is a large emigration to the manufacturing cities of the E. states and to the Canadian N.W. The great mass of the people are of British descent, but in parts of Cape Breton are found descendants of the early French settlers; in Lunenburg and the S.E. is a large German colony; near Halifax are a number of negroes from the West Indies, and scattered through the province are about 2000 Micmac Indians, who now confine themselves chiefly to the making of bows and arrows, baskets and trinkets; though they carry on a certain amount of mixed farming. Few are of absolutely pure Indian blood. The settlers of English and Scotch descent are about equal in numbers, but the latter have been more prominent in the development of the province. The Irish are found chiefly in Halifax and in the mining towns of Cape Breton. Roman Catholics, Presbyterians and Baptists predominate, though the Church of England is strong in Halifax, and still retains a certain social prestige.

Administration.—The executive authority is in the hands of a lieutenant-governor appointed for five years by the federal government, and of a council appointed from and responsible to the local legislature. This consists of a lower house of assembly, and of a legislative council of twenty life members, which the assembly has frequently, but in vain, endeavoured to abolish. The municipal system was introduced subsequent to federation, and is modelled on that of Ontario.

The revenue is chiefly made up of the Dominion subsidy (see ONTARIO), and of royalties on mining concessions, chiefly those on coal. Owing to the great increase of mining in Cape Breton, its payments towards the revenue are larger in proportion than those of the mainland.

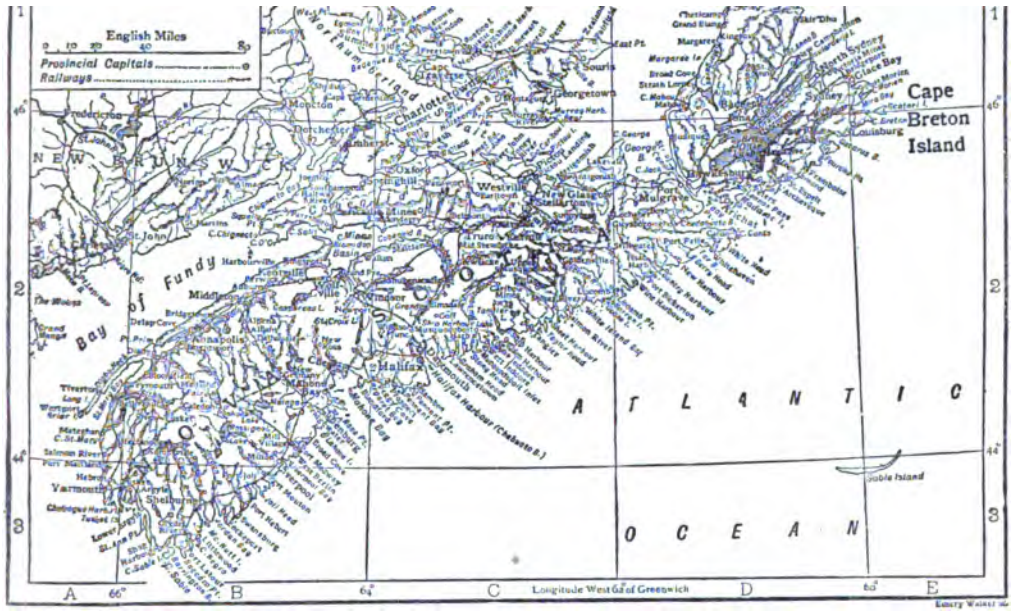
Education.—Primary education is free and compulsory; secondary education is also free but optional. In each county one high school is raised to the rank of an academy, free to all qualified students in the county, and receives an additional grant. Roman Catholics have not won the right of separate schools, as in Ontario, but in Halifax and other districts where that church is strong, a compromise has been arranged. Thus the two Roman Catholic colleges, St Francis Xavier (English) at Antigonish, and St Anne (French) at Church Point (Digby county), and most of the convents are in affiliation with the public school system. There are also many private schools, chiefly for girls, and under denominational control. But while primary and secondary education is widespread and of good quality, higher education has suffered from denominational bickerings, and the universities are still too many and too small. They are: King's College, Windsor (Anglican), founded in 1790; Acadia University, Wolfville (Baptist, 1839); St Francis Xavier, Antigonish (Roman Catholic, 1866); and Dalhousie University, Halifax (Undenominational), established by charter in 1818, reorganized in 1863, the largest and the most efficient, possessing faculties of arts, science, medicine and law. The province supports a normal school and schools of agriculture and of horticulture at Truro, and has voted $100,000 for a College of Technology at Halifax.

Commerce and Manufactures.—Nova Scotia is naturally a sea-going province, and till about 1881 had the largest tonnage, in proportion to population, in the world. Since then, her shipping has greatly diminished, though Halifax is still one of the chief winter ports of the Dominion, and Sydney is also a favourite port of call for steamers in need of "bunker" coal. The water-power provided by the rivers supports many manufactures. Several sugar-refineries exist, and a large trade is carried on with Bermuda and the West India islands.

Fisheries.—The fisheries of Nova Scotia are the most important in Canada, and the value of their products ($7,841,602 in 1904) is about one-third that of the whole Dominion. Lobsters, cod and mackerel constitute the bulk of the catch. Many boats are also fitted out in Lunenburg, Digby, Yarmouth and other ports for the Grand Banks of Newfoundland. A bounty is paid by the Dominion government, and attempts are being made to introduce more scientific methods among the fishermen. The vessels are manned by over 25,000 men, and many more are employed in the lobster canneries and kindred industries. Trout and salmon abound in the inland lakes and streams.

Lumber.—Lumbering was long the chief industry of the province and is still very important, though the percentage of forest left uncut is only about 30%. The network of small lakes and rivers enables the logs to be brought to the mills with great ease, and little rough timber is now exported. The chief export is that of spruce deals almost entirely from Halifax. The manufacture of wood-pulp for paper is also carried on.

Minerals.—Bituminous coal is mined in various parts of Cape Breton (*q.v.*) and in the counties of Cumberland and Pictou. The seams dip at a low angle, and are of great thickness, especially in Pictou county. The total product exceeds 5,000,000 tons, annually, more than two-thirds that of the whole Dominion. Of this over half is mined in the neighbourhood of Sydney, Cape Breton. Other



important centres are Springhill, Acadia Mines, Stellarton and Glace Bay (C.B.). It is shipped as far west as Montreal, and to the New England states. Iron is largely produced, chiefly in the vicinity of the Cumberland and Pictou coal-fields. The deposits include magnetite, red haematite, specular, limonite and carbonate ores. Blast furnaces are in operation, especially at New Glasgow, Sydney and North Sydney, though most of the ore used at Sydney is imported from Newfoundland. The quarries of easily worked limestone, the product of which is used as a "flux" in the blast furnaces, add to the value of the iron deposits. Gold occurs in workable quantities in the quartz all along the Atlantic coast, and several small but successful mining enterprises are in operation, yielding about $500,000 annually. Large deposits of gypsum occur, especially at Windsor in Hants county. Manganese and copper are also worked on a small scale.

Agriculture.—The attention paid to lumbering, fishing and shipping, and the subsequent emigration westwards have lessened the importance of this industry. Mixed farming is however largely carried on, and of late years dairy farming has been greatly extended and improved, and much butter and cheese is exported to England. Both the Dominion and the provincial governments have endeavoured to introduce scientific methods. Nova Scotia ranks second to Ontario in its production of apples and peaches. The centre of this industry is the valley of the Annapolis, where, it is said, one "may ride for fifty miles under apple-blossoms." At the head of the Bay of Fundy and on Minas Basin the low-lying meadows produce splendid crops of hay. Owing to high Fundy tides, the air in the neighbourhood is constantly in motion, the result being a cool temperature, even in the height of summer, which is well fitted for stock-raising.

Roads and Railroads.—Road-making machines are employed for the improvement of the ordinary highways, and steel bridges are replacing the wooden structures; but the roads in the country districts still leave much to be desired. The Intercolonial railway, owned and worked by the Dominion government, is the chief means of communication with the other provinces, and for the carriage of local traffic. Besides the main line from Halifax to Amherst, a branch runs from Truro to Sydney, and another from Oxford Junction to Pictou and Stellarton. The Canadian Pacific railway has running rights over it from St John (N.B.) to Halifax; on its completion, similar rights will be granted from Moncton to Halifax to the Grand Trunk Pacific. The Dominion Atlantic railway extends from Windsor Junction, near Halifax, to Yarmouth; the Nova Scotia Central railway from Lunenburg to Middleton on the Dominion Atlantic railway. A line along the Atlantic coast connects Halifax and Yarmouth, whence a daily line of steamers sails for Boston. Other lines connect Halifax with a number of the S.W. coast and inland towns, and a line has been projected from New Glasgow to Guysborough and the coast. Several smaller lines are owned by the various coal-mining companies. Telegraph and telephone lines extend all over the province, and there are two cable stations—one at Canso and the other at Sydney. The Marconi Company has stations for wireless telegraphy at Halifax, Cape Sable, Sable Island and Glace Bay.

History.—Nova Scotia may well have been the Markland of early Norse and Icelandic voyages, and Cape Breton was visited by the Cabots in 1497–1498, but not till 1604 was any attempt at permanent colonization made by Europeans. In that year an expedition was headed by a Frenchman, Pierre de Guast, Sieur de Monts (1560–*c.* 1630), who had received from Henry IV. full powers to explore and take possession of all lands in North America lying between the 40th and 46th parallels of north latitude. De Monts and his friend de Poutrincourt (d. 1615), endeavoured to form settlements at Port Royal (now Annapolis), St Croix (in New Brunswick) and elsewhere, but quarrels broke out with the Jesuits, and in 1613 the English colonists of Virginia made a descent upon them, claimed the territory in right of the discovery by the Cabots, and expelled the greater part of the inhabitants. In 1621 Sir William Alexander obtained from James I. a grant of the whole peninsula, which was named in the patent, Nova Scotia, instead of Acadia, the old name given to the colony by the French. During the reign of Charles I. the still existing order of Baronets of Nova Scotia was instituted, and their patents ratified in parliament. The treaty of St Germain-en-Laye (1632) confirmed France in the possession of Acadia, Cape Breton and New France; but fierce feuds broke out among the French settlers, and in 1654 a force sent out by Cromwell took possession of the country, but by the treaty of Breda (1667) it was restored to France by Charles II. Continual

fighting went on between the French and the British colonists of New England, the Indians taking part, usually on the side of the French; in 1710 the province was finally captured by Great Britain and ceded to her in 1713 by the treaty of Utrecht, under the name of "Acadia or Nova Scotia," the French remaining masters of Cape Breton. Perpetual quarrels went on concerning the boundaries of the district ceded; the English claim comprised the present Nova Scotia, Prince Edward Island, most of New Brunswick and the Gaspé peninsula, while the French restricted it to the S. half of what is now Nova Scotia. In 1749 Halifax was founded as a counterpoise to Louisbourg in Cape Breton, and over 4000 colonists sent out, but the French opposed the new settlers. In 1755 about 6000 French were suddenly seized by Governor Charles Laurence (d. 1760) and hurried into exile. After undergoing many sufferings, some eventually found their way back, while others settled in Cape Breton, or in distant Louisiana. By the treaty of Paris in 1763, France resigned all claim to the country. In 1769 Prince Edward Island (formerly Isle St Jean) was made a separate government. Meanwhile, immigration from the New England colonies had filled the fertile meadows left vacant by the Acadians. A later influx of American Loyalists led in 1784 to the erection of New Brunswick into a separate colony. In the same year, Cape Breton was also separated from Nova Scotia but reunited in 1820.

During the wars of the American and French revolutions Halifax grew apace. Hither, in June 1813, came the "Shannon" with her prize the "Chesapeake," captured off Boston harbour. Meanwhile, between 1784 and 1828, a large Scottish emigration, chiefly from the Highlands, had settled in the counties around Pictou, and the lumbering industry rose to great proportions. Agriculture was for some time neglected, but in 1818 the letters of "Agricola" (John Young, 1773–1837) gave it an impetus. Representative institutions had been granted as early as 1758, but power long rested mainly in the hands of a Council of Twelve, comprising the chief justice, the Anglican bishop and other high officials. In 1848, after a long struggle, responsible government was won by the legislative assembly, led by Joseph Howe.

In these political struggles, education was often the battle-ground, the fight ending in 1864 in the establishment of free primary and secondary schools by Dr (afterwards Sir Charles) Tupper, and the re-organization on an undenominational basis of Dalhousie University (see HALIFAX). In 1867 the province entered the new Dominion of Canada. For some years afterwards an agitation in favour of repeal was maintained, but gradually died away. Since then its history is a record of uneventful progress.

NOVATIANUS, Roman presbyter, and one of the earliest antipopes, founder of the sect of the Novatiani or Novatians, was born about the beginning of the 3rd century. On the authority of Philostorgius (*H.E.* viii. 15) he has been called a native of Phrygia, but perhaps the historian merely intended to indicate the persistence of Novatianism in Phrygia at the time when he wrote. Little is known of his life, and that only from his opponents. His conversion is said to have taken place after an intense mental struggle; he was baptized by sprinkling, and without episcopal confirmation, when in hourly expectation of death; and on his recovery his Christianity retained all the gloomy character of its earliest stages. He was ordained at Rome by Fabian, or perhaps by an earlier bishop; and during the Decian persecution he maintained the view which excluded from ecclesiastical communion all those (lapsi) who after baptism had sacrificed to idols—a view which had frequently found expression, and had caused the schism of Hippolytus. Bishop Fabian suffered martyrdom in January 250, and, when Cornelius was elected his successor in March or April 251, Novatian objected on account of his known laxity on the above-mentioned point of discipline, and allowed himself to be consecrated bishop by the minority who shared his views. He and his followers were excommunicated by the synod held at Rome in October of the same year. He is said by Socrates (*H.E.* iv. 28) to have suffered martyrdom under Valerian. After his death the Novatians spread rapidly over the empire; they called themselves *καθαροί*, or Puritans, and rebaptized their converts from the Catholic view. The eighth canon of the council of Nice provides in a liberal spirit for the readmission of the clergy of the *καθαροί* to the Catholic Church, and the sect finally disappeared some two centuries after its origin. Novatian has sometimes been confounded with his contemporary Novatus, a Carthaginian presbyter, who held similar views.

Novatian was the first Roman Christian who wrote to any considerable extent in Latin. Of his numerous writings three are extant: (1) a letter written in the name of the Roman clergy to Cyprian in 250; (2) a treatise in thirty-one chapters, *De trinitate*; (3) a letter written at the request of the Roman laity, *De cibis judaicis*. They are well-arranged compositions, written in an elegant and vigorous style. The best editions are by Welchman (Oxford, 1724) and by Jackson (London, 1728); they are translated in vol. ii. of Cyprian's works in the *Ante-Nicene Theol. Libr.* (Edinburgh, 1869). The Novatian controversy can be advantageously studied in the *Epistles* of Cyprian.

NOVATION, a legal term derived from the Roman law, in which *novatio* was of three kinds—substitution of a new debtor (*expromissio* or *delegatio*), of a new creditor (*cessio nominum vel actionum*), or of a new contract. In English law the term (though it occurs as early as Bracton) is scarcely naturalized, the substitution of a new debtor or creditor being generally called an assignment, and of a new contract a merger. It is doubtful, however, whether merger applies except where the substituted contract is one of a higher nature, as where a contract under seal supersedes a simple contract. Where one contract is replaced by another, it is of course necessary that the new contract should be a valid contract, founded upon sufficient consideration (see CONTRACT). The extinction of the previous contract is sufficient consideration. The question whether there is a novation most frequently arises in the course of dealing between a customer and a new partnership, and on the assignment of the business of a life assurance company with reference to the assent of the policyholders to the transfer of their policies. The points on which novation turns are whether the new firm or company has assumed the liability of the old, and whether the creditor has consented to accept the liability of the new debtors and discharge the old. The question is one of fact in each case. See especially the Life Assurance Companies Act 1872, s. 7, where the word "novations" occurs in the marginal note to the section, and so has quasi-statutory sanction. Scots law seems to be more stringent than English law in the application of the doctrine of novation, and to need stronger evidence of the creditor's consent to the transfer of liability. In American law, as in English, the term is something of a novelty, except in Louisiana, where much of the civil law is retained.

NOVAYA ZEMLYA (*Nova Zembla*, "new land"), an Arctic land off the coast of European Russia, to which it belongs, consisting of two large islands separated by a narrow winding channel, the Matochkin Shar. It lies between 70° 31′ and 77° 6′ N., and between 51° 35′ and 69° 2′ E. It forms an elongated crescent, being nearly 600 m. long with a width of 30 to 90 m., and an area of about 36,000 sq. m. It separates the Barents Sea on the W. from the Kara Sea on the E. With Vaygach Island, between it and the mainland, Novaya Zemlya forms a continuation of the Paë-Khoy hills. Vaygach is separated from it by the Kara Strait, 30 m. wide, and from the continent by the Yugor or Ugrian Strait, only 7 m. across. On the E. coast of Novaya Zemlya, especially between the Matochkin Shar and 75° N., there are a number of fjord-like inlets—such as Chekina, Rasmyslov and Medvizhiy bays. The greater part of the W. coast is fretted into bays and promontories, and a large number of islets lie off it. At the S. extremity there are a number of fjords and the wide bay of Sakhanikha. Then

anchoring anchorages. On the W. coast of the N. island are Krestovaya, Mashigin and Nordenskjöld bays, and to the N. are several groups of islands—Gorbovyi, Pankratiev, the Gulf Stream Islands and the Orange Islands. Off the E. coast that called Pakhtusov (actually divided by a strait into two) may be mentioned. Little is known of the interior of Novaya Zemlya. It is mountainous throughout. Transverse chains are thrown off from the main chain, and are separated by deep narrow valleys, some of which are watered by streams of considerable size, which, at the spring thaw, bring down a remarkable bulk of detritus. The general slope of the land is steeper on the E. than on the W., and at the N. and S. extremities there is a descent to a comparatively low plateau. In the S. this plateau is broken by several parallel ridges, with level valleys between them, dotted with numerous small lakes. On either side of the Matochkin Shar the hills reach 4000 ft. and upwards. The more elevated region is covered with snow-fields which feed glaciers in some cases, while the N. seems to be covered with a great ice-sheet.

Geology.—The geological structure of the central region is of the most varied description. The primary rocks which appear at Mitushev Kameñ are overlaid with thick beds of quartzites and clay-slates containing sulphide of iron, with subordinate layers of talc or mica slate, and thinner beds of fossiliferous limestone, Silurian or Devonian. More recent clay-slates and marls belonging to the middle Jurassic occur in the western coast-region about Matochkin Shar. About 74° N. the crags of the E. coast are composed of grey sandstone, while in 76° Barents's Islands, and possibly a much greater part of the N. coast, show Carboniferous strata. Traces of Eocene deposits have not been discovered on Novaya Zemlya. During the Glacial period its glaciers were much larger than at present, whilst during a later portion of the Quaternary period (to judge by the marine fossils found as high as 300 ft. above the sea) Novaya Zemlya, like the whole of the arctic coast of Russia, was submerged for several hundred feet. At present it appears to partake of the movement of upheaval common to the whole of N. Russia.

Climate.—Novaya Zemlya is colder than Spitsbergen (which lies more to the N.) as in some degree it shares in the continental conditions of northern Russia and Siberia. The middle and northern parts of the W. coast are not so cold as the E. On the W. coast the temperature appears to decrease S. of the Matochkin Shar, being reduced by a cold current from the Kara Sea through Kara Strait. On the other hand, the climate of the northern part of the W. coast is affected by a relatively warm drift from the W. Under this influence there are years when the islands can be circumnavigated without difficulty. In the Matochkin Shar region the snow-line is estimated at about 1800 to 2000 ft. Glaciers are rare S. of 72° N.

Flora and Fauna.—Grass does not grow to any extent except in Goose Land. Elsewhere even the leaved lichens are precarious, though the leather lichens flourish. Of Phanerogams, only the *Dryas octopetala* covers small areas of the débris, interspersed with isolated *Cochlearia*, &c., and, where a layer of thinner clay has been deposited in sheltered places, the surface is covered with saxifrages, &c.; and a carpet of mosses allows the arctic willow (*Salix polaris*) to develop. Where a thin sheet of humus, fertilized by lemmings, has accumulated, a few flowering plants appear, but even so their brilliant flowers spring direct from the soil, concealing the developed leaflets, while their horizontally spread roots grow out of proportion; only the *Salix lanata* rises to 7 or 8 in., sending out roots 1 in. thick and 10 to 12 ft. long. This applies only to the better-known neighbourhoods of Matochkin Shar and Kostin Shar; N. of 74° N. very few species have been found. The phanerogamic flora of Novaya Zemlya and Vaygach numbers about two hundred species. As to the genetic connexions of the Novaya Zemlya flora, it appears, according to M. Kjellmann's researches, to belong to the Asiatic rather than to the European arctic region.

The interior of Novaya Zemlya shows hardly a trace of animal life, save here and there a vagrant bird, a few lemmings, an ice-fox, a brown or white bear, and at times immigrant reindeer. Even insects are few. The sea-coast, however, is occupied by countless birds, which come from the S. for the breeding season, and at certain parts of the sea-coast the rocks are covered with millions of guillemots, while great flocks of ducks of various sorts, geese and swans swarm every summer on the valleys and lakes of the south. Whales, walruses, various seals and dolphins are frequently met with. Only two species of fish are of any importance—the goltzy (*Salmo alpinus*) in the western rivers, and the omul (*Salmo omul*) in the eastern.

The numbers of sea mammals and birds attracted Russian hunters, and even in the 16th century they had extended their huts (*stanovishtcha*) to the extreme N. of the island. Many of them wintered for

[illegible] Russian province of Archangel.

History.—Novaya Zemlya seems to have been known to Novgorod hunters in the 11th century; but its geographical discovery dates from the great movement for the discovery of the N.E. passage. In 1553 Sir Hugh Willoughby sighted what was probably Goose Land; Richard Chancellor penetrated into the White Sea. In 1556 Stephen Borough reached the S. extremity of the island, being the first western European to do so. William Barents touched the island (1594) at Sukhoy Nos (73° 46′), and followed the coast N. to the Orange Islands and S. to the Kostin Shar. Rumours of silver ore having been found induced the Russian government to send out expeditions during the second half of the 18th century. In 1760 Savva Loshkin cruised along the E. coast, spent two winters there, and in the next year, after having reached Cape Begehrte (Begheerte), returned along the W. coast, thus accomplishing the first circumnavigation; but the valuable records of his voyage have been lost. In 1768 the Russian Lieutenant Rozmyslov reached Goose Land and penetrated into the Kara Sea by the Matochkin Shar, where he spent the winter; in the following year he pursued the exploration of the Kara Sea, but was compelled to return and abandon his ship. The first real scientific information about the island is due to the expeditions (1821–1824) of Count Feodor Petrovich Lütke (1797–1882), after whom part of the N. island is named Lütke Land. Nearly all the W. coast as far as Cape Nassau, as well as Matochkin Shar, was mapped, and valuable scientific information obtained. In 1832 Lieutenant Pakhtusov mapped the E. coast as far as Matochkin Shar; and in 1835 Pakhtusov and Tsivolka his pilot, or commander of his second ship, mapped the coast as far as 74° 24′. The next expedition was that of the naturalist Karl von Baer in 1838. A new era of scientific exploration began in 1868, while Norwegian sea-hunters brought in valuable geographical information. In 1870 the Norwegian Captain Johannesen penetrated as far as 79° E., in 76° 13′ N., and afterwards accomplished the second circumnavigation of Novaya Zemlya. These explorations led the way for the famous voyages of Baron Nordenskiöld (1875–1878), which included investigations in Novaya Zemlya. In 1877 the Russian Lieutenant, Tyaghin, attempted to cross the S. island, and in 1878 M. Grinevetskiy succeeded in doing so. Among later expeditions may be mentioned those of C. Nossilov (1887–1892), T. N. Chernychev (1895) who made a crossing of the S. island, H. J. Pearson (1895 and 1897), Lieutenant Borisov (1899 and 1900) and O. Ekstam (1900 and 1903).

See accounts of the expeditions above mentioned, and especially, among earlier works, K. E. von Baer, *Expédition à Novaïa Zemlia et en Lapponie* (St Petersburg, 1838, &c.); and among later works H. J. Pearson, *Beyond Petsora Eastward*, with botanical and geological appendices by H. W. Feilden (London, 1899); also J. Spörer, *Nowaja Semlja* (Gotha, 1867); A. P. Engelhardt, *A Russian Province of the North* (Archangel, of which the author was governor), translated by H. Cooke (London, 1899).

NOVEL (from *novellus*, diminutive of Lat. *novus*, new; through the Italian *novella*), the name given in literature to a study of manners, founded on an observation of contemporary or recent life, in which the characters, the incidents and the intrigue are imaginary, and, therefore, "new" to the reader, but are founded on lines running parallel with those of actual history.

1. With the word *novel* is identified a certain adherence to the normal conditions of experience. A novel is a sustained story which is, indeed, not historically true, but might very easily be so. It is essentially a modern form of literature—that is to say, it makes its appearance when the energy of a people has considerably subsided or has taken purely civic forms, and is ready to contemplate and to criticize pictures drawn from conventional manners. The novel has been made the vehicle for satire, for instruction, for political or religious exhortation, for technical

but his influence on the novel is insignificant. It was half a century later that, in the romantic pastoral of *Astrée*, published in 1610, France may be said to have achieved her first attempt at a novel. This famous book was written by Honoré d'Urfé; in spite of its absurdities it is full of talent, and succeeds, for the first time in the history of French narrative, in depicting individual character. D'Urfé was followed, with less originality, by Marin Le Roy de Gomberville (1600–1674), who was the author of a Mexican romance, *Polexandre*, and by Gombauld (1570?–1666), the author of *Endymion* (1624). These were fictions of interminable adventures, broken by an infinite number of episodes; they seem tedious enough to us nowadays, but with their refinement of language, and their elevation of sentiment, they fascinated readers like Madame de Sévigné. To Gomberville, who has been called the Alexandre Dumas of the 17th century, succeeded Mdlle de Scudéry (1607–1701), who preserved the romantic framework of the novel, but filled it up with modern and familiar figures disguised under ancient names. Her huge *romans à clef*, tiresome as they are, form the necessary stepping-stone between *Astrée*, in which the novel was first conceived, and *La Princesse de Clèves*, where at last it found perfect expression. Meanwhile, the elephantine heroic romances were ridiculed by Charles Sorel in his *Francion* (1622) and *Le Berger extravagant* (1628). Later examples of a realistic reaction against the pompous beauty of Gomberville and Scudéry were the *Roman comique* (1651) of Scarron and *Le Roman bourgeois* (1666) of Furetière.

All these, however, were mere preparations. The earliest novelist of France is Marguerite de la Vergne, comtesse de La Fayette (1634–1693), and the earliest genuine French novels were her *Princesse de Montpensier* (1662), and her far more important *Princesse de Clèves* (1678). Madame de La Fayette was the first writer of prose narrative in Europe who portrayed, as closely to nature as she could, the actual manner and conversations of well-bred people. To show that she was capable of writing in the old style, she published, with the help of Segrais, in 1670, a *Zayde*, which is in the Spanish manner affected by Mdlle de Scudéry. It was long before the peculiar originality of the *Princesse de Clèves* was appreciated. Meanwhile La Fontaine, in 1669, published a fine romance of *Psyché*, partly in verse, and Fénelon, in 1699, his celebrated *Télémaque*. The influence of La Bruyère on the novelists, although he wrote no novels, must not be overlooked. But the *Princesse de Clèves* remained the solitary novel of moral analysis when its author died and the 17th century closed. The successes of Alain René Lesage seemed to be wholly reactionary. His realistic novels, *Gil Blas* and *Le Diable boiteux*, depended upon their comic force, their picaresque vivacity, rather than upon the sober study of average human character. But Marivaux (1688–1763) took up the psychological novel again, and produced in *Marianne* (1731) and *Le Paysan parvenu* (1735) analytical stories of Parisian manners and character which were wholly modern in form. If *Marianne* was deliberate, the exquisite *Manon Lescaut* (1731), by the Abbé Prévost d'Exiles (1697–1763), was almost an accident; but, between them, these simultaneous works started the French novel of the analysis of emotion. The brilliant stories of Voltaire, which began with *Zadig* and included *Candide*, hardly belonged to this category; they are rather satires and diversions, in which class must also be placed the fashionable boudoir novels of Crébillon *fils*, La Morlière and others. But the English taste, exemplified mainly by Richardson, Sterne and Fielding, prevailed, and its effect was seen again in the imperfect novels of Diderot and Rousseau. The *Nouvelle Héloïse* and the *Émile* of the latter are not skilfully constructed as stories, but they mark the starting-point of the novel which aims at familiarising the public mind with great ideas in an attractively romantic form. The moral purpose is equally

1830 that the novel began to be one of the main channels of imaginative writing in France, and the development of this kind of fiction was one of the main features of the romantic revival. Stendhal showed that, without any of the charms of style, and relying exclusively upon minute psychological observation, the record of a human life could be made enthrallingly interesting. Alexandre Dumas, under the direct influence of Sir Walter Scott, allowed his tropic imagination to revel and riot in brilliant chains of adventure. The imaginative novel was admirably conceived by George Sand. But it was Balzac who filled canvas after canvas with the astounding intensity of life itself, and who insisted with irresistible force that the function of the novel is to draw a consistent and unprejudiced picture of humanity under the strain of a succession of probable passions. This has been clearly comprehended by the host of later French novelists, whose record cannot be traced here, to be the function of the novel, as Mme de La Fayette invented it, as Marivaux and Prévôst developed it, and as George Sand and Balzac finally laid down its laws and settled its borders. Certain dates, however, must be recorded in the briefest record of the evolution of the French novel, and 1856 is one of these; in that year Gustave Flaubert published *Madame Bovary*, a work in which the rival realistic and romantic tendencies are combined with a mastery that had not been approached and has not since been equalled. Another is 1871, when Zola began to roll out the enormous canvas of *Les Rougon-Macquart*. Yet another in 1880, when *Boule de suif* first revealed in Maupassant a novelist whose creations were not merely amusing and striking, but absolutely convincing and logical.

5. *English.*—If we take no heed of translations of Latin stories, such as those from the *Gesta Romanorum*, we may say that the beginning of prose fiction in England is *Le Morte d'Arthur*, of Sir Thomas Malory, finished in or about 1470, and printed by Caxton in 1485. The great merits of this writer were that he got rid of the medieval burden of allegory, essayed an interpretation of the human heart, and invented a lucid and vigorous style of narrative. But his book became, as Professor W. Raleigh has said, "the feeder of poetry rather than of prose," and it gave no inkling of the methods of the modern novel. The same may be said of such versions of the Charlemagne Amadis and Palmeria cycles of romances as *Huon of Bordeaux*, published by Lord Berners, perhaps in 1535, and innumerable others. It was the *novella* of Italy from which the English novel first faintly started. Between 1560 and 1580 versions of the Italian novelists became exceedingly popular in England. Paynter in introducing the tales of Bandello and Straparola struck the true novelist's note by offering them not as works of morality or edification, but "instead of a merry companion to shorten the tedious toil of weary ways." The appreciation of these Italian stories led to the composition of the *Euphues* of Lyly (1579), a book of great interest and merit, which has been called "the first original prose novel written in English." This is somewhat to exaggerate, since *Euphues* is rather a work of elegant philosophy than a narrative. Lyly had many imitators, Munday, Greene, Dickenson, Barnabe Rich, Lodge, Nash and others, who formed a school of prose fiction which was not without a certain romantic beauty, but which possessed as little narrative vigour as possible. To compare a story written by Sacchetti in 1385 with one written by Greene in 1585 is to perceive that not merely had no progress been made towards the modern novel, but that a great deal of ground had been lost. The genius of the Elizabethan age lay in the direction of lyrical and dramatic poetry, not of prose fiction. The absence of the comic element in Elizabethan romances is very marked. M. Jusserand has claimed a peculiar merit in this and other respects for the *Jack Wilton* of Nash (1594), which, as he points out, is the earliest English example of picaresque literature. During

the reign of the heroic romances in France, their vogue violently affected the English book-market. The huge stories of Calprenède and Gomberville were imported, and translated and imitated to the exclusion of every other species of prose fiction, between 1645 and 1670. The long-winded books of Mdlle de Scudéry, especially *Cassandra* and *The Great Cyrus*, were read so universally in England as to leave their stamp on the national manners. Of original English romances, written in competition with the French masterpieces of tenderness and chivalry, the *Parthenissa* of Lord Orrery (1654) is the best known. The first definite stand against these Gallicized romances was made by two dramatists, Aphara Behn and William Congreve. Congreve's *Incognita* (1692) is remarkable for its light raillery and humour, and perhaps deserves as well as any 17th-century composition to be called the earliest novel in English. The stories of Mrs Behn have the merit of a romantic simplicity of narrative, but they are dull and devoid of art. But the novel still lingered, unwilling to make its appearance in England, and its place was taken during the age of Anne by the labours of the essayists. So rich is the character painting, so lively the touches of social colour in the *Spectator* and *Tatler*, that these periodicals have, by enthusiastic critics, been styled brilliant examples of prose fiction. But it is obvious that in the delightful essays of Addison and Steele there was no attempt made at construction, that the sustained evolution of characters was not essayed, and that even in the studies of Mr Bickerstaff's Club anything like a plot was studiously avoided. Yet these are all essential characteristics of the novel, and until they make their appearance in English literature we must not say that the secret has been discovered. Very near to the mystery, if he did not quite grasp it, was Daniel Defoe, who introduced into his narrative a minute and rude system of realistic observation, by way of giving an impression of truth to it. This exactitude he combined with a survival of the old picaresque method, the result being those strange and entertaining works *Colonel Jack* (1722) and *Roxana* (1724). Still closer he came to positive success in the immortal narrative of *Robinson Crusoe*, in which the fascination of the desolate island was first worked up in English.

6. Not even yet had the English novel been invented. It came into the world in 1740 from the unconscious hands of Samuel Richardson (1689–1761), who had hit upon the notion that morality might be helped and young persons of inexperience protected by the preparation of a set of letters exchanged between imaginary persons. The result was *Pamela: or Virtue Rewarded*, a book which is in every strict sense the earliest English novel. It has even a claim to be considered the earliest European novel of the modern kind, for the assumption of French criticism that Richardson borrowed his ideas and his characters from the *Marianne* of Marivaux is not supported by evidence. There is no reason to suppose that Richardson met with the name of Marivaux earlier than 1749. At all events, it would seem to be certain that, whether in France or England, the fourth decade of the 18th century saw the spontaneous conception of this "new species of writing." The name of the heroine of Richardson's book was Miss Pamela Andrews, and the second English novel was Fielding's *Joseph Andrews* (1742), which started as a mere burlesque of *Pamela*, but proceeded upon admirably original lines of its own, in a study of the humours and manners of contemporary country life. Fielding rejected the epistolary artifice of Richardson, and told his story in a straightforward narrative, broken indeed by arguments and ejaculations which bound the new novel to the old essay of the *Spectator* type. The creative force of Fielding filled the pages of this book with a crowd of vividly-presented characters, and this marked a step in advance, for Richardson's practice was to concentrate minute attention upon only one or two figures. It was from Richardson that the next important fiction came, in the shape of the long-drawn tragedy of *Clarissa* (1748). But a third great novelist was now at work; in 1748 appeared the *Roderick Random* of Smollett, and here we have neither the sculptural manner of Richardson nor the busy world of Fielding's realism, but a comic impression founded on an artful employment of emphasis and exaggeration. Smollett gives us neither breathing statues nor a crowd of men and women, but a gallery of "freaks," arranged with great art, indeed, but exhibited in such a way as to expose not their likeness but their unlikeness to the common stock of humanity. It is very important to note this curious divergency between the three great writers, because they exemplified the three classes into which almost all subsequent novels can with more or less ease be divided. The next move was made by Fielding, who in 1749 published his *Tom Jones*. Starting with the pungent horror of hypocrisy ever before him, Fielding constructs a fragment of the world in which men and women are seen, without exaggeration, plying their daily trades under the eye of an impartial observer who can penetrate to their secret motives. This was a great advance, and a still greater one was the sustained skill with which the author conducted the plot, the interwoven series of the actions of his characters. It may almost be said that until the publication of *Tom Jones* no novel with a real plot had been conceived in English. The rivalry of the great novelists of this time was of signal help to them, and there can be no question that the astounding richness of *Tom Jones* stirred Smollett to the exercise of increased energy in *Peregrine Pickle* (1751), a coarse and savage book, illuminated by brilliant flashes of humour. A better, because a tenderer and truer study of life was *Amelia*, which Fielding published in the same year; yet most readers have found this novel a little languid after *Tom Jones*. But if the ideal of life depicted in it was quieter and sadder, it was perhaps for that very reason more in harmony with the facts of life. Now Richardson, who had long been silent, reasserted his mastery of epistolary analysis in the huge *History of Sir Charles Grandison* (1753), in which, as its admirers claimed, "all the recesses of the human heart are explored and its whole texture unfolded." Richardson had scarcely been affected by the experiments of his contemporaries, of the very nature of which he affected to be ignorant, and the result is that in his third and last novel he depends entirely on qualities which he had already developed, and owes nothing to the discoveries of others.

7. With this book, the first great group of English novels comes to a close, and we may observe that in these eight stories everything is to be found, in germ if not in full evolution, which was during the next century and a half to make the abundant out-put of the English novel prominent. New forms, above all new subjects, were to present themselves to the imagination of capable British novelists, but the starting-point of every experiment was to be discovered in the ripest work of Richardson, Fielding and Smollett. Their influence was manifest in the writings of the second school of English novelists, in whom, however, several interesting varieties of subject and treatment were discovered. The *Tristram Shandy* (1759–1766) of Sterne, is the most masterly example in English of a humour which goes direct to pathos for its most "sentimental" effects, and of the kind of loosely-strung, reflective fiction which is hardly a narrative at all. Neither *Tristram Shandy* nor *A Sentimental Journey* (1768) can properly be included among novels. In *Rasselas* (1759) Dr Johnson showed that the new kind of writing could be used to give entertainment to a sermon and in this he was to have a multitude of followers. In *Chrysal* (1760) Charles Johnstone (d. 1800) showed that the picaresque romance could still exist, tinctured by the newly-found art of the novelist. In *The Castle of Otranto* (1764) Horace Walpole adapted the methods of the novelist to a pseudo-historical theme of horror and romance and prophesied of Walter Scott. In *The Vicar of Wakefield* (1766) Goldsmith was indebted to most of his immediate predecessors, but fused their qualities in an amalgam of gentle wit and delicate sweetness and conversational brevity which has made his one loosely-constructed novel a foremost classic of our literature. Thus, in the one quarter of a century which divides *Pamela* from *The Vicar of Wakefield*, English novel-writing was born, grew into full maturity, and adopted its adult and final forms.

8. During the remainder of the 18th century, little or nothing was done to extend the range of prose fiction in England, but one or two of those departments of novel-writing which had already

Burney (1778). These two typical books are composed on the same plan, yet essentially a whole age lies between the former and the latter. What has been called "the novel of the tea-table" now came into existence, and the 18th century was about to close in mediocrity, when its credit was partially saved by a development of Horace Walpole's romance of terror in the vigorous and sensational narratives of Anne Radcliffe (1764–1823), whose *Mysteries of Udolpho* appeared in 1794. The same year saw the publication of *Caleb Williams*, in which William Godwin (1756–1836) evolved a tragic theory of politics. A finer study than either of the works just mentioned, although not truly a novel, was the gorgeous and sinister *Vathek* (1786) of William Beckford, an oriental tale of horror. In all these books there existed an element of grotesque mingled with romantic colour, which announced the coming revival.

9. The two schools here indicated, and they may be roughly defined as the school of the Tea-Table and the school of the Skeleton-in-the-Cupboard, did not, however, betray their real significance until the second decade of the 19th century, when after several unimportant efforts, they developed into the novel of psychological satire and the romance of historical imagination. Two writers, the greatest who had yet attempted to address English readers through prose fiction, almost simultaneously came forward as the protagonists in these two spheres of work. Jane Austen published *Sense and Sensibility* in 1811, Walter Scott *Waverley* in 1814. These were epoch-making dates; in each case a new era opened for the countless readers of novels. The first-named writer, all exactitude, conscience and literary art, worked away at her "little bit (two inches wide) of ivory"; the other, with bold and flowing brush, covered vast spaces with his stimulating and noble compositions. It is, however, to be noted that the isolation in which we now regard these great writers— a *solitude à deux* only broken in measure by the presence of Miss Maria Edgeworth—is an optical delusion due to the veils of distance. The bookshops from 1810 to 1820 and onwards were thronged and glutted with novels, many of them infinitely more successful, as far as sales were concerned, than the most popular of Miss Austen's works. The novels of Miss Austen were written between 1796 and 1810, although published from 1811 to 1818; those of Sir Walter Scott date from 1814 (*Waverley*) to 1829 (*Anne of Geierstein*). Practically speaking, no additions were made to the formula of the social novel or of the historical romance, to the study of national manners, that is to say, from the satirical or from the picturesque point of view, until a quarter of a century later.

10. The next artist in prose fiction whose force of invention was sufficient to start the novel on wholly fresh tracks was born forty years later than Scott. This was Charles Dickens, whose *Pickwick Papers* (1836) marks another epoch in novel writing. His career of prodigal production ceased abruptly in 1870, by which time it had long been obvious that he was the pioneer of a great and diverse school of novelists, all born within the second decade of the century. Of these Thackeray was not really made obvious until *Vanity Fair* (1849), nor Charlotte Brontë till *Jane Eyre* (1847), nor Mrs Gaskell till *Mary Barton* (1848), nor George Eliot till *Adam Bede* (1859). The most noticeable point on which the five illustrious novelists of the Early Victorian age resembled one another and differed from all their predecessors, was the sociological or even humanitarian character of their writings. All of them had projects of moral or social reform close at heart, all desired to mend the existing scheme of things. In several of them, particularly in Dickens and Miss Brontë, the element of insubordination is extremely marked; it is present in them all; and a determination not to be content to see life beautifully, through coloured glasses, or to be content with a sarcastic travesty of it, but to realize in detail its elements of pain and injustice. The novel, which had already learned to Thomas Hardy and Robert Louis Stevenson represent, in their least challenged form, different movements in novel-writing during the second half of the 19th century; we must be content here to refer for particulars concerning them to the separate biographical articles.

11. *Spain.*—Prose narrative in Spain practically begins in the 15th century with chronicles and romances of chivalry, tempered occasionally and faintly by some knowledge of what had been attempted in Italy by Boccaccio. The Spanish version of *Amadis de Gaula*, in which the romance of knight errantry culminated, belongs to 1508; the lost original is supposed to have been Portuguese. This was the only book of its class which is saved from the burning in *Don Quixote*; it was followed by *Palmerin of England*. These interminable books, and a hundred worse than they, occupied the leisure of 16th-century readers of both sexes. Without approaching the form of novels, they prepared the ground for novel-reading. The exploration of America led to the composition of monstrous tales of the New World, which generally took the form of continuations of *Amadis*. A new thing was begun in 1554, when the anonymous picaresque romance of *Lazarillo de Tormes* started the story of fantastic modern adventure; this highly entertaining book has been called the 16th-century *Pickwick*, and Mr Fitzmaurice-Kelly remarks that it "fixed for ever the type of the comic prose epic." The pastoral romance, in the hands of Jorge de Montemór (d. 1561), who wrote an insipid *Diana* which was popular for a while throughout Europe, took readers a step backward, away from the ultimate path of the novel. It is of interest to us, however, to note that it was in one of these "vain imaginings," in his pastoral romance of *Galatea*, that Cervantes approached the field of fiction, in 1585. Few of his peculiar merits are to be found in this early work; he turned for the present to the composition of plays. It was not until 1604 that he returned to prose fiction by printing his immortal *Don Quixote*, which made an epoch in the history of the novel. This book was originally intended to ridicule the already fading passion for the romances of chivalry, but it proceeded much further than that, and there is hardly any branch of fiction which may not be traced back to the splendid initiation of some chapter of *Don Quixote*. In 1613 Cervantes published his twelve *Exemplary Novels*; these are not so well known as the great romance, and they owed not a little of their form to Italian sources, but they are very brilliant. One of the best anonymous Spanish stories of the period, *The Mock Aunt*, is a type of excellence in facetious narrative of the sarcastic class; this is now commonly attributed to Cervantes himself. No other novelist of Spain has moulded the thought of Europe, but the heroic romance which occupied so much of the attention of France in the 17th century was invented by a little-known Spanish soldier, Pérez de Hita, who, about 1600, wrote fantastic stories about Granada and the Moors. The farcical romance of *Fray Gerundio de Campazas*, 1758, by J. F. de Isla (1703–1718), competed in popularity with *Gil Blas*. Speaking broadly, however, Spain made no appreciable progress in novel-writing from the days of Cervantes to those of Walter Scott, when the *Waverley Novels* began to find such artless imitators as Martinez de la Rosa and Zorrilla. But the first original novelist of Spain was Cecilia Böhl de Faber (Fernán Caballero) (1796–1877), whose *La Gaviota*, 1848, a study of life in an Andalusian village, was the earliest Spanish novel, in the modern sense. She was followed by Valera (1824–1904), by Alarcón (1833–1891), by Pereda (b. 1834), by Perez Galdós (b. 1845) and by Palacio Valdés (b. 1853), in whom the tendencies of recent European fiction have been competently illustrated without any striking contributions to originality.

12. *Germany.*—The cultivation of the novel in its proper sense began late in Germany. It is usual to consider that H. J. C. von Grimmelshausen (1625?–1675) is the earliest German novelist;

a novel. Early in the 18th century, an extraordinary number of imitations of Defoe's great romance were published in Germany, and these are known to scholars as the *Robinsonaden*. Later on, Wieland imitated *Don Quixote*, but the earliest German novel which possesses original value is the celebrated work of Goethe, *The Sorrows of Young Werther* (1774). The still more celebrated *Wilhelm Meister* did not appear until 1796. A third novel, *Elective Affinities*, was published by Goethe in 1809. Meanwhile, a very characteristic group of picturesque stories had been issued by Johann Paul Richter (Jean Paul) (1763–1825), destined to have a wide influence upon romantic literature throughout Europe. Purely romantic were the stories of Tieck, of Brentano, of Arnim, of Fouqué, of Kleist, of Immermann. The German novelists of this period wrote like poets, deprived of the discipline of verse. In later times novels of high merit have been written by Gustav Freytag, Wilibald Alexis (1798–1871), called the German Walter Scott, Laube, Fontane, Ebers, Jeremias Gotthelf, Berthold Auerbach, Spielhagen, Heyse and many others, but the 19th century produced no German novelist of commanding originality.

13. *Russia.*—In Russia alone, among the countries of central and eastern Europe, the novel has developed with a radical originality. Until the second quarter of the 19th century the prose fiction of Russia was confined to imitators of Sir Walter Scott, but about the year 1834 Gogol (1809–1852) began to revolt against the historico-romantic school and to produce stories in which an almost savage realism was curiously blended with the Slavonic dreaminess and melancholy. Since then the Russian novel has consistently been the novel of resignation and pity, but wholly divorced from sentimentality. Gogol was succeeded by Gontcharor, Tourgéniev, Dostoïevski, Pissemski 1820–1881) and Tolstoi, forming the most consistent and, doubtless, the most powerful school of novelists which Europe saw in the 19th century. The influence of these writers on the rest of the world was immense, and even in England, where it was least acutely felt, it was significant. That the Russians have indicated the path to new fields in the somewhat outworn province of novel-writing is abundantly manifest.

14. *Oriental.*—In a primitive form, the novel has long been cultivated in Asia. It was introduced into China, but whence is unknown, in the 13th century, and Le Kuan-chung was the first Chinese novelist. The productions of this writer and of his followers are tales of bloody warfare, or record the adventures of travellers. The novel called *The Twice-Flowering Plum-Trees*, belonging to the 16th (or 17th) century, is a typical example of the moral Chinese novel, written with a virtuous purpose. Professor Giles holds that the novel of China reached its highest point of development in *The Dream of the Red Chamber*, an anonymous story of the end of the 17th century; this is a panorama of Chinese social life, "worked out with a completeness worthy of Fielding." Prose stories began to be met with in the literature of Japan early in the 10th century. But the inventor of the Japanese novel was a woman of genius, Murasaki no Shikibu, whose *Genji Monogatari* has been compared to the writings of Richardson; it was finished in 1004 and may, therefore, be considered the oldest novel in the world. This book, which is one of the great classics of Japan, was widely imitated. After the classic period novel-writing was long neglected in Japan, but the humours of 17th-century life were successfully translated into popular fiction by Saikaku (1641–1693), and later by Jisho and Kiseki, who collaborated in a great number of remarkable stories.

Pellissier, *Le Mouvement littéraire au*

NOVELDA, a town of E. Spain, in the province of Alicante; on the right bank of the river Vinalopó, and on the railway from Madrid to Alicante. Pop. (1900) 11,388. The country around is flat and fertile, producing much wine, dates, oranges, oil, saffron and aniseed. In the town there are tanneries, and manufactures of alcohol, chocolate and soap. The women make fine lace. In the neighbouring village of Salinetas de Elda there are warm sulphur and saline baths.

NOVELLI, ERMETE (1851–), Italian actor and playwright, was born in Lucca on the 5th of March 1851, the son of a prompter. He made his first appearance in 1866, and played character and leading comedy parts in the best companies between 1871 and 1884. By 1885 he had his own company, and made a great success in Paris in 1898 and 1902. He established in Rome in 1900 a new theatre, the Casa di Goldoni, on the lines of the Comédie Française. He dramatized Gaboriau's *Monsieur Lecoq*, and alone or in collaboration wrote several comedies and many monologues.

NOVELLO, VINCENT (1781–1861), English musician, son of an Italian who married an English wife, was born in London on the 6th of September 1781. As a boy he was a chorister at the Sardinian chapel in Duke Street, Lincoln's Inn Fields, where he learnt the organ; and from 1796 to 1822 he became in succession organist of the Sardinian, Spanish (in Manchester Square) and Portuguese (in South Street, Grosvenor Square) chapels, and from 1840 to 1843 of St Mary's chapel, Moorfields. He was an original member of the Philharmonic Society, of the Classical Harmonists and of the Choral Harmonists, officiating frequently as conductor. In 1849 he went to live at Nice, where he died on the 9th of August 1861. He composed an immense quantity of sacred music, much of which is still deservedly popular; but his great work lay in the introduction to England of unknown compositions by the great masters. The Masses of Haydn and Mozart were absolutely unknown in England until he edited them, as were also the works of Palestrina, the treasures of the Fitzwilliam Museum, and innumerable great compositions now well known to every one. His first work, a collection of *Sacred Music, as performed at the Royal Portuguese Chapel*, which appeared in 1811, has the additional interest of giving a date to the practical founding of the publishing firm with which his name is associated, as Novello issued it from his own house; and he did the same with succeeding works, till his son JOSEPH ALFRED NOVELLO (1810–1896), who had started as a bass singer, became a regular music publisher in 1829. It was the latter who really created the business, and who has the credit of introducing cheap music, and departing from the method of publishing by subscription. From 1841 Henry Littleton assisted him, becoming a partner in 1861, when the firm became Novello & Co., and, on J. A. Novello's retirement in 1866, sole proprietor. Having incorporated the firm of Ewer & Co. in 1867, the title was changed to Novello, Ewer & Co., and still later back to Novello & Co., and, on Henry Littleton's death in 1888, his two sons carried on the business.

Vincent Novello had several other children besides his son Joseph Alfred. Four of his daughters (of whom the youngest, Mary, married Charles Cowden Clarke) were gifted singers: but the most famous was CLARA NOVELLO (1818–1908), whose beautiful high soprano and pure style made her one of the greatest vocalists, alike in opera, oratorio and on the concert stage, from 1833 onwards. In 1843 she married Count Gigliucci, but after a few years returned to her profession, and only retired in 1860. Charles Lamb wrote a poem (*To Clara N.*) in her praise.

NOVEMBER (Lat. *novem*, nine), the ninth month of the old Roman year, which began with March. By the Julian arrangement, according to which the year began with the 1st of January, November became the eleventh month and had thirty days assigned to it. The 11th of November was held to mark the

do, Conscript Fathers, if you have *thirteen* Caesars?" The Anglo-Saxon names for November were *Windmonath*, "windmonth" and *Blodmonath* "bloodmonth." In the calendar of the first French republic November reappeared partly as Brumaire and partly as Frimaire. The principal November festivals in the calendar of the Roman Church are: All Saints' Day on the 1st, All Souls' on the 2nd, St Martin's on the 11th, the Presentation of the Virgin on the 21st, St Cecilia's on the 22nd, St Catherine's on the 25th and St Andrew's on the 30th. St Hubert commemorated on the 3rd. In the English calendar All Saints' and St Andrew's are the only feasts retained.

NOVERRE, JEAN GEORGES (1727–1810), French dancer and ballet master, was born in Paris on the 29th of March 1727. He first performed at Fontainebleau in 1743, and in 1747 composed his first ballet for the Opéra Comique. In 1748 he was invited by Prince Henry of Prussia to Berlin, but a year later he returned to Paris, where he mounted the ballets of Glück and Piccini. In 1755 he was invited by Garrick to London, where he remained two years. Between 1758 and 1760 he produced several ballets at Lyons, and published his *Lettres sur la danse et les ballets*. From this period may be dated the revolution in the art of the ballet for which Noverre was responsible. (See PANTOMIME and BALLET.) He was next engaged by the duke of Württemburg, and afterwards by the empress Maria Theresa, until, in 1775, he was appointed, at the request of Queen Marie Antoinette, *maître des ballets* of the Paris Opera. This post he retained until the Revolution reduced him to poverty. He died at St Germain on the 19th of November 1810. Noverre's friends included Voltaire, Frederick the Great and David Garrick (who called him "the Shakespeare of the dance"). The ballets of which he was most proud were his *La Toilette de Vénus*, *Les Jalousies du sérail*, *L'Amour corsaire* and *Le Jaloux sans rival*. Besides the letters, Noverre wrote *Observations sur la construction d'une nouvelle salle de l'Opéra* (1781); *Lettres sur Garrick écrites à Voltaire* (1801); and *Lettre à un artiste sur les fêtes publiques* (1801).

NOVGOROD, a government of N.W. Russia, bounded W. and N. by the governments of St Petersburg and Olonets, S.E. by Vologda, Yaroslav and Tver, and S.W. by Pskov, stretching from S.W. to N.E. 450 m. Area, 47,223 sq. m. Pop. (1906) 1,555,700. The S. is occupied by the Valdai plateau, in which are the highest elevations of middle Russia (600 to over 1000 ft.), as well as the sources of nearly all the great rivers of the country. The plateau is deeply furrowed by valleys with abrupt slopes, and descends rapidly towards the basin of Lake Ilmen in the W. (only 60 ft. above the sea-level). The N.E. of the government belongs to the lacustrine region of N.W. Russia. This tract is dotted over with innumerable sheets of water, of which Byelo-ozero (White Lake) and Vozhe are the largest of more than 3000. Immense marshes, overgrown with thin forests of birch and elm, occupy more than one-seventh of the entire area of the government; several of them have an area of 300 to 450 sq. m. each. They admit of being crossed only when frozen. Six centuries ago they were even less accessible, but the slow upheaval of N.W. Russia, going on at the rate of 3 or more feet per century, has exercised a powerful influence upon the drainage of the country. Of recent years artificial drainage has been carried out on a large scale. The forests still occupy 55% of the total area of the government.

Geologically, Novgorod exhibits in the W. vast beds of Devonian limestones and sandstones; these are elsewhere overlaid with Carboniferous limestone, dolomite, sandstones and marls. The Devonian gives rise to salt-springs, especially at Staraya Russa (S. of Lake Ilmen), and contains iron-ores, while the more recent formation has coal strata of inferior quality. The whole is covered with a thick sheet of boulder-clay, very often arranged in ridges or *eskers*, the bottom moraine of the N. European ice-sheet of the Glacial period. Numerous remains of the neolithic Stone Age are found, especially round the extinct lakes. The Baltic and Caspian Sea basins are connected by the Mariinsk, Tikhvin and Vyshniy-Volochok canals, while the Alexander-von-Württemberg canal connects the tributaries of the White Sea with those of the Baltic. The chief river is the Volkhov, which flows from Lake Ilmen into Lake Ladoga.

The yearly average temperature at Novgorod is only 40° Fahr. (14·5° in January, 62·5° in July). The severe climate, the marshy or stony soil, and the want of grazing grounds render agriculture unprofitable, though it is carried on everywhere. The yield of rye and other cereals is insufficient for the wants of the inhabitants. Fireclay, coal and turf are extracted in commercial quantities. Building, smith-work, fishing, shipbuilding, distilleries, glass and match factories, sawmills and a variety of domestic industries give occupation to about 40,000 families. Hunting is still profitable. But most of the inhabitants are dependent on the river-boat traffic; and nearly one-fourth of the able-bodied males are annually driven to other parts of Russia in search of work. The Novgorod carpenters and masons have long been renowned. Trade is chiefly in grain and timber, and in manufactures and grocery wares from St Petersburg. The fairs are numerous, and several of them (Kirilovsk monastery, Staraya Russa and Cherepovets) show considerable returns.

The inhabitants are almost exclusively Great-Russians, but they are discriminated by some historians from the Great-Russians of the basin of the Oka, as showing remote affinities with the Little-Russians. They belong mostly (96½%) to the Orthodox Greek Church, but there are many Nonconformists. There are 10,000 Karelians and 9000 Chudes, with some Jews and some Germans. Novgorod is well provided with educational institutions, and primary education is widely diffused in the villages. (P. A. K.; J. T. Bz.)

NOVGOROD (formerly known as *Velikiy-Novgorod*, Great Novgorod), a town of Russia, capital of the government of the same name, and the seat of an archbishop of the Orthodox Greek Church, situated 119 m. by rail S. of St. Petersburg, on the low flat banks of the Volkhov, 2 m. below the point where it issues from Lake Ilmen. Pop. (1900) 26,972. The present town is but a poor survival of the wealthy city of medieval times. It consists of a kremlin (old fortress), and of the city, which stands on both banks of the river, connected by a handsome stone bridge. The kremlin was much enlarged in 1044, and again in 1116. Its stone walls, originally palisades, were begun in 1302, and much extended in 1490. Formerly a great number of churches and shops, with wide squares, stood within the enclosure. Its historical monuments include the cathedral of St Sophia, built in 1045–1052 by architects from Constantinople to take the place of the original wooden structure (989), destroyed by fire in that year. Some minor changes were made in 1688 and 1692, but otherwise (notwithstanding several fires) the building remained unaltered until its restoration in 1893–1900. It contains many highly-prized relics, including bronze doors of the 12th century, one brought reputedly from Sigtuna, the ancient capital of Sweden. Another ancient building in the kremlin is the Yaroslav Tower, in the square where the Novgorod *vyeche* (common council) used to meet; it still bears the name of "the court of Yaroslav"; and was the chancellery of the secretaries of the *vyeche*. Other remarkable monuments of ancient Russian architecture are the church of St. Nicholas erected in 1135, the Snamenski cathedral of the 14th century, and churches of the 14th and 15th centuries. Within the town itself there are four monasteries and convents, two of them dating from the 11th century and two from the 12th century; and the large number in the immediate neighbourhood shows the great extent which the city formerly had. A monument to commemorate the thousandth anniversary of the foundation of Russia (the calling in of the Varangians by Novgorod in 862) was erected in 1862. Another monument commemorates the repulse of the Napoleonic invasion of 1812.

The date at which the Slavs first erected forts on the Volkhov (where it leaves Lake Ilmen and where it flows into Lake Ladoga) is unknown. That situated on a low terrace close by Lake Ilmen was soon abandoned, and Novgorod or "New-town"

(in contradistinction to the Scandinavian Aldegjeborg or Ladoga) was founded by Scandinavian sea-rovers as Holmgård on another terrace which extended a mile lower on both banks of the river. The older fort (Gorodishche) still existed in the 13th century. Even in the 9th century the new city on the Volkhov exercised a kind of supremacy over the other towns of the lake region, when its inhabitants in 862 invited the Varangians, under the leadership of Rurik, to the defence of the Russian towns of the north. Down to the end of the 10th century Novgorod was in some sort depended on Kiev; yet in 997 its inhabitants obtained from their own prince Yaroslav a charter which granted them self-government. For five centuries this charter was the bulwark of the independence of Novgorod. From the end of the 10th century the princes of Novgorod, chosen either from the sons of the great princes of Kiev (until 1136) or from some other branch of the family of Rurik, were always elected by the *vyeche*; but they were only its military defenders, and their delegates were merely assessors in the courts which levied taxes for the military force raised by the prince. The *vyeche* invariably expelled the princes as soon as they provoked discontent. Their election was often a subject of dispute between the wealthier merchants and landowners and the poorer classes; and Novgorod, which was dependent for its corn supply upon the land of Suzdal, was sometimes compelled to accept a prince from the Suzdal branch instead of from that of Kiev. After 1270 the city often refused to have princes at all, and the elected mayor was the representative of the executive. Novgorod in its transactions with other cities took the name of "Sovereign Great Novgorod" (*Gospodin Velikiy Novgorod*). The supreme power was in the hands of the *vyeche*. The city, which had a population of more than 80,000, was divided into wards, and each ward constituted a distinct commune. The wards were subdivided into streets, which corresponded to the prevailing occupations of their inhabitants, each of these again being quite independent with regard to its own affairs.

Trade was carried on by corporations. By the Volkhov and the Neva, Novgorod—then known also as Naugart and Novwerden—had direct communication with the Hanseatic and Scandinavian cities, especially with Visby or Wisby on the island of Gotland. The Dnieper brought it into connexion with the Bosporus, and it was intermediary in the trade of Constantinople with northern Europe. The Novgorod traders penetrated at an early date to the shores of the White Sea, hunted on Novaya Zemlya in the 11th century, colonized the basins of the northern Dvina, descended the Volga, and as early as the 14th century extended their trading expeditions beyond the Urals into Siberia. Two great colonies, Vyatka and Vologda, organized on the same republican principles as the metropolis, favoured the further colonization of N.E. Russia.

At the same time a number of flourishing minor towns such as Novyi Torg (Torzhok), Novaya Ladoga, Pskov, and many others arose in the lake region. Pskov soon became quite independent, and had a history of its own; the others enjoyed a large measure of independence, still figuring, however, as subordinate towns in all circumstances which necessitated common action. It is said that the population of Novgorod in the 14th century reached 400,000, and that the pestilences of 1467, 1508 and 1533 carried off no fewer than 134,000 persons. These figures, however, seem to relate rather to the whole Ilmen region.

Novgorod's struggle against the Suzdal region (now the government of Vladimir) began as early as the 12th century. In the following century it had to contend with the Swedes and the Germans, who were animated not only by the desire of territorial acquisition, but also by the spirit of religious proselytism. The advances of both were checked by battles at Ladoga and Pskov in 1240 and 1242 respectively. Protected by its marshes, Novgorod escaped the Mongol invasion of 1240–42, and was able to repel the attacks of the princes of Moscow by whom the Mongols were supported. It also successfully resisted the attacks of Tver, and aided Moscow in its struggle against this powerful neighbour; but soon the ambition of the growing Moscow state was turned against itself. The first serious invasion, in 1332, was rolled back with the aid of the Lithuanians. But in 1456 the great prince of Moscow succeeded in imposing a heavy tribute. Ivan III. of Moscow took possession of the colonies in the northern Dvina and the Perm regions, and began two bloody wars, during which Novgorod fought for its liberty under the leadership of Martha Boretskaya, the mayor. In 1475–1478 Ivan III. entered Novgorod, abolished its charters, and carried away 1000 of the wealthier families, substituting for them families from Moscow; the old free city then recognized his sovereignty. A century later Ivan IV. (the Terrible) abolished the last vestiges of the independence of the city. Having learned that a party favourable to Lithuania had been organized in Novgorod, he took the field in 1570, and entered the city (much weakened by the recent pestilences) without opposition. His followers killed the heads of the monasteries, the wealthier of the merchants and clergy, and burned and pillaged the city and villages. No fewer than 15,000 men, women and children were massacred at Novgorod alone (60,000 according to some authorities). A famine ensued, and the district of Novgorod fell into utter desolation. Thousands of families were transported to Moscow, Nizhniy-Novgorod, and other towns of the principality of Moscow. In the beginning of the 17th century Novgorod was taken and held for seven years by the Swedes; and in the 18th century the foundation of St Petersburg ultimately destroyed its trade. Its position, however, on the water highway from the Volga to St Petersburg and on the trunk road from Moscow to the capital, still gave it some commercial importance; but even this was destroyed by the opening of the Vishera canal, connecting the Msta with the Volkhov below the city, and by the construction of the railway from St Petersburg to Moscow, which passes 46 m. to the east of Novgorod. (P. A. K.; J. T. Bz).

NOVIBAZAR, Novi-Bazar, or Novipazar (ancient Rassia, Rascia, or Rashka, Turkish Yenipazar, *i.e.* "New Market"), a sanjak of European Turkey, in the vilayet of Kossovo. Pop. (1905) about 170,000. Novibazar is a mountainous region, watered by the Lim, which flows north into Bosnia, and by several small tributaries of the Servian Ibar. About three-fourths of the inhabitants are Christian Serbs, and the remainder are chiefly Moslem Albanians, with a few gipsies, Turkish officials and about 3000 Austro-Hungarian soldiers. The local trade is mainly agricultural. The sanjak is of great strategic importance, for it is the N.W. part of the Turkish empire, on the direct route between Bosnia and Salonica, and forms a wedge of Turkish territory between Servia and Montenegro. The union of these powers, combined with the annexation of Novibazar, would have impeded the extension of Austrian influence towards Salonica. But by the treaty of Berlin (1878) Austria-Hungary was empowered to garrison the towns of Byelopolye, Priyepolye, Plevlye and other strategic points within the sanjak, although the entire civil administration remained in Turkish hands. This decision was enforced in 1879. The chief approaches from Servia and Montenegro have also been strongly fortified by the Turks.

Novibazar, the capital of the sanjak, is a town of about 12,000 inhabitants, on the site of the ancient Servian city of Rassia. Near it there are Roman baths, and the old church of St Peter and St. Paul, the metropolitan church of the bishopric of Rassia, in which Stephen Nemanya, king of Servia, passed from the Roman to the Greek Church in 1143.

NOVICE (through French from Lat. *novicius* or *novitius*, one who has newly arrived, *novus*, new), a person who joins a religious order on probation. He or she is subject to the authority of the superior, wears the dress of the order, and obeys the rules. At the end of the "novitiate," which must last at least one year, the novice is free to leave without taking the vows, and the order is free to refuse to allow him or her to take them. The word was early used of a beginner in any art or science, hence an inexperienced person.

NOVI LIGURE, a town of Piedmont, Italy, in the province of Alessandria, from which it is 14 m. S.E. by rail, situated among wooded hills, 646 ft. above sea-level. Pop. (1901) 17,868. It was the scene of a victory by the Austrians and Russians under

government of Erivan, 35 m. E.N.E. of the town of Erivan, and 4 m. W. of Gok-chai Lake, 5870 ft. above the sea. Pop. 8507 in 1897, mainly Armenians. An Armenian village which stood here was destroyed by Nadir Shah of Persia in 1736, and it was not till the Turkish War of 1828–29 that the site was again occupied by Armenian refugees from the Turkish town of Bayazet or Bayazid.

NOVOCHERKASSK, a town of Russia, capital of the Don Cossacks territory, situated on a hill 400 ft. above the plain, at the confluence of the Don with the Aksai, 45 m. from the Sea of Azov, and 32 m. by rail N.E. from Rostov. Pop. (1897) 52,005. It was founded in 1805, when the inhabitants of the Cherkassk *stanitsa* (now Old Cherkassk) were compelled to leave their abodes on the banks of the Don on account of the frequent inundations. The town is an archiepiscopal see of the Orthodox Greek Church, and possesses a cathedral (1904), a museum, the palace of the *ataman* (chief) of the Cossacks, and monuments to M. I. Platov (a Cossack chief) and T. Yermak (1904), the conqueror of West Siberia. Wide suburbs extend to the S.W., and the right bank of the Aksai is dotted with the villas of the Cossack officials. Manufactures make slow progress. An active trade is carried on in corn, wine and timber (exports), and manufactures and grocery wares (imports).

NOVOGEORGIEVSK. (1) A town of Russia, usually known under the name of KRYLOV, in the government of Kherson, at the confluence of the Tyasmin with the Dnieper, 17 m. W.N.W. of Kremenchug. Its fort was erected by the Poles in 1615. The inhabitants carry on a lively trade in timber, grain and cattle, and have a few flourmills and candle-works. Pop. (1897) 11,214. (2) A first-class fortress of Russian Poland (called Modlin till 1831), at the confluence of the Narev (Bug) with the Vistula, 23 m. by rail N.W. of Warsaw. Modlin was first fortified under the Napoleonic régime in 1807, and in the wars of 1813 and 1830–31 underwent several sieges. Since that time the Russians have made many additions to the works, and the place now forms, with Warsaw, Ivangorod and Brest-Litovsk, the so-called Polish Quadrilateral. The strength of Novogeorgievsk lies mainly in the new circle of eight powerful forts, erected at a mean distance of 10 m. from the enceinte. The importance of the fortress lies in the fact that it prevents Warsaw from being turned by a force on the lower Vistula and commands the railway between Danzig and Warsaw.

NOVOMOSKOVSK, a town of Russia, in the government of Ekaterinoslav, 16 m. N.E. of the town of Ekaterinoslav. Including several villages which have been incorporated with it, it extends for nearly 7 m. along the right bank of the Samara, a tributary of the Dnieper. In the 17th century the site was occupied by several villages of Zaporogian Cossacks, known under the name of Samarchik. In 1687 Prince Golitsuin founded here the Ust-Samara fort, which was destroyed after the treaty of the Pruth (1711), but rebuilt in 1736, and the settlement of Novoselitsy established. The inhabitants of Novomoskovsk, who numbered 23,381 in 1900, are chiefly engaged in agriculture, though some are employed in tanneries, and there is a trade in horses, cattle, tallow, skins, tar and pitch. In the immediate neighbourhood is the Samarsko-Nikolayevskiy monastery, which is visited by many pilgrims.

NOVO-RADOMSK, or RADOMSKO, a town of Russian Poland, in the government of Piotrków, 28 m. by rail S.S.W. of the town of Piotrków. It has factories for bentwood furniture, woollens and cloth, tanneries, ironworks and sawmills, and is the centre of a very active trade. Pop. (1900) 14,464, many being Jews.

NOVOROSSIYSK, a seaport town of S. Russia, in the Chernomorsk or Black Sea territory, on a bay of the same name (also named Tsemes), on the N.E. coast of the Black Sea. Pop. (1900) 40,384. The bay, nearly 3 m. wide at its entrance on the crosses the Volga near Tsaritsyn, and has become an important centre for the export of corn, and since the petroleum wells of Groznyi in northern Caucasia were tapped it has become an entrepôt for the export of petroleum. Cement is manufactured. Large grain elevators have been built, and a new commercial town has grown up. Besides cereals, which amount to 69% of the whole, the exports consist of petroleum and petroleum waste, oilcake, linseed, timber, bran, millet seed, wool, potash, zinc ore and liquorice, the total annual value ranging between 3¾ and 5¼ millions sterling. The imports are small. Some 1500 acres in the vicinity of the town are planted with vines. Novorossiysk has belonged to Russia since 1829.

NOWELL, ALEXANDER (*c.* 1507–1602), dean of St Paul's, London, was the eldest son of John Nowell of Read Hall, Whalley, Lancashire, by his second wife Elizabeth Kay of Rochdale. He was educated at Middleton, Lancashire, and at Brasenose College, Oxford, where he is said to have shared rooms with John Foxe the martyrologist. He was elected fellow of Brasenose in 1526. In 1543 he was appointed master of Westminster school, and in December 1551 prebendary of Westminster. He was elected in September 1553 member of parliament for Looe in Cornwall in Queen Mary's first parliament, but in October 1553 a committee of the house reported that, having as prebendary of Westminster a seat in convocation, he could not sit in the House of Commons. He was also deprived of his prebend, probably as being a married man, before May 1554, and sought refuge at Strassburg and Frankfort, where he developed puritan and almost presbyterian views. He submitted, however, to the Elizabethan settlement of religion, and was rewarded with the archdeaconry of Middlesex, a canonry at Canterbury and in 1560 with the deanery of St Paul's. His sermons occasionally created some stir, and on one occasion Elizabeth interrupted his sermon, telling him to stick to his text and cease slighting the crucifix. He held the deanery of St Paul's for forty-two years, surviving until the 13th of February 1602. Nowell is believed to have composed the Catechism inserted before the Order of Confirmation in the Prayer Book of 1549, which was supplemented in 1604 and is still in use; but the evidence is not conclusive. Early in Elizabeth's reign, however, he wrote a larger catechism, to serve as a statement of Protestant principles; it was printed in 1570, and in the same year appeared his "middle" catechism, designed it would seem for the instruction of "simple curates." Nowell also established a free school at Middleton and made other benefactions for educational purposes. He was twice married, but left no children.

NOWGONG, a town of India, headquarters of the Bundelkhand agency and a military cantonment, in the native state of Chhatarpur, on the border of the British district of Jhansi. Pop. (1901) 11,507. It has accommodation for a force of all arms. The college for the education of the sons of chiefs in Central India, opened here in 1872, was abolished in 1898, owing to the small attendance.

NOWGONG, a town and district of British India, in the Brahmaputra valley division of eastern Bengal and Assam. The town is situated on the Kalang river. Pop. (1901) 4430. The district of Nowgong has an area of 3843 sq. m. It consists of a wide plain overgrown with jungle and canebrakes, intersected by numerous tributaries of the Brahmaputra, and dotted with shallow marshes. The Mikir hills cover an area of about 65 m. by 35 in the S. of the district; the highest peak is about 3500 ft. The slopes are very steep, and are covered with dense forest.

that the two had together refused to travel by the train the accident to which caused the death (on the 14th of May 1858) of the prince Ahmed, who would otherwise have succeeded Said. Ismail, himself a more capable man than his immediate predecessors, at once recognized the ability of Nubar, and charged him with a mission to Constantinople, not only to notify his accession, but to smooth the way for the many ambitious projects he already entertained, notably the completion of the Suez Canal, the change in title to that of khedive and the change in the order of succession. In the first of these he was completely successful; the sultan, believing as little as every one else that the canal was anything more than a dream, gave his consent at a price the moderation of which he must afterwards have regretted. The gratified Ismail created Nubar a pasha, and the sultan himself, persuaded to visit Cairo, confirmed the title so rarely accorded to a Christian. Half the work was, however, yet to be done, and Nubar was sent to Paris to complete the arrangements, and to settle the differences between Egypt and the Canal Company. In what he used to call "an expensive moment of enthusiasm," he left these differences to the arbitration of the emperor Napoleon III. and cost Egypt four millions sterling. On his return he was made Egypt's first minister of public works, and was distinguished for the energy which he threw into the creation of a new department; but in 1866 he was made minister of foreign affairs, and at once went on a special mission to Constantinople, where he succeeded in the other two projects that had been left in abeyance since his last visit. In June 1867 Ismail was declared khedive of Egypt, with succession in favour of his eldest son. Nubar now had a harder task to undertake than ever before. The antiquated system of "capitulations" which had existed in the Ottoman empire since the 15th century had grown in Egypt to be a practical creation of seventeen *imperia in imperio*: seventeen consulates of seventeen different powers administered seventeen different codes in courts before which alone their subjects were amenable. A plaintiff could only sue a Frenchman in the French court, with appeal to Aix; an Italian in the Italian court, with appeal to Ancona; a Russian in the Russian court, with appeal to Moscow. Nubar's bold design, for which alone he deserves the credit, was to induce these seventeen powers to consent to abandon their jurisdiction in civil actions, to substitute mixed International Courts and a uniform code binding on all. That in spite of the jealousies of all the powers, in spite of the opposition of the Porte, he should have succeeded, places him at once in the first rank of statesmen of his period. Nubar made no attempt to get rid of the criminal jurisdiction exercised by the consular representatives of the foreign powers—such a proposal would have had, at that time, no chance of success.

The extravagant administration of Ismail, for which perhaps Nubar can hardly be held wholly responsible, had brought Egypt to the verge of bankruptcy, and Ismail's disregard of the judgments of the Court at last compelled Great Britain and France to interfere. Under pressure, Ismail, who began to regret the establishment of the International Courts, assented to a mixed ministry under Nubar, with Rivers Wilson as minister of finance and de Blignières as minister of public works. Nubar, finding himself supported by both Great Britain and France, tried to reduce Ismail to the position of a constitutional monarch, and Ismail, with an astuteness worthy of a better cause, took advantage of a somewhat injudicious disbandment of certain regiments to incite a military rising against the ministry. The governments of Great Britain and France, instead of supporting the ministry against the khedive, weakly consented to Nubar's dismissal; but when this was shortly followed by that of Rivers Wilson and de Blignières they realized that the situation was a critical one, and they succeeded in obtaining from the sultan the deposition of Ismail and the substitution of Tewfik as khedive. ... Sir Edward Malet. The British government, under the advice of Baring, insisted on the evacuation of the Sudan, and Sherif having resigned office, the more pliant Nubar was induced to become premier, and to carry out a policy of which he openly disapproved, but which he considered Egypt was forced to accept under British dictation. At this period he used to say, "I am not here to govern Egypt, but to administer the British government of Egypt. I am simply the greaser of the official wheels." It might have been well if Nubar had confined himself to this modest programme, but it was perhaps hardly to be expected of a man of his ability and restless energy. It must be admitted, however, that the characters of Nubar and Lord Cromer were not formed to run in harness, and it was with no surprise that the public learnt in June 1888 that he had been relieved of office, though his dismissal was the direct act of the khedive Tewfik, who did not on this occasion seek the advice of the British agent. Riaz Pasha, who succeeded him, was, with one interval of eight months, prime minister until April 1894, when Nubar returned to office. By that time Lord Cromer had more completely grasped the reins of administration as well as of government, and Nubar had realized more clearly the rôle which an Egyptian minister was called on to play: Lord Cromer was the real ruler of Egypt, and the death of Tewfik in 1890 had necessitated a more open exercise of British authority. In November 1895 Nubar completed his fifty years of service, and, accepting a pension, retired from office. He lived little more than three years longer, spending his time between Cairo and Paris, where he died in January 1899 at the age of seventy-four. (C. F. M. B.)

NUBIA, a region of north-east Africa, bounded N. by Egypt, E. and W. by the Red Sea and the Libyan Desert respectively, and extending S. indefinitely to about the latitude of Khartum. It may be taken to include the Nile valley from Assuan near the First Cataract southwards to the confluence of the White and Blue Niles, stretching in this direction for about 560 m. between 16° and 24° N. Nubia, however, has no strictly defined limits, and is little more than a geographical expression. The term appears to have been unknown to the ancients, by whom everything south of Egypt was vaguely called Ethiopia, the land of the dark races. It is first associated historically, not with any definite geographical region, but with the Nobatae, a negro people removed by Diocletian from Kharga oasis to the Nile valley above Egypt (Dodecaschoenus), whence the turbulent Blemmyes had recently been driven eastwards. From Nūba, the Arabic form of the name of this people, comes the modern Nubia, a term about the precise meaning of which no two writers are in accord. Within the limits indicated the country consists mainly of sandy desert and rugged and arid steppes and plateaus through which the Nile forces its way to Upper Egypt. In this section of the river there occurs a continuous series of slight falls and rapids, including all the historical "six cataracts," beginning below Khartum and terminating at Philae. Between those places the river makes a great S-shaped bend, the region west of the Nile within the lower bend being called the Bayuda Desert, and that east of the Nile the Nubian Desert. The two districts roughly correspond to the conventional divisions of Upper and Lower Nubia respectively. Except along the narrow valley of the Nile only the southernmost portion of Nubia contains arable land. The greater part is within the almost rainless zone. An auriferous district lies between the Nile and the Red Sea, in 22° N. Politically the whole of Nubia is now included either in Egypt or the Anglo-Egyptian Sudan, and has no administrative existence.

Ethnology.—As an ethnical expression the term Nuba or Nubian has little value. Rejected by the presumable descendants of Diocletian's Nobatae, who now call themselves Berber or Barābara, it has become synonymous in the Nile valley with "slave," or "negro slave." This is due to the large number of

slaves drawn by Arab dealers from the Nūba negroes of Kordofan, who appear to constitute the original stock of the Nubian races (but see HAMITIC RACES). On the other hand, the name has never included all the inhabitants of Nubia. Peoples of three distinct stocks inhabit the country—the comparatively recent Semitic Arab intruders, mainly in Upper Nubia, the Beja (? Hamitic) family of tribes (the Ababda, Bisharin, Hadendoa, Beni-Amer, &c.), everywhere between the Nile and the Red Sea; and the Nubians (Nuba or Barābira), in Lower Nubia, where they are now almost exclusively confined to the banks of the Nile, from Assuan southwards to Dongola. Ethnologically these modern Nubians are a very mixed people, but their affiliation to negroes or negroids, which is based on physical and linguistic grounds, is confirmed by what is known of the history of the Nilotic peoples.

The first inhabitants of the region beyond Egypt appear to have been the Uaua, whose name occurs in an inscription on a tomb at Memphis of the VIth Dynasty, and again constantly in subsequent inscriptions down to the time of the Ptolemies, as the chief negro race to the south of Syene. (For the history of the country during this period see ETHIOPIA). It thus appears that throughout the historic period down to the arrival of the Romans the Nile-country above Egypt was occupied by a negro people. Egyptian monuments are found as far south as Mount Barkal (Napata), but no Egyptian settlements beyond Syene. Hence these Uaua negroes probably remained unaffected, or very slightly affected, by foreign elements until about the 3rd century A.D. Their domain then began to be encroached upon from the east by the Blemmyes, who have been identified with the present Beja of the Nubian desert. It was owing to their incessant raids that Diocletian withdrew the Roman garrisons above the cataracts, and called in the warlike Nobatae to protect the Egyptian frontier from their attacks. These negro Nobatae, originally from Kordofan, as is now evident, had advanced to the Great Oasis (Kharga) in Upper Egypt, whence they passed into the Nile valley between the cataracts. Here they absorbed the older Uaua of kindred stock, and ultimately came to terms with the Blemmyes. The two races even became intermingled, and, making common cause against the Romans, were defeated by Maximinus in 451.

The Blemmyes, remaining pagan after the Nubas had embraced Christianity (6th century) were soon after driven from the Nile valley eastwards to the kindred Megabares, Memnons and other nomads, who, with the Troglodytes, had from time immemorial held the whole steppe region between the Nile and the Red Sea from Axum to Egypt. Here their most collective name was Bugaitae (Βουγαεῖται), as appears from the Axumite inscription, whence the forms Buja, Beja, which occur in the oldest Arab records, and by which they are still known.

In the 7th century the Arabs who had conquered Egypt penetrated into Lower Nubia, where the two Jawābareh and Al-Gharbīya tribes became powerful, and amalgamated with the Nūbas of that district. Their further progress south was barred by the Christian kings of Dongola (*q.v.*) until the 14th century, when the Arabs became masters of the whole region. Still later another element was added to the population in the introduction by the Turkish masters of Egypt of a number of Bosnians. These Bosnians (Kalaji as they called themselves) settled in the country and intermarried with the Arabs and Nubians, their descendants still holding lands between Assuan and Derr. Hence it is that the Nubians of this district, fairest of all the race, still claim Arab and Osmanli (Bosnian) descent.

Nevertheless, the Nubian type remains essentially negro, being characterized by a very dark complexion, varying from a mahogany brown and deep bronze to an almost black shade, with tumid lips, large black animated eyes, doli-chocephalic head (index 73, 72), hair often woolly or strongly frizzled, and scant beard worn under the chin like the figures of the fugitives (Uaua?) in the battle-pieces sculptured on the walls of the Egyptian temples. At the same time the nose is much larger and the zygomatic arches less prominent than in the full-blood negro. The Nilotic Nubians are on the whole a strong muscular people, essentially agricultural, more warlike and energetic than the Egyptians. Many find employment as artisans, small dealers, porters and soldiers in Egypt, where they are usually noted for their honesty, and frank and cheerful temperament. Since the overthrow of the native Christian states all have become Mahommedans, but not of a fanatical type. Although a native of Dongola, the mahdi, Mahommed Ahmed, found his chief support, not among his countrymen, but among the more recently converted Kordofan negroes and the nomad Arabs and Beja. (For ethnology see also HAMITIC RACES, BEJA, ARĀBDA, BISHARIN, HADENDOA, &c.).

Language.—Little is known of the language of the ancient Nubians or of its connexion, if any, with the language, known as Meroitic, of the "Ethiopians" who preceded them. The hieroglyphs and inscriptions in Meroitic belong mostly to the first six centuries A.D.; the existing Nubian MSS. are medieval and are written chiefly in Greek letters, and in form and character resemble Coptic. They are, with one exception, written on parchment and contain lives of saints, &c., the exception being a legal document. The most noteworthy of these MSS. was found near Edfu, in Upper Egypt, early in the 20th century and purchased for the British Museum in 1908. Eutychius, patriarch of Alexandria about 930, included "Nubi" among the six kinds of writing which he mentions as current among the Hamitic peoples, and "Nubi" also appears among a list of six writings mentioned in an ancient manuscript now in the Berlin Museum.

The modern Nubian tongue, clearly the descendant of the Nubian of the MSS., is very sonorous and expressive. Its distinctly negro character is betrayed in the complete absence of grammatical gender, in its primitive vowel-system and highly-developed process of consonantal assimilation, softening all harsh combinations, lastly, in the peculiar infix *j* inserted between the verbal root and the plural pronominal object, as in *ai tokki-j-ir* = I shake them. As in Bantu, the verb presents a multiplicity of forms, including one present, three past and future tenses, with personal endings complete, passive, interrogative, conditional, elective, negative and other forms, each with its proper participial inflexions. In Lepsius's grammar the verbal paradigm fills altogether 110 pages.

Of the Nilotic as distinguished from the Kordofan branch of the Nūba language there are three principal dialects current from Assuan along the Nile southwards to Meroë, as under:—

I. NORTHERN: Dialect of *Bani Kenz* or *Mattokki*, from the first cataract to Sebū' and Wādi al-'Arab, probably dating from the Diocletian period.

II. CENTRAL: The *Makas* or *Mariss*, from Korosko to Wādi Halfā (second cataract). Here the natives are called Saidokki, in contradistinction to the northern Mattokki.

III. SOUTHERN: *Dongolawi*, throughout the province of Dongola from the second cataract to J. Dēja near Meroë, on the northern frontier of the Arab district of Dar Shagia. By the Mahasi people it is called Biderin Bannid, "language of the poor," or, collectively with the Kenz, Oshkirin Bannid, "language of slaves."

The northern and southern varieties are closely related to each other, differing considerably from the central, which shows more marked affinities with the Kordofan Nūba, possibly because the Saidokki people are later arrivals from Kordofan. For topography, &c. and archaeology, see SUDAN § *Anglo-Egyptian* and EGYPT.

ÑUBLE, a province of central Chile, bounded N. by Linares, E. by the Argentine Republic, S. by Concepción and W. by Concepción and Maule. Area, 3407 sq. m.; pop. (1895) 152,[illegible]. The province lies partly in the great central valley of Chile, noted for its fine climate and fertility, and partly on the western slopes of the Andes. The Itata river, which forms the southern boundary, and its principal tributary, the Ñuble, form the drainage system of the province. Agriculture and grazing are the principal industries. Wheat is largely produced, and there are vineyards in some localities. Stock-raising is pursued chiefly in the east, where the pastures are rich and the wa[illegible]

the hot baths of Chillan, in the eastern part of the province on the slope of the volcano of that name, about 7000 ft. above sea level, are very popular in Chile.

NUCERIA ALFATERNA (mod. *Nocera Inferiore*, *q.v.*), an ancient town of Campania, Italy, in the valley of the Sarnus (Sarno), about 10 m. E. of the modern coast line at Torre Annunziata, and 8 m. E. of Pompeii. In the period before the Roman supremacy it appears to have been the chief town in the valley of the Sarnus, Herculaneum, Pompeii, Stabiae and Surrentum all being dependent upon it. The coins of the town bear the head of the river god. It maintained its allegiance to Rome till 309 B.C. when it joined the revolted Samnites. In 308 it repulsed a Roman attempt to land at the mouth of the Sarnus, but in 307 it was besieged and surrendered. It obtained favourable terms, and remained faithful to Rome even after Cannae. Hannibal reduced it in 216 by starvation, and destroyed and plundered the town. The inhabitants returned when peace was restored. Even during the Social War Nuceria remained true to Rome, though the dependent towns joined the revolt; after it they were formed into independent communities, and Nuceria received the territory of Stabiae, which had been destroyed by Sulla in 89 B.C., as a compensation. In 73 B.C. it was plundered by Spartacus. Of the buildings of the ancient city nothing at all is to be seen; but on the hillsides on the S. are remains of villas of the Roman period, and here tombs have been found. (T. As.)

NUCLEUS (Lat. for the kernal of a nut, *nux*, the stone of fruit), the central portion of things, round which other parts of the same thing or other things collect together. The term is particularly applied to the central mass of protoplasm in a plant or animal cell (see CYTOLOGY).

NUER, a Nilotic negro people of the upper Nile, dwelling in the swampy plains south of Fashoda and at the Bahr-el-Ghazal confluence, and having for neighbours the Dinka, whom they resemble. They are long-legged and flat-footed, and live, like the aquatic birds, on fish, roots and river plants. They tattoo tribal marks on the forehead, and the women pierce the upper lips. A few Nuer families live on the floating islets of grass and reeds brought down by the river in flood.

NUEVA SAN SALVADOR, or SANTA TECLA, the capital of the department of La Libertad, Salvador; on the railway between San Salvador (10 m. N.) and the Pacific port of La Libertad. *Pop.* (1905) about 18,000. The town was founded in 1854, and intended to replace the capital, San Salvador, which was ruined by an earthquake in that year but soon afterwards rebuilt. Nueva San Salvador is an attractive town with a large and growing trade.

NUEVO LEÓN, a northern state of Mexico, bounded N., E. and S.E. by Tamaulipas, S. and S.W. by San Luis Potosí and W. and N. by Coahuila. Pop. (1900) 327,937; area 23,592 sq. m. Nuevo León lies partly upon the great Mexican plateau and partly upon its eastern slopes, the Sierra Madre Oriental crossing the state N.W. to S.E. A branch of the Sierra Madre extends northward from the vicinity of Salinas, but its elevations are low. The average elevation of the Sierra Madre within the state is slightly under 5500 ft. The general character of the surface is mountainous, though the western and south-western sides are level and dry as in the adjoining state of Coahuila. In the N. the general elevation is low, the surface sandy and covered with cactus and mesquite growth, and hot, semi-arid conditions prevail. The eastern slopes receive more rain and are well clothed with vegetation, but the lower valleys are subtropical in character and are largely devoted to sugar production. The higher elevations have a dry, temperate, healthful climate. There are many rivers and streams, notably the Salado, Pesqueria and Presas, but none is navigable within the state, though many furnish good water power. Agriculture is the principal industry, stock-raising receives considerable attention; there are about a score of large cattle ranges, and there is a considerable export of live cattle to Texas and to various Mexican states. Considerable progress has been made in manufacturing industries, and there are a large number of sugar-mills, cotton factories, woollen mills, smelting works and iron and steel works. The state is well served with railways, the capital, Monterrey, being one of the most important railway centres in northern Mexico. The Mexican National line crosses the northern half of the state and has constructed a branch from Monterrey to Matamoros, and a Belgian line (F. C. de Monterrey al Golfo Mexicano) runs from Tampico N.N.W. to Monterrey, and thence westward to Treviño (formerly Venadito) in Coahuila, a station on the Mexican International. The other principal towns are: Linares, or San Felipe de Linares (pop. 20,690 in 1900), 112 m. by rail S.E. of the capital in a rich agricultural region; Lampazos, or Lampazos de Naranjo (7704), 96 m. by rail N.W. of the capital; Cadereyta Jiminez, García, Santiago and Doctor Arroyo, the last in the extreme southern part of the state.

NUGENT, ROBERT NUGENT, EARL (1702–1788), Irish politician and poet, son of Michael Nugent, was born at Carlanstown, Co. Westmeath. He was tersely described by Richard Glover as "a jovial and voluptuous Irishman who had left popery for the Protestant religion, money and widows." His change of religion took place at a very early period in life; he married in 1736 Anna (d. 1756), daughter of James Craggs, the secretary of state, a lady who had already been twice given in marriage. His wife's property comprised the borough of St Mawes in Cornwall, and Nugent sat for that constituency from 1741 to 1754, after which date he represented Bristol until 1774, when he returned to St Mawes. He was a lord of the treasury from 1754 to 1759 and president of the board of trade from 1766 to 1768. He married in 1757 Elizabeth, dowager-countess of Berkeley, who brought him a large fortune. His support of the ministry was so useful that he was created in 1767 Viscount Clare, and in 1776 Earl Nugent, both Irish peerages. He died on the 13th of October 1788. Lord Nugent was the author of some poetical productions, several of which are preserved in the second volume of Dodsley's *Collections* (1748). The earldom descended by special remainder to the earl's son-in-law, George Nugent Temple Grenville, marquess of Buckingham, and so to his successors, the dukes of Buckingham and Chandos.

NUISANCE (through Fr. *noisance*, *nuisance*, from Lat. *nocere*, to hurt), that which gives offence or causes annoyance, trouble or injury. In English law nuisance is either public or private. A public or common nuisance is defined by Sir J. F. Stephen as "an act not warranted by law, or an omission to discharge a legal duty, which act or omission obstructs or causes inconvenience or damage to the public in the exercise of rights common to all His Majesty's subjects" (*Digest of the Criminal Law*, p. 120). A common nuisance is punishable as a misdemeanour at common law, where no special provision is made by statute. In modern times many of the old common law nuisances have been the subject of legislation. It is no defence for a master or employer that a nuisance is caused by the acts of his servants, if such acts are within the scope of their employment, even though such acts are done without his knowledge and contrary to his orders. Nor is it a defence that the nuisance has been in existence for a great length of time, for no lapse of time will legitimate a public nuisance.

A private nuisance is an act or omission which causes inconvenience or damage to a private person, and is left to be redressed by action. There must be some sensible diminution of these rights affecting the value or convenience of the property. "The real question in all the cases is the question of fact, whether the annoyance is such as materially to interfere with the ordinary comfort of human existence" (Lord Romilly in *Crump* v.

Lambert, 1867, L.R. 3 Eq. 409). A private nuisance, differing in this respect from a public nuisance, may be legalized by uninterrupted use for twenty years. It used to be thought that, if a man knew there was a nuisance and went and lived near it, he could not recover, because, it was said, it is he that goes to the nuisance and not the nuisance to him. But this has long ceased to be law, as regards both the remedy by damages and the remedy by injunction.

The remedy for a public nuisance is by information, indictment, summary procedure or abatement. An information lies in cases of great public importance, such as the obstruction of a navigable river by piers. In some matters the law allows the party to take the remedy into his own hands and to "abate" the nuisance. Thus, if a gate be placed across a highway, any person lawfully using the highway may remove the obstruction, provided that no breach of the peace is caused thereby. The remedy for a private nuisance is by injunction, action for damages or abatement. An action lies in every case for a private nuisance; it also lies where the nuisance is public, provided that the plaintiff can prove that he has sustained some special injury. In such a case the civil is in addition to the criminal remedy. In abating a private nuisance, care must be taken not to do more damage than is necessary for the removal of the nuisance.

In Scotland there is no recognized distinction between public and private nuisances. The law as to what constitutes a nuisance is substantially the same as in England. A list of statutory nuisances will be found in the Public Health (Scotland) Act 1867, and amending acts. The remedy for nuisance is by interdict or action.

The American law on the subject is practically the same as the English law.

NUKHA, a town of Russian Caucasia, in the government of Elizavetpol, and previous to 1819 the capital of the khanate of Sheki, lying 57 m. N.E. of the town of Elizavetopol, at the S. foot of the main chain of the Caucasus. Pop. (1861) 22,618; (1897) 24,811; mainly Tatars, with some Armenians. The cupola of the church in the fortress is 2455 ft. above the sea-level, in 41° 12′ 18″ N. and 47° 12′ 7″ E. The fortress, a square enclosure, erected in 1765, contains the palace, built in 1790 in the original Persian style. The leading industry is the breeding of silkworms and the spinning of silk. Nukha was a mere village down to the middle of the 18th century, when it was chosen by Hajji Chelyabi, the founder of the khanate of Sheki, as his residence. The Russian occupation dates from 1807, though the annexation was not completed till 1819.

NULLAH (Hindostani for an arm of the sea, stream or watercourse), a steep narrow valley. Like the *wadi* of the Arabs, the nullah is characteristic of mountainous or hilly country where there is little rainfall. In the drier parts of India, and in many parts of Australia there are small steep-sided valleys penetrating the hills, clothed with rough brushwood or small trees growing in the stony soil. During occasional heavy rains torrents rush down the nullahs and quickly disappear. There is little local action upon the sides, while the bed is lowered, and consequently these valleys are narrow and steep.

NULLIFICATION, the process of making null or of no effect (Lat. *nullus*, none). In United States history the term is applied to the process by which a state either (*a*) in fact suspended, or (*b*) claimed a constitutional right of suspending, the operation of a federal law within its own territory. The doctrine of nullification as a constitutional theory was probably never held by a majority of the states or of the American people at any one time, though before 1860 most of the states asserted or practised it. The belief in nullification was based on the theory that the union of the states was a voluntary one, each member retaining its sovereignty, though for purposes of convenience delegating certain powers of government to an agent—the federal government. The powers of this agent were strictly limited by the Constitution, and should it transcend these powers the states must interpose to protect their rights. This view held that the Supreme Court created by the Constitution was not a proper tribunal to decide causes arising beyond the Constitution or relating to the nature of the Union, but that its jurisdiction was limited to cases arising under the Constitution. If the Federal government usurped a right belonging to the state, the latter, being a sovereignty, must judge for itself.

As later perfected by John C. Calhoun (*q.v.*), the theory of nullification required a practice as follows. A state aggrieved by a law of the Federal congress might, in constituent convention, suspend the operation of the objectionable law, and report its action to the other states. If three-fourths of them should decide that the law in question was not unconstitutional, then in effect it became ratified (see United States Constitution, art. v.). The dissatisfied state must then submit or must draw out of the union by the act of secession (see Secession, and Confederate States). This theory of the right of nullification was considered by those who held it to be in accord with the principles laid down in the Constitution. It must be distinguished from secession, which was considered a sovereign right, one above the Constitution; yet nullification presumed the sovereignty of the state.

The earliest assertions of the doctrine of nullification are found in the Kentucky and Virginia Resolutions of 1798–1799, written respectively by Thomas Jefferson and James Madison in protest against the Alien and Sedition Acts of Congress. Nullification was first practised in 1809 by Pennsylvania, the governor ordering out the state troops to resist the execution of a decree of a Federal court. In the New England states, 1809–1815, the United States laws relating to embargo, non-intercourse and army enlistments were nullified by state action. From 1825–1829 the state of Georgia forcibly prevented the execution of Federal laws and court decrees relating to the Indians within her borders and in Alabama, 1832–1835, there was a similar nullification. The only example of nullification in which theory and practice coincided was the nullification in 1832 by South Carolina of the Federal tariff laws. In this the state acted upon the theory outlined above which was perfected by Calhoun. In the last decade before the Civil War fourteen of the Northern states in the so-called "Personal Liberty laws" nullified the Federal statutes relating to slaves and slavery by making it a crime for their citizens to obey these laws and by setting the state administration against the Federal officials. Since the Reconstruction the Southern states have in practice effected a nullification of the Fourteenth and Fifteenth Amendments to the Constitution providing for negro suffrage.

Loring, *Nullification and Secession in the United States* (New York, 1893); E. P. Powell, *Nullification and Secession in the United States* (New York, 1897); and U. B. Phillips, *Georgia and States Rights* (Washington, 1902). (W. L. F.)

NUMANTIA, an ancient hill fortress in northern Spain, in the province of Soria (Old Castile), overhanging the village of Garray, near the town of Soria, on the upper Douro. Here, on a small isolated high plateau in the middle of the valley, was the stronghold which played the principal part in a famous struggle between the conquering Romans and the native Spaniards during the years 154–133 B.C. Numantia was especially concerned in the latter part of this war from 144 onwards. It was several times unsuccessfully besieged. Once the Roman general Hostilius Mancinus with his whole army was compelled to surrender (137). Finally, Scipio Aemilianus, Rome's first and only general in that age, with some 60,000 men drew round the town 6 m. of continuous entrenchments with seven camps at intervals. After 15 months (134–133) he reduced by hunger the 6000–8000 Numantine soldiers, much as Caesar afterwards reduced Alesia in Gaul. The result was regarded as a glorious victory, and in Roman literature the fall of Numantia was placed beside the fall of Carthage (149 B.C.). In truth, the maintenance in effective condition of so large a Roman force in so remote and difficult a region was in itself a real achievement and such as at that time no one but Scipio could have performed. He redeemed by organized strategy the vacillations and follies of statesmen who had sat at home and sent out inadequate expeditions or incompetent commanders. The site was, under the Roman Empire, occupied by a Roman town called Numantia and the *Itinerary* tells of a Roman road which ran past it. It is to-day a "Monumento Nacional" of Spain, and has yielded remarkable discoveries to the skilful excavations of Dr Schulten

05–1910), who has traced the Celtiberian town, the lines Scipio and several other Roman camps dating from the mantine Wars. (F. J. H.)

UMA POMPILIUS, second legendary king of Rome (715–B.C.), was a Sabine, a native of Cures, and his wife was daughter of Titus Tatius, the Sabine colleague of Romulus. was elected by the Roman people at the close of a year's rregnum, during which the sovereignty had been exercised the members of the senate in rotation. Nearly all the early gious institutions of Rome were attributed to him. He set the worhip of Terminus (the god of landmarks), appointed festival of Fides (Faith), built the temple of Janus, reorgan- l the calendar and fixed days of business and holiday. He ituted the flamens (sacred priests) of Jupiter, Mars and rinus; the virgins of Vesta, to keep the sacred fire burning he hearth of the city; the Salii, to guard the shield that from heaven; the pontifices and augurs, to arrange the s and interpret the will of the gods; he also divided the dicraftsmen into nine gilds. He derived his inspiration from wife, the nymph Egeria, whom he used to meet by night in sacred grove. After a long and peaceful reign, during which gates of Janus were closed, Numa died and was succeeded the warlike Tullus Hostilius. Livy (xl. 29) tells a curious y of two stone chests, bearing inscriptions in Greek and in, which were found at the foot of the Janiculum (181 B.C.), purporting to contain the body of Numa and the other his ks. The first when opened was found to be empty, but the nd contained fourteen books relating to philosophy and tifical law, which were publicly burned as tending to under- e the established religion.

o single legislator can really be considered responsible for the institutions ascribed to Numa; they are essentially ian, and older than Rome itself. Even Roman tradition lf wavers; *e.g.* the fetiales are variously attributed to Tullus tilius and Ancus Marcius. The supposed law-books, which e to all appearance new when discovered, were clearly eries.

UMBER[1] (through Fr. *nombre*, from Lat. *numerus*; from ot seen in Gr. *νέμειν* to distribute), a word generally ex- sive of quantity, the fundamental meaning of which leads nalysis to some of the most difficult problems of higher hematics.

The most elementary process of thought involves a distinc- within an identity—the A and the not-A within the sphere ughout which these terms are intelligible. Again A may be neric quality found in different modes Aa, Ab, Ac, &c.; for nce, colour in the modes, red, green, blue and so on. Thus notions of "one," "two," and the vague "many" are amental, and must have impressed themselves on the human l at a very early period: evidence of this is found in the rmatical distinction of singular, dual and plural which rs in ancient languages of widely different races. A more ite idea of number seems to have been gradually acquired ealizing the equivalence, as regards plurality, of different rete groups, such as the fingers of the right hand and those e left. This led to the invention of a set of names which in irst instance did not suggest a numerical system, but denoted in recognized forms of plurality, just as blue, red, green, &c., te recognized forms of colour. Eventually the conception of series of natural numbers became sufficiently clear to lead systematic terminology, and the science of arithmetic was rendered possible. But it is only in quite recent times that notion of number has been submitted to a searching critical analysis: it is, in fact, one of the most characteristic results of modern mathematical research that the term *number* has been made at once more precise and more extensive.

[1] See also NUMERAL

2. Aggregates (also called *manifolds* or *sets*).—Let us assume the possibility of constructing or contemplating a permanent system of things such that (1) the system includes all objects to which a certain definite quality belongs; (2) no object without this quality belongs to the system; (3) each object of the system is permanently recognizable as the same thing, and as distinct from all other objects of the system. Such a collection is called an *aggregate*: the separate objects belonging to it are called its *elements*. An aggregate may consist of a single element.

It is further assumed that we can select, by a definite process, one or more elements of any aggregate A at pleasure: these form another aggregate B. If any element of A remains unselected, B is said to be a part of A (in symbols, $B < A$): if not, B is identical with A. Every element of A is a part of A. If $B < A$ and $C < B$, then $C < A$.

When a correspondence can be established between two aggregates A and B in such a way that to every element of A corresponds one and only one element of B, and conversely, A and B are said to be *equivalent*, or to have the same *power* (or *potency*); in symbols, $A \backsim B$. If $A \backsim B$ and $B \backsim C$, then $A \backsim C$. It is possible for an aggregate to be equivalent to a part of itself: the aggregate is then said to be *infinite*. As an example, the aggregates $2, 4, 6, \ldots 2n$, &c., and $1, 2, 3, \ldots n$, &c., are equivalent, but the first is only a part of the second.

3. Order.—Suppose that when any two elements a, b of an aggregate A are taken there can be established, by a definite criterion, one or other of two alternative relations, symbolized by $a < b$ and $a > b$, subject to the following conditions:—(1) If $a > b$, then $b < a$, and if $a < b$, then $b > a$; (2) If $a > b$ and $b > c$, then $a > c$. In this case the criterion is said to arrange the aggregate in order. An aggregate which can be arranged in order may be called *ordinable*. An ordinable aggregate may, in general, by the application of different criteria, be arranged in order in a variety of ways. According as $a < b$ or $a > b$ we shall speak of a as anterior or posterior to b. These terms are chosen merely for convenience, and must not be taken to imply any meaning except what is involved in the definitions of the signs $>$ and $<$ for the particular criterion in question. The consideration of a succession of events in time will help to show that the assumptions made are not self-contradictory. An aggregate arranged in order by a definite criterion will be called an *ordered* aggregate. Let a, b be any two elements of an ordered aggregate, and suppose $a < b$. All the elements c (if any) such that $a < c < b$ are said to fall within the interval (a, b). If an element b, posterior to a, can be found so that no element falls within the interval (a, b), then a is said to be *isolated* from all subsequent elements, and b is said to be the element next after a. So if $b' < a$, and no element falls within the interval (b', a), then a is isolated from all preceding elements, and b' is the element next before a. As will be seen presently, for any assigned element a, either, neither, or both of these cases may occur.

An aggregate A is said to be *well-ordered* (or *normally ordered*) when, in addition to being ordered, it has the following properties: (1) A has a first or lowest element a which is anterior to all the rest; (2) if B is any part of A, then B has a first element. It follows from this that every part of a well-ordered aggregate is itself well-ordered. A well-ordered aggregate may or may not have a last element.

Two ordered aggregates A, B are said to be *similar* ($A \backsimeq B$) when a one-one correspondence can be set up between their elements in such a way that if b, b' are the elements of B which correspond to any two elements a, a' of A, then $b > b'$ or $b < b'$ according as $a > a'$ or $a < a'$. For example, $(1, 3, 5, \ldots) \backsimeq (2, 4, 6, \ldots)$, because we can make the even number $2n$ correspond to the odd number $(2n - 1)$ and conversely.

Similar ordered aggregates are said to have the same *order-type*. Any definite order-type is said to be the *ordinal number* of every aggregate arranged according to that type. This somewhat vague definition will become clearer as we proceed.

succeeds it in the order of A. (It may happen, of course, that a' does not exist; in this case a is the last element of A.) Thus in a well-ordered aggregate every element except the last (if there be a last element) is succeeded by a definite next element. The ingenuity of man has developed a symbolism by means of which *every* symbol is associated with a definite next succeeding symbol, and in this way we have a set of visible or audible signs 1, 2, 3, &c. (or their verbal equivalents), representing an aggregate in which (1) there is a definite order, (2) there is a first term, (3) each term has one next following, and consequently there is *no last term*. Counting a set of objects means associating them in order with the first and subsequent members of this conventional aggregate. The process of counting may lead to three different results: (1) the set of objects may be finite in number, so that they are associated with a part of the conventional aggregate which has a last term; (2) the set of objects may have the same power as the conventional aggregate; (3) the set of objects may have a higher power than the conventional aggregate. Examples of (2) and (3) will be found further on. The order-type of 1, 2, 3, &c., and of similar aggregates will be denoted by ω; this is the first and simplest member of a set of transfinite ordinal numbers to be considered later on. Any finite number such as 3 is used ordinally as representing the order-type of 1, 2, 3 or any similar aggregate, and cardinally as representing the power of 1, 2, 3 or any equivalent aggregate. For reasons that will appear, ω is only used in an ordinal sense. The aggregate 1, 2, 3, &c., in any of its written or spoken forms, may be called the natural scale, and denoted by N. It has already been shown that N is infinite: this appears in a more elementary way from the fact that $(1, 2, 3, 4, \ldots) \backsimeq (2, 3, 4, 5, \ldots)$, where each element of N is made to correspond with the next following. Any aggregate which is equivalent to the natural scale or a part thereof is said to be *countable*.

5. *Arithmetical Operations.*—When the natural scale N has once been obtained it is comparatively easy, although it requires a long process of induction, to define the arithmetical operations of addition, multiplication and involution, as applied to natural numbers. It can be proved that these operations are free from ambiguity and obey certain formal laws of commutation, &c., which will not be discussed here. Each of the three direct operations leads to an inverse problem which cannot be solved except under certain implied conditions. Let a, b denote any two assigned natural numbers: then it is required to find natural numbers, x, y, z such that

$$a=b+x, \quad a=by, \quad a=z^b$$

respectively. The solutions, when they exist, are perfectly definite, and may be denoted by $a-b$, a/b and $\sqrt[b]{a}$; but they are only possible in the first case when $a>b$, in the second when a is a multiple of b, and in the third when a is a perfect bth power. It is found to be possible, by the construction of certain elements, called respectively *negative*, *fractional* and *irrational numbers*, and *zero*, to remove all these restrictions.

6. There are certain properties, common to the aggregates with which we have next to deal, analogous to those possessed by the natural scale, and consequently justifying us in applying the term *number* to any one of their elements. They are stated here, once for all, to avoid repetition; the verification, in each case, will be, for the most part, left to the reader. Each of the aggregates in question (A, suppose) is an ordered aggregate. If α, β are any two elements of A, they may be combined by two definite operations, represented by $+$ and $\times$, so as to produce two definite elements of A represented by $\alpha+\beta$ and $\alpha\times\beta$ (or $\alpha\beta$); these operations obey the formal laws satisfied by those of addition and multiplication. The aggregate A contains one (and only one) element ι, such that if α is any element of A (ι included), then $\alpha+\iota>\alpha$, and $\alpha\iota=\alpha$. Thus A contains the elements ι, $\iota+\iota$, $\iota+\iota+\iota$, &c., or, as we may write them, ι, 2ι, 3ι, . . . $m\iota$ . . . such that $m\iota+n\iota=(m+n)\iota$ and $m\iota\times n\iota=mn\iota$; selected in a definite order, a, b (to be distinguished from b, a, in which the order is reversed). In this way we obtain from N an aggregate of symbols (a, b) which we shall call *couples*, or more precisely, if necessary, *polar couples*. This new aggregate may be arranged in order by means of the following rules:—

Two couples (a, b), (a', b') are said to be equal if $a+b'=a'+b$. In other words (a, b), (a', b') are then taken to be equivalent symbols for the same thing.

If $a+b'>a'+b$, we write $(a, b)>(a', b')$; and if $a+b'<a'+b$, we write $(a, b)<(a', b')$.

The rules for the addition and multiplication of couples are:

$$(a, b)+(a', b')=(a+a', b+b')$$
$$(a, b)\times(a', b')=(aa'+bb', ab'+a'b).$$

The aggregate thus defined will be denoted by $\bar{\mathrm{N}}$; it may be called the scale of relative integers.

If ι denotes $(2, 1)$ or any equivalent couple, $(a, b)+\iota=(a+2, b+1)>(a, b)$ and $(a, b)\times\iota=(2a+b, a+2b)=(a, b)$. Hence ι is the ground element of $\bar{\mathrm{N}}$. By definition, $2\iota=\iota+\iota=(4, 2)=(3, 1)$: and hence by induction $m\iota=(m+1, 1)$, where m is any natural integer. Conversely every couple (a, b) in which $a>b$ can be expressed by the symbol $(a-b)\iota$. In the same way, every couple (a, b) in which $b>a$ can be expressed in the form $(b-a)\iota'$, where $\iota'=(1, 2)$.

8. It follows as a formal consequence of the definitions that $\iota+\iota'=(2, 1)+(1, 2)=(3, 3)=(1, 1)$. It is convenient to denote $(1, 1)$ and its equivalent symbols by 0, because

$$(a, b)+(1, 1)=(a+1, b+1)=(a, b)$$
$$(a, b)\times(1, 1)=(a+b, a+b)=(1, 1);$$

hence $\iota+\iota'=0$, and we can represent $\bar{\mathrm{N}}$ by the scheme—

$$\ldots 3\iota', 2\iota', \iota', 0, \iota, 2\iota, 3\iota \ldots$$

in which each element is obtained from the next before it by the addition of ι. With this notation the rules of operation may be written (m, n, denoting natural numbers)—

$$m\iota+n\iota=(m+n)\iota \quad m\iota'+n\iota'=(m+n)\iota'$$
$$m\iota+n\iota'=(m-n)\iota \text{ if } m>n$$
$$=(n-m)\iota' \quad m<n$$
$$m\iota\times n\iota=mn\iota, \quad m\iota'\times n\iota'=mn\iota, \quad m\iota\times n\iota'=mn\iota',$$

with the special rules for zero, that if a is any element of $\bar{\mathrm{N}}$,

$$a+0=a, \quad a\times 0=0.$$

To each element, a, of $\bar{\mathrm{N}}$ corresponds a definite element a' such that $a+a'=0$; if $a=0$, then $a'=0$, but in every other case a, a' are different and may be denoted by $m\iota$, $m\iota'$. The natural number m is called the *absolute value* of $m\iota$ and $m\iota'$.

9. If α, β are any two elements of $\bar{\mathrm{N}}$, the equation $\xi+\beta=\alpha$ is satisfied by putting $\xi=\alpha+\beta'$. Thus the symbol $\alpha-\beta$ is always interpretable as $\alpha+\beta'$, and we may say that within $\bar{\mathrm{N}}$ subtraction is always possible; it is easily proved to be also free from ambiguity. On the other hand, α/β is intelligible only if the absolute value of α is a multiple of the absolute value of β.

The aggregate $\bar{\mathrm{N}}$ has no first element and no last element. At the same time it is countable, as we see, for instance, by associating the elements 0, $a\iota$, $b\iota'$ with the natural numbers 1, $2a$, $2b+1$ respectively, thus—

$$(\mathrm{N}) \quad 1, 2, 3, 4, 5, 6, \ldots$$
$$(\bar{\mathrm{N}}) \quad 0, \iota, \iota', 2\iota, 2\iota', 3\iota \ldots$$

It is usual to write $+a$ (or simply a) for $a\iota$ and $-a$ for $a\iota'$, so that this should be possible without leading to confusion or ambiguity is certainly remarkable.

10. *Fractional Numbers.*—We will now derive from N different aggregate of couples $[a, b]$ subject to the following rule

The symbols $[a, b]$, $[a', b']$, are equivalent if $ab'=a'b$. According as ab' is greater or less than $a'b$ we regard $[a, b]$ as being greater or less than $[a', b']$. The formulae for addition and multiplication are

$$[a, b]+[a', b']=[ab'+a'b, bb']$$
$$[a, b]\times[a', b']=[aa', bb'].$$

All the couples $[a, a]$ are equivalent to $[1, 1]$, and if we den

this by v we have $[a, b]+v=[a+b, b]>[a, b]$, $[a, b]\times v=[a, b]$, so that v is the ground element of the new aggregate.

Again $2v=v+v=(2, 1)$, and by induction $mv=[m, 1]$. Moreover, if a is a multiple of b, say mb, we may denote $[a, b]$ by mv.

11. The new aggregate of couples will be denoted by R. It differs from N and $\overline{\text{N}}$ in one very important respect, namely, that when its elements are arranged in order of magnitude (that is to say, by the rule above given) they are not isolated from each other. In fact if $[a, b]=\alpha$, and $[a', b']=\alpha'$, the element $[a+a', b+b']$ lies between α and α'; hence it follows that between any two different elements of R we can find as many other elements as we please. This property is expressed by saying that R is in *close order* when its elements are arranged in order of magnitude. Strange as it appears at first sight, R is a countable aggregate; a theorem first proved by G. Cantor. To see this, observe that every element of R may be represented by a "reduced" couple $[a, b]$, in which a, b are prime to each other. If $[a, b]$, $[c, d]$ are any two reduced couples, we will agree that $[a, b]$ is anterior to $[c, d]$ if either (1) $a+b<c+d$, or (2) $a+b=c+d$, but $a<c$. This gives a new criterion by which all the elements of R can be arranged in the succession

$[1, 1]$, $[1, 2]$, $[2, 1]$, $[1, 3]$, $[3, 1]$, $[1, 4]$, $[2, 3]$, $[3, 2]$, $[4, 1]$.

which is similar to the natural scale.

The aggregate R, arranged in order of magnitude, agrees with $\overline{\text{N}}$ in having no least and no greatest element; for if a denotes any element $[a, b]$, then $[2a-1, 2b]<a$, while $[2a+1, 2b]>a$.

12. The division of one element of R by another is always possible; for by definition

$$[c, d]\times[ad, bc]=[acd, bcd]=[a, b],$$

and consequently $[a, b]+[c, d]$ is always interpretable as $[ad, bc]$. As a particular case $[m, 1]+[n, 1]=[m, n]$, so that every element of R is expressible in one of the forms mv, mv/nv. It is usual to omit the symbol v altogether, and to represent the element $[m, n]$ by m/n, whether m is a multiple of n or not. Moreover, $m/1$ is written m, which may be done without confusion, because $m/1+n/1=(m+n)/1$, and $m/1\times n/1=mn/1$, by the rules given above.

13. Within the aggregate R subtraction is not always practicable; but this limitation may be removed by constructing an aggregate $\overline{\text{R}}$ related to R in the same way as $\overline{\text{N}}$ to N. This may be done in two ways which lead to equivalent results. We may either form symbols of the type (α, β), where α, β denote elements of R, and apply the rules of § 7; or else form symbols of the type $[\alpha, \beta]$, where α, β denote elements of $\overline{\text{N}}$, and apply the rules of §10. The final result is that $\overline{\text{R}}$ contains a zero element, o, a ground element v, an element v' such that $v+v'=0$, and a set of elements representable by the symbols $(m/n)v$, $(m/n)v'$. In this notation the rules of operation are

$$\frac{m}{n}v+\frac{m'}{n'}v=\left(\frac{mn'+m'n}{nn'}\right)v,\quad \frac{m}{n}v'+\frac{m'}{n'}v'=\left(\frac{mn'+m'n}{nn'}\right)v';$$

$$\frac{m}{n}v+\frac{m'}{n'}v'=\frac{mn'-m'n}{nn'}v, \text{ or } \frac{m'n-mn'}{nn'}v', \text{ as } mn'>\text{or}<m'n:$$

$$\frac{m}{n}v\times\frac{m'}{n'}v=\frac{mm'}{nn'}v=\frac{m}{n}v'\times\frac{m'}{n'}v'\quad \frac{m}{n}v\times\frac{m'}{n'}v'=\frac{mm'}{nn'}v';$$

$$\frac{m}{n}v+\frac{m'}{n'}v=\frac{mn'}{nn'}v=\frac{m}{n}v'+\frac{m'}{n'}v',\quad \frac{m}{n}v+\frac{m'}{n'}v'=\frac{mn'}{nn'}v'=\frac{m}{n}v'+\frac{m'}{n'}v;$$

$\alpha-\beta=\alpha+\beta'$, where $\beta+\beta'=0$;

$\alpha+0=\alpha$, $\alpha\times 0=0$.

Here α and β denote any two elements of $\overline{\text{R}}$. If $\beta=(m/n)v$, then $\beta'=(m/n)v'$, and if $\beta=(m/n)v'$, then $\beta'=(m/n)v$. If $\beta=0$, then $\beta'=0$.

14. When $\overline{\text{R}}$ is constructed by means of couples taken from $\overline{\text{N}}$, we must put $[m, n]=[m', n']=(m/n)v$, $[m, n']=[m', n]=(m/n)v'$, and $[0, a]=0$, if a is any element of $\overline{\text{N}}$ except o. The symbols $[0, 0]$ and $[a, a]$ are inadmissible; the first because it satisfies the definition of equality (§ 10) with every symbol $[\alpha, \beta]$, and is therefore indeterminate; the second because, according to the rule of addition,

$$[a, 0]+[1, 1]=[a, 0]=[a, 0],$$

which is inconsistent with $\xi+v>\xi$.

In the same way, if o denotes the zero element of $\overline{\text{R}}$, and ξ any other element, the symbol o/o is indeterminate, and ξ/o inadmissible, because, by the formal rules of operation, $\xi/o+v=\xi/o$, which conflicts with the definition of the ground element v. It is usual to write $+\frac{m}{n}$ $\left(\text{or simply } \frac{m}{n}\right)$ for $\frac{m}{n}v$, and $-\frac{m}{n}$ for $\frac{m}{n}v'$. Each of these elements is said to have the absolute value m/n. The criterion for arranging the elements of $\overline{\text{R}}$ in order of magnitude is that, if ξ, η are any two elements of it, $\xi>\eta$ when $\xi-\eta$ is positive; that is to say when it can be expressed in the form $(m/n)v$.

15. The aggregate $\overline{\text{R}}$ is very important, because it is the simplest type of a *field of rationality*, or *corpus*. An algebraic corpus is an aggregate, such that its elements are representable by symbols α, β, &c., which can be combined according to the laws of ordinary algebra; every algebraic expression obtained by combining a finite number of symbols, by means of a finite chain of rational operations, being capable of interpretation as representing a definite element of the aggregate, with the single exception that division by zero is inadmissible. Since, by the laws of algebra, $\alpha-\alpha=0$, and $\alpha/\alpha=1$, every algebraic field contains $\overline{\text{R}}$, or, more properly, an aggregate which is an image of $\overline{\text{R}}$.

16. *Irrational Numbers.*—Let α denote any element of $\overline{\text{R}}$; then α and all lesser elements form an aggregate, A say; the remaining elements form another aggregate A', which we shall call complementary to A, and we may write $\overline{\text{R}}=\text{A}+\text{A}'$. Now the essence of this separation of $\overline{\text{R}}$ into the parts A and A' may be expressed without any reference to α as follows:—

I. The aggregates A, A' are complementary; that is, their elements, taken together, make up the whole of $\overline{\text{R}}$.

II. Every element of A is less than every element of A'.

III. The aggregate A' has no least element. (This condition is artificial, but saves a distinction of cases in what follows.)

Every separation $\overline{\text{R}}=\text{A}+\text{A}'$ which satisfies these conditions is called a *cut* (or *section*), and will be denoted by (A, A') We have seen that every rational number α can be associated with a cut. Conversely, every cut (A, A) in which A has a last element α is perfectly definite, and specifies α without ambiguity. But there are other cuts in which A has no last element. For instance, all the elements (α) of $\overline{\text{R}}$ such that either $\alpha\leqq 0$, or else $\alpha>0$ and $\alpha^2<2$, form an aggregate A, while those for which $\alpha>0$ and $\alpha^2>2$, form the complementary aggregate A'. This separation is a cut in which A has no last element; because if p/q is any positive element of A, the element $(3p+4q)/(2p+3q)$ exceeds p/q, and also belongs to A. *Every cut of this kind is said to define an irrational number.* The justification of this is contained in the following propositions:—

(1) A cut is a definite concept, and the assemblage of cuts is an aggregate according to definition; the generic quality of the aggregate being the separation of $\overline{\text{R}}$ into two complementary parts, without altering the order of its elements.

(2) The aggregate of cuts may be arranged in order by the rule that (A, A')<(B, B') if A is a part of B.

(3) This criterion of arrangement preserves the order of magnitude of all rational numbers.

(4) Cuts may be combined according to the laws of algebra, and, when the cuts so combined are all rational, the results are in agreement with those derived from the rational theory.

As a partial illustration of proposition (4) let (A, A'), (B, B') be any two cuts; and let C' be the aggregate whose elements are obtained by forming all the values of $\alpha'+\beta'$, where α' is any element of A' and β' is any element of B'. Then if C is the complement of C', it can be proved that (C, C') is a cut; this is said to be the sum of (A, A') and (B, B'). The difference, product and quotient of two cuts may be defined in a similar way. If π denotes the irrational cut chosen above for purposes of illustration, we shall have $\pi^2=(\text{C}, \text{C}')$ where C' comprises all the numbers $\alpha'\beta'$ obtained by multiplying any two elements, α', β' which are rational and positive, and such that $\alpha'^2>2$, $\beta'^2>2$. Since $\alpha'^2\beta'^2>4$ it follows that $\alpha'\beta'$ is positive and greater than 2; it can be proved conversely that every rational number which is greater than 2 can be expressed in the form $\alpha'\beta'$. Hence $\pi^2=2$, so that the cut π actually gives a real arithmetical meaning to the positive root of the equation $x^2=2$; in other words we

may say that η defines the irrational number $\sqrt{2}$. The theory of cuts, in fact, provides a logical basis for the treatment of all finite numerical irrationalities, and enables us to justify all arithmetical operations involving the use of such quantities.

17. Since the aggregate of cuts ($\mathfrak{N}$ say) has an order of magnitude, we may construct cuts in this aggregate. Thus if α is any element of $\mathfrak{N}$, and $\mathfrak{A}$ is the aggregate which consists of α and all anterior elements of $\mathfrak{N}$, we may write $\mathfrak{N}=\mathfrak{A}+\mathfrak{A}'$, and $(\mathfrak{A}, \mathfrak{A}')$ is a cut in which $\mathfrak{A}$ has a last element α. It is a remarkable fact that no other kind of cut in $\mathfrak{N}$ is possible; in other words, *every conceivable cut in $\mathfrak{N}$ is defined by one of its own elements*. This is expressed by saying that $\mathfrak{N}$ is a *continuous* aggregate, and $\mathfrak{N}$ itself is referred to *as the numerical continuum* of *real numbers*. The property of continuity must be carefully distinguished from that of close order (§ 11); a continuous aggregate is necessarily in close order, but the converse is not always true. The aggregate $\mathfrak{N}$ is not countable.

18. Another way of treating irrationals is by means of *sequences*. A sequence is an unlimited succession of rational numbers

$$a_1, a_2, a_3 \ldots a_m, a_{m+1} \ldots$$

(in order-type ω) the elements of which can be assigned by a definite rule, such that when any rational number ϵ, however small, has been fixed, it is possible to find an integer m, so that for *all* positive integral values of n the absolute value of $(a_{m+n}-a_m)$ is less than ϵ. Under these conditions the sequence may be taken to represent a definite number, which is, in fact, the limit of a_m when m increases without limit. Every rational number a can be expressed as a sequence in the form $(a, a, a, \ldots)$, but this is only one of an infinite variety of such representations, for instance—

$$1=(\cdot 9,\ \cdot 99,\ \cdot 999,\ \ldots)=\left(\frac{1}{2}, \frac{3}{4}, \frac{7}{8}, \ldots \frac{2^n-1}{2^n} \ldots\right).$$

and so on. The essential thing is that we have a mode of representation which can be applied to rational and irrational numbers alike, and provides a very convenient symbolism to express the results of arithmetical operations. Thus the rules for the sum and product of two sequences are given by the formulae

$$(a_1, a_2, a_3, \ldots)+(b_1, b_2, b_3, \ldots)=(a_1+b_1, a_2+b_2, a_3+b_3 \ldots)$$
$$(a_1, a_2, a_3, \ldots)\times(b_1, b_2, b_3, \ldots)=(a_1b_1, a_2b_2, a_3b_3 \ldots)$$

from which the rules for subtraction and division may be at once inferred. It has been proved that the method of sequences is ultimately equivalent to that of cuts. The advantage of the former lies in its convenient notation, that of the latter in giving a clear definition of an irrational number without having recourse to the notion of a limit.

19. *Complex Numbers.*—If α is an assigned number, rational or irrational, and n a natural number, it can be proved that there is a real number satisfying the equation $x^n=a$, except when n is even and a is negative: in this case the equation is not satisfied by any real number whatever. To remove the difficulty we construct an aggregate of polar couples $\{x, y\}$, where x, y are any two real numbers, and define the addition and multiplication of such couples by the rules

$$\{x, y\}+\{x', y'\}=\{x+x', y+y'\};$$
$$\{x, y\}\times\{x', y'\}=\{xx'-yy', xy'+x'y\}.$$

We also agree that $\{x, y\}<\{x', y'\}$, if $x<x'$ or if $x=x'$ and $y<y'$. It follows that the aggregate has the ground element $\{1, 0\}$, which we may denote by σ; and that, if we write τ for the element $\{0, 1\}$,

$$\tau^2=\{-1, 0\}=-\sigma.$$

Whenever m, n are rational, $\{m, n\}=m\sigma+n\tau$, and we are thus justified in writing, if we like, $x\sigma+y\tau$ for $\{x, y\}$ in all circumstances. A further simplification is gained by writing x instead of $x\sigma$, and regarding τ as a symbol which is such that $\tau^2=-1$, but in other respects obeys the ordinary laws of operation. It is usual to write i instead of τ; we thus have an aggregate $\mathfrak{J}$ of complex numbers $x+yi$. In this aggregate, which includes the real continuum as part of itself, not only the four rational operations (excluding division by $\{0, 0\}$, the zero element), but also the extraction of roots, may be effected without any restriction. Moreover (as first proved by Gauss and Cauchy), if $a_0, a_1, \ldots a_n$ are any assigned real or complex numbers, the equation

$$a_0z^n+a_1z^{n-1}+\ldots+a_{n-1}z+a_n=0,$$

is always satisfied by precisely n real or complex values of z, with a proper convention as to multiple roots. Thus any algebraic function of any finite number of elements of $\mathfrak{J}$ is also contained in $\mathfrak{J}$, which is, in this sense, a closed arithmetical field, just as $\mathfrak{N}$ is when we restrict ourselves to rational operations. The power of $\mathfrak{J}$ is the same as that of $\mathfrak{N}$.

20. *Transfinite Numbers.*—The theory of these numbers is quite recent, and mainly due to G. Cantor. The simplest of them, ω, has been already defined (§ 4) as the order-type of the natural scale. Now there is no logical difficulty in constructing a scheme

$$u_1, u_2, u_3 \ldots \mid v_1,$$

indicating a well-ordered aggregate of type ω immediately followed by a distinct element v_1: for example, we may think of all positive odd integers arranged in ascending order of magnitude and then think of the even number 2. A scheme of this kind is said to be of order-type $(\omega+1)$; and it will be convenient to speak of $(\omega+1)$ as the *index* of the scheme. Similarly we may form arrangements corresponding to the indices

$$\omega+2, \omega+3 \ldots \omega+n,$$

where n is any positive integer. The scheme

$$u_1, u_2, u_3 \ldots \mid v_1, v_2, v_3 \ldots$$

is associated with $\omega+\omega=2\omega$;

$$u_{11}, u_{12}, u_{13} \ldots \mid u_{21}, u_{22}, u_{23} \ldots \mid \ldots \mid u_{n1}, u_{n2} \ldots \mid \ldots$$

with $\omega.\omega$ or ω^2; and so on. Thus we may construct arrangements of aggregates corresponding to any index of the form

$$\phi(\omega)=a\omega^n+b\omega^{n-1}+\ldots+h\omega+l,$$

where $n, a, b, \ldots l$ are all positive integers.

We are thus led to the construction of a scheme of symbols—

I. $1, 2, 3, \ldots n \ldots$

II.
$\omega, \omega+1, \ldots \omega+n, \ldots$
$2\omega, 2\omega+1, \ldots 2\omega+n, \ldots$
$\vdots$
$\omega^2, \omega^2+1, \omega^2+2 \ldots \omega^2+n, \ldots$
$\vdots$
$\phi(\omega), \phi(\omega)+1, \ldots \phi(\omega)+n, \ldots$

III.
$\omega^\omega, \omega^\omega+1, \ldots \omega^\omega+n, \ldots$
$\vdots$
$\omega^{\phi(\omega)}, \omega^{\phi(\omega)}+1, \ldots \omega^{\phi(\omega)}+n, \ldots$

The symbols $\phi(\omega)$ form a countable aggregate: so that we may, if we like (and in various ways), arrange the rows of block (II) in a scheme of type ω: we thus have each element α succeeded in its row by $(\alpha+1)$, and the row containing $\phi(\omega)$ succeeded by a definite next row. The same process may be applied to (III.), and we can form additional blocks (IV.), (V.), &c., with first elements $\omega_4=\omega^{\omega^\omega}$, $\omega_5=\omega^{\omega^{\omega_4}}$ &c. All the symbols in which ω occurs are called *transfinite ordinal numbers*.

21. The index of a finite set is a definite integer however the set may be arranged; we may take this index as also denoting the power of the set, and call it the *number* of things in the set. But the index of an infinite ordinable set depends upon the way in which its elements are arranged; for instance, ind. $(1, 2, 3, \ldots)=\omega$, but ind. $(1, 3, 5, \ldots \mid 2, 4, 6, \ldots)=2\omega$. Or, to take another example, the scheme—

$$\begin{array}{l} 1, 3, 5, \ldots (2n-1) \ldots \\ 2, 6, 10, \ldots 2(2n-1) \ldots \\ \vdots \quad \vdots \quad \vdots \\ 2^m, 2^m.3, 2^m.5, \ldots 2^m(2n-1) \ldots \\ \vdots \end{array}$$

where each row is supposed to follow [illegible] above it, gives a permutation of $(1, 2, 3, \ldots)$, by which its index is changed from ω to ω^2. It has been proved that there is a permutation of the natural scale, of which the index is $\phi(\omega)$, any assigned element of (II.); and that, if the index of any ordered aggregate is $\phi(\omega)$, the aggregate is countable. Thus the power of all aggregates which can be associated with indices of the class (II.) is the same as that of the natural scale; this power may be denoted by α. Since α is associated with all aggregates of α

a: for instance, the arithmetical continuum of positive real numbers, the power of which is denoted by c. Another one is the aggregate of all those order-types which (like those in II. above) are the indices of aggregates of power a. The power of this aggregate is denoted by $\aleph_1$. According to Cantor's theory it is the transfinite cardinal number next superior to a, which for the sake of uniformity is also denoted by $\aleph_0$. It has been conjectured that $\aleph_1 = c$, but this has neither been verified nor disproved. The discussion of the aleph-numbers is still in a controversial stage (November 1907) and the points in debate cannot be entered upon here.

23. Transfinite numbers, both ordinal and cardinal, may be combined by operations which are so far analogous to those of ordinary arithmetic that it is convenient to denote them by the same symbols. But the laws of operation are not entirely the same; for instance, 2ω and $\omega 2$ have different meanings: the first has been explained, the second is the index of the scheme $(a_1 b_1 \mid a_2 b_2 \mid a_3 b_3 \mid \ldots \mid a_n b_n \mid \ldots)$ or any similar arrangement. Again if n is any positive integer, $na = a^n = a$. It should also be observed that according to Cantor's principles of construction every ordinal number is succeeded by a definite next one; but that there are definite ordinal numbers (*e.g.* ω, ω^ω) which have no ordinal immediately preceding them.

24. *Theory of Numbers.*—The theory of numbers is that branch of mathematics which deals with the properties of the natural numbers. As Dirichlet observed long ago, the whole of the subject would be coextensive with mathematical analysis in general; but it is convenient to restrict it to certain fields where the appropriateness of the above definition is fairly obvious. Even so, the domain of the subject is becoming more and more comprehensive, as the methods of analysis become more systematic and more exact.

The first noteworthy classification of the natural numbers is into those which are prime and those which are composite. A prime number is one which is not exactly divisible by any number except itself and 1; all others are composite. The number of primes is infinite (Eucl. *Elem.* ix. 20), and consequently, if n is an assigned number, however large, there is an infinite number (a) of primes greater than n.

If m, n are any two numbers, and $m > n$, we can always find a definite chain of positive integers (q_1, r_1), (q_2, r_2), &c., such that

$$m = q_1 n + r_1, \quad n = q_2 r_1 + r_2, \quad r_1 = q_3 r_2 + r_3, \quad \&c.$$

with $n > r_1 > r_2 > r_3 \ldots$; the process by which they are calculated will be called *residuation*. Since there is only a finite number of positive integers less than n, the process must terminate with two equalities of the form

$$r_{k-2} = q_k r_{k-1} + r_k, \quad r_{k-1} = q_{k+1} r_k.$$

Hence we infer successively that r_k is a divisor of r_{k-1}, $r_{k-2}, \ldots r_1$, and finally of m and n. Also r_k is the greatest common factor of m, n: because any common factor must divide r_1, r_2, and so on down to r_k; and the highest factor of r_k is r_k itself. It will be convenient to write $r_k = \mathrm{dv}(m, n)$. If $r_k = 1$, the numbers m, n are said to be *prime to each other*, or *co-primes*.

25. The foregoing theorem of residuation is of the greatest importance; with the help of it we can prove three other fundamental propositions, namely:—

(1) If m, n are any two natural numbers, we can always find two other natural numbers x, y such that

$$\mathrm{dv}(m,n) = xm - yn.$$

(2) If m, n are prime to each other, and p is a prime factor of mn, then p must be a factor of either m or n.

(3) Every number can be uniquely expressed as a product of prime factors.

Hence if $n = p^\alpha q^\beta r^\gamma \ldots$ is the representation of any number n as the product of powers of different primes, the divisors of n are the terms of the product

$$(1 + p + p^2 + \ldots + p^\alpha)\ (1 + q + \ldots + q^\beta)\ (1 + r + \ldots + r^\gamma) \ldots$$

their number is $(\alpha+1)(\beta+1)(\gamma+1)\ldots$; and their sum is $\Pi(p^{\alpha+1}-1) \div \Pi(p-1)$. This includes 1 and n among the divisors of n.

26. *Totients.*—By the totient of n, which is denoted, after Euler, by $\phi(n)$, we mean the number of integers prime to n, and not exceeding n. If $n = p^\alpha$, the numbers not exceeding n and *not* prime to it are

For example, $15 = \phi(15) + \phi(5) + \phi(3) + \phi(1) = 8 + 4 + 2 + 1$.

27. *Residues and congruences.*—It will now be convenient to include in the term "number" both zero and negative integers. Two numbers a, b are said to be *congruent with respect to the modulus* m, when $(a - b)$ is divisible by m. This is expressed by the notation $a \equiv b \pmod m$, which was invented by Gauss. The fundamental theorems relating to congruences are

If $a \equiv b$ and $c \equiv d \pmod m$, then $a \pm c \equiv b \pm d$, and $ab \equiv cd$.

If $ha \equiv hb \pmod m$ then $a \equiv b \pmod{m/d}$, where $d = \mathrm{dv}(h, m)$.

Thus the theory of congruences is very nearly, but not quite, similar to that of algebraic equations. With respect to a given modulus m the scale of relative integers may be distributed into m classes, any two elements of each class being congruent with respect to m. Among these will be $\phi(m)$ classes containing numbers prime to m. By taking any one number from each class we obtain a *complete system of residues* to the modulus m. Supposing (as we shall always do) that m is positive, the numbers $0, 1, 2, \ldots (m-1)$ form a system of least positive residues; according as m is odd or even, $0, \pm 1, \pm 2, \ldots \pm \frac{1}{2}(m-1)$, or $0, \pm 1, \pm 2, \ldots \pm \frac{1}{2}(m-2), \frac{1}{2}m$ form a system of absolutely least residues.

28. *The Theorems of Fermat and Wilson.*—Let $r_1, r_2, \ldots r_t$ where $t = \phi(m)$, be a complete set of residues prime to the modulus m. Then if x is any number prime to m, the residues $xr_1, xr_2, \ldots xr_t$ also form a complete set prime to m (§ 27). Consequently $xr_1 \cdot xr_2 \ldots xr_t \equiv r_1 r_2 \ldots r_t$, and dividing by $r_1 r_2 \ldots r_t$, which is prime to the modulus, we infer that

$$x^{\phi(m)} \equiv 1 \pmod m.$$

which is the general statement of Fermat's theorem. If m is a prime p, it becomes $x^{p-1} \equiv 1 \pmod p$.

For a prime modulus p there will be among the set $x, 2x, 3x, \ldots (p-1)x$ just one and no more that is congruent to 1: let this be xy. If $y = x$, we must have $x^2 - 1 = (x-1)(x+1) \equiv 0$, and hence $x \equiv \pm 1$: consequently the residues $2, 3, 4, \ldots (p-2)$ can be arranged in $\frac{1}{2}(p-3)$ pairs (x, y) such that $xy \equiv 1$. Multiplying them all together, we conclude that $2.3.4 \ldots (p-2) \equiv 1$ and hence, since $1.(p-1) \equiv -1$,

$$(p-1)! \equiv -1 \pmod p.$$

which is Wilson's theorem. It may be generalized, like that of Fermat, but the result is not very interesting. If m is composite $(m-1)! + 1$ cannot be a multiple of m: because m will have a prime factor p which is less than m, so that $(m-1)! \equiv 0 \pmod p$. Hence Wilson's theorem is invertible: but it does not supply any practical test to decide whether a given number is prime.

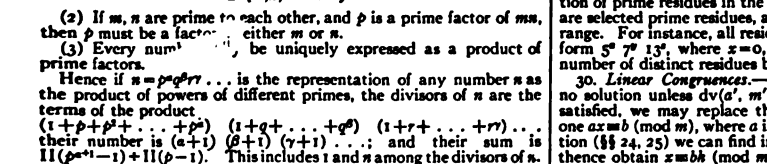
29. *Exponents, Primitive Roots, Indices.*—Let p denote an odd prime, and x any number prime to p. Among the powers $x, x^2, x^3, \ldots x^{p-1}$ there is certainly one, namely x^{p-1}, which $\equiv 1 \pmod p$; let x^e be the lowest power of x such that $x^e \equiv 1$. Then e is said to be the exponent to which x appertains (mod p): it is always a factor of $(p-1)$ and can only be 1 when $x \equiv 1$. The residues x for which $e = p - 1$ are said to be *primitive roots of* p. They always exist, their number is $\phi(p-1)$, and they can be found by a methodical, though tedious, process of exhaustion. If g is any one of them, the complete set may be represented by g, g^a, g^b, . . . &c. where a, b, &c., are the numbers less than $(p-1)$ and prime to it, other than 1. Every number x which is prime to p is congruent, mod p, to g^i, where i is one of the numbers $1, 2, 3, \ldots (p-1)$; this number i is called *the index of* x *to the base* g. Indices are analogous to logarithms: thus

$$\mathrm{ind}_g(xy) \equiv \mathrm{ind}_g x + \mathrm{ind}_g \gamma.\ \mathrm{ind}_g(x^k) \equiv k\ \mathrm{ind}_g x \pmod{\overline{p-1}}.$$

Consequently tables of primitive roots and indices for different primes are of great value for arithmetical purposes. Jacobi's *Canon Arithmeticus* gives a primitive root, and a table of numbers and indices for all primes less than 1000.

For moduli of the forms $2p$, p^m, $2p^m$ there is an analogous theory (and also for 2 and 4); but for a composite modulus of other forms there are no primitive roots, and the nearest analogy is the representation of prime residues in the form $\alpha^x \beta^y \gamma^z \ldots$, where $\alpha, \beta, \gamma, \ldots$ are selected prime residues, and $x, y, z, \ldots$ are indices of restricted range. For instance, all residues prime to 48 can be exhibited in the form $5^x 7^y 13^z$, where $x = 0, 1, 2, 3$; $y = 0, 1$; $z = 0, 1$; the total number of distinct residues being $4.2.2 = 16 = \phi(48)$, as it should be.

30. *Linear Congruences.*—The congruence $a'x \equiv b' \pmod{m'}$ has no solution unless $\mathrm{dv}(a', m')$ is a factor of b'. If this condition is satisfied, we may replace the given congruence by the equivalent one $ax \equiv b \pmod m$, where a is prime to b as well as to m. By residuation (§§ 24, 25) we can find integers h, k such that $ah - mk = 1$, and thence obtain $x \equiv bh \pmod m$ as the complete solution of the given congruence. To the modulus m' there are m'/m incongruent solutions. For example, $12x \equiv 30 \pmod{21}$ reduces to $2x \equiv 5 \pmod 7$ whence $x \equiv 6 \pmod 7 \equiv 6, 13, 20 \pmod{21}$. There is a theory of simultaneous



linear congruences in any number of variables, first developed with precision by Smith. In any particular case, it is best to replace as many as possible of the given congruences by an equivalent set obtained by successively eliminating the variables x, y, z, . . . in order. An important problem is to find a number which has given residues with respect to a given set of moduli. When possible, the solution is of the form $x \equiv a \pmod{m}$, where m is the least common multiple of the moduli. Supposing that p is a prime, and that we have a corresponding table of indices, the solution of $ax \equiv b \pmod{p}$ can be found by observing that $\operatorname{ind} x \equiv \operatorname{ind} b - \operatorname{ind} a \pmod{p-1}$.

31. *Quadratic Residues. Law of Reciprocity.*—To an odd prime modulus p, the numbers $1, 4, 9, \ldots (p-1)^2$ are congruent to $\frac{1}{2}(p-1)$ residues only, because $(p-x)^2 \equiv x^2$. Thus for $p=5$, we have $1, 4, 9, 16 \equiv 1, 4, 4, 1$ respectively. There are therefore $\frac{1}{2}(p-1)$ quadratic residues and $\frac{1}{2}(p-1)$ quadratic non-residues prime to p; and there is a corresponding division of incongruent classes of integers with respect to p. The product of two residues or of two non-residues is a residue; that of a residue and a non-residue is a non-residue; and taking any primitive root as base the index of any number is even or odd according as the number is a residue or a non-residue. Gauss writes $a \mathrm{R} p$, $a \mathrm{N} p$ to denote that a is a residue or non-residue of p respectively.

Given a table of indices, the solution of $x^2 \equiv a \pmod{p}$ when possible, is found from $2\operatorname{ind} x \equiv \operatorname{ind} a \pmod{p-1}$, and the result may be written in the form $x \equiv \pm r \pmod{p}$. But it is important to discuss the congruence $x^2 \equiv a$ without assuming that we have a table of indices. It is sufficient to consider the case $x^2 \equiv q \pmod{p}$, where q is a positive prime less than p; and the question arises whether the quadratic character of q with respect to p can be deduced from that of p with respect to q. The answer is contained in the following theorem, which is called *the law of quadratic reciprocity* (for real positive odd primes): if p, q are each or one of them of the form $4n+1$, then p, q are each of them a residue, or each a non-residue of the other; but if p, q are each of the form $4n+3$, then according as p is a residue or non-residue of q we have q a non-residue or a residue of p.

Legendre introduced a symbol $\left(\frac{m}{q}\right)$ which denotes $+1$ or -1 according as $m \mathrm{R} q$ or $m \mathrm{N} q$ (q being a positive odd prime and m any number prime to q); with its help we may express the law of reciprocity in the form

$$\left(\frac{p}{q}\right)\left(\frac{q}{p}\right) = (-1)^{\frac{1}{2}(p-1)(q-1)}.$$

This theorem was first stated by Legendre, who only partly proved it; the first complete proof, by induction, was published by Gauss, who also discovered five (or six) other more or less independent proofs of it. Many others have since been invented.

There are two supplementary theorems relating to -1 and 2 respectively, which may be expressed in the form

$$\left(\frac{-1}{p}\right) = (-1)^{\frac{1}{2}(p-1)}, \quad \left(\frac{2}{p}\right) = (-1)^{\frac{1}{8}(p^2-1)},$$

where p is any positive odd prime.

It follows from the definition that

$$\left(\frac{p_1^{\alpha} p_2^{\beta} p_3^{\gamma} \ldots}{q}\right) = \left(\frac{p_1}{q}\right)^{\alpha}\left(\frac{p_2}{q}\right)^{\beta}\left(\frac{p_3}{q}\right)^{\gamma} \ldots$$

and that $\left(\frac{m}{q}\right) = \left(\frac{m'}{q}\right)$, if $m \equiv m' \pmod{q}$. As a simple application of the law of reciprocity, let it be required to find the quadratic character of 11 with respect to 1907. We have

$$\left(\frac{11}{1907}\right) = -\left(\frac{1907}{11}\right) = -\left(\frac{6}{11}\right) = 1$$

because $6 \mathrm{N} 11$. Hence $11 \mathrm{R} 1907$.

Legendre's symbol was extended by Jacobi in the following manner. Let P be any positive odd number, and let p, p', p'', &c. be its (equal or unequal) prime factors, so that $\mathrm{P} = pp'p'' \ldots$. Then if Q is any number prime to P, we have a generalized symbol defined by

$$\left(\frac{\mathrm{Q}}{\mathrm{P}}\right) = \left(\frac{\mathrm{Q}}{p}\right)\left(\frac{\mathrm{Q}}{p'}\right)\left(\frac{\mathrm{Q}}{p''}\right) \ldots$$

This symbol obeys the law that, if Q is odd and positive,

$$\left(\frac{\mathrm{P}}{\mathrm{Q}}\right)\left(\frac{\mathrm{Q}}{\mathrm{P}}\right) = (-1)^{\frac{1}{2}(\mathrm{P}-1)(\mathrm{Q}-1)},$$

with the supplementary laws

$$\left(\frac{-1}{\mathrm{P}}\right) = (-1)^{\frac{1}{2}(\mathrm{P}-1)}, \quad \left(\frac{2}{\mathrm{P}}\right) = (-1)^{\frac{1}{8}(\mathrm{P}^2-1)}.$$

It is found convenient to add the conventions that

$$\left(\frac{\mathrm{Q}}{-\mathrm{P}}\right) = \left(\frac{\mathrm{Q}}{\mathrm{P}}\right)$$

when Q and P are both odd; and that the value of the symbol is 0 when P, Q are not co-primes.

In order that the congruence $x^2 \equiv a \pmod{m}$ may have a solution it is necessary and sufficient that a be a residue of each distinct prime factor of m. If these conditions are all satisfied, and $m = 2^{\kappa} p^{\lambda} q^{\mu} \ldots$, where p, q, &c., are the distinct odd prime factors of m, being i in all, the number of incongruent solutions of the given congruence is 2^i, 2^{i+1} or 2^{i+2}, according as $\kappa < 2$, $\kappa = 2$, or $\kappa > 2$ respectively. The actual solutions are best found by a process of exhaustion. It should be observed that $\left(\frac{a}{m}\right) = 1$ is a necessary but not a sufficient condition for the possibility of the congruence.

32. *Quadratic forms.*—It will be observed that the solution of the linear congruence $ax \equiv b \pmod{m}$ leads to all the representations of b in the form $ax + my$, where x, y are integers. Many of the earliest researches in the theory of numbers deal with particular cases of the problem: given four numbers m, a, b, c, it is required to find all the integers x, y (if there be any) which satisfy the equation $ax^2 + bxy + cy^2 = m$. Fermat, for instance, discovered that every positive prime of the form $4n+1$ is uniquely expressible as the sum of two squares. There is a corresponding arithmetical theory for forms of any degree and any number of variables; only those of linear forms and binary quadratics are in any sense complete, as the difficulty of the problem increases very rapidly with the increase of the degree of the form considered or of the number of variables contained in it.

The form $ax^2 + bxy + cy^2$ will be denoted by $(a, b, c)\,(x, y)^2$ or more simply by (a, b, c) when there is no need of specifying the variables. If k is the greatest common factor of a, b, c, we may write $(a, b, c) = k(a', b', c')$ where (a', b', c') is a *primitive* form, that is, one for which $\mathrm{d}v\,(a', b', c') = 1$. The other form is then said to be derived from (a', b', c') and to have a divisor k. For the present we shall concern ourselves only with primitive forms. Writing $\mathrm{D} = b^2 - 4ac$, the invariant D is called the *determinant* of (a, b, c), and there is a first classification of forms into *definite* forms for which D is negative, and *indefinite* forms for which D is positive. The case $\mathrm{D} = 0$ or a positive square is rejected, because in that case the form breaks up into the product of two linear factors. It will be observed that $\mathrm{D} \equiv 0$, $1 \pmod{4}$ according as b is even or odd; and that if k^2 is any odd square factor of D there will be forms of determinant D and divisor k.

If we write $x' = \alpha x + \beta y$, $y' = \gamma x + \delta y$, we have identically

$$(a, b, c)\,(x', y')^2 = (a', b', c')\,(x, y)^2$$

where

$$\begin{aligned} a' &= a\alpha^2 + b\alpha\gamma + c\gamma^2 \\ b' &= 2a\alpha\beta + b(\alpha\delta + \beta\gamma) + 2c\gamma\delta \\ c' &= a\beta^2 + b\beta\delta + \delta^2 \end{aligned}$$

Hence also

$$\mathrm{D}' = b'^2 - 4a'c' = (\alpha\delta - \beta\gamma)^2 (b^2 - 4ac) = (\alpha\delta - \beta\gamma)^2 \mathrm{D}.$$

Supposing that α, β, γ, δ are integers such that $\alpha\delta - \beta\gamma = n$, a number different from zero, (a, b, c) is said to be transformed into (a', b', c') by the substitution $\left(\begin{smallmatrix} \alpha, \beta \\ \gamma, \delta \end{smallmatrix}\right)$ of the nth order. If $n = 1$, the two forms are said to be *equivalent*, and the equivalence is said to be *proper* or *improper* according as $n = 1$ or $n = -1$. In the case of equivalence, not only are x', y' integers wherever x, y are so, but conversely, hence every number representable by (a, b, c) is representable by (a', b', c') and conversely. For the present we shall deal with proper equivalence only and write $f \sim f'$ to indicate that the forms f, f' are properly equivalent. Equivalent forms have the same divisor. A complete set of equivalent forms is said to form a *class*; classes of the same divisor are said to form an *order*, and of these the most important is the *principal* order, which consists of the primitive classes. It is a fundamental theorem that for a given determinant the number of classes is finite; this is proved by showing that every class must contain one at least of a certain finite number of so-called *reduced* forms, which can be found by definite rules of calculation.

33. *Method of Reduction.*—This differs according as D is positive or negative, and will require some preliminary lemmas. Suppose that any complex quantity $z = x + yi$ is represented in the usual way by a point (x, y) referred to rectangular axes. Then by plotting off all the points corresponding to $(\alpha z + \beta) / (\gamma z + \delta)$, we obtain a complete set of properly equivalent points. These all lie on the same side of the axis of x, and there is precisely one of them and no more which satisfies the conditions: (i.) that it is not outside the area which is bounded by the lines $2x = \pm 1$; (ii.) that it is not inside the circle $x^2 + y^2 = 1$; (iii.) that it is not on the line $2x = 1$, or on the arcs of the circle $x^2 + y^2 = 1$ intercepted by $2x = 1$ and $x = 0$. This point will be called the *reduced* point equivalent to z. In the positive half-plane ($y > 0$) the aggregate of all reduced points occupies the interior and half the boundary of the area which will be called the *fundamental triangle*, because the areas equivalent to it, and finite, are all triangles bounded by circular arcs, and having angles $\frac{1}{3}\pi$, $\frac{1}{3}\pi$, 0 and the fundamental triangle may be considered as a special case when one vertex goes to infinity. The aggregate of equivalent triangles forms a kind of mosaic which fills up the whole of the positive half-plane. It will be convenient to denote the fundamental triangle (with its half-boundary, for which $x < 0$) by ∇; for a reason which will appear later, the set of equivalent triangles will be said to make up the *modular dissection* of the positive half-plane.

(ii.) $b' = a',\ a' \leqq c'$
(iii.) $a' = c',\ 0 < b' \leqq a'$.

Cases (ii.) and (iii.) only occur when the representative point is on the boundary of ∇. A form whose representative point is reduced is said to be a reduced form. It follows from the geometrical theory that every form is equivalent to a reduced form, and that there are as many distinct classes of positive forms of determinant $-\Delta$ as there are reduced forms. The total number of reduced forms is limited, because in case (i.) we have $\Delta = 4ac - b^2 > 3b^2$, so that $b < \sqrt{\frac{1}{3}\Delta}$, while $4a^2 < 4ac < \Delta + b^2 < \frac{4}{3}\Delta$; in case (ii.) $\Delta = 4ac - a^2 > 3a^2$, or else $a = b = c = \sqrt{\frac{1}{3}\Delta}$; in case (iii.) $\Delta = 4a^2 - b^2 > 3b^2$, $4a^2 = \Delta + b^2 < \frac{4}{3}\Delta$, or else $a = b = c = \sqrt{\frac{1}{3}\Delta}$. With the help of these inequalities a complete set of reduced forms can be found by trial, and the number of classes determined. The latter cannot exceed $\frac{1}{3}\Delta$; it is in general much less.

With an indefinite form (a, b, c) we may associate the representative circle

$$a(x^2 + y^2) + bx + c = 0,$$

which cuts the axis of x in two real points. The form is said to be reduced if this circle cuts ∇; the condition for this is $a(a \pm \frac{1}{2}b + c) < 0$, which can be expressed in the form $3a^2 + (a \pm b)^2 < D$, and it is hence clear that the absolute values of a, b, and therefore of c, are limited. As before, there are a limited number of reduced forms, but they are not all non-equivalent. In fact they arrange themselves, according to a law which is not very difficult to discover, in cycles or *periods*, each of which is associated with a particular class. The main result is the same as before: that the number of classes is finite, and that for each class we can find a representative form by a finite process of calculation.

34. *Problem of Representation.*—It is required to find out whether a given number m' can be represented by the given form (a', b', c'). One condition is clearly that the divisor of the form must be a factor of m'. Suppose this is the case; and let m, (a, b, c) be the quotients of m' and (a', b', c') be the divisor in question. Then we have now to discover whether m can be represented by the primitive form (a, b, c). First of all we will consider proper representations

$$m = (a, b, c)\ (\alpha, \gamma)^2$$

where α, γ are co-primes. Determine integers β, δ such that $\alpha\delta - \beta\gamma = 1$, and apply to (a, b, c) the substitution $\begin{pmatrix} \alpha, & \beta \\ \gamma, & \delta \end{pmatrix}$; the new form will be (m, n, l), where

$$n^2 - 4ml = D = b^2 - 4ac.$$

Consequently $n^2 \equiv D \pmod{4m}$, and D must be a quadratic residue of m. Unless this condition is satisfied, there is no proper representation of m by any form of determinant D. Suppose, however, that $n^2 \equiv D \pmod{4m}$ is soluble and that n_1, n_2, &c. are its roots. Taking any one of these, say n_1, we can find out whether (m, n_1, l_1) and (a, b, c) are equivalent; if they are, there is a substitution $\begin{pmatrix} \alpha, & \beta \\ \gamma, & \delta \end{pmatrix}$ which converts the latter into the former, and then $m = a\alpha^2 + b\alpha\gamma + c\gamma^2$. As to derived representations, if $m = (a, b, c)\ (tx, ty)^2$, then m must have the square factor t^2, and $m/t^2 = (a, b, c)\ (x, y)^2$; hence everything may be made to depend on proper representation by primitive forms.

35. *Automorphs. The Pellian Equation.*—A primitive form (a, b, c) is, by definition, equivalent to itself; but it may be so in more ways than one. In order that (a, b, c) may be transformed into itself by the substitution $\begin{pmatrix} \alpha, & \beta \\ \gamma, & \delta \end{pmatrix}$, it is necessary and sufficient that

$$\begin{pmatrix} \alpha, & \beta \\ \gamma, & \delta \end{pmatrix} = \begin{pmatrix} \frac{1}{2}(t + bu), & -cu \\ au, & \frac{1}{2}(t - bu) \end{pmatrix}$$

where (t, u) is an integral solution of

$$t^2 - Du^2 = 4.$$

If D is negative and $-D > 4$, the only solutions are $t = \pm 2$, $u = 0$; $D = -3$ gives $(\pm 2, 0)$, $(\pm 1, \pm 1)$; $D = -4$ gives $(\pm 2, 0)$, $(0, \pm 1)$. On the other hand, if $D > 0$ the number of solutions is infinite, and if (t_1, u_1) is the solution for which t, u have their least positive values, all the other positive solutions may be found from

$$\frac{t_n + u_n\sqrt{D}}{2} = \left(\frac{t_1 + u_1\sqrt{D}}{2}\right)^n (n = 2, 3, 4 \ldots).$$

The substitutions by which (a, b, c) is transformed into itself are called its *automorphs*. In the case when $D \equiv 0 \pmod 4$ we have $t = 2T$, $u = 2U$, $D = 4N$, and (T, U) any solution of

$$T^2 - NU^2 = 1.$$

This is usually called the Pellian equation, though it should properly be associated with Fermat, who first perceived its importance. The

where $b^2 - 4ac = 4ac'$. In particular, if $b = 0 \pmod a$ the form (a, b, c) is improperly equivalent to itself. A form improperly equivalent to itself is said to be *ambiguous*.

36. *Characters of a form or class. Genera.*—Let (a, b, c) be any primitive form; we have seen above (§ 32) that if $\alpha, \beta, \gamma, \delta$ are any integers

$$4(a\alpha^2 + b\alpha\gamma + c\gamma^2)(a\beta^2 + b\beta\delta + c\delta^2) = b'^2 - (a\delta - \beta\gamma)^2 D$$

where $b' = 2a\alpha\beta + b(a\delta + \beta\gamma) + 2c\gamma\delta$. Now the expressions in brackets on the left hand may denote any two numbers m, n representable by the form (a, b, c); the formula shows that $4mn$ is a residue of D, and hence mn is a residue of every odd prime factor of D, and if p is any such factor the symbols $\left(\frac{m}{p}\right)$ and $\left(\frac{n}{p}\right)$ will have the same value. Putting $(a, b, c) = f$, this common value is denoted by $\left(\frac{f}{p}\right)$ and called a *quadratic character* (or simply character) of f with respect to p. Since a is representable by f $(x = 1, y = 0)$ the value $\left(\frac{f}{p}\right)$ is the same as $\left(\frac{a}{p}\right)$. For example, if $D = -140$, the scheme of characters for the six reduced primitive forms, and therefore for the classes they represent, is

	$\left(\frac{f}{5}\right)$	$\left(\frac{f}{7}\right)$
$(1, 0, 35)$	+	+
$(4, \pm 2, 9)$		
$(5, 0, 7)$	−	−
$(3, \pm 2, 12)$		

In certain cases there are supplementary characters of the type $\left(\frac{-1}{f}\right)$ and $\left(\frac{2}{f}\right)$, and the characters $\left(\frac{f}{p}\right)$ are discriminated according as an odd or even power of p is contained in D; but in every case there are certain combinations of characters (in number one-half of all possible combinations) which form the *total characters* of actually existing classes. Classes which have the same total character are said to belong to the same *genus*. Each genus of the same order contains the same number of classes.

For any determinant D we have a principal primitive class for which all the characters are +; this is represented by the principal form $(1, 0, -n)$ or $(1, 1, -n)$ according as D is of the form $4n$ or $4n + 1$. The corresponding genus is called the principal genus. Thus, when $D = -140$, it appears from the table above that in the primitive order there are two genera, each containing three classes; and the non-existent total characters are + − and − +.

37. *Composition.*—Considering X, Y as given lineo-linear functions of (x, y), (x', y') defined by the equations

$$X = p_0xx' + p_1xy' + p_2x'y + p_3yy'$$
$$Y = q_0xx' + q_1xy' + q_2x'y + q_3yy'$$

we may have identically, in x, y, x', y',

$$(A, B, C)\ (X, Y)^2 = (a, b, c)\ (x, y)^2 \times (a', b', c')\ (x', y')^2$$

and, this being so, the form (A, B, C) is said to be compounded of the two forms (a, b, c), (a', b', c'), the order of composition being indifferent. In order that two forms may admit of composition into a third, it is necessary and sufficient that their determinants be in the ratio of two squares. The most important case is that of two primitive forms ϕ, χ of the same determinant; these can be compounded into a form denoted by $\phi\chi$ or $\chi\phi$ which is also primitive and of the same determinant as ϕ or χ. If A, B, C are the classes to which ϕ, χ, $\phi\chi$ respectively belong, then any form of A compounded with any form of B gives rise to a form belonging to C. For this reason we write $C = AB = BA$, and speak of the multiplication or composition of classes. The principal class is usually denoted by 1, because when compounded with any other class A it gives this same class A.

The total number of primitive classes being finite, h, say, the series A, A^2, A^3, &c., must be recurring, and there will be a least exponent ϵ such that $A^\epsilon = 1$. This exponent is a factor of h, so that every class satisfies $A^h = 1$. Composition is associative as well as commutative, that is to say, $(AB)C = A(BC)$; hence the symbols $A_1, A_2, \ldots A_h$ for the h different classes define an Abelian group (see GROUPS) of order h, which is representable by one or more base-classes $B_1, B_2, \ldots B_t$ in such a way that each class A is enumerated once and only once by putting

$$A = B_1^x B_2^y \ldots B_t^s \quad (x \leq m, y \leq n, \ldots s \leq \rho)$$

with $mn \ldots \rho = h$, and $B_1^m = B_2^n = \ldots = B_t^\rho = 1$. Moreover, the bases may be so chosen that m is a multiple of n, n of the next corresponding index, and so on. The same thing may be said with regard

to the symbols for the classes contained in the principal genus, because two forms of that genus compound into one of the same kind. If this latter group is cyclical, that is, if all the classes of the principal genus can be represented in the form 1, A, A^2, ... A^{w-1}, the determinant D is said to be *regular*; if not, the determinant is irregular. It has been proved that certain specified classes of determinants are always irregular; but no complete criterion has been found, other than working out the whole set of primitive classes, and determining the group of the principal genus, for deciding whether a given determinant is irregular or not.

If A, B are any two classes, the total character of AB is found by compounding the characters of A and B. In particular, the class A^2, which is called the duplicate of A, always belongs to the principal genus. Gauss proved, conversely, that every class in the principal genus may be expressed as the duplicate of a class. An ambiguous class satisfies $A^2=1$, that is, its duplicate is the principal class; and the converse of this is true. Hence if $B_1, B_2, \ldots B_t$ are the base-classes for the whole composition-group, and $A=B_1^{\alpha}B_2^{\beta}\ldots B_t^{\tau}$ (as above) $A^2=1$, if $2\alpha=0$ or w, $2\beta=0$ or w, &c.; hence the number of ambiguous classes is 2^t. As an example, when $D=-1460$, there are four ambiguous classes, represented by

$$(1, 0, 365),\ (2, 2, 183),\ (5, 0, 73),\ (10, 10, 39);$$

hence the composition-group must be dibasic, and in fact, if we put B_1, B_2 for the classes represented by (11, 6, 34) and (2, 2, 183), we have $B_1^{10}=B_2^2=1$ and the 20 primitive classes are given by $B_1^{\alpha}B_2^{\beta}$ ($\alpha\leq 10$, $\gamma\leq 2$). In this case the determinant is regular and the classes in the principal genus are 1, B_1^2, B_1^4, B_1^6, B_1^8.

38. On account of its historical interest, we may briefly consider the form x^2+y^2, for which $D=-4$. If p is an odd prime of the form $4n+1$, the congruence $m^2\equiv -4 \pmod{4p}$ is soluble (§ 31); let one of its roots be m, and $m^2+4=4lp$. Then (p, m, l) is of determinant -4, and, since there is only one primitive class for this determinant, we must have $(p, m, l)\sim(1, 0, 1)$. By known rules we can actually find a substitution $\begin{pmatrix}\alpha, & \beta\\ \gamma, & \delta\end{pmatrix}$ which converts the first form into the second; this being so, $\begin{pmatrix}\delta, & -\beta\\ -\gamma, & \alpha\end{pmatrix}$ will transform the second into the first, and we shall have $p=\gamma^2+\delta^2$, a representation of p as the sum of two squares. This is unique, except that we may put $p=(\pm\gamma)^2+(\pm\delta)^2$. We also have $2=1^2+1^2$ while no prime $4n+3$ admits of such a representation.

The theory of composition for this determinant is expressed by the identity $(x^2+y^2)(x'^2+y'^2)=(xx'\pm yy')^2+(xy'\mp yx')^2$; and by repeated application of this, and the previous theorem, we can show that if $N=2^{\sigma}p^{\alpha}q^{\beta}\ldots$, where $p, q, \ldots$ are odd primes of the form $4n+1$, we can find solutions of $N=x^2+y^2$, and indeed *distinct* solutions. For instance $65=1^2+8^2=4^2+7^2$, and conversely two distinct representations $N=x^2+y^2=u^2+v^2$ lead to the conclusion that N is composite. This is a simple example of the application of the theory of forms to the difficult problem of deciding whether a given large number is prime or composite; an application first indicated by Gauss, though, in the present simple case, probably known to Fermat.

39. *Number of classes. Class-number Relations.*—It appears from Gauss's posthumous papers that he solved the very difficult problem of finding a formula for $h(D)$, the number of properly primitive classes for the determinant D. The first published solution, however, was that of P. G. L. Dirichlet; it depends on the consideration of series of the form $\Sigma(ax^2+bxy+cy^2)^{-1-s}$ where s is a positive quantity, ultimately made very small. L. Kronecker has shown the connexion of Dirichlet's results with the theory of elliptic functions, and obtained more comprehensive formulae by taking (a, b, c) as the standard type of a quadratic form, whereas Gauss, Dirichlet, and most of their successors, took $(a, 2b, c)$ as the standard, calling (b^2-ac) its determinant. As a sample of the kind of formulae that are obtained, let p be a prime of the form $4n+3$; then

$$h(-4p)=\Sigma\alpha-\Sigma\beta,\quad h(4p)\log(t+u\sqrt{p})=\log\Pi\left(\tan\frac{b\pi}{4p}\right)$$

where in the first formula $\Sigma\alpha$ means the sum of all quadratic residues of p contained in the series $1, 2, 3, \ldots \frac{1}{2}(p-1)$ and $\Sigma\beta$ is the sum of the remaining non-residues; while in the second formula (t, u) is the least positive solution of $t^2-pu^2=1$, and the product extends to all values of b in the set $1, 3, 5, \ldots(4p-1)$ of which p is a non-residue. The remarkable fact will be noticed that the second formula gives a solution of the Pellian equation in a trigonometrical form.

Kronecker was the first to discover, in connexion with the complex multiplication of elliptic functions, the simplest instances of a very curious group of arithmetical formulae involving sums of class-numbers and other arithmetical functions; the theory of these relations has been greatly extended by A. Hurwitz. The simplest of all these theorems may be stated as follows. Let $H(\Delta)$ represent the number of classes for the determinant $-\Delta$, with the convention that $\frac{1}{3}$ and not 1 is to be reckoned for each class containing a reduced form of the type $(a, 0, a)$ and $\frac{1}{2}$ for each class containing a reduced form (a, a, a); then if n is any positive integer,

$$\sum_{\kappa=0,\ \pm 1,\ \ldots} H(4n-\kappa^2)=\Phi(n)+\Psi(n)\qquad(-2\sqrt{n}\leq\kappa\leq 2\sqrt{n})$$

where $\Phi(n)$ means the sum of the divisors of n, and $\Psi(n)$ means the excess of the sum of those divisors of n which are greater than $\sqrt{n}$ over the sum of those divisors which are less than $\sqrt{n}$. The formula is obtained by calculating in two different ways the number of reduced values of s which satisfy the modular equation $J(ns)=J(s)$, where $J(z)$ is the absolute invariant which, for the elliptic function $\wp(u;\ g_2, g_3)$ is $g_2^3+(g_2^3-27g_3^2)$, and s is the ratio of any two primitive periods taken so that the real part of is is negative (see below, § 68). It should be added that there is a series of scattered papers by J. Liouville, which implicitly contain Kronecker's class-number relations, obtained by a purely arithmetical process without any use of transcendents.

40. *Bilinear Forms.*—A bilinear form means an expression of the type $\Sigma a_{ik}x_iy_k$ ($i=1, 2, \ldots m$; $k=1, 2, \ldots n$); the most important case is when $m=n$, and only this will be considered here. The invariants of a form are its determinant $[a_{ik}]$ and the elementary factors thereof. Two bilinear forms are equivalent when each can be transformed into the other by linear integral substitutions $x'=\Sigma\alpha x$, $y'=\Sigma\beta y$. Every bilinear form is equivalent to a *reduced* form $\Sigma_1^r x_iy_i$, and $r=n$, unless $[a_{ik}]=0$. In order that two forms may be equivalent it is necessary and sufficient that their invariants should be the same. Moreover, if $a\sim b$ and $c\sim d$, and if the invariants of the forms $a+\lambda c$, $b+\lambda d$ are the same for all values of λ, we shall have $a+\lambda c\sim b+\lambda d$, and the transformation of one form to the other may be effected by a substitution which does not involve λ. The theory of bilinear forms practically includes that of quadratic forms, if we suppose x_i, y_i to be cogredient variables. Kronecker has developed the case when $n=2$, and deduced various class-relations for quadratic forms in a manner resembling that of Liouville. So far as the bilinear forms are concerned, the main result is that the number of classes for the positive determinant $a_{11}a_{22}-a_{12}a_{21}=\Delta$ is $12[\Phi(\Delta)+\Psi(\Delta)]+2\epsilon$, where ϵ is 1 or 0 according as Δ is or is not a square, and the symbols Φ, Ψ have the meaning previously assigned to them (§ 39).

41. *Higher Quadratic Forms.*—The algebraic theory of quadratics is so complete that considerable advance has been made in the much more complicated arithmetical theory. Among the most important results relating to the general case of n variables are the proof that the class-number is finite; the enumeration of the arithmetical invariants of a form; classification according to orders and genera, and proof that genera with specified characters exist; also the determination of all the rational transformations of a given form into itself. In connexion with a definite form there is the important conception of its *weight*; this is defined as the reciprocal of the number of its proper automorphs. Equivalent forms are of the same weight; this is defined to be the weight of their class. The weight of a genus or order is the sum of the weights of the classes contained in it; and expressions for the weight of a given genus have actually been obtained. For binary forms the sum of the weights of all the genera coincides with the expression denoted by $H(\Delta)$ in § 39. The complete discussion of a form requires the consideration of $(n-2)$ associated quadratics; one of these is the contravariant of the given form, each of the others contains more than n variables. For certain quaternary and senary classes there are formulae analogous to the class-relations for binary forms referred to in § 39 (see Smith, *Proc. R.S.* xvi., or *Collected Papers*, i. 510).

Among the most interesting special applications of the theory are certain propositions relating to the representation of numbers as the sum of squares. In order that a number may be expressible as the sum of two squares it is necessary and sufficient for it to be of the form PQ^2, where P has no square factor and no prime factor of the form $4n+3$. A number is expressible as the sum of three squares if, and only if, it is of the form m^2n with $n\equiv 1, \ldots 2, \ldots 3 \pmod 8$; when $m=1$ and $n\equiv 3 \pmod 8$, all the squares are odd, and hence follows Fermat's theorem that every number can be expressed as the sum of three triangular numbers (one or two of which may be 0). Another famous theorem of Fermat's is that every number can be expressed as the sum of four squares; this was first proved by Jacobi, who also proved that the number of solutions of $n=x^2+y^2+z^2+t^2$ is $8\sigma(n)$, if n is odd, while if n is even it is 24 times the sum of the odd factors of n. Explicit and finite, though more complicated, formulae have been obtained for the number of representations of n as the sum of five, six, seven and eight squares respectively. As an example of the outstanding difficulties of this part of the subject may be mentioned the problem of finding all the integral (not merely rational) automorphs of a given form f. When f is ternary, C. Hermite has shown that the solution depends on finding all the integral solutions of $F(x, y, z)+t^2=1$, where F is the contravariant of f.

Thanks to the researches of Gauss, Eisenstein, Smith, Hermite and others, the theory of ternary quadratics is much less incomplete than that of quadratics with four or more variables. Thus methods of reduction have been found both for definite and for indefinite forms; so that it would be possible to draw up a table of representative forms, if the result were worth the labour. One specially important theorem is the solution of $ax^2+by^2+cz^2=0$; this is always possible if $-bc$, $-ca$, $-ab$ are quadratic residues of a, b, c respectively, and a formula can then be obtained which furnishes all the solutions.

42. *Complex Numbers.*—One of Gauss's most important and far-reaching contributions to arithmetic was his introduction of complex

integers $a+bi$, where a, b are ordinary integers, and, as usual, $i^2=-1$. In this theory there are four units ± 1, $\pm i$; the numbers $i^k(a+bi)$ are said to be *associated*; $a-bi$ is the conjugate of $a+bi$ and we write $N(a+bi)=a^2+b^2$, the *norm* of $a+bi$, its conjugate, and associates. The most fundamental proposition in the theory is that the process of residuation (§ 24) is applicable; namely, if m, n are any two complex integers and $N(m)>N(n)$, we can always find integers q, r such that $m=qn+r$ with $N(r)\leq\frac{1}{2}N(n)$. This may be proved analytically, but is obvious if we mark complex integers by points in a plane. Hence immediately follow propositions about resolutions into prime factors, greatest common measure, &c., analogous to those in the ordinary theory; it will only be necessary to indicate special points of difference.

We have $2=-i(1+i)^2$, so that 2 is associated with a square; a real prime of the form $4n+3$ is still a prime, but one of the form $4n+1$ breaks up into two conjugate prime factors, for example, $5=(1-2i)(1+2i)$. An integer is even, semi-even, or odd according as it is divisible by $(1+i)^2$, $(1+i)$ or is prime to $(1+i)$. Among four associated odd integers there is one and only one which $\equiv 1 \pmod{2+2i}$; this is said to be *primary*; the conjugate of a primary number is primary, and the product of any number of primaries is primary. The conditions that $a+bi$ may be primary are $b\equiv 0 \pmod 2$, $a+b-1\equiv 0 \pmod 4$. Every complex integer is uniquely expressed in the form $i^m(1+i)^n a^\alpha b^\beta c^\gamma \ldots$, where $0\leq m<4$, and a, b, c, ... are primary primes.

With respect to a complex modulus m, all complex integers may be distributed into $N(m)$ incongruous classes. If $m=h(a+bi)$ where a, b are co-primes, we may take as representatives of these classes the residues $x+yi$ where $x=0, 1, 2, \ldots[(a^2+b^2)h-1]$; $y=0, 1, 2, \ldots(h-1)$. Thus when $b=0$ we may take $x=0, 1, 2, \ldots(h-1)$; $y=0, 1, 2, \ldots(h-1)$, giving the h^2 residues of the real number h; while if $a+bi$ is prime, $1, 2, 3, \ldots(a^2+b^2-1)$ form a complete set of residues.

The number of residues of m that are prime to m is given by

$$\phi(m)=N(m)\Pi\left(1-\frac{1}{N(p)}\right)$$

where the product extends to all prime factors of m. As an analogue to Fermat's theorem we have, for any integer prime to the modulus,

$$x^{\phi(m)}\equiv 1 \pmod m, x^{N(p)-1}\equiv 1 \pmod p$$

according as m is composite or prime. There are $\phi[N(p)-1]$ primitive roots of the prime p; a primitive root in the real theory for a real prime $4n+1$ is also a primitive root in the new theory for each prime factor of $(4n+1)$, but if $p=4n+3$ be a prime its primitive roots are necessarily complex.

43. If p, q are any two odd primes, we shall define the symbols $\left(\frac{p}{q}\right)_2$ and $\left(\frac{p}{q}\right)_4$ by the congruences

$$p^{\frac{1}{2}[N(q)-1]}\equiv\left(\frac{p}{q}\right)_2, \quad p^{\frac{1}{4}[N(q)-1]}\equiv\left(\frac{p}{q}\right)_4 \pmod q,$$

it being understood that the symbols stand for absolutely least residues. It follows that $\left(\frac{p}{q}\right)_2=1$ or -1 according as p is a quadratic residue of q or not; and that $\left(\frac{p}{q}\right)_4=1$ only if p is a biquadratic residue of q. If p, q are primary primes, we have two laws of reciprocity, expressed by the equations

$$\left(\frac{p}{q}\right)_2=\left(\frac{q}{p}\right)_2, \quad \left(\frac{p}{q}\right)_4\left(\frac{q}{p}\right)_4=(-1)^{\frac{1}{4}[N(p)-1]\cdot\frac{1}{4}[N(q)-1]}.$$

To these must be added the supplementary formulae

$$\left(\frac{i}{p}\right)_2=(-1)^{\frac{1}{4}[N(p)-1]}, \quad \left(\frac{1+i}{a+bi}\right)_2=(-1)^{\frac{1}{4}[(a+b)^2-1]},$$

$$\left(\frac{i}{a+bi}\right)_4=i^{\frac{1}{2}(a-1)} \qquad \left(\frac{1+i}{a+bi}\right)_4=i^{\frac{1}{2}[a+b-(1+b)a]}$$

$a+bi$ being a primary odd prime. In words, the law of biquadratic reciprocity for two primary odd primes may be expressed by saying that the biquadratic characters of each prime with respect to the other are identical, unless $p=qm^3+2si \pmod 4$, in which case they are opposite. The law of biquadratic reciprocity was discovered by Gauss, who does not seem, however, to have obtained a complete proof of it. The first published proof is that of Eisenstein, which is very beautiful and simple, but involves the theory of lemniscate functions. A proof on the lines indicated in Gauss's posthumous papers has been developed by Busche; this probably admits of simplification. Other demonstrations, for instance Jacobi's, depend on cyclotomy (see below).

44. *Algebraic Numbers.*—The first extension of Gauss's complex theory was made by E. E. Kummer, who considered complex numbers represented by rational integral functions of any roots of unity, thus including the ordinary theory and Gauss's as special cases. He was soon faced by the difficulty that, in some cases, the law that an integer can be uniquely expressed as the product of prime factors appeared to break down. To see how this happens take the equation $\eta^3+\eta+6=0$, the roots of which are expressible as rational integral functions of 23rd roots of unity, and let η be either of the roots. If we define $a\eta+b$ to be an integer, when a, b are natural numbers, the product of any number of such integers is uniquely expressible in the form $l\eta+m$. Conversely every integer can be expressed as the product of a finite number of indecomposable integers $a+b\eta$, that is, integers which cannot be further resolved into factors of the same type. But this resolution is not necessarily unique: for instance $6=2\cdot 3=-\eta(\eta+1)$, where 2, 3, η, $\eta+1$ are all indecomposable and essentially distinct. To see the way in which Kummer surmounted the difficulty consider the congruence

$$u^3+u+6\equiv 0 \pmod p$$

where p is any prime, except 23. If -23 R p this has two distinct roots u_1, u_2; and we say that $a\eta+b$ is divisible by the ideal prime factor of p corresponding to u_1, if $au_1+b\equiv 0 \pmod p$. For instance, if $p=2$ we may put $u_1=0$, $u_2=1$ and there will be two ideal factors of 2, say p_1 and p_2 such that $a\eta+b\equiv 0 \pmod{p_1}$ if $b\equiv 0 \pmod 2$ and $a\eta+b\equiv 0 \pmod{p_2}$ if $a+b\equiv 0 \pmod 2$. If both these congruences are satisfied, $a\equiv b\equiv 0 \pmod 2$ and $a\eta+b$ is divisible by 2 in the ordinary sense. Moreover $(a\eta+b)(c\eta+d)=(bc+ad-ac)\eta+(bd-6ac)$ and if this product is divisible by p_1, $bd\equiv 0 \pmod 2$, whence either $a\eta+b$ or $c\eta+d$ is divisible by p_1; while if the product is divisible by p_2 we have $bc+ad+bd-7ac\equiv 0 \pmod 2$ which is equivalent to $(a+b)(c+d)\equiv 0 \pmod 2$, so that again either $a\eta+b$ or $c\eta+d$ is divisible by p_2. Hence we may properly speak of p_1 and p_2 as *prime* divisors. Similarly the congruence $u^3+u+6\equiv 0 \pmod 3$ defines two ideal prime factors of 3, and $a\eta+b$ is divisible by one or the other of these according as $b\equiv 0 \pmod 3$ or $2a+b\equiv 0 \pmod 3$; we will call these prime factors p_3, p_4. With this notation we have (neglecting unit factors)

$$2=p_1p_2, \quad 3=p_3p_4, \quad \eta=p_1p_3, \quad 1+\eta=p_2p_4.$$

Real primes of which -23 is a non-quadratic residue are also primes in the field (η); and the prime factors of any number $a\eta+b$, as well as the degree of their multiplicity, may be found by factorizing $(6a^2-ab+b^2)$, the norm of $(a\eta+b)$. Finally *every* integer divisible by p_2 is expressible in the form $\pm 2m\pm(1+\eta)n$ where m, n are natural numbers (or zero); it is convenient to denote this fact by writing $p_2=[2, 1+\eta]$, and calling the aggregate $2m+(1+\eta)n$ a compound modulus with the base 2, $1+\eta$. This generalized idea of a modulus is very important and far-reaching; an aggregate is a modulus when, if α, β are any two of its elements, $\alpha+\beta$ and $\alpha-\beta$ also belong to it. For arithmetical purposes those moduli are most useful which can be put into the form $[a_1, a_2, \ldots a_n]$ which means the aggregate of all the quantities $x_1a_1+x_2a_2+\ldots+x_na_n$ obtained by assigning to $(x_1, x_2, \ldots x_n)$, independently, the values $0, \pm 1, \pm 2$, &c. Compound moduli may be multiplied together, or raised to powers, by rules which will be plain from the following example. We have

$$p_2^2=[4, 2(1+\eta), (1+\eta)^2]=[4, 2+2\eta, -5+\eta]=[4, 12, -5+\eta]$$
$$=[4, -5+\eta]=[4, 3+\eta]$$

hence

$$p_2^3=p_2^2\cdot p_2=[4, 3+\eta]\times[2, 1+\eta]=[8, 4+4\eta, 6+2\eta, 3+4\eta+\eta^2]$$
$$=[8, 4+4\eta, 6+2\eta, -3+3\eta]=(\eta-1)[\eta+2, \eta-6, 3]=(\eta-1)[1, \eta].$$

Hence every integer divisible by p_2^3 is divisible by the actual integer $(\eta-1)$ and conversely; so that in a certain sense we may regard p_2 as a cube root. Similarly the cube of any other ideal prime is of the form $(a\eta+b)[1, \eta]$. According to a principle which will be explained further on, all primes here considered may be arranged in three classes; one is that of the real primes, the others each contain ideal primes only. As we shall see presently all these results are intimately connected with the fact that for the determinant -23 there are three primitive classes, represented by $(1, 1, 6)$ $(2, 1, 3)$, $(2, -1, 3)$ respectively.

45. Kummer's definition of ideal primes sufficed for his particular purpose, and completely restored the validity of the fundamental theorems about factors and divisibility. His complex integers were more general than any previously considered and suggested a definition of an algebraic integer in general, which is as follows: if $a_1, a_2, \ldots a_n$ are ordinary integers (*i.e.* elements of $\mathfrak{N}$, § 7), and θ satisfies an equation of the form

$$\theta^n+a_1\theta^{n-1}+a_2\theta^{n-2}+\ldots+a_{n-1}\theta+a_n=0,$$

θ is said to be an algebraic integer. We may suppose this equation irreducible; θ is then said to be of the nth order. The n roots θ, θ', θ'', $\ldots\theta^{(n-1)}$ are all different, and are said to be conjugate. If the equation began with $a_0\theta^n$ instead of θ^n, θ would still be an algebraic number; every algebraic number can be put into the form θ/m, where m is a natural number and θ an algebraic integer.

Associated with θ we have a *field* (or *corpus*) $\Omega=R(\theta)$ consisting of all rational functions of θ with real rational coefficients; and in like manner we have the conjugate fields $\Omega'=R(\theta')$, &c. The aggregate of integers contained in Ω is denoted by o.

Every element of Ω can be put into the form

$$\omega=c_0+c_1\theta+\ldots+c_{n-1}\theta^{n-1}$$

where $c_0, c_1, \ldots c_{n-1}$ are real and rational. If these coefficients are all integral, ω is an integer; but the converse is not necessarily true. It is possible, however, to find a set of integers $\omega_1, \omega_2, \ldots\omega_n$ belonging to Ω, such that every integer in Ω can be uniquely expressed in the form

$$\omega=h_1\omega_1+h_2\omega_2+\ldots+h_n\omega_n$$

is a modulus (§ 44), and we may write $\mathfrak{o} = [\omega_1, \omega_2, \ldots \omega_n]$. Having found one base, we can construct any number of equivalent bases by means of equations such as $\omega_i' = \sum_j c_{ij}\omega^j$, where the rational integral coefficients c_{ij} are such that the determinant $|c_{ik}| = \pm 1$.

If we write

$$\sqrt{\Delta} = \begin{vmatrix} \omega_1, & \omega_2, & \ldots & \omega_n \\ \omega'_1, & \omega'_2, & \ldots & \omega'_n \\ \omega''_1, & \omega''_2, & \ldots & \omega''_n \\ \vdots & & & \\ \omega_1^{(n-1)}, & \omega_2^{(n-1)}, & \ldots & \omega_n^{(n-1)} \end{vmatrix}$$

Δ is a rational integer called the *discriminant* of the field. Its value is the same whatever base is chosen.

If α is any integer in Ω, the product of α and its conjugates is a rational integer called the *norm* of α, and written $N(\alpha)$. By considering the equation satisfied by α we see that $N(\alpha) = a\alpha_1$ where a_1 is an integer in Ω. It follows from the definition that if α, β are any two integers in Ω, then $N(\alpha\beta) = N(\alpha)N(\beta)$; and that for an ordinary real integer m, we have $N(m) = m^n$.

46. *Ideals.*—The extension of Kummer's results to algebraic numbers in general was independently made by J. W. R. Dedekind and Kronecker; their methods differ mainly in matters of notation and machinery, each having special advantages of its own for particular purposes. Dedekind's method is based upon the notion of an *ideal*, which is defined by the following properties:—

(i.) An ideal $\mathfrak{m}$ is an aggregate of integers in Ω.

(ii.) This aggregate is a modulus; that is to say, if μ, μ' are any two elements of $\mathfrak{m}$ (the same or different) $\mu - \mu'$ is contained in $\mathfrak{m}$. Hence also $\mathfrak{m}$ contains a zero element, and $\mu + \mu'$ is an element of $\mathfrak{m}$.

(iii.) If μ is any element of $\mathfrak{m}$, and ω any element of $\mathfrak{o}$, then $\omega\mu$ is an element of $\mathfrak{m}$. It is this property that makes the notion of an ideal more specific than that of a modulus.

It is clear that ideals exist; for instance, $\mathfrak{o}$ itself is an ideal. Again, all integers in Ω which are divisible by a given integer a (in $\mathfrak{o}$) form an ideal; this is called a *principal ideal*, and is denoted by $\mathfrak{o}a$. Every ideal can be represented by a base (§§ 44, 45), so that we may write $\mathfrak{m} = [\mu_1, \mu_2, \ldots \mu_n]$, meaning that every element of $\mathfrak{m}$ can be uniquely expressed in the form $\sum h_i\mu_i$, where h_i is a rational integer. In other words, every ideal has a base (and therefore, of course, an infinite number of bases). If $\mathfrak{a}$, $\mathfrak{b}$ are any two ideals, and if we form the aggregate of all products $\alpha\beta$ obtained by multiplying each element of the first ideal by each element of the second, then this aggregate, together with all sums of such products, is an ideal which is called the product of $\mathfrak{a}$ and $\mathfrak{b}$ and written $\mathfrak{ab}$ or $\mathfrak{ba}$. In particular $\mathfrak{o}a = \mathfrak{a}$, $\mathfrak{o}^2 = \mathfrak{o}$, $\mathfrak{o}a \cdot \mathfrak{o}\beta = \mathfrak{o}a\beta$. This law of multiplication is associative as well as commutative. It is clear that every element of $\mathfrak{ab}$ is contained in $\mathfrak{a}$: it can be proved that, conversely, if every element of $\mathfrak{c}$ is contained in $\mathfrak{a}$, there exists an ideal $\mathfrak{b}$ such that $\mathfrak{ab} = \mathfrak{c}$. In particular, if a is any element of $\mathfrak{a}$, there is an ideal $\mathfrak{a}'$ such that $\mathfrak{o}a = \mathfrak{a}\mathfrak{a}'$. A *prime ideal* is one which has no divisors except itself and $\mathfrak{o}$. It is a fundamental theorem that every ideal can be resolved into the product of a finite number of prime ideals, and that this resolution is unique. It is the decomposition of a principal ideal into the product of prime ideals that takes the place of the resolution of an integer into its prime factors in the ordinary theory. It may happen that all the ideals in Ω are principal ideals; in this case every resolution of an ideal into factors corresponds to the resolution of an integer into actual integral factors, and the introduction of ideals is unnecessary. But in every other case the introduction of ideals or some equivalent notion, is indispensable. When two ideals have been resolved into their prime factors, their greatest common measure and least common multiple are determined by the ordinary rules. Every ideal may be expressed (in an infinite number of ways) as the greatest common measure of two principal ideals.

47. There is a theory of congruences with respect to an ideal modulus. Thus $\alpha \equiv \beta \pmod{\mathfrak{m}}$ means that $\alpha - \beta$ is an element of $\mathfrak{m}$. With respect to $\mathfrak{m}$, all the integers in Ω may be arranged in a finite number of incongruent classes. The number of these classes is called the *norm* of $\mathfrak{m}$, and written $N(\mathfrak{m})$. The norm of a prime ideal $\mathfrak{p}$ is some power of a real prime p; if $N(\mathfrak{p}) = p^f$, $\mathfrak{p}$ is said to be a prime ideal of degree f. If $\mathfrak{m}$, $\mathfrak{n}$ are any two ideals, then $N(\mathfrak{mn}) = N(\mathfrak{m})N(\mathfrak{n})$. If $N(\mathfrak{m}) = m$, then $m \equiv 0 \pmod{\mathfrak{m}}$, and there is an ideal $\mathfrak{m}'$ such that $\mathfrak{v}m = \mathfrak{m}\mathfrak{m}'$. The norm of a principal ideal $\mathfrak{o}a$ is equal to the absolute value of $N(a)$ as defined in § 45.

The number of incongruent residues prime to $\mathfrak{m}$ is—

$$\phi(\mathfrak{m}) = N(\mathfrak{m})\Pi\left(1 - \frac{1}{N(\mathfrak{p})}\right),$$

where the product extends to all prime factors of $\mathfrak{m}$. If ω is any element of $\mathfrak{o}$ prime to $\mathfrak{m}$,

$$\omega^{\phi(\mathfrak{m})} \equiv 1 \pmod{\mathfrak{m}}.$$

Associated with a prime modulus $\mathfrak{p}$ for which $N(\mathfrak{p}) = p^f$ we have $\phi(p^f - 1)$ primitive roots, where ϕ has the meaning given to it in the ordinary theory. Hence follow the usual results about exponents, indices, solutions of linear congruences, and so on. For any modulus $\mathfrak{m}$ we have $N(\mathfrak{m}) = \sum\phi(\mathfrak{d})$, where the sum extends to all the divisors of $\mathfrak{m}$.

of r_1 real and $2r_2$ imaginary fields, there is a system of units $\epsilon_1, \epsilon_2 \ldots \epsilon_r$, where $r = r_1 + r_2 - 1$, such that every unit in Ω is expressible in the form $\epsilon = \rho\epsilon_1^a\epsilon_2^b \ldots \epsilon_r^l$ where ρ is a root of unity contained in Ω and $a, b, \ldots l$ are natural numbers. This theorem is due to Dirichlet.

The norm of a unit is $+1$ or -1; and the determination of all the units contained in a given field is in fact the same as the solution of a Diophantine equation

$$F(k_1, k_2, \ldots k_n) = \pm 1.$$

For a quadratic field the equation is of the form $k_1^2 - ak_2^2 = \pm 1$, and the theory of this is complete; but except for certain special cubic corpora little has been done towards solving the important problem of assigning a definite process by which, for a given field, a system of fundamental units may be calculated. The researches of Jacobi, Hermite, and Minkowsky seem to show that a proper extension of the method of continued fractions is necessary.

49. *Ideal Classes.*—If $\mathfrak{m}$ is any ideal, another ideal $\mathfrak{n}$ can always be found such that $\mathfrak{mn}$ is a principal ideal; for instance, one such multiplier is $\mathfrak{m}^{-1}N(\mathfrak{m})$. Two ideals $\mathfrak{m}$, $\mathfrak{m}'$ are said to be equivalent ($\mathfrak{m} \sim \mathfrak{m}'$) or to belong to the same *class*, if there is an ideal $\mathfrak{n}$ such that $\mathfrak{mn}$, $\mathfrak{m}'\mathfrak{n}$ are both principal ideals. It can be proved that two ideals each equivalent to a third are equivalent to each other and that all ideals in Ω may be distributed into a finite number, h, of ideal classes. The class which contains all principal ideals is called the principal class and denoted by O.

If $\mathfrak{m}$, $\mathfrak{n}$ are any two ideals belonging to the classes A, B respectively, then $\mathfrak{mn}$ belongs to a definite class which depends only upon A, B and may be denoted by AB or BA indifferently. Thus the class-symbols form an Abelian group of order h, of which O is the unit element; and, *mutatis mutandis*, the theorems of § 37 about composition of classes still hold good.

The principal theorem with regard to the determination of h is the following, which is Dedekind's generalization of the corresponding one for quadratic fields, first obtained by Dirichlet. Let

$$\zeta(s) = \sum_{(\mathfrak{m})} N(\mathfrak{m})^{-s}$$

where the sum extends to all ideals $\mathfrak{m}$ contained in Ω; this converges so long as the real quantity s is positive and greater than 1. Then κ being a certain quantity which can be calculated when a *fundamental system of units is known*, we shall have

$$\kappa h = L\{(s-1)\zeta(s)\}_{s=1}.$$

The expression for κ is rather complicated, and very peculiar; it may be written in the form

$$\kappa = \frac{2^{r_1+r_2}\pi^{r_2}}{w} \cdot \frac{R}{\sqrt{|\Delta|}}$$

where $|\sqrt{\Delta}|$ means the absolute value of the square root of the discriminant of the field, r_1, r_2 have the same meaning as in § 48, w is the number of roots of unity in Ω, and R is a determinant of the form $|k_r(\epsilon^s)|$, of order $(r_1 + r_2 - 1)$, with elements which are, in a certain special sense, "logarithms" of the fundamental units $\epsilon_1, \epsilon_2 \ldots \epsilon_r$.

50. The discriminant Δ enjoys some very remarkable properties. Its value is always different from ± 1; there can be only a finite number of fields which have a given discriminant; and the rational prime factors of $\Delta(\Omega)$ are precisely those rational primes which, in Ω, are divisible by the square (or some higher power) of a prime ideal. Consequently, every rational prime not contained in Δ is resolvable, in Ω, into the product of distinct primes, each of which occurs only once. The presence of multiple prime factors in the discriminant was the principal difficulty in the way of extending Kummer's method to all fields, and was overcome by the introduction of compound moduli—for this is the common characteristic of Dedekind's and Kronecker's procedure.

51. *Normal Fields.*—The special properties of a particular field Ω are closely connected with its relations to the conjugate fields $\Omega', \Omega'', \ldots \Omega^{(n-1)}$. The most important case is when each of the conjugate fields is identical with Ω: the field is then said to be *Galoisian* or *normal*. The aggregate $R(\theta, \theta', \ldots \theta^{(n-1)})$ of all rational functions of θ and its conjugates is a normal field: hence every arithmetical field of order n is either normal, or contained in a normal field of a higher order. The roots of an equation $f(\theta) = 0$ which defines a normal field are associated with a group of substitutions: if this is Abelian, the field is called Abelian; if it is cyclic, the field is called cyclic. A cyclotomic field is one the elements of which are all expressible as rational functions of roots of unity; in particular the complete cyclotomic field C_m, of order $\phi(m)$, is the aggregate of all rational functions of a primitive mth root of unity. To Kronecker is due the very remarkable theorem that all Abelian (including cyclic) fields are cyclotomic: the first published proof of this was given by Weber, and another is due to D. Hilbert.

Many important theorems concerning a normal field have been established by Hilbert. He shows that if Ω is a given normal field of order m, and $\mathfrak{p}$ any of its prime ideals, there is a finite series of associated fields Ω_1, Ω_2, &c., of orders m_1, m_2, &c., such that $m, m_1, m_2 \ldots \equiv 0 \pmod{m^f, 1}$, and that if $r' = m/m^f$, $\mathfrak{p}'^{r'} = \mathfrak{p}_1$, a prime ideal in Ω'. If Ω_1 is the last of this series, it is called the *field of inertia*

(*Trägheitskörper*) for p: next after this comes another field of still lower order called the *resolving field* (*Zerlegungskörper*) for p, and in this field there is a prime *of the first degree*, $\mathfrak{p}_{t+1}$, such that $\mathfrak{p}_{t+1} = \mathfrak{p}^h$, where $h = m/m_t$. In the field of inertia $\mathfrak{p}_{t+1}$ remains a prime, but becomes of higher degree; in Ω_{t-1}, which is called the *branch-field* (*Verzweigungskörper*) it becomes a power of a prime, and by going on in this way from the resolving field to Ω, we obtain $(l+2)$ representations for any prime ideal of the resolving field. By means of these theorems, Hilbert finds an expression for the exact power to which a rational prime p occurs in the discriminant of Ω, and in other ways the structure of Ω becomes more evident. It may be observed that when m is prime the whole series reduces to Ω and the rational field, and we conclude that every prime ideal in Ω is of the first or mth degree: this is the case, for instance, when $m = 2$, and is one of the reasons why quadratic fields are comparatively so simple in character.

52. *Quadratic Fields.*—Let m be an ordinary integer different from $+1$, and not divisible by any square: then if x, y assume all ordinary rational values the expressions $x + y\sqrt{m}$ are the elements of a field which may be called $\Omega(\sqrt{m})$. It should be observed that $\sqrt{m}$ means one definite root of $x^2 - m = 0$, it does not matter which: it is convenient, however, to agree that $\sqrt{m}$ is positive when m is positive, and $i\sqrt{m}$ is negative when m is negative. The principal results relating to Ω will now be stated, and will serve as illustrations of §§ 44-51.

In the notation previously used

$$\mathfrak{o} = [1, \tfrac{1}{2}(1+\sqrt{m})] \text{ or } [1, \sqrt{m}]$$

according as $m \equiv 1 \pmod 4$ or not. In the first case $\Delta = m$, in the second $\Delta = 4m$. The field Ω is normal, and every ideal prime in it is of the first degree.

Let q be any odd prime factor of m; then $q = \mathfrak{q}^2$, where $\mathfrak{q}$ is the prime ideal $[q, \tfrac{1}{2}(q+\sqrt{m})]$ when $m \equiv 1 \pmod 4$ and in other cases $[q, \sqrt{m}]$. An odd prime p of which m is a quadratic residue is the product of two prime ideals $\mathfrak{p}, \mathfrak{p}'$, which may be written in the form $[p, \tfrac{1}{2}(a+\sqrt{m})]$, $[p, \tfrac{1}{2}(a-\sqrt{m})]$ or $[p, a+\sqrt{m}]$, $[p, a-\sqrt{m}]$, according as $m \equiv 1 \pmod 4$ or not: here a is a root of $x^2 \equiv m \pmod p$, taken so as to be odd in the first of the two cases. All other rational odd primes are primes in Ω. For the exceptional prime 2 there are four cases to consider: (i.) if $m \equiv 1 \pmod 8$, then $2 = [2, \tfrac{1}{2}(1+\sqrt{m})] \times [2, \tfrac{1}{2}(1-\sqrt{m})]$. (ii.) If $m \equiv 5 \pmod 8$, then 2 is prime: (iii.) if $m \equiv 2 \pmod 4$, $2 = [2, \sqrt{m}]^2$: (iv.) if $m \equiv 3 \pmod 4$, $2 = [2, 1+\sqrt{m}]^2$. Illustrations will be found in § 44 for the case $m = 23$.

53. *Normal Residues. Genera.*—Hilbert has introduced a very convenient definition, and a corresponding symbol, which is a generalization of Legendre's quadratic character. Let n, m be rational integers, m not a square, w any rational prime; we write $\left(\frac{n, m}{w}\right) = +1$ if, to the modulus w, n is congruent to the norm of an integer contained in $\Omega(\sqrt{m})$; in all other cases we put $\left(\frac{n, m}{w}\right) = -1$. This new symbol obeys a set of laws, among which may be especially noted $\left(\frac{n, w}{w}\right) = \left(\frac{w, n}{w}\right) = \left(\frac{n}{w}\right)$ and $\left(\frac{n, m}{w}\right) = +1$, whenever n, m are prime to p.

Now let $q_1, q_2, \ldots q_t$ be the different rational prime factors of the discriminant of $\Omega(\sqrt{m})$; then with any rational integer a we may associate the t symbols

$$\left(\frac{a, m}{q_1}\right), \left(\frac{a, m}{q_2}\right), \ldots \left(\frac{a, m}{q_t}\right)$$

and call them the total character of a with respect to Ω. This definition may be extended so as to give a total character for every ideal $\mathfrak{a}$ in Ω, as follows. First let Ω be an imaginary field ($m < 0$); we put $r = t$, $\mathfrak{N} = \mathrm{N}(\mathfrak{a})$, and call

$$\left(\frac{\mathfrak{N}, m}{q_1}\right), \ldots \left(\frac{\mathfrak{N}, m}{q_r}\right)$$

the total character of $\mathfrak{a}$. Secondly, let Ω be a real field; we first determine the t separate characters of -1, and if they are all positive we put $\mathfrak{N} = +\mathrm{N}(\mathfrak{a})$, $r = t$, and adopt the r characters just written above as those of $\mathfrak{a}$. Suppose, however, that one of the characters of -1 is negative; without loss of generality we may take it to be that with reference to q_t. We then put $r = t-1$, $\mathfrak{N} = \pm\mathrm{N}(\mathfrak{a})$ taken with such a sign that $\left(\frac{\mathfrak{N}, m}{q_t}\right) = +1$, and take as the total character of $\mathfrak{a}$ the symbols $\left(\frac{\mathfrak{N}, m}{q_i}\right)$ for $i = 1, 2, \ldots (t-1)$.

With these definitions it can be proved that all ideals of the same class have the same total character, and hence there is a distribution of classes into genera, each genus containing those classes for which the total character is the same (cf. § 36).

Moreover, we have the fundamental theorem that an assigned set of r units $= 1$ corresponds to an actually existing genus if, and only if, their product is $+1$, so that the number of actually existing genera is 2^{r-1}. This is really equivalent to a theorem about quadratic forms first stated and proved by Gauss; the same may be said about the next proposition, which, in its natural order, is easily proved by the method of ideals, whereas Gauss had to employ the theory of ternary quadratics.

Every class of the principal genus is the square of a class.

An ambiguous ideal in Ω is defined as one which is unaltered by the change of $\sqrt{m}$ to $-\sqrt{m}$ (that is, it is the same as its conjugate) and not divisible by any rational integer except ± 1. The only ambiguous prime ideals in Ω are those which are factors of its discriminant. Putting $\Delta = q_1^{\alpha} q_2^{\beta} \ldots q_t^{\tau}$, there are in Ω exactly 2^t ambiguous ideals: namely, those factors of Δ, including $\mathfrak{w}$, which are not divisible by any square. It is a fundamental theorem, first proved by Gauss, that the number of ambiguous classes is equal to the number of genera.

54. *Class-Number.*—The number of ideal classes in the field $\Omega(\sqrt{m})$ may be expressed in the following forms:—

(i.) $m < 0$:

$$h = \frac{\tau}{2\Delta} \sum_{n} \left(\frac{\Delta}{n}\right) n \qquad (n = 1, 2, \ldots, -\Delta);$$

(ii.) $m > 0$:

$$h = \frac{1}{2 \log \epsilon} \log \frac{\Pi \sin \frac{b\pi}{\Delta}}{\Pi \sin \frac{a\pi}{\Delta}}.$$

In the first of these formulae τ is the number of units contained in Ω; thus $\tau = 6$ for $\Delta = -3$, $\tau = 4$ for $\Delta = -4$, $\tau = 2$ in other cases. In the second formula, ϵ is the fundamental unit, and the products are taken for all the numbers of the set $(1, 2, \ldots \Delta)$ for which $\left(\frac{\Delta}{a}\right) = +1$, $\left(\frac{\Delta}{b}\right) = -1$ respectively. In the ideal theory the only way in which these formulae have been obtained is by a modification of Dirichlet's method; to prove them without the use of transcendental analysis would be a substantial advance in the theory.

55. Suppose that any ideal in Ω is expressed in the form $[\omega_1, \omega_2]$; then any element of it is expressible as $x\omega_1 + y\omega_2$, where x, y are rational integers, and we shall have $\mathrm{N}(x\omega_1 + y\omega_2) = ax^2 + bxy + cy^2$, where a, b, c are rational numbers contained in the ideal. If we put $x = \alpha x' + \beta y'$, $y = \gamma x' + \delta y'$, where α, β, γ, δ are rational numbers such that $\alpha\delta - \beta\gamma = \pm 1$, we shall have simultaneously $(a, b, c)\ (x, y)^2 = (a', b', c')\ (x', y')^2$ as in § 32 and also

$$(a', b', c')\ (x', y')^2 = \mathrm{N}[x'(\alpha\omega_1 + \gamma\omega_2) + y'(\beta\omega_1 + \delta\omega_2)] = \mathrm{N}(x'\omega_1' + y'\omega_2'),$$

where $[\omega_1', \omega_2']$ is the same ideal as before. Thus all equivalent forms are associated with the same ideal, and the numbers representable by forms of a particular class are precisely those which are norms of numbers belonging to the associated ideal. Hence the class-number for ideals in Ω is also the class-number for a set of quadratic forms; and it can be shown that all these forms have the same determinant Δ. Conversely, every class of forms of determinant Δ can be associated with a definite class of ideals in $\Omega(\sqrt{m})$, where $m = \Delta$ or $\frac{1}{4}\Delta$ as the case may be. Composition of form-classes exactly corresponds to the multiplication of ideals: hence the complete analogy between the two theories, so long as they are really in contact. There is a corresponding theory of forms in connexion with a field of order n: the forms are of the order n, but are only very special forms of that order, because they are algebraically resolvable into the product of linear factors.

56. *Complex Quadratic Forms.*—Dirichlet, Smith and others, have discussed forms (a, b, c) in which the coefficients are complex integers of the form $m + ni$; and Hermite has considered bilinear forms $axx' + bxy' + b'x'y + cyy'$, where x', y', b' are the conjugates of x, y, b and a, c, are real. Ultimately these theories are connected with fields of the fourth order; and of course in the same way we might consider forms (a, b, c) with integral coefficients belonging to any given field of order n: the theory would then be ultimately connected with a field of order $2n$.

57. *Kronecker's Method.*—In practice it is found convenient to combine the method of Dedekind with that of Kronecker, the main principles of which are as follows. Let $\mathrm{F}(x, y, z, \ldots)$ be a polynomial in any number of indeterminates (*umbrae*, as Sylvester calls them) with ordinary integral coefficients; if n is the greatest common measure of the coefficients, we have $\mathrm{F} = n\mathrm{E}$, where E is a primary or unit form. The positive integer n is called the divisor of F; and the divisor of the product of two forms is equal to the product of the divisors of the factors. Next suppose that the coefficients of F are integers in a field Ω of order n. Denoting the conjugate forms by $\mathrm{F}', \mathrm{F}'', \ldots \mathrm{F}^{(n-1)}$, the product $\mathrm{FF'F''} \ldots \mathrm{F}^{(n-1)} = f\mathrm{E}$, where f is a real positive integer, and E a unit form with real integral coefficients. The natural number f is called the norm of F. If F, G are any two forms (in Ω) we have $\mathrm{N(FG)} = \mathrm{N(F)N(G)}$. Let the coefficients of F be a_1, a_2, &c., those of G β_1, β_2, &c., and those of FG γ_1, γ_2, &c.; and let $\mathfrak{p}$ be any prime ideal in Ω. Then if $\mathfrak{p}^m$ is the highest power of $\mathfrak{p}$ contained in each of the coefficients a_i, and $\mathfrak{p}^n$ the highest power of $\mathfrak{p}$ contained in each of the coefficients β_i, $\mathfrak{p}^{m+n}$ is the highest power of $\mathfrak{p}$ contained by the whole set of coefficients γ_i. Writing $\mathrm{dv}(a_1, a_2, \ldots)$ for the highest ideal divisor of a_1, a_2, &c., this is called the *content* of F; and we have the theorem that the

and, supposing for simplicity that $i\omega$ is a real negative quantity,

$$\pi\theta_{00}^2 = 2K, \quad \omega\pi\theta_{00}^2 = 2iK', \quad \omega = iK'/K,$$

the notation being that which is now usual for the elliptic functions. It is found that

$$\frac{\pi K}{\pi}\operatorname{sn} 2Kz = 2\sum_{1}^{\infty}\frac{q^{n-\frac{1}{2}}}{1-q^{2n-1}}\sin(2z-1)\pi z,$$

$$\frac{\pi K}{\pi}\operatorname{cn} 2Kz = 2\sum_{1}^{\infty}\frac{q^{n-\frac{1}{2}}}{1+q^{2n-1}}\cos(2z-1)\pi z,$$

$$\frac{K}{\pi}\operatorname{dn} 2Kz = \tfrac{1}{2} + 2\sum_{1}^{\infty}\frac{q^{n}}{1+q^{2n}}\cos 2z\pi z.$$

From the last formula, by putting $z=0$, we obtain

$$1 + 4\sum_{1}^{\infty}\frac{q^{n}}{1+q^{2n}} = \frac{2K}{\pi} = \theta_{00}^2 = (1 + 2q + 2q^4 + 2q^9 + \dots)^2,$$

and hence, by expanding both sides in ascending powers of q, and equating the coefficients of q^n, we arrive at a formula for the number of ways of expressing n as the sum of two squares. If δ is any odd divisor of n, including 1 and n itself if n is odd, we find as the coefficient of q^n in the expansion of the left-hand side $4\Sigma(-1)^{\frac{1}{2}(\delta-1)}$; on the right-hand side the coefficient enumerates all the solutions $n = (\pm x)^2 + (\pm y)^2$, taking account of the different signs (except for 0^2) and of the order in which the terms are written (except when $x^2 = y^2$). Thus if n is an odd prime of the form $4k+1$, $\Sigma(-1)^{\frac{1}{2}(\delta-1)} = 2$, and the coefficient of q^n is 8, which is right, because the one possible composition $n = a^2 + b^2$ may be written $n = (\pm a)^2 + (\pm b)^2 = (\pm b)^2 + (\pm a)^2$, giving eight representations.

By methods of a similar character formulae can be found for the number of representations of a number as the sum of 4, 6, 8 squares respectively. The four-square theorem has been stated in § 41; the eight-square theorem is that the number of representations of a number as the sum of eight squares is sixteen times the sum of the cubes of its factors, if the given number is odd, while for an even number it is sixteen times the excess of the cubes of the even factors above the cubes of the odd factors. The five-square and seven-square theorems have not been derived from q-series, but from the general theory of quadratic forms.

68. Still more remarkable results are deducible from the theory of the transformation of the theta functions. The elementary formulae are

$$\theta_{11}(u, \omega+1) = e^{\pi i/4}\theta_{11}(u, \omega), \quad \theta_{10}(u, \omega+1) = e^{\pi i/4}\theta_{10}(u, \omega),$$
$$\theta_{01}(u, \omega+1) = \theta_{00}(u, \omega), \quad \theta_{00}(u, \omega+1) = \theta_{01}(u, \omega),$$
$$e^{-\pi i u^2/\omega}\theta_{11}\left(\frac{u}{\omega}, -\frac{1}{\omega}\right) = -i\sqrt{-i\omega}\,\theta_{11}(u, \omega),$$
$$e^{-\pi i u^2/\omega}\theta_{10}\left(\frac{u}{\omega}, -\frac{1}{\omega}\right) = \sqrt{-i\omega}\,\theta_{10}(u, \omega),$$
$$e^{-\pi i u^2/\omega}\theta_{01}\left(\frac{u}{\omega}, -\frac{1}{\omega}\right) = \sqrt{-i\omega}\,\theta_{01}(u, \omega),$$
$$e^{-\pi i u^2/\omega}\theta_{00}\left(\frac{u}{\omega}, -\frac{1}{\omega}\right) = \sqrt{-i\omega}\,\theta_{00}(u, \omega),$$

where $\sqrt{-i\omega}$ is to be taken in such a way that its real part is positive. Taking the definition of κ given in § 67, and considering κ as a function of ω, we find

$$\kappa(\omega+1) = i\theta_{10}^2/\theta_{01}^2 = i\kappa(\omega)/\kappa'(\omega)$$
$$\kappa\left(-\frac{1}{\omega}\right) = \theta_{01}^2/\theta_{00}^2 = \kappa'(\omega)$$

For convenience let $\kappa^2(\omega) = \sigma$: then the substitutions $(\omega, \omega+1)$ and $(\omega, -\omega^{-1})$ convert σ into $\sigma/(\sigma-1)$ and $(1-\sigma)$ respectively. Now if $\alpha, \beta, \gamma, \delta$ are any real integers such that $\alpha\delta - \beta\gamma = 1$, the substitution $[\omega, (\alpha\omega+\beta)/(\gamma\omega+\delta)]$ can be compounded of $(\omega, \omega+1)$ and $(\omega, -\omega^{-1})$; the effect on σ will be the same as if we apply a corresponding substitution compounded of $[\sigma, \sigma/(\sigma-1)]$ and $[\sigma, 1-\sigma]$. But these are periodic and of order 3, 2 respectively]; therefore we cannot get more than six values of σ, namely

$$\sigma, \quad 1-\sigma, \quad \frac{\sigma}{\sigma-1}, \quad \frac{1}{1-\sigma}, \quad \frac{\sigma-1}{\sigma}, \quad \frac{1}{\sigma},$$

and any symmetrical function of these will have the same value at any two equivalent places in the modular dissection (§ 33). Their sum is constant, but the sum of their squares may be put into the form

$$\frac{2(\sigma^2-\sigma+1)^2}{\sigma^2(\sigma-1)^2} - 3;$$

hence $(\sigma^2-\sigma+1)^2 + \sigma^2(\sigma-1)^2$ has the same value at equivalent places. F. Klein writes

$$J = \frac{4(\sigma^2-\sigma+1)^3}{27\sigma^2(\sigma-1)^2};$$

this is a transcendental function of ω, which is a special case of a

where c_1, c_2, &c., are rational integers.

69. Suppose, now, that a, b, c, d are rational integers, such that $\operatorname{dv}(a, b, c, d) = 1$ and $ad - bc = n$, a positive integer. Let $(a\omega+b)/(c\omega+d) = \omega'$; then the equation $J(\omega') = J(\omega)$ is satisfied if and only if $\omega' - \omega$, that is, if there are integers $\alpha, \beta, \gamma, \delta$ such that $\alpha\delta - \beta\gamma = 1$, and

$$(a\omega+b)(\gamma\omega+\delta) - (c\omega+d)(a\omega+\beta) = 0.$$

If we write $\psi(n) = n\Pi(1+p^{-1})$, where the product extends to all prime factors (p) of n, it is found that the values of ω fall into $\psi(n)$ equivalent sets, so that when ω is given there are not more than $\psi(n)$ different values of $J(\omega')$. Putting $J(\omega') = J'$, $J(\omega) = J$, we have a modular equation

$$f_n(J', J) = 0$$

symmetrical in J, J', with integral coefficients and of degree $\psi(n)$. Similarly when $\operatorname{dv}(a, b, c, d) = \tau$ we have an equation $f_\tau(J', J) = 0$ of order $\psi(n/\tau^2)$; hence the complete modular equation for transformations of the nth order is

$$F(J', J) = \Pi f_\tau(J', J) = 0,$$

the degree of which is $\Phi(n)$, the sum of the divisors of n.

Now if in $F(J', J)$ we put $J' = J$, the result is a polynomial in J alone, which we may call $G(J)$. To every linear factor of G corresponds a class of quadratic forms of determinant $(\kappa^2 - 4n)$ where $\kappa^2 < 4n$ and κ is an integer or zero: conversely from every such form we can derive a linear factor $(J-a)$ of G. Moreover, if with each form we associate its weight (§ 41) we find that with the notation of § 39 the degree of G is precisely $\Sigma H(4n-\kappa^2) - \epsilon_n$, where $\epsilon_n = 1$ when n is a square, and is zero in other cases. But this degree may be found in another way as follows. A complete representative set of transformations of order n is given by $\omega' = (a\omega+b)/d$, with $ad = n$. $0 \leqq b < d$; hence

$$G(J) = \Pi\left\{J(\omega) - J\left(\frac{a\omega+b}{d}\right)\right\},$$

and by substituting for $J(\omega)$ and $J\left(\frac{a\omega+b}{d}\right)$ their values in terms of q, we find that the lowest term in the factor expressed above is either $q^{-2}/1728$ or $q^{-2a+d}/1728$, or a constant, according as $a < d$, $a > d$ or $a = d$. Hence if ν is the order of $G(J)$, so that its expansion in q begins with a term in $q^{-2\nu}$ we must have

$$\nu = \sum_{d > \sqrt{n}}(1 \cdot d) + \sum_{d > \sqrt{n}}\left(\frac{a}{d} \cdot d\right) = \sum_{d > \sqrt{n}} d + \sum_{d > \sqrt{n}, a > \sqrt{n}} a$$
$$= 2\sum_{d > \sqrt{n}} d$$

extending to all divisors of n which exceed $\sqrt{n}$. Comparing this with the other value, we have

$$\Sigma H(4n-\kappa^2) = 2\sum_{d > \sqrt{n}} d + \epsilon_n = \Phi(n) + \Psi(n),$$

as stated in § 39.

70. Each of the singular moduli which are the roots of $G(J) = 0$ corresponds to exactly one primitive class of definite quadratic forms, and conversely.

Corresponding to every given negative determinant $-\Delta$ there is an irreducible equation $\psi(j) = 0$, where $j = 1728J$, the coefficients of which are rational integers, and the degree of which is $h(-\Delta)$. The coefficient of the highest power of j is unity, so that j is an arithmetical integer, and its conjugate values belong one to each primitive class of determinant $-\Delta$. By adjoining the square roots of the prime factors of Δ the function $\psi(j)$ may be resolved into the product of as many factors as there are genera of primitive classes, and the degree of each factor is equal to the number of classes in each genus. In particular, if $[1, 1, \frac{1}{4}(\Delta+1)]$ is the only reduced form for the determinant $-\Delta$, the value of j is a real negative rational cube. At the same time its approximate value is $\exp\left[-2\pi i\frac{1+i\sqrt{\Delta}}{2}\right] + 744 = 744 - e^{\pi\sqrt{\Delta}}$, so that, approximately, $e^{\pi\sqrt{\Delta}} = m^3 + 744$ where m is a rational integer. For instance $e^{\pi\sqrt{43}} = 884736743 \cdot 9997775\dots = 960^3 + 744$ very nearly, and for the class (1, 1, 11) the exact value of j is -960^3. Four and only four other similar determinants are known to exist, namely -11, -19, -67, -163, although thousands have been classified. According to Hermite the decimal part of $e^{\pi\sqrt{n}}$ begins with twelve nines; in this case Weber has shown that the exact value of j is $-2^{15} \cdot 3^3 \cdot 5^3 \cdot 23^3 \cdot 29^3$.

71. The function $j(\omega)$ is the most fundamental of a set of quantities called *class-invariants*. Let (a, b, c) be the representative of any class of definite quadratic forms, and let ω be the root of $ax^2 + bx + c = 0$ which has a positive imaginary part; then $F(\omega)$ is said to be a class-invariant for (a, b, c) if $F\left(\frac{\alpha\omega+\beta}{\gamma\omega+\delta}\right) = F(\omega)$ for all real integers $\alpha, \beta, \gamma, \delta$ such that $\alpha\delta - \beta\gamma = 1$. This is true for $j(\omega)$ whatever ω may be, and it is for this reason that j is so fundamental. But, as will be seen from the above examples, the value of j soon becomes so large that its calculation is impracticable. Moreover, there is the difficulty of constructing the modular equation $f_n(J, J') = 0$ (§69), which

Proc. Lond. Math. Soc. ix. p. 242).

For moderate values of Δ the difficulty can generally be removed by constructing algebraic functions of j. Suppose we have an irreducible equation

$$x^m + c_1 x^{m-1} + \ldots + c_m = 0,$$

the coefficients of which are rational functions of $j(\omega)$. If we apply any modular substitution $\omega' = S(\omega)$, this leaves the equation unaltered, and consequently only permutates the roots among themselves: thus if $x_1(\omega)$ is any definite root we shall have $x_1(\omega') = x_i(\omega)$, where i may or may not be equal to 1. The group of unitary substitutions which leave all the roots unaltered is a factor of the complete modular group. If we put $y = x(n\omega)$, y will satisfy an equation similar to that which defines x, with j' written for j; hence, since j, j' are connected by the equation $f_1(j, j') = 0$, there will be an equation $\psi(x, y) = 0$ satisfied by x and y. By suitably choosing x we can in many cases find $\psi(x, y)$ without knowing $f_1(j, j')$; and then the equation $\psi(x, x) = 0$ defines a set of singular moduli, each one of which belongs to a certain value of ω and all the quantities derived from it by the substitutions which leave $x(\omega)$ unaltered.

As one of the simplest examples, let $n = 2$, $x^2 - j(\omega) = y^2 - j(\omega') = 0$. Then the equation connecting x, y in its complete form is of the ninth degree in each variable; but it can be proved that it has a rational factor, namely

$$y^2 - x^3 y^3 + 495xy + x^2 - 2^6 \cdot 3^3 \cdot 5^3 = 0,$$

and if in this we put $x = y = u$, the result is

$$u^4 - 2u^2 - 495u^3 + 2^6 \cdot 3^3 \cdot 5^3 = 0,$$

the roots of which are 12, 20, -15, -15. It remains to find the values of ω, to which they belong. Writing $\gamma_3(\omega) = \sqrt[3]{j}$, it is found that we may define γ_3 in such a way that $\gamma_3(\omega+1) = \epsilon^{-2\pi i/3}\gamma_3(\omega)$, $\gamma_3(-\omega^{-1}) = \gamma_3(\omega)$, whence it is found that

$$\gamma_3\left(\frac{\alpha\omega+\beta}{\gamma\omega+\delta}\right) = \epsilon^{-\frac{2\pi i}{3}(\gamma\delta+\gamma\alpha+\beta\delta-\beta\delta\gamma^2)}\gamma_3(\omega).$$

We shall therefore have $\gamma_3(2\omega) = \gamma_3(\omega)$ for all values of such that

$$2\omega = \frac{\alpha\omega+\beta}{\gamma\omega+\delta}, \quad \alpha\delta-\beta\gamma = 1, \quad \gamma\delta+\gamma\alpha+\beta\delta-\beta\delta\gamma^2 \equiv 0 \pmod 3.$$

Putting $(\alpha, \beta, \gamma, \delta) = (0, -1, 1, 0)$ the conditions are satisfied, and $2\omega = i\sqrt{2}$. Now $j(i) = 1728$, so that $\gamma_3(i) = 12$; and since $j(\omega)$ is positive for a pure imaginary, $\gamma_3(i\sqrt{2}) = 20$. The remaining case is settled, by putting

$$\frac{\omega}{2} = \frac{\alpha\omega+\beta}{\gamma\omega+\delta},$$

with $\alpha, \beta, \gamma, \delta$ satisfying the same conditions as before. One solution is $(-1, 2, 1, 1)$ and hence $\omega^2 + 3\omega + 4 = 0$, so that $\gamma_3\left(\frac{-3+i\sqrt{7}}{2}\right) = -15$.

Besides γ_3, other irrational invariants which have been used with effect are $\gamma_2 = \sqrt{(j-1728)}$, the moduli κ, κ', their square and fourth roots, the functions f, f_1, f_2 defined by

$$f = 2^{\frac{1}{4}}(\kappa\kappa')^{-\frac{1}{6}}, \quad f_1 = \sqrt[4]{\kappa'}\, f, \quad f_2 = \sqrt[4]{\kappa}\, f,$$

and the function $\eta(n\omega)/\eta(\omega)$ where $\eta(\omega)$ is defined by

$$\eta(\omega) = q^{\frac{1}{12}} \sum_{-\infty}^{+\infty} (-1)^s q^{3s^2+s} = \frac{1}{\sqrt{3}}\theta_{11}\left(\frac{2}{3}, \frac{\omega}{3}\right) = q^{\frac{1}{12}} \prod_{1}^{\infty}(1-q^{2s}).$$

72. Another powerful method, developed by C. F. Klein and K. E. R. Fricke, proceeds by discussing the deficiency of $f_1(j, j') = 0$ considered as representing a curve. If this deficiency is zero, j and j' may be expressed as rational functions of the same parameter, and this replaces the modular equation in the most convenient manner. For instance, when $n = 7$, we may put

$$j = \frac{(\tau^2+13\tau+49)(\tau^2+5\tau+1)^3}{\tau} = \phi(\tau), \quad j' = \phi(\tau'),$$

$$\tau\tau' = 49.$$

The corresponding singular moduli are found by solving $\phi(\tau) = \phi(\tau')$. For deficiency 1 we may find in a similar way two auxiliary functions x, y connected by some simple equation $\psi(x, y) = 0$ not exceeding the fourth degree, and such that j, j' are each rational functions of x and y.

Hurwitz has extended this field of research almost indefinitely, not only by generalising the formulae for class-number sums, such as that in § 69, but also by bringing the modular-function theory into connexion with that of algebraic correspondence and Abelian integrals. A comparatively simple example may help to indicate the nature of these researches. From the formulae given at the beginning of § 67, we can deduce, by actual multiplication of the corresponding series,

$$\frac{1}{\pi}\theta'_{11}\theta_{00} = \theta^2_{00}\theta_{01}\theta_{10} = \sum_{-\infty}^{+\infty}\left(\frac{-1}{\xi}\right)|\xi| q^{\xi^2/4} \times \sum_{-\infty}^{+\infty} q^{\eta^2} \quad \left[\begin{matrix}\xi = \pm 1, \pm 3, \ldots; \\ \eta = 0, \pm 1, \pm 2, \ldots\end{matrix}\right]$$

$$= \sum \chi(m) q^{m/8} \qquad [m = 1, 5, 9, \ldots$$

where

$$\chi(m) = \sum\left(\frac{-1}{\xi}\right)|\xi|$$

$$\frac{1}{\pi}\theta'_{11}\theta_{01} = \theta_{00}\theta_{10}\theta_{01} = 2\sum(-1)^{\frac{1}{2}(m-1)}\chi(m) q^{m/2}$$

$$\frac{1}{\pi}\theta'_{11}\theta_{01} = \theta_{00}\theta_{10}\theta_{01}^2 = \sum(-1)^{\frac{1}{2}(m-1)}\chi(m) q^{m/4}$$

If, now, we write

$$j_1(\omega) = \sum\frac{(-1)^{\frac{1}{2}(m-1)}\chi(m)}{m} q^{m/2}, \quad j_2(\omega) = 2\sum\frac{(-1)^{\frac{1}{2}(m-1)}\chi(m)}{m} q^{m/4},$$

$$j_3(\omega) = 2\sum\frac{\chi(m)}{m} q^{m/4}$$

we shall have

$$dj_1 : dj_2 : dj_3 = \theta_{10} : \theta_{01} : \theta_{00}$$

where $\theta_{10}, \theta_{01}, \theta_{00}$, are connected by the relation (§ 67)

$$\theta_{10}^4 + \theta_{01}^4 - \theta_{00}^4 = 0$$

which represents, in homogeneous co-ordinates, a quartic curve of deficiency 3. For this curve, or any equivalent algebraic figure, $j_1(\omega)$, $j_2(\omega)$ and $j_3(\omega)$ supply an independent set of Abelian integrals of the first kind. If we put $x = \sqrt{\kappa}$, $y = \sqrt{\kappa'}$, it is found that

$$\int\frac{dx}{y^3} = \tfrac{1}{2}j_3(\omega), \quad \int\frac{dx}{y^3} = \tfrac{1}{2}j_2(\omega), \quad \int\frac{xdx}{y^3} = \tfrac{1}{2}j_1(\omega),$$

so that the integrals which the algebraic theory gives in connexion with $x^4 + y^4 - 1 = 0$ are directly identified with $j_1(\omega)$, $j_2(\omega)$, $j_3(\omega)$, provided that we put $x = \sqrt{\kappa(\omega)}$.

Other functions occur in this theory analogous to $j_1(\omega)$, but such that in the q-series which are the expansions of them the coefficients and exponents depend on representations of numbers by quaternary quadratic forms.

73. In the *Berliner Sitzungsberichte* for the period 1883–1890, L. Kronecker published a very important series of articles on elliptic functions, which contain many arithmetical results of extreme elegance; some of these Kronecker had announced without proof many years before. A few will be quoted here, without any attempt at demonstration; but in order to understand them, it will be necessary to bear in mind two definitions. The first relates to the Legendre-Jacobi symbol $\left(\frac{a}{b}\right)$. If a, b have a common factor we put $\left(\frac{a}{b}\right) = 0$; while if a is odd and $b = 2^h c$, where c is odd, we put $\left(\frac{a}{b}\right) = \left(\frac{2^h}{a}\right)\left(\frac{a}{c}\right)$. The other definition relates to the classification of discriminants of quadratic forms. If D is any number that can be such a discriminant, we must have $D \equiv 0$ or $1 \pmod 4$, and in every case we can write $D = D_0 Q^2$, where Q^2 is a square factor of D, and D_0 satisfies one of the following conditions, in which P denotes a product of different odd primes:—

$D_0 = P$, with $P \equiv 1 \pmod 4$
$D_0 = 4P$, $P \equiv -1 \pmod 4$
$D_0 = 8P$, $P \equiv \pm 1 \pmod 4$

Numbers such as D_0 are called *fundamental discriminants*; every discriminant is uniquely expressible as the product of a fundamental discriminant and a positive integral square.

Now let D_1, D_2 be any two discriminants, then $D_1 D_2$ is also a discriminant, and we may put $D_1 D_2 = D = D_0 Q^2$, where D_0 is fundamental: this being done, we shall have

$$\sum_{h=1}^{h=\infty}\sum_{k=1}^{k=\infty}\left(\frac{D_1 Q^2}{k}\right)\left(\frac{D_2 Q^2}{k}\right) F(hk)$$

$$= \tfrac{1}{2}\sum_{a,b,c}\left[\left(\frac{D_1}{A}\right) + \left(\frac{D_2}{A}\right)\right]\sum_{m,n}\left(\frac{Q^2}{m}\right) F(am^2 + bmn + cn^2)$$

where we are to take $h, k = 1, 2, 3, \ldots, +\infty$; $m, n = 0, \pm 1, \pm 2, \ldots \pm\infty$ except that, if $D < 0$, the case $m = n = 0$ is excluded, and that, if $D > 0$, $(2am + bn)T \neq nU$ where (T, U) is the least positive solution of $T^2 - DU^2 = 4$. The sum $\sum_{a,b,c}$ applies to a system of representative primitive forms (a, b, c) for the determinant D, chosen so that a is prime to Q, and b, c are each divisible by all the prime factors of Q. A is any number prime to $2D$ and representable by (a, b, c); and finally $\tau = 2, 4, 6, 1$ according as $D < -4$, $D = -4$, $D = -3$ or $D > 0$. The function F is quite arbitrary, subject only to the conditions that $F(xy) = F(x)F(y)$, and that the sums on both sides are convergent. By putting $F(x) = x^{-s-\rho}$, where ρ is a real positive quantity, it can be deduced from the foregoing that, if D_2 is not a square, and if D_1 is different from 1,

$$\tau H(D_1 Q^2) H(D_2 Q^2) = \mathrm{Lt}_{\rho=0}\sum_{a,b,c}\left(\frac{D_1}{A}\right)\sum_{m,n}\left(\frac{Q^2}{m}\right)(am^2 + bmn + cn^2)^{-1-\rho}$$

where the function $H(d)$ is defined as follows for any discriminant d:—

$$d = -\Delta < 0 \qquad \tau H(d) = \frac{2\pi}{\sqrt{\Delta}} h(-\Delta)$$

$$d > 0 \qquad H(d) = \frac{h(d)}{2\sqrt{d}} \log\frac{T + U\sqrt{d}}{T - U\sqrt{d}}$$

negative: then

$$\frac{\pi\theta'_{11}}{2\pi\sqrt{D_1D_2}}\sum_{s_1,s_2}\left(\frac{D_1}{s_1}\right)\left(\frac{D_2}{s_2}\right)\psi\left(\frac{2s_1}{|D_1|},\frac{2s_2}{|D_2|}\right)$$

$$=\sum_{a,b,c}\left[\left(\frac{D_1}{A}\right)+\left(\frac{D_2}{A}\right)\right]\sum_{m,n}q^{\frac{1}{2}(am^2+bmn+cn^2)}$$

where, on the left-hand side, we are to sum for $s_i=1, 2, 3 \ldots |D_i|$; and on the right we are to take a complete set of representative primitive forms (a, b, c) for the determinant D_1D_2, and give to m, n all positive and negative integral values such that $am^2+bmn+cn^2$ is odd. The quantity τ is 2, if $D_1D_2<-4$, $\tau=4$ if $D_1D_2=-4$, $\tau=6$ if $D_1D_2=-3$. By putting $D_2=1$, we obtain, after some easy transformations,

$$\sum_{s=1}^{s=\Delta}\left(\frac{-\Delta}{s}\right)\operatorname{sn}\frac{4iK}{\Delta}=\frac{4\sqrt{\Delta}}{\pi\theta_{10}^3}\sum\sum q^{\frac{1}{2}(am^2+bmn+cn^2)},$$

which holds for any fundamental discriminant $-\Delta$. For instance, taking $\omega=iK'/K$, and $\Delta=3$, we have $\theta_{10}^3=2\kappa K/\pi$, and $\Sigma q^{\frac{1}{2}(m^2+mn+n^2)}=\frac{2\kappa K\sqrt{3}}{\pi}\operatorname{sn}\frac{4K}{3}$; a verification is afforded by making $2K$ approach the value π, in which case q, κ vanish, while the limit of $q^{\frac{1}{2}}/\kappa$ is $\frac{1}{4}$, whence the limiting value of $\operatorname{sn}\frac{4K}{3}$ is that of $6q^{\frac{1}{2}}/\kappa\sqrt{3}$, which $=6/4\sqrt{3}=\sqrt{3}/2$, as it should be.

Several of Kronecker's formulae connect the solution of the Pellian equation with elliptic modular functions: one example may be given here. Let D be a positive discriminant of the form $8n+5$, let (T, U) be the least solution of $T^2-DU^2=1$: then, if $h(D)$ is the number of primitive classes for the determinant D,

$$(T-U\sqrt{D})h(D)=\Pi(2\kappa\kappa')^2$$

where the product on the right extends to a certain sixth part of those values of $2\kappa\kappa'$ which are singular, and correspond to the field $\Omega(\sqrt{-D})$, or in other words are connected with the class invariant $j(\sqrt{-D})$. For instance, if $D=5$, the equation to find $(\kappa\kappa')^2$ is

$$4.3[(\kappa\kappa')^2-1]^3+(25+13\sqrt{5})^3(\kappa\kappa')^4=0$$

one root of which is given by $(2\kappa\kappa')^2=9-4\sqrt{5}=T-U\sqrt{5}$ which is right, because in this case $h(D)=1$.

74. *Frequency of Primes.*—The distribution of primes in a finite interval $(a, a+b)$ is very irregular, if we change a and keep b constant. Thus if we put $n!=\mu$, the numbers $\mu+2$, $\mu+3, \ldots (\mu+n-1)$ are all composite, so that we can form a run of consecutive composite numbers as extensive as we please; on the other hand, there is possibly no limit to the number of cases in which p and $p+2$ are both primes. Legendre was the first to find an approximate formula for $F(x)$, the number of primes not exceeding x. He found by induction

$$F(x)=x+(\log x-1\cdot08366)$$

which answers fairly well when x lies between 100 and 1,000,000, but becomes more and more inaccurate as x increases. Gauss found, by theoretical considerations (which, however, he does not explain), the approximate formula

$$F(x)=L(x)=\int_2^x\frac{dx}{\log x}$$

(where, as in all that follows, $\log x$ is taken to the base e). This value is ultimately too large, but when x exceeds a million it is nearer the truth than the value given by Legendre's formula.

By a singularly profound and original analysis, Riemann succeeded in finding a formula, of the same type as Gauss's, but more exact for very large values of x. In its complete form it is very complicated; but, by omitting terms which ultimately vanish (for sufficiently large values of x) in comparison with those retained, the formula reduces to

$$F(x)=A+\sum_m(-1)^\mu\frac{1}{m}L(x^{1/m})\quad(m=1, 2, 3, 5, 6, 7, 11, \ldots)$$

where the summation extends to all positive integral values of m which have no square factor, and μ is the number of different prime factors of m, with the convention that when $m=1$, $(-1)^\mu=1$. The symbol A denotes a constant, namely

$$A=\sum\frac{(-1)^\mu}{m}\times\left\{\tfrac{1}{2}-\int_x^\infty\frac{dx}{x(x^2-1)\log x}\right\}$$

and L is used in the sense given above.

P. L. Tchébichev obtained some remarkable results on the frequency of primes by an ingenious application of Stirling's theorem. One of these is that there will certainly be $(k+1)$ primes between a and b, provided that

$$a<\frac{5b}{6}-2\sqrt{b}-\frac{16}{25}R\log 6(\log b)^2-\frac{5}{24R}(4k+25)-\frac{25}{6R}$$

where $R=\frac{1}{2}\log 2+\frac{1}{3}\log 3+\frac{1}{5}\log 5-\frac{1}{30}\log 30=0\cdot921292\ldots$. From Meissel. The following table gives the values of $F(n)$ for various values of n, according to Meissel's determinations:—

n	$F(n)$
20,000	2,262
100,000	9,592
500,000	41,538
1,000,000	78,498

Riemann's analysis mainly depends upon the properties of the function

$$\zeta(s)=\sum_n n^{-s}\qquad(n=1, 2, 3, \ldots),$$

considered as a function of the complex variable s. The above definition is only valid when the real part of s exceeds 1; but it can be generalized by writing

$$2\sin\pi s\Gamma(s)\zeta(s)=i\int_0^\infty\frac{(-x)^{s-1}dx}{e^x-1}$$

where the integral is taken from $x=+\infty$ along the axis of real quantities to $x=\epsilon$, where ϵ is a very small positive quantity, then round a circle of radius ϵ and centre at the origin, and finally from $x=\epsilon$ to $x=+\infty$ along the axis of real quantities. This function $\zeta(s)$ is of great importance, and has been recently studied by von Mangoldt Landau and others.

Reference has already been made to the fact that if l, m are coprimes the linear form $lx+m$ includes an infinite number of primes. Now let (a, b, c) be any primitive quadratic form with a total generic character C; and let $lx+m$ be a primitive linear form chosen so that all its values have the character C. Then it has been proved by Weber and Meyer that (a, b, c) is capable of representing an infinity of primes all of the linear form $lx+m$.

75. *Arithmetical Functions.*—This term is applied to symbols such as $\phi(n)$, $\Phi(n)$, &c., which are associated with n by an intrinsic arithmetical definition. The function $\Phi(n)$ was written fn by Euler, who investigated its properties, and by proving the formula

$$\Pi(1-q^n)=\sum_{-\infty}^{+\infty}q^{\frac{1}{2}(3s^2+s)}$$

deduced the result that

$$fn=f(n-1)+f(n-2)-f(n-5)-\ldots=\Sigma(-1)^{s-1}f\left(n-\frac{3s^2\pm s}{2}\right)$$

where on the right hand we are to take all positive values of s such that $n-\frac{1}{2}(3s^2\pm s)$ is not negative, and to interpret $f0$ as n, if this term occurs. J. Liouville makes frequent use of this function in his papers, but denotes it by $\chi(n)$.

If the quantity x is positive and not integral, the symbol $E(x)$ or $[x]$ is used to denote the integer (including zero) which is obtained by omitting the fractional part of x; thus $E(\sqrt{2})=1$, $E(0\cdot7)=0$, and so on. For some purposes it is convenient to extend the definition by putting $E(-x)=-E(x)$, and agreeing that when x is a positive integer, $E(x)=x-\frac{1}{2}$; it is then possible to find a Fourier sine-series representing $x-E(x)$ for all real values of x. The function $E(x)$ has many curious and important properties, which have been investigated by Gauss Hermite, Hacks, Pringsheim, Stern and others. What is perhaps the simplest proof of the law of quadratic reciprocity depends upon the fact that if p, q are two odd primes, and we put $p=2k+1$, $q=2k+1$

$$\sum_{r=1}^{r=k}E\left(\frac{rp}{q}\right)+\sum_{s=1}^{s=k}E\left(\frac{sp}{q}\right)=kk=\tfrac{1}{4}(p-1)(q-1)$$

the truth of which is obvious, if we rule a rectangle $p'\times q''$ into unit squares, and draw its diagonal. This formula is Gauss's, but the geometrical proof is due to Eisenstein. Another useful formula is

$$\sum_{r=1}^{r=m-1}E\left(x+\frac{r}{m}\right)=E(mx)-E(x),$$ which is due to Hermite.

Various other arithmetical functions have been devised for particular purposes; two that deserve mention (both due to Kronecker) are δ_{kk}, which means 0 or 1 according as k, k are unequal or equal, and sgn x, which means $x+|x|$.

76. *Transcendental Numbers.*—It has been proved by Cantor that the aggregate of all algebraic numbers is countable. Hence immediately follows the proposition (first proved by Liouville) that there are numbers, both real and complex, which cannot be defined by any combination of a finite number of equations with rational integral coefficients. Such numbers are said to be transcendental. Hermite first completely proved the transcendent character of e; and Lindemann, by a similar method, proved the transcendence of π. Thus it is now finally established that the quadrature of the circle is impossible, not only by rule and compass, but even with the help of any number of algebraic curves of any order when the coefficients in their equations are rational (see Hermite, *C.R.* lxxvi., 1873, and Lindemann, *Math. Ann.* xx., 1882). Another number which is almost certainly transcendent is Euler's constant C. It may be convenient to give here the following numerical values:—

theory of numbers, which is mainly the work of the 19th century, though many of the researches of Lagrange, Legendre and Gauss, as well as all those of Euler, fall within the 18th. But after all, the germ of this remarkable development is contained in what is only a part of the original Diophantine analysis, of which, beyond question, Fermat was the greatest master. The spirit of this method is still vigorous in Euler; but the appearance of Gauss's *Disquisitiones arithmeticae* in 1801 transformed the whole subject, and gave it a new tendency which was strengthened by the discoveries of Cauchy, Jacobi, Eisenstein and Dirichlet. In recent times Edouard Lucas revived something of the old doctrine, and it can hardly be denied that the Diophantine method is the one that is really germane to the subject. Even the strange results obtained from elliptic and modular functions must somehow be capable of purely arithmetical proof without the use of infinite series. Besides this, the older arithmeticians have announced various theorems which have not been proved or disproved, and made a beginning of theories which are still in a more or less rudimentary stage. As examples of the latter may be mentioned the partition of numbers (see NUMBERS, PARTITION OF, below), and the resolution of large numbers into their prime factors.

The general problem of partitions is to find all the integral solutions of a set of linear equations $\Sigma c_r x_r = m_t$ with integral coefficients, and fewer equations than there are variables. The solutions may be further restricted by other conditions—for instance, that all the variables are to be positive. This theory was begun by Euler: Sylvester gave lectures on the subject, of which some portions have been preserved; and various results of great generality have been discovered by P. A. MacMahon. The author last named has also considered Diophantine inequalities, a simple problem in which is "to enumerate all the solutions of $7x > 13y$ in positive integers."

The resolution of a given large number into its prime factors is still a problem of great difficulty, and tentative methods have to be applied. But a good deal has been done by Seelhoff, Lucas, Landry, A. J. C. Cunningham and Lawrence to shorten the calculation, especially when the number is given in, or can be reduced to, some particular form.

It is well known that Fermat was led to the erroneous conjecture (he did *not* affirm it) that 2^m+1 is a prime whenever m is a power of 2. The first case of failure is when $m=32$; in fact $2^{32}+1 \equiv 0 \pmod{641}$. Other known cases of failure are $m=2^n$, with $n=6, 12, 23, 26$ respectively; at the same time, Eisenstein asserted that he had proved that the formula 2^m+1 included an infinite number of primes. His proof is not extant; and no other has yet been supplied. Similar difficulties are encountered when we examine Mersenne's numbers, which are those of the form 2^p-1, with p a prime; the known cases for which a Mersenne number is prime correspond to $p=2, 3, 5, 7, 13, 17, 19, 31, 61$.

A perfect number is one which, like 6 or 28, is the sum of its aliquot parts. Euclid proved that $2^{p-1}(2^p-1)$ is perfect when (2^p-1) is a prime: and it has been shown that this formula includes all perfect numbers which are even. It is not known whether any odd perfect numbers exist or not.

Friendly numbers (*numeri amicabiles*) are pairs such as 220, 284, each of which is the sum of the aliquot parts of the other. No general rules for constructing them appear to be known, but several have been found, in a more or less methodical way.

78. In conclusion it may be remarked that the science of arithmetic (*q.v.*) has now reached a stage when all its definitions, processes and results are demonstrably independent of any theory of variable or measurable quantities such as those postulated in geometry and mathematical physics; even the notion of a limit may be dispensed with, although this idea, as well as that of a variable, is often convenient. For the application of arithmetic to geometry and analysis, see FUNCTI-

1865, or *Coll. Math. Papers*, vol. i.); D. Hilbert, "Bericht über die Theorie der algebraischen Zahlkörper" (in *Jahresber. d. deutschen Math.-Vereinig.*, vol. iv., Berlin, 1897); Klein-Fricke, *Elliptische Modulfunctionen* (Leipzig, 1890–1892); H. Weber, *Elliptische Functionen u. algebraische Zahlen* (Braunschweig, 1891). Extensive bibliographies will be found in the Royal Society's *Subject Index*, vol. i. (Cambridge, 1908) and *Encycl. d. math. Wissenschaften*, vol. i. (Leipzig, 1898). (G. B. M.)

NUMBERS, BOOK OF, the fourth book of the Bible, which takes its title from the Latin equivalent of the Septuagint Ἀριθμοί. While the English version follows the Septuagint directly in speaking of Genesis, Exodus, Leviticus and Deuteronomy, it follows the Vulgate in speaking of Numbers. Since this book describes the way in which an elaborate census of Israel was taken on two separate occasions, the first at Sinai at the beginning of the desert wanderings and the second just before their close on the plains of Moab, the title is quite appropriate. The name given to it in modern Hebrew Bibles from its fourth word *Bemidhbar* ("In the desert") is at least equally appropriate. The other title in use among the Jews, *Vayyidhabber* ("And he said"), is simply the first word of the book and has no reference to its contents.

Numbers is the first part of the second great division of the Hexateuch. In the first three books we are shown how God raised up for Himself a chosen people and how the descendants of Israel on entering at Sinai into a solemn league and covenant with Yahweh (Jehovah) became a separate nation, a peculiar people. In the last three books we are told what happened to Israel between the time it entered into this solemn covenant and its settlement in the Promised Land under the successor of Moses. Yet, though thus part of a larger whole, the book of Numbers has been so constructed by the Redactor as to form a self-contained division of that whole.

The truth of this statement is seen by comparing the first verse of the book with the last. The first is as evidently meant to serve as an introduction to the book as the last is to serve as its conclusion. This is not to say, however, that the book is all of a piece, or written on a systematic plan. On the contrary, no book in the Hexateuch gives such an impression of incoherence, and in none are the different strata which compose the Hexateuch more distinctly discernible.

It is noteworthy that the problems of Hexateuchal criticism are gradually changing their character, as one after another of the main contentions of Biblical scholars regarding the date and authorship of the Hexateuch passes out of the list of debatable questions into that of acknowledged facts. No competent scholars now question the existence, hardly any one the relative dates, of J, E, and P. In Numbers one can tell almost at a glance which parts belong to P, the Priestly Code, and which to JE, the narrative resulting from the combination of the Judaic work of the Yahwist with the Ephraimitic work of the Elohist. The main difficulty in Numbers is to determine to which stratum of P certain sections should be assigned.

The first large section (i.–x. 10) is wholly P, and the last eleven chapters are also P with the exception of two or three paragraphs in chap. xxxii., while the intervening portion is mainly P with the exception of three important episodes and two or three others of less importance. The three main episodes are those of the twelve spies, the rebellion of Korah, Dathan and Abiram, and Balaam's mission to Balak. The last is the only one even of these three in which there is nothing belonging to P. Another passage which we may here mention is one where the elements of JE can be readily separated and assigned to their respective authors, viz. chaps. xi. and xii. It is generally agreed that to E belongs the passage describing the outpouring of the Spirit on Eldad and Medad and the remarkable prayer of Moses in xi. 29, "Would God that all the Lord's people were prophets that the Lord

would put his Spirit upon them," a prayer that closely approaches the New Testament idea that all Christians are "priests unto God." As usual, the J and E elements possess such a vivid character as to render them familiar to ordinary readers. The legislative and statistical and especially the ritualistic parts belonging to P are so detailed and uninteresting that they make no impression on a reader's memory, and P's diffuseness, always undue, reaches a climax in chap. vii. where the offerings presented by each tribe at the dedication of the Tabernacle are actually described in such full detail that six, in themselves extremely uninteresting, verses are repeated in identical terms no fewer than twelve times. Compare also the very similar repetitions and diffuseness in chap. xxix.

Perhaps, however, the most illuminating example of the difference between traditions as recorded in J or E and traditions as given by P is found in the very first passage that occurs after the first long section of P describing the order of march of the several tribes and the position of the ark in the very centre of the host, both when encamped and on the march. Notwithstanding all this, in x. 30 we find Moses entreating Hobab, the son of Reuel his father-in-law, to come along with the Israelites to be "eyes" unto them; and in x. 33 it is stated that the ark went *before* them to seek out a resting-place for them. Whether we ascribe this whole passage simply to JE or consider, as many scholars do, that the first statement is by J and the second by E, it is clear that these statements directly contradict P's elaborate scheme, according to which the people march, tribe by tribe, with the ark in the very centre of the square, and guided by the pillar of cloud by day and the pillar of fire by night. There can be equally little doubt that these statements are much more likely to be in accordance with fact than P's. The latter's elaborate plans go on the supposition that great masses of men, women and children could be moved about over the desert as easily as pawns on a chess-board; but even the greatest military leader the world has seen would have been unable to preserve such complicated formations amid the difficulties inevitable on a desert march; and the more carefully an intelligent reader has studied the details of P's plan, the more astonished will he be to read the statement in x. 33 as to the position of the ark, and to learn that Moses, instead of simply following the pillar of cloud, requests Hobab to determine the line of march and select the sites for encampment. No clearer proof could be desired of the utterly uncritical spirit of the age in which the Hexateuch got its present form than that this detailed account should be immediately followed by two short paragraphs in palpable contradiction of the whole plan of camp and march so elaborately worked out in the preceding narrative.

The fact is that Numbers is the result of a long literary process of amalgamation both of traditions and of documents, a process that began in the closing decades of the 9th century B.C. and did not finally end till the 2nd century B.C., the earliest date being that of J, and the latest probably that of the various addenda to Balaam's prophecies, *e.g.* xxiii. 10*b*, xxiv. 9*b*, xxiv. 18–24. Balaam's prayer in xxiii. 10*b* is not only metrically superfluous, but the personal, individual note in it is quite out of keeping with every other reference in this poem, which is purely national. This addition may therefore have been originally the marginal note of a pious scribe which was afterwards transferred to the text. In xxiv. 24 Kittim is a name originally derived from Kitium, a city of Cyprus. The meaning of "Kittim" was then extended to include the inhabitants of all the islands and coast-lands of the Mediterranean. Hence it might mean not only Macedonia or Greece, but even Italy. In Dan. xi. 30 it is certainly applied to Rome, the Vulgate rendering it "Romam" there just as that version translates it here by "Italia." Hence Baentsch would refer this oracle to the time of Antiochus IV. (Epiphanes) and even to the embassy of Popillius Laenas in 168 B.C. when that haughty Roman humiliated the Syrian king by drawing a circle round him with his cane, and daring him to step out of it till he had given him an answer.

The book falls naturally into three sections, chronologically arranged: (1) Chaps. i.-x. 10, Israel's twenty days' sojourn at Sinai during which a census of the people is taken and various laws are promulgated by Moses. (2) Chaps. x. 11-xxii., incidents that occurred during the march of Israel from Sinai to the plains of Moab. These incidents seem to have been chosen for the purpose of casting light on the religious history and character of the people and showing how later generations explained the origin of various place names, cf. Taberah and Kibrothhattaavah, xi. 3, 34, and modes or objects of worship, cf. the worship of the brazen serpent, xxi. 4-11, which, as we learn from 2 Kings xviii. 4, continued down to the time of Hezekiah. (3) Chaps. xxii. 2-xxxvi., Israel's sojourn in the plains of Moab, their experiences while there, and the taking of a second census, preliminary to the invasion of Canaan.

Two examples of the very miscellaneous contents of the book will suffice to show the different literary strata of which it is composed.

(A) We shall take first the account given in chap. xvi. of the rebellion of Korah, Dathan and Abiram. There would be originally *four* independent narratives, J, E, and two very distinct strata of P, which we may call P^1 and P^2 or P^s, *i.e.* later supplements to P. The narratives of J and E can no longer be distinguished except from slight linguistic data, perceptible only to Hebrew scholars; but the three stages of development are quite apparent even in translations.

1. The first narrative is that of JE, which relates how two *Reubenites*, Dathan and Abiram, rebelled against the *civil* authority of Moses, and were punished by being buried alive, they and their households. Read together verses 1*b*, 2*a*, 12-15 and 25-34, omitting 32*b*, *i.e.* "and all the men that appertained unto Korah and all their goods," a clause due to the Redactor, who put it in to unite the narratives, forgetting that Korah, not being a Reubenite, could not have had his *tent* with its belongings among the tents of the Reubenites.

2. The second narrative is P^1, which tells how Korah, himself a Levite, at the head of 250 *Israelites* rebelled against the *religious* authority of Moses and Aaron because of the privileges conferred on the *tribe* of Levi. Korah and his associates maintained that the other tribes, belonging as they did to a holy people, had as much right as the Levites to approach Yahweh directly, without the mediation of any Levite, and offer sacrifices and even incense to Yahweh. Read together verses 1*a*, 2*b*-7, 19-24.

3. The third narrative is P^2, which relates how Korah at the head of 250 *Levites* protested against the *priestly* privileges of Aaron, claiming that all the Levites had as much right to sacrifice and offer incense to Yahweh as Aaron and his sons had. Read together verses 8-11 and 16 and 17. In both P^1 and P^2 the disputants are summoned from their tents and ordered to assemble before the Dwelling of Yahweh; and in both cases the same fate overtook the rebels. Fire descended from heaven and consumed Korah and his confederates. It is to be noticed that in both P^1 and P^2 incense is burned in pans or censers, so that even the author of P^2 knew nothing about an *altar* of incense. Indeed in xvii. 3 and 4 *the* altar is spoken of in such a way as to imply that there was only one altar, viz. the altar of burnt-offering. xvi. 2 proves that according to the second account the members of Korah's band, so far from being all Levites, as they are represented to have been in verses 8-11, were probably, with the exception of Korah himself, leading members of the secular tribes. In xxvii. 3 we find a proof, all the more conclusive from being incidental, that Korah's followers were not all Levites; for, had they been so, it could never have occurred to the daughters of Zilpahad to repudiate the idea that their father, a *Manassite*, had had a share in Korah's conspiracy. Of course none of the narratives is found in its entirety, anything common to two or more of them being given only once; and great skill has been shown in weaving them together.

(B) The story of Balaam as we have it in chaps. xxii.-xxiv. is an amalgam of J and E with later additions; but xxxi. 8, 16 proves that Balaam was not unknown to P. According to E, Balak sent certain Moabite *princes* all the way to Pethor on the Euphrates to ask Balaam to come and curse Israel. But *Elohim* came to Balaam by night and forbade him to go. So the princes returned disappointed. A second and still more influential embassy having been sent, Elohim again appeared by night, and this time permitted Balaam to go on condition that he said nothing but what Elohim bade him say. The journey being a long one and across a difficult desert, requiring a caravan well equipped with camels, the *princes of Moab* waited till Balaam was ready to accompany them. When Balaam reached the frontier of Moab Balak was waiting to welcome him, but could not refrain from asking why he had not come with the first embassy. With equal frankness Balaam replied that, though he had come now, he had no power to say anything but what Elohim might put into his mouth. On being taken to Bamoth-Baal he was met by Elohim. Thereupon, instead of cursing the Israelites, Balaam blessed them. Though bitterly disappointed Balak still attempted to effect his purpose and took Balaam to the top of Pisgah, with the result that Israel received a second blessing. Balak, now utterly disheartened, abandoned his project altogether.

According to J, Balaam was among his own people the Bne-Ammon when Balak sent *messengers* to him with presents such as soothsayers generally received, asking him to come and curse a people that had come up out of Egypt. Balaam protested that, though he were to receive a houseful of silver and gold, he could not go beyond the word of Yahweh, his God. Nevertheless his scruples were somehow overcome; and, without consulting Yahweh, he

yards, the angel of Yahweh would have slain him, had not his ass swerved and saved him. That this episode belongs to J no one need ever forget, since the only parallel in Scripture to the speaking ass is the serpent that spoke in Eden. Balaam, after being sternly rebuked, was allowed to proceed, but only on condition that "the word that I shall speak to thee, that thou shalt speak." Balak met Balaam at Ar-Moab, whence they went to Kiriath-Huzoth and thence to the top of Peor. There Balaam blessed Israel. Balak angrily taunted Balaam with having lost the honours intended for him, and bade him flee to his own place. Balaam reminded Balak of his declaration that he could not go beyond the word of Yahweh, and then boldly announced the respective destinies of Israel and Moab, xxiv. 15-19.

As *seven* is the perfect number and as Balaam had ordered seven altars to be built, the Redactor thought it would be well to have seven Mĕshālīm or metrical oracles; and so he added other three which are certainly not pertinent to the situation, as they allude not merely to the Assyrian empire but to the Macedonian, and even, as some maintain, to the Roman empire, cf. xxiv. 24.

The poetical quotations in Numbers are of the utmost importance, not only as helping to determine the date of the book but as indicating the value of poetry in its bearing on history. In xxi. 14 we have a poetical quotation from a lost volume of early poetry entitled "The Book of the Wars of Yahweh." It is highly probable that Deborah's song was also originally in this book; and when we compare the statement in that song as to Israel's full fighting strength, viz. 40,000 men, with the statements in the prose of Numbers as to 600,000 men and more, we at once realise how much closer to actual facts we are brought by early poetry than by the later prose of writers like P. Perhaps it is in chap. xxxi. that we have the clearest proof of the non-historical character of the book. There we are told that 12,000 Israelites, without losing a single man, slew every male Midianite, children included, and every Midianite woman that had known a man, and took so much booty that there had to be special legislation as to how is should be divided. But if this were actual fact, how could the Midianites have ever reappeared in history? And yet in Gideon's time they were strong enough to oppress Israel. From this chapter, unhistorical as it must be, we see how the legislation of Israel, whatever its character or origin, was referred back to Moses the great Law giver of Israel. (J. A. P.*)

NUMBERS, PARTITION OF. This mathematical subject, created by Euler, though relating essentially to positive integer numbers, is scarcely regarded as a part of the Theory of Numbers (see NUMBER). We consider in it a number as made up by the *addition* of other numbers: thus the partitions of the successive numbers 1, 2, 3, 4, 5, 6, &c., are as follows:—

1;
2, 11;
3, 21, 111;
4, 31, 22, 211, 1111;
5, 41, 32, 311, 221, 2111, 11111;
6, 51, 42, 411, 33, 321, 3111, 222, 2211, 21111, 111111.

These are formed each from the preceding ones; thus, to form the partitions of 6 we take first 6; secondly, 5 prefixed to each of the partitions of 1 (that is, 51); thirdly, 4 prefixed to each of the partitions of 2 (that is, 42, 411); fourthly, 3 prefixed to each of the partitions of 3 (that is, 33, 321, 3111); fifthly, 2 prefixed, not to each of the partitions of 4, but only to those partitions which begin with a number not exceeding 2 (that is, 222, 2211, 21111); and lastly, 1 prefixed to all the partitions of 5 which begin with a number not exceeding 1 (that is, 111111); and so in other cases.

The method gives *all* the partitions of a number, but we may consider different classes of partitions: the partitions into a given number of parts, or into not more than a given number of parts; or the partitions into given parts, either with repetitions or without repetitions, &c. It is possible, for any particular class of partitions, to obtain methods more easy for the formation of the partitions either of understanding this letter in each term, the rule gives b; c, b^2; d, bc, b^3; e, bd, c^2, b^2c, b^4, &c., which, if b, c, d, e, &c., denote 1, 2, 3, 4, &c., respectively, are the partitions of 1, 2, 3, 4, &c., respectively.

An important notion is that of conjugate partitions. Thus a partition of 6 is 42; writing this in the form $\left\{\begin{matrix}1111\\11\end{matrix}\right.$ and summing the columns instead of the lines, we obtain the conjugate partition 2211; evidently, starting from 2211, the conjugate partition is 42. If we form all the partitions of 6 into not more than three parts, these are

6, 51, 42, 33, 411, 321, 222,

and the conjugates are

111111, 21111, 2211, 222, 3111, 321, 33,

where no part is greater than 3; and so in general we have the theorem, the number of partitions of n into not more than k parts is equal to the number of partitions of n with no part greater than k.

We have for the number of partitions an analytical theory depending on generating functions; thus for the partitions of a number n with the parts 1, 2, 3, 4, 5, &c., without repetitions, writing down the product

$$1+x.1+x^2.1+x^3.1+x^4\dots, = 1+x+x^2+2x^3\dots+Nx^n+\dots,$$

it is clear that, if x^α, x^β, x^γ, ... are terms of the series x, x^2, x^3, ... for which $\alpha+\beta+\gamma+\dots=n$, then we have in the development of the product a term x^n, and hence that in the term Nx^n of the product the coefficient N is equal to the number of partitions of n with the parts 1, 2, 3, ..., without repetitions; or say that the product is the generating function (G. F.) for the number of such partitions. And so in other cases we obtain a generating function.

Thus for the function

$$\frac{1}{1-x.1-x^2.1-x^3\dots}, = 1+x+2x^2+\dots+Nx^n+\dots,$$

observing that any factor $1/1-x^l$ is $=1+x^l+x^{2l}+\dots$, we see that in the term Nx^n the coefficient is equal to the number of partitions of n, with the parts 1, 2, 3, ..., with repetitions.

Introducing another letter z, and considering the function

$$1+xz.1+x^2z.1+x^3z\dots, = 1+z(x+x^2+\dots)\dots+Nx^nz^k+\dots,$$

we see that in the term Nx^nz^k of the development the coefficient N is equal to the number of partitions of n into k parts, with the parts 1, 2, 3, 4, ..., without repetitions.

And similarly, considering the function

$$\frac{1}{1-xz.1-x^2z.1-x^3z\dots}, = 1+z(x+x^2+\dots)\dots+Nx^nz^k+\dots,$$

we see that in the term Nx^nz^k of the development the coefficient N is equal to the number of partitions of n into k parts, with the parts 1, 2, 3, 4, ..., with repetitions.

We have such analytical formulae as

$$\frac{1}{1-xz.1-x^2z.1-x^3z\dots} = 1+\frac{zx}{1-x}+\frac{z^2x^2}{1-x\,.\,1-x^2}+\dots,$$

which lead to theorems in the partition of numbers. A remarkable theorem is

$$1-x.1-x^2.1-x^3.1-x^4. = 1-x-x^2+x^5+x^7-x^{12}-x^{15}+\dots,$$

where the only terms are those with an exponent $\frac{1}{2}(3n^2\pm n)$, and for each such pair of terms the coefficient is $(-)^n1$. The formula shows that except for numbers of the form $\frac{1}{2}(3n^2\pm n)$ the number of partitions without repetitions into an odd number of parts is equal to the number of partitions without repetitions into an even number of parts, whereas for the excepted numbers these numbers differ by unity. Thus for the number 11, which is not an excepted number, the two sets of partitions are

11, 821, 731, 641, 632, 542
10.1, 92, 83, 74, 65, 5321,

in each set 6.

We have

$$1-x.1+x.1+x^2.1+x^4.1+x^8\dots = 1;$$

or, as this may be written,

$$1+x.1+x^2.1+x^4.1+x^8\dots = \frac{1}{1-x}, = 1+x+x^2+x^3+\dots,$$

showing that a number n can always be made up, and in one way only, wit the parts 1, 2, 4, 8, ... The product on the left-hand side may be taken to k terms only, thus if $k=4$, we have

$$1+x.1+x^2.1+x^4.1+x^8, = \frac{1-x^{16}}{1-x}, = 1+x+x^2\dots+x^{15},$$

that is, any number from 1 to 15 can be made up, and in one way only, with the parts 1, 2, 4, 8; and similarly any number from 1 to $2^{n}-1$ can be made up, and in one way only, with the parts 1, 2, 4, .. 2^{n-1}. A like formula is

$$\frac{1-x^{3}}{x.1-x}\cdot\frac{1-x^{9}}{x^{3}.1-x^{3}}\cdot\frac{1-x^{27}}{x^{9}.1-x^{9}}\cdot\frac{1-x^{81}}{x^{27}.1-x^{27}}=\frac{1-x^{81}}{x^{40}.1-x};$$

that is,

$$x^{-1}+1+x.x^{-3}+1+x^{3}.x^{-9}+1+x^{9}.x^{-27}+1+x^{27}$$
$$=x^{-40}+x^{-39}.+1+x\ldots+x^{39}+x^{40},$$

showing that any number from −40 to +40 can be made up, and that in one way only, with the parts 1, 3, 9, 27 taken positively or negatively; and so in general any number from $-\frac{1}{2}(3^{n}-1)$ to $+\frac{1}{2}(3^{n}-1)$ can be made up, and that in one way only, with the parts 1, 3, 9, .. 3^{n-1} taken positively or negatively.

See further COMBINATORIAL ANALYSIS. (A. CA.)

NUMENIUS, a Greek philosopher, of Apamea in Syria, Neo-Pythagorean and forerunner of the Neo-Platonists, flourished during the latter half of the 2nd century A.D. He seems to have taken Pythagoras as his highest authority, while at the same time he chiefly follows Plato. He calls the latter an "Atticizing Moses." His chief divergence from Plato is the distinction between the "first god" and the "demiurge." This is probably due to the influence of the Valentinian Gnostics and the Jewish-Alexandrian philosophers (especially Philo and his theory of the Logos). According to Proclus (*Comment. in Timaeum*, 93) Numenius held that there was a kind of trinity of gods, the members of which he designated as πατήρ, ποιητής, ποίημα ("father," "maker," "that which is made," *i.e.* the world), or πάππος, ἔκγονος, ἀπόγονος (which Proclus calls "exaggerated language"). The first is the supreme deity or pure intelligence (νοῦς), the second the creator of the world (δημιουργός), the third the world (κόσμος). His works were highly esteemed by the Neoplatonists, and Amelius is said to have composed nearly 100 books of commentaries upon them.

Fragments of his treatises on the points of divergence between the Academicians and Plato, on the Good (in which according to Origen, *Contra Celsum*, iv. 51, he makes allusion to Jesus Christ), and on the mystical sayings in Plato, are preserved in the *Praeparatio Evangelica* of Eusebius. The fragments are collected in F. G. Mullach, *Frag. phil. Graec.* iii.; see also F. Thedinga, *De Numenio philosopho Platonico* (Bonn, 1875); Ritter and Preller, *Hist. Phil. Graecae* (ed. E. Wellmann, 1898), § 624-7; T. Whittaker, *The Neo-Platonists* (1901).

NUMERAL (from Lat. *numerus*, a number), a figure used to represent a number. The use of visible signs to represent numbers and aid reckoning is not only older than writing, but older than the development of numerical language on the denary system; we count by tens because our ancestors counted on their fingers and named numbers accordingly. So used, the fingers are really numerals, that is, visible numerical signs; and in antiquity the practice of counting by these natural signs prevailed in all classes of society. In the later times of antiquity the finger symbols were developed into a system capable of expressing all numbers below 10,000. The left hand was held up flat with the fingers together. The units from 1 to 9 were expressed by various positions of the third, fourth, and fifth fingers alone, one or more of these being either closed on the palm or simply bent at the middle joint, according to the number meant. The thumb and index were thus left free to express the tens by a variety of relative positions, *e.g.* for 30 their points were brought together and stretched forward; for 50 the thumb was bent like the Greek Γ and brought against the ball of the index. The same set of signs if executed with the thumb and index of the right hand meant hundreds instead of tens, and the unit signs if performed on the right hand meant thousands.[1]

The fingers serve to express numbers, but to make a permanent note of numbers some kind of mark or tally is needed. A single stroke is the obvious representation of unity; higher numbers are indicated by groups of strokes. But when the strokes become many they are confusing, and so a new sign must be introduced, perhaps for 5, at any rate for 10, 100, 1000, and so forth. Intermediate numbers are expressed by the addition of symbols, as in the Roman system CCXXXVI = 236. This simplest way of writing numbers is well seen in the Babylonian inscriptions, where all numbers from 1 to 99 are got by repetition of the vertical arrowhead 𒁹 = 1, and a barbed sign 𒌋 = 10. But the most interesting case is the Egyptian, because from its hieratic form sprang the Phoenician numerals, and from them in turn those of Palmyra and the Syrians, as illustrated in table 1. Two things are to be noted in this table—first, the way in which groups of units come to be joined by a cross line, and then run together into a single symbol, and, further, the substitution in the hundreds of a principle of multiplication for the mere addition of symbols. The same thing appears in Babylonia, where a smaller number put to the right of the sign for 100 (𒐕) is to be added to it, but put to the left gives the number of hundreds. Thus 𒌋𒐕 = 1000, but 𒐕𒌋 = 110. The Egyptians had hieroglyphics for a thousand, a myriad, 100,000 (a frog), a million (a man with arms stretched out in admiration), and even for ten millions.

Alphabetic writing did not do away with the use of numerical symbols, which were more perspicuous, and compendious than words written at length. But the letters of the alphabet themselves came to be used as numerals. One way of doing this was to use the initial letter of the name of a number as its sign. This was the old Greek notation, said to go back to the time of Solon, and usually named after the grammarian Herodian, who described it about A.D. 200. I stood for 1, Π for 5, Δ for 10, H for 100, X for 1000, and M for 10,000; Π with Δ in its bosom was 50, with H in its bosom it was 500. Another way common to the Greeks, Hebrews, and Syrians, and which in Greece gradually displaced the Herodian numbers, was to make the first nine letters stand for the units and the rest for the tens and hundreds.

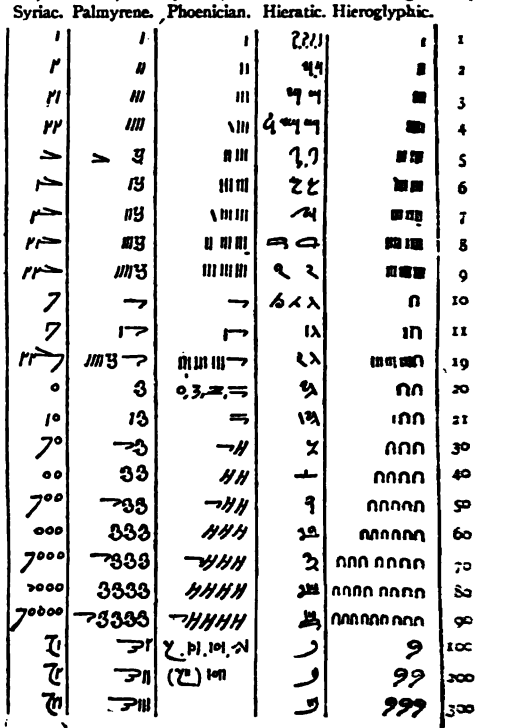


TABLE I.

[1] The system is described by Nicolaus Rhabda of Smyrna (8th century A.D.), ap. N. Caussinus, *De eloquentia sacra et humana* (Paris, 1636). The Venerable Bede gives essentially the same system, and it long survived in the East; see especially Rödiger, "Über die im Orient gebräuchliche Fingersprache, &c.," *D.M.G.* (1845), and Palmer in *Journ. of Philology*, ii. 247 sqq.

With the old Semitic alphabet of 22 letters this system broke down at ת=400, and the higher hundreds had to be got by juxtaposition; but when the Hebrew square character got the distinct final forms ך, ם, ן, ף, ץ these served for the hundreds from 500 to 900. The Greeks with their larger alphabet required but three supplemental signs, which they got by keeping for this purpose two old Phoenician letters which were not used in writing (Ϝ or ς=ι=6, and Ϙ=ϙ=90), and by adding sampi ϡ for 900.[1]

Among the Greeks the first certain use of this system seems to be on coins of Ptolemy II. The first trace of it on Semitic ground is on Jewish coins of the Ḥasmoneans. It is the foundation of gematria as we find it in Jewish book and in the apocalyptic number of the beast (נרון קסר=666). But we do not know how old gematria is; the name is borrowed from the Greek.

The most familiar case of the use of letters as numerals is the Roman system. Here C is the initial of centum and M of mille; but instead of these signs we find older forms, consisting of a circle divided vertically for 1000 and horizontally, Θ, or in the cognate Etruscan system divided into quadrants, ⊕, for 100. From the sign for 1000, still sometimes roughly shown in print as CIↃ, comes D, the half of the symbol for half the number; and the older forms of L, viz. ⊥ or ⊥, suggest that this also was once half of the hundred symbol. So V (Etruscan Λ) is half of X, which itself is not a true Roman letter. The system, therefore, is hardly alphabetic in origin, though the idea has been thrown out that the signs for 10, 50, and 100 were originally the Greek X, Ψ, Φ, which were not used in writing Latin.[2]

When high numbers had to be expressed systems such as we have described became very cumbrous, and in alphabetic systems it became inevitable to introduce a principle of periodicity by which, for example, the signs for 1, 2, 3, &c., might be used with a difference to express the same number of thousands. Language itself suggested this principle, and so we find in Hebrew א̈ or in Greek ͵α=1000. So further βMυ, βM., or simply β.=20,000 (2 myriads). If now the larger were always written to the left of the smaller elements of a number the diacritic mark could be dispensed with in such a case as βωλα (instead of ͵βωλα)=2831, for here it was plain that β=2000, not =2, since otherwise it would not have preceded ω=800. We have here the germ of the very important notion that the value of a symbol may be periodic and defined by its position. The same idea had appeared much earlier among the Babylonians, who reckoned by powers of 60, calling 60 a *soss* and 60 sixties a *sar*. On the tablets of Senkerah a list of squares and cubes is given on this principle, and here the square of 59 is written 58·1—that is, $58\times60+1$; and the cube of 30 is 7·30—that is, 7 sar+30 soss $=7\times60^2+30\times60$. Here again we have value by position; but, as there is no zero, it is left to the judgment of the reader to know which power of 60 is meant in each case. The sexagesimal system, long specially associated with astronomy, has left a trace in our division of the hour and of the circle, but as language goes by powers of 10 it is practically very inconvenient for most purposes of reckoning. The Greek mathematicians used a sort of decimal system; thus Archimedes was able to solve his problem of stating a number greater than that of the grains of sand which would fill the sphere of the fixed stars by dividing numbers into octades, the unit of the second octade being 10^8 and of the third 10^{16}. So too Apollonius of Perga teaches multiplication by regarding 7 as the πυθμήν or 70, 700 and so forth. One must then find successively the product of the several pythmens of the multiplier and the multiplicand, noticing in each case what are tens, what hundreds, and so on, and adding the results. The want of a sign for zero made it impossible mechanically to distinguish the tens, hundreds, &c., as we now do.

[1] The Arabs, who quite changed the order of the alphabet and extended it to twenty-eight letters, kept the original values of the old letters (putting ش for ס and ص for ש), while the hundreds from 500 to 1000 were expressed by the new letters in order from ت to غ. In the time of Caliph Walid (A.D. 705-715) the Arabs had as yet no signs of numeration.

[2] See further Fabretti, *Paläographische Studien*.

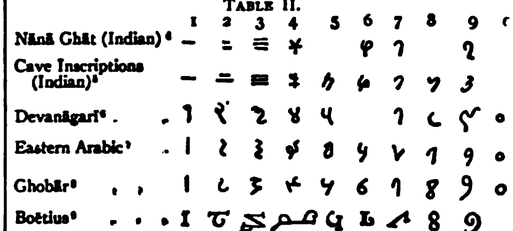
Very early, however, a mechanical contrivance, the abacus, had been introduced for keeping numbers of different denominations apart. This was a table with compartments or columns for counters, each column representing a different value to be given to a counter placed on it. This might be used either for concrete arithmetic—say with columns for pence, shillings and pounds; or for abstract reckoning—say with the Babylonian sexagesimal system. An old Greek abacus found at Salamis has columns which, taken from right to left, give a counter the value of 1, 10, 100, 1000 drachms, and finally of 1 talent (6000 drachms) respectively. An abacus on the decimal system might be ruled on paper or on a board strewed with fine sand, and was then a first step to the decimal system. Two important steps, however, were still lacking: the first was to use instead of counters distinctive marks (ciphers) for the digits from one to nine; the second and more important was to get a sign for zero, so that the columns might be dispensed with, and the denomination of each cipher seen at once by counting the number of digits following it. These two steps taken, we have at once the modern so-called Arabic numerals and the possibility of modern arithmetic; but the invention of the ciphers and zero came but slowly, and their history is a most obscure problem.

What is quite certain is that our present decimal system, in its complete form, with the zero which enables us to do without the ruled columns of the abacus, is of Indian origin. From the Indians it passed to the Arabians, probably along with the astronomical tables brought to Bagdad by an Indian ambassador in 773 A.D. At all events the system was explained in Arabic in the early part of the 9th century by the famous Abū Ja'far Moḥammed b. Musa al-Khwārizmī (Hovarezmi), and from that time continued to spread, though at first slowly, through the Arabian world.

In Europe the complete system with the zero was derived from the Arabs in the 12th century, and the arithmetic based on this system was known by the name of algoritmus, algorithm, algorism. This barbarous word is nothing more than a transcription of Al-Khwārizmī, as was conjectured by Reinaud, and has become plain since the publication of a unique Cambridge MS. containing a Latin translation—perhaps by Adelhard of Bath—of the lost arithmetical treatise of the Arabian mathematician.[3] The arithmetical methods of Khwārizmī were simplified by later Eastern writers, and these simpler methods were introduced to Europe by Leonardo of Pisa in the West and Maximus Planudes in the East. The term zero appears to come from the Arabic ṣifr through the form zephyro used by Leonardo.

Thus far modern inquirers are agreed. The disputed points are—(1) the origin and age of the Indian system, and (2) whether or not a less developed Indian system, without the zero but with the nine other ciphers used on an abacus, entered Europe before the rise of Islam, and prepared the way for a complete decimal notation.

TABLE II.



1. The use of numerals in India can be followed back to the Nānā Ghāt inscriptions, supposed to date from the early part of the 3rd century B.C. These are signs for units, tens and hundreds, as

[3] Published by Boncompagni in *Trattati d' aritmetica* (Rome, 1857).
[4] From Sir E. C. Bayley's paper in *J.R.A.S.* (1882).
[5] From Burnell's *South Indian Palaeography* (1874).
[6] Of the 10th century. (From Burnell, *op. cit.*)
[7] Of the 10th century; from a MS. written at Shirāz. (From Woepcke, *Mémoire sur la propagation des chiffres indiens*.)
[8] From a MS. at Paris. (From Woepcke, *op. cit.*)
[9] Erlangen (Altdorf) MS. (From Woepcke, *op. cit.*)

in the other old systems we have dealt with. Like the Indian alphabet, they are probably derived from abroad, but, as in the case of the alphabet, their origin is obscure. The forms of the later Indian numerals for the nine digits appear to be clearly derived from the earlier system. In table II. the first two lines give forms earlier than the introduction of the system of position, while the Devanāgarī in the third line was used with a zero and position value. The "cave" numerals were employed during the first centuries of the Christian era. The earliest known example of a date written on the modern system is of A.D. 738, while the old system is found in use as late as the early part of the 7th century (Bayley). On the other hand, there is some evidence that a system of value by position was known to Sanskrit writers on arithmetic in the 6th Christian century. These writers, however, do not use ciphers, but symbolical words and letters, so that it is not quite clear whether they refer to a system which had a zero, or to a system worked on an abacus, where the zero is represented by a blank column. There is no proof as yet for the use of any system of position in India before the 6th century, and nothing beyond conjecture can be offered as to its origin.

2. In Europe, before the introduction of the algorithm or full Indo-Arabic system with the zero, we find a transition system in which calculations were made on the decimal system with an abacus, but instead of unit counters there were placed in the columns ciphers, with values from one to nine, and of forms that are at bottom the Indian forms and agree most nearly with the numerals used by the Arabs of Africa and Spain. For among the Arabs themselves there were varieties in the forms of the Indian numeral, and in particular an eastern and a western type. The latter is called ghobār (dust), a name which seems to connect it with the use of a sand-spread tablet for calculation. The abacus with ciphers instead of counters was used at Rheims about 970–980 by Gerbert, who afterwards was pope under the title of Sylvester II., and it became well known in the 11th century. Where did Gerbert learn the use of the abacus with ciphers? There is no direct evidence as to this, for the story in William of Malmesbury, that he stole it from an Arab in Spain, is generally given up as fabulous. On the other hand, no evidence is offered for an earlier use of the abacus with ciphers, except a passage describing the system in the *Geometria* ascribed to Boëtius. If this book is genuine the Indian numerals were known in Europe and applied to the abacus in the 5th century, and Gerbert only revived the long-forgotten system. On this view we have to explain how Boëtius got the ciphers. The *Geometria* ascribes the system to the "Pythagorici"—*i.e.* the Neo-Pythagoreans—and it has been thought possible that the Indian forms for the numerals reached Alexandria, along with the cruder form of value by position involved in the use of the abacus without a zero, before direct communication between Europe and India ceased, which it did about the 4th century A.D. It is then further conjectured by Woepcke that the ghobār numerals of the western Arabs were by them borrowed from the system of Boëtius before the full Indian method with the zero reached them; and thus the resemblance between these forms and those in MSS. of Boëtius, which are essentially the same as in other MSS. of the 11th century, would be explained. This view, however, presents great difficulties, of which the total disappearance of all trace of the system between Boëtius and Gerbert is only one. We have no proof that the Indians ever used such an abacus, or that they had value by position at so early a date as is required, and the ghobār numerals are too similar to those of the eastern Arabs to make it very credible that the two systems had been separated for centuries. The genuineness of the *Geometria* is maintained by Moritz Cantor, but it has been attacked on other grounds than that of the passage about the abacus; and on the whole it is still an open question whether the abacus with ciphers is not the outcome of an early imperfect knowledge of the Arabic system, Gerbert or some other having got the signs and a general idea of value by position without having an explanation of the zero.

See M. Cantor, *Geschichte der Mathematik*, vol. i. (Leipzig, 1880); also M. Chasles, papers in the *Comptes rendus* (1843); G. Friedlein, *Die Zahlzeichen und das elementare Rechnen der Griechen und Römer*, &c. (1869); F. Woepcke, *Sur l'introduction de l'arithmétique indien en occident* (Rome, 1859), and *Mémoire sur la propagation des chiffres indiens* (Paris, 1863). For the palaeography of the Indian numerals see Burnell, *Elements of S. Indian Palaeography* (1874); and Sir E. C. Bayley in *J.R.A.S.* (1882, 1883). For Boëtius compare Friedlein's edition of his arithmetic and geometry (Leipzig, 1867), and Weissenborn in *Zeitsch. Math. Phys.* xxiv. Other references to the copious literature will be found in Cantor and Friedlein, who also discuss the subject of the notation for fractions, which cannot be entered on here. For systems passed over here, see Pihan, *Exposé des signes de numération usités chez les peuples orientaux* (Paris, 1860). (W. R. S.)

NUMERIANUS, MARCUS AURELIUS, son of the Roman emperor Carus. On the death of his father, whom he accompanied on his expedition against the Persians, he was proclaimed emperor (December, A.D. 283). He resolved to abandon the campaign, and died mysteriously on his way back to Europe, eight months afterwards. Arrius Aper, praefect of the praetorian guards, his father-in-law, who was suspected of having murdered him, was slain by Diocletian, whom the soldiers had already proclaimed his successor. Numerianus is represented as having been a man of considerable literary attainments, and of remarkably amiable character.

NUMIDIA, the name given in ancient times to a tract of country in the north of Africa, extending along the Mediterranean from the confines of Mauretania to those of the Roman province to Africa. When the Romans first came into collision with Carthage in the 3rd century B.C., the name was applied to the whole country from the river Mulucha (now the Muluya), about 100 m. W. of Oran, to the frontier of the Carthaginian territory, which nearly coincided with the modern regency of Tunis. It is in this sense that the name Numidia is used by Polybius and all historians down to the close of the Roman republic. The Numidians, as thus defined, were divided into two great tribes,—the Massyli on the east, and the Massaesyli on the west—the limit between the two being the river Ampsaga, which enters the sea to the west of the promontory called Tretum, now known as the Seven Capes. At the time of the second Punic War the eastern tribe was governed by Massinissa, who took the side of the Romans in the contest, while Syphax his rival, king of the Massaesyli, supported the Carthaginians. At the end of the war the victorious Romans confiscated the dominions of Syphax, and gave them to Massinissa, whose sway extended from the frontier of Mauretania to the boundary of the Carthaginian territory, and also south and east as far as the Cyrenaica (Appian, *Punica*, 106), so that the Numidian kingdom entirely surrounded Carthage except towards the sea. Massinissa, who reached a great age, retained the whole of these dominions till his death in 148 B.C. and was succeeded in them by his son Micipsa, who died in 118. For the war with Rome which followed the death of Micipsa see JUGURTHA.

After the death of Jugurtha as a captive at Rome in 106, the western part of his dominions was added to those of Bocchus, king of Mauretania, while the remainder (excluding perhaps the territory towards Cyrene) continued to be governed by native princes until the civil war between Caesar and Pompey, in which Juba I., then king of Numidia, who had espoused the cause of the Pompeians, was defeated by Caesar, and put an end to his own life (46 B.C.). Numidia, in the more restricted sense which it had now acquired, became for a short time a Roman province under the title of Africa Nova, but in the settlement of affairs after the battle of Actium it was restored to Juba II. (son of Juba I.), who had acquired the favour of Augustus. Soon afterwards, in 25 B.C., Juba was transferred to the throne of Mauretania, including the whole western portion of the ancient Numidian monarchy as far as the river Ampsaga, while the eastern part was added to the province of Africa, *i.e.* that part which had been called Africa Nova before it was given to Juba. It retained the official title, though it may also have been known as Numidia; together with Africa Vetus it was governed by a proconsul, and was the only senatorial province in which a legion was permanently stationed, under the orders of the senatorial governor. In A.D. 37 the emperor Gaius put an end to this arrangement by sending a legatus of his own to take over the command of the legion, thus separating the military from the civil administration, and practically separating Numidia or Africa Nova from Africa Vetus, though the two were still united in name (Tac. *Hist.* 4. 48). Under Septimus Severus (A.D. 193–211) Numidia was separated from Africa Vetus, and governed by an imperial procurator (*procurator per Numidiam*); finally, under the new organization of the empire by Diocletian, Numidia became one of the seven provinces of the diocese of Africa, being known as Numidia Cirtensis, and after Constantine as N. Constantina, corresponding closely in extent to the modern French province of Constantine. During all this period it reached a high degree of civilization, and was studded with numerous towns, the importance of which is attested by inscriptions (see vol. viii. of the *Corpus inscriptionum*), and by the massive remains of public buildings. The invasion of the Vandals in A.D. 428 reduced it to a condition of gradual decay; and the invasion of

the Arabs in the 8th century again brought desolation on the land, which was aggravated by continual misgovernment till the conquest of Algeria by the French in 1833.

The chief towns of Numidia under the Romans were: in the north, Cirta, the capital, which still retains the name Constantine given it by Constantine; Rusicada on the coast, serving as its port, on the site now occupied by Philippeville; and east of it Hippo Regius, well known as the see of St Augustine, near the modern Bona. To the south in the interior were Theveste (Tebessa) and Lambaesis (Lambessa) with extensive and striking Roman remains, connected by military roads with Cirta and Hippo respectively. Lambaesis was the seat of the legion III. Augusta, and the most important strategic centre, as commanding the passes of the Mons Aurasius, a mountain block which separated Numidia from the Gaetulian tribes of the desert, and which was gradually occupied in its whole extent by the Romans under the Empire. Including these towns there were altogether twenty which are known to have received at one time or another the title and status of Roman colonies; and in the 5th century the Notitia enumerates no less than 123 sees whose bishops assembled at Carthage in 479.

For bibliography and account of Roman remains, see under AFRICA, ROMAN.

NUMISMATICS (Lat. *numisma*, *nomisma*, a coin; from the Greek, derived from *νομίζειν*, to use according to law), the science treating of coins (Low Lat. *cuneus*, a die) and medals (Low Lat. *medalla*, a small coin).

The earliest known coins were issued by the Greeks in the 7th century before the Christian era. By the 4th century the whole civilized world used money (*q.v.*), each state generally having its proper coinage. This has continued to be the case to the present time; so that now there are few nations without a metal currency of their own, and of these but a small proportion are wholly unacquainted with the use of coins.

Coins, although they confirm history, rarely correct it, and never very greatly. The earliest belong to a time and to nations as to which we are not otherwise wholly ignorant, and they do not afford us that precise information which would fill in any important details of the meagre sketch of contemporary history. We gain from them scarcely any direct historical information, except that certain cities or princes issued money. When in later times the devices and inscriptions of the coins give more detailed information, history is far fuller and clearer, so that the numismatic evidence is rarely more than corroborative. There are, indeed, some remarkable exceptions to this rule, as in the case of the Bactrian and Indian coins, which have supplied the outlines of a portion of history which was otherwise almost wholly lost. The value of the corroborative evidence afforded by coins must not, however, be overlooked. It chiefly relates to chronology, although it also adds to our knowledge of the pedigrees of royal houses. But perhaps the most interesting manner in which coins and medals illustrate history is in their bearing contemporary, or nearly contemporary, portraits of the most famous kings and captains, from the time of the first successors of Alexander the Great to the present age, whereas pictures do not afford portraits in any number before the latter part of the middle ages; and works of sculpture, although occupying in this respect the same place as coins in the last-mentioned period and under the Roman empire, are neither so numerous nor so authentic. There is no more delightful companion in historical reading than a cabinet of coins and medals. The strength and energy of Alexander, the ferocity of Mithradates, the philosophic calmness of Antoninus, the obstinate ferocity of Nero, and the brutality of Caracalla are as plain on the coins as in the pages of history. The numismatic portraits of the time following the founding of Constantinople have less individuality; but after the revival of art they recover that quality, and maintain it to our own day, although executed in very different styles from those of antiquity. From this last class we can form a series of portraits more complete and not less interesting than that of the ancient period.

While coins and medals thus illustrate the events of history, they have an equally direct bearing on the belief of the nations by which they were issued; and in this reference lies no small part of their value in connexion with history. The mythology of the Greeks, not having been fixed in sacred writings, nor regulated by a dominant priesthood, but having grown out of the different beliefs of various tribes and isolated settlements, and having been allowed to form itself comparatively without check, can scarcely be learned from ancient books. Their writers give us but a partial or special view of it, and modern authors, in their attempts to systematize, have often but increased the confusion. The Greek coins, whether of kings or cities, until the death of Alexander, do not, with a few negligible exceptions, represent the human form. Afterwards, on the regal coins, the king's head usually occupies the obverse and a subject, usually sacred, is placed on the reverse. The coins of Greek cities under the empire have usually an imperial portrait and a reverse type usually mythological. The whole class thus affords us invaluable evidence for the reconstruction of Greek mythology. We have nowhere else so complete a series of the different types under which the divinities were represented. There are in modern galleries very few statues of Greek divinities, including such as were intended for architectural decoration, which are in good style, fairly preserved, and untouched by modern restorers. If to these we add reliefs of the same class, and the best Graeco-Roman copies, we can scarcely form a complete series of the various representations of these divinities. The coins, however, supply us with the series we desire, and we may select types which are not merely of good work, but of the finest. The mythology of ancient Italy, as distinct from that of the Greek colonies of Italy, is not so fully illustrated by the coins of the country, because these are for the most part of Greek design. There are, however, some remarkable exceptions, especially in the money of the Roman commonwealth, the greater number of the types of which are of a local character, including many that refer to the myths and traditions of the earliest days of the city. The coins of the empire are especially important, as bearing representations of those personifications of an allegorical character to which the influence of philosophy gave great prominence in Roman mythology.

Mythology.

Coins are scarcely less valuable in relation to geography than to history. The position of towns on the sea or on rivers, the race of their inhabitants, and many similar particulars are positively fixed on numismatic evidence. The information that coins convey as to the details of the history of towns and countries has a necessary connexion with geography, as has also their illustration of local forms of worship. The representations of natural productions on ancient money are of special importance, and afford assistance to the lexicographer. This is particularly the case with the Greek coins, on which these objects are frequently portrayed with great fidelity. We must recollect, however, that the nomenclature of the ancients was vague, and frequently comprised very different objects under one appellation, and that therefore we may find very different representations corresponding to the same name.

Geography.

The art of sculpture, of which coin-engraving is the offspring, receives the greatest illustration from numismatics. Not only is the memory of lost statues preserved to us in the designs of ancient coins, but those of Greece afford admirable examples of that skill by which her sculptors attained their great renown. The excellence of the designs of very many Greek coins struck during the period of the best art is indeed so great that, were it not for their smallness, they would form the finest series of art-studies in the world. The Roman coins, though at no time to be compared to the purest Greek, yet represent not unworthily the Graeco-Roman art of the empire. From the accession of Augustus to the death of Commodus they are often fully equal to the best Graeco-Roman statues. This may be said, for instance, of the dupondii struck in honour of Livia by Tiberius and by the younger Drusus, of the sestertii of Agrippina, and of the Flavian emperors, and of the gold coins of Antoninus Pius and the two Faustinas, all which present portraits of remarkable beauty and excellence. The Italian medals of the Renaissance are scarcely less useful as records of the progress and characteristics of art, and, placed by the side of the Greek and Roman coins, complete the most remarkable comparative series of monuments illustrating the history of the great schools of art

Art.

that can be brought together. Ancient coins throw some light upon the architecture as well as upon the sculpture of the nations by which they were struck. Under the empire, the Roman coins issued at the city very frequently bear representations of important edifices. The Greek imperial coins struck in the provinces present similar types, representing the most famous temples and other structures of their cities, of the form of some of which we should otherwise have been wholly ignorant. The art of gem-engraving among the ancients is perhaps most nearly connected with their coinage. The subjects of coins and gems are so similar and so similarly treated that the authenticity of gems, that most difficult of archaeological questions, receives the greatest aid from the study of coins.

After what has been said it is not necessary to do more than mention how greatly the study of coins tends to illustrate the contemporary literature of the nations which issued them. Not only the historians, but the philosophers and the poets, are constantly illustrated by the money of their times. This was perceived at the revival of letters; and during the 17th and 18th centuries coins were very frequently engraved in the larger editions of the classics.

Literature.

The science of numismatics is of comparatively recent origin. The ancients do not seem to have formed collections, although they appear to have occasionally preserved individual specimens for their beauty. Petrarch has the credit of having been the first collector of any note; but it is probable that in his time ancient coins were already attracting no little notice. The importance of the study of all coins has since been by degrees more and more recognised, and at present no branch of the pursuit is left wholly unexplored.

Origin of the Science.

Besides its bearing upon the history, the religion, the manners, and the arts of the nations which have used money, the science of numismatics has a special modern use in relation to art. Displaying the various styles of art prevalent in different ages, coins supply us with abundant means for promoting the advancement of art among ourselves. If the study of many schools be at all times of advantage, it is especially so when there is little originality in the world. Its least value is to point out the want of artistic merit and historical commemoration in modern coins, and to suggest that modern medals should be executed after some study of the rules which controlled the great works of former times.

Practical Use.

Definitions.—The following are the most necessary numismatic definitions.

1. A *coin* is a piece of metal of a fixed weight, stamped by authority of government, and employed as a circulating medium.[1]

2. A *medal* is a piece, having no place in the currency, struck to commemorate some event or person. Medals are frequently comprised with coins in descriptions that apply to both equally; thus, in the subsequent definitions, by the term coins, coins and medals must generally be understood.

3. The coinage of a country is usually divided into the classes of gold, silver and bronze (copper), for which the abbreviations *N*, *Æ*, and *Æ* are employed in catalogues. In addition to these metals, and to the modifications of them created by the presence of varying amounts of alloy, certain other compounds were frequently used, notably electrum, billon, brass and potin.

4. *Electrum* (ἤλεκτρον, ἤλεκτρος, λευκὸς χρυσός), a compound metallic substance, consisting of gold with a considerable alloy of silver. Pliny makes the proportion to have been four parts of gold to one of silver.[2] The material of early coins of Asia Minor struck in the cities of the western coast is the ancient electrum. The amount of silver varies very considerably with time and place. Gold largely alloyed with silver, not struck by the ancient Greeks or their neighbours, should be termed *pale gold*, as in the case of some of the late Byzantine coins.

5. *Billon*, a term applied to the base metal of some Roman coins, and also to that of some medieval and modern coins. It contains about one-fifth silver to four-fifths copper. When the base silver coins are replaced by copper washed with silver the term billon becomes inappropriate.

6. *Brass*, a mixture of copper and zinc. It may be used as an equivalent to the orichalcum of the Romans, a fine kind of brass of which the sestertii and dupondii were struck, but it is commonly applied indiscriminately to the whole of their copper currency under the empire.

7. *Potin*, an alloy of copper and tin (therefore a variety of bronze) used for some late Gaulish coins.

8. Various other metallic substances have been used in coinage, including iron (in Peloponnesus) and an alloy of copper and nickel employed for some Bactrian coins. The so-called "glass coins" of the Arabs are merely coin-weights.

9. The *forms* of coins have greatly varied in different countries and at different periods. The usual form in both ancient and modern times has been circular, and generally of no great thickness.

10. Coins are usually measured by millimetres, or by inches and tenths, the greatest dimension being taken, or, when they are square or oval, the greatest dimension in two directions.

11. The *weight* of a coin is of great importance, both in determining its genuineness and in distinguishing its identity. Metric weights are used by most numismatists except in England, where troy weight is still in general use.

12. The *specific gravity* of a coin may be of use in determining the metals in its composition.

13. Whatever representations or characters are borne by a coin constitute its *type*. The subject of each side is also called a type, and, when there is not only a device but an inscription, the latter may be excluded from the term. This last is the general use. No distinct rule has been laid down as to what makes a difference of type, but it may be considered to be an essential difference, however slight.

14. A difference too small to constitute a new type makes a *variety*.

15. A coin is a *duplicate* of another when it agrees with it in all particulars but those of exact size and weight. Strictly speaking, ancient coins are rarely, if ever, duplicates, except when struck from the same pair of dies.

16. *Struck* coins are those on which the designs are produced by dies impressed on the blank piece (or *flan*) of metal by some form of hammering or pressure; they are distinguished from *cast* coins made by running metal into a mould.

17. Of the two sides of a coin, that is called the *obverse* which bears the more important device. In early Greek coins it is the convex side, or the side impressed by the lower die; in Greek and Roman imperial it is the side bearing the head; in medieval and modern that bearing the royal effigy, or the king's name, or the name of the city; and in Oriental that on which the inscription begins. The other side is called the *reverse*.

18. The *field* of a coin is the space unoccupied by the principal devices or inscriptions. Any detached independent device or character is said to be in the field, except when it occupies the exergue.

19. The *exergue* is that part of the reverse of a coin which is below the main device, and distinctly separated from it; it often bears a secondary inscription. Thus, the well-known inscription CONOB occupies the exergue of the late Roman and early Byzantine gold coins.

20. The *edge* of a coin is the surface of its thickness.

21. By the *inscription* or *inscriptions* of a coin all the letters it bears are intended; an inscription is either principal or secondary.

22. In describing coins the terms *right* and *left* mean the right and left of the spectator, not the heraldic and military right and left or those of the coin.

23. A *bust* is the representation of the head and neck; it is commonly used of such as show at least the collar-bone, other busts being called heads. A *head* properly means the representation of a head alone, without any part of the neck, but it is also commonly used

[1] This definition excludes, on the one hand, paper currencies and their equivalents among barbarous nations, such as cowries, because they are neither of metal nor of fixed weight, although either stamped or sanctioned by authority, and, on the other hand, modes of keeping metal in weight, like the so-called Celtic "ring-money," because it is not stamped, although perhaps sanctioned by authority. The latter has attracted much attention, but it is by no means made out that the rings were made with the primary intention of serving as money. But it is a very common usage among savage or semi-savage races to wear all their wealth in the form of ornaments (as a woman may even now wear her dowry as ornaments in the form of coins) and to use the ornaments (or cut-off portions of them, "skillings") whenever occasion arises as a medium of exchange. These rings then were doubtless used in this manner, but they were no more money than were any other precious possessions which could be used in exchange. There is no good evidence for the use of the little Gaulish "wheels" as money. On these questions see Blanchet, *Monn. gaul.* pp. 24-29. On the border of the definition are such prehistoric "dumps" of metal as have been found at Enkomi in Cyprus and at Cnossus in Crete; one of these indeed seems to bear traces of a mark of some kind.

[2] *Hist. nat.* xxxiii. 23; cp. xxxvii. 11. Pliny distinguishes two kinds of "electron,"—amber, and this metallic substance. In Greek poetry the name seems to apply to both, but it is generally difficult to decide which is meant in any particular case. Sophocles, however, where he mentions τὰπὸ Σάρδων ἤλεκτρον, . . . καὶ τὸν Ἰσσαῖον χρυσόν (*Ant.* 1037–1039), can scarcely be doubted to refer to the metallic electrum.

when any part of the neck above the collar-bone is shown. The present article follows custom in the use of the terms *bust* and *head*. When the neck is clothed, the bust is said to be draped.

24. A bust or head is either facing, usually three-quarter face, or in profile, in which latter case it is described as *to right* or *to left*. Two busts may be placed in various relative positions, as jugate or confronted.

25. A bust wearing a laurel-wreath is said to be *laureate*.

26. A bust bound with a regal fillet (diadem) is called *diademed*.

27. A bust wearing a crown with rays is said to be *radiate*.

28. An object in the field of a coin which is neither a letter nor a monogram is usually called a *symbol*. This term is, however, only applicable when such an object is evidently the badge of a town or individual. The term *adjunct*, which is sometimes employed instead of symbol, is manifestly incorrect.

29. A *mint-mark* is a difference placed by the authorities of the mint upon all money struck by them, or upon each new die or separate issue.

30. A coin is said to be "over-struck" or "re-struck" when it has been struck on an older coin, of which the types are not altogether obliterated.

31. A *double-struck* coin is one in which the die or dies have shifted so as to cause a double impression.

32. A coin which presents two obverse types, or two reverse types, or of which the types of the obverse and reverse do not correspond, is called a *mule*; it is the result of mistake or caprice.

Arrangement of Coins.—No uniform system has as yet been applied to the arrangement of all coins. It is usual to separate them into the three great classes of ancient coins (comprising Greek and Roman), medieval and modern, and Oriental coins. The details of these classes have been differently treated, both generally and specially. The arrangement of the Greek series has been first geographical, under countries and towns, and then chronological, for a further division; that of the Roman series, chronological, without reference to geography; that of the medieval and modern, the same as the Greek; and that of the Oriental, like the Greek, but unsystematically—a treatment inadmissible except in the case of a single empire. Then, again, some numismatists have separated each denomination or each metal, or have separated the denominations of one metal and not of another. There has been no general and comprehensive system, constructed upon reasonable principles, and applicable to every branch of this complicated science. Without laying down a system of rules, or criticizing former modes of arrangement, we offer the following as a classification which is uniform without being servile.

1. *Greek Coins.*—All coins of Greeks, or barbarians who adopted Greek money, struck before the Roman rule or under it, but without imperial effigies. The countries and their provinces are placed in a geographical order from west to east, according to the system of Eckhel, with the cities in alphabetical order under the provinces, and the kings in chronological order. The civic coins usually precede the regal, as being the more important. The coins are further arranged chronologically, the civic commencing with the oldest and ending with those bearing the effigies of Roman emperors. The gold coins of each period take precedence of the silver and the silver of the copper. The larger denominations in each metal are placed before the smaller. Coins of the same denomination and period are arranged in the alphabetical order of the magistrates' names, or the letters, &c., that they bear.

2. *Roman Coins.*—All coins issued by the Roman commonwealth and empire, whether struck at Rome or in the provinces. The arrangement is chronological, or, where this is better, under geographical divisions.

3. *Medieval and Modern Coins of Europe.*—All coins issued by Christian European states, their branches and colonies, from the fall of the empire of the West to the present day. This class is arranged in a geographical and chronological order, as similar as possible to that of the Greek class, with the important exception of the Byzantine coins and the coins following Byzantine systems, which occupy the first place. The reason for this deviation is that the Byzantine money may be regarded not only as the principal source of medieval coinage but as the most complete and important medieval series, extending as it does without a break throughout the middle ages. The regal coins usually precede the civic ones, as being the more important. The medals of each nation should be arranged in two series: (1) medals of rulers, according to their dates; (2) medals of private persons, as far as possible according to the artists.

4. *Oriental Coins.*—All coins bearing inscriptions in Eastern languages, excepting those of the Jews, Phoenicians and Carthaginians, which are classed with the Greek coins from their close connexion with them. These coins should be arranged under the following divisions: Ancient Persian, Arab, Modern Persian, Indian, Chinese and coins of the Far East.

This method of arrangement will be found to be as uniform as it can be made, without being absolutely mechanical. It differs in some important particulars from most or all of those which have previously obtained; but these very differences are the result of the consideration of a complete collection, and have therefore an inductive origin. A general uniformity is no slight gain, and may well reconcile us to some partial defects.

I. Greek Coins

There are some matters relating to Greek coins in general which may be properly considered before they are described in geographical order. These are their general character, the chief denominations, with the different talents of which they were the divisions, their devices and inscriptions, their art, and the mode of striking.

The period during which Greek coins were issued was probably not much less than a thousand years, commencing about the beginning of the 7th century B.C. and generally ending at the death of Gallienus (A.D. 268). If classed with reference only to their form, fabric, and general appearance they are of three principal types—the archaic Greek, the ordinary Greek, and the Graeco-Roman. The coins of the first class are of silver, electrum and sometimes gold. They are thick lumps of an irregular round form, bearing on the obverse a device, with in some cases an accompanying inscription, and on the reverse a square or oblong incuse stamp (*quadratum incusum*), usually divided in a rude manner. The coins of the second class are of gold, electrum, silver and bronze. They are much thinner than those of the preceding class, and usually have a convex obverse and a slightly concave or flat reverse. The obverse ordinarily bears a head in bold relief. The coins of the third class are, with very few exceptions, of bronze. They are flat and broad, but thin, and generally have on the obverse the portrait of a Roman emperor. Many Greek cities, however, during the empire issued *quasi-autonomous* coins bearing the head of some deity or personification. Greek coins thus fall mainly into the classes of autonomous, quasi-autonomous and imperial. The coinage of Roman colonies in Greek as in other lands is usually distinguished by Latin inscriptions.

Monetary Systems.

Since Greek coinage originated in Asia Minor, the coins were adjusted to the weight-systems there in use, and these go back to a Babylonian origin. But it is possible that some of the standard of Greece proper had a native origin. The unit of weight in the East was the shekel (*siglos*). This was $\frac{1}{60}$ of the manah (*mina, mna*), and this $\frac{1}{60}$ of the talent (*talanton*). This scale the Greeks modified, in that, starting from the siglos as unit, they invented a money-mina of 50 sigli, with a money-talent of 60 minae or 3000 sigli. The siglos-units (and corresponding standards) chiefly employed in Asia Minor were the following (the relation between gold and silver at the time of the invention of these units seems to have been $13\frac{1}{3}$:1):—

Gold shekel, 8·40 grammes.

Phoenician silver shekel, 7·44 g. $=\frac{1}{15}$ of 111·72 g. of silver, which was equivalent to 8·4 g. of gold.

Babylonian or Persic silver shekel, 11·17 g. $=\frac{1}{10}$ of 111·72 g. of silver, which was equivalent to 8·4 g. of gold.

Thus one gold shekel was the equivalent of 15 Phoenician or 10 Babylonian silver shekels. Side by side with this system was another in which the weights were exactly double of those just given; a shekel of the heavier system might be regarded as a double shekel of the lighter. Various Babylonian weights are extant, dating from 2000 B.C. downwards, which prove the existence of minae of the two systems. The gold shekel standard was almost invariably used for gold coins, sometimes also for electrum. The Babylonian and Phoenician standards were also sometimes used for gold or electrum as well as silver. A weight more or less approaching that of the gold shekel or its multiples seems to have been usual all over the civilized world in Greek times; *e.g.* the Phocaean standard of 16·52 g. was but a modification of it. But for silver in Greece proper, from a very early period, the following standards prevailed: the Aeginetic (unit, didrachm or stater, of 12·6 g.) and the Euboic-Attic (stater of 8·72 g.), with its modification the Corinthian. The Euboic-Attic standard attained enormous importance owing to the spread of Athenian trade and the adoption of the weight by Alexander of Macedon. It was used for both gold and silver. The Corinthian standard differed only in its divisional system, the stater being divided into thirds instead of halves. From it were derived some of the standards in use among the Greeks of S. Italy. Other standards of more local importance were: the Campanian, used in a large part of S. Italy (didrachm originally of 7·41 g., afterwards reduced), and perhaps derived from

the Phoenician; the Rhodian (instituted about 400 B.C., tetradrachm about 15 g.); and the cistophoric (from about 200 B.C., with a tetradrachm of about 12·73 g.).

Denominations. The following table exhibits the weights in grammes of the principal denominations of the Greek systems:—

	Gold Shekel System.	Babylonian or Persic.	Phoenician.	Aeginetic.	Euboic-Attic.
Double shekel, distater or tetradrachm	16·80	22·40	14·92	25·20	17·44
Shekel, stater or didrachm	8·40	11·20	7·46	12·60	8·72
Hemistater or drachm	4·20	5·60	3·73	6·30	4·36
Third or tetrobol	2·80	3·73	2·49	4·48	2·92
Twelfth or obol	0·70	0·93	0·62	1·12	0·73

The term stater is usually applied to the didrachm, but also to the tetradrachm, and at Cyrene to the drachm.

The bronze standards have been less fully discussed. Some notice of them will be given under different geographical heads.

Types. In the types of Greek coins (using the term in its restricted sense) the first intention of the designers was to indicate the city or state by which the money was issued. The necessity for distinctive devices was most strongly felt in the earlier days of the art, when the obverse of a coin alone bore a design, and, if any inscription, only the first letter, or the first few letters, of the name of the people by whom it was issued. Whatever may have been the original significance of the type in itself, religious or otherwise, it was adopted for the coinage—at least in the earliest times—because it was the badge by which the issuing authority was recognized. It was only with the increased complexity of the denominations in later times, when new distinguishing types had to be found, that—as in the 4th century B.C.—the religious motive in the choice of types came deliberately into play.

Classes. Greek coins, if arranged according to their types, fall into three classes: (1) civic coins, and regal without portraits of sovereigns; (2) regal coins bearing portraits; and (3) Graeco-Roman coins, whether with imperial heads or not. The coins of the first class have either a device on the obverse and the *quadratum incusum* on the reverse, or two devices; and these last are again either independent of each other, though connected by being both local, or—and this is more common—that on the reverse is a kind of complement of that on the obverse. It will be best first to describe the character of the principal kinds of types of the first class, and then to notice their relation. It must be noted that a head or bust is usually an obverse type, and a figure or group a reverse one, and that, when there is a head on both obverse and reverse, that on the former is usually larger than the other, and represents the personage locally considered to be the more important of the two. We must constantly bear in mind that these types are local if we would understand their meaning.

Types of Civic, &c., Coins. In the following list the types of Greek coins of cities, and of kings, not having regal portraits, are classed in a systematic order, without reference to their relative antiquity.

1. Head or figure of a divinity worshipped at the town, or by the people, which issued the coin, as the head of Athena on coins of Athens, and the figure of Heracles on coins of Boeotian Thebes. Groups are rare until the period of Graeco-Roman coinage.

2. Natural or artificial objects—(*a*) animal, often sacred to a divinity of the place, as the owl (Athens) and perhaps the tortoise (Aegina); (*b*) tree or plant, as the silphium (Cyrene) and the olive-branch (Athens); (*c*) arms or implements of divinities, as the arms of Heracles (Erythrae), the tongs of Vulcan (Aesernia). It is difficult to connect many objects comprised in this class with local divinities. Some of them, as the tunny at Cyzicus, are doubtless only so connected because the chief industry of a place was placed under the tutelage of its chief divinity.

3. Head or figure of a local genius—(*a*) river-god, as the Gelas (Gela); (*b*) nymph of a lake, as Camarina (Camarina); (*c*) nymph of a fountain, as Arethusa (Syracuse).

4. Head or figure of a fabulous personage or half-human monster, as a Gorgon (Neapolis Macedoniae), the Minotaur (Cnossus).

5. Fabulous animal, as Pegasus (Corinth), a griffin (Panticapaeum), the Chimaera (Sicyon).

6. Head or figure of a hero or founder, as Ulysses (Ithaca), the Lesser Ajax (Locri Opuntii), Taras, founder of Tarentum (Tarentum).

7. Objects connected with heroes—animal connected with local hero, as the Calydonian boar or his jaw-bone (Aetolians).

8. Celebrated real or traditional sacred localities, as mountains on which divinities are seated, the labyrinth (Cnossus).

9. Representations connected with the public religious festivals and contests, as a chariot victorious at the Olympic games (Syracuse).

The relation of the types of the obverse and reverse of a coin is a matter requiring careful consideration, since they frequently illustrate one another. As we have before observed, this relation is either that of two independent objects, which are connected only by their reference to the same place, or the one is a kind of complement of the other. Among coins illustrating the former class we may instance the beautiful silver didrachms of Camarina, having on the obverse the head of the river-god Hipparis and on the reverse the nymph of the lake carried over its waters by a swan, and those of Sicyon, having on the obverse the Chimaera and on the reverse a dove. The latter class is capable of being separated into several divisions. When the head of a divinity occurs on the obverse of a coin, the reverse is occupied by an object or objects sacred to that divinity. Thus the common Athenian tetradrachms have on the one side the head of Athene and on the other an owl and an olive-branch; the tetradrachms of the Chalcidians in Macedonia have the head of Apollo and the lyre; and the copper coins of Erythrae have the head of Heracles and his weapons. The same is the case with subjects relating to the heroes: thus there are drachms of the Aetolian League which have on the obverse the head of Atalanta and on the reverse the Calydonian boar, or his jaw-bone and the spear-head with which he was killed. In the same manner the coins of Cnossus, with the Minotaur on the obverse, have on the reverse a plan of the Labyrinth. Besides the two principal devices there are often others of less importance, which, although always sacred, and sometimes symbols of local divinities, are generally indicative of the position of the town, or have some reference to the families of magistrates who used them as badges. Thus, for example, besides such representations as the olive-branch sacred to Athene on the Athenian tetradrachms, as a kind of second device dolphins are frequently seen on coins of maritime places; and almost every series exhibits many symbols which can only be the badges of the magistrates with whose names they occur. Regal coins of this class, except Alexander's, usually bear types of a local character, owing to the small extent of most of the kingdoms, which were rather the territories of a city than considerable states at the period when these coins were issued.

Regal, with Portraits. The second great class—that of coins of kings bearing portraits—is necessarily separate from the first. Religious feeling affords the clue to the long exclusion of regal portraits—the feeling that it would be profane for a mortal to take a place always assigned hitherto to the immortals. Were there any doubt of this, it would be removed by the character of the earliest Greek regal portrait, that of Alexander, which occurs on coins of Lysimachus. This is not the representation of a living personage, but of one who was not only dead but had received a kind of apotheosis, and who, having been already called the son of Zeus Ammon while living, had been treated as a divinity after his death. He is therefore portrayed as a young Zeus Ammon. Probably, however, Alexander would not have been able, even when dead, thus to usurp the place of a divinity upon the coins, had not the Greeks become accustomed to the Oriental "worship" of the sovereign, which he did not discourage. This innovation rapidly produced a complete change; every king of the houses which were raised on the ruins of the Greek empire could place his portrait on the

money which he issued, and few neglected to do so, while the sovereigns of Egypt and Syria even assumed divine titles.

The reign of Alexander produced another great change in Greek coinage, very different from that we have noticed. He suppressed the local types almost throughout his empire, and compelled the towns to issue his own money, with some slight difference for mutual distinction. His successors followed the same policy; and thus the coins of this period have a new character. The obverses of regal coins with portraits have the head of the sovereign, which in some few instances gives place to that of his own or his country's tutelary divinity, while figures of the latter sort almost exclusively occupy the reverses. Small symbols, letters, and monograms on the reverses distinguish the towns in this class.

The Graeco-Roman coins begin, at different periods, with the seizure by Rome of the territories of the Greek states. They are almost all bronze; and those in that metal are the most characteristic and important. In their types we see a further departure from the religious intention of those of earlier times in the rare admission of representations, not only of eminent persons who had received some kind of apotheosis, such as great poets, but also of others who, although famous, were not, and in some cases probably could not have been, so honoured. We also observe on these coins many types of an allegorical character.

Graeco-Romaa.

The following principal kinds of types may be specified, in addition to those of the two previous classes. (1) Head or figure of a famous personage who either had received a kind of apotheosis, as Homer (Smyrna), or had not been so honoured, as Herodotus (Halicarnassus) and Lais (Corinth). (2) Pictorial representations, always of a sacred character, although occasionally bordering on caricature. We may instance, as of the latter sort, a very remarkable type representing Athene playing on the double pipe and seeing her distorted face reflected in the water, while Marsyas gazes at her from a rock—a subject illustrating the myth of the invention of that instrument (Apamea Phrygiae). (3) Allegorical types, as Hope, &c., on the coins of Alexandria of Egypt, and many other towns. These were of Greek origin, and owed their popularity to the sculpture executed by Greeks under the empire; but the feeling which rendered such subjects prominent was not that of true Greek art, and they are essentially characteristic of the New Attic school which attained its height at Rome under the early emperors.

There is a class of coins which is always considered as part of the Graeco-Roman, although in some respects distinct. This is the colonial series, struck in Roman coloniae, and having almost always Latin inscriptions. As, however, these coloniae were towns in all parts of the empire, from Emerita in Spain (Merida) to Bostra in Arabia, in the midst of a Greek population and often of Greek origin, their coins help to complete the series of civic money, and, as we might expect, do not very markedly differ from the proper Greek imperial coins except in having Latin inscriptions and showing a preference for Roman types.

We have now to speak of the meaning of the inscriptions of Greek coins. These are either principal or secondary; but the former are always intended when inscriptions are mentioned without qualification, since the secondary ones are non-essential. The inscription of civic money is almost always the name of the people by which it was issued, in the genitive plural, as ΑΘΗΝΑΙΩΝ on coins of the Athenians, ΣΥΡΑΚΟΣΙΩΝ on coins of the Syracusans, or the name of the city in the genitive singular, as ΑΚΡΑΓΑΝΤΟΣ at Agrigentum. The inscription of regal money is the name, or name and title, of the sovereign in the genitive, as ΑΛΕΞΑΝΔΡΟΥ, or ΒΑΣΙΛΕΩΣ ΑΛΕΞΑΝΔΡΟΥ, on coins of Alexander the Great. Instead of this genitive an adjective is sometimes found, as Ἀρκαδικόν on early Arcadian coins, Ἀλεξάνδρειοι on staters of Alexander of Pherae. This genitive or adjectival form implies a nominative understood, which has been generally supposed to be νόμισμα "money," or the name of some denomination.

Inscriptions.

There are a few instances in which a nominative of this kind is expressed on coins—ΦΑΕΝΟΣ ΕΜΙ ΣΗΜΑ, "I am the badge of Phaeno (?) or Phanes" on an archaic Ionian coin; ΓΟΡΤΥΝΟΣ ΤΟ ΠΑΙΜΑ, "the striking, struck piece, or type of Gortys"; ΦΑΙΣΤΙΟΝ ΤΟ ΠΑΙΜΑ ΣΕΥΘΑ ΑΡΓΥΡΙΟΝ (silver money), or ΚΟΜΜΑ ("striking" or "struck piece"); and ΚΟΤΥΟΣ ΧΑΡΑΚΤΗΡ ("engraving" or "engraved piece"). Seuthes (end of 5th century B.C.) and Cotys (1st century B.C.), semi-barbarian Thracians, afford no evidence for Greek usage. The other instances (all archaic) point to the nominative understood in *early* times being in reality some word meaning type, or badge. But, if so, this latent nominative was eventually superseded by one meaning "money" or "coin." Thus the staters of Alexander of Pherae are inscribed Ἀλεξάνδρειοι, his drachms Ἀλεξανδρεία. Probably from the 4th century onwards "coin" was always understood. Occasionally the name of the issuing authority is found in the nominative, as Κύμε (at Cumae), Δάμυλα (Zancle-Messana), Ἀθε. ὁ δᾶμος on a late coin probably issued by the Athenians in Delos, Τάρας at Tarentum. These are by no means always descriptive of the type, but merely a straightforward way of naming the issuing authority. The simple inscriptions of the early period of Greek coinage are under the kings and the Roman empire replaced by elaborate legends, most of which, however, fall under the description above given. A certain number of inscriptions directly describe the type (not merely giving the name of its owner) as Σωσίπολις (the goddess of Gela) or Νίκα (at Terina). Others, especially in Roman times, indicate the reason of issue, as Ἰουδαίας ἁλωσίας on coins of Judaea under Vespasian, or names of festivals for which the coins were issued. These, however, properly belong to the class of secondary inscriptions which either describe secondary types, as ΑΘΛΑ, "rewards," accompanying the representation of the arms given to the victor in the exergues of Syracusan decadrachms,[1] or are the names of magistrates or other officers, or in regal coins those of cities, or are those of the engravers of the dies, of whom sometimes two were employed, one for the obverse and the other for the reverse, or are dates. These inscriptions are often but abbreviations or monograms, especially when they indicate cities on the regal coins.

The importance of Greek coins as illustrating the character of contemporary art cannot be easily overrated. They are beyond all other monuments the grammar of Greek art. Their geographical and historical range is only limited by Greek history and the Greek world; as a series they may be called complete; in quality they are usually worthy of a place beside contemporary sculpture, having indeed a more uniform merit; they are sometimes the work of great artists, and there is no question of their authenticity, nor have they suffered from the injurious hand of the restorer. Thus they tell us what other monuments leave untold, filling up gaps in the sequence of works of art, and revealing local schools known from them alone.

Art of Coins.

The art of coins belongs to the province of relief, which lies between the domains of sculpture and of painting, partaking of the character of both, but most influenced by that which was dominant in each age. Thus in antiquity relief mainly shows the rule of sculpture; in the Renaissance that of painting.

It may be expected that Greek coins will bear the impress of the sister art of sculpture, filling up the gaps in the sequence of examples of the art of which we have remains, telling us somewhat of that which has but a written tradition. Our first duty is to endeavour to place the documents in the best order, separating the geographical from the historical indications, first examining the evidence of local schools, then those of the succession of styles. It is from coins alone that we can discover the existence of great local schools, reflecting the character of the different branches of the Hellenic race. In tracing the changes in these schools we gain a great addition to our ideas of the successive styles, and can detect new examples of those which owe their fame to the leading masters. But in dealing with works in relief we have the advantage due to their intermediate character. In our larger geographical horizon we can trace the character of the successive styles, not of sculpture only, but also of sculpture and painting.

Greek coins clearly indicate three great schools, each with its subordinate groups. The school of central Greece holds the first place, including the northern group centred in Thrace and Macedonia, and the southern in the Peloponnesus, with the outlying special schools of Crete and Cyrene. The Ionian school has its northern group, Ionia, Mysia and Aeolis, and its southern, Rhodes and Caria. Beyond these are certain barbarous and semi-barbarous groups, of which the most important is that of eastern Asia Minor, Persia and Phoenicia, with Cyprus. The school of the West comprises the two groups of Italy and Sicily.

Local Schools.

The whole duration of the schools is limited, by the repulse of the Persians and the accession of Alexander, from 480 to 332 B.C. Before this age all is archaic, and it is hard to trace local characteristics. After it, the centralizing policy of the sovereigns and the fall of the free cities destroyed local art. In certain cultivated centres under enlightened kings a local art arose, but it speedily became general, and we have thus to think of a succession of styles

[1] The arms on the Syracusan decadrachms represent a reward given to the victors in the Assinarian games (see below).

during the rest of the life of Greek art. The century and a half of the local schools is significantly the great age of this art.

In the study of each school we have first to determine its character, and then to look in its successive phases for the influence of the great masters of style. Two dangers must be avoided. We must not too sharply divide the sculptors and the painters as if they always were true to the special functions of their arts. It is well to bear in mind that the earliest great painter, Polygnotus, was a portrayer of character, *καλὸς ἠθογράφος, ἠθικός*, as Aristotle calls him, whereas the latest great sculptors represented expression (*τὰ πάθη*). Thus since *ἦθος* is the special province of sculpture, and *τὰ πάθη* of painting, sculpture first weighed down the balance, afterwards painting; but it must be remembered that relief can be truer to painting than sculpture in the round, which is more limited by the conditions of the material and mechanical necessities. Our second danger is due to the ease with which local qualities may be ascribed to the influence of a leading style. It is also to be borne in mind that the movement of art in coins was during one period slower than in sculpture—hence an influence more general than particular. Pheidias and Myron do not make their mark so much as Polyclitus. In all cases the direct influence of great masters is to be looked for later than their age.

Central Greece.

The school of central Greece in its southern group, comprehending Attica, is remarkable for its widespread extent. It has its colonies in Magna Graecia at Thurium, an Athenian foundation, probably at Terina, and in Macedonia at Amphipolis and Chalcidice under Athenian rule. It alone shows instances comparable to the works of Pheidias, though its most numerous fine works are of the age of Polyclitus and that of Praxiteles and Scopas. Its qualities may be seen by comparison of the same subjects as treated by the other schools and groups. The earliest works are marked more than any others by the qualities of high promise which characterized the Aeginetan marbles—the same dignified self-restraint and calm simplicity. Next we perceive a series strong in style, and showing that lofty dignity, that reposeful embodiment of character, which are the stamp of the works of Pheidias and his contemporaries. The subjects are more remarkable for fidelity, breadth and boldness than for delicacy of execution or elaboration of ornament. Every subject is ideal, even the portrayal of animal form. Thus the character shows us what divinity is intended and the ideality what is intended by the representation of beast or bird. From these works we pass to those which reflect the style of the time of Praxiteles and Scopas, when the influence of painting began to be felt, and art inclined towards feeling and descended to sentiment. Still, to the last, character rules these coins, and the chief difference we see is in the increased love of beauty for its own sake and the fondness for representing movement, not to the exclusion of repose, but by its side. In other respects there is little change except in the finer execution and more ornamental quality of the work. Even when the greatest achievement of the Sicilian school, the female head on the decadrachms of Syracuse, is copied by the Locrians and the Messenians, the larger quality of the school of Greece asserts itself, and the copy is better than the original: there is less artifice and more breadth. The northern group is at first ruder, in the age of Pheidias severer, and afterwards it merges into the greater softness of its southern rival. If it copies, as Larissa may copy Syracuse and Neapolis in Campania, it again asserts its superior simplicity, and we prefer the copy to the original.

Ionia.

The Ionian school lacks the sequence which the rest of the Greek world affords. It is broken by the baneful influence of the Persian dominion, and consequently the best works belong to the earliest and latest part of the period. The earliest coins, of the Aeginetan age, present nothing special; the later, of the time of Praxiteles and Scopas, comprise works not inferior to those of central Greece, and remarkable, like the Western and the Cretan, as the sole records of a school otherwise unknown. They are markedly characterized by the qualities of the style of feeling, that of Praxiteles and Scopas; but more than this, they are the expression of that style in pictorial form. They represent expression, and they treat it as it could not be treated in sculpture in the round, portraying locks streaming in the air and flowing draperies. It must be remembered that, while Hellas produced the great sculptors, western Asia Minor bred the great painters after Polygnotus, himself a sculptor in painting rather than a painter. In the native land of Zeuxis, Parrhasius and Apelles we see the evidence of the rule of painting. The technical skill is inferior to that of the West, yet the skill in modelling is far greater, and has no parallel in the medallic work of any other time or country.

The West.

The school of the West, if we except such outlying examples of the art of Hellas as those of Thurium and Terina, has its highest expression in Italy, its most characteristic in Sicily. It has distinctive qualities throughout the age. Even in the earlier period we trace a striving after beauty and a delicacy of finish, with a weakness of purpose, that mark the school with an influence increasing to a time long after the extinction of its rivals. At the same time there is a knowledge of the capacity of the materials and the form of the coin and a masterly power of finish, on the whole a completeness of technical skill which is unequalled. The result in the lower subjects is splendid, if wanting in variety, but in the higher we miss the noble achievements of the greater schools. So far there is a general agreement in the northern and southern groups. Yet the Italian shows a nobler and simpler style, with some affinity to that of central Greece, which we look for in vain in Sicily, though we are dazzled by the rich beauty of the magnificent series of coins which marks her wealthiest age. Sicilian art has this apparent advantage, that the great cities, save Syracuse, perished in the Carthaginian invasion, or under the tyranny of the elder Dionysius. Thus we have no important works save of Syracuse during the second half of our period, and cannot judge fully to what this school would have fallen. The key to this exceptional development of Greek art is found in the absence of sculptors or painters in the West, except only Pythagoras of Rhegium at the very beginning of the age, whose influence is thought to be traceable on the money of his native town. On the other hand, there can be no doubt that many of the Sicilian die-engravers, as Phrygillos (to mention one whose signature is actually found on an intaglio) were gem-engravers. The Western art is that of engravers accustomed to minute and decorative work, uninfluenced by sculpture or painting. Their designs will not bear enlargement, which only enhances the charm of those of the other leading schools. Those of the great Syracusan decadrachms are small; those of the minute hectae of Cyzicus are large.

Crete.

The most important of the lesser schools is the Cretan. Crete, retaining the primitive life of older Hellas, was never truly civilized, but to the last enjoyed the privileges and exhibited the faults of an undeveloped condition. Producing in the age of high art neither sculptor nor painter of renown, the Cretans, to judge from their coins, were copyists of nature or art. At first rude, their work acquires excellence in design, but never in execution. While we see their poor reproductions of the designs of the Peloponnesus, we are amazed by their skill in portraying nature. Their gods are seated in trees with a background of foliage. Their bulls are sketched as they wandered in the meadows. All fitness for the mode of relief, as well as for the material and the shape of the coin, is entirely ignored. Hence a delight in foreshortening, and a free choice of subject with no reference to the circle in which it must be figured. In spite, however, of their skill, the Cretans never attempted the three-quarter face, which is at once the best suited to the surface of a coin and the most trying to the skill of the artist. Yet their work is delightfully fresh, as if done in the open air. There is no idealism, but much life and movement. In a word, the school is naturalistic and picturesque. Its works are of the highest value in the study of Greek art, but as examples of the application of that art to coins they are to be used with caution. Nowhere else do we see the artist so freely copying nature and art, nowhere so unshackled by academic rules, nowhere so little aware of the limitation of his province.

It is important to study the mode in which Greek money was coined, because the forms of the pieces thus receive explanation, and true coins are discriminated from such modern falsifications as have been struck, and in some degree from those which have been cast. Our direct information on the subject is extremely scanty, but we are enabled by careful inference to obtain a very near approximation to the truth on all the most important points.

Mode of Coining.

Of the dies used by the Greeks exceedingly few have been preserved. In the museum at Sofia is an iron die for the reverse of a coin of Philip II. of Macedon; and several Gaulish dies exist. Most ancient dies are of bronze, others of hardened iron or steel. The blanks were, as a rule, first cast, sometimes in a spherical form, sometimes in a form more resembling that assumed by the finished coin. The blank was placed between two dies, the lower, let into an anvil, producing the obverse, the other, let into the end of a bar, producing the reverse. The bar was struck with a hammer, so that the blank received at the same time the impressions of both dies. This general rule was of course often modified; in some parts of the Greek world the dies were hinged together, in others not; and this arrangement of hinging the dies came in at different times in different places. The machinery of striking was probably much elaborated under the Roman empire, but a collar seems never to have been used in ancient times. Greek dies must usually have worn out very quickly; hence an enormous number of slightly varying representations of the same type. But the idea that it is uncommon to find two Greek coins from the same die is exaggerated. A great number of early Italian and Roman, and a few Greek coins, of large size, were cast in moulds, not struck; and under the empire many coins, originally struck, were reproduced, not always fraudulently, by casting; but the genuine ancient coin of small size is, as an almost invariable rule, struck and not cast.

We may now pass on to notice the Greek coinage of each country, following Eckhel's arrangement. The series begins with Spain, Gaul and Britain, constituting the only great class of barbarous Greek coinage. It must not be supposed that the money of the whole class is of one general character; on the contrary, it has very many divisions, distinguished by marked peculiarities; it has, however, everywhere one common characteristic—its devices are corrupt copies of those of Greek or Roman coins. The earliest of these barbarous coinages begin with the best imitations of the gold and silver money of Philip II. of Macedon. They probably first appeared to the north of his kingdom, but the gold soon spread as far as Gaul, and even found their way into southern Britain, by which time the original types had almost disappeared through successive degradations. Next in order of time are the silver imitations of Roman coins, the victoriati and denarii of the commonwealth, which began in Spain and passed into Gaul, being current with the gold money of Greek origin; even in Britain the later coinage shows much Roman influence. The copper money of Spain follows the imitated silver types; that of Gaul and Britain, though showing Roman influence, is more original.

Greek Coinage of the Far West.

Side by side with these large coinages we find Greek money of colonies in Gaul and Spain, and a far ampler issue of Phoenician coins by the Carthaginian kings and cities of the Peninsula. The coinage of Hispania, corresponding to the modern Spain and Portugal, was issued during a period of about four centuries, closing in A.D. 41. There are four classes of money, which in the order of their relative antiquity, are Greek, of two groups, Carthaginian, Romano-Iberian and Latin. The first or older group of Greek money (from before *c.* 350 B.C.) belongs to the widespread currency, which reveals the maritime power of the Ionians of Phocaea. It consists of fractions of the drachm of the Phocaean standard, from the diobol or third downwards. Its later pieces are of the Phocaean colony of Emporiae, founded by the earlier settlement of Massilia. Next in order and in part contemporary, beginning before the middle of the 3rd century B.C., come the drachms of Emporiae, which betray the influence of Siculo-Punic art. Their standard is probably Carthaginian. Of the neighbouring Rhoda, a Rhodian colony, there is similar money. Carthaginian coins of Spain begin in the same period with the issues of the great colony of Gades, following the same weights as the Emporian drachms. These are followed by the issues of the Barcides from 234 to 219 B.C., with Carthaginian types and of Phoenician weight, struck of six denominations, from the hexadrachm to the hemidrachm. Señor Zobel de Zangróniz has classed them to Spain, on the grounds of provenance and the possession of the silver mines by the Barcide kings, against Müller, who attributes them to Africa. The types are Carthaginian, and present some interesting subjects. The true Iberian currency begins not long after the Punic. The later drachms of Emporiae, ultimately following the weight of the contemporary Roman denarius, have Iberian legends, and form the centre of a group of imitations issued by neighbouring native tribes with their distinctive inscriptions. This coinage ceased when the Roman province was formed in 206 B.C. A little before this date the Romans had begun to introduce Latin money; about this time, however, they took the backward step of permitting native coinages of Latin weight. Probably they found that native legends and types were more welcome to their subjects than those of Rome. Consequently this coinage of Spain under the republic, which lasted until 133 B.C., may be almost considered national. The two provinces Hispania Citerior and Hispania Ulterior have this marked difference: the coins of the nearer province, of silver and bronze, have always Iberian inscriptions on the reverse, and are clearly under distinct Roman regulation; those of the farther are apparently of independent origin, and consequently bear Iberian, Phoenician, Libyo-Phoenician and Latin legends, but they are of bronze alone. The interest of these coins lies mainly in their historical and geographical information. They bear the names of tribes, often the same as those of the town of mintage. The art is poor, and lacks the quaint originality and decorative quality of that of Gaul. Ultimately the native money was wholly latinized (133 B.C.), silver was no longer issued, and although the Ulterior continued to have its own coinage, in the Citerior only Emporiae and Saguntum were allowed to strike coins. Political circumstances for a time renewed the coinage under Sertorius (80–72 B.C.) in the modified form of a bilingual currency. The purely Latin issues of the two provinces, and under the empire more largely (from 27 B.C.) of the three, Tarraconensis, Baetica and Lusitania, present little of interest. They closed in the reign of Caligula (A.D. 37–41), though in later times purely Roman money in gold and silver was issued at different times in Hispania down to the establishment of the Visigothic kingdom.

Spain.

The imperial money of Hispania introduces us to one of the two great classes of provincial coins under the empire; the larger of these was the Greek imperial, bearing Greek inscriptions, the smaller the Roman colonial, with Latin inscriptions, deriving its name from the circumstance that among Greek-speaking nations the coloniae were distinguished by the use of the Latin language on their money. In the coinage of Hispania, issued by a nation adopting Latin for official use, the aspect of the coinage is colonial, though it was not wholly issued by colonies. Many of the Spanish towns belong to the kindred class of municipia; others are neither coloniae nor municipia. In Hispania the obverse of the coin bears, as usual in the colonial class, the head of the emperor or of some imperial personage, the reverse a subject proper to the town. The priest guiding a plough drawn by an ox and a cow is peculiarly proper to a colonia, as portraying the ceremony of describing the walls of the city, so also an ox, with the same reference, the altar of the imperial founder, or, as connected with his cultus, a temple, probably in some cases that of Roma and Augustus. Other types, however, portray the old temples in restored Roman shapes, or indicate directly by fishes, ears of corn and more rarely bunches of grapes, the products of the country. Some original and grotesque types have a markedly local character. The money of Augusta Emerita (Merida) in Lusitania, a colony of pensioners (emiriti), is specially interesting, including as it does the silver issues of P. Carisius, the legatus of Augustus.

The coinage commonly called that of Gaul belongs to the people more properly than to the country, for it comprehends pieces issued by the Gauls or other barbarians from the borders of Macedonia and Illyricum to the English Channel and the Bay of Biscay, through Pannonia, part of Germany, Helvetia and Gaul. It influenced the money of northern Italy, and, crossing the Channel, produced that of

The Gauls.

Britain, which has its own distinctive features. Four classes of coinage are found in these vast limits. Arranging them by date, they are the money of the Greek colony of Massilia and her dependencies, that of the Gauls and other barbarians of central and western Europe, that which can be classed to the tribes and chiefs of Gaul and the imperial coinage of that country. The coins of the Gauls and other barbarians outside Gallia include the gold coins known as "rainbow cups" (*Regenbogenschüsselchen*), which seem to have been an original currency of the tribes inhabiting the Bohemian and Bavarian districts, and other gold and silver coins (the later series bearing names in Latin characters) which circulated in Noricum, Pannonia, Helvetia, Upper Germany, &c.

The great mart of Massilia (Marseilles), founded about 600 B.C. by the Phocaeans, was the centre of the Greek settlements of Gaul and northern Spain. Emporiae was her colony, with other nearer towns of inferior fame. Yet Massilia always held the first place, as is proved by the abundance of her money. At first it consisted of Phocaean obols, part of the widespread Western currency already noticed in speaking of Emporiae. These were succeeded by Attic drachms, some of which, about Philip of Macedon's time, are beautiful in style and execution. Their obverse type is the head of Artemis, crowned with olive, at once marking the sacred tree, which had grown from a branch carried by the colonists, so tradition said, with a statue of the goddess, from Ephesus, and proclaiming the value of the olive-groves of Massilia. On the reverse we note the Asiatic lion, common to it and the last colony of Phocaea, the Italian Velia in Lucania. These coins circulated extensively in southern Gaul, and were much imitated by the barbarians on both sides of the Alps. *Massilia.*

The Gauls, on their predatory incursions into Greece, must have seized large quantities of the gold coinage circulating there, but it is probable that the gold staters of Philip (Pl. I. fig. 14), from which the chief types of the Gaulish gold are derived (Pl. I. fig. 1), had already found their way, independently of such raids, by means of trade along the Danube valley into the districts then inhabited by the Gauls. This is clear from the fact that the gold coins of Alexander were never, his silver rarely, imitated by the Gauls, yet these were in circulation at the time of the incursions. Nor did the influence of Philip's silver travel far west. But his gold money evidently travelled through central Europe to Gallia. The money of Gallia before the complete Roman conquest, to which it may be anterior in its commencement by half a century, belongs in the gold to degraded types of the earlier widespread currency. The undoubted gold and electrum of this imitative class, identified as bearing regal or geographical names, are extremely limited. By far the most interesting coin of the group is the gold piece which bears the name at full length of the brave and unfortunate Vercingetorix. The silver money is comparatively common. The Gauls were ready to copy any types that came in their way, so that in the coinage of Gaul we find imitations of the coinage of Tarentum, Campania, various Spanish cities such as Rhoda, and Roman coins of the republic and early empire. The effect of the silver of Massilia and other Greek colonies is especially noticeable in S. Gaul, and the Roman denarius naturally exerted a strong influence. The bronze money of Gaul is still more abundant than the silver, and has a special interest from its characteristic types. Some of the later local coins are casts of an alloy of copper and tin called *potin*, but merely a variety of bronze. The Roman coins recall those of Hispania, but are limited to a few coloniae. They range in date from Antony and Augustus to Claudius. The best-known coins of this time, those struck at the colony of Copia Lugdunum (Lyons) with the "Altar of Roma and Augustus," belong, however, strictly speaking, to the Roman series. The coins of Nemausus (Nîmes), commemorating the conquest of Egypt in the crocodile chained to a palm-tree, were sometimes made in the shape of the hind-leg of an animal, evidently for dedication in the sacred fountain, from the mud of which all the specimens of this variety are derived. *Gaul.*

The ancient coinage of Britain is the child of that of Gaul, retaining the marks of its parentage, yet with characters of its own due to independent growth. Money first came in trade by the easiest sea-passage, and, once established in Kent, gradually spread north and west, until the age of the earlier Roman wars, when it was issued in Yorkshire, probably in Lincolnshire, and in a territory of which the northern limits are marked by the counties of Norfolk, Cambridge, Huntingdon, Bedford, Buckingham, Oxford, Gloucester and Somerset. The oldest coins are gold imitations of Philip's staters, which, whether struck in Gaul or Britain, had a circulation on the British side of the Channel. They are the prototypes of all later money. From a careful comparison of their weights with those of later coins, and from a study of the gradual degradation of the types, Evans places the origin of the coinage between 200 and 150 B.C. Its close may be placed about the middle of the 1st century A.D. The inscribed coins occupy the last century of this period, being contemporary with uninscribed ones. The uninscribed coins are of gold, silver, bronze and tin, the gold being by far the most common. There is small variety in the types, nearly all in gold and silver, and some in copper, presenting in more or less degraded form the original Gaulish type for gold. It may be suspected that all new types and the extremely barbarous descendant of the tin series are of the age of the inscribed coins, or but little earlier. The Channel Islands are remarkable for a peculiar coinage of billon, a very base silver, presenting the usual types modified by Gaulish grotesqueness. The place of this group in the British series is merely accidental; in character as in geography it is Gaulish. *Britain.*

The inscribed coins are evidently in most cases of chiefs, though it is certain that one town (Verulamium) and some tribes had the right of striking money. The most interesting coins are those of known chiefs and their families—of Commius, probably the active prince mentioned by Caesar, of Dubnovellaunus, mentioned in the famous Ancyra inscription, which has been called the will of Augustus, and most of all the large and interesting series of Cunobelinus, Shakespeare's Cymbeline (Pl. I. fig. 2), his brother Epaticcus, and his father Tasciovanus. It is evident from the coins and historical evidence collected by Evans that Tasciovanus had a long reign. His chief town, as we learn from his money, was Verulamium. His coins are in three metals, repeat the traditional types, and present new ones, some showing a distinctly Roman influence. The money of Epaticcus is scanty, but that of Cunobelinus, with Camulodunum (Colchester) for his chief town, is even more abundant than his father's, indicating a second long reign, and having the same general characteristics. The gold shows a modification of the traditional type, the silver and bronze the free action of Roman influence and a remarkable progress in art. With the death of this prince not long before A.D. 43 the bulk of the British coinage probably ceases, none being known of his sons, Adminius, Togodumnus and the more famous Caractacus, but the coins of the Iceni may have continued as late as A.D. 50, and the Brigantes issued silver coins as late as the time of Cartimandua, whose name is partly preserved on one of them.

The ancient coins of Italy occupy the next place. They appear to have been struck during a period of more than 500 years, the oldest being probably of the beginning of the 6th century B.C. and the latest somewhat anterior to the time of Julius Caesar. The larger number, however, are of the age before the great extension of Roman power, which soon led to the use of Roman money almost throughout Italy. There are two great classes, which may be called the proper Italian and the Graeco-Italian; but many coins present peculiarities of both. The proper Italian coins are of gold, silver and bronze. Of these, the gold coins are extremely rare, and can never have been struck in any large numbers. The silver are comparatively common, but the bronze are very numerous and characteristic. A few of the earliest gold and silver coins of Etruria have a perfectly plain reverse. The most remarkable bronze coins of this class are of th kind called *aes grave*, most of which were the early proper coinage of Rome, although others are known to have bec a *Italy.*

issued by other Italian cities. These are very thick coins, some of which are of great size, while most have a rude appearance. They are always cast, and were preceded by formless lumps of bronze, known as *aes rude*, which were not properly a state-coinage. The designs of the Italian coins are generally, if not always, of Greek origin, although the influence of the native mythology may be sometimes traced. The inscriptions are in Latin, Oscan or Etruscan, and follow a native orthography; sometimes on the earlier coins they are retrograde. The art of this class is generally poor, or even barbarous. The denominations are common to Greek money, except in the case of the bronze, which follows a native system. Of this system the early proper Roman coins afford the best known examples. The Graeco-Italian coins are of gold, silver and bronze. The silver and bronze are very common, and the gold comparatively so, although struck by few states or cities. A number of the cities of S. Italy issued in the 6th century coins with an incuse design on the reverse repeating with slight modifications the design of the obverse. The designs are of Greek origin, although here, as in the proper Italian coins, but less markedly, native influence can be detected. This influence is evident in the frequent occurrence of types symbolically representing rivers; showing a bias towards the old nature-worship, and still more in the use of Latin inscriptions, with half-Italian forms of the letters on coins otherwise Greek. Of the best art of ancient Italian money we have already spoken, and we shall have occasion to mention some of its most beautiful examples. The denominations of the gold and silver coins are unquestionably derived from those of Greece, according to the weight of the Attic talent, the heaviest gold piece being the stater or 3000th part of that talent; in silver there are few tetradrachms, the didrachms are extremely common, and smaller denominations are usually not rare. We thus learn that the silver currency was chiefly of didrachms, smaller pieces being less used, and larger ones scarcely used at all. It is important here to notice that the interchange of the native or Italian bronze coinage with the Greek silver coinage led to a double standard, silver and bronze. The bronze standard, as might be suspected, was of Italian origin, the silver of foreign introduction.

The peculiarity of the Italian bronze is that in its oldest cast form it was of such weight as to show the absence in some parts of the country of silver equivalents. It was long after silver had been introduced everywhere, with struck bronze equivalents, before the heavy coinage (aes grave) went out of circulation. The silver money is at first remarkable for the evidence it affords of its extraneous character in presenting two standards. Afterwards it becomes equivalent to the bronze, or supplies equivalent pieces, and is quite regular. The original condition of the Italian currencies is best illustrated by the money of Etruria in the 4th and 3rd centuries B.C. Etruria, be it remembered, was an early goal of oriental commerce by sea. At the great mart of Populonia, and in the country round, we find, besides a few gold coins, not only silver coins of two different foreign standards, the Euboic and the so-called Persic, but also cast aes grave and later struck bronze pieces. Without discussing the origin of these various currencies it is enough to note that they bear witness to the effects of a widely-spread commerce, and show that here was the meeting-point of the native system and of foreign ones.

In Italy the aes grave long ruled. Originally it was libral, the principal coin being the as, nominally of the weight of the Italic pound of 273 grammes; this, at least, is the weight of the earliest Roman coinage. On the other hand, the aes grave of some places in E. Italy, as Hatria and Ariminum, is heavier. The successive reductions of the as belong to Roman numismatics, and it is only necessary here to add that they affected the local bronze coinages as Italy fell under the rule of the republic. The silver coinages, on the other hand, survived for a longer time throughout the Greek cities. Apart from the complicated silver coinage of Etruria, and from the Roman issues, we find in central Italy a few silver coins (the unit of 1·18 grammes being the equivalent, at the rate of 1·250, of a bronze as of 11·10 oz.) and a large silver coinage of didrachms and smaller denominations in lower Italy. This was chiefly issued by the wealthy marts which dotted the coasts of Campania, Calabria, Lucania and the Bruttii. We find Etruscan inscriptions on the coins of Etruria, and Oscan on some of those of middle and lower Italy, where they are eclipsed in number and style by the Greek issues. The chief silver standards of S. Italy are (1) the Campanian (with a didrachm of 7·41 grammes); (2) the Italic, with a stater of 8·16 grammes, divided into thirds; and (3) the Tarentine, with a stater of 8·32 grammes, divided into halves. The Tarentine stater was known as *νοῦμμος*. The independent coinage of Italy, with one exception, came to an end in 89 B.C.

Beginning in the north of Italy, the first coins that strike us are those of Populonia in Etruria. The silver money of this place is generally of the peculiar fabric in which the reverse is left perfectly plain. The aes grave of upper and middle Italy was largely dominated by the issues of the Roman mints at Rome and Capua (to be treated later). Samnium shows us a curious revival of native silver money after the local coinage of the Italian towns had been almost abolished by Rome. It was the result of the Social or Marsic War of the confederate tribes, who struck for Italy against the Roman supremacy during the years between 90 and 88 B.C. The coins present the head of Italia, and reverse types, of which the most striking are warriors, varying in number, taking an oath over a sacrificial pig, and a bull for Italy goring the prostrate wolf of Rome. The inscriptions are Oscan or Latin.

Greek towns of Italy.

Certain of the Greek towns of Italy deserve special mention for the splendour of their coinage—beautiful in style and delicate in execution. In Campania (leaving the Romano-Campanian for later notice) the two most interesting currencies are of Cumae and Neapolis, the modern Naples. Cumae presents silver money of the archaic and the early fine style, in which last we first observe the peculiar naïveté of western Greek art before it had attained elaboration. The abundant silver coins of Neapolis are of the early and the late fine periods and of the decline. The types are usually the head of the siren Parthenope, more rarely Athene; the reverse presents the man-headed bull common on Campanian money, and possibly meant for the river-god Acheloüs, father of the Sirens. The bronze money is of good style, and age has beautified it with the rich blue or green patina due to the sulphurous soil. When we reach Calabria the Greek money startles us in astonishing wealth of beauty in the currency of the opulent and luxurious mart of Tarentum, second only to Syracuse in the whole West, of all the main periods of art, and including in the age of its present prosperity and its fall (the time of the contest with Rome) the most abundant gold issues of any Greek city. The gold money of Tarentum (see Plate) is a delight to the eye, with the varied beauty of its gem-like types, which, while they show the gem-engraver's art, prove the medallist's knowledge of the rich but opaque metallic material. Several heads of divinities adorn these coins, and the chief reverse types relate to the legendary founder, Taras, son of Poseidon. Always a youth, he appears as a charioteer, perhaps as a horseman, and riding on a dolphin—the familiar Tarentine type. The most remarkable subject represents him with outstretched arms praying to Poseidon, probably in allusion to the Tarentines' appeal to Sparta for aid about 346 B.C. (Pl. I. fig. 3). The silver coinage is chiefly of didrachms of reduced Corinthian weight. The prevalent type is Taras seated on a dolphin; in the earliest money the type is single, and repeated incuse on the reverse; afterwards this subject occupies the reverse, and, itself a charming composition, is delightfully varied. On the early fine coins the people or demos, personified generally as a youth, often holding a spindle, occupies the obverse, but gives place in the 4th century to a horseman in various attitudes, affording great scope to the engraver's skill; probably he is Taras himself, save when he is a full-grown warrior. These representations illustrate the famed horsemanship of the Tarentines, and refer to contests and games which were probably local. Heraclea in Lucania shows us didrachms of the fine age, with heads of Athene and subjects connected with Heracles: the contest with the Nemean lion is most skilfully treated, and the series is very characteristic of the gem-engraver's art. The powerful city of Metapontum begins with early coins having the incuse reverse, and then displays a long series stretching down to the decline of art. The constant type, which recurs with the heraldic instinct of the West, is the ear of barley, reminding us of the "golden harvest" (*χρυσοῦν θέρος*) which the Metapontines dedicated at Delphi. Like the Tarentine badge, it first occupies the obverse, then the reverse, balanced by a charming series of heads of divinities. Persephone is the most appropriate counterpart; we also note heads of Concordia (*Ὁμόνοια*) and Hygieia, marked by an ingenuous grace peculiar to the early fine work of the Western school, of Leucippus the founder as a helmeted warrior (occurring on a rare tetradrachm and the usual didrachms), and many other types of unusual variety and originality of conception.

Poseidonia issued coins from the archaic period (beginning with the usual incuse fabric) to its capture by the Lucanians early in the 4th century. Its successor Paestum began to coin about 300, and was allowed to keep its mint open even after 89 B.C., when all other local mints in Italy were closed, until the time of Tiberius.

The ancient Sybaris, famous for her luxury, has left archaic coins; she was, however, destroyed by Croton in 510 B.C. The Athenian colony of Thurium eventually arose near the site of the old Sybaris in 443, and immediately began to issue a splendid series of coins. Not only is the face of the coin occupied by the head of Athene, and the great currency, as at Athens, of tetradrachms, but the severe beauty of the style points to the direct influence of the art of central Greece (Pl. I. fig. 4). The head of Athene is covered by a helmet adorned first with a wreath of olive and then a splendid figure of the sea-monster Scylla. The reverse shows a bull butting (*βοῦφορος*), in a strikingly ideal form. Probably the obverse type affords the nearest reflection of the masterpiece of Pheidias, or at least the closest following of his style.

Velia, the last colony of Phocaea, whose citizens sailed away to the far west rather than submit to the Persian tyrant (544 B.C.), shows coins from its foundation. The pieces of fine work witness to an Asiatic origin in the types of the lion, devouring the stag or as a single device, while the obverse displays the head of Athene so much in favour in Magna Graecia. The style, which lacks strength but not beauty, is Italian, and we see no trace of the pictorial qualities of Ionian art, which indeed had not taken its mature form when the exiles left the mother country.

The Bruttii are the first native Italians whom we find striking a fair Greek coinage. Their gold and silver is of late style, the gold presenting the head of Poseidon and Thetis on a sea-horse, the silver the head of Thetis and the figure of Poseidon, both with other subjects. Caulonia has early coins running down to the early fine period, mythologically interesting in type, and the later with a beautifully designed stag on the reverse. For Croton the ruling type is the tripod. The eagle occurs on the obverse and the tripod on the reverse. The bird of Zeus is inferior to that at Agrigentum, as this again is inferior to the eagle of Elis. We note also beautiful types of Heracles seated, one of marvellously delicate work, on the reverse of which Apollo aims an arrow at the Python from behind his tripod—a remarkable composition. The other Heracles types form a most interesting series of recollections, "memory sketches," of a famous statue, the pose of which recalls the so-called Theseus of the Parthenon, while the obverse presents the head of the Hera Lacinia worshipped on the promontory close by. The latest coins, like the parallel ones of Metapontum, are weak and pretty. The money of the Locri Epizephyrii affords two curious types of reverse, Eirene seated, of fine style, with the legend ΕΙΡΗΝΗ ΛΟΚΡΩΝ, and the later yet more remarkable subject of Roma seated while Pistis crowns her, the legend being ΡΩΜΑ ΠΙΣΤΙΣ ΛΟΚΡΩΝ. There are beautiful coins of the little known town of Pandosia, bearing the head of the nymph Pandosia (?); the reverse has the river Crathis, a splendid head of the Lacinian Hera, and Pan.

Rhegium was closely connected with Messene in Sicily opposite, and thus the great Sicilian currency of tetradrachms prevails. Anaxilaus, tyrant of Rhegium from 494 to 476 B.C., early in his rule acquired Messene through Samian adventurers. The coins of both towns at first present Samian types, and then, the Samians having been expelled, Anaxilaus commemorates his Olympic victory in the mule-car. The same type appears at Messene and last longer. In both cases the reverse bears a running hare, an animal which Anaxilaus introduced into Sicily. The later 5th-century coinage of Rhegium shows a seated figure of the Rhegine Demos, and a fine head of Apollo, by the engraver Hippocrates.

The little-known town of Terina is illustrious as having produced a series of silver didrachms which, on the whole, is the most beautiful in Italy (Pl. I. fig. 5). The obverse has the head of a goddess, who is portrayed winged on the reverse—a wonderfully fine subject, well conceived and most delicately executed in a variety of different attitudes, some recalling the Victories which adorn the balustrade of the temple of Wingless Victory at Athens. Very curiously, the money of Terina begins with an archaic coin which bears on the reverse the named figure of a Wingless Victory, surrounded by the olive-wreath.

Sicily.

The coinage of Sicily is Greek. The Hellenic and Carthaginian colonies of the coast left the barbarous natives undisturbed in the inland country, and both issued Greek money, the Punic with a tincture of Phoenician style. The coinage ranges from the 6th century B.C. until the subjugation of the island by the Romans, after which a few cities struck colonial or imperial coins for a short space. The marked periods are those of the preponderance of Syracuse from 480 to 212 B.C., interrupted by the great Carthaginian wars, which were fatal to the cities of the southern coast. The coinage is in gold and electrum, mainly issued at Syracuse, in silver and in bronze. The standard is Attic, except the earliest money of the Chalcidian colonies Himera, Zancle (Messene), and Naxos, which follows the Aeginetan weight. The metrology of Sicily has a distinct relation to that of Italy. Here also there is a double standard, silver and bronze, and in consequence an intrusive silver coin, differing but little from the obol, weighing 0·87 instead of ·73 grammes, the silver equivalent of the bronze litra, whose name it borrows. The litra in bronze was the Sicilian pound of 218 grammes, equal to half an Attic mina, and to two-thirds of the Roman libra or pound. So important was the litra in Sicily that the silver litra supplanted the obol, and the didrachm was sometimes called a stater of ten litrae, the decadrachm a piece of fifty litrae, pentecontalitron. The leading coin is the tetradrachm, not, as in Italy, the didrachm.

The Sicilian money is of extremely careful artistic work, not unfrequently even in the case of bronze allowing for a more rapid execution of the die; and the highest technical excellence is attained. The art is that of the southern branch of the great Western school, generally more skilful than the art of southern Italy, but less varied. The earlier fine work has a naïve beauty peculiar to the West and almost confined to Sicily; all that follows is evidently gem-engravers' work. These coins are remarkable for the frequency of artists' signatures, which for the short period of highest skill are almost universal on the larger silver money of Syracuse, and occur less frequently on that of the other great cities. Among these artists may be mentioned Exacestidas (at Camarina), Eucleidas, Eumenes, Phrygillus (at Syracuse), Euaenetus (Syracuse, Camarina, Catana), Cimon (Messana, Syracuse Pl. I. figs. 7, 8), Heracleidas and Choirion (Catana). As in Italy, the decline is more rapid than elsewhere in the Greek world, in consequence of the inherent weakness of the style; but it is in part due to the calamities of the island, as of lower Italy.
